# Introducing Model 9300

## Quality that's Quick & Quiet

Model 9300 Vacuum Column digital tape transport has characteristics common to all Kennedy recorders — and a few new ones. It's quick (1/25ips), quiet (noise level of less than 70db), and it has the built-in quality of all Kennedy products.

Utilizing side-by-side vacuum columns and a capacitive tape-location detector for improved tape life, air bearings and Tribaloy coated read-after-write heads to reduce tape wear and improve data integrity, Model 9300 is ideal for minicomputer and data collection applications requiring complete reliability at high tape speeds.

Model 9300 comes complete with all the operational features of the 9000 Series. Performance is guaranteed by crystal controlled timing, read threshold scanning, our

read-after-write shortened skew gate and other exclusive Kennedy features. Operation is simplified by such operator-oriented features as a front-accessible test panel, quick-release hubs and simplified tape loading.

Model 9300 has a standard tape speed of 1/25ips, with data densities of 200/556cpi or 556/800 on the 7-track unit and 800cpi, 1600cpi or 800/1600cpi on the 9-track transport. The format is INRZ/VPE.

Model 9300 is not only quick and quiet — it's very competitive. That's quite a lot, considering the Kennedy quality.

## The DREAM Machine

### CMC introduces the all new XL40 Distributed KeyProcessing™ System.

**Blending Data Retrieval, Entry And Management**, the XL40 combines the newest distributed processing and data entry technology with an exceptional file retrieval capability. *Distributed KeyProcessing* means data is entered, validated, and managed at the source—where it originates—by people who really know what the information represents. Distributed KeyProcessing reduces your data processing costs by detecting and correcting errors before they reach the mainframe, providing local pre-processing, and optimizing the management of your organization's data.

**First in a family** of CMC Distributed KeyProcessing Systems, the XL40 is available with one to seven keystations in a choice of keypunch-style keyboard or typewriter style with numeric pad, and features expandable disk capacity from 4.4 to 35.2 megabytes. Using a variety of industry-standard protocols, including HASP workstation, the XL40 communicates with your mainframe wherever it's located.

CIRCLE 4 ON READER CARD

**Your software dreams come true** with a fully compatible subset of ANSI COBOL and XL/OS, an automatic and dynamic multi-task operating system specially designed for the XL family. XL/OS provides disk and memory allocation, ensures data and system integrity, and controls all system resources. The XL40's information retrieval package, COSAM (COBOL Shared Access Method) features indexed files which you can retrieve and update on the spot, ensuring instantaneous response at the source.

**Don't just dream about it**, call or write today for our brochure on the XL40 Distributed KeyProcessing System, The DREAM Machine for Data Retrieval, Entry And Management. With the XL40, just as with dreams... the possibilities are unlimited.

KeyProcessing is a trademark of

## **IN FINANCIAL PACKAGING, THERE IS ONLY ONE ALTERNATIVE TO ITEL.**

And that's no exaggeration, either.

It's something we can back up with fact after fact.

Take our Packaged Lease, for example. We not only supply you with a total computer system (comparable to the best of IBM), but we

supply it all at the lowest possible prices.

The savings are enormous.

Moreover, if you want, you can sublease everything at attractive rates—making our Packaged Lease a virtual no risk proposition.

It's this kind of all out creative effort that has put us right up there with IBM. Not only in financial packaging. But in field engineering. In computer peripherals. In systems and software. In total computer capability.

When it comes to experience and reputation, it's either IBM. Or ITEL.

When you get to price/performance, however, there is no alternative.

There is only ITEL.

VOLUME 22 NUMBER 12

This issue 141,700 copies

DECEMBER 1976

## FEATURES

### 50 POWER, POLITICS AND DP

**Joseph Rue.** A Machiavellian handbook of survival for the dp manager.

### 53 HUMANIZING INFORMATION SYSTEMS

**Theodor D. Sterling and Kenneth Laudon.** Ombudsmen expose another kind of computer abuse.

### 61 THE COMPUTERIZED "LIBRARIAN"

**R. A. Baker and J. C. Jefferies.** Where a Librarian is needed, the position can sometimes be filled by a program.

### 67 SOURCE PROGRAM MANAGEMENT

**Larry K. Miller and David Ostrom.** That Librarian program might be nearly free, too.

### 79 SOFTWARE ENGINEERING AND LIFE CYCLE PLANNING

**Robert L. Patrick.** For those who are more interested in

getting the work out than in creating a new programming language.

### 83 RAMIS AT CITIBANK

**Robert E. Roach.** IMS was too difficult, MARK IV too rigid.

### 94 OS/CB Release 1

**Gary P. Becker.** An unusual memory trace for all our good buddies out there.

### 99 ON THE DP ROAD TO SOUTHEAST ASIA

**Bill Orr.** Technology transfer, leapfrogging, and the search for regional identity in Southeast Asia.

### 108 SOFTWARE PACKAGE RATINGS

**Herbert L. Gepner.** Everyone has heard the vendors' claims for these 250 popular packages; now here's what the users say.

### 146 IBM'S SERIES/1 MINICOMPUTERS

**Angeline Pantages and Philip Dorn.** The giant again enters a market late—but with massive resources.

### 199 FORUM

**John M. Eger.** Datran was the victim of a massive overdose of obstruction administered by Ma Bell.

## NEWS IN PERSPECTIVE

### 148 CONFERENCES

Info 76 conference in Chicago drew the types that exhibitors consider to be their kind of people.

### 150 COMPANIES

Canada's Consolidated Computer is on the road to recovery—again.

### 156 MICROCOMPUTERS

Mini/Micro show is a success in an awkward way.

### 157 SERVICES

Change is focus of Adapso talks.

### 159 ANTITRUST

West Coast cases open in Los Angeles with CalComp vs. IBM.

### 162 MANAGEMENT

DPMA makes good in Las Vegas.

### 163 ELECTRONIC FUNDS TRANSFER

EFT: other issues and legislation.

### 166 COMMUNICATIONS

Bell wears people down to capture markets from a to z.

### 172 BENCHMARKS

Justice Dept. vs. Bell; deButts on Bell bill; Another carrier; Another voice in Washington; Must improve service; High rating for DEC; Quadrupled earnings; Components firms merge; But no trophy.

## DEPARTMENTS

# DMS/OS

## THE ONLY COMPLETE DASD MANAGER

### ARCHIVAL

Data set and PDS member group designation • multiple versions of archived data • inclusion/exclusion of PDS member groups • data set and member index display and update • **TRANSPARENT RESTORE**

### SELECTIVE DUMP/RESTORE

Copy to archive • designation of number of copies • direct by data set name • PDS member and member group selectivity

### VOLUME CONFIGURATOR

Fragmentation control of individual modules • data sets from multiple volumes to one volume • selective reblocking and reallocation • designation of data sets by group • position control of data sets on target volume • 3 modes of operation simulate/allocate/migrate

### PDS MANAGEMENT

Tailored data set status reporting • member n-up listing • group reporting of members • capacity threshold notification • compression of directory and member reallocation

### DATA SET RETENTION CONTROL

Automatic scratch/archival • optional user modification • six scratch options

### INTEGRITY

Transparent restart • generation and recovery of files and tables • duplication of archived tapes • archive index reconstruction of archived tapes • reserves and dequeues of shared DASD • audit trail/and traces

### MANAGEMENT REPORTS

Idle space calculations • table for format control • volume allocation summaries • data selection during VTOC scan • single JCL procedure for all reports

### ADDITIONAL SUPPORT MODULES

1. DASD Space Billing (track days, megabytes, device type, user option)
2. TSO Command Processor
3. CICS, IMS/TP Interface
4. MSS Support (3850 Compatible)

DMS/OS is designed and documented to be self installable and requires no OS modification assemblies or link edits. DMS/OS is available for all versions of the full IBM 360/370 operating system (MFT, MVT, VS1, VS2, MVS and VM) and supports all current IBM compatible drives.

\*DOS V/S version available first qtr. 1977

# The LIBRARIAN® and MetaCOBOL® from ADR Boost Efficiency at Computer Power, Inc.

Computer Power, Inc., Jacksonville, Florida, provides complete data processing services for a number of banks, mortgage bankers and saving and loans whose mortgage portfolios have over 1,250,000 mortgage loans valued at over 24 billion dollars.

Over 8,400 program modules are now used to provide client services—modules which require storage space equivalent to 2.7 million card images.

**Until The LIBRARIAN was installed, program storage and management was an expensive and time consuming problem**

According to Technical Support Manager Roy Fileger, "Before we installed The LIBRARIAN, we stored everything on 17 IBM model 2314 disk packs. That meant we had 17 different source statement libraries. We were making 1000 pack changes a month and we were spending over 50 hours of computer time each month reorganizing files."

"Program standardization was a problem too. Programmers would make changes to one pack and not duplicate the changes on the other packs."

**The LIBRARIAN enabled Computer Power, Inc., to cut disk storage by 94%.**

After The LIBRARIAN was installed 2 years ago the entire source statement library was immediately compressed with the result that Computer Power, Inc., using the IBM 3330 disk system, now stores all of its 8400 program modules on a single disk, constantly on-line. The benefits were far greater than just the savings in disk use, however. Time required for file reallocation was virtually eliminated. Elimination of disk shutdowns and disk changes added another 50 hours a month of usable computer time. And standardization rapidly improved because common program changes no longer had to be duplicated on many different disks.

**"We really have file backup now. And that's tremendous."**

Roy Fileger remembers, "When we had 17 packs our backup and savings procedures were extremely time consuming. Now, with The LIBRARIAN and only one disk pack, we are able to save everything every single day in just 20 minutes."

**ADR's MetaCOBOL is doing more than just conversion.**

Computer Power, Inc., is in the final phases of conversion of more than 6000 program modules from DOS to OS/ANS. According to Roy Fileger, "We're running through MetaCOBOL and coming out with state-of-the-art programs, OS/ANS, single entry, single exit with I/O completely changed. All the programs we have converted so far have executed perfectly the first time."

**Programs are being standardized as they go through MetaCOBOL.**

"Everything coming out is looking alike. MetaCOBOL is picking up errors in violation of COBOL specifications that the compilers would let go through. As a result, our programs are really coming out clean," he continued.

**"As far as I know, there is no alternative to MetaCOBOL."**

"Any other system would have required hand-made changes involving a staggering amount of time," Roy Fileger added.

ADR software products are an integral part of over 5,000 installations worldwide. Each ADR product is not just a program, but a complete package with full documentation and on-site support. ADR is the only software company with 50 branch offices and representatives in 31 countries—each staffed with ADR-trained technicians.

**APPLIED DATA RESEARCH** THE SOFTWARE BUILDERS®

ADR software products: in use at over 5,000 installations worldwide.

U.S. offices in Boston (617) 245-9540, Chicago (312) 694-2244, Cleveland (216) 228-0880, Houston (713) 526-3188, Los Angeles (213) 826-5527, New York (212) 986-4050, Princeton (609) 924-9100, Washington (703) 281-2011.

# "You can't buy a 132-column printer for any less. Or, get any more."

Bob Howard, President, Centronics

But the low initial  
price for the Centronics 700 Series  
132-column printer isn't the whole story.

It's the lower cost of ownership based on the 700's  
inherent reliability and simplified construction.

The 700's unique modular construction using four different modules — printing, electronics, forms handling and keyboard — and less moving parts mean easier maintenance, lower cost and a smaller spares inventory.

Write for the full details of this tremendous offer . . . and information on the rest of the printers and teleprinters in the new Centronics 700 Series.

**Centronics means more than low price.**

And more than hardware. It's the widest range of models, features, options  
• Financially strong • Proven delivery response • Over 70,000 printers installed • 109 world-wide sales/service locations • Stringent quality control • Advanced R&D and manufacturing • Long-term spare parts availability • Customizing for specific needs.

## With Malik aforethought

Oh dear, oh dear! I have upset Mr. Gardner [see the review of Mr. Malik's *And Tomorrow the World? Inside IBM*, September p. 29] that he should splutter on in such an incoherent fashion. However, whatever else he may write, he should not be allowed to actively misrepresent me without challenge.

Why sources, when quoted, are not identified, the reliance placed on IBM documents which have or are appearing in the lawsuits it has and is involved in, and the fact that the conclusions were arrived at after the study of the evidence, all this was carefully explained in the book, some of it at length.

Mr. Gardner is entitled to disagree with what I wrote, or the reasons for doing so. He is entitled to challenge the reasons, but before doing so he should at least read them.

As to the charge of animosity, a blanket charge at that, it must also be denied. I found the case against IBM at times overwhelming, and where I did so, I wrote accordingly. I dislike the implication within Mr. Gardner's review that while it is permissible, to write pro or "objective" material about IBM, it is not permissible to write otherwise. That smacks much too much of the sort of writing with which this industry is too often treated, or, not to put too strong a term on it, PR flakery.

As to the history, in the twentieth century, Turing is the boy. One must go by the evidence, even if you have to wait for my next book but two to find it. Though it's not too difficult, it has been there all along if you know where to look.

As I wrote in *And Tomorrow . . . The World: Inside IBM*, "The mythology of American knowhow, Yankee shrewdness and foresight can stand on its own quite effectively without having to be stretched to encompass things which were, and are, manifestly not true." I try to deal in truth, or the nearest approximation to it that one can get at. History is not about whether the Russians, Americans, British or Germans are ten feet tall; it is about what actually happened, and why it did so. While the truth is supposed to set you free, freedom is not necessarily comfortable.

Anyway, thanks for "the only game in town." And there, given that I live in Europe, and IBM is an American

company, is a reflection on our profession.

REX MALIK  
*London, England*

Mr. Gardner replies: I remain consistent in my feelings about Mr. Malik's writing: I find his letter as muddled as his book. For the record, I did read his book, but it was very tough going.

## Another manager's view

In Jackson Granholm's article, "The View from the Manager's Office," (August p. 52), an individual was interviewed who expressed some very negative feelings about data processing in the public school systems. As Chairman of the California Association of School Business Officials, Data Processing Research & Development Committee, and being well acquainted with the organization in which the interviewee in the article works, I feel that the attitudes and opinions expressed in that article are not representative at all of dp, at least in the California public school system.

The individual stated that there was a problem of low motivation. To this I must reply that I have never seen in the

private sector the degree of motivation that I have seen in the public school data processing departments. Given limited resources and sometimes unrealistic time requirements, some very innovative and creative computer systems have been designed to serve the 1,200 school districts throughout the state.

The article also implied that all school district computer systems should be identical, and each district should use them all in the same way. Granted, there is room for improvement in standardization of information definition and information exchange procedures, but individual school districts perceive their own needs differently and it's rare to find the emphasis in any two school district dp centers to be in the same areas. Whether one approach is better than another is for the local taxpayers to decide and not for a statewide (or county-wide) mandate to dictate . . .

DENNIS VLASICH  
*Director Data Processing  
Claremont Unified School District  
Claremont, California*

Mr. Vlasich is mistakenly making a straw man of our anonymous manager by attributing statements to him which he never made. Mr. Vlasich accuses the manager of calling for "standardization" in all school districts, when in fact the manager said that 18 of 20 districts with dp capabilities "prefer to

have the public pay for duplicating everything" rather than share common dp solutions. This is a call for some standardization perhaps, but the manager never said "that all school district computer systems should be identical, and each district should use them all in the same way."

## IBM's little brother?

Norman J. Harris ("People," October, p. 14) is apparently quite proud of his role as IBM's little brother. In these days of investigations of conflicts of interest, the acceptance of a foreign trip as IBM's "Data Processing Executive of 1975" should cause his present and any future employers to examine closely any of his recommendations to further increase his big brother's "market penetration." I am quite sure BancOhio Corp. would not be overjoyed at the prospect of its customer base switching their business to the Bank of America to avoid the stigma of becoming "losers," [since BancOhio is not the "big brother" in the banking industry].

JOHN J. SPELLMAN  
*Roper Corporation  
Systems/Programming Manager  
Outdoor Power Group*

## Is certification premature?

Ms. Miller's reply to Mr. Ray (October p. 7) appears to rest her case for certification of dp practitioners on the precedent of other practitioners, which she attributes to public demand that they (CPA's, lawyers, etc.) have their competence certified to provide public assurance of their qualification to practice.

If one were to study the history of CPA certification, admissions to the bar, etc., I strongly suspect that the motivations behind those programs had little to do with public demand for qualified practitioners and much to do with a desire on the part of the practitioners to protect themselves from undue competition from too many practitioners.

At the time of this writing a local furor is raging over the failure rate for the Utah Bar exam. The administrators of that exam have been accused of elevating the failure rate to restrain local competition in the legal profession. Whether this accusation is true or not is beside the point, which is that the bar exam is publicly viewed locally not as a device to protect the public from unqualified lawyers (although we have our share of such around here), but as a device to protect established lawyers from competition from aspiring ones not yet established.

If this is a more accurate view of the history of certification programs in other professions, then the question of the relevance of those precedents to our situation requires very close attention.

# letters

An even greater problem, in my opinion, is that other professions are possessed of a body of professional knowledge which defines the discipline associated with the profession. We have as yet no such discipline, nor a body of professional knowledge which comes very close to defining one. Until that body of knowledge is defined, a certification program seems premature.

R. W. PRATT, CDP  
Data Base Administrator  
Salt Lake City, Utah

## S/3 Programmers

The claim is made in the September news item, "S/3 Programmers Anyone?" (p. 176), that the Los Angeles Urban League Training Center is "what may be the first training school for IBM System/3 programmers."

We at San Antonio College would like to backdate the claim by a few years. In September 1971 a System/3 was installed in the student laboratory of the Data Processing Department. Since then, we have had 155 "Associate in Applied Science in Computer Programming" graduates from our training program. Most of these students were trained to program and operate the System/3 as a part of their degree plan. In addition, they were all trained to program the IBM System/370 in BASIC, COBOL, FORTRAN, and ASSEMBLER. Many of the graduates were also trained to operate the System/370.

MERLE VOGT  
Associate Professor  
San Antonio College  
San Antonio, Texas

## Safeguard (not the soap)

Relative to Mr. Oliver Cairns' letter and your response (September p. 8): The origin of the Safeguard data encryption package is not unknown or even disputed. In fact, I wrote the Safeguard package in 1972 with assistance by Mr. Melvin Sabel while developing a budgeting application concerning the New York State Univ. system. Safeguard and several other packages were subsequently acquired by Computer Linguistics which is actively supporting, maintaining, and marketing Safeguard.

How Bell Labs became even remotely connected with the product is still a mystery to me. Such a false rumor certainly was not started by any of the CLI staff. As I recall, Bell was remotely associated through Western Electric with the Safeguard anti-ballistic missile project but neither CLI, Digital Solutions, nor Safeguard was. There

is also a soap named "Safeguard," but this connection seems unlikely.

As Mr. Cairns states, HEW has not endorsed Safeguard for their or anyone else's use, as is their policy. However, several civilian government agencies have endorsed the encryption technique in order to partially satisfy the data security provisions of the Privacy Act of 1974. In fact, an FDA memorandum concerning "Assessment of Standards for ADP System Security" states:

"Under certain circumstances of high risk, data encryption may be needed for the protection of personal data in networks. However, determination of the need to encrypt data is the responsibility of the System Manager."

This, combined with a customer list which includes HEW, NIOSH, FTC, Army, IBM, UPS, Xerox, and Mutual of Omaha, among many others, speaks for itself. I would appreciate your setting the record straight on this entire issue.

STEVEN S. HERRICK  
President  
Computer Linguistics Inc.  
Albany, New York

## SDS Fortran legacy

The principal FORTRAN capabilities which Dennis Merrill suggests in the October Forum (p. 191) for improving program structure were available to SDS (later Xerox Data Systems) Extended FORTRAN IV users in the sixties. The restriction regarding single expression execution as a result of a logical IF statement was eliminated by Extended FORTRAN's "compound statement." With this feature, the example used by Mr. Merrill could be written:

```
IF(IEQJ) A=B+C;
D=E+F; GO TO 10
U=V+W
X=Y+Z
10 CONTINUE
```

While this structure still utilizes an "infamous GO TO statement," the logic flow is much cleaner than standard FORTRAN's double GO TO configuration, and no more complicated than the implied GO TO at the end of Mr. Merrill's DO 10 block. Further, XDS Extended FORTRAN's REPEAT statement had both a REPEAT . . . FOR and a REPEAT . . . WHILE capability, which greatly expanded the flexibility of the DO type loop while at the same time permitting substantially less cluttered coding.

That these concepts should be incorporated into ANSI FORTRAN in one manner or another is clear. That the company which promoted such desirable FORTRAN features threw in the data processing towel, should serve to signal that we may be in for a long wait.

TED HEITHECKER  
Manager, Metal Buildings Dept.  
Synercom Technology, Inc.  
Houston, Texas

DATAMATION welcomes correspondence about the computer industry and its effect on society, as well as comments on the contents of this publication. # You're outgrowing your 3270. Now what?

Things really bloomed when you first put your 3270 on line.

But now your system's growing like a jungle.

Your phone lines or your mainframe go down... so your 3270 just sits idle.

And when everything is working, your lines jam up and your mainframe bogs down... so your 3270 works a lot more slowly than you'd expect.

Errors keep cropping up, but your 3270 can't weed them out.

And you'd like to keep a small data base at your terminal... but your 3270 can't handle that.

Solution? Add or replace with the Sanders 8170.

The Sanders 8170 is completely compatible with the 3270. Emulates it 100%, without requiring debugging or new software. Costs less, too.

As you grow, Sanders enhancements keep your 8170 growing by

distributing the processing... without wiping out your software investment.

When your phone lines are clogged or down, Sanders Queued Transaction Handling stores your data locally until your mainframe becomes available.

Operator errors? Sanders Local Validation and Arithmetics catch errors on the spot. Sanders Local File

Reference lets you see names or descriptions whenever you enter an account number.

Sanders Local Format Storage speeds up your operation by eliminating the transmission of lengthy formats. Sanders Automated Keystrokes give you multi-key entry from a single key depression. And Sanders Formatted Local Print lets you select, rearrange, and print data without host intervention.

Sanders 8170, The Intelligent Answer. Immediately available, so you can replant before you get lost in the jungle.

# UNIVERSAL'S NEWEST MODEM

For two-wire, full-duplex operation at 1200 BPS, Universal Data Systems proudly announces the Model 12-12, the newest addition to the UDS family of data modems. The unit operates synchronously or asynchronously over unconditioned dial-up or private telephone lines.

Terminal interface discipline with the 12-12 is identical to that commonly used for 103/113 modems. Using experience-proved phase shift modulation techniques, the UDS-12-12 transmits at 1200 BPS or any integral sub-multiple rate, without restrapping or adjustments.

The 12-12 is insensitive to word length, and it includes integral provision for automatic remote and local loopback testing. Delivery: 45 days ARO. For technical details contact UDS today.

**\$600 Single Unit Price.**

## Selling Terminals And Ex-IBMs

Being Director, International and OEM marketing for Courier Terminal Systems Inc. makes Bob McGrath a busy man. Lately he's been traveling a lot, setting up marketing programs for Courier in Asia, the Far East and Central and South America.

But he still finds time to be president of his own company, Ex-IBM Corp., an enterprise he started in 1970. McGrath resigned from IBM in January 1970 after 16 years with the firm he still admires but finds it difficult and a challenge to sell against. All his years with IBM were in sales related jobs with the data processing division. Ex-IBM started with the IBM Alumni Directory (May 1972, p. 139) but it's much more than that now.

Ex-IBM not only distributes its IBM alumni directory, now produced every six months as opposed to quarterly when it first came out, but a major league sports alumni directory, numerous training films, computer related books, labels of IBM alumni, and IBM alumni directory supplements sequenced by company and/or zip code and title.

McGrath insists Ex-IBM is a hobby. It's one he doesn't want to give up. His most recent job change came early in 1976 when he joined Courier. He had been head of the international department of Action Communication Systems, Inc., Dallas. A management change there made him want to leave and he had a number of possibilities open to him. One that was quite promising in many ways, he dismissed because it "was apparent he couldn't keep Ex-IBM going."

Why did McGrath leave IBM? "I finally realized that nothing I did for the company really made much difference." He was a national accounts manager in Cleveland at the time. He and his family headed for Dallas because "I had a brother-in-law there." He was also fleeing cold weather. McGrath graduated from St. Bonaventure Univ. in Olean, N.Y. which he describes as "snow country. I've been running away from snow ever since."

In Dallas he set himself up as a sales training consultant. He was well qualified having run sales training programs in Europe for IBM World Trade for

several years. That's where he helped develop the training films he now sells under the Ex-IBM umbrella.

As a consultant, he learned that "risk is a two-headed coin," and he opted for tails, joining Recognition Equipment Inc. in September 1971 as international vice president. He describes his activities in this job as "pushing bacon, eggs, and selling tips."

He left REI to join Action Communication Systems, Inc. in September of 1973. ACS was just beginning to think international. The company was exploring various avenues for marketing its Telecontroller programmable communications processor systems and its Watsbox long distance telephone cost-control system overseas. The job was handed to McGrath.

When he left ACS and moved from Dallas to Phoenix where Courier is headquartered, the trip was typical of

BOB McGRATH  
... a printing press for sale.

the activities of Ex-IBM which has become something of a family enterprise. En route between the two southwest cities the family was getting out a promotional mailing. "As we collated, stuffed and sealed, we mailed. Some were mailed from Albuquerque, some from Santa Fe or wherever we happened to stop."

Ex-IBM doesn't have any employees if you discount the McGrath family but it does have capital equipment. The company owns a plate maker, a slicer, a folder and a printing press. The latter is up for grabs. It's a desktop sized device McGrath would dearly love to sell. He used it for two issues of the IBM Alumni Directory in 1975 and "got more ink on myself and in splashes on the issues" than where the ink should properly have gone.

His children, he says, are a big help in getting his directories and his mailings out. His daughter types labels and her young brothers help with folding and collating. The IBM Alumni Directory which originally came out

quarterly now comes out twice a year. Each one, he says, contains more names than its predecessor. One of his biggest customers is the IBM library. His charges for the directory are \$10 for a single issue and \$14 for four consecutive issues. A company sequence supplement costs \$14 as does a title or zip code sequency supplement but, "when it comes down to it, I'll take anything I can get."

McGrath sells his major league sports alumni directory for \$5 per copy. He got into this two years ago as a result of a call from Mike Connelly, a Dallas stock broker who had heard about the IBM Alumni Directory and thought a sports directory would be something McGrath could handle. He could and did. It's now in its seventh edition. As with the IBM directory he started with known "alumni" who led him to others. Edition number seven contains 1,829 names of alumni of major league baseball and football teams.

With the IBM Alumni Directory, McGrath's first step was to write 25 letters to old friends still with IBM, outlining his project and asking their personal help in collecting names from their Christmas card lists and the like. The first reply came immediately. "Such requests should be sent to the home, dummy!" But the second one said, "I have tried to react to your request," and contained 152 names and addresses. The first issue with an eventual 717 names was off and running. The latest issue, number 17, contains 2,329 names.

McGrath doesn't do much to promote the directory beyond listing it among the things he offers for sale in occasional mailing pieces. But it sells up to 1,500 copies per issue. Who buys it? IBM alumni, of course but headhunters are a good market, says McGrath.

Maybe the next time he puts out a flyer, McGrath will add to his list of things Ex-IBM has to offer—one slightly used printing press.

## The Three William Weksels

Bill Weksel, entrepreneur. Dr. William Weksel, Ph.D. in Communications and holder of an NSF fellowship to study psycholinguistics. Señor Weksel, master's degree in Spanish literature.

The three personalities seem to trip over each other but, for the moment at least, the businessman is leading. Bill Weksel took over Information Displays Inc., Mt. Kisco, N.Y., 18 months ago. IDI, a pioneer in graphics for 15 years, was in deep trouble. Costs

If you want to stay really hot,  
you've got to go on-line.

Japanese steelmakers are universally acknowledged as the world's leading steel manufacturers. And Kawasaki Steel Corporation is one of Japan's leading steelmakers; its Mizushima Works has the most advanced No. 2 plate mill in the world.

When Kawasaki officials decided to update the automated processes in this works, they naturally wanted the best. So they came to Fujitsu.

We designed and installed a total on-line production control information system, a PCM in-house loop network centralized around our large scale FACOM 230-45S duplex system, with a total of 80 control terminals.

Operations commenced in March this year and results have been impressive. Productivity has been increased, product quality improved and material resource utilization maximized. And customers are receiving better and faster service than ever before.

**Why us?** Because Fujitsu has the muscle and skill to solve just about any data communications problem. We're a leading mainframe maker whose line spans everything from micro to very large scale computers. We're one of the world's biggest suppliers of

telecommunications equipment of all kinds. And we're uniquely experienced in meshing the two into tailor-made data communications systems.

When you want your business to go on-line, drop a line to Fujitsu.

were out of hand, debt was mounting, and marketing had fallen off to a hit and miss proposition. In that short period, Weksel renegotiated the debt, slashed the administrative and staff overhead, reorganized marketing and

DR. WILLIAM WEKSEL  
Restoring business sanity

has put the company back on the road to profitability.

Once a leader, (IDI's IDIOM system was recognized as just about the best system available in the '60s) the company had lost its technical leadership to newer and more aggressive competitors. Worse, it gradually had become ensnared in the university-oriented, one-of-a-kind type of graphics system that make for interesting reading but very little profitability.

A key element in the industrial process is the creation and modification of engineering drawings. There is nothing very glamorous about this. It's slow, tedious and labor-intensive. It is this arena into which Weksel has taken IDI,

using a computer-based system to increase the productivity of a draftsman. The key is being able to change an existing drawing in a hurry. At least 60% of all board work involves modifications. It has long been known that the retrieval and display characteristics of a digital computer are appropriate for the job. What was missing was the ability to get it done in a cost effective manner. IDI's new systems are pointed in this direction.

The technology is expensive but IDI has paid its dues. The refresh graphic technology is established. The FORTRAN-based software is well established. The system will run on its own, Weksel says, without a massive mainframe for support. "Draftsmen have to be taught that the transition from an eraser to a light pen is not nearly as traumatic as they might think."

Weksel (his linguistic background keeps sneaking through) has long been interested in problems relating to having a graphics system speak to users in their language. But, he says, it has taken years to get people to understand that such a system needs to be complete. "A partial system is of little use."

Weksel, previously with IBM, Ampex and The Diebold Group as well as having had a fling in his own microfiche company, came to IDI to salvage "a company in trouble." He's gotten past the first hurdles. IDI is intact and its technical reputation is unimpaired. Now he must prove that the marriage of graphic technology to the commercial world can generate growth revenues. He says that "... to succeed in this business you have to be able to bring your technology out of the ivory tower and down to the marketplace. IDI was in the clouds so long it almost disappeared. Fortunately it never lost its technology." Now Weksel is restoring business sanity.

## Selling ADAM

Stan Bootle lays claim to having sold "literally untold millions of dollars worth of computing equipment" in Europe.

Now he's trying to sell ADAM (November 1975, p. 164) in the U.S. ADAM is described by its manufacturer, Logical Machine Corp. of Sunnyvale, Calif., as "the self-organizing business computer." It was the creation of an Englishman, John Peers, so it's probably fitting that another Englishman, Bootle, should help sell it.

Bootle sold in Europe for Redifon Computers, Ltd., Sperry Univac, Singer and IBM. He's a graduate of Cambridge Univ. where he obtained honors in math.

Selling computers isn't his only

claim to fame. Under a nom-de-plume, Stan Kelly, Bootle has become well

STAN BOOTLE  
AKA—Stan Kelly

known as a folk singer and songwriter. His "Liverpool Lullaby" was recorded by eight different artists. He co-authored a guide book to the Liverpool dialect called "Lern Yerself Scouse" which now is in its 13th edition. He also has written a book on soccer chants and songs called "The Terrace Muse."

Maybe he can make ADAM go.

# You can spend \$2.50 to \$25,000 cleaning tapes. Our free analysis shows you where to draw the line.

Every computer room has its own character, its own individuality. A media maintenance program that's right for one data center may be totally wrong for another.

Your needs should determine which type of equipment you select, from the wide variety of tape cleaners and cleaner/evaluators available.

To help you decide, DDI has a media maintenance analyst. He has facts and figures garnered from his years in the field that can provide you with sound, economic justifications for your selection. Numbers you can also use to convince your superiors. He can help you with a lot of other tough questions, too.

Should you buy, lease or hire a service? Are you better off with a new machine or will a reconditioned one do? Should you trade in an old unit and upgrade or stay where you are?

He'd like to send you a two-page questionnaire so he can do a free analysis of your computer room media maintenance needs. If that sounds good to you, circle the reader service number and we'll take it from there.

## Data Devices

The Economic Ones.  
Make Us Prove It.

# Introducing the data system for people who know how hard it is to get a data system up and running.

Anyone who's ever put in a data system will tell you how hard it is to get it up and running. And how expensive.

But it doesn't have to be that way anymore. Because Data General has developed a new interactive data entry and access system that's a lot easier to work with. Which makes your programmers more productive.

The ECLIPSE Idea system.

The Idea system has screen formatting and a data access/retrieval capability that's hard to believe. Because it's incredibly easy and economical to get it up and running.

What makes it possible is the Idea software. It's so powerful and easy to use, you can probably do interactive screen formatting and Idea compiling the day the system is installed.

And you won't have to worry about multiterminal control. Because the software to handle up to 16 terminals is already written. For single applications. Or for as many applications as there are terminals.

The Idea software is designed to work with INFOS (our data management software). It's so powerful that all your users can get at the same data at the same time. And so easy to use that they can access data records even if they know only half a reference.

And you won't have to worry about a lot of duplicate data. Because INFOS is designed to provide a single source of information that's always up to the minute.

Also, Idea software runs on our new ECLIPSE C/330 and C/300 commercial computers. They have just what's needed to keep all your users' information up to the minute. Because they run the Real-time Disc Operating System that controls multiterminal applications concurrently with batch or telecommunications jobs. And the commercial ECLIPSE computers include ADD, MOVE, COMPARE and decimal arithmetic instructions designed specifically for commercial applications.

With the ECLIPSE C/330 and C/300, you won't have to worry about compatibility either. Because they come with large systems languages like IBM-compatible RPG II and ANSI '74 COBOL implemented at the highest levels. Plus industry compatible nine-track magnetic tape units and communications controllers that let you pass data between computers.

And because Idea systems come from Data General, they come with the full support, range of field and systems services, and financial alternatives only a major computer manufacturer can offer.

Write for our brochure on the ECLIPSE Idea systems.

It won't tell you anything you don't already know about how data systems work. But it will tell you about one that'll take less work.

## ECLIPSE Idea systems

## MORE EFFICIENT USE OF MEMORY IN RUMORED IBM LINE

One of the more detailed, if not wild, rumors concerning IBM's future offerings suggests they'll be evolutionary upgrades of the 370 line, rather than revolutionary products as was indicated in the now abandoned Future Systems line. Replacing the 370/115 and 125 will be a model 231. The recently-announced 138 and 148 will be followed by a 241 and the 168 by a 258. Rental prices will range from \$7K/mo. for the 231 to \$35K/mo. for the 168. Other versions of the 168 also are rumored: a 268 with three times the power of the 168, renting at \$55K/mo., and an even more powerful 278 renting at \$85K/mo. Memory size for the 138 and 148 replacements is 2 megabytes. Four megabyte memories are mentioned for the 258 and 268 and 6 megabytes for the 278.

The rumors are circulating overseas. IBM has followed its customary practice and is refusing to comment on speculation of future product announcements. According to the rumors, the new offerings will be announced late in the first quarter of 1977 and are to be shipped six months thereafter. The fixed size memory probably will be built in such a way as to prevent foreign attachments. The smaller size of the memories also suggest that IBM has decided to make much more efficient use of memory, probably using microprocessor-based devices for back and front end tasks.

According to the rumors, DOS/VS disappears and is replaced by VM/OS/VS3. That would reflect the fact that small customers in the 135-148 range are happily running VM today, much to the surprise of many who thought of it as a big machine system.

## IBM IN SERVICE BUSINESS--SETTING THE SCENE

Now that the mini makers have seen the reality of the IBM Peachtree threat the next group that must wait and worry are the service bureaus. In 1979, the ban on IBM's reentry into the services business will be over. (A six-year moratorium was imposed in the IBM-Control Data antitrust settlement.) Rumbles are that IBM is studying the how and when of reentry, not the whether.

The big question mark in IBM's plans must be the implementation of Satellite Business Systems. Experts are speculating that, using this facility, IBM will go for big network services. Emphasis, they guess, will be on targeted proprietary software packages, on entry level customers, and on high-level security--if the user stays with IBM from the remote system to communications to host processor. Such services could be a big boost to IBM's General Systems Div. GSD products like the System 32, Series/1, and 5100 (or their upgrades) not only could become part of the network's offering, but they also could be sold to customers who outgrow the service and want to obtain their own processors. The large service bureau, Automatic Data Processing, already has a similar strategy, using Microdata minicomputers.

Those who want to watch IBM's evolution in services before 1979 should look to Europe and Canada, where, we're told, IBM has been testing many concepts that will be imported to the U.S. One trend in the last year is the increasing emphasis on remote computing services and proprietary applications software.

## IBM SERIES/1: OUTSIDE IDEAS AND INSIDE MARKETING

IBM's reputation as a highly efficient sales machine isn't about to be tarnished with the giant's invasion of the minicomputer market. A source in on the buy at Citibank, New York, says that "as near as I can tell, these salesmen are the really good ones from everywhere within IBM--the guys who have been able to sell the big accounts successfully." As for what they will be selling, our source says the engineering talent behind the machine "came from many, many outside companies."

The "how" of the sell is as interesting as the product itself. "Discounting is an issue that has raged within IBM for years," says Frederic G. Withington of A.D. Little, "and declining, at least at the outset, to discount will preclude IBM from the high volume iron business." Companies such as Computer Automation would seem to be nearly unaffected by the announcement because they sell tremendous volumes of minis to a relative handful of customers.

Dick Anderson, general manager of Hewlett-Packard's Data Systems Div., responsible for the manufacturing of the 21MX mini, and real-time systems like the recently introduced System 1000, was surprised IBM didn't use the Series/1 announcement to replace the aging, expensive System/7. "If IBM was really serious about the sensor-based market, it sure didn't dent it with the System/7, and now it's starting over with the Series/1. I hear IBM is down to building one System/7 a month." Anderson

# LOOK AHEAD

feels the Series/1 might not move well except in installations with IBM-only purchasing policies for two reasons: the lack of discounts and the bland performance. And the lack of a single high-level language doesn't help. "Wow--it's 1965 again," says Anderson.

In addition to "blue room" installations, IBM might do surprisingly well in very small order systems house installations. One DEC customer, a successful implementor of high-ticket banking systems, has been screaming at DEC to get better account service, but feels that since he buys fewer than 20 systems per year, he has no "pull" at DEC. Discounts in these situations aren't nearly as important as the multi-hundred, or thousand unit deals, and the IBM market entry gives this buyer both a choice--and some leverage with his vendor.

## PROCESS OF ELIMINATION

Among the projects of the Senate's Rules and Administrative Subcommittee on Computer Services are two which aim to eliminate. One would eliminate some letter writing and the other could eliminate some Senate committees. Sen. Howard Cannon of Nevada, chairman of the subcommittee, says the Senate post office handles some one million letters per month.

His subcommittee's project would come up with a computer based system which would compose answers -- prearranged text with specific answers to specific questions which would be personalized. The system also would keep track of what people wrote about what issues and would see to it they are kept informed of what is happening with these issues. A second project is in support of a Senate committee to study committees. This group is supposed to determine an ideal number of standing Senate committees with a goal of cutting down the number of assignments each senator has -- currently an average of 20 apiece. Cannon's group is helping with a computer model which asks such "what if" questions as, "what if we had no committees at all."

## IT'S COOL

"The District Attorney has said Valcomp is innocent and no Valcomp employees were charged with anything," said John Cool, president of the Westlake Village, Calif., subsidiary of Tymshare Inc., a computer refurbishment firm. He was talking about an alleged theft of \$8.7 million worth of computer circuit boards and memories investigated by the D.A. beginning last July. Valcomp premises were searched at that time and a Valcomp employee was questioned. Cool said Valcomp, in the meantime, has been growing, from 50 employees early in the year to a current 70, helped by a contract from Ampex Corp. under which it supports with parts and maintenance all out-of-production Ampex tape drives worldwide.

## IN COURT AND ON THE BLOCK

Martin Wolf Inc., San Diego supplier of small business systems, moved quietly into Chapter XI when the California First National Bank, a subsidiary of the Bank of Tokyo, called a \$440,000 note. Just as quietly, two prospective buyers last month were talking purchase of the assets, which a source close to the company said were only \$1000,000 less than the \$1,370,000 total indebtedness of Martin Wolf at the time of the filing. The company's systems, of which some 120 to 130 are installed, were billed as totally turnkey and totally usable by non-computer personnel.

## THE HIGH PRICE OF TESTIMONY

Computer consultants Frederic G. Withington, of A. D. Little, and Felix Kaufman, of Coopers & Lybrand, will testify for the government against IBM for a fee of \$700 a day. The Justice Dept. issued contracts to the two men last Nov. 11, and in late November their lawyers were seeking clarification of some clauses in the contracts from the Justice Dept. Both had balked last summer when called to testify because they said proprietary company information would be involved and that they couldn't be forced to testify against their wills without being compensated. Kaufman said his daily rate was \$150 an hour. Withington fixed his daily fee at \$110 an hour. They won their case before a Federal appeals court last July 8.

The Justice Dept.'s antitrust trial against IBM is in its 19th month. Justice Dept. spokesmen said the two consultants will be paid for time during interviews before going to court, during court, and later for the time it takes defendant IBM to question them. The usual rate paid for testimony in such cases is \$30 a day.

(Continued on page 174)

**Who's published  
the best profile  
of our sort team?  
Our competitor!  
(IBM, you must be talking about us.)  
Call (201) 568-9700**

**Check out this  
team for yourself.**

One of the nice things about the Computer Giant is that he publishes so much helpful information for data-processing people.

Take the article called, "A guided bibliography to sorting," by H. Lorin, which appeared in the *IBM Systems Journal*.\* It contains the best description we've ever seen of what it takes to make a top sorting team:

"Developers of sort systems must be thoroughly familiar with the characteristics of the hardware of the sorting machine, they must be knowledgeable in program generation techniques, competent in program optimization and balancing methods, familiar with design technology and the operating system and I/O areas, as well as being competent sort specialists. In addition, since the performance of a sort is critical, a sort development team must be competent to undertake extensive prediction, analysis and test of their product's performance characteristics."

Why that's a perfect description of *our* people! That's what they do all the time — develop SyncSort, the best high-performance sort on the market today, and then test it against the competition. That is to say, IBM.

\*Volume Ten, Number Three, 1971.

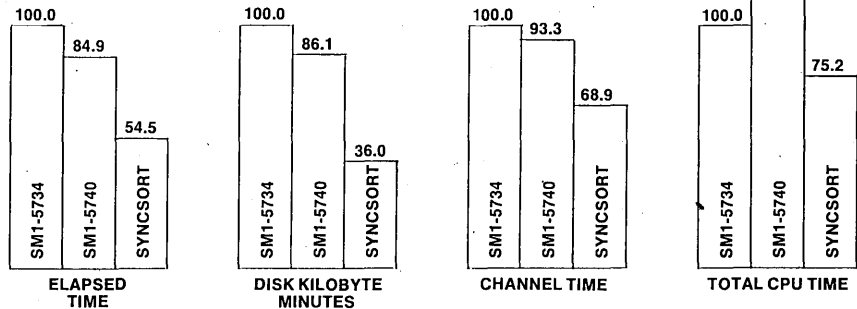

The last time this happened, we matched our SyncSort III-and-half against the Hardware Manufacturer's SM1-5734 and SM1-5740 (PEER/ICEMAN).

Frankly, the results weren't even close. IBM sent its own MF-1 monitor to evaluate the tests, and a human observer to make certain that everything was according to Höyle. But all to naught.

SyncSort performed better than the other two sorts in every category, as illustrated below:

**OVERSEAS REPRESENTATIVES —**

CAP-Gemini/CES, Brussels; CAP-Gemini GMBLL, Dusseldorf; CAP-SOGETI, Geneva; CAP-Gemini/Pandata, London; Syntax, Milano; CAP-Sogeti Prodvits, Paris; BRA, Stockholm; Advanced Technology, Tel Aviv; Shell Oil Co. of Australia, Melbourne; Deltacom Do Brasil, Sao Paulo.

Do we have some kind of magic formula? Well, we *do* have a few Top Secret and very scarce ingredients that go into every sort: intelligence, imagination, experience and hard work.

We call 'em the four horsemen.

**COMPUTER SYSTEMS Inc.** 560 Sylvan Ave., Englewood Cliffs, N.J. 07632

# Our bright idea.

## More computer power for your dollar.

The SEL 32 family of high performance 32-bit computing systems offers a balance between big computer performance and minicomputer prices. Microprogrammable input/output processors, compatible central processing units, high-speed memory systems, and efficient data processing peripherals make up the hardware elements. On the software side, operating systems, language processors, libraries, application packages, and interactive terminal support balance the scales. Together, SEL 32 hardware and software provide a cost-effective solution to your current requirements, with expansion capability to meet your growth needs.

The SEL 32/35 is the strongest price-performer of any 32-bit single or multiple-CPU system available today. These computers can be configured from 64K bytes to 512K bytes of 900 nsec memory. Resembling its more powerful brothers, the SEL 32/35 is a complete package, including central processor with floating-point arithmetic, memory, chassis, power supplies, and cabinet.

The SEL 32/55, offered in a variety of both single and multiple CPU configurations, can be configured from 32K bytes to 1 million bytes of 600 nsec memory.

The SEL 32/50 is a single chassis computer providing the same CPU, I/O, and memory capability as the 32/55, but for dedicated applications.

Just circle our number on the Reader Service Card, or call us today. We'll send you the powerful story of the SEL 32 family.

## JANUARY

**Semiconductor Memories and Magnetic Bubble Devices, Jan. 12-13, Teaneck, N.J.** This tutorial conference is designed for professionals in computer science, electrical engineering, and physics. Recent developments and applications of memory technology will be presented by leaders in the field. Fee: \$85. Contact: M. J. Sablik, Physics Dept., Fairleigh Dickinson Univ., Teaneck, N.J. 07666 (201) 836-6300.

**Symposium on Automated Production, Storage, Retrieval and Display of Digitized Engineering Data, Jan. 13-14, Monterey, Calif.** Papers on I/O devices for engineering design, software and data management of engineering data, and standards for automated engineering data will be presented. The meeting is sponsored by the Naval Ship Weapon Systems Engrg. Station and the Naval Postgraduate School. Fee: (includes proceedings) \$40, government employees and military; \$75, nongovernment. Contact: Dr. P.C.C. Wang, Code 53Wg, Naval Postgraduate School, Monterey, Calif. 93940 (408) 646-2206.

**Decision Support Systems Conference, Jan. 24-26, San Jose.** Business and government representatives will discuss developments of computer aids to decision making. Systems currently in use (in manufacturing, banking, urban planning and military planning) will be described. The meeting is sponsored by IBM Research Div., Sloan School of Management, Wharton School, and the SIGBDP group of the ACM. Fees: \$45 for persons connected with the sponsors, \$55, others. After Jan. 10 add \$10 to each fee. Contact: Eric Carlson, IBM Research Div. K54/282, 5600 Cottle Rd., San Jose, Calif. 95193 (408) 256-6431.

## FEBRUARY

**Spring Symposium, Int'l. Word Processing Assn., Feb. 1-3, Chicago.** Approximately 80 booths will display equipment and associated products in the word processing field. The exhibit is free. Registration fees for the technical sessions and workshops are \$125, IWP members; \$150, nonmembers. Contact: IWP, Maryland Rd., Willow Grove, Pa. 19090, (215) 657-3220.

**MEDCOMP Congress, Feb. 7-9, Berlin.** Originally scheduled for late November 1976, (and covered in this column in the October issue) this is the first in a proposed series of international conferences to examine the role of computers and computing techniques in the fields of medicine and public health. Conference languages will be English and German, with simultaneous translation available. Information is available from Online, Cleveland Road, Uxbridge, Middlesex, England.

**Telecommunications Workshop, American Bankers Assn., Feb. 13-16, Atlanta.** Responding to a survey which indicates a need for central planning of telecommunications needs and for more industry-related information, the workshop, sponsored by the Operations and Automation Div., is directed to telecomm professionals in banks throughout the country. The program is being developed from topics sub-

mitted by the attendees. Contact: Arnold L. Kaplan, ABA, 1120 Connecticut Ave., Washington, D.C. 20036 (202) 467-4332.

**IEEE Int'l. Solid State Circuits Conference, Feb. 16-18, Philadelphia.** News of advancements in solid state circuits will highlight this meeting; papers will be presented on the design, performance, testing or application of solid state circuits and systems in a variety of fields, including computers, communications, health and government, consumer, transportation, environmental and industrial electronics. Advance fee: (estimated) \$35, member; \$40, nonmember. Contact: Lewis Winner, ISSCC, 152 W. 42nd Street, New York, N.Y. 10036 (212) 279-3125.

**COMMUNITY '77, Feb. 21-25, Houston.** The 9th annual Computer Micrographics Technology members' conference will offer a pre-conference seminar for the new or prospective user. Other seminars will be directed toward business COM, COM-related photocomposition, and COM graphics for business and scientific applications. User group forums and a standards forum are also scheduled. Fees: pre-conference seminar Feb. 21, \$95; four-day conference, (Feb. 22-25) \$100, includes a year's membership. Contact: John Heep, Xidex Corp., 342 Countryside Dr., Roselle, Ill. 60171 (312) 894-8420.

**Symposium on Design Automation and Microprocessors, Feb. 24-25, Palo Alto.** Sponsored by the design automation groups of the IEEE and ACM, this meeting will include papers, invited talks, and informal discussions. Fee: \$40, members; \$50, nonmembers. Contact: W. M. van Cleemput, Digital Systems Lab., Stanford Univ., Stanford, Calif. 94305 (415) 497-1270.

**COMPCON '77 Spring, Feb. 28-March 3, San Francisco.** "System Design—A Discipline in Transition" is the focus of this meeting, discussing causes and implications of changes in design, and future of system design. This is the 14th IEEE Computer Society international conference. Fees: \$100, members; \$130, nonmembers. Contact: IEEE, P.O. Box 639, Silver Spring, Md. 20901 (301) 439-7007.

## ON THE AGENDA . . .

**Computer Workshop, Interactive Computer Graphics in Engineering Analysis and Design, Jan. 10-14, Tucson,** (602) 884-3054. **10th Technical Symposium, Feb. 4, Los Angeles.** ACM, P.O. Box 90698, Los Angeles, Calif. 90009. **6th Annual Communications Conference, Howard Univ., Feb. 17-20, Washington, D.C.** (202) 636-7690. **INTERFACE '77 Data Communications Conference and Exposition, March 28-30, Atlanta,** (617) 879-4502.

## CALL FOR PAPERS

**Trends and Applications 1977: Computer Security and Integrity, May 19, Gaithersburg, Md.** Tutorial papers which describe practical experiences with design or implementation, or which present new research results, are solicited for this meeting to be held at the National Bureau of Standards. Sponsored by the NBS and chapters of the IEEE Computer Society, the conference will concentrate on information management practices, privacy impact and implementation, dp auditing, data base protection, applications security, protection architecture, identification and authorization, encryption, and network controls. Authors should submit three copies of a 1,000 word abstract by Jan. 15 to John W. Benoit, MITRE Corp., Westgate Research Park, McLean, Va. 22101. For additional information contact Steven Tsakos, (301) 953-7100, ext. 7225. \*

Electronic Memories and Magnetics went into business with the dream of becoming the top add-on memory house in the business. It took over fifteen years of experience to plan for and realize that dream. Through good times and bad. Through many dramatic changes in the computer business.

**Our new position of strength.**

We reached our new position the day we took over the Cambridge Memories 360/370 add-on memory lease base. EMM achieved this position by more than doubling its add-on memory installations worldwide. More users and computer manufacturers are now using EMM memory products than those of any other independent add-on memory firm.

**Vertical integration a step at a time.**

This most recent addition is but another step in our carefully planned program of vertical integration. It has enabled EMM to better satisfy most add-on memory requirements from basic semi-conductors to large capacity units.

**The all around add-on memory package.**

Our present leadership position is no fluke. It is the result of our experience and our responsiveness to your changing needs for add-on memory availability. This experience enables us to manufacture products of exceptionally high reliability, offer complete compatibility with all major 360/370 products, provide pricing for *your* needs as well as ours, present imaginative lease or purchase financing plans, and make available round the clock/round the year worldwide service for an impressive list of quality customers.

**A statement of commitment.**

EMM's commitment to the add-on memory market is more than talk. It's the way of thinking and doing business that got us to the top. It was born in a dream. Tempered by the crushing demands of the marketplace. And motivated by the pride and the profit that results from serving you best of all. In fact, it has grown stronger with our progress. Beginning now, we will periodically issue "statements of commitment" to keep you informed of new developments regarding our activities on your behalf.

**It's tough at the top.**

Electronic Memories and Magnetics is now tops in add-on memories for very sound reasons. Not the least of which is the most complete add-on memory package in the business. We know it won't be easy to maintain this position. It will require continued close attention to your needs and a broadening of our commitment to excellence. But way back at the beginning of our dream, no one ever told us being tops would be easy.

Find out how our dream can fit into your requirements. Call your regional EMM sales office. Eastern (201) 845-0450. Central (312) 297-3110. Western (213) 477-3911. Europe: Bad Homburg, West Germany 06172/6094.

# the day our dream came true.

**All the add-on memory you need.**

**Now Norden gives  
DEC's PDP-11/34  
all the muscle it needs  
to work in any  
military environment.**

## **Announcing the new PDP-11/34M in half ATR and full ATR versions**

First of a family of military computers to spring from the union of Norden's experience in high technology military electronics and DEC's leadership in minicomputers.

The PDP-11/34M has the muscle for severe environment operation, meeting airborne (MIL-E-5400), shipborne (MIL-E-16400), and land based (MIL-E-4158) specs. It's packaged in a compact half ATR chassis or a versatile full ATR chassis each with cooling and mounting options.

### **Fully compatible with PDP-11**

The PDP-11/34M is completely compatible with DEC's commercial counterpart. Thus, the most extensive, proven software in the mini-computer industry is now available on a true military computer. Powerful, efficient operating systems cover single user, time-sharing, real-time, and multi-function choices included in RT-11, RSX-11, and RSTS/E. High level languages include MACRO-assembler FORTRAN, FORTRAN Plus, COBOL, BASIC and BASIC Plus.

### **Extensive features**

The Norden PDP-11/34M comes with the extended PDP-11 instruction set (over 400 instructions); multiple register architecture; hardware stack processing; multiple priority level vectored interrupts; and integral direct memory addressing (DMA).

What's more, the PDP-11/34M can be configured with up to 124K words of byte parity core memory using 16K or 32K word modules, and with a memory management system for program protection—plus a floating point processor for high speed number crunching.

In addition, it boasts integral CPU and memory diagnostics. And large selection of peripherals and interfaces.

### **An unbeatable combination**

Add it up and you get a military computer so muscular, so powerful, and so easy to use, it makes the others look like under-achievers. To learn more, write or call Marketing Manager, Computer Products Center, Norden Division, United Technologies Corporation, Norwalk, CT 06856. (203-838-4471)

## Guidelines for the Dp Manager

### Making Computers Pay

by John Graham  
Halsted Press (Div. of  
Wiley & Sons), 1976  
159 pp. \$15.50

There is more wisdom buried in this slim volume than may be found by attending a year's worth of so-called management seminars. John Graham has distilled his 16 years of data processing experience, and boiled it down into a set of guidelines that any senior dp executive will find full of insights.

Many books have been written about the theoretical aspects of running a dp operation. These tomes, sometimes worthy but more often far too theoretical, preach the current "in" doctrines. The panacea-peddlers change their magic words every year or so. Once it was COBOL, another year it was PERT, lately it has been "structured programming" and data base. Graham tosses all these nostrums aside and suggests that "the rules for evaluating projects and monitoring their successful execution are no more complex or arduous than those required to manage other aspects of business." This may be a heretical view to those who earn their living explaining all of the technical ideas but it is precisely on target insofar as most senior dp executives and their bosses are concerned.

Graham has no hesitation about tackling some of the harder issues involved in the management of data processing. He attempts to dissect the centralization-decentralization fight and, by and large, succeeds in making the conflicting viewpoints clear even to the most nontechnical of managers. His explanations of such complex matters as data base, charge back, project control, system audit, and dealing with software contractors are straightforward and easy to follow.

While one may not always agree with his conclusions, he has laid out the problems clearly and noted some

of the well-known but rarely stated snags. For example, he admits that data base may be expensive and slow, he says that there are political and cultural factors inherent in corporate organizations, and he admits that maintenance programming often gets out of control. Dp professionals know these things but only rarely have they been stated in a management book.

John Graham is writing for a U.K. readership. Financial information is given in pounds, spellings are English rather than American, and references and examples are to ICL hardware rather than the traditional IBM System/360. However, his basic style is so relaxed and easy to read that these minor differences are easily overlooked by the reader. It is rather surprising to

... he has laid out the problems clearly and noted some of the well-known but rarely stated snags.

see how few the differences really are between the U.K. and the U.S. when data processing is the subject; perhaps the only area where the discrepancy gets severe is in his analysis of dp costs. Relatively lower personnel costs appear in the U.K.; he might have to change his tables for the U.S. version.

The book is highly recommended for dp managers who want to look at both sides of the various problems. It is even more recommended for senior corporate managers who want to get a handle on what this data processing thing really is, how it can be managed, and what problems need to be faced.

—Philip H. Dorn

Mr. Dorn is an industry consultant and a contributing editor to *Datamation*.

### The Compleat Computer

by Dennie L. Van Tassel  
Science Research Associates,  
Inc., 259 E. Erie St., Chicago,  
Ill. 60611 (1976)  
216 pp. \$5.95 (paperback)

Dennie Van Tassel has been saving cuttings—articles, cartoons, poems—about computers, and has put the entire collection into a book. It is all interesting material, but presented in helter-skelter fashion. Thus, Fred Hapgood's *Atlantic Monthly* article "Computers Aren't So Smart After All," appears in exactly the same way as Art Buchwald's "The Great Data Famine." Both are good reading, but for different purposes and different moods. Similarly, Joe Weizenbaum's "On the Impact of the Computer on Society" and

Arthur Clarke's "Hal Lobotomy" are both influential pieces of writing, but for vastly different audiences. To be sure, Van Tassel includes a caveat: the articles are excerpted, and you should look up the original. But when Weizenbaum's article on ELIZA is reduced to one page, what reader will look up the original? And if he doesn't, what impression will he then have of the purpose and methodology of ELIZA?

The point is that putting all this material together (interspersed with *Doonesbury* cartoons and the like from the popular press) without some sort of guide may add to the confusion about computers.

Every teacher of computing has had students make outrageous statements in class which they defend vigorously because they "read it in a book." If the book was *Astounding Science Fiction*, then there may be no problem. But what if it is *this* book, which has articles by Harry Huskey, Ruth Davis, Claude Shannon, and Peter Drucker (all very serious and authentic) together with staff-written articles from *Time* and *Fortune* (also serious, but of questionable authenticity), right down to science fiction itself? How is the reader (assumed to have little or no computer knowledge) to sift out truth from fancy? Perhaps the reader won't care, but computer people should care. A little editing, or editorial comment by the anthologist, would go a long way toward improving the book.

A minor note: how can someone in the computer field misspell Herb Grosch's name three times?

—Fred Gruenberger

A frequent contributor to *Datamation*, Mr. Gruenberger is professor of computer science at California State Univ., Northridge, and publishes the periodical "Popular Computing."

## BOOK BRIEFS . . .

**Program Validation**  
Pendragon House, Inc., 2595 East  
Bayshore Road, Palo Alto, Calif.  
94303 (1976)  
243 pp. \$17.50 (paperback)

This is the final guide in the series of nine on the Evaluation of Programming and Systems Techniques, published by Britain's civil service department of the Central Computer Agency. All-path validation and structured design are the tools demonstrated for controlled and enforceable testing of systems components. The other guides are equally technical in nature, and include such titles as *Implications of Using Modular Programming* (no. 1), *Automatic Flowcharts* (no. 5), and *Choosing Programming Languages* (no. 7). A complete list and prices are available from Pendragon House or from government bookshops in Great Britain.

## Business Systems Techniques

by J. N. Chapple  
Longman Inc., 19 W. 44th St.,  
New York, N.Y. 10036 and  
Longman Group Ltd., London,  
(1976)  
172 pp. \$16.50

Systems professionals in business and public administration environments, where large and complex computer installations are commonplace, are the target of this well-organized handbook. Techniques in such basics as organization and systems development, oral presentation, writing of reports, financial evaluation, objectives and philosophy are presented clearly, with several examples and charts.

**Compiler Construction,  
An Advanced Course (2nd Ed.)**  
F. L. Bauer and J. Eickel, eds.  
Springer-Verlag, 175 Fifth Ave.,  
New York, N.Y. 10010 (1976)  
638 pp. \$17.30 (paperback)

This is Vol. 21 in the 38 volume series, Lecture Notes in Computer Science, which reports new developments in research and teaching informally, and at a high technical level. Material includes drafts of original papers and monographs, lectures, seminar reports, and meeting notes. *Compiler Construction*, written by a number of experts, is organized into six chapters devoted to introduction, analysis, synthesis, compiler-compiler, engineering a compiler, and an appendix. Numerous tables, examples and references are included.

**Conference Proceedings, 3rd Annual  
Symposium on Computer Architecture**  
IEEE Computer Society, 5855 Naples  
Plaza, Suite 301, Long Beach,  
Calif. 90803 (1976)  
202 pp. (paperback) \$15, member;  
\$20, nonmember; hardbound,  
\$18.50 and \$23.50, respectively.

The conference, held Jan. 19-21 in Clearwater, Fla., was sponsored jointly by the IEEE Computer Society and the Assn. for Computing Machinery. Current trends in research are represented by the 40 papers in this volume, which cover multi-microprocessors, applications, networks, and secondary storage, among other topics. The conference was international in scope, with authors from nine countries participating.

**Macro Processors**  
by Alfred J. Cole  
Cambridge University Press,  
32 E. 57th St., New York, N.Y.  
10022 (1976)  
230 pp. \$8.95 (paperback)

Part of the series of Cambridge Computer Science Texts, this book describes the internal structure and purposes of ten macro processors. The first six chapters require a reasonable knowledge of high level programming languages; the remaining two chapters call for knowledge of the basic principles of compiling techniques, with particular reference to syntax analyzers.

**Symposium Proceedings, Trends and  
Applications 1976: Micro and  
Mini Systems**  
IEEE Computer Society, 5855 Naples  
Plaza, Suite 301, Long Beach,  
Calif. 90803 (1976)  
142 pp. (paperback) \$6, members;  
\$8, nonmembers.

The 22 papers in this volume were presented during the symposium co-sponsored by the National Bureau of Standards, the IEEE Computer Society, and the Washington Section IEEE. They cover research and development in a rapidly-growing technical area. Sample topics are mini and microcomputer controlled process applications, a method for implementation of transparent sharing of peripherals by two processors, a translator writing system for minicomputers, and a minicomputer based distributed data base system.

**Microprocessors: Technology,  
Architecture and Applications**  
by Daniel R. McGlynn  
Wiley & Sons, 1976  
207 pp. \$11.95

This introduction to the "computer on a chip" describes computer elements and electronic semiconductor technologies that characterize microprocessors. The book also surveys various commercial microprocessors, and discusses applications, including a low-cost home computer, automotive applications, satellite communication systems, and point-of-sale terminals.

## Installation Management

The external and internal controls necessary for dp systems, the responsibilities for these controls, and their impact on auditing the system are discussed in the 95-page manual, *Management Controls for Data Processing*, part of IBM's series "Installation Management." This second edition written by Price Waterhouse & Co. also includes batch and on-line versions of an application system to illustrate control procedures, plus an audit/review questionnaire that could be a useful guide to the auditing process. Intended primarily for dp personnel and internal auditors, senior management would benefit from the first chapter which outlines some major dp control areas and responsibilities, which are then discussed in more detail in the remaining chapters. Price: \$3. Contact the nearest IBM branch office for copies; ask for GF 20-0006-1.

## Program Design

Gains in productivity of up to 40% are claimed for Michael Jackson's new programming design methodology,

which is described in detail in the 48-page handbook, *The Jackson Design Methodology: A Handbook of Program Design*. The handbook describes how the method works, the training required to use the method, and summaries of the experiences of 500 organizations already using the method. There are five sections to the handbook, and two are written by Mr. Jackson, which include the method's key features and concepts underlying his hints on good programming technique. INFO-TECH INTERNATIONAL, U.S. Training Div., Pasadena, Calif.

FOR COPY CIRCLE 201 ON READER CARD

## Dp in Japan

By 1985, the number of computer systems in Japan will reach 107,000 for a value of \$24.89 billion, compared to 34,000 systems valued at \$7.16 billion as of December 1975. This is a 3.5-fold increase at an annual compound rate of growth of 12.2%. Japan today ranks second only to the U.S. in numbers of computers installed.

The value of on-line terminal equipment installed, \$612.7 million in March 1974, will reach \$7,454 million by March 1986. And the need for dp personnel, which stood at 154,000 in 1974, will reach 578,000 by March 1986—while only 399,000 will be available. (You could get an application in early.)

These and other detailed forecasts of computer use and the scale of the "Information Industry" are provided in the 76-page report, *Edp in Japan 1976*. The report, profusely illustrated with tables and charts, was compiled by the Industrial Structure Council, an advisory body to the Minister of International Trade and Industry. Price (includes postage): \$20. JAPAN ELECTRONIC COMPUTER CO. LTD., New Kokusai Bldg., 5th Floor, 4-1 Marunouchi 3-chome, Chiyoda-ku, Tokyo 100, Japan.

## Electronics Companies

The 692-page *Electronic News Financial Fact Book & Directory* contains practical and financial information on perhaps all the electronics companies in the U.S. Officers of the company, directors, areas of work, domestic and foreign subsidiaries, number of employees, plant footage, sales and earnings, common stock equity, income account, assets, liabilities, and statistical summaries are supplied for each company. IBM, Sperry Rand, Digital Equipment Corp., and Burroughs are just a few of those companies listed, and there is a one-page ranking of the leaders according to sales. The price for this 15th annual edition: \$75. FAIRCHILD BOOKS, Dept. BR, 7 East 12th St., New York, N.Y. 10003.

(Continued on page 33)

# Why buy from a small disk media manufacturer when there are so many large ones?

ARBER INDUSTRIES is a nice little company (large in technology) that you just might like to do business with.

ARBER has successfully manufactured and installed ATHANA brand magnetic media products valued in many millions of dollars since the company was founded in 1973. These sales have been won against many large competitors who are well entrenched in a highly competitive marketplace. How has ARBER INDUSTRIES maintained this steady rate of growth against this formidable group?

Many leaders in the computer business have become debt ridden and in some cases failed during recent history. While these many and well documented failures occurred for a variety of reasons, it has become obvious that the buyer of data processing equipment and supplies has developed into a sophisticated purchaser who no longer accepts corporate size and/or price as the basic criteria for a decision of *where* to buy.

ARBER INDUSTRIES is a company totally dedicated to the preservation of quality both in our ATHANA brand magnetic media products and our business relationships.

Some companies buy products manufactured by outside sources for re-packaging and re-sale. ARBER DOES NOT. Many magnetic media manufacturers buy aluminum substrates which are pre-processed by outside sources for inclusion into the disk products which they sell. ARBER DOES NOT. It is the practice of many disk product manufacturers to purchase coated substrates from one or more of its competitors as an "answer" to production failures or to meet peak loads. ARBER DOES NOT.

We invite your inquiry and comparison. ATHANA brand magnetic media products are available on a world-wide basis direct from the factory or through qualified distributors in certain geographic areas. Your complete and detailed examination of our company and products is both welcomed and appreciated.

**CALL THIS  
NUMBER AND FIND  
OUT HOW MORE  
THAN 1,500  
UCC INSTALLED  
SYSTEMS HAVE  
SOLVED PROBLEMS  
WORLDWIDE.**

**TAPE MANAGEMENT:** UCC ONE's 500 installations represent over 75% of all installed OS tape management systems. UCC ONE manages your tapes and protects valuable data from loss or destruction. It provides real-time tape status. Eliminates costly, handwritten records and the expensive mistakes they breed. Gives you better control and greater efficiency.

**DOS UNDER OS:** UCC TWO lets you continue to use your DOS programs — without reprogramming — while you convert to OS. You plan the conversion or consolidation to fit your work schedule, instead of the other way around. You can consolidate your DOS operation into your OS/VS environment today. Or, you can spread the conversion — and the costs — over months. UCC TWO is the best path to OS and our 500 installed systems prove it.

**DISK MANAGEMENT SYSTEM:** UCC THREE/ADAM solves the problem of disk fragmentation and inefficient DASD space usage. Based on user specifications, it automatically scratches unneeded, unused and invalid data sets. Or it

# 27-3250

will migrate the data sets to tape, based upon any combination of criteria — such as usage frequency, size and retention period. Then, UCC THREE keeps the problem from recurring by controlling data set allocation. Fragmentation and the need to periodically compress packs is reduced. Accurate reports on your current space utilization are produced.

## **PDS SPACE MANAGEMENT:**

UCC SIX is the only software package that eliminates PDS compression — because it automatically inventories and controls PDS disk space. It spells the end for ABENDS and “dump and restore” operations caused by exhausted PDS disk space. You even save money on your disk investment, too.

## **IMS DATA DICTIONARY/**

**MANAGER:** UCC TEN accounts for two out of every three IMS data dictionaries in use today. You can put your finger on the information you need — quickly and precisely. You can manage and control your data base environment. Now, at last, you can get the benefits you expected from IMS.

## **RESTART MANAGEMENT:**

UCC FIFTEEN lets you restart at the proper job step — instead of at the beginning. The OS catalog is corrected, unnecessary direct access

data sets are deleted, and GDG biases are properly altered for the rerun. Automatically — so manual errors in restarting and rerunning are eliminated.

**FINANCIAL SOFTWARE:** The UCC General Ledger/Financial Control System is the most advanced and complete system of its type. Full general ledger accounting. Budgeting. Cost allocation and profit center reporting. Optionally generates over 100 standard reports. Plus, it has an easy-to-use report writer that the Accounting Department can use — with a minimum of EDP assistance.

**SUPPORT:** It takes more than code to make a good software product. It takes dependable, long-term maintenance and support of those products. Users of over 1,500 installed systems will tell you that is what UCC delivers.

# **UCC**

P.O. Box 47911 • Dallas, Texas 75247

# Which way is up?

**In business data processing,  
it depends on who you ask.**

As corporate data bases grow ever larger, many data processing managers are striving to free central computer processing capacity for use in exploiting the opportunities a larger data base presents. As you'd expect, each hardware manufacturer proposes a different solution to this workload reduction problem.

At Four-Phase, we believe the most promising solution to be **distributed processing**... maintaining local records locally and passing only data necessary to corporate planning and control upward to the central computer. We've been building distributed processing networks since 1969, and our product line is designed to permit their implementation in a planned sequence of rational, cost-efficient steps.

This sequence begins with the replacement of existing IBM 3270 displays, keypunches or remote batch terminals with

compatible Four-Phase systems at a few key sites. On these pilot installations, field-proven software speeds the implementation of local transaction processing, local data base management, report generation and communication with the central computer.

Production systems are then installed at the remaining network locations. Because the Four-Phase product line is hierarchical in organization,

each distributed processing site can be equipped with a system configured to its precise workload and communications requirements.

Once the basic distributed processing network is on-line, a stratified network structure (with geographically distributed files and display access at branch, district and regional offices) is slowly evolved to "tune" operations to measured processing and communications volume.

Thus the network evolves along an **orderly growth path**... a process made possible by Four-Phase hardware, software, systems engineering and maintenance support developed and proven over seven years for the present era of distributed processing. For further information, contact your local Four-Phase office or Four-Phase Systems  
19333 Vallco Parkway  
Cupertino, CA 95014

## ANSI Standards Proposal

The draft proposal of the American National Standard FORTRAN was published as the March issue of ACM SIGPLAN Notices. The proposed standard consists of a full language and a subset language which is a revision of X3.9-1966 FORTRAN. The ANS Committee X3J3, which developed the new standard, also recommends withdrawal of X3.10-1966 Basic FORTRAN. Based on comments received by the committee, the proposed standard will be revised as necessary and submitted to the ANS Committee X3 for letter ballot and final approval. The draft proposal is available for \$5 prepaid. ASSN. FOR COMPUTING MACHINERY, Order Dept., P.O. Box 12105, Church St. Station, New York, N.Y. 10249.

## Industrial Automation

The world market for process control products totaled nearly \$3 billion in 1975; this will grow to over \$4 billion by 1980. The chemical industry is the largest customer for process control equipment, with the petroleum industry second. Reliability is the prime consideration in purchasing this equipment, and the major suppliers are Foxboro, Honeywell, Fisher Controls, Leeds & Northrup, Taylor Instruments, and Fischer & Porter, with the first two sharing 30% of the market.

An in-depth study of the industry, the market, the technology, and the competition is found in the 60-page report, *Industrial Automation I: Process Control*. Included is a discussion of systems architecture, sensors, instruments and controllers, control elements, and actuators. Price: \$495 (also available by subscribing to CSI's Industry Analysis Service). CREATIVE STRATEGIES, INC., 4340 Stevens Creek Blvd., Suite 275, San Jose, Calif. 95129.

## European Data Communications

As part of the continuing research effort sponsored by the 17 West European Postal, Telegraph and Telephone agencies (a project known as "Eurodata"), a 150-page report, *The Western European Data Communications and Computer Terminal Outlook*, analyzes the development of data communications in Western Europe through the mid 1980s. The impact of new technologies on network terminal and modem design; IBM's strategy in Europe; PTT strategies and plans; economic trends in each of the countries; competitive influences for mainframe manufacturers, minicomputer vendors, terminal suppliers, and modem com-

panies; and the role of emerging suppliers and possible favoring of local vendors are among the topics covered.

Products analyzed are general purpose terminals (displays, keyboard/printers, remote batch), special purpose terminals (point-of-sale, credit/EFTS, banking, factory data collection), and modems. Price: \$500. PA INTERNATIONAL MANAGEMENT CONSULTANTS, c/o Richard A. Peters, P.O. Box 1275, Palo Alto, Calif. 94301.

## Computer Abuse

*Computer Abuse and Criminal Law* is a 110-page volume of materials collected for presentation at a symposium on computer abuse for prosecuting attorneys held at the Univ. of California, San Diego, in July 1976. Sorely in need of a table of contents (not to mention an index), the report contains several articles, scattered bibliographies, and extensive reprints of newspaper stories. It does make interesting although unsystematic reading on the topic. Price: \$9. Computer Center, C-010, UNIV. OF CALIF., San Diego, La Jolla, Calif. 92093.

## Data Base Directions

*Data Base Directions: The Next Steps* is a 175-page report on the results of a 3-day workshop of about 80 experts sponsored by both the National Bureau of Standards and the ACM, held at Fort Lauderdale, Fla., in October 1975. The five subject areas are auditing, evolving technology, government regulations, standards, and user experience. These proceedings provide guidance for the manager in implementation of data base concepts. Price: \$2.40; ask for SD Cat. No. C13.10:451. Superintendent of Documents, U.S. GOVERNMENT PRINTING OFFICE, Washington, D.C. 20402.

## Single Source Maintenance

With more users going to data communications networks, distributed processing, and/or multivendor terminals, it may be that single source maintenance is more efficient and economical. A brochure rates existing dp maintenance performance and discusses criteria for third party maintenance. SIRVESS, INC., Saddle Brook, N.J. FOR COPY CIRCLE 202 ON READER CARD

## Advanced Calculators

A 24-page booklet, *What To Look For Before You Buy An Advanced Calcula-*

*tor*, analyzes the available types of scientific, business, and programmable calculators. It is designed for the buyer with little or no knowledge of available functions, operating languages, and specialized calculators. Characteristics of good and poor calculators are described, and chapters include an introduction to advanced calculators, operating languages, functions and features, programmables, support material, and calculator construction. HEWLETT-PACKARD CO., Palo Alto, Calif.

FOR COPY CIRCLE 203 ON READER CARD

## Small Business System

The Wang Business System is a BASIC language small computer and associated peripherals "for use in any business." An illustrated 12-page brochure describes the system's capabilities, such as invoicing, inventory, order acknowledgments, packing lists, accounts payable, customer statements, paychecks, balance sheets, operating statements, etc. Examples from various businesses—manufacturers, retail sales, wholesale distributors, freight handlers, CPA offices, general contractors, government agencies, insurance companies, banks, school systems, townships, medical groups, public utilities—are presented. WANG LABORATORIES, INC., Tewksbury, Mass.

## Oem Line Printer

This vendor's model 2423 oem line printer, described in a data sheet, is a medium speed printer with a 132-column print line and a 64-character EBCDIC font. It was developed specifically for communications oriented and minicomputer systems requiring high performance. It is housed in a floor model cabinet with an optional "whisper-quiet" configuration available. Other fonts are also available, and print speed for the 96-character version is 180 lpm; for the 64-character version, 250 lpm; and for the 48-character version, in excess of 300 lpm. DATA 100 CORP., Minnetonka, Minn.

FOR COPY CIRCLE 206 ON READER CARD

## Display System

An 8-page catalog describes this vendor's three-dimensional display product line. Unretouched crt photos showing various images accompany a discussion of the basic principles of the system. Various depth cues generated by the system are discussed and photographic examples given. System specifications, a discussion of various modules and their functions, and system diagrams and applications are also provided. Peripheral products such as vector generators, composite video-to-analog converters, and image genera-

# source data

tors are also discussed. OPTICAL ELECTRONICS INC., Tucson, Ariz.  
FOR COPY CIRCLE 209 ON READER CARD

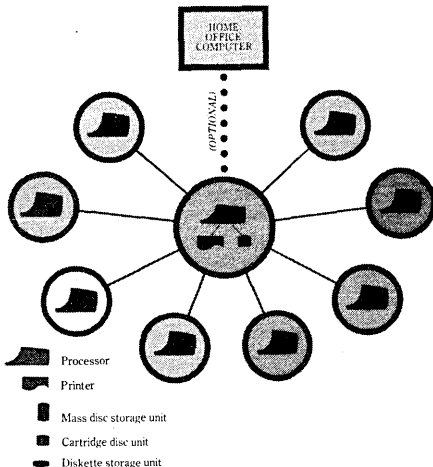

## DEC Communication

*Decnet* is a brochure describing software tools available for operating systems to allow communication between PDP-8, PDP-11, DECSYSTEM-10, and DECSYSTEM-20 computer systems. Outlined are the types of networks, sample applications, DECnet commands and functions, structure and design, and a technical summary of DECnet operation. DIGITAL EQUIPMENT CORP., Northboro, Mass.

FOR COPY CIRCLE 207 ON READER CARD

## Dispersed Dp

*An Executive Guide to Dispersed Data Processing* is an illustrated 20-page brochure which in nontechnical language describes the dispersed processing concept and its advantages. Computer networks, data communications, and ways in which dispersed processing systems and peripherals can be integrated into central computer operations

with maximum efficiency are discussed. Input error elimination, improved employee productivity, and extended automation are a few of the advantages claimed. Operating features of this vendor's dispersed processing equipment for data entry and for other field office assignments are also included. DATAPOINT CORP., San Antonio, Texas.  
FOR COPY CIRCLE 205 ON READER CARD

## Network Control

Have you an unruly on-line, interactive data network? An illustrated 14-page brochure, *The Network Control System*, will tell you how to get it under control with this vendor's system. Also described are typical network diagrams, diagnostics, backup, and hot spare modems in both multipoint and distributed processing environments. INTERTEL, Burlington, Mass.

FOR COPY CIRCLE 208 ON READER CARD

## Output for PERT

A 4-page newsletter reports on this vendor's electrostatic output systems for PERT (Project Evaluation and Review Technique). New wide format plotters, improved software, and new system configurations are described that should make high speed electrostatic plotting practical in more PERT applications. VERSATEC, Santa Clara, Calif.

FOR COPY CIRCLE 210 ON READER CARD

## High Speed Printer

A technical information bulletin describes the operation of this vendor's 8200 Series line printers. Information on the electrostatic writing technique used, toning of the paper, and the paper drive system is supplied. An overview of how a 2400 lpm printer that sells for \$3,000 works is given. HOUSTON INSTRUMENT, Austin, Texas.

FOR COPY CIRCLE 211 ON READER CARD

## Data Acquisition & Control

A 16-page illustrated brochure, *Data Acquisition and Control Systems*, features everything from computers to connectors supplied by this vendor. The DG/DAC (data acquisition and control subsystem) interfaces NOVA and ECLIPSE computers to sensors, actuators, and associated electrical circuits. Computers, peripherals, and software are presented, and support functions are discussed. Several application configurations, from a simple monitoring system to a large dual-processor-based control system, are included. DATA GENERAL CORP., Southboro, Mass.

FOR COPY CIRCLE 212 ON READER CARD

## Microprocessors & Microcomputers

Two 2-day intensive short courses are scheduled. *Microprocessors in Manufacturing and Industrial Control* will be held in Cincinnati (Jan. 11-12), Toronto (Jan. 18-19), and Newark, N.J. (Feb. 8-9). *Software/System Development: Tools and Techniques for Microcomputers* is scheduled for Cincinnati (Jan. 13-14), Toronto (Jan. 20-21), and Newark (Feb. 10-11). Price: \$395 (\$695 for both courses); notes, reference materials, hardware demonstrations, and luncheons included. INTEGRATED COMPUTER SYSTEMS, INC., P.O. Box 2368, Culver City, Calif. 90230.

## IFE Courses

Several 3-day courses of interest are scheduled. *Practical Leadership of Data Processing Projects* will be held in Chicago (Jan. 12-14) and Washington, D.C. (Feb. 9-11). *Effective Com-*

*puter Operations Management* is scheduled for Phoenix (Jan. 24-26), and Washington, D.C. (Feb. 23-25). Other courses include *Applied Data Communications Systems* in Chicago (Dec. 15-17), Washington, D.C. (Jan. 17-19), and San Diego (Feb. 16-18); *Minicomputer Systems* in Denver (Jan. 5-7) and Washington, D.C. (Feb. 16-18); and *Structured Design and Programming* in Phoenix (Jan. 12-14), Washington, D.C. (Feb. 9-11), and Chicago (Mar. 2-4). Price (includes course materials and luncheons): \$445 (\$395 if prepaid). THE INST. FOR PROFESSIONAL EDUCATION, Suite 601, 1901 N. Fort Myer Dr., Arlington, Va. 22209.

## Microprocessors

"Current state of microprocessors," "Build or Buy?" "Automatic software production for microcomputers," and "Microprocessors in control systems" are four of the 11 articles in the first issue (September 1976) of the international quarterly journal, *Microprocessors*, edited in England by Gareth W. Jones. Other features include a review of current research in the field, a calendar of worldwide meetings and events, a product and literature review, and a book review section.

The journal expects to cover developments in applications, education, software, and hardware—in other words, to keep abreast of this growing technology and to provide a forum for discussion of major worldwide developments. Subscription: £20 (British) or \$67.60 (U.S.). IPC BUSINESS PRESS LTD., Oakfield House, Perrymount Rd., Hayswards Heath, Sussex, England RH16 3DH or IPC BUSINESS PRESS LTD., 205 East 42nd St., New York, N.Y. 10017.

## Chemical Computer Techniques

*Computer Techniques and Optimization* is a new section of the well-known international quarterly chemical journal, *Analytica Chimica Acta*. The section is devoted to new developments and advances in chemical analysis by the application of computer techniques and by interdisciplinary approaches, including statistics, systems theory, and operations research. Subscription: \$49.75. Free sample copies of the first issue to include the new section (March 1977) may be requested by writing to: ELSEVIER SCIENTIFIC PUBLISHING CO., P.O. Box 211, Amsterdam, The Netherlands. \*

## **“If I buy Digital’s concept of distributed processing, what happens to my mainframe investment?”**

Digital’s concept of distributed processing is designed to protect your hardware and software investment with a series of tools that enhance it.

With these tools, you can develop new applications that can interact with your existing system so you can be more responsive to your users. And your customers.

These tools include the broadest range of small, medium and large-scale computers in the world. Supported by a powerful data entry language, high level commercial languages, industry-

standard communications protocols and sophisticated resource management and data management capabilities.

So now you can give your users the benefits of interactive applications without disrupting your smooth running batch operation. And that means you can save mainframe time for mainframe work and distribute computer power to the people who need it, without losing control over your operation.

Already, thousands of Digital Datasystems are working to increase data processing

efficiency in companies all over the world.

To find out how they can help your company, write Mr. Pat Mullen, Digital Equipment Corporation, Commercial Products Group, PK3-1/M33, Parker St., Maynard, MA 01754. European Headquarters: Mr. Henry Ancona, 81 route de l’Aire, 1211 Geneva 26. In Canada: Digital Equipment of Canada, Ltd.

**digital**

# Why twelve ads in Datamation are better than six ads in Datamation and six ads anywhere else.

It computes. In an uncomplicated way.

Think of your ads as sales calls. You'd never omit 70 of your most important 100 prospects. Neither does DATAMATION. It alone reaches all the buying influences. In fact, the next best EDP publication reaches only 30% of DATAMATION's audience.

Clearly, multiple ads anywhere else can't give you coverage of people

they never reach. Anywhere else is really nowhere.

DATAMATION multiplies your advertising effectiveness like no one else can. Our advertisers recognize this. That's why we carry more advertising than any other publication in the field.

When you think about it, that's why we should be carrying more of your advertising. Six times or twelve times, it computes.

 Technical Publishing Company

 **DATAMATION**<sup>®</sup>  
First in market coverage—worldwide.

# The Genie.

The Codex Multipoint Network Control System, MNCS. A real Genie that can put you in total control of your high speed multipoint network.

Wish for remote monitoring... You've got it. Wish for complete diagnosis of a system problem... Yours. Wish for restoration of a function so that you are assured of continuous system operation... It's yours. And you control it all from the central location with no human intervention at the remote site required.

Our Genie works like magic. So do our Fast-Poll\* Multipoint Modems.

Codex Fast-Poll modems include a wondrous "gearshift" operation to provide the fast RTS-CTS response time of 9 milliseconds typical of 2400 bps units yet with

the high inbound data throughput of a 4800 bps modem. And they offer proven reliability, performance, and economy because they include the latest advances in MOS/LSI technology.

On the outbound side the LSI 48FP, LSI 72FP, or LSI 96FP offer 4800, 7200, or 9600 bps speeds respectively to provide the maximum in completely automatic operating performance in dedicated multipoint configurations. So order the Codex Genie to make you the master of your multipoint network and the Fast-Poll slaves will grant your every wish.

“With MVS,  
our computers are  
helping us set new  
highs in service  
and productivity  
at John Hancock.”

*John Hancock's J. Edwin Matz*

# In other

"We're projecting a \$2 million reduction in operating expenses," says J. Edwin Matz, president and chief operating officer of the John Hancock Mutual Life Insurance Company. "And we're halfway there already."

"We're providing more information to our policyholders and agents than ever before, and we're able to process our steady increase in business with ease."

These are some of the advantages Hancock has realized since its recent installation of advanced computer applications that operate under MVS (Multiple Virtual Storages). The Boston-based insurance company is one of more than 185 large IBM customers in the United States that are already using MVS as their primary computer operating system.

MVS also makes possible the concept of multiprocessing—interconnecting two IBM System/370 computers to form a single operating unit. Multiprocessing offers users the combined power of both computers as if they were one.

### 200,000 transactions daily

In the individual life insurance area, one of the systems supported by MVS administers more than four million policies—including 35,000 premium notices and as many as 3,000 address changes daily.

"Our individual life system alone handles an average of 200,000 transactions each day," says Mr. Matz. "With it, some customer services, like address changes and reinstatements, are now being proc-

essed in half the time. Home office loans are done in one-fourth the time."

Under MVS, Hancock also operates a network of 550 terminals nationwide.

Called Hanstar, the network handles virtually all aspects of claims payment service for group accident and health insurance. During 1976, it has enabled the

company to absorb an 18% increase in volume—more than a quarter-million transactions—with no increase in the staff or transaction time.

### "We expect the utmost"

"Because our entire operation centers on our computer systems, we expect the utmost in reliability from them," Mr. Matz says. "MVS has allowed us to capitalize on the greater performance offered by technological advances while also enhancing reliability."

Multiprocessing under MVS is one of a number of ways IBM extends the power of the computer to people who need it. For more information, call your IBM Data Processing Division marketing representative. Or write for "MVS: Multiplying Computer Power" to the IBM Corporation, Dept. 83F, 1133 Westchester Avenue, White Plains, N.Y. 10604.

# words, results.

# Manufacturing Systems with freedom to configure.

Configure your own manufacturing system,  
from any of 95 MAS jobs.

Modular Application Systems will meet your **BUSINESS NEEDS:** already proven in over 500 world-wide implementations, MAS was designed by personnel with backgrounds in manufacturing, production, engineering and cost accounting.

The bill of material-like structure of MAS (6 systems, 20 elements, 95 jobs) provides complete **FUNCTIONAL FLEXIBILITY.** You select only the functions needed to meet your initial objectives; then plan a phased implementation, safe in the knowledge that the interfaces are proven. As your experience with MAS grows, you can switch in new facilities, add additional control and tune the system from a wide choice of policies.

Just as MAS provides functional flexibility, it also allows **TECHNICAL INDEPENDENCE.** MAS is running on IBM, Honeywell, Univac and ICL machines; is used for distributive processing and on-line inquiry; and is supported by VSAM, ISAM, TOTAL, IMS, IDMS, DBOMP and CFMS. Totally Modular ANS COBOL allows complete freedom for efficient customizing by your own shop, or by us—if required.

MAS provides a **COST EFFECTIVE** way of achieving a proven functionally viable system for as little as 80¢ per line of code, including full documentation. Budgetary flexibility is enhanced as you select, implement and purchase your systems at the job level.

Almost without exception, every one of the 500 MAS systems installed is still in use. This success has been achieved through MAS itself, and a strong commitment to **IMPLEMENTATION SUPPORT.** Our implementation people are just as likely to have manufacturing backgrounds as data processing. With MAS Documentation and Training Aids, we'll work with you to ensure successful implementation.

## Job by Job.

**For More Information:** We'll gladly

send our Manufacturing Systems Checklist which will enable you to check out MAS' ability to meet your requirements. Please contact Dick Nemerson, MMDS Headquarters, 300 East Joppa Road, Baltimore, Md. 21204 (301) 823-1600.

## Our Independent Graphics Software System Leaves You To Your Own Devices.

Our users are able to construct a sophisticated plot on a CRT terminal quickly, check it for accuracy on a drum plotter, then use microfilm for the production run. And all with the same program.

Almost every computer application can make good use of graphics. Bar charts, pie graphs, performance comparisons, route maps, even computer usage graphs are plotted from computer printouts. DISSPLA now makes plotting feasible.

DISSPLA is machine and device independent. One user installed this package and one week later ordered 30 terminals. Another averages five thousand plots daily.

1. **MACHINES** DISSPLA turnkey versions are available for IBM 360/370 (OS, DOS, TSO, VS, CMS, etc.); CDC 6000, 7000, Cyber 70 series (SCOPE and KRONOS);

**Drum Plotters**  
Interfaced to:  
Calcomp (563, 565, 763, 765, 936, 1036, 1136); H.I.; Zeta

**CRT's**  
Interfaced to:  
Tektronix (all); Computek;  
H.I.; Vector General; Adage;  
IBM 2250

**Flatbed Plotters**  
Interfaced to:  
C.I.L.; Xynetics; EAI;  
Tektronix; Hewlett Packard;  
Gerber Artwork Generator;  
Gerber

**Microfilm Devices**  
Interfaced to:  
Calcomp (835, 865, 890);  
FR 80; COMp 80; SC 4020;  
SC 4060

All we ask is the ability to draw a straight line.

UNIVAC 1100 series (Exec 8); PDP-10 (DECsystem-10); XDS Sigma 9 (Commander II).

- EASY TO USE** DISSPLA is a system of FORTRAN subroutines. And heavily used from COBOL, ALGOL and PL/I. Beginner, intermediate and advanced manuals are provided with many examples.
- PUBLICATION-QUALITY PLOTS** DISSPLA has business and scientific features, maps, 3-D hidden line surfaces, 51 publication-quality character sets, shading, and numerous other features.
- ALREADY IN WIDE USE** DISSPLA has been in use more than six years. And now in more than 50 installations in the U.S. and Europe. Ask us about our users.

## Ten Terrifying Questions to ask a person trying to sell you a computerized personnel/payroll system

### Terrifying question number one

OK, so we're sold on using a system—who's going to install it? Are you equipped to do it? Can you get it up and running fast? Are experts on hand who have done it before?

Will you give us tender, loving care while you install our new system? Will we get good support after we're up-and-running?

### Terrifying question number two

Will the system's value exceed its cost? Can you prove it? Exactly where will savings come from? How will costs be cut? Can you give us figures showing savings in time, money, and better use of our staff?

### Terrifying question number three

What's your track record? How many systems are actually in operation? Do your users boast about the system? Are they happy? Will they pass on the good news? Is there any good news?

### Terrifying question number four

How about documentation? Will we know exactly what we've got? Is it easy to understand? Can we take the reins quickly? We need high quality training and manuals. Will you provide these?

### Terrifying question number five

How about reports for EEO, ERISA, and OSHA? Can we handle those? I mean really handle them. Can we meet compliance demands quickly and inexpensively? We'd like to relax on that score.

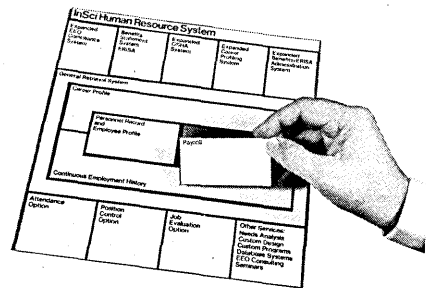

### Terrifying question number six

Will it be a hassle every time we need information? Can our Personnel or Payroll Departments retrieve information without calling in a programmer? Can your retrieval system understand English?

### Terrifying question number seven

How flexible is the system? Can we expand it as we grow? Will your people sit down and discuss our particular needs and tailor the system to them? How comprehensive is your Payroll system? What about manpower planning, salary and benefits administration? Or health and safety programs?

### Terrifying question number eight

Can you provide a forum—seminars, and so forth—for our personnel, payroll, and data processing people? Can we talk to other users grappling with the same problems? In other words, can you help us keep in touch with the the industry?

### Terrifying question number nine

If we can't use our computer, must we shelve the idea? Can we run the system on your computer? Do you have a systems service division to help us do our work? What other clients do they handle? What kind of turnaround can I expect?

### Terrifying question number ten

Is your organization stable? Are you financially secure? Will you still be around five years from now if we must expand the system? Are you growing?

**InSci**  
Information Science Incorporated

Ask InSci for answers to these terrifying questions. Ask us about our flexible, economical Human Resource System. Check the references of other systems. We've been in this business for eleven years. We'll help you define your needs and show you the best way to get the job done. The difference between sales claims and up-and-running systems is significant. InSci delivers the software and then installs it to your satisfaction. Ask InSci. We have the right answers.

# Here's a money-saving combination that you can bank on

Westinghouse software users include some of the largest, most demanding companies in the world. Like Colgate-Palmolive, General Motors, PPG Industries. They expect the most from their software. That's why they bank on Westinghouse:

## 1. DISK UTILITY SYSTEM

DOS and DOS/VS program that increases your computer's productivity

Runs up to five times faster than others  
 Gives you 13 exclusive features  
 Uses less storage space  
 Self-relocating  
 Verifies data copied/restored

## 2. WESTI

DOS/VS teleprocessing interface that manages: terminals • user core areas • display format files • application program • disk work space • user work areas

Reduces core requirements  
 Installs in as little as three hours  
 Improves system efficiency  
 Increases system flexibility

## 3. DOKUMNTR

An automated approach to documenting: technical abstracts • course material • user manuals • maintenance handbooks

Produces standard documentation  
 Simplifies revisions and indexing  
 Saves proofing time  
 Saves time on main

## 4. JOB ACCOUNTING SYSTEM

A system that helps you get more from existing resources

Identifies program reruns  
 Identifies overload  
 Examines operator/computer performance  
 Reduces memory partition idle time

## 5. asTEC SPOOLING SYSTEM

Low-cost, high-performance spooling system • release independent • partition balancing

Complete queue management  
 Multiple extents (up to 15)  
 Early punch/print start  
 Data compression  
 Multiple copy support

## 6. leTEC LINKAGE EDITOR

Relocatable linkage editor and program loader • core image library maintenance • low overhead

Operates in CE area  
 No user modifications to supervisor  
 Installs in minutes

## 7. opTEC OPERATIONS TRANSIENT

A collection of transient replacements for more flexible and efficient operations

Shorter ready messages  
 Abbreviated responses  
 Job control permits assignments  
 For real devices and pseudodevices

## 8. DISK SPACE MANAGER

Improves DOS/VS system performance by managing disk space and selecting the most efficient execution made

Partition independent JCL  
 All disk types  
 Increases throughput  
 Simplifies JCL  
 Installs in minutes  
 All DASD file support

## Don't take our word for it

Prove these claims on your own hardware. Call us today at 412 256-5583 for more information. Or write Westinghouse Electric Corporation, OSP, 2040 Ardmore Blvd., Pittsburgh, Pa. 15221.

# Say When.

**Introducing the Consul 520. Now you can get exactly what you need in teletypewriter compatible equipment. Without paying for what you don't need. Check the features below and say when.**

Let's say you need:

- Inquiry-response capabilities.
- Remote controls to X-Y address or position the cursor up, down, forward, backward and home.
- Audible alarm and keyboard lockout.
- 12" screen; 24 lines with 80 character positions per line.
- Dark lettering on light background for increased legibility.
- Bonded faceplate TV monitor.
- Five transmission rates, switch selectable.
- Scrolled or wraparound display.
- Automatic line feed button.
- EIA RS232 or 20 milliamper current loop.
- Video output.
- Full-duplex or half-duplex transmission.

*It's the Consul 520. The meat-and-potatoes basic that's pure prime quality. It features as standard what most terminals call options. Single unit price, \$1595.*

- Maybe you need all the above features, plus:
- Hard-copy capability with printer interface.
  - Cursor control keys.
  - Numeric pad.
  - Rack-mounting option.

*It's the Consul 580. Like all our terminals, the 580 has an extended warranty option, and OEM/Educational discounts. Single unit price, \$1795.*

Moving right along, we drop the printer interface, and give you the above, plus:

- Protected formats.
- Block transmission to cut down on CPU functions and considerably reduce software needs.
- Selective transmission of only variable data.
- Upper and lower case ASCII display.
- Shift and lock keys.
- Transmission by page, partial page, line or character.
- Look-ahead cursor positioning to suppress trailing blanks.
- Automatic tabbing between fields.
- Half-intensity.
- Blinking at two rates.
- Remote recognition of cursor position.

*It's the Consul 920.  
With its sophistication  
and flexibility, the 920  
is a network designer's  
dream. Without a  
nightmare price.  
Single unit price,  
\$2200.*

Still with us? Then you need the works:

- Graphics that show everything from bar charts to diagrams.
- Alphanumeric annotation of graphics.
- Line insert or delete; remote or local.
- Character insert or delete.
- Overwriting.
- Parallel and serial peripheral interfaces.
- Remote or local printing.

*It's the Consul 980.  
Top of the line,  
and acts like it.  
You simply can't  
buy better.  
Single unit price,  
\$2800.*

Now. If you've said when, we'll say where:  
Applied Digital Data Systems Inc., 100 Marcus Blvd.,  
Hauppauge, New York 11787 (516) 231-5400

# ADDS

# 36" PLOTTER WITH COST-PERFORMANCE PLUS THE NEW SERIES OF DP-8 DIGITAL PLOTTERS

## PICK THE ONE YOU NEED TODAY

- Three low-cost, high-performance models
- Nine switch-selectable step sizes
- One or three pens
- 3 or 4.5 ips
- Quiet operation
- Positive paper feed
- Can be driven by existing interfaces
- Priced from \$7600
- Options:
  - 12" paper handling drum — \$900
  - 36" paper take-up spool — \$300
  - Plexiglass cover — \$450
  - Paper tear-off bar — \$125
  - Plot timer clock — (contact factory for price)

**DP-8V**  
3 IPS, Single pen  
**\$7600**

**DP-8S** 4.5 IPS, Single pen,  
9 switch-selectable step sizes  
**\$8400**

**DP-8-S3** 4.5 IPS, 3 pen,  
9 switch-selectable step sizes  
**\$9500**

**USE IT ONLINE, OFFLINE  
OR WITH OUR NEW 734  
BATCH TERMINAL CONTROLLER**

**houston instrument** | **THE RECORDER COMPANY** | DIVISION OF BAUSCH & LOMB

In Europe: CAI Ltd., Hertford House, Maple Cross, Rickmansworth, Herts WD3 2XD, England.

Photographed on location at Loch Linnhe, Scotland.

## Black Watch® guards itself. And your valuable data.

This Scotch® brand 700 computer tape has a special name, Black Watch, for good reason. Because it has a specially-textured back side which guards against cinching, shifting and scratching that can cause tape damage.

This extra protection comes to you from the people who developed the first commercial computer tape in 1953. The people who have led the industry ever since with a long succession of innovations and improvements. They're the more than 1000 research experts, production specialists, and sales and service technicians who make up the 3M Clan.

Now, Black Watch and all Scotch computer tapes are more widely available to you than ever before. From leading data products suppliers who have joined our clan.  
3M Data Recording Products Division.

## Count on the clan.

## Power Plays

Big is not necessarily better. In fact it often appears that when organizations reach a critical mass they exhibit a kind of elephantine arrogance, a callous misuse of power that runs counter to the needs of their customers, their industry, and the very system of business that makes their existence possible.

For example, there's what one dp manager of our acquaintance rather uncharitably calls "the 168 rip-off." IBM is pushing hard to move its big shop customers to MVS and the 168, citing the advantages of new software, new peripherals, and higher reliability. But some managers, closely examining price/performance, are hard put to find any economic justification to make the switch. The 168's cpu is only slightly more powerful than the 165 and, in terms of throughput, there's no advantage at all. And lurking just below the surface like *Jaws* is the real cost of installing MVS. We know of one shop where the manager cannily estimated the cost of MVS installation as if it were priced at outside market value. When the numbers began exceeding the \$750,000 mark, he found himself regarding his 165 os installation with new found affection. "Could it be," he mused, "that the 168 has more to do with maximizing IBM's profits than solving my problems." Could be.

And might it also be that the large dp shops have been the victims of technological foot-dragging when it comes to IBM's smaller systems? Right now a small band of determined competitors—the likes of DEC with its PDP 11/70, Interdata and its 830, Data General and the Eclipse, and HP with the 3000—are offering machines in the 155 class with up to seven times the price/performance in terms of raw hardware. (Even with software costs added, the discrepancy is still startling.)

IBM has just not presented its users with this type of low cost, high performance option. Zealously protecting its huge rental base, it has kept them plodding along several years behind the available technology, tied to a monolithic philosophy of organizational control that depends on a big, expensive, centralized cpu.

\* \* \* \*

Users are not the only ones who have been trampled. Paul Armer, gray of beard but only moderately long in the tooth, has been in the computer industry since the beginning. When Armer was asked to be a CalComp witness in the antitrust trial that began last month, IBM sent him a discovery request that bordered on the absurd. Requested was every document, every paper, every scrap of material generated as a result of his long involvement with the field. Armer could afford neither the time nor the expense to comply with the order and, overwhelmed, he's since changed his status as a witness.

Bob Brueck, president of MRI Systems in Austin, Texas, received one of these legal bombshells last year. Brueck was to appear as a Justice Department witness in the interminable IBM antitrust trial still underway in New York. Included in IBM's massive discovery request was information on MRI's future business plans. Brueck worries that this material might wend its way into the hands of IBM product planners and marketing strategists. Rather like having a large, fluorescent bullseye painted on your corporate chest.

\* \* \* \*

And, speaking of antitrust cases, another indignity is being perpetrated out on the West Coast. It's Pre-Trial Order Number Three, an unusual gag order signed by presiding Judge Ray McNichols that not only applies to the CalComp vs. IBM trial but to the Memorex and Transamerica cases as well. It allows IBM and its adversaries to designate information they want kept from public scrutiny as "non-public." This smacks of the same kind of misuse of confidentiality that the military has routinely practiced for years by labeling potentially embarrassing material as "Top Secret."

Pre-trial Order Number Three will severely hamper coverage of the trial by the trade and general press. And who will be the long-term losers as a result of these secret and legal maneuverings? . . . the users, the industry, and our system of open, competitive business.

\* \* \* \*

But an even more blatant attack on our concept of a competitive marketplace is now being waged on the opposite side of the country. It appears that Ma Bell is no lady. The so-called Consumer Communications Reform Act, the Bell bill, is a naked power grab designed to kill off what remains of AT&T's worrisome competition once and for all. We highly recommend the outspoken comments by John Eger, formerly with the Office of Telecommunications Policy, in this issue's Forum on page 199.

Like us, Eger finds big business out of control an unsavory and unsettling prospect.

✻

# Power, Politics and Dp

by Joseph Rue

The first rule for survival is to learn where the power lies in an organization—and marshal the dp resources to serve it.

Knowledge is not power; control over knowledge is.

Knowledge in the form of information is obtained from the processing of relevant data by data processing. If power is to be retained by certain people or department units in an organization, then it is important that they exercise control over the relevant data and their processing. This fact gives insight into some of the conflicts and difficulties that a dp department experiences in its relationship to other departments in an organization.

## Principles of power

Power is the ability to direct, to control, or to influence the utilization of resources. In any organization, whether a private enterprise or a public institution, given resources (e.g. knowledge, people, funds, material, equipment) are used to achieve some result. This concept of power is more objective, specific, and measurable than the view of power as authoritarian behavior, confrontation, overcoming opposition and resistance, or merely intimidation.

There are some important power principles that are useful for the dp manager to understand. These principles involve the relationship of the dp department to other departments in context of the network of organizational power.

*All user departments are not created (politically) equal.*

The dp department would best serve all other departments equally when each has an equally important role in the purposes to be achieved—or, in other words, when the information generated by dp for the various departments has equivalent importance. Such a situation may be hard to conceive, let alone to observe, occurring in an organization. Yet it is not uncommon to find dp managers who must work under a policy that states that the dp department must serve all departments in the organization, often on a first-come, first-served basis, with little emphasis on priority. As a result of such a policy, the dp department may become involved in relatively useless systems, or in generating reports that are superfluous drivel.

A case in point comes from a

medium-large sized business with headquarters in the East. The company was badly in need of improved control over its production activities. The dp department was to assist in formulating a new production control and reporting system. However, because of the internal bickering among the production managers and the unified directional intensity of the maintenance supervisors, a maintenance system was implemented first—and it dominated a good share of the computer system's time. So rather than producing reports on the current status of shop orders and inventory, reports were generated on the workload and whereabouts of the pipefitters and electricians. One memorable analysis that occupied the computer's time revealed that it was better to use roll rather than sheet toilet tissue. Meanwhile the company was losing tens of thousands of dollars per month because of its production problems.

An organization is not a democracy of individuals and departmental units. Even though a policy states that all departments are to be treated equally, the perceptive dp manager will understand that some departments are "more equal" than others. He must determine which departments are of greater importance to organizational purposes, decide the priority ranking for each department that dp must serve, and direct the bulk of the dp resources to their assistance.

*Personal purposes take precedence over organizational ones every time.*

It does not take long for a dp manager to realize that users are not really "departments," "functions," or "projects," but rather certain people who are pursuing personal purposes within the organization's power structure. The purposes of the business or institution can only take precedence when these purposes are internalized by individuals who can reconcile personal purposes with those of the organization. This conflict of personal versus organizational purposes often results in "power politics" and is of particular concern to the dp manager.

A dp director of considerable technical skill discovered to his regret that it is personally costly to ignore the

feelings and purposes of individuals in a position of power. Both he and the budget director reported to the controller who in turn reported to the corporate treasurer. The controller was new to the corporation, which was in an unstable financial situation. The budget director chronically distrusted everyone. It was well known that he was tyrannical—in one instance he called one of his most conscientious workers "on the carpet," and for over two hours berated the man on his worthlessness until the worker became temporarily insane. (It may sound extreme, but it was the case.)

This budget director suspected the dp director of not adequately serving the budget dp needs. In order to dispose of the dp director, he persuaded the controller that the dp director was not well qualified. The dp director did nothing positive to counteract this. He did, however, enlist the aid of the marketing representative of a very large computer manufacturer, whom he had known for many years, to intercede on his behalf.

The marketing representative soon discovered that the new controller actually was considering the removal of the dp director. The controller, who had a reputation for disbanding dp in other businesses, also constantly threatened "to throw the junk out" every time a problem involving dp arose. Since the use of the computer equipment was at stake, the marketing rep formed a coalition with the controller. They both then persuaded the treasurer to get a new dp director.

The current dp director was displaced to a meaningless position. Shortly thereafter, he resigned, thoroughly disillusioned and not fully comprehending the web of personal purposes that engulfed him and the fine work he had done for the organization.

*Where the power lies is where the data processing goes.*

There has been much debate concerning the organizational placement of the dp department. Some claim it should report to accounting. (According to many accountants, "the accounting system is *the* information system of the organization!") Others state it should report to operations since the

operations information system is heavily involved with quantity, schedule, and location data, rather than primarily with monetary data. Still others insist that dp would best serve most users by being in a neutral administrative position, preferably reporting at least to the vice president level.

These arguments are artificial and not valid if they ignore the power network of the organization. The dp department is best located where it serves the important purposes of the enterprise. This may be in engineering, production, marketing, accounting, or administration. It can report to a given division, or to a certain project. If management decides arbitrarily to have the dp department report to a function, and this does not suit the important elements of the organization, great disruptive friction can arise.

This became evident to the executives of a very large corporation when important departments in its largest division became embroiled in an open struggle for the domination of the computer resource. Since the days of tab equipment, the accounting department had controlled dp for the organization. Accounting maintained strength in this area when dp equipment (whose yearly costs were in the tens of millions of dollars) replaced the electric accounting machines.

During this time the purposes of the organization changed from the manufacturing of mechanical equipment to include the design of advanced electronic systems. The systems and design engineers, who were located at the corporation's largest division, insisted on gaining control over, or at least unrestricted access to, the dp data files and equipment that they felt were needed to manage the engineering projects.

This was vehemently opposed by the accounting managers. They argued: (a) reasonably, that the data files such as payroll contained private information; (b) speciously, that the equipment could not be dominated by operational groups who could interfere with the orderly generation of financial reports; and (c) absurdly, that "business" dp and "scientific" (i.e., engineering) dp were incompatible, and therefore must be kept separate.

The departments directed much force against each other; this became so intense that their normal tasks began to suffer. After the conflict between the groups became disruptive, the corporation's top executives created a task force to resolve the problem. This effort was undertaken by a labyrinth of committees and a consultant who was a former executive of a very large computer manufacturer.

After six months of investigation, discussion, and a plethora of reports, the corporate executives decided to form an independent Administrative Management Systems Group at the corporate level in order to foster better dp applications and to resolve disputes at the division level. The consultant was made vice-president in charge of the new group.

This arbitrarily-conceived group was ineffective since the divisions (including the accounting and operational departments of the largest division) ignored it. The positive consequence of all these events was that the division's departments at long last started to resolve their disputes in order to better coordinate their opposition to the corporate group (which eventually atrophied).

### *When the power shifts, go with it.*

It is a practical necessity for a manager to become acquainted with the power structure of an organization and work through it in order to achieve the designated purposes of the dp department. The manager must always be aware of shifts of power as well as any changes in purpose within the organization.

It is instructive to examine how this was done by a director of a good-sized dp department. Upon being hired, he requested specific and detailed information about the previous and current history of the department, especially with regard to (1) the dp applications, (2) the departmental budget and expenditures, (3) the operational personnel and methods, and (4) the system analysts and programmers, their expertise and accomplishments.

This was not unusual. In addition, however, he acquired similar specific and detailed information about the department's users and nonusers. He also devised for his personal use a set of charts that he called "The Company Interface." Some of the topics revealed by this document were (1) the connection of the departments by purpose and people, (2) who had the greatest strength in terms of controlling or influencing budget, people, and other "factors" (i.e., resources), (3) the groups that were most important to the company.

The dp director used this information to reshuffle the priorities within his department and to reassign people and equipment use. He intensely applied the bulk of his resources to serve what he perceived to be the vital groups in the business. The outcome of these actions was enormously successful in spite of the recriminations of some of the former dp users who were now given second-class status. The enthusiasm within and without the department was remarkable. Important

nonusers, who had formerly distrusted the dp department, now became ardent dp users.

The case however had a sad epitaph. The director eventually started to assume powers beyond his sphere of dp responsibility. In a real sense, one of his purposes became the enlargement of his power base (at the expense of other groups). A backlash occurred and the important users started to boycott the dp department. The ensuing turmoil necessitated executive involvement and, shortly thereafter, the dp director resigned.

### **Power to get things done**

Power and purpose are of fundamental importance to management—as they are to other aspects of human endeavor. Dp managers may be keenly aware of the purpose of their function; but all too often they do not recognize, or do not wish to acknowledge, all of the aspects of power involved.

There are negative connotations that are popularly ascribed to the concept of power. These connotations may cause the manager, who may be a hard worker and very knowledgeable in dp, to shy away from being directly concerned with the power structure in which dp is embedded. It is unfortunate that this view of power may be taken.

Planning, organizing, directing, motivating, controlling, and decision-making are senseless without a definite purpose, and ineffectual without the required power. It is when the dp manager is in tune with the organization's structure of purpose and power that the dp department can best serve the organization. \*

Dr. Rue is an assistant professor in the College of Business Administration, Univ. of Arizona. He previously taught at the Univ. of Southern California, where he also was director of computer services for two years. His industry experience also includes being acting manager of MIS for North American Space Div., Los Angeles; group leader, business systems engineering, Northrop Nortronics, Los Angeles; assistant director of corporate dp, General Precision Librascope, Glendale, Calif.; and member of the program design group, System Development Corp., Santa Monica.

# Humanizing Information Systems

by Theodor D. Sterling and Kenneth Laudon

---

The effects of system flaws on people are nonresponsiveness, harassment, drop in performance or service, and even frank exploitation.

---

Large scale computing systems have revolutionized the management of most, if not all, means by which goods and services are produced, or information is accumulated. Such systems interact with organizational, historical, and political pressures and goals to shape the internal structure of industrial, governmental, and other organizations. And not least, they also shape the way in which organizations interact with individuals.

By any criteria of management performance, computerization of a system makes possible almost unlimited control over its details, making the computer then the ideal management tool. But the cost of the control is high. Therefore, the questions have been asked whether large computerized systems can be developed by anyone except governments and large corporations, and whether or not such organizations will use such systems mainly for antihuman purposes.

During active proliferation of new and revised management procedures, designers of information systems cannot help but also be organizational designers as well. They cannot avoid changing organizations. But which way will the changes go? Norbert Wiener pointed out many years ago that intelligent understanding of a machine mode of control may be delayed until long after this control has been exercised (*The Human Use of Human Beings*, Doubleday, New York, 1954). Thus there exists widespread concern about the ultimate effect of manage-

ment information systems on the quality of life of their end users (and also of many of their participants).

In this article, we have explored two areas to examine critically the humane qualities of Management Information Systems (MIS's): (1) criteria that may humanize information systems, and (2) development of an interface mechanism between end user and system—called “the Computer Ombudsman.” The two areas are not unrelated.

Design and implementation criteria for MIS's to make them less harsh and more amenable to human tastes have been discussed in a number of meetings sponsored by the Canadian Information Processing Society (CIPS) and ACM. A proposed set of guidelines for humanizing information systems has resulted (see the box on p. 54).

The criteria as summarized in the guidelines almost speak for themselves. Possible exceptions are D.1. and E.3. There is a complex opposition of procedures ensuring privacy to those supporting humanization. We can see this immediately if we ask what a system would need to know about an end user in order to assure that it can meet criteria A.5., B.1., B.2., C.1., C.3., and E.2. (and hence criteria D.1.). E.3. may be the most controversial and certainly the most difficult criteria to implement. More than any of the other criteria, they require clear definitions of the sources of gain for any method of benefit or loss calculation.

Here is a deceptively simple example. If technology replaces the tele-

phone operator, are ultimate cost savings to be limited to the quasi-public telephone utility, or are costs to the larger society to be included? What are the “costs” to society of losing a large number of relatively interesting (or humane type) jobs requiring relatively little technical skill and primarily filled by women, either prior to marriage or after raising a family?

In developing humanizing criteria, we had to rely largely upon anecdotal evidence of the effects of system malfunctions or of design features perceived as dehumanizing. Substantive data of the effect of systems on participants, end users, complainants, citizens, or just bystanders, now come from studies of actual incidents, or from information gathering schemes especially designed to probe relevant systems features.

## The Computer Ombudsman

One such major study was undertaken in 1973, using as a vehicle the Vancouver Ombudsman Committee. Information obtained through this Ombudsman Committee indeed justifies a concern that large scale management information systems fall short of the criteria by which their human qualities may be judged. Dp experts may differ in how much they are concerned with humane qualities of systems, especially if to implement humanizing features would require increases in systems overhead and decreases in its efficiency. Yet it may be exceedingly beneficial to discuss openly features

## HUMANIZING

that determine the quality of life of various classes of people who are affected by systems of management.

The Computer Ombudsman Service (COS) was established in 1973, after a year's study, by a special interest group of CIPS, with the cooperation of the Consumer Association of Canada (CAC) and the Law Reform Commission. The service became effective officially in 1974, with its headquarters at Simon Fraser University.

The COS is staffed by members of Vancouver CIPS (who occupy various levels of management in industry or government), with a sprinkling of academics. Cases accepted for study by COS are investigated by one of the ombudsmen. A number of investigations have also been initiated by the committee. These investigations were generated by commonly recurring observations. The CAC serves as a screening mechanism for most cases that might be viewed as consumer complaints. But cases have also been referred by private and public organizations as a result of public knowledge about the Ombudsman Service. (And there has been relatively little publicity.)

Cases that are accepted by the Ombudsman Service are characterized by three criteria:

1. They are not trivial.
2. Solutions for them have not been built into a system.
3. Possible solutions may be accomplished through expert knowledge of systems operations.

The primary purposes of the Ombudsman Service are to investigate features related to humanizing/dehumanizing dimensions of existing computer based information systems, and the ability of those systems to respond to humanizing efforts. Thus the Ombudsman is primarily a fact finding venture, and not a complaint department. However, it is true that most of the cases accepted for investigation by the Ombudsman have been resolved in the process of fact finding procedures.

It should be pointed out that only a relatively small number of cases were processed by the Ombudsman Service. The load has averaged approximately two cases a month. That number underestimates the actual number of problems that may exist or may be perceived to exist.

One limitation in the number of cases that come to the attention of the Vancouver Ombudsman Committee is imposed by the prescreening mechanism that has been established through CAC. Only those cases are passed on that clearly deal with a computer re-

lated problem not yet completely investigated. Problems for which solution models have been established subsequently may be resolved by CAC staff.

More important, however, may be the relatively small number of substantive problems that are recognized in the first place as computer or system caused. After all, modern systems have been designed with some care, and the effort has especially been made to eliminate simple sources of errors taught by experience with "manual" predecessors of computerized procedures. The results may have been an overall reduction in numbers of errors or problems.

On the other hand, those errors that occur now may be of infinitely greater complexity. They may have as their source combinations of rare events,

each of which may occur with a very low probability; however, they do appear when the total number of transactions in a system become very large. Those same rare events or combinations of them will then occur with almost complete certainty. Two errors that are independent of each other, each of which may occur no more often than one time in 1,000, will combine no more often than one time in 1,000,000. But for a system that averages 100,000 transactions a month, such rare errors would occur with almost complete certainty at least once a year.

As a consequence, only relatively complex cases come to the attention of the Ombudsman. But, at the same time, the implications of cases and studies we discuss here reflect strikingly upon

### Criteria For Humanizing Management Information Systems

#### A. Procedures for dealing with users

1. The language of a system should be easy to understand.
2. Transactions with a system should be courteous.
3. A system should be quick to react.
4. A system should respond quickly to users (if it is unable to resolve its intended procedure).
5. A system should relieve the users of unnecessary chores.
6. A system should provide for human information interface.
7. A system should include provisions for corrections.
8. Management should be held responsible for mismanagement.

#### B. Procedures for dealing with exceptions

1. A system should recognize as much as possible that it deals with different classes of individuals.
2. A system should recognize that special conditions might occur that could require special actions by it.
3. A system must allow for alternatives in input and processing.
4. A system should give individuals choices on how to deal with it.
5. A procedure must exist to override the system.

#### C. Action of the system with respect to information

1. There should be provisions to permit individuals to inspect information about themselves.
2. There should be provisions to correct errors.

3. There should be provisions for evaluating information stored in the system.
4. There should be provisions for individuals to add information that they consider important.
5. It should be made known in general what information is stored in systems and what use will be made of that information.

#### D. The problem of privacy

1. In the design of a system, all procedures should be evaluated with respect to both privacy and humanization requirements.
2. The decision to merge information from different files and systems should never occur automatically. Whenever information from one file is made available to another file, it should be examined first for its implications for privacy and humanization.

#### E. Guidelines for system design having a bearing on ethics

1. A system should not trick or deceive.
2. A system should assist participants and users and not manipulate them.
3. A system should not eliminate opportunities for employment without a careful examination of consequences to other available jobs.
4. System designers should not participate in the creation or maintenance of secret data banks.
5. A system should treat with consideration all individuals who come in contact with it.

criteria for humanizing information systems.

In studying system flaws and their effects on end users and participants, we found it useful to classify our cases according to criteria of nonresponsiveness, harassment, decrease of performance or service, and frank exploitation.

### Nonresponsiveness

A complaint heard very often is that the "computer" does not reply to inquiries, especially concerning possible errors. Our observation would bear this out. In many instances of errors, system replies to end users were slow, and in most cases nonexistent. Yet in no instance was the "system" unaware of the existence of a problem or of an error! There was always some level of management that knew of it, usually within the data processing segment.

Case A received tax notices addressed to the previous tenant of a house (who also owned the property). The new tenant returned these notices with the information that the previous tenant no longer resided at that address. When tax notices kept coming, the new tenant sent a number of letters to the tax bureau, again with the information that the previous tenant had moved. However, tax notices did not stop coming, nor was there ever any reply received from the tax office.

On investigation, the Ombudsman found that the existing rules stipulated that in cases of an unknown residence of a taxpayer, the post office was to attempt to forward mail to a new address if such an address existed. But the obliging new tenant had returned notices to the tax office rather than to the post office so that the letter could proceed with further search. No one in the provincial or municipal dp center in fact knew about that rule or had any authority to reply to messages, nor was there anyone there with authority to stop sending notices to the last known address of the taxpayer.

Case B was a customer of a large department chain who through mysterious circumstances found himself in possession of two separate accounts. For almost a year, he thought this was just a matter of confusion of bills or of his own records. When he discovered he was billed under two separate accounts, he so notified the company, but received no replies.

On investigating, the Ombudsman found that the source of these two accounts was of considerable concern to dp management. However, because of the time that had passed, and because of the load of day-to-day dp work, it was simply not possible to track the source of the error. Occasionally half-hearted attempts were made to investigate how the customer's

two accounts had come about. In the meantime, no action was taken either to reply to him or to eliminate the wrong account.

Both examples are clearly violations of criteria A. 3,4,7 and C. 2,3 (see box). In the two cases, and in fact in all cases of error investigated by the Ombudsman, some level of the system was aware that an error had occurred. No action was taken because no provision for action existed at the level of the dp management structure involved with a particular type of error. Inquiries remained unanswered, either because there was no horizontal communication between the different vertical management structures that handle different parts of the organization's responsibilities (as in Case A), or because dp management was unwilling to take action until the source of the error had been discovered (as in Case B).

### Harassment

Case B is also an example par excellence of harassment due to faulty intrasystem communications. Although the customer received no answer to inquiries concerning two account numbers, he was notified first by letter and then in person that his account was delinquent, and was subsequently threatened with action by a collection agency and damage to his credit standing.

Another instance of harassment is Case C. This individual had his wallet stolen in 1971. The credit cards that were in the wallet had been used by the thief to establish an alias. The thief was apprehended for armed robbery in 1972, and the wallet, including the credit cards but not the money, was returned. In 1976, the former victim

victim's 1975 car license plate bore the same number issued for the stolen vehicle in 1971, but which was still in the state's active stolen vehicle data base.

These examples are related to inadequate horizontal communications between vertical management structures. Upon inquiry the Royal Canadian Mounted Police agreed that there was really no need to keep this particular alias alive as the criminal in question had been apprehended and all identifications had been returned to the former victim. The RCMP, the Florida State Police, and the store's billing systems clearly failed on criteria A.7, B.1,2, C. 2,3, and D. 1,2, (although for different reasons).

The concept of harassment is of course relative. What harasses one individual may not harass another. Under a very broad definition, harassment may be any action taken by a system that could lead to damage or loss. (The action need not *actually* lead to damage or loss; the fact that such possibility exists may be felt harassing by many individuals.)

One such class of harassment (albeit relatively trivial), and that also demonstrates the problems that arise from poorly designed systems, is the lag between billing and mailing dates of bills for many major credit organizations.

After receiving a number of inquiries (not necessarily cases handled by the Ombudsman) about bills having been received too late to permit payment of obligations to avoid interest, members of Vancouver CIPS were asked to keep envelopes in which they received computerized bills and mark on them the billing date as well as the date in which the bills had been received. (The mailing date was given by

TIME LAGS IN DAYS BETWEEN BILLING DATE, POSTMARK DATE, AND DATE BILLS ARE RECEIVED

Time Intervals	Dept. Stores	Oil Companies	Credit Services
Average time lags between billing date and postmark date . . . . .	7.12	3.65	5.4
Average time lags between postmark date to date received . . . . .	10.53	8.35	8.85
Range of billing date to postmark date . . . . .	4-20	1-19	1-10
Range of postmark date to date received . . . . .	6-24	4-20	3-13

Table 1.

was stopped for a minor traffic violation and was required to go through lengthy clearing procedures. He found out that his name was on a list of possible aliases used by a dangerous known criminal.

This example from the Vancouver Ombudsman files luckily had no more serious consequences than momentary embarrassment. But under similar circumstances, a man was killed by a Florida state trooper who mistook his car for a stolen vehicle after checking with the state's crime computer. The

metered postage mark.) Replies were analyzed by type of credit industry (only major credit companies were included—the three major department chains in Canada, the banks that handled *Bank Americard* accounts [named *Chargex* in Canada], and major oil companies).

The delays between billing date and mailing date are given in Table 1. While the average periods of time lag between billing date and date at which a customer may receive a bill for different categories of accounts may

## HUMANIZING

range from 8 to 10 days, individual instances of delay actually range from 3 to 24 days. As most credit accounts are explicit in counting time from billing date during which customers can satisfy their obligations (the usual time period to settle an account is 25 days from billing date), the delay in mailing bills may result in unnecessary problems to organizations advancing the credit, and to the customer who may be confused about his obligations. Also, in general, a third of the customers received bills so late that it was not physically possible for them to settle their accounts within the specified grace period.

(Our time estimates may not hold exactly for the U.S., but the differences probably are small. The U.S. postal system seems to be more efficient than the Canadian so that the delay caused by mail handling would be less for U.S. than Canadian customers. Billing procedures for *Chargex* and the Canadian offices of the major oil companies seem to have been imported from U.S. sources. Nevertheless, it might be important to repeat the same survey for comparable U.S. companies.)

While the billing lag study addresses itself to perhaps trivial matters from

the system design perspective, it exemplifies rather well problems created both by centralizing large scale operations and by increasing the number of transactions according to the capabilities of computers. Clearly, it is not too difficult for a good system to spew out so many bills a day that the mechanical operations to stuff them into envelopes and mail all of them takes three weeks.

We have classified the billing example under "harassment" because potentially an end user of the system stands in danger of taking a financial loss. On inquiry by the Ombudsman with all companies involved in the study, it was claimed that any interest accrued when a customer complained for reasons of delayed mailing of bills would be wiped from the records. However, this still required customers to be aware that they were being billed late, and to write to the billing agency. Relatively few would do so. A recent study found that while 20% of clients of a particular organization had a legitimate complaint, fewer than 1% actually complained. The most important obstacles to complaints were ignorance of whom to address the complaint to, followed by distrust of the effectiveness of complaining. But even to correct for the registered complaints may have led to unnecessary expenses and loss to the billing agency itself.

While inquiring into this billing lag,

the Ombudsman encountered a great deal of waffling. Not a single one of the companies involved would admit that there was a time lag between printing and mailing of bills, although none of them denied it. None of the companies indicated that they would deal with that problem or try to correct it. The unwillingness to face up to system flaws however, may have additional undesirable consequences.

The failure of the industry to deal with its own problems may result in corrective legislation. In the present instance, the Ministry of Consumer Affairs of British Columbia has brought in a bill stipulating that a customer must have at least 15 days from receipt of his bill to satisfy his account. While this bill is bad on a number of counts and is opposed by COS, it may still be required unless industry takes the initiative in investigating and correcting such system design flaws itself.

### Decrease in performance or service

We use as a pragmatic criterion that a decrease in performance or service has occurred when the system, after its reorganization, gives less service to an end-user than it had previously. From this point of view, the failure of the post office to deliver mail twice a day or six days a week is such a decrease in service of the postal system. We also count as decrease in performance or service an increase in cost with no accompanying improvement in service, or an increase in the amount of work or effort required by participants and end users, not resulting in improvement in system's performance.

An example of such decrease in performance came from a study of the Vancouver Resource Board. The VRB is an attempt by the Province of British Columbia to combine all its health and welfare services. After the system was installed (and continued on without improvement for almost a year), approximately one third of the communications with the system were erroneous. Approximately one third of the checks mailed to the clients of the system had to be manually recomputed and redone. The combined welfare organizations with computerized management systems apparently result in decreased performance of service to clients (and to lower echelons of management). Other but similar system failures have been reported by the *New York Times* (March 17, 1975) which estimates that on a national level, twice as many eligible welfare clients are denied assistance than the number of ineligible who receive it.

But instances of decrease in performance or service are not limited to welfare systems. One instance is the switch from a bimonthly to monthly

"I wrote to the FBI for my personal file. They say they never heard of me and I should stop bothering them."

# Does your IBM host computer do too much telecommunications housekeeping and not enough computing?

**Introducing Flexicom's IBM-compatible telecommunications system. With clean, quick, simple host interfacing.**

If your company is using a communications network, your host computer's applications growth is limited because of expanding workloads and lack of sufficient support.

The consequences?—Escalating staff and equipment problems. And, of course, the bottom line is increasing costs for your data processing system.

For these reasons, DPF introduces Flexicom.

**Consistent Systems Architecture.**

Flexicom's software frees your host computer of telecommunications housekeeping by organizing the network and placing tasks where they belong—with Flexicom. That's because it operates as a front-end or distributed processor.

And Flexicom serves your operation by acting as a complete telecommunications system. With fast, clean, and uncomplicated host computer interfacing.

**IBM hardware. IBM-compatible software.**

With Flexicom you don't have to "pioneer." The hardware is a general purpose IBM 360/370 computer sized to your requirements and compatible with your IBM software.

This means only minimal user programming is necessary to integrate Flexicom with your host computer.

**A cost-effective, long-term solution.**

Flexicom is an inexpensive, long-term solution to data communications problems.

IBM hardware in a telecommunications system that's basically an IBM solution means little training will be required of your staff. Consistent Systems Architecture means future needs will be readily accommodated as they develop. Fewer problems with more efficient equipment means a more productive staff.

And your host computer will be free to do the basic bottom line work.

**Additional Flexicom advantages.**

- More local processing capabilities than existing competitive systems.
- The network is transparent to the host computer.
- Off-load TP monitoring from the central processing unit.
- Extensive network control statistics.
- Message switching.

**We do more than lease IBM computer systems.**

DPF is one of the largest 360/370 computer leasing firms in the country. But we do more than lease computers.

With innovative systems like Flexicom, DPF is taking IBM computer systems a step further for our clients.

Let us tell you how Flexicom can help. Call Ed Zukerman collect, at (914) 428-5000.

Or just mail this coupon.

**Flexicom**

# Hazeltine Modular One!

So reliable  
we're offering  
a full year's  
service  
-parts & labor-  
for only \$125!

modular  
one

Yes, a full year's service from date of delivery for only \$125, which includes the standard Hazeltine warranty. Factor this important reliability and service consideration into your buying decision, and Modular One has got to come out ahead.

Especially when you start comparing our standard model single-unit prices for End-Users: Basic \$1,650;  
Editing \$2,050;  
and Polling \$2,500.

Yes, Modular One, built and backed by the Company with a half-century of leadership in electronics and displays . . .

**Now clearly the new Standard in its Class.**

Sales Representatives are standing by to answer your call for a demonstration in your office.

CIRCLE 13 ON READER CARD

## HUMANIZING

mailing of alimony checks from an escrow account when the responsibility to write and mail these checks is transferred from the courts to a computerized banking service (*Denver Post*, April 13, 1976). What are we to call the recent switch of credit organizations that now only send a summary of purchases rather than copies of the original purchases (*Chargex*, 1976)? While the inconvenience to the credit holder of the service may be trivial, the fact remains that he gets less service without an accompanying decrease in cost.

Similarly the larger error rate of various systems may be viewed as a decrease in performance or service. For instance, in New York state's criminal justice system, over 20% of the summary criminal rap sheets contain substantial errors of facts (not all of which are computer related). Yet these reports are used by police, prosecutors, and judges to determine the fate of arrested persons. Despite ten years of previous experience, this particular agency has not systematically redressed the origins of these errors or investigated the consequences for arrested persons (*New York Times*, Oct. 24, 1975). In this sense too, the failure of bills to be mailed in sufficient time to give customers notice when payment is due is a decrease in the system's performance as well as a system flaw.

### Exploitation

There is a design strategy that accounts for a large number of dehumanizing practices in management systems. In order to increase the efficiency of an enterprise, end-users and participants in the systems are treated as unpaid components whose time, effort, and intelligence do not appear in the cost accounting. It is precisely this kind of exploitation of human intelligence and labor that computerized systems ought to do away with. But do they?

In the example of the Vancouver Resource Board, employees of lower management strata were required no fewer than three times to prepare the same input, listing information from each client record. Apparently no attempt was made to save previous files, or to develop an editing system or an adequate data base. And such practice of creating unnecessary work has not been limited to the Vancouver Resource Board. Very often when errors occur, lower level staff are required to redo tasks that easily could have been saved them. These examples not only violate criterion A. 5, but even more so, criterion E. 5, which requires that employees of a system be treated with the same consideration shown to others.

One related practice of many universities is a procedure by which students who add or drop courses after registration still perform many of the clerical functions for manual record keeping of enrollment. Students are usually required to fill out forms in multiples which they carry around to departments, faculty, and registrar offices. While such procedures become almost completely redundant once the registration of a student is computerized, they are continued in many schools. Although the work done by each student may be small, the total amount of labor performed by the approximately one fourth of all students who add or drop courses during each semester is enormous, and yet the amount of additional work by the computerized registration system may be next to nothing.

Another sort of exploitation is the selling of names. The cos bought a list of names and addresses of senior Canadian citizens for the Vancouver area (freely on sale) and asked each person on the list if he knew that his name was being used in this manner. Almost without exception, all individuals queried bitterly resented finding their names on a list offered for sale. (The purchaser of such a list should also have some resentment because a high percentage of the names failed to be accurate.)

### Summary conclusions

As a result of experience with the Canadian Computer Ombudsman Service and our examination of the criteria needed to humanize information systems, we note the following trends which dp managers should be alerted to. There exists:

1. A diminution of opportunities for individuals to negotiate with a bureaucracy, and thereby a diminishing of the humane qualities of the systems with which they deal.
2. A decline in the ability of the system to fulfill an intended service function.
3. Little horizontal communication between components of a management system where control functions primarily exert themselves vertically. As a consequence:
  - a) communications between end users and participants and other points of the system become difficult, and
  - b) individuals may be harassed by one part of the system that accepts incorrect output from another part for further actions.
4. Obscuring where the authority for decisions actually exist, to protect the *privacy of incompetence*.
5. Exploitation of the labor of lower level managers, workers, and end users in ways that do not show up in the

total accounting of system expenditure, in order to patch system flaws, or to bridge difficult horizontal communications between system components.

Yes, it is true that computerized management technology is relatively new, that the development of that technology is expensive, that errors are unavoidable, that large numbers of transactions made possible through computerization will multiply the probability that makes for difficulties, and that time is needed eventually to cure all ills, including those inflicted by hasty systems design. However, it is also true that time by itself will not cure errors, and that the dp community may be faced with the choice of investigating and correcting its own ills—or, failing to do so, have these ills become a running sore of an otherwise vigorous and innovating profession. ✱

Professor Sterling is chairman of the Computing Science Dept. at Simon Fraser Univ., Burnaby, Canada, and chairman of the Canadian Information Processing Society's Computer Ombudsman Community in Vancouver. He is also president of the Canadian Computer Science Assn., and has published numerous articles and 8 texts, most recently a second edition of "A Guide to PL/1" with S. Pollack.

Dr. Laudon is an associate professor of sociology at John Jay College (CUNY) and senior research associate at the Center for Policy Research in New York City. He is the author of "Computers and Bureaucratic Reform" (Wiley, 1974), and has written articles on the role of computers and telecommunications technology in contemporary society.

# “...but what sets Varian's printer/plotter apart from the others?”

**Well, first do you need controlled toning?:** Do you demand high-contrast, permanent, black-on-white documents? Do you want the output to honestly represent the intent of your input? Do you want consistent, even toning *without* unwanted or confusing dots which can affect the overall accuracy of a document, and therefore its interpretation? If so, then you want Varian's printer/plotter with the patented helical rod toning system... because it delivers just that: Consistent, clean, accurate and permanent documents.

system... because it delivers just that: Consistent, clean, accurate and permanent documents.

**And speaking of accuracy:** The mechanical efficiency of a machine often has a lot to do with its accuracy. By chaining the toning system to the drive system, we created an overall smoother operation. Then we incorporated a precise stepping motor to advance the paper by predetermined accurate steps (five times *more* accurate than the others, by the way). And, finally, we built-in the same reliable efficiency for which Varian has been known over 29 years. So now whether your endeavor is

seismic studies, meteorology, medicine, automated drafting, report generation or whatever, with our inherent accuracy you can *pin-point* virtually *any* point — throughout the length of the document.

**Next, the microprocessor:**

While serving many controlling and computing functions, this 2K X 8RAM also serves as a buffering memory to counter the “asynchronous” actions of a CPU. This then benefits the user by further smoothing out the complete output-to-document cycle as well as dramatically reducing the “gray bars”

**So we wrote the book:** It's yours free for the asking. An updated objective analysis describing the techniques, the hardware and the software of *all* printer/plotters (plus a glossary). So, write or dial (collect if you like). We'll send the book plus information on our printer/plotter. If your need is immediate we can arrange a demonstration, right now, in your facility. Then you can see what sets Varian's Printer/Plotter apart from the others.

# A Computerized "Librarian"

by R. A. Baker and J. C. Jefferies

---

In the process of defining a job for a librarian, this shop defined instead a program to do the job.

---

The programmer's job is to write programs. He will not be as effective at this if his primary responsibility is diluted with bookkeeping tasks related to program or systems libraries. Yet these bookkeeping tasks are essential.

In an attempt to cope with the situation, many excellent software management programs have been written. However, the uniform shortcoming of these programs, despite their many virtues, is that they still require some training of the programmer. At a minimum, he must learn and remember the control language and procedures of the Library program; and it is not unusual for him also to have to learn the Job Control Language (JCL) to communicate with the Operating System.

These training requirements are not difficult, especially for experienced programmers. But they do require time, and training periods can come at awkward times, adding to the problems of scheduling program development. For the trainee who is also engaged in learning many other things (such as a programming language or a data base), learning the Library language often appears impossible. And where programmers are engaged in a wide variety of activities of which only the minority require the Library language, it is easy for the programmer to forget the details. The result? Errors followed by reruns, referencing the manuals, or going to an expert for an on-the-spot refresher course.

## The solution

Faced with this situation, we at

Exxon Production Research Co., Houston, thought that surely there must be a better way. We now think we've found it. The Library program we developed requires virtually no control cards, and training is part of teaching the newcomer how to submit batch jobs. Our program operates on a mod-

---

Our problems with Library maintenance evaporated the day we installed the new program.

---

ule basis, and the only control card is the rarely used card for deleting modules. All Adds, Replaces, and Modifies are done without control cards.

We estimate our development costs for this program at 50 programmer-hours; a similar program would be within the means of most programming shops. The program is written in PL/I, and is about 600 lines of source code. We have certainly long since recovered our investment. Our problems with Library maintenance evaporated the day we installed the new program.

Getting rid of our library problems did cause us to become a little old fashioned, however. Our new Library program requires that we keep source cards for all programs, an emphasis on cards which is decidedly against modern trends. But one thing every programmer understands, regardless of background and training, is that a deck of punched cards represents a program.

We also found that we were keeping cards to some extent anyway. We

saved Library control cards because it was easier to change them than to re-punch from scratch. We also observed that we could save the overhead of control cards, which we estimated to be 50% of the original source (both the cost of the cards including handling and the cost of punching them). But we would need some card file space.

As it turned out, we found we could conveniently store 17,000 cards per square foot, not nearly the nuisance one might think. And curling is not the problem it once was, thanks to improved card readers. We've run decks over six years old. As mentioned, the only real opposition to cards is an irrational one: they're old fashioned.

## Analyzing the problem

Ours is an IBM shop writing scientific software both for local use and for internal distribution throughout a worldwide corporation. Some of the things we do are statistical analysis; simulation of hydrocarbon accumulations in the ground for oil exploration; seismic data reduction; and contour or cross section mapping on flat bed or drum plotters. FORTRAN is by far the dominant language, with local flourishes of ACL, PL/I, and COBOL. The main computer at our installation is an IBM 370/168 with four megabytes of core storage, 24 Model 3330 disc spindles, and 14 tape drives.

Our particular group writes and maintains moderately large application programs for long term local use and for outside distribution. Programs are

## "LIBRARIAN"

on the order of 10,000 source statements distributed fairly uniformly over 250 subroutines. We program in teams and use top-down design and development; the form of structured programming we use might better be termed "readable programming."

On examining our operating procedures, we found that we needed to isolate subroutines for testing purposes. Subroutines could be isolated through a standard Library procedure by copying a particular routine to a temporary data set, updating it there, then recompiling and relinking. Setting up this procedure was time consuming for an experienced programmer, and was an obscure operation for a less experienced programmer who finds JCL formidable. When any step wasn't done quite right, the results required analysis by senior personnel. Isolation of several subroutines made the operation even more complicated.

The procedure of last resort was to punch and interpret the subroutine for manual testing. This turned out to be by far the simplest and cheapest procedure. It produced a lot of punched cards and kept the interpreters going for some time, but it did allow the programmer to concentrate on the program rather than on the details of the Library system. And there were far fewer mistakes. Having observed this, we asked ourselves, "If we're going to be punching these decks, why bother to put them into the Library? Why don't we just keep the decks?"

Our answer was: we need to keep a backup copy of everything in case of loss or physical damage. The Library provided that. Moreover, with the program in the Library, distribution of the program is relatively simple. A tape of the program could be made using established Library procedures. (We keep three copies of programs at all times: on cards, on tape, and on disc.) We could also see that our ordinary processing would require reading thousands of cards through the card reader if we did not use a disc or tape library. And the fewer times a card is read, the more likely it will be there when you need it. Using the card reader on a massive scale would definitely inhibit progress, but using it on a small scale for only subroutines of interest would constitute the same amount of usage that we had with the standard Library program.

We thus reached the stage where we were convinced of the virtues of cards (after years of unsuccessfully trying to eliminate them), and the virtues of the Library. Our only hope of really getting rid of the cards seemed to lie in a

time-sharing operation, which is much more expensive than housing punched cards. Where we have been able to use a teletype or crt terminal, the cards have indeed disappeared. But our mainstream programs remained in card form, going through remote card readers or over the counter. We considered getting on-line terminals for mainstream development, but decided we really didn't need them.

We decided against new computer hardware, without considering the expense, for the following reasons: our programs print or plot more volume than is suitable at an interactive terminal. Routing the output elsewhere would make the operation another variety of batch. Interactive terminals seem to be ideally suited for debugging programs, but the larger the program, the less the utility of the terminal. The terminal tends to lock in the programmer so that he communicates with the terminal, but with little else.

Although the programmer could find and fix bugs rapidly on a terminal, he does so at the expense of other important aspects of programming. We are not convinced that the programmer is more effective in debugging at a terminal than in a team environment because (1) there is a tendency to make quick patches that later become obscure bugs themselves, and (2) only the bugs that show up in execution are fixed. There are advantages in not having instant response. It allows time to think more about what needs to be done, to communicate with other people, and to do programming jobs not associated with the computer, such as documentation. Instant response tends to *drive* the programmer so that he reacts more to the needs of the computer than to those of the user. For some of our programs, using a terminal was excellent, but for the majority, they could not be justified.

### Arriving at the solution

Again, we were back to cards and the need to keep our programs on a disc or in a tape library. We then decided to resort to the Programming Secretary, or Librarian, mentioned in the literature. No one available really had the qualifications as we understood them, so we decided to define the job in such a way that the members of the team could share or rotate the responsibility. After much discussion and a few trials, the basic operation turned out to be this: we would give the subroutine to be replaced or added to the Library to a person designated as Librarian, and he would put it on the Library and make a record of the event. The test runs, which seem to be a standard part of the Librarian's job, could be handled differently.

In the process of defining the Li-

brarian's job, we actually defined the function of the computer program we now use as our Librarian. The subroutines themselves are the control cards. We simply insert the new or modified code in the JCL deck, and the library program does the following:

1. Adds a line of source code to each subroutine which serves as a comment card with the run date on it. Thus the listing and the two source files, disc, and tape, have this date as part of the code.

2. Updates a source file on disc. If a subroutine already exists by the same name, the new one replaces the old one. If no subroutine exists by that name, it adds the new one.

3. Creates a backup tape with the same contents as the updated source file.

4. Updates an object file on disc, replacing old object code and adding new.

5. Provides a compiler listing of the updating subroutines.

6. At the end of the run, it lists the modules in order as they appear on the Library file, the date of last update, and the number of source and object records for each module, giving sub-totals for each category of old, replaced, and new, plus a total for the whole. It also produces a list in alphabetical order.

With this record, we can readily monitor the growth of the program. We are able to use the dates to determine whether a listing is the most recent, and we can relink with the updated object file for execution or testing.

### Summary

To our understanding, most Librarian programs are too general purpose. They try to deal with all varieties of source or text. The theory is that once you've learned the Librarian's program maintenance language, you can use it to operate on programs written in any language. And where a formal Library group is set up to handle programmer requests, such program maintenance languages are highly effective. The Library personnel learn only one language for handling all varieties of programmer requests. However, we have demonstrated that programmers do not have to use a formal Library group for good code maintenance. The computer can do that.

The Library program we use is, of course, tuned to FORTRAN. It recognizes subroutines and functions because these are the "control cards" of the program. It could just as easily be tuned to PL/1, COBOL, or to an assembler language; each language has suitable keywords. It would, of course, be possible to have one program operate on all languages by adding a con-

# "I COUNT ON A FULL LINE"

## "I count on a Full Line in business too."

On the football field or in the business world, a full line provides the kind of support needed for success. MSA has the only full line in the FINANCIAL SOFTWARE

FIELD. Our systems include: General Ledger, Payroll Accounting, ALLTAX™, Accounts Receivable, Accounts Payable, Financial Information and Control, Personnel Management and Reporting, Fixed Asset/Property Accounting, Supplies Inventory Con-

trol and Purchasing.

And we don't stop there. A full support staff provides the local customer contact you desire. With offices located in New York, Atlanta, Chicago and Los Angeles, you receive continuous back-up support.

You can count on us for answers to questions, additional training for new employees, and the latest in tax changes or governmental reporting requirements.

Our strategy includes systems that are out in front through data base management, on-line processing, structured programming, and on-going enhancements.

Over 2000 customers already know about our full line. You should too. You'll find you can count on it.

Fran Tarkenton, Minnesota Vikings, counts on MSA.

If you really want to improve productivity . . .

**Automate your systems maintenance  
and conversion tasks.**

According to industry experts, systems maintenance costs twice as much as systems development. True, new development *seems* more important. But the fact is, your people spend more time on maintenance. That's why DOSSIER is an important productivity aid. It automates the work functions which are most time consuming.

DOSSIER is a Documentation and Standards Tool which translates object code from IBM DOS and DOS/VS program libraries into a series of current and complete installation management reports.

Already DOSSIER has automated the management of more than 130 installations. Our free brochure tells how.

## "LIBRARIAN"

trol card giving the name of the module. But we believe that would be a bad design unless the compiler or interpreter of each language could also accept the control card. Otherwise, it becomes another training exercise and another opportunity for programmers to make mistakes.

In conclusion, we suggest that there is not nearly the need for sophisticated, general purpose, Library programs that vendors or our past experience would lead us to believe. These programs have many uses, but maintaining the source code for a project can be done a better way. The source cards themselves can serve as control cards for the Library maintenance program.

As a gauge of our results, when we added more programmers, none of them had any problems with the program. There were no questions about how to use it since everything is self-explanatory—no user manual is needed, there is no mystifying JCL, and there is *no* need for a person to fill the position of Librarian! As we said earlier, our problems with Library maintenance vanished when we installed the new program. \*

In data processing for 12 years, Mr. Baker is a senior programmer at Exxon Production Research Co., Houston, Texas. Trained as a geologist, his main areas of work include statistical analysis, computer cartography, and economic analysis.

Now retired (!), Mrs. Jefferies had been involved in research program development, including data base manipulation and simulation of natural processes in relation to oil production, at Exxon Production Research in Houston.

# Announcing The Xerox 500.

500 of the smartest companies in the country. They've found the Xerox distributed processing network is the answer to their data-processing needs, present and future, no matter how many units or geographical locations they operate. Xerox uses more than 20 big computers, covers the nation with 75,000 miles of dedicated communication lines, and provides software for almost every conceivable business application.

And, just as significant, Xerox has all the necessary installation skills, business and project-management expertise.

The Xerox distributed processing network can go to work for you immediately with no risk and no capital investment on your part.

Bob Goodwin will explain how it works. Call him toll-free at (800) 421-6653. In California call (213) 397-5889 collect. Or write him at 5310 Beethoven Street, Los Angeles, CA 90066. You can make it the Xerox 501.

*Teleprocessing  
jobs  
arriving  
faster than  
you can turn  
them around?*

## **Maybe you need a new departure in control software.**

Because we knew no single teleprocessing monitor could meet the needs of all 360/370 users, we developed three. And they're running at over 300 installations worldwide — everything from 24K DOS users with a few local terminals to large systems with hundreds of on-line terminals spread over thousands of miles. One of our teleprocessing monitors can help maximize the throughput and efficiency of your on-line applications.

MINICOMM is designed to get smaller DOS and DOS/VS users on-line fast. It supports application programs in Cobol, BAL, PL/1, and RPG, requires no hardware upgrades, and offers a whole list of features not available in other teleprocessing systems.

For DOS and DOS/VS users who want the ultimate in teleprocessing flexibility, there's BETACOMM — a fully queued, multi-threaded system that provides multitasking for application programs as well as the monitor. A comprehensive file handler allows all standard access modes, with support for popular data base systems. BAL, Cobol, and RPG II interfaces are available.

INTERCOMM, designed for OS and OS/VS users, is the most sophisticated teleprocessing system available anywhere. Its advanced features are far too numerous to list here, but include device-independent support of over 30 terminal types, comprehensive error recovery with integrated checkpoint, message, queue, file and data base recovery, restart, a large repertoire of pre-programmed utility functions, and a unique feature that provides program isolation. Over 150 INTERCOMM users attest to its superiority.

Despite their differences, MINICOMM, BETACOMM and INTERCOMM have one thing in common — the total capabilities support of the Informatics organization around the country and around the world. We're the world's largest independent soft-

ware product vendor, and we got that way by producing sophisticated, reliable systems that help you turn out more work faster, with far less programming effort. That includes a full array of back-up services — over 1,800 systems specialists, extensive documentation, professional instruction and videotape courses.

Whichever of our three teleprocessing monitors fits your particular environment, you're assured of a uniquely designed system that is stable, efficient and release independent of the operating system.

Want to hear more about MINICOMM, BETACOMM or INTERCOMM? Contact us today. We'll be happy to send complete system literature by return mail or arrange a personal presentation at your site.

# Source Program Management

by Larry K. Miller and David Ostrom

---

Here's a way to do things better which, for once, requires no upgrading, conversion, nor new product acquisition—only a change in routine.

---

How many times have you been faced with the following situation: while covering for the primary programmer on a system, the edit/update program crashes at 1 a.m. You come into work drowsy and dreary eyed, only to find that the program has been recently changed. In digging through the programmer's office, you encounter not one or two listings of the program in question, but 6 to 12 listings, all very similar. Not only do you wonder if you have the most current listing, but you also encounter two or three decks of the program in question. Thankfully this does not often happen, but those with several years in this profession, have been faced with a similar situation at some time.

This problem plus the desire to better control our production programs prompted us to evaluate available program control packages. During our evaluation, we found that we had all of the pieces necessary, without spending extra money, to solve not only the above problems, but also to gain the following advantages: obtain current copies of programs requiring maintenance on a timely basis, provide backup for production source programs, remove the requirement of backing up and protecting the program source which consisted of ten card cabinets full of a half-million cards, provide a means for protecting production load libraries, and provide an audit trail of

programs being modified.

We are a medium size shop supporting the administrative functions of Washington State University. We are one of many users of the university service center (wsusc), which in turn is one of only three service centers in the state. wsusc has dual IBM 360/65s, 5 MB of core (split 3 and 2), CalComp equivalent 3330s, and the usual assortment of tape drives, printers, and card devices.

There are 25 programmers and analysts in our office supporting all administrative areas including payroll, general accounting, financial aids, student accounts, student records, admissions, personnel records, alumni records, and institutional planning. Many of the systems are designed for teleprocessing, but the majority of the work is done by batch processing. Primary programming languages are: Assembler for teleprocessing, and COBOL, PL/1, and MARK IV for batch.

We once had the problem of programmers keeping the only copy of production program decks. This way they could always have the current copy and would be able to make changes to the production load partitioned data set at their convenience. (For those not familiar with the parlance, a "partitioned data set" consists of several sequential members with a directory at the beginning containing the name and address of each member.

In our case the sequential members consist of either source programs or executable code.)

We also had a problem of maintaining backup, and a problem of these people terminating employment and leaving us with several similar copies of the same program. Still another associated problem was that most times these programs were left in unlocked, unprotected filing cabinets which were accessible to everyone. Consequently, it was not unusual to lose some of the current decks. To combat this situation, we undertook the design of a system called Management of Program Source (MOPS).

The concept of MOPS grew out of a need and from the input of several people. Coming up with the concept took very little time, but because of our cautious approach, the volume of programs to copy, and training of personnel, it took over six months to fully implement.

To develop this concept, we used what resources were available to us without purchasing or building additional software, including: WYLBUR text editing system, mass direct access storage, a schedule and control group which was responsible for production, and several remote terminals. Although our version of MOPS is designed particularly for this environment, it could be adapted for BATCH, RJE, or some other text editing system as well.

# Why do the leading timesharing services use Zeta Plotters?

Plotting the Future...

## MANAGEMENT

MOPS gave us the following benefits:

1. We were able to remove ten card cabinets that were no longer needed to store program decks. (They had contained over a half-million cards.)

2. We were able to provide complete flexibility to the programmers for obtaining current copies of programs they needed quickly.

3. We were able to provide maximum control of the office source library and production load library without jeopardizing the flexibility necessary to make late night changes to production programs that crash.

4. We were able to get all the production programs out of the programmers' offices.

5. We were able to substantially increase the productivity of programming effort.

6. We were able to easily perform backup not only of the program source library, and the production load library, but also of the intermediate work stages of programs being modified by programmers.

7. We were able to get a handle on programs that were being placed into production so we always know where the most current copy of the program source is and can very shortly have the most current copy of the program listing filed in a central location.

To obtain a program from the office source library, the programmer need only execute a simple job that will take a copy from the source library, catalog it, and place it into a public data set for the programmer's personal use. The cost to obtain a copy is minimal (less than 15¢ to obtain copies of programs) and requires response to only two prompts on the terminal. Once the program is in a public data set, the programmer may do as he wishes with his copy. The source library is backed up to tape once a week with copies cycled on a three month basis. The public program data sets are backed up to a tape twice a week with those tapes also cycled every three months.

Once the program is made public, the programmer has easy access to it through the use of remote terminals using the WYLBUR system. If the programmer does not know how to use WYLBUR, the program can also be updated through the IBM Utility IEUPDATE. Also, if the programmer really must have his card deck as a security blanket, another JCL procedure will pull the program from the source library and punch it into card form.

When the programmer has made all changes to the program that are required, has tested it, and is ready to

enter it into production, he compiles it into a temporary load partitioned data set. This temporary load partition data set, as well as the permanent load partition data set, is backed up to tape once a week with the tapes cycled every three months. As the data sets are backed up, the Schedule and Control group monitors all programs to maintain control of both source and load. After the compile listing comes back, the programmer submits a program transmittal sheet along with the program listing to Schedule and Control.

When the program listing and the program submittal sheet is received by the Schedule and Control group, the temporary load copy is link edited into the permanent load partition data set. After verifying that the permanent copy has been replaced in the production load PDS, the control person then scratches the temporary load copy. It is also at this time that the control person compresses and copies the program source from the public library back into the office source library. Both the office source library and the production load PDS are password protected for write so that only the Schedule and Control group can copy members into them. After the copy has been made into the office source library, the public copy of the source program is scratched from the public library by the control person.

To facilitate late night changes to meet critical deadlines, every production JCL run deck points to both the temporary load PDS as well as to the permanent load partition data set. The temporary load PDS appears first with the production load PDS concatenated to it as the second DD statement of the JOBLIB or STEPLIB. Through this mechanism the system will always search the temporary load PDS first to look for the load module. To make certain the programmers do not compile programs into the temporary load and leave them, there is constant monitoring of this data set by the Schedule and Control group. If the program appears in the temporary PDS but a program transmittal sheet does not follow it within a two to three day period, the control person seeks out the responsible programmer. If an explanation cannot be given or it appears that improper use is being made of a production program, the supervisor of system support is contacted to report the problem.

Several extensions to MOPS are presently being developed. This includes putting all source programs onto microfilm periodically to provide constant historical records of program changes. Another extension might be comparing the program source in the public library to the program source in the office source library before it is replaced.

## WHY A NEW DATA TABLET/GRID DIGITIZER...

... AND AT LOWER COST\*

Because there are . . .

- No loose wires
- No wire tension aging problems
- No surface pressure problems
- No temperature, humidity, dielectric or sonic noise problems

Because NEW means significant performance and cost benefits over other data tablets to the OEM or end user resulting from the unique DATATIZER design principle (patent pending).

Check out the advantages of GTCO's electromagnetic absolute coordinate approach. For simplicity, accuracy, stability, reliability and low cost it can't be beat.

The DATATIZER uses a free cursor/stylus to convert all types of maps, drawings, charts, graphic documents, etc., into digital form. X-Y coordinates are electronically generated many times each second allowing the cursor to be lifted and the work surface to be unobstructed for unrestricted operational freedom.

If you are using or plan to use a tablet or grid digitizer for any graphic data or interactive CAD application, you will appreciate the widest range of optional features now available and the flexibility of the all new GTCO DATATIZER.

**Size:** 11" x 11" to 42" x 60"  
**Resolution:** .010" or .001", inch or metric  
**Coding:** BCD or Binary  
**Cursor:** Crosswire or stylus  
**Origin:** Absolute or re-locatable  
**Design:** All electronic, no adjustments  
**Display:** X-Y plus sign  
**Mode:** Point, line and remote  
**Add Ons:** Keyboard, stand, format programming, calculation, special sizes  
**Interfaces:** Parallel, serial, RS232, key-punch mag tape, mini, calculator, paper tape, terminal, cassette, etc.  
**Construction:** Modular, printed circuit tablet, 4 basic plug-in boards for ease of repair, stand alone, includes all necessary power supplies and cables.  
**Power:** 115-220V, 47-63 Hz

## MANAGEMENT

This will provide a record of all changes that were made to the program before it is copied back into the source library. This audit listing of changes would then be filed with the program listing by the Schedule and Control group. MOPS is also being extended for the control of copy libraries and production JCL run decks.

Since MOPS was implemented a year ago, we have improved the turnaround on modified programs, we have every single production program in the office source library under very close control, the load copies in the programs that are being executed in production are also being controlled very closely, and there have been a number of occasions where programmers accidentally lost or scratched their work copies of programs that had several modifications made to them but were able to recover because of the backup scheme. In short, the concept has proved its worth many times over for us; we suspect it could do the same in many other shops too. \*

Currently manager of administrative systems support at Washington State University, Mr. Miller has over 12 years experience in dp operations, programming, systems analysis, and management.

Mr. Ostrom is a senior technical support programmer for Washington State University, where his six years of programming and analysis work has often been oriented to student record applications and teleprocessing.

# Now, Intel rents memory for IBM 370/125.

Save up to 50% on additional memory for your IBM 370/125. You can do it now with a call to your Intel representative. We're now delivering add-on memory for the 370/125. And we give you three money-saving choices: 30 day rental, long term leases or outright purchase.

Until now you had only one choice: IBM. Our Model 7125 meets or exceeds all their specifications, with equal access and cycle times. Just plug it in. It's totally compatible with all your hardware and software. So why pay more?

Our exclusive 16K bit memory chip provides system expansion up to one megabyte in a small desk high unit. Active spare memory enables you to substitute failing memory in 32K byte increments. Maintenance features include comprehensive error checking and correction logic, automatic memory address relocation and a fault location system that enables chip replacement.

Intel is the established leader and largest

manufacturer of semiconductor memory. Our add-on memory systems for the 370/125, 370/135, 370/145, 370/158, 370/168 and, soon, 370/115, 370/138 and 370/148, enables you to add more memory, in less space and at lower cost. Start saving now. Replace your IBM memory with Intel memory. Remember us when you need to add even more.

S/370 Computer Leasing:

# OPM Introduces The Combined Lease.

## One picks up where the other leaves off.

---

*Under our new Combined Lease Plan (CLP), two lessees join forces to get the benefits of short-term flexibility and lower rates.*

### For the Short-Termer

In the past, if you needed a S/370 computer system for a short time, you had no choice. Rent under IBM MAC, and pay the premium.

Now, you have a low-cost alternative: CLP. Take the first part of our new Combined Lease Plan and get short-term flexibility at the same low monthly rate as a full-term lease. Typically, your monthly payments will be 20% to 50% less than IBM MAC, even after you factor in property taxes, maintenance and insurance.

How can we do this? We're the Custom-Leasing People. We will have arranged for another lessee to begin his lease when yours ends.

But what happens if your plans change *after* your lease starts? No problem. Under our Combined Lease Plan, we have a method which enables you to keep a S/370 longer than you originally anticipated at the same low cost. After all, we're OPM the Custom-Leasing People.

Sound good? It gets even better. Just fill out the coupon and get the full story about the Short-Term part of CLP.

### For the Long-Termer

If your plans include a large computer system in the future, we can save you several thousands of dollars on each of your monthly rental payments.

Sign up now for the last part of our new Combined Lease Plan and gain the economic benefits of the lease of the short-termer.

At the beginning of your lease, we'll transfer the computer system to you. You'll be paying rent at the lower rate of a full-term lease. But only for the shorter period of time you commit to the computer system because of the amortization of the short-termer.

In addition, you'll get the following advantages: ITC this year instead of later; a lease rate based on this year's hardware and finance costs without being exposed to possible increases; and guaranteed delivery of your S/370 computer system when you need it.

Who can argue with that? It gets even better. Just fill out the coupon and get the full story about the Long-Term part of CLP.

### Who are we to make such an offer?

We're the fastest growing company in computer leasing. After only seven years in the business, OPM has more than 2000 clients in the United States, Canada and Europe. The fact that so many of our clients return to us for their additional leasing requirements has been one of our most satisfying rewards.

If you haven't heard people talking about us yet, ask for our corporate brochure. Write to O.P.M. Leasing Services, Inc., 99 Wall Street, New York, N.Y. 10005. Or call (212) 747-0220. Outside New York State, call toll free (800) 221-2674.

# OPM THE CUSTOM-LEASING PEOPLE

O.P.M. LEASING SERVICES, INC. 99 Wall Street, New York, N.Y. 10005

Yes, I'd like to know more about your Combined Lease Plan.

CLP doesn't fit my needs. But tell me how your Custom-Leasing can reduce my monthly payments.

# IMS and TOTAL USERS

## YOUR DATA BASE

### &

## ASI-ST

## GO TOGETHER

More IMS and TOTAL installations have chosen the ASI-ST Data Management and Reporting System to implement data base applications than any other product. ASI-ST's dominance in data base environments is easily explained:

- Operates under all IBM 360/370 versions of DOS, DOS/VS, OS and OS/VS.
- Fully supports all TOTAL, IMS and DL/1 features including TOTAL 7 and secondary indexing under IMS/VS.
- Permits creating and updating TOTAL and IMS data bases as well as retrieval.
- Allows concurrent processing of conventional data files with IMS or TOTAL data bases.
- Supported in both batch and on-line environments.

IMS users such as *American Airlines, Dow Chemical, TWA, American Can, The Hartford, Union Carbide*; and TOTAL users like *Combustion Engineering, Northwestern Mutual Life, Anheuser-Busch, Corning Glass Works, Eli Lilly and Holiday Inns* are a few who agree ASI-ST and data base belong together. In addition, ASI-ST provides an unequalled return on investment by maximizing the productivity of both man and machine. Since ASI-ST fully supports conventional data files as well as complex data bases, these benefits are not restricted to IMS and TOTAL users. To obtain more information contact:

# A Christmas Medley

by Henry Martin

*H. Martin*

"Miss Pendleton, does Amalgamated Cable and Conduit Inc. own a sled?"

*H. Martin*

"Eddie, this is J.B. and I'm just calling up to wish you a very, merry bah humbug and all that!"

*H. Martin*

"This is the list of good little boys and girls from IBM, Eastman Kodak and Xerox families who, due to their fathers' promotions have been re-located since they wrote you their Christmas letters."

*H. Martin*

"I want a new modular incremental plotter with all input options allowing multiple step programming and block transfer of data for more economic plotting applications on-site or at remote terminals."

*H. Martin*

"Miss Conroy, please find out why Johnson Plumbing didn't send me their usual dopey little desk calendar that I always toss away."

*H. Martin*

"I'd like 200 shares of Ideal Toy Company at market, 300 shares of Mattel at market, 400 shares of Parker Brothers . . ."

These favorite Christmas cartoons are reprinted from past Datamation issues in the belief that Christmas humor, like Santa Claus, should live forever.

**We don't make terminals.  
We make them work.**

# How we tailored a system to fit Levi Strauss.

Levi Strauss and Co., a major apparel manufacturer, decided to upgrade their telecommunications system. To do this, a broad range of system elements had to be converted.

Levi Strauss maintains 64 manufacturing plants, located in small cities across the country. Each location is tied to their San Francisco headquarters through a message-switching computer. Their previous system, which was based on teletypewriters equipped with solid state buffers, couldn't handle their communications needs.

Levi Strauss selected Western Union Data Services to supply the faster EDT 300 teleprinters with magnetic tape cassette buffers.

## The task ahead.

The first task was to reprogram the Levi Strauss message-switching computer.

A technical support team from Western Union Data Services met with Levi Strauss system designers at the computer manufacturer's plant. "Reprogramming was done on the spot, and surprisingly fast" according to Doug Fields (at left), Manager of Telecommunications for Levi Strauss.

"Western Union Data Services personnel provided solid guidance. Terminal equipment

options, operations procedures and functional characteristics were worked out to match the computer's requirements."

## Termicare is a big factor.

"One of the nicest features of our new system is Western Union Data Services Termicare® service. If we have to report a problem, we call the Termicare Center. Their computer has a complete history of each terminal on file and the equipment to test each terminal remotely."

For more information on Western Union Data Services terminals and support capabilities, call 800-631-7050 toll-free. (In New Jersey, 201-529-1170.)

# Software Engineering and Life Cycle Planning

A single thought provided the theme for the second annual Software Engineering Conference: life cycle planning. Barry Boehm of TRW phrased it best from a management viewpoint, using two slides. The first showed a traditional pie chart with three slices for "design," "code," and "test" (40%, 20%, and 40%). He rhetorically asked the silent audience, "What's wrong with this chart?"

After a short theatrical pause, he presented a second slide showing "maintenance" as 70% of the effort, with design, code, and test proportionately reduced to 12%, 6%, and 12%, respectively. Thus he introduced the conference subject from an economic point of view.

The conference, which is jointly sponsored by ACM, IEEE, and the National Bureau of Standards, drew about 800 attendees to San Francisco during October 12-15. And it was a high-yield meeting. In contrast to the National Computer Conferences, where only about 10% of the papers are of interest to the practicing professional, about 50% of the 105 papers presented here were.

The first two were a pair of tutorials on Data Base Management and Software Design. Attendance was so high that one of them was sold out with a turn-away audience. In fact, switching sessions from room to room to better fit the audience sizes turned out to be a continuing problem, threatening to overwhelm the attendees at one point. In one light, the success of the presentations created some of the inconvenience.

Each of the three main days had a topic: "requirements and specifications," "software design and development," and "software verification and validation." With a few notable exceptions, the organizers selected papers to fit their themes, and in most cases the authors actually spoke on the subjects related to the topic—which is also unlike an NCC.

Others in the conference concentrated repeatedly on the life cycle theme Boehm had kicked off with. Statistical evidence was presented which described an autopsy on the problems found in a large military development. The origin of every problem was determined and costs were assigned. As one might intuitively suspect, the costs associated with problems found very late in the process

(during final integration and test) were much greater than the costs associated with problems found early in the development process. This gave substance to two schools of thought.

## Two ways to go

Doug Ross of Softech, Waltham, Mass., presented his SADT (structured analysis and design) technique to be used in developing hierarchical systems, and claimed it produced systems that were more likely to be correct

problem with all this (and it seemed a rather severe one to most of the audience) lay in the size of the ventures being reported. It appeared that the goodies were available only to those involved in massive projects or working for giant corporations. Through all this discussion (lasting about a day and a half) a haunting melody kept recurring—get your requirements *perfect* and then proceed to analysis, design, and implementation.

The second school of thought was represented by Harlan Mills of IBM. From the podium he mused that maybe a tremendous emphasis on requirements analysis and specification was uncalled for, expensive, and even prone to failure. Over dinner he discussed his ideas more completely. He indicated that the traditional approach called for the professional systems designer to work with the naive customer and produce requirements that the customer would endorse. Later, despite all efforts to keep the customer involved, a long sterile delay would set in before the final program was produced. By that time, the environment or the now-experienced customer would change the requirements so the program would no longer fulfill the customer's needs.

In contrast, he suggested an approach for developing systems incrementally. The analyst must sit with the customer long enough to get Package #1 defined. Then he goes away for a very short period (two weeks or a month at the most), and comes back with a piece of running code and some real reports that perfectly satisfy a small portion of the stated problem.

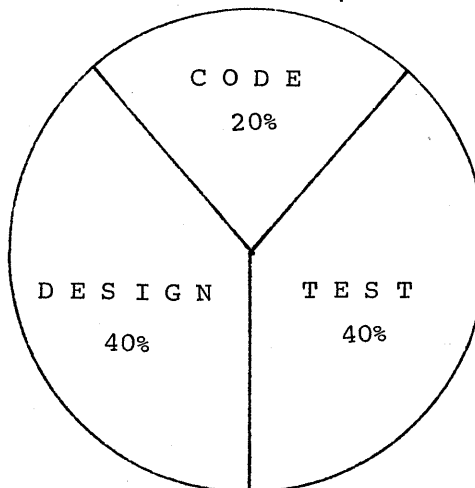

This live output greatly enhances the coupling between the analyst and the customer, and greatly increases the customer's learning rate. If the programs are designed to be changed (i.e., maintained), then a series of packages can provide increments of function which keep the customer involved, enhance his learning, shorten the total development cycle, and make him happier sooner.

In the next two years the differences in these two development strategies should come into focus, since the support tools required for each approach are quite different.

## Fault tolerant or fault intolerant?

One portion of the Conference was devoted to reliable systems. The audience heard a way-out paper describing

## Software Development

What's wrong with this chart?

than those built using traditional flow-charting techniques or even structured programming as commonly practiced. Dan Teichroew of the Univ. of Michigan presented the outputs of his ISDOS research, and described a highly automated support system to aid in requirements analysis. He claimed computer-aided structured documentation and analysis techniques lead to better requirements statements because the documentation is machine readable and hence can be processed by automated analysis programs to find inconsistencies, variables required but not defined, and instances where a variable was set but never used.

Right on the heels of Ross and Teichroew, C. R. Vick and his colleagues working on ballistic missile defense for the U.S. Army described a full-blown software support system which holds requirements in machine readable form, supports design and development, and even provides assists in validation and verification of the resulting system of programs. ## ENGINEERING

an on-board flight computer for commercial aviation which had multiple redundancies and voting logic, and whose adaptive parallel processors were claimed to allow only one error in 100,000 years.

In contrast, a much more practical approach by S. S. Yau and his colleagues at Northwestern Univ. talked about designing error resistant and fault tolerant software for current machine architectures. Through their research, which looks very encouraging, they hope to define programming structures which detect errors, be able to contain those errors within the smallest possible domain, and to provide for recovery in the most reliable fashion. Yau presented the beginnings of a taxonomy on errors and hopes his research will lead to specific antidotes or controls to apply in each case.

This subtheme was echoed by D. L. Parnas (now at Univ. of North Carolina at Chapel Hill), who concentrated on the recovery actions to be taken after errors were detected, and further developed by T. Anderson who described a special emulator they had prepared for the Digital Equipment PDP-11/45 (at the Univ. of Newcastle-upon-Tyne) to support some very interesting experiments in high reliability and automatic recovery.

As befits an engineering conference, quantization, measurement, and metrics appeared frequently throughout the three days. The contrast between the academes and the engineers (including some who happen to be in universities) was sharply displayed on several occasions. In one case, the academes stood up and presented a line of drivel and global concepts that had been distilled by reading the current literature. They were immediately followed by a manager from industry describing a large development project in which he had run several experiments that improved his programming productivity. He provided specific definitions for the experimental quantities and numerical values for the experimental results.

### And a few distractions

The conference was marred by two distractions, both of which were avoidable. There was a certain lack of perfection in the local arrangements. PA systems didn't work, speakers couldn't figure out how to turn the lights off and on, slides were presented upside down and backwards, and sessions were switched from room to room as mentioned.

The Jack Tar has never been known as a good conference hotel, and this tradition was continued with a demon-

stration of their coffee service which can best be described as stochastic queuing in the presence of a single server.

The other distraction is attributable to the program committee. After control of the ACM and a portion of the IEEE had been given over to the academic community, software engineering was to be a grass-roots effort on the part of industry to present useful accomplishments to the community at large. Well, somewhere en route to San Francisco some of the academes crept back in. We had a trivial paper from the Univ. of California-Berkeley describing storage estimates for indexes in a relational data base—a simple technique that is already a routine practice in industry. We had an abstract paper from Germany presenting a research application in set theory which would have been interesting—in some other surroundings.

We sat through a half a dozen papers presented by tired old war horses who once more displayed the same old theories we have heard at a hundred ACM meetings. Some of them were entertaining, but contributions to the art they were not. Finally, we found several more candidates for "worst paper" awards. (At the moment the leading contenders are all university Ph.D.s with foreign accents and hand-drawn slides, on very erudite subjects, which overflow the image area on a common viewgraph.) Fortunately there were no blackboards since even the arrangements committee recognized a blackboard could not be seen by all 800 people in the room.

The international theme of the conference was perpetuated by the fair city of San Francisco. Long known as a good tourist town, the Chamber of Commerce has evidently taken some lessons from Paris to make the town different. Not all of the changes have been for the better. Since the police don't enforce laws pertaining to victimless crimes, the city is festooned with women that seem to have nothing better to do than to stand in doorways and hold up buildings. Also, several of the restaurateurs have discovered they can make more money by kiting bills than they can by providing meals and service, so one must add up every check.

Over all, the bad details marred but did not scuttle a good conference. Those who are more interested in getting the work out than in creating a new programming language would be well advised to review the program and consider attending next year's conference on Software Engineering.

—R. L. Patrick

Mr. Patrick is a practicing computer consultant in Los Angeles and has long been Datamation's Editorial Advisor.

## If you think this new Xerox terminal is right for you, you may be wrong.

It's not for everybody.

To appreciate the Xerox 1700 you have to do interactive work and also want very high print quality.

And you have to be intolerant of downtime.

The mechanism is our quiet, reliable HyType II. Sharp, crisp characters, even at 45 cps. (Normal on-line speed is 30 cps.)

Full ASCII character set. Prints forward and backward. Has 1/120" horizontal and 1/48" vertical resolution so you can print charts, curves, formulas, musical scores.

Sits on a desk. The microprocessor and other electronics are inside.

Supported and maintained by Xerox.

Expensive? Definitely not. Available on purchase, one-year lease, or 90-day trial lease.

Now, after all you've read, if you still think this terminal is right for you, you just might be right.

To make sure, call 213-679-4511—Ext. 2231.

Or write Xerox, Dept. A1-15, 701 Aviation Blvd., El Segundo, CA 90245.

# XEROX

# The inventors of magnetic tape make a more reliable "Winchester" and it's guaranteed forever.

Back in 1932, BASF invented magnetic tape... the forerunner of such modern data processing media as the 3348 "Winchester" Data Module. And, because our error testing is twice as critical as drive manufacturer's specifications, we warranty our Data Module to be free from manufacturing defects for as long as you use it.

BASF research has made significant improvements on the Winchester. While still completely compatible with existing 3340 drives, our new Data Modules feature an exclusive oriented oxide coating and polishing technique which offers 30-35% better resolution properties than competitive Winchester-type packs.

Our new finish allows the read/write heads to fly uniformly and four times smoother than independent competitive module heads... resulting in greatly reduced possibilities of error generation. In addition, BASF has de-

veloped a special disk-surface lubricant, which eliminates disk coating wear and consequent contamination and errors. This lubricant also eliminates, for the first time, any possibility of a head sticking to the disk surface while the module is stored.

BASF Data Modules are available in three configurations: the 1335 Module, with 35 million-byte capacity; the 1370, with 70 million-byte capacity; and the 1375, with fixed head and quicker access.

For complete details on the BASF "Winchester" Data Module, write: BASF Systems, Crosby Drive, Bedford, MA 01730, or call our nearest regional office: in Los Angeles, (213) 451-8781; in Dallas, (214) 233-6607; in Chicago, (312) 343-6618; in Clifton, N.J., (201) 546-9111; in Montreal, (514) 341-5411; and in Toronto, (416) 677-1280.

# RAMIS at Citibank

by Robert E. Roach

For some applications, cpu time has been cut by 72% and disc I/O by 84%.

The World Corporation Group of Citibank, New York City, had a need for a data base management system for a financial application. After considering several commercially available systems, we chose the RAMIS package (Rapid Access Management Information System) of Mathematica, Inc., Princeton, N.J., which several Citibank departments have now implemented on a number of applications. Here is the story of our successful implementation of RAMIS for our particular financial application.

## Software selection

No software package can be all things to all people. Some data base management systems, such as IMS, TOTAL, and ADABAS, provide very sophisticated file structures and require host language programming. These systems feature one or more of the hierarchical, network, and inverted file structures. The strength of such systems lies in the ability to perform low volume inquiries rapidly on a large data base. But this power is purchased at the cost of slow file updates, and necessitates a high level of programmer expertise.

Other systems, such as MARK IV, offer limited file structure options and a tabular ("fill in the worksheet") report specification language. While these file management systems are easy to use, their rigid structure limits their usefulness in solving MIS problems.

A third group of data base management systems provides a considerable range of file structures, a host language capability, and a data management and report generation language facility. Systems such as RAMIS, the newer NOMAD (National CSS, Inc.), and FOCUS (Information Builders, Inc.) are representative of this type. These systems are appropriate for applications with file retrieval requirements.

In the summer of 1973, Citibank purchased RAMIS for its use in financial applications. Our software requirements included:

- a data base management system with a flexible file structure,
- an easy-to-use report generator with substantial capabilities, and
- the ability to run either in batch or interactively.

Besides RAMIS, IMS (which was being installed at Citibank for other applications) was evaluated in conjunction with the possible use of the reporting capabilities of GIS/2 (Generalized Information System) or IQF (Interactive Query Facility). The GIS/2 and IQF packages proved to have limited reporting capabilities. IMS, while providing great flexibility in data base design, was considered to require too much senior programming support. RAMIS met our requirements well and so became the logical choice.

## Implementation of the GAPS application

Our financial application was to redesign the Global Account Profitability System (GAPS), which provides Citibank's World Corporation Group (WCG) with a tool to track the volume and profitability of the WCG's total relationship with about 550 multinational companies throughout the world. Initially implemented in 1969 as an annual system, GAPS was expanded to semiannual reporting in 1973 and quarterly reporting in 1974.

In the summer of 1974, Citibank's Finance Div. recognized that GAPS was contributing to serious congestion on a PDP-10 computer, with the result that reports were produced more than 90 days after the close of the quarter. Analysis of GAPS showed that the application could readily be moved to a RAMIS based system on an in-house IBM 370/158. (Under the bank's data

center decentralization program, "Project Independence," GAPS applications was to be moved to an IBM 370/145 computer in November 1976.)

The objectives of this redesign were the following:

- to streamline the reporting system,
- to produce more timely reports,
- to provide for future expansion of the data base (for example, the inclusion of budget data),
- to provide a capability for the user to obtain ad hoc reports,
- to implement on the IBM 370/158 for third quarter 1974 report processing, and
- to eliminate the PDP-10 from GAPS processing.

The GAPS implementation followed the strategy outlined above. The first step was to create descriptions for the utility files (defined in the box). For this application a COMPANY file was set up with information such as the customer name, the account responsibility unit, and the industry code. A BANKORG file was set up with the name of departments and countries, higher level organizational codes, and other indicators. A SIC file was set up with standard industrial classification codes and names.

The second step was to set up the application reporting file (also defined in the box). For GAPS, this was a financial ACTUALS file. Reporting periods (quarters), profit centers, customer parent companies, and local companies provided the sequencing codes for the hierarchical structure. (See Fig. 1.) Nine financial items summarizing the accounts' profitability were stored. Historical data from the PDP-10 system was loaded onto the new data base.

The GAPS system must process data from more than 60 countries. Consequently, the importance of a comprehensive edit program cannot be over-emphasized. In addition to checking

# Only one distributed processing system speaks Cobol. Sycor's.

Now your branch offices can use Cobol, the language of maxi-computers, with Sycor's 440 and 410 distributed data entry and processing systems.

That means you can do many vital jobs such as report generation, file listings, post data entry editing and file maintenance faster than ever before. Because they're done at the source, instead of on your large, central computer. And Sycor's Cobol capability is available at no extra cost.

With Sycor's Cobol, a subset of ANSI '74 Cobol, you can still have central control by doing all your program development on your host computer. Or test your programs and do compiling on a 440 or 410 in your branch locations.

**Flexible Sycor systems increase efficiency.**

While Cobol is running as a background task, your data entry operators can be keying multiple applications in the foreground. All on Sycor 440 and 410 systems.

The Sycor 440 is available with 5, 10 or 20 million characters of storage, 64k bytes of memory and up to eight video display terminals for your large regional offices.

A variety of peripheral options helps stretch your data processing dollar, too. Options like five speeds of printers, three magnetic tape drives and a card reader. Plus asynchronous and binary synchronous communications.

**Put economical Cobol at smaller branches.**

The Model 410 gives you the same big Cobol processing power as the 440 system for your smaller branches, at a stand-alone-terminal price.

For \$516 a month on a three-year lease, the 410 provides 2.5 million characters of disk storage, 40k bytes of memory, a display station, communications and a 60-cps bi-directional printer. And fast, reliable maintenance from one of our 100 nearby service centers in the United States and Canada.

**Get the whole story on Sycor and Cobol.**

Find out how you can put big-computer power in your branch offices by using Sycor distributed data entry and processing equipment. Send in the reply card or write Ken Wilson, our product manager, Sycor, Inc., Corporate Offices, Ann Arbor, MI 48104. Or call him at (313) 995-1371.

Better yet, call one of our 32 conveniently located sales offices. They're in the Yellow Pages under "Data Processing Equipment."

**Sycor puts computer power where the work is.**

# SYCOR

# RAMIS

each transaction field for valid type and range of values and cross-field consistency, the GAPS edit verified the company and organizational codes against the COMPANY and BANKORG files in the data base (using the RAMIS Programmer's Interface—RPI—subroutine package).

The file maintenance function was implemented using RAMIS's data management commands to add, delete, or update records based on transaction types in the records. Two file maintenance job streams were set up: one for the financial ACTUALS file, and one for the utility files.

With the data base system in place, reports were developed. First of all, listings for the utility files were programmed. Then about a dozen reports were developed, which cut the financial results at different levels of detail by account responsibility unit, profit center, and customer. All of these reports were programmed using the RAMIS TABLE command and catalogued as RAMIS procedures.

How well did the GAPS implementation meet its objectives?

- On the PDP-10 system, both a detail file and a summary file were maintained, necessitating an extra step in the file management job stream. Elimination of the summary file and production of the summarized reports with the TABLE command significantly streamlined the system.

- The first processing cycle under the new system produced some shortening of the time to produce the GAPS reports. In succeeding quarters, the timeliness of reports was limited only by the collection and preparation of data for input into the system.

- The data base was expanded successfully (to approximately 250,000 records of considerably different lengths) by adding Budgets and other applications, as discussed later.

- Ad hoc reports were produced by making quick changes to existing reports.

- The goal of moving GAPS off the PDP-10 and onto the IBM 370 in the third quarter of 1974 was met.

In summary, the design objectives were all met. The system design and the expansion capability were especially successful. Timeliness improvements came more slowly, but with a stable system in place and by tightening up the preprocessing steps, these goals were met. And in all, the initial implementation took about one man-year.

### Post-implementation issues

A successful project raises new issues and spawns new projects. GAPS was no exception. Three of these issues

were making the system more efficient, solving the problem of report requirements which challenge RAMIS's capability, and expanding the system to other applications.

Data base systems make easy targets for the computer operations department's complaints of inefficiency. Such complaints often have merit. It is a truism that sophisticated file structures require more I/O activity than simple ones. But our experience has shown that these complaints can be defanged by the careful and continued analysis and improvement of a system. One should experience a "learning curve" of improved efficiencies both in under-

standing the facilities and the peculiarities of the data base system, and in reevaluating the application design. GAPS underwent major improvements in four areas:

- As mentioned above, the edit program referenced the BANKORG and COMPANY files. By loading in core the entire BANKORG file at a small expense in region size, the I/O activity was reduced by more than 70%.

- As we planned to store eight quarters of historical data in our data base, we had visions of enormous file sizes and incredible run times. We took a hard look at the ACTUALS file, and as a result, cut the number of data elements

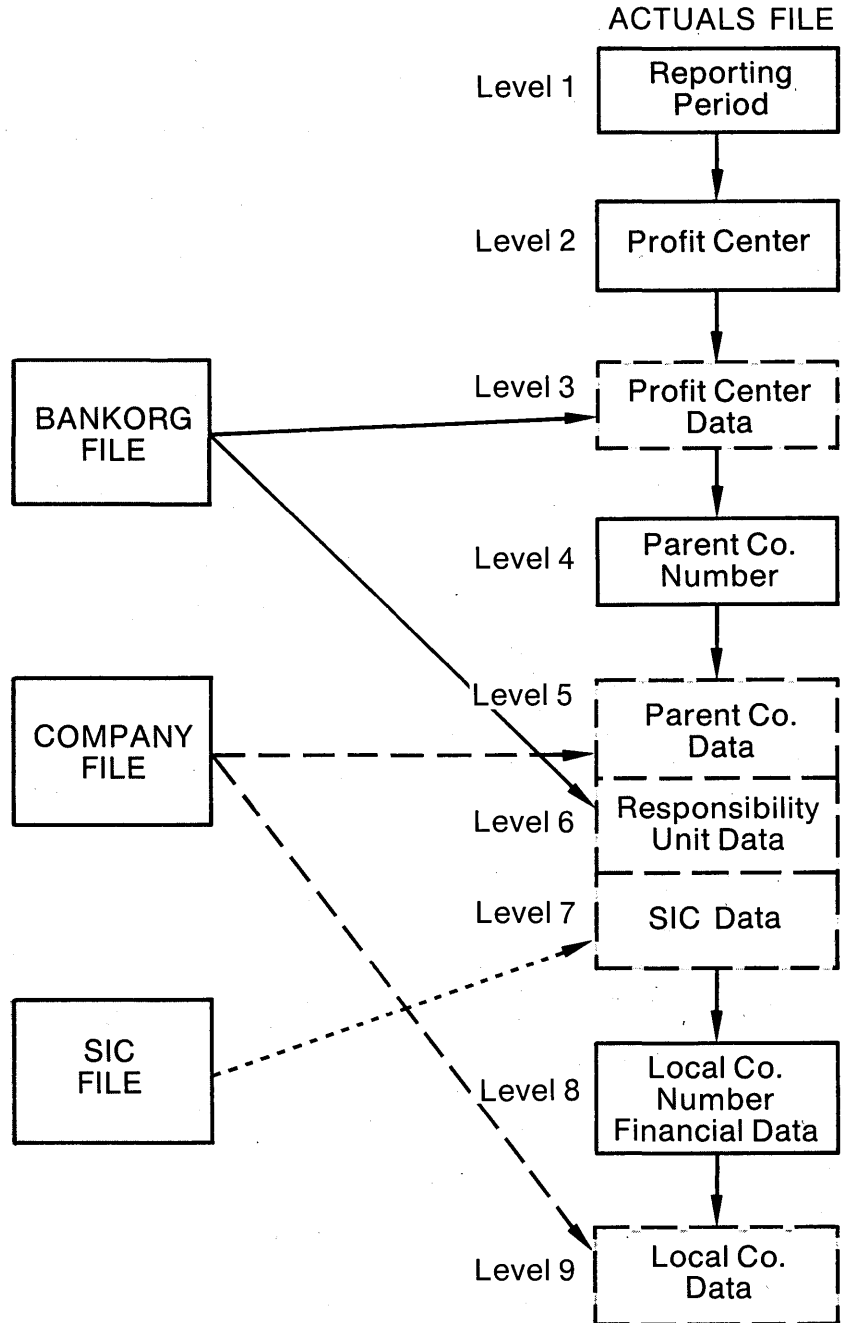

Fig. 1. The ACTUALS file was the first application reporting file (RF) implemented on the GAPS data base. It consists of nine levels representing financial items, and is linked to three virtual files: BANKORG, COMPANY, and SIC.

by 40% and eliminated several virtual levels (a major source of I/O activity). The population of GAPS accounts varies very little from quarter to quarter. Therefore, in advance of a processing cycle, we reserved space for the exact set of relationships which were reported the previous quarter. We found that by not reserving additional over-

flow areas in advance (using the RAMIS segmentation feature), we could substantially reduce the file size. The combination of these two actions reduced the ACTUALS file size by more than 30%.

- The installation of RAMIS's release 5.4.5 provided a 30% reduction in I/O activity, primarily because of the im-

provement of the virtual segment buffering. Fine tuning to optimize virtual segment buffering yielded an additional 48% reduction in I/O counts. The impact of the ACTUALS file reduction, the installation of the new RAMIS release and the fine tuning are summarized in Table 1, page 92.

- It was discovered that in certain

## DATA BASE ARCHITECTURE: THE USER ORGANIZATION'S STRATEGY

Desirable characteristics of data base management systems include a hierarchical file organization, the creation of multi-application utility files, the implementation of separate application report files (see Fig. 2) with virtual file linkage, and the open ended capability to extend the system to other applications in a modular fashion.

### *Hierarchical Files.*

File structures have evolved from the sequential organization on cards and tape to indexed sequential and direct organizations on disc. With the advent of data base systems, hierarchical data set organizations and access methods have achieved a certain vogue. A hierarchy has several advantages over conventional structures in MIS applications requiring file retrieval:

- It reduces storage requirements by grouping data common to many records at or near the top of the file (i.e., the root segment).
- It speeds up access to the data base by arranging data into logical groupings or subtrees which may be retrieved rapidly and efficiently as a unit.
- It provides for many levels of branching.
- It may provide security at one or several levels of the file.

### *Multi-Application Utility Files.*

A user organization's management information needs are usually conceptually straightforward but become hopelessly mixed up in their execution. *Straightforward* because they are tracking certain things such as financial information, personnel, marketing data, or inventory. *Mixed up* because of the multiplicity of coding schemes used to identify key data elements. If one were to analyze a department's (or a company's) MIS, he would be struck by the number of coding schemes.

Consider the problem of the proliferation of codes to identify organizational units—profit centers, cost centers, management hierarchies, account or responsibility units, etc. To

pass data from one application to another, the identifiers must be translated. In addition, each application must store and maintain its own organizational table. The system designer would score a major victory if he could establish a uniform organization code, store the organizational unit's name and indicative data in one "ORGTAB," and then maintain the ORGTAB file by one job stream. The ORGTAB file would then be available to all application files in the data base through virtual file linkage. In addition, the need for translation tables would be eliminated.

Let us refer to these multi-application files as *utility files* (UF's). (In RAMIS literature, these are often called "associated files" or "virtual files.") UF's should be set up for each type of indicative data. (Note that they also greatly reduce the amount of disc storage required.) A UF is set up with a key (i.e., an identifier code) and a list of indicative data elements for the accounts, organizational structure, product identifications, etc.

### *Application Reporting Files.*

The next step in creating a data base system is the implementation of

an application. Typically, an application will have one or more application *reporting files* (RF's) in the data base. (RF's are "working files" in RAMIS terminology.) An RF will pick up its indicative data entirely by linkage to UF's as virtual segments. In a financial system, an RF record will consist of a reporting period (monthly, quarterly, etc.), a customer, and a list of financial data. To implement the application, procedures are developed for data capture and translation, editing, file maintenance, and report production.

### *Modular Expansion.*

The final consideration in our strategy is the question of how the system may be expanded. With a data base system (and assuming intelligent planning), it is possible to add additional UF's and RF's without affecting the existing system, thus making it truly open ended. Of course, in time it may be necessary to restructure UF's (for example, to reorder, add, or delete fields.) The corresponding change must be made to the RF's. \*

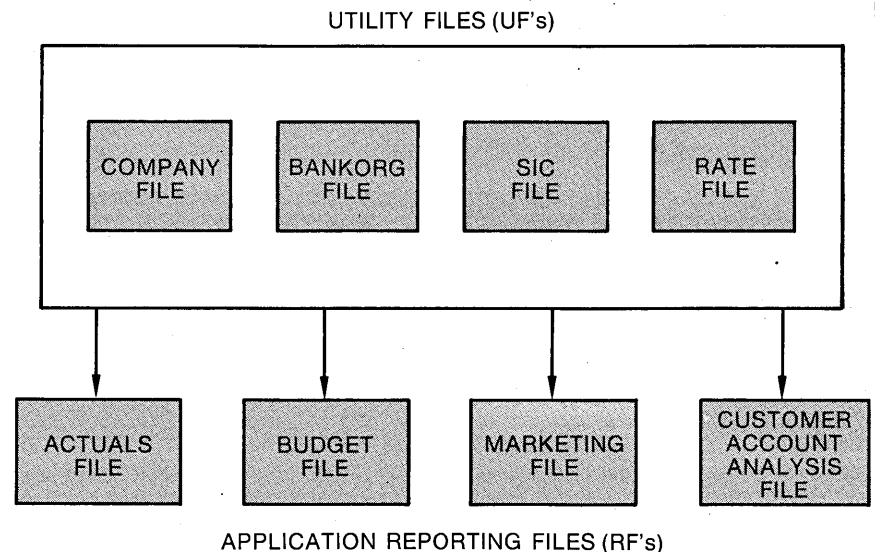

Fig. 2. This is a representation of the Global Account Profitability System (GAPS) data base. Each of the reporting files (RF's) contains virtual segments from two or more of the utility files (UF's). Additional UF's and RF's may be added to the data base without affecting those already in place.

At Aetna Life & Casualty, claims for group dental and medical insurance benefits are being processed through a new data terminal system called AECCLAIMS. It cuts down the time required to get drafts and statements in the mail, and cuts down the cost of claims processing.

Paperwork won't be a problem anymore. Records are filed electronically in Aetna's powerful computers. They are instantly retrieved and up-dated via the AECCLAIMS terminals as each new claim is processed.

AECCLAIMS is already in operation in Aetna's Hartford claim office and will soon be installed in over 40 others nationwide.

Find out why Aetna chose Bunker Ramo System 90 terminals and minicomputers for AECCLAIMS.

## RAMIS

cases the RAMIS report generator went through the retrieval motions for unwanted quarters. By modifying the RAMIS report procedure to retrieve only the desired quarters, processing costs were reduced by as much as 7/8 (retrieve 1 quarter and ignore the other 7).

With the acceptance of the initial package of reports, complicated new

	CPU Time	Disc I/O Counts
Stage 1: Old data base, (RAMIS 5.3.5)	100%	100%
Stage 2: Restructured data base, (RAMIS 5.3.5)	73%	47%
Stage 3: Restructured data base, (RAMIS 5.4.5)	40%	31%
Stage 4: Restructured data base, (RAMIS 5.4.5, additional 50K buffer)	28%	16%

Table 1. The effort to achieve efficiencies in the GAPS report production has resulted in reducing cpu time 72% and disc I/O counts 84%.

requests were made which could not be programmed with the TABLE command. We attacked this problem and developed two different approaches to solve it:

- the creation of a file extract with the DUMP command and the running of it through a COBOL program to produce the desired report; and
- the writing of a host language program (that is, with the RPI subroutine package), to produce a complex report.

Other applications have been added to the original GAPS data base in the evolution and expansion of the World Corporation Group's requirements (Fig. 2, p. 89). These applications cover such areas as Marketing Analysis, Budgeting, and Customer Account Analysis. Each has taken advantage of existing UF's. Some have created additional UF's. These new systems have had no adverse impact on existing applications.

The development of the GAPS Budget application was particularly illustrative of this evolutionary approach. The BUDGET file structure was similar to the ACTUALS file in Fig. 2; however, since budgeting was done at the parent company level, the local company levels were omitted. The BUDGET file referenced as virtuals the BANKORG and COMPANY files.

The file maintenance function was implemented in a manner completely analogous to the GAPS Actuals. Seven reports were developed using the TABLE command, and two were programmed in COBOL. These reports, like the GAPS Actuals, cut the financial data at different levels of detail for different organizational units.

Initially the GAPS Budget was kept on a separate RF to insulate the GAPS

Actuals from a developing application. When Actual data became available to compare to corresponding Budget periods, it became desirable to place the Budget data on the same file as the Actuals. The Budget and Actual data were dumped, the ACTUALS file was reorganized to include budget financial items at the parent company level, and the Budget and Actual data was loaded to the ACTUALS file. Since field names were retained, the only modification required (for the GAPS Actuals applica-

tion) was the field number references in the RAMIS file maintenance procedures. The ACTUALS file then was used for the Actuals reporting and the Budget to Actual comparison.

### Conclusions

The experience at Citibank has proved the validity of an evolutionary approach to the development of applications with a data base management system. The RAMIS package has demonstrated its ability to handle varied file structures, to provide a data management capability, and to provide both report generation and host language facilities. With a small programming staff (usually two to three), the World Corporation Group has developed an increasingly integrated data base for MIS applications, and we expect the evolution to continue. \*

Mr. Roach is a senior analyst for Citibank's World Corporation Group, where he has been responsible for the implementation of several financial MIS applications. His previous experience includes consulting work for Amtrak and a stint in the Navy as a project officer for MIS applications at the Bureau of Naval Personnel.

# Graphic hardcopy output from IBM systems: the Plotmaster® makes it a reality, not a dream.

If you have an IBM System 360/370 computer operating under DOS, OS or VS, you know what a nightmare it is to get graphic hardcopy output.

That's why the Gould Plotmaster Systems are like a dream come true. They deliver crisp, high quality graphics output from the computer, with no intermediate processing steps. They also work at incomparably fast speeds, without demanding additional system resources. No hours or days of waiting as when you use a slow pen plotter attached to the computer. No waiting for post-processing film development and blow-up as when you use graphic microfilm units.

Plus, Plotmaster Systems are economical as well as efficient. Initial and recurring costs are surprisingly low. And fast turn-around and high capacity adds up to additional savings.

Plotmaster Systems have three major components. Efficient and flexible graphics software. A Gould electrostatic printer/plotter that you can tailor to your exact application. And hardware to link the two—an on-line controller, or a tape drive for off-line operation.

In addition to this basic package, specialized software is available for business, scientific and engineering applications. Full printing capability is optional.

Let us tell you more about the

fast, powerful, versatile Plotmaster Systems. They can be purchased or leased and are supported by Gould's specially trained service force.

For a free brochure, write Gould Inc., Instrument Systems Division, 3631 Perkins Ave., Cleveland, Ohio 44114. Or Gould Advance Ltd., Raynham Road, Bishop Stortford, Herts, United Kingdom. Or call Gould toll-free at (800) 325-6400, Ext. 77. In Missouri: (800) 342-6600.

# OS/CB Release 1

One morning last summer, I created a data base of CB lingo with apparently no ill effects. Later in the day, however, a memory trace revealed something so startling, it raised many eyebrows around our data processing department. I give a portion of it here. For clarity, it should be noted that we identified four jobs being processed at the time of the trace: one from payroll (*Money Bun*), another from engineering (*Slide Rule*), number three belonged to marketing (*Seller Feller*), and finally, a telecommunication linkup to a remote crt (*Ring-a-ling*).

**SELLER FELLER:** Breaker, broke. Seller Feller looking for that one Big os.

**BIG OS:** Hold on for a 10-6, breaker. Money Bun is already on the channel with Slide Rule 10-10 on the side.

**SELLER FELLER:** Ten-four, good buddy. Mercy me, what does a guy have to do around here to get a break?

**SLIDE RULE:** Breaker, Big os. Who's the bucket mouth causing all the noise?

**BIG OS:** Some Mickey Mouse who's working the back door.

**SLIDE RULE:** Big 10-4 on that, ol' buddy.

**BIG OS:** Okay, Slide Rule, get ready to roll. Money Bun is out looking for the home 20 of some ratchet jaw, so you've got the channel.

**SLIDE RULE:** Ten-four, Big os. We're taking the hammer out of the tool box.

**SELLER FELLER:** Breaker, Big os. How about letting the channel roll? The Head Honcho wants to know how many green stamps he's dumped into Bankrupt City.

**BIG OS:** Negatory on that, Seller Feller. We've got 5,000 ratchet jaws out there anxious to get their weekly wage on

time.

**MONEY BUN:** Breaker, Big os. We're 10-8 and ready to get back on the super slab.

**BIG OS:** Ten-four, Money Bun. Turn to channel two. We just had a sick horse go 10-7 with bad motion lotion and I'm writing his comic book now.

**MONEY BUN:** Ten-four. We got the pedal to the metal.

**RING-A-LING:** Breaker, Big os.

**BIG OS:** Com'on in, lady breaker.

**RING-A-LING:** I need some fast help.

**BIG OS:** Ten-four to that, Ring-a-ling. You got a direct land line to an 18 wheeler with your garbage can aboard. Do you want on camera?

**RING-A-LING:** Mercy sakes alive, you do know how to treat a girl right!

**SELLER FELLER:** Breaker, Big os. How come that thumb merchant got in ahead of me?

**BIG OS:** She's got on a red wrapper with seatcovers to match. But don't worry, Seller Feller. Slide Rule just gave me the signal he's 10-7 with an EOJ. Bring it on up. It's clear to here.

**SELLER FELLER:** Ten-four, Big os. We're coming at you with the hammer down.

**BIG OS:** Throw your Bicycles in the hopper and we'll speed-read your holy incantations. You're got a two-wheeler waiting with a half mile of magnetic ribbon.

**MONEY BUN:** Breaker, Big os. We're going 10-7 for now. Thanks for the break and we'll catch you all on the flip-flop. This is the one Money Bun, hot out of the oven. Numbers to you. We gone!

10-7

**Break**—Request to use channel.  
**Breaker**—Station requesting a break.

**10-6**—Code for Busy, Stand By.

**10-10**—Standing By.

**Ten-four; 10-4**—OK, or Message Received.

**bucket mouth**—Someone clogging channel with talk.

**back door**—Rear vehicle (last program in line).

**home 20**—Home address.

**ratchet jaw**—Nonstop talker.

**hammer out of the tool box**—Accelerating to top speed.

**letting the channel roll**—Let others break in.

**green stamps**—Money.

**Bankrupt City**—New York City.

**Negatory**—Negative.

**10-8**—Code for ready to use the system.

**super slab**—Major highway (the large partition).

## Big OS's CB Lingo

**sick horse**—Program with errors.

**10-7**—Out of service, leaving the air.

**motion lotion**—Input data.

**comic book**—Abend dump.

**pedal to metal**—Running at top speed.

**land line**—Telephone.

**18 wheeler**—Any tractor-trailer truck (disc drive).

**garbage can**—Data base with one or more cylinders.

**camera**—Police radar unit (crt.).

**thumb merchant**—Hitchhiker.

**red wrapper**—Top priority.

**seatcovers**—Lady passengers.

**hammer down**—Same as pedal to the metal.

**Bicycles**—Card input (from brand of playing cards).

**two-wheeler**—Motorcycle (tape drive).

**flip flop**—On return run.

**numbers to you**—Sign-off information.

—Gary P. Becker

\*Some of the lingo here comes from Appendix B ("CB Lingo") of Hy Siegel's *All About CB Two-Way Radio* (Radio Shack, Fort Worth, Tex., 1976), pp. 108-11.

### IMSAI 8080: THE COMPLETE COMPUTER SYSTEM

- Computer with 16K bytes of memory, 8-level interrupt and interval clock
- 2 floppy disk drives with intelligent interface/controller
- 300 LPM printer
- 24-line by 80-column CRT with keyboard
- Programmer's front panel and software
- All peripherals interfaced

**\$10,608 UNIT PRICE\***

*\*Quantity discounts available.*

### IMSAI 8080: THE COMPLETE DEVELOPMENT SYSTEM

- Computer with 16K bytes of memory, 8-level interrupt and interval clock
- 2 floppy disk drives with intelligent interface/controller
- 2 serial I/O RS232 or TTY ports
- Chassis with 22 card slots
- Power supply, programmer's front panel and software

# The IMSAI 8080 Floppy Disk System. It's more than you'd expect for much less.

The IMSAI 8080 Intelligent Floppy Disk System. For the money, there's no development system like it: it's easier to use, more powerful, modular and versatile than anything on the market. And the tickets prove it.

The IMSAI 8080 computer is powerful, accommodating up to 64K bytes of MOS write-protect memory. It's fast, with 500 nanoseconds total memory access time and 2 microseconds minimum instruction time.

The IMSAI 8080 is modular and highly versatile. It can accommodate up to 22 boards. And there's no restriction on mix of memory and I/O interface boards.

The IMSAI 8080 can be configured for just about any application. We offer a variety of memories (RAM and EPROM), I/O interfaces (parallel, serial asynchronous and synchronous RS232C, TTY), peripherals (disks, printers, tape

cassette, CRT's), and multiprocessing capability.

And if you're an OEM, you'll like the way the IMSAI 8080 is put together. Switches are large and rugged, and the front panel, with hexadecimal and octal notation, has an extra eight program controlled LED's.

The intelligent floppy disk interface/controller has its own processor and firmware. It provides sophisticated control of the

floppy disk system with DMA and automatic retry. And this economical interface/controller can handle up to four drives. Each disk stores up to 243K bytes using the IBM 3740 format and has an average access time of 330 milliseconds.

You can immediately develop your own application software using DOS, assembler, text editor and debugger. In addition, extended BASIC and FORTRAN, both integrated with DOS, will soon be available.

The IMSAI 8080 Intelligent Floppy Disk System. Never before could you get so much for so little. For an IMSAI 8080 catalog describing options, peripherals, software, specifications and prices, write or call IMSAI.

Dealer inquiries invited.

# There is only one OEM

1.

A Wangco Autoload Tape Drive...from Wangco's broad, high quality line of tension arm, vacuum column, and autoload models. Select speeds of 12½, 25, 37½, 45, and 75 ips, 7 or 9 track NRZI, phase-encoded or dual density format and reels of 7", 8½", and 10". Design features include IBM compatible head guide spacing, high efficiency tape cleaning, tri-level read threshold, and plug compatibility with other major industry suppliers' tape drives. The ruggedized Mod 12 shown below is especially suited for large computer mainframe system integration.

1.

A Wangco Disc Drive...front or top loading cartridge or fixed disc with data capacities from 2.5 to 20 Mbytes (100 or 200 tpi) in the smallest size configurations available. Wangco designed voice-coil positioners speed access and reduce power dissipation. The new brushless DC motor, forced air cleaning system and two-sensor temperature compensator assure highest reliability.

# peripheral for your system

## 1.

A Wangco Flexible Disc Drive ...with access time of 6 ms track to track for a 164 ms random average seek. Single and dual density encoding can be accommodated in the same drive with selectable sector options including IBM and expanded soft sectoring, 32 hole hard sectoring, and sector generation. Reliability features include an IBM-type ceramic head, low friction Uni-ball positioning, die cast mainframe and open and closed door interlock. MTBF is 5000 hrs. Power consumption is only 45 watts.

## 1.

A Wangco Tape or Disc Subsystem...hardware, firmware, and software, for PDP-11 and Nova minicomputers. Wangco offers more subsystem configurations for the OEM than any other manufacturer. To the user this means single source systems with components designed together to work together as well as rapid delivery and substantial cost savings.

## 1.

A Wangco Magnetic Tape Formatter...containing all required logic to read and write IBM compatible 1600 cpi phase encoded and/or NRZI mag tape. Requiring only 5¼ in. of vertical rack space, each formatter can control up to four 7 and/or 9 track tape drives.

The one OEM peripheral for your system is from Wangco. For more information contact Wangco, Inc., 5404 Jandy Place, Los Angeles, CA 90066. (213) 390-8081. In Europe write or call Wangco, Inc., Postbox 7754, Building 70, 1st Floor, Schiphol-Oost, Netherlands. (020) 458269.

# New KODAK KOM-85 Microfilmer.

## More flexible, more capable, and reliable as ever!

When you set out to improve a COM workhorse, you don't tinker with the features that made it an outstanding performer. The advanced KODAK KOM-85 Microfilmer gives you new flexibility and capability, combined with the fast, efficient throughput and high reliability of our proven veteran, the KOM-80 Microfilmer.

If your operation calls for high volume with fast turnaround, you should check into the advantages of the new KOM-85 Microfilmer.

The advanced Hewlett-Packard front-end mini-computer gives you

automatic program loading and integrated job setup through a CRT data terminal. You get input flexibility to accept print-image records from virtually any computer system. Faster job setup, easier film handling.

The KOM-85 Microfilmer gives you multiple-microform-output capability, plus a new expanded page format with up to 172 characters per line and up to 88 lines per page. You get broad coding and indexing capability for roll or fiche. Optional document-related coding for automatic retrieval on

16 mm KODAK ORACLE Equipment. Flexible column indexing for fiche, and more . . .

It adds up to more flexibility, new capabilities. With throughput speed up to 24,000 pages per hour. And the extra-reliable Kodak hardware and comprehensive software to handle COM formatting.

There's even more behind your new KODAK KOM-85 Microfilmer. Thorough training and clear, complete documentation; fast, competent, on-the-spot service; responsive and responsible support from dedicated Kodak people—the kind of support that's helped us set an outstanding nine-year track record in COM.

Look into the new KOM-85 Microfilmer. See your Kodak representative, or write Eastman Kodak Company, Business Systems Markets Division, Dept. DP-66875, Rochester, N.Y. 14650.

Since you demand a lot from EDP, demand the same from COM.

# On the DP Road to Southeast Asia

"We are witnessing the birth of regional awareness."

With understandable satisfaction, J. Costa of the Intergovernmental Bureau for Informatics (IBI) was winding up the first Southeast Asia Regional Computer Conference, SEARCC 76, on September 9, after four days of deliberating and socializing in Singapore's amiable tropical ambience.

"Many new friendships have been struck."

F. Kohli, chairman of the organizing committee and a SEARCC 76 prime mover, was touching only one of the many benefits of the conference for its 341 delegates from 19 countries, who also heard a familiar mix of invited talks and synopses of written papers.

SEARCC 76 attracted computer men and women from a huge sector of the Eastern Hemisphere. From 4,000 miles down under, Australia sent the second-largest delegation (59). Breaking with recent stay-at-home austerity, India sent an impressive 22-person contingent from some 3,000 miles west. And a handful of delegates came from Japan, 3,000 miles north.

The largest delegation turned out from Singapore. The host city-state also furnished an efficient multiracial administrative staff who kept conference events running smoothly and dispensed insider tips on entertainment, sightseeing, and shopping. Singapore's Computer Society was a cosponsor of the event, along with those of Hong Kong, Australia, New Zealand, Japan, Iran, and India. (IBI and UNESCO contributed financial support.)

The Telecommunications Authority of Singapore provided an on-line delegate registration and query system that used Univac, Data 100, and Hewlett-Packard equipment.

Substantial delegations came from nearby Malaysia, Thailand, and Indonesia. And 15 made the 10,000-mile trip from the U.S.

The distances involved are formidable enough to challenge the organizing talents, professional zeal, and expense budgets of seasoned conference circuit riders in America and Europe. So what was it that drew the impressive turnout in Singapore?

The search for regional identity—and pride—was undoubtedly a compelling personal motivator. But the strongest stimulus for holding the conference—and probably the reason for the handsome attendance—was a more pragmatic belief that computer technologies are the natural pace-setters for general economic development.

Delegates were told by D. Chevion of Israel's Ministry of Finance (and a former IFIPS vice president) that recent U.N. data showed a constant relationship between countries' per-capita GNP and their total number of computers.

The big question for the computer people of developing nations was "if we computerize more, will that help our GNP move up to its 'proper' position on the U.N. graph?" Examining that hopeful proposition may have been what SEARCC 76 was all about.

However, taken at face value the statistics aren't all that encouraging. Dr. Chevion also pointed to a World Bank study that showed developing countries behind 1:10 in wealth, behind 1:60 in computerization, but ahead 3:1 in population.

And he cited another recent study by the SILT committee of SHARE indicating that developing countries'

---

Computers don't produce wealth. Does that make them a luxury?

---

"share" of world per-capita GNP will actually go down over the rest of the century by a few percentage points. The richer countries will get even richer faster than the poorer countries will get richer.

Still, the growth may be rapid in absolute terms, and developing countries are being perceived as interesting markets for the developed nations.

A powerful case in point: In drumming up interest in its new *Asian Wall Street Journal* (first issue: Sept. 1), the prestigious publisher pointed to the facts that between 1969-74 real GNP grew four times as fast in East Asia as it did in the U.S., and today East Asia's trade with the U.S. exceeds America's

trade with the entire European Economic Community.

## Is this technology necessary?

Kohli spelled out some practical reasons why developing countries can indeed look to computerization as a way to accelerate their general economic growth.

"Basically, societal systems are more complex than physical systems," he said. Developing countries face basic survival challenges: poverty; technology education; transportation; agriculture, food handling, and nutrition; population and family planning; rural-to-urban migration; employment; and on and on.

This creates a high-risk environment for government decisions. A decision to allocate scarce natural and human resources to promote industrial rather than agricultural productivity could critically affect a country's social "bottomline" for a decade.

From his own India, Kohli draws a real example: a five-year-old program to optimize process control and reduce required levels of fuel reserves saved enough fuel in just one year to pay for the whole cost of computerization.

Thus there is a stress on computers as decision aids in developing countries, and a large portion of the conference proceedings dealt with integrated software systems, data base management techniques, "what if" modeling, and distributed processing.

## Leapfrog, anyone?

A notion that seemed to occur to nearly everyone was the possibility that developing countries might be able to "leapfrog" decades of computer evolution and somehow land on the high side of modern technology. Several speakers did express hope that developing countries could avoid having to go down some of the technological blind alleys now so well illuminated by hindsight.

But the emphasis was not on leaping ahead, or even playing catch-up in computer technology. Instead, proceedings focused on ways of transferring knowledge from more to less advanced countries and applying it to

## SOUTHEAST ASIA

local problems. Several speakers stressed that primary goals of technology transfer ought to be the promotion of self reliance in the receiving country, along with international sharing of resources and expertise.

One session was devoted to analyzing the proper role and actual performance of international organizations in speeding the transfer of technology. Highest marks went to professional societies, including SEARCC 76 cosponsors IBI and IFIPS and benefactor UNESCO, along with the Association for Computing Machinery (ACM) and local computer groups.

Other organizations—the World Bank, various national governments, and the Ford Foundation—also drew credit for contributions of expertise, equipment and money to local projects.

Lowest marks went to mainframe manufacturers. After all, observed more than one delegate, these firms are multinational by nature and should be interested in stimulating the use of their products. Mainframe manufacturers could do a lot more in the critical area of training, it was felt, although IBM drew praise for its educational centers.

The "Company Confidential" stamp was seen by at least one delegate as a death warrant for technology transfer in such critical areas as the automation of manufacturing processes and the automation of software system design.

To stand up for the other side of those criticisms, an earnest defense of manufacturers as the most effective purveyors of know-how in practical

---

The "Company Confidential" stamp is seen as a death warrant for technology transfer.

---

applications came from the conference floor, to considerable applause.

And even with the shortcomings of formal "technology transfer," the situation is changing. The rate of change may not match expectations, but things are happening.

### Make or buy, Indian style

Speakers from India surprised many delegates by discussing its little known national policy of manufacturing its own minicomputers. DATAMATION was told that, of some 300 installed Indian minis, about one-third have a "Made in India" label. Given the country's high level of competence in computer theory—coupled with its experience as a low-cost "offshore" electronics as-

sembler—the step to local manufacturing seemed to be a natural one. The step is expected to soon provide a cost effective computer industry big enough to meet the country's relatively modest demands.

India does not plan to manufacture big computers. But—to anguished warning outcries from several Australian delegates—Indian spokesmen announced that they were ready to take the plunge and begin to manufacture their own components, including LSI chips.

The main thrust of the Indian government's computer policy is creation of data processing supercenters linked by message concentrators and switching devices to distributed networks of minis. The first of three projected supercenters was opened last year in Bombay with an assist from the U.N.

India's national computer centers will also serve as focal points for technology and management training. Another hoped-for by product of the centers is an internationally competitive software industry.

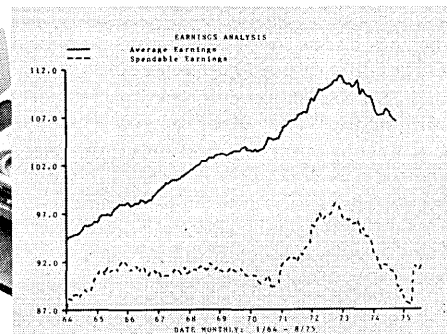

To advocates of an Indian software industry, everything seems to add up perfectly. Software development is not capital-intensive. The rapidly growing software-to-hardware ratio in modern systems, together with the rising cost of software skills, have created an inter-

# ULTRAPLOT... something to talk about

You may be familiar with the AJ 832, our very popular "daisy" keyboard printer terminal. Something you may not know about the 832 is a great option available for those who need a plotting function. We call it *Ultraplot*. Ultraplot allows the AJ 832 to act as an X-Y plotter for charts, graphs, and diagrams—printing in increments of 1/60-inch (horizontal) and 1/48-inch (vertical). *And it does it twice as fast as before.*

But there's still more. When you order the AJ 832 with Ultraplot you'll get AJ's Cal-Comp compatible FORTRAN software and a programming manual *at no additional charge*. Timesharing systems and in-house systems nationwide already have the software up and running.

If you'd like to know more, talk to us about **ULTRAPLOT**.

# MMS GENERAL LEDGER quickly builds a solid financial reporting foundation.

Financial reporting systems from Software International are the most popular data base-oriented systems in the world. More than 1,000 leading corporations all over the globe have installed MMS systems.

Because it is designed from the ground up as a data base system, the MMS GENERAL LEDGER is at home in DOS, O/S, IMS, IDMS, DL/1 and even TOTAL. It is the perfect foundation for any of the other powerful financial reporting systems from Software International.

When you build your data base financial management system with the MMS GENERAL LEDGER, you get a rock-solid foundation, including basic and advanced education, thorough and tested documentation, and the experience of the Number One financial applications software company. Get the MMS GENERAL LEDGER and companion systems . . . only from Software International.

#### ACCOUNTS PAYABLE

MMS Accounts Payable provides corporate management with positive and timely control over cash disbursements, plus complete control and reporting of vendor payments, discounts and cash commitments.

#### ACCOUNTS RECEIVABLE

MMS Accounts Receivable utilizes advanced file handling techniques, allowing user departments maximum control and flexibility in processing cash payments and controlling outstanding receivables.

#### Q-PAC PAYROLL/PERSONNEL, LABOR COSTING SYSTEM

The Q-PAC payroll/personnel, labor costing system uses advanced parameter concepts, enabling accounting, payroll and personnel departments to define and customize a system for each of their multiple payrolls.

#### FILETAB

For more than 400 users, FILETAB is a fast, simplified data processing system used for the selection and printing of data from computer files and for the maintenance of those files. FILETAB can be used either as a complementary or alternative system to conventional programming methods.

#### PRODUCTION AND INVENTORY CONTROL SYSTEM -MRP

Providing significant improvements in day-to-day direction of material planning, the NET CHANGE System gives greater control of inventory costs and production schedules.

## SOUTHEAST ASIA

national software market. And, as one speaker put it, there is no software knowledge gap in India.

Along with other developing countries, India is keenly interested in reversing the "brain drain" of its best talent to jobs with American and European manufacturers. Thai, Indian, and Israeli speakers agreed on the need for professionally challenging situations to keep local talent at home. But not at home all the time: national isolation and technology inbreeding were also blamed for contributing to the brain drain.

### Not a "cable in the sky"

If SEARCC 76 delegates got the impression that modern computer technology has created anything that can

---

If anything can serve as a national equalizer, it is data communications.

---

serve as an international equalizer, it is data communications.

Less than a month before the conference opened, the world's latest satellite communications system had become operational in Indonesia. It's a 40-station regional system, and it ap-

pears to be a textbook case of leaping over decades of hassling with telephone networks, undersea cables, and endless contention between voice and data communications priorities.

The Univ. of Hawaii's professor N. Abramson, reviewing the evolution of satellite communications, charted a dramatic decline of installation costs.

Total per-circuit lifetime costs, he told delegates, went from \$22,800 in 1965 to \$600 in 1975, and is on its way down to \$250 by 1979. The numbers include costs for building, launching, and insuring the satellites. At the same time, the cost of earth stations is dropping, too. Intelsat's 30-meter stations cost \$3,000,000 each in 1965. This year, RCA's five-meter Alaskanet stations cost \$37,000.

Abramson ticked off a list of planned future systems—including three by Japan, plus Arabian, Latin American, Indian, European, and more U.S. systems, and one for communicating with airplanes.

But Abramson expects the satellite game to get a brand new set of rules in 1979 with the launching of the Satellite Business System (SBS) satellite. The system will probably be able to communicate with tens of thousands of rooftop and other small earth stations in worldwide networks of the 1980s.

Each of these stations can be viewed as

a new kind of peripheral device.

It was pointed out that the SBS system—a joint project of IBM, Comsat, and Aetna Life—will be especially appropriate for developing countries, where tall buildings tend to be high-density centers of technology and business activity.

However, Abramson said, the communications revolution will not begin in earnest until users stop thinking of satellites as point-to-point "cables in the sky." Think "packet broadcasting," he advised, and take full advantage of the fact that messages are received simultaneously by all points in the system.

Properly designed modular systems involve moderate startup costs. And they offer another important political advantage: no country has the power to deny use of the system to other countries in the region.

### The "first" won't be the last

Finally, Robert Iau, president of the Singapore Computer Society, gaveled into history the first regional computer conference ever sponsored by IFIPs with the words: "There definitely will be a SEARCC 78."

—Bill Orr

Mr. Orr is the principal of his own firm, which is located in Santa Monica, California, and provides marketing communications services to firms doing business in Southeast Asia.

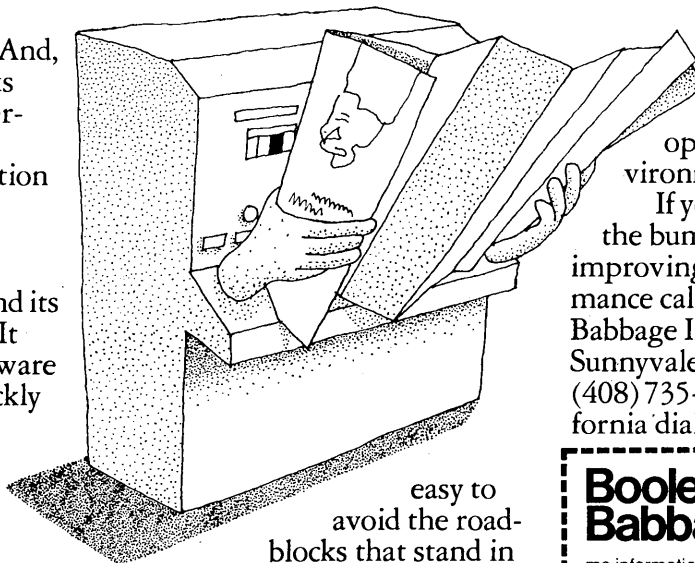

## CUE/DSO, a better roadmap to improved system performance.

There are a lot of ways to get around in your system. And, there are a lot of roadblocks along the way that slow performance.

CUE/DSO (Configuration Usage Evaluator/Data Set Optimizer) is like an overgrown roadmap that lets you see how your system and its resources are performing. It isolates hardware and software bottlenecks so you can quickly and easily improve system throughput.

CUE/DSO measures and plots CPU, channels, devices, SVCs, queues, head movements, VS paging and lots more. It gives you specific information on disk volumes, data set organizations and head movements between data sets.

With all this information it's

easy to avoid the roadblocks that stand in the way of increasing your system's performance. It also helps you establish a solid base of utilization so you can accurately project when you'll need new equipment and gives you the

documentation you need to justify the expense.

And, CUE/DSO operates in the OS/VS environment.

If you want to avoid some of the bumps along the road to improving your system's performance call or write Boole & Babbage Inc., 850 Stewart Drive, Sunnyvale, California 94086, (408) 735-9550. Outside California dial toll free 800-538-1872.

**Boole & Babbage**

I drive my system at a pretty high speed and need to know how to improve performance faster. Send me information on the CUE/DSO roadmap.

# How to choose a comprehensive DBMS

To be truly comprehensive, a DBMS must satisfy the needs of both data processing and management staffs. It must permit programming analysts to develop systems using conventional programming languages like Cobol or a nonprocedural English-like language. It must also permit management staff to tap corporate data bases without putting unnecessary pressure on the DP department.

RAMIS satisfies both requirements.

RAMIS is easy to use. It is simple and logical. There are no cryptic notations or rigid conventions. This makes RAMIS an ideal choice for non-computer specialists.

RAMIS is complete. At its core is an automatic and comprehensive DBMS. From its major subsystems, the DP professional can tailor a comprehensive information system to fit the company's needs.

RAMIS subsystems include:

- *RAMIS Data Base*. Easy to access. It appears to the user as a single hierarchical file, even when the physical data is contained in many different files or data bases.
- *RAMIS Data Base Access*. Sophisticated queuing algorithms permit both complete data independence and efficient utilization of computer resources.
- *RAMIS Data Base Interface*. Permits access to the RAMIS data base from procedural programming languages like Cobol, Fortran and PL/I.
- *RAMIS Report Writer*. Allows the use of ordinary

English-language statements to retrieve, sort, calculate and format data into either tabular or graphic reports.

- *RAMIS Records Management*. Allows the user to validate, process and log transaction data.
- *RAMIS Executive*. Permits the development of

complete data processing systems by allowing the user to catalog, interconnect and control the sequence of RAMIS procedures.

- *RAMIS External File Access*. Permits the RAMIS Report Writer to access non-RAMIS data bases.

So when you're looking for a comprehensive DBMS, only one system should come to mind—RAMIS. We can tell you more about RAMIS. Use the coupon below or contact Mark Berkowitz, Vice President, U.S. Operations, at (609) 799-2600.

# INTRODUCING THE OEM EXPRESS.™

*A complete, integrated system for business.* Express™ is a complete, integrated business computer system with extensive peripheral support. It's got an incredibly comprehensive set of software, built around a multiprogramming virtual memory operating system. It's flexible, expandable and gives you full upward and downward software compatibility from one Express configuration to another.

*More power for less money.* Express has the best price/performance ratio on the market. Microdata's user microprogramming lets you tailor our system to create the most powerful minicomputer in the world for your application. And comprehensive multiprogramming capabilities enable each of 32 independent users to use the system for his own individual needs.

*Express speaks your language.* You can program in COBOL, FORTRAN IV, scientific BASIC and EPL. EPL stands for Express Programming Language and is based on PL/1. It gives you complete control of Express system resources. EPL is so efficient and so easy to use it can cut pro-

That's the quantity-100 list price of Express I (printer not included). This system is designed for low cost entry and applications requiring up to 8 terminals. Express II, with a quantity-100 list price of \$20,737.50, provides maximum capability and expandability.

gramming costs drastically all by itself.

*Save the old and protect the new.* Extensive high-level language capability and user microprogramming let you get into a new Express system without throwing away old software. And because micro-

programming can make your system hardware totally unique, your new software will run only on your system. Proprietary software doesn't get any safer than that.

*Express is the way to go.* With Express, you can develop a whole line of minicomputer systems for a variety of applications. You can offer low cost. Stack architecture implemented in firmware. Fast I/O throughput. And a list of other features that reads like an OEM wish-list.

*There's only one way to get there.* Contact Microdata for the complete Express story. Microdata Corporation, 17481 Red Hill Avenue, Irvine, CA 92714, P.O. Box 19501, Irvine, CA 92713. Tel.: 714/540-6730. TWX: 910-595-1764.

# For improved project control GET THE PICTURE...

## automatically with **E·Z·PERT**<sup>®</sup>

Never before has project visibility been so readily and effectively available. Our exclusive EZPERT Project Graphics System puts time scaled networks, Gantt barcharts and cost/manpower graphs in your hands...automatically.

Almost as fast as your computer churns out information, EZPERT—with a little help from a plotter—can turn those words and numbers into the meaningful graphics you need for effective project planning, scheduling, monitoring and control.

No more wading through stacks of tabular data...no more waiting for a draftsman to tediously and expensively turn that information into precious graphics...EZPERT bridges the gap from tabular reports to dependable project graphics. And most important, it gives you updated graphic reports when you need them! It saves you time, money and truly improves your project control.

The EZPERT customer list reads like "who's who" across a wide range of industrial categories and government organizations. Applications are almost unlimited...product development, R & D, facilities planning and construction, systems development, corporate planning...and on and on. So if you're bogged down with words and numbers maybe you should "get the picture" too.

# Join the great computer roundup

1977 National Computer Conference — June 13-16, Dallas

There's a world of data processing information waiting for you at the 1977 National Computer Conference — a Texas-sized roundup and the first NCC ever held in the dynamic Southwest. More than 100 sessions will explore the technology of computing, management issues, the uses of computing, and the individual in the computer age. The exhibit program promises to be the largest ever with more than 250 organizations occupying over 1,000 booths.

All this and more . . . all in the spacious Dallas Convention Center in the heart of the business and cultural hub for the Southwest, only two-to-three hours' air travel time from any of the nation's major computer centers. Included will be a

number of innovative "firsts" — a national programming contest, a two-day program on personal computing, a Personal Computing Fair, plus special exhibits of products geared to the computer hobbyist.

Other highlights will include: professional development seminars; special program areas on such topics as energy, petrochemicals, retail sales, health care, and career development; plus more than 5,000 exhibitor representatives on hand to discuss your data processing needs.

The '77 NCC brings it all together at

the year's largest roundup for computer specialists and data processing users. To assist you in your planning, the NCC offers the *Everything Card* providing advance full-conference registrants with savings and other benefits; a deluxe red-

carpet travel service; and a complimentary subscription to NCC Roundup—a fact-filled newsletter covering all NCC activities and events.

## '77 NCC,

# ECONOMY

# PACK

Before you buy a PDP 11/05,  
11/34 or 11/45,  
or an Eclipse\* or Nova\* system...

Check the new Interdata Pack/16 and Pack/32 Packaged Systems. They're easier to use and cost less.

Pack/16 includes a 16-bit Model 6/16 CPU with 64KB memory. Pack/32 has a 32-bit Model 7/32 with 128KB memory.

**Easier to use.** We install each Pack as a totally integrated hardware and software system. It's ready to run immediately. Each system includes a CPU with 10MB disc, 400 CPM card reader, 200 LPM line printer and Carousel 30 terminal. Plus complete software based on the Interdata multi-tasking operating system and extended FORTRAN.

**Cost less.** Judge for yourself: Pack/16 costs \$33,500. Pack/32 costs \$43,500. Prices include installation and 90-day full service warranty. And, we deliver in 30 days.

Write. Or call our toll-free number: (800) 821-7700 Ext. 331. In Missouri, call (800) 892-7655 Ext. 331.

# User Ratings of Software Packages

by Herbert L. Gepner

---

Here's how the users feel about 250 popular software products.

---

There are now several thousand separately priced software packages on the market. Packages are available to handle almost every conceivable computer function, at prices ranging from less than \$50 to more than \$100,000. Some of these packages can probably save you many times their cost, while others will only waste your time and money. Some widely advertised packages have hundreds of satisfied users, while others have none.

Data processing executives are increasingly recognizing the many potential benefits of proprietary software packages, and it's easy to understand why. The costs of in-house programming efforts are climbing beyond all reasonable bounds, and it's difficult to recruit and retain enough competent programmers and analysts.

What's more, dp managers are becoming increasingly aware that there's real money to be saved by using "mass-produced" software wherever practical—and reserving the talents of their in-house programming staffs to concentrate upon the more specialized projects that involve unique requirements or particularly high returns.

Due to the "unbundling" moves by most of the computer makers, much of the manufacturer-supplier software that once was "free" is now offered at significant additional costs. As a result, computer users now have far more incentive to "shop around" for the best values for their software dollars.

Before putting his money on the line for a software package, a buyer deserves to know—and should demand to know—how well the product is performing in other user installations. In an effort to make this kind of information conveniently available to software

purchasers, DATAMATION and Datapro Research Corporation have just completed their second annual joint survey of software package users.

Ratings of one or more software packages were supplied by just over 2,500 installations responding to a questionnaire mailing. A total of 3,659 individual package ratings were actually collected during the project, but not all of them were used. (If fewer than three installations reported on a product, we did not feel confident enough of the results to report them.) There were fully 250 packages rated by three or more sites, and each of those is reported on in the following pages.

Many more installations returned questionnaires than returned package ratings, which is quite logical since not all sites have acquired software products. Actually, the split between the "haves" and the "have nots" was almost exactly equal, with 50.7% of the sites (2,635) reporting that they had acquired software or budgeted for software acquisitions.

Those which did report proved that the software package industry is big business. The average amount spent by these installations on software in 1975 was calculated to be \$14,561. The projected spending for 1976 averaged \$18,285. And 1977 budgets averaged \$22,393. Thus the average amount grew more than 25% from 1975 to 1976, and will go up more than 22% for next year. From this, it's clear that the proprietary software industry is a

healthy one and that its products are finding steadily increasing user acceptance.

## How they were rated

The users were asked to rate the software packages they were using as "excellent," "good," "fair," or "poor" in each of seven subjective categories: Overall Satisfaction, Throughput/Efficiency, Ease of Installation, Ease of Use, Documentation, Vendor Technical Support, and Training (if applicable).

We then converted the collective user ratings for each package into a weighted average rating for each category. In a straightforward manner similar to most college grading systems, each user rating of "excellent" was weighted as 4, "good" as 3, "fair" as 2, and "poor" as 1. Then the weighted average was calculated by dividing the sum of the products by the total number of user responses in each rating category.

It seems reasonable to assume that people who decide to acquire a software package will tend to be biased in its favor. To help offset this effect, we gave equal weight to ratings submitted by prospective users who reported that they *rejected* a package after thoroughly testing it. Also, since the reliability of a consensus of user opinions tends to improve as the number of participating users increases, we've included the number of users who actually rated each package in the presentation of the results.

Thus, by reading the listings that follow, the prospective software buyer can determine, with a considerable degree of confidence, the principal strengths and weaknesses of 250 popu-

Detailed results of the survey described in this article are contained in "User Ratings of Proprietary Software," a DATAPRO 70 report available for \$12 from Datapro Research Corporation, 1805 Underwood Boulevard, Delran, New Jersey 08075; (609) 764-0100.

THE 1976 SOFTWARE HONOR ROLL

This year no fewer than 38 packages from 27 vendors qualified for the Software Honor Roll, a 52% increase over the 25 packages that qualified in 1975. Since the total number of user ratings received this year was slightly smaller than in the 1975 survey and the overall level of user satisfaction was about the same, the only reasonable conclusion seems to be that the number of truly high-quality software packages in widespread use has increased dramatically during the past year. Clearly, this is good news for prospective software buyers.

Special recognition should go to the nine vendors that placed two or more packages on the 1976 Software Honor Roll. Software Design Inc. is the proud supplier of three of the Honor Roll packages: EPAT, GRASP, and FMAINT (now incorporated into a new package called FLEET). DNA Systems, Inc. also placed three packages on the Honor Roll: CYTOS, 1130/FORTRAN, and 1130/SORT. Companies with two packages on the list include Applied Data Research, Dylakor Software Systems, IBM, Oxford Software, Pansophic Systems, Universal Software, and Westinghouse Electric.

The makeup of the 1976 Software Honor Roll deserves a few comments. Nineteen of the 25 packages on last year's Honor Roll earned the same distinction again this year, and four of the 1976 Honor Roll packages (CYTOS, DIOPEN, DISKPLAY, and FMAINT) were Honorable Mention packages last year. The 1976 Honor Roll is again dominated by "system" packages (as distinguished from packages for specific applications), with 33 of the 38 packages falling into the systems category. And, as in 1975, most of the Honor Roll packages are relatively simple products with straightforward functions.

There has, however, been a significant breakthrough in the composition of the 1976 Honor Roll. Last year, despite the strong industry emphasis on data base management systems, not a single DBMS was able to satisfy the Honor Roll criteria (although several came very close). This year, things are different. Three data base management systems—Cincom's TOTAL, Cullinane's IDMS, and Hewlett-Packard's IMAGE—all earned places on the Honor Roll, and Burroughs' DMS-II achieved Honorable Mention. Thus, it appears that user satisfaction with data base management systems is increasing, and that it is entirely reasonable to judge these complex products by the same standards as the simpler packages. \*

## SOFTWARE RATINGS

lar software packages as judged by their users. What's more, in the many cases where two or more products from a given vendor are rated here, the prospective customer can learn quite a bit about the vendor, too.

In an effort to determine whether user satisfaction with proprietary software is increasing or decreasing, we compared the overall weighted average user ratings earned by all the packages rated in this year's survey with the same figures from last year's survey. Here are the results:

Category	1975	1976	Difference
Overall Satisfaction	3.3	3.3	0
Throughput/ Efficiency	3.1	3.1	0
Ease of Installation	3.1	3.1	0
Ease of Use	3.2	3.2	0
Documentation	3.0	2.9	-0.1
Vendor Technical Support	2.9	2.9	0
Training	2.8	2.8	0

As you can see, there was remarkably little change in the user consensus. The slight downward drift in the Documentation rating is probably too small to be of any real significance. As in 1975, Software users exhibit a fairly high level of Overall Satisfaction with the products they are using, but tend to be somewhat critical of the associated Training, Vendor Technical Support, and Documentation.

### Modifications and pricing

When shopping for a software package, one of the most important questions is whether the package will need to be modified to satisfy the user's specific requirements. About 19% of the packages reported on had to be modified by the vendor; 22% were modified by the user; 63% required no modification. In many cases both the vendor and the user made modifications, which explains why the percentage figures total more than 100%. As expected, modifications were far more frequently required for applications software than for systems software.

Of course, a second very important consideration is price. The pricing information was added to the package ratings by DATAMATION's staff after many ear-flattening hours on the phone with vendor representatives. Most software firms cooperated fully with us. Where they were not able to give purchase prices, such as when the price differed depending on the version acquired, suppliers provided price ranges. For those software producers who, by some stroke of circumstance or planning, were never able to provide answers or return our repeated calls, we have annotated the software ratings in our own way.

If you're shopping for a particular

type of software package, you can maximize the value of the information in this article by grouping the user ratings of all the relevant packages into a "sublist" that facilitates direct comparisons. As an example of this straightforward comparison technique, we've listed the ratings of all the popular data base management systems in

the smaller sample sizes meant that we could not be quite as confident about the superiority of these products.

While it can be very helpful to know what current users think about the strengths and weaknesses of a software package, the key question is always how well the package can satisfy your own particular requirements. In this

\*All weighted averages are based on a scale of 4.0 for Excellent.  
Table 1.

Table 1. In addition to the three DBMS products that made the Honor Roll (IDMS, IMAGE, and TOTAL), you can see that several others were highly regarded in one or more of the rating categories and might well be even more suitable for use in certain installations. Computer Information Management's Datacom DB, for example, received the highest user rating of any DBMS in the important Throughput/Efficiency category but failed to satisfy the Honor Roll criteria primarily because of a subpar rating in Documentation. Conversely, IBM's GIS, DL/1, and IMS were the three DBMS products rated lowest in Overall Satisfaction by their users.

### The honor roll

As in last year's survey, the packages that received outstandingly high ratings from their users were accorded special recognition. To earn a place on the "1976 Software Honor Roll," a package had to be rated by *at least six users* and satisfy the following somewhat arbitrary but useful criteria: 1) a weighted average rating of at least 3.5 in Overall Satisfaction, and 2) a weighted average rating of at least 2.8 in every other rating category except Training (which was excluded because formal user training is neither offered nor required for many of the simpler packages).

"Honorable Mention" status was awarded to packages that met the Honor Roll rating criteria but were rated by *only three to five users*, since

article, you'll find three tools to help you answer that question. First, the ratings should aid you in pinpointing the packages that are meeting the test of user satisfaction. Second, the Reader Service number listed for each package will bring you more information from its vendor. Third, the Vendor Index which follows the package listings will make it easy for you to go directly to the source. We hope you'll use all three tools, and that they'll help you to get a better return on your software expenditures. \*

Mr. Gepner is software editor of DATAPRO 70 and managing editor of Datapro Directory of Software at Datapro Research Corporation, Delran, New Jersey. He was previously manager of real-memory software support for the Marketing Division of RCA Computer Systems, and he worked in the IBM Software Product Testing Lab in Poughkeepsie, New York.

# Users' Ratings of Software Packages

The list that follows summarizes the survey results on 250 proprietary software packages rated by three or more users. The rating in each category is expressed in terms of the Weighted Average calculated on a scale of 4 for "excellent," 3 for "good," 2 for "fair," and 1 for "poor."

Honor Roll and Honorable Mention packages are highlighted in color.

# EXPORT & IMPORT

# CABLE & WIRELESS

Exporting. Importing. These things are the lifeblood of worldwide trade. And basic to this question of exports and imports is communication – communication, which, throughout the world, is the business of Cable & Wireless. In the Caribbean, the Middle East and the Far East, communication depends very much on Cable & Wireless. When a man there sends an urgent telex ... or watches a TV programme bounced from a satellite in space ... or rings across the world to say "I'll be home tomorrow"... he's a customer of Cable & Wireless. We devise specialised systems to link people nationally or internationally.

Cable & Wireless is part of everyone's life.

**CABLE &  
WIRELESS**

Keeps you in touch with the world.

**The Teletype® model 40 OEM printer.  
When you look at it from price and performance,  
you'll find it difficult to look at anything else.**

The fact of the matter is simply this:  
We don't think any other printer can even come close to the model 40.

And that's no idle boast. Not when you consider the facts.

Consider: Where else can you get a 132-column, heavy-duty impact printer that delivers over 300 lines per minute for less than \$2000, or an 80-column printer for under \$1400?

The big reason behind the model 40's price/performance advantage is our unique design.

Even though it operates at speeds of more than 300 lpm, wear and tear is less than you'd find in a conventional printer operating at considerably slower speed. Fewer moving parts and solid-state components add up to greater reliability and reduced maintenance.

Here's something else to consider: Where else can you get a printer that delivers the kind of flexibility and reliability the model 40 offers?

For complete information, please contact our Sales Headquarters at: 5555 Touhy Ave., Skokie, Ill. 60076. Or call Terminal Central at: (312) 982-2000.

**The Teletype model 40 OEM printer.  
Nothing even comes close.**

Teletype is a trademark and service mark registered in the United States Patent and Trademark Office.

**Introducing  
The compact 1  
from number 1:**

# **The minifloppy™ from Shugart**

Give your system the performance of a floppy at a cassette price. Gain the random accessibility, mechanical reliability and data integrity of a flexible disk in a more affordable size.

Go minifloppy.

This little half-pint is half the size, half the cost of a standard floppy but Shugart packs a lot of proven technology into that itty-bitty box (3.25" x 5.75" x 8.0").

The same proprietary glass bonded ferrite/ceramic read/write head and recording technology used in 40,000 standard-sized Shugart floppy drives give the SA400 minifloppy dependable data integrity— $1/10^8$  soft errors,  $1/10^{11}$  hard errors. You'll be hard pressed to find that integrity in any cassette.

You won't get 110 K byte storage capacity at 125 K bit/second data transfer rates either.

Special minifloppy drive features include direct drive stepping motor actuator, DC servo-controlled spindle drive, and less power dissipation than any standard floppy.

The minidiskette media is just like the standard flexible disk, only smaller. Available in hard or soft sectored formats from several media sources, it shares the same oxide formulation, technology and technique of manufacture.

Protective jacket is just 5.25" square.

The Shugart minifloppy drive keeps data safe, too. Positive media interlock prevents minidiskette damage.

Our standard write protect circuitry prevents loss of recorded information.

Low power consumption of only 15 watts in continuous duty and 7.5 watts in standby produces low heat and eliminates noisy fans.

Whether you build word processing equipment or an entry level microprocessor system, an intelligent calculator or a hobby computer, the Shugart minifloppy drive can help you bridge the price/performance gap between cassette and standard flexible disk.

The gap is gone.

So put the minifloppy drive to work in your system before your competitor does. Write, call or run to Shugart for complete OEM information.

***The leader in low-cost disk storage.***

# PERFORM

## COBOL with ISAM

If you've got the business application, Interdata's got the COBOL. Right now. In stock. Field proven.

We've packaged our ANSI X3.23—1974 COBOL/32 with ISAM—an enhanced file management system which works with COBOL for a wide range of commercial data base applications.

The rich array of ISAM (Indexed Sequential Access Method) utilities provide for the allocation and dedication of up to 32 contiguous files on each of 32 different disc volumes. COBOL acts as the data description and manipulation language. And maximizes transportability while providing interprogram communication with FORTRAN, CAL assembler and other COBOL programs.

Interdata COBOL/32 with ISAM has been working for more than a year at a variety of sites. Such as one of the largest banks in the U.S. A major retail chain. A large hospital group.

For your business application needs, run our COBOL/32 with ISAM. Write or call for documentation...or immediate delivery. Our toll-free number is: (800) 821-7700 Ext. 331. In Missouri, call (800) 892-7655 Ext. 331.

**INTERDATA®**

Interdata, Inc.  
Subsidiary of PERKIN-ELMER.

# When you see what we offer in management information systems, you'll make The Intelligent Choice.

Your company's data processing requirements are as unique as your company's trademark. You need an information system designed exclusively for you—not for the other firm. This means a wide range of high performance products to select from, a knowledgeable staff of representatives to make the ideal recommendations. There must be value, versatility, and the finest service. That means Mohawk Data Sciences. In data entry and data communication equipment, we help you make the Intelligent Choice.

Every MDS product is designed to be the best of its kind. Our equipment is engineered to maximize support capabilities (and manpower capabilities) while minimizing mainframe work load. The MDS Intelligent System, a

prime force in distributed data processing, makes available bold new methods for the prompt, accurate interaction of information. As a result of years of technological research, MDS offers an unparalleled scope of data systems to major corporations around the world.

Post-installation service must be a consideration of any company evaluating new equipment. MDS is synonymous with the highest standards of product service. Our 4000 plus associates worldwide insure that the highest caliber of performance is built into our equipment—the performance you can depend on in your offices.

Solid business solutions can emerge only from facts. Hard-hitting, solution-oriented facts—precisely what you'll receive from your local MDS office. Call or write us soon. We make the Intelligent Choice an easy one.

## Mohawk <sup>MS</sup> Data Sciences The Intelligent Choice.

MDS System 2300. The System 2300 is an intelligent terminal offering computer-compatible data capture, simultaneous with Document Processing at the source. The 2300 is also capable of RJE Communications. CIRCLE 27 ON READER CARD

# Congratulations: you didn't have a computer fire again last year.

You're one of the lucky ones.

Unfortunately too many companies last year did suffer major business interruptions due to fires in or near their computer rooms.

What's even more unfortunate is the fact that a lot of the damage, clean-up and downtime could have been avoided.

## Days of Downtime vs. a Few Seconds of Halon

These companies could have been protected by a high speed Fenwal Halon Fire Suppression System.

The system that snuffs out fires dry. Just seconds after they start.

*And lets you get right back to work. No wet mess to clean up.*

With some systems you've got to evacuate a room before the extinguishing agent can go to work.

But because Halon 1301 is harmless to people, it can start snuffing out the flames immediately. Which gives you the fastest jump on the fire.

With ordinary systems there's usually at least 48

hours of clean-up before your computer can go back on line.

With a Fenwal system there's virtually no clean-up, no shorted-out wires. No electrical shock hazards. No damage to tapes or records.

Fenwal's unique, modular system permits rapid agent discharge and easy extension of existing systems.

## Why Push Your Luck?

The consequences of a computer fire are a lot more devastating than you might think. Despite all the precautions you take.

At Fenwal we've got documented proof that our Halon Fire Suppression Systems are *the* solution to the damage and downtime of computer room fires.

It's proof you can see for yourself. In a film called "The Fireaters".

We think it will convince you that you need more than luck to keep your computer in business.

To arrange a viewing, call us at (617) 881-2000. Or write to Fenwal Incorporated, Ashland, MA 01721. A Division of Walter Kidde & Co., Inc. Our local, service-oriented distributors

are listed in the yellow pages under "Fire Protection".

# FENWAL

Nobody in the world has more experience in fire and explosion suppression systems.

# The Four-Phase OEM Business Plan

## Clustered Display Systems, ANSI COBOL, and a Marketing Partner Nationwide.

**The OEM Question.** You've got a great program for wholesale distribution, patient care, inventory control, truck routing or some other display-oriented application. You've decided to market it as a turnkey package. Whose hardware do you choose?

**General Answers.** As you'll be selling into business/commercial markets, you'll need an OEM partner with ANSI COBOL and system software designed for the business/commercial user. And, to help turn potential customers into actual customers, you'll need an advanced hardware package... display-oriented, transaction-based and designed for cluster configuration. Finally, unless you're handy with a soldering iron, you want an OEM supplier with a nationwide field engineering force to install the systems you sell, as well as to provide local maintenance support to your customers.

**Specific Answers.** Four-Phase Systems is one of the pioneers (and largest suppliers) of display-oriented transaction processing systems for business and commercial applications. Our unique window into memory architecture puts new data on the screen instantly

with no I/O overhead. And we've installed over 30,000 video displays on our systems. Three hundred field engineers support these installations from more than 100 Four-Phase maintenance offices nationwide.

**The OEM Partnership.** We view an OEM relationship as more of a partnership than a buyer/vendor arrangement. You agree to make our hardware a part of your system. We agree to lease you a development system on favorable terms... and provide customer demonstration time on our branch office systems in 30 cities... plus supply all our system software at no charge.

If you've explored OEM relationships with other hardware vendors, the foregoing

has to sound like a candidate's pre-election speech. But at Four-Phase, we really do commit substantial resources to helping our OEM partners achieve increased sales. Why? Because the more our OEM partners sell, the more we sell. It's as simple as that.

**All The Answers.** Write, phone or return the coupon for your copy of the Four-Phase OEM Business Plan. We'll mail a copy posthaste and contact you from the nearest Four-Phase sales office in a few days.

## Now small users can have the big benefits of in-house computer output microfilm.

### AutoCOM

You probably thought it took a huge volume to justify your own in-house computer output microfilm system. Well, it did. Until DatagraphiX introduced AutoCOM, the fully automated computer information management system designed expressly for the volume—and budgets—of smaller users.

Set up and ready to go in one day, AutoCOM hardware can be used by just about anyone. And it's compatible with data tapes from virtually any computer.

The self-contained recorder and film processor converts tapes into cut, dry microfiche at the touch of a button. The companion AutoFICHE Duplicator copies the masters at the rate of up

to 450 per hour. And you get the superb reproduction and reliability that's made DatagraphiX the leading name in COM for three decades.

So if you're going outside for microfiche, compare the big benefits of an in-house AutoCOM system. It's quick, confidential and convenient. And if you're not yet using COM, the outstanding price/performance ratio of AutoCOM means it can pay for itself in what you'll save on paper, time and storage.

Use the coupon to get all the details. You don't have to be a big user to get the big benefits of your own in-house AutoCOM.

# For Shulman Transport, a data system that delivers:

## INCOTERM<sup>®</sup>

More than half a million pounds of freight are moved by Shulman Transport Enterprises on an average day ... by road, sea and air ... throughout the world. Approaching \$100,000,000 in annual revenues, Shulman is one of the fastest growing companies in the freight forwarding business.

The part of the business that grows the fastest of all is the labor-intensive paperwork needed to move freight.

To meet that challenge, Shulman designed an advanced, transportation-oriented computer facility for corporate headquarters in Cherry Hill, N.J.

*But how could they put that computer power to work on the front lines? Where the action is ... on the street ... with the driver making freight deliveries?*

Shulman turned to INCOTERM.

To capture data where the paperwork originates. To cut down the pieces of paper needed. Keep track. Improve service. Get the waybill to the terminal before the freight rolls in.

Shulman's INCOTERM system combines on-line administrative communication and on-line transmission of waybill data. The mainframe computer at Cherry Hill dispatches error free waybills to destination points. At the same time, it picks off needed information for invoicing the customer, and a variety of other management and customer service functions.

If you'd like to know more about how INCOTERM delivers for Shulman — and can help you as well — please call or write.

More power  
to your  
terminal.

**INCOTERM<sup>®</sup>**  
CORPORATION

65 Walnut Street, Wellesley Hills, Massachusetts 02181 Telephone: (617) 237-2100  
Sales and customer service offices in major cities throughout the United States and abroad.

**“Our new NCR Criterion went in without a ripple. No conversion. No parallel operation. It was just load and go.”**

*Jerry Lindee, Director of Information Systems  
Dart International, Los Angeles, California*

The prospect of a difficult conversion can lock you into a system long after you really need better performance. Unless you have an NCR system.

Dart International, specializing in warehousing, consolidation, transportation and leasing, operates realtime 24 hours a day, five days a week. One day the NCR Century went out and the NCR Criterion went in. Five months later, the Criterion is still operating with up to 22 percent more thru-put and a record of 99.95 percent uptime. Quite an accomplishment for the first installation of a new generation.

NCR offers compatibility, not only from model to model, but from generation to generation, from NCR Century to NCR Criterion. NCR designs with your interests in mind.

To find out what the Criterion can do for you, phone your local NCR office. Or write to EDP Systems, NCR Corporation, Box 606, Dayton, Ohio 45401.

## **DECSYSTEM-20.** **It took a minicomputer company** **to offer hardware this economical.**

Not just anybody could have come out with a DECSYSTEM-20.

Because the DECSYSTEM-20 is the world's first general purpose computer to bridge the gap between big-system power and small-system price.

And that means the company that came up with it had to have a lot of experience in both big and small computers. And there is only one company that does.

Digital Equipment Corporation.

To create a DECSYSTEM-20, we took the same approach to computing that's made us the number one company in minicomputers.

That approach says that a com-

puter must first of all be affordable—giving you the most popular computer for the least amount of money.

With the DECSYSTEM-20, this approach meant giving you big system capability at a total system cost of under \$10,000 a month.

Our approach to minicomputers also said that a computer must be approachable. Meaning easy to install. Easy to use. And small in size.

With the DECSYSTEM-20, this approach meant giving you a full-scale general purpose system that installs like a dedicated mini. A sophisticated machine that

needs no operating staff and can be run interactively by just about anyone. All in a package that takes up about a fraction of the space required by other machines of similar performance.

But, to create a DECSYSTEM-20, we also took the same approach to computing that's made us the leader in large-scale interactive systems for the last eleven years.

That approach says a computer should offer you the kind of powerful software that will give you not simply everything you expect in a big system, but everything you need.

With the DECSYSTEM-20 this

# DECSYSTEM-20.

## It took a large-scale computer company to offer software this powerful.

approach meant giving you a system with: Powerful, reliable multi-stream batch. Interactive capability to run up to 64 concurrent jobs. Complete higher-level languages including FORTRAN, COBOL, APL, BASIC PLUS, ALGOL, IQL, and CPL. A true demand paged operating system with large user address space for fast throughput. Six megabytes I/O bandwidth. Six megawords per second. ECL logic. A Data Base Management System. A Business Instruction Set. High system availability. Ease of conversion. Its own front-end mini for diagnostics and to run the peripherals.

Up to 1.2 million bytes of core memory. And up to 1.4 billion bytes of high-speed, on-line disc storage.

All of which is how the DECSYSTEM-20 combines the best of the big systems with the best of the small.

DECSYSTEM-20.  
It had to be Digital's.

DS

# There's a very thin line between making it or breaking it.

## That's important to remember with high-density drives.

The advantages to 6250 CPI recording — like higher data transfer rates and a reduction in library size requirements — are numerous.

But there are also some disadvantages. One of them is the masking by the GCR format. Because of it the only way to get an accurate error listing is through sense byte interrogation. Ask your Graham product technology man why.

Because of unnoticed errors serious degradation in read/write reliability can occur. This is compounded by debris from bargain-priced computer tapes, which don't have the modulus of toughness and durability of Epoch 4.

Get certified error-free Epoch 4. It makes all the difference. Now — and for the future.

**DATAMATION**

We're a lot more than our name implies.

**INFORMS.** More and more industry professionals look to Technical Publishing Company as their first source for technical and business information. Our seven national business/professional magazines—Consulting Engineer, Datamation, Plant Engineering, Pollution Engineering, Power Engineering, Purchasing World, and Research/Development help business leaders solve practical problems, keep up on current market trends and new technologies.

**HELPS TARGET SALES.** Our seven national magazines also enable business to pinpoint its selling message to the desired specialized market. Our target selling concept is so successful that six of our seven magazines were among the top 100 specialized business publications in advertising revenues last year.

Technical Publishing Company further helps business with its annual Plant Engineering Directory and Specifications Catalog, industry's prime reference source for product information, plus services such as specialized product postcards, circulation list rental, and market research.

**TRAINS.** Our TPC Training Systems are training badly needed maintenance craftsmen for industry through self-contained modular training programs geared to 48 specific subject areas. This proven

self-study systems approach is an effective solution to an industrial need. And the cost of TPC Training materials is about one-third the industry average.

**ENTERTAINS.** Our DBI Books Subsidiary (formerly Digest Books) entertains a growing leisure market with over 60 titles devoted to sports, hobbies, crafts, and nostalgia. In addition, millions of "Digest books" are sold to U. S. corporations for premium use and sales incentives.

**GROWS.** Technical Publishing Company is committed to growth, with specific programs and diversification goals. While revenues for the rest of our industry decreased by some 5% in 1975, Technical Publishing showed a 23% gain in revenues. And for 21 consecutive quarters, our sales and earnings have bettered those for the previous year.

Technical Publishing Company is publicly owned and our stock is traded over-the-counter. For information on any of our properties or the company, write James B. Tafel, President and Chief Executive Officer.

## INTERFACE Shows the Way

Find a path to success... at Data Communications INTERFACE '77... in Atlanta, Georgia, March 28-30.

It's a productive conference. Regardless of your background in data-comm, you can plan an educational experience to improve your operation's productivity. It's an intelligent program ..... you can plot your own critical path of sessions pertinent to your information needs.

## Specialized Programs to Meet Your Objectives

Charting your own course in data communications at INTERFACE '77 is easy. Over 175 knowledgeable speakers in over 70 sessions cover the entire spectrum of datacomm in a compact three-day program. Whatever your interest in data communications, you can add to your experience by choosing a program of sessions to meet your objectives. We'll show you the way.

## For DP Beginners and Sophisticates

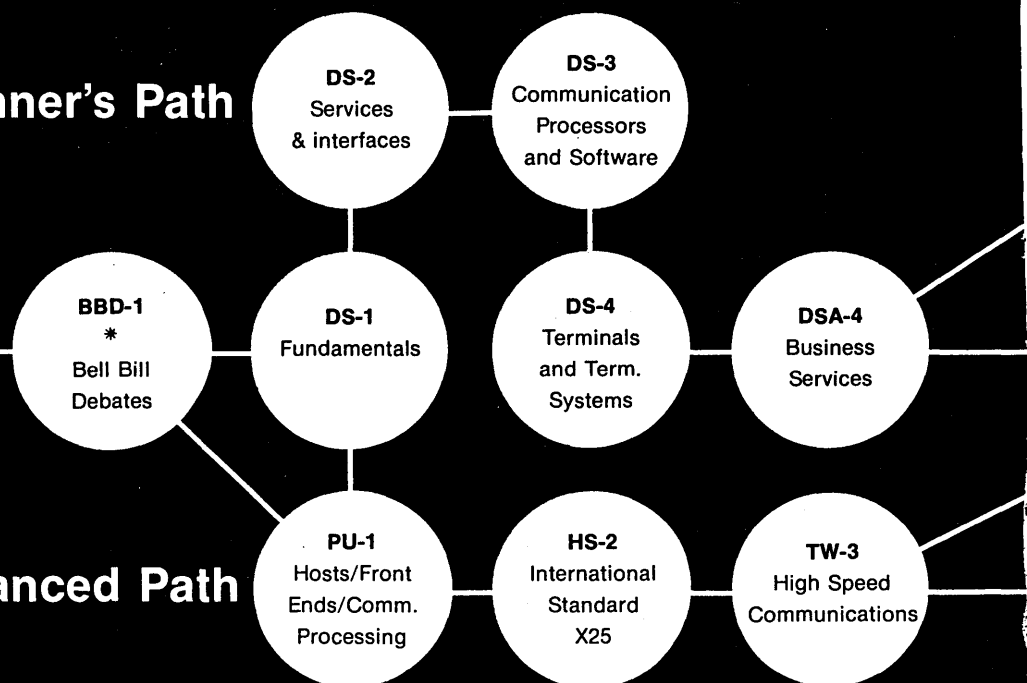

A data processing professional desiring more background in data communications can follow the illustrated path below. Beginners will find the DataComm School emphasizes fundamentals for management decision making rather than technical details. Applications Workshops by industry broaden perspectives of how datacomm helps your type of organization. Then Product and Service Updates reveal the latest cost-effective datacomm tools. Those more advanced in datacomm can follow an in-depth course of Highlight Sessions and Technology Workshops, plus more sophisticated workshops on Applications such as EFTS and distributed computing to shape a more meaningful program.

# data processing professionals... chart your own course

\*"Effects on the Consumer of Competition in Communications"

## Exhibits Galore

Every major supplier will show his wares at INTERFACE '77, the industry event in data communications. Such a dynamic array of the latest hardware, software, systems and services offers a once-a-year opportunity to evaluate in one place the resources that achieve success in data communications.

Over 150 companies will display at INTERFACE '77 to help you make your next decision more cost-effective.

## Lot's More

Springtime weather in the South Eastern Center of data communications activity ensures you of a delightful time in Atlanta. The fabulous new Georgia World Congress Center is conveniently located near Atlanta's most beautiful hotels, where conference rates are offered. And there'll be special treats for your spouse while you're busy with conference activities.

## How to Get On the Right Path

\*\*Views on FCC Effectiveness

# IBM's Series/1 Minicomputers

by Angeline Pantages, Associate Editor

The giant goes to the back of the line in the industry. Will its massive manpower, production, and dollar resources soon make it a leader?

IBM's long awaited Peachtree minicomputer line, announced Nov. 16 in the U.S. and Canada, turned out to be little more than a seedling. The shiny new Series/1, a barebones box that the user can configure to taste, left more questions unanswered than problems resolved.

Ironically, on the same day that IBM unwrapped this almost software-less series, Data General was announcing a sophisticated operating system for its minicomputer line. IBM introduced tools; DG offered solutions—a rare day.

IBM introduced two models, the 3 and 5, with a bewildering array of additional attachments. For IBM it is unique in many ways. It is available on a purchase-only basis, with prices ranging from \$4,400 for a stripped model 3 with 16K bytes, to \$100,000 for the biggest model 5 conceivable. (An IBMer guessed there were at least 1,000 different combinations.) The average price, says IBM, will probably be about \$40-50K. As is customary with IBM, there will be no discounts. No matter what.

IBM test marketed the system for eight months before announcing it, and has already delivered systems to customers, including Quaker City Motor Parts, Wilmington, Del., and Citibank, New York. Asked if IBM has checked out this approach with the government's anti-trust division, C. B. Rogers, president of General Systems Division, said, "No. Not to my knowledge."

## Little programming support

IBM offered almost no programming support but did offer built-in interfaces for "foreign" attachments. IBM's strategy, as delineated by Rogers, is to appeal to the large self-sufficient user who knows his own problems and can do his own programming. The machine will be sold by a small dedicated sales force working out of seven regional offices, but only to prospects qualified by GSD or Data Processing Division sales per-

sonnel. IBM will be looking for orders for 20 systems and up: it will only submit proposals for orders that large; anything smaller and the user will have to come to them. IBM is willing to make sales to non-IBM mainframe customers, although it will not actively canvass

IBM is now in the rack business, offering two sizes, 1 and 1.8 meters high by 19 inches wide. A technician is shown installing a model 4964 flexible disc unit, two of which will fit on one shelf of the rack. In the background one can see the control panels for IBM's newest computer series.

them. GSD will maintain the Series/1.

The IBM decision to sell to experienced, large quantity users is hardly unusual. Most minimakers have aimed in this direction first. The big companies, while few in number, have the biggest budgets, and with their in-house expertise, are least expensive to support. GSD has been plagued by a profitability less

than average within IBM. This is due to high volumes of small systems going to medium and small companies; they need more support per dollar of revenue.

The lack of much programming support has two positive effects. One is the salve to minimakers, who have been diligently developing software for what they once sold as pure iron. Secondly, whether the antitrust case is going well for IBM or not, this consideration must have had weight, since it dovetails so nicely with IBM's other major consideration: the firm is a relative newcomer to the marketplace, so is moving along slowly in determining markets, offering the tool before it gets into the added cost of providing the solution. IBM did the same thing with general purpose computers nearly two decades ago, and its users came to the rescue.

The reason IBM's announcement of iron, and technically not very exciting iron, is significant, is because it is from IBM. While arguments will rage about its technology, one fact prevails. IBM has a cast of thousands backing up its small cadre of salesmen (probably no more than 35 or 40 right now). Besides these resources, it also has thousands of "indirect" IBM salesmen. These are the scores of companies that produce software for the Series/1 ("or tell them to look in the yellow pages," quipped one IBMer.)

## Good for applications?

The Series/1 is good for "applications," according to IBM, but the firm never quite said which applications, though the demonstration highlighted a bulk fuel terminal control system. (Badge entry into a terminal moved a toy truck around the mini fuel terminal; the truck's identity, fuel limit, fuel loading, and billing were all determined and accomplished automatically. IBM said the mini could do the same thing for real trucks.) With sensor-based I/O attachments and ruggedized construction

(operating between 33 and 122 degrees Fahrenheit in 10-95% humidity), the mini is obviously oriented toward similar industrial and laboratory applications.

If users feel the Series/1 is a missing link in IBM's Systems Network Architecture, IBM will have regained some of the control it has been losing to other vendors. Citibank, while not configuring an SNA network, is a good example of this. Characterized as a collection of small banks, Citibank is gradually doing away with all big cpu's, a fortune in IBM 370s, and shifting to minicomputers for networks and dedicated applications. It is rapidly becoming the Lawrence Livermore Laboratory for minimakers (one, or in this case, a dozen of everything).

IBM now has a foot back in the door, since Citibank has taken delivery of several Series/1s for use in its correspondent banks and other yet undetermined applications. "A lot more than

20" is all that could be found out about the order. Citibank official spokesmen on the IBM announcement had left town at that time (they will be back), but sources close to the bank gave some major reasons when asked, "Why IBM?"

#### Overseas factor

"There are 100 minimakers you can deal with in the States, but when you go overseas only a few can offer the maintenance and support where Citibank needs it. DEC is one of the few, but even it has holes in its worldwide coverage that IBM does not." (Citibank has already had support problems with the other minimakers here and abroad.) He concluded, "IBM knows how to build lots of everything, and it understands end users—something minimakers are just getting around to." The hardware is "nothing to write home about," although this mini expert does give good marks for peripherals and reliability to

IBM. "The software will come." (More than one operating system is under development.) Production is coming along, too, with 90 units already having been shipped from IBM's Boca Raton, Fla. plant. IBM said that reaching planned production levels will take a year, but that heavy shipments are anticipated by April.

First evaluations of the Series/1 compared to other products has led some to say that price/performance of some models might be equal to those of DEC, DG, and Hewlett-Packard. "Equal to" is not a good condition for the competition, and one can expect they will be working hard to improve the price and quality of support, and to expand geographically to meet the needs of the cream of the buying crop—the multinational. One good thing about Series/1 for competitors is that IBM iron doesn't appear to be a steal. \*

## Blend of the 370 and Many Process Computer Systems

Architecturally, the Series/1 resembles a blend of the 370 and many process computer systems. Four levels of interrupt are provided with a total of 32 general purpose registers. The instruction set is 177-200—plus mnemonics, and includes built-in hardware multiply/divide. Floating point hardware is optional; systems without it handle floating point with a software trap. A 24-bit address structure suggests that someday the machine might be able to handle 16MB of virtual addresses, although at present 128K bytes is the limit. Basic add time for register to register operations is 1.32 usec.

While the Series/1 is microcoded, using 6K or 24K byte ROMs depending on model, the processor's instruction set may not be modified by the user. Microprocessors are used in lieu of hardwiring to provide soft device attachments. Basic technology is standard IBM MOSFET, 2K bytes for the smaller machine and 4K on the larger system. The processors are fairly conventional bipolar with 100-130 logic circuits per module using both IBM circuitry and standard outside components (we noticed TI and Sprague components on the boards). The board size is 9 x 7-inches; the small cpu fits nicely on a single board while the larger model is handled by three cards.

The two processors, model 3 (4953) and model 5(4955) are functionally similar although differing in construction, speed, size and maximum memory available. The model 3 tops out at 64K bytes, memory cycles at 800 nsec and average instruction times are 11.8 usec. The model 5 can go up to 128K bytes cycling at 660

nsec executing instructions at 3.9 usec on average. Both systems can directly address up to 256 devices, have byte-addressable storage with parity checking, include self-contained power supplies, and can transfer data on either a byte or word basis. Data is parity checked by bytes. The I/O channel can handle a

To the amazement of many, the Series/1 was announced without a single high-level language to ease user application development. Come to think of it, however, that's the way most mini manufacturers start out, adding software tools as the market demands. But for now, break out the assembler language manuals.

maximum aggregate data rate of 1.2 MB for model 3, 1.6 MB for model 5.

Peripherals include a 120 cps matrix printer, a keyboard display unit, diskettes (2 each handling .5 MB writing on both sides) and 9.3 MB cartridge disc with optional fixed head features. Sensor I/O units may be attached for those interested in han-

dling analog or digital input/output.

Communications are supported by feature cards that can be inserted in the I/O slots of the processor or the processor expansion unit. Line disciplines supported are single and multi-line asynchronous and bisynchronous as well as single line SDLC. Maximum speed is 56K bps available under bisynch single line control, with other types generally topping out at 9600 bps.

IBM has already provided four standard interfaces for attaching devices and indicated that it will engineer (for a fee) an interface for any requested device. Immediately available are interfaces for model 33/35 ttys, integrated digital I/O timers, and customer direct program control for handling 16-bit parallel data transfers.

Software is available for the Series/1 on an extremely limited basis. The control program support, CSP, bundled in the basic price, consists largely of IPS code and a set of programs to drive devices. The primary program product is a package consisting of an assembler, text editor and link editor that is available on license for \$90/month for two years. Support for the basic control program adds another \$15.50/month, and that's it.

A 64K model 5 with full disc and diskette capability, printer, keyboard/display, and an eight-line bisynch communications adaptor is available for approximately \$33K with a monthly maintenance charge of \$285 plus \$105 for the software. A miniature model 3 with 16K, diskette, printer and sensor I/O capability sells for just over \$16K.

—Phil Dorn

## Conferences

# Info 76: It's Our Kind of Show, Say Exhibitors

Third annual event draws end users of products of information systems

Sandwiched between meat people and soft drink people, the 11,300 attendees of Info 76 in Chicago last month seemed, by and large, to be mainly those people for whom the show and conference was started three years ago—end users of the products of information systems.

Info shared Chicago's vast McCormick place with conventions of the National Soft Drink Assn. and the American Meat Institute. This made for crowded conditions in eating places and in the halls but it didn't dampen the interest of Info attendees in the exhibits and in the more popular sessions.

The 137 exhibitors at the conference represented a cross section of companies selling software, minicomputer based business systems, network information services, word processing equipment and transaction-oriented products. There were others. Honeywell displayed a high speed printing system; Informer showed a system to digitize signatures for display on a crt screen in bank branches. Manitou showed a method for controlling automatically the use of copying machines in large government agencies. And Codex Corp. and Vadic Corp. displayed modems.

"They're our kind of people," said a spokesman for Datapoint Corp. of San Antonio, Tex. "Many of them are entry level computer users who (unlike such exhibits at the National Computer Conference) are interested in what the systems do for them, rather than in their architecture." A Codex official said it was important to be in Chicago after a long absence, but admitted there weren't too many modem buyers around. The same went for Deltak Corp., of Chicago, which felt its absence would have been noticed. (Its major competitor in video-type educational services, Advanced Systems, Inc., also was at the show with a large exhibit booth.)

General Automation people said the show led the company to a distributor in Dayton for its business systems. The telephone company held the second public display of its model 43 teleprinter, successor to its popular models 33 and

35 teletypewriters. Others felt the show was an important boost to distributors and representatives in the Chicago area.

### Next year too

Exhibitors generally were pleased with the audience and were planning to return next year when the exposition will be held in New York city's Coliseum.

Some companies introduced new products. Microdata Corp. announced Reality II, a low cost version of its Reality small business system which differs from Reality only in its configuration limits. Norm Heller, product manager, said that Reality II can grow only to three terminals, three ports, because of its maximum virtual memory size. Main memory can go to 32K bytes. Beyond that a user would have to convert to Reality, he said.

Cost to an end user for the smallest configuration of Reality II is \$31,000. Deliveries will begin in December.

Microdata also introduced a matrix line printer with interactive graphics terminal capabilities called Scribe. Introduction of this printer was the result of the acquisition of Applied Computing Technology, now a wholly owned subsidiary of Microdata. The printer is based on a four bit proprietary microprocessor and prints an ASCII 96 character set at a 120 or 165 characters per second rate. The company said it is producing five per month now and expects to get to 100-150 per month within 90 days.

The Commercial Systems Div. of Mauchly-Wood Systems Corp., part of the Information Service Group of Insyte Corp., introduced a new on-line order entry applications package it calls Order. It functions under the Datacom data base management system of Computer Information Management Co. (CIM), a member of the same group. CIM itself announced release 6.0 of Datacom which it says will make Datacom run faster than any other data base management system on the market.

### Like 100 programmers

An automated computer program-

ming system was introduced by National Systems Corp. of Chicago. It's called SNAPS. The company claims a systems analyst using the system can command programming power equivalent to 100 programmers.

Many companies reach far for acronyms for their products. SNAPS is supposed to be an acronym for National Systems Automatic Programming System—a bit hard to figure out. But Computer Automation may win a prize. It went to the Swahili language for a name for a new translator package that converts Datapoint programs into its SyFa (Systems for Applications) business oriented language. The translator is called UHURU, the Swahili word for freedom.

Of the 11,300 who toured the exhibits some 2,300 also took in portions of the accompanying conference. Attendance

at the 91 sessions varied from overwhelming to sparse but whatever their size, all seemed interested audiences. There was practically no coming and going during any of the sessions. People apparently knew what they wanted. They went and they stayed to the end, even on the last day and even when sessions ran overtime which several did. And almost everyone was taking voluminous notes.

John Morris, Morris Consulting, St. James, N.Y., chaired a session on "Minicomputer Small Business Systems—What You Need to Know Before You're Committed to One" which drew some 150 people. He wanted to get a handle on his audience before the session started and asked, among other things, how many people were "data processing types?" Only a handful of hands went up. Other questions revealed that the sizes of companies represented ran the gamut and that the predominant type of activity represented was manufacturing. He also learned that a large portion of the companies represented use service bureaus.

Morris told his audience that the minicomputer field "is going completely bananas." He said Digital Equipment Corp.'s sales "are approaching the billion dollar mark and they can't handle all the orders they are getting."

#### The difference is eleven

He said the differences in staff size that he's observed when companies replace a small batch type operation with an on-line minicomputer based system is "on the average like 11 people. With the batch system there typically would be one data processing manager, two systems analysts, three programmers and five in operations. With on-line 11 people are gone."

Robert Weber, president, STC Systems, Maywood, N.J., told the same audience that size of company is an irrelevant measure in the decision as to whether or not to use small systems. Better, he said, are transaction volume, number of customers and number of inventory items. "Larger and larger companies are moving toward minis for their divisions and order processing."

Up the capability ladder from small business systems was a talk on new mass storage systems.

"Concerns about IBM's capability and market commitment to mass storage systems have risen sharply," David N. Freeman, of the consulting firm of Ketrion, Inc. said.

The former IBMer noted that IBM's precursor to the 3850 mass storage device was its Data Cell, delivered a decade ago, a device plagued by poor reliability and little acceptance in the market. Also, "IBM devoted little effort to supporting Data Cell, even though full OS support had been promised to users."

Freeman said today's users question whether IBM and other suppliers of mass storage systems "have learned how to field-maintain and software-support their MSS entrants." He noted that concern over these questions arose when IBM slipped delivery on the bulk of their 3850 installations by a year, a move initiated at IBM's request, not their customers'.

#### MSS shipments

Freeman said IBM is expected to have delivered 50 such systems by the end of this year, although some 700 mass storage systems are said to be on order. California Computer Products had shipped 50 of its automated tape libraries, with 30 on order. Control Data shipped five of its 38500 systems and is

understood to have 50 on order; Precision Instruments shipped three of its System 190 laser type system and Ampex Corp. shipped five of its terabit memory systems.

He said this kind of acceptance is slow and the systems are going chiefly to very large users. Also, the systems require the latest versions of various operating systems to which users have been slow to migrate and that they require conversion from existing media. Another factor, Freeman thought, was the emergence of larger capacity disc drives and the trend towards distributed data bases.

Freeman chaired another Info session, on "International Data Communications, 1976."

"A hornet's nest of controversy—generally motivated by corporate economic interest, sometimes by national or nation-bloc political commitments—swirls around international data communications today," he said, "particularly in the area of standards. Within most nations, the victors in the competition for communications monopoly status have long since disposed of the vanquished. Having imposed standards within their nations, the victors now—most reasonably—wish to negotiate various international standards post hoc and pro bono publico . . ."

Freeman cited Japan as having "a rather unique location among the highly industrialized nations, both geographically and technologically," in introducing Shigeo Shiratori of Fujitsu's Data Communications Architecture division who described his company's standardized intra/international High Level Data Link Control (HDLC).

#### Three key concepts

Shiratori said Fujitsu has introduced a new network architecture and has developed several networks using it. He said there are three key concepts to the architecture. "The first one is separation of the on-line system functions into data processing and data communication control. The second is classification of the data communication control functions. And the third is use of High Level Data Link Control procedures, or HDLC."

He said Fujitsu's architecture is similar to IBM's Systems Network Architecture (SNA) but was developed before SNA and is different in its implementation.

Communications-related sessions generally drew well at Info. An audience of more than 150 heard Erwin Allen of Computer Sciences Corp. describe "Network Information Services Today and Tomorrow."

"Network information services have been especially effective in responding to the challenge of greater productivity by providing the necessary versatility, flexibility, and economy by making the

# news in perspective

computer more available," he said.

"NIS is evolving in the direction of a utility concept and it will continue to do so as technological and social conditions permit. The worldwide expansion into homes and offices requires that these services not only be reliable and effective but also that they be easy to use. Even today, many NIS users introducing data, generating programs, performing analysis, obtaining output from a terminal do not have—nor do they desire to have—an understanding of computer technology."

## Encouraging the concept

Allen noted that the introduction of minicomputers, intelligent terminals, and similar devices "is encouraging the concept of distributed computing. This concept, based on using dispersed local systems, intercommunicating with the powerful, centralized computers of a large time-sharing network, allows users to select and fit data processing capabilities efficiently and in accordance with specific cost and performance requirements."

The privacy issue was not left out at Info. Frank Sterner, Associate Dean, Krannert Graduate School of Management, Purdue Univ., told a less than overwhelming audience of a study conducted among some 2,000 college students indicating that the majority believed "overwhelmingly" that anyone can get data out of a computer.

He also told of a pilot study being undertaken by the Information Privacy Research Center at Purdue on personnel information systems. The study will cover both organizational practices and employee perceptions and expectations and will use four different basic industries as a sample. It will be pairs of companies including IBM and an as-yet-to-be-named computer manufacturer (two, he said, want to be included); Sears and Montgomery Ward in retailing; General Motors and Borg Warner in vehicle related manufacturing, and TRW and Rockwell International in electronics.

Sterner said 600 employees would be selected on a random basis from each company. First, he explained, questions would be asked of staff members "who know what is being done." Then there would be a series of questions for the same people on written policies and procedures of the organization. Next would come a questionnaire for the employees regarding their perceptions and expectations on both what is being done and policies and procedures as they see them. Sterner said data currently is being examined as a result of a pilot test done with a "moderate sized" midwestern manufacturing firm. A report is due

sometime this month.

A related issue, data security, was treated in a session titled "Developing an EDP Security Risk Management Plan." Session chairman Brian Ruder, information systems analyst at Stanford Research Institute, called security risk management "a very new concept . . . a quantification process . . . a ranking of threats and assets."

## He's done it

Richard Hoffman, Data Processing Systems and Software Dept., Northwestern Mutual Life Insurance Co., Milwaukee, told how his company had done a risk analysis. He described his company as the seventh largest life insurance company in the United States with 2,000 employees, 114 general agents and 250 people in data processing. They have an IBM 168 and a 158, each with three megabytes of core. Their dp is centralized and they are just starting to put terminals in the general agencies. Their security program was started in April 1974. It was instigated, he said, by the audit committee of the company's board of trustees. The risk analysis was started in April 1975. It involved two full time people. The approach was: first, preliminary preparation, second, risk analysis meetings involving a system analyst and his boss and the user of the system and his boss. The group went through the system file by file, analyzing each risk by risk. What they wanted to find out was the degree of risk, what protection would cost, probability of occurrence. He estimated that, in terms of people time, the analysis cost one hour for each file to prepare for the meetings, ten minutes for each file in the meetings and 20 minutes per file in follow up and reports. This, he said, added up to a total of 3,000 man

### Canada's Consolidated Computer On the Road to Recovery—Again

In its short but stormy eight-year history, Consolidated Computer Inc. has managed to weather a deluge of management and financial tempests. Showered with money problems just three years after its founding in 1968, the Toronto-based manufacturer of data entry equipment was bailed out in 1972 by the generous Canadian federal and Ontario provincial governments, which to date have poured close to \$43 million into the financially-worn firm.

Today, thanks to the money from its government mentors and a cozy deal

hours.

"In the beginning of the risk analysis," he said, "everyone was with us but afterward when solutions were being considered data processing management tended to back off."

There were many sessions on data base management systems, management information systems and corporate planning and decision making. For the most part they were well attended. A constant reminder came through in many of the sessions. Max Stokes, manager of Systems Development, Standard Oil Co. of Indiana, summed it up in a session on "Project Pitfalls—Plans, People and Life Cycles Do Not a Successful Project Make." He said we "are not in the computer business, we're in the petrochemical business."

Among 13 sessions on office systems, one on "Trends and Futures in Office Technology" seemed to outpace the early days of computer technology for its heady prognostications. George Simpson, president of Office Management Systems Corp. of New York, predicted that before long computers will be free. At that price, he said, there'll be up to three of them at a work station. He said communicating word processors will allow persons to work away from the office, or at home. "Or," he added, "future offices will be designed so that people can work and live in them." James Fensel, another speaker, told of his use of a Digital Equipment Corp. 310W word processing system that allows him to put everything on disc in his distribution business, giving him virtually a paperless and peopleless company—without copying machines, file cabinets for paper, or accountants.

Fred W. Bach, whose company, Quickborner Team, Inc., designs office buildings, was the last speaker on the panel of four. He said his design of offices of the future "would assume that there would be some people around."

—Edith Myers

## **Complements of Memorex: total on-line storage capability.**

Our 100, 200 and 317.5 megabyte Disc Storage Systems. Complementary drives, offering expanded capabilities and improved cost-effectiveness in temporary and resident on-line storage.

As you would expect, these Memorex 3670, 3675 and 3650 Disc Systems are fully 3330 and 3350 compatible. And as you've come to expect from Memorex, our Disc Systems also offer some exclusive advantages.

Our 3675, for instance, features heads that fly 50% higher—virtually eliminating head crashes. Our 3650 offers an exclusive data security feature for processing sensitive information, and it also offers small and medium 370 users improved cost-effectiveness with native mode DOS/VS support.

These systems represent our highest achievement to date in their respective technologies. They serve to underscore our commitment to Memory Excellence. And they set a standard of value by which to judge storage systems by any other name.

For complete information on our 3670, 3675 and 3650 Disc Systems, see your Memorex representative, in principal cities worldwide. Or contact our Equipment Products Group, San Tomas at Central Expressway, MS-1449, Santa Clara, CA 95052. Phone (408) 987-1084.

Our 3670 and 3650 Disc Files. Storage subsystems for today and tomorrow. Complements of Memorex.

# "Thanks to this Inforex support team, we blew the competition off the road."

Dick Whalen, Director, Data Processing, Kawasaki Motors Corp., U.S.A., Santa Ana, California.

In the fast-moving world of motorcycles, you need all the support you can get. The kind an Inforex Support Team gives Kawasaki Motors Corp.

The team helped Director Dick Whalen select, set up, and train operators to run a data entry/communications network based on Inforex key-to-disc systems.

The network is nationwide. And it connects all of Kawasaki's eight regional offices including four warehouses to the Santa Ana office, which acts as control center for all invoicing and inventory.

It's done a lot for Kawasaki.

It's given them a tremendously streamlined operation.

A fast 24-hour turnaround capability on all orders. And a definite competitive advantage. Which is just what they came to Inforex to get.

Besides service and reliability, what sold Kawasaki on Inforex was the very thing that sells riders on Kawasaki: Performance.

The Inforex systems could do everything Kawasaki needed: parts orders, back orders, receivables, payables, warranty registration, warranty claims, whatever.

But the real kicker was the systems' ability to receive, transmit, or print *at the same time data is being entered.*

So whatever kind of system you want — data entry, remote batch communications, or computerized record keeping — we can

provide it. Along with an Inforex Support Team to give you all the support you need.

Can Inforex really make a difference? Next time you're on the road, just count the Kawasakis.

For more information, mail us the coupon. We'll get back to you right away.

Please send me information on the following:

- Key-to-disc data entry       Remote batch communications  
 Computerized record keeping

Name \_\_\_\_\_ Title \_\_\_\_\_

More keystations in more countries than any other data entry company in the world.

Inforex / Dept. 322/21 North Avenue / Burlington, Mass. 01803.

# How the Inforex support team supports you.

An Account Representative such as Bernard Budnik will see to it that you get the best possible system for your application. He'll analyze your requirements, explain the options, and then help you select exactly what you need from our broad range of systems.

Next, a Field Engineer such as Larry Woodruff will oversee the installation and ongoing service of your new system. He'll do it fast, efficiently, and with a minimum of interruption.

Once a system is selected, a Sales Service Representative such as Jaye Lynn Towne will begin training the people who'll use it. It won't take long. Because all Inforex systems are designed to make the operator's job easy.

Inforex / Dept. 322/21 North Avenue / Burlington, Mass. 01803.

## news in perspective

January 1975 to join Central Dynamics Ltd. as executive vice president. Central Dynamics, a Montreal electronics firm, had had plans earlier in the year eventually to take over controlling interest in CCI. As this plan began to mesh, an influx of CD executives, including Sellmeyer, began to assume new management jobs at CCI.

### Deal turned sour

But this management reorganization didn't last too long because the CCI-CD sweetheart deal turned sour and was called off at the last minute, leaving Sellmeyer as president and the federal and provincial governments still holding a 52% stake in the company. With the finalization of the company's debt conversion into equity this month, the gov-

ernments' interest is expected to escalate to around 60%. Also as part of this package deal, the government has guaranteed \$30 million worth of lease financing and made available to the company another \$5 million in working capital.

Without this hefty government support, sources close to CCI note, the company could never make it. Anxious to foster its own indigenous computer industry, the Canadian government has apparently pinned most of its hopes on the trouble-ridden CCI. And the dissolution of the Central Dynamics deal has not stopped the government from looking for other potential buyers.

CCI manufacturing v.p. Ron Marsland says the government will continue searching for candidates. "It's certainly been (the government's) objective all

# news in perspective

along," he insists, "to divest themselves and only take a very minor equity role."

CCI chief Sellmeyer agrees, adding "it's a fixed strategy that the company will become independent in most areas." But in one crucial area, leasing, he explains, long-range government support will be needed for some time to come.

In the product development area, the company is relying heavily on Fujitsu to expand and enhance its line of Key-Edit data entry systems. Under the new product technology agreement, which was expected to be signed last month, Fujitsu will get a 20 percent interest in CCI in exchange for technical help.

According to Sellmeyer, one of the more fundamental ways this link-up can help the company is by providing "small system components which we have a continuous option on in terms of manufacturing in Canada based on our distributed volume." In this way, he hopes to slowly loosen the tight ties the company has traditionally had with U.S. oem'ers who have over the years supplied CCI with processors, tapes, discs and other assorted peripherals.

One of these system components, a fixed head disc (1.4 and 2.8 megabytes),

was developed last year by the Japanese company and is already being used by CCI. Other Fujitsu components being eyed by Consolidated include larger size dynamic RAMS and microprocessors.

## Also eyeing display terminals

The company's "long-term requirements," Sellmeyer adds, "will be in the range of various kinds of discs and small computers." And in the short-term, he explains, CCI will be looking for Fujitsu products comparable to the IBM 3741 data entry system.

Switching into another mode, the company next year plans to add this 3741 capability to its traditionally higher priced systems in order to compete more effectively with the similar Datapoint and Sycor lines.

Future product areas the company hopes to get more heavily involved in include distributed processing and banking. With "some degree of help from Fujitsu," CCI plans on entering the distributed processing field by late 1977 or early 1978.

For the banking products, Sellmeyer expresses cautious optimism. "I've seen other people take a very big beating in banking terminals," he comments, "so

I'm not interested in some sort of attempt at a standard banking terminal offering." What he would be interested in, he claims, is "a specific deal with one of the large charter banks."

## Aiming at end users

Getting back to the present and his plans for the company next year, Sellmeyer says this: "The emphasis in operations during the balance of the year will be placed on end user sales in Canada and the U.S. The traditionally unprofitable oem relationships will be corrected or phased out. I'm not going to do wholesale systems deals that are unprofitable," he emphasizes, adding that in 1977 the company will concentrate "much more on end user content."

Sellmeyer also predicts smaller sales for next year "but more quality in financial performance." In the six months ended June 30, 1976, CCI lost \$2.5 million on revenue of \$13.9 million. For the same period last year, the company lost \$5.9 million on \$7.1 million in revenues.

Around 30% of Consolidated's \$27 million in expected revenues this year will come from oem sales. Breaking that figure down further, Sellmeyer indicates that \$18 million of this revenue will come from exports, mostly to Europe and the U.S.

## Tame the king of the DBMS jungle.

Every day you face the perils of the DBMS jungle. Because it's taking a big bite out of your system resources, people are asking tough questions:

- Why is our system's response time so high?
- What level of service is being provided and at what cost?
- How can we equitably distribute costs among users/applications?
- Can we maintain or improve service as volumes increase?
- Where are the system problems/bottlenecks?

**CONTROL/IMS provides the answers.**

If your IMS system is a cub you need information to control its growth. If it's already running wild you need information to bring it under control.

**CONTROL/IMS is:**

- An installation management tool that gives you the information needed to control IMS.
- A financial management tool that allows you to accurately develop the cost of providing services to each user.
- A performance analysis tool that

permits you to analyze and improve the IMS system.

- A planning tool that helps you develop accurate predictions for the future based on the trends and patterns of the past.

Find out how *you* can be king of the IMS jungle. Contact Boole & Babbage, Inc., 850 Stewart Drive, Sunnyvale, California 94086, (408) 735-9550. Outside California dial toll free 800-538-1872.

**Boole & Babbage**

I want to be King of the IMS Jungle. Send me information on CONTROL/IMS immediately.

## with Datamedia Elite Video Terminals

**A family of video terminals that offers a wide range of features to perform an even wider range of data entry and display tasks.**

If you're with an OEM firm or a system house, and look at peripherals with one eye on cost and the other on performance, you'll want to take a long look at these proven products from Datamedia.

Their modular design makes troubleshooting a breeze, and facilitates conformance to your system needs, and their quality workmanship assures that those needs will be met longer than you thought possible.

And if you believe in service after the sale the way Datamedia does, you'll appreciate the new dimension we've given to the word "responsive."

Datamedia. We've been seeing things the right way for users in industry, business services, government, education, medicine and research around the world.

Why don't you see what we can do for you.

## news in perspective

Discussing his North American game plan for 1977, the CCI chief believes the company "must concentrate its sales activity in the North American end user market. And later, if we can truly qualify as an oemer, manufacturing an interesting product, we'll go out and oem it."

### Picking up the pieces

Patrick L. Shannon, CCI's head of North American marketing, claims that CCI's once-troubled North American marketing effort, started up in 1969, is slowly picking up after three years of virtually no activity. The main reason

for this he attributes to the company's "very sleek" leasing arrangement which he says has allowed CCI to sell in the North American end-user markets, with loans from two banks backed by the government.

The systems moving the best in this market, he points out, are the smaller Key-Edit 50 and 60 key-to-disc data entry units. (The original Key-Edit 100 hasn't been marketed since 1974.) The high-powered Key-Edit 1000 follows the 50 and 60 in sales, leading Shannon to predict that this system will almost equal the 50 and 60 in sales volume

## the alternative to printers that break down in the middle of the night!

OEM's now have a super-reliable 24-hour-a-day medium speed printer—designed by request. Clean, straightforward design makes IPS-7 flexible, mechanically reliable—electronically sound. Prices and capabilities are competitive.

OEM's want as few brands as possible. IPS-7 is all the printer you'll need for years to come. You don't have to put tinkertoys together to assemble your custom configuration. The functional structure is built in. Just plug in your options. Compatible? Yes, interchangeable with the printer you designed in.

How does the "7" pack in so much? Start with a big healthy micro-processor that gives the flexibility—programmable forms control, diagnostic package, character size and serial or parallel interface. This takes the burden off the computer. Use rapid, super-reliable servo and stepping motors to get rid of troublesome gears, clutches, brakes, bearings and shafts—at least 75% fewer parts (consider the MTBF of those!)—and ruggedize the rest. Provide

positive filtered air flow for operation in heat, cold and dirt without a clean room. Include sensible ideas like three head-speeds—to print, to move and to give double density without double printing time. IPS-7 has low parts cost, and low downtime which is quickly back to uptime.

**Only DATAROYAL says, "our printer will run and run and run."**

Ask for proof of the performance you're waiting for.

CIRCLE 109 ON READER CARD

next year.

Outside North America, CCI's main marketing thrust has been in Europe. Started up in early 1970, the European marketing arm was taken over a year later by International Computers Ltd. of London, when the Canadian company ran into financial problems. Under the arrangement, ICL bought up all the assets from CCI's United Kingdom and German subsidiaries.

Today, ICL has built up an installed base in Europe of around \$50 million. Under the renewed sales agreement between the two companies, ICL is expected to sharply reduce its monthly system orders by as much as 50%—or 10 systems per month, compared to the usual 20.

ICL watchers speculate that the mighty British company, pouring most of its energy into the recent Singer International acquisition, has slowed down on its Key-Edit drive. Not true, says a CCI official who claims that ICL is "actively exploring new market strategies (for the Key-Edit line). They're offering better incentives to their sales people," he maintains, "and really trying to move a lot of equipment."

But despite these rumored troubles with ICL, the company's main hope for salvation and independence from the government is still the inscrutable Fujitsu. "So long as the two companies have this basic love affair," Sellmeyer says confidently, "I can see our natural position with Fujitsu as being a good one, especially in the 1980s as our relationship grows."

Consolidated's manufacturing v.p. Marsland is more cautious in his assessment of the Fujitsu-CCI romance. "If we are aggressive in a positive sense, we can make headway with the agreement. But we have to want it. We have to be hungry. If we take a bureaucratic stance . . . then it's not going to bring us anything. Only time will tell."

—Linda Flato

### Microcomputers

## Mini/Micro Show: An Awkward Success

Lower than expected attendance, too many "vendor product pitch" technical sessions, gross imbalances in session space allocation and lack of adequate parking hardly sounds like a description of a successful computer conference, but that is indeed the consensus from both vendor and attendee alike concerning the initial Mini/Micro Computer Conference and Exposition held in late October at San Francisco's Civic Auditorium/Brooks Hall facility.

Where other conferences might have failed miserably under such circumstances, this one did not, mostly due to the exuberance of seemingly everyone

even remotely connected with the mini-computer/microcomputer phenomenon. Where children and entire families loosely roaming the exhibits area would be considered an organizer's disaster at most computer shows, they were welcome at this one. The reason for this is, of course, the fact that microcomputers can now be purchased within the constraints of a family budget with nearly as much power as the \$1 million juggernaut of 30 years ago, so the husband (or wife) was attempting to expose the spouse to the fever he or she had contracted.

Serious business went on, too, with most vendors claiming they expected to do business with nearly 50% of their booth visitors—a high percentage of the 6,949 conference attendees. Many companies sent representatives to scout the show and, in particular, attempt to measure the hobbyist computer market. Hobbyist-oriented sessions at the conference were the best attended, and there's obviously money to be made by many in this market, predicted by some to overtake the photography hobbyist market in the near future. No wonder then that such exhibitors as CalComp, DEC, Hewlett-Packard, Intel, National Semiconductor, and Centronics are looking forward to the second edition of the Mini/Micro Computer Conference and Exposition, now slated for late 1977 at the Anaheim Convention Center.

—M.W.C.

#### Services

### Change is Focus of Adapso Talks

Is there a revolution in the data processing industry? Leon Weisburgh, outgoing president of the Assn. of the Data Processing Service Organizations, seems to think so. In his opening remarks at the association's recent 45th management conference, the dp services executive claimed the latest microprocessor advancements signal a revolution, rather than "just a change" for the entire computer industry.

Focusing on this theme of change, the three-day Adapso conference was appropriately held in the "city of the future," Toronto, Canada. Usually a low-key affair, the late October gathering attracted 265 attendees, making it Adapso's second largest management conference. The meeting also featured, for the first time, a small hardware exhibit by six companies.

On the issues of privacy, taxation and electronic funds transfer systems (EFTS), association leaders presented updates on the latest initiatives. As part of its privacy and security effort, the group

announced a new position paper which will be turned over to the federal Privacy Protection Study Commission this month. The paper, in the works for several months, spells out the need for the computer services industry to establish self-regulatory standards to protect client data.

On the troublesome taxation front, the association has launched a national program to combat apparent inequities in the state and personal property tax laws. As a bottomline problem for a growing number of dp service firms, the taxation issue has become a focal point of Adapso activity in recent months. What's at stake, Alan C. Rievman, v.p. of finance for National CSS Inc., prag-

matically points out, is the "very survival of the data processing services industry."

Analyzing future trends in this industry, International Data Corp. presented figures which indicate that the services segment of the computer industry is very much alive and growing. Service industry revenues in 1975, according to IDC, grew 16% to \$4.5 billion.

Despite the unknown impact of distributed processing, IDC forecasts a 20% compounded annual growth rate in revenues for the industry in 1976, 1977 and 1978. Another industry watcher, Quantum Science Corp., for the same time frame, predicts a significantly smaller revenue growth rate of 12%.

# GREAT SOFTWARE, PANSOPHIC

That's what the DATAMATION survey shows. Every utility software system available from Pansophic Systems Incorporated is on the honor roll. Bar none.

## PANVALET EASYTRIEVE PAN\*DA

There are now more than 3,000 companies around the world using one or more Pansophic products every day. To those of you who responded so favorably to the DATAMATION survey, we thank you. To those IBM 360/370 data centers who haven't reviewed the latest version of all our products, you're missing something. We look forward to showing them to you.

## Announcing a giant increase in the NOVA line.

Towering above is the new top of the NOVA® line. The NOVA 3/D.

It features a new Memory Management and Protection Unit that lets you do both on-line multitasking and batch operations. Concurrently. For instance, applications that need real-time multi-terminal software and on-going program development.

Plus, the NOVA 3/D features a new, economical, 32K-word MOS memory module. Which is something no other major minicomputer has.

All of which makes the NOVA 3/D more NOVA computer, at a lower price, than you've ever seen before.

What's more, the NOVA 3/D also has all the things that have made NOVA the most popular name in minicomputers.

Things like extended NOVA line instructions. Reliable high-speed MOS and economical 16K-word core memory modules.

The single-board CPU design concept Data General pioneered. The same concept that led to our removeable single-board power supply module.

Plus all the other things you've come to expect from a company like Data General.

Things like field-proven, real-time operating systems: our mapped Real-time Disc Operating System, diskette-based Disc Operating System, and our Real-Time Operating System. They're compatible with the entire NOVA line of computers.

Things like high-level FORTRAN IV and FORTRAN 5, as well as easy-to-work-with extended BASIC. Also fully NOVA-line compatible.

Things like the complete and completely-compatible line of Data General peripherals. All you could ever need to put together any system you could ever need. Including 10 to 90 megabyte discs, diskettes, and our new 30 and 60 cps terminal printers.

And when you do business with Data General, you get the kind of total systems support you can only get from a major computer manufacturer. Everything from sales and systems engineering to field service, training, and special systems design.

Write for information on the new NOVA 3/D. Or call your local sales office.

And see what the NOVA line is up to now.

## Antitrust

### West Coast Cases: The First is On

The opening bell in the so-called "West Coast cases," in which IBM is charged with antitrust violations by a number of competitors, was sounded solemnly in Los Angeles last month.

Maxwell Blecher, lead counsel for California Computer Products Corp. set the tone. CalComp's \$300 million treble damages suit against the giant was the first to come to trial. Blecher both preceded and concluded his day-long opening remarks to the jury of five men and seven women with solemn admonitions as to the seriousness of the case.

"This is an historic and important piece of litigation and possibly the most important private antitrust case to be submitted to a group of men and women," he told the jury in the morning. "The decision you reach in this case may be the most important decision you will be expected to make in your lives."

He concluded by telling them, "the decision you make in this case could impact the entire economy. It could af-

fect the way business is done in this country."

IBM earlier fought the whole idea of a jury trial both before and after jury selection. The company's lead attorney David Boies asked Federal Judge Ray McNichols, who is hearing all of the West Coast cases, to either strike having a jury or to strike the particular jury selected. He contended that all jurors selected appeared to be in one economic classification and did not satisfy a constitutional requirement for cross-representation.

### From a pool of 70

The 12 jurors were picked from a pool of 70. McNichols decided they did represent a cross-representation. Jurors include: Edna E. Kindoll, retired from Hydraulic Research Corp., wife of a manufacturing engineer and a Burbank, Calif. resident for 35 years; Rosemary T. Simer, a quality control inspector with National Can Co. and wife of a millwright; Joyce Hill, a recent graduate of California State Univ. with a teaching credential and a 12-year resident of Cudahy, Calif.; Mark Conely, in the distribution department of the Southern California Gas Co. and a 25-year resident of Mar Vista, Calif.; Arvella Staten, a 25-year employee of the City of Los Angeles and currently a window

# GRASPVS

Many hundreds of leading companies throughout the world have come to SDI for help in solving their computer system problems. They have recognized problems like the inefficiencies inherent in System 360 and System 370 software supplied by the hardware vendor. Helping solve such problems is GRASPVS—a new dimension in computer resource management. GRASPVS is a modular software product which includes operating system enhancements, spooling and related functions, performance measurement tools, accounting functions, and remote terminal support. Each system is configured

to match precise user needs and normally results in a 20% to 30% improvement in *present* computer systems *without* the costly hardware expenditures normally associated with improved D.P. performance. GRASPVS will provide you with fastest service, fullest utilization, broadest availability, and complete control of your system. If you're interested in improved performance, greater utilization, and more complete control of your computer system, contact the SDI office nearest you for a presentation of GRASPVS—the new dimension in computer resource management.

cleaner supervisor; Oma Lee Coleman, unemployed, formerly a plastics inspector, and a resident of Huntington Beach, Calif.; Robert Shmabuku, American Airlines clerk and a six-year resident of Cerritos, Calif.; William C. Chicoine of Santa Ana, Calif., a school district custodian; Ernest Padilla of Altadena, Calif., a carpenter for the state and a private contractor; Alberta Keefe, 14-year resident of Chino, Calif., currently unemployed, formerly an assembler for General Dynamics; Alice Padilla of Whittier, Calif., an employee in the will-call mail order department of Sears Roebuck; and Stephanie Tuttle, housewife from Monterey Park, Calif. and wife of an Alhambra school district maintenance man.

If CalComp can win its case it is generally felt it will fare better in appeal because it was tried by a jury. Appellate courts, including the Supreme Court, tend to find it more difficult to reverse a jury decision than one by a judge. Two of the other major West Coast cases, those filed by Memorex Corp. and by Transamerica Computer Corp., also are scheduled to be tried by juries.

In his opening remarks in the CalComp case, Blecher said before an audi-

ence packed into a small courtroom and including both Frank T. Cary, IBM board chairman and Lester Kilpatrick, board chairman of CalComp, he would show with his case that "IBM, from 1963 to 1972, purposefully undertook to eliminate, suppress and destroy competition." He said he would show that IBM had damaged CalComp to the tune of \$102 million which he called a "staggering sum."

He called this "a case where you can determine IBM's guilt by their own documents" and in the course of the day, he showed the jury blown up versions of some of the "millions of documents" he said he would enter into evidence. These included memos exchanged by top IBM executives, minutes of top level meetings, and internal reports. Over and over he produced documents he said proved IBM's dedication to maintenance of its market share even if it had to sustain "huge" losses to do it.

He showed the jurors a chart labeled "IBM and the Seven Dwarfs," a label Boies objected to saying "colorful words like that have no place in this trial." The judge found the terms acceptable.

He compared IBM's actions to "those of a navy turret gunner" using its arse-

nal of technological and financial weapons to go after first, systems competitors, later leasing companies and add-on memory firms and finally the plug compatible peripheral manufacturers (PCM) "which is where CalComp got did in."

He said he would show that IBM hurt systems competitors with premature announcement of the 360 line and announcement of some machines in the line when they didn't even exist, just to protect market share. He contended IBM kept systems market share by lowering cpu prices and making up for this with high peripheral prices. When the systems competition was virtually taken care of, he contended, IBM reversed this pricing "trade-off" to the detriment of the PCM's.

Blecher produced a document which showed that IBM had done a study on how much customers could save using PCM products. It showed typical savings with a 360/30 at \$23,388 per year or 21%, with a 360/40 at \$34,740 or 19%, with a 360/50, \$76,711 or 21%, and with big machines, \$191,730 or 26%.

He followed this with a document in which IBM declared peripherals "to be a key strategic issue." He said he had another document which defines this as meaning "big headache."

Blecher said he would show that IBM's introduction of the 2319 and 2319B disc drives which put the controller functions partly into the cpu and partly into the

drives themselves were deliberate acts to lock the PCM's out of the 360 and 370 markets. Even more devastating, he said, were announcements of IBM's Fixed Term and Extended Term plans in 1971 which "were essentially price reductions."

### Bank changes mind

He said CalComp had received a letter on Dec. 11, 1971 from United California Bank from which it had notes, saying the bank was willing to convert the debt to stock. The 2319B was announced on Dec. 17. "Three days later we got a call from the bank saying it had no present intention of exercising its right to become a stockholder." CalComp, he said, then approached Lehman Brothers in an attempt to raise \$5 million to pay off UCB. It couldn't be done, Blecher said, "because financial institutions feared that IBM was going to eliminate or drastically reduce the profitability of independents in the disc and tape drive markets."

Blecher claimed IBM's "predatory and monopolistic" practices cost CalComp \$68 million in lost revenue, and \$33 million in loss of profits it would have made for a total of \$102 million.

Blecher advised the jury that a civil case is quite different from a criminal case in that it is not necessary to prove anything beyond a reasonable doubt. "You must decide for us if we tip the

scale ever so slightly."

Boies said in his opening statement on behalf of IBM that CalComp must prove five major points to win. First, he said, CalComp must satisfactorily define a general purpose computer market. Then, he added, CalComp must prove that IBM has a monopoly position in that market, that IBM achieved that position in a "wrongful" way, that CalComp suffered damages from IBM practices and the amount of such damages.

"If CalComp fails to establish even one of these points," Boies told the jury, "I feel sure the court will instruct you that they have not proven their case."

### "Basic beliefs"

Boies described IBM for the jury, its size and its "basic beliefs." The latter he listed as a respect for individuals, a desire to provide the best customer services of any company in the industry, and an emphasis on doing every task in a superior fashion.

He referred to other areas in which CalComp had lost money including a move into consumer products. He illustrated his point with a pink and yellow "rubber duckie" lighting fixture which was one of those products.

Another of IBM's attorneys, Jack E. Brown of Brown and Bain, Phoenix, said he would show that IBM did not damage CalComp. He said CalComp's prices as shown on its product data

sheets were like "car sticker prices," higher than the prices actually charged. "These prices were declining before IBM's competitive actions," he said, "and they did not actually go any lower after the action." He said there was speculation that, after IBM announced its Fixed Term Plan on May 27, 1971 there might be some difficulty for CalComp but in fact, CalComp's booking for the following three months was actually higher by 19% as reported in the CalComp annual report dated Sept. 1971.

Brown characterized IBM's introduction of the FTP as "a competitive response to CalComp and other competitors who already had introduced long term lease plans."

Brown said the defense attorneys would bring in IBM employees to tell why IBM is a great company and why they have loyal, dedicated employees and why IBM is so well managed.

At the conclusion of the two days of opening comments, Judge McNichols complimented both sides on the depth and completeness of their preparation.

Before the West Coast cases are over, he may weary of such depth and completeness for he's scheduled to hear all of them. The CalComp case is expected to last for six months. Memorex' is next and its case is said to be even more comprehensive than that prepared by CalComp.

—Edith Myers

## IS PERFORATED TAPE YOUR PAPER TIGER?

Most perforated tape installations suffer the constant problem of keeping paper tapes organized. Splicing, editing, rewinding, unwinding, repairing, repunching and many other "routine" operations contribute to the growing paper jungle. Relax. Data-link can tame your paper tiger. Now you can efficiently and economically round up loose tapes and keep them in line. Data-link offers Splicer-Gauge-Punch equipment, manual, electric and high-speed winders, center-feed unwinders, complete tape stations for Teletype and Telex® installations and an exclusive line of self-adhering patches and correction strips. If your perforated tapes are on the prowl, write today to receive your free D-L catalog... DATA-LINK, 1282 Fayette Street, P.O. Box 1145, El Cajon, CA 92022, or phone (714) 448-6716.

Sooner or later, tape file handling, security, and control are bound to become problems in your D.P. shop. When that happens, we at SDI have the solution. EPAT is a uniquely capable Data Set Catalogue System for DOS and DOS/VS users. Requiring no memory space to operate, EPAT streamlines computer operations while providing a tape library catalogue, automatic volume recognition, and full security and control. Tape drive utilization is significantly increased by EPAT's Early

Drive Release, Multiple Partition Usage, and AVR features often eliminating the need for one or more expensive tape drive. Complete cross reference and audit trail capabilities guarantee processing integrity and security. If you need the right tape, on the right drive at the right time every time, and more programming time, you need EPAT. Contact the SDI office nearest you for a presentation of EPAT—the comprehensive tape library management system.

### Management

---

## DPMA Makes Good In Las Vegas

Maybe it was the lure of Las Vegas. Maybe it was the program. Whatever it was, the Data Processing Management Assn.'s (DPMA) Info/Expo '76 came off well.

Total attendance exceeded 3,000 and session attendance was tops. The exhibits, on the other hand, were few, and for the most part, ignored except for the magician provided by Management Science America, Inc.

The sessions ranged from the blue sky to the practical. One of the most practical, and best attended, was put on by Harvey Weiss, Harvey Weiss Associates, Denver, Colo. His topic: "Using Risk Analysis Methods to Determine Cost/Benefit Relationships of Computer Projects."

Doesn't sound exciting but it drew a large and staying audience. Weiss was talking about the probability of success of a computer project, any computer project. "The computer and everything about it has come into its own and

stands alone," he said.

Risk analysis, and he was talking about whether to go ahead with a project or not, "is a procedure the result of which is a number which can provide the system developer with a probable rating of success."

"You have to look at the corporate environment," said Weiss, "what are the goals, what are the development costs, what are the annual running costs . . ."

Most sites, said Weiss, "seem to forget initial costs and how to average this across a system's life expectancy." This he estimated as an average of 20 to 36 months.

"If people are going to be cut," he said, "name them." He also advised questioning the value of making a change. "Ask questions," he urged. "Do you have the talent? Can the hardware and software do the job you are looking at? Are you the first and, if so, are you willing to be a pioneer?"

#### Pioneering idea

What might be and seemed to be to some a pioneering idea was put forth in a session titled "Obsolescence and Self Assessment," conducted by Paul Armer, a director of On-Line Business

Systems of San Francisco. Armer likened talking to people about their possible obsolescence to talking about venereal disease. "Nobody wants to admit he's going down hill."

Armer's was a well attended session with an interested if argumentative audience. He described his own evolving interest in self assessment and a self-assessment study published by the Association for Computing Machinery (ACM), suggesting that DPMA might do well by itself to publish the same test.

A questioner from the audience suggested that the ACM test was directed to ACM members. "Do we need that?" Another member of the audience said, "Maybe not but our people do."

DPMA conferences are reminiscent of small town Rotary club meetings in that all major sessions have an invocation and maybe even a flag salute. The keynote session went one better than any Rotary meeting ever held. There was an invocation, eloquently delivered by C. Richard Brune who is both an ordained minister and a data processing manager, addresses by both the mayor of Las Vegas and one of Nevada's senators, Howard Cannon, and two anthems. One was the "Star Spangled Banner," familiar to all and everyone stood. They sat down when it was over only to tentatively get up when the second went on. No one, even by the last day of the conference, was quite sure what

CIRCLE 117 ON READER CARD

that was.

The conference had another patriotic note thanks to one of its luncheon speakers, Charles P. Lecht, president, Advanced Computer Techniques Corp. He was to have addressed the privacy issue of data bases but he chose to talk about "what America is all about." "When you look at the U.S. machine," he said, "other governments are clunkers by comparison." He also noted "the rights of individual citizens are honored here more than anywhere else in the world."

Another DPMA luncheon speaker, Herbert H. R. J. Grosch, took issue with some of the things Lecht had to say. "He's spent too much time in Yugoslavia," said the perennial gadfly Grosch of Lecht. "Maybe we should call him well-traveled Charlie."

### Look at privacy

Like most of today's data processing conferences, DPMA's took a look at the privacy issue. Chairman of the session that did this was William A. Fenwick, attorney with Davis, Stafford, Kellman and Fenwick, Palo Alto, Calif. He talked about the federal Privacy Study Commission, saying that it is "the hardest working commission I've ever been associated with," but adding that "its charter is so terribly broad that it cannot possibly carry out its mission."

Fenwick did say he doesn't think

there will be any omnibus privacy legislation, either state or federal "within the next two years." He predicted that there is a growing trend in the state sector towards more "cautious legislation" which he feels will give the private sector, as yet unaffected by existing legislation, "some breathing time."

Jack Osborne, director of the Privacy Research Center at Purdue Univ., described their concept. "There is no greater power than information and control of information about individuals," he said. "Our center is going to look at some areas of information policy and attempt to factually analyze and provide some real data on given issues.\*

## Electronic Funds Transfer

### EFT: Other Issues And Legislation

It's a rare conference touching on any aspect of data processing that doesn't have a session on electronic funds transfer systems (EFTS). Only the focus changes a little.

Two conferences last month, Info 76 in Chicago and the Data Processing Management Assn.'s (DPMA) Info/Expo '76 in Las Vegas were the norm. Each looked at EFTS but from a slightly dif-

ferent angle. In Las Vegas, the major concerns seemed to be privacy impact and legislation. In Chicago it was the interests of retailers as opposed to those of financial institutions and legislation.

George Glaser, San Mateo, Calif. consultant who chaired the Las Vegas session, compared EFTS to the privacy issue as a potential legislative hot potato. "EFT is likely to make privacy look like an also-ran in terms of legislation," he said. "Banking communications raises privacy questions and other questions like consumer rights, interstate commerce, fair trade, and antitrust. Nobody is sure what can be protected or prevented."

He listed the "players" in EFTS as: banks, both federally chartered and state; mutual savings banks; savings and loans; credit unions; credit card service organizations; travel and entertainment card companies, and participating commercial organizations such as TRW and National Data Corp., and retailers, the "sleeping giant."

Another speaker on his panel, Paul Armer, a director of On-Line Business Systems Inc., San Francisco, added another—the federal government. "Branches of the federal government are in competition with one another in EFTS. Banks have been defecting from the fed and if you're paranoid, and I am, you can see the fed using EFT as a way to get them back into the fold."

HONOR ROLL  
1976

Looking for a faster, more flexible and secure system to maintain the program libraries in your computer installation? SDI has the solution, FLEET, a library control and maintenance system designed to increase program security and simplify program maintenance. Operating in DOS or DOS/VS environments, FLEET maintains core-image, relocatable and source libraries up to 10 times faster than IBM-supplied programs, while conducting extensive security checks to guarantee that the libraries being serviced are sound. FLEET also produces complete audit trail

information on every change to your libraries. FLEET programs give your programmers a new dimension in source program development and maintenance while using the standard DOS and DOS/VS libraries. All FLEET programs are self-relocating and operable in foreground environments. FLEET will save you vast amounts of time—machine time and program development time. It may even save your library. Contact the SDI office nearest you for a presentation of FLEET—the enhanced DOS and DOS/VS library maintenance and control system.

# news in perspective

## Four areas of law

Glaser noted that there are four areas of law which bear on EFT. One, he said, is legislation affecting branch banking. "Fifteen states prohibit branch banking." He listed privacy legislation as second, universal commercial code as third and antitrust legislation as fourth.

He talked about the progress of Automated Clearing Houses (ACH's). He said there were 17 in early 1976 handling 4,000 transactions per month. In July, he said, they were experiencing 23 million transactions per month with expectations of 36 million per month by the end of 1976. He told of a "large interregional ACH exchange pilot" which the Federal Reserve Board is spearheading and which is expected to get underway next spring.

Armer believes EFT legislation is needed "to protect the consumer's privacy." He feels EFT "makes it technologically feasible to abuse civil liberties on a major scale because information currently scattered becomes concentrated, accessible, and processable."

David Huemer of National BankAmericard Inc. does not want "heavy legislative control." He said this could lead to misdirection (of EFT efforts) and

could adversely impact inflation. Huemer said he believes the consumer's main concern is protection of his money. "What happens if a credit or debit card is lost or stolen."

And Herbert H. R. J. Grosch, an active questioner throughout the DPMA conference, wondered if financial institutions weren't pushing EFT out "of greed rather than necessity."

Glaser responded that there certainly is no crisis but "if they wait . . . ?"

## Favorable prognosis

At the Chicago EFT session, Joel Crabtree of Continental Bank of Chicago said he believes the prognosis is good for electronic banking legislation in 1977. Continental is a bank which isn't waiting. It often has been referred to as "the EFT pioneer." Existing laws have been a problem for Continental which is operating in a unit banking state.

He feels this circumstance has contributed to the progress Continental has made in EFT. "Look for innovation in Illinois or Oklahoma (another unit banking state). Don't look to the East Coast or California. We have to do it to survive."

Crabtree said Continental has Ad-

dressograph-Multigraph Amcat 1 terminals in 300 Dominick stores, 180 National Tea stores, eight Treasure Island stores, 12 Wieboldt's and one regional amusement park. He said the bank's network handles one million transactions per month and is experiencing 98% up-time. Terminals handle master charge authorization and check approval in from two to five seconds. On the same network, Continental has 14 Docutel automated tellers. One is in its head office lobby and two in a "convenience corner" which is one corner of the four block square the head office occupies. A recent Illinois law permitted banks a second office within 15 feet of the main office and Continental opened one. Five of its automated tellers are there, one outside and four inside.

"We hear a new law is coming which will let us have another office within two miles," Crabtree said with just an overtone of bitterness.

The last two of Continental's automated tellers are inactive now having been shut down Oct. 22, 16 months to the day from when they became operative, because of a federal court ruling that they constituted branch banks and, therefore, were illegal in Illinois.

## Two levels

Crabtree looks for electronic banking legislation "at both the state and local

level" in 1977.

He mentioned that Continental, in addition to its activities in supermarkets and with automated tellers is looking into in-home bill paying via touch tone and transaction telephones. "Our friends in the Post Office are contributing to this with their talk of the 17¢ stamp." Crabtree said in-home bill paying has been placed second in Continental's plans to supermarket terminals and automated tellers because it "represents a quantum leap in customer education."

Customer education and consideration in the evolution of EFTS was cited by two retailers addressing the Chicago EFT session as being of vital importance.

Bill Bishop, member of the Joint National Assn. of Food Chains/Supermarket Institute Electronic Funds Transfer Committee, urged financial institutions to "let this input in or it's gonna force itself in." He referred to problems the supermarkets are having because they didn't do this in introducing the Universal Product Code (UPC).

Bishop said he knew of 77 experiments involving supermarkets and financial institutions but emphasized that "most supermarkets still believe these are in an experimental phase and they are not 100% committed." He said he had attended a meeting of his committee recently in which the question was

asked: what have we learned from these experiments? The answer he said, was complete silence.

Continental's Crabtree said banks are coming to realize that customers want an "arms length" relationship with banks and that EFT fosters this.

Bishop's response to this was "banks want to move functions away from themselves and so do we (supermarkets)." He was concerned about a full debit card. If that happens, he said, "who's gonna keep the paper. We don't want to."

He had a list of things supermarkets want and don't want out of EFTS.

They want: 1. Increased convenience to customers such as in faster service. "The number one complaint of customers is waiting in line. What will happen if we add banking services?" 2. Reduced labor costs. He said supermarkets pay an average of 10¢ per minute to each clerk and this is increasing 10% per year. 3. A system that minimizes disruptions. 4. Reduced check loss.

What supermarkets don't want, Bishop said, are: 1. to increase operating costs, 2. to determine where a person banks, 3. to have to turn away customers and 4. to get too involved with the communications with their customers involving EFT.

Bob Bozeman, vice president of Allied Stores, spoke for the general mer-

chandise retailer of which, he said, there are 250,000 in the country. He said there are five characteristics financial institutions should recognize about general merchandise retailers when they think about involving them in EFTS. These are 1, diversity; 2, a large amount of business done on credit; 3, they're very industrious and ingenious in developing customer traffic; 4, they're good at putting together customer traffic and things to sell and 5, retailers are born negotiators.

"We're proprietary about our customers," he said. "We have 5,000 point-of-sale terminals on our network and we expect to expand threefold in the next few years. We think EFT should fit in some way but we're uneasy. Standardization is up in the air. The question of whose customer is up in the air. It is important that financial institutions understand the retailer better. For the general merchandise retailer EFT is going to be a step by step proposition."

The question of who should pay for EFT services came up repeatedly. Bishop's answer: "The way that's answered probably will determine the success of EFT. We (the supermarkets) probably will favor unbundling the costs and ultimately, to a degree, the customer probably will be asked to pay."

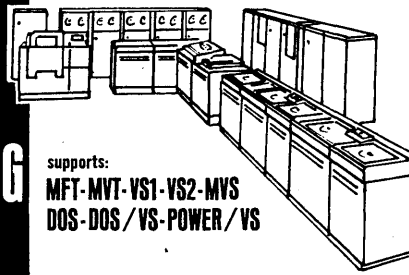

So what else is new?

## Communications

### Bell Seen 'Wearing People Down' To Capture Markets From A to Z

If American Telephone & Telegraph Co. is Joshua, then the walls of Washington, like Jericho, are going to come tumbling down. The "chiseling away" at those walls, says former telecommunications chief John Eger, has already begun.

"Over time," he predicts, the com-

munications giant "will chip away at competition and at the Federal Communications Commission's rules, getting them to redefine communications and data processing. And more and more, without a change in Congress and without a change in the consent decree, they

will have managed to get exactly what they want—a substantial chunk of the telecommunications market in which they will be able to provide telecommunications services A to Z."

In order to capture those A to Z markets, Eger sees Bell doing exactly what it's been doing so successfully for years—"wearing people down." The federal government at all levels is particularly vulnerable to this tried-and-true tactic. Eger explains why: "There are responsible people in government who honestly believe that in a world economy the only way for the U.S. to remain dominant is to build tremendous super powers, great big industries like AT&T that work hand in hand with the government.

"Unfortunately, that view of the world," Eger insists, "is perverse and antithetical to everything we've always believed about capitalism and a free economy and marketplace. But people have a sense of frustration about their government and big business, and the bureaucratic mind is very susceptible to a solution that sounds like it's going to do away with the untidiness of the free-enterprise system."

#### He's unwinding

Eger, an outspoken booster of competition, says he's unable to tap into this bureaucratic mindset. Unwinding from two-and-a-half years as the acting director of the Office of Telecommunications Policy, the 36-year-old lawyer claims he was more than ready to trade in his dark pin-striped business suits for sports clothes and sweaters.

As the executive's communications czar, Eger spent an average of 14 hours a day on the job, which he admits, has left him "physically and mentally exhausted." The change of clothes for the new job—counsel for the Washington law firm of Lamb, Eastman & Keats—has given him a new lease on life. Or so it appears.

But appearances are sometimes deceptive. Having embroiled himself in a series of pot boiling communications controversies, not the least of which was the squabble over the AT&T-sponsored Consumer Communications Reform Act, Eger, some Washington watchers are quick to point out, set himself up to be struck down. Struck down and eased out of a job that some say he could never quite lay claim to.

A native of Chicago and a lawyer by profession, Eger began piling up his communications credentials early. From 1965 to 1970, he worked with Illinois Bell, serving his last year there as business systems project coordinator and liaison to Bell Laboratories Information Systems Center. After receiving his law degree from John Marshall Law School in 1970, he joined the FCC's regulatory ranks, working as a legal assistant

## LARGE-SCALE OPPORTUNITIES IN ON-LINE SYSTEMS DEVELOPMENT

in the part of San Diego that even San Diegans dream about

#### Communications Software Development

These positions entail the system design and development of software for large communications networks. Experience at all levels in assembly language and a mini-computer background is necessary. Experience in telecommunications, software and a related BS degree is preferred.

#### Software Support

Requires persons skilled in assembly language, with a sound background in mini-computers to perform maintenance and field support of telecommunications networks. A number of these positions provide the opportunity for substantial travel and customer contact.

Even though we're in the "country"—about halfway between La Jolla and Torrey Pines—we're still just minutes from downtown San Diego. Our mission here is broad: development of large-scale on-line systems for customers throughout the world. You'll be creating for the long term, drawing from the full spectrum of NCR technical resources. You'll enjoy an excellent salary, generous benefits and the advancement potential that accompanies NCR's policy of merit reviews. If one of these new positions describes you, get set to make your last move.

Please submit your resume including salary history to Bruce Bertsch, Manager, Industrial Relations.

CIRCLE 70 ON READER CARD

Plan to be there when  
**COMPUTER**  
**EXPO 77**  
 comes to a city near you.

You'll be able to see the latest and the best in Data Communications Terminals, Software, Minicomputers, Data Input Equipment, Computer Output Equipment, Supplies, Magnetic Media, Modems, DP Education, Small Business Computer Systems, Flexible Disk Drives, Data Communications Interconnect Equipment, Miniperipherals, Magnetic Tape Transports, Cassette Systems, Power Supplies, Printer Terminals, Keyboards . . . and more!

Plus, you'll have the chance to attend exhibitor seminars covering the selection and use of these products and services. No advance registration fee is required from qualified attendees for entrance to the exhibition and exhibitor seminars. Just present your business card at the registration desk, or ask one of the vendors in your area for a free ticket to Computer Expo 77. Exposition Hours are from 10AM-5PM.

In addition to Computer Expo, there are Computer User Forums. Each day of the Caravan in all nine cities, we'll have User Forums from 9AM to 1PM. Leading local users and independent consultants will present tutorials and workshops on these important topics:

- Tuesday: Case Studies in Applying Minicomputers
- Wednesday: Case Studies in Managing Terminal Networks
- Thursday: Case Studies in Improving Software Productivity

Forums for Computer Designers will also be held in five cities on the '77 tour: San Francisco, Los Angeles, Chicago, New York and Boston. Topics will include: Evaluating and Using Microprocessors; Evaluating Peripherals for Mini- and Microcomputers; and Evaluating Memory and Storage Devices.

The fee for the Forums is just \$45 for the first day, and \$35 for additional days. Advance registration is recommended. Just call our toll-free number, (800) 225-3080 for additional information and registration materials.

**Who should attend:** President, Executive Vice President, Vice President—Operations, Director of Data Processing, Data Processing Manager, DP Operations Director, Administrative Manager, Senior Systems Analyst, Senior Programmer, Engineering Management, Engineering Staff, Financial Officers, Operating Department Heads.

**It's all coming to a city near you.** San Francisco Civic Auditorium—*March 29-31*; Los Angeles Convention Center—*April 5-7*; Cleveland Convention Center—*April 19-21*; St. Paul Civic Center, Minneapolis/St. Paul—*April 26-28*; McCormick Place, Chicago—*May 3-5*; New York Coliseum—*May 10-12*; Philadelphia Convention Center—*May 24-26*; Sheraton Park Hotel, Washington, D.C.—*May 31-June 2*; Northeast Trade Center, Boston—*June 7-9*.

# news in perspective

to chairman Dean Burch.

Nominated by former President Nixon, Eger began his first stint at OTP as deputy director in April 1974. A short five months later, he was tapped to be the acting director, replacing Clay T. Whitehead, the founding director who had resigned.

It was a big job and a big responsibility for the then-34-year-old administrator. "The first few months," he recalls, "I felt a little bit funny about being the acting director . . . But after six months I felt I might as well go ahead and do the job. People expected me to be a director so I couldn't hide in the shadows."

## A paper tiger

Stepping out of the shadows and into the spotlight, Eger soon began to confront the realities of his new job. One of the harshest realities he had to face was the severe operational restrictions crippling the executive office he was now running. Because of a "compromise" hammered out under the Nixon administration, the fledgling telecommunications authority, set up in 1970, was little more than a "paper tiger," Eger confesses.

The original proposal would have given the telecommunications office responsibility for coordinating the federal government as user and policymaker. But under Nixon, the now-famous Rostow task force report, which spearheaded the drive for a strengthened executive telecommunications voice, was virtually ignored. As a result, the subsequent Nixon reorganization plan, supplemented by an executive order, transferred the telecommunications role of the Office of Telecommunications Management and related duties of the assistant director of the abolished Office of Emergency Preparedness, to the newly-created OTP.

After all this bureaucratic maneuvering, Eger complains, the office was left with "no decision making authority at all except to coordinate under an executive order." To make the office have teeth, he contends, this executive order "should be translated into statutory authority."

With no real power behind it, the ill-fated telecommunications office became a prime target for zealous government revampers who wanted to trim the size of the executive office of the President. One such scheme surfaced early

in the Ford administration, when the Nixon backlash hit its peak. At that time, Eger remembers, OTP "was looked upon as a Nixon/Agnew/Whitehead anti-media office."

So Ford, under the advice of his top advisers, decided to take the \$9 million office with its 60 employees and "tuck it away in the Department of Commerce." But Congress, alerted to this behind-the-scenes plotting, scuttled the plan by forcing Ford to back down.

## Saving an agency

Eger, who had only been at OTP for a couple of months when the storm broke, found himself and his office under the cutting edge of this Sword of Damocles. With the help of the Hill, mainly Sen. John Pastore, Eger manager to save the agency. But maybe not for long as he points out: "OTP will always be in danger until it has statutory authority or as long as nobody is quite sure of the importance of communications in our society and the role of the President in formulating communications policy."

Unfortunately, he laments, "every President has had a different view of communications." Only time will tell what President-elect Carter will do, but Eger is hopeful that the new Democratic administration will be taking a harder look at these crucial issues. "I know

**DISPLAY AND STORAGE SYSTEM**

Introducing the DELTA 4700: the data storage and handling system that reduces computer time, lowers data processing costs, and simplifies data handling for text editing, data entry, and data storage and retrieval applications.

- Store and access up to 1.25 million characters
- Up to 16 kilobytes of read/write memory (up to 64K option)
- Data manipulation, including Read/Write, Modify, Search and Copy.

The DELTA 4700 System also:

- Is backed by nationwide customer service in over 150 locations
- Offers compatibility with IBM 3740 formats
- Includes a confidence diskette for diagnostics
- Optionally contains a Disk Monitor System for assembly and text editing of programs, along with a separate terminal/disk debug package
- Is supplied with full documentation—hardware and software.

Contact us today for more information.

Carter is serious about reorganizing government," he explains. "And if he does what Democrats traditionally do—try to use government more effectively—he will probably want to see the executive play a bigger role." This could be "healthy," Eger believes. "Carter could beef up OTP or create a department or independent agency with teeth," he speculates.

Sources close to the Carter team seem to back up Eger's contentions. A telecommunications authority, operating as a department or agency, they claim, will be set up during the next year. During his campaign, Carter evinced considerable interest in these issues, speaking out several times on the Consumer Communications Reform Act (Bell bill) and on the Justice-AT&T antitrust suit, which he apparently intends to support. As further evidence of his communications involvement, he also looked into setting up a communications policy task force in the early days of his campaign.

#### Procompetitive bill

While Carter has attempted to meet some of the tougher telecommunications issues head-on, President Ford, who has historically taken a lower key approach to these questions, has chosen to pursue the broader problem of regulatory reform. As a member of the Presi-

dent's Ad Hoc Committee on Regulatory Reform, Eger had proposed four pieces of communications legislation which he aggressively tried to get the White House to promote.

JOHN EGER

One of these bills, called the Common Carrier Competition Act, Eger characterizes as a "procompetitive bill," which he admits "is outdated as I look at it today."

The basic thrust of this measure, he

explains, was centered around the theory that "monopoly could co-exist with markets for competition." According to Eger, the bill was designed to deal with the state-federal jurisdictional questions through a supremacy clause; take the regulatory load off certain classes of carriers; and ease the burden of entry in the computer communications field by writing in a marketplace presumption to entry.

But despite Eger's valiant efforts, the bill never got out of the committee. The group, he reveals, "rejected it because it was too early in the year (1975) and too complicated." What he doesn't say is that it was also too controversial to handle so close to an election year.

#### Bell's reaction

Bell knew this all too well. Catching wind of Eger's proposal, AT&T began to brainstorm its own bill. A tremendous lobbying effort was then set into motion directed at Congress and the White House, as well as all the federal agencies. The White House tactics were perhaps the most interesting, if not the most significant, since they reportedly involved none other than AT&T board chairman John deButts and AT&T vice chairman William Ellinghaus.

On AT&T's White House campaign, Eger ironically quips that "obviously Bell had made their points well. They

## news in perspective

sold their case," he adds, "at every level of government. This is one of their biggest advantages. They have dealt with the government for a long time and nobody understands the structure of government better than AT&T."

However, one of the agencies Ma Bell didn't dare approach was OTP. "Bell gave up right from the start," he says, "with pressuring OTP. They knew that we had our hearts set on competition. So the only way to soften that blow," he reveals, "was for them to check OTP at the Office of Management and Budget, the White House and other agencies to spur the fighting between us."

And it couldn't have worked better. If anybody knows this it's John Eger. Always outspoken and ever-ready to tackle the most complex communications questions, Eger felt he had to counter Bell's moves by taking a strong stand against the competition-thwarting legislation.

Last spring, he vainly tried to rally Oval Office support for his stand. "What I was really trying to do as much as I was trying to get them to oppose the Bell bill," he explains plaintively, "was to get them to adopt the OTP bill—the Common Carrier Competition

Act." He failed dismally on both counts.

Trying to save face, he remarks, "I have said publicly that even though I privately thought that I'd like to see the President oppose it (the Bell bill), I knew that for political reasons there was no necessity yet for him to do so. I knew the legislation wasn't going to pass this year."

### Houser in the wings

But what he may or may not have known was that the White House, fed up with their Peck's bad boy, already had his replacement waiting in the wings even before he made what turned out to be his final official public pronouncements on the bill. Government sources claim that that replacement, new OTP director Thomas J. Houser, was an early-on White House favorite, having been hand-picked by top AT&Ters close to the chief executive and his coterie of advisers.

"I kind of knew the White House was looking," Eger now sheepishly admits. "I was physically and emotionally drained. I helped them (the White House) define what they needed and did some leg work for Houser. I wanted to get out of there. It was time for me

to get out. Some people might say I got pushed, eased out. But I was ready to be eased. It was mutual."

Mutual or not, Eger resigned from OTP early last summer. But not before sounding a sharply-worded warning against the Bell bill. In his June 3 address in Hyannis, Mass., before the Electronic Industries Assn., the competition enthusiast blasted the legislation, calling it a superficially appealing, deceptive and beguilingly titled bill that "will serve more to retard consumer communications than to reform it."

In that speech, Eger's, if not the Administration's, message was clear. "To propose that the development of telecommunications might best be served by a single vested interest, free to regulate the pace of technological growth, and unencumbered by the stimulating effect of aggressive competition is, in my judgment, sheer folly."

When Eger was running the show at the telecommunications office, "there were regular (OTP-Justice) consultations," he confides. "It was no secret," he says, "that it (the AT&T antitrust case) was a subject of considerable concern. It's natural to have a dialogue."

Hoping to stimulate such a dialogue on another level on other telecommunications matters, the ex-bureaucrat continues to speak out on the issues. In trying to psych out Bell's game plan, Eger

# The key difference in computing services is people.

Think for a moment. When you have problems with computer services, are they rooted in hardware, software or people? Generally, it's people.

At CallData™ we're concentrating on people to provide personalized service. But, of course, our house is in order.

We have: *five* major computer systems; *five* major software libraries plus selected application software; coast-to-coast networks in operation; complete technical support; and backup in other areas, such as microfilm services and automated publications.

So try your problems on CallData. We have a full house with a real difference: people who believe that personalized service is the way to grow.

CIRCLE 104 ON READER CARD

lays out what he believes will be "the next stage of a possible AT&T scenario." Calling the Bell booster bill "a red herring," he claims that in the next phase of AT&T's strategy they will "try to push something similar through the Senate. If that fails," he predicts AT&T will "try to work on the banking committee for an electronic funds transfer system (EFTS) bill. They could also work on the agriculture committee for a rural telecommunications bill or on the government operations committee to try to restructure the government."

Another possible Congressional target is the armed services committee. "Bell certainly can make some very convincing arguments for the need for end-to-end security," he notes.

### Bell can't lose

Even if they continue plugging their original bill, Eger feels "Bell can't lose. They can get their legislation passed and get everything. If they can get one of the provisions passed, even the findings . . . that will result in the same thing." A resolution, which Eger says would just extend the timetable, could also prove advantageous to Bell.

"It's a no lose situation for Bell," he reiterates. "They're gonna get ya. They are a big gigantic corporation with tremendous resources that's decided it doesn't like competition." And they're

also a big gigantic corporation that's totally committed to getting its way.

Eger fears that the cost to combat Bell will be monumental. It's going to cost us millions and millions, if not billions of dollars in resources," he predicts, "fighting this attempt by Bell to reaffirm its monopoly, not just over the telephone network, but over all future communications which involves the entire computer and data processing industry. It's a fight," he warns, "that Bell intends on pursuing with all of its strength, all of its resources and with all of its knowledge of government and other industries."

### Computer inquiry

Eger also worries that the company, working through the FCC's reopened computer inquiry, could get the upper hand. A redefinition of data communications, he insists, "would do nothing but enhance the telephone company's position . . . bringing over time an industry that's healthy and viable and alive and unfettered into that murky, gloppy and monopolistic regulated environment."

The threat is real, and should especially be heeded by the dp industry, he warns. If Congress fails to act and Justice reneges by not forcing a restructuring "then the strongest implications for the rest of the data processing industry

are that everything, every product, every service will be regulated. For the user that will mean very little choice. And it's the users and the public who will be the big losers."

Most of Eger's prognostications center around these big losers—the consumers—and the big winners—the corporate behemoth, AT&T. While his predictions on the outcome in this fight to the finish are gloomy, his own personal outlook is optimistic.

Now, after six months of isolation from the bureaucratic mainstream, Eger claims he can look back at his trials and tribulations at OTP and be more objective. And a little bit sorry too. Sorry that he's not in on all the action now that the controversy over these telecommunications issues has really started to heat up.

"I would be naive to say that I didn't have any regrets," he admits candidly. "But I don't feel that I'm out of it completely. I'm still given a platform to speak. Maybe it's not the spotlight but I had that and I don't need that anymore. I spoke my piece—I laid out what I thought were reasonable approaches to solving the problems. So the best thing I can do now is try to contribute by continuing to be a responsible spokesman, calling the shots as I see them."

—L.F.

# PROGRAMMER

## (ASSEMBLER)

R.J. Reynolds Industries, Inc., Winston-Salem, North Carolina, has several new openings within the Computer Planning Department for experienced BAL Programmers.

Applicants should possess the following:

- Experience in writing and debugging on-line computer programs using assembler language.
- Working knowledge of DOS and/or OS and the control language.
- Willingness to work extra or odd hours whenever necessary.
- Undergraduate degree preferable.

Excellent benefits package.

GENERAL  ELECTRIC

## News in Perspective

# BENCHMARKS

**Justice Dept. vs. Bell:** A major anti-trust case brought by the Justice Dept. against American Telephone and Telegraph Co. has been given the go-ahead after being filed two years ago on Nov. 20, 1974. Federal District Judge Joseph C. Waddy has ruled against an AT&T contention that the Federal Communications Commission has jurisdiction over issues raised in the suit and that it should be dismissed. The judge said his court holds jurisdiction and thus gave the Justice Dept.'s antitrust division the go-ahead to begin years and year of pre-trial work. In its suit, the department seeks to force AT&T to divest itself of Western Electric Co., its manufacturing arm, and of its Long Lines Department, which handles long distance service. In its initial request for AT&T documents in January 1975, the Justice Dept. asked for every piece of paper in the Bell System's possession that was "prepared, sent or received since Jan. 1, 1930," that relates to the issues.

**deButts on Bell Bill:** AT&T Chairman John D. deButts explained the other day what he feels is the purpose of such legislative activity in Congress as the Consumer Communications Reform Act. In a talk to the Telephone Pioneers of America, deButts said that "accumulating FCC decisions—each arrived at piecemeal but all trending in the same direction—might so thoroughly supplant the principles on which our business is based that we ourselves might have no other choice . . . than to set a different course for ourselves." He said he wanted Congress to decide what "the American people expect of us." He feels that course might be to realign its rates, limit its service responsibility as more and more non-Bell terminals are attached to its lines, and change its R&D priorities, giving more response to competitive pressure points and "relatively less to fundamental systemic improvements of advantage to our entire customer body." He told the meeting that this is what he "might have said" in recent testimony before the House Interstate & Foreign Commerce communications subsidiary, but didn't.

**Another Voice in Washington:** The Data Processing Management Assn. will open an office in Washington, D.C. in mid-1977 "to give the association a direct line to dp-oriented developments and legislative initiatives originating on Capitol Hill or with any regulatory agencies." DPMA president J. Ralph Leatherman said, "If any legislation is passed, it is less likely to be inconsistent with the needs and aims of the information systems profession." He said it will coordinate with the activities of the

Washington office of the American Federation of Information Processing Societies of which DPMA is a member. The association hopes to have selected someone to run the office in early 1977.

**Another Carrier:** Graphnet Systems, Inc. received Federal Communications Commission approval to launch a data transmission service by leasing 131 circuits from other carriers to create the network. Initially it will be offered in 29 of 50 cities where the company already operates a facsimile transmission service. The company told the FCC it expects to spend about \$500,000 a year on leasing costs and that its investment in related equipment will be about \$3.3 million over three years. Western Union opposed the application.

**Must Improve Service:** Canadian remote computer service firms who wish to remain viable will have to incur heavy expenses to improve services, says a study released by Frost & Sullivan, Inc., New York City market research firm. "And such investments will have to be made during an unfavorable market phase ahead," the study says. "Competition from the minicomputer will become significant, and other vendors especially insurance companies are invading the RCS field. The beginnings of a full-blown price war are evident." The study indicates that revenues generated by remote computer services in Canada, at \$60 million in 1975, will reach nearly \$360 million by 1984, an annual growth rate at more than 21%. But, it indicates that profitability will not parallel the revenue growth.

**High Rating for DEC:** Users of Digital Equipment Corp.'s large scale computers expressed a higher level of overall satisfaction than the users of any other make of general purpose computers in a survey by Datapro Research Corp. of Delran, N. J. It was the third consecutive year that DEC had placed highest in the survey, which this year involved 1,765 users who operate a total of 2,095 systems, including those of Xerox, Amdahl, IBM, Univac, Burroughs, Control Data, Honeywell and NCR, which placed in that order. In another survey, Datapro found that Data 100 Corp.'s remote batch terminals rated highest in overall performance, followed by those of Computer Machinery, IBM and Sycor. The terminals study drew responses from 250 users who have a total of 1,771 installed batch terminals. The complete survey results, which are published in the November supplement of Datapro 70, are available separately under the titles of User Ratings of General Purpose Computer Systems, and

All About Remote Batch Terminals, at \$12 per copy, from Datapro, 1805 Underwood Blvd., Delran, N.J. 08075.

**Components Firms Merge:** Intersil merged with Advanced Memory Systems Inc. in early November, creating a formidable semiconductor manufacturing organization with combined revenues of \$72.9 million. The new company will be known as Intersil, Inc. and Intersil's president Orion L. Hoch will be president and chief executive officer. Other directors: Frederick R. Adler, Paul Bancroft III, Robert J. Emmons, Christopher D. Illick and Kenneth J. Thornhill.

**Quadrupled Earnings:** Applied Data Research Inc., Princeton, N.J. software firm set a revenue record of \$3.9 billion in its third quarter this year, up from \$2.9 billion a year before. John R. Bennett, president, said income in the third period nearly quadrupled to about \$375,000 or 30 cents a share from the 1975 period's \$97,734 or eight cents a share. Bennett said the record profit included some \$235,000 or 20 cents a share, from continuing operations of the business and \$140,000 or 10 cents a share, from a tax loss carry forward.

**But No Trophy:** Data General shocked Interdata 38-6 to win the third annual Data Bowl flag football game last Nov. 6 at Westboro, Mass. In 1974 and 1975, Interdata defeated its northern rivals 19-12 and 14-6 in the annual classic which features Interdata's twirlers, a color guard, the famed "Drum, Stumble and Bugle Corps," the "Marching Kazoos" and Data General's St. Bernard mascot, Heather. Plus copious quaffing, which led Interdata coach Don Reinhart to explain that his opponents, being the home team, had not partied as heavily as his team. He said, "our players' hands were still shaking during the first half," when Data Gener-

al took a 32-0 lead. Defensive and offensive stars of the game were Mike Boucher, 6'6" and 230 pounds, and Gary Innamorati, playing his first bowl game, both from Data General. During a post-game party a van belonging to Data General's Skip Stiles was stolen. It contained souvenir Data Bowl mugs and the Data Bowl trophy, which will be replaced. \*

**“We’re doing a bigger job  
with four programmers  
than we used to with 16!”**

“We had 1000 programs in a system that was trying to maintain 128 files daily. It was almost unmanageable.

“Our workload had grown to include the servicing of 68,000 installment contracts, maintaining a land inventory of 70,000 parcels, and paying commissions to 1000 salesmen.

“We didn’t bother to estimate a new system in Cobol; we knew we couldn’t afford it. And the packaged solutions were only piecemeal. We turned to MARK IV.

“With six people and MARK IV we developed a major new system in 18 months—and it’s fantastic. It does everything from evaluating salesman effectiveness to paying water bills. It lets users develop their own requests. It provides daily data validation, daily updates, daily reporting and other-period reporting. It permits interrogation on the status of a contract, a salesman record or a lot. In its re-

sponse to changes or to one-time requests for management information, it’s extraordinary.

“We now have three data bases—land inventory, salesmen and contracts—and these four basic application modules:

1. Installment contracts, involving all processing for contract set-up, payment and adjustment application, delinquency and dunning reporting, factoring or contract pledging, and management reporting.
2. Commission payments, covering salesmen’s commissions payable and maintenance of salesmen’s accounts receivable.
3. Controlling and accounting for land inventory from the time a project is recorded to the sale and deeding of the last lot.
4. Computing of all resultant accounting entries on an installment or accrual basis.

“Now we’re doing a bigger job with four programmers than we used to with 16, and the problems we had with the old system are gone.”

**WHAT IS MARK IV?**

MARK IV is the most versatile and widely used software product in the world for application implementation, data management and information processing. Six powerful models (prices start at \$12,000) are in daily use on IBM 360/370, Univac 70/90, Siemens 4004 and Amdahl 470 equipment at 1000 sites in 42 countries. Programs in MARK IV require only about 1/10 the statements of Cobol. Users say no other system offers the power, flexibility and simplicity of MARK IV.

# LOOK AHEAD

(Continued from page 18)

## BIGGEST COMPUTER SHOW IN HISTORY

Where else but in Texas would you see the biggest computer show in history? That's what AFIPS officials are saying about the National Computer Conference next June 13-16 at the Dallas Convention Center where 250 companies already have purchased 1,060 exhibit booths. That's well ahead of the 943 booths sold last summer at the NCC in New York and the 990 booths at the largest affair to date--the Fall Joint Computer Conference in Las Vegas in 1969. In addition, with the growing interest in personal computers, a commercial exhibit for persons selling to that market also will be held in the vast convention center. It's the complement to a personal computing fair that is being held as part of the 1977 NCC.

Nobody's guessing at the turnout--but it could be big. Dallas, it's noted, is third in the nation in numbers of corporate headquarters, after New York and Chicago. That should provide a large--or at least high quality--turnout to the show and conference.

## FOR THE SMALL GUYS

A new California trade organization called the Electronic Assn. of California, staffed by a number of former WEMA executives is definitely non-competitive with WEMA, a 33-year old association of 750 companies, said its president, James Conway, formerly a WEMA vp and Eben Tisdale, formerly vice president, governmental affairs for WEMA and a legislative consultant to the new group. Both men emphasized that the new association is aimed at small companies, generally with fewer than 500 employees. It will offer such services as a credit union, group insurance, and a news letter which many of the big companies which belong to WEMA don't need. Tisdale said he will concentrate on exploring legislation which might affect member firms on the state and local levels.

## NBS MAY BE TARGET OF GAO STANDARDS STUDY

Fed up with the government's snail's pace progress in dp standards development, a fleet of auditors at the General Accounting Office has been conducting a major probe into the standards making process. Underway since last June, the study has been looking into the problems federal standards setters are having in getting hardware and software standards out on a timely and enforceable basis.

When presented to Congress early next year, the GAO recommendations may call for a revamping of the supervisory role traditionally held by the National Bureau of Standards. It also has zeroed in on the American National Standards Institute and the Computer and Business Equipment Manufacturers Association. But much of the fingerpointing will be in the direction of the National Bureau of Standards which has been a prime target of criticism for its lethargic standards activity.

NBS was blasted in a recent report released by the house government operations committee. Pointing to the agency's unsuccessful ten-year effort to develop input/output interface standards, the committee charged that this "dramatic example" of NBS failure in the standards area has hobbled competition and diminished cost savings in federal dp equipment buys.

## RUMORS AND RAW RANDOM DATA

Rosebud is the code name for IBM's modified version of Carnation--the 3750 private automatic branch exchange (PABX) marketed in Europe. Rosebud, we hear, could be announced the first quarter of 1977. Competitors still doubt IBM wants to lock horns with AT&T and say that anything announced had better be better than Carnation, which is expensive, aging and doesn't smell so good...Gulliver Technology Corp., Santa Monica, Calif., was late but still first in delivering a non-IBM tape drive with 6250 bpi capability. The first drive was delivered last month to Telefile Computer Products...Data Card Corp. of Minneapolis next month will announce a credit card embossing machine for smaller users--a 400 cards an hour machine that allows users to both emboss and encode at the same time and takes input from a keyboard or 1600 bpi tape. The company makes large machines for big users, but the new unit--the 4000--is the first for smaller users and may sell in the \$40,000 price range...IBM in January will discontinue its applications customizer program for System/3 users after deciding that most first-time users now buy the System 32, for which the company provides industry application programs...How does one computernik look at slot machines? Charles P. Lecht, president of Advanced Computer Techniques Corp., New York, described them to a Las Vegas computer conference as "those machines that tell you to insert coin and then reply with 'coin accepted'".

## Off-line

Something like the "tattletale" needle installed on race car tachometers to indicate to designers and mechanics how fast the driver really revved the engine, Media Recovery, Inc., of Fraham, Texas has introduced "Shockwatch." It's a little impact recorder for use on disc cartridges that changes colors to indicate whether the disc has been subjected to a mechanical shock or force great enough to cause a malfunction. Burroughs liked the idea so much that it now attaches them to all B9385-3 cartridges.

Lear Siegler has already shipped more than 200 kits to build its ADM-3 crt terminal since entering the computer hobbyist market just six months ago. Other interesting numbers this month: Qume Corp. has shipped its 10,000th daisy-wheel character printer, and Dutch electronics giant Philips has manufactured its 10 millionth mini-cassette dictation cartridge at its Vienna, Austria factory.

Does anyone out there manufacture a device capable of converting digital information from 1/4-inch Philips-type (ANSI standard X3BS/-75-43) cassettes to 9-track 800 on 1600 bpi tape format? If you know of one, you could do John Neal of Control Products, Inc., East Hanover, N.J. (201) 887-9400 a big favor by apprising him of the source or sources.

Do sarcastic fringeheads mind swimming in coastal waters heated to above normal temperatures by nuclear powerplants? According

to the Southern California Edison Company's marine laboratory, a 370/168 was used to help show that sarcastics and other marine life not only do not mind the warmer water, they actually thrive in it.

## EFTS Kit

Kits are all the rage among the micro-computer crowd, but now this manufacturer is offering a kit to the banking industry to help them get started in creating electronic funds transfer systems (EFTS). The kit is based on the recently introduced FT-32 financial terminal, and you get 20 of them, complete with integrated 1200 baud modems, card reader and PIN-Pad, and one RC-1500 concentrator/controller configured for two phone lines and connection to a host computer. The FT-32 is said to be simple to install and only requires a telephone drop line. Up to four FT-32s can be clustered on a single telephone drop line. Communication to the host cpu is by standard asynchronous (IBM 2858/2260 and NCR 795/720) or bisynchronous (IBM 3270) protocols. The all-inclusive price for the EFTS-32 Pilot System are \$30K for the asynchronous version, and \$35K for the bisynchronous model. Deliveries begin early next year. DATATROL INC., Hudson, Mass.

FOR DATA CIRCLE 227 ON READER CARD

## Word Processing

This firm may not ever be one of the acknowledged heavyweights in the word processing business, but it certainly is on the right track, considering that it has managed to crack the \$10K or less per station level that is required to compete with the likes of Wang Labs. The System I is a single-station unit containing a single diskette capable of storing up to 50 pages of text, a 16-line page oriented video display, and a bidirectional 30 cps printer. Material entered on the display can be printed out while the operator is typing in new material. Information on the diskette can be instantly accessed for insertion and deletion operations. Additional features include automatic carrier return, super and subscripts, simplified repagination, document assembly capability, and an extended processing package that includes automatic centering, decimal tabulation, stop and switch codes, etc.

The developers, out of Xerox and Storage Technology Corp., already have offices in Washington, Chicago, San Francisco and Denver, and representation in Memphis, Seattle, Albuquerque, Salt Lake City, and Portland. They claim to have enough venture capital behind them so that staying power is not a major concern, so maybe we're witnessing a new major vendor on the rise. System I is priced at

\$9,990. The extended word processing option goes for \$1,300. NBI, INC., Boulder, Colo.

FOR DATA CIRCLE 229 ON READER CARD

## Graphics System

Users couldn't have a wider choice of functions than with the GRAPHIC 7, for the graphics device can be used as a complete standalone system one minute, and as a powerful graphics terminal the next. The RS-232 communications interface makes it compatible with most computers, and if higher speeds are required, a high-speed parallel interface can be fitted. The basic system comprises a 21-inch crt display, terminal controller, and i/o devices such as keyboard, lightpen, and trackball. A read-only memory in the controller contains the Graphic Control Program for handling communications and controlling data entry devices.

Two microprocessors cooperate to tie the package together. The display processor is a general-purpose unit that

operates on 8-bit bytes or 16-bit words, has eight g-p registers, and an 8K 16-bit read/write memory, expandable in 8K increments. The graphic controller uses a 16-bit parallel microprocessor with 40 display instructions, 13 display registers, and four g-p registers. The refresh rates are 60, 40, and 30 Hz. One nice feature of the 7 is a one-button initialize feature that automatically readies the system and allows the operator to immediately communicate with either the host computer or the GRAPHIC 7. Also included are automatic self-test and diagnostics for fault isolation. The product is offered both to oem's and end users, with prices starting at \$32,800. SANDERS ASSOCIATES, INC., Nashua, N.H.

A NEW IDEA  
FROM  
CHARLIE & GEORGE

# Take part in MVS performance decisions with Resolve-MVS<sup>T.M.</sup>

Isn't MVS marvelous?

Its System Resource Manager (SRM) maximizes the use of hardware based on CPU load, I/O load and performance characteristics of each job.

Unfortunately, SRM makes decisions based on the system's needs, not necessarily yours.

The system may be sluggish because it has run out of page frames, auxiliary storage or a job has gone into loop. Up until now there was no way to find the problem and take corrective action.

Or your most time-critical job may be permanently swapped out of memory and you'd never know it. Even if you did know there's nothing you could do about it.

## Immediate Feedback

That was before Resolve-MVS. It lets the user inquire about the system's status and gives the response immediately at his system console or TSO station.

Resolve-MVS gives you three types of services to solve right now problems right now. You get

information services that highlight problems, action services that help you take action to solve the problems and asynchronous services that give you a warning message that a problem is developing.

## It's Resolve Plus

With Resolve-MVS you still have all of the services of Standard Resolve which solve such critical problems as enqueue conflicts, Reserve lockouts, missing I/O operations, paging thrashing and jobs looping or in a wait state.

There has never been anything so powerful to solve your day-to-day operational problems.

## Free for 21 Days

We're so confident you'll like knowing more about your MVS system's operations and in taking part in performance decisions, we're offering Resolve-MVS to you on a 21-day free trial.

For your free trial or more information, call or write Operations

Division, Boole & Babbage Inc.,  
850 Stewart Drive, Sunnyvale,  
CA 94086, (408) 735-9550.

## Mini Floppy Disc

One of the design variations mentioned as a possibility when the original flexible disc unit was introduced by IBM has finally been announced. The SA400 minifloppy disc drive is roughly one-half the size of the standard unit and stores approximately one-third the amount of information. Specific capacities are 89.6 kilobytes formatted and 109.4 kilobytes unformatted. The transfer rate for the SA400 is 125 kilobits/second, and the designers are claiming one in  $10^8$  soft errors and one in  $10^{11}$  hard errors, which is impressive. The cabinet measurements are

The new SA400 minifloppy and storage medium (left) are compared with the standard size storage components.

3.25 x 5.75 x 8 inches (H x W x D) meaning that it will be easy for product designers to tuck a few of these things into upcoming terminal or associated dp products. A controller for the SA400 was also announced, capable of controlling up to three drives. Single units go for \$390, large quantity orders drops the price to around \$250 each, and a box of 10 minidiskettes is priced at \$45. Deliveries are underway. SHUGART ASSOCIATES, Sunnyvale, Calif.

FOR DATA CIRCLE 230 ON READER CARD

## Floppy Disc Systems

The 9512 desk top flexible disc system is really a terminal that features the ability to store, rapidly retrieve, and edit recorded data. Removable media

are used, each with a capacity of 250,000 characters, thus making the 9512 a very low cost on- and off-line storage device. Off-line it can be used for data entry and file retrieval/update, and on-

line it's a terminal, with any remote cpu handling all I/O operations and editing functions through an RS-232 interface. Dual connectors are included to facilitate interface to other terminals, minis, modems, or time-sharing systems. The switch selectable data rates range from 110 to 9,600 baud. Additional standard features include track and sector address, high-speed search string, bidirectional skip, selectable stop codes, data editing, etc. It's priced at \$2,595. TECHTRAN INDUSTRIES, INC., Rochester, N.Y.

FOR DATA CIRCLE 232 ON READER CARD

## \$995 Computer

The Sol-20 is one of the more nicely packaged microcomputers introduced to date, and its developers have been smart, we think, to include a standard

keyboard into the design to make access to the system easier for non-dp oriented users. It's available in kit form or assembled and includes an Intel 8080 microprocessor, 1K character video display circuit, 1K words of random access memory, 1K words of pre-programmed PROM and a customized 85-key solid-state keyboard. Additional features are an audio cassette interface capable of controlling two recorders at 1200 baud rates, parallel and serial standardized interfaces, a power supply/fan, and cabinet.

Software includes a PROM "personality module" to tailor the machine for specific applications, and a cassette with the high-level BASIC-5 language, plus two video games. It should be remembered as well that there's more software floating around the micro-computer community that runs on the

## product spotlight

## Data Entry/Management

Not many people knew it, but before the name change to Pertec Computer Corp., Pertec did a good business in manufacturing and shipping data entry systems to both Univac and Scan Data on an oem basis. That's why many people couldn't understand the firm's recent acquisition of Computer Machinery Corp., since the product lines were so similar. It turns out that Ryal Poppa, Pertec president, thought a lot of CMC's sales force, but he wanted them to sell what Pertec had on the drawing boards to the end user market.

What was on the drawing boards was the DREAM Machine, or the XL40. DREAM is an acronym for data retrieval, entry, and management. It was clear that some fundamental advance had to be made in the capabilities of data entry devices, and the XL40 certainly has them. It performs conventional data entry, but in addition, data management and file management functions can also be performed. A new retrieval package called COSAM (COBOL Shared Access Method) permits operators to retrieve files and update records, create parallel but separate transaction files, etc. But separate things moving along, a new tree index structure, IDAM, shortens the time required to access data from disc by going straight to the applicable record.

Up to seven keystations are supported by the XL40 with a choice of either keypunch-style or typewriter-style keyboards, and disc capacity is expandable from 4.4 to 35.2 megabytes. Heavy use of microprocessors in the peripheral controllers will make it possible to incorporate IBM's SDLC protocol into the XL40 when the customer requires it. The controller, called the Micro Control Unit (MCU), is a 64K 16-bit semiconductor memory machine for executing an ANSI COBOL instruction subset and the XL/05 operating system for foreground and background control of data entry activity. The multitasking os controls multiple data entry editing and supervisory control/monitoring while simultaneously overseeing background job stream processing. Password protectors are also part of the XL40.

The manufacturer will concentrate on selling XL40s at the corporate level of relatively large users interested in distributed processing applications. For the time being, sales will be limited to the U.S. and Canada.

A system with five keypunch-style keyboards and 4.4 megabytes of disc capacity leases for \$975/month. PERTEC COMPUTER CORP., CMC DIV., Los Angeles, Calif.

FOR DATA CIRCLE 226 ON READER CARD

8080 cpu than for any other microprocessor, so getting the Sol-20 to do what you want shouldn't be a major problem. The pc-form kit for the cpu is available separately for \$475. Options

include additional memory, interface expansion, variable communication rates, peripherals, etc. PROCESSOR TECHNOLOGY CORP., Emeryville, Calif. FOR DATA CIRCLE 231 ON READER CARD

### Data Entry

The model 700 key-to-diskette device is priced to compete against the IBM 3741/3742 and is functionally equivalent. Designed for use in centralized, decentralized and remote teleprocessing environments, the 700 is offered in two versions, the 701, a single station unit which can be upgraded to a dual station model 702 by adding a second diskette, keyboard, and tabletop. The two units generate and read IBM-compatible cassettes. One nice feature of

the 700 series is that the operator's crt display is directly above the work area instead of being placed off to one side as on the IBM unit. The crt displays a full 128-character record, eliminating scrolling, and six 40-character lines per operator on both the single and dual station models provide prompting. Model 701s are priced at \$4,950; model 702s go for \$6,160. TAB PRODUCTS CO., Palo Alto, Calif. FOR DATA CIRCLE 233 ON READER CARD

### \$5 Computer

It's just a microprocessor chip, and the design is identical to its siblings, the only real physical difference being its plastic packaging, but we just couldn't let Intel's announcement of 4-bit microprocessors for as little as \$5 (in

orders of 100 and up) go unnoticed. The products are called the P4004 and the P4040 (which will cost you an additional 50¢ each in the same quantities). Systems houses will want to know that the packaging is molded epoxy dual in-line with the P4040 contained in a 24-pin package and the P4004 in a 16-pin configuration. This makes it possible for Intel to offer MCS-40 microcomputer systems complete with cpu, clock generator, memory and i/o for about \$19.25 in 100-up quantities. Maybe the price of microprocessor-controlled sewing machines will drop as a result of all this and every family will be able to afford one. INTEL CORP., Santa Clara, Calif. FOR DATA CIRCLE 234 ON READER CARD

### School/College Computer

There is absolutely a gaggle of companies preparing for, or in the process of, an attack on the school/college/university market with products incorporating microcomputers, but it would certainly seem that NCR might do well in this market simply because it's so much larger than many of the little firms attempting the task.

The 7200 model VI is what will be used to mount the attack. It includes a microprocessor with 24K bytes of random access memory, of which 4K bytes are used for problem programs. The 7200 features a 9-inch visual display, alphanumeric and numeric keyboards, and a magnetic cassette recorder for storage and retrieval. The option list reveals that a second recorder is available as an option, so conceivably students could busy themselves writing sorts. Programming is done with a special version of BASIC, and there are a goodly number of programs (more than 100) in the NCR BASIC library, including computer science applications, and problem-solving applications for other disciplines. In addition to educational applications, the marketing staff wishes to point out that the unit can also be used in a number of financial and engineering applications. For \$6,995 the buyer gets the microcomputer, a reference manual, operator's handbook, BASIC library catalogue, and one-time software license charge. NCR CORP., Dayton, Ohio.

FOR DATA CIRCLE 235 ON READER CARD

### 6250 bpi Tape Drive

With the level of performance offered by some of the newer minicomputer systems, such as DEC's PDP-11/70, Data General's Eclipse series, and others, we're a little surprised manufacturers haven't offered higher performance tape drives on their systems. After all, even discs can't beat tape drives at sequential file processing, and that's

how most files are organized. (Maybe it's a conspiracy so the manufacturers can sell us faster cpu's!)

At any rate, such high performance systems that are used on large scale mainframes are now available for manufacturers and systems houses on an oem basis from STC, a first for the company. The 1900 tape subsystem operates at 75 ips at two densities (1600 phase-encoded and 6250 group coded recording). The transfer rate at the lower density is 120 KB/second, which looks like normal mini rations, but the

transfer rate jumps up to 470 KB/second at the featured density. Up to four transports can be radially connected with the combination formatter/controller. Typical oem pricing at the 100 quantity level is \$6,400 each for manual loading units, or \$6,800 each for automatic threaders. The formatter/controller sells for \$6,580 at the same quantity. First deliveries are slated for next May. STORAGE TECHNOLOGY CORP., Louisville, Colo.

FOR DATA CIRCLE 236 ON READER CARD

### Solar-powered Calculator

Why not? Just about everything else has been done with calculators, so maybe the world is ready for a solar-powered, 8-digit, wallet-sized calculator. The Solar I operates without conventional batteries and recharges itself automatically whenever exposed to artificial light or sunlight. An array of

# hardware

46 miniature solar cells on the surface of the calculator accomplish the recharging function. Included in the design are signs for memory usage, minus indication and capacity overflow. Additional features include an independent memory register, full floating decimal, automatic square root, automatic constant, change sign key, percent, add-on/discount functions, and the ability to beam back on board the starship Enterprise. The Solar I is priced at \$99.95. LITTON INDUSTRIES, Beverly Hills, Calif.

FOR DATA CIRCLE 237 ON READER CARD

## 370/158 Attached Processor

IBM isn't about to let Intel and Amdahl swipe the bread and butter portion of its installed base without a fight. As the first card played after Intel's Advanced System announcement, IBM has announced an attached processor system for the 370/158 that provides somewhere between 1.5 and 1.8 of the internal performance of the single processor system. The Attached Processor System (APS) can be ordered on new systems or installed in customer locations starting next summer. In addition, IBM has upped the main storage capacity of the 158 to six megabytes,

an increase of 50%.

The APS processor unit is designated the 3052, and its function is to share computing, I/O capability, and all of main storage with the host CPU. The price for the performance increase seems reasonable enough: as little as \$14,935 on monthly rental, or \$452,500 on purchase to nearly double the power of the machine. Monthly rental for an APS out of the box ranges from \$52,965 with the minimum memory size (512K) to \$92,205 with six megabytes. IBM CORP., White Plains, N.Y.

FOR DATA CIRCLE 238 ON READER CARD

## Seismic Processing

One has to give IBM credit where credit is due. Gray Giant ventured down to the 46th annual international meeting of the Society of Exploration Geophysicists in Houston, Texas in late October to announce the 3838 array processor—right in the back yard of Texas Instruments, which prides itself on its long history of computing products for the seismic processing industry. There's a small catch regarding the 3838: it operates in parallel with a 370/158 or model 168 which, if you don't have one, will set you back something over \$1 million. Then you can start thinking about the \$17,875 monthly payment for a 256K model 1 3838. But if you're looking for oil you

probably have some money already.

The processor contains a standard set of more than 50 specific instructions, including arithmetic procedures (algorithms), and logical instructions for reducing the data. One of the most fundamental operations in seismic data processing is the Fast Fourier Transform, which is accomplished by the 3838 in 2.95 msec for 1K points. Computing is single-precision floating point. First shipments are scheduled for the fourth quarter of 1977. IBM CORP., White Plains, N.Y.

FOR DATA CIRCLE 239 ON READER CARD

## Dot-matrix Printer

Available just in time for Christmas is a 44-column dot-matrix printer that is

really offered for this manufacturer's IMSAI-8080 computer, but can be attached to many other microcomputers,

## If Your Computer Is Available By Phone,

then you need a PORTABLE CRT DISPLAY to really take advantage of it. The CRT is quiet, fast and saves paper. The *Digi-Log portable CRT* is lightweight, small and low cost, also.

### WHERE TO USE IT?

- with your customer
- on business trips
- in the classroom
- in the think tank
- at home
- across the campus
- in the conference room

### WHY USE IT?

- provide better service
- keep computer at fingertips
- move to a creative place
- work in comfort
- avoid travel and traffic
- get away from distraction
- enjoy the freedom

### WHY NOT?

If you want more reasons why you deserve to have a Portable CRT Display, call us for information. If you're convinced that you deserve one, as we are, then call us for immediate delivery. Only \$1795, complete with acoustic coupler, case and 5" CRT.

**SYSTEMS, INC.**

215 672-0800 Babylon Road

Horsham, Pa. 19044 215 672-0800

CIRCLE 110 ON READER CARD

especially if they're Intel 8080 based, it's claimed. The IMSAI might just be the cheapest printer ever offered; it's priced at \$549, or \$399 in kit form. It interfaces to an 8-bit parallel output port and is supplied ready to install. Additional features include a 64-character ASCII subset, software selectable double-size characters, automatic line wraparound, multiple copies, etc. IMS ASSOCIATES, INC., San Leandro, Calif. FOR DATA CIRCLE 240 ON READER CARD

### 370/125 Add-on Memory

The in-7125 is billed as being the first alternative storage system available to

IBM 370/125 users. The in-7125 can take the 125 user from 96K to a full

megabyte of memory in 32K-byte modules. Failing modules in the in-7125 can be switched off in 32K increments without loss of on-line operation. All specs are said to equal or exceed stock IBM specifications: access time is 290 nsec (somewhat faster than IBM) and the cycle time of 480 nsec is equal. Some special attention has been paid to the fault isolation aspects of the storage system. A built-in maintenance panel identifies failing memory modules and holds the memory switch on/-switch off controls, and a LED-driven fault location mechanism is also included. Automatic relocation of memory addresses, and chip-replaceable design are featured. Pricing on a 416K addition that takes a 96K system to 512K is \$2,047/month, including maintenance. Deliveries are underway. INTEL MEMORY SYSTEMS, Sunnyvale, Calif. FOR DATA CIRCLE 241 ON READER CARD

### Bar Code Reader

The model 9110 is different from most other bar code readers because it offers dual RS-232 connections. This allows it to operate together with a CRT or other on-line terminal. The communication between the CPU and the terminal is automatically transferred through the 9110. A scanner is included for reading variable length messages of up to

32 characters in length. The bar code can be bi-directionally scanned at 3-25 ips, and an audio signal confirms a correct read. (Somehow it should buzz if the read was incorrect?) The 9110 is priced at \$1,085. INTERFACE MECHANISMS, INC., Mountlake Terrace, Wash.

FOR DATA CIRCLE 213 ON READER CARD

### Printer

The printing speed of the NCR 499 data processing system can be increased from the standard 75 to 130 cps with a new printer just made available for it. It's installable on the customer's premises, and the price of only \$1,500 seems reasonable enough. For even higher performance, a 300 lpm printer is also available for the 499. NCR CORP., Dayton, Ohio. \*

# software & services

## Updates

WYLBUR, the interactive text editing and remote job entry software package developed at Stanford University, is moving to a new home. Users who managed to pry licenses to use WYLBUR raved about it so much that more than 100 installations sprung up around the world. Pretty good for any package, much less one that wasn't actively marketed.

Doing the marketing now is On-Line Business Systems, Inc., San Francisco. Primarily of interest to IBM users of 360/50 or 370/138 systems (and up), perpetual licenses now go for \$17,500, or from \$600 to \$1K per month.

The latest service to be offered on Informatics Inc.'s nationwide data services network is PREMIS, developed by K&H Business Consultants, Ltd., London. The point of interest in the CPM (Critical Path Method) package is that it was developed under contracts from the Dutch Steel Corporation and the Municipality of Amsterdam for a system capable of handling tens of thousands of activities and still be capable of running on something as common as a 370/158. Each activity can have up to 200 relationships and resources, and there's virtually no limit on the length of activity descriptions. With over 100 users worldwide, PREMIS should do well in the U.S. market.

Great Ideas For The New Year Dept.: Why should users have to pay for amount of memory required of any manufacturer's system in order to support the basic (or smallest) operating system? Some systems reserve as much as 90 percent of the systems memory for user activities, while other manufacturers' designs require 90 percent.

Industrial Marketing Advisory Services has been started up in Arlington, Va. The firm provides a computerized clearinghouse for bids and quotes on all types of electrical and electronic products, and that includes data processing equipment. Users dial a toll-free telephone number to start the ball rolling, and IMAS segments them by product category and region before sending them off as sales leads to subscribers. Subscribers pay \$60 for 60 leads, which seems more than reasonable. Current subscribers include Ampex, Burroughs, Data General, GE, and hundreds more.

## Operating System

Remember when the mini manufacturers were continually being pummeled over the lack of sophistication—or total lack—of software? If anything, it seems that the shoe is now on the other foot, with the mini mob now able to develop operating systems that actually make huge chunks of memory available for user programs! (IBM users take note.) Such is the case with Data General's latest offering, Advanced Operating System (AOS). It's described as being "heuristic," or having an ability to learn, but it seems to us that AOS is better thought of as being dynamic, perhaps the most sophisticated operating system yet run on a mini.

The claims for it are all the "right" ones: simultaneous control of multiple time-sharing, real-time, and batch operations; dynamic management of programs in memory, with sharing of common code and data, load-on-call routines, etc.; complete hierarchical file data management directory structures, file and program protection, device independent I/O, spooled output to non-shareable devices, accounting and error logs, synchronous and asynchronous communications, etc. AOS is process oriented, meaning that a group of program tasks share up to 64K bytes of memory and compete for system resources as a unit. A "process" can be a system program like an editor or a user application program. Users determine whether processes should be permanently resident in memory, preemptable (usually resident but can be swapped), or always swappable. AOS manages the competing processes and schedules each one for memory and cpu time only after determining its user-assigned numerical priority, past behavior, and the length of time it has been waiting. To further optimize memory utilization, a least-recently-used algorithm is used to manage the 2K byte pages memory is logically split into, and to decrease disc I/O as well. Processes larger than 64K bytes are handled as overlays.

Like the processes, data files are organized in a multiple level, family-tree structure. Files can expand without having to be physically contiguous on disc, and a file directory defines and catalogs programs and data, and even assigns access rights by user. Security safeguards by process, file, and system are also part of AOS.

Scheduled for availability sometime in the spring, AOS operates on ECLIPSE S/230 and C/330 configurations with

at least 192K bytes of storage, real-time clock programmable interval timer, system console, and disc. The package is bundled, but then it isn't: users must purchase a support package, which includes things like three days of system engineering assistance, for \$2,500. There is no subsequent charge for multiple systems of subsequent editions. DATA GENERAL CORP., Southboro, Mass.

## Information Retrieval

A new buzzword that has popped up lately, that of describing a product as being "user friendly" certainly applies to this product, a data base preprocessor called ROBOT. While a number of these types of packages have been worked on over the years in experimental form (at Rand, System Development Corporation, the National Science Foundation to name a few labs), this is the first product to come to our attention that is so comprehensive. Basically, ROBOT makes it not only possible, but very easy, for a non-dp professional, such as an engineer,

```

NEXT REQUEST
ROBOT? ARE THESE PEOPLE IN NY STATE?
YES
Ordinary English
"yes-no" questions.

```

```

NEXT REQUEST
ROBOT? GIVE ME THEIR AVERAGE SALARY.

AVERAGE SALARY 3982
Computation with
prompts reference.

```

```

NEXT REQUEST
ROBOT? SHOW ME WHO THEY ARE
THE NUMBER OF HITS IS 54
KING
FRONTEIRA
FREGIER
FRANIS
COLVILLE JR
HOW MANY MORE LINES SHOULD I PRINT?
ROBOT? PRINT EVERYTHING ON THEM.

```

```

THE NUMBER OF HITS IS 54
KING PUBLIC RELATIONS DIR RESIDOR N WHITE PLAINS NY
FRONTEIRA LEGAL DEPT ASSISTANT RESIDOR F NEW YORK NY
FREGIER SECRETARY RESIDOR M NEW YORK NY
FRANIS CLAIMS EXAMINER RESIDOR F ROCHESTER NY
COLVILLE JR ACTORNY RESIDOR M ROCHESTER NY
HOW MANY MORE LINES SHOULD I PRINT?
ROBOT? PRINT STATISTICS ON SALARY FOR ALL NY EMPLOYEES
Multiple computations.
THE NUMBER OF HITS IS 54
SALARY
MINIMUM 3850
MAXIMUM 31000
AVERAGE 3982
TOTAL 466590

```

```

NEXT REQUEST
ROBOT? WHAT IS THE AVERAGE SALARY OF THE EMPLOYEES LIVING IN ITHACA?
THE NUMBER OF HITS IS 9
AVERAGE SALARY 7623

```

```

NEXT REQUEST.

```

doctor, lawyer, to manipulate files and obtain information from a very sophisticated data base. If the product has a potential drawback, it's that ROBOT cannot be used to access more than one data base—it's dedicated to personnel, inventory, etc—but according to the developers, it was absolutely necessary to design the package along these lines in order to do the application *at all*. And certainly there will be many IBM 370 shops where this will not be a particular problem. (The user gets a discount when buying more than one package anyway.)

# ASI/INQUIRY

## The IMS DB/DC QUERY LANGUAGE

USED BY MORE IMS INSTALLATIONS THAN  
ANY COMPETING PRODUCT

ASI/INQUIRY is an IMS DB/DC query language that operates completely as an interactive Message Processing Program. The design of ASI/INQUIRY is such that the *structure of the data base is transparent to the user*. Moreover, one need not have familiarity with DL/1 segment logic or the complexities of multi-pathing. Extremely rapid response time is assured.

### MAJOR HIGHLIGHTS

- End-user oriented
  - Easy-to-use language
  - Requires no knowledge of IMS
  - Comprehensive diagnostic messages
- Rapid response time for even the most complex queries
- Dynamic priority scheduling to maximize system performance
- Availability of default as well as user-defined screen formatting

Recently delivered, Release 2 of ASI/INQUIRY contained a number of major enhancements, including:

- Development of a TSO-supported version
- Full support of IMS/VS secondary indexing
- Open-ended computational facilities
- Ability to SORT display output

In summary, ASI/INQUIRY represents the state-of-the-art product in an IMS DB/DC or TSO-supported IMS environment. It is the only system combining an easy to use language, complete user flexibility, and rapid response time in a single package. If you want to start answering "What if . . . ." immediately, call or write today for further information.

The Software Manufacturer

CIRCLE 77 ON READER CARD

# software & services

Any type of terminal, hardcopy or crt, that is supported by a 370 running any of the more sophisticated operating systems (os and vs for starters) can operate with ROBOT. One can obtain the answer to requests such as "HOW MANY MANAGERS EARNING BETWEEN 18000 AND 24000 LIVE IN ILLINOIS" and ROBOT, together with either the System/2000 data base management system from MRI Systems Corp. or ADABAS from Software AG, does the required processing, tells the user how many people satisfied the conditions of the sort, and, on user request, starts to print out the names. There's even ambiguity checking: in response to the question "WHICH PEOPLE WHO LIVE IN NEW YORK EARN OVER 5500?" ROBOT responds with:

REQUEST AMBIGUOUS, IS IT:

NUMBER 1

PRINT THE NAME OF ANY EMPLOYEE WITH SALARY 5500 AND CITY = NEW YORK

NUMBER 2

PRINT THE NAME OF ANY EMPLOYEE WITH SALARY 5500 AND STATE = NY PLEASE TYPE A 1 OF A 2.

The marketing policy on ROBOT is almost as interesting as the package itself. The developers, who will admit to trying to "debabelize" the software industry, are going to try to sell the packages as "front-ends" for the data base systems already mentioned (IBM's IMS is not included—too many "problems.") That means going directly to those vendors. Users can get the package for \$30K, and one very large corporation is already putting the package through tests. Finally, ROBOT will be offered to time-sharing services vendors, where it should do well, too. A three-month trial is offered, but it's not free—it will cost the user several thousand dollars to set things up. ARTIFICIAL INTELLIGENCE CORP, Kensington, Md.

FOR DATA CIRCLE 217 ON READER CARD

## MVS Monitor/Control

The complexity of IBM's most sophisticated operating system, MVS (Multiple Virtual System) is starting to attract the attention of the performance measurement vendors. One of the first products intended to smooth the operation of the system is called Resolve-MVS. Basically, it makes it possible for users to get a clearer picture of what is actually taking place in the system, and provides features for tuning or controlling the system more to the customer's wishes. More than 40 com-

puter operator and authorized TSO user commands are at hand to address specific problems that cause inefficient or sluggish system operation in such problem categories as enqueue conflicts, reserve lockouts, missing I/O operations, page thrashing, job loops, or wait state problems. With Resolve-MVS, it is possible to force jobs out of the system if they are not running as they should, force jobs to be run as soon as possible, ascertain which jobs are actually running, which ones are swapped and waiting for which particular resources, etc. Resolve-MVS operates as a real-time problem program in a 64K region and features optional password protection for all user services. A 21-day free trial is offered, and the system can be rented for \$450/month or purchased for \$10,800. BOOLE & BABBAGE INC., Sunnyvale, Calif.

FOR DATA CIRCLE 218 ON READER CARD

## 8080 Basic Interpreter

What's really going to blow the lid off the already red hot microprocessor phenomenon is when users don't have to piece programs together statement by statement using assembler language and can instead use a higher-level language. The fuse has already been lit: here's a BASIC language interpreter for the most popular microprocessor of them all, Intel's 8080 chip. Called BASIC ETC, the interpreter is a variant of the Dartmouth BASIC programming

# software spotlight

## Systems Design

Now that some progress has seemingly been made in better coding techniques and individual program design (hence the uproar over structured programming), it would seem that one of the more exciting areas for programming progress lies in the automated system design sector. At least the developers of SL/1 think so. About the only thing misleading about the package is its name, Systems Language/1, implying that it's a programming language. It's not, but what it is is even better: a total system to practically automate the generation of large scale programming systems, including documentation.

Written in a combination of assembler and COBOL for IBM 360/370 systems running OS, DOS, or the VS operating system varieties, SL/1 is used to specify the data elements of each external input and output for an entire computer application. The user can even optionally specify the format of

language. For those people not familiar with interpreters, they differ from compilers in that they directly execute program statements, in contrast to the separate machine code program generated by a compiler. One of the big advantages of this approach is that it makes debugging much easier since one only has to mull over source statements.

BASIC ETC uses 8K bytes of memory plus at least 1K of scratchpad memory. Included in the interpreter are string capability for up to 255 characters, N-dimensional arrays, variable precision arithmetic, assembly language sub-routines, direct memory and I/O addressing, 27 error codes, character/line erasure editing, 31 commands and statements, null control (0-25 seconds) and formatted output statements. The product is delivered either in the form of paper tape or audio cassette together with a 32 page user's manual. BASIC ETC is priced at \$25. BINARY SYSTEMS CORP., Richardson, Texas.

FOR DATA CIRCLE 219 ON READER CARD

## Airlines Data

AIRMARKET is just what its name implies, a data base of information on the nation's domestic airlines that should interest urban planners, airport commissions, business planners, as well as the airlines themselves. Basically the data consists of information collected in a 10% ticket sample of all certified

the system's master files or allow SL/1 algorithms to do the job. The only other information required to get SL/1 underway is a description of the target computer configuration.

SL/1 automatically designs the entire system and determines what programs are required, including the sorts. The inter-program work files required to pass information between programs is also performed, as are the actual COBOL source programs ready for compilation, all JCL, and all documentation, including flowcharts, record layouts, element dictionaries, edit dictionaries, narratives, cross references, diagnostic dictionary, operating instructions, etc. Fully 27 phases are executed to generate the target programs. Field testing (two years of it) is said to have gotten the bugs out of SL/1 and it is currently usable. It's priced at \$60K—which, if the claims made for the package are true—is astoundingly low when compared to what it would cost a number of highly-paid programmers to develop the same package. Monthly lease plans for 36 months at \$2,100/month are also available, as is a 90-day trial for \$3,900. THORNE DATA PROCESSING, INC., Springfield, Va.

# the dawn of a new day in Data Base Management Systems

# DATA COM

DATA COM/DB has taken a quantum leap in function, facility and performance with its *Release 6.0*. In terms of productivity, DATA COM/DB is to other DBMS what removable disk storage was to RAMAC, what COBOL was to machine language, what magnetic tape was to punched paper tape. We are proud to provide the data processing community the "State of the Art" in Data Base Management software.

DATA COM/DB provides the only thing that ultimately makes sense to you, the data processing professional — productivity. We will *not* use memory as if it were free; we will *not* force you to spend more time planning the intricacies of data relationships based on forced hierarchies, sets or laws; we will *not* eat up your CPU causing upgrades for the slightest volume or application increase. We will provide the results you expect. We will

make your installation cost effective in its use of people and equipment, and allow you to be more responsive than ever before.

With *Release 6.0*, DATA COM/DB's major features are enhanced and extended:

1. New buffer management techniques more than double current performance results.
2. DB/DC integration.
3. Low memory utilization.
4. High-speed batch sequential processing.
5. Facilities for multiple users and multiple data bases.
6. New, exceptionally readable and usable documentation.

If you demand these results from a data base system on your S/360 or S/370, call or write today and make us prove DATA COM to you.

You're invited to a DATA COM Seminar  
(DB Release 6.0 and DC)

route carriers conducted by The Civil Aeronautics Board that shows revenue passenger miles, total passengers ticketed, and each carrier's market share and market ranking for each yearly quarter since 1972 according to mileage and city codes. Subsequent modules to be implemented in AIRMARKET will be of more direct interest to commercial concerns, for it will show the number of people passing through particular buildings at individual airports. How's that for detail? More than 68,000 domestic city pairs are covered in AIRMARKET with detailed carrier information on more than 26,000 of them. Access to the data base, which is run from a 370/-155, is offered terminal users for \$12 per connect hour plus 50¢/cpu second. THE COMPUTER COMPANY, Richmond, Va.

FOR DATA CIRCLE 220 ON READER CARD

## Network Interface

DMEP is used to attach IBM host computers to X.25 Public Packet networks such as Canada's DATAPAC, Telenet in the U.S., or Transpac in France. DMEP

operates in either an IBM 3704 or 3705 communications controller and performs the functions required to allow remote terminals attached to the network to be supported by currently operating IBM host software.

The license fee for DMEP is \$500/-month including program maintenance and a PTF (program temporary fix) service. Offered as an option is installation at the customer site for \$2K plus travel expenses. CAMBRIDGE TELECOMMUNICATIONS INC., Bedford, Mass.

FOR DATA CIRCLE 225 ON READER CARD

## Project Management

TELOR II is a project management system developed in France now operational on this vendor's nationwide services network after undergoing testing for approximately four months. Already it has been used in some out of the ordinary applications: Exxon International's tanker department used it to aid in the conversion of an oil tanker to an offshore storage tanker, helping to establish deadlines for getting engineering planning done. TELOR II permits its users to allocate resources, determine the financial impact of changes to the basic project plan, compute the discounted cash flow and internal rate of return. Established network planning techniques are used in the package, including PERT and CPM.

The two components of the package, analysis/time-framing/skeletonization and the reporting/penalties/return on investment phase have separate charge rates: 16¢ per VPU (Virtual Processor Unit) and \$1 per thousand I/O records for the former and 11¢ per VPU and \$7 per thousand I/O records on the latter. Connect time charges are \$5/hour. NATIONAL CSS, INC., Norwalk, Conn.

FOR DATA CIRCLE 221 ON READER CARD

## Transaction Processing

The Transaction Processing System (TPS) is the result of three years of development required to implement the design on a DEC PDP-11 mini. It's an interactive application system consisting of a CODASYL subset data base management system complete with a high-level language system for giving it directions. The language, called ISL (Interactive Systems Language) is a free form language said to be much easier to understand and work with than either COBOL or FORTRAN.

There are several subsystems. The transaction dispatching system enables non-computer oriented users to use TPS without having to know or understand anything except their transaction codes and password. The data logger keeps track of all user activity as well as updates on any of the data bases. TPS

## WITH DOCS USE YOUR 3277 AS A DOS-DOS/VS CONSOLE!

**DOCS**—Display Operator Console Support—provides the IBM S/360 & S/370 DOS and DOS/VS user with 3277 display unit SYSLOG support. DOCS is simply installed on any DOS or DOS/VS system with no changes required by the user. All 1052, 3210 and 3215 typewriter functions are supported by DOCS with numerous enhancements over a non-DOCS environment. DOCS also enhances DOS/VS operation on S/370, 138, 148, and 158.

DOCS is quickly and simply installed on any system. All that the user need do is catalog the DOCS distribution tape to his Core Image library, define where the DOCS hard copy file is to be located and execute DOCS. Total installation time required is under 10 minutes.

DOCS functions concurrently with EDOS, GRASP, DOS/MVT, DOS/RS, POWER II, ASAP, POWER/VS, and ITEL's DOS/VS executing on a S/360 and will enhance the system operation by providing improved facilities for the use of these packages while DOCS is controlling SYSLOG.

DOCS is available from C F S, Inc. as a licensed program product and may be leased monthly, yearly or on a one-time lease arrangement for \$175.00, \$1,890.00 and \$5,670.00 respectively. All three lease plans include free maintenance for as long as DOCS is installed.

### SPEED

DOCS provides significant through-put improvement by the very nature of the speed of the 3277 display unit alone. Operators can even pre-answer messages on the console.

### MULTIPLE CONSOLES

DOCS allows from 1 to 16 3277 display unit consoles to be used simultaneously as SYSLOG devices.

### MULTIPLE OUTSTANDING REPLIES

DOCS permits messages followed by Reads to the typewriter to remain unanswered without tying up the system. All outstanding Reads are shown in high intensity on the display console(s).

### REDUCED SUPERVISOR SIZE & OVERHEAD

DOCS does away with any need for the Console Buffering option in DOS or DOS/VS thus providing a savings in the core required by the users' supervisor as well as greatly reducing significant overhead to the entire system. Experience has shown that total through-put improvement with DOCS installed may approach 10% to 20%.

*Send requests for DOCS to C F S. License agreements along with detailed information will be sent by return mail. Inquiries may be directed to:*

### ELIMINATES DEPENDENCY ON TYPEWRITER

DOCS will continue to operate, and allow the entire system to operate, if the 1052, 3210 and 3215 typewriter becomes inoperable. DOCS spools all typewriter data to a hard copy disk file for later printing thus obviating the need for the typewriter to be on-line at all times. Hard copy is asynchronously provided if the 1052, 3210 and 3215 is available. A hard copy listing is also available through a utility program which the user may execute in any problem program partition to list the hard copy file on SYSLST.

### NO USER PARTITION REQUIREMENT

DOCS executes in its own pseudo-partition thus allowing the user unrestricted use of the problem program partitions.

### MULTIPLE EXTERNAL INTERRUPT KEYS

DOCS provides a separate External Interrupt key for each partition (replacing the use of the MSG command). This is especially convenient for EDOS users. This function is also useful for GRASP users when communicating with a background partition problem program. A unique interrupt key is provided for each DOS/MVT region.

Mr. Richard Goran  
C F S, Inc., P.O. Box 662, Brookline, MA 02147  
(617) 731-3474 Telex 94-0285

runs on any model PDP-11 using the RSTS/E time-sharing operating system. It's priced at \$15K (until New Year's day) and comes with a one-year warranty. The user gets the source code (written in BASIC PLUS), and documentation. The developers also offer a data base management system for the PDP-11. INTERACTIVE INFORMATION SYSTEMS, Cincinnati, Ohio.  
FOR DATA CIRCLE 224 ON READER CARD

### 5100 Software/Printer

IBM has announced two more features for the model 5100 portable computer that should make the product more desirable. Now there's a 120-cps, 132-column printer available for it, the

5103 mod 2, for printing on continuous single or multipart paper. The printer is priced at \$4,175. But maybe the more interesting news is a print plot/problem solver library that enables the user to use either the 5103 mod 1 or the new mod 2 as a plotting

output device, capable of producing most of the common types of graphs, including line graphs, histograms, bar charts and point-to-point plots. The library also allows the 5100, with a serial i/o adapter, to be used with peripheral devices such as absolute vector plotters and storage display terminals. The software sells for \$500. IBM CORP., General Systems Div., Atlanta, Ga.  
FOR DATA CIRCLE 223 ON READER CARD

### Datapoint Software

This Canadian vendor has installed approximately two dozen sets of software on various Datapoint Corp. intelligent terminal products north of the border, and is now making them available in the U.S. The products consist of a data entry system, a security system, programming utilities, a Datashare editor, and a partition link system.

The data entry system provides the capability to create an unlimited number of data entry programs—if you want to do such a thing. The program is designed to operate in a multiterminal environment where the same programs can be used simultaneously. Extensive validation and editing can be performed on the input, and no special training or programming skill is required to set the program up. It's priced at \$4K.

The security system prevents un-

authorized use of the system by means of a two-level password structure. The first password allows an individual or designated terminal to access the main "menu" of program options only. A second password is required to utilize authorized program options. This system is priced at \$3K.

The utility package is said to be similar to that offered by Datapoint, but with the advantage that these all operate in Datashare, allowing a user to create a new file; look up an ISAM record using its key; write blank characters into any file; print any files; change constants of a record; delete files, etc. Bundled together in the utility package is a Datashare editor that allows several programmers to work on model 2200 and 5500 systems simultaneously while inserting, modifying, or deleting coding, and a partition link system that essentially makes it possible for any terminal operating in the Datashare partition to access the batch partition in order to run one or more "standalone" functions such as file re-indexing, sorts, compilations, etc. The utility package is priced at \$4K. At least 48K words of memory are required to implement the partition system. Packages include installation, user training, and a 90-day warranty. FORTREX CONSULTING LTD., Willowdale, Ontario, Canada.

EDOS is the Extended Disk Operating System. EDOS is 100% compatible with DOS. EDOS has many of the features of OS . . . but without conversion or overhead.

EDOS is specifically designed to optimize the performance and operational characteristics of the System/360, while allowing the user to stay abreast of the latest technology and facilities available.

EDOS is currently being used by hundreds of System/360 users worldwide.

EDOS IS PERFORMANCE — total throughput improvement of 25% to 50% is typical.

EDOS IS GROWTH — growth in terms of increased system capacity and function. Growth in terms of allowing your programmers and operators to use the latest techniques of DOS/VS and OS without costly conversions.

EDOS IS SUPPORT — support in terms of on site installation assistance; continuing assistance in optimizing the performance of your system; classroom education. Equally as important, support in terms of a continuous development plan of powerful extensions.

#### FIND JIM SMITH!!!

Looking for Smith, James, account number unknown, lives in Ohio? With index cards, tub files, or Microfiche, it may take hours to find him and get his file. With ISA's On-Line Alpha System, you can find him in seconds. Search with name and date-of-birth, or zip code, or account number, or whatever—the On-Line Alpha System will find him even if the name is misspelled. The information you want is displayed in your format—on the terminal of your choice. The On-Line Alpha System: contains powerful search logic—is adaptable to your file content—operates in batch or on-line—is teleprocessing monitor independent—uses virtually any type of terminal. For IBM 360/370, OS or DOS. Contact:

Box 47975, Atlanta, Georgia 30362

#### RPG/RPGII TO COBOL

Package accepts Sys/3 RPGII, MOD 20 DPS RPG, 360/370 DOS and OS RPG and can produce either DOS or OS ANS COBOL. Inherent functions such as Match Record, Chaining, Subscripting, as well as Table Handling are converted by the system. A cross-reference worksheet of the original RPG statements aligned with the resulting COBOL is produced. Dataware offers 2 service forms: Clean Compile and Full Implementation. Lease and License are also available.

We also have translators for:

Autocoder/SPS-To-COBOL  
Easycoder/Tran-To-COBOL  
BAL/ALC-To-COBOL  
PL/1-To-COBOL  
Autocoder (7070)-To-COBOL  
COBOL-To-COBOL  
RPG/RPGII-To-PL/1

#### AUTOCODER-TO-COBOL

The system converts source Autocoder (1401, 1440, 1410, 7010, and SPS) to ANS COBOL (DOS or OS). The converter uses a unique method to examine and interpret source code before producing COBOL. Converter features are:

- HANDLES COMPLEX LOGIC CODE; USER MACROS; INDEXING AND CHAINING
- LISTING OF THE OUTPUT COBOL VS SOURCE STATEMENTS (SIDE-BY-SIDE)
- SOURCE NAMES & COMMENTS ARE PART OF THE COBOL PROGRAM
- PROVIDES 90%++ SOURCE CONVERSION

Dataware offers 2 service forms: Clean Compile and Full Implementation. License and Lease are also available.

#### SORT/5100

A general purpose data file SORT-MERGE system is now available for your IBM 5100 Portable Computer:

- Any 5100 with BASIC; 1 or 2 tapes.
- Files as large as full Data Cartridge.
- Full sub-file capability.
- Multiple input file capability.
- Numeric, character, or bit fields (including character & bit substrings).
- Up to 24 sort KEYS.
- Equal records kept in original order.
- Stand-alone or callable.
- Sort specifications from keyboard or from tape SPECFILE.
- One year warranty.

The introductory price for this superb software product is \$275, (through Jan. 1977; \$375 thereafter). Call (203) 453-4917 for further information.

#### SUPER SOFTWARE AIDS

Our preprocessors are the answer to structured and goal directed programming problems in COBOL and FORTRAN. Developed at Volvo Flymotor, SCOBOL and SFORTRAN extend COBOL and FORTRAN control structures with while-do-endif, fully nestable if-then-else-endif, select case-endcase, and 5 others. The preprocessors, written in COBOL and FORTRAN, translate the extended languages into semantically equivalent standard COBOL or FORTRAN. Each system includes a formatter which indents programs to reflect their structure and performs other editing functions. The systems cost \$850 each and are supplied in source form—SCOBOL/ANS COBOL or SFORTRAN/ANS FORTRAN. They are currently being used for production programming on IBM, DEC, Burroughs, and CDC computers.

## SAVE WASTED DISK...

VSERV, a VTOC Service Utility, solves disk management problems of identifying wasted disk space under DOS and DOS/VS. VSERV provides graphic mapping facilities and VTOC access capabilities. Powerful VTOC manipulation commands are supplied to graphically DISPLAY a VTOC, CREATE, DELETE, UPDATE, RENAME, or TRUNCATE one or more files. VSERV allows instant identification of free space, under-blocked and over-allocated files.

User tailored default and security options provide against unauthorized use of the VTOC manipulation commands. A complete audit trail for historical use is provided.

VSERV provides all of these capabilities for a one time purchase of \$400. Join over 30 satisfied users on all types of direct access devices. Order VSERV today on a 30 day trial. Call or write:

## IMS EDUCATION

Automated Concepts Inc. has developed a complete curriculum of IMS training courses. Out of ACI's heavy involvement in IMS consulting services have come the experience and practical knowledge required to create this unique series of courses. The teaching method employed is an onsite lecture and workshop presentation by an ACI instructor. ACI offers the option of customization of course materials to reflect your installation's software environment, programming and operating procedures, etc.

ACI's IMS curriculum includes:

- Introduction to IMS DB/DC Systems
- IMS Programming Workshop
- Advanced Topics for IMS Programmers
- IMS Debugging
- IMS 3270 Design
- IMS Data Base Design
- IMS Reorganization, Recovery & Restart
- IMS for Operators

Send for ACI's "IMS Curriculum Guide" or contact: Karen Weingart, Product Manager.

## EXECUTOR

The EXECUTOR, high speed job processor, is designed to supplement OS and OS/VS job management. The EXECUTOR performs all initiation, termination, and resource allocation with techniques and algorithms specifically designed to effectively utilize all available system resources. EXECUTOR users are experiencing thru-put increases from 25% to 50% as well as experiencing a 5% to 20% return of their total CPU cycles. This thru-put increase provides such benefits as: alleviate scheduling problems, improve data center service to users, increase programmer productivity, and extend hardware life. Because there is no conversion of JCL modifications required, the EXECUTOR can be easily and quickly installed. The EXECUTOR, which is an "overnight" solution to known problems, has proven itself successful in many large corporations and service bureaus in over 1,000,000 hours of operation. Complete technical memo available upon request.

## datamac<sup>®</sup> adds File Processor Capability and subtracts \$1,000 from its price\*

If you've been looking for a superior automatic test data generator that can create "new" test data to your specifications, as well as work with existing "live" data files. wait no longer.

DATAMACS, the industry's most widely used test data generator has added a file processor capability. That's a big plus for DATAMACS. and a big plus for your installation.

Now, you can extract data records from an existing file on a conditional basis, and alter that data using all of DATAMACS' powerful capabilities. And you can create new test data files and extract from an existing file during one execution of DATAMACS. Which eliminates extra, costly computer runs.

And the file processor makes DATAMACS even easier to learn and use...which means you'll get results sooner and better from your programming staff.

It's a case of the rich getting richer. For DATAMACS has been called the ultimate management aid—providing comprehensive and effective testing that substantially reduces the time and dollars required to put programs into production. And now that capability has been extended to further help you build programmer productivity while saving valuable dollars.

If you want to achieve all this, contact us today for more details about DATAMACS' no purchase-obligation free demonstration.

\*Save \$1,000 on the File Processor option by buying before January 31, 1977

## GENERAL LEDGER

The INFONATIONAL General Ledger System is a responsibility and financial reporting system which produces consolidated and operating reports with comparative analysis. It integrates forecasts, flexible budgets, actual performance, and historical data into comparative management information. It processes up to 10,000 entities with their own chart of accounts. It automatically consolidates over 100 levels upward. The System uses automatic reversal of accruals and monthly generation of recurring vouchers plus the automatic transfer of edit errors to a suspense account. The user determines his own responsibility reporting requirements, level of supporting detail, and report format options. The Report Writer module allows custom reporting, while the flexible Cost Allocation module provides for pooling and distributing expenses. ANSI COBOL, PRICE UPON REQUEST.

## PROGRAMMING: ART OR BUSINESS?

International Computer Trading Corporation replaces the art of programming with a business-oriented, machine-intensive application development methodology.

ICT now offers you:

- Fixed price programming at a cost of \$900 per "unique product"
- Standardized, fully tested COBOL or PL/I programs
- Complete program documentation
- Unconditional warrantee

What is a unique product?

- A report or file format that is constant within a system
- A program that performs a single function
- Standard utilities (sorts, merges, etc.) are included at no cost

Your system specifications are usually acceptable. By sending them to us, you will receive in return a fixed-price proposal for the development of your system along with a fixed-time estimate.

For more information, references, prices, samples or discussion, please call or write:

## ACCOUNTS RECEIVABLE

The INFONATIONAL Accounts Receivable System provides multi-company capability to handle over 10,000 operating entities with different charts of accounts. It handles multiple accounting periods simultaneously; highlights sales returns and adjustments; provides extensive credit control information; maximizes the control of cash flow; and gives a close look at the performance of salesmen, products, and customers. It provides management tools for reporting receivables data and collecting outstanding items. The System validates and maintains detail distribution for automatic interface into the Sales Analysis and General Ledger Systems. Other features include: discount calculation; discount earned; flexible application of cash; computer generated statements, service charge calculation; automatic dunning; sales distribution balancing; open item or balance forward processing; variable length aging categories; extensive audit trails. ANSI COBOL, PRICE UPON REQUEST.

## DISK UTILITY SYSTEM

Referred to by DATAPRO as "among the best liked software products in the EDP industry," the success and satisfaction of this product is clearly evidenced by more than 2,500 installations to date. The product provides users with a fast, reliable and easy to use means of backing up or copying disk files (including libraries) and data bases, either to tape or disk and time savings. In general, the programs can dump multiple disk volumes and/or files of different organizational structure to tape, can selectively restore any file or volume dumped to tape and can copy complete volumes and/or files from disk to disk.

Features of the product include full verification of data, self relocation for running in any or all partitions, ISAM reorganizations and reblocking VSAM support, device independence among all IBM supported disk devices and equivalents, self adaptation to core and channel configurations, simple format parameter card input and library backup, condense and reorganize capabilities including selective bookname restore offer considerable operation convenience and time savings.

## WESTI TP-INTERFACE

The Westinghouse Teleprocessing Interface System provides a low cost, low overhead, easy-to-use interface for local/remote 2260/3270 type display terminals operating in a DOS or DOS/VS environment.

The monitor portion of the system manages all terminals, application programs, user core areas, disk work space, display screen files, user work areas and handles all error correction. The system can control up to 255 terminal devices and application programs and operates in a single terminal environment, multi-terminal mode enabling many terminals to communicate with the same application simultaneously or in a special multi-copy mode.

Special functions included in the monitor are high speed roll-in/roll-out, data base independence, the ability to run as a subtask, enqueueing, logging, and a collection of supportive utilities. The monitor itself can be generated to operate in as little as 2K of real core on a virtual system.

## FORESIGHT®

An "application language" for financial and management purposes. Its English-language command structure requires no programming knowledge. It has been used to develop budgets, merger and acquisition analyses, real estate feasibility analyses, banking applications, corporate management reports, and corporate financial and simulation models. Changes are easily accomplished; provides self-documentation of all the logic and data; consolidation of all kinds can be performed. Iteration, looping, and forward and backward modeling is possible through conditional branching routines. Statistical forecasting based on historical data can be done. Financial routines include Present Worth, Discount, Rate of Return, Amortize, Depreciate, and Spread. FORESIGHT models can be saved, retrieved, or modified. Other corporate files can be accessed through DATA IN; DATA OUT allows FORESIGHT applications to be used by existing routines.

Installed on machines of 8 different manufacturers, Min. 65K Bytes, Timesharing, RJE, or Batch as appropriate for the operating system of each computer—FORTRAN IV.

## JOB ACCOUNTING

The Westinghouse Job Monitor is a low cost accounting system designed to inform you on a daily basis how your computer is being used and how to make better use of the system's resources. Job Accounting information for DOS, DOS/VS, and/or POWER/VS is captured and put into comprehensive reports which provide systems, operations, and management personnel with the following information: (1) chronological reports showing daily activity of job streams, (2) Daily partition utilization, (3) CPU hourly activity, (4) Graphic analyses of overload conditions and machine and device availability, (5) Start I/O by device, paging by job and resource usage summaries, (6) 30-day statistical summaries, and (7) POWER/VS Accounting. The complete package is provided requiring no special education or programming costs and no dedication of hardware units. One time charge for purchase and free trial available.

# SPECTRUM 1

Spectrum 1 is the only complete project development methodology that causes projects to come in on schedule, within budget and to the satisfaction of the user. It is sold as a fixed price bundled package that includes all needed forms and procedures for project management, comprehensive professional training of your staff on key life cycle tasks and ample consulting services to get your first few projects successfully started using the methodology. Spectrum 1 solves problems of schedule slippage, cost overrun, inadequate documentation and high levels of rework. The Spectrum 1 estimating guidelines make the accurate estimation of projects possible. Spectrum 1 is the most complete system on the market by a wide margin, but it is also the easiest to use. ## SPSS

The Statistical Package for the Social Sciences is an integrated system of computer programs for the statistical analysis of data. It is a comprehensive set of statistical functions which enable a researcher with no programming experience to perform a wide variety of data analyses in a simple and convenient manner on most large computer systems, including IBM (OS, DOS), UNIVAC (70,1100), CDC (3000,6000), HONEYWELL, BURROUGHS, XEROX, ICL, DEC, FACOM, SIEMENS, and TELEFUNKEN. Two manuals are available from McGraw-Hill which describe the system: **SPSS**, a 675-page manual which discusses the statistical routines and their use; and the **SPSS PRIMER**, a 134-page introduction to computer technology and some major features of the SPSS system.

## Software and Computing Systems Engineers

Boeing Aerospace Company has immediate opportunities in the Seattle area for professional software and computing systems engineers with experience in:

- Software/Computing Systems Design Analysis
- Real-Time Operational Software Development
- Microprocessor Software/Firmware Design and Development
- Signal Processing Software Development
- Support Software Design and Development
- Software/Computer Systems Quality Assurance

These assignments are for command and control, avionics and related applications on a wide range of aerospace products.

A BSEE, Computer Science or other applicable engineering degree and U.S. citizenship are required.

Attractive salary, fringe benefits and moving allowances will be offered qualified candidates. Living is a pleasure in the unspoiled Northwest with its many recreational and sports activities and relaxed life styles.

Please send your résumé to The Boeing Company, P.O. Box 3707-CCU, Seattle, WA 98124.

An equal opportunity employer.

# Software Plums

Our client, a leading manufacturer of terminals and minicomputer-based systems, has several "plum" opportunities for **SYSTEMS PROGRAMMERS AND ANALYSTS**. They have a significant sales base (\$40 M), but are small enough to still have a personal environment. The customer base - airlines, railroads, insurance, banking, hospitals, etc. provides both continued and sustained growth and the challenge necessary for individual satisfaction.

Generally, individuals will be responsible for the design, test and implementation of complex and sophisticated software programs for digital minicomputers. Experience requirements range from entry level to senior levels of technical expertise. Candidates must be experienced in Assembly Language applications for minicomputers. Salary ranges are quite competitive.

All fees and charges are assumed by the client company. They are an equal opportunity employer. Please send your resume with salary history and requirements, in confidence, to:

## Even Webster's Knows About QUEST

**QUEST** (kwest). v. 1. To make a search; to go on a quest.

**QUEST SYSTEMS, INC.** n. 1. A corporation founded in 1968. 2. The largest professional recruitment firm in the U.S. functioning solely in the computer sciences; its client companies pay all employment fees, interviewing and relocation expenses. Quest is known for its deep personal commitment to relate to each candidate as an individual with individual goals. 3. Its professional staff averages over 6 years of experience in EDP recruiting (additionally, staff members have direct hands-on experience in programming, systems, hardware sales, etc.) 4. Quest is presently searching for programmers and analysts (commercial, scientific, systems software) for over 3,500 client companies in the U.S. Quest has openings in over 700 U.S. towns and cities. 5. Methodology - see Questsystem.

**QUESTSYSTEM** (kwest sis'tem). n. 1. Discussing with an individual what he would like to be doing in light of what he has been doing. 2. Analyzing the realities of his objectives as they relate to the current job marketplace. 3. Contacting client companies and other Quest staff personnel to identify positions of possible interest. 4. Introducing the job candidate to his prospective employers by providing complete details to each about the other, ensuring the efficacious use of everyone's time. 5. Arranging interviews. 6. If employment offers are extended, Quest assists in evaluating the responsibilities, compensation and opportunities (and relates those to the initially stated objectives). The Questsystem has been working for thousands of professionals at no expense, whatsoever. Ask your friends of their past dealings with Quest. Then, put the Questsystem to work for you. For additional information on this subject, please inquire directly to Quest Systems, Inc. (All inquiries/resumes received will be responded to immediately and in confidence.)

# PLAY A BIG ROLE... in our GROWTH

with an international company creating innovative products spanning the full range of the data entry spectrum.

## Senior Systems Programmers Development Group

We are seeking individuals experienced in the areas of data entry applications, operating systems, data communications, etc. You will design, develop, implement and maintain contemporary software systems for our mini-computer based product line.

## Software Systems Engineering

To perform Feasibility Studies, Product Objective Evaluation, System Performance Evaluations, Functional Specification Development Software, Cost Estimating and Hardware Evaluations.

Persons with Communications and Data Management experience, especially in the context of a consulting environment are particularly desired.

## Software-Quality Assurance

You will perform software QA testing, system maintenance and Test Plan generation in an exciting environment.

*We offer excellent salaries and comprehensive company benefits. Please send resume including salary history to Joanne Warren, Employee Relations Department.*

186 Middlesex Turnpike  
Burlington, MA 01803

*An Equal Opportunity Employer*

# SYSTEMS PROGRAMMERS: THINK ABOUT UPGRADING YOUR POTENTIAL AT THE MANUFACTURER LEVEL AND MAKE A MOVE. TO CALIFORNIA. AT AMDAHL:

## BUILDER OF THE WORLD'S MOST EXCITING COMPUTER.

Six years ago, a small group of leading designers of large computers—under the direction of a preeminent, pioneering computer scientist—set out to design and build a new generation of large computers.

Today, the Amdahl 470V/6 system is just that: a top-of-the-line, 3.8 to 5.2 million dollar computer that performs more work at lower cost than any other general-purpose computer. It's unprecedented, and so is the company.

Within the past 18 months, this exceptional company has delivered 21 of these systems. Over \$88,000,000 worth. But more to the point: 8 of the 21 were shipped during the third quarter. Which is why we need help...from exceptional, enthusiastic individuals who need to perform well because the task is worth it, and because it's fun. We made a commitment to that philosophy when we began, and we're sticking to it. We have intentionally created a friendly environment where efforts are recognized. We are keeping it that way, despite our growth.

Below are some of our more immediate needs. Karen Daly would like to hear from you at Amdahl Corporation, 1250 East Arques Avenue, Sunnyvale, California 94086. To expedite your application, please indicate on your resume the specific position you are responding to in this ad. We are, of course, an equal opportunity employer.

### SYSTEM PROGRAMMER OPPORTUNITIES AT AMDAHL (MVT/SVS/MVS/VM)

*Here are opportunities worthy of your immediate consideration. Opportunities to work shoulder-to-shoulder with some of the industry's top software talent in a company committed to forefront software support as well as forefront technology. Prove it to yourself by talking with current Amdahl users and our own software group. Then make a move and remove yourself from the mundane. All of the following openings are within our expanding software staff at our new headquarters on the San Francisco Peninsula...one of the nicest places to work, live and play in the country.*

#### SOFTWARE TECHNICAL SUPPORT

You will work closely with Amdahl field personnel and customers in our Field Support Center to resolve software problems encountered by Amdahl users. The job provides an opportunity to gain in-depth experience with operating systems components while actually shooting bugs. A detailed knowledge of the internals of at least one operating

system and a familiarity with operating systems utilities and SMP are musts for this job.

#### SOFTWARE SYSTEMS MAINTENANCE

You will develop and maintain 470V/6 model-dependent support for each of the SCPs. Incoming maintenance material is reviewed and generated for redistribution to Amdahl customers. An opportunity to evaluate new SCP function and be involved in program development. A detailed knowledge of operating systems internals and concepts is required, along with a working knowledge of operating systems utilities and SMP.

#### SOFTWARE QUALITY CONTROL

You will generate, apply, and review all software and materials distributed to users. The job provides an opportunity to operate systems in a hands-on environment. Successful candidates will possess a good working knowledge of operating systems components and operation. Additionally, close working familiarity with operating systems utilities, SMP, and assembler language is a must.

### FIELD SOFTWARE OPPORTUNITIES AT AMDAHL

*We are generating constant field openings in concert with the rate at which 470V/6 shipments are growing. We need individuals with both the attitude and aptitude to carry our enthusiasm for unparalleled software support into the field. Immediate opportunities exist in our Eastern and Midwestern Regions.*

#### FIELD SYSTEMS ENGINEERS

You should have a need to feel useful to Amdahl users in a mixed-vendor environment and have a propensity for exuding the Amdahl enthusiasm. You must have a firm grasp on software systems, in-depth knowledge of large system internals (OS/MVT, VM, VS2, SVS, or MVS) and excellent diagnostic ability.

## An Epitaph for Datran

When the Datran Company, one of the new competitive communications entities, filed for bankruptcy in the U. S. District Court for the Eastern District of Virginia recently, more than a company died. A basic American idea may also have lost its hold on life.

The idea was born a couple of hundred years ago along with the notion of individual freedom and a society shaped by its own citizens. With the death of Datran, the Data Transmission Company of Virginia, the idea that ours is a free enterprise economy that encourages competition may have also had a quiet death.

The failure of Datran, said its board chairman Sam Wyly at the company's wake, was "due to continued impediments placed in Datran's path by the American Telephone and Telegraph Company. "Our efforts to continue the business of Datran were made impossible," Wyly said, "by a series of AT&T actions arising from AT&T's determination to eliminate competition in telecommunications."

Datran had a short and an unhappy life. Born in 1968, it was heralded at birth as the harbinger of a new age in computer communications for personal and business use, in homes and offices. Datran was building the nation's first all-digital communications system, capable of transmitting bits of data across the country in less time and for less money than the telephone company could. After a mere five years Datran died, the victim, it is alleged, of a massive overdose of obstruction administered by Ma Bell, who perhaps sincerely believes she must extend her protected monopoly over *all* wire communications to *all* terminal services, and thus reserve to herself the sole right to plug the rest of us into her system on her own terms, at her own pace, at her own price.

Datran is dead and no one cares, except, of course, the few who invested the millions that brought the company to life. No one else cares because no one ever really cares about the failure of a company, or even thinks of a company as having life—of being born and then of dying.

In the impersonal language of the business world companies don't die. They simply fail. Some fail because they are undercapitalized at birth, some because they are created to meet a market that doesn't really exist, and some because they are badly managed and unable to compete. But it seems that none of this was true of Datran. It was born and nurtured with a healthy investment of over \$100 million. The market for which it was created is undoubtedly there and eager for the services Datran offered. And Datran management was experienced and astute.

If Datran management failed at anything, it was perhaps in the underestimation of the strength and size of their principal competitor, AT&T, and AT&T's determination to seize Datran's market for itself. This is Datran's belief

anyway—and the reason for its \$285 million antitrust suit against AT&T.

The actions taken by AT&T, said Datran's board chairman Wyly, included "the improper introduction of services similar to Datran's digital services at rates slashed 40% below Datran's," an action only a rich and powerful, monopoly-based corporate giant like AT&T could take.

Another action taken by AT&T to defeat Datran and anyone else who can raise the capital and has the temerity to go after this market was the introduction of a bill in the Congress that would effectively eliminate all of AT&T's competition. That bill, deceptively labeled "the Consumer Communications Reform Act of 1976," is still alive and well. Only Datran is dead.

More commonly known as the Bell Bill, this legislation would completely eliminate the minor competition that still exists in domestic markets for private lines and terminal equipment. It is a bill that, even more, would permit the total elimination of all future competition except that which the established industry, AT&T, decided to tolerate. The Consumer Communications Reform Act of 1976 is a bill designed to kill all the remaining Datrans and any new Datrans that might emerge.

There is in the tragedy of Datran's death a potential tragedy for us all. And there is a message for us all. The message is that once again, despite the passage of the Anti-Trust Act many years ago, monopoly still threatens to overwhelm competition and thus threatens not simply

young and innovative firms like Datran but the free enterprise system on which our whole society rests.

The message is, further, that this can happen as long as no one is aware, as long as no one perceives, as long as no one listens to what's happening. It can happen as long as consumers, who are the real losers in the unequal struggle between Datran and AT&T, don't understand what is at stake, the freedom to compete. It can happen as long as the people do not realize that despite the determined efforts of the Federal Communications Commission to foster full and fair competition, the AT&T monopoly continues to be the single dominant force in the telecommunications marketplace.

—John M. Eger

Former acting director of the Office of Telecommunications Policy, Mr. Eger is an attorney with the Washington, D.C., firm of Lamb, Eastman & Keats. He is also an advisor to the White House office on Science and Technology policy, and a Datamation Contributing Editor.

## SR. PROGRAMMER ANALYST

### To Evaluate Software Developed by Engineers

This is a key software evaluation position whose responsibility is to analyze and test software developed by our engineering personnel for both existing and future retail Point-of-Sale Terminal Systems. You will develop appropriate systems to test their software work. Accordingly, you should be pretty confident of your software ability based on a degree and from 3-5 years experience including assembly language on mini or microcomputers.

NCR's Point-of-Sale engineering/manufacturing staff is expanding rapidly to meet the opportunities of the retail systems market. This is a highly visible position with very strong growth.

## ENGINEERING PROGRAMMER ANALYST

To design and develop C.A.D. programs for use by our Point-of-Sale terminals systems engineering departments in a design automation activity to include simulation, PCB, I.C. layout, and interactive graphics applications. A good background in COBOL and/or FORTRAN and some recent experience with CDC Cybernet or G.E. Mark III O.S. are desirable. A degree in engineering/computer science will round out your qualifications.

NCR's Retail Point-of-Sale Terminal Systems Division in the rural setting of Cambridge, Ohio is expanding its staff to meet the needs of the exploding P.O.S. market.

*We invite your consideration as soon as practical.*

## COBOL PROGRAMMERS CONSTRUCTION

Gilbert/Commonwealth, one of the nation's leading engineering and consulting firms, has immediate career opportunities for programmers with backgrounds in accounting and cost control.

The individuals selected must be able to work independently on the design and implementation of computer systems relating to the management of major power plant construction projects. For these positions, located in Richmond at the Vepco Project Office, a degree or equivalent programming experience is required.

If you are looking for advancement based on your own ability and share our commitment to professional excellence—find out more about what we have to offer. Send your resume in confidence to J. F. Heisel at Gilbert/Commonwealth, P.O. Box 1498 WQ, Reading, Pa. 19603.

## BURROUGHS 6700 SOFTWARE SPECIALIST

A national consulting firm located in suburban Chicago and specializing in finance/personnel related matters is in the process of converting their present Burroughs 4700 system to the 6700.

We are seeking an individual who has:

- Significant experience in Burroughs 6700 system software.
- Detailed knowledge of the 6700 operating system, utility programs and programming languages (APL, ALGOL, FORTRAN, with an emphasis on COBOL).
- A working knowledge of the Burroughs 4700.
- Some conversion experience is highly desirable.

Compensation is highly competitive. This is an excellent opportunity for an individual with the requisite interpersonal skills and intellectual capabilities to join our consulting staff upon completion of the conversion.

For immediate consideration please send a detailed resume to include salary history, in confidence to:

# MRI and SYSTEM 2000®

## Your resourceful approach to Data Base Management.

Data is a resource—a resource which can provide a wealth of information for management as well as technical personnel—a resource which can aid and increase productivity throughout a company. MRI Systems Corporation is in the business of providing tools for tapping this resource through the facilities of effective data base management.

Since 1969, MRI has continued to refine a system which satisfies user requirements, increases "resourcefulness" of data, and prevents user operating costs from rising.

The result of this refinement is SYSTEM 2000®, a generalized data base management system, a practical and proven capability used by hundreds of organizations which have recognized the need to get more out of their data.

MRI Systems Corporation has the specialists to help you bridge the gap from basic resources to highly refined management information. The technology is data base management and the company dedicated to serving your current and future DBMS needs is MRI. Together they make your data a more manageable and available resource.

Call your nearest MRI representative or write David Jackson at MRI corporate headquarters. Ask about SYSTEM 2000® and data base management. Ask about MRI's consulting services, educational programs, and customer support.

Take advantage of your resources . . . and ours.

## Just how long is the model 40 designed to last?

The Teletype® model 40 system will last for a very long time for a very good reason. Its modular design permits it to grow as your needs grow.

Because of this modularity, you can select from a variety of configurations to suit your present application. Then, as your requirements increase, a full complement of capabilities and options can be added to permit maximum expansion at minimum costs.

Advanced solid-state circuitry and high-quality parts and components also add to the model 40's long, trouble-free life. And just as we've increased longevity and reliability, we've decreased service and maintenance requirements.

No matter how you look at your data needs, the model 40 system offers outstanding reliability, versatility and economy. For a very long time. And delivery is sooner than you might expect. No wonder you can't beat the model 40 on a price/performance basis. Now. Or later.

For complete information, please contact our Sales Headquarters at: 5555 Touhy Ave., Skokie, Ill. 60076. Or call Terminal Central at: (312) 982-2000.

Teletype is a trademark and service mark registered in the United States Patent and Trademark Office.
