FORMATS AND CODES

Q.763

1. General

ISDN user part messages are carried on the signalling link by means of signal units the format of which is described in Recommendation Q.703, section 2.2.

The format of and the codes used in the service information octet are described in Recommendation Q.704, section 13.2. The service indicator for the ISDN user part is coded '0 1 0 1'.

The signalling information field of each message signal unit containing an ISDN user part message consists of an integral number of octets and encompasses the following parts (see Figure 1/Q.763):

- a) routing label;
- b) circuit identification code;
- c) message type code;
- d) the mandatory fixed part;
- e) the mandatory variable part;
- f) the optional part, which may contain fixed length and variable length parameter fields.

Note: The service information octet, the routing label and circuit identification code are not included in the information transferred between the ISDN user part and signalling connection control part.

A description of the various message parts is given in the following sections.

A ^{*} indicates a change from the CCITT Red Book Vol. VI.

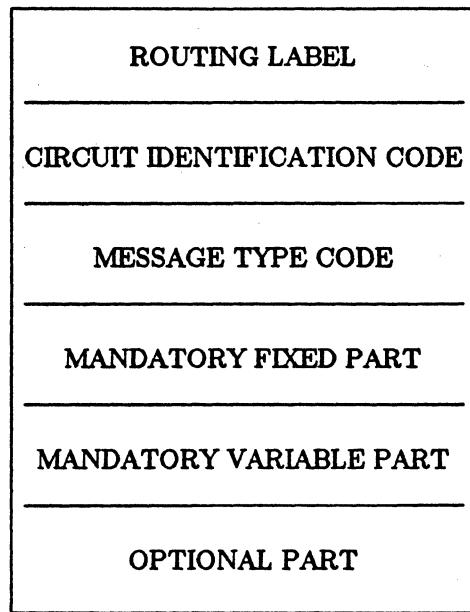

Figure 1/Q.763 - ISDN user part message parts

1.1 Routing Label. The format and codes used for the routing label are described in Recommendation Q.704, section 2.2. For each individual circuit connection, the same routing label must be used for each message that is transmitted for that connection.

1.2 Circuit Identification Code. The format of the circuit identification code is shown in Figure 2/Q.763.

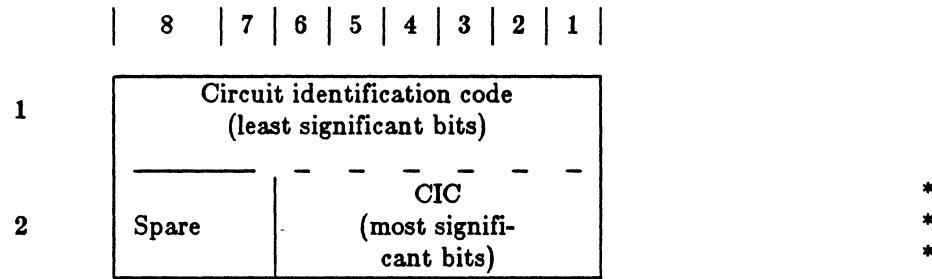

Figure 2/Q.763 - Circuit identification field

The allocation of circuit identification codes to individual circuits is determined by bilateral agreement and/or in accordance with applicable predetermined allocations.

Allocations for certain applications are defined below:

- a) *2048 kbit/s digital path* (Not specified for the U.S. networks.) *
- b) *8448 kbit/s digital path* (Not specified for the U.S. networks.) *
- c) *Frequency division multiplex (FDM) systems in networks using the 2048 kbit/s pulse code modulation standard* (Not specified for the U.S. networks.) *

1.3 Message Type Code. The message type code consists of a one octet field and is mandatory for all messages. The message type code uniquely defines the function and format of each ISDN user part message.

FORMATS AND CODES

Q.763

The allocation with reference to the appropriate descriptive section of this Recommendation is summarized in Table 3/Q.763.

1.4 Formatting Principles. Each message consists of a number of PARAMETERS listed and described in Section 2. Each parameter has a NAME which is coded as a single octet (see Table 4/Q.763). The length of a parameter may be fixed or variable, and a LENGTH INDICATOR of one octet for each parameter may be included as described below.

The detailed format is uniquely defined for each message type as described in Section 3.

A general format diagram is shown in Figure 3/Q.763.

1.5 Mandatory Fixed Part. Those parameters that are mandatory and of fixed length for a particular message type will be contained in the Mandatory Fixed Part. The position, length and order of the parameters is uniquely defined by the message type, thus the names of the parameters and the length indicators are not included in the message.

1.6 Mandatory Variable Part. Mandatory parameters of variable length will be included in the mandatory variable part.

Pointers are used to indicate the beginning of each parameter. Each pointer is encoded as single octet.

The name of each parameter and the order in which the pointers are sent is implicit in the message type. Parameter names are, therefore, not included in the message.

The details of how pointers are encoded is found in Section 2.3. The number of parameters, and thus the number of pointers is uniquely defined by the message type.

A pointer is also included to indicate the beginning of the optional part. If the message type indicates that no optional part is allowed, then this pointer will not be present. If the message type indicates that an optional part is possible, but there is no optional part included in this particular message, then a pointer field containing all zeros will be used.

All the pointers are sent consecutively at the beginning of the variable mandatory part. Each parameter contains the parameter length indicator followed by the contents of the parameters.

1.7 Optional Part. The optional part consists of parameters that may or may not occur in any particular message type. Both fixed length and variable length parameters may be included. Optional parameters may be transmitted in any order. Each optional parameter will include the parameter name (one octet) and the length indicator (one octet) followed by the parameter contents.

1.8 Number of Pointers in a Message. The number of pointers will be equal to the number of mandatory variable parameters in a message, plus one additional pointer if there are any optional parameters allowed in the message.

1.9 End of Optional Parameters Octet. After all optional parameters have been sent an "end of optional parameters" octet containing all zeros will be transmitted.

1.10 Order of Transmission. Since all the fields consist of an integral number of octets, the formats are presented as a stack of octets. The first octet transmitted is the one shown at the top of the stack and the last is the bottom (see Figure 3/Q.763).

Within each octet the bits are transmitted with the least significant bit first.

1.11 Coding of Spare Bits. Spare bits are coded 0 unless indicated otherwise.

1.12 National Message Types and Parameters. If message type codes and parameter codes are required for national uses, the codes chosen should be from the highest code downwards, that is starting at code 1 1 1 1 1 1 1 0. Code 1 1 1 1 1 1 1 1 is reserved for future use. Codes 1 1 1 1 1 1 1 0 to 1 1 1 1 0 * 0 0 0 are reserved for individual network use only.

* * * * *

2.2 Coding of the Length Indicator. The length indicator field is binary coded to indicate the number of octets in the parameter content field. The length indicator does not include the parameter name octet or the length indicator octet.

2.3 Coding of the Pointers. The pointer value (in binary) gives the number of octets between the pointer itself (included) and the first octet (not included) of the parameter associated with that pointer.

The pointer value all zeros is used to indicate that, in the case of optional parameters, no optional parameter is present.

3. ISDN User Part parameters

3.1 Parameter Names. The parameter name codes are given in Table 2/Q.763 together with references to the subsections in which they are described.

FORMATS AND CODES

Q.763

3.2 Access Transport. The format of the access transport parameter field is shown in Figure 4/Q.763.

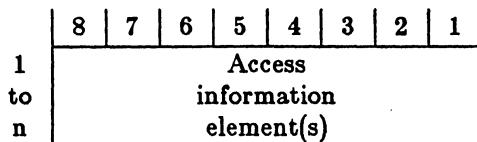

Figure 4/Q.763 - Access transport parameter field

The access information element is coded as described in Recommendation Q.931, section 4.5. Multiple Q.931 information elements can be included within the access transport parameter.

3.3 Automatic Congestion Level. The format of the automatic congestion level parameter is shown in Figure 5/Q.763.

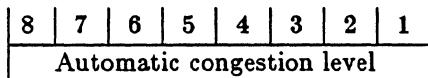

Figure 5/Q.763 - Automatic congestion level parameter

The following codes are used in the automatic congestion level parameter field:

00000000	spare
00000001	ACL 1
00000010	ACL 2
00000011	
to	spare
11111111	

3.4 Backward Call Indicators. The format of the backward call indicators parameter field is shown in Figure 6/Q.763.

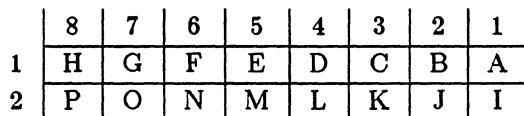

Figure 6/Q.763 - Backward call indicators parameter field

The following codes are used in the backward call indicators parameter field:

bits BA	charge indicator
00	no indication
01	no charge
10	charge
11	spare (interpreted as 00)
bits DC	called party's status indicator
00	no indication
01	subscriber free
10	connect when free
11	call delay at the terminating interface

FORMATS AND CODES

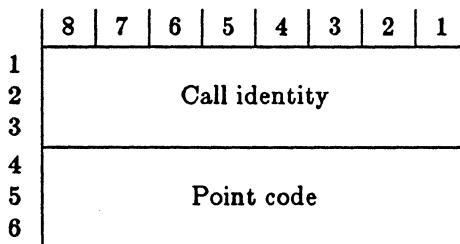

Q.763

bits	FE	called party's category indicator	
	00	no indication	*
	01	ordinary subscriber (non-payphone)	*
	10	payphone	*
	11	spare (interpreted as 00)	*
bits	HG	end-to-end method indicator (note)	
	00	no end-to-end method available	
	01	pass along method available	
	10	SCCP method available	
	11	pass along and SCCP methods available

bit	J	end-to-end information indicator (note)	
	0	no end-to-end information available	
	1	end-to-end information available	
bit	K	ISDN User Part indicator (note)	
	0	ISDN User Part not used all the way	
	1	ISDN User Part used all the way	
bit	L	reverse holding indicator	
	0	reverse holding not required	
	1	reverse holding required	
bit	M	ISDN access indicator	*
	0	non-ISDN access signalling	*
	1	ISDN access signalling	*
bits	N-P	spare	*

Note: Bits G-K constitute the protocol control indicator.

3.5 Call Modification Indicators. [Parameter for further study.]

3.6 Call Reference. The format of the call reference parameter is shown in Figure 7/Q.763.

Note: The least significant octet is send first for each subfield.

Figure 7/Q.763 - Call reference parameter field

The following codes are used in the subfields of the call reference parameter field:

- a) Call identity. A code expressing in pure binary representation the identification number allocated to the call.
- b) Point code. The code of the signalling point in which the call identity is relevant.

FORMATS AND CODES

Q.763

- 3.7 Called Party Number. The format of the called party number parameter field is shown in Figure 8/Q.763.

	8	7	6	5	4	3	2	1	*

1 1 1 1 1 1 0	reserved for expansion	*

c) Numbering plan

0 0 0	spare	*
0 0 1	ISDN (Telephony) numbering plan (CCITT Rec. E.164(E.163))	*
0 1 0	to reserved	*
1 0 0		*
1 0 1	private numbering plan	*
1 1 0	reserved	*

FORMATS AND CODES

Q.763

1 1 1 reserved

*

d) Address information

The address information is divided into 4-bit address signals coded as follows.

0 0 0 0	digit 0
0 0 0 1	digit 1
0 0 1 0	digit 2
0 0 1 1	digit 3
0 1 0 0	digit 4
0 1 0 1	digit 5
0 1 1 0	digit 6
0 1 1 1	digit 7
1 0 0 0	digit 8
1 0 0 1	digit 9
1 0 1 0	spare
1 0 1 1	code 11
1 1 0 0	code 12
1 1 0 1	spare
1 1 1 0	spare
1 1 1 1	ST

The most significant address signal is sent first. Subsequent address signals are sent in successive 4-bit fields. In case of an odd number of address signals, the filler code '0 0 0 0' is inserted after the last address signal.

3.8 Calling Party Number. The format of the calling party number parameter field is as shown in Figure 9/Q.763.

	8	7	6	5	4	3	2	1
1	O/E	Nature of address indicator						
2	Spare	Numbering Plan	Presentation	Screening				
3	2nd address signal		1st address signal					
to								
n								

Figure 9/Q.763 - Calling party number parameter field

The following codes are used in the calling party number parameter field.

a) Odd/even indicator: see para. 3.7 a)

*

b) Nature of address indicator:

*

0 0 0 0 0 0 0	spare
0 0 0 0 0 0 1	unique subscriber number
0 0 0 0 0 1 0	spare, reserved for national use
0 0 0 0 0 1 1	unique national (significant) number
0 0 0 0 1 0 0	unique international number
0 0 0 0 1 0 1	
to	spare

1 1 1 0 1 0 0	non-unique international number	*
1 1 1 0 1 0 1	spare	*
1 1 1 0 1 1 0	spare	*
1 1 1 0 1 1 1	test line test call	*
1 1 1 1 0 0 0		*
	to reserved for network specific codes	*
1 1 1 1 1 1 0		*
1 1 1 1 1 1 1	reserved for expansion	*

c) Numbering plan: see para. 3.7 c)

d) Presentation indicator:

0 0	presentation allowed	*
0 1	presentation restricted	*
1 0	spare	*
1 1	spare	*

e) Screening indicator:

0 0	User provided, not screened	*
0 1	User provided, passed network screening	*
1 0	User provided, failed network screening	*
1 1	Network provided	*

f) Address information: see para. 3.7 e), as applicable

Note: Other types of nature of address indications (e.g. transit exchange identity) are for further study.

3.9 Calling Party's Category. The format of the calling party's category parameter field is shown in Figure 9/Q.763.

| 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |

Calling party's category

Figure 10/Q.763 - Calling party's category indicator parameter field

FORMATS AND CODES

Q.763

The following codes are used in the calling party's category indicator parameter field.

0 0 0 0 0 0 0	calling party's category unknown	
0 0 0 0 0 0 1	operator, language French	
0 0 0 0 0 1 0	operator, language English	
0 0 0 0 0 1 1	operator, language German	
0 0 0 0 1 0 0	operator, language Russian	
0 0 0 0 1 0 1	operator, language Spanish	
0 0 0 0 1 1 0	available to administrations for	
0 0 0 0 1 1 1	selecting a particular language	
0 0 0 1 0 0 0	by mutual agreement	
0 0 0 1 0 0 1	reserved (see CCITT Rec. Q.104)(note)	*
0 0 0 1 0 1 0	ordinary calling subscriber (precedence level 1)	*
0 0 0 1 0 1 1	calling subscriber with priority	*
0 0 0 1 1 0 0	data call (voice band data)	*
0 0 0 1 1 0 1	test call	*
0 0 0 1 1 1 0	non-voice terminal (for further study)	*
0 0 0 1 1 1 1	payphone	*
0 0 1 0 0 0 0	to	
	spare	
1 1 1 1 1 0 0 1		
1 1 1 1 1 0 1 0	calling subscriber with precedence level 2	*
1 1 1 1 1 0 1 1	calling subscriber with precedence level 3	*
1 1 1 1 1 1 0 0	calling subscriber with precedence level 4	*
1 1 1 1 1 1 0 1	calling subscriber with precedence level 5	*
1 1 1 1 1 1 1 0	spare	*
1 1 1 1 1 1 1 1	spare	*

Note: In national networks code 0 0 0 1 0 0 1 may be used to indicate that the calling party is a national operator.

3.10 Carrier selection information The format of the carrier selection information parameter is shown in Figure 11/Q.763.

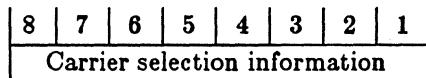

Figure 11/Q.763 - Carrier selection information parameter

The following codes are used:

00000000	no indication(default)	*
00000001	selected carrier ID code presubscribed and not input by calling party	*
00000010	selected carrier ID code presubscribed and input by calling party	*
00000011	selected carrier ID code presubscribed, no indication	*
00000100	selected carrier ID code not presubscribed and input by calling party	*
00000101	to	*
	spare	*
11111110		*
11111111	reserved	*

3.11 Cause indicator The format of the cause indicator parameter field is shown in Figure 12/Q.763.

FORMATS AND CODES

Q.763

8	7	6	5	4	3	2	1	*
1 ext	Coding Standard	0			General Location			*
0/1 ext		Cause Value (class)			(value in class)			*
		Diagnostics (if any)						*

Figure 12/Q.763 - Cause indicator parameter field

Coding standard would be set as follows:

- 00 CCITT standard
- 01 reserved for other internat. standard
- 10 national standard
- 11 network specific

General location would be coded as follows:

- 0000 user
- 0001 local private network
- 0010 local local network
- 0011 transit network
- 0100 remote network
- 0101 remote private network
- 0110 local interface
- 0111 international network
- 1010 unknown (default)

Cause values currently used are as follows:

- 000 normal event class
- 000 0001 unallocated number
- 000 0010 no route to specified transit network
- 000 0011 no route to destination
- 000 0101 misdialled trunk prefix
- 001 normal event class
- 001 0000 normal release
- 001 0001 user busy
- 001 0010 no user responding
- 001 0101 call rejected
- 001 0110 number changed
- 001 1011 destination out of order
- 001 1100 address incomplete
- 001 1111 normal, unspecified (default)
- 010 resource unavailable
- 010 0010 no circuit available
- 010 0110 network out of order
- 010 1001 temporary failure
- 010 1010 switching congestion

FORMATS AND CODES

Q.763

010 1011	access information discarded	*
010 1100	requested channel not available	*
010 1101	preemption	*
010 1111	resource unavailable, unspecified (default)	*
		*
011	service or option not available	*
011 1001	bearer capability not authorized	*
011 1010	bearer capability not presently available	*
011 1111	service not available, unspecified (default)	*
		*
100	service or option not implemented	*
100 0001	bearer capability not implemented	*
100 0110	only restricted digital information available	*
100 1111	service not implemented, unspecified (default)	*
		*
101	invalid message	*
101 1111	invalid message, unspecified (default)	*
		*
110	protocol error	*
110 0001	message type non-existent or not implemented	*
110 0011	parameter non-existent or not implemented	*
110 0100	invalid parameter contents	*
110 0101	parameter non-existent or not implemented - discarded	*
110 1111	protocol error, unspecified (default)	*
		*
111	interworking	*
111 1111	failure unspecified due to interworking (default)	*

Those cause value codepoints which are not specifically labeled are considered reserved.

The format and existence of the diagnostic field is dependant on the cause value and the location of generation. For causes generated within the network, the following diagnostics may be included:

Cause	Diagnostic	Format	*
22	Called party number	see 3.7	*
38	Network identity	see 3.49	*
42	Network identity	see 3.49	*
57	Attribute identity	for further study	*
58	Attribute identity	for further study	*
65	Attribute identity	for further study	*
97-110	Concerned message type or parameter name code	Tables 1-2	*

3.12 Charge Number The format of the charge number parameter field is shown in Figure 8/Q.763.

The following codes are used in the subfields of the charge number parameter field:

- a. Odd/even indicator: see para.3.7a.
- b. Nature of address indicator:

FORMATS AND CODES

Q.763

0 0 0 0 0 0 0	spare	*

10	hardware carrier handling	*
11	spare	*
bits GH	Continuity Check Requirements Indicator	*
00	unknown	*
01	no continuity check	*
10	statistical continuity check	*
11	per call continuity check	*

3.14 Circuit Group Supervision Message Type Indicator. The format of the circuit group supervision message type indicator parameter field is shown in Figure 14/Q.763.

FORMATS AND CODES

Q.763

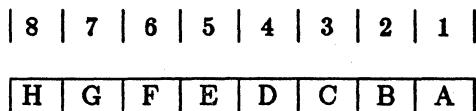

Figure 14/Q.763 - Circuit group supervision message type indicator parameter field

The following codes are used in the circuit group supervision message type indicator parameter field:

bits	BA	
	00	maintenance oriented (no immediate release)
	01	hardware failure oriented (immediate release)
	10	software generated
	11	spare
bits	C-H	spare

3.15 Circuit Identification Name The format of the circuit identification name parameter field is shown in Figure 15/Q.763.

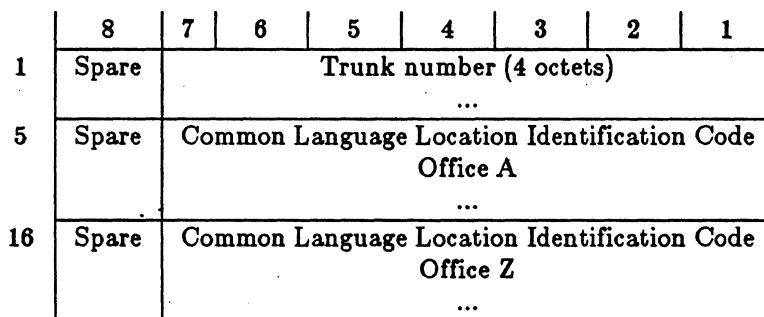

Figure 15/Q.763 - Circuit ID name parameter field

All octets consist of IA5 characters, one per octet. The Common Language Location Identification (CLLI)¹ Code can also be used as separate parameter, in cases where the full CIN is not known.

3.16 Circuit State Indicator The format of the circuit state indicator parameter field is shown in Figure 16/Q.763.

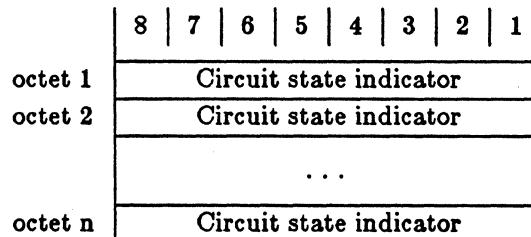

Figure 16/Q.763 - Circuit state indicator parameter field

The number of octets in the circuit state indicator parameter field is equal to the specified range + 1, and is limited to 24 octets (32 internationally). Each circuit state indicator is

1. Common Language and CLLI are registered trademarks of Bell Communications Research, Inc.

FORMATS AND CODES

Q.763

associated with a circuit identification code such that octet n is associated with circuit identification code m+n, where m is the circuit identification code contained in the message.

The following codes are used in each circuit state indicator octet:

bits	HGFEDCBA	Circuit state indicator	*
	00000000	transient	*
	00000001	spare	*
	00000010	spare	*
	00000011	unequipped	*
	00000100	incoming circuit busy, active	*
	00000101	incoming circuit busy, locally blocked	*
	00000110	incoming circuit busy, remotely blocked	*
	00000111	incoming circuit busy, locally and remotely blocked	*
	00001000	outgoing circuit busy, active	*
	00001001	outgoing circuit busy, locally blocked	*
	00001010	outgoing circuit busy, remotely blocked	*
	00001011	outgoing circuit busy, locally and remotely blocked	*
	00001100	idle	*
	00001101	idle, locally blocked	*
	00001110	idle, remotely blocked	*
	00001111	idle, locally and remotely blocked	*
	00010000	spare	*
to			*
	11111111	spare	*

3.17 Circuit Validation Response The format of the circuit validation response indicator parameter field is shown in Figure 17/Q.763.

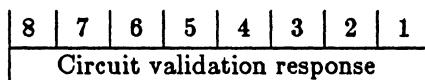

Figure 17/Q.763 - Circuit validation response parameter field

The following codes are used in the circuit validation response indicator parameter field:

00000000	successful	*
00000001	failure	*
other	spare	*

3.18 Closed User Group Interlock Code. The format of the closed user group interlock code parameter field is shown in Figure 18/Q.763.

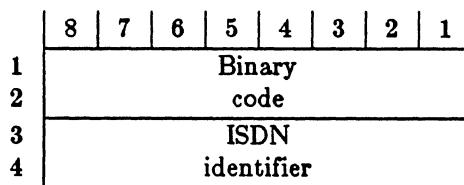

Figure 18/Q.763 - Closed user group interlock code

Note: The least significant octet is sent first for each subfield.

The following codes are used in the subfields of the closed user group interlock code parameter field:

FORMATS AND CODES

Q.763

- a) Binary code
A code allocated to a closed user group in a particular ISDN.
- b) ISDN identifier
A code identifying a particular ISDN (for further study).

3.19 CLLI Code The format of the CLLI code parameter field is shown in Figure 19/Q.763. All octets are coded with IA5 characters.

	8	7	6	5	4	3	2	1	
1	Spare	Town (4 octets)							*
									*
5	Spare	State (2 octets)							*
									*
7	Spare	Building (2 octets)							*
									*
9	Spare	Subdivision (3 octets)							*
									*
									*

Figure 19/Q.763 - CLLI code parameter field

3.20 Connected Number The format of the connected number parameter field corresponds to the format shown in Figure 20/Q.763.

	8	7	6	5	4	3	2	1	
1	O/E	Nature of address indicator							*
2	Spare	Numbering Plan		Presentation		Reserved			*
3	2nd address signal			1st address signal					*
to									*
n									*

Figure 20/Q.763 - Connected number parameter field

The fields are coded as in section 3.8.

3.21 Connection Request. The format of the connection request parameter field is shown in Figure 21/Q.763.

	8	7	6	5	4	3	2	1	
1									*
2	Local reference								*
3									*
4									*
5	Point code								*
6									*
7	Protocol class								*
8	Credit								*

Note: The least significant octet is sent first for each subfield.

Figure 21/Q.763 - Connection request parameter field

The following codes are used in the subfields of the connection request parameter field:

FORMATS AND CODES

Q.763

a) Local reference

A code indicating the local reference allocated by the signalling connection control part to the end-to-end connection.

b) Point code

A code identifying the signalling point at which the connection request originated.

c) Protocol class

A code identifying in pure binary representation the protocol class requested for the end-to-end connection.

d) Credit

A code identifying in pure binary representation the window size requested for the end-to-end connection.

Note: The credit subfield is required only for protocol class 3 and class 4.

3.22 Continuity Indicators. The format of the continuity indicators parameter field is shown in Figure 22/Q.763.

8	7	6	5	4	3	2	1
H	G	F	E	D	C	B	A

Figure 22/Q.763 - Continuity indicators parameter field

The following codes are used in the continuity indicators parameter field:

bit	A	continuity indicator
	0	continuity check failed
	1	continuity check successful
bits	B-H	spare

3.23 End of Optional Parameter Fields Indicator. The last optional parameter field of a message is followed by the end of optional parameter fields indicator, which occupies a one octet field containing all zeros.

3.24 Event Information. The format of the Event Information Indicators parameter is shown in Figure 23/Q.763.

8	7	6	5	4	3	2	1
H	G	F	E	D	C	B	A

Figure 23/Q.763 - Event information parameter

It conveys information about the type of event which caused the message to be sent. The following codes are used in the event information indicators parameter field:

GFEDCBA Event indication

0000000	spare
0000001	alerting
0000010	progress
0000011	inband information or appropriate pattern now available
0000100	call forwarded on busy
0000101	call forwarded on no reply

FORMATS AND CODES

Q.763

0000110	call forwarded unconditional	*
0000111		*
to	spare	*
1111110		*
1111111	reserved	*
Bit H	Event presentation restriction indicator	
0	no indication	*
1	presentation restricted	*

3.25 Facility Indicator. The format of the facility indicator parameter field is shown in Figure 24/Q.763.

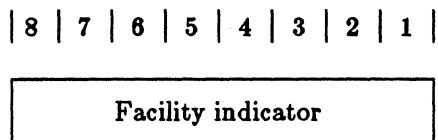

Figure 24/Q.763 - Facility indicator parameter field

The following codes are used in the facility indicator parameter field.

0 0 0 0 0 0 0	spare
0 0 0 0 0 0 1	reserved
0 0 0 0 0 1 0	
to	spare
1 1 1 1 1 1 1	

3.26 Facility Information Indicators. The format of the facility information indicators parameter field is shown in Figure 25/Q.763.

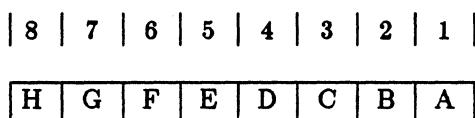

Figure 25/Q.763 - Facility information indicators parameters field

The following codes are used in the facility information indicators parameter field:

bit A	:	Called party free indicator
0		called party busy
1		called party free
bit B	:	Calling party answer indicator
0		no calling party answer
1		calling party answer
bit C	:	Facility request enquiry indicator
0		no enquiry
1		facility request active enquiry
bit D	:	Facility request active indicator
0		facility request not active
1		facility request active

FORMATS AND CODES

Q.763

3.27 Forward Call Indicators. The format of the forward call indicators parameter field is shown in Figure 26/Q.763.

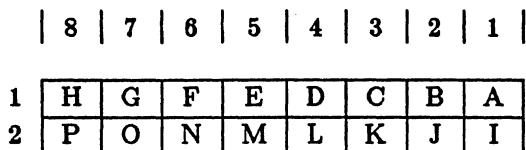

Figure 26/Q.763 - Forward call indicators parameter field

The following codes are used in the forward call indicators parameter field:

bit	A :	National/international call indicator	*
	0	incoming national call	*
	1	incoming international call	*
bits	CB:	End-to-end method indicator (note)	*
	00	no end-to-end method available	*
	01	pass along method available	*
	10	SCCP method available	*
	11	pass along and SCCP methods available	*
bit	D :	Interworking indicator (note)	*
	0	no interworking encountered (No. 7 signalling all the way)	*
	1	interworking encountered	*
bit	E :	End-to-end information indicator (note)	*
	0	no end-to-end information available	*
	1	end-to-end information available	*
bit	F :	ISDN user part indicator (note)	*
	0	ISDN user part not used all the way	*
	1	ISDN user part used all the way	*
bits	HG :	ISDN User Part Preference indicator	*
	00	ISUP preferred	*
	01	no preference	*
	10	ISUP required	*
	11	spare	*
bit	I :	ISDN access signalling indicator	*
	0	non-ISDN access protocol	*
	1	ISDN access protocol	*
bits	H-L:	spare	*
bits	M-P:	reserved for national use	*

Note: Bits B-F constitute the protocol control indicator

3.28 Generic Address The format of the generic address parameter field is shown in Figure 27/Q.763.

FORMATS AND CODES

Q.763

	8	7	6	5	4	3	2	1

3.32 Information Request Indicators. The format of the information request indicators parameter field is shown in Figure 31/Q.763.

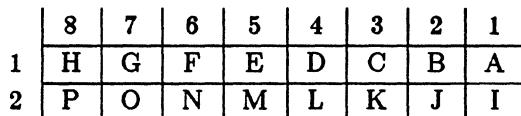

Figure 31/Q.763 - Information request indicators parameter field

The following codes are used in the information request indicators parameter field.

bits	BA:	Calling party address request indicator
	00	calling party address not requested
	01	calling party address requested, hold not required
	11	calling party address requested, hold required
bit	C :	Connected address request indicator
	0	connected address not requested
	1	connected address requested
bit	D :	Calling party's category request indicator
	0	calling party's category not requested
	1	calling party's category requested
bit	E :	Charge information request indicator
	0	charge information not requested
	1	charge information requested
bit	F :	Redirecting address request indicator
	0	redirecting address not requested
	1	redirecting address requested
bit	G :	Index request indicator
	0	index not requested
	1	index requested
bit	H :	Malicious call identification request indicator
	0	malicious call identification not requested
	1	malicious call identification requested

*

FORMATS AND CODES

Q.763

bit I :	Holding indicator
0	holding of the connection not requested
1	holding of the connection requested
bits J-P:	spare

3.33 Nature Of Connection Indicators. The format of the nature of connection indicators parameter field is shown in Figure 32/Q.763.

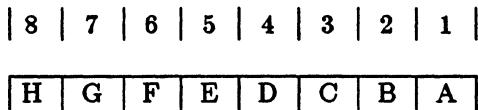

Figure 32/Q.763 - Nature of connection indicators parameter field

The following codes are used in the nature of connection indicators parameter field:

bits BA:	Satellite indicator
00	no satellite circuit in the connection
01	one satellite circuit in the connection
10	spare
11	spare
bits DC:	Continuity check indicator
00	continuity check not required
01	continuity check required on this circuit
10	continuity check performed on a previous circuit
11	spare
bit E :	Echo suppressor indicator
0	outgoing half echo suppressor not included
1	outgoing half echo suppressor included
bits F-H:	spare

3.34 Optional Backward Call Indicators. The format of the optional backward call indicators parameter field is shown in Figure 33/Q.763.

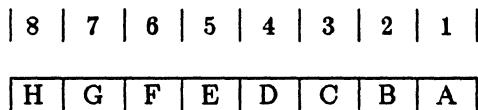

Figure 33/Q.763 - Optional backward call indicators parameter field

The following codes are in the optional backward call indicators parameter field:

bit A	Inband information indicator
-------	------------------------------

FORMATS AND CODES

Q.763

	0	no indication	*
	1	inband information or appropriate pattern now available	*
bit	B	Call forwarding may occur indication	*
	0	no indication	*
	1	call forwarding may occur	*
bits	C-G	spare	*
bit	H	User-network interaction indicator	*
	0	no indication	*
	1	user-network interaction, cut-through of bearer needed	*

3.35 Optional Forward Call Indicators. The format of the optional forward call indicators parameter field is shown in Figure 34/Q.763.

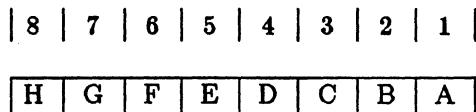

Figure 34/Q.763 - Optional forward call indicators parameter field

The following codes are in the optional forward call indicators parameter field:

bits	BA:	Closed user group call indicator	*
	00	closed user group check successful	*
	01	ordinary call	*
	10	closed user group call, outgoing access allowed	*
	11	closed user group call, outgoing access not allowed	*
bit	C :	spare	*
bit	D :	spare	*
bit	E :	CCBS call indicator	*
	0	not a CCBS call	*
	1	CCBS call	*
bit	F :	spare	*
bit	G :	Calling party address incomplete indicator	*
	0	calling party address complete	*
	1	calling party address incomplete	*
bit	H :	Connected address request indicator	*
	0	connected address not requested	*
	1	connected address requested	*

3.36 Original Called Number The format of the original called number parameter is identical to that shown in Figure 20/Q.763.

The following codes are used in the subfields of the redirection number parameter field:

- a) Odd/even (O/E) indicator: see para. 3.7 a)
- b) Nature of address indicator: see para. 3.7 b)
- c) Numbering plan: see para. 3.7 c)

FORMATS AND CODES

Q.763

- d) Presentation: see para. 3.8 d)
- e) Address information: see para. 3.7 e), as applicable

3.37 Originating Line Information The format of the originating line information parameter is shown in Figure 35/Q.763.

8	7	6	5	4	3	2	1
H	G	F	E	D	C	B	A

Figure 35/Q.763 - Originating Line Information

The codes used in the originating line information parameter are the binary equivalents of the decimal codes used in the II digits of the ANI sequence for inband signalling systems. The decimal codes are assigned and administered by Bell Communications Research. Examples of existing codes are given below.

00000000	Identified Line - No special treatment
00000001	ONI (Multiparty)
00000010	ANI failure (unavailable)
00000110	Hotel (without room identification)
00000111	Coinless, Hospital, Inmate
00001000	InterLATA restricted
00010100	AIOD - listed DN sent
00010111	Coin or non-coin (identified line)
00011000	800 call
00011011	Coin line
01000100	InterLATA restricted - Hotel line
01001110	InterLATA restricted - Coinless line

3.38 Outgoing Trunk Group Number The format of the trunk group number parameter is given in Figure 36/Q.763.

	8 7 6 5 4 3 2 1
1	digit 2
2	digit 4
:	
n	digit 2n
	digit 2n-1

Figure 36/Q.763 - Trunk group number parameter field

The number of octets, n, may be 1, 2 or 3. Most trunk group numbers will consist of four digits. The number will be coded in binary coded decimal. Only an even number of digits will be sent.

3.39 Range And Status. The format of the range and status parameter field is shown in Figure 37/Q.763.

FORMATS AND CODES

Q.763

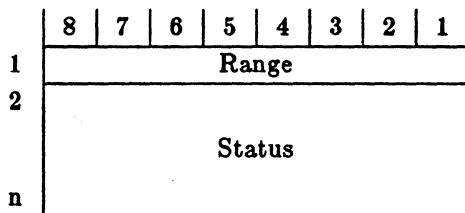

Figure 37/Q.763 - Range and status parameter field

The following codes are used in the subfields of the range and status parameter field:

a) Range

A number in pure binary representation ranging from 0 to 23(31 internationally). Range code 0 * indicates absence of the status field. The number represented by a non-zero range code +1 indicates the range of circuits affected by the message.

b) Status

The status subfield contains from 1 to 24(32 internationally) status bits numbered from 0 to 23(31 internationally). Status bit 0 is located in bit position 1 of the first status subfield octet. Other status bits follow in numerical order. The number of relevant status bits in a given status subfield is equal to range +1.

Each status bit is associated with a circuit identification code such that status bit n is associated with circuit identification code m+n, where m is the circuit identification code contained in the message.

The status bits are coded as follows:

- in circuit group blocking messages
 - 0 no blocking
 - 1 blocking
- in circuit group blocking acknowledgement messages
 - 0 no blocking acknowledgement
 - 1 blocking acknowledgement
- in circuit group unblocking messages
 - 0 no unblocking
 - 1 unblocking
- in circuit group unblocking acknowledgement messages
 - 0 no unblocking acknowledgement
 - 1 unblocking acknowledgement
- in circuit group reset acknowledgement messages
 - 0 no blocking
 - 1 blocking for maintenance reasons

3.40 Redirecting Number. The format of the redirecting number parameter field corresponds to the * format shown in Figure 9/Q.763.

The following codes are used in the subfields of the redirecting number parameter field:

- a) Odd/even indicator: see para. 3.7 a)
- b) Nature of address indicator: see para. 3.8 b)
- c) Numbering plan: see para 3.7 c)

FORMATS AND CODES

Q.763

- d) Presentation indicator: see para. 3.8 d)
- e) Screening indicator: see para. 3.8 e)
- f) Address information: see para. 3.7 f), as applicable

3.41 Redirection Information. The format of the redirection information parameter field is shown in Figure 38/Q.763.

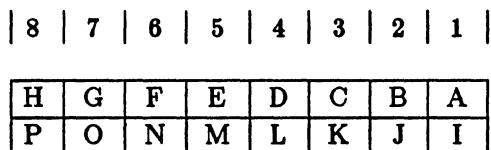

Figure 38/Q.763 - Redirection information parameter field

The following codes are used in the redirection information parameter field:

bits	CBA:	Redirecting indicator
	000	no redirection
	001	call rerouted
	010	call rerouted, redirection information restricted
	011	call forwarded
	100	call forwarded, redirection information restricted
	101	call rerouted, redirection number restricted
	110	call forwarded, redirection number restricted
	111	spare
bit	D :	Call forwarding no reply undergone indicator
	0	false
	1	true
bits	HGFE:	Original redirecting reason
	0000	unknown/not available
	0001	user busy
	0010	no reply
	0011	unconditional
	0100	to spare
	1111	
bits	KJI:	Redirection counter The number of redirections undergone expressed as a binary number in the range 1 to 5
bit	L:	spare
bits	PONM:	Redirecting reason
	0000	unknown/not available
	0001	user busy
	0010	no reply
	0011	unconditional
	0100	to spare
	1111	

FORMATS AND CODES

Q.763

3.42 Redirection Number. The format of the redirection number parameter field corresponds to the format shown in Figure 20/Q.763.

The following codes are used in the subfields of the redirection number parameter field:

- a) Odd/even (O/E) indicator: see para. 3.7 a)
- b) Nature of address indicator: see para. 3.7 b)
- c) Numbering plan: see para. 3.7 c)
- d) Presentation: see para. 3.8 d)
- e) Address information: see para. 3.7 e), as applicable

3.43 Service Code Indicator The format of the service code indicator parameter field is shown in Figure 39/Q.763.

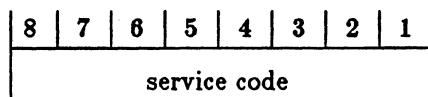

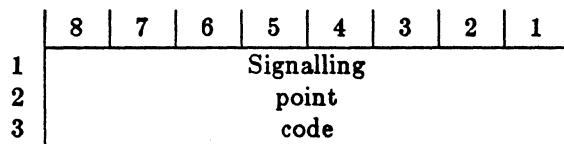

Figure 39/Q.763 - Service code indicator parameter field

The codes used in the service code indicator parameter field are the binary equivalents of the decimal codes used in the Service Code digits for Facility/Service Selective Signalling. These decimal codes are assigned and administered by Bell Communications Research.

3.44 Signalling Point Code. The format of the signalling point code parameter field is shown in Figure 40/Q.763.

Note: The least significant octet is sent first.

Figure 40/Q.763 - Signalling point code

The signalling point code is a pure binary representation of the code allocated to a node in the signalling network.

3.45 Special Processing Request The format of the special processing request parameter field is shown in Figure 41/Q.763.

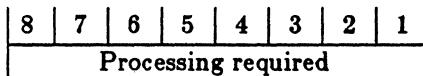

Figure 41/Q.763 - Special processing request parameter

The following codes are used in the special processing request parameter:

00000000 spare

FORMATS AND CODES

Q.763

00000001	reserved for international use, starting with 00000001
to	reserved for national use, starting with 01111110
01111110	
01111111	SSP processing required
10000000	
to	reserved for network specific use
11111110	
11111111	reserved

3.46 Supplementary Line Information The format of the supplementary line information parameter field is shown in Figure 42/Q.763.

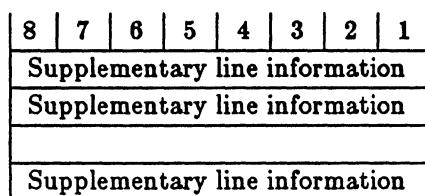

Figure 42/Q.763 - Supplementary line information parameter

Coding of the octets is for further study.

3.47 Suspend/Resume Indicators. The format of the suspend/resume indicators parameter field is shown in Figure 43/Q.763.

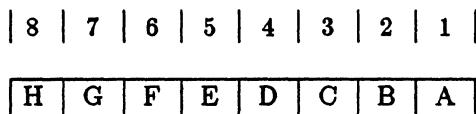

Figure 43/Q.763 - Suspend/Resume indicators parameter field

The following codes are used in the suspend/resume indicators parameter field:

bit	A:	Network initiated indicator
0:		ISDN subscriber initiated
1:		network initiated
bits	B-H:	spare

3.48 Transaction Request The format of the transaction request parameter is shown in Figure 44/Q.763.

FORMATS AND CODES

Q.763

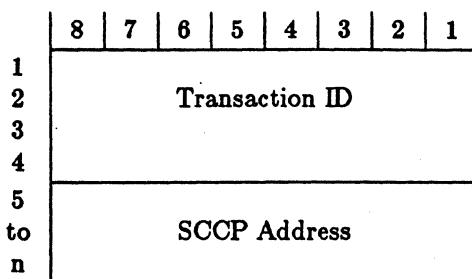

Figure 44/Q.763 - Transaction request parameter field

The Transaction ID field is used to identify a Transaction Capabilities interaction that is to be associated with further call processing by the TC Application Specific Entity (ASE) indicated in the SCCP address field. It is coded per paragraph 3.5 of Q.773.

The SCCP address field is used to identify a TC ASE at a signalling point in the network. It is coded per paragraph 3.4 of Q.713.

3.49 Transit Network Selection The format of the transit network selection parameter is shown in Figure 45/Q.763.

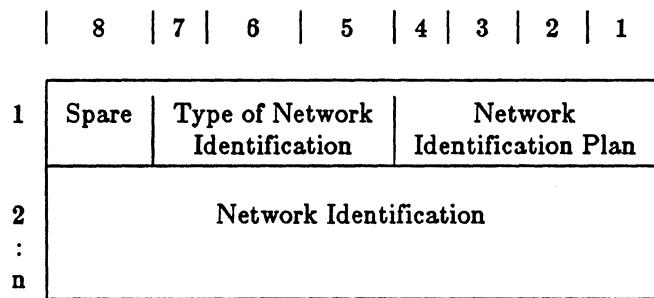

Figure 45/Q.763 - Transit network selection parameter field

The following codes are used in the subfields of the transit network selection parameter field:

a) Type of network identification

- 0 0 0 CCITT-standardized identification
- 0 1 0 national network identification
- other reserved

b) Network identification plan

i. CCITT-standardized identification

- 0 0 0 0 unknown
- 0 0 1 1 public data network identification code
(DNIC - CCITT Recommendation X.121)
- 0 1 1 0 public land mobile network identification code
(MNIC - CCITT Recommendation E.212)
- other reserved

(Routing to these networks using the ISDN User Part is for further study.)

ii. National network identification

FORMATS AND CODES

Q.763

0 0 0 0	unknown	*
0 0 0 1	Carrier identification code with circuit code (Three digit code for interexchange carrier, plus circuit code. Coding for interexchange carrier is administered by Bell Communications Research.)	** ** ** ** **
other	reserved	*
		*

c) Network identification

Currently, only the national network identification carrier identification code is required to be recognized for routing purposes. The network identification in that case is shown in Figure 46/Q.763.

8	7	6	5	4	3	2	1	
				2nd digit	1st digit			
				Circuit code	3rd digit			

Figure 46/Q.763 - Carrier Identification Code with Circuit Code

The four bits allocated for circuit code are coded as follows:

0000	unspecified	
0001	international call, no operator requested	
0010	international call, operator requested	
0011	to spare	
0111		
1000	to network specific use	
1111		

3.50 User Service Information. The format of the user service information parameter field is shown in Figure 47/Q.763. This format is the same as the bearer capability information element from CCITT Recommendation Q.931 and not all capabilities coded here are supported at this time.

	8	7	6	5	4	3	2	1	
1	1	Coding standard	Information transfer capability						
2	ext	transfer mode	Information transfer rate						
2a	ext	Structure		Configur.	Establishment				
2b	1	Symmetry	Information transfer rate (destination → origination)						
3	Multiplier or Layer Identification	Bearer capability multiplier/ Protocol identification							
	ext								

Figure 47/Q.763 - User service information parameter field

- Notes:
- o Octet 2a may be omitted, except when 2b is present.
 - o Octet 2b may be omitted.
 - o Octet 3 may be omitted. It may also be repeated; e.g. to identify several protocols at one or more layers.

FORMATS AND CODES

Q.763

The following codes are used in the subfields of the User service information parameter field:

- a) Extension indicator (ext)
 - 0 octet continues through the next octet
(e.g. octet 2 to 2a, 2a to 2b, 3 to 3a)
 - 1 last octet
- b) Coding standard
 - 0 0 CCITT standardized in this recommendation
 - 0 1 reserved for other international standards
 - 1 0 national standard
 - 1 1 reserved
- c) Information transfer capability
 - 0 0 0 0 speech
 - 0 1 0 0 unrestricted digital information
 - 0 1 0 1 restricted digital information (note)
 - 1 0 0 0 3.1 kHz audio
 - 1 0 0 0 1 7kHz audio
 - 1 0 0 1 0 15 kHz audio
 - 1 1 0 0 Video

All other values are reserved

Note: Only permitted in conjunction with 64 kbit/s information transfer rate. See CCITT Recommendation I.340, Appendix 1, for details.

- d) Transfer mode
 - 0 0 circuit mode
 - 1 0 packet mode

All other values are reserved for further study
- e) Information transfer rate (octets 2 and 2b) (note)
 - 0 0 0 0 channel size
 - 1 0 0 0 0 64 kbit/s
 - 1 0 0 1 1 384 kbit/s
 - 1 0 1 0 1 1536 kbit/s
 - 1 0 1 1 1 1920 kbit/s

All other values are for further study. The definition of throughput rates for packet-mode bearer capabilities is for further study; 0 0 0 0 shall be used for packet mode calls.

Note: When octet 2b is omitted, the bearer capability is bidirectional symmetric at the information transfer rate specified in octet 2. When octet 2b is included, the information rate in octet 2 refers to the origination → destination direction.
- f) Structure
 - 0 0 0 default (note)
 - 0 0 1 8 kHz integrity
 - 1 0 0 service data unit integrity
 - 1 1 1 unstructured

All other values are reserved

Note: If octet 2a is omitted, or the structure field is coded 0 0 0, then the value of the structure attribute is according to the following:

<i>transfer mode</i>	<i>transfer capability</i>	<i>structure</i>	*
----------------------	----------------------------	------------------	---

FORMATS AND CODES

Q.763

circuit	speech	8 kHz integrity	*
circuit	unrestricted digital	8 kHz integrity	*
circuit	restricted digital	8kHz integrity	*
circuit	audio	8kHz integrity	*
circuit	video	8kHz integrity	*
packet	unrestricted digital	service data unit integrity	*

- g) Configuration
 - 0 0 point-to-point
 - 1 0 multipoint
 - All other values are reserved for further study. If omitted, the configuration is assumed to be point-to-point.
- h) Establishment
 - 0 0 demand
 - All other values are reserved for further study. If omitted, the establishment is assumed to be demand.
- i) Symmetry
 - 0 0 bidirectional symmetric
 - 0 1 bidirectional asymmetric
 - 1 0 unidirectional (origination → destination)
 - 1 1 undirectional (destination → origination)
 - If omitted, the symmetry is assumed to be bidirectional symmetric.
- j) Multiplier or layer identification
 - 0 0 bearer capability multiplier:
 - bits 5-1 represent the number (binary encoding) of instances of bearer capability requested; e.g. "00010" means two instances of the described bearer capability are requested
 - 0 1 user information layer 1 protocol
 - 1 0 user information layer 2 protocol
 - 1 1 user information layer 3 protocol

Note: When this subfield indicates a user information protocol, bits 5-1 of the same octet represent the corresponding identification as per sections k, l, and m below.
- k) User information layer 1 protocol identification
 - 0 0 0 0 CCITT Recommendation I.412; no additional layer 1 protocol specified for this bearer capability
 - 0 0 0 1 Rate adaption: the extension bit in this octet is set to "0" and the following octet is coded:

8	7	6	5	4	3	2	1	*
1	Spare				rate			*

The rate is encoded as follows:

	synchronous rate	CCITT reference	*
0 0 0 0 0	—		*
0 0 0 0 1	0.6 kbit/s	Rec X.1 and I.461	*

FORMATS AND CODES

Q.763

0 0 0 1 0	1.2 kbit/s	Rec. X.1 and I.461	*
0 0 0 1 1	2.4 kbit/s	Rec. X.1 and I.461	*
0 0 1 0 0	3.6 kbit/s	Rec. V.5 and I.463	*
0 0 1 0 1	4.8 kbit/s	Rec. X.1 and I.461	*
0 0 1 1 0	7.2 kbit/s	Rec. V.5 and I.463	*
0 0 1 1 1	8.0 kbit/s	Rec. I.460	*
0 1 0 0 0	9.6 kbit/s	Rec. X.1 and I.461	*
0 1 0 0 1	14.4 kbit/s	Rec. V.5 and I.463	*
0 1 0 1 0	16.0 kbit/s	Rec. I.460	*
0 1 0 1 1	19.2 kbit/s	Rec. V.5 and I.463	*
0 1 1 0 0	32.0 kbit/s	Rec. I.460	*
0 1 1 0 1	48.0 kbit/s	Rec. X.1 and I.461	*
0 1 1 1 1	56.0 kbit/s	Rec. I.463	*

0 0 0 1 0 Rec. G.711 u-law speech *

0 0 0 1 1 Rec. G.711 A-law speech *

0 0 1 0 0 Rec. G.721 32 kbit/s ADPCM and Rec. I.460 *

All other values are reserved for further study. *

l) User information layer 2 protocol identification *

0 0 0 0 0 undefined *

0 0 0 0 0 Rec. Q.921 (I.441) *

0 0 1 0 0 Rec. Q.710 *

0 0 1 1 0 Rec. X.25 link level *

All other values are reserved for further study. *

m) User information layer 3 protocol identification *

0 0 0 0 0 undefined *

0 0 0 1 0 Rec. Q.931 (I.451) *

0 0 1 1 0 Rec. X.25 packet level *

All other values are reserved for further study. *

Note: If octet 3 is omitted, the user information low layer protocols are assumed to be undefined. Octet 3 *may* be omitted if the transfer mode is "circuit-mode" and the information transfer capability is "unrestricted digital information" or "restricted digital information"; otherwise octet 3 must be provided.

3.51 User-To-User Information. The format of the user-to-user information parameter is shown in Figure 48/Q.763. This field is used to carry the contents of the User-user information element described in Recommendation Q.931, and is not interpreted by the network.

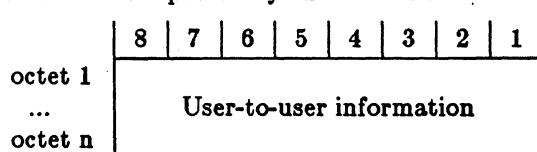

Figure 48/Q.763 - User-to-user Information Parameter

4. ISDN User Part Messages And Codes

4.1 General.

4.1A Message Tables. In the following the format and coding of ISDN user part messages is specified.

For each message a list of the relevant parameters is given in a tabular form.

FORMATS AND CODES

Q.763

4.1B Parameter References. For each parameter the table also includes:

- *a reference* to the section where the formatting and coding of the parameter content is specified;
- *the type* of the parameter. The following types are used in the tables:
 F = mandatory fixed length parameter;
 V = mandatory variable length parameter;
 O = optional parameter of fixed or variable length;
- *the length* of the parameter. The value in the table includes:
 - *for the type F parameters* the length, in octets, of the parameter content;
 - *for type V parameters* the length, in octets, of the length indicator and of the parameter content. The minimum and the maximum length are indicated;
 - *for type O parameters* the length, in octets, of the parameter name, length indicator and parameter content.

For variable length parameters the minimum and maximum length is indicated.

4.1C Principles. For each message type, type F parameters and the pointers for the type V parameters must be sent in the order specified in the following tables.

The routing label and circuit identification code fields, which are transmitted ahead of the message type field if required are not shown. Parameter names, pointer to variable mandatory fields and length indicators appear in the message in accordance with Figure 1/Q.763 and are not shown explicitly in Tables 3-23/Q.763.

Table 14/Q.763 -

Message type: Facility accepted
Facility deactivated
Facility request

Parameter	Reference section	Type	Length (octets)
Message type	2.1	F	1
Facility indicator	3.25	F	1
Called party number	3.7	O	5-12
Calling party number	3.8	O	5-12
Compatibility information	note	O	note
Call reference	3.6	O	8

*

FORMATS AND CODES

Q.763

Table 19/Q.763 -
 Message type: Information request

Parameter	Reference section	Type	Length (octets)
Message type	2.1	F	1
Information request indicators	3.32	F	2
Call reference	3.6	O	8
Connection request	3.21	O	10

Table 20/Q.763 -
 Message type: Initial address

Parameter	Reference section	Type	Length (octets)
Message type	2.1	F	1
Nature of connection indicators	3.33	F	1
Forward call indicators	3.27	F	2
Calling party's category	3.9	F	1
User service information	3.50	V	3-?
Called party number	3.7	V	4-11
Transit network selection	3.49	O	3-5
Call reference	3.6	O	8
Calling party number	3.8	O	5-12
Optional forward call indicators	3.35	O	3
Redirecting number	3.40	O	5-12
Closed user group interlock code	3.18	O	6
Connection request	3.21	O	10
User-to-user information	3.51	O	3-130
Access transport	3.2	O	3-?
Carrier selection	3.10	O	3
Generic address	3.28	O	6-?
Generic digits	3.29	O	5-?
Original called number	3.36	O	5-12
Redirection information	3.41	O	3-4
Service code indicator	3.43	O	3
Supplementary line information	3.46	O	3-?
Special processing request	3.45	O	3
Transaction request	3.47	O	8-?
Charge number	3.12	O	3-12
Originating line information	3.37	O	3

FORMATS AND CODES

Q.763

Table 21/Q.763 -
Message type: Pass along

Parameter	Reference section	Type	Length (octets)
Message type	2.1	F	1
Any of the messages defined in Table 5-22/Q.763			

Table 22/Q.763 -
Message type: Release

Parameter	Reference section	Type	Length (octets)
Message type	2.1	F	1
Cause indicator	3.11	V	4-10
Access transport	3.2	O	3-?
Automatic congestion level	3.3	O	3
Call reference	3.6	O	8
Closed user group interlock code	3.13	O	6
Redirection information	3.41	O	3-4
Redirection number	3.42	O	5-12
Redirecting number	3.40	O	5-12
Signalling point code (Note 2)	3.44	O	5
User-to-user information	3.51	O	3-130

Note 2: For national use only
