Sustainable Waste Management; Case study of Nagpur INDIA

Dr Vivek S Agrawal, Trustee Secretary drvivekagrawal@hotmail.com
Centre for Development Communication http://www.cdcindia.org

I. BACKGROUND

There has been a significant increase in municipal solid waste (MSW) generation in India in the last few decades. This is largely because of rapid population growth and economic development in the country. The per capita of MSW generated daily in India ranges from about 100 gm in small towns to 500 gm in large towns. The increased MSW generation can be ascribed to our changing lifestyles, food habits and change in living standards. In India the amount of waste generated per capita is estimated to increase at a rate of 1%-1.33% annually. It is estimated that the total waste quantity generated in by the year 2047 would be approximately about 260 million tonnes per year, more than five times the present level of about 55 million tonnes. The enormous increase in solid waste generation will have significant impacts in terms of the land required for waste disposal. It is estimated that if the waste is not disposed off in a more systematic manner, more than 1400 sq. km of land which is equivalent to the size of city of Delhi would be required in the country by the year 2047 for its disposal.

In our country municipal corporations are primarily responsible for solid waste management. But with the growing population and urbanization municipal bodies are facing financial crunch and can no longer cope with the demands. The limited revenues earmarked for the municipalities make them ill equipped to provide for high cost involved in the collection, storage, treatment and proper disposal of waste. Municipalities are only able to provide secondary collection of waste, means they only collect waste from municipal bins or depots. A substantial part of the municipal solid waste generated remains unattended and grows in the heaps at poorly maintained collection centres. Open dumping of garbage facilitates breeding of disease vectors such as flies, mosquitoes, cockroaches, rats and other pests.

At present the standard of solid waste management is far from being satisfactory. The environmental and health hazards caused by the unsanitary conditions in the cities were epitomized by the episode of Plague in Surat in 1994. That triggered public interest litigation in the Supreme Court of India. Based on the recommendations of the committee set up by the apex court in that Public Interest Litigation (PIL), the Government of India has framed Municipal Solid Waste (Management and Handling) Rules 2000, under the Environmental Protection Act, 1986. The Municipal Solid Waste (Management and Handling) Rules 2000 are as follows:

1. Collection of municipal solid wastes- Organising doorstep collection of municipal solid waste from houses, hotels, restaurants, office complexes and commercial areas.
2. Segregation of municipal solid wastes- Municipal authority shall organise awareness programs for segregating the waste at source as dry and wet waste and promote recycling or reuse of segregated materials.
3. Storage of municipal solid waste- Municipal authorities shall establish and maintain storage facilities such that wastes stored are not exposed to open atmosphere and shall be aesthetically acceptable and user friendly and it should have easy to operate design for handling, transfer and transportation of waste.
4. Transportation of municipal solid wastes- Vehicles used for transportation of waste shall be covered and waste should not be visible to public, nor exposed to open environment and shall be so designed that multiple handling of wastes prior to final disposal, is avoided.

5. Processing of municipal solid wastes- Municipal authorities shall adopt suitable technology or combination of such technologies to make use of wastes so as to minimize burden on landfill.
6. Disposal of municipal solid waste- Land filling shall be restricted to non-biodegradable, inert waste and other waste that are not suitable either for recycling or for biological processing. Land filling of mixed waste shall be avoided unless the same is found unsuitable for waste processing.

II. SWACHATA DOOT APLYA DARI: A SCIENTIFIC AND INNOVATIVE APPROACH FOR MUNICIPAL SOLID WASTE MANAGEMENT

As can be seen from the above guidelines, collection and segregation of municipal solid waste is a primary requirement for implementation of MSW Rules 2000. Primary collection of garbage is important to prevent littering of waste on the streets. As per the MSW guidelines, waste has to be collected in segregated form so that it can be recycled to the extent possible by adoption of suitable technology. This recycling will minimise the burden on landfills.

Though doorstep collection of segregated waste is important for municipal solid waste management, it is not carried out by many of the municipal bodies in the country as they are lacking in financial resources or the expertise to comply with those rules and they often make little effort to revise outdated and deficient waste management systems. As the authorities were hardly able to provide cost-efficient service to citizens, one possibility was to outsource solid waste management by putting in charge professional private organizations like Centre for Development Communication (CDC). The key concept is a daily door-to-door collection of segregated domestic waste, but the model includes all aspects of solid waste management from waste generation to waste processing (e.g. recycling and vermi-composting) and the final disposal. The end consumer is both main contributor and main beneficiary, as he should segregate the waste instead of littering it and, in turn, profits from the cleanliness of the city and creation of a new awareness that CDC work is generating. Presently the Swachta Doot project is being successfully being implemented in several cities of India.

The Swachta Doot Project is a major solid waste management program that includes the following aspects:

A. Daily door-to-door garbage collection
B. Waste segregation
C. Garbage lifting and Transportation
D. Employment Generation
E. Awareness building

A. Daily Door-to-door Garbage Collection

Daily door-to-door garbage collection is the core of the CDC model. It is most essential for complying with the norms prescribed by the Municipal Solid Wastes (Management and Handling) Rules, 2000 as well as the Supreme Court Guidelines for solid waste management.

Swachta Doot
Rag pickers and private sweepers who were previously working in the same sector and spent their life at foul-smelling and most unhygienic places rummaging through debris with bare hands and getting an uncertain and irregular low payment for this dirty work are brought into organised sector by CDC, and now called as Swachta Doots

Training
Swachta Doots undergo a special training that equips them with the abilities necessary for their job:

- Handling the waste in a proper and hygienic manner
- Polite and helpful behaviour towards local residents
- Discipline, sincerity commitment to their work

The properly trained workers collect the waste from households and shops seven days a week and 365 days a year. This service is provided in the morning time (between 6.00 am to 1.00 pm). They wear colourful work clothes (uniforms) so that residents and shopkeepers can easily identify them. Training and neat public appearance helps the worker to be better accepted by the community.

The garbage is directly transported and unloaded to local containers (transfer stations) using specially designed vehicles. Those Containers are brought to landfill sites outside the city by municipal corporation workforce. There is a close cooperation between CDC and the municipal bodies so that waste is not stored longer than necessary in residential areas.

This way of domestic waste management is in compliance of MSW guidelines and guarantees that:

- Waste is handled only once
- It is exposed nowhere
- There is no need of burning the garbage or dumping it in streets, drains and open places

Equipment
CDC has developed a micro-plan to adopt waste collection to the special conditions that prevail in different areas. For example, in slum areas different type of waste is produced than in posh colonies and the size of the streets is varying. To implement this micro-plan, CDC uses different types of vehicles.

Swachta Doots collect the garbage with specially designed mechanical tricycle rickshaws and multi bucket wheelbarrows. They have several advantages:

- Workers can access even very narrow roads (for example in Slum areas)
- Segregated waste collection
- The waste can be directly unloaded in the container. It does not have to be touched. So, hygienic conditions for workers are improved.

CDC follows a dynamic model of selection of equipment and modifies the equipment according to the requirements of a particular locality, town or a city.

Evolution of Primary Collection Equipment

a) Open Body Tricycle Rickshaws: The open body tricycle rickshaw is the most basic primary collection equipment and its capacity is about 50 Kgs. Its benefits include low cost and since it collects the mixed waste, it takes less time for waste collection from individual households. This type of equipment is no more in use as it collects the waste in mixed form, which is in contravention of MSW Rules. Further the collected waste is often dumped onto the ground or road and attracts rag pickers to sort out the recyclable part of the waste, exposing them to serious health risks. Additionally, since the waste is transported open to atmosphere, it is non-aesthetic and it is also observed that waste keeps spilling from the sides of the rickshaw.

b) 6 Container Tricycle Rickshaws: In order to overcome some of the problems faced in the above model, CDC evolved a 6-container tricycle rickshaw for primary collection of waste. The major advantages of this type of equipment is that it allows collection of waste in segregated form and prevents multiple handling as the waste can be directly unloaded to the secondary collection vehicle. Due to these reasons, this type of equipment complies with the MSW guidelines. Its cost is a little more than the open body tricycle rickshaw and can carry 75 kgs of waste in one trip. The only limitation with this type of equipment is that it led to frequent thefts of plastic containers requiring their replacement. This unnecessarily adds to the costs.

Types of Containers	
Metal Containers	*Plastic Containers*
Heavy, Corrosive and Expensive	Light Weight & Durable and Non- Corrosive

c) Closed Body Container with 2 compartments: In some of the areas, a new type of tricycle rickshaw has also been utilised viz. Closed Body Container with 2 Compartments, which aids in segregated collection of waste, and since it's a closed body type the waste is not exposed to the atmosphere and therefore has aesthetic appearance. This type of equipment can carry 150 Kgs of waste and costs about Rs. 8000/-, which is a little more than 6 container type tricycle rickshaw. The only limitation with this equipment is that since the waste cannot be unloaded to the secondary collection vehicle, it leads to multiple handling, which is in contravention to MSW guidelines. This type of equipment is highly suitable for smaller cities where the waste can be directly transferred after collection to the landfill site.

d) Closed Tipping Bodies with 2 containers: To overcome the problem of multiple waste handling, a further improvement is in the design of rickshaw has been incorporated, that includes hydraulic lifting of the rear side of the rickshaw unto the height of secondary collection vehicle so that the waste can be directly disposed off. This type of equipment is most expensive and requires more maintenance as compared to the earlier ones.

e) Mechanised Auto Rickshaws with closed container body with compartments: In some cases CDC has deployed mechanised equipment in the form of Auto rickshaws for primary waste collection. The benefits of this type of equipment include high coverage area and can handle more waste. Further, since it has a closed container body, it is aesthetic in appearance and can directly unload the waste to final disposal point. This type of equipment is most optimum for smaller cities and towns as the overall economics is favourable as compared to manually driven rickshaws. The only demerit with this equipment as compared to the earlier models is that the initial capital cost is higher.

f) Mechanised operations with Medium Utility Vehicles: In line with the above-mentioned mechanised operations, CDC has also introduced medium utility vehicles for primary waste collection in some of its projects. The advantage of this type of system is that it can handle more waste than auto rickshaws and is most ideal for bin-free cities. It fully complies with the MSW guidelines and is aesthetic in appearance, as waste is not exposed in the open atmosphere. The demerit is that it is more expensive.

Door-to-Door Garbage Collection - The Monitoring System

Supervisors and Zonal In-charges inspect the field everyday. They regularly get in touch with households and shops to check for feedback, complaints and suggestions so that a satisfying service can be maintained. The CDC customer care service, telephone number is available from 6.00 am till 8.00 pm. In most cases complaints are redressed within 30 - 60 minutes during working hours, or the next morning if problems arise outside working hours.

B. Waste Segregation

Waste is not all the same. It has different characteristics according to which it can be divided accordingly:

- Recyclable e.g. glass, paper, plastic
- Organic e.g. food leftovers, garden waste
- Toxic e.g. tin, batteries
- Reusable e.g. plastic bottles, polythene bags

While recyclable waste is dry in nature, the organic kind is wet and 100% biodegradable. Hence, bacterial action is faster in the latter. If waste is segregated, it is easier to handle, does not cause much pollution and can be reused, recycled or decomposed.

The CDC model of waste management is based on the principle of segregating waste and treating it according to its characteristics. Waste should be segregated at the place or source of origin. In order to realize this concept CDC, implements the following approach:

- Educating the community about waste characteristics and the consequences of inappropriate waste dumping
- Collecting the waste in a segregated manner every day
- Using specially designed multi-chambered rickshaws for garbage collection

C. Garbage Lifting and Transportation

Since June 2004, CDC is also lifting the local containers and transporting them to landfill sites in few cities. This enables CDC to co-ordinate the different processes of primary waste collection and transportation. Containers are lifted before they overflow and waste is not stored longer than necessary in residential areas. Furthermore, superfluous containers can be removed for better public convenience.

D. Employment Generation

As CDC is not a profit-oriented organization, it is committed to improve quality of life, especially for the deprived section of the society. For this reason, most grassroots workers have been recruited from slum areas. CDC started its work initially with few workers. This number increased every day and now CDC could create livelihood for about 6000 persons in the Swachta Doot Project. The services have grown in various cities and presently CDC is catering to a population of nearly 6 million.

The following table highlights some of the current projects of CDC in various cities including employment generated approximate quantity of waste collected, utilized and finally transported as inert material to landfill sites.

City	House-holds covered	Road sweeping (length in km)	Employment generation	Waste collected (T/day)	Organic matter (T/day)	Recyclable content (1) (T/day)	Inert & Inorganic (T/day)
Jaipur	50000	150	300	100	60	10	30
Nagpur	450000	200	2500	900	540	90	270
Ahmedabad	30000	35	125	60	36	6	18
Gandhinagar	60000	0	100	120	72	12	36
Surat	100000	0	100	200	120	20	60
Nanded	10000	0	150	20	12	2	6
Delhi	200000	450	629	126	0	0	0
Bilaspur	10000	0	30	10	0	0	0
Udaipur	3000	40	30	0	0	0	0
Bharatpur	10000	60	94	15	0	0	0
Hanumangarh	17000	60	90	0	0	0	0
Beawar	10000	85	100	16	0	0	0
Jaisalmer	3000	30	32	0	0	0	0
Total	953000	1110	4280	1551	840	140	420
Average 5 members per Household				0 indicates non availability of data			

Note: 1) Recyclable contents include paper, glass, plastic and metal
2) All weight values are approximate values.

Introduction of door-to-door collection service has improved the financial condition of Swachta Doots who now receive regular payment as compared to the earlier situation when they could earn low (12-15/-per day) and irregular incomes. They are now enjoying dignified working conditions at CDC, as their profession is viewed with greater respect amongst society members compared to their earlier work. As both genders are treated equally the number of women is almost as high as the number of male grassroots workers. Women are given the chance to make an own contribution to the living standard of their families. Additionally unemployed or underemployed educated youth profit from these job opportunities as they are recruited as Managers and Supervisors.

E. Awareness Building

It is CDC's conviction that the cleanliness of city is a collective good. It can only be achieved with the participation of all concerned. Therefore, CDC encourages and motivates people to keep their surroundings clean. They are provided education regarding sanitation and garbage disposal through various means of communication such as:

- Posters, folders, booklets, leaflets
- Exhibitions
- Wall paintings
- Living society meetings
- Debates and painting competitions in schools
- Regular talks with citizens

III. BENEFITS OF SWACHTA DOOT PROJECT

Social

- Improving social standard of Swachta Doots by providing training and financial stability
- The community is made aware of the consequences of unscientific waste throwing and can participate actively
- As the citizens are also involved in the project they develop a sense of belongingness

- People appreciate the service and consider it as necessary and essential. This makes the project self-sustainable

Economic
- City's image as a "green and clean" city can boost local economy especially in tourism branch
- Creates new avenues of employment
- Composting of organic matter and recycling of paper, glass, plastics and metals yield productive outcomes and reduces burden on landfill site

Public Health and Life Quality
- Waste is handled in a hygienic and scientific manner, so no pollution is caused at any stage
- Garbage on the roads is tremendously reduced
- Drains are no longer clogged with garbage – no smell, no breeding site for malaria spreading mosquitoes, no meeting place for pigs and other stray animals
- Quality of life improves as the whole city looks clean and aesthetic

This shows that the model is not only a convincing theoretical concept but also a successful intervention in the field of Municipal Solid Waste Management.

Methodology
- The idea of door-to-door (D2D) collection of garbage was not new for Nagpur Municipal Corporation (NMC). This work was started in 1996 in some wards of the city covering about 30% of the total population. But after the Supreme Court directive regarding 100% D2D garbage collection, it was implemented throughout the city.
- Requirements for implementing the directive included equipments like cycle rickshaws, ghanta gadi and manpower.
- In the city of Nagpur there are different types of residential areas like skyscrapers, slums, independent houses, bungalows, government colonies, etc. These categories have been grouped and suitable volunteers have been deployed for garbage collection.
- The volunteers were trained and oriented about waste disposal.
- Every volunteer i.e. 'Swachata Doot', cover about 200 – 300 households everyday depending upon the category.
- All the volunteers have been provided with uniforms and safety kit, which includes hand gloves, face mask, cap, etc.
- To oversee project implementation, one supervisor and coordinator has been appointed for every zone.

Key Highlights

- First project in India involving D2D collection of garbage from 100% households on all 365 days.
- The only project on solid waste management in India to recruit physically challenged persons. At present there are 37 such persons working on this project and thereby earning livelihood for themselves and their families.
- No dependence on external funding.
- Community involvement on a large scale.
- Well-defined roles for NMC, NGO and the community under the scheme.

Strategy followed

All concerned stakeholders were consulted before finalizing the implementation plan.
Implementation plan

- The work of D2D collection of waste by 'Volunteer' begins at 6.00 a.m. daily.
- Every household in the given group is attended daily.
- The doot goes around the demarcated households & announces his arrival by blowing a whistle.
- When the cycle rickshaw is completely filled with waste, it is unloaded in the nearby community dustbins. After unloading, the volunteer covers the remaining households.

- During every unloading, the recyclable waste is separated by the volunteer.
- At no point of time, he does manual handling of the waste collected.
- Monitoring indicators have been set in consultation with the NGO, which have further ensured prompt implementation of the project, e.g. households covered, timely complainant redressal, regular and surprise filed visits, community feedback, etc. are monitored regularly.

IV. RESULTS

- Benefits to NMC
  1. Successfully implemented the Supreme Court guidelines.
  2. Savings worth Rs. 5 crores in terms of lower costs for providing D2D garbage collection service to the citizens.
- Benefits to CDC (NGO)
  1. Other municipal corporations in India are adopting Swatchata Doot model. CDC has assisted in preparation of policy in Rajasthan.
  2. CDC's budget for the financial year 2003-04 was Rs. 53 lakhs. After being appointed as implementer for this project, its financial credibility has escalated to Rs.15 crores. Moreover, we have been appointed to implement similar project in other cities of India.
  3. Financial institutions like Kotak Mahindra, ICICI, Tata Finance, etc. have come forward to sponsor equipments required for D2D collection. To date credit worth Rs.1 crore has been availed from these institutions.
  4. NMC has further reposed its confidence in CDC activities and has handed over the responsibility of secondary transportation of Municipal Solid Waste also to a joint venture involving CDC.
  5. Improvement in sanitation.
- Benefits to Citizens
  1. Regular D2D collection of garbage and active participation in the zero garbage drive.
  2. Better and prompt service at minimum costs.

Stakeholders / Partners:
'Swachata Doot Aplya Dari' is a joint initiative undertaken by various stakeholders / partners to maintain good hygiene and jointly create a cleaner city. In the following section we would like to highlight those who have made a significant contribution towards the initiative. These include:

a) Nagpur Municipal Corporation (NMC): Keeping the city clean has taken on a whole new meaning in the orange city i.e. Nagpur, the second capital of Maharashtra. Being innovative, clean and green has had a significant bearing on the city's future competitiveness and attractiveness as a business and traveling hub. Firm determination and hard administrative measures have contributed towards the success of the efforts of NMC. The innovative steps taken by NMC in MSW handling and disposal have led to visible changes in the city. Nagpur is recognized as one of the cleanest cities in the country.

b) Civic Cops (Nuisance Detectors): The civic cops supervise the work of Swachata doots i.e. the volunteers and addresses the grievances of the citizens. Furthermore, they collect the previous day's regarding information and report it to the higher authorities at the zonal office in writing, which was collected at the main office. Supervision by higher officials at the zonal office and appreciation of their efforts keeps these civic cops motivated & on their toes.

c) Non – Governmental Organizations (NGOs) Center for Development Communication (CDC): CDC had the most Herculean task i.e. implementation, wherein it had to involve people in implementing the programme, apart from recruiting volunteers, training and orientation, convincing the masses, etc. 'Show and tell' observation of a functioning D2D primary collection system was used to train the volunteers.

As it is rightly said ‘public support comes when people see tangible results and benefit from such change’. The residents not only co-operated but also applauded the joint efforts undertaken by CDC, who have been responsible for making Nagpur a ‘Green and Clean’ city.

d) Swachata Doot (Volunteer): The volunteers or the Swachata Doots were the vital links and key contributors for making Nagpur a ‘Green and Clean’ city. These volunteers some of who were earlier know as *‘Rag Pickers’* would previously collect and sort the recyclable dry waste like paper, plastics, metals, rags, etc for their daily living. Commencement of ‘Swachata Doo Aaplya Dari’ scheme has had positive impacts on the lives of these rag pickers and substitute sanitation workers resulting in livelihood creation for the members of the most downtrodden segment of society giving them dignity of wlrk as ‘Swachata Doots’ having uniform and protective.

e) Citizens: The citizens have contributed to the scheme by whole-heartedly adopting the idea of waste disposal to volunteers only and making voluntary token monetary contribution towards the welfare of the volunteers.

Shifting Millions from Open Defecation to Hygienic Practices

Ms Rokeya Ahmed, Poverty & Equity Adviser
WaterAid Bangladesh
http://www.wateraid.org
rahmed@wateraidbd.org

A successful case study of WaterAid Bangladesh and Village Education Resource Centre (VERC) to achieve 100% sanitation in Bangladesh

Bangladesh fact file

- 74% of the population have access to water supplies, but the quality of many of the supplies is poor.[1]
- According to 2003 survey report, average sanitation coverage is only 32% falling to 15% in some areas, and poor hygiene practices are widespread[2].
- Every day 20,000 metric tons of human excreta are deposited on public lands and in waterways, causing serious contamination of surface water.
- Unsafe water and human excreta are the main transmission routes of 40 of the 50 most prevalent diseases.
- An estimated 250,000 people, including 115,000 children under the age of five, die every year of diarrhoeal diseases.[3]
- The treatment of hygiene-related diseases costs 5 billion taka (US $80 million) a year.[4]

Introduction

The Government of Bangladesh and its development partners plan to achieve nation-wide total sanitation by 2010. This is essential, as poor hygiene practices, open defecation and minimal environmental sanitation are currently taking a major toll on the national's health.

Traditional approaches to improving sanitation have focused on technocratic and financial patronage, rather than health and hygiene education. Water supply coverage is relatively high, but safe water alone leads to only minor health improvements and does not prevent serious diseases like cholera and dysentery.

The majority of people in Bangladesh have a poor understanding of the link between poor hygiene and disease. People tend to want to have latrines for reasons of convenience, privacy and status, rather than sanitation and health.

There are a number of barriers to achieving total sanitation, as outlined below:

Barriers to achieving total sanitation

- The Government is centralised and functions in a top-down and supply-driven manner
- Fixed latrine models are too expensive for the poorest people and in many geophysical areas prove non-user friendly
- Lack of tenure rights, particularly for slum dwellers, mean poor people have no right to build latrines where they live
- Women's specific sanitation-related needs are unrecognised by the community
- Cultural taboos and embarrassment hinder open discussion

Institutional reform will be a key factor in implementing people-centred integrated water, sanitation and hygiene programmes. Although the debate is on, any significant change in the policy on decentralisation appears unlikely in the near future.

WaterAid Bangladesh and VERC's innovated approach

WaterAid Bangladesh and its rural partner NGO VERC have jointly developed an integrated, empowering approach in collaboration with community people living in rural areas. The approach has proven effective in establishing safe water supplies, environmental sanitation and promoting good hygiene practices. Other partners of WaterAid's are now using this approach as a 'tool kit' with which to build a context sensitive approach for their specific target communities.

The approach is based on the following key principles:

- **Integration** Safe water supply, environmental sanitation and hygiene promotion are addressed simultaneously. Projects are appropriate, sustainable and affordable for the community.
- **Participation** The whole community, including the hardcore poor, are actively involved in project planning, implementation, monitoring and evaluation. Individuals in the community are trained to become trainers; the community determines the best water supply and sanitation infrastructure option and hygiene promotion education inputs are facilitated.
- **Empowerment** People's capacities, skills and indigenous knowledge are recognised and valued. Support is provided in the form of capacity-building to strengthen the ability of individuals who emerge as leaders to work as agents of change within the community. Communities act as facilitating agents in their neighbouring areas. Empowered communities increase their confidence to analyse and voice their needs constructively to local government agencies or other development programmes.

Key aspects of the approach

- People's skills, abilities and knowledge are valued
- 0% subsidy for latrine construction
- 'Whole community' approach
- Use of participatory research tools to analyse the problems
- Formation of Village Development Committees - local engineering groups
- Identification of potential community leaders and involve them as community 'catalysts'
- Mobilisation of local resources
- Involvement of local government

Outcomes of the approach

- More than 250 villages are 100% sanitised
- Eight sub districts are actively working towards creating 100% sanitised.
- 20 innovative hygienic latrine designs have been put forward by communities
- A cultural shift from 'top down' to 'bottom up' approaches has happened in the organisation and at community level
- WaterAid Bangladesh and partners are providing training support to a number of local and international aid agencies to integrate the approach
- The Government of India is replicating the approach in the state of Maharastra

Village Education Resource Centre (VERC), a rural based partner of WaterAid, began piloting the 100% Sanitation Approach in 1999 in response to the poor impact of previous attempts to improve sanitation.

VERC's approach is based on the assumption that, once the issues have been understood, communities have the commitment and ability to overcome their water and sanitation problems themselves. Field staff assists communities in drawing up a behaviour-focused working definition of 100% sanitation, through which communities come to recognise that in the area of water and sanitation the behaviour of an individual has a direct impact on the health and wellbeing of others. Community mobilisation is triggered and the community plans and implements sustainable solutions that meet their own needs. Community elites work together with the hardcore poor providing land, materials and/or cash for the construction of latrines, to achieve total community coverage.

Due to empowerment of the community, many technical, social and economic innovations took place. The communities designed many local and low-cost models of toilets which are affordable and to suit the local conditions of the community. The engineers from VERC and Water Aid Bangladesh encouraged this innovation by providing technical help and support without dictating ways of doing it. There are more than twenty models of toilets innovated by the local community and the cheapest one costs only Tk.70 (US$ 1.05).

The process involves the community in all aspects of the project. This introduces ownership of the programme, as well as ensuring sustainability for the future. As part of the wider community, local Government bodies, NGOs, community based organisations and other stakeholders have successfully been brought into the process. The approach is proving self-replicating as other villages are adopting the 100% Sanitation Approach, seeking advice and help from community leaders.

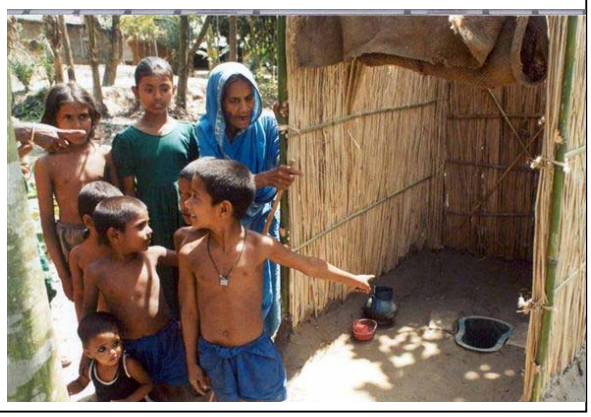
Programme to Programme Support

WaterAid Bangladesh and VERC provided training support to World Vision Bangladesh and Dhaka Ahsania Mission (lead NGO of DPHE-DANIDA Coastal belt project) in their implementation of a sanitation project following the 100% sanitation approach. They are working to assist 1230 villages for total sanitation. Plan International and CARE Bangladesh are also following the same approach for total sanitation in seven sub districts of Bangladesh.

WaterAid is also working in collaboration with four partner organisations on rural sanitation programmes serving over 3200 villages of 160 unions across 15 districts.

A working definition of 100% sanitation

- No open defecation or open/hanging latrine use.
- Effective hand-washing after defecation and before eating / taking or handling food.
- Food and water are covered.
- Good personal hygienic practices, such as brushing teeth and trimming nails
- Latrines are well managed.
- Sandals are worn when defecating.
- Clean courtyards and roadsides.
- Garbage is disposed of in a fixed place, such as a pit.
- Safe water use for all domestic purposes.
- Water points are well managed.
- Waste water is disposed of down drains or in a fixed place.
- No spitting in public places.



Impacts & Benefits of 100% sanitation projects

- **Women's advancement**

In Bangladesh there is a rigid division of labour regarding activity related to water, sanitation and hygiene promotion. Women and adolescent girls are disproportionately burdened by inadequate and poor quality water and sanitation services as they normally collect water, clean the household and care for the sick. Lack of privacy in sanitation facilities also exposes them to increased risks of urinary tract infection, reproductive health problems and physical attack.

Women have reported that improved access to water and sanitation services has resulted in a more productive use of time and resources. Traditional gender roles are being challenged as men and women recognise the direct contribution that women's participation is making to the community's improvement and to household economic benefits. Through the process of forming and developing community institutions women have increased their confidence and capabilities in private and public spheres.

- **Poverty reduction**

Loss of earnings and production are additional handicaps for poor people, whose physical fitness is their main productive asset. Use of safe drinking water and sanitation facilities, together with improved hygiene practices, has a direct impact on poverty by reducing the vulnerability of poor people, especially women and children, to disease, ill health and death. Use of improved facilities releases women and girls' time for paid work, schooling and rest. Savings are made from household expenditure on medical expenses.

- **Improved governance**

Poor people in Bangladesh lack the awareness, information and opportunities to demand their rights. The worst off are excluded from collective decision-making and denied the voice to lobby government for basic services. Through community empowerment, constructive relations are being built with Union and Upazilla level government in rural areas.

- **Scaling up to national sanitation**

Given the success of the new approach WaterAid has expanded its rural and urban programmes, refining and developing new initiatives. Programmes are better linked to local government and efforts for their emulation in national programmes will continue. The Government recognises the public health benefits of water and sanitation and has adopted a National Strategy for Sanitation based on the demand-responsive approach.

In 2003 the Water Supply and Sanitation Collaborative Council, of which WaterAid is a member and the Government collaborated in the development of a National Sanitation Campaign. The campaign launched in October 2003. The target is to achieve total sanitation by 2010.

In October 2003 the Government also arranged an international conference named South Asian Conference on Sanitation (SACOSAN). The overall goal of the conference was to "accelerate the progress of sanitation and hygiene work in South Asia so as to enhance people's quality of life, in fulfilment of the Millennium Development Goals and the commitments made in the World Summit on Sustainable Development (WSSD). In the conference VERC approach was presented as a successful case study.

DFID's assessment [5] of VERC results in areas with improved water facilities and 100% sanitation

- Reductions of 99% in diarrhoea, 90% in dysentery and 51% in stomach-related problems such as intestinal worms, in rural areas.
- Monthly medical costs for common illnesses are 55% lower.
- Working days lost due to illness have fallen from 77 to 35 per year in rural areas
- Schooldays lost due to illness have fallen from 16 to 7 per year in rural areas.
- Expenditure on food and clothing has risen by 6%.

[5] Farouk A. Chowdhury, an Economic Evaluation of WaterAid Bangladesh's Water and Sanitation programme in specified areas of Bangladesh, December 2002, DFID Bangladesh.

WaterAid is an international non-governmental organisation dedicated exclusively to the provision of safe domestic water, sanitation and hygiene education to the world's poorest people. These most basic services are essential to life; without them vulnerable communities, particularly women and children, are trapped in the stranglehold of disease and poverty.

WaterAid works with poor people in 15 developing countries in Asia and Africa and has been working in Bangladesh since 1986. WaterAid works with local partner organisations setting up low cost, sustainable projects using appropriate technology that can be managed by the community itself.

WaterAid also seeks to influence the policies of other key organisations, such as governments, to secure and protect the right of poor people to safe, affordable water and sanitation services.

VI. SUMMARY AND CONCLUSIONS

6.1 Environmental Standards Experience in Developing Countries

Since the establishment of the DC/NEnPAs (most were formed following establishment of UNEP at the Stockholm Conference of 1972), these NEnPAs have promulgated numerous ESs, mostly in the WQ and AQ sectors. Generally the NEnPAs have assumed that promulgation of ESs would somehow achieve environmental cleanup, primarily because of the impact of the experience of the USA (which has had the lead role in the ICs in use of ESs). The USEPA has had the power and funds to set ESs and to enforce them including monitoring/surveillance capabilities. Generally the ESs set by the DCs, because of the complexity of the process of devising appropriate DC/ESs, have been essentially adaptations of ESs used by the ICs, and often have not been affordable/appropriate for DC use, hence have often been largely ignored. They have not served to contribute to continuing sound national economic-cum-environmental development and often have been counterproductive and have tended to impair the credibility of the NEnPAs with the national economic planning and implementing agencies. An important aspect of this is the lack of recognition that use of ESs, to be meaningful, must involve continuing surveillance/monitoring by the NEnPA together with power for follow-up enforcement measures, but generally the DC/NEnPAs have not had these capabilities, and it is expected that they will have limited such capabilities in the foreseeable future (the next decade or two). Hence, if ESs are to be successfully used by the DCs, the approach for this must not be an adaptation of IC practices but to use practices tailored for DC use.

6.2 Utilization of Results of Study by Developing Countries

Section 5 of the present study presents a series of guidelines which indicate how the findings and conclusions of the present study may be applied by DCs to help meet their needs. These guidelines are based on the "Engineering Approach" which embodies the concept that the planning of water supply and pollution control facilities should be as cost effective as possible, meaning (i) use of ESs which are appropriate, (ii) competent planning/design of facilities to achieve least cost investment which will meet the standards, and (iii) competent monitoring and enforcement following construction to ensure adequate performance.

6.3 Manual on Environmental Standards for Developing Countries

6.3.1 Need for Manual

It would certainly be in the interest of developing countries for a manual to be developed that would function as follow:

(a) When a country intends to allocate resources to spend on environmental affairs, it would use the organized formats presented in the manual to determine:

(i) The technical areas which are most critical with respect to benefits in environmental expenditures.

(ii) The type of improvements which would produce maximal beneficial

results to the environment.

(iii) The appropriate standards to which the project should be designed, to achieve optimal economic-cum-environmental development.

(iv) The hierarchy of risks to be attacked in order as resources become available (short term and long term planning).

(b) When a country plans for the financing of a given project, the financing authority would make use of the manual to determine the overall appropriateness and cost effectiveness of the project.

(c) Without an organized system for project analysis and the development of appropriate standards, the decisions as to what projects to implement is largely subjective in nature. Such a subjective decision making process tends to produce projects which benefit selected groups, rather than the population as a whole. Without a system for developing appropriate standards, there is a tendency in developing countries to simply "copy" standards being used in the ICs, such as the USA. The application of standards developed in affluent countries will almost always result in large wastage in terms of capital costs and in terms of building systems where the needed minimum O&M budgets/skills will not be available. The ESs must be tailored to suit the particular needs of the particular DC, and must be revised from time to time as economic and socio-economic conditions improve.

6.3.2 Recommendations

It is recommended that the international assistance agencies (IAAs) fund a project which would develop a manual entitled, "A Procedures Manual for Formulation of Appropriate Environmental Goals/Standards and Associated Design Objectives for Developing Countries", beginning with the water quality and air quality sectors. This would be a "Phase II" study to follow-up on the information presented in the present report. The estimated cost for Phase II is approximately $ 1 million each for water quality and air quality.

The IAAs should also fund similar projects covering every important environmental degradation sector for both (a) the "brown" (urbanizing/industrializing) problems of degradation and (b) the "green" problem area (forests, wildlife, aquatic resources, eco-swamps). For category (a) far priority ESs needs are for occupation health, industrial emergency response systems, and urban highways.

In the area of natural resources, very few guidelines useful for DCs are available, but are needed as much as for the brown sector. The reason for the relative inattention to the green sector is that, historically, the field of environmental protection began in the brown area (the area at sanitary engineering). The need for applying sound scientific/engineering planning is equally great in both brown and green sectors if DC growth is to be sustainable, that is, economically-cum-environmentally sound.

ABSTRACT

Developing Countries are increasing their wealth, but have substantial ecological problems including high population growth, mass movement of rural populations to cities, and severe net negative cultural and ecological/environmental impacts. Additionally the World Community is now so closely watched by the media that political leaders of developing countries are forced by their citizens to give the appearance of personal and environmental protection by adopting the same ecological/environmental standards/criteria as the industrialized nations, when the economic and manpower resources make enforcement essentially impossible. The problem is intensified by the fact that the standards/criteria for industrialized countries are often based upon non-scientific/non-economic rationales driven by politically motivated media and environmental pressure groups. The developing countries, as well as the industrialized countries must eventually maximize the utilization of their available resources by utilizing the best scientific/economic rationale possible. Data is presented for the U.S.A. showing its development from about 1890 to the present. From these data it was apparent that the developing countries are following a very similar pattern. It is accordingly very important that these countries be aided to develop and utilize scientific/economic standards/criteria appropriate to their stage of development.

INTRODUCTION

Discharge standards established in the more highly industrialized countries for the protection of air, land, and water environments are often utilized without modification in developing countries. A number of reasons for this practice are discussed in the following paragraphs. It is proposed that such direct transfer is not optimal from scientific and public health viewpoints. The highly industrialized countries have often based their design standards upon a very politically guided interpretation of protection of beneficial values of the air, land, and water environment. Developing countries should base their standards upon net benefits to a sustainable society and environment. That is, they should initially engage in short-term planning, focusing on critical local public health and societal goals to establish first level local standards.

These standards can be made more rigorous as the society develops a greater economic base from which to address its more subtle environmental secondary problems. In fact, the more industrialized nations did engage in this process up to the mid 1970s when the current era of "eco-irrationalism" became dominant. Presently the wealth of many of these industrialized nations allows them to indulge in politically motivated environmental requirement excesses without significantly affecting the lifestyle of their citizens.

The development of standards in any country is subject to political pressures. In the U.S.A., because of societal development from a public health orientation to a more ecologically based structure outlined by Anderson and Garber (Anderson and Garber, 1990), the responsibility for the development and subsequent enforcement of environmental programs was shifted from the US Public Health Service to a newly created agency, the US Environmental Protection Agency (USEPA). Political pressures had created a situation in which certain observable or perceived negative environmental impacts appeared to the public to be so critical that there was no time for scientific study and the subsequent development of rational standards. Conservative, costly standards and related enforcement to effect compliance with those standards were demanded. Conceptually these standards would be modified as research results justified such modification. Unfortunately little of this research has been done, thus there is a paucity of scientific knowledge as to contaminant toxicity and related risk assessment. For the most part the requirements are established based on untested theoretically based models. In many cases the actions of the national legislature, in setting up the laws under which the standards were developed and enforced, was dominated by what was termed economic equity; but what was in reality uniformity in regulation which ignored economic design and did not encourage environmental improvement. It was hoped in this manner that no area of the country would be permitted to gain a competitive advantage under the new laws. This situation often makes U.S.A. standards impractical for use by other nations. Unfortunately the U.S.A. is perceived by the less industrialized nations as having the most fully developed environmental programs, thus the U.S.A. standards have often been utilized, if not copied, by other less developed nations. Such copying could be either directly or indirectly via "international" standards established by various international agencies.

Although there has been much publicity given to the need to develop technology appropriate for use in developing countries, very little has been done to initiate the preparation of standards or criteria appropriate to their ecological needs. The reasons for this were suggested above, but more specifically include the following.

1. The political simplicity of transposing standards/criteria of the industrialized countries to the developing country makes such a practice the process of least effort and greatest apparent acceptability. Additionally the World Health Organization, the International Assistance Agencies and others who advise the Developing Countries tend to copy the U.S.A. standards because the only readily available background data is found in U.S. EPA publications and these publications have been spread all over the World. An added difficulty is the importation of foreign "experts" by aid agencies such as USAID who really do not appreciate the need to use technology and design appropriate to the Developing Countries.
2. Due to the appearance of condescension, officials in developing countries have great political difficulty in proposing standards/criteria/technology which are perceived as "less stringent" than those used in industrialized countries.

3. Because "appropriate technology" means solving an ecological problem with lower costs, the risk level in the population, generated by risk assessment models, may appear to be greater. Few officials can or are willing to recommend risk levels higher than those used in industrialized countries.

These factors along with other socioeconomic considerations usually result in the developing countries adopting the standards/criteria used by industrialized countries. However, such standards/ /criteria are most generally not affordable and are not, as a practical matter, implementable being inappropriate both from the point of view of affordability and the unavailability of needed operation and maintenance or other needed skills. Consequently there is often little resulting improvement in environmental/ecological quality. Ideally developing countries, where appropriate and possible, should attempt to relate their standards and criteria to those utilized in the industrial countries at the time those countries were at an equivalent stage of development. For example the criteria in California U.S.A. for allowable grease/oil in petroleum refinery waste effluents was 50 mg/l 50 years ago but is presently 2 mg/l. As a practical reality this change has had little perceptible effect upon the receiving water environment. Operation and maintenance skills suffer because facility operation budgets are most often only a fraction of the need because sufficient funds are simply not available.

In developing countries, sewerage and water services (as well as most other capital expenditures included in the larger definition of urban ecology) tend to focus on service to the more affluent areas of population centers. This is often a practicable and acceptable initial plan of implementation, considering the overall limitation on funds and the need for cost recovery for financing. Facilities must be paid for, and generally the user must pay. There is no way to give poor people what they need within the funds available to developing societies. Massive aid from industrial societies aimed specifically at these poor people is perhaps the only possible alternative. In point of fact the way to proceed is to increase the income level of the poor by helping increase the rate of development towards an industrial society state. The poor in any society will never be able to afford the same or an equivalent degree of service as the affluent. Sewerage and standard types of sewage treatment is a luxury affordable only when the GNP and average income is quite high. For the problem of excreta management for the poor the only affordable satisfactory approach in developing societies would be to provide well designed, decent on-site subsurface leaching systems. These with proper servicing handle the excreta problem at perhaps one tenth the cost of sewering. Very often substantial improvement projects are planned, but more often than not later phases of the program are not actually constructed. As a practical reality the basic public health of the less affluent areas in a city inevitably affect the public health of the total population accordingly water supply services and/or sewerage or excreta management programs must include service to the entire community.

Since the industrially developed countries are significantly affected by the conditions in the developing countries, it is very important to the World Society (Spaceship Earth) that the ecological standards/criteria utilized by the developing countries be appropriate to their relative stages of development. The standards/criteria which had been used by the presently industrialized countries, at a similar stage in their development, furnish guidelines as to appropriate actions. The larger goal for all the countries, and the World, must be achieving a sustainable society and environment, that is, economic-cum-environmental development. Officials in developing countries must be aided in resisting the imposition of inappropriate standards/criteria so that they can maximize the use of their resources for the ecological improvement so important to all world societies.

DISCUSSION

The general hierarchy of real and perceived societal needs has evolved in the affluent countries in the following historical sequence:

1. Food and shelter.
2. Protection from premature illness and death (communicable diseases).
3. Improvement of the aesthetic quality of life.
4. Maintenance of a desirable ecology.
5. Extension of life for the aged.
6. Improving the species through science such as genetic manipulation.

HISTORICAL ENVIRONMENTAL PROGRESS IN THE U.S.A.

Figures 1 through 9 illustrate some of the environmentally related changes which occurred in the U.S.A. as it became an Industrial Country (Ludwig, H.,Anderson, D. and Garber W., 1989).
Figures 1, 2, 3, and 4 follow the changes in national and personal wealth in the general period 1900 to 1988 when the U.S.A. was changing from a developing country to an industrialized country. Figure 1 shows the progress of the Gross National Product (GNP) per capita in constant 1929 dollars; increased from about 450 in 1890 to 1,400 in 1955 and is even higher now. (The effort of countries like China to reach $1,000 per capita within 10 years can be better evaluated with this background.) Figure 2 presents per capita assets in constant 1929 dollars; these assets increased from 2,000 in 1900 to 22,000 in 1960. Figure 3 permits examination of these changes relative to population. Figure 4 shows that average manufacturing salaries in constant 1929 dollars increased from about $10 per week in 1910 to almost $400 in 1985. During the period of rapid growth there were serious impacts upon the environment such as the stripping of the eastern and mid-continent forests. However, at the turn of the century the society was beginning to achieve control of public health and the primary need was to provide for food and housing. The U.S.A. was then a developing country, forced like many now developing countries to utilize its natural resources in achieving the next level of its hierarchy of needs.

Figure 9 should be viewed in comparison with Figures 1 and/or 2. That is, for public health reasons, there were only 9 regulated environmental parameters in 1930 and these were all for potable water. By 1988, as a national average, there were 63 regulated parameters for potable waters, 9 for air contaminants, and 38 for wastewaters. Figure 1 shows that during the 25 year portion (1930 - 1955) of the 1930 to 1988 period, the GNP per capita increased from about 780 constant 1929 dollars to about 1,400. Similarly from Figure 2, assets per capita increased from 7,800 to 22,500 constant 1929 dollars over the 1930 to 1960 portion of the period. There has also been a significant increase since 1960. The values in Figure 9 are based upon Federal requirements. Individual states may add more. For example in Southern California more than 140 "priority pollutants" are also tested for and controlled.

The parallel between the stage of development and the degree of environmental protection demanded by the public is clearly shown by Figures 1, 2, and 9. During this period, the country's resources grew rapidly, making such environmental regulation affordable. In 1930 the concern was for public health with water supply most critical. By 1988 concerns had included individual contaminants suspected of being toxic or carcinogenic, with zero risk for the population set as a primary goal. Inasmuch as the per capita GNP in the U.S.A. is now many times that of most developing countries, it can to a degree afford "non-engineering/economics". It could not have done so in 1930, so it is not reasonable to expect that Developing Countries be able to afford or to utilize standards and solutions now required in the U.S.A.. If the World

Community is convinced that some practices in Developing Countries can cause worldwide environmental/ecological problems, then the World Community must provide funding and other aid to the developing nations to aid them in reaching mutually acceptable solutions. It must be made clear to the World Community that each Developing Country's first priority must be to take care of critical environmental needs within their own boundaries; but that many cannot yet even afford that. It is therefore futile to expect such countries to contribute financially to global programs such as ozone depletion or "greenhouse" warming. The Developing Countries must be included and participate but the extra costs involved must be borne by the affluent societies.

Figures 5, 6, 7 and 8 clearly illustrate that public health in the U.S.A., during its period of development, was directly related to its GNP and the wealth of its citizens. Figure 5 for example shows the average age at death to have been about 38 years in 1874 and about 74 in 1983. Figure 6 is somewhat anomalous since it shows cancer increasing while other diseases decrease. The reasons for this are important, since the fear of cancer has driven the extreme standards/criteria adopted in the U.S.A. Part of the reason for the apparent increase in cancer deaths is improvements in diagnosis. However the major reason is that cancer is a disease of the aging, and increased affluence brings longer life spans. Table 1 shows the age - cancer relationship in the U.S.A. (Anderson and Garber, 1988).

TABLE 1

AGE AND CANCER DEATHS IN THE U.S.A.
1985

Age	Population	Cancer Deaths *	Age	Population	Cancer Deaths *
2.5	18,037,000	0	42	14,055,000	11,505
7	16,822,000	7	47	11,648,000	15,312
12	17,103,000	71	52	10,942,000	22,019
17	18,651,000	338	57	11,337,000	33,583
22	20,993,000	1,128	62	10,997,000	46,419
27	21,751,000	2,769	70	16,995,000	119,597
32	20,267,000	5,278	80	11,536,000	142,459
37	17,708,000	8,499			
	Sum	238,842,000		408,992	

Mean age at death for those who die of cancer = 67.23

* 1983 U.S.A. death rate for malignant neoplasms/100,000
Death Rate = 0.0000193 times age raised to the 4.412 power.

Given that the mean age at death from cancer in the U.S.A. in 1985 was over 67 years, at what time in the national development did the average age of the population reach this figure? Figure 5 shows this occurred in 1960. Prior to that time other causes of death were of greater significance. By 1990, with the ageing population of the U.S.A., cancer had become a significant cause of death. Accordingly, contaminant standards/criteria are now based upon protection from carcinogens. The writers believe that a basic criterion of zero carcinogens, arising from the concern about cancer, is extreme and probably not really affordable even in the U.S.A.. Certainly the Developing Countries must be careful not to promulgate standards with similar bases.

APPLICATION OF LEVEL OF DEVELOPMENT BASED STANDARDS

For developing countries where the average age at time of death is sub-

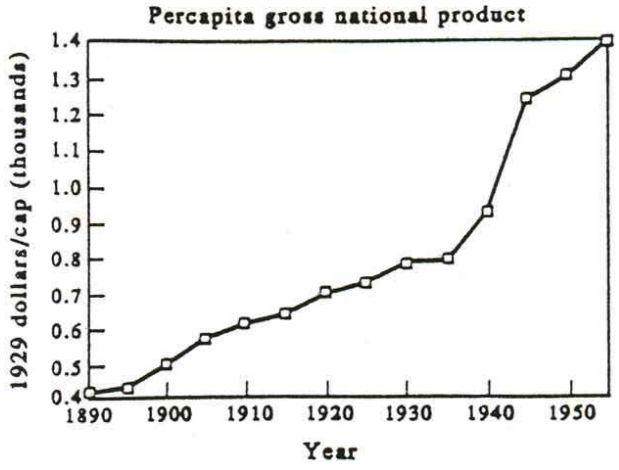

Figure 1

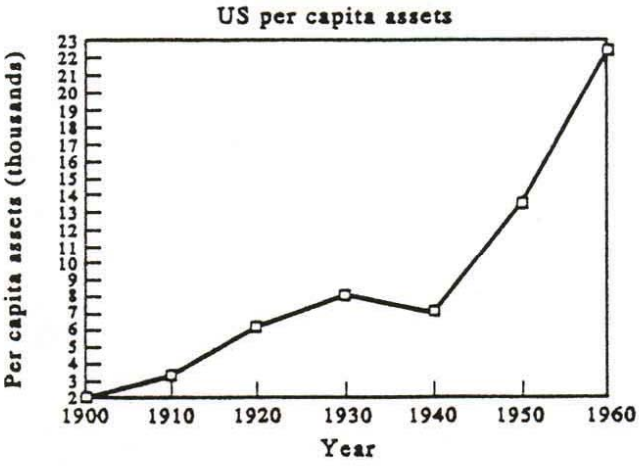

Figure 2

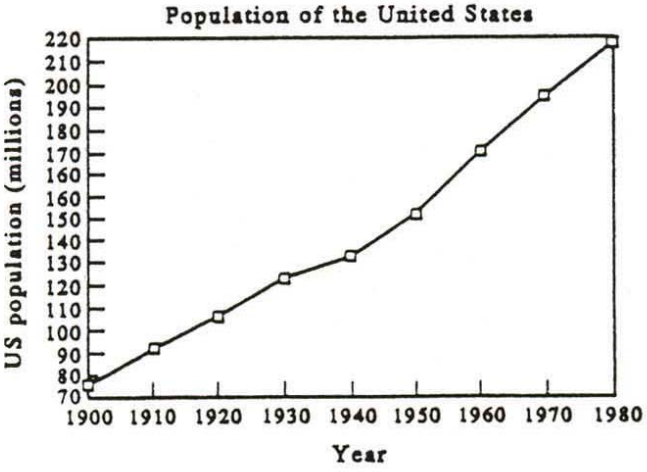

Figure 3

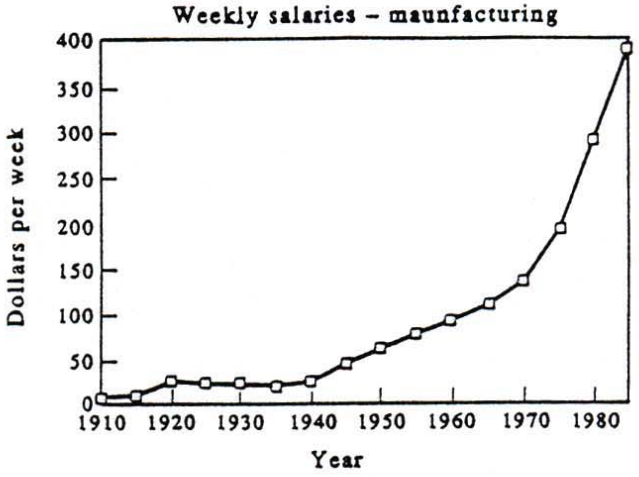

Figure 4

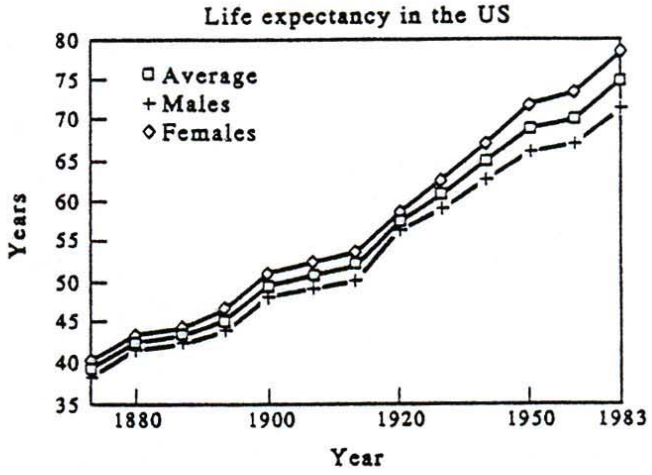

Figure 5

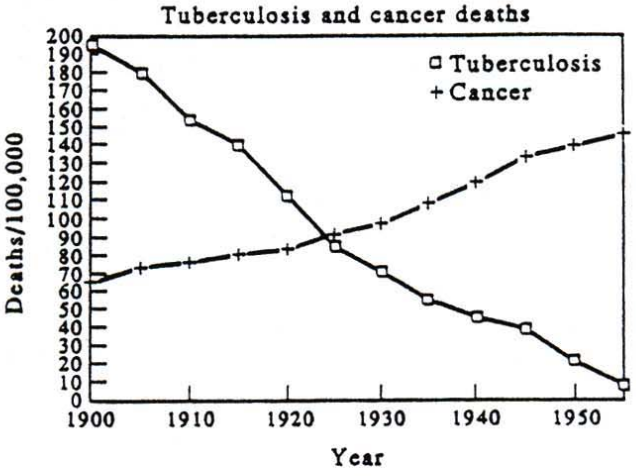

Figure 6

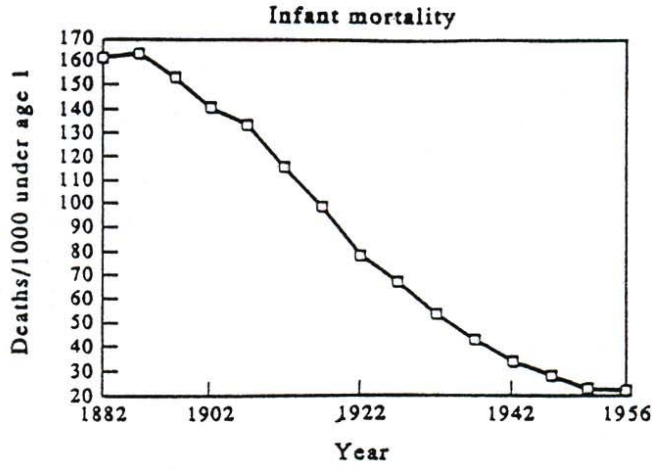

Figure 7

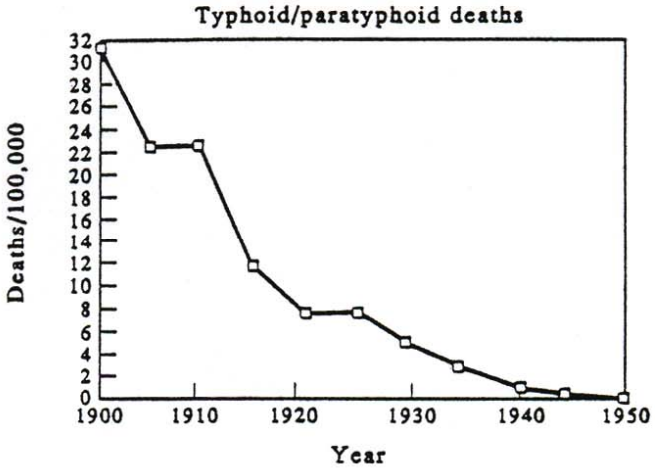

Figure 8

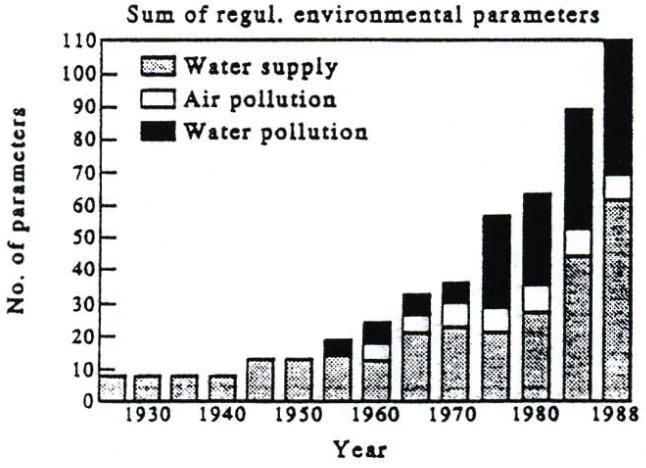

Figure 9

stantially lower than the level in the U.S.A., other causes of death are much more important. Therefore the use of cancer based standards/criteria does not address the real problem. These countries should be encouraged to develop their own standards/criteria reflecting their needs at their particular stage of development.

It is believed that, because of economic realities, all societies, developing or industrialized, must eventually return to an engineering/economic basis for setting standards. Moreover, if true public health protection is to be achieved in the urban areas of Developing Countries, affluent and non-affluent must receive suitable water and sanitary services. As already noted facilities must be paid for so the poor areas must have different facilities to affluent areas; but the facilities must address the significant problems while being appropriate in terms of the ability to pay. Work in Developing Countries in Southeast Asia (Ludwig, H.F., 1989)(Ludwig, H.F. and Browder, G., 1990) has indicated the following engineering/economic environmental socioeconomic considerations to always be required and/or known.

A. Urban Water Supply
   1. Total investment in all urban facilities.
   2. Percentage of the GNP represented by this investment.
   3. Is this percentage generally comparable with the percentages found to be suitable for other countries at the same level of development?
   4. How is the total investment distributed between major cities and their subsidiary regions and other cities and rural areas?
   5. Unit price of water in the various regions throughout the nation.
   6. Amount of the total investment in urban facilities in each area of the nation as a percentage of the family incomes in each of these areas.

B. Urban Sewerage/Sanitation
   1. Total investment in all urban facilities.
   2. Percentage of the GNP (or GDP for a region) represented by this investment.
   3. Is this percentage generally comparable with the percentages found to be suitable for a sustainable society in other countries at the same level of development?
   4. How is the total investment distributed between major cities and their subsidiary region and other cities and rural areas?
   5. What percentage of the GNP should be recommended on an engineering/economic basis as an allocation for sanitary sewerage facilities?
   6. What should be the distribution throughout the nation, on an engineering/economic basis, of the total resources determined to be suitable as the national sanitary sewerage allocation?

For the scientist/engineer approaching an evaluation of the feasibility of any water supply or sewerage/sanitation project at any place in the world, given the considerations listed above, certain basic engineering/economic questions must therefore be answered before the project can be recommended. These include the following.

1. What is the estimated project cost and is this cost in terms of the percent of the total infrastructure cost for the region within the limits found to be suitable for a sustainable society in countries at a similar level of development?
2. What is the estimated per family cost as a percentage of family income for the non-affluent as well as affluent areas in terms

of maintaining a sustainable society as compared with other countries at a similar stage of development?

3. What does a benefit/cost analysis show for the proposed project, including costs and expected benefits? The benefits should be tangible ones which include estimates of property value increase and public health improvements.

A BRIEF LOOK AT SOME DEVELOPING COUNTRY CONDITIONS

Developing countries face enormous problems which should not be ignored by the balance of the world community. The designation "Developing Country" is generally synonymous with countries having rapidly expanding populations (Brown, L.R., 1990). Such growth is present in Central and South America, Africa, and parts of Asia. The rate of growth varies from about 2 to 3 percent per year. In most cases land resources are stressed, so the excess rural population must move to the cities or encroach into upland forest or coastal fishery areas. As a result the ecology suffers, and the cities swell at about a 4% per year growth rate. Most of the largest cities in the world will soon be in the Developing Countries.

Growth of the cities is generally not at all desirable for the countries now experiencing it. Cities force investment to move toward them from the rural areas and thus encourage misuse of land resources as the farm population strip forests and overuse land in their struggle to survive. For example in India, between the 1970s and the early 1980s the forested areas within 100 kilometres of their 41 largest cities shrank by 33% (Economist, 6 October 1990). The cities themselves also develop enormous environmental problems because most Developing Countries do not have the resources available to cope with city population growths of 4% per year. To illustrate in part, more than 33% of the people in Dhaka, Manila, Kuala Lumpur, Bangkok, and Jakarta live in slums with non-existent sewerage service or safe potable water supplies. They also have essentially no access to roads, health care, or education. This condition obviously degrades human ecology including natural resources and the human quality of life in the urban areas. Basic health levels of all urban residents both affluent and poor are also seriously degraded. The world community is similarly affected since most of the world disease pandemics start in such slum conditions. Figures 10 to 13 (Economist, 6, October 1990) summarize some of the ecological conditions now seen in the parts of Asia undergoing these changes. Table 2 (Los Angeles Times, 16 October 1990) also illustrates one of the greatest imperatives faced by any Developing Country government, that of feeding the population. This problem is emphasized by the fact that whereas 55.7% of family income is needed for food in India, only 12.3% is required in the U.S.A.

Given these conditions and the fact that the largest of these Developing Countries, China, is attempting to achieve a goal of a Gross Domestic Product (GDP) level of wealth for its people of $1,000 per capita within 10 years, it is unrealistic to believe that the non-economically based standards current in the U.S.A and Europe can be afforded or enforced by developing countries. Japan, which is now a highly industrialized country, had a per capita income in 1956 similar to that now found in the Philippines. At that time period a growing chemical company discharged methyl mercury wastes to Minimata Bay which poisoned fish and people. Now Japan's GDP is such that there is the wealth required to attack ecological problems, although the amount of wastewater receiving treatment is still only about 40%.

How can the present non-economic/engineering approaches of the highly industrialized countries and their perceived evaluations as to worldwide ecological/environmental imperatives be reconciled with the immediate need of the Developing Countries to feed their citizens and develop wealth enough to first achieve decent acceptable living conditions and

eventually to become affluent societies? Criticism of their efforts by environmental groups and foreign "Green" parties will likely not be beneficial unless they are suitable to the realities of the situation in each separate Developing Country. The Prime Minister of Malaysia, on being so criticized for poor control of logging in his country, accused his critics of economic imperialism pointing out that Europe and America were once forest covered. These forests were destroyed to allow Europe and America to develop to the status of industrial nations. The answer to this problem is believed to be in the concept of Economic-cum-Environmental Development as recommended in October 1990 by the Asian Development Bank's report, "Economic Policies for Sustainable Development" (ADB, 1990). This study is believed to be unique in recognizing that the Decision Makers in practically all Developing Countries, at the technical level, are Economists, not those such as engineers who recognize the concurrent need for environmental protection, and the only meaningful solution is to modify economic development analytical procedures to incorporate proper attention to long-term environmental needs as well as the pressing and immediate economic needs. This reoriented approach, interalia, incorporates the concept that environmental standards in Developing Countries must suit the ongoing economic/ socio-economic constraints. Otherwise they will be unrealistic, unaffordable, unenforceable, and counter-productive.

Standards/criteria should be evaluated with this background, and the industrialized countries should seek to aid the developing countries to utilize the funds available to set and enforce standards/criteria aimed at the most important factors in the present level of their hierarchy of needs. Pressures to adopt the non-economic/non-scientific politically based standards/criteria of the industrial countries when resources to enforce them are non-exisent really represent an anti-environment approach.

CONCLUSIONS

Standards/criteria directed toward achieving ecological/environmental improvement should be considered as differing for each nation or region.

These standards/criteria should be related to the local stage of current development. At present, because of factors such as worldwide media coverage and increasing world travel and study, political leaders in developing countries are under constant pressure to try to afford their citizens the same degree of apparent ecological protection given in the affluent industrialized countries. This has often resulted in the adoption of the standards/criteria now implemented in the industrialized nations. Unfortunately the industrialized nations, under political pressures arising from poorly informed politically motivated media presentations and very active "environmental" pressure groups, no longer utilize a scientific/engineering/economic basis for formulating their standards/criteria. The writers believe that they must again do so, but for the moment, their affluence is such that they can still support such unrealistic politically based approaches. The Developing Countries, on the other hand, must utilize scientific/engineering/economic standards/criteria if they are réally to expect to achieve affordable rational goals. The Industrial Countries should examine their own period of development and review what their own standards/criteria were at earlier stages of such development to find how they can best help the developing countries to reach both their short-term and long-term goals.

Trained people exist within each Developing Country who know their hierarchy of needs most fully, and can best use available resources to meet their critical ecological problems. Assistance from other nations is available but often has not been utilized effectively and often has even been counter-productive in that the "Experts" made available from the affluent countries are themselves familiar only with the practice and standards of their own country. The Developing Countries need to be shown how their development can be furthered by ecological improvement, and how resources used for this purpose can be used to contribute optimally to economic-cum-environmental development. As shown by the example of the development of the U.S.A., criteria and standards should be established in terms of the stage of development the nation is then experiencing. Critical worldwide environmental questions will need worldwide resource allocations to aid the Developing Countries since local resources are most often limited by their current stage of development.

Foreword

Most people living in cities would like to be connected to a 24-hour supply of piped water. Unfortunately, in most Asian cities less than 30% of the residents enjoy 24-hour supplies, and low service coverage and intermittent water supplies are the norm. The Asian Development Bank (ADB) would like to change this. ADB's "Water for All" policy emphasizes, among other things, expanding the delivery of water services, conservation of water, increased efficiencies, facilitation of the exchange of water sector information and experience, and improving governance. *Asian Water Supplies—Reaching the Urban Poor* has been produced for ADB by staff member Arthur McIntosh to provide greater understanding and awareness among key stakeholders on these matters. The book is particularly focused on ADB's overarching goal of poverty reduction.

There are three voices in this book: that of ADB (based on policy and the findings of regional consultations), the author (based on his more than 20 years' experience in Asian water supplies), and other noted authors in the sector (based on papers and publications). Structuring the book in this manner has provided some degree of balance and given Arthur McIntosh a certain amount of freedom to be frank when addressing sensitive issues, such as governance and corruption. This is the case in the first chapter, where the author brings attention to some of these issues by polarizing them. While ADB does not necessarily endorse every view of Arthur McIntosh put forward in this book, it does respect his opinions and endorses the overall thrust of this work.

In this first guide and sourcebook of its kind dealing with water supplies in developing countries, the author makes some provocative suggestions in separating myths and misconceptions from realities. He analyzes the reasons for poor performance of water utilities, proposes some solutions, and concludes that governance and tariffs are at the core of the problems and any possible solutions.

When considering governance, the main message is that transparent government policies must come first, followed by independent regulators. Civil society participation is also needed to ensure that policies are implemented. When operating water utilities, it is time to develop more autonomy, ensure staff performance is based on incentives, and stop the use of civil servant rules and salaries. Regulation based on policies, not contracts, should be developed for both public- and private-operated utilities.

In his examination of tariffs, it is suggested that the great inequities, which result in the poor subsidizing the rich, can only be rectified when consumers pay the full cost of water provision and when the money trail no longer runs through governments. It is surprising to learn, for instance, that in Manila those not connected to a 24-hour piped water supply (mostly the poor) pay around $20 per month for 6 cubic meters of clean water, while those connected (mostly the rich) pay around $4 per month for 30 cubic meters of clean water. This is the basis for two controversial recommendations: (i) hike the tariffs to help the poor, and (ii) fund development directly out of tariffs.

In some cities, there may be a link between high non-revenue water and low service coverage. The author suggests that leakage may be used to cover up the illegal use of water, because operators derive considerably more revenue (both official and unofficial) from selling water to vendors than from formally connecting consumers to the piped supply. As long as poor regulation encourages the status quo, there is little incentive for operators to do otherwise.

Business as usual is not an option. The inequities affecting the poor are begging for attention. ADB believes governments need to seriously consider the author's recommendations, as there are no other solutions on the horizon that could have the same impact. With this in mind, I commend the efforts of Arthur McIntosh in identifying the problems and proposing solutions.

This guide and sourcebook will be useful for governments, utilities, consultants, development agencies, and nongovernment organizations. The main finding of ADB's regional consultation in 2002 on *Water in Asian Cities—The Role of Civil Society* was the general lack of understanding and awareness of the sector among stakeholders. This book is expected to improve the situation. It is aimed at professionals in the sector, especially newly arrived professionals, who may not be aware of all the problems. It will be valued (as were ADB's water utilities data books) for its up-to-date data on Asian water supplies. The best measure of this guide's success, however, will be governments' readiness to enact reforms and civil society's readiness to keep governments accountable for their policies.

Preface

Objective

The purpose of this book is to give stakeholders a point of reference and some tools with which they can move forward. In this way, it is hoped that the mistakes of the last 20 years will not be repeated. It should not be necessary for a new generation of water professionals to learn everything all over again. Instead, they should be able to take what has been learned up to now and move on. To help facilitate this process, this book was designed to create greater understanding and awareness of the issues and possible solutions among all stakeholders in the sector.

Scope

This guide starts by identifying some myths, misconceptions, and realities. It then looks at problems and solutions related to a number of important topics. Governance and tariffs are identified as both core problems and core solutions. A new approach to the development and management of water supplies is proposed, which is based on transparent government policy and regulation and the involvement of civil society. Appendixes include (i) 19 city water profiles, (ii) 6 case studies on utilities, and (iii) 6 examples of small-scale water providers, all based on recent data from the field.

Approach

To the extent feasible, I have confined my views to areas of my own experience. On some topics—particularly water resources management, private sector participation, and sanitation—I have additionally included the pronouncements of others in the sector. Material sourced from outside the Asian Development Bank or my own experience is shown in italics. Although most chapters of the book deal with the problems and the solutions for a given subject, one of the findings is that problems cannot be solved in isolation. They can only be solved in the context of the big picture. While there is a chapter on sanitation, it scarcely does the topic justice, since sanitation deserves to be the subject of a book on its own. Additionally, the Asian water supplies sector as a whole is dynamic. For this reason, some of the data in this book might soon be out of date, but the principles outlined are expected to apply for some time. In those instances where cities and countries (such as Manila and India) are named, it is felt that the matters covered are common to many parts of the region and therefore do not reflect negatively upon the entities mentioned. Likewise, where I have been critical of governments in terms of governance, it should be noted that my statements do not necessarily apply to all governments.

How to Use the Book

This book can be read from cover to cover, or it can be used as a reference on a given topic. There is some repetition, but only on important points. Chapters were chosen to be topical, and there is not necessarily a flow from one to the next. However, Chapter 2 (Problems and Solutions) binds them all together. The chapters have introductions and “nutshell” summaries. Important pronouncements appear in red. When I use “we” and “us,” these refer to all stakeholders. Everyone involved in water supplies in developing countries can learn something from this book, especially new professionals in the sector, who will find this resource particularly useful in getting quickly up to speed.

Arthur C. McIntosh

Acknowledgements

Many people have contributed to this book. In terms of content, my Asian Development Bank (ADB) colleagues Graham Jackson, Alex Jorgensen, and Rudolf Frauendorfer made many useful comments and contributions. Philip McNamara, as editor, was responsible for some major restructuring, which greatly improved readability. He also showed great perseverance with the microediting, striking a balance between ADB's rules and my more casual style. Grendel Salvadar and Josephine Pagunsan made changes to numerous drafts. Vic Angeles and Anna Juico ably directed the ADB Printing Office inputs of Ronnie Elefano (cover design) and Ruben Marmita (map). Rose Arcano did a great job on the typesetting to make the book user-friendly. Haris Pinidiya, Rick McGowan, and Nancy Barnes made contributions on specific topics. Cesar Yniguez offered advice on the structure and flow. Akira Seki, ADB's former Director General, Regional Sustainable Development Department, gave me the green light and encouraged me to produce this book. Brad Philips, Director, Agriculture, Natural Resources, and Social Sectors Division, Regional and Sustainable Development Department, helped keep my feet on the ground and guided me professionally. Geoff Bridges pulled together the Study on Water in 20 Asian Cities (Appendix 1), which provided a factual basis for my work. Lynette Mallery (Publications/ADB) was encouraging and helpful in the presentation (title and cover design and guidance on typesetting) and in moving approvals through official channels. I would also like to thank Wouter Lincklaen Arriens, K. E. Seetharam, Almud Weitz, and Maria Paniagua for their contributions to regional technical assistance relevant to the book.

There are a host of others who also helped make this book possible. I would like to offer my special thanks to the International Water Association for stepping in early with an offer to copublish. This will make a big difference in translating rhetoric into action. Winnie Flores (my household help), who is shown on the front cover, inspired me to champion the plight of the urban poor. Poshan Nath Nepal (Kathmandu), Mohammed Didi (Malé), Premakumar Fernando (Colombo), Perry Rivera (Manila), and Ek Sonn Chan (Phnom Penh) authored the case studies in Appendix 2. Herve Conan, Maria Paniagua, Fiscalina Amadora-Nolasco, Usha P. Raghupathi, Abu Rayhan Al-Beeroonee, Huynh Thi Hoai Nguyen, and Kishore Kumar Jha contributed to the examples of small-scale water providers (Appendix 3). I would like to give credit to Eric Sales (ADB), Yayasan Dian Desa (Indonesia), Nepal Forum of Environmental Journalists (Nepal), Sevanatha Urban Resource Centre (Sri Lanka), and Environmental Broadcast Circle (Philippines) for the photographs provided.

I am especially grateful to Ranjith Wirasinha, Khun Chuanpit Dhamasiri, and Ir Hendropranoto Suselo, first for agreeing to review this publication and second for their very insightful comments.

Finally, and most of all, I need to acknowledge the contribution of my wife, Pauline, who supported my work on this book through almost every weekend for 2 years.

Chapter 1

Myths, Misconceptions, and Realities

As an introduction to this book, I would like to be provocative in identifying what I feel are myths and misconceptions and in suggesting the corresponding realities. These realities are proposed at the outset in the hope that they will be considered by each reader but not fully accepted until the ideas presented in the following chapters have been explored. My views have purposely been polarized to bring attention to these matters, but I recognize that what I am stating will not apply across the board. The lack of awareness and understanding of the subject of Asian water supplies was recently illustrated during the Asian Development Bank (ADB) regional consultation in Manila (*Water in Asian Cities—The Role of Civil Society*). This explains why there are so many interrelated problems in the sector yet to be resolved. With that in mind, let me briefly examine some of the beliefs, which I have found to be commonly held, that have shaped perceptions related to urban water supply in Asia.

1. **Coverage with piped water requires major urban water utilities to seek funds from external sources.** I suggest that, in most cities with more than a million people, the development of urban water supplies can be funded directly through tariffs. Support for this statement comes from the millions of urban poor not being served in places like Manila (Philippines). These people pay up to $5 per cubic meter (/$m^3$) for water bought by the container, while those served with piped water often pay only $0.10/$m^3$. In Malé (Maldives), all people pay $5/$m^3$ for piped water. The People's Republic of China (PRC) is already heavily funding new investments directly from tariffs. Raising the tariffs of those served (most of whom are not poor) is feasible and will provide the funds needed to serve the poor, who will be happy to pay a fraction of their current costs for a reliable piped water supply. On a more practical note, I suggest that achieving this status could be a 5-year policy objective.

2. **Shortage of water is the reason for intermittent water supply.** I suggest that sound hydraulics and demand management through pricing and strict metering can assure a 24-hour piped water supply with very little water. In Malé, they deliver 34 liters per capita per day (l/c/d) with a reliable 24-hour supply.

3. **The poor are unwilling and cannot afford to pay the full cost of piped water.** I suggest that the poor pay many times the amount the rich pay for water, in unit rate and total cost terms. An example of this comes from Manila, where a household helper pays 900 pesos per month for vended water (water sold by itinerant vendors) while her employer pays 200 pesos per month for piped water.

4. **It is possible to run a $20–100 million per year commercial operation (selling water) with civil servant rules and salaries.** I suggest that management and staff must be the best available on the open market, and incentives must match performance. The Singapore Public Utilities Board, perhaps the best water utility in the world, pays its management staff more than $150,000 per year, compared with the average of $5,000 per year paid to managers employed by many Asian water utilities. Other good examples come from the water utilities of Malé (Maldives), Phnom Penh (Cambodia), and Bangkok (Thailand).

5. **Reducing non-revenue water (NRW) below about 20% of production is not economically justified.** I suggest that this is influenced by developed country costs and artificially low tariffs in developing countries. The Singapore Public Utilities Board and some cities in Japan have reduced NRW to less than 10% of production. I further suggest that many systems with NRW above 40% have numerous visible leaks in service connections, high rates of estimated consumption, and thousands of illegal connections that can all be addressed to reduce NRW. In these cases, the priority should be to fix visible leaks.

6. **The private sector will bring much needed funds for development to the table and improve water utility efficiency.** I suggest that the reality is that the private sector has brought funds to the table in areas such as water production and treatment (mostly through build-operate-transfer [BOT] contracts) but has failed to invest adequately in extending piped water supply services to those not yet served. Likewise, efficiency gains in terms of reducing NRW have generally been well below expectations. Jakarta and Manila are two examples.

7. **In answer to rapid urbanization, it is necessary to go farther and farther a field to find more water sources.** I suggest that there are simple options not yet seriously addressed, including demand management, rainwater harvesting, trading water rights, building check dams, and rehabilitating watersheds. These only require political commitment to be realized.

8. **Intermittent water supply is OK.** I suggest that people believe this because they are unaware of the coping costs and health risks tied to intermittent supply and, in many cases, do not know that 24-hour supply to the home is the norm in most countries.

9. **Appropriate legislation allows a water utility to operate with autonomy.** I suggest that legislation is a necessary but not sufficient condition for autonomy. Governments frequently do not allow corporate bodies to exercise their autonomy, especially in terms of staffing, tariffs, and investments. Examples of this come from the National Water Supply and Drainage Board in Sri Lanka and the Nepal Water Supply Corporation (see Appendix 2).

10. **Water utilities do not suffer when the money trail runs through governments.** I suggest that some elected officials are reluctant to raise tariffs, not to protect consumers but to protect their own power and access to funds. When there are major subsidies, the bulk of the money trail goes through governments. When consumers, through tariffs, pay the full cost of water supply, the money trail is direct from consumer to operator, and there is less chance for corruption because consumers will demand accountability. The latter is the case in Bangkok and Singapore.

11. **Households in Asia need at least 200 l/c/d.** The average domestic consumption in Europe is around 130 l/c/d. The average domestic consumption in Malé is 34 l/c/d. In major cities in Asia, half the people use less than 40 l/c/d. I suggest that there is a need for more equitable water use in Asian cities and that the average domestic consumption can be in the range of 100–150 l/c/d.

12. **Private operators are the cause of higher tariffs.** I suggest that, in general, higher tariffs are long overdue. It is therefore unfair to saddle private operators with this criticism. Moreover, I believe that the converse of this belief is true. In my opinion, there is no future for private operators while tariffs are kept artificially low. The reason for this is that some funds for investment will have to come from tariffs.

13. **Regulatory bodies are only needed because of private sector contracts.** I suggest that they are needed just as much for public water supplies, where accountability, efficiency, transparency, and equitability need to be monitored.

14. **Private operators are eager to serve the urban poor.** I suggest that the record shows that private sector efforts to help the poor connect to piped water are to some extent "showcased." The increase in new domestic connections tells the real story. The private sector sells water to vendors and distribution contractors, provides connections serving multiple households, and asks those connected to share water with their neighbors. The correlation between low service coverage and high NRW is no coincidence. Those with vested interests will try to maintain the status quo.

15. **Private sector participation (PSP) brings competition.** I suggest that the bulk of private sector contracts in the water sector has gone to just a few firms from two countries and that this is because prequalification criteria have restricted bidding. A recent example was the prequalification for a lease contract for the Kathmandu Valley water supply. PSP has not brought much competition.

Realities in a Nutshell

- Coverage with piped water does not always require major urban water utilities to seek funds from external sources.
- Shortage of water is not the reason for intermittent water supply.
- The poor are willing and can afford to pay the full cost of piped water.
- It is not possible to run a $20–100 million per year commercial operation (selling water) with civil servant rules and salaries.
- Reducing NRW below 20% of production is economically justified.
- The private sector will not always bring much needed funds for development to the table and improve water utility efficiency.
- In answer to rapid urbanization, it is not necessary to go farther and farther afield to find more water sources.
- Intermittent water supply is not OK.
- Appropriate legislation does not always allow a water utility to operate with autonomy.
- Water utilities suffer when the money trail runs through governments.
- Households in Asia do not need 200 l/c/d.
- Private operators are not always the cause of higher tariffs.
- Regulatory bodies are not only needed because of private sector contracts.
- Private operators are not always eager to serve the urban poor.
- Private sector participation does not always bring competition.

Chapter 2

Problems and Solutions

This is probably the most important chapter in this book, because it puts forward the notion that an individual problem cannot be solved in isolation. It can only be addressed after the core problems have been resolved. Although this guide deals with topics by chapters, and for ease of reading problems and solutions are discussed in the same chapter, it must be recognized that the prerequisite for any solution lies in addressing first the core problems. It should also be recognized that the solutions proposed may not be appropriate for every set of circumstances. What follows is an introduction to the main problems and solutions and the connections to the core problems and core solutions. Later in this guide, in chapters on specific topics, more justification for these connections is provided.

No piped water

A. Problem Chart

Figure 2.1 identifies poor governance and low tariffs as core problems. Polluted waterways result from a failure to invest in wastewater collection and treatment and implement legislation pertaining to pollution. Degraded watersheds result from illegal logging, human occupation of catchments, and a lack of revenue that can be used to reforest the land. Overexploitation of groundwater can be traced to a lack of monitoring and control. When industry is allowed to use this resource (which belongs to all) for free, and when tariffs for formal piped water are low, the wrong message is sent to groundwater users.

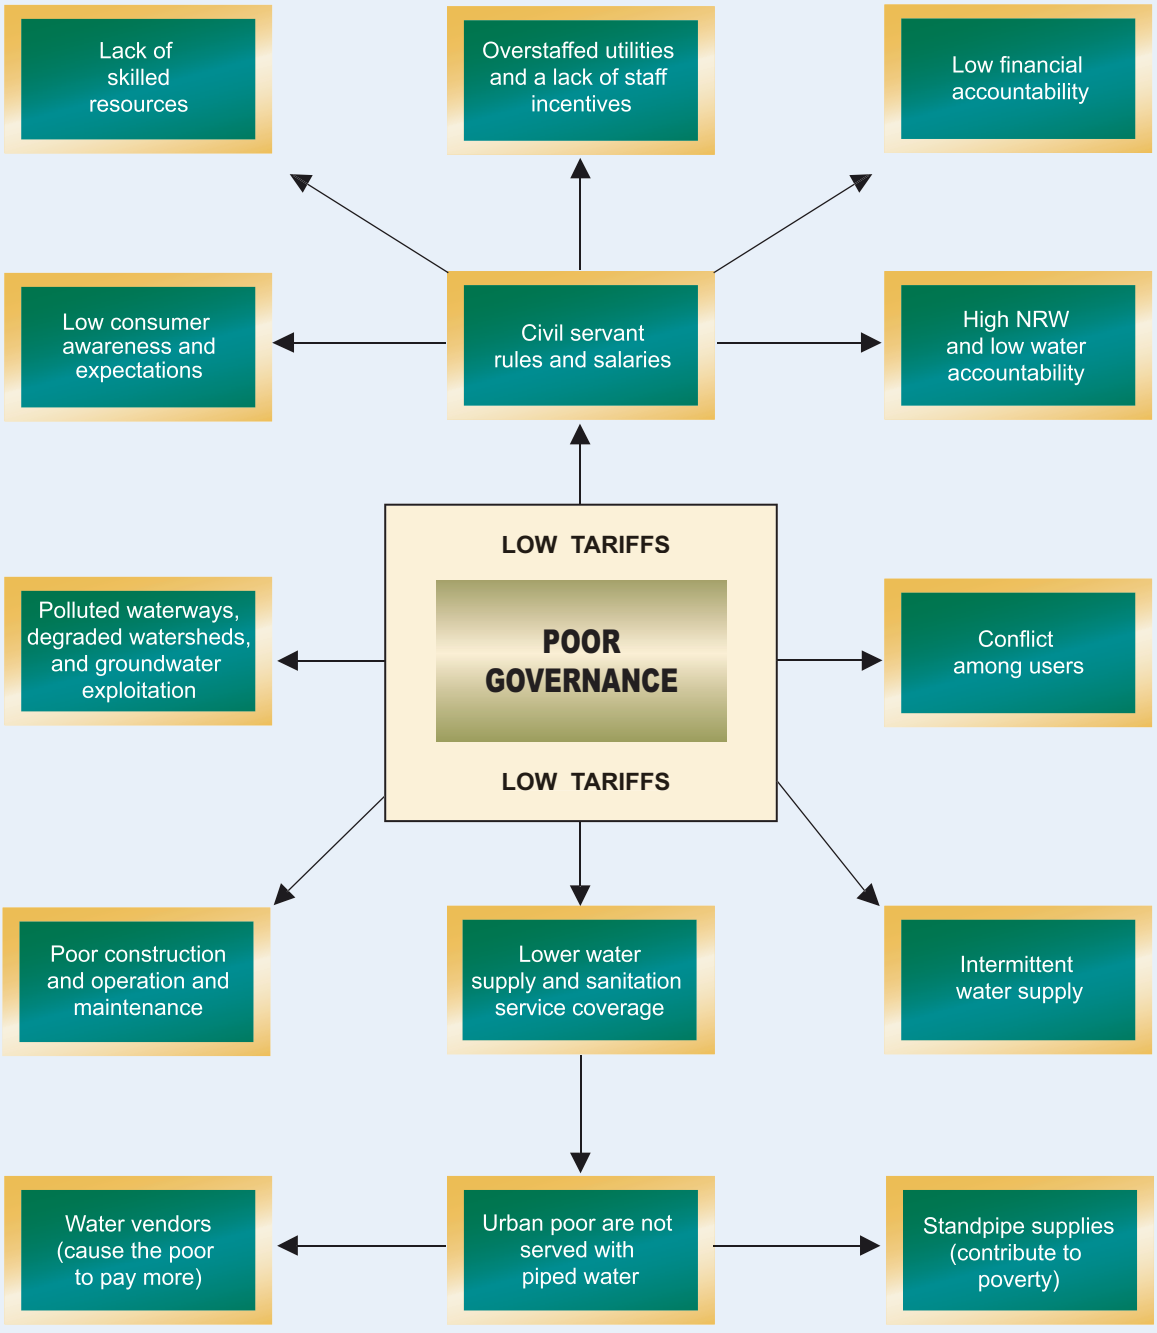
The objective

Low water supply and sanitation service coverage can be traced to low tariffs and a lack of revenue to undertake development. This in turn can be traced to a desire by governments to maintain control of the money trail by providing heavy subsidies. It may also be found that there are those—including utility staff, government officials, and elected officials—with vested interests in maintaining a status quo that allows a considerable amount of informal revenue (the price paid by vendors for water at the source) to enter their pockets. Thus, there is little incentive to connect more people (especially the urban poor) to formal piped systems.

Intermittent water supply often results from elected officials insisting on extending the distribution pipework beyond its hydraulic capabilities. Low tariffs contribute to the lack of revenue available for the modification of this pipework. Strong metering, billing, and collection are needed to overcome intermittent water supply, and they, too, rely on good governance and adequate tariffs.

There is a conflict of interest between rural farmers (who want water for irrigation) and urban water users. A low tariff differential between urban and rural users exacerbates the problem. Poor governance is manifested in short-term and politically expedient development planning, which in turn leads to more frequent conflict among users. Conflict in water use is sometimes resolved in an ad hoc manner by elected officials, rather than through more institutionalized procedures for dealing with water rights.

Figure 2.1 Problem Chart



Alternative source—traditional stone tap

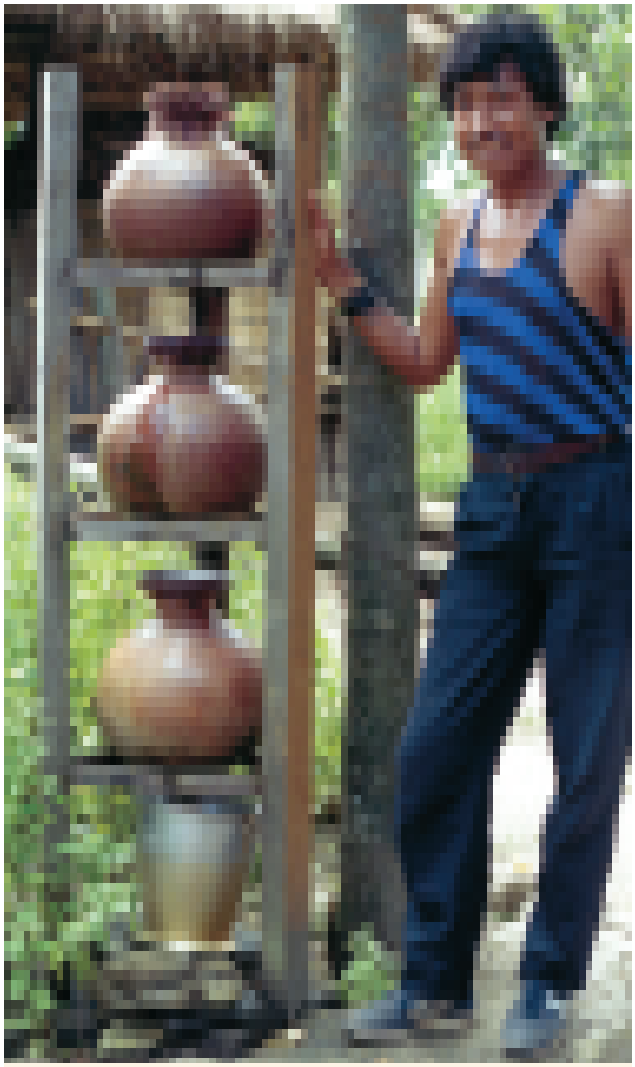
High NRW and low water accountability result from illegal connections, inadequate metering and meter reading, and inadequate billing on the one hand and from leakage of water on the other. As mentioned above, the illegal sale of water by vendors is another manifestation of poor governance. Civil servant rules and salaries, which are also part of poor governance, contribute to these problems. Civil servant rules are complex, outdated, and not appropriate for transparency and decision making. Civil servant salaries are so low, in some cases, that it is very difficult for employees to earn enough to support their families. This situation can result in the bending of the rules (if bribes are offered) and the performance of unauthorized services, including those that facilitate illegal connections.

Poor construction can result from consultants and contractors being squeezed of their profits after rendering special payments to government or elected officials. Moreover, low tariffs affect the quality of maintenance. In line with this, new projects are commonly proposed before the replacement of meters and old pipes can be addressed, which should not be the case.

Low consumer expectations can also result from low tariffs. Most consumers in South Asia, for example, are unaware that they are entitled to receive a 24-hour piped water supply. Poor governance ensures that consumers are unaware of government policies and that there is no one to keep governments accountable for implementing these policies. Civil servant salaries do not encourage staff to help consumers.

Indirect consequences of poor governance and low tariffs also abound. Low financial accountability is linked to civil servant rules. The overstaffing of utilities is mostly due to nepotism and outside interference. A lack of skilled human resources is linked to civil servant salaries. Standpipe supplies (a feature of poverty) often go hand in hand with intermittent water supply. Poverty results, in part, from low water supply and sanitation service coverage. Always, it is the poor who are last served. The poor continue to pay very high prices for water purchased from vendors, and they use meager amounts of this resource as a result.

The lesson to be learned from all this is that it is indeed futile to attempt to resolve an isolated problem like high NRW without addressing first its root causes, which are poor governance (mostly corruption and outside interference) and low tariffs (which feed on poor governance).



How people cope—traditional filter

B. Solution Chart

Figure 2.2 places transparent policies, regulatory bodies, the involvement of civil society, and a paradigm shift in tariffs at the core of the new solutions.

Good governance equates to transparent policies, regulatory bodies, and civil society involvement—not necessarily to passing laws. There are examples in many countries, including the Philippines, showing that the existence of laws is no guarantee that they will be implemented. In most cases, when the public is ignorant of a law, that law cannot be implemented. What is needed is something more in the public eye, like a government policy statement on the subject (in this case on urban water supply and sanitation). An active civil society can ensure that government policies are kept in front of the public. Civil society can be assisted in monitoring the implementation of government policies by more formal and independent regulatory bodies. Civil society can also insist on being involved in consultations to formulate or change government policies. A paradigm shift in tariffs is part of the solution for three reasons. First, this will place the consumer more in the driving seat and reduce the amount of corruption. Second, it will quickly lead to improvements in coverage with piped water and a reduction in intermittent water supplies. And third, it will cause a reduction in demand and further reduce the need to fund the development of new water supplies.

Higher tariffs will automatically lead to demand management and the consideration of a range of new options for water source development, including trading water rights, rehabilitating watersheds, rainwater harvesting, and wastewater recycling. Good governance will lead to improved operation and maintenance (O&M) efficiency, pollution control, organization development, accountability, and consumer education and awareness. In combination with higher tariffs, it will provide incentives for private sector investment. Good governance will also provide incentives for improving water utility performance, including staff sourcing from the open market, and it will lead to sustainable developments, including improved coverage with water supply and sanitation facilities for the urban poor and 24-hour water supply for all. In addition, higher tariffs for water supply will allow development agency and government funds to be diverted to urban sanitation improvements.

What the solution chart highlights is that there cannot be isolated solutions. It shows that a whole range of specific solutions is possible, if the core problems of governance and tariffs are addressed first.

C. Chapters and Appendixes

The chapters that follow deal with specific topics that often attract a lot of attention by themselves. Many are interrelated, such as private sector participation and tariffs, subsidies, and development funding. A few important points will be repeated in more than one chapter, but this will allow many chapters to be read alone.

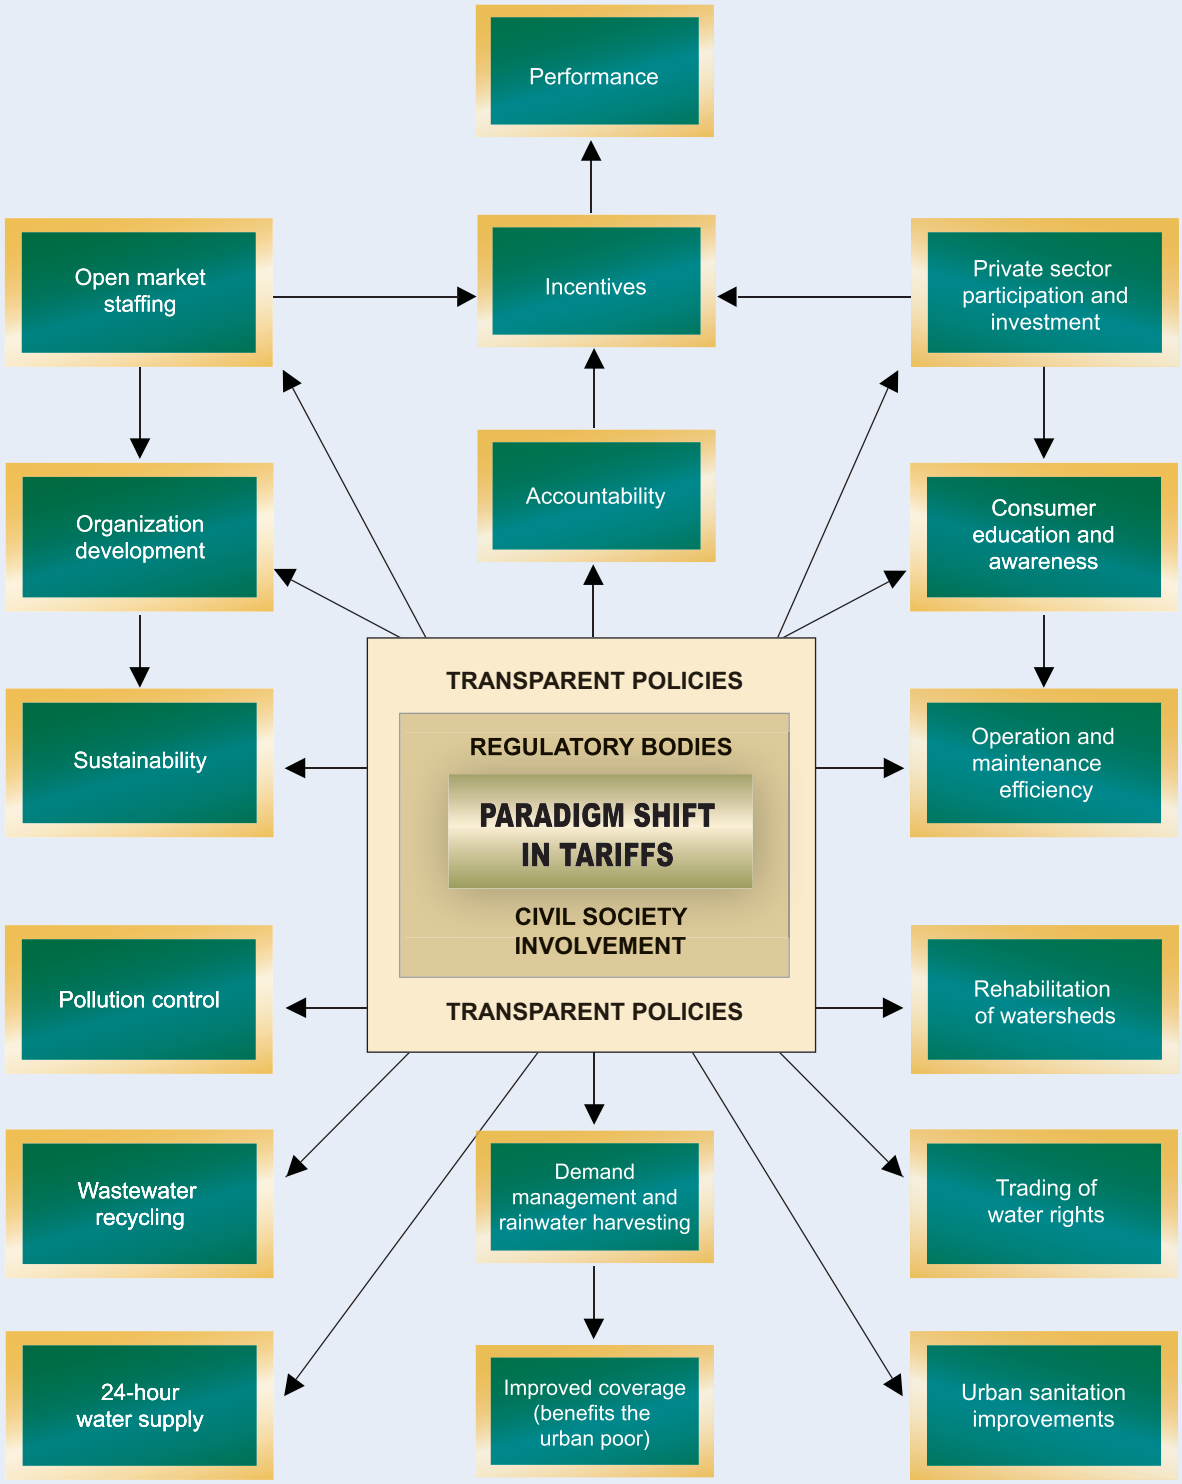
The city water profiles in **Appendix 1** provide thumbnail sketches of the situation in each city examined with respect to water resources, policies and regulations, PSP, tariffs, service levels, and sanitation. Some comments from civil society and my own remarks are added. The purpose of Appendix 1 is to tie the problems presented in this book to the reality of what is happening throughout Asia.

The six case studies presented in **Appendix 2** (Malé, Phnom Penh, Manila, Kathmandu, Colombo, and Dalian) illustrate lessons learned relating to regulation, willingness to pay for water, leadership, PSP efficiency and investment, water shortages, intermittent supply, NRW reduction, autonomy of utilities, and investments funded from tariffs. These case studies are especially important because they were written by experts closely associated with the water utilities described. In line with that fact, these studies are evidence from the field showing that many views expressed in this book are similar to views held by key stakeholders in developing countries.

In **Appendix 3** there are six studies that shed some light on the activities of small-scale water providers in Cebu, Delhi, Dhaka, Ho Chi Minh City, Kathmandu, and Manila. These illustrate the nature and extent of these operations, which should encourage others to want to learn more. They also highlight the great inequities in urban water supply in many parts of Asia.

At the end of the day, the problem and solution charts will tie this guide and sourcebook together.

Figure 2.2 Solution Chart



Problems and Solutions in a Nutshell

- An individual problem, such as NRW, cannot be solved in isolation. It can only be addressed after the core problems have been resolved.
- The core problems are poor governance (including corruption) and low tariffs.
- The core solutions include a transparent policy, an independent regulatory body, a paradigm shift in tariffs, and the involvement of civil society.

Chapter 3

Water Resources Management

Water supply does not exist in isolation. There are many factors that affect city water supplies, including social, environmental, and economic impacts. Water resources management is one of the most important environmental dimensions. A sustainable supply of water to a city will depend on the quantity and quality of the water available and its distance from that city. Other major factors are population growth and the wise use of the water resources available. This chapter deals with the latter by considering the supply aspects, the demand aspects, and policy and management.

A. Supply Aspects

This section examines water supply by looking at sources, sustainability, and rights of users.

Groundwater Sources

Cities are usually located near adequate or once adequate water supplies—mostly near groundwater, but sometimes near surface waters. Looking around Asia, many examples (Bangkok, Jakarta, and Manila) of groundwater overexploitation can be seen. These examples show that what could have been a finite but long-term sustainable resource has been destroyed through the depletion of aquifers, which has caused salinization and land subsidence. The excessive use of groundwater has been a short-term expediency that is becoming a long-term disaster (Figure 3.1 shows the extent of surface water use in major cities in Asia). Watersheds have been allowed to become denuded, which encourages flash runoff that erodes fertile soils and results in the loss of steady water flows in the dry season. Industrial wastewater and domestic sewage have been allowed to pass untreated into major waterways, thereby endangering water supplies of downstream users. Asian cities cannot continue to go to other water catchments without first ensuring that they have optimized water availability and use within the vicinity of urban demand.

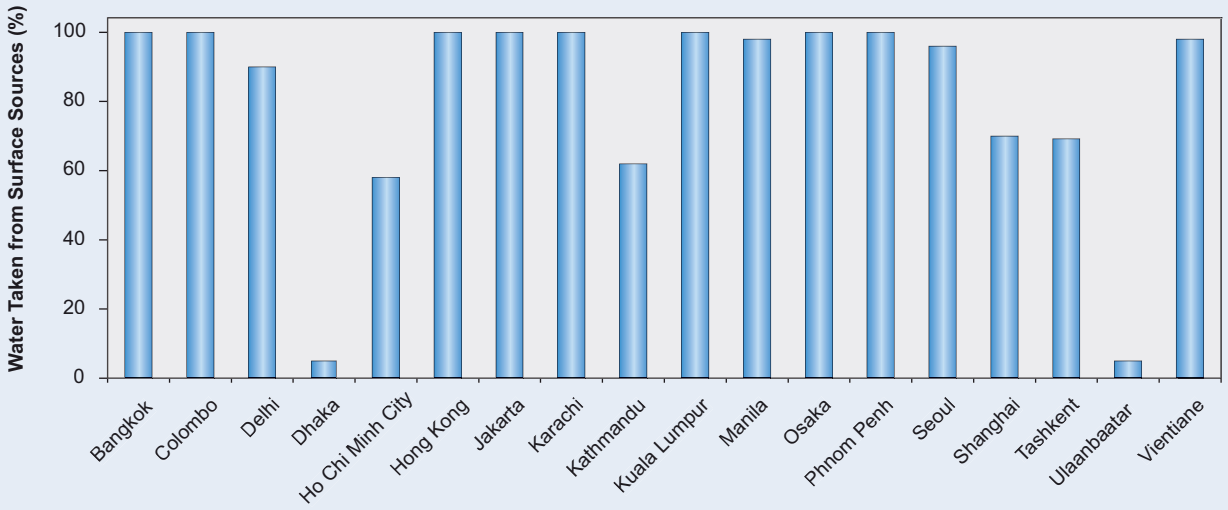
Over the last hundred years there have been two major shifts in water management. First, the people have given over their role to governments. Second, people rely less on using rainwater and have instead exploited rivers and groundwater through the use of dams and tubewells. This second fact has led to a growing and in some places unbearable stress on water from these sources. In India, the exploitation of groundwater has been encouraged, but little has been done to recharge it. As a result, groundwater tables nationwide are falling. In years when rains are low, this problem becomes an emergency. The poor, who depend on dug wells (which dry off first), are the first to suffer. (Agarwal, 2001)

Many still rely on groundwater

Watershed Rehabilitation

One difference between developed and developing countries is that catchments for water supplies in developed countries are strongly protected. They have good vegetation cover, and human, animal, or agricultural uses of that land are prohibited. In developing countries, especially those with large populations, the governance associated with the use of watersheds for

Figure 3.1 Surface Water Sources (2001)
[piped supplies only]



other purposes is invariably quite weak. Furthermore, the rehabilitation of watersheds is a long-term undertaking that does not find much support when measured against the need for short-term political gains.

When watersheds are denuded of trees, through logging and cutting for firewood, rainfall rapidly becomes runoff, which causes the erosion of fertile land and reduces the time during which this water can be used, unless it is stored using dams. This situation is of course exacerbated by the wet and dry seasons that dominate the climates of many Asian countries. Watershed rehabilitation will facilitate the retention of rainwater, which will help river flows become perennial. The National Water Supply and Drainage Board (Sri Lanka) has been experimenting with watershed rehabilitation in different topographical and soil regions with a view to determining in each region the appropriate amount of integrated ground cover that would also give farmers the potential for revenue generation.

It is possible to reforest more than 100 million hectares of degraded and unproductive land in India. Watershed development of 100 million hectares at the present norm would cost about $10 billion. At $1 billion per year, assuming a 10-year completion period, the cost is insignificant compared with the enormous benefits that would be derived. In terms of water storage, flood control, reduced soil erosion and loss of nutrients, and additional agricultural crops, fuel, timber, and other produce, the value of India's reforestation in monetary terms would be much more than the total value of all the country's current industrial assets.[1] *If even a tiny fraction of the value of this great asset was spent on its upkeep, and if traditional (village) rainwater storage systems are revived, India's economy would improve more rapidly than by any other means.* (IEI News, 2000)

Promotion of rainwater harvesting

[1] This may be a matter of opinion, rather than fact, but it is worth careful consideration.

Potential for rainwater harvesting

Rainwater Harvesting

Why is rainwater harvesting important? It is often said that water should be free, because it is a gift from nature. That is true if the user of that water collects it as it falls from the sky or draws it from a spring, before it has been treated or delivered, because it is the treatment and transport of water that have associated costs. Water tariffs must be raised to meet the costs of water supply, which continue to increase due to more advanced treatment, greater distances to be traveled, lower groundwater tables, and more costly distribution in densely populated areas. As tariffs rise, rainwater harvesting and other options become attractive.[2] To collect water off the roof of a home or office and store it for future use is efficient. While there are some constraints, such as the room for storage in very densely populated areas, there is tremendous potential not yet harnessed. What is required is for local authorities to amend the bylaws so that no new home is built that does not have rainwater collection from the full roof area and storage for that water on-site. In addition, for the owners of existing houses to also comply with these bylaws, time frames of 5–10 years can be given for the modification of the roofs and grounds of all existing homes. Chennai (India) is an example of a city making good progress in rainwater harvesting (see www.geocities.com on the Internet). Once again, governance is important.

It does not matter how much rain you get, if it is not captured you can still be short of water. India receives most of its annual rainfall in just 100 hours. If this water is not captured, there will be shortages. When water harvesting and watershed development programs are handled well, it has been shown that rainwater harvesting is the starting point for meeting drinking water needs, eradicating rural poverty, generating massive rural employment, and reducing distress migration from rural areas to urban areas. Because smaller catchments give much more water than larger catchments, one state is planning to construct 10,000 check dams (one dam with a catchment of 10 hectares will collect much less water than 10 smaller dams, each with a catchment of 1 hectare). If the Government puts its mind to it, drought can be banished completely in a maximum of 10 years. The problem is one of mindsets. Rainwater harvesting demands a new approach to governance, a participatory form of governance instead of a top-down bureaucratic one. (Agarwal, 2001)

Check Dams and Wetlands

There is no doubt that one major frustration of water resources management in Asia is the failure to capture the wet season runoff so that it can be used throughout the dry season. In the past, too much attention was given to building large dams. Now, more attention is being turned to small (check) dams. Kathmandu Valley in Nepal is an example of a location where many check dams might be used to store water during the wet season. When urban water supply tariffs are raised to around $0.40–0.50/m³, it may become attractive for the private sector to build check dams that would divert wet season flows into Sri Lankan style "tanks," or even artificially constructed underground storage, so that the water collected can be sold to the utility for urban supply purposes in the dry season.

The dams of the estimated 200 million beavers that once lived in the continental United States made meadows out of forests, as wetlands slowly captured silt.

[2] I once had a conversation with a man from Frankfurt, Germany. The cost of water was discussed, and the man said water cost $2/m³ and sewerage cost $3/m³ in his home city. Then he said, "but I don't pay that—I collect rainwater off my roof." These days, Frankfurt is well known as a city that uses rainwater harvesting.

These dams resulted in a remarkable and uniform buildup of organic material in valleys, a checkerboard of meadows throughout the woodlands, and a great deal of edge (the fruitful zone where natural communities meet). Beavers are a keystone species. Their dams create wetlands that provide homes and food for dozens of other species, including ducks, moose, fish, frogs, and great blue herons. Wetlands clarify water and prevent soil from washing downstream. When beavers make a series of dams and ponds within a drainage basin, the water cycle in an entire watershed is affected. Wetlands are like sponges. They soak up water during storms and release it slowly in drier times. Water detained in wetlands behind beaver dams is more likely to percolate down to groundwater, raising the water table and creating springs and small streams throughout a watershed. A tenth of the total land of the United States was once beaver built wetland. Now the beavers and these wetlands are gone. (Outwater, 1996)

Pollution Control

Water availability can drive economic growth. And, along with a ready source of labor and ready markets or transport to markets, water availability has encouraged industries to spring up in cities. Industries, however, damage waterways through pollution, discharge of raw sewage, and disposal of garbage. Incentives must be created for the relocation of industries to industrial estates, preferably downstream of cities, where their effluents can be treated before they are discharged. Town planning rules must be transparent to the public and implemented. Industries that are water intensive should be closely monitored, like they are in Singapore, not only for pollution but also for their conservation measures. In line with this, relatively high tariffs can encourage conservation. The "polluter pays" principle can be applied in urban areas, and this can be regarded as trading for the right to restrict other uses. This more than anything is a question of governance. Others may argue that one could also consider a "beneficiary pays" principle. Perhaps there is room for both. As noted at the Third World Water Forum, which was held in Japan in March 2003, national actions should be more focused on pollution control at the source instead of simply building more and more advanced water treatment plants at high cost.

Trading Water Rights

While there have been many advocates of trading water rights (mostly on economic grounds), the expected advantages of allowing the market to determine water resources management have not always resulted. The following learning experience from Australia is a timely warning that theory is not always manifested in practice.

The legislative basis for water markets in Australia is almost complete, and water trading for irrigation is now possible in 87% of its river systems. It was expected that managing water demand, including environmental needs, would lead to a reduction in water usage and increase efficiency as water moved (via trade) from low value to high value users. Contrary to expectations, increased prices have increased water usage overall. And most of the water sold interstate was not originally used by the sellers. Moreover, this water is being transferred to land that was not previously irrigated (leading to increased risks of salinity). One outcome of the operation of water markets is that rice and cotton crops, those that have the greatest impact on Australian rivers, are showing no signs of decline. Instead, rice is on track to break production levels, and the top nine private water holders are in the cotton trade. (Isaac, 2002)

Current conflicts among water users are governed mostly by ad hoc political decisions. If, however, they were governed by the free market value of water, and if customary and legal water rights were freely traded, then such conflicts could result in win-win situations freely chosen by all parties. What we need to precipitate this is a paradigm shift in urban water supply tariffs. The options for the farmers are then considerable. They can sell the whole of their customary water rights. They can improve irrigation efficiency or plant crops that are less water intensive and sell the water saved. Or, they can sell their water rights only for the dry season. While it is important to secure economic gains for farmers, the question of job losses cannot be ignored, so alternative employment should be secured as part of the solution.

Subsidies and having the money trail run through governments are impeding the trading of water rights. More effort must be made to recognize the customary water rights of farmers and others. More awareness of this matter needs to be developed through the Internet and other media outlets. Records and documentation related to trading water rights should be more transparent for the public. We must explore, through surveys, the willingness of farmers to trade water rights. It is quite possible that more private sector development and management of water would result from freely trading these rights.

It is an unreasonable situation that Asia is now facing, one in which new water sources to satisfy increased demands—resulting from rapid urbanization—are now often secured on the basis of a 10-year design horizon, instead of design horizons of 50 or 100 years, which would be acceptable to secure water for basic human needs. The problems must be sorted out now, before they become even more acute and civil conflicts and wars emerge over water use. Two keys to resolving these issues are recognizing water as an economic good and trading water rights. For example, Angat Dam in the Philippines represents the next major source of water for Manila, but only if the water rights can be traded (see Box 3.1). When water supply tariffs rise to approximate the real cost of water, that is to say in the \$0.30–0.40/m³ range for many Asian utilities, other options for water security present themselves, such as trading water rights.

B. Demand Aspects

This section examines demand by looking at water use and access to this resource.

Irrigation

About 90% of all water use in Asia is for irrigation. Yet, when we talk of a "water crisis," it seems that the gains that can be made from this sector in terms of efficiencies and recognizing water as an economic good have to a large extent been ignored. Low efficiencies result from water losses in canals through evaporation, leakage, and pilferage. They come from irrigation methods that waste water. They come from growing crops that are heavy water users, such as paddy crops, when

Box 3.1 Trading Water Rights—Angat Dam Irrigation versus Manila Water Supply

Economic Justification

- Five million of the 12 million people in Manila are not connected to piped water, 5 years after PSP in water supply.
- Two reasons for the high number of people not connected are given. First, the tariff is too low to allow concessionaires to invest. Second, there is an inadequate water source.
- The farming population of 22,000 also relies on water from Angat Dam to irrigate (mostly paddy) crops. Yet, in times of drought, they can lose all water to Manila.
- Most of the land being irrigated from Angat Dam will in all likelihood become urbanized within the next 20 years.
- There can be a win-win situation for the urban poor in Manila not connected to piped water and the farmers, if the whole of the water rights of the farmers are traded to the urban dwellers over time (say, for example, 10 years).
- If a price of \$0.03/m³ is paid to farmers, they have the potential to triple their current income, as long as they also plant new crops (like potatoes) that do not need irrigated water.
- When compared with developing a new source, payment of \$0.03/m³ by the water utility for a guaranteed source of 21 m³ per second represents a much cheaper and faster solution to providing piped water to the 5 million people in Manila without access to piped supplies. This should translate into an increase in the water tariff of no more than \$0.06/m³.
- An average domestic tariff of \$0.40/m³ in Manila is clearly feasible and affordable and should ensure that all the urban poor not connected to piped water get connected as quickly as possible.

Political Reality

- Water rights are held by the National Irrigation Administration. And this organization, in response to rapid urbanization, encourages irrigation of more land.
- Owners of the land have no water rights.
- Tillers of the land (farmers) have no water rights.

Government Options

- Produce a transparent policy or plan for land and water use in the future.
- Buy the land or require private developers to buy the land for controlled urban development and lease back to farmers in the interim.

for the purpose of generating income other crops will do just as well on much less water. They come from the salinization of soils caused by the use of too much water. They come from the lack of mechanisms to trade customary water rights in a free market. And they come from national policies on subsidies and food security that are often in conflict.

Continuous irrigation, without proper drainage, gradually destroys land and nearby streams and rivers through salinization. The sun's heat evaporates irrigation water, leaving salts behind. This water also flushes salts out of mineral rich soil, leaving these to dry on the surface or dissolve in groundwater and poison plant roots. Furthermore, where rainfall is limited, crops must be carefully chosen. Sugarcane is just about the worst crop choice in terms of water needed—whereas potatoes would be much more beneficial. (Time International, 1990)

Subsidized irrigation is one reason for waste. Farmers rarely pay more than one fifth of the cost of operating public irrigation schemes, let alone capital costs. In most cases, farmers can cut their water use by 10–50%. It has been shown that an investment in irrigation efficiency is usually an investment in crop and soil productivity. Better water management often leads to increased yields, a reduction in erosion, and a reduction in the amount of fertile cropland that becomes water logged, salted, or sapped of nutrients. (Postel, 1997)

Demand Management and Water Conservation

Although average domestic water consumption in European cities is only 130 liters per capita, many cities in Asia use around 200 liters per capita (for those connected to piped water). This can be traced primarily to low tariffs and a lack of public awareness concerning the importance of conserving water as a scarce resource. When tariffs are raised in many Asian cities (Chennai, Colombo, and Manila are examples) there is no drop in demand, indicating that there is no price elasticity of demand at these levels. Standpipe water is in many cases free to users, and it is common to see water being wasted at standpipes in South Asian countries. Water is also wasted through poor plumbing in homes, leaks in distribution systems, and overstorage on a 24-hour basis, which is related to users' attempts to adjust to intermittent water supplies. In Asia, unlike Europe, there is little attempt to conserve water through toilet or shower retrofitting. Singapore is an exception, and the PRC offers some good examples of industrial and domestic water conservation. The block tariff systems employed by Asian utilities invariably have large volumes at lifeline rates, thereby providing subsidies to all, including the rich.

Little effort is going into rehabilitating watersheds to secure future supplies. It is a waste of funds to treat and distribute water if it is lost or wasted. As urban populations continue to expand, there is sometimes a need to go farther afield (more than 100 kilometers) to harness new water sources, and this is becoming very costly, not only in capital costs but also in operating (pumping) costs. Unfortunately, this fact is seldom reflected in tariffs. Much can be done to have more efficient use of water in the urban context. In some cities, including Bangkok, Jakarta, Kathmandu, and Manila, NRW is around 40% of production or more. The tariffs for piped water are so low that there is little demand management.

Water Scarcity

Water scarcity is a relative term. It depends on location, climate, season, and potential use by humans. The scarcity value of water is determined by the quality of water, the quantity of water, and the number and type of water users. It is greatly influenced, therefore, by the integrity of watersheds, overexploitation of groundwater, cost of water transport and distribution, density of populations, and water pollution levels. What is being seen (and is clearly demonstrated by the rapid rise of bottled water use) is that the urban issue is one of scarcity of clean and potable water, which is also a reason behind rainwater harvesting becoming more and more relevant for cities. But water scarcity in Asia is not manifested across the board. It is characterized more by unequal access to water. For example, half the population in a city might get piped water and half might rely on vended water. Another example, involving irrigation, is where farmers at the head of a system might get plenty of water and farmers at the bottom of a system might miss out altogether on water for their crops. The challenge, then, is to overcome this lack of equality.

Grossly underpricing water perpetuates the illusion that it is plentiful and nothing is lost when it is wasted. Many of the world's water shortages stem from failing to value water at anything close to its true worth. (Postel, 1997)

Most of the world does not treat water as a scarce resource. The foremost challenge related to water scarcity in developing countries involves inefficient water use in agriculture and urban areas and by industry. Inefficient use is linked to subsidized rural and urban water use. In line with this, irrigation water is essentially

not priced. The price of water in cities does not cover the cost of delivery. And capital investment decisions in all sectors are divorced from the management of this resource. It is not uncommon for water subsidies to go disproportionately to the better off (irrigation farmers and urban water users connected to public systems). (Rosegrant, 1995)

Industrial Water Use

Water utilities in cities often rely heavily on revenue from industrial users to stay financially viable. In Greater Colombo, for example, the average industrial tariff is six times the average domestic tariff. Yet industry is invariably not controlled in terms of location and type, so polluting industries, like carpet factories, are located upstream from domestic water users. There are very few industrial estates (where some collective treatment of effluents can be made). There are almost no incentives for industries to relocate to areas where they will have less effect on residential zones. There is heavy exploitation of groundwater (normally without charge) by industry, and there is little knowledge of or control over water use by industry in terms of water needs and conservation measures. In addition, it has been noted that some major industrial users of public piped water are using armed personnel to guard illegal connections. Moreover, in Sri Lanka, the sand mining of rivers—a livelihood for many and a cheap resource for construction—is allowing seawater to move far inland, which is upsetting the water supply intakes for several towns. In short, governance is a real issue in the industrial use of water in Asian cities.

Water for the Environment

The need for minimal "environmental flows" for water left in rivers during the dry season is now beginning to be recognized. These flows are still very low and probably inadequate, but recognition is at least a start. There is a need to consider the whole ecological regime of rivers, including fishing as a livelihood; fishing as a sport; recreational needs, such as swimming, sailing, and white-water rafting; flood and fertility regimes; artificial lakes with tourism potential; garbage control; and storage of wet season flows.

C. Policy and Management

This section examines policy and management by looking at different approaches and challenges.

ADB'S Water Policy

ADB's water policy (see Box 3.2) addresses approaches to water management and development. It seeks to promote the concept of water as a socially vital economic good that needs increasingly careful management to sustain equitable economic growth and reduce poverty. The conservation and protection of water resources in the region through a participatory approach are at the heart of the policy. References are made to specifics of the water policy throughout this book.

Management Principles

The following ideas reflect some of the latest thinking from South Asia.

- *Three sets of stakeholders—managers, users, and social auditors—need to interact.*
- *Society's ability to respond to local water management needs is primarily an issue concerning information, governance processes, and the structure of civil society.*
- *Watershed management has to do with afforestation and check dams as much as with livelihood issues concerned with irrigated agriculture.*
- *History suggests that an effective approach to water management may be to allocate equitable shares among stakeholders.*
- *Absence of clear water rights results in inequitable access to water resources, and the establishment of water markets and rights will create incentives for users to make efficient use of their water entitlements.*
- *The most effective instruments to reduce water demand may be agricultural price policies and subsidies.*
- *Management issues are rooted in interactions between complex and interdependent water resources and economic, environmental, cultural, institutional, and social systems.* (Moench et al, 1999)

Box 3.2 The Water Policy of the Asian Development Bank (in a Nutshell)

Promote a national focus on water sector reform. Developing member countries (DMCs) will be supported to adopt effective national water policies, water laws, and sector coordination arrangements; improve institutional capacities and information management; and develop a national action agenda for the water sector. Throughout, the needs of the poor will be specifically factored into legal, institutional, and administrative frameworks.

Foster the integrated management of water resources. Integrated management will be based on conducting comprehensive water resources assessments and concentrating interlinked water investments in river basins.

Improve and expand the delivery of water services. Focusing on water supply and sanitation (rural and urban), irrigation and drainage, and other subsectors, support will be provided for autonomous and accountable service providers, PSP, and public-private partnerships emphasizing equity in access to water for the poor and underserved.

Foster the conservation of water and increase system efficiencies. Packages that combine water use and resources management charges to recover costs, improved regulation and increased public awareness, and provisions to ensure that the poor are not excluded will be supported.

Promote regional cooperation and increase the mutually beneficial use of shared water resources within and between countries. The primary focus will be on the exchange of information and experiences in water sector reform. Support will be provided to enhance awareness of the benefits of shared water resources, create sound hydrologic and socio-environmental databases relevant to the management of transboundary water resources, and implement joint projects between riparian countries.

Facilitate the exchange of water sector information and experiences. Socially inclusive development principles will be supported to promote stakeholder consultation and participation at all levels, increase the access of poor consumers to basic water services, and enhance water investments in DMCs through public-private and community-nongovernment organization (NGO) partnerships.

Improve governance. This will be accomplished by promoting decentralization; strengthening monitoring, evaluation, research, and learning at all levels, particularly in public sector institutions; and building capacity. (ADB, 2001a)

River Basin versus Local Management

On the one hand we learned at Dublin[3] that water should be managed at its lowest practicable level, but on the other hand we are now told that comprehensive water resources management on a river basin basis[4] is best. There is potential for conflict. This has to do as much with local versus national politics as with anything. We are seeing (in Sri Lanka) how it is very difficult to get various water users to agree on development and management on a more comprehensive basis. Allocation of water rights is still an issue. In many countries, irrigation authorities do not willingly share information with water supply authorities. In default of the desired trading of water rights, however, we see other mechanisms, such as compensation and water levy payments, that mimic this type of trading. The Melamchi Water Supply Project in Nepal provides such an example (see Appendix 2, Kathmandu case study).

Managing Water Resources to Meet Megacity Needs

Some findings of a regional study and consultation on this subject—in the cities of Bangkok, Beijing, Delhi, Dhaka, Jakarta, Karachi, London, Manila, Seoul, Singapore, and Tokyo (ADB,1993)—are presented. Ten years later the findings are still valid.

[3] International Conference on Water and Environment held in Dublin, Ireland, in January 1992.

[4] Management on a river basin basis is the management of water from the top to the bottom of its catchment of rainfall in an integrated manner, rather than the management of water within the confines of local authorities.

Problems

- Growth rates are explosive.
- The use of resources causes conflicts.
- Rivers and the living environment are polluted.
- The urban poor are marginalized.

Main Findings

- Controlling pollution is the top priority.
- Demand management by pricing is needed.
- Water must be treated as an economic as well as social good.
- Scope for recycling and reuse in industry and agriculture must be identified.
- Water is a priority need of the poor, and they are willing to pay.

Urban Planning

- Development strategies should have a horizon of 15–25 years.
- Urban zoning with industrial estates is needed.
- Development in flood plains should be avoided.
- Urban planning should integrate water planning with land use, housing, drainage, and environmental protection.
- Equitable sharing of water resources can be based on a basin development plan addressing social, political, and economic aspects of various options.
- Water resources planning and management should include monitoring the quantity and quality of sources.
- Investment cost analyses should include public and private expenditures, as the latter can be very high if the supply is intermittent.

Wastewater Disposal

- In dense areas of megacities, the long-term solution to wastewater disposal is piped sewerage and treatment with separate sewage and drainage pipes.
- Effluent discharges should be downstream from water supply intakes. Discharge standards should be consistent with water uses in catchments.
- Sanitation schemes that achieve local improvements in one area at the expense of others are not appropriate in megacities.
- Wastewater should be regarded as potentially having value for reuse in agriculture, maintaining surface water flows, and groundwater recharge.

Institutions

- Roles of agencies should be carefully defined.
- Water and sanitation utilities in megacities should be able to act as bulk suppliers to urban poor areas. Utilities and local governments should adopt flexible approaches to the provision of water to unauthorized settlements and base their decisions on commitments to pay for services.

Economic and Financial Aspects

- Demand side should receive more attention, and increased efforts need to be made to estimate demand and understand its determinants in an economic sense. Financial revenue estimation should increasingly be made on demand information, rather than simply estimating required revenues based on future financial costs.
- Subsidies, when used, should be explicit and transparent and target the urban poor. They should be directed at the demand side rather than the supply side.

Conflict of Water Users

The main users of freshwater in Asia are farmers (through irrigation), next come the urban water utilities that serve domestic, commercial, industrial, and some gardening and stock raising needs. Hydropower facilities are, strictly speaking, not consumptive users, but their activities do influence others. The environment needs a certain amount of water to be reasonably well maintained. And recreation and tourism also rely on freshwater.

By far the greatest potential for conflict among users involves irrigators and urban water utilities, as urbanization continues to grow at rates of around 5% per annum. First comes the desire to take over the water used by the irrigators, as it is the next nearest source of water to develop. Next comes the sale of farmland for subdivision and estate construction. But there is also great conflict between farmers for water. Those at the bottom end of the irrigation network invariably miss out in times of drought. Then there is the conflict that arises when water is taken from one locality or river basin and transferred to another for irrigation or water supply. Certainly the environment is greatly altered. Livelihoods (water wheels, irrigation, and fishing) are affected, and

aesthetics are impaired. Hydropower often involves dams for storage of potential energy, and these dams severely alter the regime of rivers for other users. When industrial and domestic water users mine groundwater, they are in conflict with future users, because access will be deeper and more costly, and the risk of saline intrusion will often be ignored until the damage has been done. Pollution of waters, especially by industrial users, affects other users of the water downstream as well as groundwater users. Religious use of water is greatly impaired by such activity. Finally, there is the potential conflict of use that results from local management of water versus comprehensive water resources management on a river basin scale. Watersheds involve the conflict between urban water users and inhabitants who live in or near watersheds and cut down trees for much needed fuel for cooking. When it comes to interbasin transfer, governments often state that water belongs to the nation, but more and more now the customary rights of the settled people are being observed. In line with this, their past and future use of water must be considered.

Unfortunately, where these uses conflict, it is not easy to compare apples with apples. The nearest we can come to that is (sadly) to put a monetary value on such uses and allow market forces to determine proper rewards and penalties. This means that we must recognize customary use now and in the future and allow current and future beneficiaries to participate in determining equitable sharing. Once trading water rights becomes a reality, conflict resolution by politics can be eliminated. But the impetus for trading water rights must come from domestic urban water users. When they pay tariffs of around $0.40/m^3, instead of roughly $0.05/m^3, there will be something with a realistic value to trade. But as long as domestic tariffs remain low, there will be little incentive to transfer water rights.

The case of water transfer from Melamchi Valley to Kathmandu Valley for domestic water supply is interesting, as the water levy is to be charged to consumers in Kathmandu Valley and paid to the people living in Melamchi Valley. In essence this is trading water rights, but it does not go under that name because legally the people of Melamchi Valley do not own the rights to that water, the nation holds the rights.

Chile has been a pioneer in introducing tradable water rights. In 1981, Chile's water code allocated (without charge) property rights to existing users of water. Property rights for new users were sold by auction. Property rights can be used for loan collateral and are assigned for consumptive and nonconsumptive uses. Agriculture was and remains the largest consumptive use. The city of La Serena initially planned to construct the Puclara Dam to satisfy its rapidly growing water requirements. With the introduction of a water code, many farmers in the region recognized that the water rights they held had a higher value than their water's current agricultural use. Farmers put in place more efficient irrigation systems requiring lower water volumes and sold all or part of their water rights to the city at good prices. The transfer of the agricultural water rights to La Serena has led to the indefinite postponement of the dam's construction. The reduction in water use in the agriculture sector has helped control salinity, which was primarily caused by excessive use of water. Introducing an economic value for water rights has also had positive impacts on water utilities. For example, Chile's main water company chose to invest in the reduction of NRW rather than pay for additional water rights to meet its customers' growing demand.

Groundwater use by industries should first be examined to decide whether it is in the best interest of cities and their environments to relocate these industries. However, if it is found that these industries provide essential services, like the services provided by tourist hotels, their use of groundwater should be monitored in an effort to control extraction, and they should pay for the water used, as the water belongs to the nation and industrial use prevents or restricts other uses.

D. Conclusion

In most cases, but especially in South Asia, water is treated as a social rather than an economic good. The most pressing need is to get entire populations in urban areas connected to 24-hour supplies of potable piped water. Without tariff levels being appreciably raised, however, this is unlikely to happen. Yet affordability is not preventing such increases, as there are very few cases in which those connected to piped water pay more than 3% of their household income for the service.

Just as the past 20 years has shown that NRW cannot be reduced by dealing with this problem in isolation, it can be seen that water conservation and demand management cannot be introduced in the same way. They are part of the bigger picture of governance, policy, regulation, accountability, and transparency (see Figure 2.2). Conflict between water users is as much about governance as anything else. In the absence of clearly defined and transparent policies, ad hoc interventions or prevention by elected officials will continue to promote this kind of conflict. We need transparent

government policies covering watershed rehabilitation and protection; reduction of NRW; the increase of tariff levels, so that these curtail excessive demand; and regulatory bodies to see that policies are implemented. Such policies should include measures designed to educate schoolchildren on the need for and the ways and means of water conservation. And they should include provisions stating that utilities and regulators must create, through media, public awareness on these matters so that to some extent positive peer pressure can come into play.

Computerization will help everyone involved analyze the effects of tariff increases on demand and fine-tune this relationship over time. Carefully structured block tariff systems can ensure that the poor are not penalized and that demand is controlled. Gradual tariff increases matching service improvements are best.

In the end, it will be relatively high urban water supply tariffs that put pressure on nearby irrigation systems to either greatly improve efficiencies in water use or trade their water rights to cities.

The recent modeling of water demand and supply in Kathmandu Valley shows the value of comprehensive water resources management, which is not an exact science. Balancing economic, social, and environmental concerns is very much time dependent and influenced by outside considerations. Creating the Kathmandu Valley Water Authority, however, will give local governments some control over their environment and at the same time facilitate comprehensive water resources management at arm's length from these considerations. This study has highlighted the need for constructing good databases and maintaining them over many years.

More recently, the concept of managing water where it falls is being emphasized around the world, especially in regard to rainwater harvesting, control of storm-water runoff, and wastewater management. There are good lessons to learn from the beavers who gave America their wetlands by creating millions of small dams. We should think about floods and fertility. We need to think more about the morality of transferring water from one river basin to another. We should share good case studies through the Internet. We should learn from history. And we should learn to be proactive and not reactive in managing water.

In the years ahead we may come to judge our success at water management by our ability to share water equitably, to do more with less of it, and to restore life and integrity to the earth's rivers. (Postel, 1997)

Water Resources Management (Problems) in a Nutshell

- Watersheds are degraded—the trees have been felled and wet season rains are lost.
- Groundwater is overexploited because it is free.
- Irrigation is often a wasteful use of water—both in terms of crop types chosen and poor water delivery mechanisms.
- Urban water supplies have high rates of NRW.
- Underpricing water does not help conservation.
- There is conflict between urban and rural water users.
- Water pollution results from ineffective governance.

Water Resources Management (Solutions) in a Nutshell

- Water policies and social auditing are needed.
- Have long-term planning horizons.
- Introduce demand management through awareness and pricing.
- Plant more trees to rehabilitate watersheds.
- Plant crops that use much less water than do rice, cotton, and sugarcane.
- Do not subsidize water management.
- Remember the triple bottom line: environmental, social, and economic development.
- Develop rainwater harvesting in cities.
- Remember the beavers—build check dams.
- Trade customary water rights.

Chapter 4

Water and Sanitation Service Coverage

No piped water

Not enough of this

It is reported that coverage with improved water supply in urban Asia is 93%.[5] But what does "coverage" mean? In Manila, coverage is calculated on 9.2 persons per connection, yet the 2000 census states that there is an average of 4.6 persons per household. In many cities in South Asia, more than half the people rely on standpipe supplies. Is that considered coverage? Likewise, intermittent water supply is considered the norm in many South Asian cities, and this type of service is classified under coverage. This chapter explores the real levels of water supply and sanitation service in Asian cities. For greater insight, the city water supply profiles in Appendix 1 may be reviewed.

A. Water Supply

The best measure of good water supply service in a city is 24-hour piped supply to the home. This is because 24-hour piped supply is linked to water quality and quantity, as well as to price, reliability, and convenience. Why is the percentage of people receiving piped water supply in many of Asia's major cities (see Figure 4.1) so low? First, in some of these cities there are domestic wells—dug wells, shallow tubewells, and deep tubewells)[6]—but as groundwater levels fall from overextraction, and the groundwater becomes either salinized from overpumping or contaminated by polluted surface water, this water use will be threatened. Second, there are, especially in South Asia, extensive intermittent water supplies due to low tariffs, low metering, and the extension of distribution systems beyond their 24-hour hydraulic capabilities (see Figure 4.2). Third, there are many people in areas of cities where there is no piped water. There is a failure of water resources and water distribution to keep up with demand. It is the people living in areas of cities where there is no piped water who deserve the most attention, because they are forced to pay the vended price for water. Most say a lack of funds has caused this situation. But in most of these cities, tariffs are low and well below affordable limits (5% of household income). If tariffs were raised, there would be money available to extend services to the urban poor who are not being served. It is all a matter of equity of services and good governance.

During the Indonesian Water Sector Reforms Seminar in 2001, the Government identified problems, which included low urban coverage, low tariffs, high debt service, low development agency support, and a lack of

[5] (World Health Organization et al, 2000).

[6] Postevaluation findings of World Bank and ADB projects over the last 20 years have shown that water demand is invariably overestimated. Mostly this is because people already have access to alternate water supplies, such as wells, and this has not been properly factored into designs.

Figure 4.1 Access to Sewerage and Piped Water Systems (2001)

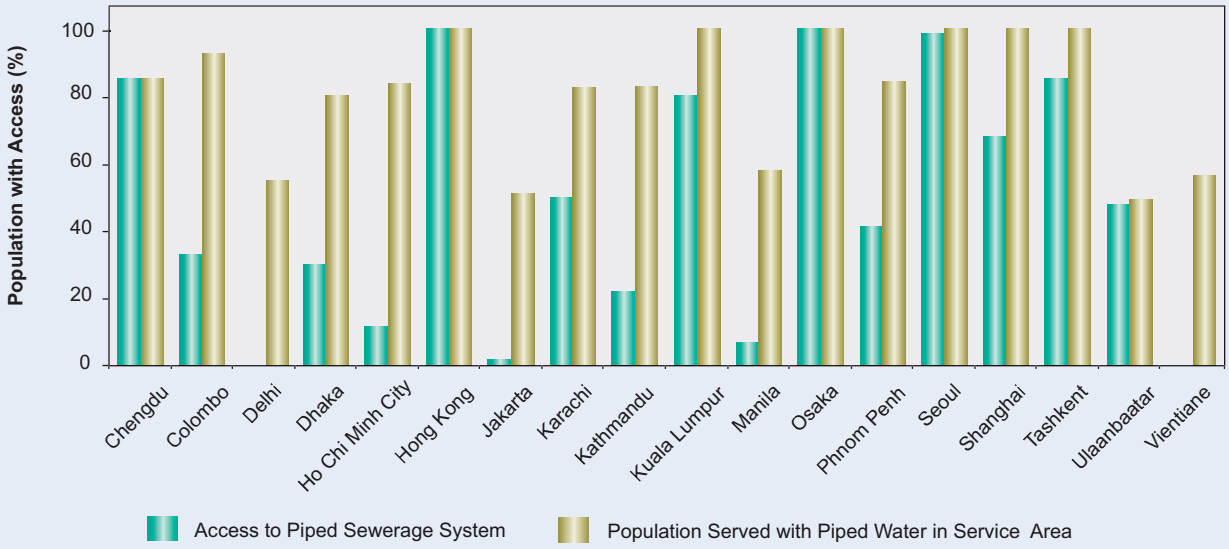


Figure 4.2 24-Hour Water Availability (2001)
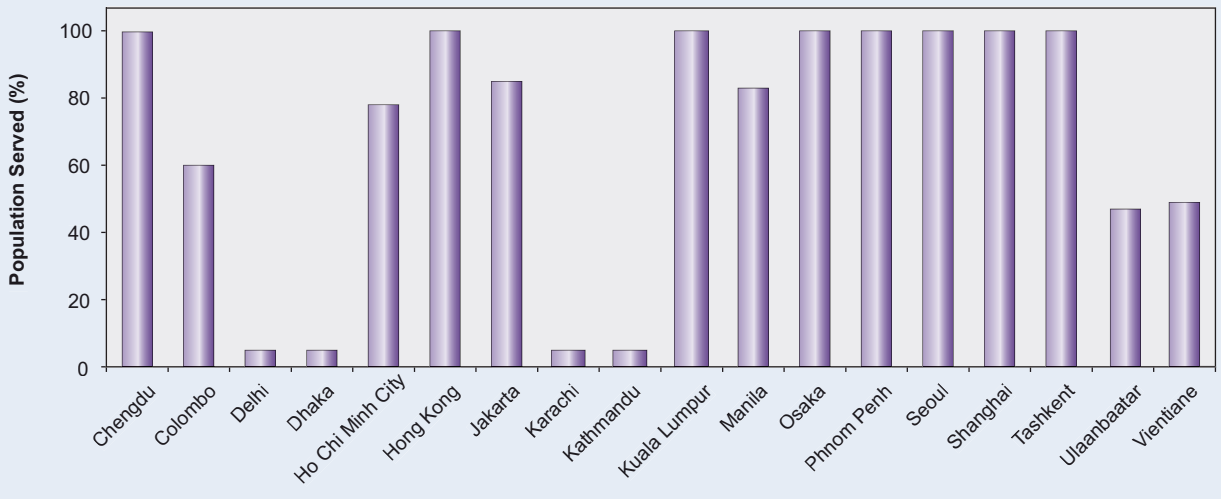
[among population served]



coordination. Per capita consumption varies enormously (see Figure 4.3). What needs to be examined is the equity of supply. For example, some households get 6 m³ per month and others get 30 m³ per month. Appendix 1 gives more specific figures for per capita consumption from house connections.

A more objective way to look at coverage with piped water is to evaluate the population per connection for a given city. Table 4.1 examines this situation for some Asian cities and shows the increase in the number of connections from 1996 to 2001. Some disturbing results surface: In Delhi, Dhaka, and Manila the increase in connections over these 5 years is 15%, 11%, and 10%, respectively. It is apparent that the rate of increase in connections to piped water does not match the population increase in these cities, which would be at least 2.5% per annum. The other disturbing result is that the "effective coverage," using five persons per household, is close to 30% or below in 5 of 11 cities

Figure 4.3 Average Domestic Per Capita Consumption (2001)

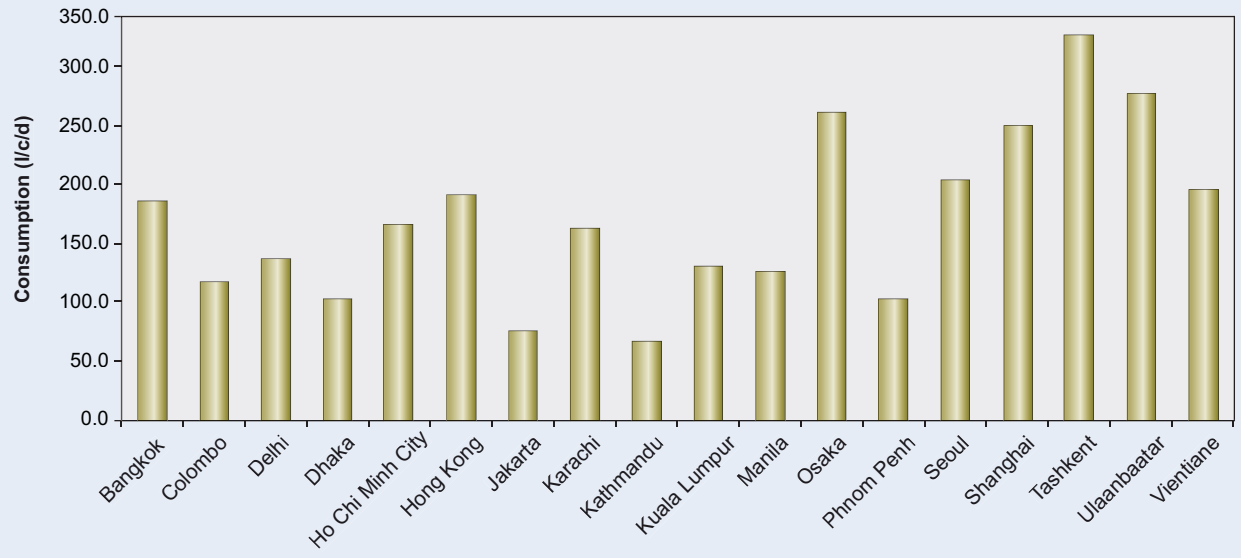


Table 4.1 Effective Coverage with Piped Water (based on connections)

City	Domestic Connections (1996)	Domestic Connections (2001)	Increase (%)	Population (2001)	People per Connection (2001)	Coverage[a] (%)
Bangkok	951,543	1,090,786	15	7.6 million	7.0	72
Delhi	1,096,916	1,266,303	15	13.8 million	10.9	46
Dhaka	160,000	176,823	11	9.0 million	50.9	10
Ho Chi Minh City	236,433	337,500	43	5.3 million	15.7	32
Jakarta	312,168	564,527	81	9.0 million	15.9	31
Karachi	830,366	1,280,000	54	13.5 million	10.5	47
Kathmandu	92,600	119,891	29	1.1 million	9.2	54
Manila	719,878	794,827	10	12.4 million	15.6	32
Phnom Penh	27,387	62,970	130	1.0 million	15.9	31
Shanghai	1,753,190	2,909,053	66	10.5 million	3.6	100
Vientiane	22,273	36,121	62	0.4 million	11.1	45

and is under 50% in 8 of 11 cities. It is time for all concerned to have a good look at what is going on. Shared connections, neighborhood resale of water, vended supply of water, standpipes, and intermittent supply are not good enough. It is time for Asia to set its sights on 24-hour piped water in all homes and design a road map to get there. The first step will of course be to more accurately determine the facts from the field, preferably through an independent public audit of water sources, levels of service, and the number of people not served with piped water.

B. Sanitation

In the 1980s, the focus was on sewage treatment. More recently, it has turned to wastewater treatment. Everyone would agree, however, that too little is being done to improve urban environmental sanitation, especially considering the rapid urbanization that is taking place in Asia's developing countries. The poor who are living in unauthorized settlements, located on generally low-lying land that is subject to flooding, are the most vulnerable. Hygiene education is needed, but water without sanitation still leaves the poor vulnerable to waterborne diseases. With good water supply as the top priority, there are just not enough funds left for major investments in sanitation. Catch-up is being played in water supply. So, when will attention be turned to sanitation? That question has been asked for the last 10 years and nothing much has happened. Without a doubt sanitation needs more advocacy. Does another epidemic like the cholera epidemic that hit Peru in the early 1990s have to occur before action is taken? When disease strikes, the cost can dwarf the amount that should have been spent on prevention. In Peru, in the first 10 weeks of the epidemic, losses in agricultural exports and revenue from tourism were greater than three times the amount spent on sanitation in the whole of the 1980s. Cities need to provide sanitation services to the entire population. Figure 4.2 shows that on average only 30% of the people in Asian cities have access to sewerage.

There are many factors to consider in sanitation: these include the needs of people (privacy, convenience, health, etc.), available resources (space, skills, financing, responsible agencies, etc.), and the local situation (climate, soil, surface water and groundwater, traditions, culture, religion, hygiene awareness, proximity of other people, leadership, and institutions). (Pickford, 1995)

Water and Sanitation Service Coverage (Problems) in a Nutshell

- There is inadequate reporting of service levels.
- Coverage in terms of 24-hour access to piped water in homes is very low.
- Alternate sources (especially groundwater) are often ignored.
- Intermittent water supplies are the norm in South Asia
- Standpipe water supplies are prevalent in South Asia.
- Little attention is paid to sanitation.
- The urban poor not being served are the main victims.

Water and Sanitation Service Coverage (Solutions) in a Nutshell

- Compare the number of connections with the number of people.
- Examine the extent of intermittent water supply.
- Examine the extent of standpipe supply.
- Examine on-site sanitation versus sewerage versus treatment.
- Undertake independent professional audits of service levels.
- Analyze root causes of inadequate coverage.
- Promote awareness of the situation among civil society.
- Address as a priority the needs of those with no access to piped water.

Chapter 5

Intermittent Water Supply

Intermittent water supply may be defined as a piped water supply service that delivers water to users for less than 24 hours in 1 day. It is a type of service that, although little found in developed countries, is very common in developing countries, especially in South Asia. Changes in water supply can be effected by Asia's growing middle class and its small but very powerful rich group, if they use their influence, but they do not do this because they secure their water supply as individuals through the use of tanks, pumps, and in many cases private wells. This chapter examines the consequences of intermittent water supply and suggests how this problem can be tackled.

A. Prevalence

Many South Asian cities provide less than 10% of the people in their service areas with 24-hour piped supply. In contrast, most Southeast Asian cities provide 80% or more of the people in their service areas with 24-hour piped water supply, but often large proportions of their populations are not served. Neither of these situations is satisfactory. In South Asia, the prevalence of intermittent water supply is so high that most people regard it as normal and are therefore not greatly motivated to do anything about it. In Kathmandu, in the dry season, most people get water for about one hour every other day. In Indian cities, two or three hours of water a day is considered good. See Figure 4.2 in Chapter 4 for the prevalence of 24-hour supply in some Asian cities.

B. Causes

The primary cause of intermittent water supply is extending distribution systems beyond their hydraulic capacities to provide 24-hour service. This is usually done at the behest of elected officials. In Kathmandu, for example, they continue to add 5,000 new connections a year, despite an inadequate distribution system. Other causes of intermittent supply are a failure to meter completely and accurately and a failure to charge and collect on sufficiently high tariffs. It is often said that there is not enough water for 24-hour supply. This is not valid, because much of the water available is wasted. What is needed is demand management. One city where this practice has been successful is Malé, where people get about 34 l/c/d and have a 24-hour piped supply. What determines their consumption is a high tariff ($5/m^3) and strict metering, billing, and collection (see Malé case study in Appendix 2). NRW, in terms of leakage and illegal connections, contributes to intermittent water supply by lowering water pressure in the distribution system. One reason given for designing systems to provide water intermittently is the high cost of pumping for 20–24 hours. What is probably not understood is that pumping times are drastically reduced when balance storage is constructed and metering, billing, and collection controls are set. Very low tariffs add to problems related to excessive pumping, since utilities that lack funds struggle to meet O&M costs if there are long pumping hours.

One hour a day—no tap

Diverting supply to one location

Coping Costs of Intermittent Water Supply

Queuing for water

Underground storage

Rooftop storage

Buying bottled drinking water

Booster pumping

C. Consequences

Households with intermittent water supply must invest extra money in pumping, storing, and treating this resource. In Kathmandu, for example, as much as one half of an average power bill can be attributed to the operation of a pump. Consumers without access to a 24-hour supply tend to use more water than others. Because they are never certain when they will next be served, they throw away the surplus "old" water from yesterday to make way for "fresh" new water today. Intermittent supply causes anxiety, and generally one person from each residence has to devote time to ensuring that water is received when it comes. Valve operators can extract bribes from consumers who wish to ensure that they will receive adequate service. Sometimes females must venture out into the dark at 2:00 a.m. to retrieve water from standpipes, which can make them vulnerable to assault. No water from an intermittent water supply system is safe to drink, because under vacuum conditions foul water can be drawn into the pipes. Certainly hygiene education is important under these conditions, which put at risk people connected to an intermittent supply. Most meters do not register accurately under intermittent supply conditions, raising doubts as to the validity of metering at all. Constant valve manipulation increases the need for more frequent valve maintenance and replacement. Another consequence of intermittent supply is overexploitation of groundwater, particularly by industries (see the Kathmandu case study in Appendix 2). Last, the quantity of water to be made available over 24 hours has to be made available in fewer hours in an intermittent system, which requires distribution pipes with larger diameters. The findings of a conference on intermittent water supply held recently in Mumbai (India) are shown in Box 5.1.

Experience has shown that, once intermittent service becomes the norm, the hours of service continue to decline. The high costs of intermittent supply are paid by the utility, which incurs higher investment and operating costs; the customers, who pay to cope with unsatisfactory service and to protect themselves against unsafe water; and the population as a whole, as the risk of epidemics increases due to the consumption of contaminated water. (Yepes, et al, 2001)

Box 5.1 Intermittent Water Supply
(Mumbai Conference, January 2000)

Advantages *(perceived)*

- *Leakage of water is reduced.*
- *Available water is distributed equally.*
- *There is time for repairs and maintenance.*

Disadvantages

- *Systems do not operate as designed.*
- *Reservoir capacities are underutilized.*
- *There is frequent wear and tear on valves.*
- *More manpower is needed.*
- *Contaminated water requires consumer treatment or the use of bottled water.*
- *Higher doses of chlorine are needed.*
- *Oversizing of networks is needed to supply the necessary quantities in a shorter time.*
- *Inconvenient supply times mostly affect the poor.*
- *Consumers have to pay for storage and pumping.*
- *Water meters malfunction, which can lead to a loss of revenue and customer disputes.*
- *Accountability per subzone is not provided.*
- *In case of fire, immediate supply is unavailable.*

(Indian Water Works Association, 2000)

D. From Intermittent to 24-Hour Supply

To move from an intermittent to a 24-hour supply, it must be accepted that governance and tariffs are at the core of the problem, and those issues must be addressed first. Then it will be necessary to embark on extensive stakeholder awareness programs to convince people that 24-hour access to piped water in the home is possible for all. For this type of service to become standard, moratoriums must be imposed on new connections while distribution systems are

being hydraulically improved. This is best done by starting with 24-hour supply zones and gradually expanding these. Higher tariffs can be imposed on those with 24-hour supply, and the extra funds can be used to improve systems. When tariffs are sufficiently high, there will also be less water used in 24-hour zones, making more water available for use when these zones are extended. Twenty-four-hour zones must be 100% metered, and meters must be accurate (if they are found to be inaccurate, they must be replaced). District metering can be installed to pursue NRW goals, and full computerization of accounts in 24-hour zones should be accomplished. Illegal connections must be pursued in the field—this is a fundamental governance issue.

Intermittent Water Supply (Problems) in a Nutshell

- There is a high prevalence of intermittent supply in South Asia.
- Intermittent supply is caused by extending distribution networks beyond their hydraulic capacities, often at the behest of elected officials.
- Low tariffs and poor collection contribute to intermittent supply.
- Compared with 24-hour supply, intermittent supply uses more water.
- Intermittent supply leads to higher costs and greater inconvenience for consumers and utilities.
- When the supply is intermittent, consumers risk contracting diseases from using water that is not potable.
- Intermittent supply can lead to the exploitation of the poor (who often have to use bribes to get adequate service).
- Expectations of consumers (due to a lack of awareness) are low.

Intermittent Water Supply (Solutions) in a Nutshell

- Promote awareness among stakeholders.
- Address governance issues related to the autonomy of utilities.
- Introduce higher tariffs for 24-hour zones.
- Place moratoriums on new connections.
- Invest in hydraulic modification of distribution systems.
- Start with 24-hour zones, and then expand these.
- Enforce strict metering and collection.
- Reduce NRW.

Chapter 6

Water and Poverty

There are many links between water and poverty, and some of these are identified at the start of this chapter. One of these links—the economic link—is best illustrated by the dramatic effect it has on the poor getting connected to piped water. Disposable income can increase by up to 20% as a result of moving from vended water to piped water. This chapter discusses the access of the urban poor to piped water, how connection fees act as a constraint, and affordability and willingness to pay. The issue of environmental sanitation and how it affects the poor is also discussed. Comparisons are made between those connected and those not connected in terms of the volume of water used and its cost.

A. Links

There are many links between water and poverty.

(1) Water and poverty are linked by access to potable piped water. There are two parts to this. The objective is 24-hour access to potable piped water in every home. **Poor people either have no access to piped water and must buy water from vendors or they have access but service is very poor** (like standpipe water that is 500 meters away from the home and available for one hour each day).

(2) Water and poverty are linked by **the economic effects of inadequate service**. If a poor family in Manila pays 900 pesos each month for vended water, but would only be paying 100 pesos each month if connected to piped water, that family is greatly affected economically. That extra 800 pesos each month, out of a total monthly household income of 6,000 pesos, could be the difference between a family of six living in a building made of temporary materials (without windows) that rents for 1,000 pesos per month and living in a house made of permanent materials (with windows) that rents for 1,500 pesos per month. It could be the difference between buying rice or electricity on credit with effective interest rates of 20% per month or buying those commodities at normal prices.

(3) Water and poverty are linked by the people who are **last in line to get piped water**. Private concessionaires are not too eager to connect the poor because they do not buy much water, cannot pay for connection fees up front, and often lack the security of land tenure (see Box 6.1). Concessionaires fear that the poor will not pay and that they will not be able to afford to connect properly in unauthorized settlements. Elected officials often tell these families that "piped water will be available next year," but often nothing happens. The poor do not have access to reliable information.

(4) Water and poverty are linked by the **quality of water that the poor receive**. The cheaper vended water cannot be used for drinking, and it

Waiting for water

Box 6.1 Difficulties Encountered in Serving the Urban Poor

It was realized that land tenure is complex and an issue. The reason for this is that supplying water will alter the status of the land. Moreover, regularization of land tenure before introducing water and sanitation is important. Tap water in every home cannot be seen as an aim in itself. A transition period will be required to achieve this goal.

- ***Problems in equipping poor neighborhoods:***
  - *(a) Connection costs are too high.*
  - *(b) There are high percentages of unpaid bills.*
  - *(c) There are high rates of unbilled or fraudulent consumption.*
  - *(d) There are low levels of individual consumption.*
  - *(e) Network maintenance costs are high.*
- ***Problems related to equipping areas of spontaneous and temporary housing:***
  - *(a) Authorities will not legalize/recognize settlements.*
  - *(b) Crime and vandalism are rampant.*
  - *(c) It is impossible to draw up a customer file.*
  - *(d) Billing methods are inappropriate.*
  - *(e) The situation is precarious.*
- ***Solutions regarding connection fees:***
  - *(a) Spread out payments over several months.*
  - *(b) Labor participation.*
  - *(c) Extend grants where town councils supply materials.*
  - *(d) Welfare connections.*
  - *(e) Microloans.*
  - *(f) Pooled investments.*
  - *(g) Municipal tax compensation.*
- ***Neighborhood resale:***
  - *(a) A person connected to a network sells water to a person who is not connected (this is regularized in Jakarta, Phnom Penh, and Ho Chi Minh City).*
  - *(b) In Jakarta, 30% of the people buy water from street hawkers.*
  - *(c) Is believed to make a considerable contribution to making potable water more widely accessible in disadvantaged areas, which justifies its gradual regularization in developing countries.*
- ***Conclusion:***

Disadvantaged areas need a special approach that leaves concessionaires some flexibility.

It is best to spread the cost of the work in disadvantaged areas among customers who are already connected, municipalities, developers, future customers, and any donor institutions. (Lyonnaise des Eaux, 1998)

often stains clothes during washing. The **reliability** of supply is not good, and new sources sometimes must be found at a day's notice.

(5) Water and poverty are linked by **intermittent supply**. The extra costs related to this type of service can be seen in terms of **distance to access**; **inconvenient** times of supply (in Kathmandu water could arrive at 2:00 a.m.); uncertainty and **anxiety** over when water will come; **bribes** to ensure that water will come; **sleep disorders**; waiting in **queues**; **conflicts** with neighbors; the **burdens** of carting water, in-house storage, and boiling and filtering water for drinking and cooking; and finally the **security** risk for women sent to retrieve water at night (see Box 6.2).

(6) Water and poverty are linked by the poor who rely on groundwater and household or community wells. Water and poverty are also linked by the always increasing and real threat of **falling groundwater tables,** which require water to be pumped or the unaffordable deepening of wells. Saline intrusion, caused by overextraction of

Box 6.2 Poor Water Supply Service in Kathmandu

In a letter published in the Kathmandu Post on 17 June 2002, Paliza Shrestha stated the following.

The supply of water in Kathmandu city is grossly irregular. There's literally no schedule, whatsoever, for when the water comes and goes, and on several occasions we (Bansbari tole) have no supply of water. Water is a daily necessity. It is impossible to carry out household activities without water. Also, it becomes very annoying to get up early in the morning every time to check whether water has come or not. Due to this we have had to put up with sleep disorder. Almost every day the issue worries us. Most of the time since there is no water supplied to our taps, we have to walk long distance to collect water from waterspouts and at other times from the neighborhood. We use our store of water cautiously as we are afraid there won't be enough water for the next day. Add to this the pain of going to a Dhungedhara (waterspout) waiting in long queues, washing clothes, and bringing them back to our houses. Sometimes there are conflicts between landlords and tenants over sharing water. I see many people at Dhungedharas fighting.

It is the responsibility of the Government to provide a reliable water supply. The Government should take our plight seriously. Why on earth can't they just provide a regular supply of water? I don't think we are asking too much. A fixed timing of water should be printed in the newspapers (both in English and Nepali) as well as posted on radios and TVs. Perhaps this will make the life of the urbanites a bit easier.

groundwater by industries, can also wipe out a cheap source of water for the poor.

(7) Water and poverty are linked by the possibility that the poor connected to piped supplies can be exploited. If one family manages to get a connection and shares the water received with several neighbors, all are charged at high consumption penalty rates, because of **block rates** tied to consumption.

Even the water vendor is poor

(8) Water and poverty are linked by the whole **inequity** of a situation in which the poor get the worst service—intermittent water supply through standpipes, no service at all, or vended water in lieu of piped water—while the rich or better off get relatively inexpensive piped water. Invariably, the poor consume around one fifth (6 m^3 per month) of what those directly connected to piped water consume and pay five times the amount the rich pay. Subsidies benefit the rich more than the poor.

(9) Water and poverty are linked by private sector contracts not being based on a policy of connecting the poor, which leads to **regulation by contract**. This situation has made it necessary for concessionaires to increase tariffs to invest in connections to the poor, and this has proved hard to do.

(10) Water and poverty are linked by **private operators** with concessions promising to bring investment funds to the table to improve coverage, which they have not done, and water and poverty are linked by the poor suffering as a consequence.

(11) Water and poverty are linked by the status quo and vested interests working against the poor. **Water vending** is a very big business, and elected officials and utility staff have been

known to receive a share of the profits**.** It is not in the interests of such persons to help the poor get connected to piped water. Some of the so-called NRW can be bought by water vendors with the permission of certain authorities, and these authorities would then collect money from its distribution.

(12) Water and poverty are linked by the **poor suffering more than others from corruption**. In Bangalore (India), a study on governance (Paul and Sekhar,1999) concluded that one poor household in four pays bribes for getting its problems solved at public agencies. Moreover, evidence indicated that the poor pay a higher price for corruption than others. While government subsidies are high and the money trail runs through governments, the poor will remain underserved or not served with piped water, because there are not enough funds to invest.

(13) Water and poverty are linked by the **lack of transparent government policies** that target water service to the poor. Sometimes these policies are made for development agencies but are later ignored or forgotten.

(14) Water and poverty are linked by the rich being able to afford to protect themselves from disease by buying **bottled drinking water** and the poor not being able to afford this luxury.

(15) Water and poverty are linked by the poor being made to suffer in regard to sanitation as well as water service. Many underprivileged citizens have no access to **formal sanitation facilities** and must defecate in the open or in hanging latrines. Women in particular suffer ill health as a result of not being able to use public sanitation facilities.

(16) Water and poverty are linked by **very low consumer expectations** in regard to water services. In parts of South Asia, people are happy to get water from standpipes for one hour every day. They do not know that they are entitled to a 24-hour piped supply in their homes, like that enjoyed by others elsewhere in the world.

(17) Water and poverty are linked by the rich being able to afford to pay bribes to get **illegal connections** and the poor not being able to do the same.

(18) Water and poverty are linked by **connection fees** being often over $100 and the need to pay these up front. The poor cannot save that amount of money, especially when paying for expensive vended water.

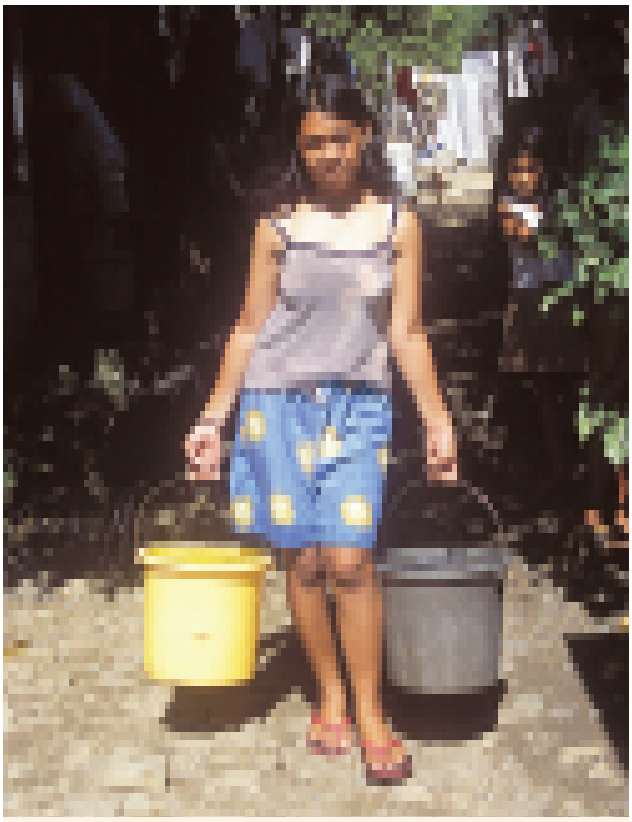
(19) Water and poverty are linked by connected consumers having a collective voice and **the poor who are not connected having no voice**.

B. Water Policy

ADB's water policy is linked to its poverty reduction strategy. The policy specifically provides for the involvement of the poor in water conservation and management. It recognizes that the specific needs and vulnerabilities of the poor are central in formulating sound and equitable water strategies. The poor must be enabled to influence decisions that affect their access to water for both consumptive and productive uses. The policy also reflects the considerable potential that exists for mobilizing community efforts to directly contribute to pro-poor water development, and it requires the development of knowledge bases related to the water needs of the poor.

C. Connection Fees

Connection fees in many Asian countries can be as high as one fifth of a poor household's annual income, thereby making it difficult if not impossible for



Burden of carrying water

Should be in school

the poor to connect. In most cities there is no option apart from up-front lump sum payment. A survey of 20 Asian cities revealed that half require the connection fee to be paid up-front in a lump sum.[7] Phnom Penh officials say that the problem the urban poor face is the connection fee being too high, which inhibits connection and therefore demand. Formal water supply is one fourth the informal cost in terms of the tariff but higher in terms of the connection fee**.** In Andhra Pradesh (India), when the Government dropped the connection fee from 4,000 to 2,000 rupees, more than 5,000 households registered. Using the cash inflow, the municipality extended its distribution lines to other areas that were not served. One-off connection charges may impede access, so these costs should be recovered by monthly charges over a period of up to 5 years. In the case of new development, these charges can be included in financing the total cost of the undertaking.

[7] I have found from field experience that, even if the official policy is to allow connection fees to be paid in installments with the tariff, often the people are unaware of that policy.

D. Low Coverage and Low Service Levels

Notwithstanding PSP in water supply in Manila, there are still about 5 million people in the city who do not have direct access to piped water. This would be reasonable if they have an acceptable alternative supply, such as tubewells with handpumps or dug wells, but in most cases they do not. Instead, many pay up to 20% of their household income to buy water from vendors. A typical example would be one quarter of a family's water (sourced from the utility) purchased at high cost for drinking and cooking and three quarters of its water (sourced from groundwater) purchased at lower cost for washing and bathing. The situation that pertains to Manila is repeated in other cities in Southeast Asia. In South Asia, the situation is somewhat different. In general, coverage with piped water is more complete, but the service levels are lower than in Southeast Asia. Intermittent water supply is the norm, with many people receiving water for only one hour every other day in the dry season. Furthermore, there are many people served only by standpipes, which results in queues for water and the burden of carting it home, when and if it comes. It is important to note that it is mostly the urban poor who do not have 24-hour access to supplies of piped water. The more fortunate rich often enjoy 24-hour piped supplies. The experience of a standpipe user in Delhi is described in Box 6.3. This illustrates that, even though standpipe water may be nominally free, the cost of transport to get this water home makes it effectively very expensive ($2.50/m^3).

It seems that increased scarcity of water results in those who control it taking advantage of the poor. For example, a valve operator in Kathmandu once confessed (with a grin on his face) that he worked 18 hours per day, 7 days per week, because the bribes he received paid him to do so.

The cost of intermittent water supply to the consumer is considerable. A group of consumers in Kathmandu was asked to compare what they paid for water with what they paid for electricity. The finding was that their electricity bills were almost 20 times higher than their water bills. This was unusual, because the average ratio in Asia is around 4:1. Upon further discussion, however, it was revealed that half of the cost of the electricity bills resulted from pumping water. So, from this example, it can be seen that pumping can be a major cost associated with intermittent water supply. Storage and treatment (boiling and filtering) costs are also appreciable.

Box 6.3 Standpipe Supply in Delhi

A family of five people living in an unauthorized settlement uses groundwater for washing, bathing, and cleaning, but travels 1,500 meters to a standpipe each day to get 40 liters of water for drinking and cooking. The water is available at the standpipe for just six hours each day and is free. The journey on foot takes about 25 minutes, and depending on the season (summer or winter) it may be necessary after arrival to queue for water for 15–60 minutes. The journey home is by rickshaw and costs $0.10 per day (this equates to buying water at $2.50/m³ or a monthly water bill of $3). At home the family has 500 liters of storage, which is used mostly for groundwater. The standpipe water is used for drinking without boiling or filtering. The family members are happy enough with the water utility, because they can access good water. But they say nothing can be done to get them a house connection to piped water, as the utility has not planned to provide water to this unauthorized settlement. When asked about the worst thing related to collecting water, the answer was "the long distance to be traveled and the long queue."

The unsatisfactory state of water supply in Asia (many people not served or poorly served) is the consequence of numerous forces interacting to reach a comfortable situation for the controlling stakeholders. The status quo is a natural state and has its own inertia. Moving from that state requires considerable new forces to overcome that inertia.

E. Affordability

People often hear that the poor cannot afford to pay water tariffs. This is not the case, and proof of this comes from Manila, where a typical household connected to a piped supply pays around $4 each month for water and uses 30 m³ per month, while the urban poor not being served pay around $20 each month for their water and use 6 m³ per month. Having to pay an up-front lump sum of around $100 for connection fees, however, is more than can be expected of the poor. Other arrangements are needed.

If a ceiling of 5% of household income is imposed for combined water supply and sanitation affordability, there will be plenty of revenue. In cities like Manila the income profile is wide ranging, so the tariff structure can be fine-tuned to optimize this state. Utilities must, however, become better informed about that profile before they do the fine-tuning. They must also not ignore alternative water sources and services.

It was recently found in India that households in Dehradun receiving the existing intermittent water supply were willing to pay more than twice the prevailing rate to receive a continuous water supply. It was further discovered that, on average, households were paying up to five times the prevailing rate in coping costs, which arise from the existing irregular and unreliable supply. In Delhi, in 1998, households paid up to 2,000 rupees per year in direct and indirect coping costs resulting from existing intermittent supply. This revenue source was not tapped by formal providers, as it was paid directly to smaller and unregulated private sector interests. It was also found that if tariff increases are implemented without increases in service, consumers are not likely to be convinced to accept future proposed increases. (Water and Sanitation Program, 2001)

F. Environmental Sanitation

City slums are often located in areas where the installation of water systems presents engineering problems. For example, several such areas are on steep slopes and at higher elevations than storage reservoirs. Water must therefore be pumped, resulting in additional costs. Invariably it is the poor who live on marginal lands

Health risk

Unsanitary conditions

that suffer from flooding one time and poor drainage the next. Land tenure has been an issue, so the poor are often forced to be unauthorized settlers and still pay an informal rent to those who control even public lands. Toilets are often hanging latrines. Hygiene education is lacking for many of the poor, so they suffer from bad hygiene as well as bad water service. The matter of the right of the poor to live and work in our cities is addressed in Box 6.4.

G. Government Policy and Governance

The issue of water and poverty is about governance, including the lack of transparent and implemented policies directed at getting the poor 24-hour access to piped water. The poor are willing and able to pay for piped water, but governments are in general unwilling to increase tariffs to a level that would provide the funds needed to invest in connecting the poor. A large underground economy involving water vendors is flourishing, but vested interests (including governments, utility staff, and the private sector) are not eager to change the status quo.

Everything begins with policy—let us not forget that. But policies must be developed after consulting with stakeholders, and the policies must address the main issues. Most of all, policies must be transparent and kept in the public eye. They must specifically target the urban poor in terms of (i) piped water access in homes; (ii) 24-hour supply; (iii) affordability, willingness to pay, tariffs, and tariff structure; (iv) priority of service; (v) water quality; (vi) alternative sources; (vii) water quantity; (viii) private sector obligations; (ix) sanitation facilities; (x) information; (xi) water vending; (xii) bottled water; (xiii) connection fees; and (xiv) the right of access to water. In line with this, policy makers may want or need to do the following.

- Look at how water vendors can be turned into distribution caretakers.
- Require an assessment of subsidies to determine tariff policies.
- Consider the income profile of a city first.
- Consider a ceiling on affordability set at 5% of household income.
- Consider that hiking tariffs helps the poor, not only by having the funds to invest in connecting them to piped water but also through reducing water demand and releasing the water to serve them without the extra costs of source development.

Box 6.4 Mega Slums—The Coming Sanitary Crisis

Too often in the past development policies have failed because those whose lives were supposed to be transformed were not consulted, and their views and wishes were not heard. Policy makers must therefore recognize that the energies of the poor are a resource that can be tapped to help find solutions to the problem of squalor. A fundamental change in public attitudes is needed. Instead of simply using the poor as a source of cheap labor, the right of the poor to belong to a city, and to become permanent residents in every meaning of the term, must also be acknowledged. In line with this, more modest types of urban settlements and amenities, within the scope of building and other municipal regulations, must be accommodated. And it must be recognized that appropriate service delivery systems need to belong to their own consumer context, not to standards of technological excellence set in Europe that come with a corresponding price tag. What poor communities need is freedom from extreme commercialization generated by water scarcity in their neglected and underserved localities. They also need help in overcoming the many disadvantages they experience due to their relative lack of socioeconomic and political clout. NGOs have a special role to play in facilitating change. (Black, 1994)

- Consider that those with piped water should be obliged to pay a little more, so that those without piped water can get connected.
- Encourage NGOs to form consumer societies that look after the interests of the poor, especially those not connected to piped water.
- Consider direct subsidies to the poor, such as those subsidies introduced in Chile (see Box 6.5).
- Consider installing public toilets, such as those used in Pune (India).
- Consider recognizing water vendors and other small-scale water providers.
- Look at rainwater harvesting as a way of helping the poor.
- Encourage the media to bring information to the urban poor.
- Encourage a consumer service targeted at the urban poor.
- Require that the plight of the urban poor is benchmarked, monitored, and published regularly through a public audit of water service levels.
- Insist that policies for the poor are regulated and that social auditors are appointed.
- Consider whether bulk sales of water to the poor and neighborhood resale comply with policies.
- Consider hygiene education for the urban poor.
- Target the schools first.
- Look at how one connection can equitably serve several families.

The PRC has some good (safety net) policies related to water and poverty. For example, in the city of Zhangjiakou, Hebei Province, poor families (those that receive welfare from the Civil Affairs Bureau) are entitled to receive a cash rebate on 5 m³ of consumption per month.

Civil society can help create the necessary public awareness to pressure governments into enacting the right policies (those that will ensure equitable water service for all) and the proper strategy (increase tariffs significantly) to achieve this. Civil society should include all stakeholders, including served consumers, the urban poor not being served, utilities, the private sector, unions, government officials, elected officials, NGOs, journalists, and academics.

H. Raise the Tariff to Help the Poor

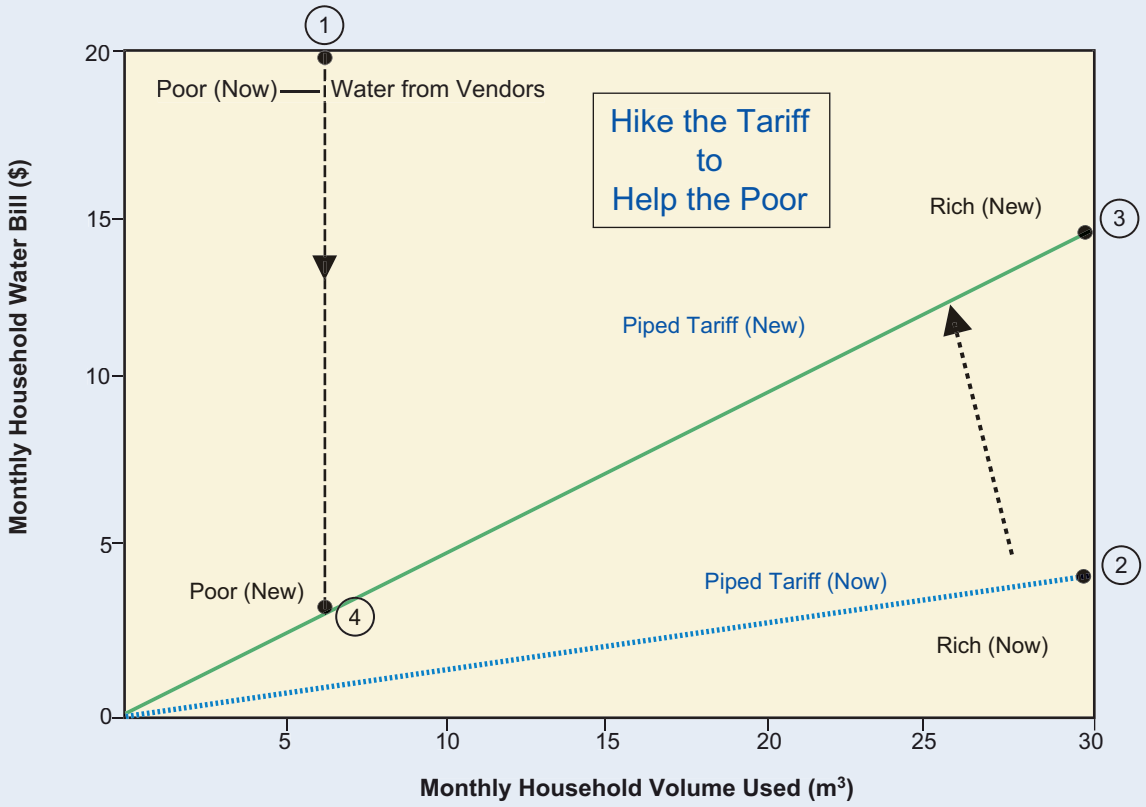
The irony of the situation is that the main way to help the poor is to substantially raise tariffs. This will free up funds for investments designed to connect the poor and turn intermittent water supply into 24-hour supply (without standpipes). A hypothetical example is shown in Figure 6.1, and an actual example is related in Box 6.6 (see also the Colombo and Phnom Penh case studies in Appendix 2, which illustrate the ability of consumers to pay for water).

Box 6.5 Output-Based Subsidies for Water Consumption

- *Chile introduced an individual means-tested consumption subsidy a decade ago. Although the public authorities determine how the subsidy is applied, the mostly private companies deliver the service.*
- *An important part of the reform was a new tariff setting methodology aimed at raising water prices to the true economic cost of the service.*
- *The Government reimburses the companies for the subsidies based on the actual amount of water consumed by each beneficiary.*
- *By law the subsidy can cover 25–85% of a household's water and sewerage bill for consumption of up to 15 m³ per month, with the client paying the rest. All consumption above that limit is charged at the full tariff.*
- *An eligibility scoring system is the main instrument used in Chile for distributing means-tested subsidies. It produces a score for each household wishing to be evaluated, which is based on a personal interview and the answers to 50 questions. The score is valid for 2 years and can be used to avail of other subsidies, including pensions, family benefits, and health benefits.*
- *Metering is essential, and it requires a strong institutional capacity at the municipal level. It is expensive to apply output-based subsidies just for water, but when combined with other benefits it is more cost-effective.*

(World Bank, 1999)

Figure 6.1 Effect of Tariff Increase on Rich and Poor



- For the Poor (1) $20 → (4) $3 (6 m³)
- For the Rich (2) $4 → (3) $15 (30 m³)

Average Tariff (Now) = $0.13/m³
Average Tariff (New) = $0.50/m³

Water queue for the poor

Bottled water for the rich

Box 6.6 Hiking Tariffs to Help the Poor

Winnie Flores (shown on front cover) lives at the Manggahan floodway in Metro Manila. She is one of about 5 million people who still have no access to piped water. She pays almost as much for water as she does for rent. Winnie could greatly improve her quality of life if she could get connected to piped water. "It's coming next year," she has been told. But she has listened to that line for the last 5 years.

Recently, when her husband lost his job, they and their four children had to move to cheaper accommodations, costing 1,000 pesos a month. Yet Winnie pays 900 pesos a month for 6 m^3 of water, while many connected to piped water pay about 160 pesos a month for 30 m^3. She gets her water from two sources: the first is an entrepreneur who drilled a well to pipe water to some families in the neighborhood. Winnie buys eight 16-liter jerry cans per day from this vendor for 10 pesos. The water is of poor quality. Her second source of water is another vendor, who comes twice a day to deliver 16-liter jerry cans of drinking water sourced from a water main about 2 kilometers away. She buys four containers a day at 5 pesos a container.

Why are Winnie and so many others in this deplorable situation? It is not a question of land tenure—the neighborhood has concrete streets and many homes built with permanent materials. It is all about where the funds are to bring the urban poor piped water. When PSP was introduced, many said that the private sector would invest funds in water supply and improve efficiency by reducing NRW, etc. In reality, after almost 5 years, NRW has not been reduced greatly and new funding has been much less than expected. What happened?

The "water crisis" in Manila in 1996 was the rationale for the introduction of PSP, which was completed in just 18 months. Unfortunately, two mistakes were made. First, the contracts with two different concessionaires were not based on a formal and publicized government policy that might have included serving the urban poor. There was no independent regulator to monitor the implementation of the policies and to see that the contract conformed to these. Instead, the former Metropolitan Waterworks and Sewerage System was appointed as a regulator, but it ended up acting as a contract administrator. The second mistake was having concessionaires compete to provide water based on the lowest tariff. The winning bids were 57% and 26% of the pre-bid MWSS tariff. The signal most likely sent to consumers was that water was very plentiful and ready to be used. It lulled consumers into a false sense of security.

When El Niño and the Asian currency crisis came along, one of the concessionaires started asking for a major tariff adjustment. When would they get the money to get on with the efficiency measures and connect the millions without access to piped water? The answer was, "Sorry, it is not in your contract." Of course, had the contract been based on a policy of connecting the poor, it would have been easy for the two parties to get together to amend the contract and align it with the policy and agree on a tariff hike. After all, both concessionaires are guaranteed a certain rate of return based on the whole contract. But there was no policy, only a constricting and restrictive contract. So, for a couple of years, the Government (not the regulator!) fought to resist the tariff increase. Who was this hurting? Without a doubt the poor, like Winnie, who are still not connected.

One of the mysteries is why NGOs did not assist the poor by demanding a tariff increase. In the end, the poor asked for the tariff increase themselves. The logic was simple: If the tariff for those people connected was raised from an average of 5 pesos/m^3 to 10 pesos/m^3, and if that allowed the concessionaires to connect the poor, the poor would go from paying 150 pesos/m^3 to 10 pesos/m^3 and be much better off. Is it too much to ask those connected to piped water to help pay for those not connected to get the same access? The Government finally capitulated and gave the tariff adjustment to both concessionaires.

What are the lessons to be learned? First, policy is everything, but it must be in front of the public at all times. Second, counter intuitively, hiking tariffs can help the poor who are not yet connected to piped water. Third, in the future, investments in large city water supplies should be financed directly from tariffs.

Note: This material was originally produced by the author for ADB and UN-Habitat newsletters.

Water and Poverty (Problems) in a Nutshell

- The poor are willing to pay but governments are unwilling to charge.
- The poor often pay $20 per month for 6 m^3 of water. The rich often pay $4 per month for 30 m^3 of water.
- Up-front lump sum connection fees are an impediment to the poor getting connected to piped water.
- The status quo is determined by those with vested interests who profit from the plight of the poor.
- Intermittent water supply exploits the poor.
- The private sector is not very willing to connect the urban poor—there are few incentives.
- The poor have no voice.
- Standpipe supplies are not an adequate service.

Water and Poverty (Solutions) in a Nutshell

- Public audits are needed to obtain the facts about service levels.
- Policies are needed that focus on providing the poor with piped water.
- Raise the tariffs to connect the urban poor.
- Employ a block tariff structure, but watch the sizes and prices of blocks.
- Soften the terms of payment for connection fees.
- Eliminate standpipes wherever feasible.
- Encourage civil society (NGOs) to champion the poor.
- Detach land tenure issues from access to piped water.
- Governance is at the core of the solutions.
- Develop knowledge bases related to the water needs of the urban poor.
- Enable the poor to influence decision making.

Chapter 7

Small-Scale Water Providers

An ADB-funded survey was conducted in 2002 to gather and analyze information about small-scale water providers (SSWPs) in eight cities: Cebu, Delhi, Dhaka, Ho Chi Minh City, Jakarta, Kathmandu, Shanghai, and Ulaanbaatar. An independent survey by the Water and Sanitation Program was conducted in Manila, and the author also conducted field surveys in this city. Appendix 3 provides brief examples from Cebu, Delhi, Dhaka, Ho Chi Minh City, Kathmandu, and Manila.

Evidence suggests that a large percentage of urban poor populations is still without access to water and sanitation services, despite improvements in this sector. Many surveys done in Africa and Latin America have demonstrated that a significant number of urban populations are served by SSWPs that provide competitive and appropriate service to households without access to utility connections. There is little data on this phenomenon. For this reason, nobody has a clear picture of the role played by SSWPs in water supply, particularly with respect to the urban poor. This chapter looks at that role.

Water vendor in Manila

A. Limits of Conventional Responses

Over the past decades, governments have favored large water utility companies, and results remain unsatisfactory. With existing tariffs and management structures, these companies have been unable to provide piped water coverage to whole populations. For example, in some unauthorized settlements, a large percentage of people draw (or illegally receive) their water from "spaghetti networks" that connect to the edge of a municipal grid system. Others remain without service for one or more of the following reasons.

- Connection fees are too high, and lump sum upfront payments exclude the poor.
- Total available water is not always sufficient to cover whole populations, and vulnerable groups are the first to be left out.
- Even when water supplies are sufficient, tariffs and low volumes of water consumption may not make it attractive for utilities to deliver services in low-income areas, where the minimum cost of extending services is relatively high.
- When people occupy land illegally, it can mark them as not eligible for public services (otherwise, the provision of public service could provide de facto a proxy for legal status).

Even if water companies are allowed or mandated to serve poor households, they often do not have the know-how to do so, which leads to the following.

- Service levels are often not tailored to demand, but are instead based on technical standards and therefore are not affordable for low-income families.
- Payment systems are at times not adapted to the particular conditions and constraints of the poor (irregular income).
- Employees of main operators do not always communicate well with residents of low-income areas, which only exacerbates the risks of being overcharged or penalized in the case of improper billing.

B. Alternative Water Supply Services and Local Initiatives

Because of the failure of conventional utilities to serve many low-income households, a large number of people rely on alternative forms of service, which are either run by community groups or delivered by local entrepreneurs. Yet sector reform and modernization have focused exclusively on large-scale operators and have ignored the potential offered by community-led initiatives and local private operators. Private sector involvement now increasingly includes SSWPs.

Surveys have highlighted the comparative advantages of SSWPs over large utilities in periurban areas, low-income neighborhoods, smaller towns and centers, and consolidated inner-city neighborhoods. Low-income households buy their water from these operators because they provide the right service at the right price. Even if the cost of water from SSWPs is higher than the nominal tariff charged by utilities, poor consumers may prefer the former because the supply is reliable and flexible (particularly in terms of quantity and hours of supply) and there is no excessively high connection fee.

C. Types of Small-Scale Water Providers

SSWPs can be small companies, cooperatives, individuals, and community-based organizations. They are independent to the extent that some are self-employed entrepreneurs or artisans. Most work without formal recognition from local authorities and are not usually subcontracted by major water distribution companies. Unlike multinational companies, such operators enter markets freely, take risks, and invest without an agreement with the public sector. Small-scale investors and local entrepreneurs have always supplemented trunk concessions and public companies in serving hard-to-reach parts of towns and in tailoring services to the poor. They account for a significant share of the market. There are three main types of SSWPs.

- **Partners of water utilities**

  Some local operators work with water utilities, whose water they distribute at kiosks or standpipes. These operators buy water from water companies at a flat rate and sell it on to end users at a profit. They do not receive a salary.

Small-scale water provider

No need to regulate (yet)

- **Vendors and resellers**

  Vendors include mobile water truckers, carters and water carriers, and household resellers. They provide water (most often drawn from water company taps) at times and places that water utilities are unable to serve.

- **Pioneers of small piped networks**

  Pioneers bring piped water from their own sources (often groundwater) to communities where water utilities have not yet expanded their networks. The level of investment and the initiatives and financial risks taken by these various types of water providers are quite different (see Table 7.1). The level of service provided fits with urban population demand. Due to the dynamism of this service and the strong existing barriers for these private operators, there is a need for more in-depth analysis.

Table 7.1 Types of Small-Scale Water Providers

Type of Provider	Level of Investment	Level of Initiative	Link with Water Utility	Financial Risk	Level of Service
Partners of Water Utilities	Very Low	Very Low	Strong	Very Low	Low (water outside home)
Resellers	Very Low	Low	Strong	Very Low	–
Carters and Water Carriers	Low	Low	Weak to Strong	Low	Average (water delivered to home)
Truckers	Medium to High	High	Weak to Strong	Medium (water trucks can be used for construction activities, etc.)	Average (water delivered to home)
Pioneers of Piped Networks	Medium	High	Weak to Strong	High	Average to High (water delivered to home by hose or household connection)

D. Scope and Scale of Small-Scale Water Providers in Asian Cities

The role played by SSWPs in water supply in selected cities is strongly linked to the water service provided by water utilities. For example, in Shanghai the utility provides good service with a low connection fee. Apart from bottled water businesses, there are no SSWPs in Shanghai. In cities like Delhi, Dhaka, and Kathmandu, about 5–10% of all households are served by SSWPs. The high level of subsidy and the policy of providing "free" water to the poor in South Asian countries, combined with good access to groundwater, have limited the niche market for SSWPs, despite the low level of service provided by water utilities. Currently, the most important input of SSWPs is in Southeast Asia, where the coverage of piped systems operated by water utilities is about 50% with medium-to-high connection fees. Roughly 20–45% of households in Cebu (Philippines), Ho Chi Minh City, Jakarta, and Manila may rely on water supply services provided by SSWPs. Table 7.2 shows the types of services provided.

E. Small-Scale Piped Systems

Apart from real estate developers who have installed piped systems for their own residential areas, few local entrepreneurs have installed piped systems in low-income areas to provide household connections. The number of people served by each system is still limited in the cities studied (100–700 connections). In Manila, a small local company—Inpart Engineering—operates 12 systems and serves today around 30,000 households in low-income areas (see Appendix 3).

Nevertheless, local entrepreneurs have implemented low-cost technology and proposed low connection fees to customers. The connection cost is limited to the cost of the needed materials (pipes, meters, etc.). The materials generally fit the settlements they serve, and these entrepreneurs adapt billing to the customers' forms of income (from daily to monthly payments). In Ho Chi Minh City, entrepreneurs have invested in a water treatment unit to serve safe water to customers. In most cases, SSWPs support the total amount of their investments through privately sourced loans with high interest rates of up to 5% per month. They do not have access to commercial loans and do not receive any financial support from local authorities or external support agencies.

Table 7.2 Services Provided by Small-Scale Water Providers in Study Cases

Service	City	Main Location of the Service		Population Targeted	Origin of Water
		Within Utility-Operated Piped System	Outside Utility-Operated Piped System		
Household Connection	Cebu Delhi Dhaka Ho Chi Minh City	–	X	All people	Groundwater
	Cebu	X	–	Medium-income to poor families who cannot afford the ($100) connection fee	Groundwater
Standpipe	Cebu	–	X (in areas with limited access to groundwater)	All people	Groundwater and water utility
Kiosk	Ulaanbaatar	–	X (in *Ger* area not served by utility kiosk)	All people	Groundwater
Tanker	Ho Chi Minh City	–	X (in an area with quality issues concerning groundwater salinity)	All people	Water utility and surface water
	Ulaanbaatar	–	X (in *Ger* area not served by utility kiosk)	All people	–
	Delhi Kathmandu	–	X	High- and medium-income families (to supplement the low water quantity provided by the utility)	Groundwater, spring, and surface water
Pushcart	Dhaka	X	–	Medium- and low-income families (to supplement the low water quantity provided by the utility)	Utility standpipe
	Delhi Jakarta	–	X (in area near the utility's piped system)	Low-income families	Utility standpipe
Reseller	Cebu Ho Chi Minh City Jakarta	X	–	Poor people who cannot afford a household connection	Tap
Water Carrier	Dhaka	X	–	High-income families (to supplement the low water quantity provided by the utility)	Utility standpipe

Their legal environment is poor, and generally they work under an illegal framework (due to water distribution monopolies of utilities). This situation is particularly true in Delhi and Dhaka. In Cebu, however, operators have received authorization from the local authority (chief of the *barangay*), and in Ho Chi Minh City some entrepreneurs have signed contracts with the water utility that define the water tariff.

The tariff charged by SSWPs is lower when they operate in a friendlier environment. In Delhi, Dhaka, and Kathmandu, where SSWPs operate in an illegal environment, the water tariff is 6–10 times more than the utility tariff (which is strongly subsidized). In Cebu and Ho Chi Minh City, where SSWPs have received official authorization, the multiplier is respectively 2.6 and 1.7.

F. Examples of Small-Scale Water Providers[8]

Cebu

The water utility serves only about 30% of the 1.5 million people in this city. Several SSWPs provide water services, mostly based on small distribution networks connected to privately owned and maintained wells. These systems are of various sizes, serving up to 500 households. Average consumption is in the range of 12–15 m^3 per month, and the monthly water bill is $6–8. In comparison with the utility service, which is not available in locations served by SSWPs, connection arrangements are simpler and cheaper but the tariff is higher.

Delhi

About 60% of Delhi's 14 million people live in slums, resettlement colonies, and low-income clusters. Most of these are not served by household connections. Instead, they get water from public standpipes, tubewells (with handpumps), and water tankers. The utility—Delhi Jal Board—operates about 1,000 tankers delivering 23,000 m^3 per day. Supply by tanker costs close to $1/$m^3$, while supply through the piped system costs only $0.10/$m^3$. The utility's tankers must provide free water to the poor who have no other source of water. These tankers, when requested, also serve middle- and high-income households. The role of SSWPs in Delhi is very limited because the utility's water price is low and water is provided free to the poor. There are, nevertheless, a few private pipeline providers who supply connections using their own tubewells. The users pay $4–10 for about 15–30 m^3 per month. There are also tricycle services. These involve payment for the cost of transporting water from standpipes to homes, which equates to about $4–6 for 1.2 m^3 per month of drinking or cooking water per household. The bottled water industry is also strong, with 24-liter bottles of treated water costing around $0.80.

SSWPs often use meters to manage

Dhaka

The need for water of people living in informal settlements prompted the establishment of one SSWP business in Dhaka. It serves 9,100 households through 100 individual connections and 15 standpipes, and it is located about 1.3 kilometers from the utility network from which it sources its water without charge. The whole operation is illegal, but it provides a basic human need to the people. The business charges $0.86/$m^3$ for water, compared with the utility's $0.12/$m^3$. Only about 300 m^3 of water is supplied to the neighborhood each day, which equates to about 1 m^3 per household per month. It would seem that this water can only be used for drinking and cooking.

Ho Chi Minh City

About 19% of the households in Ho Chi Minh City use SSWPs. Most providers (about 60%) are resellers (households with connections from the water company, which resell water to 3–5 other households in the neighborhood). The rest are tanker operators, providers using small pipeworks, and bottled-water providers.

[8] For details see Appendix 3.

Bottled-water provider

Water tanker for people not being served

Average consumption from household resale is 17.5 m^3 per month, which can be compared with 36 m^3 per month from the water utility. The average tariff for household resale is \$0.56/m^3. Average consumption from water tankers is 6.6 m^3 per month, and the average tariff is \$0.90/m^3. A network provider on the outskirts of Ho Chi Minh City uses groundwater from his own well. His system has a design capacity of 720 m^3 per day, but presently only 100 m^3 per day is provided. The designed number of connections is 2,000, but only 400 households have been connected in the first 2–3 years. Water is sold at \$0.22/m^3, and household use is about 7.5 m^3 per month. This provider has a license to operate for 3 years and a tax exemption for 5 years. What is unique about the Ho Chi Minh City case is the real partnership and spirit of partnership created between the water utility (Ho Chi Minh City Water Company) and SSWPs.

Kathmandu

More than half of the city's 1.1 million people depend on sources other than the utility to meet their water needs. About 31% rely on their own wells, 15% on community managed systems, 6% on SSWPs, and 5% on neighbors' connections. Most SSWP services are provided by about 65 tankers operated by 36 providers. The quality of the water depends on the source, which can be natural springs or groundwater. Consumers prefer one company over another based on its source of water. In general, this service is provided to the more affluent members of the community (who can afford to pay \$1.30/m^3 for delivered water).

Manila

It is estimated that millions of people in this city receive water from SSWPs. About 2 million receive water (by resale) from neighbors' connections or from neighborhood kiosks, another 2 million from pushcart water vendors and tanker deliveries, and a further 1 million from direct connection or hose. The average consumption volume per household is 6 m^3 per month, and the monthly water bill is \$10–20. By contrast, those on the utility supply get about 30 m^3 per month and pay \$3–6 per month. In most cases, the source of water is the water utility.

G. Conclusions

"Water for All" is the catch cry of governments, development agencies, and operators alike. Yet in many deliberations over the years, SSWPs have been to a large extent ignored. But in terms of the total revenue turnover from water in megacities, like Jakarta or Manila, SSWPs are responsible for more revenue turnover than formal utilities. This alone is justification for taking a much closer look at SSWP operations. When their operations are seen as intimately linked to the urban poor, because of low rates of effective coverage with piped water (often less than 50%), there is another powerful reason for further investigating their operations.

The main issue with SSWPs is the great lack of equality between those connected to piped water and those not connected. There are people with vested interests (which might include utility staff, utility owners, local authorities, and government and elected officials) who are keen on maintaining the status quo. It should be noted that the only vested interests of SSWPs relate to employment and the operation of small businesses. The studies to date appear to show

that SSWPs make little profit and do not exploit their clients (who are mostly the urban poor).

Is there a need to regulate SSWPs? Evidence suggests that there is not. That would probably drive many of them out of business. To a large extent, the market promotes regulation through customer choice concerning price and quality of water. Competition is strong. There is, however, a need to recognize SSWPs officially. Then it will be important to undertake comprehensive, independent audits of water and service levels to ascertain the facts from the field. Water utilities need to be regulated and guided by clear policy statements from governments on piped water service coverage and SSWPs. Any water supply study strategy for a city must consider the role of SSWPs. Finally, financial assistance should be made more readily accessible to SSWPs so that more investments can be made to bring good-quality piped water to the urban poor.

Small-Scale Water Providers in a Nutshell

- Services provided include distribution pipework for utility water and/or groundwater, kiosk sales, pushcart and tanker vendor deliveries, and neighborhood resale of utility water.
- Water sources (whether legal or illegal) are mostly water utilities, but also groundwater.
- SSWPs sometimes generate more revenue than formal water utilities.
- In default of the water utility, SSWPs provide the urban poor with essential services. Many SSWPs are also poor.
- The great inequity: the connected can pay $4 for 30 m^3 and those not connected (supplied by SSWPs) can pay $20 for 6 m^3. The status quo is maintained by those with vested interests.
- In many cases, SSWPs are not formally recognized by utilities or local governments.
- Tariffs are higher than those charged by utilities but connection fees are lower.
- SSWPs provide more flexible arrangements for connections and payments than water utilities, leading to better relations with customers.
- Officials need to learn more by auditing existing utilities and SSWPs, so that SSWPs can be registered and recognized but not regulated (yet).
- Residents need to have clear policy statements from governments on piped water coverage and SSWPs. Governments should include SSWPs in water supply strategies.
- SSWPs need access to financing.

Chapter 8

Management

This chapter examines the problems associated with managing water utilities responsible for major urban water supplies in Asia's developing countries. It identifies the lack of autonomy of water utilities as one of the core problems leading to secondary problems, such as the caliber and skills of management and staff, the overstaffing of utilities, and the lack of accountability and incentives (including remuneration) to perform. Of course, autonomy is also linked to the ability of a utility to set tariffs in accordance with government policy—and that degree of autonomy is rarely attained. This chapter looks at solutions in the context of good governance, higher tariffs, organization development, reducing NRW, ending intermittent supply, and effective metering of water use.

A. Current Situation

Autonomy

The lack of autonomy extended to the management of most Asian water utilities is the strongest factor affecting their performance. This means that matters concerning staff numbers, staff remuneration, and staff recruitment are not decided by service providers. This also means that matters concerning tariffs, on which the financial viability of each utility depends; investment, including extensions of supply (often beyond hydraulic design limits); and disconnection for nonpayment of bills are not decided by the people who are probably most qualified to make these decisions. In short, it means that managers of many utilities are not being allowed to manage.

Caliber and Skills of Management

The civil servant rules in Asia's developing countries result, in most cases, in seniority or longevity of service leading to promotion to management positions, not management skills or merit and performance. The lack of autonomy extended to management encourages this state of affairs. Men and women who do not rock the boat are supported. Even if managers had the autonomy to manage, many would not have the skills to do so. Most senior positions in water utilities are filled by staff with little, if any, management training.

Caliber and Skills of Staff

What is found in water utilities in Asia is a heavy predominance of engineering professional staff, many of whom have degrees from universities in developed countries. What is lacking is more qualified professional accountants and financial managers, because the market rates for such people are well above civil servant salary rates. There is a need for more professional staff with backgrounds in sociology, information technology, public relations, and environmental studies. When it comes to professional staff preferences, development (with its associated perks from development agencies) is much more attractive than O&M functions. Indeed, at the field level, O&M staff are often inadequately trained for their jobs. Training is given more to professional staff than to field workers. As a consequence, the quality of repairs and maintenance is not great.

Number of Staff

Many water utilities are heavily overstaffed, mostly as a consequence of the involvement of elected officials and nepotism. In 1996, for example, the utilities of Delhi, Dhaka, and Faisalabad (Pakistan) had 21.4, 18.5, and 25 staff per 1,000 connections respectively, whereas Singapore, Seoul, and Hong Kong had 2.0, 2.3, and 2.8 staff per 1,000 connections. Overstaffing lowers staff morale, because some staff do much more work than others. Output or productivity is low. Many professional staff also moonlight as freelance consultants, to augment their income. Unions tend to be strong and active when it comes to staff being laid off (regardless of the reason, even wrongdoing).

Incentives to Perform

There are examples of bonuses given to water utility staff, but this often has more to do with the tariff level and financial performance of a utility than the merit and performance of its staff. In general, there is little incentive with civil servant bureaucracy and civil servant salaries for staff to extend themselves. Promotion, after all, is usually based on seniority, not merit. NRW reduction is often seen as a necessary evil that provides justification for employment. It is not seen as

a challenge associated with bonuses for meeting goals. Incentives relate also to accountability. If there is no accountability for performance, there can be no incentives. In fact, staff incentives often relate to illegal connections, meter reading manipulation, and valve operation for intermittent supply, all of which are associated with staff receiving bribes from the public.

Measurement of Performance

Some attempt is being made nowadays by water utilities in developing countries to measure indicators of performance, such as NRW, collection efficiency, operating ratio, etc. If, however, managers are not inspired to act on the information collected, staff soon become less enthusiastic about collecting data. Today we have computerization and the ability to carry out in-depth analysis, which can then lead to action, but these tools are not being adequately employed.

Delegation and Micromanagement

A consequence of the lack of autonomy extended to water utility management is the lack of delegation extended down the line by management to staff. It is not an uncommon sight in South Asia to see the head of a water utility seated at his desk with as many as six telephones at his side. He must answer all questions, even if these pertain to matters that are trivial and should be answered by a division manager. In other words, true management is rare. Good examples of utility management can be found in Bangkok, Malé, Phnom Penh, and Singapore (Malé and Phnom Penh may be further reviewed in the case studies in Appendix 2).

Billing and Collection

Billing and collection may be improved in many places by making it very easy to pay bills. One way to do this is to have many local outlets where customers can pay bills without having to queue for a long time. In addition, utility fees could be paid daily, weekly, biweekly, monthly, bimonthly, or quarterly, depending on each customer's earning cycle. Another option, which is used in Bangkok and elsewhere, is to encourage consumers to read their own meters and pay on that basis each month. From time to time, those readings must be checked by utility employees.

Financial Management

Annual audited reports of water utilities have a tendency to surface for public consumption about 3 years after the year of reporting. They are then useless as management tools and of little interest to the public. The annual report of the Metropolitan Waterworks Authority in Bangkok, however, is always in public hands within 6 months of each fiscal year's end. Internal audit offices are often ineffective and inadequate, and external audits, conducted under the auspices of an auditor general's office, tend to concentrate on minor offences and ignore the big picture. It is indeed an unfortunate state of affairs when this situation can apply to $100 million per year businesses being controlled by only one or two qualified accountants. Much more attention needs to be given to utility and project accounting. More transparency is required.

Water Management

There are often major deficiencies in measuring water production and consumption, but estimates of NRW indicate figures of 30–60% for most Asian cities. As for the breakdown of NRW into its component parts and committed strategies to deal with each of them, few utilities embark on such tasks.

If you can't measure...you can't manage

Working Environment and Incentives

Through transparent policies and independent regulatory bodies, Asia must ensure autonomous water utilities. Then it must obtain free market remuneration for water utility staff, based on accountable, incentive-based, and merit-based performance. While Asian water utilities have many very well-educated professional staff who have been trained in developed countries, their potential has not been realized. The Singapore Public Utilities Board, perhaps the best water utility in the world, gives us a very strong example of how to do it right. It offers strong incentives for staff to perform. Managers are paid more than $150,000 annually. In Bangkok, Metropolitan Waterworks Authority managers are also paid relatively high salaries, which are at least commensurate with those in the private sector. Only when utilities have this type of enabling environment can they go to work on organization development. An example of a successful reform program is shown in Box 8.1.

Box 8.1 Indonesian Water Utility Rehabilitation

In 1998 many of Indonesia's 300 municipal water enterprises were, due to rocketing costs of electricity and chemicals, putting untreated water through mains, which could have led to large epidemics. The situation was so bad that some enterprises were planning complete shutdowns that would have devastated the urban poor. The Water Efficiency Team (WET) project quickly created a database and used the information gathered to diagnose the major problems of these enterprises. WET helped small entities create recovery plans and understand the Government's stance. Seventy engineer trainers were trained under the project. These trainers learned about re-rating water treatment plants to increase efficiency, which saved money by eliminating the need for new construction. In one plant, capacity increased from 100 liters per second to 170 liters per second. The savings totaled about $240,000 (roughly four times the cost of the WET project). WET's emphasis on transparency and self-help, instead of capital infusion, has helped the Government shift its water sector development priorities toward full commercialization. The project demonstrated that even small enterprises can become self-funding if proper systems and procedures are implemented. (Woodcock, 2001)

B. Organization Development[9]

New organizations are formed and old ones are energized through organization development. Resources are directed to high priorities. Goals are established and translated into jobs that people do every day. Efforts are balanced with available resources. People are rewarded for achievement and initiative. In short, organization development embodies the principles of modern management.

Leadership skills and management skills are important, and they are not the same. In managing change, leadership skills will be more important. Once the organization is up and running, management skills will become more important. Leadership must emanate from the governing body, move to the management group, and filter down into the ranks of the organization. Leaders inspire others and set a good example. The Director of the Phnom Penh Water Supply Authority is an example of such a leader (see case study in Appendix 2). A governing body leads through policy, planning and budgeting, delegation, oversight, and advocacy. An organization must have a clear mission and objectives. It must have a strategy to implement policies. It must start off by analyzing what function it needs to be able to perform and determine what organizational structure is best for that purpose. Then job titles and job descriptions need to be defined. Clearly, the number of employees necessary to do the job will be a key consideration. The management culture needs to include planning, delegation, and management by results. Employee development must be a cornerstone of the organization. This will include professional human resources management, compensation and rewards, training, and creating a pleasant work environment.

Information is needed for management (see Box 8.2 for Bill Gates' views). For a water utility, managers should be provided with data relating to revenue and expenditures, accounts receivable, water production, water consumption, new connections, water availability, number of staff, etc. There is a need to computerize information about every dwelling in a utility's area of responsibility, and whether each dwelling has an official connection. Managers need to know how many people (adults and children) live in the service area, what alternative sources of water

[9] Special acknowledgement to Barnes, 2003.

Box 8.2 Business @ the Speed of Thought

(This advice is just as applicable to selling water as any other product.)

- *No one is using information well.*
- *Turn passive data into active information.*
- *You are competing.*
- *Customer service will become the primary value-added function in every business.*
- *Be proactive, not reactive.*
- *It is all about public awareness and transparency.*
- *Knowledge is power.*
- *Companies should focus on their core competence and outsource everything else.*
- *Web lifestyle eases geographic constraints. Knowledge workers can live where they like.*
- *Competition in hiring the best people will increase in the years ahead.*
- *Historical consumer data are a valuable asset.*
- *The speed with which you respond to bad news is critical. Focus on the consumer's definition of good service.*
- *Collect detailed data on consumers and nonconsumers.*
- *Analysis should lead to action.*
- *Use data mining (where computers look for patterns).* (Gates, 1999)

they use, their average monthly consumption from the utility, whether that consumption is metered, how long ago meters were installed, the state of internal plumbing, etc. For this information to be fed to computers, on-the-ground caretakers are needed for zones of up to 500 connections. These caretakers should also maintain detailed information on those not served with a piped supply, including whether or not those without service have applied for connections, what sources they currently use, what their constraints are, when they were told they would be connected, etc. Interface between staff and consumers is important, especially in the field. Performance indicators need to be developed. Utilities can benchmark their performance against other utilities regionally or nationally and also against their past performance. Information technology needs to be introduced to make reporting systems easy, transparent, and able to incorporate feedback. Utilities need strong public awareness and customer service units. Interactive Web sites are nowadays expected. Public and employee safety issues should be addressed.

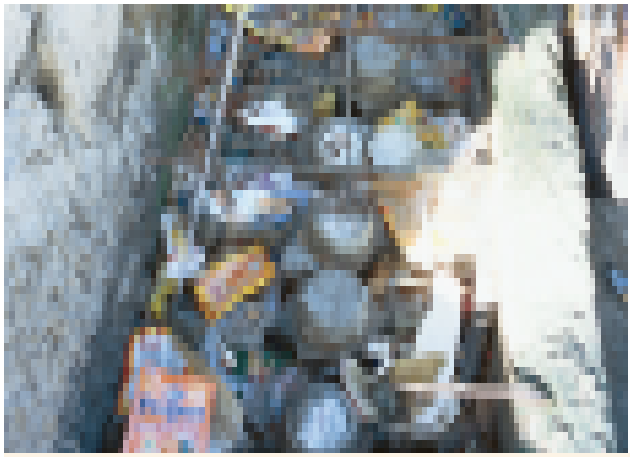
A culture of continuous improvement needs to be inculcated. The Singapore Public Utilities Board, for example, was not satisfied when it had NRW down to 7%. It continued to work on reducing this figure, and it is now less than 5%. Bearing in mind the current culture, a special effort will be required to build up prestige in O&M. Much more effort will be needed in training the hands-on people in organizations and helping them take pride in their performance. Utilities should be encouraged to network informally among themselves. Country, regional, and global water partnerships are flourishing. It would be healthy to take advantage of these to improve utility performance by implementing integrated water resources management, which is the theme of these partnerships. Utility staff can learn a great deal straight from the Internet. For example, reading the articles on a Web site such as *www.watermagazine.com* can be very enlightening. Yes, there is a need for governments to create enabling environments, but there is also a need for professionals to behave responsibly. This will be done when they promote learning, share information with government agencies, and inculcate professional ethics.

There is probably nothing so guaranteed to lift the morale of water utility staff as tariffs being high enough to ensure that utilities are financially viable. There are also few excuses for not having excellent information, on which management decisions can be based. Computerization has made all of this possible.

C. Metering

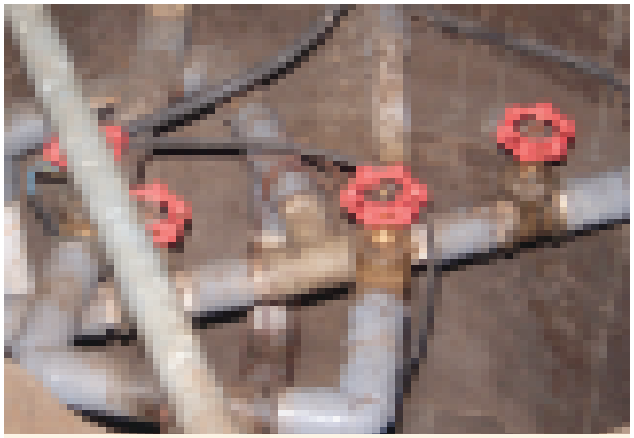
It has been said that if you cannot measure, you cannot manage. Moreover, if a job is worth doing, it is worth doing well. These statements are true in water and metering. So, wherever there is 24-hour supply, there should be 100% metering, and all meters should be in working condition. Where intermittent water supply exists, a plan to gradually increase 24-hour coverage should be set in motion. Likewise, all groundwater extraction by industry should be metered and charged if that resource is to be controlled and maintained.

Are these read?



Water meters—how many are working?

Meter all or nothing



A need for construction standards

Meters must be of good quality and should be replaced regularly (about every 5 years). The large users of water should be accurately metered, and the meters used might need to be replaced every 2 or 3 years. To some extent, it must be acknowledged that when tariffs are very low (as they are in most of South Asia) metering is somewhat irrelevant, as the cost of maintaining and reading meters may be more than the water bill itself.

When it comes down to estimating consumption where metering is absent, such as on standpipes, it is quite simple to meter a number of standpipes for a short time and extrapolate the results for others. The same holds true for household connections that are not metered. Pump hours run compared with the pump performance curve is often used to estimate production volume. This, however, is not a long-term recommendation. When it comes to production, there are almost no excuses for not having good metering. The accuracy of any assessment of NRW is important, especially when the result is to be used for monitoring improvement in performance.

It is estimated that two thirds of household water consumption and almost 100% of industrial consumption in Organisation for Economic Co-operation and Development member countries are now metered, and meter penetration continues to expand in most other countries (OECD, 1999). Certainly, in countries like Australia and New Zealand, metering consumer connections has recently been deemed necessary in reducing water use.

Management (Problems) in a Nutshell

- There is a lack of autonomy of utilities.
- Revenue (tariffs) is affected by political considerations.
- Utilities are overstaffed.
- Management skills are lacking.
- Accountability is needed (annual reports + 3 years).
- Civil servant rules and civil servant salaries are ineffective.
- Public relations are poor, and there is a lack of awareness among consumers.
- O&M functions are treated as "project" capital works.
- High rates of NRW, intermittent supply, and standpipe service need to be addressed.
- Construction standards are poor.

Management (Solutions) in a Nutshell

- Policies must provide autonomy and revenue (tariffs).
- There should be accountability through regulatory bodies and annual reports.
- Organization development is necessary.
- If you cannot measure, you cannot manage.
- Incentives must be linked to performance.
- Use open market salaries for professionals.
- Give O&M prestige.
- Interface between staff and consumers should be given importance in the field.

Chapter 9

Non-Revenue Water

The terms unaccounted for water (UFW) and non-revenue water (NRW) have been widely used in the past. The use of these terms, however, has been confusing. The International Water Association (IWA) recommends the use of NRW (IWA, 2000). IWA "Best Practice" Water Balance and Terminology for NRW and its components is explained in Box 9.1 and Box 9.2. In these, UFW equates to Water Losses. Accordingly, throughout this book, reference is made wherever possible to NRW, not UFW.

Spaghetti network repairs and leaks

A. Components of Non-Revenue Water

Unbilled Authorized Consumption can include water used for fire fighting or free water distributed at standpipes or provided to religious institutions.

Apparent Losses comprise unauthorized consumption and metering inaccuracies. It is estimated that in Asian cities 50–65% of NRW is due to apparent

Box 9.1 International Water Association Water Balance

The following are definitions of principal components of IWA water balance.

- ***System Input Volume*** *is the annual volume put into the part of a water supply system that relates to water balance calculation.*
- ***Authorized Consumption*** *is the annual volume of metered and/or non-metered water taken by registered customers, water suppliers, and others who are implicitly or explicitly authorized to do so for residential, commercial, and industrial purposes. It includes water that is exported.*
- ***Water Losses*** *can be identified by calculating the difference between system input volume and authorized consumption. They consist of apparent losses and real losses.*
- ***Apparent Losses*** *result from unauthorized consumption and all types of inaccuracies associated with metering.*
- ***Real Losses*** *result from losses at mains, service reservoirs, and service connections (up to the point of customer metering). The annual volume lost through all types of leaks, bursts, and overflows depends on their individual frequencies, flow rates, and duration.*
- ***Non-Revenue Water*** *is the difference between system input volume and billed authorized consumption, and it consists of the following:*
  - *Unbilled Authorized Consumption (usually a minor component of water balance),*
  - *Apparent Losses, and*
  - *Real Losses.*

Box 9.2 "IWA Best Practice" Water Balance and Terminology				
System Input Volume	Authorized Consumption	Billed Authorized Consumption	Billed Metered Consumption (including water exported)	Revenue Water
			Billed Non-metered Consumption	
		Unbilled Authorized Consumption	Unbilled Metered Consumption	Non-Revenue Water
			Unbilled Non-metered Consumption	
	Water Losses	Apparent Losses	Unauthorized Consumption	
			Metering Inaccuracies	
		Real Losses	Leakage on Transmission and/or Distribution Mains	
			Leakage and Overflows at Utility's Storage Tanks	
			Leakage on Service Connections up to Customers' Meters	

losses. Unauthorized consumption means illegal use, and this could be (i) sole illegal connections, (ii) illegal connections to properties that also have legal connections,[10] or (iii) illegal connections for the purpose of selling water. Metering inaccuracies can include malfunctioning water meters, estimated water consumption (when meters are not working), and misreading water meters.

Real Losses comprise leakage from transmission or distribution mains, leakage and overflow from utility storage and balance tanks, and leakage in reticulation systems (especially service connections) up to the point of metering. Experience has shown that most leakage results from service connections, and to a large extent this is due to poor construction.

B. Consequences

The issues related to high NRW rates are (i) consumers paying for inefficiencies of water utilities, (ii) a precious and scarce resource being wasted, and (iii) unnecessary investments in production. Another important consideration is that high NRW rates equate to poor governance, which results in low utility staff morale. From the consumers' point of view, those who have illegal connections or have estimated actual consumption below real consumption are cheating those who pay for water. Poor governance is at the root of the problem. See Figure 9.1 for an illustration of the extent of NRW in Asian cities.

Illegal connection in Nepal

[10] I once watched many residents on one street (in Manila) divert water for a short time from their illegal to their legal connections.

Linkage of Non-Revenue Water to Low Service Coverage

Where there is low coverage with piped water there is also likely to be high NRW. It is possible that those with vested interests condone the illegal sale of utility water to SSWPs at high prices (low volumes). The total revenue obtained from this source may be of the same order of magnitude as the official sale of water by utilities. Someone should ask where the revenue generated through illegal sales to SSWPs goes, because the answer to that question might explain why the status quo (the urban poor not receiving service) has remained for so long.

Service connection leakage

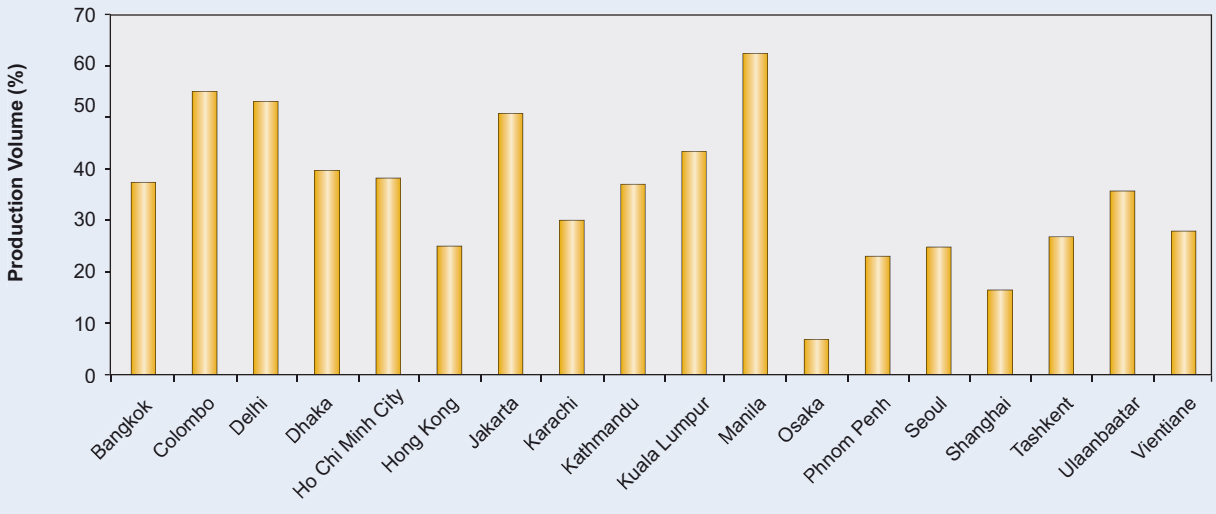
C. Reducing Non-Revenue Water

The benefits of reducing NRW include:

- need for less water to be produced, treated, and pumped, translating into the postponement of the expansion of capacity—producing less water also translates immediately into cost savings on O&M, due to savings in energy and treatment costs;
- reduction in apparent losses, which will result in more water being billed and more revenue for utilities—it has also been shown that water metering and adequate rates reduce wasteful consumption, which will likely decrease total consumption;
- adequate understanding of consumption patterns, which will allow utilities to optimize distribution systems;
- better knowledge of real consumption, which will improve demand projections; and
- reduced sewage flows and pollution.

These benefits depend on adequate pricing of water resources and services. Subsidies for water extraction, discharge of wastewater, capital investment, and operation of water supply systems lower the cost of water as perceived by utilities and thus remove an incentive to reduce physical losses. Low

Figure 9.1 Non-Revenue Water in Asian Cities (2001)



water rates for consumers do not encourage utilities to meter their water consumption and detect and deter unauthorized water use. Moreover, low rates fail to provide consumers with an incentive to deal with leaks and wastage beyond their meters.

It is often said that there is no point in reducing NRW below about 20% of production, because the costs outweigh the benefits. An example from Singapore seems to disprove that theory (see Box 9.3).

Mapping

The distribution systems of most Asian cities are very poorly mapped. Only when these are well mapped can the hydraulics be properly calculated and limitations on extensions to the distribution systems be properly controlled. Now, with global imaging tools and computerization, this work can be more easily accomplished and maintained. Good records and public scrutiny (with the help of neighbors) will help eliminate illegal connections.

Control Measures

Programs for controlling NRW should tackle at least the following three main causes of loss: (i) metering inaccuracies, (ii) unauthorized consumption, and (iii) leakage. Methods of controlling leakage include passive control, regular sounding, district metering, waste metering, combined district and waste metering, and pressure control. Selecting the most appropriate method would depend on the level of leakage, the cost of leakage, and the cost-effectiveness of each method.

System leakage

Box 9.3 Case Study Singapore (pop. 2.8 million)—Public Utilities Board

- *NRW was reduced from 10.6% in 1989 to 6% in 1994.*[a]
- *Metering of production and consumption is 100%.*
- *Meter accuracy is very high. Production meters are calibrated every month. Domestic consumer meters are replaced every 7 years and industrial meters every 4 years.*
- *Volume of water used for fire fighting is estimated or measured and fire departments are billed.*
- *Commercial system is highly reliable and controls are in place to prevent tampering.*
- *Billing complaints are dealt with promptly.*
- *High and low consumption patterns are investigated.*
- *Average water rates are close to the incremental cost of water.*
- *The entire distribution system is surveyed for leaks every year.*
- *Water districts can be fully isolated to monitor for leaks. Distribution pipes are cement lined to reduce corrosion and are replaced if the number of breaks exceeds three per kilometer per year.*
- *House connections are made of stainless steel or copper.*
- *Certified plumbers do in-house repairs and installations.* (Yepes, 1995)

[a] NRW was reduced to 5% in 2000.

Points to Remember

- Accountability must be high at all levels.
- Water services must be adequately priced.
- Reducing commercial losses is very important, because it helps improve the revenue stream almost immediately.
- Reliable information on production and consumption is necessary.
- NRW is the result of a combination of factors, not of a single one.
- NRW programs must be institutionalized and not be the result of sporadic exercises associated with the availability of grants or loan financing.
- NRW cannot be addressed in isolation. An enabling environment must be created. This means that (i) utilities must have autonomy in terms of management, and they need competent and motivated employees; (ii) tariffs must be adequate, which will result in cost and benefit incentives to reduce NRW; and (iii) good governance must be practiced.

The proportion of all accounts that show an estimated billing amount or a minimum figure is a good indication of the whole discipline of accountability. These days, with computerized accounts, there are few excuses for not identifying and correcting these inadequacies. Amnesties to ferret out illegal connections, public advertising, and convictions in courts of law for those discovered with illegal connections (who did not come forward when amnesty was offered) may be implemented.

It might surprise some to know that in cities of developing countries, under projects assisted by development agencies, the first effort to reduce NRW often involves the purchase of leak detection equipment. This is the developed country approach, and in most cases it has little relevance when solving developing country problems. It is far more realistic to go out and repair all visible leaks (of which there are usually plenty) and carefully scrutinize and accurately meter large water consumers. A caretaker approach to O&M and reducing NRW is shown in Box 9.4.

Pipe Replacement

In Singapore and Tokyo galvanized iron and polyvinyl chloride (PVC) service connections have been replaced with stainless steel service connections, and NRW levels in these cities (4% and 8% respectively) demonstrate the success of this approach. Singapore, Tokyo, and other cities also have programs for replacing asbestos cement pipes in distribution systems, as pipe breaks have increased over time.

Benchmarking

Benchmarking NRW is useful, as it enables utilities to compare themselves with others. Moreover, benchmarking helps utilities compare their performance during one period with their performance during another. The leakage component can be measured in other ways—as water lost per kilometer of distribution and as water lost per connection—but this assumes that NRW does not have a high component of apparent losses.

Summary Remarks

Reducing NRW is not technically difficult. It is, however, challenging in a governance sense. Illegal connections can only be eliminated when utilities have autonomy and discipline, and when they are accountable to regulators and the public. In addition, utility employees need genuine incentives to do their jobs and replace the incentives they have made for themselves through illegal connections, false meter reading, etc. (see Phnom Penh case study in Appendix 2). The status quo needs to be overturned. Comprehensive audits of water and service levels are needed and links between NRW, low service coverage, and SSWPs need to be explored. When tariffs are much higher, consumers will put pressure on operators to eliminate leaks and chase illegal connections. Good organizational development is needed to take advantage of autonomy and deliver accountability.

Box 9.4 Caretaker Approach to Operation and Maintenance and Reducing NRW

Rationale: Legal and technical approaches to combating NRW have met with limited success. Generally, utility staff will only appear when called out in an emergency or a crisis situation, rather than show a daily presence in a given locality. The proposed caretaker approach would add a social dimension to addressing the problem. It is based on managing water supplies at the lowest practicable level and on maintaining a good utility and consumer interface. It is particularly suitable for those developing countries without shortages of relatively cheap manpower.

Definition: The caretaker approach is essentially one in which the whole of a distribution system is divided into zones, each containing about 500 connections. A caretaker is appointed to be responsible for all water supply activities within a given zone. The concept is not new. In fact, it is employed in Tokyo and is, to some extent, also used effectively by one of the concessionaires in Manila. An SSWP in Manila uses this approach to manage its system by assigning one *aguador* to every 100 connections.

Institutional Framework: A caretaker who lives in the locality is given responsibility for a water distribution zone. The caretaker will report to an O&M supervisor located at a nearby maintenance depot. The caretaker's area of responsibility is small enough that it can be walked in its entirety once per week. This individual will lease an office from a resident in his or her zone of responsibility and have access to a telephone at that point (or will use a mobile phone). The O&M supervisor (an engineer) will be responsible for 10 caretakers and not more than 5,000 connections.

Caretaker Duties: The caretaker is expected to develop a friendly relationship with the people living in the zone of responsibility. He or she will do the following.

- Keep a daily diary of all activities in the zone.
- Be responsible for mapping the distribution system, including all connections.
- Be responsible for accurately metering all consumer connections and arranging for meter replacement when necessary.
- Analyze billing records and collections monthly, investigate high and low consumption and tardy payments, and report total consumption each month.
- Report leaks to be repaired and record the dates the repairs were effected.
- Report maintenance or new work requested and completed.
- Record and follow up on consumer complaints.
- Inspect plumbing in all households and assist with repairs, where feasible.
- Disseminate to consumers notices of interruption of supply for maintenance purposes and information concerning water tariffs, water consumption and conservation, demand management, hygiene education, and utility performance.
- Report alternative sources of water used by both utility customers and noncustomers.
- Report hours of service and pressure to the zone (day and night).
- Report numbers of persons in each household in the zone each year.
- Read district flow meters and pressure gauges daily.
- Inspect the entire zone on foot weekly.

O&M Supervisor Duties: The O&M supervisor is expected to support the caretaker in the following manner.

- Provide timely support and quality control on maintenance and repairs.
- Visit and talk with each caretaker daily.
- Review caretaker diaries weekly and provide comments and guidance.
- Inspect with each caretaker his or her zone monthly.

next page

Box 9.4 continued

- Encourage competition and incentives among caretakers for good performance.
- Comment on all caretaker reports before submitting them to the head office.

Conclusion: In this age of information technology there are few excuses for not having up-to-date data on every connected and nonconnected household in a given water service area. If this information is appropriately analyzed, it will be relatively easy to trace illegal connections, defective meters, and incorrect meter reading. At the same time, with the ability of caretakers to get to know the people in their zones, and with the timely use of amnesty periods, it should be possible to flush out most illegal connections. By examining individual zones and comparing these with others, it should be possible to identify quickly any problem areas.

Non-Revenue Water (Problems) in a Nutshell

- NRW includes water not billed as a result of leakage, illegal use, inadequate measurement, and free (authorized) use.
- NRW averages 30% of production in Asian cities, but ranges from 4% to 65%.
- High NRW is connected to low piped water coverage.
- There is a need to determine whether physical losses (leakage) are maintained to mask the illegal use and sale of water.
- Illegal sale of water from utilities can generate revenue equal to legal sales.
- Consumers pay for utility inefficiencies.
- A precious and scarce resource is being wasted.
- Unnecessary investments in production are made.

Non-Revenue Water (Solutions) in a Nutshell

- Governance and tariffs must be tackled first.
- Leak detection equipment comes last, not first.
- Repair visible leaks.
- Make utility staff responsible for small zones (caretakers).
- Meter all production and consumption properly.
- Add district metering.
- Provide incentives for utility staff performance.
- Explore links to water vendors.

Chapter 10

Sanitation

Conventional wisdom dictates that water should not be supplied without complementary sanitation. This is a development principle. The reality, as many know, is different, because there has not been enough funding for water supply, let alone sanitation.

Given a choice, the needy urban poor will always opt first for water supply, since it will have a direct economic benefit, whereas sanitation will have more indirect benefits related to health. Because sanitation in Asian cities could well be the subject of a book by itself, the function of this chapter is merely to give some indication of the existing status of sanitation in Asia, emphasize its importance, identify some appropriate technologies, and look at what is needed to break out of the status quo.

Improved environmental sanitation also improves economic benefits. Consider the case of investments for sewage collection in Santiago, Chile. The principal justification for the investments was to reduce the extraordinarily high incidence of typhoid fever in the city, but a secondary justification was the need to maintain access to the markets of industrialized countries for Chile's increasingly important exports of fruits and vegetables. (Briscoe, 1993)

A. Gender Issues

World Bank findings from studies indicate that men and women value sanitation very differently. For women, since they are more personally concerned with these issues and more intimately involved in them with respect to their families, sanitation is often the second highest development priority. For men it may be the eighth development priority. To ensure that water sector activities are gender responsive at policy and institutional levels, ADB will promote the integration of gender concerns in policies, plans, programs, and projects. Incorporating explicit gender equity provisions in the objectives and scope of water sector activities will be encouraged.

B. Analysis

Sewerage costs are in the $300 per capita range, septic tanks cost $100 per capita, and latrines cost $25 per capita. The advantages of sewerage are convenience; low health risk; no nuisance from smells, mosquitoes and flies; no problems with gray water (sullage); and no problems discharging industrial wastewater. The disadvantages are high cost, need for access to a reliable supply of piped water, difficulty of construction in high-density areas, unsuitability for self-help, need for pumping on flat ground, difficulty of maintenance, and concentration of pollution. Blockages and the breakdown of pumping equipment pose problems in sewerage systems, especially for low-income communities. There is now, on environmental as well as economic grounds, a growing appreciation of the fact that large sewerage schemes are not necessarily the best solution for some parts of cities, especially those with predominantly low-income communities (see Box 10.1).

In countries where sewerage service costs have risen significantly, industrial users have increasingly questioned whether the public sewer system represents the most cost-effective means of discharging their sewage. There is evidence of a trend toward more use of self-treatment and effluent reuse options. (Organisation for Economic Co-operation and Development, 1999)

Health risk—water pipe in drain

Box 10.1 Rethinking Sewage in Low-Income and Slum Areas

(This material was prepared specifically for this book by ADB's Alex Jorgensen.)

It is quite common for an international consulting firm to use conventional thinking in scoping and sizing various project facilities, including sewage collection and treatment systems. This often leads to the gross oversizing of these systems for a variety of reasons, which are not always the fault of the consultant. Normally it is the city council that insists on "fully modern" sewerage systems, regardless of actual demand. The officials involved have read or believe that such systems are essential for good sanitation, and these men and women are not amenable to a simpler technical solution, such as on-site septic tanks or even pit latrines in low-income or slum areas.

The basic design criteria for water are 24-hour supply and 120–150 l/c/d consumption. This consumption figure ignores NRW (often more than 50%), low pressure, and intermittent supply. Actual water supply is often between one hour every other day and two hours per day, and at low pressure. The real consumption in many areas is more like 30–40 l/c/d. Therefore, the conventional 80% wastewater generation ratio is false. Actual wastewater generation is closer to 50% of the "real" water supply. A related issue concerns individual house or property connections. Due to the cost of these being loaded onto the users, the connection rate is often low. The cost of connections from the street sewer to the property line should automatically be included in the project cost and be financed under the "loan." While the cost of the connection from the property line to the house would normally be the responsibility of the owner, there may still be a case for this being financed under the project when a low-income household is involved.

In addition to the capital cost aspect, there are serious operational problems. Sewers tend to be designed to minimum slopes to reduce pumping. When the actual flow in these sewers is half of that anticipated, or much less (as is often the case in low-income and poor areas), the scour velocity is not maintained and the sewers clog. Having an incoming wastewater volume half or less of that expected exacerbates problems, as the wastewater is much stronger in terms of solids and organic content. Therefore the minimum scour velocity needed is much higher. Operational process problems, with resulting odors, poor effluent quality, and high O&M costs, occur when sewage treatment plants have gross excess hydraulic capacity and the sewage strength is stronger than anticipated. To make matters worse, the income from water and sewerage tariffs ends up as a fraction of that projected, which leads to an inability to pay for O&M costs and a greatly reduced ability to repay capital costs.

The answer is for loan agencies to insist on a careful review of actual water use and wastewater generation at the planning stage as a condition of the loan and likewise at the detailed design stage. Once this is done, low-density, low-income, and slum areas should be converted to low-cost sanitation—septic tanks where space and groundwater conditions permit, dual pit latrines with squatter plates in slum areas (where there is usually no space), and good people-sensitive public toilets (like in Pune). Coverage of sewers and reticulation pumping stations and treatment systems should be reduced accordingly.

Nonconventional sewerage—using smaller pipes, laying pipes on a flatter gradient and at a shallower depth, laying pipes inside plots, reducing the number of manholes, and providing interceptor tanks for the settlement of solids—is a potential solution for low-income communities. Recently, in cities like Yogyakarta (Indonesia), small and affordable sewerage schemes have been seen. These serve 200–500 plots with local treatment facilities underground or landscaped. An NGO in this city says government needs to agree to adopt community-based sanitation. The entry point is giving unauthorized settlers a semilegal status.

Septic tanks are constructed in many areas in Asian cities. Unfortunately, they are often not constructed properly (as in the Maldives, where the effluent outlet feeds almost directly into the water table) or discharge effluent directly into storm-water drains. Furthermore, in areas where there are many septic tanks, desludging and treatment and disposal of sludge are often totally

inadequate. As with sewerage systems, if the system is designed to operate a certain way, it should be operated in that way.

There are many different types of on-site latrines used in Asian cities. These include pit, twin pit, pour flush, and ventilated improved pit varieties. "Overhung" latrines (where excretion is direct to a water body) and bucket latrines (where the excreta is dumped outside the community) are also seen. The type of latrine will depend on local conditions, especially the level of groundwater.

C. "Sanitation Connection"

The selected information that follows was sourced from the "Sanitation Connection" Web site. It is offered here as a guide to addressing sanitation issues in developing countries.

The World Health Organization (WHO), United Nations Environment Programme (UNEP), Water and Sanitation Program (WSP), Water Supply and Sanitation Collaborative Council (WSSCC), and International Water Association (IWA) form an international partnership known as the "Sanitation Connection" to offer a comprehensive Internet resource to environmental sanitation practitioners.

Health risks

Policies and Strategies

- *Provide increasing emphasis on demand responsive approaches where the services provided are closely linked to what consumers want and are willing to pay for.*
- *Minimize the quantity of waste: for example, improve water demand management to reduce the quantity of wastewater generated at source and reduce transfer of wastes to the wider environment through reuse and recycling.*
- *Promote solutions that are, as far as is possible, locally based at the household or neighborhood levels, rather than depending upon "downstream" transfer of wastes.*
- *Develop institutional arrangements, mechanisms, and incentives that stress the participation of users and encourage the involvement of both the formal and the informal private sectors.*
- *Develop procedures for economic and financial analyses and planning of investments that include the consequences of suboptimal development: for example, downstream environmental damage or failing to make the best use of local resources.*
- *Develop mechanisms for cost recovery that provide appropriate incentives to achieve stated policy objectives: for example, with regard to subsidy and financial performance.*

Sanitation is needed, too

Health and Society

The starting point is the household, as people are most likely to be at risk from contamination in the place where they spend most of their time. Health benefits accrue to families who have latrines, even if their neighbours do not; additional benefits then accrue as coverage extends to the whole neighbourhood. Gender equality needs to be promoted through recognizing that women are key providers of health and hygiene services to the family. This household-centered approach rather reverses the way in which planners and engineers view the situation; their starting point tends to be with centralized treatment and primary networks, rather than households. It is important to note

Desludging to the drain

that where wastewater treatment is inadequate, the hazard is moved around rather than eliminated, thereby emphasizing impacts on coastal areas.

Adopting a household-centered approach provides the opportunity to find out what householders think about the sanitation they already have and to explore what they actually want, rather than have other people decide for them. When people are ignored and the local context is not taken into account, sanitation schemes will fail. It is important to build awareness and create the environment to make informed choices. Social marketing is likely to be a key means of stimulating effective demand. This has to be followed up with supporting and facilitating measures to respond to the generated demand: for example, through better access to finance.

Inadequate sanitation impacts on children. Even where facilities are available, there are problems of acceptability and sharing of latrines and of the willingness of children to use them. There is a need for special attention to children's sanitation (including health and hygiene education) both in the home and at school. As well as being essential for a healthy environment at school, there are important opportunities for outreach into households and communities through educating school children.

Environment

- *It is important not to lose sight of the fact that the first environmental priority for most families is a clean household that is an attractive place to live. Next comes the local neighbourhood environment around their house and on their street. Only after these are all satisfied is there likely to be much concern with the area beyond, such as the city or rural environment as a whole.*
- *An important component of sanitation programmes is therefore increasing user awareness of problems of environmental pollution and of local means that can be adopted to minimize adverse impacts of activities.*
- *Wider problems of regional and national water scarcity and consequent environmental degradation have focused attention on the quantity of water used by different sanitation systems, both sewered and unsewered. In addition to moves towards improved reuse and recycling of wastewater, this is leading to calls for sanitation systems that use far less water than is presently the norm. There are a number of on-plot latrine systems that do not require water in order to function, and interest in this area has gained momentum.*

D. Community-Oriented Sanitation in Pune[11]

This now well-known example of urban community sanitation development is presented because it is a success story and as a result is replicated in many parts of South Asia.

The Pune Municipal Corporation (PMC) has been constructing community toilet blocks in slums for more than 30 years. However, the number of blocks built was small and far below the demand for toilets. Moreover, costs were high because of expensive designs and the involvement of contractors. Finally, in the absence of community involvement during project preparation and implementation, existing toilet blocks were abused and became dilapidated, and municipal conservancy staff could not maintain them. As a result, people had to suffer the indignity of having to defecate in the open, and the incidence of diseases like diarrhea was higher in slum areas. The surrounding environment was polluted, leading to the spread of other diseases.

For the first time, in 1999, the Municipal Commissioner wanted to tackle the issues effectively. First, he took up the program at a citywide scale and managed to reach 500,000 people out of a slum population of 600,000. Second, he invited bids only from NGOs so that community participation in construction, design, and maintenance would be ensured. The final partners in the program included the local authority, PMC, Society for the Promotion of Area Resource Center (the

[11] Based on ADB's Impact Evaluation Study on Water Supply and Sanitation Projects in Selected Developing Member Countries (2002), presentations made to ADB in Manila, and numerous Internet links to this case study.

lead NGO), and seven other NGOs. Third, he brought down costs significantly by laying down the condition that the eight NGOs chosen could not bid higher than the estimated cost. The total project cost was $4.2 million, equivalent to about $25 per family. Fourth, he personally reviewed in weekly meetings the implementation of the program of building about 3,500 toilet seats within 2 years, which helped energize all PMC staff and also remove obstacles.

The role of PMC, which has taken the initiative and provided the basic framework for implementing the scheme, is worth recording. What stands out in the program is the willingness on the part of PMC to involve the beneficiaries through NGOs and let them make their own decisions in matters related to the planning, design, and maintenance of the toilets. In limiting its role to providing finances, PMC may have been the first such corporation in India to adapt itself to a new role, that of the state as a facilitator of development, instead of relying on the straitjacket approach of centralized planning. Having made a tangible impact on the urban poor in Pune, the program has all the characteristics of good practice in terms of partnerships, sustainability, replicability, scalability, and empowerment of beneficiaries.

An independent survey by the Human Settlements Management Institute (India) covered eight case study toilets—each toilet block had 30–40 seats serving about 125 adults and children—operated by caretakers providing 24-hour service. The survey has provided an insight into how a community-based approach to the problem of sanitation along with participatory planning and execution can work wonders in a lifeless system. The survey concludes that the Pune program has demonstrated an innovative solution to tackling the seemingly intractable problem of public health and sanitation. The expeditious implementation of the project and the maintenance of the toilet blocks by the community with the guidance of NGOs are the highlights of this achievement. There were no time and cost overruns in the project, and it provided a citywide solution to the sanitation problem. It has also confirmed that people are willing to pay user charges at the rate of $0.50 per month per family for sanitation and that these services would not be a burden on the government anymore. The survey records that the program has opened a possibility for a paradigm shift in sanitation infrastructure development.

This experiment in Pune has attracted many visitors from other Indian cities, governments in other countries, and international agencies. The Pune experiment led to the acceptance of this model in Mumbai on a large scale, as well as in other cities. The Government of India has based its new program for universal sanitation in India on the principles of the Pune program, confirming the replication of this approach.

E. Some Solutions

Worldwide experience shows that sanitation solutions must come from joint efforts of governments and communities. The community must understand the problem and be willing to act. It helps to have a champion of the cause within the community, and members of the community must have a sense of ownership of the project. But no community is an island. Households should pay for on-site facilities, residents of a block for collection, and residents of a neighborhood for treatment and disposal.

It increasingly appears that it does not make sense to mix feces and urine with water to transport and treat these. Eco-sanitation is the process of safely sanitizing and reusing human feces and urine while minimizing water use. Eco-sanitation largely comprises desiccating and composting toilets. These toilets contain and destroy the pathogens, convert the feces into a safe soil improver, and use the nutrients in the urine to grow useful biomass. This approach is being tried in many countries, including Sri Lanka (through an ADB-funded project), with some success. There are cities in the PRC where up to 200,000 households employ eco-sanitation. This process is not a second-rate technology for the rural poor. It is equally, if not more, applicable to periurban and urban habitation at all income levels.

A variation of roof zone technology, the INDION reed bed system, treats and recycles sullage and sewage. Combining physiochemical and biological processes into a single operation, the reed bed forms a complete treatment unit that also reduces energy use and the load on the central sewer system. It can easily be implemented at housing complexes, holiday resorts, schools, hotels, and military camps. It consists of a treatment tank that is filled with proprietary reed bed support and filtering material and planted with wetland plants. Wastewater flows through the medium and around the roots of acclimatized plants and gets treated for organic and suspended impurities by the combined action of plants, microorganisms, and fungi. It can then be disinfected for toilet flushing, gardening and irrigation, or to recharge groundwater. (IEI News, 2000)

Development agencies and governments should funnel development financing away from large urban water supplies (consumers can pay) and into urban

sanitation and rural water supply. The real issue is hygiene education and awareness. Efforts must start with all schools. For pupils to understand this subject and relate to it, they must see good water supplies and sanitation facilities in each and every school throughout a given country. Efforts must ensure that there are good and adequate public sanitation facilities in every town in a given country. The Sulabh (private financed) or Pune (public financed) public pay toilets in India are good examples that can be followed elsewhere. Efforts must address environmental sanitation issues affecting the urban poor residing in unauthorized settlements.

How can this agenda begin to be addressed? The foundation must start with transparent government policies on integrated water resources management. These should include specific policy statements on sanitation. Then independent regulatory bodies (joint water supply and sanitation regulatory bodies) are needed, so that civil society can be assured governments will indeed implement those policies. Development agencies need to partner with one another, and with governments and NGOs, in pursuing the sanitation development agenda. When it comes to "privatization" of services in urban areas, care should be taken to ensure that water supply and sewerage remain bundled. Development agencies can highlight the needs and issues with regional studies and capacity-building efforts. Last, but not by any means least, culture, traditions, and religion must start to be used to inspire people to action on sanitation.

It is important to realize that there is no universal solution. Different ethnic and cultural conditions will affect every approach. Some factors, however, will be involved regardless of other considerations. These factors include understanding that social, cultural, and technical aspects need to be addressed; understanding that small is OK, which means that stakeholders must develop their own approaches; realizing that capacity improvement is needed when considering regional autonomy; realizing that government agreement is needed when adopting community-based sanitation; understanding the need for credit facility, education, and awareness; and knowing that the entry point is giving informal settlers some type of legal status. (Sudjarwo, 2001)

Sanitation (Problems) in a Nutshell

- Funding for sanitation development is a constraint.
- Willingness to pay for sanitation is relatively low.
- Awareness of the need for sanitation is minimal.
- The poor are often in the most vulnerable environments.
- There is a gender issue here—women place a much higher priority on sanitation than men.
- Septic tank design, construction, and maintenance are poor.
- Poor sanitation can lead to cholera or typhoid epidemics.
- The situation is compounded by inadequate solid waste disposal.

Sanitation (Solutions) in a Nutshell

- There is a need for explicit government policies.
- In densely developed areas, conventional centralized sewerage systems are a must.
- In less densely developed areas, it may be possible to construct decentralized small sewerage systems with local, appropriately landscaped, sewage treatment facilities.
- On-site sanitation is OK, if the plot size and ground permeability are adequate and the groundwater table is low.
- Eco-sanitation (not mixing feces with water) has promise.
- Reed bed technology for treatment of wastewater is OK.
- Target the urban poor as a matter of priority.
- Divert development agency and government funding from major urban water supply projects to urban sanitation projects.
- Solutions must be part of integrated water resources management.
- Opt for community sanitation facilities, like those in Pune.
- Get the facilities and education in the schools first.

Chapter 11

Tariffs, Subsidies, and Development Funding

This is a very important chapter. If there is one specific matter that has most constrained the development and management of water supplies in developing countries, it is the issue of tariffs. Some governments have found all sorts of reasons not to approve tariff increases, even though these increases would be strictly in accordance with stated policies and legislation. The consequences have been a low level of development, poor O&M practices, low staff morale, and the facilitation of corruption. This chapter examines tariff levels, tariff structures, affordability, willingness to pay, connection fees, types and levels of subsidies, and the money trail. It describes why there is a need for a paradigm shift in tariff levels and the good things that can happen when this takes place. Last, the most viable source of development funding is identified. In line with this, ADB's water policy suggests that the economic value of water should be recognized and reflected in national policies and strategies by 2005 and mechanisms established by 2015 to facilitate full cost pricing for water services where guarantees for the poor exist.

A. Tariffs

Policy Considerations

Governments of developing countries prepare policy statements, including those on cost recovery and tariffs. Many of these governments go through this exercise at the request of development agencies. Once loans are approved, however, these statements are sometimes considered irrelevant, which is unfortunate because the public does not get to see them, leaving the door open for elected officials to interpret and adjust policies on an ad hoc basis. When tariff revisions are required, the utilities will put them before the relevant government entities for approval. Often the entities concerned, on the instruction of the highest elected authorities, will defer tariff revisions citing (i) pending elections (presidential, national, provincial, or local authority), (ii) high NRW, or (iii) affordability issues involving the poor. Alternatively, tariff revisions are approved, which are only a fraction of what was sought. This undermines the morale of utility staff, perpetuates unnecessary government subsidies, and encourages corruption. Above all, this remains an obstacle to the urban poor connecting to piped water and intermittent water supply becoming a 24-hour service.

Official policies often support tariffs covering O&M costs plus the greater of depreciation or debt servicing (interest and capital repayment) and a contribution to new capital investment. O&M costs are not defined, so there is a gray area between O&M and rehabilitation. Also, depreciation is subjectively assessed, which results in it being invariably greatly underestimated. The area for the greatest subsidy, however, pertains to the contribution by central governments to capital investments that can be in the form of grants or soft loans. Quite unnecessarily some large cities, such as Colombo and Kathmandu, continue to enjoy grant financing of their capital investments. Policies also cover such matters as "apparent" cross subsidies, including those from large domestic consumers to the poor, those from industry to domestic users, and those from large cities to small towns. Policy may also address matters such as service coverage, service levels, demand management, and new connection fees. Most important of all, however, there is often no accountability for the implementation of policies. What we commonly see in terms of tariffs in water utilities is a roller-coaster ride taking the utility in and out of financial viability and a large number of water supply schemes that do not meet even their O&M costs from tariffs. In some cases, like that of Colombo, the average domestic tariff is only about one seventh of the average nondomestic tariff and equates to about 1% of household income. In fact, the tariff is so low that for many people transportation costs are higher than the amount of the bill itself, thus making collection a problem. Certainly the potential for resource mobilization from the consumers has never been fully explored.

In 1985, a World Bank evaluation of projects came up with the following conclusions.

- *The Bank's main concern is that the costs be recovered to the maximum extent feasible.*
- *The study concluded that the majority of public utilities failed to meet their revenue covenants, largely due to inadequate action on approval of new tariffs by governments.*

- *Financial covenants have worked better when linked with detailed action plans.*

In 1990, the World Bank reiterated that the economic analyses of projects and pricing policies have been neglected with adverse results in project design and justification. ADB findings at around the same time were similar (see Box 11.1). Despite these findings, which were recorded many years ago, little has been done to change the situation.

Box 11.1 Water Pricing—ADB Postevaluation Results

Tariffs and recovery rates continue to remain critical issues in nearly all developing member countries, notwithstanding the evidence that in most cases people have been willing to pay for water supply above existing tariff levels and that tariffs can be structured to appropriately blend equity and efficiency objectives. The difficulty has been that there is general political resistance to tariff increases and to maintaining tariff levels in real terms. The tariff structure should be sufficient to cover O&M costs, enable debt servicing, and support development plans while at the same time providing low lifeline rates for low consumption and a penalty rate for high consumption. Experience shows that increasing tariffs and improving billing and collection cannot be achieved solely through loan covenants. (ADB, 1994)

Objectives

The transparent policies of governments must state the objectives of tariffs and the rationale of tariff policies. The main goal may be to protect consumers while achieving and maintaining the financial viability of utilities. Other objectives may include serving the urban poor, using lifeline rates for the urban poor, encouraging demand management, developing schemes that ensure self-sufficient O&M, setting average tariffs for industrial use that are not more than twice the average tariffs for domestic use, and making connection fees payable as tariffs. In addition, tariffs should be based on the full price of water, which includes source development, purchase of raw water, treatment, and distribution costs. Allowable costs (those required for providing an efficiently operated water supply service) should be defined. One objective that should be applied for major cities, but has seldom found favor, is that of funding all capital works directly from tariffs. This is not an unreasonable objective when we consider that on average the monthly power bill in an Asian city is some four times the amount of the monthly water bill.[12] It also is not unreasonable if one considers the potential revenue to be gained if 5% of household income is the ceiling applied to all households for water charges in a city (see Figure 11.1). In setting tariffs, the first consideration must be a transparent tariff policy endorsed by the government. This policy should reconcile economic efficiency, social equity, and financial viability. We need tariff goals. What is to be achieved in 5 years? What is to be achieved in 10 years? We need to examine the need for loans that must be paid with interest against the possibilities of tariff increases to cover capital development directly. As can be seen from the example of Greater Colombo (see case study in Appendix 2), it is eminently possible to fund all major urban water supply developments directly from tariffs. We should not forget that all funding, except grants, must also be paid or repaid (loans) out of tariffs.

It is the reluctance of elected officials to increase tariffs that has, more than any other single factor, constrained water supply development in terms of quality of service and coverage. Also, it is their reluctance to consider funding development directly from tariffs that has, as a matter of policy, further constrained development.

Tariff Levels

Tariff levels should be tied to meeting objectives, and two of those objectives should be connecting the urban poor to piped water and providing 24-hour potable piped water in the home to all. The average domestic tariff in Asian water utilities is \$0.05–0.15/m³, but this is a long way short of meeting the stated objectives. Domestic tariff levels are so low in South Asian countries (\$0.01–0.05/m³) that there is no possibility of achieving price elasticity of demand (see Figure 11.2 and Box 11.2). The tariffs in Jakarta and Manila were less in 2001 than in 1995–1996. European urban water supply tariffs are generally \$1.20–1.80/m³. While Singapore's tariff is about \$1/m³, the average domestic tariff in Asia is about \$0.20/m³. This tells us something.

Tariff Structures

Graphs derived from the *Second Water Utilities Data Book—Asian and Pacific Region* (Figure 11.3a and Figure 11.3b) show the types of tariff structures typically used by Asian city utilities. The most obvious conclusion is that the lifeline rate is far too broad, offering extensive subsidies to the rich. Also, demand management through penalty rates for excessive use is ineffective to a large extent. This is the case for two reasons: (i) the tariff rate is too low; and (ii) the penalty rate occurs only after high volumes have been used. Much has been said about the failure of the block tariff[13] system to benefit the poor. Most of the poor, however, are not even connected to distribution systems. And when one connection serves multiple households, as is common among the poor, the tariff is normally applied at the penalty rate for high consumption.

[13] A block tariff is one in which the tariff varies for different consumption ranges. It is normally an ascending tariff (for example, 0–10 m³ at $0.10/m³, 10–20 m³ at $0.20/m³, etc.).

Block Tariffs

Although most developing countries readily accept block tariffs, there has been some opposition to these from economists for the reasons cited above (Whittington, 1992). In this age of computerization, however, it should not be difficult to make allowances for individual families with special conditions and allow their use of water at the lower lifeline rate. There is a need to consider that the range of household income in a city like Manila can be as wide as 1:100 (or, in other words, from $500 per annum to $50,000 per annum). In a city like this, a flat rate tariff may be too high for some and too low for others. The best block tariff system might be a three-block system with the lifeline consumption rate at 0–6 m³ (tariff limited to 5% of household income for the lowest 10th percentile), consumption of 6–20 m³ charged at a rate to recover all financial costs, and consumption of more than 20 m³ charged at a penalty rate equal to about $1/m³ (to conserve water). It has also been noted that rising block tariffs is an ineffective means of targeting subsidies, because the income elasticity of household water demand is low. This is true, but it is obvious that when there is no elasticity of demand the general level of tariffs is too low. Care should be taken with the tariff structure in the width and price of the block.

Tariffs and the Urban Poor

The poor are better served by gaining access to piped water than by continuing global subsidies. Subsidy mechanisms targeted at the poorest households can be designed, and these policies can be energetically publicized. This worked in Chile. We know from Manila that most of the poor who are not connected,

One objective—to eliminate this

Figure 11.3a Tariff Structures in South Asia (*ADB Second Water Utilities Data Book*, 1997)

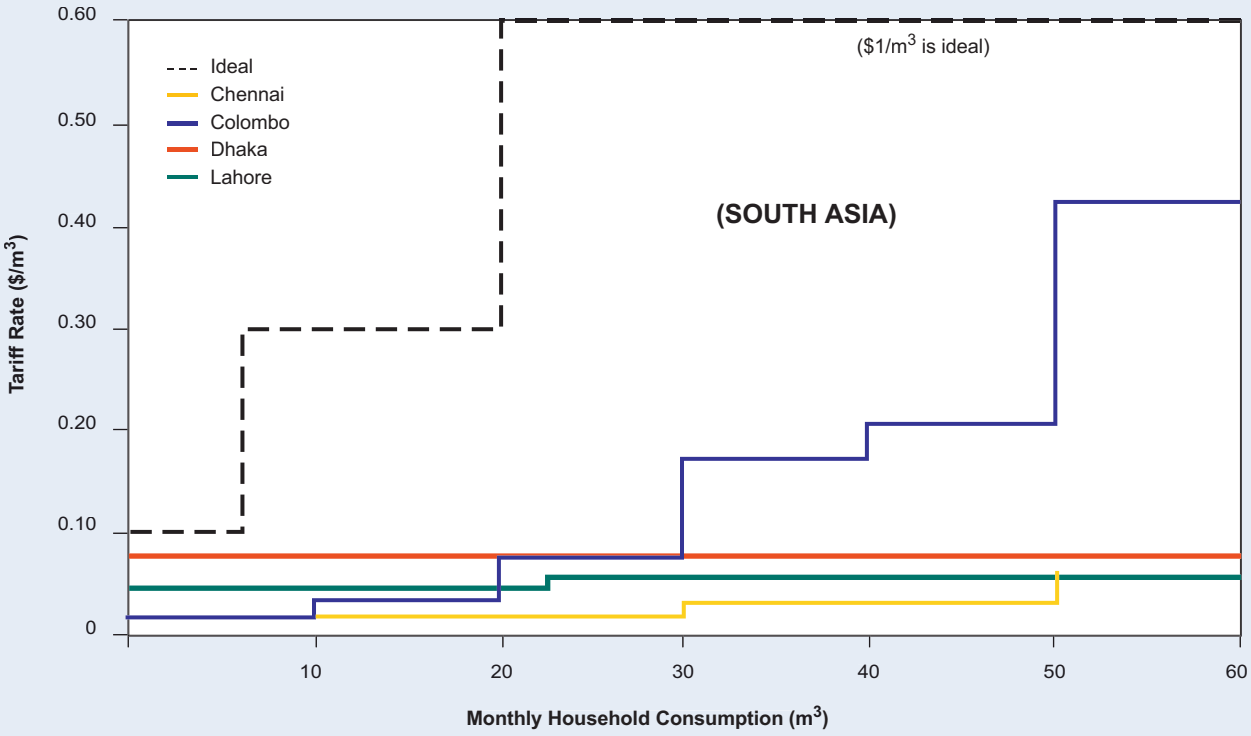

Figure 11.3b Tariff Structures in Southeast Asia (*ADB Second Water Utilities Data Book*, 1997)

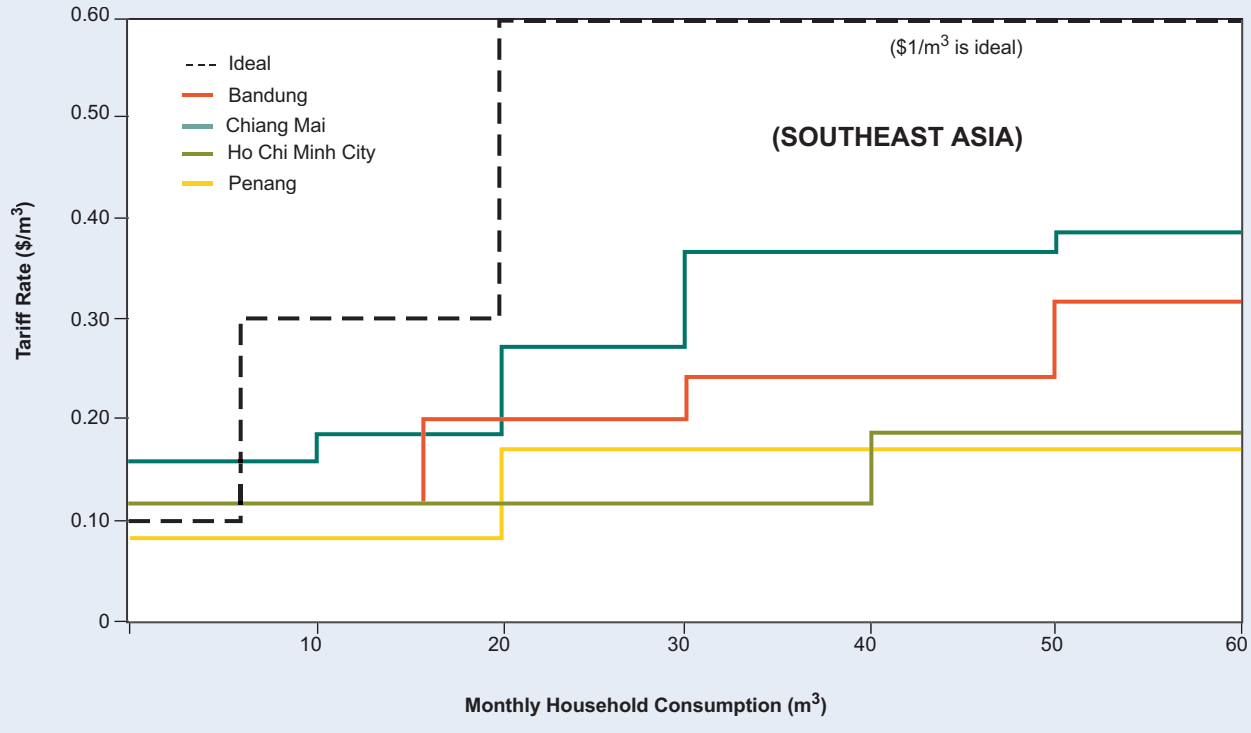


who pay up to 1,000 pesos per month to water vendors, would be very happy to pay 300 pesos per month for piped water. Box 11.3 shows that there is plenty of room for financing from tariffs.

In the case of the intermittent standpipe water supply services that are common in South Asia, the poor can have 24-hour direct access to piped water. This can happen if tariffs are raised equitably throughout society, with a ceiling of 5% of household income as the upper limit of affordability. For those already connected, there are considerable savings in terms of water treatment and pumping and storage costs once water is supplied on a 24-hour basis. As an interim measure, those receiving a 24-hour water supply should pay a much higher tariff than those receiving an intermittent water supply. Going from an intermittent to a 24-hour water supply, however, will only be possible when a water utility has full autonomy and is free from political interference, especially regarding pressure for new connections in a system that is hydraulically inadequate.

Box 11.3 The Hidden Economy

In developing countries, households cope with unreliable water supply by building in-house storage tanks, installing booster pumps, and sinking wells. The size of this informal and often hidden water economy dwarfs that of the visible water economy. In a city in an African country, for example, water vendors collect 10 times the revenue collected by the formal utility. The existence of this hidden economy shows that there is a high demand for service that is not being met by the formal sector. While the informal sector provides some services efficiently, the costs related to other services (such as water vending in the urban periphery) can be excessive. The reason for this is tied to the inability of these providers to transmit water by pipe, instead of by person or vehicle. A profound implication is clear: there is an enormous reservoir of resources that can be drawn on at reduced costs for all. This can happen when the formal sector begins to meet consumer demand and provide services in a responsive and accountable way. The bulk of financing, which is needed for improved service, can and should come from users. But this can only happen when supply and demand side factors have been considered. On the supply side, the focus must be on facilitating the provision of responsive and accountable service at least cost, which can be done through developing institutional arrangements. On the demand side, it is important to concentrate efforts on providing the services that people want and are willing to pay for. (Seregeldin, 1994)

Affordability

Some 20 years ago, a figure of 5% of household income was arbitrarily set as a realistic ceiling on affordability for water supply and sanitation services. It was felt that nearly all people in developing countries could pay this amount. Today, this is still a reasonable benchmark. We can, of course, see examples of those not connected to piped water paying up to 20% of household income for water purchased from vendors. That is not a measure of affordability, but rather a measure of willingness to pay where there are few options. However, we rarely see (with the possible exception of Malé) anyone connected to a piped supply paying over 5% of their household income for water. Why? Because they have the ability to adjust their consumption level to fit their income. Box 11.4 shows why an average domestic tariff of $0.40/m^3 is affordable in any large Asian city.

Profiling Household Income

To get a good appreciation of the theoretical potential revenue in an urban area, it would be very useful for the utility to profile the full range of household

Box 11.4 Tariff Affordability

First, assume there is a population of 1 million, with five persons per household and a 5% of household income ceiling. Next, assume that consumption of 0–10 m^3 is billed at 20 cents/m^3, consumption of 10–20 m^3 is billed at 40 cents/m^3, and consumption of more than 20 m^3 is billed at $1/m^3. Last, assume 200,000 people (40,000 homes) have an annual income of $500 and use 10 m^3 per month, 600,000 people (120,000 homes) have an annual income of $1,000 and use 20 m^3 per month, and 200,000 people (40,000 homes) have an annual income of $5,000 and use 40 m^3 per month. This would result in a revenue total of $22,080,000; a total consumption of 52,800,000 m^3, and an average tariff of 41.8 cents/m^3.

income in that whole urban area. A typical profile would give a series of annual income ranges and the percentage of households in each category, for example $0–500 (60%), $501–1,000 (20%), $1,001–2,000 (10%), $2,001–4,000 (5%), $4,001–8,000 (3%), and greater than $8,000 (2%). This information could then be used to structure tariff charges, assuming a ceiling on affordability of 5% of household income. Of course, we should not forget that willingness to pay will depend on (i) household income, (ii) tariff, and (iii) alternative water supplies.

Willingness to Pay

It has been said that the people in Asian cities have a willingness to pay for water but governments do not have a willingness to charge (United Nations Development Programme 1991b). An example of willingness to pay for piped water comes from Malé ($5/m³). Willingness to pay depends on the tariff, the household income, and the volume consumed. But most of all it depends on the option of the consumers to use alternative sources, such as dug wells or handpump-operated tubewells. This is the main reason why ADB and World Bank postevaluation findings on water supply projects conclude that demand is invariably overestimated.

Connection Fee

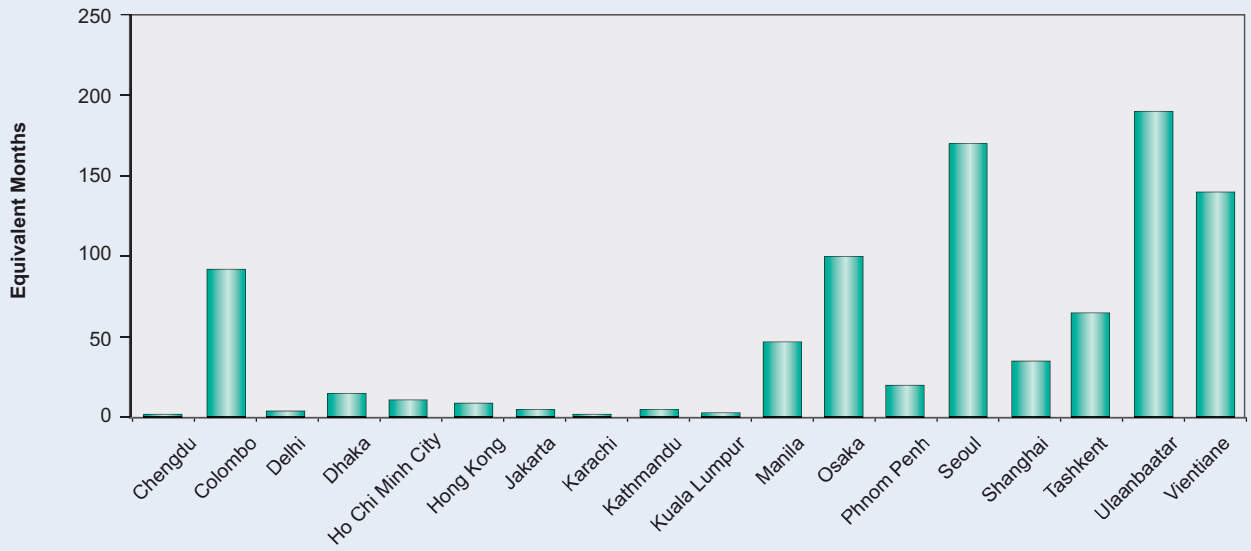
One reason so many of the urban poor are not connected to piped water is that the advance payment of the connection fee is too high (often over $100). Perhaps it has been kept artificially high because potential (rich) consumers have an incentive to approach moonlighting utility staff and ask for the installation of illegal connections. Perhaps it has been kept artificially high so that water can continue to be "informally" sold by utility staff to water vendors. Regardless of the reason, connection fees are so high in some places (Kathmandu is one example) that despite receiving no water consumers continue to pay a minimum charge every month rather than get disconnected (see Figure 11.4).

There is no doubt that this has been a barrier in the past to the urban poor getting connected to piped water from existing systems. It is certainly feasible to allow connection fees to be paid over a period of years by bundling them with tariffs. There is for that reason no need for households to seek microcredit finance to pay these fees. If bundling starts as a matter of policy, it can be implemented without hurting the operator. For new systems, there is no reason why connection costs cannot be included under development loans.

20 pesos a day for clean water

High connection fees keep the poor from being served

Figure 11.4 Connection Fee—Equivalent Months of Typical Tariff
(based on typical consumption of 20 m³ per month)



Private Sector Participation and Tariffs

It is unfortunate that the private sector gets the blame for high tariffs. Much higher tariffs are needed anyway, and if tariffs are increased before "privatization" there would be many more private operators interested in bidding.

Ten years ago, the push for PSP in water supplies of developing countries was spearheaded by the belief that the private sector would bring much needed monies to the table. For a while this happened, and it resulted in the construction of many BOT projects for production and treatment facilities. Malaysia was one of the countries embracing this approach. It was later acknowledged that unsolicited bids, "take or pay" contracts, and dealing with only one component of a water supply system (the easiest) left many problems unresolved. What we now see is very little funding coming from the private sector for concession contracts, despite contractual obligations to expand services. The primary reason for this is low tariffs. In other words, the main problem is still unresolved.

Tariffs and Decentralization

Tariffs are mostly controlled by elected officials holding central government offices. This goes against the principle of managing water at its lowest practicable level. It also prevents true devolution of power to local governments. However, as has happened in Sri Lanka, even when local governments are given the power to run their own water supplies, they find ways to hand systems back to national authorities when it comes time to increase tariffs, and in that way avoid making that unpleasant decision themselves. Later, they often ask for the systems to be returned.

Tariffs and Regulation

Tariff systems cannot exist in isolation. They need to be based on transparent policies that are kept in the public eye. Regulators need to see that policies are implemented as intended. When operators believe tariff increases are necessary, they should make specific references to policies in justifying the tariff increases requested. Regulators then must review requests before approving them, to see if they are needed and that they comply with policies. The intent of policies, such as providing sufficient capital to connect more urban poor, should be paramount. Everyone involved needs to be aware of and educated about tariffs and how the monies from tariffs will be used. It would be healthy for regulators to promote consumer societies. The objectives of the operators, in terms of performance, also need to be agreed upon and monitored by the regulators.

Tariffs and Civil Society

If governments are to change their policies on tariffs, they need the strong support of development agencies and civil society. Central to the debate is agreeing on what the long-term solutions should be and how to effect these. Resistance to tariff increases in the past has come from elected officials. One reason some elected officials do not want to increase tariffs is that the money trail runs through governments, and eliminating subsidies through higher tariffs means that it would not. So the issue here is governance. Three changes are needed: first, transparent policies that include funding investments from tariffs must be developed. Second, independent regulatory bodies to monitor the implementation of those policies must be formed. Third, organization development that includes a step away from civil servant rules and civil servant salaries for commercial operations and remuneration based on the market and accountability and incentives for performance must be implemented. These changes must come about through civil society pressure. Governments will not voluntarily reform themselves.

How to Increase Tariffs

There are a couple of golden rules here that can help assuage the complaints of consumers. First, once goals have been set, tariffs may be increased gradually every month until the goals are reached. This was done once in Manila, when tariffs were doubled over a period of about 15 months, and almost no one appeared to complain. The second rule is to make sure that service improvements, in terms of 24-hour coverage or reduced NRW, parallel tariff increases. Public education and awareness are very important. Today, with the Internet, it is possible to keep many consumers informed of such matters as tariffs. And those without access to the Internet can be informed through radios, televisions, and newspapers. When this happens, the consumer will be more in control. Civil society (NGOs, journalists, and academics) has a role to play. Public relations consultants can also be employed to get the story on tariffs across to consumers. Once major capital investments have been made, and city populations begin to stabilize, it should then be possible to stabilize tariff levels, apart from annual adjustments for the consumer price index. Utilities must be given the right to implement automatic adjustments based on increases in wages or power costs. Utilities should also develop good graphical presentations of past versus future tariff adjustments in relation to the implementation of policies. A cash-needs accounting method can be effective in showing the public where tariffs went or will go (for example, rehabilitation, new works, debt service, interest payments, etc.).

Tariff Management

A dynamic situation is created when tariffs are at a level to induce demand management. This needs careful monitoring to see the effect of tariff adjustment on consumption levels for all types of consumers. In Sri Lanka, for example, very high nondomestic tariffs have forced some businesses to drill their own wells. Such information can then be used to fine-tune the tariff structure to more accurately achieve policy objectives. Monitoring the effects of tariff adjustments is so important that one person could be given this job as a full-time task, and this person's findings should be documented so that others can learn from the experience. Utilities need all the information they can get about consumers and nonconsumers in service areas. With modern computerization it is much easier to collect, for analysis and management, information on consumers. An audit of computerized accounts can show whether or not systems are being properly managed. Analysis of annual information can, for example, reveal that there was a 10% increase in connections but only a 2% increase in revenue. This would need further investigation. Also, care should be taken in the accounting process to record the bulk supply of water to estates.

B. Subsidies

Where there are very high subsidies, the money trail runs through governments, which can be inefficient or even suffer from corruption. This is a major reason for long implementation delays due to procurement issues related to development projects.

In Manila, the urban poor not being served have a monthly water bill up to five times that of those connected to piped water. They buy water from vendors but can only afford one fifth of the volume that those connected to piped water consume. Thus their effective unit price for water (which is also often of inferior quality) is 25 times that paid by those connected to piped water.

The following were some findings of the World Bank in India (2001).

- *Residential and commercial consumers are willing to purchase water from tankers at 50 times the price that households are charged.*
- *Commercial and industrial consumers took 10% of the water but provided 80% of the revenues. Tariffs*

An emergency every day

for commercial and industrial consumers ranged from 7 to 38 times the domestic tariff.

The Water and Sanitation Program's Survey (2001) on Tariffs and Subsidies from 260 Cities and Towns in India revealed the following.

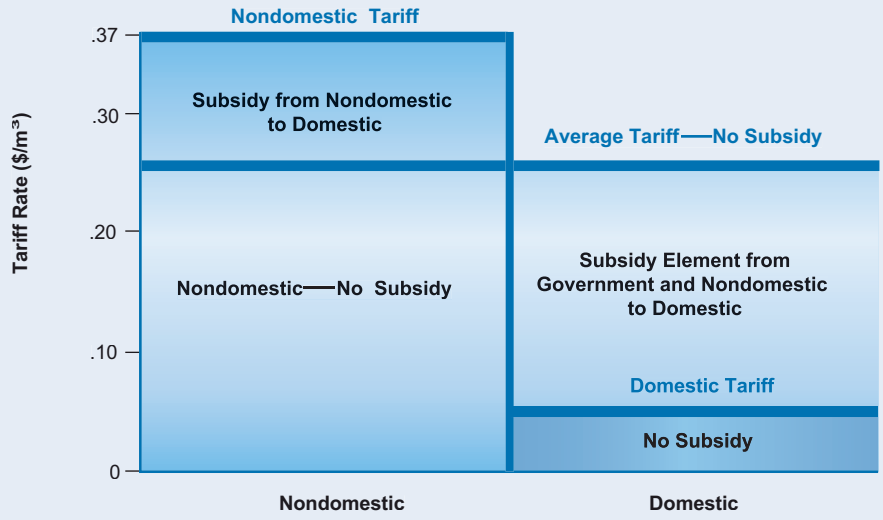
- *45% use water charges, 17% use a water tax, and 38% use a combination of the two to fund water and sanitation services.*
- *17% use only metered connections and 38% use a combination of metered and unmetered connections. The rest are unmetered. Many metered connections are not working.*
- *There are two types of tariffs for metered connections, a flat rate and an increasing block tariff. The former is much more prevalent.*
- *The tariff for unmetered connections is based on either a simple fixed rate per month per household, a rate based on the diameter of the water pipe, or a rate based on the number of taps per house.*

We can justify subsidies if they have a specific purpose, such as targeting the poor. But they must be transparent and there must be a time-bound plan to phase them out. We need to analyze subsidies to see who benefits. It is today quite common to see a large lifeline rate for those served with piped water that benefits most of those connected, but there are still millions of poor consumers who are not yet connected and pay vendors very high prices to get water. More recently, such as in Chile, there have been attempts to directly subsidize the poor. Complete socioeconomic surveys of households determine those eligible for benefits, including water subsidies. Such families pay the utility only a reduced tariff, and the balance of the cost of water is recovered by the utility directly from the municipality through the use of a fully computerized database. This is known as an output-based subsidy (see Box 6.5).

Sewerage is normally charged as a percentage of the water bill sufficient to cover O&M costs of that service, but not capital costs. Thus there are normally grants to utilities for sewerage investments. These need to be phased out over time.

Cross subsidies include those from large users to small users, industrial users to domestic users, and large cities to small towns. These are, however, normally only apparent subsidies, because in reality, the large city, the large domestic consumer, and the industrial consumer nearly always receive some subsidy (although small) from the central government, represented by the grant or soft loan element in capital

Figure 11.5 Subsidies—Greater Colombo



financing, risk taking on foreign exchange, etc. In Colombo, at one time, industrial water tariffs were 13 times domestic water tariffs. Even now, they are as high as 7:1 (see Figure11.5). This distorts development. More generally, in Asia, the figure is around 2:1. In Tokyo and Singapore domestic tariffs are now the same as industrial tariffs. Note, however, that household income is somewhat more uniform in these cities than in cities like Colombo or Manila.

An example of the distortion of subsidies is provided from the current tariff in Cebu. Since everyone must pay the $2 service charge, the effective tariff for the poor, who may use only 6 m^3 per month is $0.60/$m^3$, while the rich, who use 30 m^3 per month, pay an effective tariff of $0.36/$m^3$.

National tariffs help increase coverage with water by spreading investment costs, but they are not good for the sustainability of individual schemes. Every water supply scheme must be able to at least meet its O&M costs from its own tariffs. In the long term, schemes should become self-sustaining.

Removing subsidies on urban water use can have dramatic effects. An increase in the water tariff in Bogor (Indonesia) from $0.15/$m^3$ to $0.42/$m^3$ resulted in a 30% decrease in household water demand. Increased water tariffs induced a 50% reduction in water use over 5 years in a fertilization factory in Goa (India).

When a government gives a grant to a major urban water utility, it is in effect the people who pay taxes in the country who are contributing, but only the few who are in the city are the beneficiaries. It could also be said that this is a form of the poor (in rural areas) cross-subsidizing the rich (in urban areas). This is particularly so for sewerage development.

Governments also need to show, in a transparent manner, what effective financial subsidies are provided to farmers for irrigation when they compete with domestic water supplies in the development and use of water.

C. Funding Development

The Funding Mind-set

A policy briefing paper on financing water and sanitation recently prepared by an international NGO identified the potential solutions to meet the financing gap in water and sanitation as (i) increasing bilateral aid flows, (ii) international PSP, (iii) reallocating public sector resources, (iv) debt relief, (v) recognizing household and community contributions, and (vi) global potential for innovative mechanisms (trading water rights, debt swaps, and water bonds). Recognition of household and community contributions through tariff increases represents perhaps the greatest potential solution of all.

Self-Funding

There is evidence that internal cash generation, used to finance water supply and sanitation in developing countries, has declined. World Bank figures indicate that it went from 34% in 1988 to 10% in 1991, and by 1998 it was only 8%. This is a sad indication of the development of sustainable water supplies, as one would expect that the figures would be increasing each year in line with an exit strategy for funding assistance. Figure 11.6 shows the proportion of total O&M plus capital expenditure covered by tariff revenue in Asian cities.

Funding Operation and Maintenance

Most utilities do not have a very clear definition of what comprises O&M. Therefore, governments often fund maintenance work, such as replacing water meters and vehicles, under capital works programs. Indeed, whenever public enterprise utilities fail to meet their obligations from tariffs, governments are all too ready to bail them out.

Amount of Funding

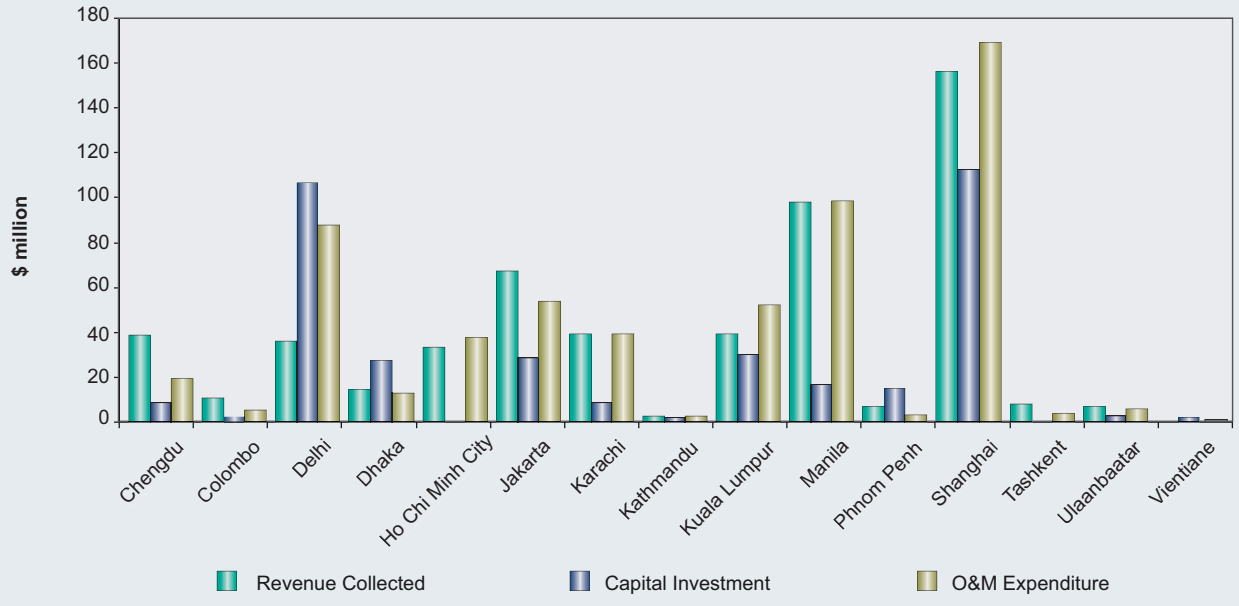
It is generally recognized that there has been inadequate funding of water supply development in urban areas of Asia to keep pace with the rapid trends in urbanization. Large portions of the population are not served with piped water. A very large number of South Asia's people rely on standpipe supplies and receive very poor intermittent water supply service. This is evidence that there is inadequate funding of development.

What is the reason for this inadequate funding? It has been realized for at least 10 years that governments and bilateral and multilateral funding agencies do not have sufficient capital to make much difference if they continue to allocate only 5% of their development budgets to water supply and sanitation. So, one issue is prioritization of the sector. It was once said that the private sector would be able to bridge the development funding gap, but recent evidence suggests that this is not so. The pace of development needs far outstrips private sector involvement, not to mention contributions. Furthermore, tariff increases under private sector contracts are constrained by these contracts, rather than guided by policies.

Sources of Funding

The sources of funding depend on the performance of utilities and the economic conditions of developing countries. They also rely on government policies. Depending on the economic status of a developing country, the sources of funds are likely to vary between government and bilateral or multilateral funding institutions.

Figure 11.6 Annual Investments and Revenue Collection (2001)



Well-established utilities, like the Metropolitan Waterworks Authority in Bangkok, have in the past been able to access domestic money markets through bond issues. Major utilities, like the Metropolitan Waterworks and Sewerage System in Manila, were able to borrow money directly from institutions like ADB. Where concession or BOT contracts are under way, the private sector may provide funding, but depending on the contract it may (like in Manila) not be timely.

The main source of funding for urban water supplies should be tariffs. Secondary sources may include central and local government loans, and private sector capital. Once a utility has established a good reputation, it may also use public bond issues to fund development. Consideration might be given to writing off all debt owed by a utility to the national government, if the utility opts to fund all future development itself directly from tariffs. In the long term, neither development agencies nor governments should be funding major urban water supply development. For this to be the case, an exit strategy is required.

Terms of Funding

Many major utilities continue to receive much of their funding in the form of grants. For example, development agencies extend loans and grants (on a 50–50 basis) to the National Water Supply and Drainage Board in Sri Lanka to finance the Greater Colombo Water Supply Project. But if development funding is from governments directly, all the money is passed on in grant form. Tariff revisions then fail to be made on time and adequately, and debt servicing is often forgiven by governments (the Nepal Water Supply Corporation is an example). Government policies, therefore, are not always followed. When funding is sourced from an international funding institution, loan covenants will apply. ADB has in the past had soft loans with long grace periods, long repayment periods (40 years), and low interest rates (equivalent to about 1% per annum). The eligible countries for these loans affecting the water supply sector were the least-developed countries. ADB also had loans from its ordinary capital resources with shorter repayment periods (20 years) and higher interest rates (around 6–7% per annum). These loans were for more developed countries and large countries like the PRC and India.

Funding Investment from Tariffs

The main solution to the shortage of financing for urban water supply infrastructure lies in a policy reform that dictates that most, if not all, financing for investments must come directly from increased tariffs. In general, this will mean raising the average tariff from the range of $0.05–0.10/m^3 to $0.40–0.50/m^3. The example of Greater Colombo (see the Greater Colombo case study in Appendix 2) shows that this is eminently affordable (less than 5% of household income). Such tariff increases may be made incrementally (a little every month) until the target is met and must be accompanied by improvements in service, such as increasing the number of people with access to a 24-hour supply. The PRC is already implementing this policy through the Harbin Water Supply Project. A $70 million investment is provided directly from tariffs (see Box 11.5). In a practical sense, governments would be advised to set such policy objectives as 5- or 10-year goals.

Funding Priorities

If major urban entities can fund all or nearly all their investments directly from tariffs, government and development agency funds can concentrate more on rural and small town water supplies and on sanitation. What makes this solution reasonable is that there has not been any other viable solution put on the table by development partners or governments that would have the same impact. Nevertheless, we should remember that integrated development reforms are needed. So, organizational development and the extension of real

Box 11.5 People's Republic of China Water Tariff Study

The tariff study approved by ADB in 1997 assisted the Government in preparing the first ever *National Guidelines on Water Tariffs*, which was promulgated in September 1998. Major features included (i) selecting a tariff structure based on local conditions and priorities, (ii) considering a two-part tariff with a volumetric and fixed demand charge, (iii) adopting full cost recovery as the main objective in setting and approving tariffs, and (iv) adopting a simplified process for tariff regulation requiring evaluation and approval at the local level, which was supported by review and monitoring at the provincial and national levels. The *National Guidelines on Water Tariffs* is expected to improve the long-term financial viability of water supply companies, provide for O&M and service expansion, and increase PSP in the water sector.

autonomy to the water utilities, which are products of policy and regulatory reform, must accompany tariff reform, too. Funding should also be provided for watershed rehabilitation. This is long-term thinking, but very necessary for sustainable sources. Rainwater harvesting, wastewater recycling, and trading water rights should also receive funding when tariffs are raised.

Conclusion

The problem in funding the development of water supplies is the dual government policy of not committing more than 5% of annual development budgets to the water supply and sanitation sector and not allowing tariffs to increase to help fund development. It is this dual government policy that has constrained water supply development in many Asian countries. Even policies of funding development through "privatization" have been hamstrung by tariff issues. What is more relevant is that there are no exit strategies for development agencies and governments funding major urban water supplies.

The most important reason for increasing tariffs is to implement government policies, especially those parts that prioritize connecting the urban poor to piped water. The next most important reason is the matter of governance, since improvements in this will put the consumer more in control (the one who pays the piper calls the tune). After tariffs are increased, water will be recognized as primarily an economic good. Higher tariffs will reduce excessive consumption and waste. These reductions will focus attention on reducing NRW (leaks, illegal connections, and metering problems). These savings in water can help eliminate intermittent water supply and will allow other sources of water to be developed, such as rainwater harvesting, trading water rights, wet season storage, recycling wastewater, and watershed rehabilitation. When Asia gets ahead of the game with investments in water, it will spur economic growth in general. Macau,[14] in the1990s, was a good example of this. In Box 11.6, Peter Rogers summarizes why it is necessary to increase the price paid for water.

Box 11.6 Water in the 21st Century, "The Looming Crisis Averted"

- *Increased price reduces demand, substitutes become cheaper, conservation becomes affordable, and it changes consumption preference.*
- *Increased price increases supply, marginal projects become affordable, and economic incentives are provided to reduce water losses.*
- *Increased price facilitates reallocation between sectors, from irrigation to domestic and industrial and from off-stream to in-stream uses.*
- *Increased price improves managerial efficiency, due to increased revenues that improve maintenance, improve staff training and education, and make modern monitoring techniques and modern management techniques affordable.*
- *Increased price reduces the per unit cost of water to poor people, extending piped supply, which reduces the reliance of the poor on water vendors and makes water available to tail enders in irrigation systems.*
- *Increased price leads to sustainability, as it reduces demands on the resource base, reduces pollution loads (due to recycled industrial water), and makes more water available for ecosystems.* (Rogers, 2001)

[14] Macau has one of the best examples of "privatization" of water services in the Asian region.

Tariffs, Subsidies, and Development Funding (Problems) in a Nutshell

- Tariffs are too low in most parts of Asia to influence demand.
- Tariff structures are also to blame for subsidies going to the rich and inadequate demand management.
- Major tariff reform is needed before PSP makes sense.
- The poor are able and willing to pay, but many governments are unwilling to charge.
- High subsidies equate to low governance.
- Tariff covenants do not work.
- Tariff policy is invariably ignored.
- The poor often pay about 25 times the unit rate (for water) paid by the rich, because the poor are not connected to a piped supply.
- Low tariffs perpetuate the status quo, where the hidden economy of water vending is tapped.

Tariffs, Subsidies, and Development Funding (Solutions) in a Nutshell

- Tariffs begin with policy—analyze subsidies.
- Tariff reform is a manifestation of good governance—fewer subsidies.
- Alter the money source from governments to consumers.
- Those connected must pay more so that those not connected can get piped water.
- No question of affordability—the hidden economy proves this.
- Block tariff structures are best when income profile varies greatly.
- Fund investment directly from tariffs—the PRC is doing this now.
- Connection fees can be absorbed by tariffs.
- Tariff reform is needed to encourage PSP.
- Higher tariffs make good things happen in terms of water development options.

Chapter 12

Private Sector Participation

For the last 10 years, PSP in water supplies has been a hot topic. There was a little "pull" from governments and a lot of "push" from development agencies and the private sector toward PSP, which was spearheaded by half a dozen French and British companies. This chapter looks at the progress made in Asia against the main reasons for PSP, and it looks at the future of PSP in Asia through several different eyes to get some perspective on the subject. The Malé and Manila case studies in Appendix 2 give a more in-depth look at two examples of PSP.

ADB's water policy notes that private sector initiatives and market-oriented behavior are expected to improve performance and efficiency, particularly in service delivery. ADB will seek to provide innovative financial packages to enable commercial lenders and promoters to manage the risks involved when investing in water and related projects. ADB will also develop modalities for public-private partnerships in managing physical infrastructure.

A. Promises and Realities

The advantages of PSP heralded in the 1990s included bringing greater efficiency to management, bringing investment monies to the table for development, and bringing autonomy of operations through legal contracts. Looking around the developing country scene in Asia, 10 years later, it can be perceived that the governments of these countries initially welcomed the BOT type of PSP, but soon became disillusioned with "take or pay" contracts, unsolicited bids, and the fact that these focused on production facilities when the real problems lay in distribution. Some governments—such as those in India, Pakistan, and Sri Lanka—were not prepared to accept long-term concession contracts dominated by foreign contractors for major city water supplies. Labor unions and activist NGOs have provided resistance to PSP. Disappointment about PSP may have been caused by expectations that were too high and wrong perceptions about what can be achieved in the short term. Unfortunately, the need for higher tariffs (which has little to do with PSP per se) has been used against the PSP process. Moreover, and just as unfortunately, regulation by contract became a noose around the necks of

Service in low-income areas (after the meter)

contractors and governments, as illustrated by the foreign currency exchange risk issue and demands for higher tariffs to compensate for the effects of the Asian financial crisis. Finally, neither regulation nor domestic PSP were offered as solutions by themselves. These might have been more appropriate steps in the development process. Only now are we beginning to see independent regulatory bodies being established in Asia (Nepal and Sri Lanka) and attempts at domestic PSP (Bangkok).

Examples of PSP in Asian Water Supplies

- **Bangkok:** Consultants proposed splitting the city into two concessions (like Jakarta and Manila). The Metropolitan Waterworks Authority rejected this and proposed instead that, like Thai Airways, the Government would retain a 51% shareholding and the rest of the stock would be offered to the public through the stock exchange. This will be effected in 2003.
- **Chengdu:** This BOT project, prepared under ADB financing, was designed to produce 400,000 m^3 per day on a “take or pay” basis. There were five bidders, and Vivendi with Marubeni was successful. Regulation is by contract. The contractor put in only about 30% of the financing. Meeting the terms of the “take or pay” arrangement is now difficult, because demand was overestimated.

- **Colombo:** The World Bank proposed a concession. The Government turned it down. The real issue was autonomy, as already provided for under legislation but not allowed in practice, because the Government averred that all public enterprises need to be similarly treated. Under ADB loan covenants a regulatory body is being established, and PSP is now being introduced through a BOT contract for water production.
- **Ho Chi Minh City:** Three BOT contracts for bulk supply of treated water were signed in 1995, 1997, and 1999. This is a "take or pay" deal, but there was a mismatch of production and distribution capacity, so the water company had to pay for water that could not be sold. One of the BOT operators is pulling out due to financial difficulties.
- **Jakarta:** Only 30% of the 10 million people in Jakarta are directly served with piped water. Concession contracts that split the city's water supply were negotiated directly with Suez Lyonnaise des Eaux and Thames Water in 1998. Originally the concessionaires were joined by local partners, but after the change in government the Indonesian partners relinquished their shareholdings. NGOs claim concessionaires are not investing their own money in capital works but are using instead the money collected from consumers. The legality and fairness of the contracts were questioned, which led to renegotiations. Both concessionaires have had to grapple with the consequences of the Asian financial crisis and low tariffs.
- **Karachi:** Leveraged by loans to the public sector, the World Bank (water supply) and ADB (sewerage) tried to introduce private sector concession contracts from 1996 to 1998. Due to major objections from NGOs and consumer groups, these failed to eventuate. Recently, NGOs have suggested that the sewerage component could be implemented for just $20 million, versus $100 million under the ADB proposal, by using gravity instead of a pumped design and local consultants, suppliers, and contractors.
- **Kathmandu:** Preparations for a management contract for the Kathmandu Valley Urban Water Supply and Sewerage began in 1996. It was a precondition for ADB support to the $464 million Melamchi Water Supply Project. The World Bank agreed to provide financial support to the PSP process in 1997. In mid-2002, the World Bank pulled out after two unsuccessful attempts to prequalify contractors ended with only one prequalified each time. ADB staff requested that joint ventures of water utilities from developed countries and international consultants with experience in developing countries be allowed to bid. ADB will now revisit the PSP and regulation processes.
- **Kuala Lumpur:** Syabus, a joint venture between the state government and private firms, has been chosen to produce, distribute, and sell water to consumers. The former Selangor Waterworks Department is expected to take over as regulator. The award to Syabus follows the federal Government's directive stating that companies that have been given the right to undertake the treatment of raw water must also be involved in water distribution. From mostly BOT projects in the early 1990s, government policy shifted to PSP in the whole system, from source to consumer.
- **Macau:** The city has about 500,000 people and 170,000 water supply connections. Although it was originally under the private sector around 100 years ago, the Macau Water Supply is regarded as one of the best examples of a water supply run by the private sector. The concessionaire is 85% owned by Sino-French Holdings Ltd., which comprises Lyonnaise des Eaux (50%) and New World Group (50%). Rapid development of the service in the late 1980s was seen as a major catalyst in spurring economic growth. Major achievements include reducing NRW from 48% to 11%, introducing European water quality standards, increasing connections from 55,500 in 1985 to 170,600 in 2000, and increasing production from 85,000 m^3 per day to 265,000 m^3 per day. The average tariff is now around $0.60/$m^3$. Recently, there have been some problems with the raw water source and upstream pollution in the PRC.
- **Manila:** Metro Manila has about 12 million people and service coverage with piped water is nominally about 60%. The PSP process was started in November 1995, and the two concession agreements were signed in February 1997. This was in and of itself a remarkable achievement for the largest ever water supply "privatization" in the world, and it was due to two factors—strong political will (of President Ramos) and managing the process of change (with about $8 million in support from International Finance Corporation). The concessions were bid on a low tariff and awarded to Benpres Holdings Corporation and Lyonnaise des Eaux for the west at 4.97 pesos/m^3 and to Ayala, Bechtel, and North West for the east at 2.32 pesos/m^3. The winning bids can be compared with the then Metropolitan Waterworks and Sewerage System average tariff of 8.78 pesos/m^3. Performance to date is mixed. The

east concession seems to have reduced NRW from about 65% to 57%. The west concession has not reduced NRW (now around 68%). By the end of 2001, only about 75,000 connections had been added. On 10 December 2002, the west concession sought to withdraw—citing failure to agree on new tariff rates and a moratorium (5 years) on the payment of the concession fee as factors in its decision to pull out.

Box 12.1 shows that PSP is of concern to many people all over the world. A major review of PSP in water supplies of developing countries is long overdue. While the results may not augur well for the policy, this study needs to be carried out, and preferably by an independent body of professional repute. Areas of evaluation could include NRW reduction, investment magnitude, staff training, asset mapping, metering, computerization, performance analysis, service to the urban poor, reselling water, and tariff constraints on investment. Box 12.2 summarizes some problems of PSP in the water sector.

Box 12.1 Private Sector Participation in Islamic Countries

Most Muslim scholars agree that a just price for water is that determined by the market, providing the market is free from unfair practices, such as collusion. Even if full privatization of the water sector is allowable in Islam, that does not mean it is desirable. Instead, as is generally the consensus in the rest of the world, where the private sector participates in providing water services, public-private partnerships are recommended where the government retains its "ownership" of water for the community and allows the private sector to deliver (withdraw, treat, and distribute) water and sewerage services but regulates the sector to ensure equitable access and also to ensure that quality standards are maintained. (Faruqui et al, 2001)

Box 12.2 Problems of Private Sector Participation in the Water Sector

- *The headlong rush toward private markets has failed to address some of the most important issues and concerns about water. Water has vital social, cultural, and ecological roles to play that cannot be protected by purely market forces.*
- *There is a need to provide for the basic water requirements of people and ecosystems, permit access to water for poor populations, include affected parties in decision making, and improve water use efficiency and productivity.*
- *Openness, transparency, and strong public regulatory oversight are fundamental requirements in any efforts to shift the public responsibility for providing clean water to private entities.*
- *The World Bank, other international aid agencies, and some water organizations like the World Water Council are increasingly pushing privatization in their efforts, but without a common set of guidelines and principles.*
- *The rapid pace of privatization in recent years and the inappropriate ways several projects have been implemented have compounded the worries of local communities, NGOs, and policy makers. As a result, private water companies are increasingly seeing serious and sustained public opposition to privatization proposals.*
- *Improvements in efficiency reduce water sales and hence may lower revenue. As a result, utilities or companies that provide utility services may have little or no incentive to encourage conservation.*
- *Efforts should be made to strengthen the ability of governments to meet water needs. Unfortunately the worst risks of privatization are also where governments are weakest.* (Gleick et al, 2002)

B. Investments

While investment monies did flow into the "take or pay" BOTs, they have not flowed as expected into the major concessions. In Manila, 5 years after "privatization," there are still 5 million urban poor without access to piped water. In Jakarta, 4 years after "privatization," there are about the same number without access to piped water. Elizabeth Brubaker, in a paper prepared in 1998, noted that *the French system is heavily subsidized. Both public and private operations receive subsidies from many levels of government and from one another. In other words, the privatization of the delivery of services has not led to the privatization of the financing of services.* In Jakarta, the leading NGO for consumers has become a watchdog monitoring the implementation of private contractor investment programs. Even where concessions are in place or planned, funding by development banks continues. When international private contractors do invest, they often seek funding from private sector windows of development banks. So, it must be concluded that PSP has not proved to be a panacea for the shortage of development funding in the water supply sector. Part of the reason for this lies with low tariffs that do not encourage operators to invest. Table 12.1 shows utility performance in Jakarta and Manila in 2001. The high NRW, low service coverage, and low capital expenditure levels should be noted.

In Malaysia, by 1996, 57 water treatment plants with a total capacity of 3.8 million m^3 per day had been placed in the hands of the private sector. Consumers now enjoy better service in terms of both reliability and quality of water without any substantial increase in tariffs. Nevertheless, the major problem in Malaysia's water sector, the high level of NRW, has not been addressed.

C. Efficiencies

NRW has not been greatly reduced under private sector management. In Jakarta, some consumers think that there is just as much corruption in illegal connections and meter reading as there was under the public water utility. According to some residents, these practices are so common among employees that only firing all staff and hiring new staff would likely resolve the issue. The two concessions in Jakarta have NRW of 48% and 53%. The two concessions in Manila have NRW of 66% and 57%, based on 2001 data. None of these figures are in any way respectable.

D. Competition

International competition for private sector contracts in water supplies has been severely restricted. Early attempts to increase private sector competition for the Kathmandu Valley Urban Water Supplies management and lease contract were resisted. BOTs were also in the early days fraught with much unsolicited bidding and direct negotiation.

Inexperienced organizations with no knowledge of the water industry may begin to make an appearance. These organizations may focus on short-term financial gains instead of on finding long-term solutions to the management and technical challenges resulting from the need to provide quality water and wastewater services to consumers. (Lyonnaise des Eaux, 1998)

Table 12.1 Utility Performance—PSP Concessions (2001)

Contract	Piped Water Coverage (%)[a]	Supply Continuity (%)	NRW (%)	Staff per 1,000 Connections	Ratio of Revenue to O&M Cost	Annual Capex[b] ($ millions)
Jakarta West	41	92	48	5.2	1.3	6.7
Jakarta East	51	92	53	5.5	1.2	7.6
Manila West	37	88	66	4.3	0.9	0.1
Manila East	34	88	57	4.5	1.1	16.8

[a] Based on household connections (five persons per connection).
[b] Capital expenditure.

E. Tariffs

It cannot be presumed that there will be any success with PSP in water supplies of developing countries until the problem of low tariffs is addressed. This can only be accomplished through government policies that encourage tariffs covering investments, not just O&M plus depreciation or debt servicing. Then independent regulatory bodies need to be in place and tasked with ensuring that utilities, on the one hand, and governments, on the other, adhere to these policies. Given that the consumer must pay for investments sooner or later, and given that private sector financing is generally the most expensive, it is quite possible that tariffs in the future can fund all water supply investments in cities with more than a million people.

F. Regulation and Contracts

One problem facing water utilities and governments of developing countries, in regard to PSP in water supplies, is the uneven playing field. The knowledge of contractors (one party to the contracts) is far greater than the knowledge of governments (the other party to the contracts). This knowledge disparity is exacerbated by the potential for corruption in making the "deal." Some senior level civil servants and elected officials may have a short shelf life and a tendency to “take and run,” leaving other civil servants and another administration to wrestle with the consequences of skewed negotiations. Transparency has also not been evident in deals. It is not normally possible for the public to review contracts signed between concessionaires and governments. Indeed, many legal contracts are so replete with confusing language that very few people can understand what has been written. The draft lease contract for the Kathmandu Valley Urban Water Supply was such an example.

G. Serving the Poor

The summary of problems and solutions in serving the urban poor by Lyonnaise de Eaux (see Box 6.1) illustrates that there are indeed many problems to be overcome, but that there is some reluctance on the part of the private sector to take much financial responsibility for the solutions. Perhaps this is because contracts were not based on policies to serve the urban poor. In Manila, one concessionaire has responded to serving the urban poor by selling water in bulk to a third party who connects the poor to a 24-hour supply of piped water. Unfortunately, the monthly cost to the consumer is four times the normal rate, and the volume consumed is one quarter of the normal consumption. Likewise, one connection is offered to multiple households, so these users are forced to pay a penalty for high consumption.

H. Risks

A major banker notes that the main risks that banks want to see addressed pertain to construction, revenue, operations, politics, and finance. Significant currency risk arises because customers pay in domestic currency, which does not match the currency of international debt and equity financing. It has also been observed that fewer projects have been successfully financed with private capital than in other infrastructure sectors, and projects financed with private capital have tended to involve direct financial or credit support from governments or third parties, such as bilateral, multilateral, and export credit agencies. When we consider risks, the guaranteed rate of return on concession contracts gives an impression that the main risk assumed by the contractor is one of cash flow. Likewise, on BOTs, contractors take negligible risks under the take or pay scenario. Risks for investors can also be reduced if PSP is considered for a pool of towns at one time, which allows risk sharing.

Difficulties of management in low-income areas

I. Future of Private Sector Participation

There is no doubt that the jury is still out after 10 years of PSP in the water sector. The following excerpts from different sources, however, may provide some guidance on the future directions of PSP.

1. Developing Best Practices for Promoting Private Sector Investment in Infrastructure and Water Supply (ADB, 2002)

The Reform Unit

Establishing a state-owned enterprise reform unit is an important first step toward water supply reform and the introduction of private sector investment in water supply. The unit should consist of a team of trained individuals with expertise in economics, management and finance, water supply, and negotiation.

Sector Reforms

There is a strong case for introducing wider sector reforms, such as commercialization and corporatization of water supply utilities, particularly if the introduction of PSP in water supply is to be a phased or staged process.

Tariff Reform

Tariff reforms are essential if the scarcity value of water and efficient use of water are to be achieved. If water tariffs fail to reflect the costs, householders, when deciding to use water, do not know the value of water in its alternative uses. The same is true for the irrigation farmer and the industrialist. Major river diversions for irrigation needs or hydro schemes will only make sense if nearly all potential water uses are factored into calculations. In some cases, closure of irrigation schemes and generous compensation of farmers may be attractive. This is because the new water released may permit industrial and residential expansion and the export of goods and services far more valuable than some grain foregone. As in other markets, appropriately set tariffs will operate as signals for efficient water consumption, production, and investment in water supply. Tariff reforms should be a precursor to PSP in the water supply sector. Without tariff reform, water supply investments will not be financially viable from the private sector lender's and investor's point of view. If private sector investment goes ahead without tariff reform, DMC governments will need to fund the difference between the lower water tariff paid by consumers and the higher payment made by DMC governments to the private sector. This situation is unlikely to be sustainable in the long term.

Risk Mitigation and Management

In general, risks should be allocated to the party that can minimize and manage risks most effectively. Where no party has a clear comparative advantage in managing risks, they should be shared. Careful identification, analysis, and ranking of risks by an expert team before competitive tendering is a key to best practice in risk mitigation and management. The reform unit, if necessary, in consultation with independent experts, can undertake this process. Ideally, the information gained should be published as part of the tender process.

2. Lessons Learned from the Study of Privatization of Water Supplies in 10 Asian Cities (McIntosh and Yniguez, 2000)

- A regulatory body must be in place prior to signing contracts.
- Governments and water utilities should obtain expert advice.
- The appropriate PSP option should be selected.
- Good relations between governments and private operators are needed.
- Transparency, public awareness, and public relations are beneficial.
- An integrated approach (bundling from source to consumer) is best.
- Employee rights need to be protected, and staff transfer needs to be planned.
- Good and reliable water sources are needed for long-term viability.
- Appropriate tariff structures and tariff-setting mechanisms should be agreed upon.
- Fair and open competition is better than negotiated contracts.
- There is no blueprint for "privatization." Its elements and processes should be adapted to the culture, political structure, and legal and regulatory framework of a given city.

3. The Dutch Model (Blokland et al, 1999)

In many countries water supply is a public service controlled by the Government. There is a lot to be said for this, even if it is only that good water supply and sanitation is in the public interest. The other side of the coin however is that government operated utilities are not always a shining example of efficiency. In recent years, privatization of the water supply sector has therefore been the favoured option. Market forces must ensure that supply and demand are efficiently matched. Private business however has tended to focus on areas where demand is backed up by purchasing power. That means that there are still sections of the population who do not have access to affordable, good quality water.

There is an alternative however. The Netherlands can draw on almost 100 years of experience of working with an alternative mode of organization that is a cross between a public owned utility and a private company: the Public Water PLC (a government owned public limited company). Public Water PLCs are incorporated as private companies and are also subject to the rules and regulations governing commercial business. The majority of their shares however are owned by local or national government. These Public Water PLCs are relatively common in the water supply business. They can be found in Europe as well as in North America, Asia and Africa. In actual fact, the Public Water PLC combines the best of both worlds: public ownership with operation according to commercial business principles. As a public limited company it is required to provide optimum water supply services for everyone in its service area. The fact that it operates on a commercial basis means that the cost of services provided has to be recovered from the users. Another advantage, the importance of which can scarcely be underestimated, is the financial transparency of a Public Water PLC, which is required to open its accounts to public scrutiny. As a public limited company it cannot conceal data in the annual figures of the holding company.

Depending on the local situation, various success factors have a part to play:

- *One important factor is the political will to make the public water supply system a success. This is no easy task, as politicians and administrators—paradoxically enough—have to relinquish a degree of influence to make this happen.*
- *The shares and the seats on the board of directors must be divided carefully among the various local authorities to prevent one local authority gaining the upper hand.*
- *Encouraging local share ownership is important as it ensures that the customers can influence policy. Local involvement is increased by appointing representatives of local authorities or consumers.*
- *It is advisable to consider private minority shareholding in the PLC. The introduction of private shareholdership is likely to increase pressure on the management to improve efficiency. It also means that the water utility can benefit from the private shareholders' knowledge of the market.*
- *It is vital that the board of directors possesses sufficient utility-specific expertise in the fields of engineering, finance, environmental protection and human resources. This prevents a knowledge imbalance between the managing director and the board.*
- *Company law must ensure that Public Water PLCs are accountable for their actions, just like other businesses. This transparency is essential to prevent abuse of power and mismanagement.*
- *It may be advisable to appoint an independent regulator, for instance to reduce political intervention and guard against both technical and financial mismanagement of the water utility.*

4. Excerpt from *The New Economy of Water: The Risks and Benefits of Globalization and Privatization of Fresh Water* (Gleick et al, 2002)

Principles and Guidelines (Suggested for PSP)

- ***Continue to Manage Water as a Social Good.*** *(1) Meet basic human needs for water. All residents in a service area should be guaranteed a basic water quantity under any privatization agreement. (2) Meet basic ecosystem needs for water. Natural ecosystems should be guaranteed a basic water requirement under any privatization agreement. (3) The basic water requirement for users should be provided at subsidized rates where necessary for reasons of poverty.*
- ***Use Sound Economics in Water Management.*** *(1) Water and water services should be provided at fair and reasonable rates. (2) Wherever possible link proposed rate increases with agreed upon improvements in service. (3) Subsidies, if necessary, should be economically and socially sound. (4) Private companies should be required*

to demonstrate that new water supply projects are less expensive than projects to improve water conservation and water use efficiency, before they are permitted to invest and raise water rates to repay investment.

- ***Maintain Strong Government Regulation and Oversight.*** *(1) Governments should retain or establish public ownership or control of water sources. (2) Contracts that lay out the responsibilities of each partner are a prerequisite for the success of any privatization. (3) Clear dispute resolution procedures should be developed prior to privatization. (4) Independent technical assistance and contract review should be standard. (5) Negotiations over privatization contracts should be open, transparent, and include all affected stakeholders.*

5. The Private Sector in Water—Competition and Regulation (World Bank, 1999)

Private Participation in the Water and Sewerage Sector—Recent Trends

- *There is potential for gains from private sector involvement through greater efficiency and improved access to finance for new investments.*
- *There has been considerable political resistance to raising tariffs to cost-recovery levels, increasing the risk of long-term investment in water and sewerage assets.*
- *By the end of 1997, private companies operating in developing countries had reached financial closure on $25 billion of investment in water and sewerage projects. There were 97 projects in 35 countries, including management contracts, leases, concessions, divestitures, and build-operate-own and BOT projects. Just a few international companies were sponsoring and operating most projects. About 33% of the investments were in East Asia and the Pacific and 48% in Latin America and the Caribbean. None were in South Asia; 41 of 97 projects were awarded to just two firms (Lyonnaise des Eaux and Vivendi).*
- *Water and sewerage contracts increasingly are attracting bids from consortia of multisector utility and construction companies.*
- *The water sector has a long history of tariffs below costs and political resistance to raising them. Considerable government commitment is required to raise tariffs to cover costs and to build regulatory arrangements that give private companies confidence they can make a fair rate of return on their investments.*

Improving Water Services through Competition

- *Regulators and consumers may compare utilities to judge their performance.*
- *The price a firm may charge is set by the costs of other firms in the industry.*
- *Regulatory benchmarking of companies against one another should be practiced.*
- *Comparisons of the performance of companies should be publicized by the media.*

Regulating Water Companies

- *To regulate well, the regulator needs to have an idea of how much it would cost an efficient company to supply high quality water. One way of generating that information is to auction the right to supply water every 20 years or so. Firms state the price at which they would be willing to supply water of a specified quality, and the firm offering the lowest price wins the contract.*
- *Prices can be adjusted between auctions based on maintaining a given rate of return on capital or on retail price index minus a factor to account for productivity gains and other changes.*

Getting the Private Sector Involved in Water—What to do in the Poorest of Countries?

- *Take a stepwise approach—begin with a management contract.*
- *Simplify contracts with clear and indisputable performance indicators and a strong monitoring agency.*
- *Contract out parts of the regulatory function—independent auditors.*
- *Renegotiate and adjust contracts over time.*

Competition in Water and Sanitation and the Role of Small-Scale Service Providers

- *There has long been a belief that the water and sanitation sector has a high degree of monopoly. But competition is widespread in the low-income retail market in developing countries. There is no inherent monopoly in such small-scale*

activities as reselling water by the bucket. Small-scale service entrepreneurs supply unserved niches of the water and sanitation market. Small enterprises often account for a larger share of the market than do incumbent utilities, and they are well placed to complement and even compete with trunk concessions and public companies in tailoring services to the poor. Thus governments should take account of existing or potential small providers when designing concessions or any long-term rules for the sector.

J. Conclusion

Some comments above could apply equally well to governments running public utilities and private companies running their own utilities. A transparent government policy that adequately addresses tariff issues is the foundation for all water supply development. An independent regulatory body governing water operators is the next step. Regardless of PSP or a lack thereof, an infusion from the private sector into public utilities is needed in human resources management and financial management. Much more training is needed in-house, and training programs must be structured and include all staff. In this modern age of information technology, everyone can improve with some training each year. This is not an option, it is a mandatory requirement.

If the international contractor is not going to be a part of the permanent solution, a time-bound program of knowledge transfer to national counterparts must be put in place. This has worked well for the Malé Water and Sewerage Company, where after 5 years there were no longer foreign personnel (apart from Sri Lankans and Indians) on the staff. This, of course, works against long-term international inputs, as it should. All private sector contracts should include the transfer of knowledge from foreign to local staff and be accompanied by the requisite training to achieve these objectives.

The main thrust of new approaches to PSP must come from a policy (not just a contract) that promotes tariffs covering investment and a regulatory environment. Domestic "privatization" must be encouraged much more than it was in the past. Water consumer societies and civil society in general must be watchdogs monitoring the performance of water utilities and the implementation of government policies. The public has a right to know the essence of all private sector contracts and should have access to information, including annual reports of utilities. Comparative benchmarking of performance with other utilities is needed. To level the playing field, much more competition should be encouraged. This includes joint ventures involving consultants with experience in developing countries and utilities from developed countries. More public awareness, public relations, and public involvement programs are needed, as these will ensure the public can learn the facts, instead of myths, about PSP. An exit strategy for any international involvement should be considered as a matter of policy.

Future PSP efforts should look to bundling "source to consumer" facilities, because the "series" system of delivering water is only as good as its weakest parts. If there are parts of that system under public corporation or government department control, the benefits of PSP in other parts will to a large extent be nullified.

The Dutch model of crossing a public-owned utility with a private company, in which mostly local authorities own a water utility that is managed by the private sector, could be replicated. The Malé model of 70% public ownership and 30% private ownership for 20 years also appears to be successful, perhaps because the Government has been strong over the need for tariffs to cover investment costs (see the Malé case study in Appendix 2).

Private Sector Participation (Problems) in a Nutshell

- Promises of finance and efficiency are largely unfulfilled.
- There is a lack of competition and transparency.
- Playing field is uneven.
- Service to the urban poor is a major constraint.
- Social, ecological, and cultural matters are sometimes ignored.
- Tariff reform is needed for the private sector to engage.
- Regulation by contract is not the answer.
- Take or pay is not a good option.
- There is much civil society resistance to PSP.

Private Sector Participation (Solutions) in a Nutshell

- Manage the process of change.
- Domestic PSP is preferred.
- Contracts should be based on policies.
- Consider exit strategies for internationals.
- Tariff reform is a prerequisite.
- Competition and transparency are musts.
- Public-private partnership has promise.
- Principles and guidelines are needed.
- Independent evaluation will help.
- SSWPs should be included.
- Regulatory arrangements must come first.

Chapter 13

Governance

The story may begin and end with governance. What do we mean by governance? It has to do with, first of all, enforcement of the law and accountability, transparency, and implementation of government policy. It also means having the knowledge (ability) and autonomy to practice sound management. A first principle of governance is that "the one who pays the piper calls the tune." When water supplies in developing countries are examined, it is found that low tariffs that allow governments and not consumers to be in control are at the core of such problems as the urban poor not being served, high NRW rates, intermittent water supply, lack of demand management, and conflict among water users. Unlinking tariffs and the political process should be at the core of all governance objectives.

ADB's water policy suggests that governments need to modify their role. They need to move away from being service providers and become regulators. Most DMCs require a phased program to increase the autonomy and accountability of service providers either as new enterprises or by reorganizing existing agencies. Legal and regulatory systems need to ensure that water service providers and resource managers are held accountable by law for their performance relative to prescribed standards. The allocation of water to high-value uses is a matter of economic accountability, and ADB will support DMCs in developing appropriate methodologies for improved allocation efficiencies. Externalities, especially social and environmental, will be considered in the allocation. The promotion of participation involving public, private, community, and NGO stakeholders is a key element of this policy. Transparency will be most effective when governments ensure the timely availability of information about water policies and projects to the general public and clarify government rules, regulations, and decisions in the sector.

This chapter explores governance in the context of "operations" and "projects." It invites readers to return to the Problem Chart and the Solution Chart in Chapter 2 to see why governance is both a core problem and part of a core solution. The role of policy and regulation, civil society involvement, and tariff reform in effecting a new form of governance is described. There is some good advice from Kamal Siddiqui.[15] (Siddiqui, 1996). Some good examples of governance are provided in the case studies on Dalian, Malé, and Phnom Penh in Appendix 2.

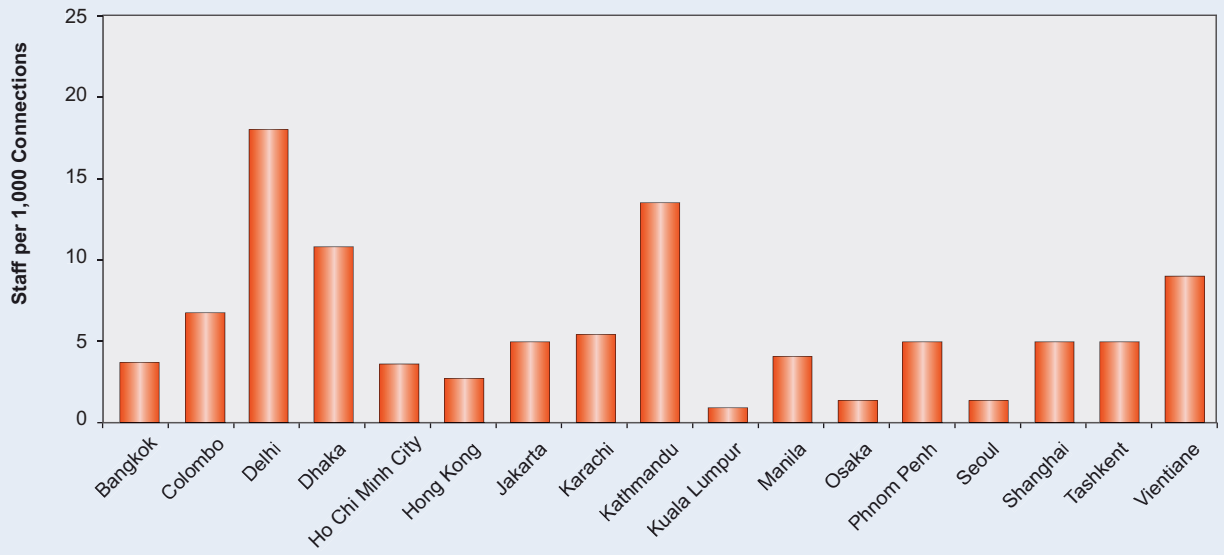
A. Operations

One of the most important considerations in operations is autonomy to run a utility efficiently and competently. The current situation in many utilities is, however, characterized by the interference of elected officials when utilities attempt to exercise the autonomy granted to them to set tariffs to recover costs. This situation is also characterized by the control that elected officials, as opposed to utility management, have over utility staffing. A good utility will have around two staff for every 1,000 connections, but many in Asia have much more than that (see Figure 13.1). In one country, roughly 500 staff were suddenly added to a utility at the behest of an elected official. Moreover, many utilities are not allowed to pay their professional staff market rates of remuneration, which affects the quality of their personnel. In some countries, on the open market, accountants can command salaries of up to three times those earned by engineers, but when civil servant salaries and rules govern, this is not the case. The result is that these utilities attempt to run $100 million per year businesses without competent and qualified accountants. Some elected officials have also been known to interfere in

Water and life

[15] Kamal Siddique is a former ADB Director for Bangladesh.

Figure 13.1 Staff per 1,000 Connections (2001)



granting new connections, and they have been known to prevent disconnection for nonpayment of bills.

In some cases, elected officials appear to support large bulk water users being served by illegal connections. These officials keep new connection fees high, which can encourage illegal connections. Certain elected officials have allowed syndicates to control water supplies to the poor. Officials can profit from vendors purchasing utility water, and some condone groundwater use for free by major industries. They often use their influence to get access to 24-hour supplies for themselves, while most people suffer an intermittent water supply. Elected officials have been known to become overly involved in the daily operations of water utilities, control management, and replace heads of utilities on political grounds. For example, since 1984, the Nepal Water Supply Corporation has had about a dozen general managers. Some office holders insist on distribution network extensions beyond hydraulic design criteria, causing intermittent water supply. The current situation is characterized by a lack of transparent government policy on tariffs, service levels, operator performance, and incentives. Consumers are unaware of policies, and even governments are apt to change policies to suit the current political climate. Without such policies there is no accountability for the performance of governments and utilities. High NRW levels and intermittent water supply are direct results of this lack of accountability.

When many water utilities are examined, human resources management and financial management are found to be weak. Utilities lack skilled staff in these areas because of civil servant rules and salaries. Staff do not have job descriptions, and promotion is based on age, not merit. Most of all, there are no incentives for staff to perform well. Many staff of water utilities have no skills, some are also ghost staff—employees who are listed on the books and receive wages without being physically present. Interestingly, there are many highly educated technical and engineering professionals in these institutions, but while utilities lack autonomy, accountability, transparency, and proper management, these skills to a large extent go untapped. The culture of O&M being a poor relation of development is prevalent because there are no incentives. As a result, some valve operators, meter readers, and new connection teams choose to collude with customers to create their own incentives.

Lack of accountability means meters are not replaced when they are no longer functioning properly. Low tariffs contribute to this situation. Annual reports on operations could easily be produced within 6 months of the end of a given financial year, but often such reports become official only about 2 or 3 years later and are therefore of little use to the public in responding to performance. Consumer satisfaction is a factor in good governance, but consumers have for so long been used to poor service that they regard it as normal

and expect nothing more. This is particularly so with respect to intermittent water supply in South Asia. Low billing and collection efficiency are exacerbated by low tariffs (see Figure 13.2), and they result from a lack of accountability and discipline in complying with the law in general and rules and regulations in particular. An example of this would be the existence of laws stating that local authorities are responsible for water supplies when in practice central governments continue to control these.

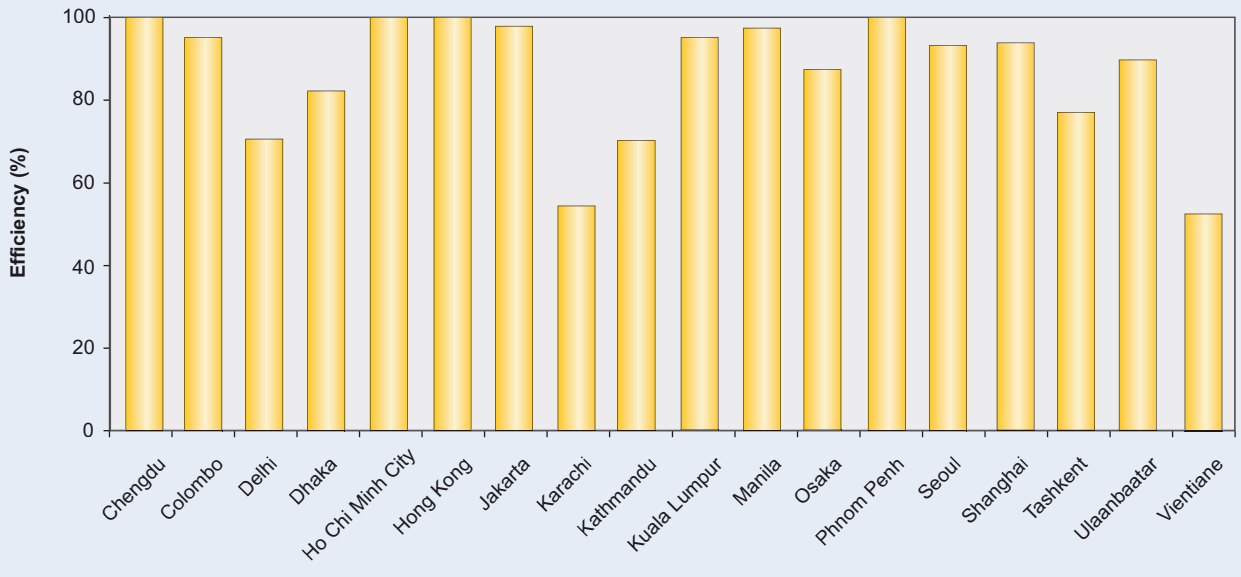
Regulation by contract is a form of governance now prevalent among private operators in developing countries. PSP contracts in Manila show how a lack of transparent policy dooms regulation by contract to failure. When the Asian financial crisis hit, and operators were exposed to high currency exchange risks, the urban poor not being served suffered. If the contracts were based on a transparent policy, they could have been revised easily by the parties concerned, which would have ensured that the underlying policy (providing water to the poor) was accommodated. Regulation by contract prevented this from happening.

The prevalence of high NRW and low service coverage is an indication of poor governance. Some NRW is illegally sold to SSWPs. The profit to those with vested interests (some elected officials, utility staff, utility owners, and local authorities) is considerable, which explains the desire to maintain a status quo that keeps the urban poor paying 25 times the unit rate the rich pay for water. This is also probably why visible leakage is maintained (to mask illegal use). Metro Cebu provides an illustration of this linkage between low service coverage and high NRW. Piped water service coverage based on five persons per connection is 29%. NRW is 34%, and the urban poor buy water from water vendors.

Valve turning is a governance issue

ADB's experience has been that legislation is necessary, but it is certainly not sufficient to ensure the autonomy of water utilities (see Box 13.1). There must be an effort to clean up legislation and make it more relevant to today's world. Civil society needs to take more interest in ensuring that governments do not ignore the law. This might apply especially in extending distribution systems beyond their capacity to provide a 24-hour supply.

Figure 13.2 Revenue Collection Efficiency (2001)



Box 13.1 Institutional Development of Water Utilities

For water utilities to become independent and financially sustainable enterprises, it is necessary that (i) water utilities be manned by qualified staff; (ii) water charges be increased to financially viable levels; (iii) management information, accounting, and accounting systems, including billing and collection, be improved; (iv) a degree of real autonomy and accountability be established; and (v) O&M be improved and NRW reduced to acceptable levels. ADB did address these matters, but such institutional development efforts proved to be inadequate in making a significant impact on water utilities. New measures that may be considered include wider application of commercial management principles, broader use of competition, and increased involvement of users and stakeholders where commercial and competitive action is constrained. Experience has shown that one factor that influenced the success of water utilities was the degree of autonomy that utilities had in planning and operations. More managerial and financial autonomy and more accountability of performance are needed. (ADB, 1994)

If we analyze the current governance situation with respect to operations in a water utility, we can conclude that part of the problem lies in having owner, regulator, and operator as one entity—whereas it is generally acknowledged that in developing countries it would be best if these positions were separated. Self-regulation can only work in a highly disciplined society. If we have a transparent policy, an independent regulator, and an operator with incentives to perform, the situation may change.

If poor governance is at the root of the problem and government is in control, we cannot ask government to reform itself. There is too much vested interest, and too many people are too comfortable with the status quo. We must go outside government to the people who are most affected, such as the urban poor not being served who pay $5/m³ to water vendors. Civil society must put pressure on governments for reforms, and it can do this if it understands the issues and is interested in doing something for the poor and the ill-served. We can begin with transparent policies and a civil society that holds governments accountable for implementing these policies.

There is no question that water utility operators need to have incentives, autonomy, accountability, and the ability to perform. Incentives and the ability to perform can come only when staff are opened up to market forces. As the Executive Director of Dhaka's Water Supply and Sewerage Authority opined, "Why do developing country governments think we can run a multimillion-dollar per year commercial business with civil servant rules and civil servant salaries?" This cannot be done, and the highly successful Singapore Public Utilities Board, which pays its top management staff more than $150,000 per annum—because that is what they would be paid in the private sector—illustrates the point. Bangkok's Metropolitan Waterworks Authority, another better managed utility in Asia, pays its top managers salaries that are comparable with those paid in the private sector. Besides, if you want to limit corruption, you should remove incentives for corruption.

Autonomy and accountability for operators will come with a transparent policy and independent regulation. Operators need to know what is expected of them and that the public will hold them responsible.

B. Projects

When the Nepal Water Supply Corporation was criticized for its poor performance, comments focused on two areas—utility operation and project management. Neither, of course, was in their hands, because of outside interference. The current situation for project management in many water supplies in developing countries is characterized by outside interference, and the effects are far greater than most can see. We can start with outside interference in extending water distribution systems beyond their capacity to provide a 24-hour supply. Take for example the case of the Nepal Water Supply Corporation in Kathmandu. Despite having water for one hour every other day in the dry season, this utility is adding 5,000 connections per year because of the demands of elected officials. These officials should be held accountable for the extra costs associated with health risks arising from intermittent water supply and for household coping costs, including storage, pumping, and treatment.

Then there is the choice of location for investments. It is fairly common to see investments occur in the hometowns of government leaders. When this

happens, feasibility studies can be subverted if leaders push for investments that cannot be sustained. In these instances it would not be prudent for governments to provide O&M subsidies to these water supplies indefinitely. Other leaders, however, prefer to spread investments thinly. When this occurs, efficiency may be sacrificed for popularity. The result is that many things are not addressed thoroughly for the future, which means that the poor are often neglected in favor of new investments, partly because they have no voice and partly because some leaders might have other interests in maintaining the status quo, including condoning syndicates. Pork barrel spending subverts policy and allows some officials to promote their personal agendas. Investment policies are ignored when elected officials support short-term projects that are politically expedient and can be completed during their own terms in office. This is incompatible with developing water supplies for sustainability.

When it comes to project management, development agency-financed projects in particular are hindered by the involvement of elected officials. It is claimed that consultants and contractors are expected to favor elected and appointed government officials with percentages of their contracts. Otherwise their bids will not be considered. Payments are made first for shortlisting or prequalification, then again for the winning bid. Naturally, this means that consultants and contractors must share the blame with officials for perpetuating this system.

The consequences are far-reaching and aggregated. When consultants' fees are squeezed, they can scarcely make a profit, so they skimp on supervising construction. When contractors are squeezed, what was to be their profit disappears. The only way they can compensate is to lower specifications on materials and civil works. This, of course, is aided and abetted by consultants who cannot provide adequate supervision. One result is that pipelines that were made to last for 40 years may end up serving for less than 10 years, because lower pressure rating pipe may be installed and inadequate bedding and backfilling may be used. When this happens, traffic damages the pipes. Another result is that steel can be left out of structures, and lower quality concrete can be supplied. If this happens, safety will be at risk, because water retaining structures may leak, and corrosion may set in on the reinforcing steel very early in its life. In addition, fittings that are not properly protected against corrosion can be supplied.

When development agency financing is involved, governments almost always call for less international

Construction standards?

consultant input, which might be a way of preventing close scrutiny of procurement and construction. At times, governments might try to downgrade international competitive bidding to local competitive bidding. One reason for this could be that local contractors are more easily controlled. It is not uncommon for civil servants working alongside consultants to be paid under the table by these consultants to gain their full cooperation. It has been said that there is a pervasive lack of professionalism among local consultants and government staff. When international consultants and contractors take the view "when in Rome," their professionalism is lowered, too. When a long time is taken in procuring goods or recruiting consultants, it is possible that corruption could be a cause. Leaders might be motivated to approve agreements of this kind, if they are given the chance to visit countries of suppliers or consultants without charge as a favor for appointment. Estimated costs are often inflated to take into account the so-called bribery and corruption factor. Finally, the cost of facilitation in developing countries is considerable. Knowledge is power, and two government agencies, such as one for irrigation and one for water supply, will not necessarily cooperate with each other unless the wheels are oiled. This is all part of the "governance scene." All this is not to say that developing country governments are the only ones at fault. Development agencies and consultants contribute to this unsavory situation, too (see Box 13.2).

In terms of governance and projects, the following can be concluded. A transparent investment policy would certainly help lay the foundation for good governance. This should spell out the criteria to be met and what the overall objectives and goals are. Civil society can then monitor performance while implementating the policy. Providing service to the urban poor should be at the top of the policy list. Consulting and procurement can be taken right out of government's hands and

Box 13.2 Examples of Corruption in South Asia (provided by voluntary informants)

- *Contract kickbacks occur in procuring goods (10–15%), civil works (25%), engineering design (20%), technical assistance (12–15%).*
- *Quality control problems arise in pipe class (PVC), cement, trench depth and width, taps and fittings specifications, aggregate size, corrugated iron thickness and galvanizing standards, dimensions of concrete structures, number and thickness of reinforcing bars, etc.*
- *Political influence is exerted through ministries in prequalifying contractors and consultants; using inappropriate techniques when appointing technical evaluation committees; using incorrect procedures for the constitution of cabinet level tender boards; providing false information to development agencies; collecting money from contractors, suppliers, and consultants for electioneering; harassing contractors to receive money (delaying approvals); extending contracts for unnecessary work; protecting unfit contractors; approving incorrect payments; directly negotiating with contractors over claims; harassing contractors over delays in paying agreed commissions on bribes; and terminating and suspending contracts to exact revenge.*
- *Sector institution corruption includes drawing up specifications to favor certain suppliers, releasing documents and estimates to contractors prior to bidding, having government officials prepare contract bidding documents, paying government officials during tender evaluation, and delaying payment on contractor invoices until bribes are paid. The methods of collecting money are usually through local agents using direct payments with cash notes or deposits in foreign bank accounts; sponsoring foreign tours; covering the costs of educating children in developed countries; and purchasing luxury homes and vehicles. Entertainment costs for government officials during study tours and inspection visits related to the contracts can include payments for shopping and entertainment. Payments are usually made out of the mobilization or advance payment from the development agency.*

subcontracted to a project management team. The performance of this team in complying with the guidelines or rules and regulations can be audited from time to time. Of course, this outsourcing can be done voluntarily (as of now) or it can be mandatory (when the tariff increases to a level that puts consumers in control). Development agencies can get tough on the implementation of loan covenants and provide far closer audits of quality control. Development agencies can also look at reducing bureaucracy, so that projects are implemented in 2 years instead of 8 years. And last, development agencies can more actively promote professional societies and professionalism in developing countries. But before any of this can happen, governments must provide clear policy directions on water resources management, including allocating and trading water rights, pollution control, watershed protection and rehabilitation, and groundwater use for industry.

C. Tariffs and Governance

Since the money trail and power run through governments when there are high subsidies and low tariffs, the answer is to raise tariffs. The more consumers pay, the more power they will have to demand better service.

Policies need to include much higher tariffs that are compatible with full cost recovery. There must be a move toward tariffs covering investments directly and governance shifts from governments being in control to consumers being in control. Some government officials, however, may be reluctant to let this happen, as they currently benefit from improprieties when they control funds that are maintained through high subsidies to water supplies.

D. Public Awareness and Transparency

Corruption can be addressed by increasing transparency in operations, empowering civil organizations through information and involvement, and rationalizing and enforcing laws that already exist. What exist now that did not in the past are the Internet and civil society (represented by NGOs, journalists, and academics who are becoming much better informed about the world around them). Moreover, there are few excuses for not having excellent information upon which management decisions can be made. Computerization has made all that possible.

E. Private Sector Participation as a Solution to Corruption

While it has been suggested by some that PSP is a solution to the problem of corruption in water supply, others note that some big private operators have already been convicted of corruption.

Governance (Problems) in a Nutshell

- Bureaucracy feeds corruption.
- Political interference (corruption) exists in projects and in operations.
- Snowball effect of corruption in consultant recruitment and procurement is devastating.
- Low tariffs feed corruption.
- Autonomy of utilities is denied.
- Money trail runs through governments.
- Poor governance and low tariffs are at the core of all problems.

Governance (Solutions) in a Nutshell

- Transparent policies and independent regulators are needed.
- Tariff reform to put consumers in control is necessary.
- Civil society involvement is a must.
- Good things happen when tariffs are raised.
- Governance is at the core of all solutions.

Chapter 14

Government Policy

If governance is both a core problem and part of a core solution, the transparency and implementation of government policies are the criteria against which governance can be measured. This chapter looks at what has happened to government policies in the past and then explores what should be addressed in government policies on water supply and sanitation in the urban context, who should be consulted during the policy formulation process, in what form policies can be communicated, and how policies should be monitored.

A. A Framework for the Policy

ADB's water policy notes that national water policies should address both resource management and service delivery aspects. Effective water policies will involve several reforms, including the development of a neutral sector apex body that can oversee the policy formulation and sector reform processes. ADB will provide support for the review and revision of legislation, particularly in water rights and allocation among competing uses, water quality standards, groundwater use, demand management, resource conservation, private participation, and institutional responsibilities for water sector functions at national, regional, or basin levels. ADB will continue to press for and support policies that provide the explicit participation of the poor in water and related projects. ADB recognizes that women are important water users, clients, and beneficiaries, as well as managers of water for family nutrition, hygiene, and health and community activities. Equally, women are development agents, professionals, and decision makers in water sector activities. ADB will therefore promote the integration of gender concerns in policies, plans, programs, and projects.

The following findings from ADB's Sector Synthesis of Post-Evaluation Findings in the Water Supply and Sanitation Sector (1994) indicate the areas of concern in the sector and some elements water supply and sanitation policies should be addressing.

- Political hesitancy related to regularly raising tariffs could possibly be overcome through a combination of (i) continued policy dialogue supported by progressive privatization congruent with market values of water and (ii) direct ADB assistance aimed at supporting consumers' education and making them more aware of the value of water, the costs of treatment and supply, and the need for both conservation and further capacity expansion of the supply system.
- The extent to which benefits from water supply are likely to be sustained will depend upon greater recognition of the role that prices can play in managing water demand to expand supply and protect the environment.
- Focus should be on reducing water losses and wastage rather than investing in supply capacity expansion and new distribution systems.
- Rigorous socioeconomic research is required to provide a better understanding of the market for piped water and the response of consumers to different service standards, tariff levels, and pricing structures.
- Several new systems were reported to be underutilized. This was largely due to slower-than-expected growth in water demand, which resulted from unrealistic targets for users of public taps, declining household income, and increased water prices. Slow growth in demand was also in part due to the existence of alternative water supplies and the perceived difference between piped and natural supplies.

Extracts from a draft vision for Gujarat (India) appear in Box 14.1. These extracts could form the basis for preparing a more specific national or state policy.

B. Transparency and Policy

Why is government policy important? Governments have had policies in the past, and policy statements were agreed with development agencies as conditions for loans. Sadly, these policies too often did not translate into actions and were thwarted by the ad hoc involvement of elected officials in management and decision-making processes. The most telling part about these policies was their lack of transparency. In other words, the public did not know about them. Civil society,

Box 14.1 Draft Gujarat Vision for Water Supply and Sanitation, 2010

- ***Human Rights***—*Access to safe water and sanitation is recognized as a human right and citizens are active partners and managers in water and sanitation services.*
- ***Water Supply***—*Everyone has access through a connection to a regular, reliable, and affordable supply of adequately safe water through systems that are socially acceptable, environmentally sustainable, technologically and economically viable, and managed in a way that is centered on people. Every public tap gives potable water.*
- ***Water Resources***—*Integrated water resources management is practiced at all levels.*
- ***Sanitation***—*Everyone has access to latrines connected to waste disposal systems. All schools have latrines for boys and girls. Slum dwellers also have sanitation.*
- ***Health and Hygiene***—*These are strongly promoted.*
- ***Information, Education, and Communication*** —*These are promoted.*
- ***Equity***—*Gender, religion, class, caste, and community equity are attained. Slum settlements are integrated into urban water supply and sanitation systems. Women are involved in decision making for natural resources management. Instances of girls dropping out of school on account of water and sanitation are eliminated.*
- ***Financial and Economic***—*Users are paying for services. They pay according to the level of service they want and are willing to pay for. O&M costs involve communities. Household contributions toward both capital and service costs, routed through communities, make the water supply system more sustainable. Community groups monitor service charges as well as maintenance. Water charges are raised at a progressive rate in urban areas. In urban areas pay-and-use sanitation systems are available.*
- ***Water Technology***—*All urban structures have rainwater harvesting facilities. Local sources predominate in drinking water supply. Tanker supplies are reduced to a minimum. Research and development are promoted. Desalinization is introduced.*
- ***Water Recycling***—*All high-rises and large structures have recycling facilities. At least 50% of water used is recycled. Storm water is used to recharge underground aquifers.*
- ***Sanitation Technology***—*Water use is minimized. Manual handling of excreta is banished.*
- ***State Institutions***—*Government monopoly is transformed into facilitation. The Gujarat Water Authority oversees the water sector and undertakes water accounting and auditing. Good governance, transparency, and accountability are practiced. Each district has its own water authority.*
- ***Civil Society and Market Institutions***—*The Gujarat Water Authority, set up as an autonomous body with full stakeholder participation, is the apex organization in charge of regulating all water resources in Gujarat. Civil society is an active participant in it. Water committees are functional in every community. User groups have been trained. Local people's institutions are legally empowered. Thirty percent of larger schemes are maintained through private sector initiatives. Civil society in general and women in particular are involved in planning. A positive and synergistic partnership between communities, government, the private sector, and NGOs is established.*
- ***Policy, Legislation, and Regulation***—*Policy framework toward decentralized control as well as responsibilities is centered on people and gives opportunity for employment creation, leading to greater self-sufficiency and sustainability of services. Gujarat has a water policy and legislation to back up its actions. Drinking water gets first claim on water supplies. A regulatory framework has been developed to encourage and control private operators of water and sanitation services. Recognition and incentives for drinking water and sanitation performance are given. Regional water supply schemes are adopted as a last resort or backup system. Industrial pollution is controlled. Conflict resolution mechanisms are put in place.* (National Institute of Design, Gujarat, Jal-Disha, 2000)

therefore, could not share in the policy making or monitor implementation. What is needed first is stakeholder consultation, followed by policy statements for the public that are put up on walls, printed in newspapers, posted on the Internet, broadcast over the radio, etc., in the national language, for everyone to see or hear. In some countries this might be enough. In other countries it may be necessary to introduce independent regulatory bodies to oversee implementation. If elected officials continue to influence management and decision making, the final line of defense would be private sector contracts for the development and management of water supplies. If there are transparent policies, independent regulators, and operators with incentives to perform, the situation may change. Because governments set the policies, there can be no advancing until policy statements have been agreed.

C. Scope of Water Supply and Sanitation Policy

Scope of Policy

It is best to start with those who have no piped water. Policies on new connections and on new investments and their locations and priorities are needed. Once these are established, those served with standpipes should be considered, as well as when and how these people are going to get direct connections. Next, intermittent water supply needs to be reviewed, to provide a policy on 24-hour supply. A policy on water quality is needed. Most of all, a clear policy on tariffs and subsidies and how subsidies may be phased out is needed. The financing policy must be spelled out. Where the funds will come from for investments must be decided. There need to be policies on demand management and water conservation. Certainly, policies on PSP need to be explained. Policies on competition for operating water supplies need to be defined. Decisions must be made in terms of who will be responsible for given water supplies—national water authorities, local authorities, or private operators. Policies covering the operations and investments of SSWPs should be created. Policies on incentives for water operators, designed to improve performance and benchmarking of that performance, are needed. Crosscutting policies on service to the urban poor are needed. Policies on watershed rehabilitation are needed. Policies on wastewater pollution and control, wastewater recycling, rainwater harvesting, and trading water rights should be considered. While these needs are mostly related to water supply, policies on sanitation are needed as well. These should cover service levels (sewerage, septic tanks, and latrines), tariffs, and financing in particular. The question of who will have institutional responsibility must be answered, and the financing terms need to be defined.

Policies are dynamic and can change with time. But what is needed for formulating sound policies is good field data and appropriate analysis of data, which must be followed by discussions with stakeholders on the objectives, scope, and implementation of policies.

Community bathhouse—a matter of policy

New Investments

Considering those people living in urban areas not being served with piped water should be the starting point for investment policies. These are often the urban poor. Governments should first of all recognize the human right to water. Next, governments should address the issue of land tenure in relation to their policies of providing water to unauthorized settlements. In line with this, some questions need to be asked: What are the policies on the provision of water to new housing estates and industrial estates? What towns have the highest priority for new investments and why? What is the basis for declaring new investments financially viable? How do policies address natural and urban migration population growth? What is the end game for development agency borrowing or government borrowing? How can civil society monitor the implementation of investment policies? How are new investment policies linked with tariffs and subsidies policies? How do policies address the phasing out of standpipe supplies and the achievement of a 24-hour supply? What are the policies concerning the portion of the development budget going to water supply and sanitation? What portion will go to water supply versus sanitation?

New Connections

The policies on new connections, especially that part of them that relates to connection fees, should facilitate the urban poor obtaining direct connections. In new developments, connection fees can be included in development cost financing. In existing developments, the fees can be paid over 2–5 years with the monthly tariff.

Water Quality

Do governments have policies providing potable water at the tap in their piped water supplies? What are the standards of water quality that governments will be required to meet? What are the water quality monitoring policies that will safeguard the people from arsenic poisoning, bacterial contamination, or heavy metal toxicity? How does all this relate to intermittent supply? Finding the answers to these questions is the first step in determining the level of commitment of Asian governments to ensuring that the water being supplied is of acceptable quality.

Water Accountability

What are the policies on metering water production and consumption? If the job is worth doing, then surely it must be done well. With that in mind, what are the policies on meter replacement? What are the policies on reducing NRW, especially regarding illegal connections and leaks? In this age of information technology, administrative losses should be negligible.

Tariffs and Subsidies

Before these policies can be formulated, the existing subsidies should be clearly determined. The answers to the following questions will help in doing this. What are the policies on phasing out subsidies? What are the policies on national or scheme-specific tariffs? What are the cost recovery objectives? What about tariff structures? Should block tariffs be retained to give lifeline rates to the poor and penalty rates to high-volume consumers? (In a city where household income varies from $500 per year to $50,000 per year, block tariffs are essential.) Should those people receiving a 24-hour supply pay a higher tariff than those receiving intermittent supply? Should tariffs be raised in the dry season to introduce water conservation? What should be the ratio of industrial to domestic tariffs? What about the policy to reduce this ratio? To what extent should tariffs contribute directly to investments? (One hundred percent of water supply investments in large cities can be funded out of tariffs.) Should tariff policies tie tariffs to a maximum of 5% of household income? Should tariffs include or exclude sewerage charges? What are the tariff policies on sewerage? Are they designed just to collect O&M costs? What then are the policies on phasing in future capital costs? Should tariff increases be matched by service improvements as a matter of policy? Is it good policy to increase tariffs a little every month to achieve objectives, or is it better to have heavy increases from time to time? Should any scheme be subsidized to cover O&M costs? Why?

Financing

When considering issues related to financing, it might be helpful to ask the following questions. What are the policies on financing urban water supplies? What are the policies on financing urban sanitation? What are the mixtures of loans and grants to cities or utilities? What are the policies for phasing out grants? What are the onlending terms? Where will governments get the funds? What proportion of funds should be from World Bank, ADB, Japan Bank for International Cooperation, bilaterals, etc.? What proportion of investments will be funded directly out of tariffs? What are the policies for increasing this to 100% over time? What about municipal or utility bond issues? What about private sector financing of investments? What about BOTs? Most importantly, what is the end game for independence? What about options concerning alternative technologies that alter the need for vast public financing of water infrastructure, such as rainwater harvesting and eco-sanitation? Will governments provide financing for household rainwater harvesting and eco-sanitation? Will policies support local financing, suppliers, contractors, and consultants in lieu of those from abroad, as is now being proposed by NGOs for the Karachi Sewerage Project?

Private Sector Participation

What are government policies on PSP? Do these just amount to outsourcing? Do they include management contracts, leases, concessions, and BOTs? Do they include public-private partnerships? To what extent are the limits of international involvement constrained? Three steps in the development process appear to have been missed in much of Asia: (i) the creation of a public utility with a regulatory body, (ii) the addition of domestic PSP with a regulatory body, and (iii) the addition of international PSP with a regulatory body. Instead, a number of Asian governments jumped straight to international PSP and regulation by contract, and this is not working. It would, for this reason, be good to

see many more instances where domestic PSP with a regulatory body is introduced. The domestic private sector can provide good human resources management and financial management expertise. Occasionally, the international private sector could contribute through consultancies in the water supply technical field. What do governments expect from the private sector? Are investment monies expected? Is expertise in providing efficiencies expected? Are contracts to ensure autonomy expected? What are government policies on competition for private sector contracts? Will they relax prequalification based on government policies and enact these policies with regulatory bodies in place? Or will governments sign private sector contracts that lead to regulation by contract without basing these on government policies? In government policies, what incentives are to be offered to private sector operators? Will public sector operators be allowed to compete with private sector operators on a level playing field? How will governments ensure level playing fields when negotiating with private sector operators? Will consultants be employed to manage the process of change? What are government policies on redundant staff in water utilities? What are government policies on service to the urban poor under private sector operators? Will governments consider output-based subsidies? All these must be considered when the subject of PSP is raised.

Small-Scale Water Providers

Again, before governments can formulate policies on this subject, they need good data from the field related to these people and who they are, how much money they make, how many jobs are involved, what the price of the water is at the source and to customers, what the source of water is, what water quality is like, how much water is being provided, and how the customers regard this service. Governments must consider registration. Governments must consider financial assistance to SSWPs. They must consider employment issues both now and in the future. The policies on SSWPs must be closely linked with policies and priorities concerning investments. We should remember that the total revenue turnover from SSWPs in large cities is sometimes more than that of the formal water utilities.

Performance Incentives

Government policies must recognize that it is not possible to run major water utilities with civil servant rules and civil servant salaries. Staff need incentives to perform. Performance criteria must be set and staff held accountable for meeting these. Staff must be given training appropriate to their jobs. Policies on participation in national, regional, and international conferences help provide incentives to perform. Government policies that do not address this key issue of performance incentives will surely fail. Utilities must be required to report their performance on agreed performance indicators and show improvement over time. They should be required to compare themselves with others nationally, regionally, and internationally.

Water Conservation and Demand Management

Policies must be specific about how to effect water conservation. Will conservation efforts include watershed rehabilitation, reducing NRW, rainwater harvesting, wastewater recycling, and demand management through both public awareness and pricing? How will each one of these be implemented? Will implementation include working inside homes to eliminate leaks? Will it include extensive and continuous programs in schools? To what extent will the media be employed? How can implementation be monitored so that everyone can see the results? Rainwater harvesting in cities through the regulation of building permits and provision of incentives to households; demand management by pricing; and reducing NRW will be the most significant developments in cities of developing countries in the next 10 years. In addition, Asia cannot ignore the rehabilitation of its watersheds. Rehabilitation will not just happen. Government policies and a commitment to implementing them will be necessary.

Trading Water Rights

It should be remembered that around 90% of water is used for irrigation. With its rapid urbanization, Asia cannot ignore a comparison of the uses of water for irrigation and urban water supplies. Only when the price of urban water is 10 times the price of irrigation water will there be the proper incentive to trade water rights on a win-win basis. This is coming. The case of the Angat Dam in Manila is a good example. But first the legal ties dictating who owns the water must be loosened, and people must be prepared to trade or at least lease customary rights. Government policies on water supply and sanitation in cities must address this issue.

Can policy protect the poor?

After the meter—a matter of policy?

Wastewater and Sanitation

Government policies on water supply in cities cannot ignore the fact that first and foremost Asian countries need an integrated water resources management approach. This means especially that it is time for separate government agencies dealing with water resources, hydropower, irrigation, wastewater, and water supply to share information with one another and develop coordinated and integrated approaches to the development and management of water. Policies should refer to quality control on effluent discharged from industries. Policies should address the need for industries to treat effluents before discharge, the relocation of industries to industrial estates, and incentives offered to industries to either obtain good treatment or relocate. Policies should address the issue of combined or separate wastewater and domestic sewage treatment. And, policies should consider the issue of large or small sewerage schemes.

In terms of appropriate sanitation, policies should guide developers in the appropriate levels of service, such as conventional sewerage, small bore and/or condominial sewerage with local underground or landscaped sewage treatment, septic tanks, or latrines. Policies on septic tank desludging should be defined. Encouraging the use of eco-sanitation or other appropriate technology solutions should also be included in policies. We should not collect our wastes to put them in someone else's backyard. We should deal with them in our own backyard.

Institutions

Policies should define institutional responsibilities, since these overlap for many institutions in the water sector. Where reforms are taking place, policies should elaborate on the reforms and on who will be responsible for what. Do policies support decentralization or devolution of power to local authorities? If so, how will this be achieved? Have national water authorities become too big and inefficient, and will they need to be broken up and their work outsourced? Can regional centers that can run autonomously be created? These are all issues for government policies on water supply and sanitation. A checklist is provided in Box 14.2.

Box 14.2 Government Policy Checklist (Not Exclusive)

Policy statements for release to the public should at least address the following matters.

- Water supply service coverage
- Tariff policies and objectives
- Sewerage service coverage
- NRW
- Water availability (hours per day)
- Demand management
- Water quality
- Criteria for selecting investments
- Levels of service
- Accountability of utilities
- Service to the urban poor
- Accountability of water
- Water vending
- Accountability of finances
- Bottled water
- Public awareness
- Funding of source development
- Water pollution control
- Funding of capital investments
- Tariff structure
- Trading water rights
- Water extraction (groundwater)
- Subsidies and cross subsidies
- Watershed conservation
- Recovery of O&M costs of sewerage
- Private water supplies
- New connections
- Reselling water
- Operator performance
- PSP
- Operator incentives
- Regulation
- Staff numbers
- Illegal connections
- Wastewater and sanitation
- Institutional responsibilities

D. Policy, Regulation, and Civil Society

Governments have a right to formulate their own policies (preferably in consultation with stakeholders and civil society). But for governments to be held accountable for implementing those policies, these must be made available to the people—and this means those connected to piped water (the customer or consumer) and those not connected to piped water. NGOs and the media can play an important role in bringing this policy to the people and in monitoring its implementation.

Independent regulatory bodies will go a long way toward ensuring that there is a continuous focus on the implementation of government policies, whether the focus is on actions of government agencies or those of water utilities. This focus will also give civil society a focal point for gathering information and expressing people's views. Without civil society and regulatory bodies keeping an eye on the implementation of government policies, nothing from the past will change—and the chances of good governance and sustainable tariffs being achieved are low.

From the utility point of view, government policies on autonomy and tariffs are paramount. Utilities should be heartened when regulatory bodies and civil society monitor the implementation of those policies.

Government Policy in a Nutshell

- Obtain good field data and analyze them.
- Consult with stakeholders and civil society.
- Address governance and tariff issues.
- Address NRW, service levels, SSWPs, and the urban poor.
- Address PSP and public utility performance incentives.
- Address the roles of institutions in the sector.
- Civil society will monitor policy implementation.
- Regulatory bodies will monitor policy implementation.
- NGOs and the media will bring policies to the people.

Chapter 15

Regulation and Benchmarking

By definition, regulation is about making and enforcing rules for, in this case, the development and management of urban water supplies and sanitation in developing countries. This book focuses mostly on economic regulation, which includes investment, tariffs, and service levels. Other regulation connected with urban water supplies includes water resources and environmental and health regulation, but these are all major fields by themselves.

ADB's water policy notes that, to serve the best interests of consumers and managers of water resources, the pricing and incentive and penalty systems, regardless of their simplicity or sophistication, require regulation. Regulatory systems need to be established to ensure that laws, standards, rules, and regulations are equitably and consistently applied.

This chapter touches on why regulation of water supplies has now become important, its objectives, what should be regulated, how the regulation should be undertaken, and who should be doing it. Some principles of regulation are put forward, and the summary findings from an ADB regional seminar on the regulation of water supplies, held in 2001, are listed. The importance of benchmarking the performance of water utilities is emphasized, and the contribution in this field of ADB's two water utilities data books is noted.

A. Purpose of Regulation

In most Asian countries, the entities in charge of water supply and sanitation are nominally given the responsibility of seeing that government policies and legislation are implemented. What is the reality? In a city-state, like Singapore, there is discipline and commitment by the Government, and the Singapore Public Utilities Board ends up self-regulating and doing a fine job. Many developed countries, although not perfect, operate in much the same fashion. But in many Asian countries, both legislation and policy are overlooked. Elected officials become involved in the development and management of water supplies on a daily basis. The crux of the problem is that water utilities do not have the autonomy needed (even though this is legislated) to manage their own affairs. The result has been low tariffs, intermittent water supply, a large number of urban poor not being served, and high NRW. This problem has also resulted in corrupt procurement, consultant recruitment, and contracting that have severely threatened economic lives of projects. Even though self-regulation was not working in several South Asian and Southeast Asian countries, until very recently there was no move to introduce independent regulation.

Then along came "privatization," and suddenly it was realized that, in the best interest of civil society, Asia should have regulatory bodies to see that the private sector does not abuse its monopoly privilege. But regulatory bodies take time to develop. So, in the meantime, Asia has effectively had regulation by contract. Private sector contracts have not been based on declared government policies, but on an ad hoc set of rules determined at the time by the contracting parties.

When regulatory bodies were set up, such as in Manila, they were not true regulatory bodies. Instead, they were more like contract administrators. While development agencies generally agree that to enter into a private sector contract without first establishing regulatory arrangements is a recipe for disaster, the reality is that over the last 10 years in most developing countries there was only regulation by contract. The example of Manila is a classic case, but it is typical of what has been happening elsewhere in the world. Of course, in most cases, the private sector wants regulation by contract, because private operators will not then be affected by changes in government policies. But as the private sector found in Jakarta, a contract is little protection from the will of the people. Nevertheless, independent regulation can encourage the private sector to invest in Asian water supplies by providing a more stable, transparent, and accountable environment.

Now let us consider public water supplies in urban areas of Asian developing countries. Can regulation help them? Well, one main purpose of regulation is to gain autonomy for utilities. That starts with transparent government policies. In many countries, transparent government policies and regulatory bodies are both needed for utilities to maintain an arm's length separation from elected officials.

B. Objectives

We can see from the statements above that one main objective of regulation is to ensure that water utilities have the autonomy needed to comply with government policies and legislation. But how does this work? First, regulation must have its basis in government policies and legislation. Second, while the regulator does not implement policies, it must monitor the implementation of policies. And, third, a regulator should ask many questions, which might include the following. Is the Government facilitating the implementation of its policies? Is the water utility complying with these? Are private sector contracts also in compliance?

Regulation must apply to all water operators, not just those in the private sector. Regulation brings with it sector transparency, accountability, equitability, and efficiency. Regulatory bodies are the entities that civil society can turn to if it is not getting the services it expects. Regulatory bodies must protect consumer interests. And, they must equally protect operator interests. Regulators should not be tasked with administering contracts. That is between owners and contractors. Regulatory bodies should only be tasked with seeing that contracts conform to policies and that policies are implemented. Regulation is not control.

Another objective of regulation is good governance. This applies to corruption in decision making related to the implementation of water supply and sanitation projects as well as new connections, utility staffing, disconnections and illegal connections, and syndicates like those that control informal service providers of water.

C. Scope of Regulation

The first question to decide is the geographic extent of regulation. Should regulation be carried out on the national, state, provincial, or municipal level? Is a multiple sector regulator best? The second question to decide is what policies will fall under this regulator. Is it possible that a regulator could start with a few things to regulate and in time phase in more and more? Regulation is a process or journey. For example, even now water quality is being more closely regulated every year in developed countries. For economic regulation, the first priorities might be water supply investments, tariffs, service levels, and incentives for and performance of operators. If water supplies are bundled from source to consumer, they will be easier to regulate. In fact, if any operator does not have control over the source of water, it will be very difficult to tie that operator to contractual obligations.

Tariffs, the lifeblood of any water utility, are the first and most important matter to be regulated. It should be noted that regulators do not set tariffs but approve them after confirming that they conform to government policies. Political obligations should not influence tariff decisions. Tariff structures may also be regulated in terms of objectives, such as serving the urban poor and demand management.

Investment proposals need to conform to government policies, including economic, financial, environmental, and social feasibility on the one hand and priority locations for poverty reduction on the other. Procurement, consulting, and construction must be audited from time to time to see that they conform to policies.

Service levels need to be defined and operators held responsible for providing those service levels. This includes piped water coverage, water quality, 24-hour supply, and phasing out standpipes. It may also include public toilets, on-site sanitation, and septic tank sludge disposal.

Water utility operator performance needs to be regulated. Performance indicators can include the number of connections, production volume, NRW, 24-hour supply, water quality, staff per 1,000 connections, metering, billing and collection, and operating ratio. An independent public audit of the water balance and of service levels should be conducted from time to time. Profit or other incentives need to be linked to performance, both in terms of bonuses and penalties. A regulator must determine which targets are satisfactory by benchmarking over time a utility's present performance against its past performance and the performance of others in the sector operating nationally and regionally.

Competition for water supply contracts must be regulated. While competent operators are necessary, broad competition is desirable also. This has been one major failure of the "privatization" process over the last 10 years. Competition has been limited to a select few contractors.

Groundwater regulation is also needed in most Asian cities. Who should be responsible for this is often debated. One opinion is that groundwater regulation is so intimately linked to the water supply itself that it should come under the economic regulator.

We need specific regulation of service to the urban poor. This will address the payment of connection fees, access to piped water, block tariffs, and freedom of information. It will also address SSWPs.

Water conservation must also be regulated. This can include public awareness, education, watershed protection, rainwater harvesting, reducing NRW, and demand management through pricing. Economic regulators will need to coordinate with water resources, environment, and health regulators on these matters.

D. How to Regulate

There is little experience in regulating water supplies in developing countries. Chile provides perhaps one of the better examples, and the main feature is that this country has considerable financial and human resources to carry out various tasks. It uses a hypothetical model to determine the operator's target efficiencies. It also has introduced direct subsidies to low-income consumers on a means basis. There is, however, no blueprint. Each country, and even each location within a country, will have its own characteristics that need to be considered when deciding how to regulate. It is good to remember that regulation is a dynamic process that takes time. The journey should be designed. Consumers are the ultimate regulators. Regulation should involve monitoring, not control. It should be remembered that regulation already exists, but it is mostly not structured, strong, or independent. Regulators do not provide water. Regulators must have access to information. Most information can be provided by water utilities as part of their management regime. Regulators can independently check this information on a sample or audit basis. It is also very important to agree on the validity of information. For example, how will NRW be estimated when the whole system is not metered and half the meters are not working anyway? There is an old adage: if you cannot measure, you cannot manage. That is very relevant to water supplies of developing countries. Regulators should be involved in the process leading up to the signing of a contract with a private sector operator. This is primarily to ensure that it is compatible with government policies. It has been said that regulatory principles should include social equity combined with financial sustainability in a transparent manner. There is a need to ensure that policy, regulation, and operation are separated. Almost everyone agrees that having relatively high tariffs will mean fewer problems. A rigorous analysis of subsidies will help. In fact, it could be said that unless governments are committed to higher tariffs, compatible with full cost recovery, as a matter of policy, most regulation will be of little use. An active consumer body will be healthy for regulators. Civil society in the form of journalists, academics, and NGOs should keep regulators on their toes.

E. Choosing Regulators

There are perhaps three schools of thought here. One is that one person should be appointed as the regulator. This person does not necessarily need to be an expert in anything, but he or she should be regarded highly by most people from most political parties. The regulator would have a team of experts in law, water, finance, economics, and social capital to collect and analyze information and advise him or her. The second school of thought is that a regulatory body should be formed by the experts themselves, totaling not less than three or more than five persons. The third school of thought is that the regulatory body should comprise people representing the stakeholders, including industrial and domestic consumers, operators, and local governments. Common to all these is the thought that there should be appropriate gender representation in the regulatory body, since women are often the main providers of water at the household level. The regulatory body needs adequate finances to function properly, and it is commonly believed that these should be sourced from tariffs to retain independence from government and should be in the order of 1–2% of the revenue gained from tariffs. Most agree that the success of a regulatory body could depend on its having (i) a clear mandate, (ii) autonomy, (iii) accountability through arbitration, (iv) transparency, (v) stability, (vi) professionalism, and (vii) objectivity. Whoever the regulators are, they need continued education and the ability to network with other regulators in the Asian region. ADB has been supporting this approach.[16] Other advice indicates that regulators should be of the highest caliber and possess great personal integrity to resist political overtones.

F. Principles of Regulation

Regulation must be based on a transparent government policy. Private sector contracts must also be based on that policy. Regulation by contract is not a solution. Regulation should apply to all water supply operators, be they private sector, national authority, or local authority. Regulation is needed to provide autonomy to the water utility and to improve governance. In doing this, it will encourage private sector investment. The principles of accountability, efficiency, equitability, and transparency should be objectives of a regulatory body. Without a government policy that embraces the provision of incentives to operators for performance and a commitment to much higher domestic tariffs, the

[16] Regulatory Systems and Networking of Water Utilities and Regulatory Bodies (ADB, 2001b).

benefits of a regulatory body will be negligible. A summary of findings from a regional seminar on regulatory systems, held at ADB in 2001, is given in Box 15.1.

G. Benchmarking

It is necessary to differentiate between metric benchmarking and process benchmarking. The former is a quantitative aspect and includes collecting and analyzing data leading to the identification of areas of relatively good and poor performance. The latter concentrates on improving the current work process to meet or exceed the targets set by metric benchmarking. Process benchmarking does this by breaking down current work practices into a series of small steps that are then compared with best practices in other organizations outside the industry.

The ADB *Water Utilities Data Book—Asian and Pacific Region* (1993) and *Second Water Utilities Data Book—Asian and Pacific Region* (1997) provide information that allows water utilities to assess their rank among themselves in terms of various performance parameters. They also allow one utility to assess its own performance over time. A good way to get started is for every utility to set itself no more than 10 performance targets that are manageable (see Box 15.2). If tariff

Box 15.1 Summary of Findings—Regional Seminar on Regulation of Water Supplies

- Sound regulation will attract investment.
- In Chile, the head of the regulatory body is appointed directly by the President.
- Regulation of water vendors is needed, too.[a]
- Five caveats: equitability, efficiency, accountability, transparency, and sustainability.
- Three more: performance standards, incentives, and competition.
- Regulation is based on policy and any PSP or other contract must comply with policy.
- The PRC has National Tariff Guidelines and a Municipal Price Bureau.
- Having a transparent policy that the public is aware of is itself a regulatory function.
- Legislation is necessary but not sufficient. A regulatory body can oversee.
- Civil society is the ultimate regulator.
- What we have today is the information age, including the Internet, E-mail, and mobile phones. The media can tap into this to bring information to the grassroots level. Therefore, we have an opportunity for transparency. But are all governments ready for transparency?
- Active consumer NGOs can serve as watchdogs.
- Operators must have contracts for performance. Regulators may suggest actions to be taken to improve performance.
- Benchmarking water utilities at country, regional, and international levels is important. This information must also be made available to the public, so it can see how one utility is doing compared with others (ADB water utilities data books).
- If you cannot measure it, you cannot manage it.
- Protection of customer interests is important.
- Regulators must have access to information.
- Regulation in Colombia is based on principles of social equity, financial sustainability, and transparency.
- Regulation in Zambia includes a board of stakeholders and team of experts. Policy came first.
- It is important to get strong skills in a regulator.
- There should be a code of practice for operators with obligations to consumers.
- Regulation is a dynamic process. The journey needs to be designed. Start simple.
- Regulation needs flexibility .
- Anything can work if there is a strong political will. (ADB, 2001b)

[a] The latest thinking is that this should be limited in the short term to registration.

policies and loan covenants are to include references to O&M, it is essential that every utility clearly defines O&M. Likewise, it is important to differentiate between NRW and UFW (see Chapter 9). Preparation and timely publication of an annual report on operations are essential for the accountability of the utility to the government and the public. This report can include the information listed in Box 15.2.

Box 15.2 Suggested Indicators for City Water Supply

- Population in city (persons)
- Piped water production (m^3 per day)
- Number of household connections (persons per household)
- Number of standpipes (persons per standpipe)
- 24-hour supply in service area (%)
- Per capita consumption from house connections (l/c/d)
- NRW (percentage of production)
- Average actual domestic tariff ($/$m^3$)
- Operating ratio (expenses against revenue)
- Utility staff per 1,000 connections

H. Evaluation of Water Utilities

This is becoming more and more important as a means of determining whether a utility represents a good investment for development agencies or the private sector. The evaluation needs to be made in two parts. The first part relates to the degree of autonomy of a water utility in terms of governance. These are factors normally outside the control of a utility. The second part relates to aspects under the control of a utility, such as consumer satisfaction, water management, and accountability.

Tables 15.1 and 15.2 can be used as a basis for deriving detailed evaluation criteria for each subheading, so that it is then possible to compare "apples with apples" each year. Development agencies can prepare their own detailed evaluation criteria, so that they can compare utilities on the same basis.

Table 15.1 Evaluation of Water Utilities (Part A)—Governance

• Transparent Policies	20%
• Independent Regulatory Bodies	10%
• Private Sector Participation	10%
• Civil Society Involvement	10%
• Subsidies (low)	10%
• Tariffs per Policy	20%
• Utility with Autonomy	20%
	100%

Table 15.2 Evaluation of Water Utilities (Part B)—Utility Performance

Consumer Satisfaction		40%
Coverage	10%	
Water Availability (24 hours)	10%	
Service Level	10%	
New Connection Fee	10%	
Water Management		20%
Metering	5%	
NRW	10%	
Consumption	5%	
Financial Management		20%
Self-Financed Investments	5%	
Operating Ratio	10%	
Accounts Receivable	5%	
Human Resource Management		10%
Staff per 1,000 Connections	5%	
Management Salaries	5%	
Accountability		10%
Annual Report	10%	
		100%

I. Public Audit

From time to time, but not less than every 5 years, it will be necessary for regulatory bodies to conduct independent public audits on the water balance and on water service levels. This will establish clearly the elements of NRW, so they may be appropriately addressed, and ascertain where the focus should be placed with regard to capital works designed to connect those people not connected to piped water. It is important to conduct these audits at the same time, so that a check on compatibility of findings can be made.

Utility water audits should of course follow the elements shown in Box 9.2. But under "Authorized Consumption" there should be a further breakdown into (i) Illegal Connection for Own Use and (ii) Illegal Sale. Likewise, "Metering Inaccuracies" can be broken down into (i) No Meters, (ii) Meters Not Working, (iii) Meters Not Recording Accurately, and (iv) Meters Misread.

Audits of water service levels must start with total populations of cities and account for all people by noting their sources of water (often more than one), the quantities of water consumed monthly from each source, and the amounts paid for that water.

The different categories audited may include (on the source side) water utilities (legal), water utilities (illegal), groundwater (own), and groundwater (others). For service levels, there will be a range of possibilities, including house connection; shared house connection; purchase from neighbor, public tank, public tap (standpipe), tanker, or water vendor; public dug well; public tubewell; own dug well; and own tubewell. To have good public audits of service levels, it will be necessary to register all SSWPs.

Regulation and Benchmarking in a Nutshell

- Regulation and benchmarking should be based on transparent government policy.
- The objective is autonomy and good governance through accountability, transparency, equitability, and efficiency.
- Why, what, who, and how must be addressed.
- There are three options: (i) one regulator, (ii) body of experts, or (iii) body of stakeholders.
- Civil society is the ultimate regulator.
- PSP contracts should be based on policy, not on regulation by contract.
- PSP and public water supplies should be regulated.
- Information technology improves transparency.
- Operators need incentives based on performance.
- Stakeholders should design the journey, which is a dynamic process.
- Benchmarking is fundamental to regulation.
- Evaluating utilities on governance and performance is desirable.

Chapter 16

Civil Society Involvement

Civil society includes all stakeholders with interests in the water sector (consumers, NGOs, academics, journalists, etc.). These stakeholders are important because, ultimately, the pressure (on governments) for necessary reforms is going to have to come from civil society, not development agencies. The first step in this process is for civil society to become much better informed, which was the main finding of *Water in Asian Cities—The Role of Civil Society*, the regional consultation held at ADB in October 2002. This chapter starts with what consumers are saying, looks at special findings from the regional consultation, then deals with issues of governance. It goes on to explore what can happen when the consumer is in control, expands on public awareness and transparency, then identifies some specific roles for NGOs, academics, and journalists. Appendix 1 contains views from civil society.

Water projects supported by ADB will incorporate carefully designed components that promote the participation of civil society in identifying needs and issues, designing solutions, and establishing mechanisms for monitoring and dispute resolution.

A. What the Consumers Are Saying

The following is a summary of the main points learned from numerous interviews with consumers in Asian cities conducted in 2001.

- Poor water quality is the main complaint.
- Intermittent supply (including power cuts) is the next complaint.
- Low pressure means household pumping—waiting in queues.
- They have difficulty in paying the water bill.
- Connection fee is high (corruption).
- There is a lack of consumer awareness about the issues and solutions.
- Groundwater levels are falling.
- Piped water service coverage is low, but there are tens of thousands of applications.
- People are willing to pay for good service—up to $10 per month.
- There are too many standpipes and not enough connections.
- Illegal connections abound.
- Meter reading is sometimes inaccurate.
- Utility staff fear they will lose their jobs if privatization comes.
- Unions and NGOs are against privatization—they say it will bring higher tariffs.
- High benefits to utility staff result in fewer illegal connections.
- Those not connected have no idea when they will get piped water.
- Paying the connection fee over 6–12 months is OK.

The conclusion is that governance and tariffs are the core problems, and promoting public awareness of the problems and solutions is the first requirement.

B. Regional Consultation Findings

Special findings from the ADB regional consultation in October 2002, *Water in Asian Cities—The Role of Civil Society*, are given below to further enhance stakeholder understanding and awareness.

- Large water supply projects can be completed by the private sector within 18 months.
- Use city forums (coalition of civil society groups).
- Consider rainwater harvesting in cities (India's Chennai is an example).
- Civil society can give a voice to the poor.
- Filmmaking can help, but target the audience and message.
- It is not just government boards that interfere in water utilities.
- Remove the biggest polluters from the cities.

- There is a need to protect watersheds—users must pay for this.
- Correct public utilities and be careful not to jump to PSP.
- Operators must have a social dimension and involve their customers.
- The rich and middle class get subsidies, not the poor.
- We must recognize SSWPs.
- Utilities should get involved in bottled water.
- Water and human values and water and culture are important.
- Property titles should never be an impediment to piped water.
- Development agencies should work with local governments and help attract local financing.

C. Issue of Governance[17]

If poor governance is at the root of the problem and government is in control, government cannot be asked to reform itself. There is too much vested interest, and people are too comfortable with the status quo. Efforts must be made to go outside government to the people who are most affected, such as the urban poor not being served who pay $5/m³ to water vendors. Civil society must put pressure on government, if reforms are to happen. This can be done when issues are understood and civil society is interested in doing something for the poor and the ill-served. We can begin with a transparent policy and a civil society that holds government accountable for implementing that policy.

D. When the Consumer is in Control

Information technology has allowed consumers to make informed choices and hold governments more accountable. In this context, the word "consumers" refers not only to those already receiving a service but also to those with the potential to receive that service.

Customer relationships count. Their experience matters. And they are in control when they have access to information. (Seybold, 2001)

When consumers are in control through paying the full cost of water service delivery, (i) corruption is minimized, (ii) there is more accountability for finances and water, (iii) there is more efficiency in water service delivery, (iv) there is more transparency regarding information, (v) there is more staff responsibility, (vi) service is more equitable, (vii) a consumer society will likely be formed, (viii) service levels will be reviewed, (ix) performance benchmarking is encouraged, and (x) there is pressure to improve service.

E. Public Awareness and Transparency

ADB will promote wide-ranging public awareness and community education programs—especially among women, youth, and farmer groups—to broadcast the message of water being a resource that needs prudent management. In particular, education that helps communities understand the links between water, sanitation, health, and productivity will be encouraged. ADB will incorporate components that educate industrial consumers on the efficient use of water and the need for higher prices for water use and efficient treatment and discharge.

The Internet helps civil society become better informed about the world. Once it is informed, civil society can help create the necessary public awareness to pressure governments into the right policies (those that will ensure that water is provided equitably) and encourage leaders to use the right strategy to implement these (for example, tariff reforms). Civil society can include all stakeholders—development agencies, served consumers, the urban poor not being served, utilities, the private sector, unions, civil servants, politicians, NGOs, journalists, and academics.

Objectives of Public Awareness

These may include the following:

- helping the public understand water service levels;
- educating the public about water use, including how to reduce waste in the home, and promoting good hygiene;
- educating the public about water conservation;
- helping the public understand where the cost of water comes from and why tariff increases are necessary;
- keeping the operator on its toes in terms of performance responsibilities;

[17] There is some repetition here from other parts of the book, but this ensures that due emphasis is placed on important matters and that this chapter can be more readily understood by itself.

- letting the public know about government policies and plans;
- informing the public about development agency funding and its requirements; and
- encouraging people to compare their water utility with others in the region.

Scope of Public Awareness Activities

These may include the following:

- appointing a public relations firm to prepare materials and programs;
- undertaking consumer and school surveys to test public knowledge and awareness;
- using media (radio, television, newspapers, and the Internet) at least monthly;
- explaining tariffs to the people;
- publishing the main findings of water utility annual reports;
- preparing textbooks for schools and educating teachers;
- forming consumer associations;
- explaining the role of the regulatory body to the public;
- explaining PSP to the public;
- surveying homes for water use and waste;
- establishing a consumer complaint response center;
- maintaining a utilities Web site and updating it daily on news and status of services;
- establishing a service for low-income consumers, which gives special attention to the poor;
- inviting the public to follow up on leak repairs;
- conducting public meetings with special interest groups;
- making short videos on different water supply situations to encourage public discussion;
- hiring an independent consultant to check operator performance;
- publicizing widely and continuously government policy and the status of its implementation, especially with regard to serving the urban poor;
- proactively preparing feature articles on water supply issues for the media;
- publishing comparative data from other utilities;
- publicizing activities and views of the principal regulator; and
- encouraging consumers to write to newspapers and regulators.

F. Role of NGOs

NGOs have a vital role to play in ensuring that the interests of the poor, those not connected, and the ill-served are safeguarded and that their voices are heard in public and private sector debates. NGOs can be initiators of consumer societies. In cooperation with academics, journalists, and regulators, they can monitor the implementation of government policy. The example of the NGO Forum for Water Supply and Sanitation in Kathmandu (Nepal), which was initially established with support from WaterAid, is one that could be replicated elsewhere. This organization has clearly demonstrated that, when they are well informed on the subject, the views of NGOs will be respected.

G. Role of Academics

Academics can keep an eye on the big picture. They can analyze subsidies in particular and report the amounts going to the poor or the rich. They can analyze tariffs and tariff structures. They can discuss questions of governance and PSP. They can analyze the water balance to see where water is being used and lost. And they can analyze the service levels and payments for water by urban residents. Recent studies on SSWPs have clearly identified the need to investigate these areas.

H. Role of the Media

Journalists can focus on the poor, the people not being served, tariffs, water utilities and their efficiency, the performance of governments in implementing their declared policies, and private sector involvement. But first they should spend time and effort in becoming educated on the subject. In every major city, at least one journalist could become an “expert” on water. While much material is available on the Internet, including the Web sites of water utilities, it is up to the media to bring this to the attention of those who do not have access to computers, which can be done by passing on this information via newspapers or radio.

Civil Society Involvement in a Nutshell

- Consumers indicate governance and tariffs are core problems.
- Focal points are NGOs, academics, and journalists. City forums help.
- Civil society needs to be better informed.
- Starting point is involvement through key stakeholder consultation in formulating government policy.
- Public awareness and transparency are keys to civil society involvement.
- When consumers pay the full price of water, they will be in the driving seat, which is the objective.
- Civil society should interact with the regulator.
- NGOs can champion the poor and can form consumer societies.
- Academics can investigate facts, especially concerning subsidies.
- The media can be powerful, but first it must be well informed.
- Civil society involvement promotes good governance by monitoring the implementation of government policy.

Chapter 17

Research

For an organization, institution, or government agency to be effective, it must constantly engage in research as a part of striving to do better. Research is needed in the urban water supply sector to provide awareness and understanding that in turn will give a basis for sound decision making. This chapter identifies topics that can be further investigated and researched, and it suggests some focal points for that research. In general, there is a need for balanced research that takes into account social, economic, and environmental considerations. It is important that the results of research be shared, which can be done by posting these results on the Internet.

A. Topics for Research

Intermittent Supply

The subject of intermittent water supply in developing countries requires research. We need to know the real cost of intermittent versus 24-hour water supply. What are the pumping costs? What are the storage costs? What are the treatment costs? What is the volume and value of water wasted every day? How accurately can water consumption be measured? What is the quality of the water delivered? What is the value of time wasted waiting for water? What is the anxiety factor? How many days in the year does water not come? What is the prevalence of bottled water for drinking? What solutions to this situation do the stakeholders envisage? What is the extent of good hygiene practiced in homes? This research should be done in at least 10 cities in five countries to get a good understanding of the situation.

Income Profiles

Every water utility involved with a city in Asia with a population of over 100,000 should evaluate the household income profile for people living in the potential service area. This should be done on a sample basis and reported with reference to location. It should then be aggregated for overall results. This provides an upper revenue limit based on affordability. Of course, this information must be analyzed in the context of alternative water supplies and the tariff structure to determine willingness to pay.

Alternative Water Supplies

Willingness to pay for piped water depends more than anything else on what alternative water supplies are available to consumers. Research should carefully evaluate this factor to ensure that demand is not overestimated in new water supply schemes. A factor in the use of alternative water supplies is hygiene education, so this too should be evaluated (see Health Factors on page 126). What is the quality of alternative supplies and for what purpose are they used? Is there a need for education and awareness programs?

Effective Subsidies

What are the subsidies being provided by governments to different water users, including farmers, urban domestic consumers, industrial consumers, and rural domestic consumers? Are there apparent or real cross subsidies from (i) high-volume domestic consumers to low-volume domestic consumers, (ii) industrial consumers to domestic consumers, or (iii) urban consumers to rural consumers? Consider the block tariff structure—who benefits most from subsidies, the rich or the poor? How many people are not connected (in their homes) to piped water?

Price Elasticity of Demand

There is a need to look at per capita water consumption and the cost of water. Does a tariff increase result in a temporary or permanent reduction in the volume of water used? This is now easy to evaluate, if a computer sampling of accounts is used. To what extent is demand influenced by income, by tariff level, and by alternative source availability?

Service Levels and the Water Balance

In any major city there are gray areas relating to statistics on service levels and the water balance. If the NRW rate is 60%, what is the basis for assuming

that 10% is due to metering inaccuracies, 30% to illegal use, and 20% to leakage? If there is 30% illegal use, how much of that comes from illegal sales? How much results from illegal connections? If there are 10 million people in a city and only a million connections, how do those not connected get water? Do they use shared connections? Do they purchase from neighbors or vendors? Do they use groundwater? What is the volume of water used by each category, and what do they pay for it?

Small-Scale Water Providers

There needs to be more research on these entrepreneurs. All should be registered and officially recognized to understand how they fit into the overall water supply system. The sources of their water, the amount of water distributed, the method of distribution, the source cost, the consumer cost, and the quality of the water delivered need to be recorded. The results need to be compared for compatibility with the research (above) on service levels and the water balance. The profit element for SSWPs needs to be examined. Then the long-term role of SSWPs vis-à-vis government policies and formal piped water development plans needs to be assessed. This is big business, and it is important to know as much as possible about it.

Health Factors

There is a need for research into the extent of the knowledge and practice of hygiene, especially among the more informal settlements in Asian cities. What are the sources and quality of drinking water? Is it boiled or filtered? What is the practice concerning hand washing? What is the practice concerning sanitation? Since major improvements in hygiene practice can be made at little cost, this is an area where research can quickly lead to action. Research should be conducted on the stunting of child growth and its links to the quality and quantity of drinking water.

Pollution

Research is needed on big industries that pollute waterways. What is the nature and quantity of effluent produced? What pretreatment or treatment is done on-site? What type of treatment is required by law? Are industries properly zoned? What are the official government policies on zoning? What are the regulatory arrangements? What are the consequences of uncontrolled pollution? Who benefits? Who pays?

Groundwater Monitoring

As mentioned elsewhere in this book, groundwater has been overexploited in the past and continues to be overexploited now. There is a need to control extraction, to ensure that the resource remains sustainable and usable. Research is needed to establish the amount of the current extraction and compare it with the sustainable yield. Research must cover the incidence of falling groundwater levels, the incidence of saline intrusion in coastal environments, and ground subsidence.

The Urban Poor

There needs to be, for public review, an independent annual report on the water supply and sanitation situation of the urban poor. This should include poverty mapping of the city, water supply and sanitation service levels, and costs (both direct and indirect) to the urban poor. The annual progress in improving the plight of the poor should be highlighted. To what extent are government policies on water supply and sanitation services to the urban poor being implemented? Are modifications or improvements to those policies needed?

Private Sector Participation

After 10 years, the jury is still out on PSP in urban water supplies in Asia. There is a need to supply those governments considering PSP with independent and objective assessments of ongoing PSP activities in the sector. The research should identify (i) attempts that failed to get off the ground and why, (ii) problems with ongoing PSP contracts, (iii) success stories, and (iv) the prognosis. The research should take a look at how well the objectives of increased efficiency, more investment funds, and greater autonomy are being realized.

B. Focal Points for Research

It is fine to suggest lots of research, but who is going to do this, and how is it going to be funded? First, there is the need to determine focal points for research. In this regard, it must be determined if research will be done on a regional or national basis. At a regional level, institutions like ADB, Japan International Cooperation Agency, World Bank, UN-Habitat, World Health Organization, Economic and Social Commission for Asia and the Pacific, and the Asian Institute of Technology (Bangkok) can be focal points. At a national level, the

Marga Institute (Sri Lanka), the Ateneo Center for Social Policy and Public Affairs at the Ateneo de Manila University (Philippines), the National Institute of Public Finance and Policy (New Delhi, India), and PERPAMSI (the association of water utilities in Indonesia) are examples of potential focal points. Institutes aside, any university in Asia that wishes to undertake research on Asian urban water supply issues in connection with a thesis for a master's or doctorate level degree could be a potential focal point. The University of Tokyo has been working with ADB for several years on such topics. Where regional institutions like ADB are involved, it is more natural for the research assignment to be undertaken by selected consultants.

C. Funding Research

Whether it is conducted by World Bank, ADB, or any other institution involved in urban water supply development in Asia, there is a need for research and for funding that research. In this way all stakeholders will be more aware of facts, and important policy reform decisions based on these facts can be made. The two institutions mentioned have access to special water cooperation funds, which are heavily supported by the Dutch Government. The World Bank's Water and Sanitation Program is supported by bilateral development agencies. ADB has its own budget for advisory technical assistance. Most important of all, however, is that the participating government or governments request support for research on the topics mentioned above. There has to be an expressed need. There will also be strong competition for funds, so the justification must be strong and well presented.

Research in a Nutshell

- Research is a part of the very necessary effort to increase awareness and understanding among all stakeholders.
- Researchers should balance social, economic, and environmental considerations.
- Research should target income profiles, subsidies, service levels, SSWPs, intermittent supply, alternative supplies, health factors, price elasticity of demand, the urban poor, illegal use, illegal sales, corruption, pollution, groundwater, and PSP.
- Focal points are universities, institutes, and water associations.
- Funding could be sourced from ADB, World Bank, and bilateral development agencies.
- Results should be posted on the Internet.

Chapter 18

Guiding Principles

The purpose of this chapter is to take a step back and see the big picture, so that the messages in this book may be viewed against broader perspectives.

- *We neglect history at our peril. Lord Raleigh once observed that a lack of understanding of history meant that the heights of technical achievement were reconquered again and again at great intellectual expense.*
- *Sensitivity and compassion must be at the root of any development project.*
- *Success in the past came because the people who ran (an undertaking) had a stake in it.*
- *Security of supply is important.*

Bob Norman, past President, Institution of Professional Engineers, New Zealand. *Engineering Heritage: Artifact or Instrument?* Keynote address, ALGENZ Conference, Dunedin, New Zealand. (Norman,1998)

. . . . . .

- *In just the first 10 weeks of the cholera epidemic in Peru, losses from reduced agricultural exports and tourism were estimated at $1 billion, or more than three times the amount invested in water and sanitation services in the whole country during the 1980s.*

John Briscoe, World Bank. *When the Cup is Half Full*. Article for *Environment—Water and Sanitation Success Stories*. (Briscoe, 1993)

. . . . . .

- *Our voice must be for those whose access is always threatened—the poor, the slum dweller, the dispossessed.*
- *We know that women are the key, even if we don't use the key yet. Women must be written into the water equation. It takes courage to break the mold.*
- *Data is not information. Information is not knowledge, and knowledge is not wisdom.*
- *There is enough water. It is only that we do not use it wisely enough.*

Margaret Catley-Carlson, former Chairperson, Water Supply and Sanitation Collaborative Council. (Catley-Carlson, 1997)

. . . . . .

- *What we did in Curitiba was essentially a partnership with the people.*
- *We planted one million trees.*
- *Separate used water. This represents a colossal economy and the possibility of treating effectively all the city sewage, avoiding river pollution.*
- *What will make cities different is their ability to reconcile with nature and their inhabitants.*

Mayor Jaime Lerner of Curitiba, Brazil. *Intervention in Curitiba, Brazil*. Paper presented at the Water Supply and Sanitation Collaborative Council Meeting, Rabat. (Lerner, 1993)

. . . . . .

- *The Asian vision requires urgent action to reach the underserved and unserved population.*
- *It requires good governance and compassion for transparency and accountability and corruption-free practices.*
- *We agree on a gender-sensitive, people-centered, and self-reliant development model that promotes consultation and dialogue between and among all stakeholders, empowering those who are socially and economically disadvantaged.*

***Vision 21 of the Water Supply and Sanitation Collaborative Council*.** (Water Supply and Sanitation Collaborative Council, 2000)

. . . . . .

We need a water ethic, a guide to the right conduct in the face of complex decisions about natural systems we do not and cannot fully understand. The essence of such an ethic is to make the protection of water ecosystems a central goal in all that we do. It is no more radical a notion than suggesting that a building be given a solid foundation before raising it 10 storeys high. Water is the basis of life and our stewardship of it will determine not only the quality but the staying power of human societies. Living by such an ethic would mean using less whenever we can and sharing what we have. The challenge is to put as much human ingenuity into learning to live in balance with water as we have into controlling and manipulating it. The last oasis is conservation, efficiency, recycling, and reuse.

Sandra Postel. *Last Oasis—Facing Water Scarcity*. (Postel,1997)

. . . . . .

Guiding Principles in a Nutshell

- Learn from history. Success in the past came because the people who ran an undertaking had a stake in it.
- Partner with the people and civil society.
- Plant a million trees.
- There should be a sustainable water ethic for all.
- Good governance is at the core.
- Target the underserved and those not served.
- Remember the epidemics.
- Write women into the equation.

Chapter 19

Strategy for Action

There is no blueprint for improving urban water supplies in Asia. Every country and every city have their own unique social, political, physical, and economic environment that will determine what is appropriate in regard to development. Nevertheless, it will be useful for governments and utilities to have a general strategy for action. The purpose of this chapter is to condense the findings of this book into one "nutshell," representing a framework for action. Remember that all solutions are dependent on the resolution of the core problems of governance and tariffs, which can be accomplished by introducing transparent policies, independent regulatory bodies, and involvement of civil society.

One way of involving civil society is to hold stakeholder consultations as a basis for formulating government policy. First comes the identification of key stakeholder groups. These may include (i) urban poor using vended water, (ii) small-scale water providers, (iii) domestic consumers, (iv) industrial consumers, (v) utility staff, (vi) utility management, (vii) unions, (viii) government officials, (ix) politicians, (x) the private sector, (xi) development agencies, (xii) NGOs, (xiii) academics, (xiv) the media, (xv) consultants, (xvi) contractors and suppliers, and (xvii) professional associations. Second come separate stakeholder consultation meetings, convened by the government, with each group. Ideally these would be 2-day meetings and *Asian Water Supplies* would be used as a sourcebook throughout. The first day would be for listening to ideas of stakeholders regarding problems and solutions. The second day would be for responding to findings and offering further solutions. A representative of the stakeholder group should be elected. After the proceedings of the first stakeholder consultation meeting for all stakeholder groups have been documented, they should be analyzed as a whole and one report prepared for dissemination to all stakeholder groups. A second phase stakeholder consultation should then be held with representatives of stakeholder groups to discuss the findings. At this meeting, experts from successful water utilities in the region (for example, those from Bangkok, Dalian, Malé, and Phnom Penh) could be invited to tell their stories. Finally, a draft government policy statement would be prepared, based on the views of stakeholder representatives.

In this book there are chapters on specific topics, and at the end of these chapters the solutions in a nutshell are presented. This chapter brings all these together in one place. It is best to view this as a menu from which selections can be made as appropriate for a given enabling environment and location. All the solutions from the chapters are unlikely to be applicable in any given situation, but many can be. It is also important to remember that none of these solutions will work unless the core solution of good governance (policy, regulation, and civil society involvement) and a paradigm shift in tariffs (funding investments out of tariffs) are first addressed.

Realities

- Coverage with piped water does not always require major urban water utilities to seek funds from external sources.
- Shortage of water is not the reason for intermittent water supply.
- The poor are willing and can afford to pay the full cost of piped water.
- It is not possible to run a $20–100 million per year commercial operation (selling water) with civil servant rules and salaries.
- Reducing NRW below 20% of production is economically justified.
- The private sector will not always bring much needed funds for development to the table and improve water utility efficiency.
- In answer to rapid urbanization, it is not necessary to go farther and farther afield to find more water sources.

- Intermittent water supply is not OK.
- Appropriate legislation does not always allow a water utility to operate with autonomy.
- Water utilities suffer when the money trail runs through governments.
- Households in Asia do not need 200 l/c/d.
- Private operators are not always the cause of higher tariffs.
- Regulatory bodies are not only needed because of private sector contracts.
- Private operators are not always eager to serve the urban poor.
- Private sector participation does not always bring competition.

Problems and Solutions

- An individual problem, such as NRW, cannot be solved in isolation. It can only be addressed after the core problems have been resolved.
- The core problems are poor governance (including corruption) and low tariffs.
- The core solutions include a transparent policy, an independent regulatory body, a paradigm shift in tariffs, and the involvement of civil society.

Water Resources Management

- Water policies and social auditing are needed.
- Have long-term planning horizons.
- Introduce demand management through awareness and pricing.
- Plant more trees to rehabilitate watersheds.
- Plant crops that use much less water than do rice, cotton, and sugarcane.
- Do not subsidize water management.
- Remember the triple bottom line: environmental, social, and economic development.
- Develop rainwater harvesting in cities.
- Remember the beavers—build check dams.
- Trade customary water rights.

Water and Sanitation Service Coverage

- Compare the number of connections with the number of people.
- Examine the extent of intermittent water supply.
- Examine the extent of standpipe supply.
- Examine on-site sanitation versus sewerage versus treatment.
- Undertake independent professional audits of service levels.
- Analyze root causes of inadequate coverage.
- Promote awareness of the situation among civil society.
- Address as a priority the needs of those with no access to piped water.

Intermittent Water Supply

- Promote awareness among stakeholders.
- Address governance issues related to the autonomy of utilities.
- Introduce higher tariffs for 24-hour zones.
- Place moratoriums on new connections.
- Invest in hydraulic modification of distribution systems.
- Start with 24-hour zones, and then expand these.
- Enforce strict metering and collection.
- Reduce NRW.

Water and Poverty

- Public audits are needed to obtain facts about service levels.
- Policies are needed that focus on providing the poor with piped water.
- Raise tariffs to connect the urban poor.
- Employ a block tariff structure, but watch the sizes and prices of blocks.
- Soften terms of payment for connection fees.
- Eliminate standpipes wherever feasible.

- Encourage civil society (NGOs) to champion the poor.
- Detach land tenure issues from access to piped water.
- Governance is at the core of the solutions.
- Develop knowledge bases related to the water needs of the urban poor.
- Enable the poor to influence decision making.

Small-Scale Water Providers

- Services provided include distribution pipework for utility water and/or groundwater, kiosk sales, pushcart and tanker vendor deliveries, and neighborhood resale of utility water.
- Water sources (whether legal or illegal) are mostly water utilities, but also groundwater.
- SSWPs sometimes generate more revenue than formal utilities.
- In default of the water utility, SSWPs provide the urban poor with essential services. Many SSWPs are also poor.
- The great inequity: the connected can pay $4 for 30 m^3 and those not connected (supplied by SSWPs) can pay $20 for 6 m^3. The status quo is maintained by those with vested interests.
- In many cases, SSWPs are not formally recognized by utilities or local governments.
- Tariffs are higher than those charged by utilities but connection fees are lower.
- SSWPs provide more flexible arrangements for connections and payments than water utilities, leading to better relations with customers.
- Officials need to learn more by auditing existing utilities and SSWPs, so that SSWPs can be registered and recognized but not regulated (yet).
- Residents need to have clear policy statements from governments on piped water coverage and SSWPs. Governments should include SSWPs in water supply strategies.
- SSWPs need access to financing.

Management

- Policies must provide autonomy and revenue (tariffs).
- There should be accountability through regulatory bodies and annual reports.
- Organization development is necessary.
- If you cannot measure, you cannot manage.
- Incentives must be linked to performance.
- Use open market salaries for professionals.
- Give O&M prestige.
- Interface between staff and consumers should be given importance in the field.

Non-Revenue Water

- Governance and tariffs must be tackled first.
- Leak-detection equipment comes last, not first.
- Repair visible leaks.
- Make utility staff responsible for small zones (caretakers).
- Meter all production and consumption properly.
- Add district metering.
- Provide incentives for utility staff performance.
- Explore links to water vendors.

Sanitation

- There is a need for explicit government policies.
- In densely developed areas, conventional centralized sewerage systems are a must.
- In less densely developed areas, it may be possible to construct decentralized small sewerage systems with local, appropriately landscaped, sewage treatment facilities.
- On-site sanitation is OK, if the plot size and ground permeability are adequate and the groundwater table is low.
- Eco-sanitation (not mixing feces with water) has promise.
- Reed bed technology for treatment of wastewater is OK.

- Target the urban poor as a matter of priority.
- Divert development agency and government funding from major urban water supply projects to urban sanitation projects.
- Solutions must be part of integrated water resources management.
- Opt for community sanitation facilities, like those in Pune.
- Get the facilities and education in the schools first.

Tariffs, Subsidies, and Development Funding

- Tariffs begin with policy—analyze subsidies.
- Tariff reform is a manifestation of good governance—fewer subsidies.
- Alter the money source from governments to consumers.
- Those connected must pay more so that those not connected can get piped water.
- No question of affordability—the hidden economy proves this.
- Block tariff structures are best when income profile varies greatly.
- Fund investments directly from tariffs—the PRC is doing this now.
- Connection fees can be absorbed by tariffs.
- Tariff reform is needed to encourage PSP.
- Higher tariffs make good things happen in terms of water development options.

Private Sector Participation

- Manage the process of change.
- Domestic PSP is preferred.
- Contracts should be based on policies.
- Consider exit strategies for internationals.
- Tariff reform is a prerequisite.
- Competition and transparency are musts.
- Public-private partnership has promise.
- Principles and guidelines are needed.
- Independent evaluation will help.
- SSWPs should be included.
- Regulatory arrangements must come first.

Governance

- Transparent policies and independent regulators are needed.
- Tariff reform to put consumers in control is necessary.
- Civil society involvement is a must.
- Good things happen when tariffs are raised.
- Governance is at the core of all solutions.

Government Policy

- Obtain good field data and analyze them.
- Consult with stakeholders and civil society.
- Address governance and tariff issues.
- Address NRW, service levels, SSWPs, and the urban poor.
- Address PSP and public utility performance incentives.
- Address the roles of institutions in the sector.
- Civil society will monitor policy implementation.
- Regulatory bodies will monitor policy implementation.
- NGOs and the media will bring policies to the people.

Regulation and Benchmarking

- Regulation and benchmarking should be based on transparent government policy.
- The objective is autonomy and good governance through accountability, transparency, equitability, and efficiency.
- Why, what, who, and how must be addressed.
- There are three options: (i) one regulator, (ii) body of experts, or (iii) body of stakeholders.
- Civil society is the ultimate regulator.

- PSP contracts should be based on policy, not on regulation by contract.
- PSP and public water supplies should be regulated.
- Information technology improves transparency.
- Operators need incentives based on performance.
- Stakeholders should design the journey, which is a dynamic process.
- Benchmarking is fundamental to regulation.
- Evaluating utilities on governance and performance is desirable.

Civil Society Involvement

- Consumers indicate governance and tariffs are core problems.
- Focal points are NGOs, academics, and journalists. City forums help.
- Civil society needs to be better informed.
- Starting point is involvement through key stakeholder consultation in formulating government policy.
- Public awareness and transparency are keys to civil society involvement.
- When consumers pay the full price of water, they will be in the driving seat, which is the objective.
- Civil society should interact with the regulator.
- NGOs can champion the poor and can form consumer societies.
- Academics can investigate facts, especially concerning subsidies.
- The media can be powerful, but first it must be well informed.
- Civil society involvement promotes good governance by monitoring the implementation of government policy.

Research

- Research is a part of the very necessary effort to increase awareness and understanding among all stakeholders.
- Researchers should balance social, economic, and environmental considerations.
- Research should target income profiles, subsidies, service levels, SSWPs, intermittent supply, alternative supplies, health factors, price elasticity of demand, the urban poor, illegal use, illegal sales, corruption, pollution, groundwater, and PSP.
- Focal points are universities, institutes, and water associations.
- Funding could be sourced from ADB, World Bank, and bilateral donors.
- Results should be posted on the Internet.

Guiding Principles

- Learn from history. Success in the past came because the people who ran an undertaking had a stake in it.
- Partner with the people and civil society.
- Plant a million trees.
- There should be a sustainable water ethic for all.
- Good governance is at the core.
- Target the underserved and those not served.
- Remember the epidemics.
- Write women into the equation.

Chapter 20

Messages to Stakeholders

It is useful to summarize the main messages of this book as given in A and B below. And let us not forget the Problem Chart and Solution Chart in Chapter 2, which give a more visual explanation of these messages. Messages C and D place the urban water supplies of Asia into a broader context.

A. Creating the Enabling Environment (Governance)

We need transparent policies and an independent regulatory environment that will give autonomy to water utilities, equitability of service, and a paradigm shift in tariffs. None of this will be possible without the active involvement of civil society.

B. Hike Tariffs to Help the Poor

It may sound strange, but the best way to help the poor is to hike tariffs. In this way, the poor not being served can receive service, and those with an intermittent water supply can get 24-hour piped water in their homes. Questions of affordability and willingness to pay are best answered by the poor themselves, who invariably declare that they are willing to pay for water, if they get good service.

C. Water as the Entry Point for Development

Water is a basic human need. Improving the lives of the urban poor must start with water and sanitation. Success here will give these people hope and show the way to other development needs, including health and education. Water supply must be integrated into other urban development needs.

D. Water and Culture

The future rests with the young. It is time for them to learn about the ancient links between water, culture, and religion. In this way, they might find again the spiritual qualities of water, and give water—this precious resource—the respect and reverence it had in the past.

Developing Wastewater Services in Emerging Market Economies: The Cases of China and Ukraine

John Bachmann, PADCO

Delivering affordable, dependable and sustainable wastewater services is a challenge for local governments worldwide. But it is an especially tall order in emerging market economies, in which the old service norms, institutional forms and pricing policies often constrain the development of autonomous and competent wastewater service providers that can develop their systems to meet users' needs and collect sufficient revenues to cover their costs.

China and Ukraine are two countries that are wrestling with the problems of developing sustainable wastewater collection and disposal services while their economies transition toward the market. This paper examines the performance of local governments and their Wastewater Service Providers (WASPs) in selected towns in both countries and seeks to identify the factors that contribute toward improving service quality and achieving financial sustainability.[1] The goal of the analysis is to draw conclusions that may be applicable to WASPs in other emerging market economies.

The paper will examine in turn three aspects of wastewater service delivery — institutional arrangements, service pricing and stakeholder participation — in each of the two countries. For each aspect, the paper will briefly define the Chinese and Ukrainian contexts and identify the main problems faced by WASPs and local governments (LGs). A final section will attempt to draw conclusions about the types of interventions that could be successful in promoting improved service delivery in the future.

Institutional Arrangements for Wastewater Service Delivery

In both China and Ukraine, wastewater service delivery is a devolved function for which local governments are responsible. Ukraine's law "On Local Government" of 1996 makes LGs responsible for the provision of a number of "communal services," including piped wastewater collection and disposal. Most LGs execute this official mandate through "vodokanals," which are legally independent organizations that are nominally owned by the local community (residents of the town or city) but in practice operate under the direction of the local government. (A minority of vodokanals or their fixed assets are leased to private companies.) Vodokanals are generally responsible for water supply and piped wastewater collection and disposal.

Chinese towns are also responsible for the delivery of local wastewater services. In small cities and towns, services are usually provided by a municipal department, often operating independently from the water company, a municipally owned utility. In large cities, wastewater collection and disposal services are generally carried out by municipal departments or LG-owned water/wastewater companies.

The broad outlines of the institutional arrangements in both countries are favorable to responsive, sustainable wastewater service delivery to the extent that local governments can design and implement their own programs. However, the specific roles and responsibilities of

[1] The material in this paper is drawn from two technical assistance projects implemented by Planning and Development Collaborative International, Inc. (PADCO): the ADB-financed "Town-Based Urbanization Strategy Study" (TA 4335-PRC) implemented China in 2004-2005, and the USAID-financed "Ukraine Tariff Reform and Communal Services Enterprise Restructuring Project" implemented in 2000-2005.

the WASPs are insufficiently defined, and there are few incentives for WASP managers and staff to improve institutional performance and/or service quality.

In the Chinese case, the operational environment for wastewater delivery is first and foremost undermined by the political imperatives of local government leaders. In recent years, the Government of the People's Republic of China (PRC) has put heavy emphasis on economic growth. Local government leaders — both in the Party and the town or city government — are evaluated based on the amount of new investment they leverage and the increase in local economic output. Prospects for promotion within the party and to larger urban settlements will depend first and foremost on economic growth. The degree of environmental sustainability of local growth is not an evaluation criterion. These political priorities do not incentivize improvements in urban environmental infrastructure generally or in wastewater service delivery in particular. On the contrary, many officials are driven to undertake any investment project that will boost growth, regardless of its impact on the environment.

Another constraint in Chinese towns is the dependence on decision-makers at higher levels of government in order to improve wastewater services. Large capital investment projects and tariff increases require approval of higher-level governments, such as a county, county-level city or prefecture-level city.

Finally, the performance of many Chinese WASPs is undermined by their separation from water service providers. It is much more effective to bill customers for wastewater and water supply services at the same time (through the same bill), given that willingness-to-pay for water supply is always higher than willingness-to-pay for wastewater collection. The fact that water suppliers are able to disconnect their customers in case of non-payment also contributes to higher payment collection rates, which benefit wastewater service providers also when billing is combined.

Unlike their Chinese counterparts, Ukrainian local have the authority to set tariffs for wastewater services delivered by vodokanals (communal service enterprises) without higher-level approvals. The vodokanals calculate the tariffs and make a proposal to the LG, which approves the tariff by action of its executive committee. While the autonomy afforded by this arrangement is an asset, it also subjects the pricing of wastewater services to the vagaries of local government politics in an emerging democracy. Many Ukrainian mayors feel that raising the prices of communal services will lower their chances of being reelected. The old notions of water as a public good that the State should provide for free run deep in Ukrainian society, especially among older people and pensioners, which make up a large portion of the total population. It takes a progressive local government leader to decide that raising tariffs is either (i) the right thing to do for sustainable service delivery, despite its unpopularity, or (ii) can be fashioned into a political asset by emphasizing improvements to service coverage or quality.

Economic growth continues to trump environmental protection in Chinese towns.

In both Ukraine and China there is a general lack of clarity about the roles and responsibilities of WASPs vis-à-vis municipal owners and end users (customers). There are few written agreements between local governments and wastewater service providers specifying the responsibilities of the wastewater service provider with respect to service levels, capital investment financing, and service pricing (tariffs). The obligations of the local government — in effect, the LG's contribution to improving wastewater services — are also underarticulated: there is no specific commitment by the municipality to provide financing for improvements, build public support for increasing payment collection, or approve necessary tariff increases. At the same time, there are no contractual agreements between WASPs and end users. In this operational environment, the wastewater service provider lacks clear targets to work toward and clear commitments from the city and customers to assist in achieving institutional and sector objectives.

Pricing of Wastewater Collection and Disposal Services

At its best, the pricing of urban services such as wastewater collection and disposal is a complex, interdisciplinary and flexible exercise through which interested parties set prices to achieve a set of often conflicting objectives. On the one hand, user charges should be affordable to customers. On the other hand, tariffs should be set to ensure the level of revenue needed to keep providing decent services in the future. Where fixed assets require rehabilitation or coverage must be expanded, tariff revenues may have to cover capital investment costs too. In a successful service development planning and tariff setting process, the different parties work together to find common goals and then formulate interventions to achieve them.

Such a "holistic" view of the tariff setting process is not yet widespread in Ukraine. In the 1990s, most municipalities, despite being responsible for service pricing, distanced themselves from this process in order to limit perceived political damage. Cities would posit themselves as the arbiter of the tariff setting process, a role that assumes conflicting views among vodokanals and customers. Generally siding with the customers in order to strengthen their position for future elections, municipal governments would generally reject tariff increases proposed by vodokanals, thereby locking the WASPs into a downward spiral of aging assets, rising energy costs and financial shortfalls.

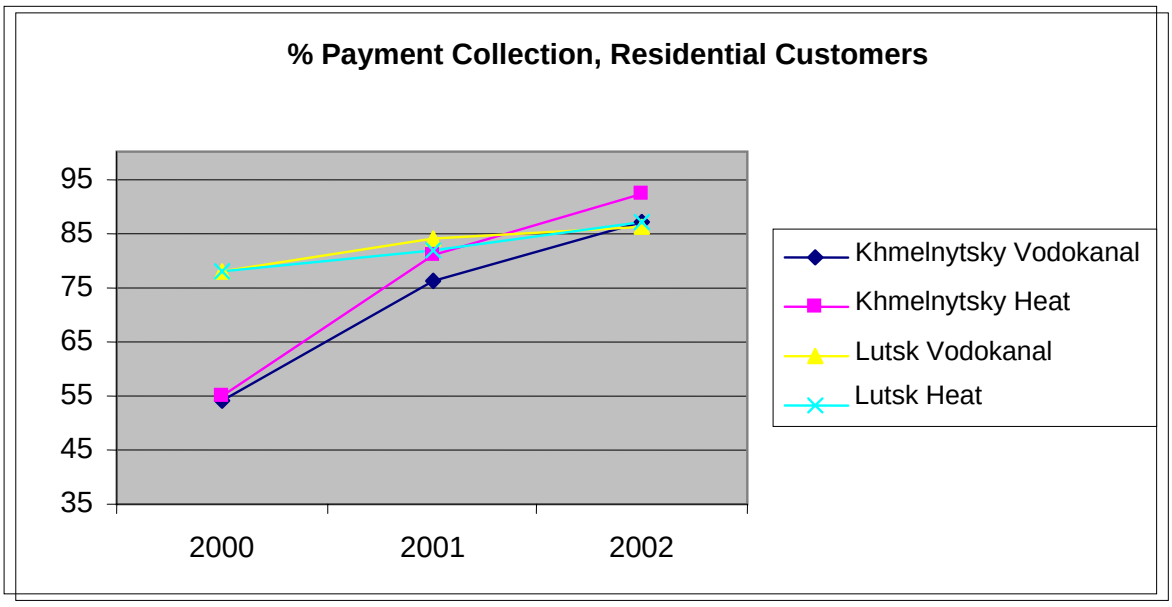
Wastewater service pricing in China is also influenced by the notion of water supply (and by association, wastewater) as a public good to which all citizens are entitled. Local government leaders are wary of raising water and wastewater tariffs, which are consequently below the level required for recovery of operation and maintenance (O&M) costs in most towns.

In cities in China and Ukraine, extensive capital investment is needed to ensure adequate future service delivery. In China, it is necessary to expand coverage of piped wastewater collection services in response to rapid urban development and to build appropriate wastewater treatment facilities. Ukrainian municipalities need to rebuild pumping stations and treatment plants to reduce energy consumption and lower energy costs; moreover, much of the aging piped network needs replacement.

Under the principle that the customer should bear as much of the cost of service provision as possible, WASPs in both countries should calculate new tariffs that cover O&M costs and whatever share of investment costs the end user can bear. This calculation requires knowledge of household income and expenditures. Ability-to-pay analysis was carried out under the USAID-financed Tariff Reform and Communal Services Enterprise Restructuring Project in two Ukrainian cities (Lutsk and Khmelnytsky) to evaluate the impact of alternative hypothetical tariff scenarios on household finances. The analysis concluded that there was additional disposable income, and that it would be possible to raise water and wastewater tariffs without surpassing the normative "15% limit" set by the local governments: combined housing and communal services costs should not exceed 15% of the income of a household at the 25th income percentile.

On the basis of this analysis and extensive stakeholder consultation, the City of Lutsk decided to increase its water and wastewater tariffs by 32 percent in June 2002. In combination with increased payment collection, the higher tariffs provided enough revenue to cover O&M costs and finance a modest $500,000 short-term capital investment plan.

Following on the Lutsk experience, three-quarters of the 29 communal service enterprises that graduated from the Tariff Reform Project over the period 2002–2005 achieved cost recovery through a combination of tariff increases, higher payment collection rates and operational cost reduction (27 enterprises were loss-making at entry into project).



Municipal public works departments and wastewater companies in China also desperately need to raise tariffs in order to generate financing for the construction of wastewater treatment plants. But there is no standard methodology for calculating tariffs that include a component for O&M and another component for capital investment. And ability-to-pay

analysis is not used to systematically evaluate the capacity of customers to pay more. Perhaps most critically, there is no established public forum in which packages of service improvements and pricing options could be discussed and agreed with customers and other stakeholders in Chinese cities in towns.

Stakeholder Participation in Wastewater Service Delivery

The Government of the PRC is currently pursuing a goal of creating a “harmonious society” in which the benefits of growth are equitably distributed among different population groups. Equitable distribution of the benefits of urban development requires dialogue among the various concerned parties: local governments, real estate developers, holders of use rights to land, buyers of newly created real estate products, and users of wastewater and other municipally provided services. In China today, however, customers do not have a voice in the provision of urban services. Decisions about service levels and coverage in many cities are taken primarily based on engineering requirements and the availability of capital investment subsidies from higher-level governments. There is no systematic consultation of different population groups, and end user preferences and priorities are not incorporated into the service planning and pricing process.

The investment requirements of Chinese towns and cities in the area of wastewater treatment are staggering. If the current trend in environmental degradation of surface and ground water supplies is to be halted, thousands of urban settlements across the country will need to build wastewater treatment facilities. Under current conditions — an unfunded mandate to provide services coupled with insufficient authority to increase tariffs — it would seem difficult for Chinese WASPs to respond to the challenge. Any successful approach to improving service levels will have to be multi-pronged, but one important aspect is likely to be improving relations with stakeholders: the users of wastewater collection and disposal services. In the respect, the recent experience of Ukrainian cities may prove instructive.

In the 1990s Ukraine adopted a representative democratic form of government in which executive and legislative officials are elected at the local government level. This system requires some degree of responsiveness to the priorities of the public on behalf of local mayors and council deputies. But as described in the service pricing section above, elected officials have in many cases acted as arbiters rather than leaders in the area of urban services provision. This is now changing. Town halls in such cities as Komsomolsk, Chernigiv, Kalush and Lutsk have forged partnerships with their communal service enterprises (including vodokanals) and the local stakeholders.

Where such partnerships have been forged, the parties have been able to agree on and implement substantial improvements in service delivery and sustainability. The process in most towns has followed this general outline:

1. Build customer awareness. Conduct public outreach and carry out media campaigns to educate the public about the need to rehabilitate or expand wastewater systems, to increase revenues in order to pay for improvements, and to pay for services in order to ensure the financial viability of vodokanals.
2. Gather information on customer preferences and priorities. Conduct focus groups and/or customer surveys to find out what customers see as the major problems, what types of service improvements are most important to them, and whether they are willing to pay more in user charges in order to receive better services.
3. Formulate proposals that respond to customers’ stated priorities. In the process of service planning and capital investment programming, include the projects and operational changes that will improve coverage, improve wastewater treatment, protect local rivers and streams, etc. Formalize these proposals into strategic action plans.

4. Garner public support for the strategic plans. Publicize the plans by distributing summary versions of them, posting them in public places for review, and holding public hearings on the plans.

Public hearings in Ukraine are used to build stakeholder support for wastewater services reform.

Participants in focus groups and public hearings can be presented with different technical/pricing options that have different sets of capital improvements associated with them. Each option or scenario is presented as a package; for example, achieving 24 hour a day water supply (from scheduled delivery) will necessitate a 20% tariff increase, while 24/7 water *and* higher water pressure above the second story will entail a 30% increase. Participants should be able to evaluate the costs and benefits of each package themselves, and contribute their opinion to the decision-making process.

Conclusions

This brief review of the wastewater sector in Chinese and Ukrainian towns indicates that there is great scope for refining and improving institutional arrangements, pricing policies and stakeholder participation. The following concrete recommendations are set out for consideration by policy-makers and practitioners in emerging market economies.

- Reinforce the legal and regulatory basis of WASPs so that they can establish technical service targets, plan capital investments and set prices in collaboration with local governments and stakeholders;
- Develop and implement service agreements in which the rights and responsibilities of local governments and WASPs are clarified. Local government commitments to achieving service delivery targets must be spelled out clearly;
- Get the incentives right for improved performance of WASPs and LGs. Link improvements in wastewater services and environmental protection to the career advancement among civil servants and elected officials.
- Unite the entities responsible for water supply and wastewater collection into a single organization responsible for both services. This will improve service planning and facilitate tariff payment collection;
- Use ability-to-pay analysis to determine how much local households can afford to pay for improved wastewater services;
- Use customer outreach techniques such as focus groups and customer surveys to determine end user preferences and priorities with respect to wastewater service levels and coverage.
- Develop a tariff calculation methodology that includes a capital investment component.

- Develop and evaluate alternative capital investment and tariff scenarios with input from stakeholders;
- Build consensus for a preferred option or scenario through information dissemination and public hearings.
- Implement the strategic plan.

Successful Approaches to Improving Wastewater Management and Sanitation in Pakistan

Dr. Rashid Bajwa and Virginia Appell
National Rural Support Programme, Pakistan
www.rspn.org/files/mo/nrsp.htm
rbajwa@nrsp.org.pk virginia@nrsp.org.pk

The paper outlines the planning, methods and results of working with members of small and medium sized rural communities to meet identified needs for wastewater management and sanitation. The projects were designed and implemented by the National Rural Support Programme, Pakistan's largest NGO.

Although many rural people recognize the need for wastewater management and sanitation, these remain neglected issues in the majority of villages, in part because people assume that the Government is responsible for funding and implementing the necessary infrastructure. Since economically-marginal villagers cannot afford the costs themselves, innovative methods of raising funds and providing expertise are required.

The paper argues that NRSP's methods of 'mobilizing' villagers provide a basis from which to overcome the inertia and to address these critical problems. NRSP has successfully implemented hundreds of wastewater management and sanitation schemes, using social mobilisation and drawing on social capital. It has implemented these projects through small Community Organizations and larger Village Organizations. NRSP has also worked with members of District Governments to fund and implement small and large-scale projects.

The paper describes the methods used to accomplish these activities. It also describes the benefits to everyone involved in participatory methods. It argues that the practices followed by NRSP provide a model for other NGOs and Government departments interested in similar activities.

SUCCESSFUL APPROACHES TO IMPROVING WASTEWATER MANAGEMENT AND SANITATION IN PAKISTAN

Dr. RASHID BAJWA
NATIONAL RURAL SUPPORT PROGRAMME
PAKISTAN

Introduction

This paper outlines the planning, methods and results of working with members of a number of small and medium sized rural communities to meet identified needs for wastewater management and sanitation. The projects were implemented by the National Rural Support Programme (NRSP), Pakistan's largest NGO.[1]

Since NRSP's mandate is to alleviate rural poverty, it is central to NRSP's philosophy that the economically-marginal have the right to decent sanitation systems in their communities. It is an operating principle at NRSP that any physical infrastructure project, including wastewater management and sanitation schemes, must benefit the majority of households in a village and must include the poorest community members.

In describing an integrated, community-based approach to wastewater management and disposal, the paper identifies a proven method of overcoming the prevailing combination of dependency and mistrust that exists with respect to village development projects in most rural communities in Pakistan.

Wastewater Management Issues in Pakistan

Only 13.5% of rural households in Pakistan have any sewage collection and disposal system[2], and many of these provide only minimal 'disposal' *i.e.* untreated waste is deposited in open gutters in laneways or, at best, in fields at the edge of the village. In the projects carried out by NRSP, 90 to 100% of the households did not have a latrine prior to the project.

In most villages, the narrow lanes between the houses are not properly surfaced, which means that rainwater, kitchen runoff, animal waste and human waste accumulate in the streets. In the majority of rural areas, household, farmyard and small-scale industrial effluents flow into surface ponds, rivers or the canal irrigation system. Whether the wastewater seeps into the soil or flows into the drinking water supply, water borne diseases are only one aspect of a 'negative nexus' that follows from poor sanitation and wastewater management.

NRSP's Portfolio of Projects

NRSP's Wastewater Management and Sanitation projects are part of a long-term effort to implement physical improvements in communities. NRSP's portfolio of Community Physical Infrastructure (CPI) schemes includes drinking water supply schemes, communication (i.e. link roads and small bridges) schemes and agriculture-related

[1] NRSP is one of ten Rural Support Programmes operating in Pakistan.
[2] Bhutta, Dr. M. Nawaz

projects (many based in improving the supply of irrigation water) in addition to sewerage and drainage schemes.

NRSP's Physical Infrastructure and Technology Department had implemented 617 of these Community Physical Infrastructure schemes prior to 2000.

NRSP became a partner of the Pakistan Poverty Alleviation Fund (PPAF) in the year 2000. That partnership enabled NRSP to rapidly scale up its CPI programme. Since then, NRSP has implemented 143 stand-alone drainage and sanitation projects with funding from the PPAF. (See Appendix A) These projects have benefited 11,241 households, and cost a total of Rs 58,466,366 (USD 974,472).

NRSP has implemented five large scale Integrated Community Physical Infrastructure Projects with PPAF funding. These have a combined value of USD 165,870. (See Appendix B)

There have also been 268 Sanitation projects implemented by NRSP with funds from other donors, including the Barani Village Development Project,[3] Islamic Relief, ActionAid and the D. G. Khan Rural Development project. These are detailed in Table 2, Appendix A. These have benefited almost 75,000 households.

In a few cases, NRSP has implemented large-scale sanitation projects with funds from foreign donors: Canada's CIDA, for example, has provided funds for NRSP-implemented large-scale sanitation projects in Lodhran (southern Punjab).

Technological and Social requirements for successful wastewater management Projects

In its 13 years of operation NRSP has found that the only way to achieve a comprehensive solution to wastewater management and sanitation problems is to devise projects based on community requirements and to involve community members at every stage, from identifying needs to the long-term maintenance of the projects. These needs must be understood in both technological and social terms and the two must be integrated with each other, if a project is to be both successfully implemented and sustained in the long term.[4]

Social Mobilisation

Because the history of rural development in Pakistan is largely a history of under-performance, mistrust and apathy, it is necessary to build trust between a development NGO and rural communities. Since it was founded in 1992, NRSP has used "social mobilisation" as the framework for all of its poverty alleviation and development activities. Social mobilisation begins when NRSP 'Social Organizers' engage in dialogues with members of rural communities. These dialogues are founded on two things: the first is that if they form one or more Community Organizations (COs), each

[3] Funded by the International Fund for Agricultural Development and the Rawalpindi District Government

[4] NRSP's approach to the social aspects of organizing communities to meet their sanitation and wastewater needs reflects that of its exemplar, the Orangi Pilot Project in Karachi, Pakistan's largest city.

with members of 15 to 20 households, and if they pool their human and financial resources, members of rural communities can meet their development needs. Once a CO is formed, the community members prioritize their needs: many identify sanitation schemes as their first priority because they understand the connection between unsanitary conditions very well.

The other requirement is that CO members must work together to make maintain the physical infrastructure of the project for the long term. All COs are encouraged to save small amounts of money regularly: when a CO takes on a sanitation project its members have funds in reserve to make the necessary contribution, which averages about 20%. Households that are poorer than others can contribute to the project by providing labour.

For large wastewater and sanitation projects, several COs form a Village Organisation (VO) to represent the majority of the households. The VO elects a President, a Secretary and a Manager. The CO or VO members are responsible for providing the land for wells, water tanks and filtration ponds. In NRSP's experience there is always someone willing to donate land for these projects.

The next step is for NRSP and the COs (or the VO) to sign a formal 'Terms of Partnership' (ToP) agreement. At least 75% of the community representatives must be present in a meeting to sign this agreement. In the meeting, the NRSP staff explains every detail of the project. Before they sign, everyone involved knows the specifications, the contributions required from all parties, the disbursement schedule for funds, the implementation process and procedures, the time required to complete the project and the estimated annual operation and maintenance costs. They are also aware of the roles and responsibilities of NRSP and other partners.

The CO or VO then constitutes a Project Committee which assumes responsibility for the overall implementation of the project, and the management and operation of the project after its completion. The Committee, working closely with NRSP, supervises the project execution, makes sure that instructions from the NRSP engineer are followed, assigns responsibilities to VO members and keeps accurate records of all activities and expenditures. The committee also records the progress of the work and reports it to NRSP. The same committee maintains the Project records and accounts. If there are any discrepancies, the committee informs the VO members and NRSP as soon as possible.

After signing the ToP, the CO or VO opens a Project bank account. NRSP disburses the grant to the VO in instalments, as each stage of the work is completed. The Project Committee forwards a request to NRSP for the release of the funds in the form of a 'Resolution' signed by at least 75% of the VO members. NRSP's accounting staff check the expenditure vouchers, and the Engineers check the progress and quality of the work. Before releasing the final payment the NRSP Engineer makes sure that the work has been completed satisfactorily and that the best materials have been used.

Working with Local Governments to Implement Sanitation Schemes

In the year 2000 the entire system of Government in Pakistan was re-structured, resulting in decentralized administrative and financial authority. The purpose was to achieve more effective service delivery and transparency in decision-making. Twenty-five percent of each District's development budget is now required to be channelled

through bodies called Citizen Community Boards (CCBs). This has provided an excellent opportunity for NRSP and its member COs and VOs to be registered as CCBs and to utilise some of these development funds for wastewater management and sanitation projects.

Some elected officials, one of them a Member of the National Assembly, have enthusiastically taken up the challenge of joining with NRSP and with COs and VOs to meet these needs. Members of several District Governments have also co-operated, realising that the development funds available to them can be leveraged with community funds and with donor funds (in this case PPAF and NRSP), thereby reducing their costs while accomplishing necessary development projects. Here, too, community involvement following from social mobilisation was the key to completing the project successfully.

Some elected members of District Governments have been slower to respond, perhaps fearing that their role as 'donors' in control of development funds would be diminished. Some also worry that working with an NGO might reduce their authority, or that it might result in more complicated procedures. NRSP always works to dispel these concerns and to encourage potential partners to visit completed schemes and talk to everyone involved.

Training and Capacity Building

NRSP arranges training programmes for the members of the committees established by the COs and VOs. The members learn how to manage the construction process, how to keep records, how to procure high quality materials, and, after project completion, how to properly operate and maintain their projects. They are also encouraged to adopt participatory ways of working: holding regular meetings, ensuring attendance of at least 75% of members in meetings and ensuring that CO members are saving regularly. Members learn how to maintain accurate records and to link the VO with relevant organizations.

When the local Government is a partner in a sanitation scheme, NRSP also trains the relevant Government officials in planning, designing and implementing projects and in mobilising and motivating community members to participate in them.

Technological Requirements of Projects

Members of NRSP's Physical Infrastructure and Technology Development Department, all of them qualified Engineers, assess the needs identified by community members and then create a Project Digest which identifies the technical, economic and environmental requirements for the specific project. In an Integrated Project (Appendix B), this usually includes water harvesting and storage systems, distribution systems, street paving, installing connections to the drainage system in each household, installing sewers, building filtration and water treatment tanks and installing pipes to safely carry treated waste away from the village – either into the fields where it can be used as fertilizer or into a water channel.

The Project Digest also details the costs of the project, including all materials and labour, and the contributions of the community members and NRSP. When a District Government is involved as a partner, its share is also recorded in the project Digest. The

Digest also estimates the operation and maintenance costs, to give the Committees a clear idea of their financial responsibilities.

Potential environmental impacts are also accounted for, although all of the stand-alone or integrated projects are both 'low-tech' and relatively small scale. Care is taken to ensure that only high quality materials are used: this ensures that the systems will last as long as possible and that they will not negatively affect the eco-system.

Monitoring

NRSP has found that regular monitoring is vital to projects. The relevant committees and the NRSP Field Staff monitor the day-to-day activities. If other partners are involved (for example, another funding agency, or members of a District Council), they also check the progress. If a District Government is involved the projects are reviewed regularly in the Union Council[5] meetings. The NRSP Engineering staff produces monthly and quarterly Progress Reports which they forward to NRSP's regional and head offices. They also maintain a daily diary in which they record progress and/or problems.

Lessons Learned

The effects of cleaner streets and a proper wastewater disposal system are clear and immediate: pollution is reduced or eliminated; people can move about more freely to conduct daily affairs; they can also engage in social and ritual events with more comfort, when they no longer have to worry about staying clean. In some communities, people used to say that the dirty streets worried them when they had to attend funerals but that problem has now been solved.

The Projects result in clean streets, which means fewer mosquitoes and other pests. Fewer people fall ill and the children miss fewer days at school. People develop a keener sense of civic responsibility, and keep the streets clean. Although everyone benefits in terms of lower expenditures on health, there are particular benefits for women and children. The economic situation can also improve because of increased crop production from the wastewater.

Mutual accountability is the key to completing the project on time. A truly participatory approach like the one described here requires that all information be shared, and that decision-making be based on trust and full disclosure. Partnerships with elected representatives present a particular challenge, because Government officials have tended in the past to resist sharing responsibility and resource- allocation with village residents. However, the experience so far indicates that everyone involved realizes that they benefit from being part of this participatory method.

Once people have seen how well these projects can work, they are ready to tackle other development projects that are vital to their communities. Members of local Governments are also more willing to become involved in participatory sanitation projects when they have been involved with NRSP and with CO members. A degree of mutual trust and willingness to plan future projects almost invariably results.

[5] A Union Council is the smallest unit in the decentralised system.

Although many rural residents are quite poor, they are willing and able to contribute funds for community development. In the Integrated projects discussed in this paper, CO members contributed a total of Rs 2,070,451 (USD 34,423). If we count the value of the unskilled labour contributed, (usually about Rs 100 or USD 1.67) per day for unskilled labour) this value is a great deal higher. The total community contribution to all of the projects described in this report is Rs 54,289,161 (USD 904,819).

Once it has been demonstrated that effective interaction between partners is successful, endeavours of this kind can be implemented in other villages. NRSP's small-scale efforts in implementing wastewater management and sanitation projects have been scaled up: the integrated village development and sanitation projects described here are also being replicated on a large scale in several Provinces.

Projects using the principles and methods described in this paper represent significant improvements in the physical condition of the villages – indeed, in most cases they represent the first efforts ever, to work with communities to address sanitation issues. They also exemplify the ways that people can be mobilized to work together to respond to sanitation needs.

Perhaps most importantly, both provide tremendous learning opportunities for other organizations interested in demand-driven projects of this kind, and serve as potential models for local governments, other communities and donors interested in implementing wastewater management and sanitation projects.

CONTEXT

1.1 MDG Target

Sanitation has received international attention in recent times. In September 2000 the United Nations General Assembly endorsed eight Millennium Development Goals (MDG). Two of these goals are directly linked with sanitation-reduction in child mortality and ensuring environmental sustainability. Targets for achieving these goals are to reduce by two-thirds the under-five mortality rate within 2015 and to improve the lives of at least 100 million slum dwellers by 2020 through access to better sanitation. Two years later, in September 2002, the World Summit on Sustainable Development (WSSD) voiced a stronger concern for promoting sanitation. In the Implementation Plan of WSSD, nations agreed to pursue a specific sanitation target: halving the figure of 2.4 billion people who do not have access to basic sanitation facilities by 2015.

The Government of Bangladesh (GoB) is committed to achieve the MDG targets. This commitment is reflected in the draft Poverty

Reduction Strategy Paper (PRSP) that envisages reducing infant mortality rate from the 2000 benchmark value of 66 to 37 by 2010 and 22 by 2015. Similarly, child mortality is to be reduced from 94 to 52 by 2010 and 31 by 2015. To achieve the targets, the government has emphasized improving sanitation as a national priority.

1.2 Impact of Low Sanitation Coverage

As in many other developing countries, sanitation remains a major challenge in Bangladesh. The low sanitation coverage (33%) in Bangladesh poses a serious public health concern. It is estimated that 71% rural households and 40% urban households practice open defecation or use unhygienic latrines. Diarrhea remains a major killer disease. About 110,000 children under five die of diarrheal disease every year. It is thought that one out of four deaths of under-five children is caused by diarrhea. Over 65 million episodes of diarrheal diseases occur annually among under-five children. An average child in Bangladesh suffers 3-4 episodes of diarrheal disease every year. There has been no significant reduction in morbidity rate of diarrheal diseases despite having a high safe water access. Other water-borne diseases are also prevalent.

The high disease burden translates into high healthcare cost. It is estimated that the people of Bangladesh spend no less than Taka 500 crore annually to cover physician's fee, medicine and travel cost to clinics in treating the major water-borne diseases. The cost would be much higher if the loss of income, time spent for patient care, and effect on child development are factored in. Diarrheal diseases in Bangladesh cause the loss of 5.7 million Disabilities Adjusted Life Years, 61% of total DALYS. The poor are the hardest hit by the sanitation related diseases. Loss of income and productivity due to the diseases may push a poor family further into poverty and debt, thereby perpetuating the cycle of poverty.

1.3 Sanitation and Poverty Linkage

The linkage between sanitation and poverty is often overlooked. It is the poor people who suffer most from lack of access to basic facilities and services. Loss of earnings and production are additional handicaps for poor people, for whom physical fitness is the main productive asset. Use of safe drinking water and sanitation facilities, together with improved

hygiene practices, has a direct impact on poverty by reducing the vulnerability of poor people, specially women and children, to disease, ill health and death. Use of improved facilities releases women and girls time for paid work, school and rest, savings are made from household expenditure on medical expenses.

There is hard evidence that sanitation interventions lead to significant improvement in disease control and overall well-being. A study documented that total sanitation coverage and improved water facilities reduced diarrhea by 99%, dysentery by 90% and other stomach-related problems such as intestinal worms by 51%. As a result, monthly medical costs for common illnesses decreased by 55% in rural areas and 26% in urban areas. Working days lost due to illness fell from 77 to 35 days per year, and schooldays lost due to illness fell from 16 to 7 days per year in rural areas. The savings were passed to buying food and clothing. Expenditure on food and clothing increased by 6% and 2% respectively. These figures testify to the poverty alleviation dimension of sanitation intervention. Such evidence has led to the global call for sanitation improvement. In response to the international goal, the Government of Bangladesh (GoB) has expressed a firm commitment to improve the sanitation situation.

1.4 National Sanitation Goal

The national sanitation goal is to achieve 100% sanitation coverage by 2010. This challenging target is much ahead of the MDGs. The government has already taken the initiatives to achieve this national sanitation target in collaboration with development partners and NGOs.

1.5 Objectives of the National Sanitation Strategy

The primary objective of this national sanitation strategy is to delineate the ways and means of achieving the national target through providing a uniform guideline for all concerned.

More specifically, the objectives of this strategy are to:

- address the key sector issues,
- define the roles of various actors and
- guide the creation of enabling conditions for success.

1.6 Scope of the National Sanitation Strategy

The scope of this present strategy is to address primarily the issues related to unhygienic defecation and personal hygiene practice. However, strategies for addressing the issues of solid waste management, and disposal of household waste water and storm water will be considered separately also as a matter of priority.

1.7 Process of Developing the Strategy

The GoB assigned a team of experts to draft a national sanitation strategy for this purpose. A participatory approach was adopted in developing this strategy. Consultative meetings were organized with stakeholders from the central to the grass roots level. However, this is designed as a living document and may be revised from time to time in the light of progress made and changed needs.

2

BASELINE SURVEY ON SANITATION

A nationwide baseline survey was conducted in 2003 to assess the sanitation coverage in the country. The survey covered all rural and urban households. The survey revealed an appallingly poor sanitation scenario in the country. Only 33% of the households were found to have hygienic latrines, while 25% have unhygienic ones. About 55 million people (42% households) do not use any form of latrine. A brief summary of the survey results is given below.

Households with hygienic, unhygienic or no latrine

Area/ Region	Number of households	Households with hygienic latrines (%)	Households with unhygienic latrines (%)	Households with no latrines (%)
National	2,13,94,093	33	25	42
Rural	1,83,26,332	29	24	47
Urban	30,67,761	60	28	13

Reasons reported for not having a latrine

Area/ Region	Number of households with no latrines	Lack of money (%)	Lack of awareness (%)	Lack of space (%)	Preference for open defecation (%)
National	89,82,551	73	25	11	4
Rural	85,95,626	73	25	10	4
Urban	3,86,925	80	21	18	3

Note: Data collected based on multiple response survey

The survey also showed varying level of coverage under different socio-economic and hydro-geological conditions of the country. It also documented reasons reported by households for not having a sanitary latrine. The results of the baseline survey are extremely important and form the basis for designing future interventions to achieve the national sanitation target.

Considering the per annum growth rate of about 4% sanitation coverage in the past and also considering that the required rate of sanitation coverage would be of the order of 12% per annum to achieve 100% coverage, the task ahead is extremely challenging. Accordingly the sector capacity needs to be sufficiently strengthened to ensure the required growth rate.

3

IMPORTANT TERMS AND DEFINITIONS

Several key terms are defined here for clarity and consistency. They are not the last words on the subject, but are presented to foster a common understanding of all concerned.

3.1 100% Sanitation

At the very least, the term "100% sanitation" will mean to include all of the followings:

- No open defecation
- Hygienic latrines available to all
- Use of hygienic latrines by all
- Proper maintenance of latrines for continual use, and
- Improved hygienic practice

However, it is to be emphasized that health impacts of sanitation are the primary reason for sanitation improvement programmes. Health consequences should be considered as central. Therefore, Total

Sanitation should also mean total sanitary condition for healthy living. Thus the term must include,

- hygienic latrine facilities away from the environment,
- proper management of solid waste, and
- proper disposal of household wastewater and storm water.

3.2 Hygienic Latrine

The linkage between sanitation and health leads to an understanding that the primary focus of sanitation should be on the environmental transmission routes of excreta related diseases. Based on this understanding, a "hygienic latrine" is defined as a sanitation facility the use of which effectively breaks the cycle of disease transmission. Improved hygiene practice is to be emphasized and proper use of hygienic latrines ensured because both play the vital role in breaking the cycle of disease transmission.

The most fundamental health objective of sanitation must be achieved through proper design, installation, and use of a sanitary or hygienic latrine. There is no universal design of a hygienic latrine that could be effectively used under all socio-economic and hydrogeological conditions. It is therefore important that a wide range of sanitary or hygienic latrine technologies is available to suit different conditions.

A hygienic latrine would mean to include all of the following:

(1) Confinement of feces away from the environment,

(2) Sealing of the passage between the squat hole and the pit to effectively block the pathways for flies and other insect vectors thereby breaking the cycle of disease transmission, and

(3) Venting out of foul gases generated in the pit through a properly positioned vent pipe to keep the latrine odor free and encourage continual use of the hygienic latrine.

3.3 Operational Definition of Hardcore Poor

The following set of eligibility criteria shall be used to define hardcore poor households. These criteria have been taken from Pro-poor strategy for water and Sanitation sector in Bangladesh (2005). The focus is

mainly on the hardcore poor households since they are the prime target group of the subsidized program of the government. The criteria will ensure that the targeted groups actually enjoy the greater benefits of the government subsidized sanitation services.

The criteria are very simple and can easily be measured through simple observation. Note that the household is the unit of measurement for these criteria.

The strategy suggests relaxing these criteria for identification of hardcore poor households in Chittagong Hill Tracts (CHT) and saline-prone coastal areas.

Eligibility criteria

1. Landless households
2. Pavement dwellers/homeless
3. The main earning person or the head of family is a day laborer, owning less than 50 decimal of agriculture land or residing in a rented premise lesser than 200 square feet, and having no fixed source of income.
4. Households headed by Disabled or Females or Old (65+ years) persons.

If the answer to any of the above criteria is 'yes', the household will be treated as hardcore poor to give priority in subsidized sanitation services.

3.4 Basic Minimum Level of Service

Referring to the definition of hygienic latrine, the basic minimum level of sanitation service would be that every member of a household should have access to a safe hygienic latrine - either a separate household latrine, shared latrine subject to use by maximum of two households or a community latrine.

A basic unit could be a simple pit latrine that is designed for effectively confining the faeces, sealing of the squatting hole, and a provision for a vent pipe for the release of gases. 3 to 5 litres of water per person should be available for anal cleansing, hand washing, and cleanliness of the latrine. However, design and construction of a basic unit may vary from place to place depending on the hydro-geological conditions.

4

15 GUIDING PRINCIPLES

The following principles lie at the heart of the National Sanitation Strategy. The principles are primarily based on the guiding principles included in the 'Dhaka Declaration' of the South Asian Conference on Sanitation (SACOSAN), held in 2003. These principles have subsequently been elaborated and refined during the process of preparing this strategy and should apply in all conditions, in rural and urban areas, in rich and poor communities, and whether sanitation is an individual household system or a community system.

Sanitation is a human right

The international acceptance that health and access to water are human rights clearly implies that access to sanitation should also be considered as a human right. The national government is therefore obliged to progressively ensure access to basic sanitation equitably and without discrimination.

Sanitation is primarily about health

The primary objective of the national sanitation campaign is to contribute to improving the health and quality of life of the entire population. It is focused on the elimination of open defecation and other unhygienic practices, as well as the promotion of good hygiene practices.

Sanitation is also about privacy, convenience, dignity, safety and security

While the primary objective of sanitation is about health, other social factors such as privacy, convenience, dignity, safety and security are also important.

Creating and sustaining demand

Hygiene promotion and behaviour change leads to creating and sustaining demand for sanitation facilities.

Hygiene promotion and behaviour change

Sanitation improvement is focused on achieving sustainable changes in hygiene behaviour and not limited to latrine installation only.

Software financing are needed for scaling up and sustainability

Government and community financing are crucial for promotion, awareness, capacity-building and the creation of funding mechanisms for scaling up sanitation and hygiene programmes.

Hardware subsidies only for the poorest

Hardware subsidies should only be provided to the poorest of the poor, to be given under appropriate and effective monitoring and evaluation arrangements.

Communities are central to the sanitation planning process

Communities must be at the centre of planning and implementing sanitation programmes. Special emphasis needs to be placed on effectively involving the poorest in the communities.

Gender sensitive approach

The planning of, investment in, and promotion of sanitation facilities must address the special needs and priorities of women and children. Gender aspects need full consideration in sanitation programmes.

Social, cultural and technical appropriateness

Local values and cultural practices should be given due consideration in sanitation improvement programmes. Sanitation technology should be viable, affordable and locally appropriate. Indigenous knowledge and local skills must be promoted.

Decentralization of decision-making

Decision-making and implementation of sanitation programmes must be conducted at the local level by the local government institutions (e.g. union parishad, gram sarkar, ward commissioners) for sustained sanitation services. The central government will be responsible for funding, guiding, monitoring, and coordinating sanitation programmes throughout the country following a coherent consultative process.

Equitable allocation of resources

Funds to support sanitation programmes should be equitably distributed throughout the country, considering population and level of development of different areas. Funding should not be disproportionately allocated to certain sections of the population.

Partnership approach

Effective, strategic partnerships, at national and local levels, involving government bodies, non-government organisations, development partners, community-based organisations and the private sector are essential for achieving progress on sanitation.

Environmental integrity

Sanitation services that have unacceptable impacts on the environment, particularly pollution of water resources, will not be considered adequate. Particular attention is required to the adequate separation of latrines and water points.

Emergency preparedness

Sanitation services need to be planned with consideration of the impact of emergency situations, such as floods and cyclones.

5

RELEVANT POLICY GUIDELINES

5.1 The National Policy for Safe Water Supply and Sanitation 1998

The National Policy for Safe Water Supply and Sanitation 1998 is the basic policy document governing the water supply and sanitation sector.

The policy mentions that the Government's goal is to ensure that all people have access to safe water and sanitation services at an affordable cost. The policy emphasizes elements of behavioral changes and sustainability through user participation in planning, implementation, management, and cost sharing. Ensuring the installation of one sanitary latrine in each household in the rural areas and improving public health standard through inculcating the habit of proper use of sanitary latrines is mentioned as one of the objectives.

About urban sanitation, the policy objective is to ensure sanitary latrine within easy access of every urban household through technology options ranging from pit latrines to water borne sewerage. Installing public latrines in schools, bus stations and important public places and

community latrines in densely populated poor communities without sufficient space for individual household latrines is also emphasized.

Local government and communities shall be the focus of all activities relating to sanitation. All other stakeholders including the private sector and NGOs shall provide inputs into the development of the sector within the purview of overall government policy with Department of Public Health Engineering (DPHE) ensuring coordination.

Appropriate water supply and sanitation technology options shall be adopted to specific regions, geological situations and social groups. Continuous research and development activities shall be conducted to improve the existing technologies and to develop new technologies.

The role of women in the process of planning, decision-making and management shall be promoted through their increased representation in management committees and boards (Pourashavas/ Water and Sewerage Authorities, WASAs).

The users shall be responsible for operation and maintenance of sanitation facilities and will bear its total cost. However, in case of hard-core poor communities, educational institutions, mosques and other places of worship, the costs may be subsidized partially or fully. In public toilets separate provision shall be made for women users. Credit facilities should be made available to bear costs of water and sanitation service. Private sector and NGO participation in sanitation shall be encouraged.

Within a specified period legislation shall be enacted making use of sanitary latrine compulsory. Regular qualitative and quantitative monitoring and evaluation shall be conducted to review progress of activities and revision of the strategy based on experiences. The Local Government Division will prepare Half Yearly Report on the activities of the sector and submit to the concerned authorities.

5.2 Draft Poverty Reduction Strategy Paper (PRSP)

The government of Bangladesh issued the first version of the interim Poverty Reduction Strategy Paper (IPRSP) in April 2002 and the second version in December 2002. Water and sanitation issues received little attention in the IPRSPs. These were included only as minor issues under

Infrastructure Development. In October 2003 the Government started the process of developing a full PRSP that is scheduled to be finalized in 2005.

In the process of developing the full PRSP the Government has acknowledged the potential of Water Supply and Sanitation (WSS) issues as a sub-thematic issue under health following a civil society sector submission to the Poverty Reduction Strategy process in Bangladesh and increasing demand from sector agencies. Since the national budget allocation and donor support will be provided as per the PRSP in the near future, the inclusion of WSS as a separate chapter in the full PRSP will help ensure adequate funds for accessible water supply and sanitation services for all in Bangladesh.

5.3 National Water Management Plan 2004

The national water management plan has envisaged access to appropriate sanitation to all by 2010 and has also made a provision for waterborne sanitation and storm water drainage in major cities. Also it has proposed resource allocation to achieve time bound targets. Accordingly, the sanitation strategy would consider this plan to enhance total sanitation through agreed resource planning of the government.

5.4 Sector Development Framework (SDF) 2004

Government of Bangladesh (GoB) has approved a Sector Development Framework (SDF) which guides planning, coordination and monitoring of all future sector development activities with a focus on devolution of authority to LGIs, user participation, economic pricing, public-NGO-private partnership, gender-sensitivity. Accordingly, the national sanitation strategy would conform to this framework.

5.5 Pro-Poor Strategy for Water and Sanitation Sector 2005

The Pro-poor strategy for water and sanitation provides the operational definition of hardcore poor households, definition of basic minimum service level, targeting and organising the hardcore poor households, and mechanism for administering subsidies.

5.6 Sanitation Related Policy Decisions 2004

Beginning in 2004, the Government has allocated 20% of the Annual Development Programme (ADP) fund to Upazillas for improving sanitation coverage. According to government decision, 90% of this

allocation would be used to procure sanitary latrines for distribution free of charge to the hardcore poor people. The sweated labour for carrying sanitation materials and for construction of latrines will be considered as sweat equity from the beneficiaries. The remaining 10% funds are to be used for promotional activities. In addition, Tk. 5000.00 has been allocated and disbursed to each Gram Sarkar for their local development, sanitation being one of the major activities. Subsequently in January 2005, the decision has been revised to raise the funds for promotional activities from 10% to 25%. For urban sanitation also, Government has allocated 20% of the Annual Development Programme (ADP) fund to Paurashavas and City Corporations.

One important aspect of the decision is that the focal point of the national sanitation campaign is the Union Parishad at rural level and in urban areas it is Ward of Municipalities and City-corporations. The Union Parishads have been entrusted with the task of latrine distribution and promotion.

6

BUILDING ON SUCCESSES AND LESSONS LEARNED

While the set national goal of 100% sanitation by the year 2010 may seem ambitious and the challenges ahead herculean, there have been a number of positive experiences in the recent past which provide useful lessons to build upon. The strongest ones of these are:

6.1 Public Sector Led Sanitation and Hygiene Programme

The nationwide social mobilisation for sanitation was implemented by the public sector (DPHE) during the 1980s and 1990s. The approach was to create demand through social mobilization and the project emphasized fixed-place defecation and homemade latrines to popularize the use of sanitary latrines among the people. The ring-slab latrines were still available at subsidized cost to the people. The sanitary latrine coverage perked up during the social mobilization campaign but the pace fell back with the end of the project. Local government involvement was attempted under this programme by introducing union WATSAN committees. Success was limited due to a slow decentralization process and lack of a proper supportive environment.

6.2 NGO Implemented Programme

NGOs have implemented many sanitation programme with direct support from donor agencies. Many NGOs implemented successful sanitation initiatives by building community demand for improved sanitation. Starting in early 2000, a number of NGOs stated a completely new approach. Instead of appealing to individual households, they addressed a whole village as one unit. The focus shifted from individual action to collective action. There was no subsidy on hardware, not even for the poor people. Instead, many types of latrine models were developed to suit all sections of the population. Confinement of feces in a hygienic manner was the minimum requirement. A vigorous motivational campaign was mounted to raise awareness and demand for sanitation. Villagers and local government were full partners in these campaigns. The result was spectacular. Many villages attained 100% sanitation with every household having access to a sanitary latrine.

6.3 Union Parishad Led Initiative

There have been several Union Parishads which have provided effective leadership to the community in achieving 100% sanitation coverage. They have accomplished this with the support from Government, NGOs/CBOs for creating hygiene awareness and community mobilization. Till date 94 Union Parishads have achieved 100% sanitation coverage.

6.4 Upazila Led Initiative

100% sanitation coverage could also be achieved in some Upazilas , where Upazila Nirbahi Officers (UNOs) could rally support from the Union Parishads and the community. Some successful examples are Rajarhat of Kurigram, Puthia of Rajshahi, Saturia of Manikganj and Rajapur of Jhalakathi. These demonstrate what can be achieved if local government institutions take the initiative.

6.5 Local Small Scale Private Initiatives

There are hundreds of Village Sanitation Centers run by private sector providing sanitation services at the door steps of rural community at competitive prices. They also have a role in creating demand for sanitation. Investment from small scale private sector is also considerable.

6.6 Facing the Urban Challenges Through Public-private-community Partnership

One of the most serious challenges faced by urban slum dwellers revolves around the lack of tenure rights. Virtually no slums in Bangladesh are 'recognized' and therefore the provision of basic services, including water and sanitation, is theoretically illegal. Only 16% of the population in urban slums uses safe water, whilst sanitation coverage is just 13.5%.

An NGO initially approached the Dhaka city water authorities on behalf of slum communities and was granted temporary permission to use the land for water point construction. Although the connections legally have to be in the NGO's name, community involvement has been maximised, particularly in the area of operation and maintenance of the water points. Given scarcity of land, sanitation blocks housing latrines and washing facilities are constructed for the shared use of 60 to 100 families. These are managed by the community. The community has also been at the forefront of health and hygiene awareness raising campaigns. This successful integrated model has attracted the interest of other national and international development actors working in slums and is being replicated at other urban centres, including slums of Chittagong, the second largest city in Bangladesh, working together with Chittagong Water Supply and Sewerage Authority (CWASA).

6.7 Lessons Learned

There are some important lessons, which can be learned from the efforts made so far, and these need to be disseminated and discussed so as to reach a national consensus for strategy development. The lessons could be summarised as:

- National campaigns are effective at raising awareness for accelerated efforts.
- Commitment of local government is a key to achieving the goal.
- GO-NGO-Community partnership is essential.
- Duplication of efforts shall be avoided.
- Adequate community mobilistation for motivation and sustainability increases sanitation coverage.

- All members of the community including women, students, children, community leaders can play an important role for community mobilization.
- No hardware support or subsidy should be provided except for the hardcore poor.
- A range of sanitation options and costs should be provided.
- The poor will need special support and assistance and this should be agreed and adopted by the community.

6.8 Scaling Up

However exciting, the successful projects have so far been small scale and may not have contributed significantly in reducing the under served on a national scale. However, there are important lessons from the small-scale experiments, which demonstrate that improvement is possible. With proper adaptation of the lessons from the small pilots, it will be possible to reach the objective of 100% sanitation by 2010.

The government and other stakeholders have now started to think about scaling up the sanitation effort and its sustainability. It is, however, recognized that for both issues the role of local government is crucial. Local Government Institutions (LGI) is the glue that ties villages together. Government funds and other assistance are to be channeled through the LGIs. It is the LGIs who can motivate the entire population of unions and upazillas.

7

MAJOR SANITATION ISSUES

In order to achieve the goal of 100% sanitation by the year 2010, the focus of strategies shall be on the following 6 major areas of concern:

- Open defecation
- Hardcore poor remaining unserved
- Use of unhygienic (hanging/open) latrines
- Lack of hygiene practice
- Urban sanitation
- Solid waste and household wastewater disposal not duly addressed

Institutional, financial, technological and social aspects shall be considered in formulating strategies to address each of these issues.

According to the nationwide baseline survey on sanitation (2003), 42%

of the population i.e. about 55 million people do not have any form of latrine and therefore, resort to open defecation. The survey further reveals that of this 42%, about 73% households do not have latrines due to lack of financial resources, people of 25% households are not aware of the importance of having a latrine, 11% households do not have space for latrine installation while about 4% households preferred defecation in the open. This strategy paper is intended to address the following 21 specific issues in the sanitation sector.

21 Specific Issues:

- Lack of financial resources for having latrines in the households
- Lack of awareness of the benefits of sanitation on health and economic productivity
- Lack of space particularly among landless people
- Habit for open defecation
- Lack of technological know-how among people for building low cost hygienic latrine
- Lack of institutional capacity / mechanism to support people build their own hygienic latrine at affordable cost
- Inadequate hardware outlets
- Absence of mechanism for identifying hardcore poor and ensuring effective utilization of government subsidy
- Public toilet facilities are grossly inadequate particularly in urban areas, and also in public transport systems e.g., Trains, Boats, Motor-launches and Steamers
- Land tenureship/ownership remains a crucial issue for providing services to urban slum dwellers
- Limited technology options to address sanitation requirements particularly in densely populated slum areas
- Discrete and inequitable investment

- Absence of mechanisms for effective monitoring and evaluation at all levels and lack of coordination
- Concerned organizations lack mission, vision and strategy for continual improvement of services
- Public agencies need more orientation on process based approach
- Socio-economic dimension of WSS are not fully understood/ considered
- Provision for staff development and continuing education in public agencies particularly in LGIs not in place
- Weak partnership among public agencies, local government institutions, non-government organizations, private sector and development partners
- Lack of incentives for successes
- Absence of emergency response plan on sanitation
- Absence of a legal framework for improved sanitation

8 STRATEGIES FOR SANITATION IMPROVEMENT

8.1 Creating Effective Demand through Health Education and Hygiene Promotion

Investments in sanitation can deliver major benefits in terms of improved health, economic growth, enhancement of quality of life, poverty reduction, and environmental sustainability, provided that the investments are in response to effective demand and that service delivery is effective and efficient. This demand for sanitation can effectively be generated once people are convinced of the need for sanitation improvements and they will then invest their own resources into improvement programmes.

However, sanitation improvements can never be confined to the provision of latrines by government agencies as it has been clearly demonstrated in the past that how essential it is to link health and hygiene education with water supply and sanitation for achieving lasting health benefits.

Improved sanitation facilities will only achieve a parallel reduction in

diarrheal diseases if they are developed alongside appropriate hygiene programmes. It must be fully recognized that hygiene contributes to the prevention of transmission of excreta related diseases and seeks to create effective barriers between pathogens that cause diseases, the intermediate carrier and the people.

Despite strong links between sanitation and health, there is, however, little public awareness of this and consequently sanitation is low on people's priorities. The national sanitation campaign must, therefore, redress this situation through information and education to promote awareness of the role of sanitation in lasting health benefits and thus stimulate effective demand for hygienic latrines.

The most important strategy for sanitation improvement is to raise public awareness that we must change unhealthy behaviour and practices in order to achieve sustained health benefits. The national sanitation program must support and provide health and hygiene education that will enable people to improve their health through correct hygienic practices, which eventually will lead to increased demand for appropriate sanitation facilities.

Health and hygiene education and promotion

- must be an integral part of all sanitation and water supply projects
- must be undertaken by all concerned dealing with health, environment, infrastructure and education; Ministries of Local Government, Health, Environment, Information and Education must take a coordinated effort for health and hygiene promotion
- DPHE and Local Government Engineering Department (LGED) through their countrywide organizational network, must play an appropriate role in facilitating LGIs in technology choice and also for creating demand for sanitation.
- should be targeted at all levels of the community with particular focus at high risk groups such as mothers of infants, small children and the economically disadvantaged groups
- must be enhanced through field-level health workers after proper orientation, education and training in effective health and hygiene

promotion methods

- must be sensitive to specific local issues, such as rural and urban differences and cultural factors

8.2 Ensuring Individual and Community Actions

The success of the national sanitation initiatives will depend on firm commitment not only of government but of every individual household. Unless all members of every household are aware of the damaging effects of poor sanitation, they will not commit their time, energy and money to sanitation improvements.

It is, therefore, important that the whole community be at the center of all the pre-planning, planning, design, decision-making and implementation stages of all sanitation programmes as their effective participation will ensure increased commitment, ownership and sustainability of sanitation improvements. Not only the family decision makers but all members particularly women and children must participate in the decision making process.

Enabling community members to play an active role in planning and decision making will ensure that local values are incorporated and thus will ensure that the resulting sanitation program is relevant, appropriate, acceptable, accessible, affordable, equitable, empowering, and makes use of indigenous knowledge and local skills.

NGOs have considerable experience in various aspects of community-based sanitation and health and hygiene promotion programmes. It is envisaged that NGOs will continue to play this important role of involving the entire community in sanitation programs.

Private sector involvement particularly in building sanitation facilities will result in local business development and provisions for employment opportunities.

Schools, both primary and secondary, will be a major community focal point for sanitation development and health and hygiene promotion. All schools must have hygienic latrines and hand washing facilities and the use of these facilities must be linked to lessons on health and personal hygiene.

8.3 Activating LGIs to Play the Key Role for Improving Sanitation Coverage

Capacity of LGIs should be enhanced in terms of awareness, responsibilities, accountabilities and more decision making power regarding planning, implementation and monitoring.

Public fund should flow directly and timely to Union Parishads / Wards to empower them to implement their sanitation programmes.

Capacity of Union Parishads/Wards should be enhanced through additional staffing so that LGIs can effectively supervise or oversee sanitation programmes in their localities.

Effective partnership between LGIs and community should be established for providing appropriate sanitation services to the local communities.

DPHE should facilitate the LGIs in implementation of sanitation programmes

Effective collaboration amongst LGIs, NGOs/CBOs and private sector should be developed for implementation of sanitation programmes as per requirement of local need.

8.4 Facilitating Adequate Supply Chain of "Hygienic Latrines"

- Capacity enhancement of existing production centers and establishing new production centers at each Union Parishad/Ward level to meet the requirements of about 12% growth of "hygienic latrine" per annum.

- Motivation of private sector producers for more investments

- DPHE should be capable enough to monitor the quantity and quality of hygienic latrines.

8.5 Reaching the Hardcore Poor

Although there are some separate success cases in Bangladesh, initiatives in general to provide rural and urban population with safe sanitation have not been particularly successful in reaching the poorest of the poor due to lack of specific guidelines. The poorest of the poor have, by definition the least asset, the least social, political status and the greatest difficulties to acquire their right of subsidized sanitation services. Studies and

experience suggest that despite the provisions and budget allocation for subsidized sanitation services by the government, donor and NGOs policies for the poorest, such services rarely reach to the poorest. The Pro-Poor Strategy for Water and Sanitation sector in Bangladesh (2005) provides specific guidelines for assisting the hardcore poor. However, the following steps should also be considered carefully in conjunction with the pro-poor strategy.

- Poverty is a multidimensional and a relative phenomenon. Therefore, the poorest of the poor need to be defined separately at each of the lowest tier of local government institutions both in urban and rural, based on some specific criteria following consultation process amongst different stakeholders i.e. community representatives, NGOs/CBOs, local government agencies etc. Identification of hardcore poor should be based on the specific criteria set by the pro-poor strategy for water and sanitation in Bangladesh.

- Latrine options and the cost of each option for the hardcore poor vary according to region/ location. Therefore, the minimum level of subsidized services needs to be defined at least at upazila level through consultation with different stakeholders i.e. community representatives, NGOs/CBOs, local government agencies, etc. rather than a fixed flat-rate for the whole country.

- Apart from the centralized/ project based subsidized services, local resources (kind/ cash) at the local government institution level needs to be mobilized to assist the hardcore poor on a priority basis based on their poverty ranking.

- Local government institutions, government agencies, and NGOs/ CBOs should provide interest free or with low interest micro-credit facilities to the moderate poor.

- To make the whole process transparent, accountable and effective, an institutional arrangement from community level to central level should be strengthened. Existing WatSan/Taskforce committees at Union and Ward levels both in rural and urban areas should be reviewed to include CBO/NGOs/Civil Society and community representatives if needed. Union and Ward level WatSan committees should steer the whole process.

8.6 Strategies for Improved Urban Sanitation

Strategies for large cities

One of the major problems in large cities is lack of services to slum dwellers. This leaves a large section of urban population without sanitation services. To extend sanitation service to slums the following strategies will be adopted:

- Service provision should be delinked from land tenureship. This will allow the utilities to extend their services to the slums.

- Public-private-community partnership be promoted for effective sanitation service delivery to slums. It is proposed that partnership be forged between public utilities/LGIs, NGOs/private sector and slum dwellers to set up and manage community sanitation solutions in all slums.

- Effective coordination between city planning authorities, city corporations and public utilities must be established in order to ensure appropriate sanitation service delivery.

Furthermore there is a large percentage of floating population without any kind of public toilet facilities.

- Adequate public toilet facilities be constructed at places where people congregate such as railway stations, bus stations, river stations, parks, markets and other public places. City Corporations should build these facilities and be leased out to NGOs/private sector for better operation under a public-private partnership arrangement.

Strategies for small and medium towns

Apart from a few project based initiatives, service delivery mechanism particularly for sanitation is virtually non existent in small and medium towns.

- New service delivery mechanism needs to be established through effective partnership among communities, municipalities, private sector and NGOs.

- A sanitation cell within each municipality will take the initiative to plan, monitor and coordinate all the sanitation programmes including

solid waste and wastewater disposal facilities in respective municipal service area.

- Private sector investment be encouraged for installation, operation and management of public/community sanitation facilities.

Technologies for urban sanitation

A number of technological challenges are to be overcome for achieving adequate sanitation coverage in urban areas. The following strategies should be adopted:

- Low cost technology options are much better than long absence of high cost sophisticated solutions.

- Sewage treatment technologies with greater emphasis on resources recovery and recycling must be given top priority in improving urban sanitation situation. Emphasis should be on less energy intensive technologies e.g. constructed wetland, oxidation ditch, extended aeration, stabilization ponds, etc.

- Appropriate desludging of septic tanks and pit latrines must be enforced and effluent disposed of in a proper manner. Sludge emptying services by City Corporations and Paurashavas must be in place.

- Multiple technology options must be considered including decentralized wastewater management option.

- Medium cost sewerage technologies should be developed based on simplified or modified conventional sewerage technology, particularly for small and medium townships.

- Low-cost appropriate technology (e.g. twin pit, eco-sanitation) should be promoted in peri-urban areas as well as in other small to medium sized urban centers where feasible.

Public utilities

- Policies and practices of public utilities for sanitation services must include provisions for the poorest (e.g., slums, urban fringes etc.)

- Cost recovery mechanism must be devised based on level of services provided.

Institutional arrangement for urban sanitation

- All city corporations must establish a full fledged Sanitation Division to plan, implement, and monitor sanitation programmes in cities.
- All Pourashavas in small and medium towns must establish Sanitation Cells/Units for planning, implementing, and monitoring sanitation programmes.
- Respective public agencies like WASAs, DPHE, LGED will provide technical assistance to the LGIs in urban areas.

8.7 Media Campaign

Improvement of sanitation largely depends on behavioral factors. Media has a tremendous impact on changing human behavior and practices. The following strategies must be adopted to maximize the benefit of media (both electronic and print) campaign for sanitation improvement:

- Sanitation must find a space within media
- Regular reporting of sanitation related important information
- Reporting best practices and success stories
- Reporting of updated progresses
- Particular attention must be given in broadcasting emergency sanitation messages

8.8 Strategies for Sustainability

National Sanitation Focal Point

A well organized institutional setup is a prerequisite for sustainability. As a national focal point, a Sanitation Wing within the Local Government Division of the Ministry of Local Government, Rural Development and Cooperatives (LGRD&C) is to be established to guide the overall national sanitation improvement programme in the country with an objective of achieving 100% sanitation by 2010.

The already constituted Sanation Secretariat within DPHE will be strengthened to monitor sanitation improvement progress and multi-level communication.

The institutional arrangment of the sector as defined in the National policy for Safe Water Supply and Sanitation 1998 will be followed.

Integrated Approach

Sanitation requires priority attention to enhance healthy living and overall development of the nation. An integrated approach combining safe sanitation, hygiene education and promotion and safe water supply ensures improved health and livelihood.

Multi- stakeholders Approach

The successful promotion and implementation of sanitation programmes require that all stakeholders be involved from the pre-planning stage, through implementation to monitoring and evaluation stages.

Multi-sectoral Approach

Sanitation development is essentially multi-sectoral. Education, health, environment, finance, information sectors must work hand in hand for sustainable sanitation improvement.

Sustainable, Appropriate and Affordable Options

Informed choice of a variety of technological options must be available for people considering affordability, cultural acceptance and environmental friendliness.

NGO Facilitation

Non-governmental organizations have shown strong technical and community development skills that could be transferred and expanded for the benefit of the water and sanitation sector. NGO facilitation is extremely important in confidence building in communities/ LGIs to own sanitation development programmes. Government at all levels should build partnership with NGOs and civil society organizations for greater facilitation.

Private Sector Participation

Enabling environment shall be created for increased private sector participation for the promotion of different technology options and improvement of sanitation service delivery. Soft credit and skill development will be promoted by government/ non-government agencies to encourage private sector participation.

Legislation

Appropriate legislation for the enhancement of sanitation service delivery at all levels shall be enacted based on the existing public health and environment related laws and bye-laws.

Ownership and Responsibilities

Although it is accepted that sanitation is a basic household activity, specific institutional structures have to be in place to guide these activities and strengthen the sector. These structures include government agencies and local government institutes responsible for sanitation, hygiene education and water supply as well as NGOs/ civil society organizations. The ownership of the facilities and the responsibility for operation and maintenance shall be that of the households and the communities.

Research and Development

The advancement and upgrading of technologies and participatory hygiene methods through research and development of appropriate and affordable technologies and management systems shall be pursued. Research organizations should be given the responsibility to improve and develop new technologies. The developed technologies should be disseminated and skills transferred to local level for implementation.

8.9 Financing of Sanitation Programmes

Public funding

The government has already set an encouraging trend by allocating development fund for promoting sanitation. However, public funding for sanitation improvement should be further increased from the present level. Decision making for the use of the public fund should be left to LGIs.

Donor funding

Donor agency funding has been declining. In view of the overall health and poverty impact donor funding must be substantially increased for sanitation activities. Donor funding must be channeled in a coordinated manner for optimal use of funds.

Private funding

Private financing, particularly in latrine component manufacturing and

retailing, should be encouraged. Credit and training facility should be made available to assist such private initiatives.

Community resource mobilization

Sector financing is largely contributed by community resources. Awareness raising is crucial for increased mobilization of community resources which is essential for ensuring 100% sanitation coverage within communities.

8.10 Strategies for Monitoring and Evaluation

Regular monitoring is required to measure progress. Acquisition of accurate data is essential to ascertain progress against the national sanitation target. Collection and maintenance of national sanitation data requires intensive work from the grassroots level to national level.

Parameters to be monitored

Sanitation data must be monitored at the village and moholla (neighbourhood) level. The National Sanitation Secretariat shall determine the monitoring mechanism and parameters to be monitored. The monitoring parameters could be based on the experience of Nationwide Sanitation Survey conducted in 2003.

Recommended monitoring mechanism could include:

- Ward level (rural and urban) periodical information on sanitation be sent to respective local government institutions (i.e. union parishads/ pourashavas/city corporations)

- Union Parishads will send the verified data/ information to the respective upazila level in rural areas. Local level representatives from CBOs/ civil society organizations should be included in the verifying process of the information

- Upazila level verified data will be sent directly to the National Sanitation Secretariat through concerned Executive Engineer, DPHE with copy to the concerned Deputy Commissioner (DC). Representatives from CBOs/ civil society organizations should be included in the verification process of the information. Sanitation Secretariat will analyze and further verify the received data and send it to the national sanitation focal point (proposed Sanitation Wing of LGD).

- Pourashava will send the verified data/ information directly to the Sanitation Secretariat through concerned Executive Engineer, DPHE with copy to the concerned Deputy Commissioner (DC). Local level representatives from CBOs/ civil society organizations should be included in the verifying process of the information. Sanitation Secretariat will analyze and further verify the received data and send it to the national sanitation focal point (proposed Sanitation Wing of LGD).

- City corporation level verified data will be sent directly to the sanitation secretariat. Representatives from CBOs/ civil society organizations/ consumer groups should be included in the verifying process of the information. Sanitation Secretariat will analyze and further verify the received data and send it to the national sanitation focal point (proposed Sanitation Wing of LGD).

Recommended monitoring parameters could be:

- Households with hygienic / unhygienic / no latrines

- Public places (e.g., markets, schools, mosques) with hygienic / unhygienic / no latrines

- For urban areas, drainage and waste management data may also be included.

- Basic hygiene practice, e.g., soap use after defecation and before eating should be monitored also.

Data shall be consolidated and preserved at all levels. A synthesized data book will be published annually and distributed by the Sanitation Secretariat.

Monitoring and evaluation protocol

The National Sanitation Secretariat will prepare protocols for monitoring and evaluation of sanitation data. The Secretariat may take assistance from Bangladesh Bureau of Statistics.

The frequency of nationwide monitoring shall be twice a year preferably in March and September and the accumulated results be reported during the observation of sanitation month in October.

Evaluation

- Evaluation may be done for two purposes: (1) to verify and declare totally sanitized villages and neighborhoods, and (2) to recommend remedial steps for better planning.

- Upazilas/UPs/ Paurashavas/Villages/ neighborhoods may be declared 100% sanitized only after third party verification. The third party will consist of representatives from government and non-government organizations and the civil society. The evaluation should be open and transparent.

- Long-term impact assessment such as those involving health and poverty may be conducted by specialized teams.

8.11 Strategies for Emergency Response

Bangladesh, pre-dominantly, is a disaster prone country. Every year millions of sanitation installations are damaged and coverage reduced dramatically by recurring floods and cyclones. The following strategies should be considered to address emergency situations.

- Emergency preparedness programmes must include sanitation components

- Designate flood shelters e.g., schools, colleges, cyclone shelters and other public private institutions with adequate sanitation facilities

- Special motivational activities with key hygienic messages must be undertaken during emergencies

- Delineation of flood prone areas and building sanitation facilities above flood level

- Various sanitation options for emergency situation e.g., hygienic trench latrine facilities at the shelters, mobile toilets, pot defecation for children and aged people must be made available

9

DEVELOPING ACTION PLANS

The national sanitation strategy broadly guides the respective institutions e.g. LGIs, NGOs, public utilities and government agencies to develop their own action plans for achieving 100% sanitation in their implementation areas. The following broad actions will help develop individual action plans:

- Development of national sanitation mapping
- Review and updating of national sanitation mapping
- Assessment of sector progress

9.1 Cost of Implementation

The cost of implementation will be determined by the respective institutions e.g., LGIs, NGOs, public utilities and government agencies at local level considering local context particularly addressing the socio-cultural needs, economic and hydro-geological conditions.

In response to the global call, the water target 10 of the "Millennium Development Goals (MDGs)", subsequently expanded in WSSD in Johannesburg in 2002 to include sanitation target, the Government of Bangladesh set its national target of achieving 100% sanitation by 2010. This challenging target is much ahead of MDGs target. But GoB has realized the importance of sanitation for sustainable development and put emphasis on achieving the target that will have immense impact on poverty reduction.

Following the route of the sanitation campaign the last working session of the SACOSAN 2003, on Bangladesh country paper identified the importance of a National Sanitation Strategy based on which Plan of Action at local level could be prepared. The GoB recognized the need for a National Sanitation Strategy paper and accordingly decided to develop the strategy paper.

The process of developing the National Sanitation Strategy started in a meeting of the National Sanitation Taskforce held on 10 June 2004. A committee was formed comprising ITN-BUET, LGD, DPHE and Sanitation Secretariat with Director of ITN-BUET as its Convenor and was given the responsibility to draft a national sanitation strategy. This decision was highly appreciated in the sector as reflected in different meetings of the Organizing and Finance Committee for National Sanitation Campaign and the meeting with the Development Partners on 28 June 2004. Active participation of UPI, DPHE, LGED, Sanitation Secretariat, WaterAid Bangladesh, WSP-WB, Unicef, WSSCC-B, VERC, Danida, NGO Forum for DWSS, WHO and Plan Bangladesh enriched the national strategy paper.

WaterAid Bangladesh provided the financial support for the development of the strategy including its publication.

A participatory approach was adopted in developing this strategy. Consultative meetings were organized with stakeholders from the central to the grass roots level. Experience gathered from interaction with community people and LGI representatives assisted in formulating this pragmatic strategy paper. Comments from different stakeholders reinforced the strategy paper further. However, this strategy paper is designed as a living document and may be revised from time to time in the light of progress made and changed needs.

Why Borrow for Capacity Building?

Nancy E. Barnes
http://www.partnersinOD.com
nancybwater@cs.com

Some sovereign nations do not want to borrow for capacity building. Yes, we see this all the time. But, I ask myself, why? That got me thinking and my thoughts went back to senior year in college.

My college thesis[1] starts out with this quote from Joseph Schumpeter: "Add successively as many mail coaches as you please, you will never get a railway thereby"[2]. The thesis applies theories of creativity to the development of Japan after the Meiji restoration in 1868. In the 1880s, the Ministry of Education spent 66% of its annual budget to hire foreign technicians to teach Japanese students.

Let's fast forward, though. Today's development banks originated in the Marshall Plan that financed reconstruction of Europe after World War II. The plan gave loans to Europeans who were already well educated, had well-developed civil societies and were able to manage their affairs effectively. They had the capacity to take care of their assets and manage to repay their loans.

The Marshall Plan led to the formation of the World Bank and likely influenced the establishment of other development banks. As the challenge in Europe receded, development funds began to flow into underdeveloped countries. During the Cold War, development funds went to places chosen by political expediency – to keep those dominoes from falling. Cold War over, we can still see how politics affects development aid in some places (Iraq or Egypt) but aid is more widespread now, going into every needy country in the world, albeit in differing amounts.

A lot of development aid in the period 1960-1985 went for large-scale infrastructure and engineers made up a significant proportion of development bank or agency staff. Some argue that when engineers look at a problem they are naturally disposed to solve it with an engineering solution – build something to solve the problem. We each play to our strengths, don't we? So, by the late 1980s a lot of infrastructure projects had been built around the world.

By the late 1980s, infrastructure projects built 10-15 years earlier failed or operated at significantly less than capacity. Why? Development professionals concluded that lack of maintenance, spare parts, knowledge and lack of funds were to blame, etc. Enter the notion of capacity building or institutional strengthening with a focus on inventory, training and tariff setting.

[1] Titled: *Developmental Economic Change: Motivation and Effect*
[2] In *The Theory of Economic Development*

Perhaps this was the embedded, but unrecognized problem: the Marshall Plan approach worked because loans went to countries and people who were already educated and had the capacity to take care of assets and repay loans. The infrastructure projects in developing countries went to countries and people who did not have the capacity of the Europeans of the 1940s. They did not have the education, well-developed civil societies or the discipline to repay loan obligations.

Were the development banks wise to take the same approaches with developing countries that the Marshall Plan took with Europe? Doubtful. It may have been better to recognize the weaknesses of developing countries and start with capacity building before making the loans for large infrastructure projects that were otherwise doomed to fail before their time.

Between the development banks and aid agencies, billions upon billions of dollars have gone into infrastructure projects over the last 25-30 years and yet we have not alleviated the problems of the poor as much as hoped. Why? Perhaps because there has been a lack of sufficient commitment or understanding in developing countries about good stewardship of assets and financial assistance. Perhaps the cart came before the horse in building valuable assets for people who did not have the capacity to care for them.

The mission of development banks is to make loans, assuming that bilateral aid agencies will do the capacity building. While this is an excellent idea in theory, especially in light of MDGs, it doesn't always work. If it did, we would see far less suffering among the poor and a lot more debt repayment. What we can see in some places is that bi-lateral agencies compete with each other, applying different approaches and philosophies that often clash. (One agency paid people in Fayoum, Egypt to come to meetings. So, naturally, people working with other donor-funded projects demanded the same payments. This was a problem for the new project because it could not make such payments.)

Reality plays out: country takes the loan, builds the infrastructure; infrastructure fails before its time and the country is not much better off – in fact, maybe worse off since now it has to repay the debt for an asset that no longer works. With exchange rate risk, this problem can become dire. With a country in dire straits, the banks "forgive" the loan and the whole "revolving fund" idea goes down the tubes along with any discipline the country might develop if "forgiveness" of the loan was not possible.

Let us go back to the Meiji in Japan the 1880s. They started with capacity building. They invested significant amounts of money. Combined with a sound cultural foundation, Japan became what it is today and the capacity building investment paid off over and over.

So, why should countries not borrow money for capacity building? This money is an investment in the people who will operate and care for the infrastructure. Are they not equally as important as the physical asset? Could capacity building loans precede infrastructure – or maybe even be a precondition for infrastructure loans. After all, countries that wish to join the European Union are required to qualify and this often means policy reform. If capacity building means that assets last longer, work better and contribute to the sustainability of a utility, then capacity building is not "soft stuff" – it is a good investment with a big payoff.

But, it seems, the words "Capacity Building" turn people off these days – I wonder why?

There have been many capacity building projects around the world over the last 10 years. Let me refer to the institutional strengthening projects of USAID in Egypt, which I know the best. In response to complaints that counterparts lacked spare parts, resources and knowledge, USAID began a number of projects in the early 1990s, which focused on training, tariff setting, inventory control, personnel policies, etc. While these projects did

some good, their benefits were limited by national government policies and the legal framework for the utilities that restricted the extent to which they could reform and improve. In addition, project efforts focused in many cases on relatively low-level utility managers.

What can we learn from this: 1) the best way to do capacity building is in an environment that allows – or even encourages - people to change and improve. This means laying the foundation at the upper reaches of national governments and then building support for reform with the leaders of utility organizations. Otherwise, you run the risk of introducing new approaches and having them fail because of restrictions from above. It makes little sense to empower an organization if it has to live within a bad overall system. 2) Projects that focus on specific functions - like inventory control – will have some impact but not as great an impact as when these functions are part of a more comprehensive approach – like organization development.

We wrote the Guidebook to lay out a rational approach to build a strong foundation that would support further development and continuous improvement. It starts with the legal framework and then moves to leadership and commitment. In other words, it starts with the most important and pervasive influences on an organization – it does not start with inventory control.

Another reason that capacity building may have developed a bad name is that it often plays out into management training courses that often focus on changing behaviors with little or no attention to the building blocks of good management like job descriptions, mission statements, management reports or approaches like Managing by results. It doesn't do much good to train people in Team Building if they don't know what the team is supposed to accomplish. So, it is likely that many well-intentioned training courses have taken place around the world but they have had minimal effect because the students return to organizations without the fundamental building blocks of good management in place.

Again, we wrote the Guidebook to fill the void that we saw in many places – the void of attention to the building blocks for a strong foundation for management.

What would really good Capacity Building be like? Ah – the real question. We are all learning together all of the time. So any implied criticisms in this paper come with the knowledge that life is a journey not a destination – as we learn we find ways to improve and go further.

Great capacity building would start with top level commitment to effective reforms – not the kind of grudging "commitment" that governments are often forced into to get a larger support package.

The capacity building program would be one designed in conjunction with counterparts, based on their own realization of the need to improve. In other words, a capacity building effort without ownership by counterparts is no capacity building program at all.

There are few hard and fast requirements for a capacity building program but there are certain minimum areas of attention:

- **Management Foundation**– on the idea that any management system must be built – it doesn't magically appear
- **Behaviors**
- **Functional Expertise** – on the idea that you cannot expect someone to be an accountant if they don't know the first thing about accounting
- **Management Information Systems** – on the idea that "if you can measure it, you can manage it."

Isn’t it time for us all to have a harder look at capacity building and do it better? After all, management capacity building is one of those empowering efforts that have benefits for years to come – if not decades.

AN INNOVATIVE APPROACH TO URBAN WASTEWATER TREATMENT IN THE DEVELOPING WORLD

D. R. F. Harleman* and S. Murcott**

*Ford Professor of Environmental Engineering, Emeritus, ** Lecturer

Department of Civil and Environmental Engineering
Massachusetts Institute of Technology, Cambridge, MA 02139

ABSTRACT

Should cities of the developing world invest in the dominant municipal wastewater treatment technology of Western Europe and North America --- conventional primary plus activated sludge? Or, are there alternative "sustainable sanitation" approaches? This paper discusses these issues and makes a specific technological proposal --- the adoption of recent innovations in chemically enhanced primary treatment, known as CEPT, as the appropriate first step in urban wastewater management.

Why is CEPT a superior choice?

- CEPT uses small doses of coagulant salts and flocculant polymers to produce a highly efficient, single stage treatment process that is superior in terms of suspended solids and organic carbon removal to conventional primary treatment alone, but also, in terms of phosphorus removal and energy consumption, to conventional primary plus activated sludge.

- CEPT, because of enhanced settling, results in increased treatment capacity and removal efficiency. As has been demonstrated by retrofitting some of California's largest conventional primary plants, CEPT provides a low-cost way of quickly upgrading overloaded plants.

- New CEPT plants can take advantage of enhanced settling to increase the surface overflow rate and reduce the number of settling tanks. When Hong Kong's new plant switched from conventional primary to CEPT, in the design stage, the number of settling tanks was reduced to two-thirds. In Mexico City it is estimated that capital and O & M costs for CEPT would be about 55% of the cost of conventional primary and secondary biological treatment, including sludge handling.

- CEPT effluent, in contrast to conventional primary effluent, can be effectively disinfected. This is important in controlling public health problems caused by water supply contamination by contact with raw or inadequately treated wastewater.

- CEPT sludge is readily dewatered and processed. The amount of CEPT sludge is generally only 10 to 15% greater than that produced by the removal of suspended solids.

- CEPT is an effective and appropriate first stage treatment process, it may be followed by biological treatment if the incremental effluent improvement, the risk of toxic upsets of the biological process and increased biosolids disposal can be justified and afforded. Subsequent biological treatment plants will be smaller and more efficient because of reduced organic load and increased solubility of the CEPT effluent.

The paper includes a frank discussion of the impediments to the adoption of innovative and appropriate wastewater treatment technologies in the developing world.

While CEPT is already being applied in mega-cities, it is appropriate for small cities as well. Ongoing studies are aimed at reducing the cost and increasing the efficiency of wastewater treatment lagoons frequently used in small cities by combining CEPT and lagoon treatment technologies. CEPT tanks can be used as a pre-lagoon treatment to reduce solids and BOD loading to lagoons or coagulants can be added directly at the lagoon inlet.

Recommendations for needed research are presented.

INTRODUCTION

Population growth in mega-cities and other urban areas of the developing world and the associated water-related pollution and public health problems are a much discussed topic. The important issue is whether the developing world should follow the model of using the municipal wastewater treatment technology of Western Europe and North America or whether there is an alternative "sustainable sanitation" approach?

A committee of the U.S. National Research Council (NRC, 1996) reported on "sustainable water and sanitation services for mega-cities in the developing world." Unfortunately, the report is long on generalities and short on specifics. The authors indicate that "water and sanitation professionals must take a broader view of sanitation to prevent disease resulting from a wide range of activities and multiple exposure routes." On the role of treatment technology, the authors state that "technical innovation should be based on carefully considered performance criteria appropriate to maintaining a healthy environment." The final conclusion notes that, "With appropriate treatment, reclamation and reuse of municipal wastewater for non-potable uses can become an increasingly cost-effective conservation measure."

The issue of appropriate wastewater treatment for the developing world has also been featured in *Water Science and Technology* (Henze et al,1997). Half the papers address the definition and analysis of sustainability, while the other half deal with the technology. Most of the technology papers are concerned with non-conventional (and very expensive) collection systems designed to separate, treat and

dispose of liquid and fecal wastes by different processes. An overview paper by Varis and Somlyody (ibid) addresses the issue of global urbanization and asks the question: "Can sustainability be afforded?" They conclude that the conventional urban wastewater infrastructure of the industrialized world is neither sustainable nor transferable. However, they provide no specific answers as to what is affordable or what should be done to solve the water and sanitation problems of mega-cities.

In another exchange by three academic experts in *Water Quality International,* Keinath (1996) "believes the time has come to seriously consider the direct and deliberate reuse of water for potable uses in the mega-cities of the world." He contends that "treating water to high levels of quality -- is likely to be less costly than further exploiting distant surface and subsurface waters" and recommends focusing research on the further development of advanced oxidation and adsorption processes and membrane technologies. Okun (1996) agrees with Keinath's basic premise, but contends that reuse should be limited to non-potable uses such as agricultural irrigation because this would require only "secondary treatment followed by filtration and chlorination" and thus require no new technology. Alaerts (1997) offers a third perspective, stating that it would be "more cost effective to reduce water demand in factories and in households. Rather than cleaning up a given effluent, we may prefer to promote cleaner production technologies, stimulate in-plant reuse, relocate the plant to less sensitive watersheds, or abolish the industry altogether." He concludes that "innovative and cost-effective technologies are essential components in these schemes." However, he does not identify what these technologies are, nor does he explore the likelihood that developing countries will abolish industries because of environmental concerns.

This paper, prompted by disappointment with the lack of realistic and concrete proposals offered by European and North American water experts, puts forward specific technological proposals in order to encourage the continued vital discussion of which treatment technologies are appropriate for solving the urban sanitation problems of the developing world.

While it is true that some cities (Jakarta, for example) lack a sewage collection system, many urban areas have extensive sewerage systems that discharge untreated wastewater and contaminate adjacent rivers, shallow embayments or coastal waters. Only a small fraction of collected wastewater is treated, usually in "token" secondary plants with conventional primary settling and activated sludge. Such plants frequently suffer from poor performance due to inadequate funds for maintenance and operator training or to biological upsets caused by toxic industrial inputs.

Rather than attempting to prescribe an ultimate effluent end use and its corresponding level of advanced treatment (as in the perspectives of Keinath, Okun and others) , it seems much more useful to try to define the most efficient and cost-effective, minimum level of treatment needed to protect public health. Consider Mexico City as an example.

MEXICO CITY -- A CASE STUDY IN MEGA-CITY NEEDS

The Valley of Mexico, with 21 million inhabitants, covers an area of 1300 km^2. The city lies on an old lake bed on a high plateau with no natural drainage or source of fresh water. It would appear to be a prime candidate for reusing sewage for potable water since most of the drinking water is pumped from deep ground water wells or from distant lower surface water sources. The city produces an average of 75 m^3/s of wastewater and this raw sewage is used to irrigate 85000 ha of agricultural land in the neighboring state of Hidalgo. These crops feed and provide income for the local population. The raw sewage is high in organic, nitrogen and phosphorus nutrients, as well as in fecal coliforms and helminth eggs, a debilitating parasite, in concentrations as high as 250 eggs/L. Because the soil in the valley is poor, the organic material, nitrogen and phosphorus in the wastewater has greatly improved crop yields -- corn production has increased 150%, onion 100%, tomato 94%, etc. (Landa, H., et. al., 1997). The irrigated area receives over 80 kg/ha of nitrogen per year.

Keinath's proposal for reuse of sewage as potable water for Mexico City is mind-boggling when one considers the cost of high-tech tertiary treatment for all or even a significant fraction of the 75 m^3/s of raw sewage. The critical issue in Mexico City's use of raw sewage for irrigation is the high prevalence of enteric and parasitic disease among the more than 100,000 agricultural workers in the irrigated areas (CNA, 1995). Mexico City's pressing need is to find a level of treatment that will protect the workers through helminth egg removal and pathogen inactivation, while allowing continued use of the organics and nutrients for irrigation. Okun advocates reuse of sewage for agriculture, but immediately couples it with the need for secondary treatment prior to disinfection. This is consistent with the thinking of most Western environmental planners and engineers. However, it must be questioned whether the capital and operating costs for full secondary treatment of the wastewater of Mexico City, given its other infrastructure needs, is a necessary or feasible option.

During visits to Mexico City in 1993 -1995, the authors urged the National Water Authority to consider and test chemically enhanced primary treatment (CEPT), as a single-stage treatment process that would result in a high level of suspended solids removal, including helminth eggs, and would thereby produce an effluent that could be effectively and economically disinfected. This proposal became the basis for a number of pilot and full-scale tests in Mexico City (Murcott, et. al.,1996). Additional pilot plant studies on the use of CEPT alone and in combination with high-rate sand filters have been completed (Landa,H. et.al., 1997).

CEPT is very effective in removing helminth eggs to a range of 2 – 5 eggs/L. Polishing sand filters were added to insure an effluent with less than 1 egg/L. The Mexican authorities made a cost evaluation of CEPT treatment in comparison with conventional primary plus activated sludge treatment for a number of proposed plants (CNA, 1995). For example, for the proposed El Salto plant (15 m^3/s treatment capacity and 5.2 m^3/s mean flow) the construction cost (including sludge disposal) of the CEPT plant was estimated at US$70 million while the conventional

primary plus activated sludge facility cost was higher by a factor of 1.85. Annual operating costs were US$4 million for CEPT and US$7 million for the primary plus secondary plant. The annual cost of the CEPT chemicals is more than offset by the high energy cost for secondary aeration tanks.

SOUTHERN CALIFORNIA -- A CASE STUDY IN RETROFITTING CHEMICALLY ENHANCED PRIMARY TREATMENT

In 1985, the passage of California's ocean protection plan required that all treatment plants with ocean outfalls had to achieve suspended solids removal of 75% or greater. At this time, the four largest Southern California plants all had conventional primary treatment; three, the City and County of Los Angeles and Orange County, had partial secondary treatment while San Diego had only primary treatment. Because of rapid population growth, the plants were over-loaded by a factor of two or more above their original design capacity. Plant operators, faced with poor performance due to overloaded conditions, met the State effluent requirement by turning to a century-old potable water treatment process -- the addition of trivalent metal salts, to increase solids removal by coagulation and flocculation. They retrofitted their plants for CEPT treatment quickly and at very low cost.

Physical-chemical treatment of wastewater was a well-known technology that had fallen into disfavor in the second half of the 1900's because lime, the preferred chemical at high doses, produced very large quantities of additional sludge. The new twist in California in 1985 was the combination of a low dose of ferric chloride (~25 mg/L) as a primary coagulant together with a minuscule amount of an anionic polymer (~ 0.2 mg/L) as a flocculant. The CEPT process improved treatment efficiency considerably with only a marginal increase in primary sludge production over that due to increased solids removal.

At Pt. Loma, San Diego's overloaded conventional primary plant, suspended solids removal increased to about 85% after the CEPT retrofit. BOD removal increased to more than 55% and phosphorus removal (by precipitation as ferric phosphate) to 85%. Even more impressive was the fact that the increased CEPT pollutant removal efficiencies were obtained at average surface overflow rates of up to 4.5 m/h, about three times larger than commonly used in the design of conventional primary settling tanks. (Morrissey and Harleman, 1992).

San Diego occupies a unique place in the history of urban wastewater treatment in the USA. In the late 1980's, the City was under intense pressure and a federal court order to comply with the EPA requirement to add an expensive secondary treatment plant. Certain city officials questioned the value of spending two billion dollars to obtain a small increase in BOD removal for an already clean CEPT effluent that was being discharged through a long ocean outfall. Their arguments were: (1) extensive monitoring had shown no degradation of the ocean following the 1985 CEPT upgrade, and (2) since San Diego is at the short-end of California's fresh water allocation, it would be more sensible and much less costly to construct a new tertiary plant to treat a fraction of San Diego's wastewater for reuse. Scripps scientists, who had been monitoring the CEPT effluent, strongly supported this viewpoint and San Diego joined with Boston and others in requesting a National

Academy of Engineering review of wastewater management in coastal urban areas. The study was completed (NRC, 1993) and Congress subsequently passed a special secondary treatment waiver for San Diego allowing it to continue CEPT treatment at Point Loma and to build a new water reclamation plant to treat about 15% of its wastewater for reuse on land.

Other plants, such as the City of Los Angeles' Hyperion facility, that had partial secondary treatment, were able to double their secondary flow capacity after CEPT implementation. This was related to the decreased BOD loading to the secondary stage and the fact that the BOD remaining in the CEPT effluent was largely soluble and readily oxidizable.

The first use of low dose chemically enhanced primary treatment in North America was in several Canadian primary plants. These facilities started using CEPT in the early 1980's (Heinke,G. et.al., 1980) in order to reduce the discharge of phosphorus into the Great Lakes. In Europe, a similar process is known as "direct precipitation." For example, in Norway, higher doses (100 - 250 mg/L) of metal salt coagulant are used to meet the requirement for 95% phosphorus removal, with no biological treatment. More recently, chemical treatment with lamella plates has been promoted in France and French Canada at very high overflow rates. In these plants CEPT is followed by aerated biofilters with sludge removal by periodic back-washing. The result, because of the elimination of secondary clarifiers, is a compact, although expensive, treatment plant that can be located in congested urban areas.

IMPEDIMENTS TO CEPT IN THE DEVELOPING WORLD

It is reasonable to ask why, if CEPT is such an efficient and cost-effective treatment technology, is it not more widely known and used. There are several reasons: (1) The California CEPT upgrades were carried out by plant operators who provided no exposure of their results in the technical literature; (2) There are few "basic research" papers on CEPT because the process cannot be studied generically in university laboratories. Bench-scale and pilot plant tests must be done at the site to determine effective coagulant chemicals and dosages. (3) There is a widespread belief that chemical treatment produces “too much sludge.” The fact is that low dose CEPT produces only 10 to 15% more sludge than that resulting from the removal of suspended solids. (4) Private engineering design firms are reluctant to use what they consider to be new approaches. A recent study by the American Consulting Engineers Council reported that three-fourths of their respondents avoid using innovative technology because they are afraid they could be sued if something goes wrong. This is a common "red herring" used to justify the continuation of past practice. (5) There is greater profit in designing plant expansions than in retrofitting and upgrading existing plants with CEPT. (6) The practice in the USA is for a municipality to engage a firm on a non-competitive basis to design a plant, ask bids for construction and then operate the plant with city employees. This discourages innovation because the only competition is in the construction. In contrast, the European practice of bidding on a design/build/operate package encourages competition through the use of cost-effective innovative treatment processes. European design firms who engage in this type of bidding have their own research

laboratories to insure that they understand and advance the treatment processes they propose.

There are now a growing number of examples of CEPT being tested and implemented in the developing world. Their objective is to protect public health, in a cost-effective manner, by first building the minimum level of wastewater treatment that permits effective removal of pollutants and deactivation of pathogens. Because of the increased surface overflow rate compared to conventional primary treatment, CEPT provides the minimum cost per unit volume of wastewater treated. There is no constraint on future biological upgrades; in fact, CEPT technology insures that any subsequent biological treatment, if it can be justified, will be more efficient and smaller in both size and cost.

CEPT EXPERIENCE IN HONG KONG

In 1994 the British government of Hong Kong appointed an International Review Panel (including the first author) to resolve a conflict over plans for the collection and treatment of sewage from the most populated areas of Kowloon and Hong Kong Island. The long range government plan called for a conventional primary treatment plant within the harbor at Stonecutters Island (SCI) and effluent discharge through a long (20+ km) ocean outfall into southern waters. The mainland government complained that the treatment was inadequate and that pollution would be exported from the harbor to Chinese territorial waters.

The Panel completed its review in 1995, recommended that (1) the initial treatment at SCI be upgraded to CEPT, (2) a pilot plant study of the CEPT process and (3) the long outfall be postponed. Subsequently the government redesigned the conventional primary as a CEPT plant and in doing so reduced the number of settling tanks to two-thirds by taking advantage of a higher surface overflow rate. (Harleman, Harremoes & Qian, 1997)

In May 1997, Hong Kong completed construction of the world's largest CEPT plant having a maximum capacity of 40 m^3/s and a 20 m^3/s average flow. Operating data from the CEPT plant show removals of the order of 85% for suspended solids and 74% for BOD with a dosage of only 10 mg/L of ferric chloride. The surface overflow rate of about 60 m/d is roughly twice that for conventional primary treatment. The use of seawater for flushing toilets undoubtedly contributes to the remarkable efficiency of the Hong Kong CEPT plant.

In April 2000 the Hong Kong government appointed a new International Review Panel (again including the first author) to address the issue of completing the collection and treatment of all of Hong Kong Island's sewage and meeting ammonia water quality standards. The Government plan again proposed construction of the long southern outfall in order to achieve ammonia objectives by multi-port diffuser dilution. In November 2000, the Panel submitted its report (IRP 2000) and recommended elimination of the long outfall, by-passing secondary treatment and going directly to nitrification of the CEPT effluent at SCI using compact biological aerated filters. Discharge of the tertiary effluent will meet water quality standards at the local SCI outfall. The Government, in its initial response (EPD Hong Kong

2001) decided to move ahead with the EPD recommendations. In the view of the IRP this may ultimately result in a saving of the order of one billion US dollars.

CEPT EXPERIENCE IN BRAZIL

Bench-scale and full-plant CEPT demonstration tests have been successfully completed, first in Sao Paulo, under the sponsorship of the state wastewater agency. (SABESP, 1996) Next, in Rio de Janeiro, in 1997, the World Bank requested a demonstration of CEPT technology at an existing treatment plant. The objective was to show whether CEPT technology should be used in future treatment plants designed to solve severe eutrophication problems within Guanabara Bay. One of the major treatment objectives is low-cost phosphorus removal, the limiting nutrient controlling the large algal blooms that cause oxygen depletion and odors in the Bay. Tests of CEPT showed that it is possible to remove about 90% of the phosphate as well as high levels of TSS and BOD. (Harleman and Murcott, 1998) The first two CEPT treatment plants in Rio have been constructed by CEDAE, the state agency, and have begun operation.

In l998 it was decided to use the Brazil CEPT experience to provide Master of Engineering thesis opportunities for Massachusetts Institute of Technology students. Site visits to design, test and collect data on innovative treatment processes were made. The focus was on municipalities which have overloaded and poorly functioning plants. In Brazil, most wastewater treatment in medium size cities is by open lagoons at the edge of the urban area. The usual method of upgrading existing lagoon performance and treatment capacity is by cleaning and reconstructing the lagoons and installing surface aeration units. However, in addition to the initial costs, most cities cannot afford the large annual costs to run and maintain the aerators.

Students obtained data on anaerobic and facultative lagoons serving a coastal community having a large variation in seasonal population. A numerical model (Ferrara and Harleman, 1980) was used to predict the performance of the wastewater treatment lagoons. The calibrated model was then used to design two treatment upgrade alternatives for a city which had planned to upgrade existing lagoons by installing aerators. (Chagnon, 1999)

In the first treatment upgrade alternative, a small CEPT tank is placed in front of the first lagoon. This reduces the solids and BOD load on the lagoons and eliminates the need for aerators. The second alternative used an in-lagoon CEPT concept whereby chemical coagulants are added directly at the inlet of the first lagoon, again eliminating aerators. This type of CEPT lagoon, first successfully used in Scandinavia (Hanaeus, 1991), would be expected to perform better in the warmer climate of Brazil. A comparative cost study showed that both alternatives were less expensive, in capital and O & M costs, than the original aerated lagoon design. (Cabral, et al, 2000)

CONCLUSIONS AND RECOMMENDATIONS

Public health is the major water-related environmental concern in urban areas of the developing world. In many instances, drinking water and receiving water sources are contaminated by raw or inadequately treated wastewater effluents. Even when conventional primary treatment exists, its effluent cannot be effectively disinfected.

The objective of initial wastewater treatment investments or upgrades of existing treatment facilities should be a high-flow rate, low-cost treatment technology such as CEPT, that provides a high level of suspended solids removal, thereby permitting effective pathogen inactivation by disinfection.

The issue is not one of chemical versus biological treatment. Chemically enhanced primary treatment is the most cost-effective first step, it can always be followed at a later stage by more advanced biological treatment processes if they can be justified and afforded.

Most CEPT studies in developing countries have been carried out on a short-term ad-hoc basis with little time and effort devoted to exploration and research. There is a clear need to develop long-range research and field studies at several existing treatment plants having different raw waste characteristics.

The following topics are recommended for further research:

- The interaction of metal salts as coagulants and anionic polymers as flocculants. This would explore the optimization of combinations of metal salts and polymer dosages for maximum removal efficiency at high surface overflow rates;

- The trade-off between various proportions of metal salts and cationic polymers as primary coagulants. This would offer potential savings in sludge production which might offset the higher cost of the polymers;

- The efficiency improvements in CEPT technology through controlled mixing of coagulants and flocculants. This would demonstrate the effectiveness of mixing and flocculation devices upstream of settling tanks;

- The effectiveness of recycling waste potable water treatment sludge and/or CEPT sludge. There is evidence that either may be effective in reducing coagulant doses;

- The efficiency of combining CEPT, with primary effluent filtration or CEPT with aerated biofilters. The latter effectively uses the highly soluble BOD remaining after CEPT and, by backwashing, eliminates the cost and space required by secondary clarifiers.

- The cost and enery savings of CEPT versus activated sludge wastewater treatment plants.

- The interaction of CEPT and wastewater lagoons with either pre-lagoon CEPT treatment or in-lagoon chemical treatment. Collection of data on operating CEPT/lagoon combinations to improve numerical modeling of lagoons to optimize final effluent quality and ultimate sludge disposal.

- The potential uses of processed CEPT sludge for agricultural applications. Collection of data on effectiveness of nutrients in the sludge.

- The disinfection by UV, or other options, following CEPT treatment.

The Future of Chemically Enhanced Primary Treatment: Evolution Not Revolution

by

Denny S. Parker, James Barnard, Glen T. Daigger, Rudy J. Tekippe and Eric J. Wahlberg

Harleman and Murcott challenge the professionals in the wastewater industry to adopt a specific technology, chemically enhanced primary treatment (CEPT). They opine that its lack of broader acceptance is due to lack of publications covering the practice, absence of basic research, concerns over sludge production, risk adverse design consultants, the profit motive of design consultants who are aligned with more expensive solutions, and the lack of competitiveness in technology applications in the USA.

There is value in reviewing any technology, innovative or well proven, and encouraging its unfettered consideration. However in this case, Harleman and Murcott move well beyond an objective technical assessment of CEPT technology. Their claim of the neglect of this technology by international water quality experts caused a member of the Editorial Board of Water 21 to invite us to submit this discussion. We accepted this responsibility and believe Harleman and Murcott should be held accountable for their blanket attack on the professional integrity of a broad class of environmental engineering professionals.

The senior discusser has been involved in process development of particle separation processes throughout his 31 years of consulting engineering practice. This has included involvement in various CEPT projects throughout his career. And all of our firms have been involved in investigation, research and application of CEPT. We will demonstrate that CEPT is both a well-established tool and one that is well documented in the literature. Furthermore, we will show by our involvement in projects that have included CEPT that we do not regard it as a high-risk venture. And finally, those who broadly question the ethics of design consultants should have more to back it up than mere opinions and statements of generalities. Indeed, challenging another party's professionalism without well-documented and substantiated information starts the accusers down a very slippery slope.

Harleman and Murcott's selective use of literature citations only inadequately reflects the extent of contributions in technology development for the developing world. It is patently unfair to demonstrate that there is little interest on the part of the water quality profession in appropriate technologies by picking a single IWA conference volume on futuristic concepts for integrated wastewater system design, when its principal focus was not on wastewater treatment technology for centralized treatment plants. There have been a number of IWA conferences that presented a very wide array of centralized treatment technologies specifically proposed as appropriate technology for developing countries (Wang et al., 1991, Ho and Mathew, 1993, El-Gohary, 1995, Lima et al., 1996, Mara et al., 1996 and Khanna and Kaul, 1996). Research has reflected the following

treatment technologies for centralized treatment: oxidation ponds, aerated lagoons, anaerobic lagoons, land treatment and disposal, anaerobic reactors of various configurations, pond treatment prior to reuse, activated sludge including sequencing batch reactors, evaporation systems, solids processing systems and separate industrial wastewater treatment systems. Our review revealed that CEPT is not featured in these volumes. This may indicate either that it has limited application or that it is considered already at the state of development where the technology can be transferred to developing countries without further research. Or, on the other hand, will Harleman and Murcott imply in their rebuttal that the more than three hundred investigators with papers in these IWA volumes have a bias against CEPT or that they lack creativity?

Reading Harleman and Murcott's article might lead the reader to believe that all relevant applications of CEPT began with the work of Canadian engineers in the early eighties (who indeed made valuable contributions) or by the operators of California treatment plants in the mid-eighties (who indeed also made valuable contributions) or as a result of Professor Harleman's recent advocacy of CEPT. In fact, our review shows a steady and consistent development and practical application of CEPT beginning at least 35 years ago. Our own reference list shows 76 investigators (consulting engineers, municipal engineers, scientists and operators) who have advanced CEPT technology. These investigators (many with multiple contributions) are from the following countries: USA (59), Canada (7), Scandinavia (7), Israel (2), Australia (1) and Bulgaria (1). A technology assessment should have at its heart a thorough literature review and an acknowledgement of prior work. Will Harleman and Murcott acknowledge in their rebuttal that almost without exception they have overlooked the work of these investigators?

History of CEPT Development

.

The earliest reported practice of CEPT seems to be in England as early as 1870 and it also is stated that it was used extensively in the 1890s and early 1900s in the USA before the development of biological treatment. It is also stated that CEPT had a resurgence in the 1930s in the USA (Metcalf & Eddy, Inc., 1991), but for these periods of practice we could find no useful technical articles in our libraries or files.

CEPT: a response to eutrophication concerns. In the 1960s, with eutrophication problems in the Great Lakes, specific objectives for phosphorus reduction appeared on the near-term horizon for many municipal dischargers. This was before the development of proven systems for biological phosphorus removal, and technologists turned to chemical addition for reliable treatment. A major equipment vendor, Dorr Oliver, advanced an innovative two-step system consisting of CEPT followed by activated sludge treatment. Termed the "Phosphate Extraction Process," it was postulated that if the pH was adjusted to between 9.5 to 10 with lime in the primary clarifier, carbon dioxide generation in the aeration basins would be sufficient to decrease the pH to an acceptable range while achieving 90 percent phosphorus removal across the entire process (Albertson and Sherwood, 1967). Basic research at bench-scale explored such

variables as the effect of lime dosage and pH on residual BOD, COD and phosphorus along with the influence of sludge recirculation to the CEPT flocculation zone.

At the same time, chemical suppliers developed application technology. For instance, the Dow Chemical developed their CEPT concept around low dose applications of ferric chloride as the primary coagulant with supplemental anionic polymer. The investigators named it "The Dow Process for Phosphorus Removal." Starting initially with basic research at bench-scale, the work progressed almost immediately went to full-scale tests at Grayling and Lake Odessa, Michigan (Wukash, 1968, Dow Chemical Company, 1967a, and Dow Chemical Company, 1967b). These studies dealt with the practical issues of locating appropriate coagulant addition points in plants without designed-in flocculation facilities. Dow extended their work at Buffalo, New York, Benton Harbor, Michigan and Cleveland, Ohio. At Fe dosages of 14 to 20 mg/l with 0.5 mg/l of anionic polymer, 64 to 80 percent suspended solids (SS) removals were obtained compared to 0 to 40 percent in the controls (Johnson et al., 1969, Dow Chemical Company, 1970a and 1970b). It was found that performance was highly sensitive to the polymer addition point and if polymer was added to the process too far ahead of the primary sedimentation tanks, floc breakup would occur in the conveyance facilities.

Later, Heinke et al. (1980) conducted CEPT testing at the Windsor, Sarnia and CCIW plants in Ontario. At the Windsor plant, optimum performance was achieved with ferric chloride (17 mg/l as Fe) and 0.3 mg/l of anionic polymer. It should be noted that Heinke et al. (1980) confirmed the earlier work in the Dow Process in that it was shown that CEPT increases the particle settling rates and removal efficiency. Further, they showed that the technology allowed higher surface overflow rates than previously had been employed in design of primary clarifiers in Canada.

In parallel with the work of Dorr Oliver and Dow Chemical, Allied Chemical made strides with its aluminum products (Allied Chemical Corporation, 1970). Success was shown with alum in CEPT applications, such as at Windsor, Ontario (Allied, Chemical Corporation, 1973).

Wilson et al. (1975) report successful full-scale trials on use of CEPT with alum and polymer at Tampa, Florida. CEPT was shown capable of SS and BOD removals of 83 and 44 percent, respectively. Later, basic research in the laboratory by Dentel and Gosset (1987) showed that regions of raw wastewater coagulation with alum were similar to that occurring in water treatment, provided that some of the differences are accounted for.

Parallel European development of CEPT technology started in the early 1970s and was concentrated in Scandinavia, largely out of concerns over algal blooms. Erickson (1973) reported on early CEPT trials in Sweden. Testing resulted in the full-scale application at two plants with low iron dosages. While not much benefit was seen in terms of SS removal improvements with CEPT, after subsequent biological treatment the final effluent phosphorus objectives were realized. Odegaard (1992) reported on developments in Norway where 28 of the plants provided CEPT alone without subsequent biological treatment. This report reflects years of practical work with CEPT optimization. It was

believed that for the weak, fresh and cold wastewater typical in Norway, CEPT technology was especially appropriate. Average BOD and SS removals of 82 and 87 percent were obtained due to the low concentration of soluble BOD, albeit with much higher chemical dosages than used with the Dow Process in North America.

Odegaard's (1998) basic research on CEPT has been on the influence of organic polymers as supplements to metal salt additions. He showed a considerable enhancement to floc settling rates allowing higher surface overflow rates than when the metal salt was used alone, confirming earlier practical experience in North America. Of perhaps more significance, it was shown at bench-scale that cationic polymers could be substituted for metal salts to minimize sludge production when no phosphorus removal was required. The best removals overall were achieved with a combination of metal salts and organic polymer. As shown earlier in North America, using polymer as a supplemental coagulant could minimize metal salt usage.

CEPT as part of a physical/chemical flowsheet for secondary treatment. The development of CEPT continued in the USA in the 1970s. Some of the work took place because of the interest in CEPT as the first step in a treatment scheme followed by activated carbon. For example, the work of Shuckrow and Bonner (1971), Feige and Berg (1973) and Burns and Shell (1973) is of interest. Here, various coagulant comparisons were made such as low dose iron to lime and alum to lime at pilot- and full-scale. Basic research in the laboratory by Bowen and DiGiano (1975) involved settling column tests and adaptation of the water treatment jar testing procedures of Tekippe and Ham (1970) for CEPT. This allowed the development of design methodologies that enabled the engineer to select optimum coagulant dosages, pH values, flocculation intensities and sedimentation times for CEPT. It was shown that alum could not sustain as high a clarifier surface overflow rate for the same removal as that obtained with lime and also that alum sludges were more difficult to dewater.

The use of CEPT followed by activated carbon did not prove to be an unqualified success in warmer climates with septic wastewater. More than 10 municipal plants were built with this flowsheet, but all but one failed due to process or mechanical reasons and were taken out of service. Roll and Crocker (1996) describe the efforts of plant staff to keep the Niagara Falls plant in effective operation under very trying circumstances.

CEPT coupled with biological treatment for advanced wastewater treatment. At the same time as the work on physical chemical treatment, California investigators continued work on CEPT followed by biological treatment. The CEPT work was at full-scale with lime as the primary coagulant and focused on optimizing CEPT for maximizing the effectiveness of downstream nitrification (Horstkotte et al., 1974). With the use of lime at pH 10.2 and with iron as a supplemental coagulant, BOD and SS removals with CEPT were 66 and 87 percent respectively, compared to 40 and 75 percent in the control. When primary effluent pH was less than 11.0, acid production and carbon dioxide generation in the activated sludge process was sufficient to rapidly decrease the pH in the aeration basins to a normal operating range. Research was extended to include demonstration of centrifugal sludge classification and lime recovery through recalcination in a multiple

hearth furnace (Parker et al., 1974a, 1975). This test work served as the basis for design of two large wastewater treatment plants, one in California and one Australia (e.g. see Eisenhauer et al., 1976 and Philp, 1985). The work also formed the basis of a USEPA report on process design on CEPT with lime (Parker et al., 1974b).

The California work on CEPT followed by a nitrifying process has been followed up by a number of engineers and research investigators. Interest transitioned from using lime in the primary to the use of aluminum or iron compounds (usually supplemented by polymer) largely because this simplified sludge management. The senior discusser was involved in process design in the 1980s of two secondary treatment plants that were constructed downstream of CEPT using iron salts. One is located in Cleveland (Ohio) and is a Trickling Filter/Solids Contact plant and the other is in Appleton (Wisconsin) and is a nitrifying activated sludge plant. Andersson and Rosen (1989) report on how ferric chloride addition to the primary treatment stage effected organic load reductions in addition to phosphorus removal and thereby improved nitrification in two Swedish activated sludge plants. The work was extended to show the significant influence of supplemental polymer addition on increasing SS removal (Andersson et al., 1997).

Galil and Rebhun (1990) showed that the reduction in organic levels with CEPT with either lime or alum as the coagulant allowed a remarkable reduction in the size of the aeration tank required for nitrification in the downstream activated sludge process. And the City of Atlanta (Georgia) has alternatively used aluminum and iron products in a CEPT mode ahead of a nitrifying activated sludge plant to meet its interim phosphorus removal requirements at its largest plant as it transitions to full biological phosphorus removal. Sedlak (1992) and Daigger and Parker (2000) review other full-scale work using CEPT ahead of the activated sludge process. Also, similar work with fixed film processes (biological aerated filters and trickling filter technology) has been done at Windsor, Ontario with CEPT at low iron dosages preceding the biological processes. Chemical addition to the primary tank gained a double benefit from the coagulant in that it reduced both phosphorus and organics, resulting in an overall optimized design for nitrification and phosphorus removal (Newbigging et al., 1995 and Parker et al., 1998).

CEPT for ocean disposal. The late 1960s and 1970s saw another impetus for CEPT development. Ocean dischargers on the West Coast of the USA could reasonably predict that regulatory agencies would require an upgrading of treatment from conventional primary to biological treatment. Recognizing the high cost of secondary treatment and the lack of a demonstrable benefit for high degrees of BOD removal for effluents discharged through deep ocean outfalls, agencies sought a more cost-effective and appropriate combination of treatment and dilution than existed for their inland counterparts. For instance, CEPT research was done at pilot and plant-scale at San Francisco, California (City and County of San Francisco, 1967, Brown and Caldwell, 1971) and Seattle, Washington (Brown and Caldwell, 1978a). The senior discusser participated in the pilot-scale CEPT work for both municipalities.

The City and County of San Francisco (1967) modified the Dow Process with purposeful seawater addition with a Fe dose of 8 mg/l and an anionic polymer dosage of 0.2 to 0.4

mg/l anionic polymer. The test was very successful and resulted in SS removals of 76 to 80 percent. However, it was later reported that the use of seawater caused severe corrosion of the existing tank internal equipment.

In Seattle, both lime and alum were tested at pilot-scale during different periods. Basic research was conducted on the effects of coagulant dosage, flocculation conditions, solids production, use of secondary coagulants (e.g. polymer with alum and iron with lime), sludge recycle and the use of seawater to provide magnesium for coagulation in the lime system. It was found that particulate BOD was removed to the same extent as the suspended matter, but that soluble BOD was only marginally removed. Both systems were capable of removing 94 percent of the influent SS. During the full-scale trials with alum, SS removals decreased to 84 percent but chemical application points were possibly not optimized during the short test periods.

The West Coast USA dischargers were confounded when the USEPA issued uniform secondary treatment requirements in 1974 that allowed no exceptions for deep ocean disposal. Publicly elected representatives, utility managers and engineering consultants lobbied for a change in the law to allow for lower cost alternatives to full biological treatment such as CEPT or blends of biological and primary effluents. In the same period, the senior discusser was the project manager for wastewater facilities planning for the City of Santa Cruz and Santa Cruz County (California). We argued against the USEPA's rigid position that only biological secondary treatment alternatives be considered. We favored CEPT consisting of low dosage iron and polymer as a more cost-effective. The compromise was for the City to include the alternative in the project report as an initial step (Brown and Caldwell, 1978b). Once the US Congress passed the "ocean waiver" discharge permit provision and the USEPA promulgated the implementation regulations, the City of Santa Cruz engaged the senior discusser's firm to prepare their application and to complete the design. Pilot- and field-scale studies were used to optimize the use of preaeration for flocculation with low dosage iron followed with polymer addition prior to the existing primary tanks (Volpe et al., 1987). The constructed plant easily met California's required monthly average 75 percent SS removal criterion with coagulation with low dose ferric chloride and polymer.

However, getting an ocean waiver approval process established by the US Congress provided no assurance that a permit for discharge would ultimately be obtained. Often, public hearings associated with the consideration of the discharge permits by USEPA brought out an electorate activated by environmentalists who took the position that anything less than secondary treatment was bad for ocean water quality. Rather than suffer continual controversy, a number of agencies backed away from the ocean waiver process and either declined to apply for waivers, abandoned their applications mid-process or did not renew them after one or two permit terms. If this negative public reaction had not occurred, there would be many more holders of ocean waiver permits in the USA today (and likely more CEPT plants).

The City of San Diego, California was a case where an ocean waiver application was not completed by mandated deadlines and therefore no ocean waiver permit was issued by

the USEPA. Highly vocal public opposition discouraged the City from submitting an application. However, prominent scientists at the University of California Scripps Institute of Oceanography strongly advocated the position that their investigations showed that no harm was being caused by the existing deep ocean outfall serving the City's large Point Loma primary wastewater treatment plant. This cut the ground out from under the protesting groups. With this scientific backing, the City decided to reconfigure the system in a manner that would leave the Point Loma as a CEPT facility and to take what would have been spent on secondary treatment to build upstream water reclamation plants for a portion of the flow. The City applied for and received from a US federal judge a number of stays in the City's deadlines for secondary treatment completion at Point Loma, despite the legal and technical opposition of the USEPA. Ultimately, they were successful in getting a waiver granted directly by the US Congress.

The experience of several California ocean dischargers with CEPT using low dosage iron and polymer is summarized and compared by Ooten et al. (1993). Recently, progress on one of these CEPT plants was reviewed by Hetherington et al. (1999).

Other West Coast agencies lacking permits with ocean waiver provisions proceeded with planning for full biological treatment. In California, the City of Los Angeles' Hyperion Treatment plant was in this position. In the 1980s, engineers on City and program management consultant (CH2M HILL) staff did not fail to look at CEPT as a potential technology to reduce the size and cost of the secondary treatment expansion. A detailed comparison was made of capital and operating costs of CEPT (based upon plant experience with low dosage ferric chloride with polymer) and conventional primaries ahead of activated sludge treatment was made. All of the impacts were considered and summarized, such as the marginal increase in sludge with CEPT as well as the reduced oxygen requirements of the planned downstream oxygen activated sludge system. It was found that there was a net total cost increase with CEPT (Chaudary et al., 1989). After more years of operating experience with CEPT and high rate activated sludge treatment, operators at the Hyperion plant returned to the issue of comparing that process configuration to conventional primary treatment followed by activated sludge. They subsequently developed a proposal that was different than the plan the City had adopted. They showed a sludge production increase just as in the original study; but in this case found a net total cost decrease (Shao et al., 1996).

The issue was looked at again in the nineties by the City and the design consultant (Black & Veatch). In the final design of the Hyperion plant, the City decided to provide for the addition of ferric chloride but also provided adequate secondary treatment capacity to handle design flows if this chemical were not added. The reasoning was that the supply or price of chemicals was uncertain so the City did not want to have to rely on them. But it was decided to retain the chemical addition capability and among the reasons was that iron addition controlled sulfide and struvite formation in the digesters. The Hyperion case example makes the point that those involved with CEPT applications can have professional differences of opinion. Indeed, the same individual may "change sides" in an argument when new information becomes available.

The National Research Council (1993) has evaluated treatment technologies useful for ocean disposal. Engineering studies showed that while CEPT was significantly less expensive than biological treatment, it had no cost advantage when coupled with biological treatment over a conventional primary treatment/biological treatment flowsheet. This was shown to be the case for both the low and high dosage forms of CEPT.

Recently, two of the discussers have been involved in the revaluation of CEPT to optimize its efficiency. These investigations have been oriented to identifying organic polymers that could substitute for metal coagulants and to extending the usefulness of jar tests and settling column tests to allow more rapid field optimization of optimum coagulant dosages and application points and to identify where flocculation opportunities are best enhanced in existing CEPT systems (Wahlberg et al., 1998 and Parker et al., 2000). For the studies on substitution of polymer, no benefit could be shown beyond that achieved by flocculation without any coagulant addition. The procedures have been also been used to reconfigure some existing and design new CEPT tanks that employ low iron dosages. The latter work was completed for the Orange County Sanitation District, a current holder of an ocean waiver permit in California.

Summary of CEPT development. Overall, the reader should conclude from this review that the CEPT technology has been well developed after at least 35 years of basic and applied research at bench-, pilot- and field-scale. There is a wealth of research and practical experience to draw upon. In addition to the cited references, recent design manuals and textbooks do a good job of presenting design approaches for CEPT (e.g., Bouker et al, 1987, Sedlack, 1992, and WEF and ASCE, 1998).

CEPT in Hong Kong

Two of the discussers were involved as treatment technology consultants advising the Honk Kong based firm conducting the independent review of Stage II of the Strategic Sewage Disposal Scheme for the Hong Kong government. This occurred at the same time as Professor Harleman's first involvement as an International Review Panel member. The reports of the two groups are bound in the same volume and should be considered together (Pypun, 1995 and Yi et al., 1995).

Harleman and Murcott are in error when they assert that Professor Harleman was instrumental in arguing that the conventional primary treatment planned for Stonecutter's Island in Stage I of the plan should be replaced with CEPT. In fact, the consultant (Montgomery Watson) had planned on CEPT using low lime (pH 9.7) treatment for the first stage of construction.

Harleman and Murcott are correct that it was the panel's recommendation to increase the surface overflow rate of the primary sedimentation tanks and that low dose iron should be used, however the iron was to replace lime as a coagulant. It should be noted that the independent consultants (Pypun, 1995) had previously concluded under Option 9 for

Stage II that a shift should be made to low dose iron treatment with polymer at higher surface overflow rates. This was based on our prior North American experience with CEPT. The fact that Professor Harleman and the rest of the panel would draw the same conclusions for Stage I is not surprising, since they also had access to information from North American CEPT practice.

The 1995 Hong Kong review had the same intended effect as the Value Engineering studies typically conducted in North America and elsewhere, i.e. to recommend changes in design which will save the owner money initially or over the long term. Such peer reviews are a normal aspect of one's professional career.

In the paper, the impression is created that the Hong Kong plant is fully operational. Only a fraction of wastewater is reaching the plant and it is in a fresher state than it will be ultimately. When the 17 km interceptor tunnel is completed, the bulk of the wastewater containing a portion of seawater will be discharged to the tunnel and pumped out. Anaerobic conditions and sulfide development can be expected due to the long residence times and high wastewater temperature. A degree of hydrolysis of the particulate matter could result, likely resulting in lower BOD and SS removals than is reported by Harleman and Murcott. Once the system is full operational, these effects should be tested and analyzed.

CEPT in Developing Countries

Harleman and Murcott assert that CEPT technology is particularly applicable to the developing world. It could be an appropriate first step of treatment in individual cases, but no claim should be made for universal applicability, as there are many competing technologies. Selection of a treatment system should involve a careful engineering evaluation that includes a host of considerations, such as desired water quality, affordability, practical aspects of implementation, alternative technologies and, of course, cost considerations. For example in Brazil, anaerobic pre-treatment systems have been developed that remove 60 percent of the BOD while producing substantially less sludge (Sandino and Yee-Batista, 2000). When this is followed by pond systems, low overall sludge production and little or no power is used. In South Africa, anaerobic pond systems followed by algae ponds resulted in no sludge production in seven years while treating very strong wastewater. The addition of a simple trickling filter captured the algae and produced effluents with BOD less than 10 mg/L and ammonia was reduced from 70 to less than 5 mg/L. The plant used little power and no chemicals (Barnard and Meiring, 1995). On the other hand, Nenov (1995) concluded that CEPT was particularly appropriate for discharges to the Black Sea. When compared to activated sludge it had lower capital and operating costs and could achieve relatively high BOD and SS removals at high surface overflow rates.

The authors also mention the recent start-up of two treatment plants (ETE's Pavuna and Sarapui) incorporating CEPT as part of the Guanabara Bay clean-up effort for Rio de Janeiro. It should be noted that a consulting engineering firm (Black & Veatch)

recommended this process to CEDAE, the implementing agency, as early as 1996, and had completed preliminary designs almost a year earlier than the pilot testing efforts cited by the authors. These plants were designed with the intent of subsequently building an activated sludge stage.

An obvious example of where CEPT can easily be screened out as a potential treatment alternative is the case of many small island nations that have no infrastructure for in-country production of coagulant chemicals, and all chemicals have to be shipped in at high cost. It is obvious that in such cases, there are more appropriate technologies.

CEPT and Nutrient Removal

Harleman and Murcott refer several times to the removal of phosphorus but hardly ever to the removal of nitrogen. Organic carbon compounds are required and in many instances only limited primary treatment or none at all is used in order to allow sufficient carbon for denitrification. The alternative is to import carbon (e.g. methanol) for denitrification. The main energy cost in nitrogen removal is for nitrification and much of the energy is recuperated during the denitrification process. Not mentioned at all is the effect of chemicals on the pH of subsequent processes for downstream nitrification. There are instances where CEPT must include pH correction to allow for nitrification. Denitrification using internal carbon sources is also required in many cases to counter the drop in pH in low alkalinity water. In some cases, these considerations tend to counter the benefits of CEPT.

The references to phosphorus removal are also rather selective. The removal of 85 percent of phosphorus is sometimes achieved in activated sludge plants without a great deal of effort. Chemical precipitation requires heavy dosages to achieve low effluent phosphorus levels. Two of the discussers were involved in recent studies at a plant in Oregon, USA where it was shown that by utilizing biological phosphorus removal with chemical polishing, alum consumption could be reduced from 70 to 20 mg/L.

CEPT and chemical phosphorus removal were considered seriously in South Africa in the early 1970s. The main reason for the wide adoption of biological phosphorus removal was the problem of salt addition to the wastewater with chemicals used in CEPT. Recycling in inland situations increases salinity and using chemicals could further impair the value of the effluent.

Research Needs

Harleman and Murcott provide a listing of research needs, but the discussers find most of the topics have already been adequately addressed. Indeed, most of the research areas are no longer basic research issues at all and are most appropriately addressed as part of the study and implementation phases of actual projects. We do agree with the call for more research on UV disinfection of CEPT effluents, since the technology is in the early stages

of development for low UV transmittance wastewaters. Also, there has been interesting bench-scale work done with aerating and recycling primary sludge to improve its flocculation potential so as to increase colloidal and soluble BOD removal in primary clarifiers (Huang and Li, 2000). With the promise of enhancing primary treatment without chemical addition, it should be extended at least to pilot-scale.

Curiously, Harleman and Murcott are silent on a more recent development of CEPT, ballasted sedimentation, that is being pilot-tested all over the USA for treatment of CSOs, SSOs and for excess flows at wastewater treatment plants (e.g., see Chang et al., 1998). There is much to be learned as the first full-scale plants go into operation.

Professional Discourse on Treatment Alternatives: Turning Down the Volume

For Harleman and Murcott to impugne the integrity of a class of professional engineers daily engaged in wastewater technology applications does nothing positive to influence decision-makers on the merits of their positions. Indeed, in making inflammatory and undocumented accusations against this group, Harleman and Murcott raise questions about their own professional ethics rather than direct attention to CEPT technology.

The discussers have never encountered consulting engineers in their own firms or in firms with which they have worked with who would make recommendations about technology that was oriented to increasing their client's costs. On the contrary, every pressure on the design consultant is in the opposite direction, which is to competitively deliver cost-effective projects that demonstrate the value of our services. In fact, those of us in practice know that engineering selections are highly competitive and in many cases the best ideas presented in the competition for selection are the most important aspect of the selection process.

The authors asserted that doing away with the USA practice of design and construction and the adoption of design/build/operate (DBO) schemes will result in more frequent adoption of CEPT. Recent DBO projects in Dublin and Bangkok seemed to belie this statement. For example, in Bangkok the high temperature and flat topography resulted in highly septic and well-hydrolyzed wastewater. On this account, not only did CEPT not feature in any of the designs that were offered, primary tanks were mostly not even considered.

Harleman and Murcott claim that the CEPT technology has been overlooked by international experts; we have shown that this is not the case. And as demonstrated by the examples reviewed herein, design consultants do not view the use of CEPT technology as a high-risk proposition nor do they avoid it due to any particular prejudice. We have pointed to examples where our firms were involved in its development and application. And there are rich sources of information on both the theoretical and practical aspects of CEPT applications to draw on with many full-scale examples. We are quite willing to recommend its use in cases when a cost-effectiveness evaluation shows it to be appropriate. But any alternative must have a full and fair evaluation before

adopting it, including an assessment of existing facilities, effluent requirements and alternative processes. Where CEPT fits use it!

If Harleman and Murcott want to encourage further consideration of their concepts, they should publish the scientific and technical bases for their broad judgements about the wide applicability of the CEPT technology. This should be published in a journal where other investigators can offer discussions.

Rebuttal by Harleman and Murcott to the Parker et al. discussion paper: "The Future of Chemically Enhanced Primary Treatment: Evolution Not Revolution".

We welcome the discussion of our paper prepared by five distinguished members of the US environmental engineering consulting profession. Their discussion provides a wealth of supplemental information on the history and development of chemically enhanced primary treatment (CEPT) in the industrialized world. They argue that the future of CEPT is evolution and not revolution

We argue in our paper that enormous water pollution problems related to inadequately treated wastewater in the large cities of the developing world requires innovative, revolutionary thinking, not the complacency of "evolutionary" solutions. Parker et al. devote three paragraphs (out of 12 pages) to CEPT in developing countries -- the main focus of our paper. They state: "it [CEPT] could be an appropriate first step of treatment in individual cases, but no claim should be made for universal applicability, as there are many competing technologies." What are their "competing technologies"?

In Brazil, they suggest the use of anaerobic pre-treatment (UASB) followed by pond systems, and in South Africa, anaerobic pond systems followed by algae ponds followed by trickling filters to capture algae. If these are the "competing technologies," we can confidently restate our claim that CEPT is the most environmentally sound and cost effective first-stage treatment system for large urban areas where the large space requirements and odor problems of anaerobic wastewater treatment processes and wastewater stabilization ponds make them impractical.

Parker et al. cite many IWA conference volumes in the 1990s that purport to deal with centralized wastewater treatment technology appropriate to developing countries. We agree that CEPT is not featured in these volumes and this is the prime reason for writing our paper.

We find it both strange and significant that the words "public health" do not appear in the Parker et al. paper. Their emphasis is on "CEPT as part of a physical/chemical flow sheet for secondary treatment,"on "CEPT coupled with biological treatment for advanced wastewater treatment," and on "CEPT and Nutrient Removal." These advanced wastewater treatment processes are not relevant to the major public health needs of megacities in the developing world. For this reason we recommend CEPT, as a first-stage treatment process that produces an effluent that can be effectively disinfected. The use of CEPT + disinfection, at about half the cost, energy use and operational difficulties of

conventional primary + activated sludge, would allow the goal of full treatment in these cities to be attained more rapidly.

CEPT, in addition to providing BOD and TSS removals that equal or approach secondary treatment levels, is also effective in phosphorus removal. If, at a later stage of urban development, nitrification or denitrification is deemed necessary and affordable, the cost-effective solution would be to skip secondary treatment and go directly to biological aerated filters (BAF) that have the advantage of not requiring additional clarifiers.

Parker et al. have criticized us for including, as one of six impediments to CEPT in the developing world, the comment that profit motive may drive the use of inappropriate treatment technology. They refer to this as a "blanket attack on the professional integrity of a broad class of environmental engineering professionals." We certainly do not intend a blanket attack on US or European professionals. We can, however, provide support for our statement from the following:

"To find solutions to their environmental problems, developing countries usually seek the assistance of engineers and scientists from developed countries. Many times, however, either out of ignorance of the local condition or due to financial motivations, these experts come out with solutions which are far from being considered as the 'most appropriate.' As a result, the basic objective of protecting the environment is not achieved." (Curi, 1985)

Based on extensive experience in developing countries, we have seen too many conventional primary + activated sludge plants that are treating only a fraction of the municipal wastewater. In most cases the effluent from these plants is ultimately mingled with and overwhelmed by the remaining raw sewage discharges to form a stream or river with no discernable protection of the public health. For example, in Sao Paulo, about 30% of the wastewater flow is treated to the secondary level, yet the Tiete River flowing through the city center is essentially an open sewer. Similarly, in Beijing, about 25% of urban wastewater is treated in a token activated sludge plant at Gao Bei Dian while the remaining raw sewage is discharged directly to canals and rivers. Many other examples could be cited. We have also observed that there is a bias against CEPT related to a perception of second class status because it not been widely adopted in the Western world.

Parker et al. refer to the treatment plant costs in the National Research Council (1993) study in which we and Glen Daigger participated. Parker et al. state: "Engineering studies showed that while CEPT was significantly less expensive than conventional primary plus biological treatment, it had no cost advantage when coupled with biological treatment." We agree with the first-half of the quotation. The NRC total cost figures provided by Mr. Daigger do indeed show that the cost of CEPT is 60% of conventional primary treatment plus activated sludge. The

second half of the quotation simply reinforces our argument that CEPT should not be followed by activated sludge because there is no environmental benefit in a CEPT + activated sludge plant that produces a small increase in TSS and BOD removals at great expense. The 1993 NRC cost figures also show that the capital cost of CEPT is somewhat greater that of conventional primary treatment. This is no longer true. The NRC costs do not reflect the fact that CEPT results in a downsizing of the plant because overflow rates at least twice that for conventional primary treatment are now common. (Harleman et al. 1997)

We appreciate the careful documentation of the development of the City of Los Angeles' Hyperion plant by Parker et al. Here is a case in which the early experience with CEPT clearly showed the downsizing capability of CEPT in both the primary tanks and in the size and efficiency of the activated sludge plant. The excuse for not taking advantage of CEPT in the final plant because of uncertainty in the supply or cost of chemicals is weak. Fortunately the same argument has not been put forward to avoid using the same chemicals in potable water treatment.

Likewise the Parker et al. argument against the use of CEPT by small island nations is weak. CEPT has been successfully demonstrated at full-scale by the authors in Hawaii's two main treatment plants at Sand Island and Honouliuli. (Harleman and Murcott 1996) Because of the higher cost of shipping metal salts we tested ferric chloride and as an alternative the use of cationic polymers. Our recommendation was to use 2 to 3 mg/L of cationic polymer as the sole coagulant. This low dose gave 80% TSS removal and 50% BOD removal. A recent study in The Netherlands (Mels and van N. 2000) also compared ferric chloride and cationic polymers. They showed that in terms of chemical costs the reduced dosage (4 mg/L) of polymer and the higher polymer cost (7.5 times higher than the ferric per mg of active product) was about equal to the higher dosage and lower unit cost of the iron salt. There is also a saving in sludge processing because the polymer produces no additional chemical sludge.

A further argument in favor of CEPT by island states or nations is on account of energy savings outweighing chemical costs. At present, Hawaii imports more than three-quarters of its energy resources in the form of fossil fuels. Conventional primary treatment + activated sludge uses considerably more energy than CEPT. Thus, the cost of importing chemicals is cheaper than the cost of importing fossil fuels. In addition, most of Puerto Rico's municipal wastewater plants are using CEPT as a low cost way of upgrading overloaded plants.

In regard to "CEPT in Hong Kong" Parker et al. state: "Harleman and Murcott are in error when they assert that Professor Harleman was instrumental in arguing that conventional primary treatment planned for Stonecutters Island in Stage I of the plan should be replaced with CEPT. In fact, the consultant (Montgomery Watson) had planned on CEPT using low lime (pH9.7) treatment for the first stage of construction."

The Montgomery Watson (MW) plan (referred to above) was reviewed by Professor Harleman as a member of the first Hong Kong International Review Panel (IRP) in 1994/95. Several major problems ultimately led to its rejection:

(1) the use of lime was intended as a temporary measure at Stonecutters Island (SCI) to provide a degree of disinfection (ineffective in our opinion at a pH of 9.7) of the effluent until such time as a long (20+ km) and expensive ocean outfall would be constructed. At that time the SCI plant would revert to conventional primary treatment, thus losing both the downsizing capability and increased pollutant removal of the coagulant.

(2) A dose of 120 mg/L of lime is required to obtain a pH of 9.7. Although MW calls this “low dose” it produces an enormous quantity of hard-to- dewater sludge. In fact, the sludge produced by the lime is equal to that produced by TSS removal (assumed to be 65%.)

The acronym CEPT (which we first proposed more than 10 years ago) was never intended to include the use of lime (either low or high dose) as a primary coagulant. In our terminology, CEPT means use of iron or aluminum salts at a low dosage. The Hong Kong CEPT plant at SCI, which uses only10 mg/L of ferric chloride and produces an effluent essentially equivalent to secondary treatment, is a prime example.

It is not our intention to engage in a “we got there first” debate; however, in relation to comments on our work in Brazil we would like to set the record straight. In relation to the recent start-up of two CEPT plants in Brazil, Parker at al. state: “It should be noted that a consulting engineering firm (Black & Veatch) recommended this process --- as early as 1996 --- almost a year earlier than the pilot testing efforts cited by the authors.” In fact, we made our first presentation and full plant tests promoting the use of CEPT in Brazil in 1995. (Harleman and Murcott, 1995)

Parker et al write: "If Harleman and Murcott want to encourage further consideration of their concepts, they should publish their scientific and technical bases for their broad judgements about the wide applicability of the CEPT technology." We have already published extensively on chemical wastewater treatment, both in peer reviewed publications and technical reports. We did not feel the need to revisit or cite all our previous publications or early CEPT history in this Water 21 article. More than 20 publications can be found on our Web sites at:

http://web.mit.edu/civenv/html/people/faculty/harleman.html
http://web.mit.edu/civenv/html/people/faculty/murcott.html

We are delighted that engineers at the consulting firms represented in Parker et al. are actively engaged in the developing world. We must all work harder to convince regional and local authorities that the normal wastewater treatment technologies of the Western world are not necessarily the most effective first step in protecting the public health of their constituency.

As environmental engineering educators, we are not in competition with the reputable environmental engineering consultants who prepared the rebuttal to our paper. While they design and build treatment plants, we train present and future generations of engineers to think outside the box. Our role is to challenge the status quo, to raise hard questions, to point out critical issues and possible directions. But whether we are consultants or academics, our ethical responsibility as engineers and as human beings should be to address and solve critical water pollution problems not only in our nation but in the rest of the world.

We welcome this exchange of ideas not simply as a means to promote a specific technology but more generally to put forward the pressing need for innovative, revolutionary thinking in order to solve the water pollution and public health problems of the 21st century.

An Introduction to Chemically Enhanced Primary Treatment

Introduction

Chemically Enhanced Primary Treatment (CEPT) is the process by which chemicals, typically metal salts and/or polymers in the form of organic polyelectrolytes, are added to primary sedimentation basins. The chemicals cause the suspended particles to clump together via the processes of coagulation and flocculation. The particle aggregates, or flocs, settle faster thereby enhancing treatment efficiency, measured as removal of solids, organic matter and nutrients from the wastewater. The chemicals utilized in CEPT are the same ones commonly added in potable water treatment (e. g. ferric chloride, aluminum sulfate), and there are practically no residual metals in the supernatant (Harleman and Murcott, 1992).

CEPT may be implemented using a dedicated "CEPT tank" (i. e. a settling tank specially designed for CEPT), or by retrofitting a conventional primary treatment facility, or stabilization ponds (Ødegaard et al., 1987; Hanaeus, 1991a,b,c). The later two incarnations of CEPT are relevant when upgrading overloaded or underdesigned existing systems (Harleman and Murcott, 1992).

CEPT has many important advantages over conventional treatment. It offers a cheaper, simpler and more efficient alternative to conventional treatment, as is discussed in the following sections. Most importantly, it is the least expensive wastewater treatment process in which the effluent can be effectively disinfected.

Financial Benefits of CEPT

CEPT allows the sedimentation basins to operate at higher overflow rates, while still maintaining a high removal rates of total suspended solids (TSS) and biochemical oxygen demand (BOD). Hence the treatment infrastructure can be smaller, which reduces capital costs. Additionally, CEPT provides the opportunity for either reducing the size of subsequent treatment units, or increasing the capacity of existing conventional treatment plants, such as activated sludge basins. The addition of metal salts and/or a polymer will only

require tanks for the chemicals and injection equipment. Table 1 presents data comparing the costs of primary treatment, secondary biological treatment, and chemically enhanced primary treatment.

Table 1: Comparison of Treatment Costs (National Research Council, 1992)

	Capital Costs ($\$/10^3 m^3.d^{-1}$)	O&M Costs ($\$/10^6 m^3$)	Total Costs ($\$/10^6 m^3$)
Conventional Primary Treatment	3.1 — 4.2	0.8 — 0.9	1.7 — 2.1
Conventional Primary + Biological Secondary Treatment	9.1 — 9.8	1.2 — 1.6	3.5 — 4.3
Chemically Enhanced Primary Treatment	4.2 — 5.3	0.9 — 1.1	2.1 — 2.6

CEPT costs minimally more than primary treatment, and only about half as much as secondary treatment. Yet, the removal efficiencies show CEPTs superiority, as discussed in the next section.

Efficiency of CEPT

Table 2 illustrates how CEPT enhances the removal of TSS and its associated BOD, through chemical coagulation and flocculation, followed by settling of the floc. The data, based on a survey of 100 wastewater treatment plants in the United States, show CEPTs superior efficiencies over conventional primary treatment. Moreover, when combined with the cost analysis presented in Table 1, it can be said that CEPT is highly competitive with biological secondary treatment.

CEPT is ideal for a coastal city since the removal of TSS is very high and the decrease in BOD is sufficient so as to not impact oxygen concentrations in the ocean. This is the case in two of the largest operating CEPT facilities in the world (San Diego and Hong Kong). Hong Kong's Stone Cutter's Island plant also benefits from increased performance due to seawater addition (Harleman et al., 1997).

CEPT is also appropriate for in-land wastewater facilities, and is utilized for phosphorus removal by a number of facilities discharging their effluent into the Great Lakes (Harleman and Murcott, 1992). Indeed, while biological secondary treatment removes TSS and BOD at a very high efficiency, it does not effectively remove phosphorus and produces nitrates (Harleman and Morrissey, 1992). If this effluent does not undergo nutrient removal before it is released into a body of water, eutrophication can occur. The algal blooms often accompanying this kind of nutrient loading deprive the water body of oxygen, which is equivalent releasing a high-BOD effluent into that body of water. CEPT effectively removes a high amount of phosphorus, which is usually the limiting nutrient in fresh water systems.

Finally, in developing countries, the primary objective of any sanitation system is disinfection, due to the high levels of morbidity incurred by water-borne illnesses. CEPT is the least expensive method of treatment in which the effluent can be appropriately disinfected (Harleman and Murcott, 2001b,a).

Table 2: Comparison of Removal Efficiencies (National Research Council, 1992)

	TSS (%)	BOD (%)	TP (%)	TN[1] (%)	FOG[2] (%)
Conventional Primary Treatment	55	35	20	15	51
Conventional Primary + Biological Secondary Treatment	91	85	30	31	98
Chemically Enhanced Primary Treatment	85	57	85	37	71

Ease of Implementation

A conventional primary treatment process consists of bar screens, a grit chamber, and a settling tank (or primary clarifier) (see Figure 1). To upgrade a conventional primary treatment facility to a CEPT facility, all that is needed is the addition of a chemical coagulant (and optionally a flocculent) as shown in Figure 1. With CEPTs high surface overflow rate, the sedimentation basins will not need to be large when compared to conventional primary sedimentation basins (Harleman et al., 1997).

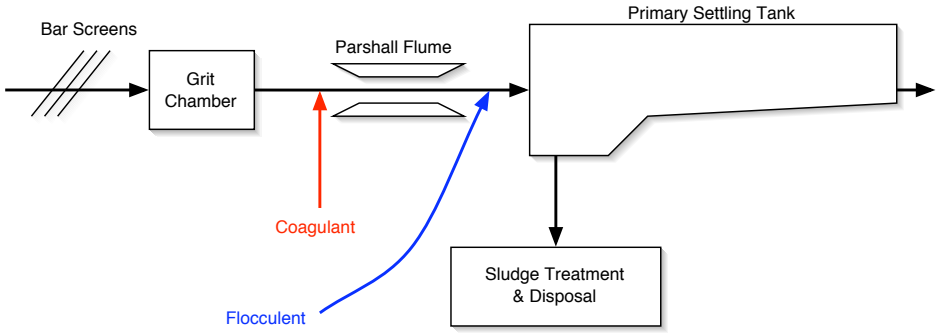

Figure 1: Schematic of Conventional Primary Treatment and CEPT

[1]Total Nitrogen
[2]Fats, Oils and Grease

Conclusion

CEPT is an efficient, cost-effective and easily implemented wastewater treatment technology. The addition of chemical coagulants and/or polyelectrolytes allows for the increased removal of phosphorus, suspended solids and its associated biochemical oxygen demand. The increased removal efficiencies allow for the design of smaller basins and greater overflow rates.

CEPT has been used for over one hundred years, yet it is not as commonly found as would be expected upon analysis of its performance. The misconception is that CEPT dramatically increased sludge production. However, CEPT is used today with a minimal coagulant dosage (10 - 50 mg/L), and the chemicals themselves make only a slight contribution to the total sludge production. The greatest portion of the increase of sludge production is due to the increased solids removal in the settling tank. And that is precisely CEPT's goal.

CEPT treatment does not preclude secondary or tertiary treatment. It makes any subsequent treatment smaller and less costly due to the increased efficiency. CEPT is a relatively simple technology providing a low-cost and effective treatment, which is easily implemented over existing infrastructure (Harleman and Murcott, 1992, 2001b,a).

Wastewater Treatment for Mega-Cities in the Developing World

Frédéric Chagnon

Donald R.F. Harleman

ADB - September 20, 2005

Massachusetts Institute of Technology

Outline

Public Health in Developing Countries

Staged Wastewater Treatment

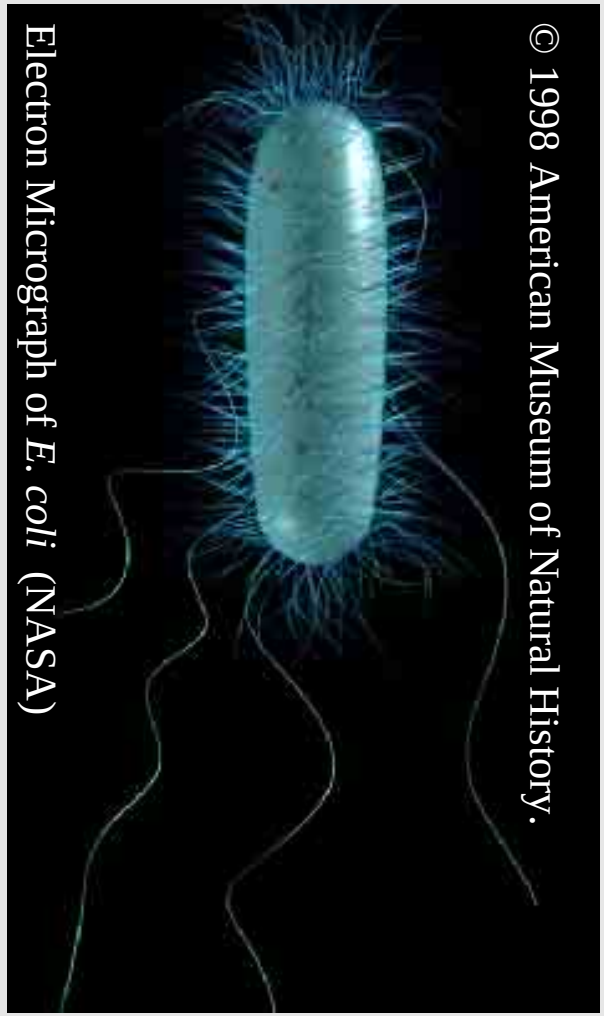
Chemically Enhanced Primary Treatment

Sanitation in Developing Countries

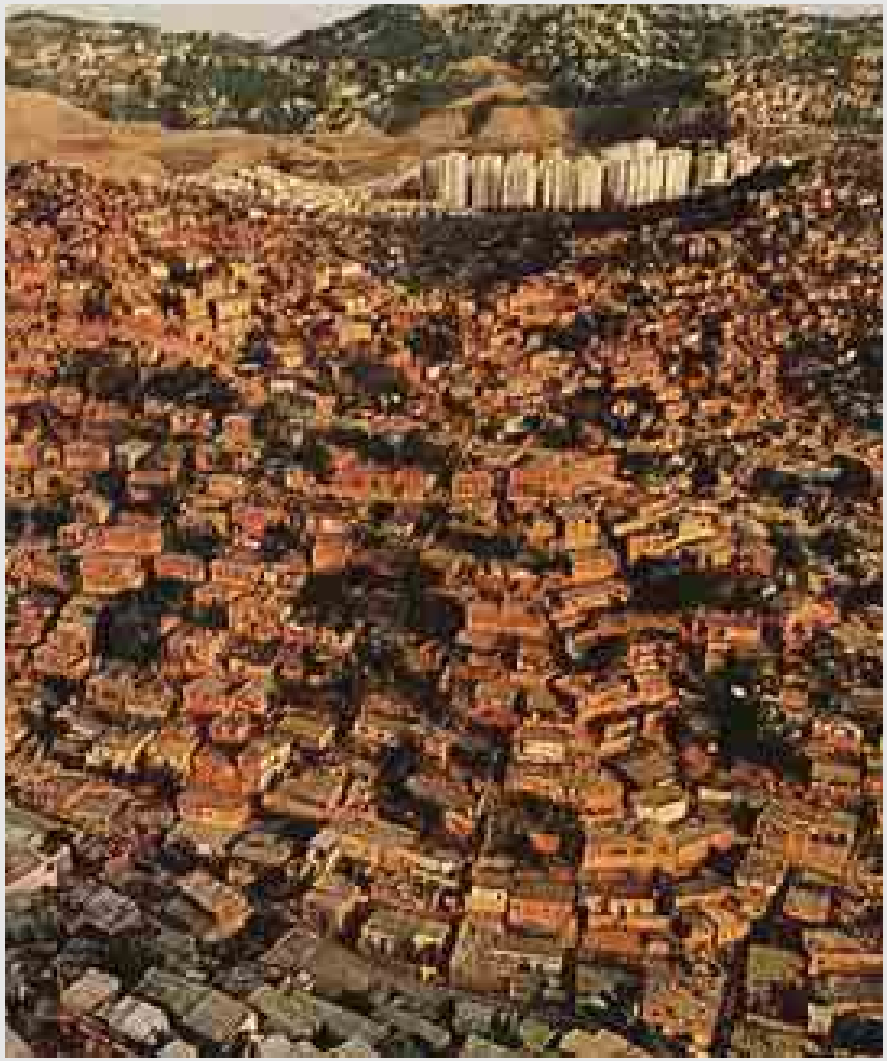
- 3 billion without appropriate sanitation
- 2 billion more urban dwellers in next 20 years
- 95% sewage untreated before discharge

Sanitation Related Public Health

- Diseases
  - Water is Transmission Pathway:
- Women & children most affected
  - 1.5 million children die each year from diarrhoeal disease
- Large improvements conferred by appropriate water and sanitation
- Environmental quality benefits from sanitation



Urban Areas & Slums



Sanitation & Development

- Costs of poor sanitation
  - Human morbidity (lost productivity; healthcare services)
  - Environmental degradation (loss of ecosystem services)
  - Foregone revenues
- Appropriate infrastructure alleviates poverty
  - Stimulates economic growth
  - Narrows socio-economic gap
  - Increases productivity
  - Improves health
- Women & children stand to gain most
  - Children more vulnerable to disease
  - Women have more contact with water/wastewater

Outline

Public Health in Developing Countries

Staged Wastewater Treatment

Chemically Enhanced Primary Treatment

Constraints

- Objectives are to improve public health and environmental quality

- Strict environmental regulations
- Limited budgets, high costs
- Limited capacity/willingness to pay on consumer behalf

- Resulting “partial treatment” financially wasteful, no public health benefit, little environmental improvements

Constraints

- Limited cost recovery possibility
  - User charges incentive to serve users
  - User charges incentive to limit waste
  - But possible limited ability or willingness to pay (initially)
- Limited operating capacity
  - No previous experience with wastewater treatment
  - Simple treatment = learn basics and build-up capacity

$\Rightarrow$ Start with affordable tariffs (that fully recover O&M) and simple technology (for which capacity to operate easy & quick to build)

Non-Phased Development

- Initial wastewater treatment to high environmental standard
- Cost recovery through user charges difficult (no capacity/willingness to pay)
- Limited technical capacity for operations
- Only part of a city's wastewater can be collected and treated
- Wastewater treatment plants and infrastructure may not be operated properly
  - Not able to pay for O&M
  - Not technically able to properly operate

Phased Development

- Prioritization of problems to be tackled
- Comprehensive design of sanitation infrastructure and treatment
  - Meets environmental standards
  - Designed for future growth
- Staged implementation
  - Start with full wastewater collection and simple affordable treatment, build-up gradually
  - First priority is to treat 100% of wastewater to level where disinfection effective to mitigate public health problems
  - Subsequent implementation of planned/designed secondary treatment to comply with environmental regulations

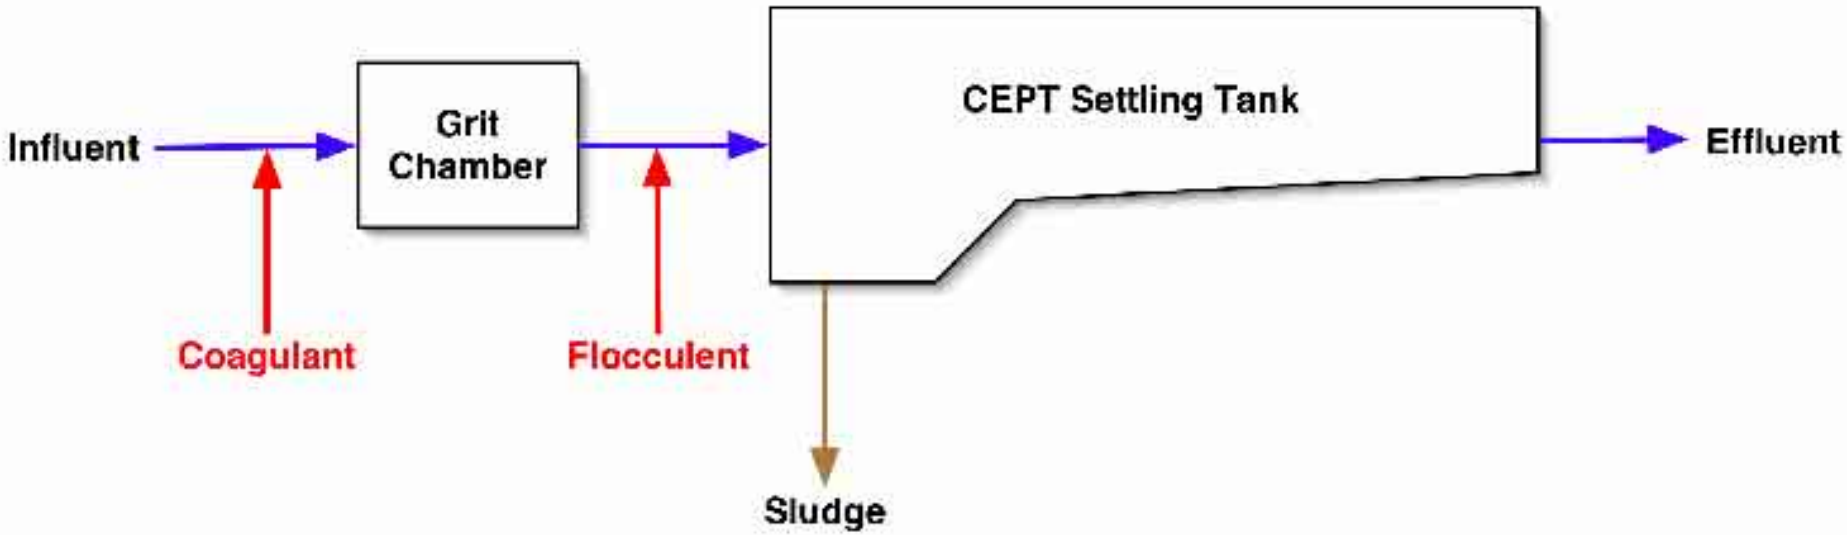
Outline

Public Health in Developing Countries

Staged Wastewater Treatment

Chemically Enhanced Primary Treatment

CEPT



- Chemicals added to clump smaller particles together into larger particles
- Larger particles settle faster
- Enhanced version of conventional primary treatment
- Can be followed by secondary treatment and/or outfall

Primary Efficiency

Conventional Primary Treatment

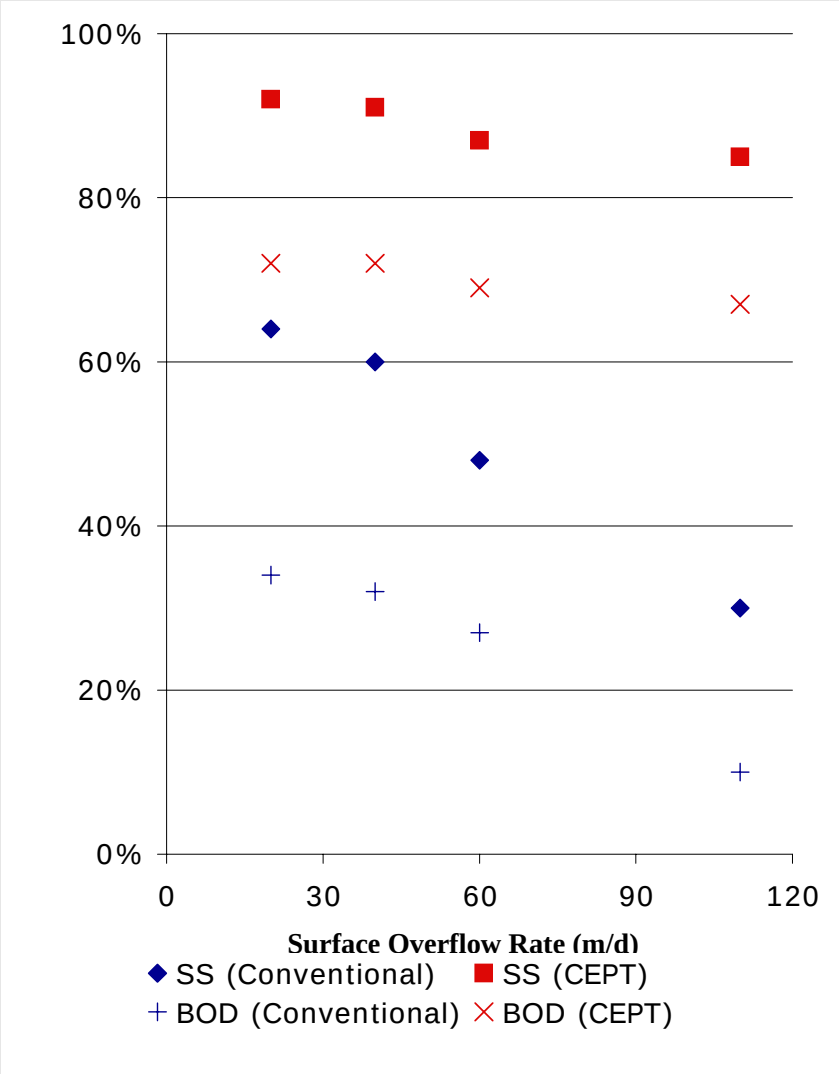
Overflow Rate (m/d)	% Removal			
	BOD	SS	Phosphorus	Pathogens
30–50	25–40	40–70	5–10	50–60

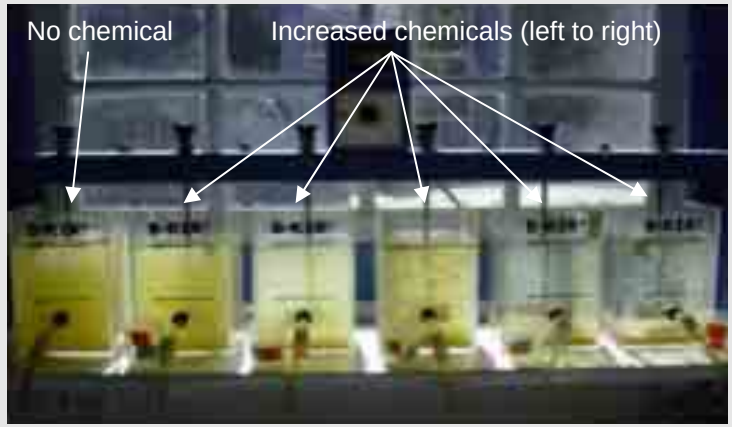
Chemically Enhanced Primary Treatment

Overflow Rate (m/d)	% Removal			
	BOD	SS	Phosphorus	Pathogen
60–120	40–70	60–90	70–90	80–90

Simple technologies
Low energy and operator skill requirements

Primary Treatment



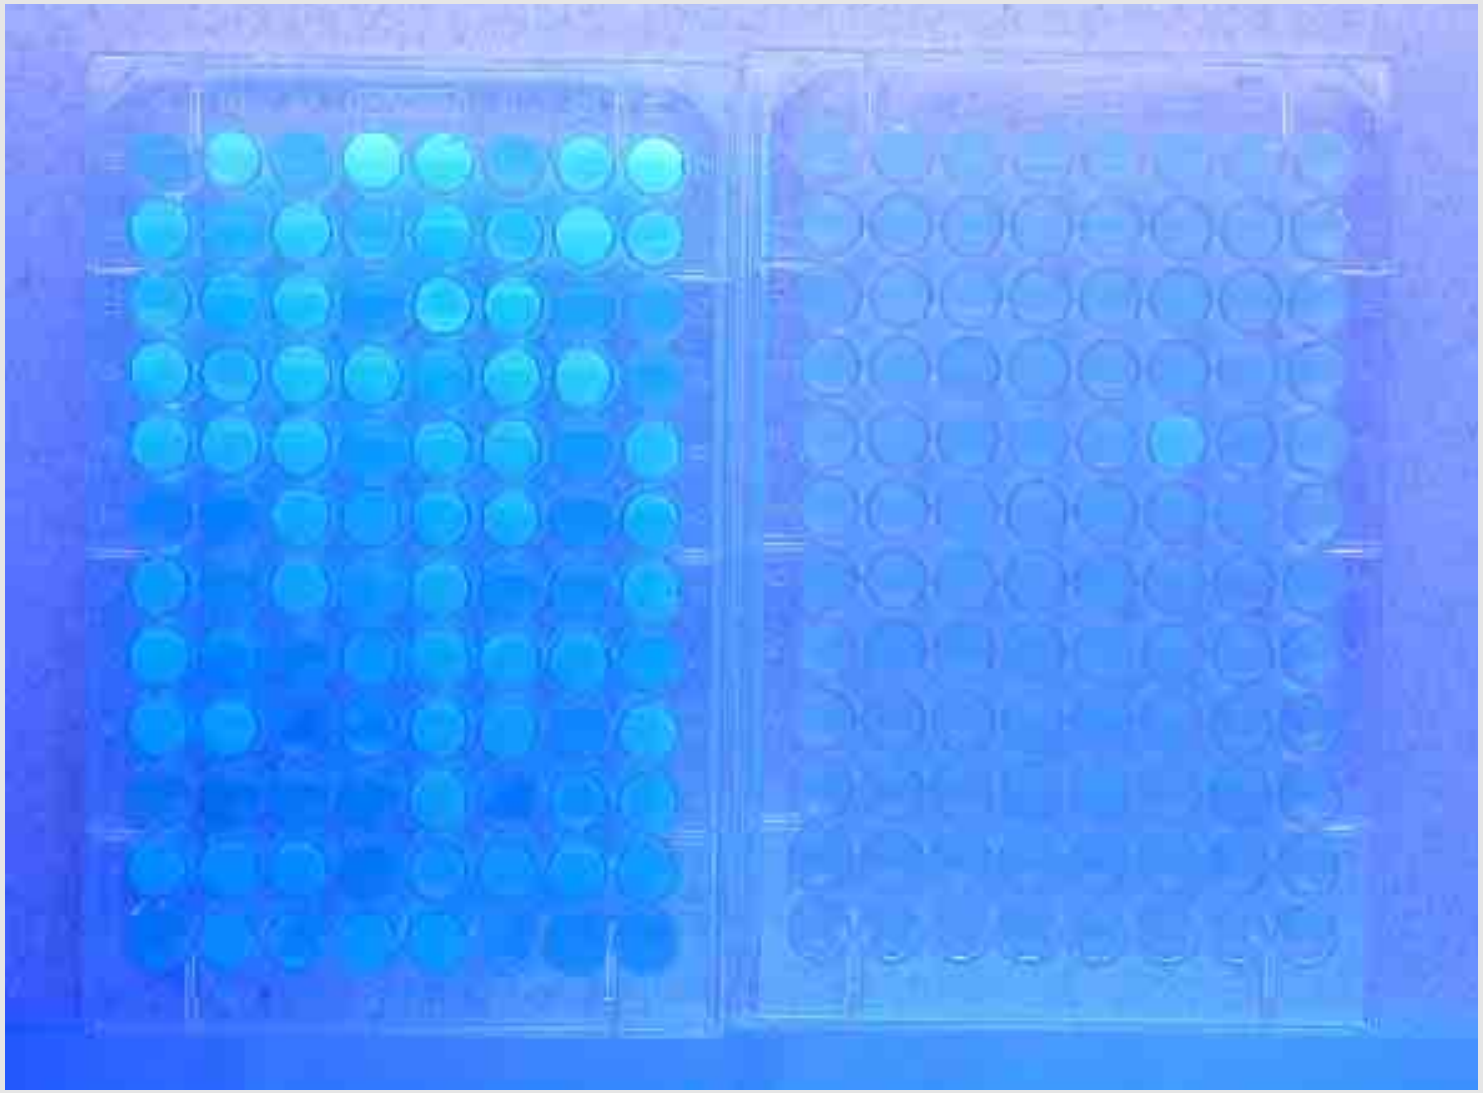


- CEPT vs. Conventional Primary
  - Higher BOD & SS removal
  - Operates at higher overflow rate
  - Smaller area requirement
  - Lower Capital Cost
  - Greater resilience to flow variation
  - Reduced size of subsequent secondary treatment
  - Effluent can be disinfected
  - Larger amount of sludge produced
  - Higher O&M (chemicals)

Bench-Scale CEPT

Massachusetts Institute of Technology

Disinfection of CEPT Effluent



Cost Comparison

	Capital Costs (US$M/$m^3.s^{-1}$)	O&M Costs (US$M/$m^3.s^{-1}$/yr)
PT without Disinfection	1.5	0.2
CEPT + Disinfection	**1.3**	**0.5**
PT + AS + Disinfection	5.0	1.0

Construction costs based on plant capacity;

O&M costs based on average daily flow (1/2 plant capacity).

Massachusetts Institute of Technology

Advantages of CEPT as 1st Stage

Effluent can be disinfected

2x-3x conventional primary surface OFR

Approaches biological secondary treatment removal efficiencies for BOD and TSS

Reduces size of subsequent treatment

High phosphorus removal

Conclusion

- Appropriate wastewater treatment & collection is desirable and has high Return on Investment
- Recovery of Operation & Maintenance costs through user fees critically important
- Tradeoffs necessary between desire for high environmental standards, affordability and technical capacity

→ **PHASED DEVELOPMENT**

- CEPT is a flexible and low-cost treatment technology
- Appropriate for initial stage

Wastewater from production activities in craft villages and some mitigation solutions

Dang Kim Chi Assoc. Prof. Dr.

Hoang Thu Huong MSc

Institute for Environmental Science and Technology (Vietnam)

dangkimchi2002@yahoo.com inest@hn.vnn.vn

I. INTRODUCTION

Production in craft villages is an economic form quite typical of Vietnam rural areas, particularly in the development of traditional handicraft. The policy for renovating the economy has blown fresh vitality to traditional handicrafts. According to the recent data [1], Vietnam has nearly 1,450 craft villages distributed in the 58 provinces and cities, especially in the Red River Delta with about 800 villages. Over the past 10 years, Vietnam craft villages have achieved the growth rate of 8% per year according to their outputs. The main occupations practiced in villages are textile-dyeing, agro-food processing, waste recycling, fine arts handicraft, and porcelain & construction materials.

Besides the encouraging signs for the traditional handicraft development, a disturbing reality is the high risk of pollution from these activities, especially wastewater pollution. The pollution risk is generated by the production characteristics – petty, scattered, obsolescent technology as well as unprompted development. On the other hand, due to the lack of the knowledge, people do not understand damaging impacts of their activities on their health.

The population density is often high in the craft villages, so the lack of the production space leads to the interposition of residence and production areas. Since production expands, the pollution caused by chemicals and wastes have contaminated the living environment, particularly in the waste recycling and agro-food processing villages.

The rural infrastructure is in a poor condition. Only about 20% of production establishments having proper workshops, 86% have electricity supply, 37% have their work mechanized and more than 60% do their work by hands.

2. POLLUTION CAUSED BY WASTEWATER IN SOME TYPICAL OCCUPATION VILLAGES OF VIET NAM

The water pollution, especially water pollution, from village production is a pressing problem that is catching the community's attention, could be presented as follows.

Agro-food processing cottage

This is the most long-standing occupation in Vietnam's villages but has been scattered in different households. In the whole Vietnam, there are 197 agro-food processing villages making up 13.58% of the 1,450 occupation villages. This kind of production not only meets the food demand but also provide the material sources for other processing industries.

Agro-food processing consumes a huge volume of water and most of it is discharged directly after use. Wastewater from craft villages is rich in inorganic matter and highly biodegradable. At present, the effluent is not treated before being discharged outside. The stagnated

wastewater in the sewage may cause air pollution with anaerobic digestion, soil pollution with over nutrients and the underground water pollution by penetrating into soil. Therefore, ground water in these areas is found to be seriously polluted with high concentrations of COD, TS and NH_4^+. Water from drilling wells of Tan Do and Ninh Van villages have the sign of coliform contamination. In Hai Thanh, a fish sauce production village, water taken from the well was heavily polluted with COD=186 mg/l. In many craft villages, villagers have to buy fresh water from other places. On the other hand, the majority of the refuse from agro-food production are used for livestock feeding, which also contributes to the water pollution.

Table 1
Waste water characteristics at the agro-food processing

ChØ tiªu	TCCP 5945-1995	Tinh bét B×nh Minh	Bón Phó §«	N-íc m¾m H¶i Thanh *	NÊu r-îu T©n §«	§Ëu phô Quang B×nh
PH	**5.5-9**	4.6	6.1	9.59	-	5.1
SS (mg/l)	**100**	926	414	10	266	1764
COD (mg/l)	**100**	1858	2967	597	3868	1271
BOD_5 (mg/l)	**50**	743	1850	250	1700	1080
ΣN (mg/l)	**60**	145.6	20.9	9.62	1002	67
ΣP (mg/l)	**6**	27.5	2.79	0.034	44.2	23

According to health survey, community health in these villages is significantly influenced by the production activities. The most popular diseases are gynecology (13-38%), digestion (8-30%), dermatitis (4.5-23%), respiration (6-18%), ophthalmic (9-15%). The main reasons are low environment quality and shortage of clean water. The rate of occupational diseases in Duong Lieu (Ha Tay) and Vu Hoi (Thai Binh) noodle villages is 70%, in Phu Do noodle and Tan Do alcohol villages is 50%.

Waste recycling villages

These villages make use of waste as raw materials and therefore reduce input cost and also contribute to mitigation of environmental pollution. Presently, the development of these villages creates network of waste, scraps and raw materials collecting. These kinds of villages are encouraged to develop. There are 3 sub-groups: waste paper, waste metal and waste plastic recycling, mostly concentrated in the Northern part.

The waste recycling villages in existence are in small numbers, but the proportion of mechanization of 50-70%, is much higher than that in others. Some large-scale occupation villages attract large numbers of local laborers. For example, the plastic recycling village of Minh Khai, Hung Yen contain more than 4,000 workers; the waste paper recycling village of Duong O, Bac Ninh with an annual productivity of 12,000 tons of paper attracts 5,000 workers; the iron and aluminum recycling village of Van Chang, Nam Dinh, which consumes roughly tons of wastage on a daily basic, has 3,000 employees. As newly-established craft villages engage in household scale production, the dynamic and creative spirit in monitoring and diversifying product lines have been brought into full play by villagers, whose incomes and living standards are relatively high.

As for waste paper recycling villages, the soaking, cooking and grinding of materials produce the main source of wastewater. The unrestrained discharge of untreated wastewater into surface water has adversely affected the environmental quality. This wastewater contains

extra chemicals, pulp and high organic contents, which results in near zero amount of dissolved oxygen. Pulp and fiber left in wastewater raise the level of canals, ponds and lakes. In Duong O and Phu Lam villages alone, 1,450 – 3,000 kg COD and over 3,000kg of pulp are pushed out to surface water daily.

As to plastic recycling villages, due to variety of material sources and high proportion of impurities, much water is used to wash scrap. This amount of water is estimated as high as 20-25 m^3/ton of waste plastic. The single waste plastic Minh Khai village produces 445,000 m^3 of wastewater on an annual basis. The composition of this wastewater is very complicated as it carries many organic, inorganic compounds, including toxic substances (from pesticide container, chemicals etc.) and micro-organisms carrying germs.

In metal recycling villages, even though not much water is used, mainly for cooling, cleaning equipment and workshops, wastewater generated by metal treating and coating has relatively high concentrations of noxious chemicals, especially heavy metals.

Table 2
Heavy metal concentration in wastewater in metal recycling villages (mg/l)

TT	Sampling points	Cr^{2+}	∑Fe	Pb^{2+}	Cu^{2+}	Zn^{2+}	Al^{3+}
1	Lead recycling Chi Dao, Bac Ninh	0.04	0.4	0.35	0.1	0.6	-
2	Mechanic Van Chang, Nam Dinh	63 -187	12	0.9	1.5	8.7	10.4
3.	Bronze casting Phuoc Kieu	0.2	7.6	0.6	3.1	1.8	2.1
4.	Mechanic Xuan Tien, Nam Dinh	0.8	0.3	0.44	3.25	2.15	0.32
	TCVN 5945-1995	**1**	**5**	**0.1**	**1**	**2**	**-**

The heavy pollution due to indiscriminate collection and discarding has affected the ecology and human health to a serious extent. It is impossible for fish to grow in most of these villages' lakes and ponds because they are subject to a large quantity of wastewater of high concentrations beyond the self-cleaning capacity of the environment and garbage has raised the level of lake bed and blocked its stream. An international survey team once hired some children in Van Chang village to look for aquatic organisms in the 1 km section of river flowing past the village, but no living creatures were found.

Survey results have revealed that the percentage of occupational diseases in recycling villages is 15-25% higher than in non-production villages. About 30-45% of children and women are afflicted with diseases, primarily respiration diseases, bronchitis, pneumonia in children and gyneacology in women. Life expectancy in these villages is low, ranging from 55 to 65. There are frequent outbreaks of epidemic such as diarrhea, sore eyes, poisoning especially in metal recycling villages. [3]

Textile and dying villages

With the initial demands for and self-sufficiency of garment, textile and dying villages have gradually been established and passed down from generation to generation and continue to live on until today. There are a total of 173 textile and dying villages in the whole country, making up 10% of craft villages, of which 85.5% concentrated in the Northern provinces.

Wastewater pollution presents the biggest environmental problem in the textile-dying craft villages. Large amounts of water are discharged together with chemicals and dye stuffs (about 10-30% dye stuffs and 85-90% chemicals used are discharged together with wastewater). Properties of wastewater in some typical textile-dying villages are presented as follows:

Table 3
Properties of wastewater in some typical textile-dying villages

No	Names of villages	Amount of wastewater m^3/day	Wastewater quality criteria				
			pH	COD	BOD_5	SS	Color
1.	CoChat silworm coccoons unwinding, Nam Dinh	100	-	6076	2400	764	4110
2.	Phuong La textile and dying, Thai Binh	960	8-9.7	320-900	72 -410	14	77-139
3.	Tuong Giang textile and dying, Bac Ninh	1.266	8-9.8	120-350	100	55-284	190-250
4.	Dong Yen silworm coccoons unwinding Quang Nam	20	7.2	632	241	517	69
5.	Bao Loc silworm coccoons unwinding Lam Dong	500	7.8	1.020	780	215	466
6.	Nam Cao silk weaving – thai Binh	-	8.2	372	212	375	260
7.	Thai Phuong textile and dying, Thai Binh	-	6.9	312	272	205	195
	VN standards 5945-1995 (B)		**5.5-9**	**100**	**50**	**100**	

The results of healthcare surveys in textile and dying villages [2] have shown that diseases like rhinitis, sore throat and nervous debility are widespread among workers in these villages. Production is the cause for 20% of the diseases in silk weaving village of Bao Loc, Lam Dong and silkworm cocoons unwinding village of Dong Yen, Quang Nam and 55% in textile and dying village of Thai Phuong, Thai Binh. This figure is 70% for the silkworm cocoons unwinding village of Co Chat, Nam Dinh.

Fine art handicraft villages

Of 1,450 craft villages in whole country, fine art handicraft villages are in a majority: 618 villages. The principal handicraft types include: rattan and bamboo weaving, embroidery, sea grass products, woodwork, lacquer painting, pottery, sculpture, silver carving etc.

As far as the water environment is concerned, lacquer and silver carving villages produce the most pollution. The amount of water consumed is not high, but comprises high concentrations of pollutants. In the lacquer villages of Ha Thai (Ha Tay), the COD, the BOD, SS contents are 1.8 to 3.5 times higher than the allowed level. In silver carving villages, many chemicals such as H_2SO_4,HNO_3 ... are used for coating. Therefore, wastewater from coating has low pH level, cyanide sometimes reaches 0.75 mg/l (1.5 times higher than allowed level) and mercury concentration also exceeds the allowed level. The horn handicraft village of Do Hai, Nam Dinh annually consumes 100 tons of cattle's horns; but the surface water here had the pH level of 4.4, SS and COD exceeds the allowed level dozens of times. Similarly to most of other craft villages, this wastewater, mixed with domestic wastewater, is flushed into the common canal.

III. SOLUTIONS FOR WASTEWATER POLLUTION MINIMIZATION IN CRAFT VILLAGES

In order to improve the current environmental status, reasonable production development planning is of foremost importance.

Environmental management solutions

Environmental policy: Develop appropriate policies for encouraging technology innovation in craft villages towards environmental friendly technologies and products. Besides, there should be a mechanism to apply policy “polluter pays” in craft villages.

Establishing local environment management mechanism including clean environment group, developing environmental programs in the villages (environmental protection statues, penalty regulations, environmental fees and funds, etc)

Local authorities should develop regulations on environmental management, special staffs responsible for environmental problems to help management authorities to have throughout understanding of implementing environmental related regulations, waste treatment in order to develop encouragement policies to initiatives for mitigating negative impacts on environment as well as provide timely decision to cope with problems arisen during production activities in craft villages. ***For craft villages, management in commune level is a core in environmental management as authorities can get close contact with each household to successfully implement management solutions.***

Clustering craft villages in rural areas

This model is suitable with newly-developed craft villages engaged in small scale industry. The cluster is built in the vicinity of villages, which is favorable for overall planning and still retains exclusive advantages of production in craft villages.

A number of projects for clustering craft villages in an area with appropriate infrastructure and waste treatment system have been carried out in the Phong Khe waste paper recycling village, Da Hoi ion village, Dong Ky woodwork village, Duong Noi textile village, van Chang mechanics village and Minh Khai waste plastic village. However, the master plans for these industrial clusters are not well developed and implemented causing difficulties in dealing with environmental problems in these clusters. According to the master plan, waste water from each household will be collected after preliminary treatment and brought to the concentrated treatment system.

The pressing demand for small and medium industrial clusters for craft villages results from the need for better life, the pressure on the environment and accords with the rural industrialization, modernization policies of Vietnam. However, concrete directions and guidelines are crucially important for localities to conduct planning and space organization, sensibly arrange industrial production establishments and rural occupation establishments scattered in villages into medium and small scale industrial complexes and to avoid production expansion from being turned into population displacement.

Environmental education

Build mass education program, enhancing people’s awareness of environmental protection in craft villages, especially in use and discharge of wastewater into the environment. Besides, it is necessary to open on-the-spot classes on pollution prevention and treatment in craft villages.

Appropriate technical solutions

In many craft villages, if timely survey and assessment of the production states are conducted in great details, sensible technical solutions might be put forward for improvement of water environment in the villages. It is necessary to combine production area re-arranging, application of cleaner technologies and construction of wastewater treatment system according to the villages' production reality. Recently, the Institute for Environmental Science and Technology has brought the experimental model of pollution prevention and wastewater treatment system villages into operation in some craft villages: waste paper recycling village of Phu Lam, Bac Ninh, the textile and dying village of Tri Nhan, Ha Tay, Zinc coated iron establishment in Khai Hung, Ha Tay, which has delivered promising results and has reasonable cost.

IV. CONCLUSION

It is important for managing agencies, research and environmental technology transfer institutions to pay attention to the environmental pollution caused by wastewater in craft villages in order to find out appropriate and feasible solutions in the production context of craft villages. As a matter of fact, concentrated wastewater treatment is only used in well-established and developed industrial clusters of craft villages. In the short term, preliminary treatment solutions are needed for each establishment to reduce pollutants before discharging into receiving bodies. Looking for funding and financial support from international organizations is also crucial for helping craft villages to solve environmental sanitation and wastewater. However, the prime importance is that environmental sanitation in general and wastewater pollution in particular in craft villages must be understood throughout and dealt with by the local residents themselves.

UNDP-World Bank
Water and Sanitation Program

Institutional Development of the Urban Water and Sanitation Sector in Chile

by Raquel Alfaro

These Urban Environmental Sanitation Working Papers have not been formally published and this is an opportunity to share this information more widely to:

- stimulate discussion and to broaden thinking within the sector, and in particular, to encourage dialogue within and among our clients in developing countries; and
- build more awareness of the Program among UES clients.

Working Paper produced in November 1997

Bringing Optimal Water and Sanitation Services to the Poor
Three Essays on the Experiences of EMOS
(The Municipal Works Company of Santiago, Chile)

In these three essays Raquel Alfaro, Civil Engineer and Master in Production Management of the University of Strathclyde, Scotland, recounts the successful policies and practices which led EMOS, Municipal Sanitation Company of Santiago, Chile to its position as a model among Latin American utilities. At the same time, Alfaro shares her personal vision of what a public utility should be - at once an enterprise guided by commercial principles of efficiency and a spirit of social obligation. Given her professional history with EMOS, of which she was General Manager from 1990 until her retirement in 1996, Alfaro knows very well the limits and possibilities of the utility companies. Her confidence in the capacity of other companies to match the achievements of EMOS should be encouraging to all readers interested in the water and sanitation sector.

The first essay: *Linkages between Municipalities and Utilities: An Experience in Overcoming Urban Poverty* explores the responsibilities of the utility companies and those of the local governments in extending services to the poor. Alfaro cites the reasons frequently given to explain why the poor are unserved that poor countries lack capital to invest in needed water and sanitation infrastructure, the poor themselves live in circumstances which increase costs beyond their already limited capacity to pay tariffs. For a utility company, however, the right to use resources which are public goods also brings with it an obligation to meet the needs of all citizens. It should also seek to maximize its clientele as a matter of good business. When families cannot meet the costs of service, it is the responsibility of local government, not the utility, to make up the difference.

The second essay, *Institutional Development of the Water and Sanitation Sector in Chile,* traces the history of legal reforms which led to the present institutional environment. It emphasizes the importance of regulation, but also of liberating tariffs and links key reforms to increased service coverate and improved utility performance. In 1989 the General Law on Sanitation Services put public utilities on a footing similar to private ones, obliging them to organize as equity corporations and to bid for concessions from local governments. The Law and Regulations of Tariffs, passed in 1988 and 89 respectively establishes a five year period for applying and reviewing tariffs which must cover costs. The Superintendency of Sanitation Services, created in 1989 establishes an overall regulatory system.

The third essay, *Reaching the Poor with Water and Sanitation Infrastructure - Key Factors Not to Forget*, challenges the believe that the total cost of services is too high for the poor to pay arguing that good management, in particular reduction of losses, increasing the number of connections and maximizing efficiencies through use of a single operating system, can reduce costs and make full service effective.

Institutional Development Of The Urban Water And Sanitation Sector In Chile

Chilean Urban Water and Sanitation sector have been in continuous development since the middle of the 19th century. That is, when the first water and sewerage works started being built in the main cities of the country. The last two major institutional changes started at the end of 1970 decade an a third one is being foreseen shortly.

1. The situation of the urban water and sanitation sector at the end of the 1970 decade.

By the end of the 70th, a large number of public services delivered drinking water or collected wastewater in the main cities of Chile, whose urban population amounted to some 8.5 million people. The urban population of Santiago, the capital city, and the population of the environs' villages, was about 4 million people. This population was been served mainly, by a semiautonomous public drinking water enterprise, Empresa de Agua Potable de Santiago (EAPS). There was also a public sewerage service, Servicio de Alcantarillado de Santiago, and other small drinking water public services. A private company delivered drinking water and collected wastewater in the upper part of the city. The population served by this company was of some 250,000 people.

Supervision and control of the services were also under different government bodies that were responsible for water quality control, technical supervision of the services, and tariffs setting. Chilean quality standards for drinking water followed European and American standards and were closely controlled by the Ministry of Health. Thus, the quality of the water was considered fairly good, while the urban water coverage (table 1) was rather high for a developing country. EAPS, the main water company, had good qualified staff and a good level of technical and administration development. For instance, water meters coverage was near 100 %.

However, in all cities, including Santiago, sewerage coverage was low. In addition, there was no wastewater treatment and safe disposal of the sewage collected. The rate of enteric diseases (typhoid, hepatitis) all over the country was very high. This rate was even higher in the Metropolitan Region than in other regions. This could be attributed to poor hygiene practices due to lack of sewerage in many crowded neighborhoods. Yet, it could be attributed also to untreated sewage discharges to natural water courses crossing the city and in turn feeding irrigation canals.

On the other hand, tariff's level was kept low. Thus, public water companies and services were kept financially supported by the government. Sewerage tariffs' level was extremely low. Companies and services hardly covered water and sewerage operational costs, and they do not covered capital cost at all. Government funds went to assist operational costs of some of the services, and to finance new water and sewerage infrastructure of nearly all of them. There was an annual increase of coverage because the bulk infrastructure was there, yet the annual amount of the investments decreased and systems become overcharged. In addition, the companies did not have funds to proper maintenance, rehabilitation and upgrading of aging systems.

Table 1 shows coverage and annual investment for the period 1965- 1980

Table 1
National Urban Coverage and Annual Investments
1965- 1980

Year	Water Annual %	Sewerage %	Investment million dollars
1965	53.5	25.4	80
1970	66.5	31.1	61
1975	77.4	43.5	58
1980	91.4	67.4	40

(Superintendency of Sanitary Services, Annual Report, 1995)

2. First Institutional Reform

The first important institutional reform was made by the year 1977. It had as a main objective the integration in one hand of water and sanitation activities to take advantage of scale economies and to optimize and enhance the systems. The new entities were designed to be working on a regional basis. Two semi- autonomous utilities were created, EMOS in the metropolitan region and ESVAL in the 5th region. Eleven regional services were also established, one in each of the remaining 11 regions of the country. EMOS integrated EAPS, Empresa de Alcantarillado de Santiago and the other public water services in the region.

A regulator body was instituted, SENDOS (Servicio Nacional de Obras Sanitarias), as a main division of the Ministry for Public Works. SENDOS was made responsible for central planning, financing and administration of the regional services and became the regulator and controller of services and utilities. SENDOS made tariff's proposal for being presented for approval to the Ministry of Economy.

However, tariffs' level was kept low in the regions and the regional services continued receiving financial assistance from central government. EMOS and ESVAL benefited from water and sewerage integration, had some tariff increases and started to use its own financial resources for investments. In 1980, EMOS received a 26 million dollar's loan from the World Bank to upgrade the water system according with a 70 million dollar's investment plan. This plan included the first master plan for wastewater treatment and safe disposal in the metropolitan region It also included a master plan to extend the sewerage system. In 1986 EMOS received a 60 million dollar's second loan from the World Bank , to be applied in a 150 million dollar's new investment plan, that included the basic works for wastewater treatment.

By the same period SENDOS received a loan from IDB to upgrade regional services.

The missions of the World Bank had a positive influence in the already qualified staff of EMOS that applied the policies and recommendations of the Bank's officials. Operational activities were reinforced with new technologies and procedures. Unaccounted for water, for instance, started as a routine activity, while Planning and Financial activities were strengthened because of the Bank's periodical assessments. By the same time EMOS started to contract out not only designs and construction of infrastructure works but also some maintenance activities. For instance, network maintenance and replacement, metering and bill's distribution, connection's maintenance and replacement, were contracted externally. New contractors and consultants brought new technologies and external developments to the utility. A computerized simulation model of EMOS's water system was made by French and Spanish consultants associated with Chilean consultants. A master plan for maintenance, repair, rehabilitation and replacement of EMOS water distribution system was made by the British Water Research Center associated with Chilean consultants.

Coverage continued increasing throughout the country. However, the low level of tariffs still did not allow all services and utilities to grow in terms of maintenance of the new systems and in terms of maintenance, rehabilitation and replacement of old systems. This was an important constraint for efficient service delivery. There also was no fund allocation to reinforcement of the storage infrastructure, in order to cope with an increasing scarcity of fresh water as cities and population grew. Moreover, the capacity of the water systems to face droughts, big emergencies or not expected local demand increases, was very weak. In the regions, SENDOS's responsibility as a regulator body was mixed with its responsibility as a regional operator.

Table 2 shows national urban coverage and annual investment for the period 1980-1990.

Table 2
National Urban Water and Sewerage Coverage and Annual Investment 1980-1990

Year	Water %	Sewerage %	Annual Investment million dollars
1980	91.4	67.4	40
1985	95.2	75.1	79
1990	97.4	81.8	65

Source: Memoria Anual de la Superintendencia de Servicios Sanitarios, 1995.

3. Second Reform

By the end of the 80th decade (1988- 1989) a second important institutional reform was applied to the Chilean water and sanitation sector. Its main objective was to give financial stability to water and sanitation activities, while reinforcing the regulatory capacity of the government. A set of law and regulations were passed and a regulatory body, totally separated from operational activities, was created. The reform also included laws that allowed the selling of EMOS and ESVAL to private sector. A summary of the new laws is given below :

Ley General de Servicios Sanitarios, 1989 (General law for sanitary services)

Its main features were:

* The law establishes the concession's system. That is, a right granted by the government to public or private companies, to perform water and sanitation activities for an indefinite period of time. Nevertheless the concession right can be lapsed if the concessionaire incurred in the faults contemplated in the law. Four types of concessions were granted: water production; water distribution into a geographical zone; wastewater collection into the same geographical zone (although this concession can be granted to a different concessionaire) and wastewater treatment and safe disposal . Concessions have to be applied for, and are granted after a bidding procedure. A transitory article of the law granted concessions to the companies and services that were performing or that had on going projects for performing water and sanitation activities. Concessions' rights can be sold and transferred.

* Concessionaires have to organize themselves as equity societies. They must have and apply an approved development plan, must charge approved tariffs and meet quality standards and norms. Concessions for water distribution and sewerage collection implies obligatory service within the geographical zone.

Ley de Tarifas , 1988 y Reglamento, 1989. (Tariffs law and regulation of the law)

* Tariffs are set for a period of five years, with adjustments for inflation and other variation of macro-economic indicators, during this period. Charges are calculated according to formulae which follow "long run marginal cost methodology" .Tariffs are adjusted to financial viability , that is to cover the companies operational and capital cost during a period of at least 15 years ahead, taking into account a capital cost of at least 7 % (2 higher points than the normal interest rate in credit instrument investments). Parameter and variable values considered in the calculation are defined by the regulator for a "model of efficiency" theoretical enterprise. The regulator takes into account the different conditions of the services production and delivery, and the development plan of each company.

* Tariff structure consists of a fixed charge and a variable charge for water and the same for sewerage. Water charges have an overprice for over consumption during the peak of demand (summer period).Fixed charges are intended to cover connections and secondary network maintenance costs; and billing and money collection costs. These costs are considered independent of consumption in the short and in the long term. Variable charges are intended to cover all current and capital cost considered variable in the short and in the long term. (Fixed charges represent about 20 % of a typical water and sewerage monthly bill)

* There are no gratuities, nor differences in prices for different type of client. The existing cross subsidy for the first 10 m3 of monthly consumption was eliminated and replaced by a government subsidy targeted in low income families. Companies make a discount to eligible customers, to be reimbursed by municipalities with the funds provided by central government. Municipality qualifies the law income situation.

Ley que crea la Superintendencia de Servicios Sanitarios (SISS), 1989 (Law that creates the Superintendency of Sanitary Services,SISS).

The main responsibilities given by this law to the regulator body are:

* The implementation and supervision of the concessions system, including concession transfers, bidding and lapsing.

* The implementation and supervision of the tariff system, including tariff's setting and control.

* The setting of technical standards for design, construction and exploitation of water and sanitation works and control of standard's compliance.

LEYES QUE CREAN LAS SOCIEDADES ANONIMAS (S. A) EMOS, ESVAL Y 11 EMPRESAS REGIONALES (Laws that create EMOS S.A., ESVAL S.A and 11 regional equity companies)

These laws created public corporate equity companies. The laws that created EMOS and ESVAL did not set limit to the sale of the shares of these companies. The laws that created the other regional public companies established that at least 51 % of the shares should be kept in the government's hands.

The democratic government in power in 1990 did not sell the public water and sanitation utilities. They were transformed in commercial oriented public corporations affiliated to CORFO (government body) to whom the majority of the shares were entrusted. The companies follow regulations applied to private companies, although their annual budget has to be approved by the Finance Ministry.

With the new orientation and the funds coming from fair tariffs, public companies started a period of enhancement and high investments. The first five year tariff's period began in 1990, and considered a gradual annual raise until to reach the legal limit. This meant, on average, a total increase of about 70 % in real terms, that is without taking into account adjustments for inflation. The second five year tariff's period started in 1995. The average tariff's raise was now about 6 % and was to be maintained until 1999. EMOS in its main system had a water tariff reduction of about 2 %. In 1992 a revision was made in the tariff subsidy system, to facilitate accessibility and to take into account regional differences in tariffs and in average family income. In 1995, central government paid 23 million dollars on this subsidy, but now the government had not need to give financial assistance to any public company. On the contrary, some of the companies as EMOS, were paying shares' dividend to the government.
The growth of public utilities infrastructure was outstanding. New tanks, mains, collectors, water treatment plants, etc., were built in every region. Urban water and sewerage coverage reached the highest levels of Latin America. EMOS, the main utility put special emphasis in water conservation and water resource management to cope with the demand increase. The demand for water and sanitation was increasing as a result of urban developments in the metropolitan region, and because of the extension of water and sanitation systems to poor neighborhoods. EMOS activities for unaccounted for water were reinforced by macrometering, telemetering and telecontrol in strategic points of the water production and distribution system. Rehabilitation and replacement of deteriorated installations, contributed to the reduction of unnaccounted for water.

The first works for wastewater treatment and safe disposal started to be built and operated by the beginning of the 1990th.. EMOS and ESVAL initiated the construction of wastewater discharges interceptors (big collectors). In 1992 the first wastewater treatment plant, a pilot non conventional plant, was built in Santiago. The definitive plan for wastewater treatment in the metropolitan region was completed in 1994. In 1995 the decision of building three large plants was taken, to reach a sewage treatment coverage of about 70 % within 15 years. In other regions, wastewater collectors, non conventional wastewater treatment plans and marine out- falls for safe sewage disposal were designed , and started to be built and to be operated. Cholera was controlled in Chile as a result of emergency measures taken by the Ministry of Health. Yet, it is important to take into account the rise in sewerage coverage and the initiation of the basic works for wastewater treatment and safe disposal in the metropolitan region and in other regions. Other waterborne diseases, as typhoid, decreased from 6,700 cases in the year 1989 to 1,400 in the year 1995. The decrease of typhoid cases was even more important in the metropolitan region, from 4,100 cases in the year 1989 to 390 cases in the year 1995.

Public companies started also a new style of work. Long term regular planning for infrastructure development, working in a coordinated way with municipalities, communities and government bodies was a new managerial feature applied for EMOS and other companies. Comprehensive approach to management and participant and multi-disciplinary work was also part of the new style of work. Water conservation should be understood not only by the company's staff but also by clients, particularly when tariffs were rising. Public companies leaded by EMOS began a full campaign for client education in water conservation and appropriate utilization of water and sewerage infrastructure. Public companies also oriented low income families towards government subsidy, and helped municipalities in the administrative tasks of its implementation. Collective bargaining was now an obligation imposed by the new legal status of the companies. To develop new systems for human resource management, motivation and compensation, was a requisite that the new companies had to face.

New tariffs and increases in efficiency allow many of the companies to elevate its internal rate of return while performing new activities, intensifying others, taking new responsibilities and elevating wages and salaries to market's price. The average profit after taxes of these companies, referred to fixed assets, rose from a negative value of (0.76) % in 1989 to a positive value of 6.3 % in 1995 (data from SISS). EMOS raised its rate of return, from 5.7 % in 1989, to 11.0 % in 1995. It is important to point out that according to international standards the level of EMOS's tariffs is fairly low (0.40 US$ /m3, water and sewerage). Because of its sound financial situation, EMOS was able to treble its annual investments, to pay dividends of shares to the government its main shareholder, and to paid in advance the first loan with the World Bank. . EMOS also decided not to withdraw entirely the second loan with the World Bank.

BOOT contracts were thought to be awarded to the private sector for building and operating the future wastewater treatment plants.

Table 3 shows coverage and annual investments for the period 1990-1995. In this table it is included wastewater coverage in 1989 and in 1995.

Table 3
National Water and Sanitation Urban Coverage and Annual Investments 1990- 1995

* Include marine out-falls.

Third Institutional Reform.

Although most of these public companies are well run, some of them lack business administration capacity, and technological development. On the other hand, large infrastructure investments, yearly increasing, are required. The main investments are required for providing service to new urban population, for upgrading deteriorated systems, for building wastewater treatment plants, for developing new raw water sources, etc. It is required also, new procedures and methods, and new policies and organizational developments. Competition normally leads private companies to constant growth to survive in an always changing business environment. Public companies lack enough flexibility to face a continuous situation of advancement and renewal. Political interference could be also a menace to modern management of public companies. Thus, the sale of the public water and sanitation companies to the private sector, could be an advisable government policy..

By the middle of 1995, the government presented the Congress a proposal of modification of the current law. The government conditioned the sale of public companies to the pass of the new law.

The main aims of the proposal were: to join in one legal document the different laws in action; to prevent power concentration (majority of shares of many sector companies in one hand); to ensure that urban development is supported by water and sanitation infrastructure; and to protect and introduce some forms of competitiveness. The proposal has had many changes as a result of the discussion between the government and the Congress. The government and the Congress have introduced many new articles. The main features of the new law, after the Senate amendments are:

* SISS is being given the power to extend concession zones in order to make them coherent with government plans for urban development. (Development plan, and tariffs if required, would be modified)

* Public bidding is introduced as an obligation for contracting acquisition of goods and services over 150,000 dollars value.

* Power concentration is restricted by limiting the number of shares in one hand according to the quantity and size of the companies.

* Production concessionaires are being given the right to use, with due compensations, the water transport system of a different distribution concessionaire. They are also being given the right to build its own system to transport water to large final consumers. (That is, introducing in the water sector the multicarrier concept)

The main reforms presented by the government and rejected by the Senate are:

* To keep in the hands of the government, at least 35 % of the companies' shares.

* To transfer public companies' water rights to CORFO, to be administrated for this entity.

The law project has to follow the constitutional procedures that consider new discussion in the hamber of Deputies and the Senate. The government can also insist in its rejected proposals.

Summing up, the third institutional reform is being aimed to ensure the sustainability of a business model that has proved successful in the Chilean sanitary sector. Going further to corporate and commercial public companies, the government is considering its privatization . However before that, the government wants to take all the measures to ensure that this new reform allows the country to have its entire urban population served by sound and efficient water and sanitation companies.

Institutional Development Of The Urban Water And Sanitation Sector In Chile

Chilean Urban Water and Sanitation sector have been in continuous development since the middle of the 19th century. That is, when the first water and sewerage works started being built in the main cities of the country. The last two major institutional changes started at the end of 1970 decade an a third one is being foreseen shortly.

1. The situation of the urban water and sanitation sector at the end of the 1970 decade.

By the end of the 70th, a large number of public services delivered drinking water or collected wastewater in the main cities of Chile, whose urban population amounted to some 8.5 million people. The urban population of Santiago, the capital city, and the population of the environsvillages, was about 4 million people. This population was been served mainly, by a semiautonomous public drinking water enterprise, Empresa de Agua Potable de Santiago (EAPS). There was also a public sewerage service, Servicio de Alcantarillado de Santiago, and other small drinking water public services. A private company delivered drinking water and collected wastewater in the upper part of the city. The population served by this company was of some 250,000 people.

Supervision and control of the services were also under different government bodies that were responsible for water quality control, technical supervision of the services, and tariffs setting. Chilean quality standards for drinking water followed European and American standards and were closely controlled by the Ministry of Health. Thus, the quality of the water was considered fairly good, while the urban water coverage (table 1) was rather high for a developing country. EAPS, the main water company, had good qualified staff and a good level of technical and administration development. For instance, water meters coverage was near 100 %.

However, in all cities, including Santiago, sewerage coverage was low. In addition, there was no wastewater treatment and safe disposal of the sewage collected. The rate of enteric diseases (typhoid, hepatitis) all over the country was very high. This rate was even higher in the Metropolitan Region than in other regions. This could be attributed to poor hygiene practices due to lack of sewerage in many crowded neighborhoods. Yet, it could be attributed also to untreated sewage discharges to natural water courses crossing the city and in turn feeding irrigation canals.

On the other hand, tariffs level was kept low. Thus, public water companies and services were kept financially supported by the government. Sewerage tariffslevel was extremely low. Companies and services hardly covered water and sewerage operational costs, and they do not covered capital cost at all. Government funds went to assist operational costs of some of the services, and to finance new water and sewerage infrastructure of nearly all of them. There was an annual increase of coverage because the bulk infrastructure was there, yet the annual amount of the investments decreased and systems become overcharged. In addition, the companies did not have funds to proper maintenance, rehabilitation and upgrading of aging systems.

Table 1 shows coverage and annual investment for the period 1965- 1980

Table 1
National Urban Coverage and Annual Investments
1965- 1980

(Superintendency of Sanitary Services, Annual Report, 1995)

2. First Institutional Reform

The first important institutional reform was made by the year 1977. It had as a main objective the integration in one hand of water and sanitation activities to take advantage of scale economies and to optimize and enhance the systems. The new entities were designed to be working on a regional basis. Two semi- autonomous utilities were created, EMOS in the metropolitan region and ESVAL in the 5th region. Eleven regional services were also established, one in each of the remaining 11 regions of the country. EMOS integrated EAPS, Empresa de Alcantarillado de Santiago and the other public water services in the region.

A regulator body was instituted, SENDOS (Servicio Nacional de Obras Sanitarias), as a main division of the Ministry for Public Works. SENDOS was made responsible for central planning, financing and administration of the regional services and became the regulator and controller of services and utilities. SENDOS made tariffs proposal for being presented for approval to the Ministry of Economy.

However, tariffslevel was kept low in the regions and the regional services continued receiving financial assistance from central government. EMOS and ESVAL benefited from water and sewerage integration, had some tariff increases and started to use its own financial resources for investments. In 1980, EMOS received a 26 million dollar's loan from the World Bank to upgrade the water system according with a 70 million dollar's investment plan. This plan included the first master plan for wastewater treatment and safe disposal in the metropolitan region It also included a master plan to extend the sewerage system. In 1986 EMOS received a 60 million dollars second loan from the World Bank , to be applied in a 150 million dollars new investment plan, that included the basic works for wastewater treatment.

By the same period SENDOS received a loan from IDB to upgrade regional services.

The missions of the World Bank had a positive influence in the already qualified staff of EMOS that applied the policies and recommendations of the Banks officials. Operational activities were reinforced with new technologies and procedures. Unaccounted for water, for instance, started as a routine activity, while Planning and Financial activities were strengthened because of the Banks periodical assessments. By the same time EMOS started to contract out not only designs and construction of infrastructure works but also some maintenance activities. For instance, network maintenance and replacement, metering and bills distribution, connection's maintenance and replacement, were contracted externally. New contractors and consultants brought new technologies and external developments to the utility. A computerized simulation model of EMOSs water system was made by French and Spanish consultants associated with Chilean consultants. A master plan for maintenance, repair, rehabilitation and replacement of EMOS water distribution system was made by the British Water Research Center associated with Chilean consultants.

Coverage continued increasing throughout the country. However, the low level of tariffs still did not allow all services and utilities to grow in terms of maintenance of the new systems and in terms of maintenance, rehabilitation and replacement of old systems. This was an important constraint for efficient service delivery. There also was no fund allocation to reinforcement of the storage infrastructure, in order to cope with an increasing scarcity of fresh water as cities and population grew. Moreover, the capacity of the water systems to face droughts, big emergencies or not expected local demand increases, was very weak. In the regions, SENDOSs responsibility as a regulator body was mixed with its responsibility as a regional operator.

Table 2 shows national urban coverage and annual investment for the period 1980-1990.

1990	97.4	81.8	65

Source: Memoria Anual de la Superintendencia de Servicios Sanitarios, 1995.

3. Second Reform

By the end of the 80th decade (1988- 1989) a second important institutional reform was applied to the Chilean water and sanitation sector. Its main objective was to give financial stability to water and sanitation activities, while reinforcing the regulatory capacity of the government. A set of law and regulations were passed and a regulatory body, totally separated from operational activities, was created. The reform also included laws that allowed the selling of EMOS and ESVAL to private sector. A summary of the new laws is given below :

Ley General de Servicios Sanitarios, 1989 (General law for sanitary services)

Its main features were:

* The law establishes the concessions system. That is, a right granted by the government to public or private companies, to perform water and sanitation activities for an indefinite period of time. Nevertheless the concession right can be lapsed if the concessionaire incurred in the faults contemplated in the law. Four types of concessions were granted: water production; water distribution into a geographical zone; wastewater collection into the same geographical zone (although this concession can be granted to a different concessionaire) and wastewater treatment and safe disposal . Concessions have to be applied for, and are granted after a bidding procedure. A transitory article of the law granted concessions to the companies and services that were performing or that had on going projects for performing water and sanitation activities. Concessions' rights can be sold and transferred.

* Concessionaires have to organize themselves as equity societies. They must have and apply an approved development plan, must charge approved tariffs and meet quality standards and norms. Concessions for water distribution and sewerage collection implies obligatory service within the geographical zone.

Ley de Tarifas , 1988 y Reglamento, 1989. (Tariffs law and regulation of the law)

* Tariffs are set for a period of five years, with adjustments for inflation and other variation of macro-economic indicators, during this period. Charges are calculated according to formulae which follow long run marginal cost methodology .Tariffs are adjusted to financial viability , that is to cover the companies operational and capital cost during a period of at least 15 years ahead, taking into account a capital cost of at least 7 % (2 higher points than the normal interest rate in credit instrument investments). Parameter and variable values considered in the calculation are defined by the regulator for a model of efficiency theoretical enterprise. The regulator takes into account the different conditions of the services production and delivery, and the development plan of each company.

* Tariff structure consists of a fixed charge and a variable charge for water and the same for sewerage. Water charges have an overprice for over consumption during the peak of demand (summer period).Fixed charges are intended to cover connections and secondary network maintenance costs; and billing and money collection costs. These costs are considered independent of consumption in the short and in the long term. Variable charges are intended to cover all current and capital cost considered variable in the short and in the long term. (Fixed charges represent about 20 % of a typical water and sewerage monthly bill)

* There are no gratuities, nor differences in prices for different type of client. The existing cross subsidy for the first 10 m3 of monthly consumption was eliminated and replaced by a government subsidy targeted in low income families. Companies make a discount to eligible customers, to be reimbursed by municipalities with the funds provided by central government. Municipality qualifies the law income situation.

Ley que crea la Superintendencia de Servicios Sanitarios (SISS), 1989 (Law that creates the Superintendency of Sanitary Services,SISS).

The main responsibilities given by this law to the regulator body are:

* The implementation and supervision of the concessions system, including concession transfers, bidding and lapsing.

* The implementation and supervision of the tariff system, including tariffs setting and control.

* The setting of technical standards for design, construction and exploitation of water and sanitation works and control of standards compliance.

LEYES QUE CREAN LAS SOCIEDADES ANONIMAS (S. A) EMOS, ESVAL Y 11 EMPRESAS REGIONALES (Laws that create EMOS S.A., ESVAL S.A and 11 regional equity companies)

These laws created public corporate equity companies. The laws that created EMOS and ESVAL did not set limit to the sale of the shares of these companies. The laws that created the other regional public companies established that at least 51 % of the shares should be kept in the governments hands.

The democratic government in power in 1990 did not sell the public water and sanitation utilities. They were transformed in commercial oriented public corporations affiliated to CORFO (government body) to whom the majority of the shares were entrusted. The companies follow regulations applied to private companies, although their annual budget has to be approved by the Finance Ministry.

With the new orientation and the funds coming from fair tariffs, public companies started a period of enhancement and high investments. The first five year tariffs period began in 1990, and considered a gradual annual raise until to reach the legal limit. This meant, on average, a total increase of about 70 % in real terms, that is without taking into account adjustments for inflation. The second five year tariff's period started in 1995. The average tariffs raise was now about 6 % and was to be maintained until 1999. EMOS in its main system had a water tariff reduction of about 2 %. In 1992 a revision was made in the tariff subsidy system, to facilitate accessibility and to take into account regional differences in tariffs and in average family income. In 1995, central government paid 23 million dollars on this subsidy, but now the government had not need to give financial assistance to any public company. On the contrary, some of the companies as EMOS, were paying sharesdividend to the government.
The growth of public utilities infrastructure was outstanding. New tanks, mains, collectors, water treatment plants, etc., were built in every region. Urban water and sewerage coverage reached the highest levels of Latin America. EMOS, the main utility put special emphasis in water conservation and water resource management to cope with the demand increase. The demand for water and sanitation was increasing as a result of urban developments in the metropolitan region, and because of the extension of water and sanitation systems to poor neighborhoods. EMOS activities for unaccounted for water were reinforced by macrometering, telemetering and telecontrol in strategic points of the water production and distribution system. Rehabilitation and replacement of deteriorated installations, contributed to the reduction of unnaccounted for water.

The first works for wastewater treatment and safe disposal started to be built and operated by the beginning of the 1990th.. EMOS and ESVAL initiated the construction of wastewater discharges interceptors (big collectors). In 1992 the first wastewater treatment plant, a pilot non conventional plant, was built in Santiago. The definitive plan for wastewater treatment in the metropolitan region was completed in 1994. In 1995 the decision of building three large plants was taken, to reach a sewage treatment coverage of about 70 % within 15 years. In other regions, wastewater collectors, non conventional wastewater treatment plans and marine out- falls for safe sewage disposal were designed , and started to be built and to be operated. Cholera was controlled in Chile as a result of emergency measures taken by the Ministry of Health. Yet, it is important to take into account the rise in sewerage coverage and the initiation of the basic works for wastewater treatment and safe disposal in the metropolitan region and in other regions. Other waterborne diseases, as typhoid, decreased from 6,700 cases in the year 1989 to 1,400 in the year 1995. The decrease of typhoid cases was even more important in the metropolitan

region, from 4,100 cases in the year 1989 to 390 cases in the year 1995.

Public companies started also a new style of work. Long term regular planning for infrastructure development, working in a coordinated way with municipalities, communities and government bodies was a new managerial feature applied for EMOS and other companies. Comprehensive approach to management and participant and multi-disciplinary work was also part of the new style of work. Water conservation should be understood not only by the company's staff but also by clients, particularly when tariffs were rising. Public companies leaded by EMOS began a full campaign for client education in water conservation and appropriate utilization of water and sewerage infrastructure. Public companies also oriented low income families towards government subsidy, and helped municipalities in the administrative tasks of its implementation. Collective bargaining was now an obligation imposed by the new legal status of the companies. To develop new systems for human resource management, motivation and compensation, was a requisite that the new companies had to face.

New tariffs and increases in efficiency allow many of the companies to elevate its internal rate of return while performing new activities, intensifying others, taking new responsibilities and elevating wages and salaries to market's price. The average profit after taxes of these companies, referred to fixed assets, rose from a negative value of (0.76) % in 1989 to a positive value of 6.3 % in 1995 (data from SISS). EMOS raised its rate of return, from 5.7 % in 1989, to 11.0 % in 1995. It is important to point out that according to international standards the level of EMOS's tariffs is fairly low (0.40 US$ /m3, water and sewerage). Because of its sound financial situation, EMOS was able to treble its annual investments, to pay dividends of shares to the government its main shareholder, and to paid in advance the first loan with the World Bank. . EMOS also decided not to withdraw entirely the second loan with the World Bank.

BOOT contracts were thought to be awarded to the private sector for building and operating the future wastewater treatment plants.

Table 3 shows coverage and annual investments for the period 1990-1995. In this table it is included wastewater coverage in 1989 and in 1995.

* Include marine out-falls.

Third Institutional Reform.

Although most of these public companies are well run, some of them lack business administration capacity, and technological development. On the other hand, large infrastructure investments, yearly increasing, are required. The main investments are required for providing service to new urban population, for upgrading deteriorated systems, for building wastewater treatment plants, for developing new raw water sources, etc. It is required also, new procedures and methods, and new policies and organizational developments. Competition normally leads private companies to constant growth to survive in an always changing business environment. Public companies lack enough flexibility to face a continuous situation of advancement and renewal. Political interference could be also a menace to modern management of public companies. Thus, the sale of the public water and sanitation companies to the private sector, could be an advisable government policy..

By the middle of 1995, the government presented the Congress a proposal of modification of the current law. The government conditioned the sale of public companies to the pass of the new law.

The main aims of the proposal were: to join in one legal document the different laws in action; to prevent power concentration (majority of shares of many sector companies in one hand); to ensure that urban development is supported by water and sanitation infrastructure; and to protect and introduce some forms of competitiveness. The proposal has had many changes as a result of the discussion between the government and the Congress. The government and the Congress have introduced many new articles. The main features of the new law, after the Senate amendments are:

* SISS is being given the power to extend concession zones in order to make them coherent with government plans for urban development. (Development plan, and tariffs if required, would be modified)

* Public bidding is introduced as an obligation for contracting acquisition of goods and services over 150,000 dollars value.

* Power concentration is restricted by limiting the number of shares in one hand according to the quantity and size of the companies.

* Production concessionaires are being given the right to use, with due compensations, the water transport system of a different distribution concessionaire. They are also being given the right to build its own system to transport water to large final consumers. (That is, introducing in the water sector the multicarrier concept)

The main reforms presented by the government and rejected by the Senate are:

* To keep in the hands of the government, at least 35 % of the companiesshares.

* To transfer public companieswater rights to CORFO, to be administrated for this entity.

The law project has to follow the constitutional procedures that consider new discussion in the hamber of Deputies and the Senate. The government can also insist in its rejected proposals.

Summing up, the third institutional reform is being aimed to ensure the sustainability of a business model that has proved successful in the Chilean sanitary sector. Going further to corporate and commercial public companies, the government is considering its privatization . However before that, the government wants to take all the measures to ensure that this new reform allows the country to have its entire urban population served by sound and efficient water and sanitation companies.

FEDERAL WATER POLLUTION CONTROL ACT

[As Amended Through P.L. 107–303, November 27, 2002]

FEDERAL WATER POLLUTION CONTROL ACT

(33 U.S.C. 1251 et seq.)

AN ACT To provide for water pollution control activities in the Public Health Service of the Federal Security Agency and in the Federal Works Agency, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

TITLE I—RESEARCH AND RELATED PROGRAMS

DECLARATION OF GOALS AND POLICY

SEC. 101. (a) The objective of this Act is to restore and maintain the chemical, physical, and biological integrity of the Nation's waters. In order to achieve this objective it is hereby declared that, consistent with the provisions of this Act—

(1) it is the national goal that the discharge of pollutants into the navigable waters be eliminated by 1985;

(2) it is the national goal that wherever attainable, an interim goal of water quality which provides for the protection and propagation of fish, shellfish, and wildlife and provides for recreation in and on the water be achieved by July 1, 1983;

(3) it is the national policy that the discharge of toxic pollutants in toxic amounts be prohibited;

(4) it is the national policy that Federal financial assistance be provided to construct publicly owned waste treatment works;

(5) it is the national policy that areawide treatment management planning processes be developed and implemented to assure adequate control of sources of pollutants in each State;

(6) it is the national policy that a major research and demonstration effort be made to develop technology necessary to eliminate the discharge of pollutants into the navigable waters, waters of the contiguous zone and the oceans; and

(7) it is the national policy that programs for the control of nonpoint sources of pollution be developed and implemented in an expeditious manner so as to enable the goals of this Act to be met through the control of both point and nonpoint sources of pollution.

(b) It is the policy of the Congress to recognize, preserve, and protect the primary responsibilities and rights of States to prevent, reduce, and eliminate pollution, to plan the development and use (including restoration, preservation, and enhancement) of land and water resources, and to consult with the Administrator in the exercise of his authority under this Act. It is the policy of Congress that the States manage the construction grant program under this Act and implement the permit programs under sections 402 and 404 of

this Act. It is further the policy of the Congress to support and aid research relating to the prevention, reduction, and elimination of pollution, and to provide Federal technical services and financial aid to State and interstate agencies and municipalities in connection with the prevention, reduction, and elimination of pollution.

(c) It is further the policy of Congress that the President, acting through the Secretary of State and such national and international organizations as he determines appropriate, shall take such action as may be necessary to insure that to the fullest extent possible all foreign countries shall take meaningful action for the prevention, reduction, and elimination of pollution in their waters and in international waters and for the achievement of goals regarding the elimination of discharge of pollutants and the improvement of water quality to at least the same extent as the United States does under its laws.

(d) Except as otherwise expressly provided in this Act, the Administrator of the Environmental Protection Agency (hereinafter in this Act called "Administrator") shall administer this Act.

(e) Public participation in the development, revision, and enforcement of any regulation, standard, effluent limitation, plan, or program established by the Administrator or any State under this Act shall be provided for, encouraged, and assisted by the Administrator and the States. The Administrator, in cooperation with the States, shall develop and publish regulations specifying minimum guidelines for public participation in such processes.

(f) It is the national policy that to the maximum extent possible the procedures utilized for implementing this Act shall encourage the drastic minimization of paperwork and interagency decision procedures, and the best use of available manpower and funds, so as to prevent needless duplication and unnecessary delays at all levels of government.

(g) It is the policy of Congress that the authority of each State to allocate quantities of water within its jurisdiction shall not be superseded, abrogated or otherwise impaired by this Act. It is the further policy of Congress that nothing in this Act shall be construed to supersede or abrogate rights to quantities of water which have been established by any State. Federal agencies shall co-operate with State and local agencies to develop comprehensive solutions to prevent, reduce and eliminate pollution in concert with programs for managing water resources.

(33 U.S.C. 1251)

COMPREHENSIVE PROGRAMS FOR WATER POLLUTION CONTROL

SEC. 102. (a) The Administrator shall, after careful investigation, and in cooperation with other Federal agencies, State water pollution control agencies, interstate agencies, and the municipalities and industries involved, prepare or develop comprehensive programs for preventing, reducing, or eliminating the pollution of the navigable waters and ground waters and improving the sanitary condition of surface and underground waters. In the development of such comprehensive programs due regard shall be given to the improvements which are necessary to conserve such waters for the protection and propagation of fish and aquatic life and wildlife, recreational purposes, and the withdrawal of such waters for public

water supply, agricultural, industrial, and other purposes. For the purpose of this section, the Administrator is authorized to make joint investigations with any such agencies of the condition of any waters in any State or States, and of the discharges of any sewage, industrial wastes, or substance which may adversely affect such waters.

(b)(1) In the survey or planning of any reservoir by the Corps of Engineers, Bureau of Reclamation, or other Federal agency, consideration shall be given to inclusion of storage for regulation of streamflow, except that any such storage and water releases shall not be provided as a substitute for adequate treatment or other methods of controlling waste at the source.

(2) The need for and the value of storage for regulation of streamflow (other than for water quality) including but not limited to navigation, salt water intrusion, recreation, esthetics, and fish and wildlife, shall be determined by the Corps of Engineers, Bureau of Reclamation, or other Federal agencies.

(3) The need for, the value of, and the impact of, storage for water quality control shall be determined by the Administrator, and his views on these matters shall be set forth in any report or presentation to Congress proposing authorization or construction of any reservoir including such storage.

(4) The value of such storage shall be taken into account in determining the economic value of the entire project of which it is a part, and costs shall be allocated to the purpose of regulation of streamflow in a manner which will insure that all project purposes, share equitable in the benefits of multiple-purpose construction.

(5) Costs of regulation of streamflow features incorporated in any Federal reservoir or other impoundment under the provisions of this Act shall be determined and the beneficiaries identified and if the benefits are widespread or national in scope, the costs of such features shall be nonreimbursable.

(6) No license granted by the Federal Power Commission for a hydroelectric power project shall include storage for regulation of streamflow for the purpose of water quality control unless the Administrator shall recommend its inclusion and such reservoir storage capacity shall not exceed such proportion of the total storage required for the water quality control plan as the drainage area of such reservoir bears to the drainage area of the river basin or basins involved in such water quality control plan.

(c)(1) The Administrator shall, at the request of the Governor of a State, or a majority of the Governors when more than one State is involved make a grant to pay not to exceed 50 per centum of the administrative expenses of a planning agency for a period not to exceed three years, which period shall begin after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, if such agency provides for adequate representation of appropriate State, interstate, local, or (when appropriate) international interests in the basin or portion thereof involved and is capable of developing an effective, comprehensive water quality control plan for a basin or portion thereof.

(2) Each planning agency receiving a grant under this subsection shall develop a comprehensive pollution control plan for the basin or portion thereof which—

(A) is consistent with any applicable water quality standards, effluent and other limitations, and thermal discharge regulations established pursuant to current law within the basin;

(B) recommends such treatment works as will provide the most effective and economical means of collection, storage, treatment, and elimination of pollutants and recommends means to encourage both municipal and industrial use of such works;

(C) recommends maintenance and improvement of water quality within the basin or portion thereof and recommends methods of adequately financing those facilities as may be necessary to implement the plan; and

(D) as appropriate, is developed in cooperation with, and is consistent with any comprehensive plan prepared by the Water Resources Council, any areawide waste management plans developed pursuant to section 208 of this Act, and any State plan developed pursuant to section 303(e) of this Act.

(3) For the purposes of this subsection the term "basin" includes, but is not limited to, rivers and their tributaries, streams, coastal waters, sounds, estuaries, bays, lakes, and portions thereof, as well as the lands drained thereby.

(d) [Repealed by section 2021(a) of Public Law 104–66 (109 Stat. 726).]

(33 U.S.C. 1252)

INTERSTATE COOPERATION AND UNIFORM LAWS

SEC. 103. (a) The Administrator shall encourage cooperative activities by the States for the prevention, reduction, and elimination of pollution, encourage the enactment of improved and, so far as practicable, uniform State laws relating to the prevention, reduction, and elimination of pollution; and encourage compacts between States for the prevention and control of pollution.

(b) The consent of the Congress is hereby given to two or more States to negotiate and enter into agreements or compacts, not in conflict with any law or treaty of the United States, for (1) cooperative effort and mutual assistance for the prevention and control of pollution and the enforcement of their respective laws relating thereto, and (2) the establishment of such agencies, joint or otherwise, as they may deem desirable for making effective such agreements and compacts. No such agreement or compact shall be binding or obligatory upon any State a party thereto unless and until it has been approved by the Congress.

(33 U.S.C. 1253)

RESEARCH, INVESTIGATIONS, TRAINING, AND INFORMATION

SEC. 104. (a) The Administrator shall establish national programs for the prevention, reduction, and elimination of pollution and as part of such programs shall—

(1) in cooperation with other Federal, State, and local agencies, conduct and promote the coordination and acceleration of, research, investigations, experiments, training, demonstrations, surveys, and studies relating to the causes, effects, extent, prevention, reduction, and elimination of pollution;

(2) encourage, cooperate with, and render technical services to pollution control agencies and other appropriate public or private agencies, institutions, and organizations, and individuals, including the general public, in the conduct of activities referred to in paragraph (1) of this subsection;

(3) conduct, in cooperation with State water pollution control agencies and other interested agencies, organizations and persons, public investigations concerning the pollution of any navigable waters, and report on the results of such investigations;

(4) establish advisory committees composed of recognized experts in various aspects of pollution and representatives of the public to assist in the examination and evaluation of research progress and proposals and to avoid duplication of research;

(5) in cooperation with the States, and their political subdivisions, and other Federal agencies establish, equip, and maintain a water quality surveillance system for the purpose of monitoring the quality of the navigable waters and ground waters and the contiguous zone and the oceans and the Administrator shall, to the extent practicable, conduct such surveillance by utilizing the resources of the National Aeronautics and Space Administration, the National Oceanic and Atmospheric Administration, the Geological Survey, and the Coast Guard, and shall report on such quality not later than 90 days after the date of convening of each session of Congress; and

(6) initiate and promote the coordination and acceleration of research designed to develop the most effective practicable tools and techniques for measuring the social and economic costs and benefits of activities which are subject to regulations under this Act; and shall transmit a report on the results of such research to the Congress not later than January 1, 1974.

(b) In carrying out the provisions of subsection (a) of this section the Administrator is authorized to—

(1) collect and make available, through publications and other appropriate means, the results of and other information, including appropriate recommendations by him in connection therewith, pertaining to such research and other activities referred to in paragraph (1) of subsection (a);

(2) cooperate with other Federal departments and agencies, State water pollution control agencies, interstate agencies, other public and private agencies, institutions, organizations, industries involved, and individuals, in the preparation and conduct of such research and other activities referred to in paragraph (1) of subsection (a);

(3) make grants to State water pollution control agencies, interstate agencies, other public or nonprofit private agencies, institutions, organizations, and individuals, for purposes stated in paragraph (1) of subsection (a) of this section;

(4) contract with public or private agencies, institutions, organizations, and individuals, without regard to sections 3648 and 3709 of the Revised Statutes (31 U.S.C. 529; 41 U.S.C. 5), referred to in paragraph (1) of subsection (a);

(5) establish and maintain research fellowships at public or nonprofit private educational institutions or research organizations;

(6) collect and disseminate, in cooperation with other Federal departments and agencies, and with other public or private agencies, institutions, and organizations having related responsibilities, basic data on chemical, physical, and biological effects of varying water quality and other information pertaining to pollution and the prevention, reduction, and elimination thereof; and

(7) develop effective and practical processes, methods, and prototype devices for the prevention, reduction, and elimination of pollution.

(c) In carrying out the provisions of subsection (a) of this section the Administrator shall conduct research on, and survey the results of other scientific studies on, the harmful effects on the health or welfare of persons caused by pollutants. In order to avoid duplication of effort, the Administrator shall, to the extent practicable, conduct such research in cooperation with and through the facilities of the Secretary of Health, Education, and Welfare.

(d) In carrying out the provisions of this section the Administrator shall develop and demonstrate under varied conditions (including conducting such basic and applied research, studies, and experiments as may be necessary):

(1) Practicable means of treating municipal sewage, and other waterborne wastes to implement the requirements of section 201 of this Act;

(2) Improved methods and procedures to identify and measure the effects of pollutants, including those pollutants created by new technological developments; and

(3) Methods and procedures for evaluating the effects on water quality of augmented streamflows to control pollution not susceptible to other means of prevention, reduction, or elimination.

(e) The Administrator shall establish, equip, and maintain field laboratory and research facilities, including, but not limited to, one to be located in the northeastern area of the United States, one in the Middle Atlantic area, one in the southeastern area, one in the midwestern area, one in the southwestern area, one in the Pacific Northwest, and one in the State of Alaska, for the conduct of research, investigations, experiments, field demonstrations and studies, and training relating to the prevention, reduction and elimination of pollution. Insofar as practicable, each such facility shall be located near institutions of higher learning in which graduate training in such research might be carried out. In conjunction with the development of criteria under section 403 of this Act, the Administrator shall construct the facilities authorized for the National Marine Water Quality Laboratory established under this subsection.

(f) The Administrator shall conduct research and technical development work, and make studies, with respect to the quality of the waters of the Great Lakes, including an analysis of the present and projected future water quality of the Great Lakes under varying conditions of waste treatment and disposal, an evaluation of the water quality needs of those to be served by such waters, an

evaluation of municipal, industrial, and vessel waste treatment and disposal practices with respect to such waters, and a study of alternate means of solving pollution problems (including additional waste treatment measures) with respect to such waters.

(g)(1) For the purpose of providing an adequate supply of trained personnel to operate and maintain existing and future treatment works and related activities, and for the purpose of enhancing substantially the proficiency of those engaged in such activities, the Administrator shall finance pilot programs, in cooperation with State and interstate agencies, municipalities, educational institutions, and other organizations and individuals, of manpower development and training and retraining of persons in, on entering into, the field of operation and maintenance of treatment works and related activities. Such program and any funds expended for such a program shall supplement, not supplant, other manpower and training programs and funds available for the purposes of this paragraph. The Administrator is authorized, under such terms and conditions as he deems appropriate, to enter into agreements with one or more States, acting jointly or severally, or with other public or private agencies or institutions for the development and implementation of such a program.

(2) The Administrator is authorized to enter into agreements with public and private agencies and institutions, and individuals to develop and maintain an effective system for forecasting the supply of, and demand for, various professional and other occupational categories needed for the prevention, reduction, and elimination of pollution in each region, State, or area of the United States and, from time to time, to publish the results of such forecasts.

(3) In furtherance of the purposes of this Act, the Administrator is authorized to—

(A) make grants to public or private agencies and institutions and to individuals for training projects, and provide for the conduct of training by contract with public or private agencies and institutions and with individuals without regard to sections 3648 and 3709 of the Revised Statutes;

(B) establish and maintain research fellowships in the Environmental Protection Agency with such stipends and allowances, including traveling and subsistence expenses, as he may deem necessary to procure the assistance of the most promising research fellows; and

(C) provide, in addition to the program established under paragraph (1) of this subsection, training in technical matters relating to the causes, prevention, reduction, and elimination of pollution for personnel of public agencies and other persons with suitable qualifications.

(4) The Administrator shall submit, through the President, a report to the Congress not later than December 31, 1973, summarizing the actions taken under this subsection and the effectiveness of such actions, and setting forth the number of persons trained, the occupational categories for which training was provided, the effectiveness of other Federal, State, and local training programs in this field, together with estimates of future needs, recommendations on improving training programs, and such other information and recommendations, including legislative recommendations, as he deems appropriate.

(h) The Administrator is authorized to enter into contracts, with, or make grants to, public or private agencies and organizations and individuals for (A) the purpose of developing and demonstrating new or improved methods for the prevention, removal, reduction, and elimination of pollution in lakes, including the undesirable effects of nutrients and vegetation, and (B) the construction of publicly owned research facilities for such purpose.

(i) The Administrator, in cooperation with the Secretary of the department in which the Coast Guard is operating, shall—

(1) engage in such research, studies, experiments, and demonstrations as he deems appropriate, relative to the removal of oil from any waters and to the prevention, control, and elimination of oil and hazardous substances pollution;

(2) publish from time to time the results of such activities; and

(3) from time to time, develop and publish in the Federal Register specifications and other technical information on the various chemical compounds used in the control of oil and hazardous substances spills.

In carrying out this subsection, the Administrator may enter into contracts with, or make grants to, public or private agencies and organizations and individuals.

(j) The Secretary of the department in which the Coast Guard is operating shall engage in such research, studies, experiments, and demonstrations as he deems appropriate relative to equipment which is to be installed on board a vessel and is designed to receive, retain, treat, or discharge human body wastes and the wastes from toilets and other receptacles intended to receive or retain body wastes with particular emphasis on equipment to be installed on small recreational vessels. The Secretary of the department in which the Coast Guard is operating shall report to Congress the results of such research, studies, experiments, and demonstrations prior to the effective date of any regulations established under section 312 of this Act. In carrying out this subsection the Secretary of the department in which the Coast Guard is operating may enter into contracts with, or make grants to, public or private organizations and individuals.

(k) In carrying out the provisions of this section relating to the conduct by the Administrator of demonstration projects and the development of field laboratories and reseach facilities, the Administrator may acquire land and interests therein by purchase, with appropriated or donated funds, by donation, or by exchange for acquired or public lands under his jurisdiction which he classifies as suitable for disposition. The values of the properties so exchanged either shall be approximately equal, or if they are not approximately equal, the values shall be equalized by the payment of cash to the grantor or to the Administrator as the circumstances require.

(l)(1) The Administrator shall, after consultation with appropriate local, State, and Federal agencies, public and private organizations, and interested individuals, as soon as practicable but not later than January 1, 1973, develop and issue to the States for the purpose of carrying out this Act the latest scientific knowledge available in indicating the kind and extent of effects on health and welfare which may be expected from the presence of pesticides in

the water in varying quantities. He shall revise and add to such information whenever necessary to reflect developing scientific knowledge.

(2) The President shall, in consultation with appropriate local, State, and Federal agencies, public and private organizations, and interested individuals, conduct studies and investigations of methods to control the release of pesticides into the environment which study shall include examination of the persistency of pesticides in the water environment and alternative thereto. The President shall submit reports, from time to time, on such investigations to Congress together with his recommendations for any necessary legislation.

(m)(1) The Administrator shall, in an effort to prevent degradation of the environment from the disposal of waste oil, conduct a study of (A) the generation of used engine, machine, cooling, and similar waste oil, including quantities generated, the nature and quality of such oil, present collecting methods and disposal practices, and alternate uses of such oil; (B) the long-term, chronic biological effects of the disposal of such waste oil; and (C) the potential market for such oils, including the economic and legal factors relating to the sale of products made from such oils, the level of subsidy, if any, needed to encourage the purchase by public and private nonprofit agencies of products from such oil, and the practicability of Federal procurement, on a priority basis, of products made from such oil. In conducting such study, the Administrator shall consult with affected industries and other persons.

(2) The Administrator shall report the preliminary results of such study to Congress within six months after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, and shall submit a final report to Congress within 18 months after such date of enactment.

(n)(1) The Administrator shall, in cooperation with the Secretary of the Army, the Secretary of Agriculture, the Water Resources Council, and with other appropriate Federal, State, interstate, or local public bodies and private organizations, institutions, and individuals, conduct and promote, encourage contributions to, continuing comprehensive studies of the effects of pollution, including sedimentation, in the estuaries and estuarine zones of the United States on fish and wildlife, on sport and commercial fishing, on recreation, on water supply and water power, and on other beneficial purposes. Such studies shall also consider the effect of demographic trends, the exploitation of mineral resources and fossil fuels, land and industrial development, navigation, flood and erosion control, and other uses of estuaries and estuarine zones upon the pollution of the waters therein.

(2) In conducting such studies, the Administrator shall assemble, coordinate, and organize all existing pertinent information on the Nation's estuaries and estuarine zones; carry out a program of investigations and surveys to supplement existing information in representative estuaries and estuarine zones; and identify the problems and areas where further research and study are required.

(3) For the purpose of this subsection, the term "estuarine zones" means an environmental system consisting of an estuary and those transitional areas which are consistently influenced or affected by water from an estuary such as, but not limited to, salt

marshes, coastal and intertidal areas, bays, harbors, lagoons, inshore waters, and channels, and the term "estuary" means all or part of the mouth of a river or stream or other body of water having unimpaired natural connection with open sea and within which the sea water is measurably diluted with fresh water derived from land drainage.

(o)(1) The Administrator shall conduct research and investigations on devices, systems, incentives, pricing policy, and other methods of reducing the total flow of sewage, including, but not limited to, unnecessary water consumption in order to reduce the requirements for, and the costs of, sewage and waste treatment services. Such research and investigations shall be directed to develop devices, systems, policies, and methods capable of achieving the maximum reduction of unnecessary water consumption.

(2) The Administrator shall report the preliminary results of such studies and investigations to the Congress within one year after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, and annually thereafter not later than 90 days after the date of convening of each session of Congress. Such report shall include recommendations for any legislation that may be required to provide for the adoption and use of devices, systems, policies, or other methods of reducing water consumption and reducing the total flow of sewage. Such report shall include an estimate of the benefits to be derived from adoption and use of such devices, systems, policies, or other methods and also shall reflect estimates of any increase in private, public, or other cost that would be occasioned thereby.

(p) In carrying out the provisions of subsection (a) of this section the Administrator shall, in cooperation with the Secretary of Agriculture, other Federal agencies, and the States, carry out a comprehensive study and research program to determine new and improved methods and the better application of existing methods of preventing, reducing, and eliminating pollution from agriculture, including the legal, economic, and other implications of the use of such methods.

(q)(1) The Administrator shall conduct a comprehensive program of research and investigation and pilot project implementation into new and improved methods of preventing, reducing, storing, collecting, treating, or otherwise eliminating pollution from sewage in rural and other areas where collection of sewage in conventional, community-wide sewage collection systems is impractical, uneconomical, or otherwise infeasible, or where soil conditions or other factors preclude the use of septic tank and drainage field systems.

(2) The Administrator shall conduct a comprehensive program of research and investigation and pilot project implementation into new and improved methods for the collection and treatment of sewage and other liquid wastes combined with the treatment and disposal of solid wastes.

(3) The Administrator shall establish, either within the Environmental Protection Agency, or through contract with an appropriate public or private non-profit organization, a national clearinghouse which shall (A) receive reports and information resulting from research, demonstrations, and other projects funded under this Act related to paragraph (1) of this subsection and to sub-

section (e)(2) of section 105; (B) coordinate and disseminate such reports and information for use by Federal and State agencies, municipalities, institutions, and persons in developing new and improved methods pursuant to this subsection; and (C) provide for the collection and dissemination of reports and information relevant to this subsection from other Federal and State agencies, institutions, universities, and persons.

(4) SMALL FLOWS CLEARINGHOUSE.—Notwithstanding section 205(d) of this Act, from amounts that are set aside for a fiscal year under section 205(i) of this Act and are not obligated by the end of the 24-month period of availability for such amounts under section 205(d), the Administrator shall make available $1,000,000 or such unobligated amount, whichever is less, to support a national clearinghouse within the Environmental Protection Agency to collect and disseminate information on small flows of sewage and innovative or alternative wastewater treatment processes and techniques, consistent with paragraph (3). This paragraph shall apply with respect to amounts set aside under section 205(i) for which the 24-month period of availability referred to in the preceding sentence ends on or after September 30, 1986.

(r) The Administrator is authorized to make grants to colleges and universities to conduct basic research into the structure and function of fresh water aquatic ecosystems, and to improve understanding of the ecological characteristics necessary to the maintenance of the chemical, physical, and biological integrity of freshwater aquatic ecosystems.

(s) The Administrator is authorized to make grants to one or more institutions of higher education (regionally located and to be designated as "River Study Centers") for the purpose of conducting and reporting on interdisciplinary studies on the nature of river systems, including hydrology, biology, ecology, economics, the relationship between river uses and land uses, and the effects of development within river basins on river systems and on the value of water resources and water related activities. No such grant in any fiscal year shall exceed $1,000,000.

(t) The Administrator shall, in cooperation with State and Federal agencies and public and private organizations, conduct continuing comprehensive studies of the effects and methods of control of thermal discharges. In evaluating alternative methods of control the studies shall consider (1) such data as are available on the latest available technology, economic feasibility including cost-effectiveness analysis, and (2) the total impact on the environment, considering not only water quality but also air quality, land use, and effective utilization and conservation of fresh water and other natural resources. Such studies shall consider methods of minimizing adverse effects and maximizing beneficial effects of thermal discharges. The results of these studies shall be reported by the Administrator as soon as practicable, but not later than 270 days after enactment of this subsection, and shall be made available to the public and the States, and considered as they become available by the Administrator in carrying out section 316 of this Act and by the State in proposing thermal water quality standards.

(u) There is authorized to be appropriated (1) not to exceed $100,000,000 per fiscal year for the fiscal year ending June 30,

1973, the fiscal year ending June 30, 1974, and the fiscal year ending June 30, 1975, not to exceed $14,039,000 for the fiscal year ending September 30, 1980, not to exceed $20,697,000 for the fiscal year ending September 30, 1981, not to exceed $22,770,000 for the fiscal year ending September 30, 1982, such sums as may be necessary for fiscal years 1983 through 1985, and not to exceed $22,770,000 per fiscal year for each of the fiscal years 1986 through 1990, for carrying out the provisions of this section, other than subsections (g)(1) and (2), (p), (r), and (t), except that such authorizations are not for any research, development, or demonstration activity pursuant to such provisions; (2) not to exceed $7,500,000 for fiscal years 1973, 1974, and 1975, $2,000,000 for fiscal year 1977, $3,000,000 for fiscal year 1978, $3,000,000 for fiscal year 1979, $3,000,000 for fiscal year 1980, $3,000,000 for fiscal year 1981, $3,000,000 for fiscal year 1982, such sums as may be necessary for fiscal years 1983 through 1985, and $3,000,000 per fiscal year for each of the fiscal years 1986 through 1990, for carrying out the provisions of subsection (g)(1); (3) not to exceed $2,500,000 for fiscal years 1973, 1974, and 1975, $1,000,000 for fiscal year 1977, $1,500,000 for fiscal year 1978, $1,500,000 for fiscal year 1979, $1,500,000 for fiscal year 1980, $1,500,000 for fiscal year 1981, $1,500,000 for fiscal year 1982, such sums as may be necessary for fiscal years 1983 through 1985, and $1,500,000 per fiscal year for each of the fiscal years 1986 through 1990, for carrying out the provisions of subsection (g)(2); (4) not to exceed $10,000,000 for each of the fiscal years ending June 30, 1973, June 30, 1974, and June 30, 1975, for carrying out the provisions of subsection (p); (5) not to exceed $15,000,000 per fiscal year for the fiscal years ending June 30, 1973, June 30, 1974, and June 30, 1975, for carrying out the provisions of subsection (r); and (6) not to exceed $10,000,000 per fiscal year for the fiscal years ending June 30, 1973, June 30, 1974, and June 30, 1975, for carrying out the provisions of subsection (t).

(v) STUDIES CONCERNING PATHOGEN INDICATORS IN COASTAL RECREATION WATERS.—Not later than 18 months after the date of the enactment of this subsection, after consultation and in cooperation with appropriate Federal, State, tribal, and local officials (including local health officials), the Administrator shall initiate, and, not later than 3 years after the date of the enactment of this subsection, shall complete, in cooperation with the heads of other Federal agencies, studies to provide additional information for use in developing—

(1) an assessment of potential human health risks resulting from exposure to pathogens in coastal recreation waters, including nongastrointestinal effects;

(2) appropriate and effective indicators for improving detection in a timely manner in coastal recreation waters of the presence of pathogens that are harmful to human health;

(3) appropriate, accurate, expeditious, and cost-effective methods (including predictive models) for detecting in a timely manner in coastal recreation waters the presence of pathogens that are harmful to human health; and

(4) guidance for State application of the criteria for pathogens and pathogen indicators to be published under section

304(a)(9) to account for the diversity of geographic and aquatic conditions.

(33 U.S.C. 1254)

GRANTS FOR RESEARCH AND DEVELOPMENT

SEC. 105. (a) The Administrator is authorized to conduct in the Environmental Protection Agency, and to make grants to any State, municipality, or intermunicipal or interstate agency for the purpose of assisting in the development of—

(1) any project which will demonstrate a new or improved method of preventing, reducing, and eliminating the discharge into any waters of pollutants from sewers which carry storm water or both storm water and pollutants; or

(2) any project which will demonstrate advanced waste treatment and water purification methods (including the temporary use of new or improved chemical additives which provide substantial immediate improvement to existing treatment processes), or new or improved methods of joint treatment systems for municipal and industrial wastes;

and to include in such grants such amounts as are necessary for the purpose of reports, plans, and specifications in connection therewith.

(b) The Administrator is authorized to make grants to any State or States or interstate agency to demonstrate, in river basins or portions thereof, advanced treatment and environmental enhancement techniques to control pollution from all sources, within such basins or portions thereof, including nonpoint sources, together with in stream water quality improvement techniques.

(c) In order to carry out the purposes of section 301 of this Act, the Administrator is authorized to (1) conduct in the Environmental Protection Agency, (2) make grants to persons, and (3) enter into contracts with persons, for research and demonstration projects for prevention of pollution of any waters by industry including, but not limited to, the prevention, reduction, and elimination of the discharge of pollutants. No grant shall be made for any project under this subsection unless the Administrator determines that such project will develop or demonstrate a new or improved method of treating industrial wastes or otherwise prevent pollution by industry, which method shall have industrywide application.

(d) In carrying out the provisions of this section, the Administrator shall conduct, on a priority basis, an accelerated effort to develop, refine, and achieve practical application of:

(1) waste management methods applicable to point and nonpoint sources of pollutants to eliminate the discharge of pollutants, including, but not limited to, elimination of runoff of pollutants and the effects of pollutants from inplace or accumulated sources;

(2) advanced waste treatment methods applicable to point and nonpoint sources, including inplace or accumulated sources of pollutants, and methods for reclaiming and recycling water and confining pollutants so they will not migrate to cause water or other environmental pollution; and

(3) improved methods and procedures to identify and measure the effects of pollutants on the chemical, physical, and biological integrity of water, including those pollutants created by new technological developments.

(e)(1) The Administrator is authorized to (A) make, in consultation with the Secretary of Agriculture, grants to persons for research and demonstration projects with respect to new and improved methods of preventing, reducing, and eliminating pollution from agriculture, and (B) disseminate, in cooperation with the Secretary of Agriculture, such information obtained under this subsection, section 104(p), and section 304 as will encourage and enable the adoption of such methods in the agricultural industry.

(2) The Administrator is authorized, (A) in consultation with other interested Federal agencies, to make grants for demonstration projects with respect to new and improved methods of preventing, reducing, storing, collecting, treating, or otherwise eliminating pollution from sewage in rural and other areas where collection of sewage in conventional, community-wide sewage collection systems is impractical, uneconomical, or otherwise infeasible, or where soil conditions or other factors preclude the use of septic tank and drainage field systems, and (B) in cooperation with other interested Federal and State agencies, to disseminate such information obtained under this subsection as will encourage and enable the adoption of new and improved methods developed pursuant to this subsection.

(f) Federal grants under subsection (a) of this section shall be subject to the following limitations:

(1) No grant shall be made for any project unless such project shall have been approved by the appropriate State water pollution control agency or agencies and by the Administrator;

(2) No grant shall be made for any project in an amount exceeding 75 per centum of cost thereof as determined by the Administrator; and

(3) No grant shall be made for any project unless the Administrator determines that such project will serve as a useful demonstration for the purpose set forth in clause (1) or (2) of subsection (a).

(g) Federal grants under subsections (c) and (d) of this section shall not exceed 75 per centum of the cost of the project.

(h) For the purpose of this section there is authorized to be appropriated $75,000,000 per fiscal year for the fiscal year ending June 30, 1973, the fiscal year ending June 30, 1974, and the fiscal year ending June 30, 1975, and from such appropriations at least 10 per centum of the funds actually appropriated in each fiscal year shall be available only for the purposes of subsection (e).

(i) The Administrator is authorized to make grants to a municipality to assist in the costs of operating and maintaining a project which received a grant under this section, section 104, or section 113 of this Act prior to the date of enactment of this subsection so as to reduce the operation and maintenance costs borne by the recipients of services from such project to costs comparable to those for projects assisted under title II of this Act.

(j) The Administrator is authorized to make a grant to any grantee who received an increased grant pursuant to section

202(a)(2) of this Act. Such grant may pay up to 100 per centum of the costs of technical evaluation of the operation of the treatment works, costs of training of persons (other than employees of the grantee), and costs of disseminating technical information on the operation of the treatment works.

(33 U.S.C. 1255)

GRANTS FOR POLLUTION CONTROL PROGRAMS

SEC. 106. (a) There are hereby authorized to be appropriated the following sums, to remain available until expended, to carry out the purposes of this section—

(1) $60,000,000 for the fiscal year ending June 30, 1973; and

(2) $75,000,000 for the fiscal year ending June 30, 1974, and the fiscal year ending June 30, 1975, $100,000,000 per fiscal year for the fiscal years 1977, 1978, 1979, and 1980, $75,000,000 per fiscal year for the fiscal years 1981 and 1982, such sums as may be necessary for fiscal years 1983 through 1985, and $75,000,000 per fiscal year for each of the fiscal years 1986 through 1990;

for grants to States and to interstate agencies to assist them in administering programs for the prevention, reduction, and elimination of pollution, including enforcement directly or through appropriate State law enforcement officers or agencies.

(b) From the sums appropriated in any fiscal year, the Administrator shall make allotments to the several States and interstate agencies in accordance with regulations promulgated by him on the basis of the extent of the pollution problem in the respective States.

(c) The Administrator is authorized to pay to each State and interstate agency each fiscal year either—

(1) the allotment of such State or agency for such fiscal year under subsection (b), or

(2) the reasonable costs as determined by the Administrator of developing and carrying out a pollution program by such State or agency during such fiscal year,

whichever amount is the lesser.

(d) No grant shall be made under this section to any State or interstate agency for any fiscal year when the expenditure of non-Federal funds by such State or interstate agency during such fiscal year for the recurrent expenses of carrying out its pollution control program are less than the expenditure by such State or interstate agency of non-Federal funds for such recurrent program expenses during the fiscal year ending June 30, 1971.

(e) Beginning in fiscal year 1974 the Administrator shall not make any grant under this section to any State which has not provided or is not carrying out as a part of its program—

(1) the establishment and operation of appropriate devices, methods, systems, and procedures necessary to monitor, and to compile and analyze data on (including classification according to eutrophic condition), the quality of navigable waters and to the extent practicable, ground waters including biological monitoring; and provision for annually updating such data and including it in the report required under section 305 of this Act;

(2) authority comparable to that in section 504 of this Act and adequate contingency plans to implement such authority.

(f) Grants shall be made under this section on condition that—

(1) Such State (or interstate agency) filed with the Administrator within one hundred and twenty days after the date of enactment of this section:

(A) a summary report of the current status of the State pollution control program, including the criteria used by the State in determining priority of treatment works; and

(B) such additional information, data, and reports as the Administrator may require.

(2) No federally assumed enforcement as defined in section 309(a)(2) is in effect with respect to such State or interstate agency.

(3) Such State (or interstate agency) submits within one hundred and twenty days after the date of enactment of this section and before July 1 of each year thereafter for the Administrator's approval of its program for the prevention, reduction, and elimination of pollution in accordance with purposes and provisions of this Act in such form and content as the Administrator may prescribe.

(g) Any sums allotted under subsection (b) in any fiscal year which are not paid shall be reallotted by the Administrator in accordance with regulations promulgated by him.

(33 U.S.C. 1256)

MINE WATER POLLUTION CONTROL DEMONSTRATIONS

SEC. 107. (a) The Administrator in cooperation with the Appalachian Regional Commission and other Federal agencies is authorized to conduct, to make grants for, or to contract for, projects to demonstrate comprehensive approaches to the elimination or control of acid or other mine water pollution resulting from active or abandoned mining operations and other environmental pollution affecting water quality within all or part of a watershed or river basin, including siltation from surface mining. Such projects shall demonstrate the engineering and economic feasibility and practicality of various abatement techniques which will contribute substantially to effective and practical methods of acid or other mine water pollution elimination or control, and other pollution affecting water quality, including techniques that demonstrate the engineering and economic feasibility and practicality of using sewage sludge materials and other municipal wastes to diminish or prevent pollution affecting water quality from acid, sedimentation, or other pollutants and in such projects to restore affected lands to usefulness for forestry, agriculture, recreation, or other beneficial purposes.

(b) Prior to undertaking any demonstration project under this section in the Appalachian region (as defined in section 403 of the Appalachian Regional Development Act of 1965, as amended), the Appalachian Regional Commission shall determine that such demonstration project is consistent with the objectives of the Appalachian Regional Development Act of 1965, as amended.

(c) The Administrator, in selecting watersheds for the purposes of this section, shall be satisfied that the project area will not be

affected adversely by the influx of acid or other mine water pollution from nearby sources.

(d) Federal participation in such projects shall be subject to the conditions—

(1) that the State shall acquire any land or interests therein necessary for such project; and

(2) that the State shall provide legal and practical protection to the project area to insure against any activities which will cause future acid or other mine water pollution.

(e) There is authorized to be appropriated $30,000,000 to carry out the provisions of this section, which sum shall be available until expended.

(33 U.S.C. 1257)

POLLUTION CONTROL IN GREAT LAKES

SEC. 108. (a) The Administrator, in cooperation with other Federal departments, agencies, and instrumentalities is authorized to enter into agreements with any State, political subdivision, interstate agency, or other public agency, or combination thereof, to carry out one or more projects to demonstrate new methods and techniques and to develop preliminary plans for the elimination or control of pollution, within all or any part of the watersheds of the Great Lakes. Such projects shall demonstrate the engineering and economic feasibility and practicality of removal of pollutants and prevention of any polluting matter from entering into the Great Lakes in the future and other reduction and remedial techniques which will contribute substantially to effective and practical methods of pollution prevention, reduction, or elimination.

(b) Federal participation in such projects shall be subject to the condition that the State, political subdivision, interstate agency, or other public agency, or combination thereof, shall pay not less than 25 per centum of the actual project costs, which payment may be in any form, including, but not limited to, land or interests therein that is needed for the project, and personal property or services the value of which shall be determined by the Administrator.

(c) There is authorized to be appropriated $20,000,000 to carry out the provisions of subsections (a) and (b) of this section, which sum shall be available until expended.

(d)(1) In recognition of the serious conditions which exist in Lake Erie, the Secretary of the Army, acting through the Chief of Engineers, is directed to design and develop a demonstration waste water management program for the rehabilitation and environmental repair of Lake Erie. Prior to the initiation of detailed engineering and design, the program, along with the specific recommendations of the Chief of Engineers and recommendations for its financing, shall be submitted to the Congress for statutory approval. This authority is in addition to, and not in lieu of, other waste water studies aimed at eliminating pollution emanating from select sources around Lake Erie.

(2) This program is to be developed in cooperation with the Environmental Protection Agency, other interested departments, agencies, and instrumentalities of the Federal Government, and the States and their political subdivisions. This program shall set forth alternative systems for managing waste water on a regional

basis and shall provide local and State governments with a range of choice as to the type of system to be used for the treatment of waste water. These alternative systems shall include both advanced waste treatment technology and land disposal systems including aerated treatment-spray irrigation technology and will also include provisions for the disposal of solid wastes, including sludge. Such program should include measures to control point sources of pollution, area sources of pollution, including acid-mine drainage, urban runoff and rural runoff, and in place sources of pollution, including bottom loads, sludge banks, and polluted harbor dredgings.

(e) There is authorized to be appropriated $5,000,000 to carry out the provisions of subsection (d) of this section, which sum shall be available until expended.

(33 U.S.C. 1258)

TRAINING GRANTS AND CONTRACTS

SEC. 109. (a) The Administrator is authorized to make grants to or contracts with institutions of higher education, or combinations of such institutions, to assist them in planning, developing, strengthening, improving, or carrying out programs or projects for the preparation of undergraduate students to enter an occupation which involves the design, operation, and maintenance of treatment works, and other facilities whose purpose is water quality control. Such grants or contracts may include payment of all or part of the cost of programs or projects such as—

(A) planning for the development or expansion of programs or projects for training persons in the operation and maintenance of treatment works;

(B) training and retraining of faculty members;

(C) conduct of short-term or regular session institutes for study by persons engaged in, or preparing to engage in, the preparation of students preparing to enter an occupation involving the operation and maintenance of treatment works;

(D) carrying out innovative and experimental programs of cooperative education involving alternate periods of full-time or part-time academic study at the institution and periods of full-time or part-time employment involving the operation and maintenance of treatment works; and

(E) research into, and development of, methods of training students or faculty, including the preparation of teaching materials and the planning of curriculum.

(b)(1) The Administrator may pay 100 per centum of any additional cost of construction of treatment works required for a facility to train and upgrade waste treatment works operation and maintenance personnel and for the costs of other State treatment works operator training programs, including mobile training units, classroom rental, specialized instructors, and instructional material.

(2) The Administrator shall make no more than one grant for such additional construction in any State (to serve a group of States, where, in his judgment, efficient training programs require multi-State programs), and shall make such grant after consultation with and approval by the State or States on the basis of (A) the suitability of such facility for training operation and maintenance personnel for treatment works throughout such State or

States; and (B) a commitment by the State agency or agencies to carry out at such facility a program of training approved by the Administrator. In any case where a grant is made to serve two or more States, the Administrator is authorized to make an additional grant for a supplemental facility in each such State.

(3) The Administrator may make such grant out of the sums allocated to a State under section 205 of this Act, except that in no event shall the Federal cost of any such training facilities exceed $500,000.

(4) The Administrator may exempt a grant under this section from any requirement under section 204(a)(3) of this Act. Any grantee who received a grant under this section prior to enactment of the Clean Water Act of 1977 shall be eligible to have its grant increased by funds made available under such Act.

(33 U.S.C. 1259)

APPLICATION FOR TRAINING GRANT OR CONTRACT; ALLOCATION OF GRANTS OR CONTRACTS

SEC. 110. (1) A grant or contract authorized by section 109 may be made only upon application to the Administrator at such time or times and containing such information as he may prescribe, except that no such application shall be approved unless it—

(A) sets forth programs, activities, research, or development for which a grant is authorized under section 109 and describes the relation to any program set forth by the applicant in an application, if any, submitted pursuant to section 111;

(B) provides such fiscal control and fund accounting procedures as may be necessary to assure proper disbursement of and accounting for Federal funds paid to the applicant under this section; and

(C) provides for making such reports, in such form and containing such information, as the Administrator may require to carry out his functions under this section, and for keeping such records and for affording such access thereto as the Administrator may find necessary to assure the correctness and verification of such reports.

(2) The Administrator shall allocate grants or contracts under section 109 in such manner as will most nearly provide an equitable distribution of the grants or contracts throughout the United States among institutions of higher education which show promise of being able to use funds effectively for the purpose of this section.

(3)(A) Payments under this section may be used in accordance with regulations of the Administrator, and subject to the terms and conditions set forth in an application approved under paragraph (1), to pay part of the compensation of students employed in connection with the operation and maintenance of treatment works, other than as an employee in connection with the operation and maintenance of treatment works or as an employee in any branch of the Government of the United States, as part of a program for which a grant has been approved pursuant to this section.

(B) Departments and agencies of the United States are encouraged, to the extent consistent with efficient Administration, to enter into arrangements with institutions of higher education for the full-time, part-time, or temporary employment, whether in the

competitive or excepted service, of students enrolled in programs set forth in applications approved under paragraph (1).

(33 U.S.C. 1260)

AWARD OF SCHOLARSHIPS

SEC. 111. (1) The Administrator is authorized to award scholarships in accordance with the provisions of this section for undergraduate study by persons who plan to enter an occupation involving the operation and maintenance of treatment works. Such scholarships shall be awarded for such periods as the Administrator may determine but not to exceed four academic years.

(2) The Administrator shall allocate scholarships under this section among institutions of higher education with programs approved under the provisions of this section for the use of individuals accepted into such programs, in such manner and accordance to such plan as will insofar as practicable—

(A) provide an equitable distribution of such scholarships throughout the United States; and

(B) attract recent graduates of secondary schools to enter an occupation involving the operation and maintenance of treatment works.

(3) The Administrator shall approve a program of any institution of higher education for the purposes of this section only upon application by the institution and only upon his finding—

(A) that such program has as a principal objective the education and training of persons in the operation and maintenance of treatment works;

(B) that such program is in effect and of high quality, or can be readily put into effect and may reasonably be expected to be of high quality;

(C) that the application describes the relation of such program to any program, activity, research, or development set forth by the applicant in an application, if any, submitted pursuant to section 110 of this Act; and

(D) that the application contains satisfactory assurances that (i) the institution will recommend to the Administrator for the award of scholarships under this section, for study in such program, only persons who have demonstrated to the satisfaction of the institution a serious intent, upon completing the program, to enter an occupation involving the operation and maintenance of treatment works, and (ii) the institution will make reasonable continuing efforts to encourage recipients of scholarships under this section, enrolled in such program, to enter occupations involving the operation and maintenance of treatment works upon completing the program.

(4)(A) The Administrator shall pay to persons awarded scholarships under this section such stipends (including such allowances for subsistence and other expenses for such persons and their dependents) as he may determine to be consistent with prevailing practices under comparable federally supported programs.

(B) The Administrator shall (in addition to the stipends paid to persons under paragraph (1)) pay to the institution of higher education at which such person is pursuing his course of study

such amount as he may determine to be consistent with prevailing practices under comparable federally supported programs.

(5) A person awarded a scholarship under the provisions of this section shall continue to receive the payments provided in this section only during such periods as the Administrator finds that he is maintaining satisfactory proficiency and devoting full time to study or research in the field in which such scholarship was awarded in an institution of higher education, and is not engaging in gainful employment other than employment approved by the Administrator by or pursuant to regulation.

(6) The Administrator shall by regulation provide that any person awarded a scholarship under this section shall agree in writing to enter and remain in an occupation involving the design, operation, or maintenance of treatment works for such period after completion of his course of studies as the Administrator determines appropriate.

(33 U.S.C. 1261)

DEFINITIONS AND AUTHORIZATIONS

SEC. 112. (a) As used in sections 109 through 112 of this Act—

(1) The term "institution of higher education" means an educational institution described in the first sentence of section 101 of the Higher Education Act of 1965 (other than an institution of any agency of the United States) which is accredited by a nationally recognized accrediting agency or association approved by the Administrator for this purpose. For purposes of this subsection, the Administrator shall publish a list of nationally recognized accrediting agencies or associations which he determines to be reliable authority as to the quality of training offered.

(2) The term "academic year" means an academic year or its equivalent, as determined by the Administrator.

(b) The Administrator shall annually report his activities under sections 109 through 112 of this Act, including recommendations for needed revisions in the provisions thereof.

(c) There are authorized to be appropriated $25,000,000 per fiscal year for fiscal years ending June 30, 1973, June 30, 1974, and June 30, 1975, $6,000,000 for the fiscal year ending September 30, 1977, $7,000,000 for the fiscal year ending September 30, 1978, $7,000,000 for the fiscal year ending September 30, 1979, $7,000,000 for the fiscal year ending September 30, 1980, $7,000,000 for the fiscal year ending September 30, 1981, $7,000,000 for the fiscal year ending September 30, 1982, such sums as may be necessary for fiscal years 1983 through 1985, and $7,000,000 per fiscal year for each of the fiscal years 1986 through 1990, to carry out sections 109 through 112 of this Act.

(33 U.S.C. 1262)

ALASKA VILLAGE DEMONSTRATION PROJECTS

SEC. 113. (a) The Administrator is authorized to enter into agreements with the State of Alaska to carry out one or more projects to demonstrate methods to provide for central community facilities for safe water and elimination or control of pollution in those native villages of Alaska without such facilities. Such project

shall include provisions for community safe water supply systems, toilets, bathing and laundry facilities, sewage disposal facilities, and other similar facilities, and educational and informational facilities and programs relating to health and hygiene. Such demonstration projects shall be for the further purpose of developing preliminary plans for providing such safe water and such elimination or control of pollution for all native villages in such State.

(b) In carrying out this section the Administrator shall cooperate with the Secretary of Health, Education, and Welfare for the purpose of utilizing such of the personnel and facilities of that Department as may be appropriate.

(c) The Administrator shall report to Congress not later than July 1, 1973, the results of the demonstration projects authorized by this section together with his recommendations, including and necessary legislation, relating to the establishment of a statewide program.

(d) There is authorized to be appropriated not to exceed $2,000,000 to carry out this section. In addition, there is authorized to be appropriated to carry out this section not to exceed $200,000 for the fiscal year ending September 30, 1978, and $220,000 for the fiscal year ending September 30, 1979.

(e) The Administrator is authorized to coordinate with the Secretary of the Department of Health, Education, and Welfare, the Secretary of the Department of Housing and Urban Development, the Secretary of the Department of the Interior, the Secretary of the Department of Agriculture, and the heads of any other departments or agencies he may deem appropriate to conduct a joint study with representatives of the State of Alaska and the appropriate Native organizations (as defined in Public Law 92–203) to develop a comprehensive program for achieving adequate sanitation services in Alaska villages. This study shall be coordinated with the programs and projects authorized by sections 104(q) and 105(e)(2) of this Act. The Administrator shall submit a report of the results of the study, together with appropriate supporting data and such recommendations as he deems desirable, to the Committee on Environment and Public Works of the Senate and to the Committee on Public Works and Transportation of the House of Representatives not later than December 31, 1979. The Administrator shall also submit recommended administrative actions, procedures, and any proposed legislation necessary to implement the recommendations of the study no later than June 30, 1980.

(f) The Administrator is authorized to provide technical, financial and management assistance for operation and maintenance of the demonstration projects constructed under this section, until such time as the recommendations of subsection (e) are implemented.

(g) For the purpose of this section, the term "village" shall mean an incorporated or unincorporated community with a population of ten to six hundred people living within a two-mile radius. The term "sanitation services" shall mean water supply, sewage disposal, solid waste disposal and other services necessary to maintain generally accepted standards of personal hygiene and public health.

(33 U.S.C. 1263)

LAKE TAHOE STUDY

SEC. 114. (a) The Administrator, in consultation with the Tahoe Regional Planning Agency, the Secretary of Agriculture, other Federal agencies, representatives of State and local governments, and members of the public, shall conduct a thorough and complete study on the adequacy of and need for extending Federal oversight and control in order to preserve the fragile ecology of Lake Tahoe.

(b) Such study shall include an examination of the interrelationships and responsibilities of the various agencies of the Federal Government and State and local governments with a view to establishing the necessity for redefinition of legal and other arrangements between these various governments, and making specific legislative recommendations to Congress. Such study shall consider the effect of various actions in terms of their environmental impact on the Tahoe Basin, treated as an ecosystem.

(c) The Administrator shall report on such study to Congress not later than one year after the date of enactment of this subsection.

(d) There is authorized to be appropriated to carry out this section not to exceed $500,000.

(33 U.S.C. 1264)

IN-PLACE TOXIC POLLUTANTS

SEC. 115. The Administrator is directed to identify the location of in-place pollutants with emphasis on toxic pollutants in harbors and navigable waterways and is authorized, acting through the Secretary of the Army, to make contracts for the removal and appropriate disposal of such materials from critical port and harbor areas. There is authorized to be appropriated $15,000,000 to carry out the provisions of this section, which sum shall be available until expended.

(33 U.S.C. 1265)

HUDSON RIVER PCB RECLAMATION DEMONSTRATION PROJECT

SEC. 116. (a) The Administrator is authorized to enter into contracts and other agreements with the State of New York to carry out a project to demonstrate methods for the selective removal of polychlorinated biphenyls contaminating bottom sediments of the Hudson River, treating such sediments as required, burying such sediments in secure landfills, and installing monitoring systems for such landfills. Such demonstration project shall be for the purpose of determining the feasibility of indefinite storage in secure landfills of toxic substances and of ascertaining the improvement of the rate of recovery of a toxic contaminated national waterway. No pollutants removed pursuant to this paragraph shall be placed in any landfill unless the Administrator first determines that disposal of the pollutants in such landfill would provide a higher standard of protection of the public health, safety, and welfare than disposal of such pollutants by any other method including, but not limited to, incineration or a chemical destruction process.

(b) The Administrator is authorized to make grants to the State of New York to carry out this section from funds allotted to

such State under section 205(a) of this Act, except that the amount of any such grant shall be equal to 75 per centum of the cost of the project and such grant shall be made on condition that non-Federal sources provide the remainder of the cost of such project. The authority of this section shall be available until September 30, 1983. Funds allotted to the State of New York under section 205(a) shall be available under this subsection only to the extent that funds are not available, as determined by the Administrator, to the State of New York for the work authorized by this section under section 115 or 311 of this Act or a comprehensive hazardous substance response and clean up fund. Any funds used under the authority of this subsection shall be deducted from any estimate of the needs of the State of New York prepared under section 516. The Administrator may not obligate or expend more than $20,000,000 to carry out this section.

(33 U.S.C. 1266)

SEC. 117. CHESAPEAKE BAY.

(a) DEFINITIONS.—In this section, the following definitions apply:

(1) ADMINISTRATIVE COST.—The term "administrative cost" means the cost of salaries and fringe benefits incurred in administering a grant under this section.

(2) CHESAPEAKE BAY AGREEMENT.—The term "Chesapeake Bay Agreement" means the formal, voluntary agreements executed to achieve the goal of restoring and protecting the Chesapeake Bay ecosystem and the living resources of the Chesapeake Bay ecosystem and signed by the Chesapeake Executive Council.

(3) CHESAPEAKE BAY ECOSYSTEM.—The term "Chesapeake Bay ecosystem" means the ecosystem of the Chesapeake Bay and its watershed.

(4) CHESAPEAKE BAY PROGRAM.—The term "Chesapeake Bay Program" means the program directed by the Chesapeake Executive Council in accordance with the Chesapeake Bay Agreement.

(5) CHESAPEAKE EXECUTIVE COUNCIL.—The term "Chesapeake Executive Council" means the signatories to the Chesapeake Bay Agreement.

(6) SIGNATORY JURISDICTION.—The term "signatory jurisdiction" means a jurisdiction of a signatory to the Chesapeake Bay Agreement.

(b) CONTINUATION OF CHESAPEAKE BAY PROGRAM.—

(1) IN GENERAL.—In cooperation with the Chesapeake Executive Council (and as a member of the Council), the Administrator shall continue the Chesapeake Bay Program.

(2) PROGRAM OFFICE.—

(A) IN GENERAL.—The Administrator shall maintain in the Environmental Protection Agency a Chesapeake Bay Program Office.

(B) FUNCTION.—The Chesapeake Bay Program Office shall provide support to the Chesapeake Executive Council by—

(i) implementing and coordinating science, research, modeling, support services, monitoring, data

collection, and other activities that support the Chesapeake Bay Program;

(ii) developing and making available, through publications, technical assistance, and other appropriate means, information pertaining to the environmental quality and living resources of the Chesapeake Bay ecosystem;

(iii) in cooperation with appropriate Federal, State, and local authorities, assisting the signatories to the Chesapeake Bay Agreement in developing and implementing specific action plans to carry out the responsibilities of the signatories to the Chesapeake Bay Agreement;

(iv) coordinating the actions of the Environmental Protection Agency with the actions of the appropriate officials of other Federal agencies and State and local authorities in developing strategies to—

(I) improve the water quality and living resources in the Chesapeake Bay ecosystem; and

(II) obtain the support of the appropriate officials of the agencies and authorities in achieving the objectives of the Chesapeake Bay Agreement; and

(v) implementing outreach programs for public information, education, and participation to foster stewardship of the resources of the Chesapeake Bay.

(c) INTERAGENCY AGREEMENTS.—The Administrator may enter into an interagency agreement with a Federal agency to carry out this section.

(d) TECHNICAL ASSISTANCE AND ASSISTANCE GRANTS.—

(1) IN GENERAL.—In cooperation with the Chesapeake Executive Council, the Administrator may provide technical assistance, and assistance grants, to nonprofit organizations, State and local governments, colleges, universities, and interstate agencies to carry out this section, subject to such terms and conditions as the Administrator considers appropriate.

(2) FEDERAL SHARE.—

(A) IN GENERAL.—Except as provided in subparagraph (B), the Federal share of an assistance grant provided under paragraph (1) shall be determined by the Administrator in accordance with guidance issued by the Administrator.

(B) SMALL WATERSHED GRANTS PROGRAM.—The Federal share of an assistance grant provided under paragraph (1) to carry out an implementing activity under subsection (g)(2) shall not exceed 75 percent of eligible project costs, as determined by the Administrator.

(3) NON-FEDERAL SHARE.—An assistance grant under paragraph (1) shall be provided on the condition that non-Federal sources provide the remainder of eligible project costs, as determined by the Administrator.

(4) ADMINISTRATIVE COSTS.—Administrative costs shall not exceed 10 percent of the annual grant award.

(e) IMPLEMENTATION AND MONITORING GRANTS.—

(1) IN GENERAL.—If a signatory jurisdiction has approved and committed to implement all or substantially all aspects of the Chesapeake Bay Agreement, on the request of the chief executive of the jurisdiction, the Administrator—

(A) shall make a grant to the jurisdiction for the purpose of implementing the management mechanisms established under the Chesapeake Bay Agreement, subject to such terms and conditions as the Administrator considers appropriate; and

(B) may make a grant to a signatory jurisdiction for the purpose of monitoring the Chesapeake Bay ecosystem.

(2) PROPOSALS.—

(A) IN GENERAL.—A signatory jurisdiction described in paragraph (1) may apply for a grant under this subsection for a fiscal year by submitting to the Administrator a comprehensive proposal to implement management mechanisms established under the Chesapeake Bay Agreement.

(B) CONTENTS.—A proposal under subparagraph (A) shall include—

(i) a description of proposed management mechanisms that the jurisdiction commits to take within a specified time period, such as reducing or preventing pollution in the Chesapeake Bay and its watershed or meeting applicable water quality standards or established goals and objectives under the Chesapeake Bay Agreement; and

(ii) the estimated cost of the actions proposed to be taken during the fiscal year.

(3) APPROVAL.—If the Administrator finds that the proposal is consistent with the Chesapeake Bay Agreement and the national goals established under section 101(a), the Administrator may approve the proposal for an award.

(4) FEDERAL SHARE.—The Federal share of a grant under this subsection shall not exceed 50 percent of the cost of implementing the management mechanisms during the fiscal year.

(5) NON-FEDERAL SHARE.—A grant under this subsection shall be made on the condition that non-Federal sources provide the remainder of the costs of implementing the management mechanisms during the fiscal year.

(6) ADMINISTRATIVE COSTS.—Administrative costs shall not exceed 10 percent of the annual grant award.

(7) REPORTING.—On or before October 1 of each fiscal year, the Administrator shall make available to the public a document that lists and describes, in the greatest practicable degree of detail—

(A) all projects and activities funded for the fiscal year;

(B) the goals and objectives of projects funded for the previous fiscal year; and

(C) the net benefits of projects funded for previous fiscal years.

(f) FEDERAL FACILITIES AND BUDGET COORDINATION.—

(1) SUBWATERSHED PLANNING AND RESTORATION.—A Federal agency that owns or operates a facility (as defined by the Administrator) within the Chesapeake Bay watershed shall

participate in regional and subwatershed planning and restoration programs.

(2) COMPLIANCE WITH AGREEMENT.—The head of each Federal agency that owns or occupies real property in the Chesapeake Bay watershed shall ensure that the property, and actions taken by the agency with respect to the property, comply with the Chesapeake Bay Agreement, the Federal Agencies Chesapeake Ecosystem Unified Plan, and any subsequent agreements and plans.

(3) BUDGET COORDINATION.—

(A) IN GENERAL.—As part of the annual budget submission of each Federal agency with projects or grants related to restoration, planning, monitoring, or scientific investigation of the Chesapeake Bay ecosystem, the head of the agency shall submit to the President a report that describes plans for the expenditure of the funds under this section.

(B) DISCLOSURE TO THE COUNCIL.—The head of each agency referred to in subparagraph (A) shall disclose the report under that subparagraph with the Chesapeake Executive Council as appropriate.

(g) CHESAPEAKE BAY PROGRAM.—

(1) MANAGEMENT STRATEGIES.—The Administrator, in coordination with other members of the Chesapeake Executive Council, shall ensure that management plans are developed and implementation is begun by signatories to the Chesapeake Bay Agreement to achieve and maintain—

(A) the nutrient goals of the Chesapeake Bay Agreement for the quantity of nitrogen and phosphorus entering the Chesapeake Bay and its watershed;

(B) the water quality requirements necessary to restore living resources in the Chesapeake Bay ecosystem;

(C) the Chesapeake Bay Basinwide Toxins Reduction and Prevention Strategy goal of reducing or eliminating the input of chemical contaminants from all controllable sources to levels that result in no toxic or bioaccumulative impact on the living resources of the Chesapeake Bay ecosystem or on human health;

(D) habitat restoration, protection, creation, and enhancement goals established by Chesapeake Bay Agreement signatories for wetlands, riparian forests, and other types of habitat associated with the Chesapeake Bay ecosystem; and

(E) the restoration, protection, creation, and enhancement goals established by the Chesapeake Bay Agreement signatories for living resources associated with the Chesapeake Bay ecosystem.

(2) SMALL WATERSHED GRANTS PROGRAM.—The Administrator, in cooperation with the Chesapeake Executive Council, shall—

(A) establish a small watershed grants program as part of the Chesapeake Bay Program; and

(B) offer technical assistance and assistance grants under subsection (d) to local governments and nonprofit or-

ganizations and individuals in the Chesapeake Bay region to implement—

(i) cooperative tributary basin strategies that address the water quality and living resource needs in the Chesapeake Bay ecosystem; and

(ii) locally based protection and restoration programs or projects within a watershed that complement the tributary basin strategies, including the creation, restoration, protection, or enhancement of habitat associated with the Chesapeake Bay ecosystem.

(h) STUDY OF CHESAPEAKE BAY PROGRAM.—

(1) IN GENERAL.—Not later than April 22, 2003, and every 5 years thereafter, the Administrator, in coordination with the Chesapeake Executive Council, shall complete a study and submit to Congress a comprehensive report on the results of the study.

(2) REQUIREMENTS.—The study and report shall—

(A) assess the state of the Chesapeake Bay ecosystem;

(B) compare the current state of the Chesapeake Bay ecosystem with its state in 1975, 1985, and 1995;

(C) assess the effectiveness of management strategies being implemented on the date of enactment of this section and the extent to which the priority needs are being met;

(D) make recommendations for the improved management of the Chesapeake Bay Program either by strengthening strategies being implemented on the date of enactment of this section or by adopting new strategies; and

(E) be presented in such a format as to be readily transferable to and usable by other watershed restoration programs.

(i) SPECIAL STUDY OF LIVING RESOURCE RESPONSE.—

(1) IN GENERAL.—Not later than 180 days after the date of enactment of this section, the Administrator shall commence a 5-year special study with full participation of the scientific community of the Chesapeake Bay to establish and expand understanding of the response of the living resources of the Chesapeake Bay ecosystem to improvements in water quality that have resulted from investments made through the Chesapeake Bay Program.

(2) REQUIREMENTS.—The study shall—

(A) determine the current status and trends of living resources, including grasses, benthos, phytoplankton, zooplankton, fish, and shellfish;

(B) establish to the extent practicable the rates of recovery of the living resources in response to improved water quality condition;

(C) evaluate and assess interactions of species, with particular attention to the impact of changes within and among trophic levels; and

(D) recommend management actions to optimize the return of a healthy and balanced ecosystem in response to improvements in the quality and character of the waters of the Chesapeake Bay.

(j) AUTHORIZATION OF APPROPRIATIONS.—There is authorized to be appropriated to carry out this section $40,000,000 for each of fis-

cal years 2001 through 2005. Such sums shall remain available until expended.

(33 U.S.C. 1267)

SEC. 118. GREAT LAKES.

(a) FINDINGS, PURPOSE, AND DEFINITIONS.—

(1) FINDINGS.—The Congress finds that—

(A) the Great Lakes are a valuable national resource, continuously serving the people of the United States and other nations as an important source of food, fresh water, recreation, beauty, and enjoyment;

(B) the United States should seek to attain the goals embodied in the Great Lakes Water Quality Agreement of 1978, as amended by the Water Quality Agreement of 1987 and any other agreements and amendments, with particular emphasis on goals related to toxic pollutants; and

(C) the Environmental Protection Agency should take the lead in the effort to meet those goals, working with other Federal agencies and State and local authorities.

(2) PURPOSE.—It is the purpose of this section to achieve the goals embodied in the Great Lakes Water Quality Agreement of 1978, as amended by the Water Quality Agreement of 1987 and any other agreements and amendments, through improved organization and definition of mission on the part of the Agency, funding of State grants for pollution control in the Great Lakes area, and improved accountability for implementation of such agreement.

(3) DEFINITIONS.—For purposes of this section, the term—

(A) "Agency" means the Environmental Protection Agency;

(B) "Great Lakes" means Lake Ontario, Lake Erie, Lake Huron (including Lake St. Clair), Lake Michigan, and Lake Superior, and the connecting channels (Saint Mary's River, Saint Clair River, Detroit River, Niagara River, and Saint Lawrence River to the Canadian Border);

(C) "Great Lakes System" means all the streams, rivers, lakes, and other bodies of water within the drainage basin of the Great Lakes;

(D) "Program Office" means the Great Lakes National Program Office established by this section;

(E) "Research Office" means the Great Lakes Research Office established by subsection (d);

(F) "area of concern" means a geographic area located within the Great Lakes, in which beneficial uses are impaired and which has been officially designated as such under Annex 2 of the Great Lakes Water Quality Agreement;

(G) "Great Lakes States" means the States of Illinois, Indiana, Michigan, Minnesota, New York, Ohio, Pennsylvania, and Wisconsin;

(H) "Great Lakes Water Quality Agreement" means the bilateral agreement, between the United States and Canada which was signed in 1978 and amended by the Protocol of 1987;

(I) "Lakewide Management Plan" means a written document which embodies a systematic and comprehensive ecosystem approach to restoring and protecting the beneficial uses of the open waters of each of the Great Lakes, in accordance with article VI and Annex 2 of the Great Lakes Water Quality Agreement; and

(J) "Remedial Action Plan" means a written document which embodies a systematic and comprehensive ecosystem approach to restoring and protecting the beneficial uses of areas of concern, in accordance with article VI and Annex 2 of the Great Lakes Water Quality Agreement.

(b) GREAT LAKES NATIONAL PROGRAM OFFICE.—The Great Lakes National Program Office (previously established by the Administrator) is hereby established within the Agency. The Program Office shall be headed by a Director who, by reason of management experience and technical expertise relating to the Great Lakes, is highly qualified to direct the development of programs and plans on a variety of Great Lakes issues. The Great Lakes National Program Office shall be located in a Great Lakes State.

(c) GREAT LAKES MANAGEMENT.—

(1) FUNCTIONS.—The Program Office shall—

(A) in cooperation with appropriate Federal, State, tribal, and international agencies, and in accordance with section 101(e) of this Act, develop and implement specific action plans to carry out the responsibilities of the United States under the Great Lakes Water Quality Agreement of 1978, as amended by the Water Quality Agreement of 1987 and any other agreements and amendments,;[1]

(B) establish a Great Lakes system-wide surveillance network to monitor the water quality of the Great Lakes, with specific emphasis on the monitoring of toxic pollutants;

(C) serve as the liaison with, and provide information to, the Canadian members of the International Joint Commission and the Canadian counterpart to the Agency;

(D) coordinate actions of the Agency (including actions by headquarters and regional offices thereof) aimed at improving Great Lakes water quality; and

(E) coordinate actions of the Agency with the actions of other Federal agencies and State and local authorities, so as to ensure the input of those agencies and authorities in developing water quality strategies and obtain the support of those agencies and authorities in achieving the objectives of such agreement.

(2) GREAT LAKES WATER QUALITY GUIDANCE.—

(A) By June 30, 1991, the Administrator, after consultation with the Program Office, shall publish in the Federal Register for public notice and comment proposed water quality guidance for the Great Lakes System. Such guidance shall conform with the objectives and provisions of the Great Lakes Water Quality Agreement, shall be no less restrictive than the provisions of this Act and national water quality criteria and guidance, shall specify numer-

[1] See P.L. 100–688, section 1008.

ical limits on pollutants in ambient Great Lakes waters to protect human health, aquatic life, and wildlife, and shall provide guidance to the Great Lakes States on minimum water quality standards, antidegradation policies, and implementation procedures for the Great Lakes System.

(B) By June 30, 1992, the Administrator, in consultation with the Program Office, shall publish in the Federal Register, pursuant to this section and the Administrator's authority under this chapter, final water quality guidance for the Great Lakes System.

(C) Within two years after such Great Lakes guidance is published, the Great Lakes States shall adopt water quality standards, antidegradation policies, and implementation procedures for waters within the Great Lakes System which are consistent with such guidance. If a Great Lakes State fails to adopt such standards, policies, and procedures, the Administrator shall promulgate them not later than the end of such two-year period. When reviewing any Great Lakes State's water quality plan, the agency shall consider the extent to which the State has complied with the Great Lakes guidance issued pursuant to this section.

(3) REMEDIAL ACTION PLANS.—

(A) For each area of concern for which the United States has agreed to draft a Remedial Action Plan, the Program Office shall ensure that the Great Lakes State in which such area of concern is located—

(i) submits a Remedial Action Plan to the Program Office by June 30, 1991;

(ii) submits such Remedial Action Plan to the International Joint Commission by January 1, 1992; and

(iii) includes such Remedial Action Plans within the State's water quality plan by January 1, 1993.

(B) For each area of concern for which Canada has agreed to draft a Remedial Action Plan, the Program Office shall, pursuant to subparagraph (c)(1)(C) of this section, work with Canada to assure the submission of such Remedial Action Plans to the International Joint Commission by June 30, 1991, and to finalize such Remedial Action Plans by January 1, 1993.

(C) For any area of concern designated as such subsequent to the enactment of this Act, the Program Office shall (i) if the United States has agreed to draft the Remedial Action Plan, ensure that the Great Lakes State in which such area of concern is located submits such Plan to the Program Office within two years of the area's designation, submits it to the International Joint Commission no later than six months after submitting it to the Program Office, and includes such Plan in the State's water quality plan no later than one year after submitting it to the Commission; and (ii) if Canada has agreed to draft the Remedial Action Plan, work with Canada, pursuant to subparagraph (c)(1)(C) of this section, to ensure the submission of such Plan to the International Joint Commission within

two years of the area's designation and the finalization of such Plan no later than eighteen months after submitting it to such Commission.

(D) The Program Office shall compile formal comments on individual Remedial Action Plans made by the International Joint Commission pursuant to section 4(d) of Annex 2 of the Great Lakes Water Quality Agreement and, upon request by a member of the public, shall make such comments available for inspection and copying. The Program Office shall also make available, upon request, formal comments made by the Environmental Protection Agency on individual Remedial Action Plans.

(E) REPORT.—Not later than 1 year after the date of enactment of this subparagraph, the Administrator shall submit to Congress a report on such actions, time periods, and resources as are necessary to fulfill the duties of the Agency relating to oversight of Remedial Action Plans under—

(i) this paragraph; and

(ii) the Great Lakes Water Quality Agreement.

(4) LAKEWIDE MANAGEMENT PLANS.—The Administrator, in consultation with the Program Office shall—

(A) by January 1, 1992, publish in the Federal Register a proposed Lakewide Management Plan for Lake Michigan and solicit public comments;

(B) by January 1, 1993, submit a proposed Lakewide Management Plan for Lake Michigan to the International Joint Commission for review; and

(C) by January 1, 1994, publish in the Federal Register a final Lakewide Management Plan for Lake Michigan and begin implementation.

Nothing in this subparagraph shall preclude the simultaneous development of Lakewide Management Plans for the other Great Lakes.

(5) SPILLS OF OIL AND HAZARDOUS MATERIALS.—The Program Office, in consultation with the Coast Guard, shall identify areas within the Great Lakes which are likely to experience numerous or voluminous spills of oil or other hazardous materials from land based facilities, vessels, or other sources and, in consultation with the Great Lakes States, shall identify weaknesses in Federal and State programs and systems to prevent and respond to such spills. This information shall be included on at least a biennial basis in the report required by this section.

(6) 5-YEAR PLAN AND PROGRAM.—The Program Office shall develop, in consultation with the States, a five-year plan and program for reducing the amount of nutrients introduced into the Great Lakes. Such program shall incorporate any management program for reducing nutrient runoff from nonpoint sources established under section 319 of this Act and shall include a program for monitoring nutrient runoff into, and ambient levels in, the Great Lakes.

(7) 5-YEAR STUDY AND DEMONSTRATION PROJECTS.—(A) The Program Office shall carry out a five-year study and demonstration projects relating to the control and removal of toxic

pollutants in the Great Lakes, with emphasis on the removal of toxic pollutants from bottom sediments. In selecting locations for conducting demonstration projects under this paragraph, priority consideration shall be given to projects at the following locations: Saginaw Bay, Michigan; Sheboygan Harbor, Wisconsin; Grand Calumet River, Indiana; Ashtabula River, Ohio; and Buffalo River, New York.

(B) The Program Office shall—

(i) by December 31, 1990, complete chemical, physical, and biological assessments of the contaminated sediments at the locations selected for the study and demonstration projects;

(ii) by December 31, 1990, announce the technologies that will be demonstrated at each location and the numerical standard of protection intended to be achieved at each location;

(iii) by December 31, 1992, complete full or pilot scale demonstration projects on site at each location of promising technologies to remedy contaminated sediments; and

(iv) by December 31, 1993, issue a final report to Congress on its findings.

(C) The Administrator, after providing for public review and comment, shall publish information concerning the public health and environmental consequences of contaminants in Great Lakes sediment. Information published pursuant to this subparagraph shall include specific numerical limits to protect health, aquatic life, and wildlife from the bioaccumulation of toxins. The Administrator shall, at a minimum, publish information pursuant to this subparagraph within 2 years of the date of the enactment of this title.

(8) ADMINISTRATOR'S RESPONSIBILITY.—The Administrator shall ensure that the Program Office enters into agreements with the various organizational elements of the Agency involved in Great Lakes activities and the appropriate State agencies specifically delineating—

(A) the duties and responsibilities of each such element in the Agency with respect to the Great Lakes;

(B) the time periods for carrying out such duties and responsibilities; and

(C) the resources to be committed to such duties and responsibilities.

(9) BUDGET ITEM.—The Administrator shall, in the Agency's annual budget submission to Congress, include a funding request for the Program Office as a separate budget line item.

(10) COMPREHENSIVE REPORT.—Within 90 days after the end of each fiscal year, the Administrator shall submit to Congress a comprehensive report which—

(A) describes the achievements in the preceding fiscal year in implementing the Great Lakes Water Quality Agreement of 1978 and shows by categories (including judicial enforcement, research, State cooperative efforts, and general administration) the amounts expended on Great

Lakes water quality initiatives in such preceding fiscal year;

(B) describes the progress made in such preceding fiscal year in implementing the system of surveillance of the water quality in the Great Lakes System, including the monitoring of groundwater and sediment, with particular reference to toxic pollutants;

(C) describes the long-term prospects for improving the condition of the Great Lakes; and

(D) provides a comprehensive assessment of the planned efforts to be pursued in the succeeding fiscal year for implementing the Great Lakes Water Quality Agreement of 1978, which assessment shall—

(i) show by categories (including judicial enforcement, research, State cooperative efforts, and general administration) the amount anticipated to be expended on Great Lakes water quality initiatives in the fiscal year to which the assessment relates; and

(ii) include a report of current programs administered by other Federal agencies which make available resources to the Great Lakes water quality management efforts.

(11) CONFINED DISPOSAL FACILITIES.—(A) The Administrator, in consultation with the Assistant Secretary of the Army for Civil Works, shall develop and implement, within one year of the date of enactment of this paragraph, management plans for every Great Lakes confined disposal facility.

(B) The plan shall provide for monitoring of such facilities, including—

(i) water quality at the site and in the area of the site;

(ii) sediment quality at the site and in the area of the site;

(iii) the diversity, productivity, and stability of aquatic organisms at the site and in the area of the site; and

(iv) such other conditions as the Administrator deems appropriate.

(C) The plan shall identify the anticipated use and management of the site over the following twenty-year period including the expected termination of dumping at the site, the anticipated need for site management, including pollution control, following the termination of the use of the site.

(D) The plan shall identify a schedule for review and revision of the plan which shall not be less frequent than five years after adoption of the plan and every five years thereafter.

(12) REMEDIATION OF SEDIMENT CONTAMINATION IN AREAS OF CONCERN.—

(A) IN GENERAL.—In accordance with this paragraph, the Administrator, acting through the Program Office, may carry out projects that meet the requirements of subparagraph (B).

(B) ELIGIBLE PROJECTS.—A project meets the requirements of this subparagraph if the project is to be carried out in an area of concern located wholly or partially in the United States and the project—

(i) monitors or evaluates contaminated sediment;

(ii) subject to subparagraph (D), implements a plan to remediate contaminated sediment; or

(iii) prevents further or renewed contamination of sediment.

(C) PRIORITY.—In selecting projects to carry out under this paragraph, the Administrator shall give priority to a project that—

(i) constitutes remedial action for contaminated sediment;

(ii)(I) has been identified in a Remedial Action Plan submitted under paragraph (3); and

(II) is ready to be implemented;

(iii) will use an innovative approach, technology, or technique that may provide greater environmental benefits, or equivalent environmental benefits at a reduced cost; or

(iv) includes remediation to be commenced not later than 1 year after the date of receipt of funds for the project.

(D) LIMITATION.—The Administrator may not carry out a project under this paragraph for remediation of contaminated sediments located in an area of concern—

(i) if an evaluation of remedial alternatives for the area of concern has not been conducted, including a review of the short-term and long-term effects of the alternatives on human health and the environment; or

(ii) if the Administrator determines that the area of concern is likely to suffer significant further or renewed contamination from existing sources of pollutants causing sediment contamination following completion of the project.

(E) NON-FEDERAL SHARE.—

(i) IN GENERAL.—The non-Federal share of the cost of a project carried out under this paragraph shall be at least 35 percent.

(ii) IN-KIND CONTRIBUTIONS.—The non-Federal share of the cost of a project carried out under this paragraph may include the value of in-kind services contributed by a non-Federal sponsor.

(iii) NON-FEDERAL SHARE.—The non-Federal share of the cost of a project carried out under this paragraph—

(I) may include monies paid pursuant to, or the value of any in-kind service performed under, an administrative order on consent or judicial consent decree; but

(II) may not include any funds paid pursuant to, or the value of any in-kind service performed under, a unilateral administrative order or court order.

(iv) OPERATION AND MAINTENANCE.—The non-Federal share of the cost of the operation and maintenance of a project carried out under this paragraph shall be 100 percent.

(F) MAINTENANCE OF EFFORT.—The Administrator may not carry out a project under this paragraph unless the non-Federal sponsor enters into such agreements with the Administrator as the Administrator may require to ensure that the non-Federal sponsor will maintain its aggregate expenditures from all other sources for remediation programs in the area of concern in which the project is located at or above the average level of such expenditures in the 2 fiscal years preceding the date on which the project is initiated.

(G) COORDINATION.—In carrying out projects under this paragraph, the Administrator shall coordinate with the Secretary of the Army, and with the Governors of States in which the projects are located, to ensure that Federal and State assistance for remediation in areas of concern is used as efficiently as practicable.

(H) AUTHORIZATION OF APPROPRIATIONS.—

(i) IN GENERAL.—In addition to other amounts authorized under this section, there is authorized to be appropriated to carry out this paragraph $50,000,000 for each of fiscal years 2004 through 2008.

(ii) AVAILABILITY.—Funds made available under clause (i) shall remain available until expended.

(13) PUBLIC INFORMATION PROGRAM.—

(A) IN GENERAL.—The Administrator, acting through the Program Office and in coordination with States, Indian tribes, local governments, and other entities, may carry out a public information program to provide information relating to the remediation of contaminated sediment to the public in areas of concern that are located wholly or partially in the United States.

(B) AUTHORIZATION OF APPROPRIATIONS.—There is authorized to be appropriated to carry out this paragraph $1,000,000 for each of fiscal years 2004 through 2008.

(d) GREAT LAKES RESEARCH.—

(1) ESTABLISHMENT OF RESEARCH OFFICE.—There is established within the National Oceanic and Atmospheric Administration the Great Lakes Research Office.

(2) IDENTIFICATION OF ISSUES.—The Research Office shall identify issues relating to the Great Lakes resources on which research is needed. The Research Office shall submit a report to Congress on such issues before the end of each fiscal year which shall identify any changes in the Great Lakes system with respect to such issues.

(3) INVENTORY.—The Research Office shall identify and inventory, Federal, State, university, and tribal environmental research programs (and, to the extent feasible, those of private organizations and other nations) relating to the Great Lakes system, and shall update that inventory every four years.

(4) RESEARCH EXCHANGE.—The Research Office shall establish a Great Lakes research exchange for the purpose of facilitating the rapid identification, acquisition, retrieval, dissemination, and use of information concerning research projects which are ongoing or completed and which affect the Great Lakes system.

(5) RESEARCH PROGRAM.—The Research Office shall develop, in cooperation with the Coordination Office, a comprehensive environmental research program and data base for the Great Lakes system. The data base shall include, but not be limited to, data relating to water quality, fisheries, and biota.

(6) MONITORING.—The Research Office shall conduct, through the Great Lakes Environmental Research Laboratory, the National Sea Grant College program, other Federal laboratories, and the private sector, appropriate research and monitoring activities which address priority issues and current needs relating to the Great Lakes.

(7) LOCATION.—The Research Office shall be located in a Great Lakes State.

(e) RESEARCH AND MANAGEMENT COORDINATION.—

(1) JOINT PLAN.—Before October 1 of each year, the Program Office and the Research Office shall prepare a joint research plan for the fiscal year which begins in the following calendar year.

(2) CONTENTS OF PLAN.—Each plan prepared under paragraph (1) shall—

(A) identify all proposed research dedicated to activities conducted under the Great Lakes Water Quality Agreement of 1978;

(B) include the Agency's assessment of priorities for research needed to fulfill the terms of such Agreement; and

(C) identify all proposed research that may be used to develop a comprehensive environmental data base for the Great Lakes system and establish priorities for development of such data base.

(3) HEALTH RESEARCH REPORT.—(A) Not later than September 30, 1994, the Program Office, in consultation with the Research Office, the Agency for Toxic Substances and Disease Registry, and Great Lakes States shall submit to the Congress a report assessing the adverse effects of water pollutants in the Great Lakes System on the health of persons in Great Lakes States and the health of fish, shellfish, and wildlife in the Great Lakes System. In conducting research in support of this report, the Administrator may, where appropriate, provide for research to be conducted under cooperative agreements with Great Lakes States.

(B) There is authorized to be appropriated to the Administrator to carry out this section not to exceed $3,000,000 for each of fiscal years 1992, 1993, and 1994.

(f) INTERAGENCY COOPERATION.—The head of each department, agency, or other instrumentality of the Federal Government which is engaged in, is concerned with, or has authority over programs relating to research, monitoring, and planning to maintain, enhance, preserve, or rehabilitate the environmental quality and natural resources of the Great Lakes, including the Chief of Engineers of the Army, the Chief of the Soil Conservation Service, the Commandant of the Coast Guard, the Director of the Fish and Wildlife Service, and the Administrator of the National Oceanic and Atmospheric Administration, shall submit an annual report to the Ad-

ministrator with respect to the activities of that agency or office affecting compliance with the Great Lakes Water Quality Agreement of 1978.

(g) RELATIONSHIP TO EXISTING FEDERAL AND STATE LAWS AND INTERNATIONAL TREATIES.—Nothing in this section shall be construed—

(1) to affect the jurisdiction, powers, or prerogatives of any department, agency, or officer of the Federal Government or of any State government, or of any tribe, nor any powers, jurisdiction, or prerogatives of any international body created by treaty with authority relating to the Great Lakes; or

(2) to affect any other Federal or State authority that is being used or may be used to facilitate the cleanup and protection of the Great Lakes.

(h) AUTHORIZATIONS OF GREAT LAKES APPROPRIATIONS.—There are authorized to be appropriated to the Administrator to carry out this section not to exceed—

(1) $11,000,000 per fiscal year for the fiscal years 1987, 1988, 1989, and 1990, and $25,000,000 for fiscal year 1991;

(2) such sums as are necessary for each of fiscal years 1992 through 2003; and

(3) $25,000,000 for each of fiscal years 2004 through 2008.

(33 U.S.C. 1268)

SEC. 119. LONG ISLAND SOUND.—(a) The Administrator shall continue the Management Conference of the Long Island Sound Study (hereinafter referred to as the "Conference") as established pursuant to section 320 of this Act, and shall establish an office (hereinafter referred to as the "Office") to be located on or near Long Island Sound.

(b) ADMINISTRATION AND STAFFING OF OFFICE.—The Office shall be headed by a Director, who shall be detailed by the Administrator, following consultation with the Administrators of EPA regions I and II, from among the employees of the Agency who are in civil service. The Administrator shall delegate to the Director such authority and detail such additional staff as may be necessary to carry out the duties of the Director under this section.

(c) DUTIES OF THE OFFICE.—The Office shall assist the Management Conference of the Long Island Sound Study in carrying out its goals. Specifically, the Office shall—

(1) assist and support the implementation of the Comprehensive Conservation and Management Plan for Long Island Sound developed pursuant to section 320 of this Act, including efforts to establish, within the process for granting watershed general permits, a system for promoting innovative methodologies and technologies that are cost-effective and consistent with the goals of the Plan;

(2) conduct or commission studies deemed necessary for strengthened implementation of the Comprehensive Conservation and Management Plan including, but not limited to—

(A) population growth and the adequacy of wastewater treatment facilities,

(B) the use of biological methods for nutrient removal in sewage treatment plants,

(C) contaminated sediments, and dredging activities,

(D) nonpoint source pollution abatement and land use activities in the Long Island Sound watershed,

(E) wetland protection and restoration,

(F) atmospheric deposition of acidic and other pollutants into Long Island Sound,

(G) water quality requirements to sustain fish, shellfish, and wildlife populations, and the use of indicator species to assess environmental quality,

(H) State water quality programs, for their adequacy pursuant to implementation of the Comprehensive Conservation and Management Plan, and

(I) options for long-term financing of wastewater treatment projects and water pollution control programs.

(3) coordinate the grant, research and planning programs authorized under this section;

(4) coordinate activities and implementation responsibilities with other Federal agencies which have jurisdiction over Long Island Sound and with national and regional marine monitoring and research programs established pursuant to the Marine Protection, Research, and Sanctuaries Act;

(5) provide administrative and technical support to the conference;

(6) collect and make available to the public publications, and other forms of information the conference determines to be appropriate, relating to the environmental quality of Long Island Sound;

(7) not more than two years after the date of the issuance of the final Comprehensive Conservation and Management Plan for Long Island Sound under section 320 of this Act, and biennially thereafter, issue a report to the Congress which—

(A) summarizes the progress made by the States in implementing the Comprehensive Conservation and Management Plan;

(B) summarizes any modifications to the Comprehensive Conservation and Management Plan in the twelve-month period immediately preceding such report; and

(C) incorporates specific recommendations concerning the implementation of the Comprehensive Conservation and Management Plan; and

(8) convene conferences and meetings for legislators from State governments and political subdivisions thereof for the purpose of making recommendations for coordinating legislative efforts to facilitate the environmental restoration of Long Island Sound and the implementation of the Comprehensive Conservation and Management Plan.

(d) GRANTS.—(1) The Administrator is authorized to make grants for projects and studies which will help implement the Long Island Sound Comprehensive Conservation and Management Plan. Special emphasis shall be given to implementation, research and planning, enforcement, and citizen involvement and education.

(2) State, interstate, and regional water pollution control agencies, and other public or nonprofit private agencies, institutions, and organizations held to be eligible for grants pursuant to this subsection.

(3) Citizen involvement and citizen education grants under this subsection shall not exceed 95 per centum of the costs of such work. All other grants under this subsection shall not exceed 50 per centum of the research, studies, or work. All grants shall be made on the condition that the non-Federal share of such costs are provided from non-Federal sources.

(e) ASSISTANCE TO DISTRESSED COMMUNITIES.—

(1) ELIGIBLE COMMUNITIES.—For the purposes of this subsection, a distressed community is any community that meets affordability criteria established by the State in which the community is located, if such criteria are developed after public review and comment.

(2) PRIORITY.—In making assistance available under this section for the upgrading of wastewater treatment facilities, the Administrator may give priority to a distressed community.

(f) AUTHORIZATIONS.—(1) There is authorized to be appropriated to the Administrator for the implementation of this section, other than subsection (d), such sums as may be necessary for each of the fiscal years 2001 through 2005.

(2) There is authorized to be appropriated to the Administrator for the implementation of subsection (d) not to exceed $40,000,000 for each of fiscal years 2001 through 2005.

(33 U.S.C. 1269)

SEC. 120. LAKE CHAMPLAIN BASIN PROGRAM.

(a) ESTABLISHMENT.—

(1) IN GENERAL.—There is established a Lake Champlain Management Conference to develop a comprehensive pollution prevention, control, and restoration plan for Lake Champlain. The Administrator shall convene the management conference within ninety days of the date of enactment of this section.

(2) IMPLEMENTATION.—The Administrator—

(A) may provide support to the State of Vermont, the State of New York, and the New England Interstate Water Pollution Control Commission for the implementation of the Lake Champlain Basin Program; and

(B) shall coordinate actions of the Environmental Protection Agency under subparagraph (A) with the actions of other appropriate Federal agencies.

(b) MEMBERSHIP.—The Members of the Management Conference shall be comprised of—

(1) the Governors of the States of Vermont and New York;

(2) each interested Federal agency, not to exceed a total of five members;

(3) the Vermont and New York Chairpersons of the Vermont, New York, Quebec Citizens Advisory Committee for the Environmental Management of Lake Champlain;

(4) four representatives of the State legislature of Vermont;

(5) four representatives of the State legislature of New York;

(6) six persons representing local governments having jurisdiction over any land or water within the Lake Champlain basin, as determined appropriate by the Governors; and

(7) eight persons representing affected industries, nongovernmental organizations, public and private educational institutions, and the general public, as determined appropriate by the trigovernmental Citizens Advisory Committee for the Environmental Management of Lake Champlain, but not to be current members of the Citizens Advisory Committee.

(c) TECHNICAL ADVISORY COMMITTEE.—(1) The Management Conference shall, not later than one hundred and twenty days after the date of enactment of this section, appoint a Technical Advisory Committee.

(2) Such Technical Advisory Committee shall consist of officials of: appropriate departments and agencies of the Federal Government; the State governments of New York and Vermont; and governments of political subdivisions of such States; and public and private research institutions.

(d) RESEARCH PROGRAM.—The Management Conference shall establish a multi-disciplinary environmental research program for Lake Champlain. Such research program shall be planned and conducted jointly with the Lake Champlain Research Consortium.

(e) POLLUTION PREVENTION, CONTROL, AND RESTORATION PLAN.—(1) Not later than three years after the date of the enactment of this section, the Management Conference shall publish a pollution prevention, control, and restoration plan for Lake Champlain.

(2) The Plan developed pursuant to this section shall—

(A) identify corrective actions and compliance schedules addressing point and nonpoint sources of pollution necessary to restore and maintain the chemical, physical, and biological integrity of water quality, a balanced, indigenous population of shellfish, fish and wildlife, recreational, and economic activities in and on the lake;

(B) incorporate environmental management concepts and programs established in State and Federal plans and programs in effect at the time of the development of such plan;

(C) clarify the duties of Federal and State agencies in pollution prevention and control activities, and to the extent allowable by law, suggest a timetable for adoption by the appropriate Federal and State agencies to accomplish such duties within a reasonable period of time;

(D) describe the methods and schedules for funding of programs, activities, and projects identified in the Plan, including the use of Federal funds and other sources of funds;

(E) include a strategy for pollution prevention and control that includes the promotion of pollution prevention and management practices to reduce the amount of pollution generated in the Lake Champlain basin; and

(F) be reviewed and revised, as necessary, at least once every 5 years, in consultation with the Administrator and other appropriate Federal agencies.

(3) The Administrator, in cooperation with the Management Conference, shall provide for public review and comment on the draft Plan. At a minimum, the Management Conference shall conduct one public meeting to hear comments on the draft plan in the State of New York and one such meeting in the State of Vermont.

(4) Not less than one hundred and twenty days after the publication of the Plan required pursuant to this section, the Administrator shall approve such plan if the plan meets the requirements of this section and the Governors of the States of New York and Vermont concur.

(5) Upon approval of the plan, such plan shall be deemed to be an approved management program for the purposes of section 319(h) of this Act and such plan shall be deemed to be an approved comprehensive conservation and management plan pursuant to section 320 of this Act.

(f) GRANT ASSISTANCE.—(1) The Administrator may, in consultation with participants in the Lake Champlain Basin Program, make grants to State, interstate, and regional water pollution control agencies, and public or nonprofit agencies, institutions, and organizations.

(2) Grants under this subsection shall be made for assisting research, surveys, studies, and modeling and technical and supporting work necessary for the development and implementation of the Plan.

(3) The amount of grants to any person under this subsection for a fiscal year shall not exceed 75 per centum of the costs of such research, survey, study and work and shall be made available on the condition that non-Federal share of such costs are provided from non-Federal sources.

(4) The Administrator may establish such requirements for the administration of grants as he determines to be appropriate.

(g) DEFINITIONS.—In this section:

(1) LAKE CHAMPLAIN BASIN PROGRAM.—The term "Lake Champlain Basin Program" means the coordinated efforts among the Federal Government, State governments, and local governments to implement the Plan.

(2) LAKE CHAMPLAIN DRAINAGE BASIN.—The term "Lake Champlain drainage basin" means all or part of Clinton, Franklin, Warren, Essex, and Washington counties in the State of New York and all or part of Franklin, Hamilton, Grand Isle, Chittenden, Addison, Rutland, Bennington, Lamoille, Orange, Washington, Orleans, and Caledonia counties in Vermont, that contain all of the streams, rivers, lakes, and other bodies of water, including wetlands, that drain into Lake Champlain.

(3) PLAN.—The term "Plan" means the plan developed under subsection (e).

(h) NO EFFECT ON CERTAIN AUTHORITY.—Nothing in this section—

(1) affects the jurisdiction or powers of—

(A) any department or agency of the Federal Government or any State government; or

(B) any international organization or entity related to Lake Champlain created by treaty or memorandum to which the United States is a signatory;

(2) provides new regulatory authority for the Environmental Protection Agency; or

(3) affects section 304 of the Great Lakes Critical Programs Act of 1990 (Public Law 101–596; 33 U.S.C. 1270 note).

(i) AUTHORIZATION.—There are authorized to be appropriated to the Environmental Protection Agency to carry out this section—

(1) $2,000,000 for each of fiscal years 1991, 1992, 1993, 1994, and 1995;

(2) such sums as are necessary for each of fiscal years 1996 through 2003; and

(3) $11,000,000 for each of fiscal years 2004 through 2008.

(33 U.S.C. 1270)

SEC. 121. LAKE PONTCHARTRAIN BASIN.

(a) ESTABLISHMENT OF RESTORATION PROGRAM.—The Administrator shall establish within the Environmental Protection Agency the Lake Pontchartrain Basin Restoration Program.

(b) PURPOSE.—The purpose of the program shall be to restore the ecological health of the Basin by developing and funding restoration projects and related scientific and public education projects.

(c) DUTIES.—In carrying out the program, the Administrator shall—

(1) provide administrative and technical assistance to a management conference convened for the Basin under section 320;

(2) assist and support the activities of the management conference, including the implementation of recommendations of the management conference;

(3) support environmental monitoring of the Basin and research to provide necessary technical and scientific information;

(4) develop a comprehensive research plan to address the technical needs of the program;

(5) coordinate the grant, research, and planning programs authorized under this section; and

(6) collect and make available to the public publications, and other forms of information the management conference determines to be appropriate, relating to the environmental quality of the Basin.

(d) GRANTS.—The Administrator may make grants—

(1) for restoration projects and studies recommended by a management conference convened for the Basin under section 320; and

(2) for public education projects recommended by the management conference.

(e) DEFINITIONS.—In this section, the following definitions apply:

(1) BASIN.—The term ''Basin'' means the Lake Pontchartrain Basin, a 5,000 square mile watershed encompassing 16 parishes in the State of Louisiana and 4 counties in the State of Mississippi.

(2) PROGRAM.—The term ''program'' means the Lake Pontchartrain Basin Restoration Program established under subsection (a).

(f) AUTHORIZATION OF APPROPRIATIONS.—

(1) IN GENERAL.—There is authorized to be appropriated to carry out this section $20,000,000 for each of fiscal years 2001

through 2005. Such sums shall remain available until expended.

(2) PUBLIC EDUCATION PROJECTS.—Not more than 15 percent of the amount appropriated pursuant to paragraph (1) in a fiscal year may be expended on grants for public education projects under subsection (d)(2).

(33 U.S.C. 1273)

SEC. 121. WET WEATHER WATERSHED PILOT PROJECTS.[1]

(a) IN GENERAL.—The Administrator, in coordination with the States, may provide technical assistance and grants for treatment works to carry out pilot projects relating to the following areas of wet weather discharge control:

(1) WATERSHED MANAGEMENT OF WET WEATHER DISCHARGES.—The management of municipal combined sewer overflows, sanitary sewer overflows, and stormwater discharges, on an integrated watershed or subwatershed basis for the purpose of demonstrating the effectiveness of a unified wet weather approach.

(2) STORMWATER BEST MANAGEMENT PRACTICES.—The control of pollutants from municipal separate storm sewer systems for the purpose of demonstrating and determining controls that are cost-effective and that use innovative technologies in reducing such pollutants from stormwater discharges.

(b) ADMINISTRATION.—The Administrator, in coordination with the States, shall provide municipalities participating in a pilot project under this section the ability to engage in innovative practices, including the ability to unify separate wet weather control efforts under a single permit.

(c) FUNDING.—

(1) IN GENERAL.—There is authorized to be appropriated to carry out this section $10,000,000 for fiscal year 2002, $15,000,000 for fiscal year 2003, and $20,000,000 for fiscal year 2004. Such funds shall remain available until expended.

(2) STORMWATER.—The Administrator shall make available not less than 20 percent of amounts appropriated for a fiscal year pursuant to this subsection to carry out the purposes of subsection (a)(2).

(3) ADMINISTRATIVE EXPENSES.—The Administrator may retain not to exceed 4 percent of any amounts appropriated for a fiscal year pursuant to this subsection for the reasonable and necessary costs of administering this section.

(d) REPORT TO CONGRESS.—Not later than 5 years after the date of enactment of this section, the Administrator shall transmit to Congress a report on the results of the pilot projects conducted under this section and their possible application nationwide.

(33 U.S.C. 1274)

[1] The second section 121 was added by section 112(b) of the Miscellaneous Appropriations Act, 2001 (114 Stat. 2763A–225), as enacted into law by section 1(a)(6) of Public Law 106–554 (114 Stat. 2763).

TITLE II—GRANTS FOR CONSTRUCTION OF TREATMENT WORKS

PURPOSE

SEC. 201. (a) It is the purpose of this title to require and to assist the development and implementation of waste treatment management plans and practices which will achieve the goals of this Act.

(b) Waste treatment management plans and practices shall provide for the application of the best practicable waste treatment technology before any discharge into receiving waters, including reclaiming and recycling of water, and confined disposal of pollutants so they will not migrate to cause water or other environmental pollution and shall provide for consideration of advanced waste treatment techniques.

(c) To the extent practicable, waste treatment management shall be on an areawide basis and provide control or treatment of all point and nonpoint sources of pollution, including in place or accumulated pollution sources.

(d) The Administrator shall encourage waste treatment management which results in the construction of revenue producing facilities providing for—

(1) the recycling of potential sewage pollutants through the production of agriculture, silviculture, or aquaculture products, or any combination thereof;

(2) the confined and contained disposal of pollutants not recycled;

(3) the reclamation of wastewater; and

(4) the ultimate disposal of sludge in a manner that will not result in environmental hazards.

(e) The Administrator shall encourage waste treatment management which results in integrating facilities for sewage treatment and recycling with facilities to treat, dispose of, or utilize other industrial and municipal wastes, including but not limited to solid waste and waste heat and thermal discharges. Such integrated facilities shall be designed and operated to produce revenues in excess of capital and operation and maintenance costs and such revenues shall be used by the designated regional management agency to aid in financing other environmental improvement programs.

(f) The Administrator shall encourage waste treatment management which combines "open space" and recreational considerations with such management.

(g)(1) The Administrator is authorized to make grants to any State, municipality, or intermunicipal or interstate agency for the construction of publicly owned treatment works. On and after October 1, 1984, grants under this title shall be made only for projects for secondary treatment or more stringent treatment, or any cost effective alternative thereto, new interceptors and appurtenances, and infiltration-in-flow correction. Notwithstanding the preceding sentences, the Administrator may make grants on and after October 1, 1984, for (A) any project within the definition set forth in section 212(2) of this Act, other than for a project referred to in the preceding sentence, and (B) any purpose for which a grant may be

made under sections [1] 319 (h) and (i) of this Act (including any innovative and alternative approaches for the control of nonpoint sources of pollution), except that not more than 20 per centum (as determined by the Governor of the State) of the amount allotted to a State under section 205 of this Act for any fiscal year shall be obligated in such State under authority of this sentence.

(2) The Administrator shall not make grants from funds authorized for any fiscal year beginning after June 30, 1974, to any State, municipality, or intermunicipal or interstate agency for the erection, building, acquisition, alteration, remodeling, improvement, or extension of treatment works unless the grant applicant has satisfactorily demonstrated to the Administrator that—

(A) alternative waste management techniques have been studied and evaluated and the works proposed for grant assistance will provide for the application of the best practicable waste treatment technology over the life of the works consistent with the purposes of this title; and

(B) as appropriate, the works proposed for grant assistance will take into account and allow to the extent practicable the application of technology at a later date which will provide for the reclaiming or recycling of water or otherwise eliminate the discharge of pollutants.

(3) The Administrator shall not approve any grant after July 1, 1973, for treatment works under this section unless the applicant shows to the satisfaction of the Administrator that each sewer collection system discharging into such treatment works is not subject to excessive infiltration.

(4) The Administrator is authorized to make grants to applicants for treatment works grants under this section for such sewer system evaluation studies as may be necessary to carry out the requirements of paragraph (3) of this subsection. Such grants shall be made in accordance with rules and regulations promulgated by the Administrator. Initial rules and regulations shall be promulgated under this paragraph not later than 120 days after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972.

(5) The Administrator shall not make grants from funds authorized for any fiscal year beginning after September 30, 1978, to any State, municipality, or intermunicipal or interstate agency for the erection, building, acquisition, alteration, remodeling, improvement, or extension of treatment works unless the grant applicant has satisfactorily demonstrated to the Administrator that innovative and alternative wastewater treatment processes and techniques which provide for the reclaiming and reuse of water, otherwise eliminate the discharge of pollutants, and utilize recycling techniques, land treatment, new or improved methods of waste treatment management for municipal and industrial waste (discharged into municipal systems) and the confined disposal of pollutants, so that pollutants will not migrate to cause water or other environmental pollution, have been fully studied and evaluated by the applicant taking into account section 201(d) of this Act and taking into account and allowing to the extent practicable the more efficient use of energy and resources.

[1] So in original. Probably should be "section".

(6) The Administrator shall not make grants from funds authorized for any fiscal year beginning after September 30, 1978, to any State, municipality, or intermunicipal or interstate agency for the erection, building, acquisition, alteration, remodeling, improvement, or extension of treatment works unless the grant applicant has satisfactorily demonstrated to the Administrator that the applicant has analyzed the potential recreation and open space opportunities in the planning of the proposed treatment works.

(h) A grant may be made under this section to construct a privately owned treatment works serving one or more principal residences or small commercial establishments constructed prior to, and inhabited on the date of enactment of this subsection where the Administrator finds that—

(1) a public body otherwise eligible for a grant under subsection (g) of this section has applied on behalf of a number of such units and certified that public ownership of such works is not feasible;

(2) such public body has entered into an agreement with the Administrator which guarantees that such treatment works will be properly operated and maintained and will comply with all other requirements of section 204 of this Act and includes a system of charges to assure that each recipient of waste treatment services under such a grant will pay its proportionate share of the cost of operation and maintenance (including replacement); and

(3) the total cost and environmental impact of providing waste treatment services to such residences or commercial establishments will be less than the cost of providing a system of collection and central treatment of such wastes.

(i) The Administrator shall encourage waste treatment management methods, processes, and techniques which will reduce total energy requirements.

(j) The Administrator is authorized to make a grant for any treatment works utilizing processes and techniques meeting the guidelines promulgated under section 304(d)(3) of this Act, if the Administrator determines it is in the public interest and if in the cost effectiveness study made of the construction grant application for the purpose of evaluating alternative treatment works, the life cycle cost of the treatment works for which the grant is to be made does not exceed the life cycle cost of the most effective alternative by more than 15 per centum.

(k) No grant made after November 15, 1981, for a publicly owned treatment works, other than for facility planning and the preparation of construction plans and specifications, shall be used to treat, store, or convey the flow of any industrial user into such treatment works in excess of a flow per day equivalent to fifty thousand gallons per day of sanitary waste. This subsection shall not apply to any project proposed by a grantee which is carrying out an approved project to prepare construction plans and specifications for a facility to treat wastewater, which received its grant approval before May 15, 1980. This subsection shall not be in effect after November 15, 1981.

(l)(1) After the date of enactment of this subsection, Federal grants shall not be made for the purpose of providing assistance solely for facility plans, or plans, specifications, and estimates for

any proposed project for the construction of treatment works. In the event that the proposed project receives a grant under this section for construction, the Administrator shall make an allowance in such grant for non-Federal funds expended during the facility planning and advanced engineering and design phase at the prevailing Federal share under section 202(a) of this Act, based on the percentage of total project costs which the Administrator determines is the general experience for such projects.

(2)(A) Each State shall use a portion of the funds allotted to such State each fiscal year, but not to exceed 10 per centum of such funds, to advance to potential grant applicants under this title the costs of facility planning or the preparation of plans, specifications, and estimates.

(B) Such an advance shall be limited to the allowance for such costs which the Administrator establishes under paragraph (1) of this subsection, and shall be provided only to a potential grant applicant which is a small community and which in the judgment of the State would otherwise be unable to prepare a request for a grant for construction costs under this section.

(C) In the event a grant for construction costs is made under this section for a project for which an advance has been made under this paragraph, the Administrator shall reduce the amount of such grant by the allowance established under paragraph (1) of this subsection. In the event no such grant is made, the State is authorized to seek repayment of such advance on such terms and conditions as it may determine.

(m)(1) Notwithstanding any other provisions of this title, the Administrator is authorized to make a grant from any funds otherwise allotted to the State of California under section 205 of this Act to the project (and in the amount) specified in Order WQG 81–1 of the California State Water Resources Control Board.

(2) Notwithstanding any other provision of this Act, the Administrator shall make a grant from any funds otherwise allotted to the State of California to the city of Eureka, California, in connection with project numbered C–06–2772, for the purchase of one hundred and thirty-nine acres of property as environmental mitigation for siting of the proposed treatment plant.

(3) Notwithstanding any other provision of this Act, the Administrator shall make a grant from any funds otherwise allotted to the State of California to the city of San Diego, California, in connection with that city's aquaculture sewage process (total resources recovery system) as an innovative and alternative waste treatment process.

(n)(1) On and after October 1, 1984, upon the request of the Governor of an affected State, the Administrator is authorized to use funds available to such State under section 205 to address water quality problems due to the impacts of discharges from combined storm water and sanitary sewer overflows, which are not otherwise eligible under this subsection, where correction of such discharges is a major priority for such State.

(2) Beginning fiscal year 1983, the Administrator shall have available $200,000,000 per fiscal year in addition to those funds authorized in section 207 of this Act to be utilized to address water quality problems of marine bays and estuaries subject to lower levels of water quality due to the impacts of discharges from combined

storm water and sanitary sewer overflows from adjacent urban complexes, not otherwise eligible under this subsection. Such sums may be used as deemed appropriate by the Administrator as provided in paragraphs (1) and (2) of this subsection, upon the request of and demonstration of water quality benefits by the Governor of an affected State.

(o) The Administrator shall encourage and assist applicants for grant assistance under this title to develop and file with the Administrator a capital financing plan which, at a minimum—

(1) projects the future requirements for waste treatment services within the applicant's jurisdiction for a period of no less than ten years;

(2) projects the nature, extent, timing, and costs of future expansion and reconstruction of treatment works which will be necessary to satisfy the applicant's projected future requirements for waste treatment services; and

(3) sets forth with specificity the manner in which the applicant intends to finance such future expansion and reconstruction.

(p) TIME LIMIT ON RESOLVING CERTAIN DISPUTES.—In any case in which a dispute arises with respect to the awarding of a contract for construction of treatment works by a grantee of funds under this title and a party to such dispute files an appeal with the Administrator under this title for resolution of such dispute, the Administrator shall make a final decision on such appeal within 90 days of the filing of such appeal.

(33 U.S.C. 1281)

FEDERAL SHARE

SEC. 202. (a)(1) The amount of any grant for treatment works made under this Act from funds authorized for any fiscal year beginning after June 30, 1971, and ending before October 1, 1984, shall be 75 per centum of the cost of construction thereof (as approved by the Administrator), and for any fiscal year beginning on or after October 1, 1984, shall be 55 per centum of the cost of construction thereof (as approved by the Administrator), unless modified to a lower percentage rate uniform throughout a State by the Governor of that State with the concurrence of the Administrator. Within ninety days after the enactment of this sentence the Administrator, shall issue guidelines for concurrence in any such modification, which shall provide for the consideration of the unobligated balance of sums allocated to the State under section 205 of this Act, the need for assistance under this title in such State, and the availability of State grant assistance to replace the Federal share reduced by such modification. The payment of any such reduced Federal share shall not constitute an obligation on the part of the United States or a claim on the part of any State or grantee to reimbursement for the portion of the Federal share reduced in any such State. Any grant (other than for reimbursement) made prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972 from any funds authorized for any fiscal year beginning after June 30, 1971, shall, upon the request of the applicant, be increased to the applicable percentage under this section. Notwithstanding the first sentence of this paragraph,

in any case where a primary, secondary, or advanced waste treatment facility or its related interceptors or a project for infiltration-in-flow correction has received a grant for erection, building, acquisition, alteration, remodeling, improvement, extension, or correction before October 1, 1984, all segments and phases of such facility, interceptors, and project for infiltration-in-flow correction shall be eligible for grants at 75 per centum of the cost of construction thereof for any grant made pursuant to a State obligation which obligation occurred before October 1, 1990. Notwithstanding the first sentence of this paragraph, in the case of a project for which an application for a grant under this title has been made to the Administrator before October 1, 1984, and which project is under judicial injunction on such date prohibiting its construction, such project shall be eligible for grants at 75 percent of the cost of construction thereof. Notwithstanding the first sentence of this paragraph, in the case of the Wyoming Valley Sanitary Authority project mandated by judicial order under a proceeding begun prior to October 1, 1984, and a project for wastewater treatment for Altoona, Pennsylvania, such projects shall be eligible for grants at 75 percent of the cost of construction thereof.

(2) The amount of any grant made after September 30, 1978, and before October 1, 1981, for any eligible treatment works or significant portion thereof utilizing innovative or alternative wastewater treatment processes and techniques referred to in section 201(g)(5) shall be 85 per centum of the cost of construction thereof, unless modified by the Governor of the State with the concurrence of the Administrator to a percentage rate no less than 15 per centum greater than the modified uniform percentage rate in which the Administrator has concurred pursuant to paragraph (1) of this subsection. The amount of any grant made after September 30, 1981, for any eligible treatment works or unit processes and techinques thereof utilizing innovative or alternative wastewater treatment processes and techniques referred to in section 201(g)(5) shall be a percentage of the cost of construction thereof equal to 20 per centum greater than the percentage in effect under paragraph (1) of this subsection for such works or unit processes and techniques, but in no event greater than 85 per centum of the cost of construction thereof. No grant shall be made under this paragraph for construction of a treatment works in any State unless the proportion of the State contribution to the non-Federal share of construction costs for all treatment works in such State receiving a grant under this paragraph is the same as or greater than the proportion of the State contribution (if any) to the non-Federal share of construction costs for all treatment works receiving grants in such State under paragraph (1) of this subsection.

(3) In addition to any grant made pursuant to paragraph (2) of this subsection, the Administrator is authorized to make a grant to fund all of the costs of the modification or replacement of any facilities constructed with a grant made pursuant to paragraph (2) if the Administrator finds that such facilities have not met design performance specifications unless such failure is attributable to negligence on the part of any person and if such failure has significantly increased capital or operating and maintenance expenditures. In addition, the Administrator is authorized to make a grant to fund all of the costs of the modification or replacement of biodisc

equipment (rotating biological contractors) in any publicly owned treatment works if the Administrator finds that such equipment has failed to meet design performance specifications, unless such failure is attributable to negligence on the part of any person, and if such failure has significantly increased capital or operating and maintenance expenditures.

(4) For the purposes of this section, the term "eligible treatment works" means those treatment works in each State which meet the requirements of section 201(g)(5) of this Act and which can be fully funded from funds available for such purpose in such State.

(b) The amount of the grant for any project approved by the Administrator after January 1, 1971, and before July 1, 1971, for the construction of treatment works, the actual erection, building or acquisition of which was not commenced prior to July 1, 1971, shall, upon the request of the applicant, be increased to the applicable percentage under subsection (a) of this section for grants for treatment works from funds for fiscal years beginning after June 30, 1971, with respect to the cost of such actual erection, building, or acquisition. Such increased amount shall be paid from any funds allocated to the State in which the treatment works is located without regard to the fiscal year for which such funds were authorized. Such increased amount shall be paid for such project only if—

(1) a sewage collection system that is a part of the same total waste treatment system as the treatment works for which such grant was approved is under construction or is to be constructed for use in conjunction with such treatment works, and if the cost of such sewage collection system exceeds the cost of such treatment works, and

(2) the State water pollution control agency or other appropriate State authority certifies that the quantity of available ground water will be insufficient, inadequate, or unsuitable for public use, including the ecological preservation and recreational use of surface water bodies, unless effluents from publicly-owned treatment works after adequate treatment are returned to the ground water consistent with acceptable technological standards.

(c) Notwithstanding any other provision of law, sums allotted to the Commonwealth of Puerto Rico under section 205 of this Act for fiscal year 1981 shall remain available for obligation for the fiscal year for which authorized and for the period of the next succeeding twenty-four months. Such sums and any unobligated funds available to Puerto Rico from allotments for fiscal years ending prior to October 1, 1981, shall be available for obligation by the Administrator of the Environmental Protection Agency only to fund the following systems: Aguadilla, Arecibo, Mayaguez, Carolina, and Camuy Hatillo. These funds may be used by the Commonwealth of Puerto Rico to fund the non-Federal share of the costs of such projects. To the extent that these funds are used to pay the non-Federal share, the Commonwealth of Puerto Rico shall repay to the Environmental Protection Agency such amounts on terms and conditions developed and approved by the Administrator in consultation with the Governor of the Commonwealth of Puerto Rico. Agreement on such terms and conditions including the payment of interest to be determined by the Secretary of the Treasury, shall

be reached prior to the use of these funds for the Commonwealth's non-Federal share. No Federal funds awarded under this provision shall be used to replace local governments funds previously expended on these projects.

(33 U.S.C. 1282)

PLANS, SPECIFICATIONS, ESTIMATES, AND PAYMENTS

SEC. 203. (a)(1) Each applicant for a grant shall submit to the Administrator for his approval, plans, specifications, and estimates for each proposed project for the construction of treatment works for which a grant is applied for under section 201(g)(1) from funds allotted to the State under section 205 and which otherwise meets the requirements of this Act. The Administrator shall act upon such plans, specifications, and estimates as soon as practicable after the same have been submitted, and his approval of any such plans, specifications, and estimates shall be deemed a contractual obligation of the United States for the payment of its proportional contribution to such project.

(2) AGREEMENT ON ELIGIBLE COSTS.—

(A) LIMITATION ON MODIFICATIONS.—Before taking final action on any plans, specifications, and estimates submitted under this subsection after the 60th day following the date of the enactment of the Water Quality Act of 1987, the Administrator shall enter into a written agreement with the applicant which establishes and specifies which items of the proposed project are eligible for Federal payments under this section. The Administrator may not later modify such eligibility determinations unless they are found to have been made in violation of applicable Federal statutes and regulations.

(B) LIMITATION ON EFFECT.—Eligibility determinations under this paragraph shall not preclude the Administrator from auditing a project pursuant to section 501 of this Act, or other authority, or from withholding or recovering Federal funds for costs which are found to be unreasonable, unsupported by adequate documentation, or otherwise unallowable under applicable Federal costs principles, or which are incurred on a project which fails to meet the design specifications or effluent limitations contained in the grant agreement and permit pursuant to section 402 of this Act for such project.

(3) In the case of a treatment works that has an estimated total cost of $8,000,000 of less (as determined by the Administrator), and the population of the applicant municipality is twenty-five thousand or less (according to the most recent United States census), upon completion of an approved facility plan, a single grant may be awarded for the combined Federal share of the cost of preparing construction plans and specifications, and the building and erection of the treatment works.

(b) The Administrator shall, from time to time as the work progresses, make payments to the recipient of a grant for costs of construction incurred on a project. These payments shall at no time exceed the Federal share of the cost of construction incurred to the date of the voucher covering such payment plus the Federal share

of the value of the materials which have been stockpiled in the vicinity of such construction in conformity to plans and specifications for the project.

(c) After completion of a project and approval of the final voucher by the Administrator, he shall pay out of the appropriate sums the unpaid balance of the Federal share payable on account of such project.

(d) Nothing in this Act shall be construed to require, or to authorize the Administrator to require, that grants under this Act for construction of treatment works be made only for projects which are operable units usable for sewage collection, transportation, storage, waste treatment, or for similar purposes without additional construction.

(e) At the request of a grantee under this title, the Administrator is authorized to provide technical and legal assistance in the administration and enforcement of any contract in connection with treatment works assisted under this title, and to intervene any civil action involving the enforcement of such a contract.

(f) DESIGN/BUILD PROJECTS.—

(1) AGREEMENT.—Consistent with State law, an applicant who proposes to construct waste water treatment works may enter into an agreement with the Administrator under this subsection providing for the preparation of construction plans and specifications and the erection of such treatment works, in lieu of proceeding under the other provisions of this section.

(2) LIMITATION ON PROJECTS.—Agreements under this subsection shall be limited to projects under an approved facility plan which projects are—

(A) treatment works that have an estimated total cost of $8,000,000 or less; and

(B) any of the following types of waste water treatment systems: aerated lagoons, trickling filters, stabilization ponds, land application systems, sand filters, and subsurface disposal systems.

(3) REQUIRED TERMS.—An agreement entered into under this subsection shall—

(A) set forth an amount agreed to as the maximum Federal contribution to the project, based upon a competitively bid document of basic design data and applicable standard construction specifications and a determination of the federally eligible costs of the project at the applicable Federal share under section 202 of this Act;

(B) set forth dates for the start and completion of construction of the treatment works by the applicant and a schedule of payments of the Federal contribution to the project;

(C) contain assurances by the applicant that (i) engineering and management assistance will be provided to manage the project; (ii) the proposed treatment works will be an operable unit and will meet all the requirements of this title; and (iii) not later than 1 year after the date specified as the date of completion of construction of the treatment works, the treatment works will be operating so as to meet the requirements of any applicable permit for such treatment works under section 402 of this Act;

(D) require the applicant to obtain a bond from the contractor in an amount determined necessary by the Administrator to protect the Federal interest in the project; and

(E) contain such other terms and conditions as are necessary to assure compliance with this title (except as provided in paragraph (4) of this subsection).

(4) LIMITATION ON APPLICATION.—Subsections (a), (b), and (c) of this section shall not apply to grants made pursuant to this subsection.

(5) RESERVATION TO ASSURE COMPLIANCE.—The Administrator shall reserve a portion of the grant to assure contract compliance until final project approval as defined by the Administrator. If the amount agreed to under paragraph (3)(A) exceeds the cost of designing and constructing the treatment works, the Administrator shall reallot the amount of the excess to the State in which such treatment works are located for the fiscal year in which such audit is completed.

(6) LIMITATION ON OBLIGATIONS.—The Administrator shall not obligate more than 20 percent of the amount allotted to a State for a fiscal year under section 205 of this Act for grants pursuant to this subsection.

(7) ALLOWANCE.—The Administrator shall determine an allowance for facilities planning for projects constructed under this subsection in accordance with section 201(l).

(8) LIMITATION ON FEDERAL CONTRIBUTIONS.—In no event shall the Federal contribution for the cost of preparing construction plans and specifications and the building and erection of treatment works pursuant to this subsection exceed the amount agreed upon under paragraph (3).

(9) RECOVERY ACTION.—In any case in which the recipient of a grant made pursuant to this subsection does not comply with the terms of the agreement entered into under paragraph (3), the Administrator is authorized to take such action as may be necessary to recover the amount of the Federal contribution to the project.

(10) PREVENTION OF DOUBLE BENEFITS.—A recipient of a grant made pursuant to this subsection shall not be eligible for any other grants under this title for the same project.

(33 U.S.C. 1283)

LIMITATIONS AND CONDITIONS

SEC. 204. (a) Before approving grants for any project for any treatment works under section 201(g)(1) the Administrator shall determine—

(1) that any required areawide waste treatment management plan under section 208 of this Act (A) is being implemented for such area and the proposed treatment works are included in such plan, or (B) is being developed for such area and reasonable progress is being made toward its implementation and the proposed treatment works will be included in such plan;

(2) that (A) the State in which the project is to be located (i) is implementing any required plan under section 303(e) of

this Act and the proposed treatment works are in conformity with such plan, or (ii) is developing such a plan and the proposed treatment works will be in conformity with such plan, and (B) such State is in compliance with section 305(b) of this Act;

(3) that such works have been certified by the appropriate State water pollution control agency as entitled to priority over such other works in the State in accordance with any applicable State plan under section 303(e) of this Act, except that any priority list developed pursuant to section 303(e)(3)(H) may be modified by such State in accordance with regulations promulgated by the Administrator to give higher priority for grants for the Federal share of the cost of preparing construction drawings and specifications for any treatment works utilizing processes and techniques meeting the guidelines promulgated under section 304(d)(3) of this Act for grants for the combined Federal share of the cost of preparing construction drawings and specifications and the building and erection of any treatment works meeting the requirements of the next to the last sentence of section 203(a) of this Act which utilizes processes and techniques meeting the guidelines promulgated under section 304(d)(3) of this Act.[1]

(4) that the applicant proposing to construct such works agrees to pay the non-Federal costs of such works and has made adequate provisions satisfactory to the Administrator for assuring proper and efficient operation, including the employment of trained management and operations personnel, and the maintenance of such works in accordance with a plan of operation approved by the state water pollution control agency or, as appropriate, the interstate agency, after construction thereof;

(5) that the size and capacity of such works relate directly to the needs to be served by such works, including sufficient reserve capacity. The amount of reserve capacity provided shall be approved by the Administrator on the basis of a comparison of the cost of constructing such reserves as a part of the works to be funded and the anticipated cost of providing expanded capacity at a date when such capacity will be required, after taking into account, in accordance with regulations promulgated by the Administrator, efforts to reduce total flow of sewage and unnecessary water consumption. The amount of reserve capacity eligible for a grant under this title shall be determined by the Administrator taking into account the projected population and associated commercial and industrial establishments within the jurisdiction of the applicant to be served by such treatment works as identified in an approved facilities plan, an areawide plan under section 208, or an applicable municipal master plan of development. For the purpose of this paragraph, section 208, and any such plan, projected population shall be determined on the basis of the latest information available from the United States Department of Commerce or from the States as the Administrator, by regulation, determines appropriate. Beginning October 1, 1984, no grants shall be made

[1] So in law. The period should be a semicolon.

under this title to construct that portion of any treatment works providing reserve capacity in excess of existing needs (including existing needs of residential, commercial, industrial, and other users) on the date of approval of a grant for the erection, building, acquisition, alteration, remodeling, improvement, or extension of a project for secondary treatment or more stringent treatment or new interceptors and appurtenances, except that in no event shall reserve capacity of a facility and its related interceptors to which this subsection applies be in excess of existing needs on October 1, 1990. In any case in which an applicant proposes to provide reserve capacity greater than that eligible for Federal financial assistance under this title, the incremental costs of the additional reserve capacity shall be paid by the applicant;

(6) that no specification for bids in connection with such works shall be written in such a manner as to contain proprietary, exclusionary, or discriminatory requirements other than those based upon performance, unless such requirements are necessary to test or demonstrate a specific thing or to provide for necessary interchangeability of parts and equipment. When in the judgment of the grantee, it is impractical or uneconomical to make a clear and accurate description of the technical requirements, a "brand name or equal" description may be used as a means to define the performance or other salient requirements of a procurement, and in doing so the grantee need not establish the existence of any source other than the brand or source so named.

(b)(1) Notwithstanding any other provision of this title, the Administrator shall not approve any grant for any treatment works under section 201(g)(1) after March 1, 1973, unless he shall first have determined that the applicant (A) has adopted or will adopt a system of charges to assure that each recipient of waste treatment services within the applicant's jurisdiction, as determined by the Administrator, will pay its proportionate share (except as otherwise provided in this paragraph) of the costs of operation and maintenance (including replacement) of any waste treatment services provided by the applicant; and (B) has legal, institutional, managerial, and financial capability to insure adequate construction, operation, and maintenance of treatment works throughout the applicant's jurisdiction, as determined by the Administrator. In any case where an applicant which, as of the date of enactment of this sentence, uses a system of dedication ad valorem taxes and the Administrator determines that the applicant has a system of charges which results in the distribution of operation and maintenance costs for treatment works within the applicant's jurisdiction, to each user class, in proportion to the contribution to the total cost of operation and maintenance of such works by each user class (taking into account total waste water loading of such works, the constituent elements of the waste, and other appropriate factors), and such applicant is otherwise in compliance with clause (A) of this paragraph with respect to each industrial user, then such dedication ad valorem tax system shall be deemed to be the user charge system meeting the requirements of clause (A) of this paragraph for the residential user class and such small non-residential user classes as defined by the Administrator. In defining small non-resi-

dential users, the Administrator shall consider the volume of wastes discharged into the treatment works by such users and the constituent elements of such wastes as well as such other factors as he deems appropriate. A system of user charges which imposes a lower charge for low-income residential users (as defined by the Administrator) shall be deemed to be a user charge system meeting the requirements of clause (A) of this paragraph if the Administrator determines that such system was adopted after public notice and hearing.

(2) The Administrator shall, within one hundred and eighty days after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, and after consultation with appropriate State, interstate, municipal and intermunicipal agencies, issue guidelines applicable to payment of waste treatment costs by industrial and nonindustrial receipts of waste treatment services which shall establish (A) classes of users of such services, including categories of industrial users; (B) criteria against which to determine the adequacy of charges imposed on classes and categories of users reflecting all factors that influence the cost of waste treatment, including strength, volume, and delivery flow rate characteristics of waste; and (C) model systems and rates of user charges typical of various treatment works serving municipal-industrial communities.

(3) Approval by the Administrator of a grant to an interstate agency established by interstate compact for any treatment works shall satisfy any other requirement that such works be authorized by Act of Congress.

(4) A system of charges which meets the requirement of clause (A) of paragraph (1) of this subsection may be based on something other than metering the sewage or water supply flow of residential recipients of waste treatment services, including ad valorem taxes. If the system of charges is based on something other than metering the Administrator shall require (A) the applicant to establish a system by which the necessary funds will be available for the proper operation and maintenance of the treatment works; and (B) the applicant to establish a procedure under which the residential user will be notified as to that portion of his total payment which will be allocated to the costs of the waste treatment services.

(c) The next to the last sentence of paragraph (5) of subsection (a) of this section shall not apply in any case where a primary, secondary, or advanced waste treatment facility or its related interceptors has received a grant for erection, building, acquisition, alteration, remodeling, improvement, or extension before October 1, 1984, and all segments and phases of such facility and interceptors shall be funded based on a 20-year reserve capacity in the case of such facility and a 20-year reserve capacity in the case of such interceptors, except that, if a grant for such interceptors has been approved prior to the date of enactment of the Municipal Wastewater Treatment Construction Grant Amendments of 1981, such interceptors shall be funded based on the approved reserve capacity not to exceed 40 years.

(d)(1) A grant for the construction of treatment works under this title shall provide that the engineer or engineering firm supervising construction or providing architect engineering services during construction shall continue its relationship to the grant appli-

cant for a period of one year after the completion of construction and initial operation of such treatment works. During such period such engineer or engineering firm shall supervise operation of the treatment works, train operating personnel, and prepare curricula and training material for operating personnel. Costs associated with the implementation of this paragraph shall be eligible for Federal assistance in accordance with this title.

(2) On the date one year after the completion of construction and initial operation of such treatment works, the owner and operator of such treatment works shall certify to the Administrator whether or not such treatment works meet the design specifications and effluent limitations contained in the grant agreement and permit pursuant to section 402 of the Act for such works. If the owner and operator of such treatment works cannot certify that such treatment works meet such design specifications and effluent limitations, any failure to meet such design specifications and effluent limitations shall be corrected in a timely manner, to allow such affirmative certification, at other than Federal expense.

(3) Nothing in this section shall be construed to prohibit a grantee under this title from requiring more assurances, guarantees, or indemnity or other contractual requirements from any party to a contract pertaining to a project assisted under this title, than those provided under this subsection.

(33 U.S.C. 1284)

ALLOTMENT

SEC. 205. (a) Sums authorized to be appropriated pursuant to section 207 for each fiscal year beginning after June 30, 1972, before September 30, 1977, shall be allotted by the Administrator not later than the January 1st immediately preceding the beginning of the fiscal year for which authorized, except that the allotment for fiscal year 1973 shall be made not later than 30 days after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972. Such sums shall be allotted among the States by the Administrator in accordance with regulations promulgated by him, in the ratio that the estimated cost of constructing all needed publicly owned treatment works in each State bears to the estimated cost of construction of all needed publicly owned treatment works in all of the States. For the fiscal years ending June 30, 1973, and June 30, 1974, such ratio shall be determined on the basis of table III of House Public Works Committee Print No. 92–50. For the fiscal year ending June 30, 1975, such ratio shall be determined one-half on the basis of table I of House Public Works Committee Print Numbered 93–28 and one-half on the basis of table II of such print, except that no State shall receive an allotment less than that which it received for the fiscal year ending June 30, 1972, as set forth in table III of such print. Allotments for fiscal years which begin after the fiscal year ending June 30, 1975 shall be made only in accordance with a revised cost estimate made and submitted to Congress in accordance with section 516 of this Act and only after such revised cost estimate shall have been approved by law specifically enacted hereafter.

(b)(1) Any sums allotted to a State under subsection (a) shall be available for obligation under section 203 on and after the date

of such allotment. Such sums shall continue available for obligation in such State for a period of one year after the close of the fiscal year for which such sums are authorized. Any amounts so allotted which are not obligated by the end of such one-year period shall be immediately reallotted by the Administrator, in accordance with regulations promulgated by him, generally on the basis of the ratio used in making the last allotment of sums under this section. Such reallotted sums shall be added to the last allotments made to the States. Any sum made available to a State by reallotment under this subsection shall be in addition to any funds otherwise allotted to such State for grants under this title during any fiscal year.

(2) Any sums which have been obligated under section 203 and which are released by the payment of the final voucher for the project shall be immediately credited to the State to which such sums were last allotted. Such released sums shall be added to the amounts last allotted to such State and shall be immediately available for obligation in the same manner and to the same extent as such last allotment.

(c)(1) Sums authorized to be appropriated pursuant to section 207 for the fiscal years during the period beginning October 1, 1977, and ending September 30, 1981, shall be allotted for each such year by the Administrator not later than the tenth day which begins after the date of enactment of the Clean Water Act of 1977. Not-withstanding any other provision of law, sums authorized for the fiscal years ending September 30, 1978, September 30, 1979, September 30, 1980, and September 30, 1981, shall be allotted in accordance with table 3 of Committee Print Numbered 95–30 of the Committee on Public Works and Transportation of the House of Representatives.

(2) Sums authorized to be appropriated pursuant to section 207 for the fiscal years 1982, 1983, 1984, and 1985 shall be allotted for each such year by the Administrator not later than the tenth day which begins after the date of enactment of the Municipal Wastewater Treatment Construction Grant Amendments of 1981. Notwithstanding any other provision of law, sums authorized for the fiscal year ending September 30, 1982, shall be allotted in accordance with table 3 of Committee Print Numbered 95–30 of the Committee on Public Works and Transportation of the House of Representatives. Sums authorized for the fiscal years ending September 30, 1983, September 30, 1984, September 30, 1985, and September 30, 1986, shall be allotted in accordance with the following table:

(d) Sums allotted to the States for a fiscal year shall remain available for obligation for the fiscal year for which authorized and for the period of the next succeeding twelve months. The amount of any allotment not obligated by the end of such twenty-four-month period shall be immediately reallotted by the Administrator on the basis of the same ratio as applicable to sums allotted for the

then current fiscal year, except that none of the funds reallotted by the Administrator for fiscal year 1978 and for fiscal years thereafter shall be allotted to any State which failed to obligate any of the funds being reallotted. Any sum made available to a State by reallotment under this subsection shall be in addition to any funds otherwise allotted to such State for grants under this title during any fiscal year.

(e) For the fiscal years 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, and 1990, no State shall receive less than one-half of 1 per centum of the total allotment under subsection (c) of this section, except that in the case of Guam, Virgin Islands, American Samoa, and the Trust Territories not more than thirty-three one-hundredths of 1 per centum in the aggregate shall be allotted to all four for these jurisdictions. For the purpose of carrying out this subsection there are authorized to be appropriated, subject to such amounts as are provided in appropriation Acts, not to exceed $75,000,000 for each fiscal years 1978, 1979, 1980, 1981, 1982, 1983, 1984, 1985, 1986, 1987, 1988, 1989, and 1990. If for any fiscal year the amount appropriated under authority of this subsection is less than the amount necessary to carry out this subsection, the amount each State receives under this subsection for such year shall be the same ratio for the amount such State would have received under this subsection in such year if the amount necessary to carry it out had been appropriated as the amount appropriated for such year bears to the amount necessary to carry out this subsection for such year.

(f) Notwithstanding any other provision of this section, sums made available between January 1, 1975, and March 1, 1975, by the Administrator for obligation shall be available for obligation until September 30, 1978.

(g)(1) The Administrator is authorized to reserve each fiscal year not to exceed 2 per centum of the amount authorized under section 207 of this title for purposes of the allotment made to each State under this section on or after October 1, 1977, except in the case of any fiscal year beginning on or after October 1, 1981, and ending before October 1, 1994, in which case the percentage authorized to be reserved shall not exceed 4 per centum.[1] or $400,000 whichever amount is the greater. Sums so reserved shall be available for making grants to such State under paragraph (2) of this subsection for the same period as sums are available from such allotment under subsection (d) of this section, and any such grant shall be available for obligation only during such period. Any grant made from sums reserved under this subsection which has not been obligated by the end of the period for which available shall be added to the amount last allotted to such State under this section and shall be immediately available for obligation in the same manner and to the same extent as such last allotment. Sums authorized to be reserved by this paragraph shall be in addition to and not in lieu of any other funds which may be authorized to carry out this subsection.

(2) The Administrator is authorized to grant to any State from amounts reserved to such State under this subsection, the reasonable costs of administering any aspects of sections 201, 203, 204,

[1] P.L. 97–117 added this phrase with a period at the end; probably should be a comma.

and 212 of this Act the responsibility for administration of which the Administrator has delegated to such State. The Administrator may increase such grant to take into account the reasonable costs of administering an approved program under section 402 or 404, administering a statewide waste treatment management planning program under section 208(b)(4), and managing waste treatment construction grants for small communities.

(h) The Administrator shall set aside from funds authorized for each fiscal year beginning on or after October 1, 1978, a total (as determined by the Governor of the State) of not less than 4 percent nor more than 7½ percent of the sums allotted to any State with a rural population of 25 per centum or more of the total population of such State, as determined by the Bureau of the Census. The Administrator may set aside no more than 7½ percent of the sums allotted to any other State for which the Governor requests such action. Such sums shall be available only for alternatives to conventional sewage treatment works for municipalities having a population of three thousand five hundred or less, or for the highly dispersed sections of larger municipalities, as defined by the Administrator.

(i) SET-ASIDE FOR INNOVATIVE AND ALTERNATIVE PROJECTS.—Not less than ½ of 1 percent of funds allotted to a State for each of the fiscal years ending September 30, 1979, through September 30, 1990, under subsection (c) of this section shall be expended only for increasing the Federal share of grants for construction of treatment works utilizing innovative processes and techniques pursuant to section 202(a)(2) of this Act. Including the expenditures authorized by the preceding sentence, a total of 2 percent of the funds allotted to a State for each of the fiscal years ending September 30, 1979, and September 30, 1980, and 3 percent of the funds allotted to a State for the fiscal year ending September 30, 1981, under subsection (c) of this section shall be expended only for increasing grants for construction of treatment works pursuant to section 202(a)(2) of this Act. Including the expenditures authorized by the first sentence of this subsection, a total (as determined by the Governor of the State) of not less than 4 percent nor more than 7½ percent of the funds allotted to such State under subsection (c) of this section for each of the fiscal years ending September 30, 1982, through September 30, 1990, shall be expended only for increasing the Federal share of grants for construction of treatment works pursuant to section 202(a)(2) of this Act.

(j)(1) The Administrator shall reserve each fiscal year not to exceed 1 per centum of the sums allotted and available for obligation to each State under this section for each fiscal year beginning on or after October 1, 1981, or $100,000, whichever amount is the greater.

(2) Such sums shall be used by the Administrator to make grants to the States to carry out water quality management planning, including, but not limited to—

(A) identifying most cost effective and locally acceptable facility and non-point measures to meet and maintain water quality standards;

(B) developing an implementation plan to obtain State and local financial and regulatory commitments to implement measures developed under subparagraph (A);

(C) determining the nature, extent, and causes of water quality problems in various areas of the State and interstate region, and reporting on these annually; and

(D) determining those publicly owned treatment works which should be constructed with assistance under this title, in which areas and in what sequence, taking into account the relative degree of effluent reduction attained, the relative contributions to water quality of other point or nonpoint sources, and the consideration of alternatives to such construction, and implementing section 303(e) of this Act.

(3) In carrying out planning with grants made under paragraph (2) of this subsection, a State shall develop jointly with local, regional, and interstate entities, a plan for carrying out the program and give funding priority to such entities and designated or undesignated public comprehensive planning organizations to carry out the purposes of this subsection. In giving such priority, the State shall allocate at least 40 percent of the amount granted to such State for a fiscal year under paragraph (2) of this subsection to regional public comprehensive planning organizations in such State and appropriate interstate organizations for the development and implementation of the plan described in this paragraph. In any fiscal year for which the Governor, in consultation with such organizations and with the approval of the Administrator, determines that allocation of at least 40 percent of such amount to such organizations will not result in significant participation by such organizations in water quality management planning and not significantly assist in development and implementation of the plan described in this paragraph and achieving the goals of this Act, the allocation to such organization may be less than 40 percent of such amount.

(4) All activities undertaken under this subsection shall be in coordination with other related provisions of this Act.

(5) NONPOINT SOURCE RESERVATION.—In addition to the sums reserved under paragraph (1), the Administrator shall reserve each fiscal year for each State 1 percent of the sums allotted and available for obligation to such State under this section for each fiscal year beginning on or after October 1, 1986, or $100,000, whichever is greater, for the purpose of carrying out section 319 of this Act. Sums so reserved in a State in any fiscal year for which such State does not request the use of such sums, to the extent such sums exceed $100,000, may be used by such State for other purposes under this title.

(k) The Administrator shall allot to the State of New York from sums authorized to be appropriated for the fiscal year ending September 30, 1982, an amount necessary to pay the entire cost of conveying sewage from the Convention Center of the City of New York to the Newtown sewage treatment plant, Brooklyn-Queens area, New York. The amount allotted under this subsection shall be in addition to and not in lieu of any other amounts authorized to be allotted to such State under this Act.

(l) MARINE ESTUARY RESERVATION.—

(1) RESERVATION OF FUNDS.—

(A) GENERAL RULE.—Prior to making allotments among the States under subsection (c) of this section, the Administrator shall reserve funds from sums appropriated

pursuant to section 207 for each fiscal year beginning after September 30, 1986.

(B) FISCAL YEARS 1987 AND 1988.—For each of fiscal years 1987 and 1988 the reservation shall be 1 percent of the sums appropriated pursuant to section 207 for such fiscal year.

(C) FISCAL YEARS 1989 AND 1990.—For each of fiscal years 1989 and 1990 the reservation shall be 1½ percent of the funds appropriated pursuant to section 207 for such fiscal year.

(2) USE OF FUNDS.—Of the sums reserved under this subsection, two-thirds shall be available to address water quality problems of marine bays and estuaries subject to lower levels of water quality due to the impacts of discharges from combined storm water and sanitary sewer overflows from adjacent urban complexes, and one-third shall be available for the implementation of section 320 of this Act, relating to the national estuary program.

(3) PERIOD OF AVAILABILITY.—Sums reserved under this subsection shall be subject to the period of availability for obligation established by subsection (d) of this section.

(4) TREATMENT OF CERTAIN BODY OF WATER.—For purposes of this section and section 201(n), Newark Bay, New Jersey, and the portion of the Passaic River up to Little Falls, in the vicinity of Beatties Dam, shall be treated as a marine bay and estuary.

(m) DISCRETIONARY DEPOSITS INTO STATE WATER POLLUTION CONTROL REVOLVING FUNDS.—

(1) FROM CONSTRUCTION GRANT ALLOTMENTS.—In addition to any amounts deposited in a water pollution control revolving fund established by a State under title VI, upon request of the Governor of such State, the Administrator shall make available to the State for deposit, as capitalization grants, in such fund in any fiscal year beginning after September 30, 1986, such portion of the amounts allotted to such State under this section for such fiscal year as the Governor considers appropriate; except that (A) in fiscal year 1987 such deposit may not exceed 50 percent of the amounts allotted to such State under this section for such fiscal year, and (B) in fiscal year 1988, such deposit may not exceed 75 percent of the amounts allotted to such State under this section for this [1] fiscal year.

(2) NOTICE REQUIREMENT.—The Governor of a State may make a request under paragraph (1) for a deposit into the water pollution control revolving fund of such State—

(A) in fiscal year 1987 only if no later than 90 days after the date of the enactment of this subsection, and

(B) in each fiscal year thereafter only if 90 days before the first day of such fiscal year,

the State provides notice of its intent to make such deposit.

(3) EXCEPTION.—Sums reserved under section 205(j) of this Act shall not be available for obligation under this subsection.

(33 U.S.C. 1285)

[1] So in original. Probably should be "such".

REIMBURSEMENT AND ADVANCED CONSTRUCTION

SEC. 206. (a) Any publicly owned treatment works in a State on which construction was initiated after June 30, 1966, but before July 1, 1973, which was approved by the appropriate State water pollution control agency and which the Administrator finds meets the requirements of section 8 of this Act in effect at the time of the initiation of construction shall be reimbursed a total amount equal to the difference between the amount of Federal financial assistance, if any, received under such section 8 for such project and 50 per centum of the cost of such project, or 55 per centum of the project cost where the Administrator also determines that such treatment works was constructed in conformity with a comprehensive metropolitan treatment plan as described in section 8(f) of the Federal Water Pollution Control Act as in effect immediately prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972. Nothing in this subsection shall result in any such works receiving Federal grants from all sources in excess of 80 per centum of the cost of such project.

(b) Any publicly owned treatment works constructed with or eligible for Federal financial assistance under this Act in a State between June 30, 1956, and June 30, 1966, which was approved by the State water pollution control agency and which the Administrator finds meets the requirements of section 8 of this Act prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972 but which was constructed without assistance under such section 8 or which received such assistance in an amount less than 30 per centum of the cost of such project shall qualify for payments and reimbursement of State or local funds used for such project from sums allocated to such State under this section in an amount which shall not exceed the difference between the amount of such assistance, if any, received for such project and 30 per centum of the cost of such project.

(c) No publicly owned treatment works shall receive any payment or reimbursement under subsection (a) or (b) of this section unless an application for such assistance is filed with the Administrator within the one year period which begins on the date of enactment of the Federal Water Pollution Control Act Amendments of 1972. Any application filed within such one year period may be revised from time to time, as may be necessary.

(d) The Administrator shall allocate to each qualified project under subsection (a) of this section each fiscal year for which funds are appropriated under subsection (e) of this section an amount which bears the same ratio to the unpaid balance of the reimbursement due such project as the total of such funds for such year bears to the total unpaid balance of reimbursement due all such approved projects on the date of enactment of such appropriation. The Administrator shall allocate to each qualified project under subsection (b) of this section each fiscal year for which funds are appropriated under subsection (e) of this section an amount which bears the same ratio to the unpaid balance of the reimbursement due such project as the total of such funds for such year bears to the total unpaid balance of reimbursement due all such approved projects on the date of enactment of such appropriation.

(e) There is authorized to be appropriated to carry out subsection (a) of this section not to exceed $2,600,000,000 and, to carry out subsection (b) of this section, not to exceed $750,000,000. The authorizations contained in this subsection shall be the sole source of funds for reimbursements authorized by this section.

(f)(1) In any case where a substantial portion of the funds allotted to a State for the current fiscal year under this title have been obligated under section 201(g), or will be so obligated in a timely manner (as determined by the Administrator), and there is construction of any treatment work project without the aid of Federal funds and in accordance with all procedures and all requirements applicable to treatment works projects, except those procedures and requirements which limit construction of projects to those constructed with the aid of previously allotted Federal funds, the Administrator, upon his approval of an application made under this subsection therefore, is authorized to pay the Federal share of the cost of construction of such project when additional funds are allotted to the State under this title if prior to the construction of the project the Administrator approves plans, specifications, and estimates therefor in the same manner as other treatment works projects. The Administrator may not approve an application under this subsection unless an authorization is in effect for the first fiscal year in the period for which the application requests payment and such requested payment for that fiscal year does not exceed the State's expected allotment from such authorization. The Administrator shall not be required to make such requested payment for any fiscal year—

(A) to the extent that such payment would exceed such State's allotment of the amount appropriated for such fiscal year; and

(B) unless such payment is for a project which, on the basis of an approved funding priority list of such State, is eligible to receive such payment based on the allotment and appropriation for such fiscal year.

To the extent that sufficient funds are not appropriated to pay the full Federal share with respect to a project for which obligations under the provisions of this subsection have been made, the Administrator shall reduce the Federal share to such amount less than 75 per centum as such appropriations do provide.

(2) In determining the allotment for any fiscal year under this title, any treatment works project constructed in accordance with this section and without the aid of Federal funds shall not be considered completed until an application under the provisions of this subsection with respect to such project has been approved by the Administrator, or the availability of funds from which this project is eligible for reimbursement has expired, whichever first occurs.

(33 U.S.C. 1286)

AUTHORIZATION

SEC. 207. There is authorized to be appropriated to carry out this title, other than sections 206(e), 208 and 209, for the fiscal year ending June 30, 1973, not to exceed $5,000,000,000, for the fiscal year ending June 30, 1974, not to exceed $6,000,000,000, and for the fiscal year ending June 30, 1975, not to exceed

$7,000,000,000, and, subject to such amounts as are provided in appropriation Acts for the fiscal year ending September 30, 1977, $1,000,000,000 for the fiscal year ending September 30, 1978, $4,500,000,000 and for the fiscal years ending September 30, 1979, September 30, 1980, not to exceed $5,000,000,000; for the fiscal year ending September 30, 1981, not to exceed $2,548,837,000; and for the fiscal years ending September 30, 1982, September 30, 1983, September 30, 1984, and September 30, 1985, not to exceed $2,400,000,000 per fiscal year; and for each of the fiscal years ending September 30, 1986, September 30, 1987, and September 30, 1988, not to exceed $2,400,000,000; and for each of the fiscal years ending September 30, 1989, and September 30, 1990, not to exceed $1,200,000,000.

(33 U.S.C. 1287)

AREAWIDE WASTE TREATMENT MANAGEMENT

SEC. 208. (a) For the purpose of encouraging and facilitating the development and implementation of areawide waste treatment management plans—

(1) The Administrator, within ninety days after the date of enactment of this Act and after consultation with appropriate Federal, State, and local authorities, shall by regulation publish guidelines for the identification of those areas which, as a result of urban-industrial concentrations or other factors, have substantial water quality control problems.

(2) The Governor of each State, within sixty days after publication of the guidelines issued pursuant to paragraph (1) of this subsection, shall identify each area within the State which, as a result of urban-industrial concentrations or other factors, has substantial water quality control problems. Not later than one hundred and twenty days following such identification and after consultation with appropriate elected and other officials of local governments having jurisdiction in such areas, the Governor shall designate (A) the boundaries of each such area, and (B) a single representative organization, including elected officials from local governments or their designees, capable of developing effective areawide waste treatment management plans for such an area. The Governor may in the same manner at any later time identify any additional area (or modify an existing area) for which he determines areawide waste treatment management to be appropriate, designate the boundaries of such area, and designate an organization capable of developing effective areawide waste treatment management plans for such area.

(3) With respect to any area which, pursuant to the guidelines published under paragraph (1) of this subsection, is located in two or more States, the Governors of the respective States shall consult and cooperate in carrying out the provisions of paragraph (2), with a view toward designating the boundaries of the interstate area having common water quality control problems and for which areawide waste treatment management plans would be most effective, and toward designating, within one hundred and eighty days after publication of guidelines issued pursuant to paragraph (1) of this sub-

section, of a single representative organization capable of developing effective areawide waste treatment management plans for such area.

(4) If a Governor does not act, either by designating or determining not to make a designation under paragraph (2) of this subsection, within the time required by such paragraph, or if, in the case of an interstate area, the Governors of the States involved do not designate a planning organization within the time required by paragraph (3) of this subsection, the chief elected officials of local governments within an area may by agreement designate (A) the boundaries for such an area, and (B) a single representative organization including elected officials from such local governments, or their designees, capable of developing an areawide waste treatment management plan for such area.

(5) Existing regional agencies may be designated under paragraphs (2), (3), and (4) of this subsection.

(6) The State shall act as a planning agency for all portions of such State which are not designated under paragraphs (2), (3), or (4) of this subsection.

(7) Designations under this subsection shall be subject to the approval of the Administrator.

(b)(1)(A) Not later than one year after the date of designation of any organization under subsection (a) of this section such organization shall have in operation a continuing areawide waste treatment management planning process consistent with section 201 of this Act. Plans prepared in accordance with this process shall contain alternatives for waste treatment management, and be applicable to all wastes generated within the area involved. The initial plan prepared in accordance with such process shall be certified by the Governor and submitted to the Administrator not later than two years after the planning process is in operation.

(B) For any agency designated after 1975 under subsection (a) of this section and for all portions of a State for which the State is required to act as the planning agency in accordance with subsection (a)(6), the initial plan prepared in accordance with such process shall be certified by the Governor and submitted to the Administrator not later than three years after the receipt of the initial grant award authorized under subsection (f) of this section.

(2) Any plan prepared under such process shall include, but not be limited to—

(A) the identification of treatment works necessary to meet the anticipated municipal and industrial waste treatment needs of the area over a twenty-year period, annually updated (including an analysis of alternative waste treatment systems), including any requirements for the acquisition of land for treatment purposes; the necessary waste water collection and urban storm water runoff systems; and a program to provide the necessary financial arrangements for the development of such treatment works, and an identification of open space and recreation opportunities that can be expected to result from improved water quality, including consideration of potential use of lands associated with treatment works and increased access to water-based recreation;

(B) the establishment of construction priorities for such treatment works and time schedules for the initiation and completion of all treatment works;

(C) the establishment of a regulatory program to—

(i) implement the waste treatment management requirements of section 201(c),

(ii) regulate the location, modification, and construction of any facilities within such area which may result in any discharge in such area, and

(iii) assure that any industrial or commercial waste discharged into any treatment works in such area meet applicable pretreatment requirements;

(D) the identification of those agencies necessary to construct, operate, and maintain all facilities required by the plan and otherwise to carry out the plan;

(E) the identification of the measures necessary to carry out the plan (including financing), the period of time necessary to carry out the plan, the costs of carrying out the plan within such time, and the economic, social, and environmental impact of carrying out the plan within such time;

(F) a process to (i) identify, if appropriate, agriculturally and silviculturally related nonpoint sources of pollution, including return flows from irrigated agriculture, and their cumulative effects, runoff from manure disposal areas, and from land used for livestock and crop production, and (ii) set forth procedures and methods (including land use requirements) to control to the extent feasible such sources;

(G) a process of (i) identify, if appropriate, mine-related sources of pollution including new, current, and abandoned surface and underground mine runoff, and (ii) set forth procedures and methods (including land use requirements) to control to the extent feasible such sources;

(H) a process to (i) identify construction activity related sources of pollution, and (ii) set forth procedures and methods (including land use requirements) to control to the extent feasible such sources;

(I) a process to (i) identify, if appropriate, salt water intrusion into rivers, lakes, and estuaries resulting from reduction of fresh water flow from any cause, including irrigation, obstruction, ground water extraction, and diversion, and (ii) set forth procedures and methods to control such intrusion to the extent feasible where such procedures and methods are otherwise a part of the waste treatment management plan;

(J) a process to control the disposition of all residual waste generated in such area which could affect water quality; and

(K) a process to control the disposal of pollutants on land or in subsurface excavations within such area to protect ground and surface water quality.

(3) Areawide waste treatment management plans shall be certified annually by the Governor or his designee (or Governors or their designees, where more than one State is involved) as being consistent with applicable basin plans and such areawide waste treatment management plans shall be submitted to the Administrator for his approval.

(4)(A) Whenever the Governor of any State determines (and notifies the Administrator) that consistency with a statewide regulatory program under section 303 so requires, the requirements of clauses (F) through (K) of paragraph (2) of this subsection shall be developed and submitted by the Governor to the Administrator for approval for application to a class or category of activity throughout such State.

(B) Any program submitted under subparagraph (A) of this paragraph which, in whole or in part, is to control the discharge or other placement of dredged or fill material into the navigable waters shall include the following:

(i) A consultation process which includes the State agency with primary jurisdiction over fish and wildlife resources.

(ii) A process to identify and manage the discharge or other placement of dredged or fill material which adversely affects navigable waters, which shall complement and be coordinated with a State program under section 404 conducted pursuant to this Act.

(iii) A process to assure that any activity conducted pursuant to a best management practice will comply with the guidelines established under section 404(b)(1), and sections 307 and 403 of this Act.

(iv) A process to assure that any activity conducted pursuant to a best management practice can be terminated or modified for cause including, but not limited to, the following:

(I) violation of any condition of the best management practice;

(II) change in any activity that requires either a temporary or permanent reduction or elimination of the discharge pursuant to the best management practice.

(v) A process to assure continued coordination with Federal and Federal-State water-related planning and reviewing processes, including the National Wetlands Inventory.

(C) If the Governor of a State obtains approval from the Administrator of a statewide regulatory program which meets the requirements of subparagraph (B) of this paragraph and if such State is administering a permit program under section 404 of this Act, no person shall be required to obtain an individual permit pursuant to such section, or to comply with a general permit issued pursuant to such section, with respect to any appropriate activity within such State for which a best management practice has been approved by the Administrator under the program approved by the Administrator pursuant to this paragraph.

(D)(i) Whenever the Administrator determines after public hearing that a State is not administering a program approved under this section in accordance with the requirements of this section, the Administrator shall so notify the State, and if appropriate corrective action is not taken within a reasonable time, not to exceed ninety days, the Administrator shall withdraw approval of such program. The Administrator shall not withdraw approval of any such program unless he shall first have notified the State, and made public, in writing, the reasons for such withdrawal.

(ii) In the case of a State with a program submitted and approved under this paragraph, the Administrator shall withdraw approval of such program under this subparagraph only for a sub-

stantial failure of the State to administer its program in accordance with the requirements of this paragraph.

(c)(1) The Governor of each State, in consultation with the planning agency designated under subsection (a) of this section, at the time a plan is submitted to the Administrator, shall designate one or more waste treatment management agencies (which may be an existing or newly created local, regional or State agency or potential subdivision) for each area designated under subsection (a) of this section and submit such designations to the Administrator.

(2) The Administrator shall accept any such designation, unless, within 120 days of such designation, he finds that the designated management agency (or agencies) does not have adequate authority—

(A) to carry out appropriate portions of an areawide waste treatment management plan developed under subsection (b) of this section;

(B) to manage effectively waste treatment works and related facilities serving such area in conformance with any plan required by subsection (b) of this section;

(C) directly or by contract, to design and construct new works, and to operate and maintain new and existing works as required by any plan developed pursuant to subsection (b) of this section;

(D) to accept and utilize grants, or other funds from any source, for waste treatment management purposes;

(E) to raise revenues, including the assessment of waste treatment charges;

(F) to incur short- and long-term indebtedness;

(G) to assure in implementation of an areawide waste treatment management plan that each participating community pays its proportionate share of treatment costs;

(H) to refuse to receive any wastes from any municipality or subdivision thereof, which does not comply with any provisions of an approved plan under this section applicable to such area; and

(I) to accept for treatment industrial wastes.

(d) After a waste treatment management agency having the authority required by subsection (c) has been designated under such subsection for an area and a plan for such area has been approved under subsection (b) of this section, the Administrator shall not make any grant for construction of a publicy owned treatment works under section 201(g)(1) within such area except to such designated agency and for works in conformity with such plan.

(e) No permit under section 402 of this Act shall be issued for any point source which is in conflict with a plan approved pursuant to subsection (b) of this section.

(f)(1) The Administrator shall make grants to any agency designated under subsection (a) of this section for payment of the reasonable costs of developing and operating a continuing areawide waste treatment management planning process under subsection (b) of this section.

(2) For the two-year period beginning on the date of the first grant is made under paragraph (1) of this subsection to an agency, if such first grant is made before October 1, 1977, the amount of each such grant to such agency shall be 100 per centum of the costs

of developing and operating a continuing areawide waste treatment management planning process under subsection (b) of this section, and thereafter the amount granted to such agency shall not exceed 75 per centum of such costs in each succeeding one-year period. In the case of any other grant made to an agency under such paragraph (1) of this subsection, the amount of such grant shall not exceed 75 per centum of the costs of developing and operating a continuing areawide waste treatment management planning process in any year.

(3) Each applicant for a grant under this subsection shall submit to the Administrator for his approval each proposal for which a grant is applied for under this subsection. The Administrator shall act upon such proposal as soon as practicable after it has been submitted, and his approval of that proposal shall be deemed a contractual obligation of the United States for the payment of its contribution to such proposal, subject to such amounts as are provided in appropriation Acts. There is authorized to be appropriated to carry out this subsection not to exceed $50,000,000 for the fiscal year ending June 30, 1973, not to exceed $100,000,000 for the fiscal year ending June 30, 1974, not to exceed $150,000,000 per fiscal year for the fiscal years ending June 30, 1975, September 30, 1977, September 30, 1978, September 30, 1979, and September 30, 1980, not to exceed $100,000,000 per fiscal year for the fiscal years ending September 30, 1981, and September 30, 1982, and such sums as may be necessary for fiscal years 1983 through 1990.

(g) The Administrator is authorized, upon request of the Governor or the designated planning agency, and without reimbursement, to consult with, and provide technical assistance to, any agency designated under subsection (a) of this section in the development of areawide waste treatment management plans under subsection (b) of this section.

(h)(1) The Secretary of the Army, acting through the Chief of Engineers, in cooperation with the Administrator is authorized and directed, upon request of the Governor or the designated planning organization, to consult with, and provide technical assistance to, any agency designed [1] under subsection (a) of this section in developing and operating a continuing areawide waste treatment management planning process under subsection (b) of this section.

(2) There is authorized to be appropriated to the Secretary of the Army, to carry out this subsection, not to exceed $50,000,000 per fiscal year for the fiscal years ending June 30, 1973, and June 30, 1974.

(i)(1) The Secretary of the Interior, acting through the Director of the United States Fish and Wildlife Service, shall, upon request of the Governor of a State, and without reimbursement, provide technical assistance to such State in developing a statewide program for submission to the Administrator under subsection (b)(4)(B) of this section and in implementing such program after its approval.

(2) There is authorized to be appropriated to the Secretary of the Interior $6,000,000 to complete the National Wetlands Inventory of the United States, by December 31, 1981, and to provide information from such Inventory to States as it becomes available to

[1] So in original. Probably should be "designated".

assist such States in the development and operation of programs under this Act.

(j)(1) The Secretary of Agriculture, with the concurrence of the Administrator, and acting through the Soil Conservation Service and such other agencies of the Department of Agriculture as the Secretary may designate, is authorized and directed to establish and administer a program to enter into contracts, subject to such amounts as are provided in advance by appropriation acts, of not less than five years nor more than ten years with owners and operators having control of rural land for the purpose of installing and maintaining measures incorporating best management practices to control nonpoint source pollution for improved water quality in those States or areas for which the Administrator has approved a plan under subsection (b) of this section where the practices to which the contracts apply are certified by the management agency designated under subsection (c)(1) of this section to be consistent with such plans and will result in improved water quality. Such contracts may be entered into during the period ending not later than September 31, 1988. Under such contracts the land owners or operator shall agree—

(i) to effectuate a plan approved by a soil conservation district, where one exists, under this section for his farm, ranch, or other land substantially in accordance with the schedule outlined therein unless any requirement thereof is waived or modified by the Secretary;

(ii) to forfeit all rights to further payments or grants under the contract and refund to the United States all payments and grants received thereunder, with interest, upon his violation of the contract at any stage during the time he has control of the land if the Secretary, after considering the recommendations of the soil conservation district, where one exists, and the Administrator, determines that such violation is of such a nature as to warrant termination of the contract, or to make refunds or accept such payment adjustments as the Secretary may deem appropriate if he determines that the violation by the owner or operator does not warrant termination of the contract;

(iii) upon transfer of his right and interest in the farm, ranch, or other land during the contract period to forfeit all rights to further payments or grants under the contract and refund to the United States all payments or grants received thereunder, with interest, unless the transferee of any such land agrees with the Secretary to assume all obligations of the contract;

(iv) not to adopt any practice specified by the Secretary on the advice of the Administrator in the contract as a practice which would tend to defeat the purposes of the contract;

(v) to such additional provisions as the Secretary determines are desirable and includes in the contract to effectuate the purposes of the program or to facilitate the practical administration of the program.

(2) In return for such agreement by the landowner or operator the Secretary shall agree to provide technical assistance and share the cost of carrying out those conservation practices and measures set forth in the contract for which he determines that cost sharing is appropriate and in the public interest and which are approved

for cost sharing by the agency designated to implement the plan developed under subsection (b) of this section. The portion of such cost (including labor) to be shared shall be that part which the Secretary determines is necessary and appropriate to effectuate the installation of the water quality management practices and measures under the contract, but not to exceed 50 per centum of the total cost of the measures set forth in the contract; except the Secretary may increase the matching cost share where he determines that (1) the main benefits to be derived from the measures are related to improving offsite water quality, and (2) the matching share requirement would place a burden on the landowner which would probably prevent him from participating in the program.

(3) The Secretary may terminate any contract with a landowner or operator by mutual agreement with the owner or operator if the Secretary determines that such termination would be in the public interest, and may agree to such modification of contracts previously entered into as he may determine to be desirable to carry out the purposes of the program or facilitate the practical administration thereof or to accomplish equitable treatment with respect to other conservation, land use, or water quality programs.

(4) In providing assistance under this subsection the Secretary will give priority to those areas and sources that have the most significant effect upon water quality. Additional investigations or plans may be made, where necessary, to supplement approved water quality management plans, in order to determine priorities.

(5) The Secretary shall, where practicable, enter into agreements with soil conservation districts, State soil and water conservation agencies, or State water quality agencies to administer all or part of the program established in this subsection under regulations developed by the Secretary. Such agreements shall provide for the submission of such reports as the Secretary deems necessary, and for payment by the United States of such portion of the costs incurred in the administration of the program as the Secretary may deem appropriate.

(6) The contracts under this subsection shall be entered into only in areas where the management agency designated under subsection (c)(1) of this section assures an adequate level of participation by owners and operators having control of rural land in such areas. Within such areas the local soil conservation district, where one exists, together with the Secretary of Agriculture, will determine the priority of assistance among individual land owners and operators to assure that the most critical water quality problems are addressed.

(7) The Secretary, in consultation with the Administrator and subject to section 304(k) of this Act, shall, not later than September 30, 1978, promulgate regulations for carrying out this subsection and for support and cooperation with other Federal and non-Federal agencies for implementation of this subsection.

(8) This program shall not be used to authorize or finance projects that would otherwise be eligible for assistance under the terms of Public Law 83–566.

(9) There are hereby authorized to be appropriated to the Secretary of Agriculture $200,000,000 for fiscal year 1979, $400,000,000 for fiscal year 1980, $100,000,000 for fiscal year 1981, $100,000,000 for fiscal year 1982, and such sums as may be nec-

essary for fiscal years 1983 through 1990, to carry out this subsection. The program authorized under this subsection shall be in addition to, and not in substitution of, other programs in such area authorized by this or any other public law.

(33 U.S.C. 1288)

BASIN PLANNING

SEC. 209. (a) The President, acting through the Water Resources Council, shall, as soon as practicable, prepare a Level B plan under the Water Resource Planning Act for all basins in the United States. All such plans shall be completed not later than January 1, 1980, except that priority in the preparation of such plans shall be given to those basins and portions thereof which are within those areas designated under paragraphs (2), (3), and (4) of subsection (a) of section 208 of this Act.

(b) The President, acting through the Water Resources Council, shall report annually to Congress on progress being made in carrying out this section. The first such report shall be submitted not later than January 31, 1973.

(c) There is authorized to be appropriated to carry out this section not to exceed $200,000,000.

(33 U.S.C. 1289)

ANNUAL SURVEY

SEC. 210. The Administrator shall annually make a survey to determine the efficiency of the operation and maintenance of treatment works constructed with grants made under this Act, as compared to the efficiency planned at the time the grant was made. The results of such annual survey shall be reported to Congress not later than 90 days after the date of convening of each session of Congress.

(33 U.S.C. 1290)

SEWAGE COLLECTION SYSTEMS

SEC. 211. (a) No grant shall be made for a sewage collection system under this title unless such grant (1) is for replacement or major rehabilitation of an existing collection system and is necessary to the total integrity and performance of the waste treatment works serving such community, or (2) is for a new collection system in an existing community with sufficient existing or planned capacity adequately to treat such collected sewage and is consistent with section 201 of this Act.

(b) If the Administrator uses population density as a test for determining the eligibility of a collector sewer for assistance it shall be only for the purpose of evaluating alternatives and determining the needs for such system in relation to ground or surface water quality impact.

(c) No grant shall be made under this title from funds authorized for any fiscal year during the period beginning October 1, 1977, and ending September 30, 1990, for treatment works for control of pollutant discharges from separate storm sewer systems.

(33 U.S.C. 1291)

DEFINITIONS

SEC. 212. As used in this title—

(1) The term "construction" means any one or more of the following: preliminary planning to determine the feasibility of treatment works, engineering, architectural, legal, fiscal, or economic investigations or studies, surveys, designs, plans, working drawings, specifications, procedures, field testing of innovative or alternative waste water treatment processes and techniques meeting guidelines promulgated under section 304(d)(3) of this Act, or other necessary actions, erection, building, acquisition, alteration, remodeling, improvement, or extension of treatment works, or the inspection or supervision of any of the foregoing items.

(2)(A) The term "treatment works" means any devices and systems used in the storage, treatment, recycling, and reclamation of municipal sewage or industrial wastes of a liquid nature to implement section 201 of this act, or necessary to recycle or reuse water at the most economical cost over the estimated life of the works, including intercepting sewers, outfall sewers, sewage collection systems, pumping, power, and other equipment, and their appurtenances; extensions, improvements, remodeling, additions, and alterations thereof; elements essential to provide a reliable recycled supply such as standby treatment units and clear well facilities; and any works, including site acquisition of the land that will be an integral part of the treatment process (including land use for the storage of treated wastewater in land treatment systems prior to land application) or is used for ultimate disposal of residues resulting from such treatment.

(B) In addition to the definition contained in subparagraph (A) of this paragraph, "treatment works" means any other method or system for preventing, abating, reducing, storing, treating, separating, or disposing of municipal waste, including storm water runoff, or industrial waste, including waste in combined storm water and sanitary sewer systems. Any application for construction grants which includes wholly or in part such methods or systems shall, in accordance with guidelines published by the Administrator pursuant to subparagraph (C) of this paragraph, contain adequate data and analysis demonstrating such proposal to be, over the life of such works, the most cost efficient alternative to comply with sections 301 or 302 of this Act, or the requirements of section 201 of this Act.

(C) For the purposes of subparagraph (B) of this paragraph, the Administrator shall, within one hundred and eighty days after the date of enactment of this title, publish and thereafter revise no less often than annually, guidelines for the evaluation of methods, including cost-effective analysis, described in subparagraph (B) of this paragraph.

(3) The term "replacement" as used in this title means those expenditures for obtaining and installing equipment, accessories, or appurtenances during the useful life of the treatment works necessary to maintain the capacity and performance for which such works are designed and constructed.

(33 U.S.C. 1292)

LOAN GUARANTEES FOR CONSTRUCTION OF TREATMENT WORKS

SEC. 213. (a) Subject to the conditions of this section and to such terms and conditions as the Administrator determines to be necessary to carry out the purposes of this title, the Administrator is authorized to guarantee, and to make commitments to guarantee, the principal and interest (including interest accruing between the date of default and the date of the payment in full of the guarantee) of any loan, obligation, or participation therein of any State, municipality, or intermunicipal or interstate agency issued directly and exclusively to the Federal Financing Bank to finance that part of the cost of any grant-eligible project for the construction of publicly owned treatment works not paid for with Federal financial assistance under this title (other than this section), which project the Administrator has determined to be eligible for such financial assistance under this title, including, but not limited to, projects eligible for reimbursement under section 206 of this title.

(b) No guarantee, or commitment to make a guarantee, may be made pursuant to this section—

(1) unless the Administrator certifies that the issuing body is unable to obtain on reasonable terms sufficient credit to finance its actual needs without such guarantee; and

(2) unless the Administrator determines that there is a reasonable assurance or repayment of the loan, obligation, or participation therein.

A determination of whether financing is available at reasonable rates shall be made by the Secretary of the Treasury with relationship to the current average yield on outstanding marketable obligations of municipalities of comparable maturity.

(c) The Administrator is authorized to charge reasonable fees for the investigation of an application for a guarantee and for the issuance of a commitment to make a guarantee.

(d) The Administrator, in determining whether there is a reasonable assurance of repayment, may require a commitment which would apply to such repayment. Such commitment may include, but not be limited to, any funds received by such grantee from the amounts appropriated under section 206 of this Act.

(33 U.S.C. 1293)

PUBLIC INFORMATION

SEC. 214. The Administrator shall develop and operate within one year of the date of enactment of this section, a continuing program of public information and education on recycling and reuse of wastewater (including sludge), the use of land treatment, and methods for the reduction of wastewater volume.

(33 U.S.C. 1294)

REQUIREMENTS FOR AMERICAN MATERIALS

SEC. 215. Notwithstanding any other provision of law, no grant for which application is made after February 1, 1978, shall be made under this title for any treatment works unless only such unmanufactured articles, materials, and supplies as have been mined or produced in the United States, and only such manufactured arti-

cles, materials, and supplies as have been manufactured in the United States, substantially all from articles, materials, or supplies mined, produced, or manufactured, as the case may be, in the United States will be used in such treatment works. This section shall not apply in any case where the Administrator determines, based upon those factors the Administrator deems relevant, including the available resources of the agency, it to be inconsistent with the public interest (including multilateral government procurement agreements) or the cost to be unreasonable, or if articles, materials, or supplies of the class or kind to be used or the articles, materials, or supplies from which they are manufactured are not mined, produced, or manufactured, as the case may be, in the United States in sufficient and reasonably available commercial quantities and of a satisfactory quality.

(33 U.S.C. 1295)

DETERMINATION OF PRIORITY

SEC. 216. Notwithstanding any other provision of this Act, the determination of the priority to be given each category of projects for construction of publicly owned treatment works within each State shall be made solely by that State, except that if the Administrator, after a public hearing, determines that a specific project will not result in compliance with the enforceable requirements of this Act, such project shall be removed from the State's priority list and such State shall submit a revised priority list. These categories shall include, but not be limited to (A) secondary treatment, (B) more stringent treatment, (C) infiltration-in-flow correction, (D) major sewer system rehabilitation, (E) new collector sewers and appurtenances, (F) new interceptors and appurtenances, and (G) correction of combined sewer overflows. Not less than 25 per centum of funds allocated to a State in any fiscal year under this title for construction of publicly owned treatment works in such State shall be obligated for those types of projects referred to in clauses (D), (E), (F), and (G) of this section, if such projects are on such State's priority list for that year and are otherwise eligible for funding in that fiscal year. It is the policy of Congress that projects for wastewater treatment and management undertaken with Federal financial assistance under this Act by any State, municipality, or intermunicipal or interstate agency shall be projects which, in the estimation of the State, are designed to achieve optimum water quality management, consistent with the public health and water quality goals and requirements of the Act.

(33 U.S.C. 1296)

COST-EFFECTIVENESS GUIDELINES

SEC. 217. Any guidelines for cost-effectiveness analysis published by the Administrator under this title shall provide for the identification and selection of cost effective alternatives to comply with the objective and goals of this Act and sections 201(b), 201(d), 201(g)(2)(A), and 301(b)(2)(B) of this Act.

(33 U.S.C. 1297)

COST EFFECTIVENESS

SEC. 218. (a) It is the policy of Congress that a project for waste treatment and management undertaken with Federal financial assistance under this Act by any State, municipality, or intermunicipal or interstate agency shall be considered as an overall waste treatment system for waste treatment and management, and shall be that system which constitutes the most economical and cost-effective combination of devices and systems used in the storage, treatment, recycling, and reclamation of municipal sewage or industrial wastes of a liquid nature to implement section 201 of this Act, or necessary to recycle or reuse water at the most economical cost over the estimated life of the works, including intercepting sewers, outfall sewers, sewage collection systems, pumping power, and other equipment, and their appurtenances; extension, improvements, remodeling, additions, and alterations thereof; elements essential to provide a reliable recycled supply such as standby treatment units and clear well facilities; and any works, including site acquisition of the land that will be an integral part of the treatment process (including land use for the storage of treated wastewater in land treatment systems prior to land application) or which is used for ultimate disposal of residues resulting from such treatment; water efficiency measures and devices; and any other method or system for preventing, abating, reducing, storing, treating, separating, or disposing of municipal waste, including storm water runoff, or industrial waste, including waste in combined storm water and sanitary sewer systems; to meet the requirements of this Act.

(b) In accordance with the policy set forth in subsection (a) of this section, before the Administrator approves any grant to any State, municipality, or intermunicipal or interstate agency for the erection, building, acquisition, alteration, remodeling, improvement, or extension of any treatment works the Administrator shall determine that the facilities plan of which such treatment works are a part constitutes the most economical and cost-effective combination of treatment works over the life of the project to meet the requirements of this Act, including, but not limited to, consideration of construction costs, operation, maintenance, and replacement costs.

(c) In furtherance of the policy set forth in subsection (a) of this section, the Administrator shall require value engineering review in connection with any treatment works, prior to approval of any grant for the erection, building, acquisition, alteration, remodeling, improvement, or extension of such treatment works, in any case in which the cost of such erection, building, acquisition, alteration, remodeling, improvement, or extension is projected to be in excess of $10,000,000. For purposes of this subsection, the term "value engineering review" means a specialized cost control technique which uses a systematic and creative approach to identify and to focus on unnecessarily high cost in a project in order to arrive at a cost saving without sacrificing the reliability or efficiency of the project.

(d) This section applies to projects for waste treatment and management for which no treatment works including a facilities plan for such project have received Federal financial assistance for

the preparation of construction plans and specifications under this Act before the date of enactment of this section.

(33 U.S.C. 1298)

STATE CERTIFICATION OF PROJECTS

SEC. 219. Whenever the Governor of a State which has been delegated sufficient authority to administer the construction grant program under this title in that State certifies to the Administrator that a grant application meets applicable requirements of Federal and State law for assistance under this title, the Administrator shall approve or disapprove such application within 45 days of the date of receipt of such application. If the Administrator does not approve or disapprove such application within 45 days of receipt, the application shall be deemed approved. If the Administrator disapproves such application the Administrator shall state in writing the reasons for such disapproval. Any grant approved or deemed approved under this section shall be subject to amounts provided in appropriation Acts.

(33 U.S.C. 1299)

SEC. 220. PILOT PROGRAM FOR ALTERNATIVE WATER SOURCE PROJECTS.

(a) POLICY.—Nothing in this section shall be construed to affect the application of section 101(g) of this Act and all of the provisions of this section shall be carried out in accordance with the provisions of section 101(g).

(b) IN GENERAL.—The Administrator may establish a pilot program to make grants to State, interstate, and intrastate water resource development agencies (including water management districts and water supply authorities), local government agencies, private utilities, and nonprofit entities for alternative water source projects to meet critical water supply needs.

(c) ELIGIBLE ENTITY.—The Administrator may make grants under this section to an entity only if the entity has authority under State law to develop or provide water for municipal, industrial, and agricultural uses in an area of the State that is experiencing critical water supply needs.

(d) SELECTION OF PROJECTS.—

(1) LIMITATION.—A project that has received funds under the reclamation and reuse program conducted under the Reclamation Projects Authorization and Adjustment Act of 1992 (43 U.S.C. 390h et seq.) shall not be eligible for grant assistance under this section.

(2) ADDITIONAL CONSIDERATION.—In making grants under this section, the Administrator shall consider whether the project is located within the boundaries of a State or area referred to in section 1 of the Reclamation Act of June 17, 1902 (32 Stat. 385), and within the geographic scope of the reclamation and reuse program conducted under the Reclamation Projects Authorization and Adjustment Act of 1992 (43 U.S.C. 390h et seq.).

(3) GEOGRAPHICAL DISTRIBUTION.—Alternative water source projects selected by the Administrator under this section shall reflect a variety of geographical and environmental conditions.

(e) COMMITTEE RESOLUTION PROCEDURE.—

(1) IN GENERAL.—No appropriation shall be made for any alternative water source project under this section, the total Federal cost of which exceeds $3,000,000, if such project has not been approved by a resolution adopted by the Committee on Transportation and Infrastructure of the House of Representatives or the Committee on Environment and Public Works of the Senate.

(2) REQUIREMENTS FOR SECURING CONSIDERATION.—For purposes of securing consideration of approval under paragraph (1), the Administrator shall provide to a committee referred to in paragraph (1) such information as the committee requests and the non-Federal sponsor shall provide to the committee information on the costs and relative needs for the alternative water source project.

(f) USES OF GRANTS.—Amounts from grants received under this section may be used for engineering, design, construction, and final testing of alternative water source projects designed to meet critical water supply needs. Such amounts may not be used for planning, feasibility studies or for operation, maintenance, replacement, repair, or rehabilitation.

(g) COST SHARING.—The Federal share of the eligible costs of an alternative water source project carried out using assistance made available under this section shall not exceed 50 percent.

(h) REPORTS.—On or before September 30, 2004, the Administrator shall transmit to Congress a report on the results of the pilot program established under this section, including progress made toward meeting the critical water supply needs of the participants in the pilot program.

(i) DEFINITIONS.—In this section, the following definitions apply:

(1) ALTERNATIVE WATER SOURCE PROJECT.—The term ''alternative water source project'' means a project designed to provide municipal, industrial, and agricultural water supplies in an environmentally sustainable manner by conserving, managing, reclaiming, or reusing water or wastewater or by treating wastewater. Such term does not include water treatment or distribution facilities.

(2) CRITICAL WATER SUPPLY NEEDS.—The term ''critical water supply needs'' means existing or reasonably anticipated future water supply needs that cannot be met by existing water supplies, as identified in a comprehensive statewide or regional water supply plan or assessment projected over a planning period of at least 20 years.

(j) AUTHORIZATION OF APPROPRIATIONS.—There is authorized to be appropriated to carry out this section a total of $75,000,000 for fiscal years 2002 through 2004. Such sums shall remain available until expended.

(33 U.S.C. 1300)

SEC. 221. SEWER OVERFLOW CONTROL GRANTS.

(a) IN GENERAL.—In any fiscal year in which the Administrator has available for obligation at least $1,350,000,000 for the purposes of section 601—

(1) the Administrator may make grants to States for the purpose of providing grants to a municipality or municipal entity for planning, design, and construction of treatment works to intercept, transport, control, or treat municipal combined sewer overflows and sanitary sewer overflows; and

(2) subject to subsection (g), the Administrator may make a direct grant to a municipality or municipal entity for the purposes described in paragraph (1).

(b) PRIORITIZATION.—In selecting from among municipalities applying for grants under subsection (a), a State or the Administrator shall give priority to an applicant that—

(1) is a municipality that is a financially distressed community under subsection (c);

(2) has implemented or is complying with an implementation schedule for the nine minimum controls specified in the CSO control policy referred to in section 402(q)(1) and has begun implementing a long-term municipal combined sewer overflow control plan or a separate sanitary sewer overflow control plan;

(3) is requesting a grant for a project that is on a State's intended use plan pursuant to section 606(c); or

(4) is an Alaska Native Village.

(c) FINANCIALLY DISTRESSED COMMUNITY.—

(1) DEFINITION.—In subsection (b), the term ''financially distressed community'' means a community that meets affordability criteria established by the State in which the community is located, if such criteria are developed after public review and comment.

(2) CONSIDERATION OF IMPACT ON WATER AND SEWER RATES.—In determining if a community is a distressed community for the purposes of subsection (b), the State shall consider, among other factors, the extent to which the rate of growth of a community's tax base has been historically slow such that implementing a plan described in subsection (b)(2) would result in a significant increase in any water or sewer rate charged by the community's publicly owned wastewater treatment facility.

(3) INFORMATION TO ASSIST STATES.—The Administrator may publish information to assist States in establishing affordability criteria under paragraph (1).

(d) COST-SHARING.—The Federal share of the cost of activities carried out using amounts from a grant made under subsection (a) shall be not less than 55 percent of the cost. The non-Federal share of the cost may include, in any amount, public and private funds and in-kind services, and may include, notwithstanding section 603(h), financial assistance, including loans, from a State water pollution control revolving fund.

(e) ADMINISTRATIVE REPORTING REQUIREMENTS.—If a project receives grant assistance under subsection (a) and loan assistance from a State water pollution control revolving fund and the loan assistance is for 15 percent or more of the cost of the project, the project may be administered in accordance with State water pollution control revolving fund administrative reporting requirements for the purposes of streamlining such requirements.

(f) AUTHORIZATION OF APPROPRIATIONS.—There is authorized to be appropriated to carry out this section $750,000,000 for each

of fiscal years 2002 and 2003. Such sums shall remain available until expended.

(g) ALLOCATION OF FUNDS.—

(1) FISCAL YEAR 2002.—Subject to subsection (h), the Administrator shall use the amounts appropriated to carry out this section for fiscal year 2002 for making grants to municipalities and municipal entities under subsection (a)(2), in accordance with the criteria set forth in subsection (b).

(2) FISCAL YEAR 2003.—Subject to subsection (h), the Administrator shall use the amounts appropriated to carry out this section for fiscal year 2003 as follows:

(A) Not to exceed $250,000,000 for making grants to municipalities and municipal entities under subsection (a)(2), in accordance with the criteria set forth in subsection (b).

(B) All remaining amounts for making grants to States under subsection (a)(1), in accordance with a formula to be established by the Administrator, after providing notice and an opportunity for public comment, that allocates to each State a proportional share of such amounts based on the total needs of the State for municipal combined sewer overflow controls and sanitary sewer overflow controls identified in the most recent survey conducted pursuant to section 516(b)(1).

(h) ADMINISTRATIVE EXPENSES.—Of the amounts appropriated to carry out this section for each fiscal year—

(1) the Administrator may retain an amount not to exceed 1 percent for the reasonable and necessary costs of administering this section; and

(2) the Administrator, or a State, may retain an amount not to exceed 4 percent of any grant made to a municipality or municipal entity under subsection (a), for the reasonable and necessary costs of administering the grant.

(i) REPORTS.—Not later than December 31, 2003, and periodically thereafter, the Administrator shall transmit to Congress a report containing recommended funding levels for grants under this section. The recommended funding levels shall be sufficient to ensure the continued expeditious implementation of municipal combined sewer overflow and sanitary sewer overflow controls nationwide.

(33 U.S.C. 1301)

TITLE III—STANDARDS AND ENFORCEMENT

EFFLUENT LIMITATIONS

SEC. 301. (a) Except as in compliance with this section and sections 302, 306, 307, 318, 402, and 404 of this Act, the discharge of any pollutant by any person shall be unlawful.

(b) In order to carry out the objective of this Act there shall be achieved—

(1)(A) not later than July 1, 1977, effluent limitations for point sources, other than publicly owned treatment works, (i) which shall require the application of the best practicable control technology currently available as defined by the Administrator pursuant to section 304(b) of this Act, or (ii) in the case

of a discharge into a publicly owned treatment works which meets the requirements of subparagraph (B) of this paragraph, which shall require compliance with any applicable pretreatment requirements and any requirements under section 307 of this Act; and

(B) for publicly owned treatment works in existence on July 1, 1977, or approved pursuant to section 203 of this Act prior to June 30, 1974 (for which construction must be completed within four years of approval), effluent limitations based upon secondary treatment as defined by the Administrator pursuant to section 304(d)(1) of this Act; or,

(C) not later than July 1, 1977, any more stringent limitation, including those necessary to meet water quality standards, treatment standards, or schedule of compliance, established pursuant to any State law or regulations, (under authority preserved by section 510) or any other Federal law or regulation, or required to implement any applicable water quality standard established pursuant to this Act.

(2)(A) for pollutants identified in subparagraphs (C), (D), and (F) of this paragraph, effluent limitations for categories and classes of point sources, other than publicly owned treatment works, which (i) shall require application of the best available technology economically achievable for such category or class, which will result in reasonable further progress toward the national goal of eliminating the discharge of all pollutants, as determined in accordance with regulations issued by the Administrator pursuant to section 304(b)(2) of this Act, which such effluent limitations shall require the elimination of discharges of all pollutants if the Administrator finds, on the basis of information available to him (including information developed pursuant to section 315), that such elimination is technologically and economically achievable for category or class of point sources as determined in accordance with regulations issued by the Administrator pursuant to section 304(b)(2) of this Act, or (ii) in the case of the introduction of a pollutant into a publicly owned treatment works which meets the requirements of subparagraph (B) of this paragraph, shall require compliance with any applicable pretreatment requirements and any other requirement under section 307 of this Act;

[(B) subparagraph (B) repealed by section 21(b) of P.L. 97–117.]

(C) with respect to all toxic pollutants referred to in table 1 of Committee Print Numbered 95–30 of the Committee on Public Works and Transportation of the House of Representatives compliance with effluent limitations in accordance with subparagraph (A) of this paragraph as expeditiously as practicable but in no case later than three years after the date such limitations are promulgated under section 304(b), and in no case later than March 31, 1989;

(D) for all toxic pollutants listed under paragraph (1) of subsection (a) of section 307 of this Act which are not referred to in subparagraph (C) of this paragraph compliance with effluent limitation in accordance with subparagraph (A) of this paragraph as expeditiously as practicable, but in no case later

than three years after the date such limitations are promulgated under section 304(b), and in no case later than March 31, 1989;

(E) as expeditiously as practicable but in no case later than three years after the date such limitations are promulgated under section 304(b), and in no case later than March 31, 1989, compliance with effluent limitations for categories and classes of point sources, other than publicly owned treatment works, which in the case of pollutants identified pursuant to section 304(a)(4) of this Act shall require application of the best conventional pollutant control technology as determined in accordance with regulations issued by the Administrator pursuant to section 304(b)(4) of this Act; and

(F) for all pollutants (other than those subject to subparagraphs (C), (D), or (E) of this paragraph) compliance with effluent limitations in accordance with subparagraph (A) of this paragraph as expeditiously as practicable but in no case later than 3 years after the date such limitations are established, and in no case later than March 31, 1989.

(3)(A) for effluent limitations under paragraph (1)(A)(i) of this subsection promulgated after January 1, 1982, and requiring a level of control substantially greater or based on fundamentally different control technology than under permits for an industrial category issued before such date, compliance as expeditiously as practicable but in no case later than three years after the date such limitations are promulgated under section 304(b), and in no case later than March 31, 1989; and

(B) for any effluent limitation in accordance with paragraph (1)(A)(i), (2)(A)(i), or (2)(E) of this subsection established only on the basis of section 402(a)(1) in a permit issued after enactment of the Water Quality Act of 1987, compliance as expeditiously as practicable but in no case later than three years after the date such limitations are established, and in no case later than March 31, 1989.

(c) The Administrator may modify the requirements of subsection (b)(2)(A) of this section with respect to any point source for which a permit application is filed after July 1, 1977, upon a showing by the owner or operator of such point source satisfactory to the Administrator that such modified requirements (1) will represent the maximum use of technology within the economic capability of the owner or operator; and (2) will result in reasonable further progress toward the elimination of the discharge of pollutants.

(d) Any effluent limitation required by paragraph (2) of subsection (b) of this section shall be reviewed at least every five years and, if appropriate, revised pursuant to the procedure established under such paragraph.

(e) Effluent limitations established pursuant to this section or section 302 of this Act shall be applied to all point sources of discharge of pollutants in accordance with the provisions of this Act.

(f) Notwithstanding any other provisions of this Act it shall be unlawful to discharge any radiological, chemical, or biological warfare agent, any high-level radioactive waste, or any medical waste, into the navigable waters.

(g) MODIFICATIONS FOR CERTAIN NONCONVENTIONAL POLLUTANTS.—

(1) GENERAL AUTHORITY.—The Administrator, with the concurrence of the State, may modify the requirements of subsection (b)(2)(A) of this section with respect to the discharge from any point source of ammonia, chlorine, color, iron, and total phenols (4AAP) (when determined by the Administrator to be a pollutant covered by subsection (b)(2)(F)) and any other pollutant which the Administrator lists under paragraph (4) of this subsection.

(2) REQUIREMENTS FOR GRANTING MODIFICATIONS.—A modification under this subsection shall be granted only upon a showing by the owner or operator of a point source satisfactory to the Administrator that—

(A) such modified requirements will result at a minimum in compliance with the requirements of subsection (b)(1)(A) or (C) of this section, whichever is applicable;

(B) such modified requirements will not result in any additional requirements on any other point or nonpoint source; and

(C) such modification will not interfere with the attainment or maintenance of that water quality which shall assure protection of public water supplies, and the protection and propagation of a balanced population of shellfish, fish, and wildlife, and allow recreational activities, in and on the water and such modification will not result in the discharge of pollutants in quantities which may reasonably be anticipated to pose an unacceptable risk to human health or the environment because of bioaccumulation, persistency in the environment, acute toxicity, chronic toxicity (including carcinogenicity, mutagenicity or teratogenicity), or synergistic propensities.

(3) LIMITATION ON AUTHORITY TO APPLY FOR SUBSECTION (c) MODIFICATION.—If an owner or operator of a point source applies for a modification under this subsection with respect to the discharge of any pollutant, such owner or operator shall be eligible to apply for modification under subsection (c) of this section with respect to such pollutant only during the same time-period as he is eligible to apply for a modification under this subsection.

(4) PROCEDURES FOR LISTING ADDITIONAL POLLUTANTS.—

(A) GENERAL AUTHORITY.—Upon petition of any person, the Administrator may add any pollutant to the list of pollutants for which modification under this section is authorized (except for pollutants identified pursuant to section 304(a)(4) of this Act, toxic pollutants subject to section 307(a) of this Act, and the thermal component of discharges) in accordance with the provisions of this paragraph.

(B) REQUIREMENTS FOR LISTING.—

(i) SUFFICIENT INFORMATION.—The person petitioning for listing of an additional pollutant under this subsection shall submit to the Administrator sufficient information to make the determinations required by this subparagraph.

(ii) TOXIC CRITERIA DETERMINATION.—The Administrator shall determine whether or not the pollutant

meets the criteria for listing as a toxic pollutant under section 307(a) of this Act.

(iii) LISTING AS TOXIC POLLUTANT.—If the Administrator determines that the pollutant meets the criteria for listing as a toxic pollutant under section 307(a), the Administrator shall list the pollutant as a toxic pollutant under section 307(a).

(iv) NONCONVENTIONAL CRITERIA DETERMINATION.—If the Administrator determines that the pollutant does not meet the criteria for lising as a toxic pollutant under such section and determines that adequate test methods and sufficient data are available to make the determinations required by paragraph (2) of this subsection with respect to the pollutant, the Administrator shall add the pollutant to the list of pollutants specified in paragraph (1) of this subsection for which modifications are authorized under this subsection.

(C) REQUIREMENTS FOR FILING OF PETITIONS.—A petition for lising of a pollutant under this paragraph—

(i) must be filed not later than 270 days after the date of promulgation of an applicable effluent guideline under section 304;

(ii) may be filed before promulgation of such guideline; and

(iii) may be filed with an application for a modification under paragraph (1) with respect to the discharge of such pollutant.

(D) DEADLINE FOR APPROVAL OF PETITION.—A decision to add a pollutant to the list of pollutants for which modifications under this subsection are authorized must be made within 270 days after the date of promulgation of an applicable effluent guideline under section 304.

(E) BURDEN OF PROOF.—The burden of proof for making the determinations under subparagraph (B) shall be on the petitioner.

(5) REMOVAL OF POLLUTANTS.—The Administrator may remove any pollutant from the list of pollutants for which modifications are authorized under this subsection if the Administrator determines that adequate test methods and sufficient data are no longer available for determining whether or not modifications may be granted with respect to such pollutant under paragraph (2) of this subsection.

(h) The Administrator, with the concurrence of the State, may issue a permit under section 402 which modifies the requirements of subsection (b)(1)(B) of this section with respect to the discharge of any pollutant from a publicly owned treatment works into marine waters, if the applicant demonstrates to the satisfaction of the Administrator that—

(1) there is an applicable water quality standard specific to the pollutant for which the modification is requested, which has been identified under section 304(a)(6) of this Act;

(2) the discharge of pollutants in accordance with such modified requirements will not interfere, alone or in combination with pollutants from other sources, with the attainment or

maintenance of that water quality which assures protection of public water supplies and the protection and propagation of a balanced, indigenous population of shellfish, fish and wildlife, and allows recreational activities, in and on the water;

(3) the applicant has established a system for monitoring the impact of such discharge on a representative sample of aquatic biota, to the extent practicable, and the scope of such monitoring is limited to include only those scientific investigations which are necessary to study the effects of the proposed discharge;

(4) such modified requirements will not result in any additional requirements on any other point or nonpoint source;

(5) all applicable pretreatment requirements for sources introducing waste into such treatment works will be enforced;

(6) in the case of any treatment works serving a population of 50,000 or more, with respect to any toxic pollutant introduced into such works by an industrial discharger for which pollutant there is no applicable pretreatment requirement in effect, sources introducing waste into such works are in compliance with all applicable pretreatment requirements, the applicant will enforce such requirements, and the applicant has in effect a pretreatment program which, in combination with the treatment of discharges from such works, removes the same amount of such pollutant as would be removed if such works were to apply secondary treatment to discharges and if such works had no pretreatment program with respect to such pollutant;

(7) to the extent practicable the applicant has established a schedule of activities designed to eliminate the entrance of toxic pollutants from nonindustrial sources into such treatment works;

(8) there will be no new or substantially increased discharges from the point source of the pollutant to which the modification applies above that volume of discharge specified in the permit;

(9) the applicant at the time such modification becomes effective will be discharging effluent which has received at least primary or equivalent treatment and which meets the criteria established under section 304(a)(1) of this Act after initial mixing in the waters surrounding or adjacent to the point at which such effluent is discharged.

For the purposes of this subsection the phrase "the discharge of any pollutant into marine waters" refers to a discharge into deep waters of the territorial sea or the waters of the contiguous zone, or into saline estuarine waters where there is strong tidal movement and other hydrological and geological characteristics which the Administrator determines necessary to allow compliance with paragraph (2) of this subsection, and section 101(a)(2) of this Act. For the purposes of paragraph (9), "primary or equivalent treatment" means treatment by screening, sedimentation, and skimming adequate to remove at least 30 percent of the biological oxygen demanding material and of the suspended solids in the treatment works influent, and disinfection, where appropriate. A municipality which applies secondary treatment shall be eligible to receive a permit pursuant to this subsection which modifies the re-

quirements of subsection (b)(1)(B) of this section with respect to the discharge of any pollutant from any treatment works owned by such municipality into marine waters. No permit issued under this subsection shall authorize the discharge of sewage sludge into marine waters. In order for a permit to be issued under this subsection for the discharge of a pollutant into marine waters, such marine waters must exhibit characteristics assuring that water providing dilution does not contain significant amounts of previously discharged effluent from such treatment works. No permit issued under this subsection shall authorize the discharge of any pollutant into saline estuarine waters which at the time of application do not support a balanced indigenous population of shellfish, fish and wildlife, or allow recreation in and on the waters or which exhibit ambient water quality below applicable water quality standards adopted for the protection of public water supplies, shellfish, fish and wildlife or recreational activities or such other standards necessary to assure support and protection of such uses. The prohibition contained in the preceding sentence shall apply without regard to the presence or absence of a causal relationship between such characteristics and the applicant's current or proposed discharge. Notwithstanding any other provisions of this subsection, no permit may be issued under this subsection for discharge of a pollutant into the New York Bight Apex consisting of the ocean waters of the Atlantic Ocean westward of 73 degrees 30 minutes west longitude and northward of 40 degrees 10 minutes north latitude.

(i)(1) Where construction is required in order for a planned or extisting publicly owned treatment works to achieve limitations under subsection (b)(1)(B) or (b)(1)(C) of this section, but (A) construction cannot be completed with the time required in such subsection, or (B) the United States has failed to make financial assistance under this Act available in time to achieve such limitations by the time specified in such subsection, the owner or operator of such treatment works may request the Administrator (or if appropriate the State) to issue a permit pursuant to section 402 of this Act or to modify a permit issued pursuant to that section to extend such time for compliance. Any such request shall be filed with the Administrator (or if appropriate the State) within 180 days after the date of enactment of the Water Quality Act of 1987. The Administrator (or if appropriate the State) may grant such request and issue or modify such a permit, which shall contain a schedule of compliance for the publicly owned treatment works based on the earliest date by which such financial assistance will be available from the United States and construction can be completed, but in no event later than July 1, 1988, and shall contain such other terms and conditions, including those necessary to carry out subsections (b) through (g) of section 201 of this Act, section 307 of this Act, and such interim effluent limitations applicable to that treatment works as the Administrator determines are necessary to carry out the provisions of this Act.

(2)(A) Where a point source (other than a publicly owned treatment works) will not achieve the requirements of subsections (b)(1)(A) and (b)(1)(C) of this section and—

(i) if a permit issued prior to July 1, 1977, to such point source is based upon a discharge into a publicly owned treatment works; or

(ii) if such point source (other than a publicly owned treatment works) had before July 1, 1977, a contract (enforceable against such point source) to discharge into a publicly owned treatment works; or

(iii) if either an application made before July 1, 1977, for a construction grant under this Act for a publicly owned treatment works, or engineering or architectural plans or working drawings made before July 1, 1977, for a publicly owned treatment works, show that such point source was to discharge into such publicly owned treatment works,

and such publicly owned treatment works is presently unable to accept such discharge without construction, and in the case of a discharge to an existing publicly owned treatment works, such treatment works has an extension pursuant to paragraph (1) of this subsection, the owner or operator of such point source may request the Administrator (or if appropriate the State) to issue or modify such a permit pursuant to such section 402 to extend such time for compliance. Any such request shall be filed with the Administrator (or if appropriate the State) within 180 days after the date of enactment of this subsection or the filing of a request by the appropriate publicly owned treatment works under paragraph (1) of this subsection, whichever is later. If the Administrator (or if appropriate the State) finds that the owner or operator of such point source has acted in good faith, he may grant such request and issue or modify such a permit, which shall contain a schedule of compliance for the point source to achieve the requirements of subsections (b)(1)(A) and (C) of this section and shall contain such other terms and conditions, including pretreatment and interim effluent limitations and water conservation requirements applicable to that point source, as the Administrator determines are necessary to carry out the provisions of this Act.

(B) No time modification granted by the Administrator (or if appropriate the State) pursuant to paragraph (2)(A) of this subsection shall extend beyond the earliest date practicable for compliance or beyond the date of any extension granted to the appropriate publicly owned treatment works pursuant to paragraph (1) of this subsection, but in no event shall it extend beyond July 1, 1988, and no such time modification shall be granted unless (i) the publicly owned treatment works will be in operation and available to the point source before July 1, 1988, and will meet the requirements to subsections (b)(1) (B) and (C) of this section after receiving the discharge from that point source; and (ii) the point source and the publicly owned treatment works have entered into an enforceable contract requiring the point source to discharge into the publicly owned treatment works, the owner or operator of such point source to pay the costs required under section 204 of this Act, and the publicly owned treatment works to accept the discharge from the point source; and (iii) the permit for such point source requires point source to meet all requirements under section 307 (a) and (b) during the period of such time modification.

(j)(1) Any application filed under this section for a modification of the provisions of—

(A) subsection (b)(1)(B) under subsection (h) of this section shall be filed not later that [1] the 365th day which begins after the date of enactment of the Municipal Wastewater Treatment Construction Grant Amendments of 1981, except that a publicly owned treatment works which prior to December 31, 1982, had a contractual arrangement to use a portion of the capacity of an ocean outfall operated by another publicly owned treatment works which has applied for or received modification under subsection (h), may apply for a modification of subsection (h) in its own right not later than 30 days after the date of the enactment of the Water Quality Act of 1987, and except as provided in paragraph (5);

(B) subsection (b)(2)(A) as it applies to pollutants identified in subsection (b)(2)(F) shall be filed not later than 270 days after the date of promulgation of an applicable effluent guideline under section 304 or not later than 270 days after the date of enactment of the Clean Water Act of 1977, whichever is later.

(2) Subject to paragraph (3) of this section, any application for a modification filed under subsection (g) of this section shall not operate to stay any requirement under this Act, unless in the judgment of the Administrator such a stay or the modification sought will not result in the discharge of pollutants in quantities which may reasonably be anticipated to pose an unacceptable risk to human health or the environment because of bioaccumulation, persistency in the environment, acute toxicity, chronic toxicity (including carcinogenicity, mutagenicity or teratogenicity), or synergistic propensities, and that there is a substantial likelihood that the applicant will succeed on the merits of such application. In the case of an application filed under subsection (g) of this section, the Administrator may condition any stay granted under this paragraph on requiring the filing of a bond or other appropriate security to assure timely compliance with the requirements from which a modification is sought.

(3) COMPLIANCE REQUIREMENTS UNDER SUBSECTION (g).—

(A) EFFECT OF FILING.—An application for a modification under subsection (g) and a petition for listing of a pollutant as a pollutant for which modifications are authorized under such subsection shall not stay the requirement that the person seeking such modification or listing comply with effluent limitations under this Act for all pollutants not the subject of such application or petition.

(B) EFFECT OF DISAPPROVAL.—Disapproval of an application for a modification under subsection (g) shall not stay the requirement that the person seeking such modification comply with all applicable effluent limitations under this Act.

(4) DEADLINE FOR SUBSECTION (g) DECISION.—An application for a modification with respect to a pollutant filed under subsection (g) must be approved or disapproved not later than 365 days after the date of such filing; except that in any case in which a petition for listing such pollutant as a pollutant for which modifications are authorized under such subsection is

[1] So in law. Probably should be "than".

approved, such application must be approved or disapproved not later than 365 days after the date of approval of such petition.

(5) EXTENSION OF APPLICATION DEADLINE.—

(A) IN GENERAL.—In the 180-day period beginning on the date of the enactment of this paragraph, the city of San Diego, California, may apply for a modification pursuant to subsection (h) of the requirements of subsection (b)(1)(B) with respect to biological oxygen demand and total suspended solids in the effluent discharged into marine waters.

(B) APPLICATION.—An application under this paragraph shall include a commitment by the applicant to implement a waste water reclamation program that, at a minimum, will—

(i) achieve a system capacity of 45,000,000 gallons of reclaimed waste water per day by January 1, 2010; and

(ii) result in a reduction in the quantity of suspended solids discharged by the applicant into the marine environment during the period of the modification.

(C) ADDITIONAL CONDITIONS.—The Administrator may not grant a modification pursuant to an application submitted under this paragraph unless the Administrator determines that such modification will result in removal of not less than 58 percent of the biological oxygen demand (on an annual average) and not less than 80 percent of total suspended solids (on a monthly average) in the discharge to which the application applies.

(D) PRELIMINARY DECISION DEADLINE.—The Administrator shall announce a preliminary decision on an application submitted under this paragraph not later than 1 year after the date the application is submitted.

(k) In the case of any facility subject to a permit under section 402 which proposes to comply with the requirements of subsection (b)(2)(A) or (b)(2)(E) of this section by replacing existing production capacity with an innovative production process which will result in an effluent reduction significantly greater than that required by the limitation otherwise applicable to such facility and moves toward the national goal of eliminating the discharge of all pollutants, or with the installation of an innovative control technique that has a substantial likelihood for enabling the facility to comply with the applicable effluent limitation by achieving a significantly greater effluent reduction than that required by the applicable effluent limitation and moves toward the national goal of eliminating the discharge of all pollutants, or by achieving the required reduction with an innovative system that has the potential for significantly lower costs than the systems which have been determined by the Administrator to be economically achievable, the Administrator (or the State with an approved program under section 402, in consultation with the Administrator) may establish a date for compliance under subsection (b)(2)(A) or (b)(2)(E) of this section no later than two years after the date for compliance with such effluent limitation which would otherwise be applicable under such sub-

section, if it is also determined that such innovative system has the potential for industrywide application.

(l) Other than as provided in subsection (n) of this section, the Administrator may not modify any requirement of this section as it applies to any specific pollutant which is on the toxic pollutant list under section 307(a)(1) of this Act.

(m)(1) The Administrator, with the concurrence of the State, may issue a permit under section 402 which modifies the requirements of subsections (b)(1)(A) and (b)(2)(E) of this section, and of section 403, with respect to effluent limitations to the extent such limitations relate to biochemical oxygen demand and pH from discharges by an industrial discharger in such State into deep waters of the territorial seas, if the applicant demonstrates and the Administrator finds that—

(A) the facility for which modification is sought is covered at the time of the enactment of this subsection by National Pollutant Discharge Elimination System permit number CA0005894 or CA0005282;

(B) the energy and environmental costs of meeting such requirements of subsections (b)(1)(A) and (b)(2)(E) and section 403 exceed by an unreasonable amount the benefits to be obtained, including the objectives of this Act;

(C) the applicant has established a system for monitoring the impact of such discharges on a representative sample of aquatic biota;

(D) such modified requirements will not result in any additional requirements on any other point or nonpoint source;

(E) there will be no new or substantially increased discharges from the point source of the pollutant to which the modification applies above that volume of discharge specified in the permit;

(F) the discharge is into waters where there is strong tidal movement and other hydrological and geological characteristics which are necessary to allow compliance with this subsection and section 101(a)(2) of this Act;

(G) the applicant accepts as a condition to the permit a contractural obligation to use funds in the amount required (but not less than $250,000 per year for ten years) for research and development of water pollution control technology, including but not limited to closed cycle technology;

(H) the facts and circumstances present a unique situation which, if relief is granted, will not establish a precedent or the relaxation of the requirements of this Act applicable to similarly situated discharges; and

(I) no owner or operator of a facility comparable to that of the applicant situated in the United States has demonstrated that it would be put at a competitive disadvantage to the applicant (or the parent company or any subsidiary thereof) as a result of the issuance of a permit under this subsection.

(2) The effluent limitations established under a permit issued under paragraph (1) shall be sufficient to implement the applicable State water quality standards, to assure the protection of public water supplies and protection and propagation of a balanced, indigenous population of shellfish, fish, fauna, wildlife, and other aquatic organisms, and to allow recreational activities in and on the

water. In setting such limitations, the Administrator shall take into account any seasonal variations and the need for an adequate margin of safety, considering the lack of essential knowledge concerning the relationship between effluent limitations and water quality and the lack of essential knowledge of the effects of discharges on beneficial uses of the receiving waters.

(3) A permit under this subsection may be issued for a period not to exceed five years, and such a permit may be renewed for one additional period not to exceed five years upon a demonstration by the applicant and a finding by the Administrator at the time of application for any such renewal that the provisions of this subsection are met.

(4) The Administrator may terminate a permit issued under this subsection if the Administrator determines that there has been a decline in ambient water quality of the receiving waters during the period of the permit even if a direct cause and effect relationship cannot be shown: *Provided*, That if the effluent from a source with a permit issued under this subsection is contributing to a decline in ambient water quality of the receiving waters, the Administrator shall terminate such permit.

(n) FUNDAMENTALLY DIFFERENT FACTORS.—

(1) GENERAL RULE.—The Administrator, with the concurrance of the State, may establish an alternative requirement under subsection (b)(2) or section 307(b) for a facility that modifies the requirements of national effluent limitation guidelines or categorical pretreatment standards that would otherwise be applicable to such facility, if the owner or operator of such facility demonstrates to the satisfaction of the Administrator that—

(A) the facility is fundamentally different with respect to the factors (other than cost) specified in section 304(b) or 304(g) and considered by the Administrator in establishing such national effluent limitation guidelines or categorical pretreatment standards;

(B) the application—

(i) is based solely on information and supporting data submitted to the Administrator during the rule making for establishment of the applicable national effluent limitation guidelines or categorical pretreatment standard specifically raising the factors that are fundamentally different for such facility; or

(ii) is based on information and supporting data referred to in clause (i) and information and supporting data the applicant did not have a reasonable opportunity to submit during such rulemaking;

(C) the alternative requirement is no less stringent than justified by the fundamental difference; and

(D) the alternative requirement will not result in a non-water quality environmental impact which is markedly more adverse than the impact considered by the Administrator in establishing such national affluent limitation guideline or categorical pretreatment standard.

(2) TIME LIMIT FOR APPLICATIONS.—An application for an alternative requirement which modifies the requirements of an effluent limitation or pretreatment standard under this sub-

section must be submitted to the Administrator within 180 days after the date on which such limitation or standard is established or revised, as the case may be.

(3) TIME LIMIT FOR DECISION.—The Administrator shall approve or deny by final agency action an application submitted under this subsection within 180 days after the date such application is filed with the Administrator.

(4) SUBMISSION OF INFORMATION.—The Administrator may allow an applicant under this subsection to submit information and supporting data until the earlier of the date the application is approved or denied or the last day that the Administrator has to approve or deny such application.

(5) TREATMENT OF PENDING APPLICATIONS.—For the purposes of this subsection, an application for an alternative requirement based on fundamentally different factors which is pending on the date of the enactment of this subsection shall be treated as having been submitted to the Administrator on the 180th day following such date of enactment. The applicant may amend the application to take into account the provisions of this subsection.

(6) EFFECT OF SUBMISSION OF APPLICATION.—An application for an alternative requirement under this subsection shall not stay the applicant's obligation to comply with the effluent limitation guideline or categorical pretreatment standard which is the subject of the application.

(7) EFFECT OF DENIAL.—If an application for an alternative requirement which modifies the requirements of an effluent limitation or pretreatment standard under this subsection is denied by the Administrator, the applicant must comply with such limitation or standard as established or revised, as the case may be.

(8) REPORTS.—By January 1, 1997, and January 1 of every odd-numbered year thereafter, the Administrator shall submit to the Committee on Environment and Public Works of the Senate and the Committee on Transportation and Infrastructure of Representatives a report on the status of applications for alternative requirements which modify the requirements of effluent limitations under section 301 or 304 of this Act or any national categorical pretreatment standard under section 307(b) of this Act filed before, on, or after such date of enactment.

(o) APPLICATION FEES.—The Administrator shall prescribe and collect from each applicant fees reflecting the reasonable administrative costs incurred in reviewing and processing applications for modifications submitted to the Administrator pursuant to subsections (c), (g), (i), (k), (m), and (n) of section 301, section 304(d)(4), and section 316(a) of this Act. All amounts collected by the Administrator under this subsection shall be deposited into a special fund of the Treasury entitled "Water Permits and Related Services" which shall thereafter be available for appropriation to carry out activities of the Environmental Protection Agency for which such fees were collected.

(p) MODIFIED PERMIT FOR COAL REMINING OPERATIONS.—

(1) IN GENERAL.—Subject to paragraphs (2) through (4) of this subsection, the Administrator, or the State in any case

which the State has an approved permit program under section 402(b), may issue a permit under section 402 which modifies the requirements of subsection (b)(2)(A) of this section with respect to the pH level of any pre-existing discharge, and with respect to pre-existing discharges of iron and manganese from the remined area of any coal remining operation or with respect to the pH level or level of iron or manganese in any pre-existing discharge affected by the remining operation. Such modified requirements shall apply the best available technology economically achievable on a case-by-case basis, using best professional judgment, to set specific numerical effluent limitations in each permit.

(2) LIMITATIONS.—The Administrator or the State may only issue a permit pursuant to paragraph (1) if the applicant demonstrates to the satisfaction of the Administrator or the State, as the case may be, that the coal remining operation will result in the potential for improved water quality from the remining operation but in no event shall such a permit allow the pH level of any discharge, and in no event shall such a permit allow the discharges of iron and manganese, to exceed the levels being discharged from the remined area before the coal remining operation begins. No discharge from, or affected by, the remining operation shall exceed State water quality standards established under section 303 of this Act.

(3) DEFINITIONS.—For purposes of this subsection—

(A) COAL REMINING OPERATION.—The term "coal remining operation" means a coal mining operation which begins after the date of the enactment of this subsection at a site on which coal mining was conducted before the effective date of the Surface Mining Control and Reclamation Act of 1977.

(B) REMINED AREA.—The term "remined area" means only that area of any coal remining operation on which coal mining was conducted before the effective date of the Surface Mining Control and Reclamation Act of 1977.

(C) PRE-EXISTING DISCHARGE.—The term "pre-existing discharge" means any discharge at the time of permit application under this subsection.

(4) APPLICABILITY OF STRIP MINING LAWS.—Nothing in this subsection shall affect the application of the Surface Mining Control and Reclamation Act of 1977 to any coal remining operation, including the application of such Act to suspended solids.

(33 U.S.C. 1311)

WATER QUALITY RELATED EFFLUENT LIMITATIONS

SEC. 302. (a) Whenever, in the judgment of the Administrator or as identified under section 304(l), discharges of pollutants from a point source or group of point sources, with the application of effluent limitations required under section 301(b)(2) of this Act, would interfere with the attainment or maintenance of that water quality in a specific portion of the navigable waters which shall assure protection of public health, public water supplies, agricultural and industrial uses, and the protection and propagation of a bal-

anced population of shellfish, fish and wildlife, and allow recreational activities in and on the water, effluent limitations (including alternative effluent control strategies) for such point source or sources shall be established which can reasonably be expected to contribute to the attainment or maintenance of such water quality.

(b) MODIFICATIONS OF EFFLUENT LIMITATIONS.—

(1) NOTICE AND HEARING.—Prior to establishment of any effluent limitation pursuant to subsection (a) of this section, the Administrator shall publish such proposed limitation and within 90 days of such publication hold a public hearing.

(2) PERMITS.—

(A) NO REASONABLE RELATIONSHIP.—The Administrator, with the concurrence of the State, may issue a permit which modifies the effluent limitations required by subsection (a) of this section for pollutants other than toxic pollutants if the applicant demonstrates at such hearing that (whether or not technology or other alternative control strategies are available) there is no reasonable relationship between the economic and social costs and the benefits to be obtained (including attainment of the objective of this Act) from achieving such limitation.

(B) REASONABLE PROGRESS.—The Administrator, with the concurrence of the State, may issue a permit which modifies the effluent limitations required by subsection (a) of this section for toxic pollutants for a single period not to exceed 5 years if the applicant demonstrates to the satisfaction of the Administrator that such modified requirements (i) will represent the maximum degree of control within the economic capability of the owner and operator of the source, and (ii) will result in reasonable further progress beyond the requirements of section 301(b)(2) toward the requirements of subsection (a) of this section.

(c) The establishment of effluent limitations under this section shall not operate to delay the application of any effluent limitation established under section 301 of this Act.

(33 U.S.C. 1312)

WATER QUALITY STANDARDS AND IMPLEMENTATION PLANS

SEC. 303. (a)(1) In order to carry out the purpose of this Act, any water quality standard applicable to interstate waters which was adopted by any State and submitted to, and approved by, or is awaiting approval by, the Administrator pursuant to this Act as in effect immediately prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, shall remain in effect unless the Administrator determined that such standard is not consistent with the applicable requirements of this Act as in effect immediately prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972. If the Administrator makes such a determination he shall, within three months after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, notify the State and specify the changes needed to meet such requirements. If such changes are not adopted by the State within ninety days after the date of such notification,

the Administrator shall promulgate such changes in accordance with subsection (b) of this section.

(2) Any State which, before the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, has adopted, pursuant to its own law, water quality standards applicable to intrastate waters shall submit such standards to the Administrator within thirty days after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972. Each such standard shall remain in effect, in the same manner and to the same extent as any other water quality standard established under this Act unless the Administrator determines that such standard is inconsistent with the applicable requirements of this Act as in effect immediately prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972. If the Administrator makes such a determination he shall not later than the one hundred and twentieth day after the date of submission of such standards, notify the State and specify the changes needed to meet such requirements. If such changes are not adopted by the State within ninety days after such notification, the Administrator shall promulgate such changes in accordance with subsection (b) of this section.

(3)(A) Any State which prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972 has not adopted pursuant to its own laws water quality standards applicable to intrastate waters shall, not later than one hundred and eighty days after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, adopt and submit such standards to the Administrator.

(B) If the Administrator determines that any such standards are consistent with the applicable requirements of this Act as in effect immediately prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, he shall approve such standards.

(C) If the Administrator determines that any such standards are not consistent with the applicable requirements of this Act as in effect immediately prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, he shall, not later than the ninetieth day after the date of submission of such standards, notify the State and specify the changes to meet such requirements. If such changes are not adopted by the State within ninety days after the date of notification, the Administrator shall promulgate such standards pursuant to subsection (b) of this section.

(b)(1) The Administrator shall promptly prepare and publish proposed regulations setting forth water quality standards for a State in accordance with the applicable requirements of this Act as in effect immediately prior to the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, if—

(A) the State fails to submit water quality standards within the times prescribed in subsection (a) of this section,

(B) a water quality standard submitted by such State under subsection (a) of this section is determined by the Administrator not to be consistent with the applicable requirements of subsection (a) of this section.

(2) The Administrator shall promulgate any water quality standard published in a proposed regulation not later than one

hundred and ninety days after the date he publishes any such proposed standard, unless prior to such promulgation, such State has adopted a water quality standard which the Administrator determines to be in accordance with subsection (a) of this section.

(c)(1) The Governor of a State or the State water pollution control agency of such State shall from time to time (but at least once each three year period beginning with the date of enactment of the Federal Water Pollution Control Act Amendments of 1972) hold public hearings for the purpose of reviewing applicable water quality standards and, as appropriate, modifying and adopting standards. Results of such review shall be made available to the Administrator.

(2)(A) Whenever the State revises or adopts a new standard, such revised or new standard shall be submitted to the Administrator. Such revised or new water quality standard shall consist of the designated uses of the navigable waters involved and the water quality criteria for such waters based upon such uses. Such standards shall be such as to protect the public health or welfare, enhance the quality of water and serve the purposes of this Act. Such standards shall be established taking into consideration their use and value for public water supplies, propagation of fish and wildlife, recreational purposes, and agricultural, industrial, and other purposes, and also taking into consideration their use and value for navigation.

(B) Whenever a State reviews water quality standards pursuant to paragraph (1) of this subsection, or revises or adopts new standards pursuant to this paragraph, such State shall adopt criteria for all toxic pollutants listed pursuant to section 307(a)(1) of this Act for which criteria have been published under section 304(a), the discharge or presence of which in the affected waters could reasonably be expected to interfere with those designated uses adopted by the State, as necessary to support such designated uses. Such criteria shall be specific numerical criteria for such toxic pollutants. Where such numerical criteria are not available, whenever a State reviews water quality standards pursuant to paragraph (1), or revises or adopts new standards pursuant to this paragraph, such State shall adopt criteria based on biological monitoring or assessment methods consistent with information published pursuant to section 304(a)(8). Nothing in this section shall be construed to limit or delay the use of effluent limitations or other permit conditions based on or involving biological monitoring or assessment methods or previously adopted numerical criteria.

(3) If the Administrator, within sixty days after the date of submission of the revised or new standard, determines that such standard meets the requirements of this Act, such standard shall thereafter be the water quality standard for the applicable waters of that State. If the Administrator determines that any such revised or new standard is not consistent with the applicable requirements of this Act, he shall not later than the ninetieth day after the date of submission of such standard notify the State and specify the changes to meet such requirements. If such changes are not adopted by the State within ninety days after the date of notification, the Administrator shall promulgate such standard pursuant to paragraph (4) of this subsection.

(4) The Administrator shall promptly prepare and publish proposed regulations setting forth a revised or new water quality standard for the navigable waters involved—

(A) if a revised or new water quality standard submitted by such State under paragraph (3) of this subsection for such waters is determined by the Administrator not to be consistent with the applicable requirements of this Act, or

(B) in any case where the Administrator determines that a revised or new standard is necessary to meet the requirements of this Act.

The Administrator shall promulgate any revised or new standard under this paragraph not later than ninety days after he publishes such proposed standards, unless prior to such promulgation, such State has adopted a revised or new water quality standard which the Administrator determines to be in accordance with this Act.

(d)(1)(A) Each State shall identify those waters within its boundaries for which the effluent limitations required by section 301(b)(1)(A) and section 301(b)(1)(B) are not stringent enough to implement any water quality standard applicable to such waters. The State shall establish a priority ranking for such waters, taking into account the severity of the pollution and the uses to be made of such waters.

(B) Each State shall identify those waters or parts thereof within its boundaries for which controls on thermal discharges under section 301 are not stringent enough to assure protection and propagation of a balanced indigenous population of shellfish, fish, and wildlife.

(C) Each State shall establish for the waters identified in paragraph (1)(A) of this subsection, and in accordance with the priority ranking, the total maximum daily load, for those pollutants which the Administrator identifies under section 304(a)(2) as suitable for such calculation. Such load shall be established at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety which takes into account any lack of knowledge concerning the relationship between effluent limitations and water quality.

(D) Each State shall estimate for the waters identified in paragraph (1)(D) of this subsection the total maximum daily thermal load required to assure protection and propagation of a balanced, indigenous population of shellfish, fish and wildlife. Such estimates shall take into account the normal water temperatures, flow rates, seasonal variations, existing sources of heat input, and the dissipative capacity of the identified waters or parts thereof. Such estimates shall include a calculation of the maximum heat input that can be made into each such part and shall include a margin of safety which takes into account any lack of knowledge concerning the development of thermal water quality criteria for such protection and propagation in the identified waters or parts thereof.

(2) Each State shall submit to the Administrator from time to time, with the first such submission not later than one hundred and eighty days after the date of publication of the first identification of pollutants under section 304(a)(2)(D), for his approval the waters identified and the loads established under paragraphs (1)(A), (1)(B), (1)(C), and (1)(D) of this subsection. The Administrator shall either approve or disapprove such identification and

load not later than thirty days after the date of submission. If the Administrator approves such identification and load, such State shall incorporate them into its current plan under subsection (e) of this section. If the Administrator disapproves such identification and load, he shall not later than thirty days after the date of such disapproval identify such waters in such State and establish such loads for such waters as he determines necessary to implement the water quality standards applicable to such waters and upon such identification and establishment the State shall incorporate them into its current plan under subsection (e) of this section.

(3) For the specific purpose of developing information, each State shall identify all waters within its boundaries which it has not identified under paragraph (1)(A) and (1)(B) of this subsection and estimate for such waters the total maximum daily load with seasonal variations and margins of safety, for those pollutants which the Administrator identifies under section 304(a)(2) as suitable for such calculation and for thermal discharges, at a level that would assure protection and propagation of a balanced indigenous population of fish, shellfish and wildlife.

(4) LIMITATIONS ON REVISION OF CERTAIN EFFLUENT LIMITATIONS.—

(A) STANDARD NOT ATTAINED.—For waters identified under paragraph (1)(A) where the applicable water quality standard has not yet been attained, any effluent limitation based on a total maximum daily load or other waste load allocation established under this section may be revised only if (i) the cumulative effect of all such revised effluent limitations based on such total maximum daily load or waste load allocation will assure the attainment of such water quality standard, or (ii) the designated use which is not being attained is removed in accordance with regulations established under this section.

(B) STANDARD ATTAINED.—For waters identified under paragraph (1)(A) where the quality of such waters equals or exceeds levels necessary to protect the designated use for such waters or otherwise required by applicable water quality standard, any effluent limitation based on a total maximum daily load or other waste load allocation established under this section, or any water quality standard established under this section, or any other permitting standard may be revised only if such revision is subject to and consistent with the antidegradation policy established under this section.

(e)(1) Each State shall have a continuing planning process approved under paragraph (2) of this subsection which is consistent with this Act.

(2) Each State shall submit not later than 120 days after the date of the enactment of the Water Pollution Control Amendments of 1972 to the Administrator for his approval a proposed continuing planning process which is consistent with this Act. Not later than thirty days after the date of submission of such a process the Administrator shall either approve or disapprove such process. The Administrator shall from time to time review each State's approved planning process for the purpose of insuring that such planning process is at all times consistent with this Act. The Administrator

shall not approve any State permit program under title IV of this Act for any State which does not have an approved continuing planning process under this section.

(3) The Administrator shall approve any continuing planning process submitted to him under this section which will result in plans for all navigable waters within such State, which include, but are not limited to, the following:

(A) effluent limitations and schedules of compliance at least as stringent as those required by section 301(b)(1), section 301(b)(2), section 306, and section 307, and at least as stringent as any requirements contained in any applicable water quality standard in effect under authority of this section;

(B) the incorporation of all elements of any applicable areawide waste management plans under section 208, and applicable basin plans under section 209 of this Act;

(C) total maximum daily load for pollutants in accordance with subsection (d) of this section;

(D) procedures for revision;

(E) adequate authority for intergovernmental cooperation;

(F) adequate implementation, including schedules of compliance, for revised or new water quality standards, under subsection (c) of this section;

(G) controls over the disposition of all residual waste from any water treatment processing;

(H) an inventory and ranking, in order of priority, of needs for construction of waste treatment works required to meet the applicable requirements of sections 301 and 302.

(f) Nothing in this section shall be construed to affect any effluent limitation, or schedule of compliance required by any State to be implemented prior to the dates set forth in sections 301(b)(1) and 301(b)(2) nor to preclude any State from requiring compliance with any effluent limitation or schedule of compliance at dates earlier than such dates.

(g) Water quality standards relating to heat shall be consistent with the requirements of section 316 of this Act.

(h) For the purposes of this Act the term ''water quality standards'' includes thermal water quality standards.

(i) COASTAL RECREATION WATER QUALITY CRITERIA.—

(1) ADOPTION BY STATES.—

(A) INITIAL CRITERIA AND STANDARDS.—Not later than 42 months after the date of the enactment of this subsection, each State having coastal recreation waters shall adopt and submit to the Administrator water quality criteria and standards for the coastal recreation waters of the State for those pathogens and pathogen indicators for which the Administrator has published criteria under section 304(a).

(B) NEW OR REVISED CRITERIA AND STANDARDS.—Not later than 36 months after the date of publication by the Administrator of new or revised water quality criteria under section 304(a)(9), each State having coastal recreation waters shall adopt and submit to the Administrator new or revised water quality standards for the coastal recreation waters of the State for all pathogens and patho-

gen indicators to which the new or revised water quality criteria are applicable.

(2) FAILURE OF STATES TO ADOPT.—

(A) IN GENERAL.—If a State fails to adopt water quality criteria and standards in accordance with paragraph (1)(A) that are as protective of human health as the criteria for pathogens and pathogen indicators for coastal recreation waters published by the Administrator, the Administrator shall promptly propose regulations for the State setting forth revised or new water quality standards for pathogens and pathogen indicators described in paragraph (1)(A) for coastal recreation waters of the State.

(B) EXCEPTION.—If the Administrator proposes regulations for a State described in subparagraph (A) under subsection (c)(4)(B), the Administrator shall publish any revised or new standard under this subsection not later than 42 months after the date of the enactment of this subsection.

(3) APPLICABILITY.—Except as expressly provided by this subsection, the requirements and procedures of subsection (c) apply to this subsection, including the requirement in subsection (c)(2)(A) that the criteria protect public health and welfare.

(33 U.S.C. 1313)

INFORMATION AND GUIDELINES

SEC. 304. (a)(1) The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall develop and publish, within one year after the date of enactment of this title (and from time to time thereafter revise) criteria for water quality accurately reflecting the latest scientific knowledge (A) on the kind and extent of all identifiable effects on health and welfare including, but not limited to, plankton, fish, shellfish, wildlife, plant life, shorelines, beaches, esthetics, and recreation which may be expected from the presence of pollutants in any body of water, including ground water; (B) on the concentration and dispersal of pollutants, or their byproducts, through biological, physical, and chemical processes; and (C) on the effects of pollutants on biological community diversity, productivity, and stability, including information on the factors affecting rates of eutrophication and rates of organic and inorganic sedimentation for varying types of receiving waters.

(2) The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall develop and publish, within one year after the date of enactment of this title (and from time to time thereafter revise) information (A) on the factors necessary to restore and maintain the chemical, physical, and biological integrity of all navigable waters, ground waters, waters of the contiguous zone, and the oceans; (B) on the factors necessary for the protection and propagation of shellfish, fish, and wildlife for classes and categories of receiving waters and to allow recreational activities in and on the water; and (C) on the measurement and classification of water quality; and (D) for the purpose of section 303, on and the identification of pollutants suitable for

maximum daily load measurement correlated with the achievement of water quality objectives.

(3) Such criteria and information and revisions thereof shall be issued to the States and shall be published in the Federal Register and otherwise made available to the public.

(4) The Administrator shall, within 90 days after the date of enactment of the Clean Water Act of 1977 and from time to time thereafter, publish and revise as appropriate information identifying conventional pollutants, including but not limited to, pollutants classified as biological oxygen demanding, suspended solids, fecal coliform, and pH. The thermal component of any discharge shall not be identified as a conventional pollutant under this paragraph.

(5)(A) The Administrator, to the extent practicable before consideration of any request under section 301(g) of this Act and within six months after the date of enactment of the Clean Water Act of 1977, shall develop and publish information on the factors necessary for the protection of public water supplies, and the protection and propagation of a balanced population of shellfish, fish and wildlife, and to allow recreational activities, in and on the water.

(B) The Administrator, to the extent practicable before consideration of any application under section 301(h) of this Act and within six months after the date of enactment of Clean Water Act of 1977, shall develop and publish information on the factors necessary for the protection of public water supplies, and the protection and propagation of a balanced indigenous population of shellfish, fish and wildlife, and to allow recreational activities, in and on the water.

(6) The Administrator shall, within three months after enactment of the Clean Water Act of 1977 and annually thereafter, for purposes of section 301(h) of this Act publish and revise as appropriate information identifying each water quality standard in effect under this Act of State law, the specific pollutants associated with such water quality standard, and the particular waters to which such water quality standard applies.

(7) GUIDANCE TO STATES.—The Administrator, after consultation with appropriate State agencies and on the basis of criteria and information published under paragraphs (1) and (2) of this subsection, shall develop and publish, within 9 months after the date of the enactment of the Water Quality Act of 1987, guidance to the States on performing the identification required by section 304(l)(1) of this Act.

(8) INFORMATION ON WATER QUALITY CRITERIA.—The Administrator, after consultation with appropriate State agencies and within 2 years after the date of the enactment of the Water Quality Act of 1987, shall develop and publish information on methods for establishing and measuring water quality criteria for toxic pollutants on other bases than pollutant-by-pollutant criteria, including biological monitoring and assessment methods.

(9) REVISED CRITERIA FOR COASTAL RECREATION WATERS.—

(A) IN GENERAL.—Not later than 5 years after the date of the enactment of this paragraph, after consultation and in cooperation with appropriate Federal, State, tribal, and local officials (including local health officials), the Adminis-

trator shall publish new or revised water quality criteria for pathogens and pathogen indicators (including a revised list of testing methods, as appropriate), based on the results of the studies conducted under section 104(v), for the purpose of protecting human health in coastal recreation waters.

(B) REVIEWS.—Not later than the date that is 5 years after the date of publication of water quality criteria under this paragraph, and at least once every 5 years thereafter, the Administrator shall review and, as necessary, revise the water quality criteria.

(b) For the purposes of adopting or revising effluent limitations under this Act the Administrator shall, after consultation with appropriate Federal and State agencies and other interested persons, publish within one year of enactment of this title, regulations, providing guidelines for effluent limitations, and, at least annually thereafter, revise, if appropriate, such regulations. Such regulations shall—

(1)(A) identify, in terms of amounts of constituents and chemical, physical, and biological characteristics of pullutants, the degree of effluent reduction attainable through the application of the best practicable control technology currently available for classes and categories to point sources (other than publicly owned treatment works); and

(B) specify factors to be taken into account in determining the control measures and practices to be applicable to point sources (other than publicly owned treatment works) within such categories of classes. Factors relating to the assessment of best practical control technology currently available to comply with subsection (b)(1) of section 301 of this Act shall include consideration of the total cost of application of technology in relation to the effluent reduction benefits to be achieved from such application, and shall also take into account the age of equipment and facilities involved, the process employed, the engineering aspects of the application of various types of control techniques, process changes, non-water quality environmental impact (including energy requirements), and such other factors as the Administrator deems appropriate;

(2)(A) identify, in terms of amounts of constituents and chemical, physical, and biological characteristics of pollutants, the degree of effluent reduction attainable through the application of the best control measures and practices achievable including treatment techniques, process and procedure innovations, operating methods, and other alternatives for classes and categories of point sources (other than publicly owned treatment works); and

(B) specify factors to be taken into account in determining the best measures and practices available to comply with subsection (b)(2) of section 301 of this Act to be applicable to any point source (other than publicly owned treatment works) within such categories of classes. Factors relating to the assessment of best available technology shall take into account the age of equipment and facilities involved, the process employed, the engineering aspects of the application of various types of control techniques, process changes, the cost of achieving such ef-

fluent reduction, non-water quality environmental impact (including energy requirements), and such other factors as the Administrator deems appropriate;

(3) identify control measures and practices available to eliminate the discharge of pollutants from categories and classes of point sources, taking into account the cost of achieving such elimination of the discharge of pollutants; and

(4)(A) identify, in terms of amounts of constituents and chemical, physical, and biological characteristics of pollutants, the degree of effluent reduction attainable through the application of the best conventional pollutant control technology (including measures and practices) for classes and categories of point sources (other than publicly owned treatment works); and

(B) specify factors to be taken into account in determining the best conventional pollutant control technology measures and practices to comply with section 301(b)(2)(E) of this Act to be applicable to any point source (other than publicly owned treatment works) within such categories or classes. Factors relating to the assessment of best conventional pollutant control technology (including measures and practices) shall include consideration of the reasonableness of the relationship between the costs of attaining a reduction in effluents and the effluent reduction benefits derived, and the comparison of the cost and level of reduction of such pollutants from the discharge from publicly owned treatment works to the cost and level of reduction of such pollutants from a class or category of industrial sources, and shall take into account the age of equipment and facilities involved, the process employed, the engineering aspects of the application of various types of control techniques, process changes, non-water quality environmental impact (including energy requirements), and such other factors as the Administrator deems appropriate.

(c) The Administrator, after consultation, with appropriate Federal and State agencies and other interested persons, shall issue to the States and appropriate water pollution control agencies within 270 days after enactment of this title (and from time to time thereafter) information on the processes, procedures, or operating methods which result in the elimination or reduction of the discharge of pollutants to implement standards of performance under section 306 of this Act. Such information shall include technical and other data, including costs, as are available on alternative methods of elimination or reduction of the discharge of pollutants. Such information, and revisions thereof, shall be published in the Federal Register and otherwise shall be made available to the public.

(d)(1) The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall publish within sixty days after enactment of this title (and from time to time thereafter) information, in terms of amounts of constituents and chemical, physical, and biological characteristics of pollutants, on the degree of effluent reduction attainable through the application of secondary treatment.

(2) The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall publish

within nine months after the date of enactment of this title (and from time to time thereafter) information on alternative waste treatment management techniques and systems available to implement section 201 of this Act.

(3) The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall promulgate witin one hundred and eighty days after the date of enactment of this subsection guidelines for identifying and evaluating innovative and alternative wastewater treatment process and techniques referred to in section 201(g)(5) of this Act.

(4) For the purposes of this subsection, such biological treatment facilities as oxidation ponds, lagoons, and ditches and trickling filters shall be deemed the equivalent of secondary treatment. The Administrator shall provide guidance under paragraph (1) of this subsection on design criteria for such facilities, taking into account pollutant removal efficiencies and, consistent with the objective of the Act, assuring that water quality will not be adversely affected by deeming such facilities as the equivalent of secondary treatment.

(e) The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, may publish regulations, supplemental to any effluent limitations specified under subsections (b) and (c) of this section for a class or category of point sources, for any specific pollutant which the Administrator is charged with a duty to regulate as a toxic or hazardous pollutant under section 307(a)(1) or 311 of this Act, to control plant site runoff, spillage or leaks, sludge or waste disposal, and drainage from raw material storage which the Administrator determines are associated with or ancillary to the industrial manufacturing or treatment process within such class or category of point sources and may contribute significant amounts of such pollutants, to navigable waters. Any applicable controls established under this subsection shall be included as a requirement for the purposes of section 301, 302, 307, or 403, as the case may be, in any permit issued to a point source pursuant to section 402 of this Act.

(f) The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall issue to appropriate Federal agencies, the States, water pollution control agencies, and agencies designated under section 208 of this Act, within one year after the effective date of this subsection (and from time to time thereafter) information including (1) guidelines for identifying and evaluating the nature and extent of nonpoint sources of pollutants, and (2) processes, procedures, and methods to control pollution resulting from—

(A) agricultural and silvicultural activities, including runoff from fields and crop and forest lands;

(B) mining activities, including runoff and siltation from new, currently operating, and abandoned surface and underground mines;

(C) all construction activity, including runoff from the facilities resulting from such construction;

(D) the disposal of pollutants in wells or in subsurface excavations;

(E) salt water intrusion resulting from reductions of fresh water flow from any cause, including extraction of ground water, irrigation, obstruction, and diversion; and

(F) changes in the movement, flow, or circulation of any navigable waters or ground waters, including changes caused by the construction of dams, levees, channels, causeways, or flow diversion facilities.

Such information and revisions thereof shall be published in the Federal Register and otherwise made available to the public.

(g)(1) For the purpose of assisting States in carrying out programs under section 402 of this Act, the Administrator shall publish, within one hundred and twenty days after the date of enactment of this title, and review at least annually thereafter and, if appropriate, revise guidelines for pretreatment of pollutants which he determines are not susceptible to treatment by publicly owned treatment works. Guidelines under this subsection shall be established to control and prevent the discharge into the navigable waters, the contiguous zone, or the ocean (either directly or through publicly owned treatment works) of any pollutant which interferes with, passes through, or otherwise is incompatible with such works.

(2) When publishing guidelines under this subsection, the Administrator shall designate the category or categories of treatment works to which the guidelines shall apply.

(h) The Administrator shall, within one hundred and eighty days from the date of enactment of this title, promulgate guidelines establishing test procedures for the analysis of pollutants that shall include the factors which must be provided in any certification pursuant to section 401 of this Act or permit application pursuant to section 402 of this Act.

(i) The Administrator shall (1) within sixty days after the enactment of this title promulgate guidelines for the purpose of establishing uniform application forms and other minimum requirements for the acquisition of information from owners and operators of point-sources of discharge subject to any State program under section 402 of this Act, and (2) within sixty days from the date of enactment of this title promulgate guidelines establishing the minimum procedural and other elements of any State program under section 402 of this Act which shall include:

(A) monitoring requirements;

(B) reporting requirements (including procedures to make information available to the public);

(C) enforcement provisions; and

(D) funding, personnel qualifications, and manpower requirements (including a requirement that no board or body which approves permit applications or portions thereof shall include, as a member, any person who receives, or has during the previous two years received, a significant portion of his income directly or indirectly from permit holders or applicants for a permit).

(j) LAKE RESTORATION GUIDANCE MANUAL.—The Administrator shall, within 1 year after the date of the enactment of the Water Quality Act of 1987 and biennially thereafter, publish and disseminate a lake restoration guidance manual describing methods, procedures, and processes to guide State and local efforts to improve, re-

store, and enhance water quality in the Nation's publicly owned lakes.

(k)(1) The Administrator shall enter into agreements with the Secretary of Agriculture, the Secretary of the Army, and the Secretary of the Interior, and the heads of such other departments, agencies, and instrumentalities of the United States as the Administrator determines, to provide for the maximum utilization of other Federal laws and programs for the purpose of achieving and maintaining water quality through appropriate implementation of plans approved under section 208 of this Act and nonpoint source pollution management programs approved under section 319 of this Act.

(2) The Administrator is authorized to transfer to the Secretary of Agriculture, the Secretary of the Army, and the Secretary of the Interior and the heads of such other departments, agencies, and instrumentalities of the United States as the Administrator determines, any funds appropriated under paragraph (3) of this subsection to supplement funds otherwise appropriated to programs authorized pursuant to any agreement under paragraph (1).

(3) There is authorized to be appropriated to carry out the provisions of this subsection, $100,000,000 per fiscal year for the fiscal years 1979 through 1983 and such sums as may be necessary for fiscal years 1984 through 1990.

(l) INDIVIDUAL CONTROL STRATEGIES FOR TOXIC POLLUTANTS.—

(1) STATE LIST OF NAVIGABLE WATERS AND DEVELOPMENT OF STRATEGIES.—Not later than 2 years after the date of the enactment of this subsection, each State shall submit to the Administrator for review, approval, and implementation under this subsection—

(A) a list of those waters within the State which after the application of effluent limitations required under section 301(b)(2) of this Act cannot reasonably be anticipated to attain or maintain (i) water quality standards for such waters reviewed, revised, or adopted in accordance with section 303(c)(2)(B) of this Act, due to toxic pollutants, or (ii) that water quality which shall assure protection of public health, public water supplies, agricultural and industrial uses, and the protection and propagation of a balanced population of shellfish, fish and wildlife, and allow recreational activities in and on the water;

(B) a list of all navigable waters in such State for which the State does not expect the applicable standard under section 303 of this Act will be achieved after the requirements of sections 301(b), 306, and 307(b) are met, due entirely or substantially to discharges from point sources of any toxic pollutants listed pursuant to section 307(a);

(C) for each segment of the navigable waters included on such lists, a determination of the specific point sources discharging any such toxic pollutant which is believed to be preventing or impairing such water quality and the amount of each toxic pollutant discharged by each such source; and

(D) for each such segment, an individual control strategy which the State determines will produce a reduction in the discharge of toxic pollutants from point sources identified by the State under this paragraph through the estab-

lishment of effluent limitations under section 402 of this Act and water quality standards under section 303(c)(2)(B) of this Act, which reduction is sufficient, in combination with existing controls on point and nonpoint sources of pollution, to achieve the applicable water quality standard as soon as possible, but not later than 3 years after the date of the establishment of such strategy.

(2) APPROVAL OR DISAPPROVAL.—Not later than 120 days after the last day of the 2-year period referred to in paragraph (1), the Administrator shall approve or disapprove the control strategies submitted under paragraph (1) by any State.

(3) ADMINISTRATOR'S ACTION.—If a State fails to submit control strategies in accordance with paragraph (1) or the Administrator does not approve the control strategies submitted by such State in accordance with paragraph (1), then, not later than 1 year after the last day of the period referred to in paragraph (2), the Administrator, in cooperation with such State and after notice and opportunity for public comment, shall implement the requirements of paragraph (1) in such State. In the implementation of such requirements, the Administrator shall, at a minimum, consider for listing under this subsection any navigable waters for which any person submits a petition to the Administrator for listing not later than 120 days after such last day.

(m) SCHEDULE FOR REVIEW OF GUIDELINES.—

(1) PUBLICATION.—Within 12 months after the date of the enactment of the Water Quality Act of 1987, and biennially thereafter, the Administrator shall publish in the Federal Register a plan which shall—

(A) establish a schedule for the annual review and revision of promulgated effluent guidelines, in accordance with subsection (b) of this section;

(B) identify categories of sources discharging toxic or nonconventional pollutants for which guidelines under subsection (b)(2) of this section and section 306 have not previously been published; and

(C) establish a schedule for promulgation of effluent guidelines for categories identified in subparagraph (B), under which promulgation of such guidelines shall be no later than 4 years after such date of enactment for categories identified in the first published plan or 3 years after the publication of the plan for categories identified in later published plans.

(2) PUBLIC REVIEW.—The Administrator shall provide for public review and comment on the plan prior to final publication.

(33 U.S.C. 1314)

WATER QUALITY INVENTORY

SEC. 305. (a) The Administrator, in cooperation with the States and with the assistance of appropriate Federal agencies, shall prepare a report to be submitted to the Congress on or before January 1, 1974, which shall—

(1) describe the specific quality, during 1973, with appropriate supplemental descriptions as shall be required to take into account seasonal, tidal, and other variations, of all navigable waters and the waters of the contiguous zone;

(2) include an inventory of all point sources of discharge (based on a qualitative and quantitative analysis of discharges) of pollutants, into all navigable waters and the waters of the contiguous zone; and

(3) identify specifically those navigable waters, the quality of which—

(A) is adequate to provide for the protection and propagation of a balanced population of shellfish, fish, and wildlife and allow recreational activities in and on the water;

(B) can reasonably be expected to attain such level by 1977 or 1983; and

(C) can reasonably be expected to attain such level by any later date.

(b)(1) Each State shall prepare and submit to the Administrator by April 1, 1975, and shall bring up to date by April 1, 1976, and biennially thereafter, a report which shall include—

(A) a description of the water quality of all navigable waters in such State during the preceding year, with appropriate supplemental descriptions as shall be required to take into account seasonal, tidal, and other variations, correlated with the quality of water required by the objective of this Act (as identified by the Administrator pursuant to criteria published under section 304(a) of this Act) and the water quality described in subparagraph (B) of this paragraph;

(B) an analysis of the extent to which all navigable waters of such State provide for the protection and propagation of a balanced population of shellfish, fish, and wildlife, and allow recreational activities in and on the water;

(C) an analysis of the extent to which the elimination of the discharge of pollutants and a level of water quality which provides for the protection and propagation of a balanced population of shellfish, fish, and wildlife and allows recreational activities in and on the water, have been or will be achieved by the requirements of this Act, together with recommendations as to additional action necessary to achieve such objectives and for what waters such additional action is necessary;

(D) an estimate of (i) the environmental impact, (ii) the economic and social costs necessary to achieve the objective of this Act in such State, (iii) the economic and social benefits of such achievement, and (iv) an estimate of the date of such achievement; and

(E) a description of the nature and extent of nonpoint sources of pollutants, and recommendations as to the programs which must be undertaken to control each category of such sources, including an estimate of the costs of implementing such programs.

(2) The Administrator shall transmit such State reports, together with an analysis thereof, to Congress on or before October 1, 1975, and October 1, 1976, and biennially thereafter.

(33 U.S.C. 1315)

NATIONAL STANDARDS OF PERFORMANCE

SEC. 306. (a) For purposes of this section:

(1) The term "standard of performance" means a standard for the control of the discharge of pollutants which reflects the greatest degree of effluent reduction which the Administrator determines to be achievable through application of the best available demonstrated control technology, processes, operating methods, or other alternatives, including, where practicable, a standard permitting no discharge of pollutants.

(2) The term "new source" means any source, the construction of which is commenced after the publication of proposed regulations prescribing a standard of performance under this section which will be applicable to such sources, if such standard is thereafter promulgated in accordance with this section.

(3) The term "source" means any building, structure, facility, or installation from which there is or may be the discharge of pollutants.

(4) The term "owner or operator" means any person who owns, leases, operates, controls, or supervises a source.

(5) The term "construction" means any placement, assembly, or installation of facilities or equipment (including contractual obligations to purchase such facilities or equipment) at the premises where such equipment will be used, including preparation work at such premises.

(b)(1)(A) The Administrator shall, within ninety days after the date of enactment of this title publish (and from time to time thereafter shall revise) a list of categories of sources, which shall, at the minimum, include:

pulp and paper mills;
paperboard, builders paper and board mills;
meat product and rendering processing;
dairy product processing;
grain mills;
canned and preserved fruits and vegetables processing;
canned and preserved seafood processing;
sugar processing;
textile mills;
cement manufacturing;
feedlots;
electroplating;
organic chemicals manufacturing;
inorganic chemicals manufacturing;
plastic and synthetic materials manufacturing;
soap and detergent manufacturing
fertilizer manufacturing;
petroleum refining;
iron and steel manufacturing;
nonferrous metals manufacturing;
phosphate manufacturing;
steam electric powerplants;
ferroalloy manufacturing;
leather tanning and finishing;
glass and asbestos manufacturing;
rubber processing; and

timber products processing.

(B) As soon as practicable, but in no case more than one year, after a category of sources is included in a list under subparagraph (A) of this paragraph, the Administrator shall propose and publish regulations establishing Federal standards of performance for new sources within such category. The Administrator shall afford interested persons an opportunity for written comment on such proposed regulations. After considering such comments, he shall promulgate, within one hundred and twenty days after publication of such proposed regulations, such standards with such adjustments as he deems appropriate. The Administrator shall, from time to time, as technlogy and alternatives change, revise such standards following the procedure required by this subsection for promulgation of such standards. Standards of performance, or revisions thereof, shall become effective upon promulgation. In establishing or revising Federal standards of performance for new sources under this section, the Administrator shall take into consideration the cost of achieving such effluent reduction, and any non-water quality environmental impact and energy requirements.

(2) The Administrator may distinguish among classes, types, and sizes within categories of new sources for the purpose of establishing such standards and shall consider the type of process employed (including whether batch or continuous).

(3) The provisions of this section shall apply to any new source owned or operated by the United States.

(c) Each State may develop and submit to the Administrator a procedure under State law for applying and enforcing standards of performance for new sources located in such State. If the Administrator finds that the procedure and the law of any State require the application and enforcement of standards of performance to at least the same extent as required by this section, such State is authorized to apply and enforce such standards of performance (except with respect to new sources owned or operated by the United States).

(d) Notwithstanding any other provision of this Act, any point source the construction of which is commenced after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972 and which is so constructed as to meet all applicable standards of performance shall not be subject to any more stringent standard of performance during a ten-year period beginning on the date of completion of such construction or during the period of depreciation or amortization of such facility for the purposes of section 167 or 169 (or both) of the Internal Revenue Code of 1954, whichever period ends first.

(e) After the effective date of standards of performance promulgated under this section, it shall be unlawful for any owner or operator of any new source to operate such source in violation of any standard of performance applicable to such source.

(33 U.S.C. 1316)

TOXIC AND PRETREATMENT EFFLUENT STANDARDS

SEC. 307. (a)(1) On and after the date of enactment of the Clean Water Act of 1977, the list of toxic pollutants or combination of pollutants subject to this Act shall consist of those toxic

polllutants listed in table 1 of Committee Print Numbered 95–30 of the Committee on Public Works and Transportation of the House of Representatives, and the Administrator shall publish, not later than the thirtieth day after the date of enactment of the Clean Water Act of 1977, that list. From time to time thereafter, the Administrator may revise such list and the Administrator is authorized to add to or remove from such list any pollutant. The Administrator in publishing any revised list, including the addition or removal of any pollutant from such list, shall take into account the toxicity of the pollutant, its persistence, degradability, the usual or potential presence of the affected organisms in any waters, the importance of the affected organisms, and the nature and extent of the effect of the toxic pollutant on such organisms. A determination of the Administrator under this paragraph shall be final except that if, on judicial review, such determination was based on arbitrary and capricious action of the Administrator, the Administrator shall make a redetermination.

(2) Each toxic pollutant listed in accordance with paragraph (1) of this subsection shall be subject to effluent limitations resulting from the application of the best available technology economically achieveable for the applicable category or class of point sources established in accordance with section 301(b)(2)(A) and 304(b)(2) of this Act. The Administrator, in his discretion, may publish in the Federal Register a proposed effluent standard (which may include a prohibition) establishing requirements for a toxic pollutant which, if an effluent limitation is applicable to a class or category of point sources, shall be applicable to such category or class only if such standard imposes more stringent requirements. Such published effluent standard (or prohibition) shall take into account the toxicity of the pollutant, its persistence, degradability, the usual or potential presence of the affected organisms in any waters, the importance of the affected organisms and the nature and extent of the effect of the toxic pollutant on such organisms, and the extent to which effective control is being or may be achieved under other regulatory authority. The Administrator shall allow a period of not less than sixty days following publication of any such proposed effluent standard (or prohibition) for written comment by interested persons on such proposed standard. In addition, if within thirty days of publication of any such proposed effluent standard (or prohibition) any interested person so requests, the Administrator shall hold a public hearing in connection therewith. Such a public hearing shall provide an opportunity for oral and written presentations, such cross-examination as the Administrator determines is appropriate on disputed issues of material fact, and the transcription of a verbatim record which shall be available to the public. After consideration of such comments and any information and material presented at any public hearing held on such proposed standard or prohibition, the Administrator shall promulgate such standards (or prohibition) with such modifications as the Administrator finds are justified. Such promulgation by the Administrator shall be made within two hundred and seventy days after publication of proposed standard (or prohibition). Such standard (or prohibition) shall be final except that if, on judicial review, such standard was not based on substantial evidence, the Administrator shall promulgate a revised standard. Effluent limitations shall be established in accord-

ance with sections 301(b)(2)(A) and 304(b)(2) for every toxic pollutant referred to in table 1 of Committee Print Numbered 95–30 of the Committee on Public Works and Transportation of the House of Representatives as soon as practicable after the date of enactment of the Clean Water Act of 1977, but no later than July 1, 1980. Such effluent limitations or effluent standards (or prohibitions) shall be established for every other toxic pollutant listed under paragraph (1) of this subsection as soon as practicable after it is so listed.

(3) Each such effluent standard (or prohibition) shall be reviewed and, if appropriate, revised at least every three years.

(4) Any effluent standard promulgated under this section shall be at that level which the Administrator determines provides an ample margin of safety.

(5) When proposing or promulgating any effluent standard (or prohibition) under this section, the Administrator shall designate the category or categories of sources to which the effluent standard (or prohibition) shall apply. Any disposal of dredged material may be included in such a category of sources after consultation with the Secretary of the Army.

(6) Any effluent standard (or prohibition) established pursuant to this section shall take effect on such date or dates as specified in the order promulgating such standard, but in no case, more than one year from the date of such promulgation. If the Administrator determines that compliance within one year from the date of promulgation is technologically infeasible for a category of sources, the Administrator may establish the effective date of the effluent standard (or prohibition) for such category at the earliest date upon which compliance can be feasibly attained by sources within such category, but in no event more than three years after the date of such promulgation.

(7) Prior to publishing any regulations pursuant to this section the Administrator shall, to the maximum extent practicable within the time provided, consult with appropriate advisory committees, States, independent experts, and Federal departments and agencies.

(b)(1) The Administrator shall, within one hundred and eighty days after the date of enactment of this title and from time to time thereafter, publish proposed regulations establishing pretreatment standards for introduction of pollutants into treatment works (as defined in section 212 of this Act) which are publicly owned for those pollutants which are determined not to be susceptible to treatment by such treatment works or which would interfere with the operation of such treatment works. Not later than ninety days after such publication, and after opportunity for public hearing, the Administrator shall promulgate such pretreatment standards. Pretreatment standards under this subsection shall specify a time for compliance not to exceed three years from the date of promulgation and shall be established to prevent the discharge of any pollutant through treatment works (as defined in section 212 of this Act) which are publicly owned, which pollutant interfers with, passes through, or otherwise is incompatible with such works. If, in the case of any toxic pollutant under subsection (a) of this section introduced by a source into a publicly owned treatment works, the treatment by such works removes all or any part of such toxic pol-

lutant and the discharge from such works does not violate that effluent limitation or standard which would be applicable to such toxic pollutant if it were discharged by such source other than through a publicly owned treatment works, and does not prevent sludge use or disposal by such works in accordance with section 405 of this Act, then the pretreatment requirements for the sources actually discharging such toxic pollutant into such publicly owned treatment works may be revised by the owner or operator of such works to reflect the removal of such toxic pollutant by such works.

(2) The Administrator shall, from time to time, as control technology, processes, operating methods, or other alternative change, revise such standards following the procedures established by this subsection for promulgation of such standards.

(3) When proposing or promulgating any pretreatment standard under this section, the Administrator shall designate the category or categories of sources to which such standard shall apply.

(4) Nothing in this subsection shall affect any pretreatment requirement established by any State or local law not in conflict with any pretreatment standard established under this subsection.

(c) In order to ensure that any source introducing pollutants into a publicly owned treatment works, which source would be a new source subject to section 306 if it were to discharge pollutants, will not cause a violation of the effluent limitations established for any such treatment works, the Administrator shall promulgate pretreatment standards for the category of such sources simultaneously with the promulgation of standards of performance under section 306 for the equivalent category of new sources. Such pretreatment standards shall prevent the discharge of any pollutant into such treatment works, which pollutant may interfere with, pass through, or otherwise be incompatible with such works.

(d) After the effective date of any effluent standard or prohibition or pretreatment standard promulgated under this section, it shall be unlawful for any owner or operator of any source to operate any source in violation of any such effluent standard or prohibition or pretreatment standard.

(e) COMPLIANCE DATE EXTENSION FOR INNOVATIVE PRETREATMENT SYSTEMS.—In the case of any existing facility that proposes to comply with the pretreatment standards of subsection (b) of this section by applying an innovative system that meets the requirements of section 301(k) of this Act, the owner or operator of the publicly owned treatment works receiving the treated effluent from such facility may extend the date for compliance with the applicable pretreatment standard established under this section for a period not to exceed 2 years—

(1) if the Administrator determines that the innovative system has the potential for industrywide application, and

(2) if the Administrator (or the State in consultation with the Administrator, in any case in which the State has a pretreatment program approved by the Administrator)—

(A) determines that the proposed extension will not cause the publicly owned treatment works to be in violation of its permit under section 402 or of section 405 or to contribute to such a violation, and

(B) concurs with the proposed extension.

(33 U.S.C. 1317)

INSPECTIONS, MONITORING, AND ENTRY

SEC. 308. (a) Whenever required to carry out the objective of this Act, including but not limited to (1) developing or assisting in the development of any effluent limitation, or other limitation, prohibition, or effluent standard, pretreatment standard, or standard of performance under this Act; (2) determining whether any person is in violation of any such effluent limitation, or other limitation, prohibition or effluent standard, pretreatment standard, or standard of performance; (3) any requirement established under this section; or (4) carrying out sections 305, 311, 402, 404 (relating to State permit programs), 405, and 504 of this Act—

(A) the Administrator shall require the owner or operator of any point source to (i) establish and maintain such records, (ii) make such reports, (iii) install, use, and maintain such monitoring equipment or methods (including where appropriate, biological monitoring methods), (iv) sample such effluents (in accordance with such methods, at such locations, at such intervals, and in such manner as the Administrator shall prescribe), and (v) provide such other information as he may reasonably require; and

(B) the Administrator or his authorized representative (including an authorized contractor acting as a representative of the Administrator), upon presentation of his credentials—

(i) shall have a right of entry to, upon, or through any premises in which an effluent source is located or in which any records required to be maintained under clause (A) of this subsection are located, and

(ii) may at reasonable times have access to and copy any records, inspect any monitoring equipment or method required under clause (A), and sample any effluents which the owner or operator of such source is required to sample under such clause.

(b) Any records, reports, or information obtained under this section (1) shall, in the case of effluent data, be related to any applicable effluent limitations, toxic, pretreatment, or new source performance standards, and (2) shall be available to the public, except that upon a showing satisfactory to the Administrator by any person that records, reports, or information, or particular part thereof (other than effluent data), to which the Administrator has access under this section, if made public would divulge methods or processes entitled to protection as trade secrets of such person, the Administrator shall consider such record, report, or information, or particular portion thereof confidential in accordance with the purposes of section 1905 of title 18 of the United States Code. Any authorized representative of the Administrator (including an authorized contractor acting as a representative of the Administrator) who knowingly or willfully publishes, divulges, discloses, or makes known in any manner or to any extent not authorized by law any information which is required to be considered confidential under this subsection shall be fined not more than $1,000 or imprisoned not more than 1 year, or both. Nothing in this subsection shall prohibit the Administrator or an authorized representative of the Administrator (including any authorized contractor acting as a representative of the Administrator) from disclosing records, reports,

or information to other officers, employees, or authorized representatives of the United States concerned with carrying out this Act or when relevant in any proceeding under this Act.

(c) Each State may develop and submit to the Administrator procedures under State law for inspection, monitoring, and entry with respect to point sources located in such State. If the Administrator finds that the procedures and the law of any State relating to inspection, monitoring, and entry are applicable to at least the same extent as those required by this section, such State is authorized to apply and enforce its procedures for inspection, monitoring, and entry with respect to point sources located in such State (except with respect to point sources owned or operated by the United States).

(d) ACCESS BY CONGRESS.—Notwithstanding any limitation contained in this section or any other provision of law, all information reported to or otherwise obtained by the Administrator (or any representative of the Administrator) under this Act shall be made available, upon written request of any duly authorized committee of Congress, to such committee.

(33 U.S.C. 1318)

FEDERAL ENFORCEMENT

SEC. 309. (a)(1) Whenever, on the basis of any information available to him, the Administrator finds that any person is in violation of any condition or limitation which implements section 301, 302, 306, 307, 308, 318, or 405 of this Act in a permit issued by a State under an approved permit program under section 402 or 404 of this Act, he shall proceed under his authority in paragraph (3) of this subsection or he shall notify the person in alleged violation and such State of such finding. If beyond the thirtieth day after the Administrator's notification the State has not commenced appropriate enforcement action, the Administrator shall issue an order requiring such person to comply with such condition or limitation or shall bring a civil action in accordance with subsection (b) of this section.

(2) Whenever, on the basis of information available to him, the Administrator finds that violations of permit conditions or limitations as set forth in paragraph (1) of this subsection are so widespread that such violations appear to result from a failure of the State to enforce such permit conditions or limitations effectively, he shall so notify the State. If the Administrator finds such failure extends beyond the thirtieth day after such notice, he shall give public notice of such finding. During the period beginning with such public notice and ending when such State satisfies the Administrator that it will enforce such conditions and limitations (hereafter referred to in this section as the period of "federally assumed enforcement"), except where an extension has been granted under paragraph (5)(B) of this subsection, the Administrator shall enforce any permit condition or limitation with respect to any person—

(A) by issuing an order to comply with such condition or limitation, or

(B) by bringing a civil action under subsection (b) of this section.

(3) Whenever on the basis of any information available to him the Administrator finds that any person is in violation of section 301, 302, 306, 307, 308, 318, or 405 of this Act, or is in violation of any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act by him or by a State or in a permit issued under section 404 of this Act by a State, he shall issue an order requiring such person to comply with such section or requirement, or he shall bring a civil action in accordance with subsection (b) of this section.

(4) A copy of any order issued under this subsection shall be sent immediately by the Administrator to the State in which the violation occurs and other affected States. In any case in which an order under this subsection (or notice to a violator under paragraph (1) of this subsection) is issued to a corporation, a copy of such order (or notice) shall be served on any appropriate corporate officers. An order issued under this subsection relating to a violation of section 308 of this Act shall not take effect until the person to whom it is issued has had an opportunity to confer with the Administrator concerning the alleged violation.

(5)(A) Any order issued under this subsection shall be by personal service, shall state with reasonable specificity the nature of the violation, and shall specify a time for compliance not to exceed thirty days in the case of a violation of an interim compliance schedule or operation and maintenance requirement and not to exceed a time the Administrator determines to be reasonable in the case of a violation of a final deadline, taking into account the seriousness of the violation and any good faith efforts to comply with applicable requirements.

(B) The Administrator may, if he determines (i) that any person who is a violator of, or any person who is otherwise not in compliance with, the time requirements under this Act or in any permit issued under this Act, has acted in good faith, and has made a commitment (in the form of contracts or other securities) of necessary resources to achieve compliance by the earliest possible date after July 1, 1977, but not later than April 1, 1979; (ii) that any extension under this provision will not result in the imposition of any additional controls on any other point or nonpoint source; (iii) that an application for a permit under section 402 of this Act was filed for such person prior to December 31, 1974; and (iv) that the facilities necessary for compliance with such requirements are under construction, grant an extension of the date referred to in section 301(b)(1)(A) to a date which will achieve compliance at the earliest time possible but not later than April 1, 1979.

(6) Whenever, on the basis of information available to him, the Administrator finds (A) that any person is in violation of section 301(b)(1) (A) or (C) of this Act, (B) that such person cannot meet the requirements for a time extension under section 301(i)(2) of this Act, and (C) that the most expeditious and appropriate means of compliance with this Act by such person is to discharge into a publicly owned treatment works, then, upon request of such person, the Administrator may issue an order requiring such person to comply with this Act at the earliest date practicable, but not later than July 1, 1983, by discharging into a publicly owned treatment works if such works concur with such order. Such order shall include a schedule of compliance.

(b) The Administrator is authorized to commence a civil action for appropriate relief, including a permanent or temporary injunction, for any violation for which he is authorized to issue a compliance order under subsection (a) of this section. Any action under this subsection may be brought in the district court of the United States for the district in which the defendant is located or resides or is doing business, and such court shall have jurisdiction to restrain such violation and to require compliance. Notice of the commencement of such action shall be given immediately to the appropriate State.

(c) CRIMINAL PENALTIES.—

(1) NEGLIGENT VIOLATIONS.—Any person who—

(A) negligently violates section 301, 302, 306, 307, 308, 311(b)(3), 318, or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act by the Administrator or by a State, or any requirement imposed in a pretreatment program approved under section 402(a)(3) or 402(b)(8) of this Act or in a permit issued under section 404 of this Act by the Secretary of the Army or by a State; or

(B) negligently introduces into a sewer system or into a publicly owned treatment works any pollutant or hazardous substance which such person knew or reasonably should have known could cause personal injury or property damage or, other than in compliance with all applicable Federal, State, or local requirements or permits, which causes such treatment works to violate any effluent limitation or condition in any permit issued to the treatment works under section 402 of this Act by the Administrator or a State;

shall be punished by a fine of not less than $2,500 nor more than $25,000 per day of violation, or by imprisonment for not more than 1 year, or by both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $50,000 per day of violation, or by imprisonment of not more than 2 years, or by both.

(2) KNOWING VIOLATIONS.—Any person who—

(A) knowingly violates section 301, 302, 306, 307, 308, 311(b)(3), 318, or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act by the Administrator or by a State, or any requirement imposed in a pretreatment program approved under section 402(a)(3) or 402(b)(8) of this Act or in a permit issued under section 404 of this Act by the Secretary of the Army or by a State; or

(B) knowingly introduces into a sewer system or into a publicly owned treatment works any pollutant or hazardous substance which such person knew or reasonably should have known could cause personal injury or property damage or, other than in compliance with all applicable Federal, State, or local requirements or permits, which causes such treatment works to violate any effluent limita-

tion or condition in a permit issued to the treatment works under section 402 of this Act by the Administrator or a State;

shall be punished by a fine of not less that $5,000 nor more than $50,000 per day of violation, or by imprisonment for not more than 3 years, or by both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $100,000 per day of violation, or imprisonment of not more than 6 years, or by both.

(3) KNOWING ENDANGERMENT.—

(A) GENERAL RULE.—Any person who knowingly violates section 301, 302, 306, 307, 308, 311(b)(3), 318, or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act by the Administrator or by a State, or in a permit issued under section 404 of this Act by the Secretary of the Army or by a State, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than $250,000 or imprisonment of not more than 15 years, or both. A person which is an organization shall, upon conviction of violating this subparagraph, be subject to a fine of not more than $1,000,000. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, the maximum punishment shall be doubled with respect to both fine and imprisonment.

(B) ADDITIONAL PROVISIONS.—For the purpose of subparagraph (A) of this paragraph—

(i) in determining whether a defendant who is an individual knew that his conduct placed another person in imminent danger of death or serious bodily injury—

(I) the person is responsible only for actual awareness or actual belief that he possessed; and

(II) knowledge possessed by a person other than the defendant but not by the defendant himself may not be attributed to the defendant;

except that in proving the defendant's possession of actual knowledge, circumstantial evidence may be used, including evidence that the defendant took affirmative steps to shield himself from relevant information;

(ii) it is an affirmative defense to prosecution that the conduct charged was consented to by the person endangered and that the danger and conduct charged were reasonably foreseeable hazards of—

(I) an occupation, a business, or a profession; or

(II) medical treatment or medical or scientific experimentation conducted by professionally approved methods and such other person had been made aware of the risks involved prior to giving consent;

and such defense may be established under this subparagraph by a preponderance of the evidence;

(iii) the term "organization" means a legal entity, other than a government, established or organized for any purpose, and such term includes a corporation, company, association, firm, partnership, joint stock company, foundation, institution, trust, society, union, or any other association of persons; and

(iv) the term "serious bodily injury" means bodily injury which involves a substantial risk of death, unconsciousness, extreme physical pain, protracted and obvious disfigurement, or protracted loss or impairment of the function of a bodily member, organ, or mental faculty.

(4) FALSE STATEMENTS.—Any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under this Act or who knowingly falsifies, tampers with, or renders inaccurate any monitoring device or method required to be maintained under this Act, shall upon conviction, be punished by a fine of not more than $10,000, or by imprisonment for not more than 2 years, or by both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than $20,000 per day of violation, or by imprisonment of not more than 4 years, or by both.

(5) TREATMENT OF SINGLE OPERATIONAL UPSET.—For purposes of this subsection, a single operational upset which leads to simultaneous violations of more than one pollutant parameter shall be treated as a single violation.

(6) RESPONSIBLE CORPORATE OFFICER AS "PERSON".—For the purpose of this subsection, the term "person" means, in addition to the definition contained in section 502(5) of this Act, any responsible corporate officer.

(7) HAZARDOUS SUBSTANCE DEFINED.—For the purpose of this subsection, the term "hazardous substance" means (A) any substance designated pursuant to section 311(b)(2)(A) of this Act, (B) any element, compound, mixture, solution, or substance designated pursuant to section 102 of the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, (C) any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Act (but not including any waste the regulation of which under the Solid Waste Disposal Act has been suspended by Act of Congress), (D) any toxic pollutant listed under section 307(a) of this Act, and (E) any imminently hazardous chemical substance or mixture with respect to which the Administrator has taken action pursuant to section 7 of the Toxic Substances Control Act.

(d) Any person who violates section 301, 302, 306, 307, 308, 311(b)(3), 318 or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act by the Administrator, or by a State, or in

a permit issued under section 404 of this Act by a State,,[1] or any requirement imposed in a pretreatment program approved under section 402(a)(3) or 402(b)(8) of this Act, and any person who violates any order issued by the Administrator under subsection (a) of this section, shall be subject to a civil penalty not to exceed $25,000 per day for each violation. In determining the amount of a civil penalty the court shall consider the seriousness of the violation or violations, the economic benefit (if any) resulting from the violation, any history of such violations, any good-faith efforts to comply with the applicable requirements, the economic impact of the penalty on the violator, and such other matters as justice may require. For purposes of this subsection, a single operational upset which leads to simultaneous violations of more than one pollutant parameter shall be treated as a single violation.

(e) Whenever a municipality is a party to a civil action brought by the United States under this section, the State in which such municipality is located shall be joined as a party. Such State shall be liable for payment of any judgment, or any expenses incurred as a result of complying with any judgment, entered against the municipality in such action to the extent that the laws of that State prevent the municipality from raising revenues needed to comply with such judgment.

(f) Whenever, on the basis of an information available to him, the Administrator finds that an owner or operator of any source is introducing a pollutant into a treatment works in violation of subsection (d) of section 307, the Administrator may notify the owner or operator of such treatment works and the State of such violation. If the owner or operator of the treatment works does not commence appropriate enforcement action within 30 days of the date of such notification, the Administrator may commence a civil action for appropriate relief, including but not limited to, a permanent or temporary injunction, against the owner or operator of such treatment works. In any such civil action the Administrator shall join the owner or operator of such source as a party to the action. Such action shall be brought in the district court of the United States in the district in which the treatment works is located. Such court shall have jurisdiction to restrain such violation and to require the owner or operator of the treatment works and the owner or operator of the source to take such action as may be necessary to come into compliance with this Act. Notice of commencement of any such action shall be given to the State. Nothing in this subsection shall be construed to limit or prohibit any other authority the Administrator may have under this Act.

(g) ADMINISTRATIVE PENALTIES.—

(1) VIOLATIONS.—Whenever on the basis of any information available—

(A) the Administrator finds that any person has violated section 301, 302, 306, 307, 308, 318, or 405 of this Act, or has violated any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act by the Administrator or by a State, or in a permit issued under section 404 by a State, or

[1] So in law. See P.L. 100–4, sec. 313(a)(1), 101 Stat. 45.

(B) the Secretary of the Army (hereinafter in this subsection referred to as the "Secretary") finds that any person has violated any permit condition or limitation in a permit issued under section 404 of this Act by the Secretary,

the Administrator or Secretary, as the case may be, may, after consultation with the State in which the violation occurs, assess a class I civil penalty or a class II civil penalty under this subsection.

(2) CLASSES OF PENALTIES.—

(A) CLASS I.—The amount of a class I civil penalty under paragraph (1) may not exceed $10,000 per violation, except that the maximum amount of any class I civil penalty under this subparagraph shall not exceed $25,000. Before issuing an order assessing a civil penalty under this subparagraph, the Administrator or the Secretary, as the case may be, shall give to the person to be assessed such penalty written notice of the Administrator's or Secretary's proposal to issue such order and the opportunity to request, within 30 days of the date the notice is received by such person, a hearing on the proposed order. Such hearing shall not be subject to section 554 or 556 of title 5, United States Code, but shall provide a reasonable opportunity to be heard and to represent evidence.

(B) CLASS II.—The amount of a class II civil penalty under paragraph (1) may not exceed $10,000 per day for each day during which the violation continues; except that the maximum amount of any class II civil penalty under this subparagraph shall not exceed $125,000. Except as otherwise provided in this subsection, a class II civil penalty shall be assessed and collected in the same manner, and subject to the same provisions, as in the case of civil penalties assessed and collected after notice and opportunity for a hearing on the record in accordance with section 554 of title 5, United States Code. The Administrator and the Secretary may issue rules for discovery procedures for hearings under this subparagraph.

(3) DETERMINING AMOUNT.—In determining the amount of any penalty assessed under this subsection, the Administrator or the Secretary, as the case may be, shall take into account the nature, circumstances, extent and gravity of the violation, or violations, and, with respect to the violator, ability to pay, any prior history of such violations, the degree of culpability, economic benefit or savings (if any) resulting from the violation, and such other matters as justice may require. For purposes of this subsection, a single operational upset which leads to simultaneous violations of more than one pollutant parameter shall be treated as a single violation.

(4) RIGHTS OF INTERESTED PERSONS.—

(A) PUBLIC NOTICE.—Before issuing an order assessing a civil penalty under this subsection the Administrator or Secretary, as the case may be, shall provide public notice of and reasonable opportunity to comment on the proposed issuance of such order.

(B) PRESENTATION OF EVIDENCE.—Any person who comments on a proposed assessment of a penalty under this subsection shall be given notice of any hearing held under this subsection and of the order assessing such penalty. In any hearing held under this subsection, such person shall have a reasonable opportunity to be heard and to present evidence.

(C) RIGHTS OF INTERESTED PERSONS TO A HEARING.—If no hearing is held under paragraph (2) before issuance of an order assessing a penalty under this subsection, any person who commented on the proposed assessment may petition, within 30 days after the issuance of such order, the Administrator or Secretary, as the case may be, to set aside such order and to provide a hearing on the penalty. If the evidence presented by the petitioner in support of the petition is material and was not considered in the issuance of the order, the Administrator or Secretary shall immediately set aside such order and provide a hearing in accordance with paragraph (2)(A) in the case of a class I civil penalty and paragraph (2)(B) in the case of a class II civil penalty. If the Administrator or Secretary denies a hearing under this subparagraph, the Administrator or Secretary shall provide to the petitioner, and publish in the Federal Register, notice of and the reasons for such denial.

(5) FINALITY OF ORDER.—An order issued under this subsection shall become final 30 days after its issuance unless a petition for judicial review is filed under paragraph (8) or a hearing is requested under paragraph (4)(C). If such a hearing is denied, such order shall become final 30 days after such denial.

(6) EFFECT OF ORDER.—

(A) LIMITATION ON ACTIONS UNDER OTHER SECTIONS.—Action taken by the Administrator or the Secretary, as the case may be, under this subsection shall not affect or limit the Administrator's or Secretary's authority to enforce any provision of this Act; except that any violation—

(i) with respect to which the Administrator or the Secretary has commenced and is diligently prosecuting an action under this subsection,

(ii) with respect to which a State has commenced and is diligently prosecuting an action under a State law comparable to this subsection, or

(iii) for which the Administrator, the Secretary, or the State has issued a final order not subject to further judicial review and the violator has paid a penalty assessed under this subsection, or such comparable State law, as the case may be,

shall not be the subject of a civil penalty action under subsection (d) of this section or section 311(b) or section 505 of this Act.

(B) APPLICABILITY OF LIMITATION WITH RESPECT TO CITIZEN SUITS.—The limitations contained in subparagraph (A) on civil penalty actions under section 505 of this Act shall not apply with respect to any violation for which—

(i) a civil action under section 505(a)(1) of this Act has been filed prior to commencement of an action under this subsection, or

(ii) notice of an alleged violation of section 505(a)(1) of this Act has been given in accordance with section 505(b)(1)(A) prior to commencement of an action under this subsection and an action under section 505(a)(1) with respect to such alleged violation is filed before the 120th day after the date on which such notice is given.

(7) EFFECT OF ACTION ON COMPLIANCE.—No action by the Administrator or the Secretary under this subsection shall affect any person's obligation to comply with any section of this Act or with the terms and conditions of any permit issued pursuant to section 402 or 404 of this Act.

(8) JUDICIAL REVIEW.—Any person against whom a civil penalty is assessed under this subsection or who commented on the proposed assessment of such penalty in accordance with paragraph (4) may obtain review of such assessment—

(A) in the case of assessment of a class I civil penalty, in the United States District Court for the District of Columbia or in the district in which the violation is alleged to have occurred, or

(B) in the case of assessment of a class II civil penalty, in United States Court of Appeals for the District of Columbia Circuit or for any other circuit in which such person resides or transacts business,

by filing a notice of appeal in such court within the 30-day period beginning on the date the civil penalty order is issued and by simultaneously sending a copy of such notice by certified mail to the Administrator or the Secretary, as the case may be, and the Attorney General. The Administrator or the Secretary shall promptly file in such court a certified copy of the record on which the order was issued. Such court shall not set aside or remand such order unless there is not substantial evidence in the record, taken as a whole, to support the finding of a violation or unless the Administrator's or Secretary's assessment of the penalty constitutes an abuse of discretion and shall not impose additional civil penalties for the same violation unless the Administrator's or Secretary's assessment of the penalty constitutes an abuse of discretion.

(9) COLLECTION.—If any person fails to pay an assessment of a civil penalty—

(A) after the order making the assessment has become final, or

(B) after a court in an action brought under paragraph (8) has entered a final judgment in favor of the Administrator or the Secretary, as the case may be,

the Administrator or the Secretary shall request the Attorney General to bring a civil action in an appropriate district court to recover the amount assessed (plus interest at currently prevailing rates from the date of the final order or the date of the final judgment, as the case may be). In such an action, the validity, amount, and appropriateness of such penalty shall not be subject to review. Any person who fails to pay on a timely

basis the amount of an assessment of a civil penalty as described in the first sentence of this paragraph shall be required to pay, in addition to such amount and interest, attorneys fees and costs for collection proceedings and a quarterly nonpayment penalty for each quarter during which such failure to pay persists. Such nonpayment penalty shall be in an amount equal to 20 percent of the aggregate amount of such person's penalties and nonpayment penalties which are unpaid as of the beginning of such quarter.

(10) SUBPOENAS.—The Administrator or Secretary, as the case may be, may issue subpoenas for the attendance and testimony of witnesses and the production of relevant papers, books, or documents in connection with hearings under this subsection. In case of contumacy or refusal to obey a subpoena issued pursuant to this paragraph and served upon any person, the district court of the United States for any district in which such person is found, resides, or transacts business, upon application by the United States and after notice to such person, shall have jurisdiction to issue an order requiring such person to appear and give testimony before the administrative law judge or to appear and produce documents before the administrative law judge, or both, and any failure to obey such order of the court may be punished by such court as a contempt thereof.

(11) PROTECTION OF EXISTING PROCEDURES.—Nothing in this subsection shall change the procedures existing on the day before the date of the enactment of the Water Quality Act of 1987 under other subsections of this section for issuance and enforcement of orders by the Administrator.

(33 U.S.C. 1319)

INTERNATIONAL POLLUTION ABATEMENT

SEC. 310. (a) Whenever the Administrator, upon receipts of reports, surveys, or studies from any duly constituted international agency, has reason to believe that pollution is occurring which endangers the health or welfare of persons in a foreign country, and the Secretary of State requests him to abate such pollution, he shall give formal notification thereof to the State water pollution control agency of the State or States in which such discharge or discharges originate and to the appropriate interstate agency, if any. He shall also promptly call such a hearing, if he believes that such pollution is occurring in sufficient quantity to warrant such action, and if such foreign country has given the United States essentially the same rights with respect to the prevention and control of pollution occurring in that country as is given that country by this subsection. The Administrator, through the Secretary of State, shall invite the foreign country which may be adversely affected by the pollution to attend and participate in the hearing, and the representative of such country shall, for the purpose of the hearing and any further proceeding resulting from such hearing, have all the rights of a State water pollution control agency. Nothing in this subsection shall be construed to modify, amend, repeal, or otherwise affect the provisions of the 1909 Boundary Waters Treaty between Canada and the United States or the Water Utilization

Treaty of 1944 between Mexico and the United States (59 Stat. 1219), relative to the control and abatement of pollution in waters covered by those treaties.

(b) The calling of a hearing under this section shall not be construed by the courts, the Administrator, or any person as limiting, modifying, or otherwise affecting the functions and responsibilities of the Administrator under this section to establish and enforce water quality requirements under this Act.

(c) The Administrator shall publish in the Federal Register a notice of a public hearing before a hearing board of five or more persons appointed by the Administrator. A majority of the members of the board and the chairman who shall be designated by the Administrator shall not be officers or employees of Federal, State, or local governments. On the basis of the evidence presented at such hearing, the board shall within sixty days after completion of the hearing make findings of fact as to whether or not such pollution is occurring and shall thereupon by decision, incorporating its findings therein, make such recommendations to abate the pollution as may be appropriate and shall transmit such decision and the record of the hearings to the Administrator. All such decisions shall be public. Upon receipt of such decision, the Administrator shall promptly implement the board's decision in accordance with the provisions of this Act.

(d) In connection with any hearing called under this subsection, the board is authorized to require any persons whose alleged activities result in discharges causing or contributing to pollution to file with it in such forms as it may prescribe, a report based on existing data, furnishing such information as may reasonably be required as to the character, kind, and quantity of such discharges and the use of facilities or other means to prevent or reduce such discharges by the person filing such a report. Such report shall be made under oath or otherwise, as the board may prescribe, and shall be filed with the board within such reasonable period as it may prescribe, unless additional time is granted by it. Upon a showing satisfactory to the board by the person filing such report that such report or portion thereof (other than effluent data), to which the Adminsitrator has access under this section, if made public would divulge trade secrets or secret processes of such person, the board shall consider such report or portion thereof confidential for the purposes of section 1905 of title 18 of the United States Code. If any person required to file any report under this paragraph shall fail to do so within the time fixed by the board for filing the same, and such failure shall continue for thirty days after notice of such default, such person shall forfeit to the United States the sum of $1,000 for each and every day of the continuance of such failure, which forfeiture shall be payable into the Treasury of the United States, and shall be recoverable in a civil suit in the name of the United States in the district court of the United States where such person has his principal office or in any district in which he does business. The Administrator may upon application therefor remit or mitigate any forfeiture provided for under this subsection.

(e) Board members, other than officers or employees of Federal, State, or local governments, shall be for each day (including traveltime) during which they are performing board business, entitled to

receive compensation at a rate fixed by the Administrator but not in excess of the maximum rate of pay for grade GS–18, as provided in the General Schedule under section 5332 of title 5 of the United States Code, and shall, notwithstanding the limitations of sections 5703 and 5704 of title 5 of the United States Code, be fully reimbursed for travel, subsistence, and related expenses.

(f) When any such recommendation adopted by the Administrator involves the institution of enforcement proceedings against any person to obtain the abatement of pollution subject to such recommendation, the Administrator shall institute such proceedings if he believes that the evidence warrants such proceedings. The district court of the United States shall consider and determine de novo all relevant issues, but shall receive in evidence the record of the proceedings before the conference or hearing board. The court shall have jurisdiction to enter such judgment and orders enforcing such judgment as it deems appropriate or to remand such proceedings to the Administrator for such further action as it may direct.

(33 U.S.C. 1320)

OIL AND HAZARDOUS SUBSTANCE LIABILITY

SEC. 311. (a) For the purpose of this section, the term—

(1) "oil" means oil of any kind or in any form, including, but not limited to, petroleum, fuel oil, sludge, oil refuse, and oil mixed with wastes other than dredged spoil;

(2) "discharge" includes, but is not limited to, any spilling, leaking, pumping, pouring, emitting, emptying or dumping, but excludes (A) discharges in compliance with a permit under section 402 of this Act, (B) discharges resulting from circumstances identified and reviewed and made a part of the public record with respect to a permit issued or modified under section 402 of this Act, and subject to a condition in such permit, ,(C)[1] continuous or anticipated intermittent discharges from a point source, identified in a permit or permit application under section 402 of this Act, which are caused by events occurring within the scope of relevant operating or treatment systems, and (D) discharges incidental to mechanical removal authorized by the President under subsection (c) of this section;

(3) "vessel" means every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on water other than a public vessel;

(4) "public vessel" means a vessel owned or bareboat-chartered and operated by the United States, or by a State or political subdivision thereof, or by a foreign nation, except when such vessel is engaged in commerce;

(5) "United States" means the States, the District of Columbia, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands, Guam, American Samoa, the Virgin Islands, and the Trust Territory of the Pacific Islands;

(6) "owner or operator" means (A) in the case of a vessel, any person owning, operating, or chartering by demise, such vessel, and (B) in the case of an onshore facility, and an off-

[1] So in law.

shore facility, any person owning or operating such onshore facility or offshore facility, and (C) in the case of any abandoned offshore facility, the person who owned or operated such facility immediately prior to such abandonment;

(7) "person" includes an individual, firm, corporation, association, and a partnership;

(8) "remove" or "removal" refers to containment and removal of the oil or hazardous substances from the water and shorelines or the taking of such other actions as may be necessary to prevent, minimize, or mitigate damage to the public health or welfare, including, but not limited to, fish, shellfish, wildlife, and public and private property, shorelines, and beaches;

(9) "contiguous zone" means the entire zone established or to be established by the United States under article 24 of the Convention on the Territorial Sea and the Contiguous Zone;

(10) "onshore facility" means any facility (including, but not limited to, motor vehicles and rolling stock) of any kind located in, on, or under, any land within the United States other than submerged land;

(11) "offshore facility" means any facility of any kind located in, on, or under, any of the navigable waters of the United States, and any facility of any kind which is subject to the jurisdiction of the United States and is located in, on, or under any other waters, other than a vessel or a public vessel;

(12) "act of God" means an act occasioned by an unanticipated grave natural disaster;

(13) "barrel" means 42 United States gallons at 60 degrees Fahrenheit;

(14) "hazardous substance" means any substance designated pursuant to subsection (b)(2) of this section;

(15) "inland oil barge" means a non-self-propelled vessel carrying oil in bulk as cargo and certificated to operate only in the inland waters of the United States, while operating in such waters;

(16) "inland waters of the United States" means those waters of the United States lying inside the baseline from which the territorial sea is measured and those water outside such baseline which are a part of the Gulf Intracoastal Waterway;

(17) "otherwise" subject to the jurisdiction of the United States" means subject to the jurisdiction of the United States by virtue of United States citizenship, United States vessel documentation or numbering, or as provided for by international agreement to which the United States is a party;

(18) "Area Committee" means an Area Committee established under subsection (j);

(19) "Area Contingency Plan" means an Area Contingency Plan prepared under subsection (j);

(20) "Coast Guard District Response Group" means a Coast Guard District Response Group established under subsection (j);

(21) "Federal On-Scene Coordinator" means a Federal On-Scene Coordinator designated in the National Contingency Plan;

(22) "National Contingency Plan" means the National Contingency Plan prepared and published under subsection (d);

(23) "National Response Unit" means the National Response Unit established under subsection (j);

(24) "worst case discharge" means—

(A) in the case of a vessel, a discharge in adverse weather conditions of its entire cargo; and

(B) in the case of an offshore facility or onshore facility, the largest foreseeable discharge in adverse weather conditions; and

(25) "removal costs" means—

(A) the costs of removal of oil or a hazardous substance that are incurred after it is discharged; and

(B) in any case in which there is a substantial threat of a discharge of oil or a hazardous substance, the costs to prevent, minimize, or mitigate that threat.

(b)(1) The Congress hereby declares that it is the policy of the United States that there should be no discharges of oil or hazardous substances into or upon the navigable waters of the United States, adjoining shorelines, or into or upon the waters of the contiguous zone, or in connection with activities under the Outer Continental Shelf Lands Act or the Deepwater Port Act of 1974, or which may affect natural resources belonging to, appertaining to, or under the exclusive management authority of the United States (including resources under the Fishery Conservation and Management Act of 1976).

(2)(A) The Administrator shall develop, promulgate, and revise as may be appropriate, regulations designating as hazardous substances, other than oil as defined in this section, such elements and compounds which, when discharged in any quantity into or upon the navigable waters of the United States or adjoining shorelines or the waters of the contiguous zone or in connection with activities under the Outer Continental Shelf Lands Act or the Deepwater Port Act of 1974, or which may affect natural resources belonging to, appertaining to, or under the exclusive management authority of the United States (including resources under the Fishery Conservation and Management Act of 1976), present an imminent and substantial danger to the public health or welfare, including, but not limited to, fish, shellfish, wildlife, shorelines, and beaches.

(B) The Administrator shall within 18 months after the date of enactment of this paragraph, conduct a study and report to the Congress on methods, mechanisms, and procedures to create incentives to achieve a higher standard of care in all aspects of the management and movement of hazardous substances on the part of owners, operators, or persons in charge of onshore facilities, offshore facilities, or vessels. The Administrator shall include in such study (1) limits of liability, (2) liability for third party damages, (3) penalties and fees, (4) spill prevention plans, (5) current practices in the insurance and banking industries, and (6) whether the penalty enacted in subclause (bb) of clause (iii) of subparagraph (B) of subsection (b)(2) of section 311 of Public Law 92–500 should be enacted.

(3) The discharge of oil or hazardous substances (i) into or upon the navigable waters of the United States, adjoining shorelines, or into or upon the waters of the contiguous zone, or (ii) in

connection with activities under the Outer Continental Shelf Lands Act or the Deepwater Port Act of 1974, or which may affect natural resources belonging to, appertaining to, or under the exclusive management authority of the United States (including resources under the Fishery Conservation and Management Act of 1976), in such quantities as may be harmful as determined by the President under paragraph (4) of this subsection, is prohibited, except (A) in the case of such discharges into the waters of the contiguous zone or which may affect natural resources belonging to, appertaining to, or under the exclusive management authority of the United States (including resources under the Fishery Conservation and Management Act of 1976), where permitted under the Protocol of 1978 Relating to the International Convention for the Prevention of Pollution from Ships, 1973, and (B) where permitted in quantities and at times and locations or under such circumstances or conditions as the President may, by regulation, determine not to be harmful. Any regulations issued under this subsection shall be consistent with maritime safety and with marine and navigation laws and regulations and applicable water quality standards.

(4) The President shall by regulation determine for the purposes of this section those quantities of oil and any hazardous substances the discharge of which may be harmful to the public health or welfare or the environment of the United States, including but not limited to fish, shellfish, wildlife, and public and private property, shorelines, and beaches.

(5) Any person in charge of a vessel or of an onshore facility or an offshore facility shall, as soon as he has knowledge of any discharge of oil or a hazardous substance from such vessel or facility in violation of paragraph (3) of this subsection, immediately notify the appropriate agency of the United States Government of such discharge. The Federal agency shall immediately notify the appropriate State agency of any State which is, or may reasonably be expected to be, affected by the discharge of oil or a hazardous substance. Any such person (A) in charge of a vessel from which oil or a hazardous substance is discharged in violation of pragraph (3)(i) of this subsection, or (B) in charge of a vessel from which oil or a hazardous substance is discharged in violation of paragraph (3)(ii) of this subsection and who is otherwise subject to the jurisdiction of the United States at the time of the discharge, or (C) in charge of an onshore facility or an offshore facility, who fails to notify immediately such agency of such discharge shall, upon conviction, be fined in accordance with title 18, United States Code, or imprisoned for not more than 5 years, or both. Notification received pursuant to this paragraph shall not be used against any such natural person in any criminal case, except a prosecution for perjury or for giving a false statement.

(6) ADMINISTRATIVE PENALTIES.—

(A) VIOLATIONS.—Any owner, operator, or person in charge of any vessel, onshore facility, or offshore facility—

(i) from which oil or a hazardous substance is discharged in violation of paragraph (3), or

(ii) who fails or refuses to comply with any regulation issued under subsection (j) to which that owner, operator, or person in charge is subject,

may be assessed a class I or class II civil penalty by the Secretary of the department in which the Coast Guard is operating or the Administrator.

(B) CLASSES OF PENALTIES.—

(i) CLASS I.—The amount of a class I civil penalty under subparagraph (A) may not exceed $10,000 per violation, except that the maximum amount of any class I civil penalty under this subparagraph shall not exceed $25,000. Before assessing a civil penalty under this clause, the Administrator or Secretary, as the case may be, shall give to the person to be assessed such penalty written notice of the Administrator's or Secretary's proposal to assess the penalty and the opportunity to request, within 30 days of the date the notice is received by such person, a hearing on the proposed penalty. Such hearing shall not be subject to section 554 or 556 of title 5, United States Code, but shall provide a reasonable opportunity to be heard and to present evidence.

(ii) CLASS II.—The amount of a class II civil penalty under subparagraph (A) may not exceed $10,000 per day for each day during which the violation continues; except that the maximum amount of any class II civil penalty under this subparagraph shall not exceed $125,000. Except as otherwise provided in this subsection, a class II civil penalty shall be assessed and collected in the same manner, and subject to the same provisions, as in the case of civil penalties assessed and collected after notice and opportunity for a hearing on the record in accordance with section 554 of title 5, United States Code. The Administrator and Secretary may issue rules for discovery procedures for hearings under this paragraph.

(C) RIGHTS OF INTERESTED PERSONS.—

(i) PUBLIC NOTICE.—Before issuing an order assessing a class II civil penalty under this paragraph the Administrator or Secretary, as the case may be, shall provide public notice of and reasonable opportunity to comment on the proposed issuance of such order.

(ii) PRESENTATION OF EVIDENCE.—Any person who comments on a proposed assessment of a class II civil penalty under this paragraph shall be given notice of any hearing held under this paragraph and of the order assessing such penalty. In any hearing held under this paragraph, such person shall have a reasonable opportunity to be heard and to present evidence.

(iii) RIGHTS OF INTERESTED PERSONS TO A HEARING.—If no hearing is held under subparagraph (B) before issuance of an order assessing a class II civil penalty under this paragraph, any person who commented on the proposed assessment may petition, within 30 days after the issuance of such order, the Administrator or Secretary, as the case may be, to set aside

such order and to provide a hearing on the penalty. If the evidence presented by the petitioner in support of the petition is material and was not considered in the issuance of the order, the Administrator or Secretary shall immediately set aside such order and provide a hearing in accordance with subparagraph (B)(ii). If the Administrator or Secretary denies a hearing under this clause, the Administrator or Secretary shall provide to the petitioner, and publish in the Federal Register, notice of and the reasons for such denial.

(D) FINALITY OF ORDER.—An order assessing a class II civil penalty under this paragraph shall become final 30 days after its issuance unless a petition for judicial review is filed under subparagraph (G) or a hearing is requested under subparagraph (C)(iii). If such a hearing is denied, such order shall become final 30 days after such denial.

(E) EFFECT OF ORDER.—Action taken by the Administrator or Secretary, as the case may be, under this paragraph shall not affect or limit the Administrator's or Secretary's authority to enforce any provision of this Act; except that any violation—

(i) with respect to which the Administrator or Secretary has commenced and is diligently prosecuting an action to assess a class II civil penalty under this paragraph, or

(ii) for which the Administrator or Secretary has issued a final order assessing a class II civil penalty not subject to further judicial review and the violator has paid a penalty assessed under this paragraph,

shall not be the subject of a civil penalty action under section 309(d), 309(g), or 505 of this Act or under paragraph (7).

(F) EFFECT OF ACTION ON COMPLIANCE.—No action by the Administrator or Secretary under this paragraph shall affect any person's obligation to comply with any section of this Act.

(G) JUDICIAL REVIEW.—Any person against whom a civil penalty is assessed under this paragraph or who commented on the proposed assessment of such penalty in accordance with subparagraph (C) may obtain review of such assessment—

(i) in the case of assessment of a class I civil penalty, in the United States District Court for the District of Columbia or in the district in which the violation is alleged to have occurred, or

(ii) in the case of assessment of a class II civil penalty, in United States Court of Appeals for the District of Columbia Circuit or for any other circuit in which such person resides or transacts business,

by filing a notice of appeal in such court within the 30-day period beginning on the date the civil penalty order is issued and by simultaneously sending a copy of such notice by certified mail to the Administrator or Secretary, as the case may be, and the Attorney General. The Administrator or Secretary shall promptly file in such court a certified

copy of the record on which the order was issued. Such court shall not set aside or remand such order unless there is not substantial evidence in the record, taken as a whole, to support the finding of a violation or unless the Administrator's or Secretary's assessment of the penalty constitutes an abuse of discretion and shall not impose additional civil penalties for the same violation unless the Administrator's or Secretary's assessment of the penalty constitutes an abuse of discretion.

(H) COLLECTION.—If any person fails to pay an assessment of a civil penalty—

(i) after the assessment has become final, or

(ii) after a court in an action brought under subparagraph (G) has entered a final judgment in favor of the Administrator or Secretary, as the case may be,

the Administrator or Secretary shall request the Attorney General to bring a civil action in an appropriate district court to recover the amount assessed (plus interest at currently prevailing rates from the date of the final order or the date of the final judgment, as the case may be). In such an action, the validity, amount, and appropriateness of such penalty shall not be subject to review. Any person who fails to pay on a timely basis the amount of an assessment of a civil penalty as described in the first sentence of this subparagraph shall be required to pay, in addition to such amount and interest, attorneys fees and costs for collection proceedings and a quarterly nonpayment penalty for each quarter during which such failure to pay persists. Such nonpayment penalty shall be in an amount equal to 20 percent of the aggregate amount of such person's penalties and nonpayment penalties which are unpaid as of the beginning of such quarter.

(I) SUBPOENAS.—The Administrator or Secretary, as the case may be, may issue subpoenas for the attendance and testimony of witnesses and the production of relevant papers, books, or documents in connection with hearings under this paragraph. In case of contumacy or refusal to obey a subpoena issued pursuant to this subparagraph and served upon any person, the district court of the United States for any district in which such person is found, resides, or transacts business, upon application by the United States and after notice to such person, shall have jurisdiction to issue an order requiring such person to appear and give testimony before the administrative law judge or to appear and produce documents before the administrative law judge, or both, and any failure to obey such order of the court may be punished by such court as a contempt thereof.

(7) CIVIL PENALTY ACTION.—

(A) DISCHARGE, GENERALLY.—Any person who is the owner, operator, or person in charge of any vessel, onshore facility, or offshore facility from which oil or a hazardous substance is discharged in violation of paragraph (3), shall be subject to a civil penalty in an amount up to $25,000 per day of violation or an amount up to $1,000 per barrel

of oil or unit of reportable quantity of hazardous substances discharged.

(B) FAILURE TO REMOVE OR COMPLY.—Any person described in subparagraph (A) who, without sufficient cause—

(i) fails to properly carry out removal of the discharge under an order of the President pursuant to subsection (c); or

(ii) fails to comply with an order pursuant to subsection (e)(1)(B);

shall be subject to a civil penalty in an amount up to $25,000 per day of violation or an amount up to 3 times the costs incurred by the Oil Spill Liability Trust Fund as a result of such failure.

(C) FAILURE TO COMPLY WITH REGULATION.—Any person who fails or refuses to comply with any regulation issued under subsection (j) shall be subject to a civil penalty in an amount up to $25,000 per day of violation.

(D) GROSS NEGLIGENCE.—In any case in which a violation of paragraph (3) was the result of gross negligence or willful misconduct of a person described in subparagraph (A), the person shall be subject to a civil penalty of not less than $100,000, and not more than $3,000 per barrel of oil or unit of reportable quantity of hazardous substance discharged.

(E) JURISDICTION.—An action to impose a civil penalty under this paragraph may be brought in the district court of the United States for the district in which the defendant is located, resides, or is doing business, and such court shall have jurisdiction to assess such penalty.

(F) LIMITATION.—A person is not liable for a civil penalty under this paragraph for a discharge if the person has been assessed a civil penalty under paragraph (6) for the discharge.

(8) DETERMINATION OF AMOUNT.—In determining the amount of a civil penalty under paragraphs (6) and (7), the Administrator, Secretary, or the court, as the case may be, shall consider the seriousness of the violation or violations, the economic benefit to the violator, if any, resulting from the violation, the degree of culpability involved, any other penalty for the same incident, any history of prior violations, the nature, extent, and degree of success of any efforts of the violator to minimize or mitigate the effects of the discharge, the economic impact of the penalty on the violator, and any other matters as justice may require.

(9) MITIGATION OF DAMAGE.—In addition to establishing a penalty for the discharge of oil or a hazardous substance, the Administrator or the Secretary of the department in which the Coast Guard is operating may act to mitigate the damage to the public health or welfare caused by such discharge. The cost of such mitigation shall be deemed a cost incurred under subsection (c) of this section for the removal of such substance by the United States Government.

(10) RECOVERY OF REMOVAL COSTS.—Any costs of removal incurred in connection with a discharge excluded by subsection

(a)(2)(C) of this section shall be recoverable from the owner or operator of the source of the discharge in an action brought under section 309(b) of this Act.

(11) LIMITATION.—Civil penalties shall not be assessed under both this section and section 309 for the same discharge.

(12)[1] WITHHOLDING CLEARANCE.—If any owner, operator, or person in charge of a vessel is liable for a civil penalty under this subsection, or if reasonable cause exists to believe that the owner, operator, or person in charge may be subject to a civil penalty under this subsection, the Secretary of the Treasury, upon the request of the Secretary of the department in which the Coast Guard is operating or the Administrator, shall with respect to such vessel refuse or revoke—

(A) the clearance required by section 4197 of the Revised Statutes of the United States (46 U.S.C. App. 91);

(B) a permit to proceed under section 4367 of the Revised Statutes of the United States (46 U.S.C. App. 313); and

(C) a permit to depart required under section 443 of the Tariff Act of 1930 (19 U.S.C. 1443);

as applicable. Clearance or a permit refused or revoked under this paragraph may be granted upon the filing of a bond or other surety satisfactory to the Secretary of the department in which the Coast Guard is operating or the Administrator.

(c) FEDERAL REMOVAL AUTHORITY.—

(1) GENERAL REMOVAL REQUIREMENT.—(A) The President shall, in accordance with the National Contingency Plan and any appropriate Area Contingency Plan, ensure effective and immediate removal of a discharge, and mitigation or prevention of a substantial threat of a discharge, of oil or a hazardous substance—

(i) into or on the navigable waters;

(ii) on the adjoining shorelines to the navigable waters;

(iii) into or on the waters of the exclusive economic zone; or

(iv) that may affect natural resources belonging to, appertaining to, or under the exclusive management authority of the United States.

(B) In carrying out this paragraph, the President may—

(i) remove or arrange for the removal of a discharge, and mitigate or prevent a substantial threat of a discharge, at any time;

(ii) direct or monitor all Federal, State, and private actions to remove a discharge; and

(iii) remove and, if necessary, destroy a vessel discharging, or threatening to discharge, by whatever means are available.

(2) DISCHARGE POSING SUBSTANTIAL THREAT TO PUBLIC HEALTH OR WELFARE.—(A) If a discharge, or a substantial threat of a discharge, of oil or a hazardous substance from a vessel, offshore facility, or onshore facility is of such a size or character as to be a substantial threat to the public health or welfare of the United States (including but not limited to fish,

[1] Indentation so in law.

shellfish, wildlife, other natural resources, and the public and private beaches and shorelines of the United States), the President shall direct all Federal, State, and private actions to remove the discharge or to mitigate or prevent the threat of the discharge.

(B) In carrying out this paragraph, the President may, without regard to any other provision of law governing contracting procedures or employment of personnel by the Federal Government—

(i) remove or arrange for the removal of the discharge, or mitigate or prevent the substantial threat of the discharge; and

(ii) remove and, if necessary, destroy a vessel discharging, or threatening to discharge, by whatever means are available.

(3) ACTIONS IN ACCORDANCE WITH NATIONAL CONTINGENCY PLAN.—(A) Each Federal agency, State, owner or operator, or other person participating in efforts under this subsection shall act in accordance with the National Contingency Plan or as directed by the President.

(B) An owner or operator participating in efforts under this subsection shall act in accordance with the National Contingency Plan and the applicable response plan required under subsection (j), or as directed by the President, except that the owner or operator may deviate from the applicable response plan if the President or the Federal On-Scene Coordinator determines that deviation from the response plan would provide for a more expeditious or effective response to the spill or mitigation of its environmental effects.

(4) EXEMPTION FROM LIABILITY.—(A) A person is not liable for removal costs or damages which result from actions taken or omitted to be taken in the course of rendering care, assistance, or advice consistent with the National Contingency Plan or as otherwise directed by the President relating to a discharge or a substantial threat of a discharge of oil or a hazardous substance.

(B) Subparagraph (A) does not apply—

(i) to a responsible party;

(ii) to a response under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (42 U.S.C. 9601 et seq.);

(iii) with respect to personal injury or wrongful death; or

(iv) if the person is grossly negligent or engages in willful misconduct.

(C) A responsible party is liable for any removal costs and damages that another person is relieved of under subparagraph (A).

(5) OBLIGATION AND LIABILITY OF OWNER OR OPERATOR NOT AFFECTED.—Nothing in this subsection affects—

(A) the obligation of an owner or operator to respond immediately to a discharge, or the threat of a discharge, of oil; or

(B) the liability of a responsible party under the Oil Pollution Act of 1990.

(6) RESPONSIBLE PARTY DEFINED.—For purposes of this subsection, the term "responsible party" has the meaning given that term under section 1001 of the Oil Pollution Act of 1990.

(d) NATIONAL CONTINGENCY PLAN.—

(1) PREPARATION BY PRESIDENT.—The President shall prepare and publish a National Contingency Plan for removal of oil and hazardous substances pursuant to this section.

(2) CONTENTS.—The National Contingency Plan shall provide for efficient, coordinated, and effective action to minimize damage from oil and hazardous substance discharges, including containment, dispersal, and removal of oil and hazardous substances, and shall include, but not be limited to, the following:

(A) Assignment of duties and responsibilities among Federal departments and agencies in coordination with State and local agencies and port authorities including, but not limited to, water pollution control and conservation and trusteeship of natural resources (including conservation of fish and wildlife).

(B) Identification, procurement, maintenance, and storage of equipment and supplies.

(C) Establishment or designation of Coast Guard strike teams, consisting of—

(i) personnel who shall be trained, prepared, and available to provide necessary services to carry out the National Contingency Plan;

(ii) adequate oil and hazardous substance pollution control equipment and material; and

(iii) a detailed oil and hazardous substance pollution and prevention plan, including measures to protect fisheries and wildlife.

(D) A system of surveillance and notice designed to safeguard against as well as ensure earliest possible notice of discharges of oil and hazardous substances and imminent threats of such discharges to the appropriate State and Federal agencies.

(E) Establishment of a national center to provide coordination and direction for operations in carrying out the Plan.

(F) Procedures and techniques to be employed in identifying, containing, dispersing, and removing oil and hazardous substances.

(G) A schedule, prepared in cooperation with the States, identifying—

(i) dispersants, other chemicals, and other spill mitigating devices and substances, if any, that may be used in carrying out the Plan,

(ii) the waters in which such dispersants, other chemicals, and other spill mitigating devices and substances may be used, and

(iii) the quantities of such dispersant, other chemicals, or other spill mitigating device or substance which can be used safely in such waters,

which schedule shall provide in the case of any dispersant, chemical, spill mitigating device or substance, or waters

not specifically identified in such schedule that the President, or his delegate, may, on a case-by-case basis, identify the dispersants, other chemicals, and other spill mitigating devices and substances which may be used, the waters in which they may be used, and the quantities which can be used safely in such waters.

(H) A system whereby the State or States affected by a discharge of oil or hazardous substance may act where necessary to remove such discharge and such State or States may be reimbursed in accordance with the Oil Pollution Act of 1990, in the case of any discharge of oil from a vessel or facility, for the reasonable costs incurred for that removal, from the Oil Spill Liability Trust Fund.

(I) Establishment of criteria and procedures to ensure immediate and effective Federal identification of, and response to, a discharge, or the threat of a discharge, that results in a substantial threat to the public health or welfare of the United States, as required under subsection (c)(2).

(J) Establishment of procedures and standards for removing a worst case discharge of oil, and for mitigating or preventing a substantial threat of such a discharge.

(K) Designation of the Federal official who shall be the Federal On-Scene Coordinator for each area for which an Area Contingency Plan is required to be prepared under subsection (j).

(L) Establishment of procedures for the coordination of activities of—

(i) Coast Guard strike teams established under subparagraph (C);

(ii) Federal On-Scene Coordinators designated under subparagraph (K);

(iii) District Response Groups established under subsection (j); and

(iv) Area Committees established under subsection (j).

(M) A fish and wildlife response plan, developed in consultation with the United States Fish and Wildlife Service, the National Oceanic and Atmospheric Administration, and other interested parties (including State fish and wildlife conservation officials), for the immediate and effective protection, rescue, and rehabilitation of, and the minimization of risk of damage to, fish and wildlife resources and their habitat that are harmed or that may be jeopardized by a discharge.

(3) REVISIONS AND AMENDMENTS.—The President may, from time to time, as the President deems advisable, revise or otherwise amend the National Contingency Plan.

(4) ACTIONS IN ACCORDANCE WITH NATIONAL CONTINGENCY PLAN.—After publication of the National Contingency Plan, the removal of oil and hazardous substances and actions to minimize damage from oil and hazardous substance discharges shall, to the greatest extent possible, be in accordance with the National Contingency Plan.

(e) CIVIL ENFORCEMENT.—

(1) ORDERS PROTECTING PUBLIC HEALTH.—In addition to any action taken by a State or local government, when the President determines that there may be an imminent and substantial threat to the public health or welfare of the United States, including fish, shellfish, and wildlife, public and private property, shorelines, beaches, habitat, and other living and nonliving natural resources under the jurisdiction or control of the United States, because of an actual or threatened discharge of oil or a hazardous substance from a vessel or facility in violation of subsection (b), the President may—

(A) require the Attorney General to secure any relief from any person, including the owner or operator of the vessel or facility, as may be necessary to abate such endangerment; or

(B) after notice to the affected State, take any other action under this section, including issuing administrative orders, that may be necessary to protect the public health and welfare.

(2) JURISDICTION OF DISTRICT COURTS.—The district courts of the United States shall have jurisdiction to grant any relief under this subsection that the public interest and the equities of the case may require.

(f)(1) Except where an owner or operator can prove that a discharge was caused solely by (A) an act of God, (B) an act of war, (C) negligence on the part of the United States Government, or (D) an act or omission of a third party without regard to whether any such act or omission was or was not negligent, or any combination of the foregoing clauses, such owner or operator of any vessel from which oil or a hazardous substance is discharged in violation of subsection (b)(3) of this section shall, notwithstanding any other provision of law, be liable to the United States Government for the actual costs incurred under subsection (c) for the removal of such oil or substance by the United States Government in an amount not to exceed, in the case of an inland oil barge $125 per gross ton of such barge, or $125,000, whichever is greater, and in the case of any other vessel, $150 per gross ton of such vessel (or, for a vessel carrying oil or hazardous substances as cargo, $250,000), whichever is greater, except that where the United States can show that such discharge was the result of willful negligence or willful misconduct within the privity and knowledge of the owner, such owner or operator shall be liable to the United States Government for the full amount of such costs. Such costs shall constitute a maritime lien on such vessel which may be recovered in an action in rem in the district court of the United States for any district within which any vessel may be found. The United States may also bring an action against the owner or operator of such vessel in any court of competent jurisdiction to recover such costs.

(2) Except where an owner or operator of an onshore facility can prove that a discharge was caused solely by (A) an act of God, (B) an act of war, (C) negligence on the part of the United States Government, or (D) an act or omission of a third party without regard to whether any such act or omission was or was not negligent, or any combination of the foregoing clauses, such owner or operator of any such facility from which oil or a hazardous substance is discharged in violation of subsection (b)(3) of this section shall be lia-

ble to the United States Government for the actual costs incurred under subsection (c) for the removal of such oil or substance by the United States Government in an amount not to exceed $50,000,000, except that where the United States can show that such discharge was the result of willful negligence or willful misconduct within the privity and knowledge of the owner, such owner or operator shall be liable to the United States Government for the full amount of such costs. The United States may bring an action against the owner or operator of such facility in any court of competent jurisdiction to recover such costs. The Administrator is authorized, by regulation, after consultation with the Secretary of Commerce and the Small Business Administration, to establish reasonable and equitable classifications, of those onshore facilities having a total fixed storage capacity of 1,000 barrels or less which he determines because of size, type, and location do not present a substantial risk of the discharge of oil or hazardous substance in violation of subsection (b)(3) of this section, and apply with respect to such classifications differing limits of liability which may be less than the amount contained in this paragraph.

(3) Except where an owner or operator of an onshore facility can prove that a discharge was caused solely by (A) an act of God, (B) an act of war, (C) negligence on the part of the United States Government, or (D) an act or omission of a third party without regard to whether any such act or omission was or was not negligent, or any combination of the foregoing clauses, such owner or operator of any such facility from which oil or a hazardous substance is discharged in violation of subsection (b)(3) of this section shall, notwithstanding any other provision of law, be liable to the United States Government for the actual costs incurred under subsection (c) for the removal of such oil or substance by the United States Government in an amount not to exceed $50,000,000, except that where the United States can show that such discharge was the result of willful negligence or willful misconduct within the privity and knowledge of the owner, such owner or operator shall be liable to the United States Government for the full amount of such costs. The United States may bring an action against the owner or operator of such facility in any court of competent jurisdiction to recover such costs.

(4) The costs of removal of oil or a hazardous substance for which the owner or operator of a vessel or onshore or offshore facility is liable under subsection (f) of this section shall include any costs or expenses incurred by the Federal Government or any State government in the restoration or replacement of natural resources damaged or destroyed as a result of a discharge of oil or a hazardous substance in violation of subsection (b) of this section.

(5) The President, or the authorized representative of any State, shall act on behalf of the public as trustee of the natural resources to recover for the costs of replacing or restoring such resources. Sums recovered shall be used to restore, rehabilitate, or acquire the equivalent of such natural resources by the appropriate agencies of the Federal Government, or the State government.

(g) Where the owner or operator of a vessel (other than an inland oil barge) carrying oil or hazardous substances as cargo or an onshore or offshore facility which handles or stores oil or hazardous substances in bulk, from which oil or a hazardous substance is dis-

charged in violation of subsection (b) of this section, alleges that such discharge was caused solely by an act or omission of a third party, such owner or operator shall pay to the United States Government the actual costs incurred under subsection (c) for removal of such oil or substance and shall be entitled by subrogation to all rights of the United States Government to recover such costs from such third party under this subsection. In any case where an owner or operator of a vessel, of an onshore facility, or of an offshore facility, from which oil or a hazardous substance is discharged in violation of subsection (b)(3) of this section, proves that such discharge of oil or hazardous substance was caused solely by an act or omission of a third party, or was caused solely by such an act or omission in combination with an act of God, an act of war, or negligence on the part of the United States Government, such third party shall, not withstanding any other provision of law, be liable to the United States Government for the actual costs incurred under subsection (c) for removal of such oil or substance by the United States Government, except where such third party can prove that such discharge was caused solely by (A) an act of God, (B) an act of war, (C) negligence on the part of the United States Government, or (D) an act or omission of another party without regard to whether such an act or omission was or was not negligent, or any combination of the foregoing clauses. If such third party was the owner or operator of a vessel which caused the discharge of oil or a hazardous substance in violation of subsection (b)(3) of this section, the liability of such third party under this subsection shall not exceed, in the case of an inland oil barge $125 per gross ton of such barge, $125,000, whichever is greater, and in the case of any other vessel, $150 per gross ton of such vessel (or, for a vessel carrying oil or hazardous substances as cargo, $250,000), whichever is greater. In any other case the liability of such third party shall not exceed the limitation which would have been applicable to the owner or operator of the vessel or the onshore or offshore facility from which the discharge actually occurred if such owner or operator were liable. If the United States can show that the discharge of oil or a hazardous substance in violation of subsection (b)(3) of this section was the result of willful negligence or willful misconduct within the privity and knowledge of such third party, such third party shall be liable to the United States Government for the full amount of such removal costs. The United States may bring an action against the third party in any court of competent jurisdiction to recover such removal costs.

(h) The liabilities established by this section shall in no way affect any rights which (1) the owner or operator of a vessel or of an onshore facility or an offshore facility may have against any third party whose acts may in any way have caused or contributed to such discharge, or (2) The [1] United States Government may have against any third party whose actions may in any way have caused or contributed to the discharge of oil or hazardous substance.

(i) In any case where an owner or operator of a vessel or an onshore facility or an offshore facility from which oil or a hazardous substance is discharged in violation of subsection (b)(3) of this section acts to remove such oil or substance in accordance with

[1] So in law. Should not be capitalized.

regulations promulgated pursuant to this section, such owner or operator shall be entitled to recover the reasonable costs incurred in such removal upon establishing, in a suit which may be brought against the United States Government in the United States Claims Court, that such discharge was caused solely by (A) an act of God, (B) an act of war, (C) negligence on the part of the United States Government, or (D) an act or omission of a third party without regard to whether such act or omission was or was not negligent, or of any combination of the foregoing clauses.

(j) NATIONAL RESPONSE SYSTEM.—

(1) IN GENERAL.—Consistent with the National Contingency Plan required by subsection (c)(2) of this section, as soon as practicable after the effective date of this section, and from time to time thereafter, the President shall issue regulations consistent with maritime safety and with marine and navigation laws (A) establishing methods and procedures for removal of discharged oil and hazardous substances, (B) establishing criteria for the development and implementation of local and regional oil and hazardous substance removal contingency plans, (C) establishing procedures, methods, and equipment and other requirements for equipment to prevent discharges of oil and hazardous substances from vessels and from onshore facilities and offshore facilities, and to contain such discharges, and (D) governing the inspection of vessels carrying cargoes of oil and hazardous substances and the inspection of such cargoes in order to reduce the likelihood of discharges of oil from vessels in violation of this section.

(2) NATIONAL RESPONSE UNIT.—The Secretary of the department in which the Coast Guard is operating shall establish a National Response Unit at Elizabeth City, North Carolina. The Secretary, acting through the National Response Unit—

(A) shall compile and maintain a comprehensive computer list of spill removal resources, personnel, and equipment that is available worldwide and within the areas designated by the President pursuant to paragraph (4), and of information regarding previous spills, including data from universities, research institutions, State governments, and other nations, as appropriate, which shall be disseminated as appropriate to response groups and area committees, and which shall be available to Federal and State agencies and the public;

(B) shall provide technical assistance, equipment, and other resources requested by a Federal On-Scene Coordinator;

(C) shall coordinate use of private and public personnel and equipment to remove a worst case discharge, and to mitigate or prevent a substantial threat of such a discharge, from a vessel, offshore facility, or onshore facility operating in or near an area designated by the President pursuant to paragraph (4);

(D) may provide technical assistance in the preparation of Area Contingency Plans required under paragraph (4);

(E) shall administer Coast Guard strike teams established under the National Contingency Plan;

(F) shall maintain on file all Area Contingency Plans approved by the President under this subsection; and

(G) shall review each of those plans that affects its responsibilities under this subsection.

(3) COAST GUARD DISTRICT RESPONSE GROUPS.—(A) The Secretary of the department in which the Coast Guard is operating shall establish in each Coast Guard district a Coast Guard District Response Group.

(B) Each Coast Guard District Response Group shall consist of—

(i) the Coast Guard personnel and equipment, including firefighting equipment, of each port within the district;

(ii) additional prepositioned equipment; and

(iii) a district response advisory staff.

(C) Coast Guard district response groups—

(i) shall provide technical assistance, equipment, and other resources when required by a Federal On-Scene Coordinator;

(ii) shall maintain all Coast Guard response equipment within its district;

(iii) may provide technical assistance in the preparation of Area Contingency Plans required under paragraph (4); and

(iv) shall review each of those plans that affect its area of geographic responsibility.

(4) AREA COMMITTEES AND AREA CONTINGENCY PLANS.—(A) There is established for each area designated by the President an Area Committee comprised of members appointed by the President from qualified personnel of Federal, State, and local agencies.

(B) Each Area Committee, under the direction of the Federal On-Scene Coordinator for its area, shall—

(i) prepare for its area the Area Contingency Plan required under subparagraph (C);

(ii) work with State and local officials to enhance the contingency planning of those officials and to assure preplanning of joint response efforts, including appropriate procedures for mechanical recovery, dispersal, shoreline cleanup, protection of sensitive environmental areas, and protection, rescue, and rehabilitation of fisheries and wildlife; and

(iii) work with State and local officials to expedite decisions for the use of dispersants and other mitigating substances and devices.

(C) Each Area Committee shall prepare and submit to the President for approval an Area Contingency Plan for its area. The Area Contingency Plan shall—

(i) when implemented in conjunction with the National Contingency Plan, be adequate to remove a worst case discharge, and to mitigate or prevent a substantial threat of such a discharge, from a vessel, offshore facility, or onshore facility operating in or near the area;

(ii) describe the area covered by the plan, including the areas of special economic or environmental importance that might be damaged by a discharge;

(iii) describe in detail the responsibilities of an owner or operator and of Federal, State, and local agencies in removing a discharge, and in mitigating or preventing a substantial threat of a discharge;

(iv) list the equipment (including firefighting equipment), dispersants or other mitigating substances and devices, and personnel available to an owner or operator and Federal, State, and local agencies, to ensure an effective and immediate removal of a discharge, and to ensure mitigation or prevention of a substantial threat of a discharge;

(v) compile a list of local scientists, both inside and outside Federal Government service, with expertise in the environmental effects of spills of the types of oil typically transported in the area, who may be contacted to provide information or, where appropriate, participate in meetings of the scientific support team convened in response to a spill, and describe the procedures to be followed for obtaining an expedited decision regarding the use of dispersants;

(vi) describe in detail how the plan is integrated into other Area Contingency Plans and vessel, offshore facility, and onshore facility response plans approved under this subsection, and into operating procedures of the National Response Unit;

(vii) include any other information the President requires; and

(viii) be updated periodically by the Area Committee.

(D) The President shall—

(i) review and approve Area Contingency Plans under this paragraph; and

(ii) periodically review Area Contingency Plans so approved.

(5) TANK VESSEL AND FACILITY RESPONSE PLANS.—(A) The President shall issue regulations which require an owner or operator of a tank vessel or facility described in subparagraph (B) to prepare and submit to the President a plan for responding, to the maximum extent practicable, to a worst case discharge, and to a substantial threat of such a discharge, of oil or a hazardous substance.

(B) The tank vessels and facilities referred to in subparagraph (A) are the following:

(i) A tank vessel, as defined under section 2101 of title 46, United States Code.

(ii) An offshore facility.

(iii) An onshore facility that, because of its location, could reasonably be expected to cause substantial harm to the environment by discharging into or on the navigable waters, adjoining shorelines, or the exclusive economic zone.

(C) A response plan required under this paragraph shall—

(i) be consistent with the requirements of the National Contingency Plan and Area Contingency Plans;

(ii) identify the qualified individual having full authority to implement removal actions, and require immediate communications between that individual and the appro-

priate Federal official and the persons providing personnel and equipment pursuant to clause (iii);

(iii) identify, and ensure by contract or other means approved by the President the availability of, private personnel and equipment necessary to remove to the maximum extent practicable a worst case discharge (including a discharge resulting from fire or explosion), and to mitigate or prevent a substantial threat of such a discharge;

(iv) describe the training, equipment testing, periodic unannounced drills, and response actions of persons on the vessel or at the facility, to be carried out under the plan to ensure the safety of the vessel or facility and to mitigate or prevent the discharge, or the substantial threat of a discharge;

(v) be updated periodically; and

(vi) be resubmitted for approval of each significant change.

(D) With respect to any response plan submitted under this paragraph for an onshore facility that, because of its location, could reasonably be expected to cause significant and substantial harm to the environment by discharging into or on the navigable waters or adjoining shorelines or the exclusive economic zone, and with respect to each response plan submitted under this paragraph for a tank vessel or offshore facility, the President shall—

(i) promptly review such response plan;

(ii) require amendments to any plan that does not meet the requirements of this paragraph;

(iii) approve any plan that meets the requirements of this paragraph; and

(iv) review each plan periodically thereafter.

(E)[1] A tank vessel, offshore facility, or onshore facility required to prepare a response plan under this subsection may not handle, store, or transport oil unless—

(i) in the case of a tank vessel, offshore facility, or onshore facility for which a response plan is reviewed by the President under subparagraph (D), the plan has been approved by the President; and

(ii) the vessel or facility is operating in compliance with the plan.

(F) Notwithstanding subparagraph (E), the President may authorize a tank vessel, offshore facility, or onshore facility to operate without a response plan approved under this paragraph, until not later than 2 years after the date of the submission to the President of a plan for the tank vessel or facility, if the owner or operator certifies that the owner or operator has ensured by contract or other means approved by the President the availability of private personnel and equipment necessary to respond, to the maximum extent practicable, to a worst case discharge or a substantial threat of such a discharge.

---

[1] Subparagraph (E) of section 311(j)(5) shall take effect 36 months (August 18, 1993) after the date of the enactment of Public Law 101-380. See P.L. 101-380, sec. 4202(b)(4)(C), 104 Stat. 532.

(G) The owner or operator of a tank vessel, offshore facility, or onshore facility may not claim as a defense to liability under title I of the Oil Pollution Act of 1990 that the owner or operator was acting in accordance with an approved response plan.

(H) The Secretary shall maintain, in the Vessel Identification System established under chapter 125 of title 46, United States Code, the dates of approval and review of a response plan under this paragraph for each tank vessel that is a vessel of the United States.

(6) EQUIPMENT REQUIREMENTS AND INSPECTION.—Not later than 2 years after the date of enactment of this section, the President shall require—

(A) periodic inspection of containment booms, skimmers, vessels, and other major equipment used to remove discharges; and

(B) vessels operating on navigable waters and carrying oil or a hazardous substance in bulk as cargo to carry appropriate removal equipment that employs the best technology economically feasible and that is compatible with the safe operation of the vessel.

(7) AREA DRILLS.—The President shall periodically conduct drills of removal capability, without prior notice, in areas for which Area Contingency Plans are required under this subsection and under relevant tank vessel and facility response plans. The drills may include participation by Federal, State, and local agencies, the owners and operators of vessels and facilities in the area, and private industry. The President may publish annual reports on these drills, including assessments of the effectiveness of the plans and a list of amendments made to improve plans.

(8) UNITED STATES GOVERNMENT NOT LIABLE.—The United States Government is not liable for any damages arising from its actions or omissions relating to any response plan required by this section.

[Subsection (k) was repealed by sec. 2002(b)(2) of P.L. 101-380.]

(l) The President is authorized to delegate the administration of this section to the heads of those Federal departments, agencies, and instrumentalities which he determines to be appropriate. Each such department, agency, and instrumentality, in order to avoid duplication of effort, shall, whenever appropriate, utilize the personnel, services, and facilities of other Federal departments, agencies, and instrumentalities.

(m) ADMINISTRATIVE PROVISIONS.—

(1) FOR VESSELS.—Anyone authorized by the President to enforce the provisions of this section with respect to any vessel may, except as to public vessels—

(A) board and inspect any vessel upon the navigable waters of the United States or the waters of the contiguous zone,

(B) with or without a warrant, arrest any person who in the presence or view of the authorized person violates the provisions of this section or any regulation issued thereunder, and

(C) execute any warrant or other process issued by an officer or court of competent jurisdiction.

(2) FOR FACILITIES.—

(A) RECORDKEEPING.—Whenever required to carry out the purposes of this section, the Administrator or the Secretary of the Department in which the Coast Guard is operating shall require the owner or operator of a facility to which this section applies to establish and maintain such records, make such reports, install, use, and maintain such monitoring equipment and methods, and provide such other information as the Administrator or Secretary, as the case may be, may require to carry out the objectives of this section.

(B) ENTRY AND INSPECTION.—Whenever required to carry out the purposes of this section, the Administrator or the Secretary of the Department in which the Coast Guard is operating or an authorized representative of the Administrator or Secretary, upon presentation of appropriate credentials, may—

(i) enter and inspect any facility to which this section applies, including any facility at which any records are required to be maintained under subparagraph (A); and

(ii) at reasonable times, have access to and copy any records, take samples, and inspect any monitoring equipment or methods required under subparagraph (A).

(C) ARRESTS AND EXECUTION OF WARRANTS.—Anyone authorized by the Administrator or the Secretary of the department in which the Coast Guard is operating to enforce the provisions of this section with respect to any facility may—

(i) with or without a warrant, arrest any person who violates the provisions of this section or any regulation issued thereunder in the presence or view of the person so authorized; and

(ii) execute any warrant or process issued by an officer or court of competent jurisdiction.

(D) PUBLIC ACCESS.—Any records, reports, or information obtained under this paragraph shall be subject to the same public access and disclosure requirements which are applicable to records, reports, and information obtained pursuant to section 308.

(n) The several district courts of the United States are invested with jurisdiction for any actions, other than actions pursuant to subsection (i)(1), arising under this section. In the case of Guam and the Trust Territory of the Pacific Islands, such actions may be brought in the district court of Guam, and in the case of the Virgin Islands such actions may be brought in the district court of the Virgin Islands. In the case of American Samoa and the Trust Territory of the Pacific Islands, such actions may be brought in the District Court of the United States for the District of Hawaii and such court shall have jurisdiction of such actions. In the case of the Canal Zone, such actions may be brought in the United States District Court for the District of the Canal Zone.

(o)(1) Nothing in this section shall affect or modify in any way the obligations of any owner or operator of any vessel, or of any owner or operator of any onshore facility or offshore facility to any person or agency under any provision of law for damages to any publicly owned or privately owned property resulting from a discharge of any oil or hazardous substance or from the removal of any such oil or hazardous substance.

(2) Nothing in this section shall be construed as preempting any State or political subdivision thereof from imposing any requirement or liability with respect to the discharge of oil or hazardous substance into any waters within such State, or with respect to any removal activites related to such discharge.

(3) Nothing in this section shall be construed as affecting or modifying any other existing authority of any Federal department, agency, or instrumentality, relative to onshore or offshore facilities under this Act or any other provision of law, or to affect any State or local law not in conflict with this section.

[Subsection (p) was repealed by sec. 2002(b)(4) of Public Law 101-380, 104 Stat. 507.]

(q) The President is authorized to establish, with repect to any class or category of onshore or offshore facilities, a maximum limit of liability under subsections (f)(2) and (3) of this section of less than $50,000,0000, but not less than, $8,000,000.

(r) Nothing in this section shall be construed to impose, or authorize the imposition of any limitation on liability under the Outer Continental Shelf Lands Act or the Deepwater Port Act of 1974.

(s) The Oil Spill Liability Trust Fund established under section 9509 of the Internal Revenue Code of 1986 (26 U.S.C. 9509) shall be available to carry out subsections (b), (c), (d), (j), and (l) as those subsections apply to discharges, and substantial threats of discharges, of oil. Any amounts received by the United States under this section shall be deposited in the Oil Spill Liability Trust Fund.

(33 U.S.C. 1321)

MARINE SANITATION DEVICES

SEC. 312. (a) For the purpose of this section, the term—

(1) "new vessel" includes every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on the navigable waters, the construction of which is initiated after promulgation of standards and regulations under this section;

(2) "existing vessel" includes every description of watercraft or other artificial contrivance used, or capable of being used, as a means of transportation on the navigable waters, the construction of which is initiated before promulgation of standards and regulations under this section;

(3) "public vessel" means a vessel owned or bareboat chartered and operated by the United States, by a State or political subdivision thereof, or by a foreign nation, except when such vessel is engaged in commerce;

(4) "United States" includes the States, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, American Samoa, the Canal Zone, and the Trust Territory of the Pacific Islands;

(5) "marine sanitation device" includes any equipment for installation on board a vessel which is designed to receive, retain, treat, or discharge sewage, and any process to treat such sewage;

(6) "sewage" means human body wastes and the wastes from toilets and other receptacles intended to receive or retain body wastes except that, with respect to commercial vessels on the Great Lakes, such term shall include graywater;

(7) "manufacture" means any person engaged in the manufacturing, assembling, or importation of marine sanitation devices or of vessels subject to standards and regulations promulgated under this section;

(8) "person" means an individual, partnership, firm, corporation, association, or agency of the United States, but does not include an individual on board a public vessel;

(9) "discharge" includes, but is not limited to, any spilling, leaking, pumping, pouring, emitting, emptying or dumping;

(10) "commercial vessels" means those vessels used in the business of transporting property for compensation or hire, or in transporting property in the business of the owner, lessee, or operator of the vessel;

(11) "graywater" means galley, bath, and shower water;

(12) "discharge incidental to the normal operation of a vessel"—

(A) means a discharge, including—

(i) graywater, bilge water, cooling water, weather deck runoff, ballast water, oil water separator effluent, and any other pollutant discharge from the operation of a marine propulsion system, shipboard maneuvering system, crew habitability system, or installed major equipment, such as an aircraft carrier elevator or a catapult, or from a protective, preservative, or absorptive application to the hull of the vessel; and

(ii) a discharge in connection with the testing, maintenance, and repair of a system described in clause (i) whenever the vessel is waterborne; and

(B) does not include—

(i) a discharge of rubbish, trash, garbage, or other such material discharged overboard;

(ii) an air emission resulting from the operation of a vessel propulsion system, motor driven equipment, or incinerator; or

(iii) a discharge that is not covered by part 122.3 of title 40, Code of Federal Regulations (as in effect on the date of the enactment of subsection (n));

(13) "marine pollution control device" means any equipment or management practice, for installation or use on board a vessel of the Armed Forces, that is—

(A) designed to receive, retain, treat, control, or discharge a discharge incidental to the normal operation of a vessel; and

(B) determined by the Administrator and the Secretary of Defense to be the most effective equipment or management practice to reduce the environmental impacts

of the discharge consistent with the considerations set forth in subsection (n)(2)(B); and

(14) "vessel of the Armed Forces" means—

(A) any vessel owned or operated by the Department of Defense, other than a time or voyage chartered vessel; and

(B) any vessel owned or operated by the Department of Transportation that is designated by the Secretary of the department in which the Coast Guard is operating as a vessel equivalent to a vessel described in subparagraph (A).

(b)(1) As soon as possible, after the enactment of this section and subject to the provisions of section 104(j) of this Act, the Administrator, after consultation with the Secretary of the department in which the Coast Guard is operating, after giving appropriate consideration to the economic costs involved, and within the limits of available technology, shall promulgate Federal standards of performance for marine sanitation devices (hereinafter in this section referred to as "standards") which shall be designed to prevent the discharge of untreated or inadequately treated sewage into or upon the navigable waters from new vessels and existing vessels, except vessels not equipped with installed toilet facilities. Such standards and standards established under subsection (c)(1)(B) of this section shall be consistent with maritime safety and the marine and navigation laws and regulations and shall be coordinated with the regulations issued under this subsection by the Secretary of the department in which the Coast Guard is operating. The Secretary of the department in which the Coast Guard is operating shall promulgate regulations, which are consistent with standards promulgated under this subsection and subsection (c) of this section and with maritime safety and the marine and navigation laws and regulations governing the design, construction, installation, and operation of any marine sanitation device on board such vessels.

(2) Any existing vessel equipped with a marine sanitation device on the date of promulgation of initial standards and regulations under this section, which device is in compliance with such initial standards and regulations, shall be deemed in compliance with this section until such time as the device is replaced or is found not to be in compliance with such initial standards and regulations.

(c)(1)(A) Initial standards and regulations under this section shall become effective for new vessels two years after promulgation; and for existing vessels five years after promulgation. Revisions of standards and regulations shall be effective upon promulgation, unless another effective date is specified, except that no revision shall take effect before the effective date of the standard or regulation being revised.

(B) The Administrator shall, with respect to commercial vessels on the Great Lakes, establish standards which require at a minimum the equivalent of secondary treatment as defined under section 304(d) of this Act. Such standards and regulations shall take effect for existing vessels after such time as the Administrator determines to be reasonable for the upgrading of marine sanitation devices to attain such standard.

(2) The Secretary of the department in which the Coast Guard is operating with regard to his regulatory authority established by this section, after consultation with the Administrator, may distinguish among classes, types, and sizes of vessels as well as between new and existing vessels, and may waive applicability of standards and regulations as necessary or appropriate for such classes, types, and sizes of vessels (including existing vessels equipped with marine sanitation devices on the date of promulgation of the initial standards required by this section), and, upon application, for individual vessels.

(d) The provisions of this section and the standards and regulations promulgated hereunder apply to vessels owned and operated by the United States unless the Secretary of Defense finds that compliance would not be in the interest of national security. With respect to vessels owned and operated by the Department of Defense, regulations under the last sentence of subsection (b)(1) of this section and certifications under subsection (g)(2) of this section shall be promulgated and issued by the Secretary of Defense.

(e) Before the standards and regulations under this section are promulgated, the Administrator and the Secretary of the department in which the Coast Guard is operating shall consult with the Secretary of State; the Secretary of Health, Education, and Welfare; the Secretary of Defense; the Secretary of the Treasury; the Secretary of Commerce; other interested Federal agencies; and the States and industries interested; and otherwise comply with the requirements of section 553 of title 5 of the United States Code.

(f)(1)(A) Except as provided in subparagraph (B), after the effective date of the initial standards and regulations promulgated under this section, no State or political subdivision thereof shall adopt or enforce any statute or regulation of such State or political subdivision with respect to the design, manufacture, or installation or use of any marine sanitation device on any vessel subject to the provisions of this section.

(B) A State may adopt and enforce a statute or regulation with respect to the design, manufacture, or installation or use of any marine sanitation device on a houseboat, if such statute or regulation is more stringent than the standards and regulations promulgated under this section. For purposes of this paragraph, the term "houseboat" means a vessel which, for a period of time determined by the State in which the vessel is located, is used primarily as a residence and is not used primarily as a means of transportation.

(2) If, after promulgation of the initial standards and regulations and prior to their effective date, a vessel is equipped with a marine sanitation device in compliance with such standards and regulations and the installation and operation of such device is in accordance with such standards and regulations, such standards and regulations shall, for the purposes of paragraph (1) of this subsection, become effective with respect to such vessel on the date of such compliance.

(3) After the effective date of the initial standards and regulations promulgated under this section, if any State determines that the protection and enhancement of the quality of some or all of the waters within such State require greater environmental protection, such State may completely prohibit the discharge from all vessels of any sewage, whether treated or not, into such waters, except

that no such prohibition shall apply until the Administrator determines that adequate facilities for the safe and sanitary removal and treatment of sewage from all vessels are reasonably available for such water to which such prohibition would apply. Upon application of the State, the Administrator shall make such determination within 90 days of the date of such application.

(4)(A) If the Administrator determines upon application by a State that the protection and enhancement of the quality of specified waters within such State requires such a prohibition, he shall by regulation completely prohibit the discharge from a vessel of any sewage (whether treated or not) into such waters.

(B) Upon application by a State, the Administrator shall, by regulation, establish a drinking water intake zone in any waters within such State and prohibit the discharge of sewage from vessels within that zone.

(g)(1) No manufacturer of a marine sanitation device shall sell, offer for sale, or introduce or deliver for introduction in interstate commerce, or import into the United States for sale or resale any marine sanitation device manufactured after the effective date of the standards and regulations promulgated under this section unless such device is in all material respects substantially the same as a test device certified under this subsection.

(2) Upon application of the manufacturer, the Secretary of the department in which the Coast Guard is operating shall so certify a marine sanitation device if he determines, in accordance with the provisions of this paragraph, that it meets the appropriate standards and regulations promulgated under this section. The Secretary of the department in which the Coast Guard is operating shall test or require such testing of the device in accordance with procedures set forth by the Administrator as to standards of performance and for such other purposes as may be appropriate. If the Secretary of the department in which the Coast Guard is operating determines that the device is satisfactory from the standpoint of safety and any other requirements of maritime law or regulation, and after consideration of the design, installation, operation, material, or other appropriate factors, he shall certify the device. Any device manufactured by such manufacturer which is in all material respects substantially the same as the certified test device shall be deemed to be in conformity with the appropriate standards and regulations established under this section.

(3) Every manufacturer shall establish and maintain such records, make such reports, and provide such information as the Administrator or the Secretary of the department in which the Coast Guard is operating may reasonably require to enable him to determine whether such manufacturer has acted or is acting in compliance with this section and regulations issued thereunder and shall, upon request of an officer or employee duly designated by the Administrator or the Secretary of the department in which the Coast Guard is operating, permit such officer or employee at reasonable times to have access to and copy such records. All information reported to or otherwise obtained by the Administrator or the Secretary of the department in which the Coast Guard is operating or their representatives pursuant to this subsection which contains or relates to a trade secret or other matter referred in section 1905 of title 18 of the United States Code shall be considered confiden-

tial for the purpose of that section, except that such information may be disclosed to other officers or employees concerned with carrying out this section. This paragraph shall not apply in the case of the construction of a vessel by an individual for his own use.

(h) After the effective date of standards and regulations promulgated under this section, it shall be unlawful—

(1) for the manufacturer of any vessel subject to such standards and regulations to manufacture for sale, to sell or offer for sale, or to distribute for sale or resale any such vessel unless it is equipped with a marine sanitation device which is in all material respects substantially the same as the appropriate test device certified pursuant to this section;

(2) for any person, prior to the sale or delivery of a vessel subject to such standards and regulations to the ultimate purchaser, wrongfully to remove or render inoperative any certified marine sanitation device or element of design of such device installed in such vessel;

(3) for any person to fail or refuse to permit access to or copying of records or to fail to make reports or provide information required under this section; and

(4) for a vessel subject to such standards and regulations to operate on the navigable waters of the United States, if such vessel is not equipped with an operable marine sanitation device certified pursuant to this section.

(i) The district courts of the United States shall have jurisdictions to restrain violations of subsection (g)(1) of this section and subsections (h)(1) through (3) of this section. Actions to restrain such violations shall be brought by, and in, the name of the United States. In case of contumacy or refusal to obey a subpena served upon any person under this subsection, the district court of the United States for any district in which such person is found or resides or transacts business, upon application by the United States and after notice to such person, shall have jurisdiction to issue an order requiring such person to appear and give testimony or to appear and produce documents, and any failure to obey such order of the court may be punished by such court as a contempt thereof.

(j) Any person who violates subsection (g)(1), clause (1) or (2) of subsection (h), or subsection (n)(8) shall be liable to a civil penalty of not more than $5,000 for each violation. Any person who violates clause (4) of subsection (h) of this section or any regulation issued pursuant to this section shall be liable to a civil penalty of not more than $2,000 for each violation. Each violation shall be a separate offense. The Secretary of the department in which the Coast Guard is operating may assess and compromise any such penalty. No penalty shall be assessed until the person charged shall have been given notice and an opportunity for a hearing on such charge. In determining the amount of the penalty, or the amount agreed upon in compromise, the gravity of the violation, and the demonstrated good faith of the person charged in attempting to achieve rapid compliance, after notification of a violation, shall be considered by said Secretary.

(k) The provisions of this section shall be enforced by the Secretary of the department in which the Coast Guard is operating and he may utilize by agreement, with or without reimbursement, law enforcement officers or other personnel and facilities of the Ad-

ministrator, other Federal agencies, or the States to carry out the provisions of this section. The provisions of this section may also be enforced by a State.

(l) Anyone authorized by the Secretary of the department in which the Coast Guard is operating to enforce the provisions of this section may, except as to public vessels, (1) board and inspect any vessel upon the navigable waters of the United States and (2) execute any warrant or other process issued by an officer or court of competent jurisdiction.

(m) In the case of Guam and the Trust Territory of the Pacific Islands, actions arising under this section may be brought in the district court of Guam, and in the case of the Virgin Islands such actions may be brought in the district court of the Virgin Islands. In the case of American Samoa and the Trust Territory of the Pacific Islands, such actions may be brought in the District Court of the United States for the District of Hawaii and such court shall have jurisdiction of such actions. In the case of the Canal Zone, such actions may be brought in the District Court for the District of the Canal Zone.

(n) UNIFORM NATIONAL DISCHARGE STANDARDS FOR VESSELS OF THE ARMED FORCES.—

(1) APPLICABILITY.—This subsection shall apply to vessels of the Armed Forces and discharges, other than sewage, incidental to the normal operation of a vessel of the Armed Forces, unless the Secretary of Defense finds that compliance with this subsection would not be in the national security interests of the United States.

(2) DETERMINATION OF DISCHARGES REQUIRED TO BE CONTROLLED BY MARINE POLLUTION CONTROL DEVICES.—

(A) IN GENERAL.—The Administrator and the Secretary of Defense, after consultation with the Secretary of the department in which the Coast Guard is operating, the Secretary of Commerce, and interested States, shall jointly determine the discharges incidental to the normal operation of a vessel of the Armed Forces for which it is reasonable and practicable to require use of a marine pollution control device to mitigate adverse impacts on the marine environment. Notwithstanding subsection (a)(1) of section 553 of title 5, United States Code, the Administrator and the Secretary of Defense shall promulgate the determinations in accordance with such section. The Secretary of Defense shall require the use of a marine pollution control device on board a vessel of the Armed Forces in any case in which it is determined that the use of such a device is reasonable and practicable.

(B) CONSIDERATIONS.—In making a determination under subparagraph (A), the Administrator and the Secretary of Defense shall take into consideration—

(i) the nature of the discharge;

(ii) the environmental effects of the discharge;

(iii) the practicability of using the marine pollution control device;

(iv) the effect that installation or use of the marine pollution control device would have on the operation or operational capability of the vessel;

(v) applicable United States law;

(vi) applicable international standards; and

(vii) the economic costs of the installation and use of the marine pollution control device.

(3) PERFORMANCE STANDARDS FOR MARINE POLLUTION CONTROL DEVICES.—

(A) IN GENERAL.—For each discharge for which a marine pollution control device is determined to be required under paragraph (2), the Administrator and the Secretary of Defense, in consultation with the Secretary of the department in which the Coast Guard is operating, the Secretary of State, the Secretary of Commerce, other interested Federal agencies, and interested States, shall jointly promulgate Federal standards of performance for each marine pollution control device required with respect to the discharge. Notwithstanding subsection (a)(1) of section 553 of title 5, United States Code, the Administrator and the Secretary of Defense shall promulgate the standards in accordance with such section.

(B) CONSIDERATIONS.—In promulgating standards under this paragraph, the Administrator and the Secretary of Defense shall take into consideration the matters set forth in paragraph (2)(B).

(C) CLASSES, TYPES, AND SIZES OF VESSELS.—The standards promulgated under this paragraph may—

(i) distinguish among classes, types, and sizes of vessels;

(ii) distinguish between new and existing vessels; and

(iii) provide for a waiver of the applicability of the standards as necessary or appropriate to a particular class, type, age, or size of vessel.

(4) REGULATIONS FOR USE OF MARINE POLLUTION CONTROL DEVICES.—The Secretary of Defense, after consultation with the Administrator and the Secretary of the department in which the Coast Guard is operating, shall promulgate such regulations governing the design, construction, installation, and use of marine pollution control devices on board vessels of the Armed Forces as are necessary to achieve the standards promulgated under paragraph (3).

(5) DEADLINES; EFFECTIVE DATE.—

(A) DETERMINATIONS.—The Administrator and the Secretary of Defense shall—

(i) make the initial determinations under paragraph (2) not later than 2 years after the date of the enactment of this subsection; and

(ii) every 5 years—

(I) review the determinations; and

(II) if necessary, revise the determinations based on significant new information.

(B) STANDARDS.—The Administrator and the Secretary of Defense shall—

(i) promulgate standards of performance for a marine pollution control device under paragraph (3) not later than 2 years after the date of a determination

under paragraph (2) that the marine pollution control device is required; and

(ii) every 5 years—

(I) review the standards; and

(II) if necessary, revise the standards, consistent with paragraph (3)(B) and based on significant new information.

(C) REGULATIONS.—The Secretary of Defense shall promulgate regulations with respect to a marine pollution control device under paragraph (4) as soon as practicable after the Administrator and the Secretary of Defense promulgate standards with respect to the device under paragraph (3), but not later than 1 year after the Administrator and the Secretary of Defense promulgate the standards. The regulations promulgated by the Secretary of Defense under paragraph (4) shall become effective upon promulgation unless another effective date is specified in the regulations.

(D) PETITION FOR REVIEW.—The Governor of any State may submit a petition requesting that the Secretary of Defense and the Administrator review a determination under paragraph (2) or a standard under paragraph (3), if there is significant new information, not considered previously, that could reasonably result in a change to the particular determination or standard after consideration of the matters set forth in paragraph (2)(B). The petition shall be accompanied by the scientific and technical information on which the petition is based. The Administrator and the Secretary of Defense shall grant or deny the petition not later than 2 years after the date of receipt of the petition.

(6) EFFECT ON OTHER LAWS.—

(A) PROHIBITION ON REGULATION BY STATES OR POLITICAL SUBDIVISIONS OF STATES.—Beginning on the effective date of—

(i) a determination under paragraph (2) that it is not reasonable and practicable to require use of a marine pollution control device regarding a particular discharge incidental to the normal operation of a vessel of the Armed Forces; or

(ii) regulations promulgated by the Secretary of Defense under paragraph (4);

except as provided in paragraph (7), neither a State nor a political subdivision of a State may adopt or enforce any statute or regulation of the State or political subdivision with respect to the discharge or the design, construction, installation, or use of any marine pollution control device required to control discharges from a vessel of the Armed Forces.

(B) FEDERAL LAWS.—This subsection shall not affect the application of section 311 to discharges incidental to the normal operation of a vessel.

(7) ESTABLISHMENT OF STATE NO-DISCHARGE ZONES.—

(A) STATE PROHIBITION.—

(i) IN GENERAL.—After the effective date of—

(I) a determination under paragraph (2) that it is not reasonable and practicable to require use of a marine pollution control device regarding a particular discharge incidental to the normal operation of a vessel of the Armed Forces; or

(II) regulations promulgated by the Secretary of Defense under paragraph (4);

if a State determines that the protection and enhancement of the quality of some or all of the waters within the State require greater environmental protection, the State may prohibit 1 or more discharges incidental to the normal operation of a vessel, whether treated or not treated, into the waters. No prohibition shall apply until the Administrator makes the determinations described in subclauses (II) and (III) of subparagraph (B)(i).

(ii) DOCUMENTATION.—To the extent that a prohibition under this paragraph would apply to vessels of the Armed Forces and not to other types of vessels, the State shall document the technical or environmental basis for the distinction.

(B) PROHIBITION BY THE ADMINISTRATOR.—

(i) IN GENERAL.—Upon application of a State, the Administrator shall by regulation prohibit the discharge from a vessel of 1 or more discharges incidental to the normal operation of a vessel, whether treated or not treated, into the waters covered by the application if the Administrator determines that—

(I) the protection and enhancement of the quality of the specified waters within the State require a prohibition of the discharge into the waters;

(II) adequate facilities for the safe and sanitary removal of the discharge incidental to the normal operation of a vessel are reasonably available for the waters to which the prohibition would apply; and

(III) the prohibition will not have the effect of discriminating against a vessel of the Armed Forces by reason of the ownership or operation by the Federal Government, or the military function, of the vessel.

(ii) APPROVAL OR DISAPPROVAL.—The Administrator shall approve or disapprove an application submitted under clause (i) not later than 90 days after the date on which the application is submitted to the Administrator. Notwithstanding clause (i)(II), the Administrator shall not disapprove an application for the sole reason that there are not adequate facilities to remove any discharge incidental to the normal operation of a vessel from vessels of the Armed Forces.

(C) APPLICABILITY TO FOREIGN FLAGGED VESSELS.—A prohibition under this paragraph—

(i) shall not impose any design, construction, manning, or equipment standard on a foreign flagged ves-

sel engaged in innocent passage unless the prohibition implements a generally accepted international rule or standard; and

(ii) that relates to the prevention, reduction, and control of pollution shall not apply to a foreign flagged vessel engaged in transit passage unless the prohibition implements an applicable international regulation regarding the discharge of oil, oily waste, or any other noxious substance into the waters.

(8) PROHIBITION RELATING TO VESSELS OF THE ARMED FORCES.—After the effective date of the regulations promulgated by the Secretary of Defense under paragraph (4), it shall be unlawful for any vessel of the Armed Forces subject to the regulations to—

(A) operate in the navigable waters of the United States or the waters of the contiguous zone, if the vessel is not equipped with any required marine pollution control device meeting standards established under this subsection; or

(B) discharge overboard any discharge incidental to the normal operation of a vessel in waters with respect to which a prohibition on the discharge has been established under paragraph (7).

(9) ENFORCEMENT.—This subsection shall be enforceable, as provided in subsections (j) and (k), against any agency of the United States responsible for vessels of the Armed Forces notwithstanding any immunity asserted by the agency.

(33 U.S.C. 1322)

FEDERAL FACILITIES POLLUTION CONTROL

SEC. 313. (a) Each department, agency, or instrumentality of the executive, legislative, and judicial branches of the Federal Government (1) having jurisdiction over any property or facility, or (2) engaged in any activity resulting, or which may result, in the discharge or runoff of pollutants, and each officer, agent, or employee thereof in the performance of his official duties, shall be subject to, and comply with, all Federal, State, interstate, and local requirements, administrative authority, and process and sanctions respecting the control and abatement of water pollution in the same manner, and to the same extent as any nongovernmental entity including the payment of reasonable service charges. The preceding sentence shall apply (A) to any requirement whether substantive or procedural (including any recordkeeping or reporting requirement, any requirement respecting permits and any other requirement, whatsoever), (B) to the exercise of any Federal, State, or local administrative authority, and (C) to any process and sanction, whether enforced in Federal, State, or local courts or in any other manner. This subsection shall apply notwithstanding any immunity of such agencies, officers, agents, or employees under any law or rule of law. Nothing in this section shall be construed to prevent any department, agency, or instrumentality of the Federal Government, or any officer, agent, or employee thereof in the performance of his official duties, from removing to the appropriate Federal district court any proceeding to which the department, agency, or instru-

mentality or officer, agent, or employee thereof is subject pursuant to this section, and any such proceeding may be removed in accordance with 28 U.S.C. 1441 et seq. No officer, agent, or employee of the United States shall be personally liable for any civil penalty arising from the performance of his official duties, for which he is not otherwise liable, and the United States shall be liable only for those civil penalties arising under Federal law or imposed by a State or local court to enforce an order or the process of such court. The President may exempt any effluent source of any department, agency, or instrumentality in the executive branch from compliance with any such a requirement if he determines it to be in the paramount interest of the United States to do so; except that no exemption may be granted from the requirements of section 306 or 307 of this Act. No such exemptions shall be granted due to lack of appropriation unless the President shall have specifically requested such appropriation as a part of the budgetary process and the Congress shall have failed to make available such requested appropriation. Any exemption shall be for a period not in excess of one year, but additional exemptions may be granted for periods of not to exceed one year upon the President's making a new determination. The President shall report each January to the Congress all exemptions from the requirements of this section granted during the preceding calendar year, together with his reason for granting such exemption. In addition to any such exemption of a particular effluent source, the President may, if he determines it to be in the paramount interest of the United States to do so, issue regulations exempting from compliance with the requirements of this section any weaponry, equipment, aircraft, vessels, vehicles, or other classes or categories of property, and access to such property, which are owned or operated by the Armed Forces of the United States (including the Coast Guard) or by the National Guard of any State and which are uniquely military in nature. The President shall reconsider the need for such regulations at three-year intervals.

(b)(1) The Administrator shall coordinate with the head of each department, agency, or instrumentality of the Federal Government having jurisdiction over any property or facility utilizing federally owned wastewater facilities to develop a program of cooperation for utilizing wastewater control systems utilizing those innovative treatment processes and techniques for which guidelines have been promulgated under section 304(d)(3). Such program shall include an inventory of property and facilities which could utilize such processes and techniques.

(2) Construction shall not be initiated for facilities for treatment of wastewater at any Federal property or facility after September 30, 1979, if alternative methods for wastewater treatment at such property or facility utilizing innovative treatment processes and techniques, including but not limited to methods utilizing recycle and reuse techniques and land treatment are not utilized, unless the life cycle cost of the alternative treatment works exceeds the life cycle cost of the most cost effective alternative by more than 15 per centum. The Administrator may waive the application of this paragraph in any case where the Administrator determines it to be in the public interest, or that compliance with this para-

graph would interfere with the orderly compliance with the conditions of a permit issued pursuant to section 402 of this Act.

(33 U.S.C. 1323)

CLEAN LAKES

SEC. 314. (a) ESTABLISHMENT AND SCOPE OF PROGRAM.—

(1) STATE PROGRAM REQUIREMENTS.—Each State on a biennial basis shall prepare and submit to the Administrator for his approval—

(A) an identification and classification according to eutrophic condition of all publicly owned lakes in such State;

(B) a description of procedures, processes, and methods (including land use requirements), to control sources of pollution of such lakes;

(C) a description of methods and procedures, in conjunction with appropriate Federal agencies, to restore the quality of such lakes;

(D) methods and procedures to mitigate the harmful effects of high acidity, including innovative methods of neutralizing and restoring buffering capacity of lakes and methods of removing from lakes toxic metals and other toxic substances mobilized by high acidity;

(E) a list and description of those publicily owned lakes in such State for which uses are known to be impaired, including those lakes which are known not to meet applicable water quality standards or which require implementation of control programs to maintain compliance with applicable standards and those lakes in which water quality has deteriorated as a result of high acidity that may reasonably be due to acid deposition; and

(F) an assessment of the status and trends of water quality in lakes in such State, including but not limited to, the nature and extent of pollution loading from point and nonpoint sources and the extent to which the use of lakes is impaired as a result of such pollution, particularly with respect to toxic pollution.

(2) SUBMISSION AS PART OF 305(b)(1) REPORT.—The information required under paragraph (1) shall be included in the report required under section 305(b)(1) of this Act, beginning with the report required under such section by April 1, 1988.

(3) ELIGIBILITY REQUIREMENT.—Beginning after April 1, 1988, a State must have submitted the information required under paragraph (1) in order to receive grant assistance under this section.

(b) The Administrator shall provide financial assistance to States in order to carry out methods and procedures approved by him under subsection (a) of this section. The Administrator shall provide financial assistance to States to prepare the identification and classification surveys required in subsection (a)(1) of this section.

(c)(1) The amount granted to any State for any fiscal year under subsection (b) of this section shall not exceed 70 per centum of the funds expended by such State in such year for carrying out

approved methods and procedures under subsection (a) of this section.

(2) There is authorized to be appropriated $50,000,000 for each of fiscal years 2001 through 2005 for grants to States under subsection (b) of this section which such sums shall remain available until expended. The Administrator shall provide for an equitable distribution of such sums to the States with approved methods and procedures under subsection (a) of this section.

(d) DEMONSTRATION PROGRAM.—

(1) GENERAL REQUIREMENTS.—The Administrator is authorized and directed to establish and conduct at locations throughout the Nation a lake water quality demonstration program. The program shall, at a minimum—

(A) develop cost effective technologies for the control of pollutants to preserve or enhance lake water quality while optimizing multiple lakes uses;

(B) control nonpoint sources of pollution which are contributing to the degradation of water quality in lakes;

(C) evaluate the feasibility of implementing regional consolidated pollution control strategies;

(D) demonstrate environmentally preferred techniques for the removal and disposal of contaminated lake sediments;

(E) develop improved methods for the removal of silt, stumps, aquatic growth, and other obstructions which impair the quality of lakes;

(F) construct and evaluate silt traps and other devices or equipment to prevent or abate the deposit of sediment in lakes; and

(G) demonstrate the costs and benefits of utilizing dredged material from lakes in the reclamation of despoiled land.

(2) GEOGRAPHICAL REQUIREMENTS.—Demonstration projects authorized by this subsection shall be undertaken to reflect a variety of geographical and environmental conditions. As a priority, the Administrator shall undertake demonstration projects at Lake Champlain, New York and Vermont; Lake Houston, Texas; Beaver Lake, Arkansas; Greenwood Lake and Belcher Creek, New Jersey; Deal Lake, New Jersey; Alcyon Lake, New Jersey; Gorton's Pond, Rhode Island; Lake Washington, Rhode Island; Lake Bomoseen, Vermont; Sauk Lake, Minnesota; Otsego Lake, New York; Oneida Lake, New York; Raystown Lake, Pennsylvania; Swan Lake, Itasca County, Minnesota; Walker Lake, Nevada; Lake Tahoe, California and Nevada; Ten Mile Lakes, Oregon; Woahink Lake, Oregon; Highland Lake, Connecticut; Lily Lake, New Jersey; Strawbridge Lake, New Jersey; Baboosic Lake, New Hampshire; French Pond, New Hampshire; Dillon Reservoir, Ohio; Tohopekaliga Lake, Florida; Lake Apopka, Florida; Lake George, New York; Lake Wallenpaupack, Pennsylvania; Lake Allatoona, Georgia; and Lake Worth, Texas.

(3) REPORTS.—Notwithstanding section 3003 of the Federal Reports Elimination and Sunset Act of 1995 (31 U.S.C. 1113 note; 109 Stat. 734–736), by January 1, 1997, and January 1 of every odd-numbered year thereafter, the Administrator shall

report to the Committee on Transportation and Infrastructure of the House of Representatives and the Committee on Environment and Public Works of the Senate on work undertaken pursuant to this subsection. Upon completion of the program authorized by this subsection, the Administrator shall submit to such committees a final report on the results of such program, along with recommendations for further measures to improve the water quality of the Nation's lakes.

(4) AUTHORIZATION OF APPROPRIATIONS.—

(A) IN GENERAL.—There is authorized to be appropriated to carry out this subsection not to exceed $40,000,000 for fiscal years beginning after September 30, 1986, to remain available until expended.

(B) SPECIAL AUTHORIZATIONS.—

(i) AMOUNT.—There is authorized to be appropriated to carry out subsection (b) with respect to subsection (a)(1)(D) not to exceed $25,000,000 for fiscal years beginning after September 30, 1986, to remain available until expended.

(ii) DISTRIBUTION OF FUNDS.—The Administrator shall provide for an equitable distribution of sums appropriated pursuant to this subparagraph among States carrying out approved methods and procedures. Such distribution shall be based on the relative needs of each such State for the mitigation of the harmful effects on lakes and other surface waters of high acidity that may reasonably be due to acid deposition or acid mine drainage.

(iii) GRANTS AS ADDITIONAL ASSISTANCE.—The amount of any grant to a State under this subparagraph shall be in addition to, and not in lieu of, any other Federal financial assistance.

(33 U.S.C. 1324)

NATIONAL STUDY COMMISSION

SEC. 315. (a) There is established a National Study Commission, which shall make a full and complete investigation and study of all of the technological aspects of achieving, and all aspects of the total economic, social, and environmental effects of achieving or not achieving, the effluent limitations and goals set forth for 1983 in section 301(b)(2) of this Act.

(b) Such Commission shall be composed of fifteen members, including five members of the Senate, who are members of the Public Works committee, appointed by the President of the Senate, five members of the House, who are members of the Public Works committee, appointed by the Speaker of the House, and five members of the public appointed by the President. The Chairman of such Commission shall be elected from among its members.

(c) In the conduct of such study, the Commission is authorized to contract with the National Academy of Sciences and the National Academy of Engineering (acting through the National Research Council), the National Institute of Ecology, Brookings Institution, and other nongovernmental entities, for the investigation of matters within their competence.

(d) The heads of the departments, agencies and instrumentalities of the executive branch of the Federal Government shall cooperate with the Commission in carrying out the requirements of this section, and shall furnish to the Commission such information as the Commission deems necessary to carry out this section.

(e) A report shall be submitted to the Congress of the results of such investigation and study, together with recommendations, not later than three years after the date of enactment of this title.

(f) The members of the Commission who are not officers or employees of the United States, while attending conferences or meetings of the Commission or while otherwise serving at the request of the Chairman shall be entitled to receive compensation at a rate not in excess of the maximum rate of pay for grade GS–18, as provided in the General Schedule under section 5332 of title V of the United States Code, including traveltime and while away from their homes or regular places of business they may be allowed travel expenses, including per diem in lieu of subsistence as authorized by law (5 U.S.C. 73b–2) for persons in the Government service employed intermittently.

(g) In addition to authority to appoint personnel subject to the provisions of title 5, United States Code, governing appointments in the competitive service, and to pay such personnel in accordance with the provisions of chapter 51 and subchapter III of chapter 53 of such title relating to classification and General Schedule pay rates, the Commission shall have authority to enter into contracts with private or public organizations who shall furnish the Commission with such administrative and technical personnel as may be necessary to carry out the purpose of this section. Personnel furnished by such organizations under this subsection are not, and shall not be considered to be, Federal employees for any purposes, but in the performance of their duties shall be guided by the standards which apply to employees of the legislative branches under rules 41 and 43 of the Senate and House of Representatives, respectively.

(h) There is authorized to be appropriated, for use in carrying out this section, not to exceed $17,250,000.

(33 U.S.C. 1325)

THERMAL DISCHARGES

SEC. 316. (a) With respect to any point source otherwise subject to the provisions of section 301 or section 306 of this Act, whenever the owner or operator of any such source, after opportunity for public hearing, can demonstrate to the satisfaction of the Administrator (or, if appropriate, the State) that any effluent limitation proposed for the control of the thermal component of any discharge from such source will require effluent limitations more stringent than necessary to assure the projection and propagation of a balanced, indigenous population of shellfish, fish, and wildlife in and on the body of water into which the discharge is to be made, the Administrator (or, if appropriate, the State) may impose an effluent limitation under such sections for such plant, with respect to the thermal component of such discharge (taking into account the interaction of such thermal component with other pollutants), that will assure the projection and propagation of a balanced, in-

digenous population of shellfish, fish, and wildlife in and on that body of water.

(b) Any standard established pursuant to section 301 or section 306 of this Act and applicable to a point source shall require that the location, design, construction, and capacity of cooling water intake structures reflect the best technology available for minimizing adverse environmental impact.

(c) Notwithstanding any other provision of this Act, any point source of a discharge having a thermal component, the modification of which point source is commenced after the date of enactment of the Federal Water Pollution Control Act Amendments of 1972 and which, as modified, meets effluent limitations established under section 301 or, if more stringent, effluent limitations established under section 303 and which effluent limitations will assure protection and propagation of a balanced, indigenous population of shellfish, fish, and wildlife in or on the water into which the discharge is made, shall not be subject to any more stringent effluent limitation with respect to the thermal component of its discharge during a ten year period beginning on the date of completion of such modification or during the period of depreciation or amortization of such facility for the purpose of section 167 or 169 (or both) of the Internal Revenue Code of 1954, whichever period ends first.

(33 U.S.C. 1326)

FINANCING STUDY

SEC. 317. (a) The Administrator shall continue to investigate and study the feasibility of alternate methods of financing the cost of preventing, controlling and abating pollution as directed in the Water Quality Improvement Act of 1970 (Public Law 91–224), including, but not limited to, the feasibility of establishing a pollution abatement trust fund. The results of such investigation and study shall be reported to the Congress not later than two years after enactment of this title, together with recommendations of the Administrator for financing the programs for preventing, controlling and abating pollution for the fiscal years beginning after fiscal year 1976, including any necessary legislation.

(b) There is authorized to be appropriated for use in carrying out this section, not to exceed $1,000,000.

(33 U.S.C. 1327)

AQUACULTURE

SEC. 318. (a) The Administrator is authorized, after public hearings, to permit the discharge of a specific pollutant or pollutants under controlled conditions associated with an approved aquaculture project under Federal or State supervision pursuant to section 402 of this Act.

(b) The Administrator shall by regulation establish any procedures and guidelines which the Administrator deems necessary to carry out this section. Such regulations shall require the application to such discharge of each criterion, factor, procedure, and requirement applicable to a permit issued under section 402 of this title, as the Administrator determines necessary to carry out the objective of this Act.

(c) Each State desiring to administer its own permit program within its jurisdiction for discharge of a specific pollutant or pollutants under controlled conditions associated with an approved aquaculture project may do so if upon submission of such program the Administrator determines such program is adequate to carry out the objective of this Act.

(33 U.S.C. 1328)

SEC. 319. NONPOINT SOURCE MANAGEMENT PROGRAMS.

(a) STATE ASSESSMENT REPORTS.—

(1) CONTENTS.—The Governor of each State shall, after notice and opportunity for public comment, prepare and submit to the Administrator for approval, a report which—

(A) identifies those navigable waters within the State which, without additional action to control nonpoint sources of pollution, cannot reasonably be expected to attain or maintain applicable water quality standards or the goals and requirements of this Act;

(B) identifies those categories and subcategories of nonpoint sources or, where appropriate, particular nonpoint sources which add significant pollution to each portion of the navigable waters identified under subparagraph (A) in amounts which contribute to such portion not meeting such water quality standards or such goals and requirements;

(C) describes the process, including intergovernmental coordination and public participation, for identifying best management practices and measures to control each category and subcategory of nonpoint sources and, where appropriate, particular nonpoint sources identified under subparagraph (B) and to reduce, to the maximum extent practicable, the level of pollution resulting from such category, subcategory, or source; and

(D) identifies and describes State and local programs for controlling pollution added from nonpoint sources to, and improving the quality of, each such portion of the navigable waters, including but not limited to those programs which are receiving Federal assistance under subsections (h) and (i).

(2) INFORMATION USED IN PREPARATION.—In developing the report required by this section, the State (A) may rely upon information developed pursuant to sections 208, 303(e), 304(f), 305(b), and 314, and other information as appropriate, and (B) may utilize appropriate elements of the waste treatment management plans developed pursuant to sections 208(b) and 303, to the extent such elements are consistent with and fulfill the requirements of this section.

(b) STATE MANAGEMENT PROGRAMS.—

(1) IN GENERAL.—The Governor of each State, for that State or in combination with adjacent States, shall, after notice and opportunity for public comment, prepare and submit to the Administrator for approval a management program which such State proposes to implement in the first four fiscal years beginning after the date of submission of such management program for controlling pollution added from nonpoint sources to the

navigable waters within the State and improving the quality of such waters.

(2) SPECIFIC CONTENTS.—Each management program proposed for implementation under this subsection shall include each of the following:

(A) An identification of the best management practices and measures which will be undertaken to reduce pollutant loadings resulting from each category, subcategory, or particular nonpoint source designated under paragraph (1)(B), taking into account the impact of the practice on ground water quality.

(B) An identification of programs (including, as appropriate, nonregulatory or regulatory programs for enforcement, technical assistance, financial assistance, education, training, technology transfer, and demonstration projects) to achieve implementation of the best management practices by the categories, subcategories, and particular nonpoint sources designated under subparagraph (A).

(C) A schedule containing annual milestones for (i) utilization of the program implementation methods identified in subparagraph (B), and (ii) implementation of the best management practices identified in subparagraph (A) by the categories, subcategories, or particular nonpoint sources designated under paragraph (1)(B). Such schedule shall provide for utilization of the best management practices at the earliest practicable date.

(D) A certification of the attorney general of the State or States (or the chief attorney of any State water pollution control agency which has independent legal counsel) that the laws of the State or States, as the case may be, provide adequate authority to implement such management program or, if there is not such adequate authority, a list of such additional authorities as will be necessary to implement such management program. A schedule and commitment by the State or States to seek such additional authorities as expeditiously as practicable.

(E) Sources of Federal and other assistance and funding (other than assistance provided under subsections (h) and (i)) which will be available in each of such fiscal years for supporting implementation of such practices and measures and the purposes for which such assistance will be used in each of such fiscal years.

(F) An identification of Federal financial assistance programs and Federal development projects for which the State will review individual assistance applications or development projects for their effect on water quality pursuant to the procedures set forth in Executive Order 12372 as in effect on September 17, 1983, to determine whether such assistance applications or development projects would be consistent with the program prepared under this subsection; for the purposes of this subparagraph, identification shall not be limited to the assistance programs or development projects subject to Executive Order 12372 but may include any programs listed in the most recent Catalog of Federal Domestic Assistance which may have an ef-

fect on the purposes and objectives of the State's nonpoint source pollution management program.

(3) UTILIZATION OF LOCAL AND PRIVATE EXPERTS.—In developing and implementing a management program under this subsection, a State shall, to the maximum extent practicable, involve local public and private agencies and organizations which have expertise in control of nonpoint sources of pollution.

(4) DEVELOPMENT ON WATERSHED BASIS.—A State shall, to the maximum extent practicable, develop and implement a management program under this subsection on a watershed-by-watershed basis within such State.

(c) ADMINISTRATIVE PROVISIONS.—

(1) COOPERATION REQUIREMENT.—Any report required by subsection (a) and any management program and report required by subsection (b) shall be developed in cooperation with local, substate regional, and interstate entities which are actively planning for the implementation of nonpoint source pollution controls and have either been certified by the Administrator in accordance with section 208, have worked jointly with the State on water quality management planning under section 205(j), or have been designated by the State legislative body or Governor as water quality management planning agencies for their geographic areas.

(2) TIME PERIOD FOR SUBMISSION OF REPORTS AND MANAGEMENT PROGRAMS.—Each report and management program shall be submitted to the Administrator during the 18-month period beginning on the date of the enactment of this section.

(d) APPROVAL OR DISAPPROVAL OF REPORTS AND MANAGEMENT PROGRAMS.—

(1) DEADLINE.—Subject to paragraph (2), not later than 180 days after the date of submission to the Administrator of any report or management program under this section (other than subsections (h), (i), and (k)), the Administrator shall either approve or disapprove such report or management program, as the case may be. The Administrator may approve a portion of a management program under this subsection. If the Administrator does not disapprove a report, management program, or portion of a management program in such 180-day period, such report, management program, or portion shall be deemed approved for purposes of this section.

(2) PROCEDURE FOR DISAPPROVAL.—If, after notice and opportunity for public comment and consultation with appropriate Federal and State agencies and other interested persons, the Administrator determines that—

(A) the proposed management program or any portion thereof does not meet the requirements of subsection (b)(2) of this section or is not likely to satisfy, in whole or in part, the goals and requirements of this Act;

(B) adequate authority does not exist, or adequate resources are not available, to implement such program or portion;

(C) the schedule for implementing such program or portion is not sufficiently expeditious; or

(D) the practices and measures proposed in such program or portion are not adequate to reduce the level of pollution in navigable waters in the State resulting from nonpoint sources and to improve the quality of navigable waters in the State;

the Administrator shall within 6 months of the receipt of the proposed program notify the State of any revisions or modifications necessary to obtain approval. The State shall thereupon have an additional 3 months to submit its revised management program and the Administrator shall approve or disapprove such revised program within three months of receipt.

(3) FAILURE OF STATE TO SUBMIT REPORT.—If a Governor of a State does not submit the report required by subsection (a) within the period specified by subsection (c)(2), the Administrator shall, within 30 months after the date of the enactment of this section, prepare a report for such State which makes the identifications required by paragraphs (1)(A) and (1)(B) of subsection (a). Upon completion of the requirement of the preceding sentence and after notice and opportunity for comment, the Administrator shall report to Congress on his actions pursuant to this section.

(e) LOCAL MANAGEMENT PROGRAMS; TECHNICAL ASSISTANCE.—If a State fails to submit a management program under subsection (b) or the Administrator does not approve such a management program, a local public agency or organization which has expertise in, and authority to, control water pollution resulting from nonpoint sources in any area of such State which the Administrator determines is of sufficient geographic size may, with approval of such State, request the Administrator to provide, and the Administrator shall provide, technical assistance to such agency or organization in developing for such area a management program which is described in subsection (b) and can be approved pursuant to subsection (d). After development of such management program, such agency or organization shall submit such management program to the Administrator for approval. If the Administrator approves such management program, such agency or organization shall be eligible to receive financial assistance under subsection (h) for implementation of such management program as if such agency or organization were a State for which a report submitted under subsection (a) and a management program submitted under subsection (b) were approved under this section. Such financial assistance shall be subject to the same terms and conditions as assistance provided to a State under subsection (h).

(f) TECHNICAL ASSISTANCE FOR STATE.—Upon request of a State, the Administrator may provide technical assistance to such State in developing a management program approved under subsection (b) for those portions of the navigable waters requested by such State.

(g) INTERSTATE MANAGEMENT CONFERENCE.—

(1) CONVENING OF CONFERENCE; NOTIFICATION; PURPOSE.—If any portion of the navigable waters in any State which is implementing a management program approved under this section is not meeting applicable water quality standards or the goals and requirements of this Act as a result, in whole or in part, of pollution from nonpoint sources in another State,

such State may petition the Administrator to convene, and the Administrator shall convene, a management conference of all States which contribute significant pollution resulting from nonpoint sources to such portion. If, on the basis of information available, the Administrator determines that a State is not meeting applicable water quality standards or the goals and requirements of this Act as a result, in whole or in part, of significant pollution from nonpoint sources in another State, the Administrator shall notify such States. The Administrator may convene a management conference under this paragraph not later than 180 days after giving such notification, whether or not the State which is not meeting such standards requests such conference. The purpose of such conference shall be to develop an agreement among such States to reduce the level of pollution in such portion resulting from nonpoint sources and to improve the water quality of such portion. Nothing in such agreement shall supersede or abrogate rights to quantities of water which have been established by interstate water compacts, Supreme Court decrees, or State water laws. This subsection shall not apply to any pollution which is subject to the Colorado River Basin Salinity Control Act. The requirement that the Administrator convene a management conference shall not be subject to the provisions of section 505 of this Act.

(2) STATE MANAGEMENT PROGRAM REQUIREMENT.—To the extent that the States reach agreement through such conference, the management programs of the States which are parties to such agreements and which contribute significant pollution to the navigable waters or portions thereof not meeting applicable water quality standards or goals and requirements of this Act will be revised to reflect such agreement. Such management programs shall be consistent with Federal and State law.

(h) GRANT PROGRAM.—

(1) GRANTS FOR IMPLEMENTATION OF MANAGEMENT PROGRAMS.—Upon application of a State for which a report submitted under subsection (a) and a management program submitted under subsection (b) is approved under this section, the Administrator shall make grants, subject to such terms and conditions as the Administrator considers appropriate, under this subsection to such State for the purpose of assisting the State in implementing such management program. Funds reserved pursuant to section 205(j)(5) of this Act may be used to develop and implement such management program.

(2) APPLICATIONS.—An application for a grant under this subsection in any fiscal year shall be in such form and shall contain such other information as the Administrator may require, including an identification and description of the best management practices and measures which the State proposes to assist, encourage, or require in such year with the Federal assistance to be provided under the grant.

(3) FEDERAL SHARE.—The Federal share of the cost of each management program implemented with Federal assistance under this subsection in any fiscal year shall not exceed 60 percent of the cost incurred by the State in implementing such

management program and shall be made on condition that the non-Federal share is provided from non-Federal sources.

(4) LIMITATION ON GRANT AMOUNTS.—Notwithstanding any other provision of this subsection, not more than 15 percent of the amount appropriated to carry out this subsection may be used to make grants to any one State, including any grants to any local public agency or organization with authority to control pollution from nonpoint sources in any area of such State.

(5) PRIORITY FOR EFFECTIVE MECHANISMS.—For each fiscal year beginning after September 30, 1987, the Administrator may give priority in making grants under this subsection, and shall give consideration in determining the Federal share of any such grant, to States which have implemented or are proposing to implement management programs which will—

(A) control particularly difficult or serious nonpoint source pollution problems, including, but not limited to, problems resulting from mining activities;

(B) implement innovative methods or practices for controlling nonpoint sources of pollution, including regulatory programs where the Administrator deems appropriate;

(C) control interstate nonpoint source pollution problems; or

(D) carry out ground water quality protection activities which the Administrator determines are part of a comprehensive nonpoint source pollution control program, including research, planning, ground water assessments, demonstration programs, enforcement, technical assistance, education, and training to protect ground water quality from nonpoint sources of pollution.

(6) AVAILABILITY FOR OBLIGATION.—The funds granted to each State pursuant to this subsection in a fiscal year shall remain available for obligation by such State for the fiscal year for which appropriated. The amount of any such funds not obligated by the end of such fiscal year shall be available to the Administrator for granting to other States under this subsection in the next fiscal year.

(7) LIMITATION ON USE OF FUNDS.—States may use funds from grants made pursuant to this section for financial assistance to persons only to the extent that such assistance is related to the costs of demonstration projects.

(8) SATISFACTORY PROGRESS.—No grant may be made under this subsection in any fiscal year to a State which in the preceding fiscal year received a grant under this subsection unless the Administrator determines that such State made satisfactory progress in such preceding fiscal year in meeting the schedule specified by such State under subsection (b)(2).

(9) MAINTENANCE OF EFFORT.—No grant may be made to a State under this subsection in any fiscal year unless such State enters into such agreements with the Administrator as the Administrator may require to ensure that such State will maintain its aggregate expenditures from all other sources for programs for controlling pollution added to the navigable waters in such State from nonpoint sources and improving the quality of such waters at or above the average level of such ex-

penditures in its two fiscal years preceding the date of enactment of this subsection.

(10) REQUEST FOR INFORMATION.—The Administrator may request such information, data, and reports as he considers necessary to make the determination of continuing eligibility for grants under this section.

(11) REPORTING AND OTHER REQUIREMENTS.—Each State shall report to the Administrator on an annual basis concerning (A) its progress in meeting the schedule of milestones submitted pursuant to subsection (b)(2)(C) of this section, and (B) to the extent that appropriate information is available, reductions in nonpoint source pollutant loading and improvements in water quality for those navigable waters or watersheds within the State which were identified pursuant to subsection (a)(1)(A) of this section resulting from implementation of the management program.

(12) LIMITATION ON ADMINISTRATIVE COSTS.—For purposes of this subsection, administrative costs in the form of salaries, overhead, or indirect costs for services provided and charged against activities and programs carried out with a grant under this subsection shall not exceed in any fiscal year 10 percent of the amount of the grant in such year, except that costs of implementing enforcement and regulatory activities, education, training, technical assistance, demonstration projects, and technology transfer programs shall not be subject to this limitation.

(i) GRANTS FOR PROTECTING GROUNDWATER QUALITY.—

(1) ELIGIBLE APPLICANTS AND ACTIVITIES.—Upon application of a State for which a report submitted under subsection (a) and a plan submitted under subsection (b) is approved under this section, the Administrator shall make grants under this subsection to such State for the purpose of assisting such State in carrying out groundwater quality protection activities which the Administrator determines will advance the State toward implementation of a comprehensive nonpoint source pollution control program. Such activities shall include, but not be limited to, research, planning, groundwater assessment, demonstration programs, enforcement, technical assistance, education and training to protect the quality of groundwater and to prevent contamination of groundwater from nonpoint sources of pollution.

(2) APPLICATIONS.—An application for a grant under this subsection shall be in such form and shall contain such information as the Administrator may require.

(3) FEDERAL SHARE; MAXIMUM AMOUNT.—The Federal share of the cost of assisting a State in carrying out groundwater protection activities in any fiscal year under this subsection shall be 50 percent of the costs incurred by the State in carrying out such activities, except that the maximum amount of Federal assistance which any State may receive under this subsection in any fiscal year shall not exceed $150,000.

(j) AUTHORIZATION OF APPROPRIATIONS.—There is authorized to be appropriated to carry out subsections (h) and (i) not to exceed $70,000,000 for fiscal year 1988, $100,000,000 per fiscal year for

each of fiscal years 1989 and 1990, and $130,000,000 for fiscal year 1991; except that for each of such fiscal years not to exceed $7,500,000 may be made available to carry out subsection (i). Sums appropriated pursuant to this subsection shall remain available until expended.

(k) CONSISTENCY OF OTHER PROGRAMS AND PROJECTS WITH MANAGEMENT PROGRAMS.—The Administrator shall transmit to the Office of Management and Budget and the appropriate Federal departments and agencies a list of those assistance programs and development projects identified by each State under subsection (b)(2)(F) for which individual assistance applications and projects will be reviewed pursuant to the procedures set forth in Executive Order 12372 as in effect on September 17, 1983. Beginning not later than sixty days after receiving notification by the Administrator, each Federal department and agency shall modify existing regulations to allow States to review individual development projects and assistance applications under the identified Federal assistance programs and shall accommodate, according to the requirements and definitions of Executive Order 12372, as in effect on September 17, 1983, the concerns of the State regarding the consistency of such applications or projects with the State nonpoint source pollution management program.

(l) COLLECTION OF INFORMATION.—The Administrator shall collect and make available, through publications and other appropriate means, information pertaining to management practices and implementation methods, including, but not limited to, (1) information concerning the costs and relative efficiencies of best management practices for reducing nonpoint source pollution; and (2) available data concerning the relationship between water quality and implementation of various management practices to control nonpoint sources of pollution.

(m) SET ASIDE FOR ADMINISTRATIVE PERSONNEL.—Not less than 5 percent of the funds appropriated pursuant to subsection (j) for any fiscal year shall be available to the Administrator to maintain personnel levels at the Environmental Protection Agency at levels which are adequate to carry out this section in such year.

(33 U.S.C. 1329)

SEC. 320. NATIONAL ESTUARY PROGRAM.

(a) MANAGEMENT CONFERENCE.—

(1) NOMINATION OF ESTUARIES.—The Governor of any State may nominate to the Administrator an estuary lying in whole or in part within the State as an estuary of national significance and request a management conference to develop a comprehensive management plan for the estuary. The nomination shall document the need for the conference, the likelihood of success, and information relating to the factors in paragraph (2).

(2) CONVENING OF CONFERENCE.—

(A) IN GENERAL.—In any case where the Administrator determines, on his own initiative or upon nomination of a State under paragraph (1), that the attainment or maintenance of that water quality in an estuary which assures protection of public water supplies and the protection and propagation of a balanced, indigenous population of shell-

fish, fish, and wildlife and allows recreational activities, in and on the water, requires the control of point and nonpoint sources of pollution to supplement existing controls of pollution in more than one State, the Administrator shall select such estuary and convene a management conference.

(B) PRIORITY CONSIDERATION.—The Administrator shall give priority consideration under this section to Long Island Sound, New York and Connecticut; Narragansett Bay, Rhode Island; Buzzards Bay, Massachusetts; Massachusetts Bay, Massachusetts (including Cape Cod Bay and Boston Harbor);[1] Puget Sound, Washington; New York-New Jersey Harbor, New York and New Jersey; Delaware Bay, Delaware and New Jersey; Delaware Inland Bays, Delaware; Albermarle Sound, North Carolina; Sarasota Bay, Florida; San Francisco Bay, California; Santa Monica Bay, California; Galveston Bay, Texas;[2] Barataria-Terrebonne Bay estuary complex, Louisiana; Indian River Lagoon, Florida; Lake Pontchartrain Basin, Louisiana and Mississippi; and Peconic Bay, New York.

(3) BOUNDARY DISPUTE EXCEPTION.—In any case in which a boundary between two States passes through an estuary and such boundary is disputed and is the subject of an action in any court, the Administrator shall not convene a management conference with respect to such estuary before a final adjudication has been made of such dispute.

(b) PURPOSES OF CONFERENCE.—The purposes of any management conference convened with respect to an estuary under this subsection shall be to—

(1) assess trends in water quality, natural resources, and uses of the estuary;

(2) collect, characterize, and assess data on toxics, nutrients, and natural resources within the estuarine zone to identify the causes of environmental problems;

(3) develop the relationship between the inplace loads and point and nonpoint loadings of pollutants to the estuarine zone and the potential uses of the zone, water quality, and natural resources;

(4) develop a comprehensive conservation and management plan that recommends priority corrective actions and compliance schedules addressing point and nonpoint sources of pollution to restore and maintain the chemical, physical, and biological integrity of the estuary, including restoration and maintenance of water quality, a balanced indigenous population of shellfish, fish and wildlife, and recreational activities in the estuary, and assure that the designated uses of the estuary are protected;

(5) develop plans for the coordinated implementation of the plan by the States as well as Federal and local agencies participating in the conference;

---

[1] Both P.L. 100–653 and P.L. 100–658 inserted the same Massachusetts Bay phrase after Buzzards Bay; so that the phrase appears twice.

[2] P.L. 100–688, section 2001(3) inserted the Louisiana, Florida, New York bays after "Galveston, Texas;" which technically could not be executed.

(6) monitor the effectiveness of actions taken pursuant to the plan; and

(7) review all Federal financial assistance programs and Federal development projects in accordance with the requirements of Executive Order 12372, as in effect on September 17, 1983, to determine whether such assistance program or project would be consistent with and further the purposes and objectives of the plan prepared under this section.

For purposes of paragraph (7), such programs and projects shall not be limited to the assistance programs and development projects subject to Executive Order 12372, but may include any programs listed in the most recent Catalog of Federal Domestic Assistance which may have an effect on the purposes and objectives of the plan developed under this section.

(c) MEMBERS OF CONFERENCE.—The members of a management conference convened under this section shall include, at a minimum, the Administrator and representatives of—

(1) each State and foreign nation located in whole or in part in the estuarine zone of the estuary for which the conference is convened;

(2) international, interstate, or regional agencies or entities having jurisdiction over all or a significant part of the estuary;

(3) each interested Federal agency, as determined appropriate by the Administrator;

(4) local governments having jurisdiction over any land or water within the estuarine zone, as determined appropriate by the Administrator; and

(5) affected industries, public and private educational institutions, and the general public, as determined appropriate by the Administrator.

(d) UTILIZATION OF EXISTING DATA.—In developing a conservation and management plan under this section, the management conference shall survey and utilize existing reports, data, and studies relating to the estuary that have been developed by or made available to Federal, interstate, State, and local agencies.

(e) PERIOD OF CONFERENCE.—A management conference convened under this section shall be convened for a period not to exceed 5 years. Such conference may be extended by the Administrator, and if terminated after the initial period, may be reconvened by the Administrator at any time thereafter, as may be necessary to meet the requirements of this section.

(f) APPROVAL AND IMPLEMENTATION OF PLANS.—

(1) APPROVAL.—Not later than 120 days after the completion of a conservation and management plan and after providing for public review and comment, the Administrator shall approve such plan if the plan meets the requirements of this section and the affected Governor or Governors concur.

(2) IMPLEMENTATION.—Upon approval of a conservation and management plan under this section, such plan shall be implemented. Funds authorized to be appropriated under titles II and VI and section 319 of this Act may be used in accordance with the applicable requirements of this Act to assist States with the implementation of such plan.

(g) GRANTS.—

(1) RECIPIENTS.—The Administrator is authorized to make grants to State, interstate, and regional water pollution control agencies and entities, State coastal zone management agencies, interstate agencies, other public or nonprofit private agencies, institutions, organizations, and individuals.

(2) PURPOSES.—Grants under this subsection shall be made to pay for activities necessary for the development and implementation of a comprehensive conservation and management plan under this section.

(3) FEDERAL SHARE.—The Federal share of a grant to any person (including a State, interstate, or regional agency or entity) under this subsection for a fiscal year—

(A) shall not exceed—

(i) 75 percent of the annual aggregate costs of the development of a comprehensive conservation and management plan; and

(ii) 50 percent of the annual aggregate costs of the implementation of the plan; and

(B) shall be made on condition that the non-Federal share of the costs are provided from non-Federal sources.

(h) GRANT REPORTING.—Any person (including a State, interstate, or regional agency or entity) that receives a grant under subsection (g) shall report to the Administrator not later than 18 months after receipt of such grants and biennially there after on the progress being made under this section.

(i) AUTHORIZATION OF APPROPRIATIONS.—There are authorized to be appropriated to the Administrator not to exceed $35,000,000 for each of fiscal years 2001 through 2005 for—

(1) expenses related to the administration of management conferences under this section, not to exceed 10 percent of the amount appropriated under this subsection;

(2) making grants under subsection (g); and

(3) monitoring the implementation of a conservation and management plan by the management conference or by the Administrator, in any case in which the conference has been terminated.

The Administrator shall provide up to $5,000,000 per fiscal year of the sums authorized to be appropriated under this subsection to the Administrator of the National Oceanic and Atmospheric Administration to carry out subsection (j).

(j) RESEARCH.—

(1) PROGRAMS.—In order to determine the need to convene a management conference under this section or at the request of such a management conference, the Administrator shall coordinate and implement, through the National Marine Pollution Program Office and the National Marine Fisheries Service of the National Oceanic and Atmospheric Administration, as appropriate, for one or more estuarine zones—

(A) a long-term program of trend assessment monitoring measuring variations in pollutant concentrations, marine ecology, and other physical or biological environmental paramenters which may affect estuarine zones, to provide the Administrator the capacity to determine the potential and actual effects of alternative management strategies and measures;

(B) a program of ecosystem assessment assisting in the development of (i) baseline studies which determine the state of estuarine zones and the effects of natural and anthropogenic changes, and (ii) predictive models capable of translating information on specific discharges or general pollutant loadings within estuarine zones into a set of probable effects on such zones;

(C) a comprehensive water quality sampling program for the continuous monitoring of nutrients, chlorine, acid precipitation dissolved oxygen, and potentially toxic pollutants (including organic chemicals and metals) in estuarine zones, after consultation with interested State, local, interstate, or international agencies and review and analysis of all environmental sampling data presently collected from estuarine zones; and

(D) a program of research to identify the movements of nutrients, sediments and pollutants through estuarine zones and the impact of nutrients, sediments, and pollutants on water quality, the ecosystem, and designated or potential uses of the estuarine zones.

(2) REPORTS.—The Administrator, in cooperation with the Administrator of the National Oceanic and Atmospheric Administration, shall submit to the Congress no less often than biennially a comprehensive report on the activities authorized under this subsection including—

(A) a listing of priority monitoring and research needs;

(B) an assessment of the state and health of the Nation's estuarine zones, to the extent evaluated under this subsection;

(C) a discussion of pollution problems and trends in pollutant concentrations with a direct or indirect effect on water quality, the ecosystem, and designated or potential uses of each estuarine zone, to the extent evaluated under this subsection; and

(D) an evaluation of pollution abatement activities and management measures so far implemented to determine the degree of improvement toward the objectives expressed in subsection (b)(4) of this section.

(k) DEFINITIONS.—For purposes of this section, the terms "estuary" and "estuarine zone" have the meanings such terms have in section 104(n)(3) of this Act, except that the term "estuarine zone" shall also include associated aquatic ecosystems and those portions of tributaries draining into the estuary up to the historic height of migration of anadromous fish or the historic head of tidal influence, whichever is higher.

(33 U.S.C. 1330)

TITLE IV—PERMITS AND LICENSES

CERTIFICATION

SEC. 401. (a)(1) Any applicant for a Federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities, which may result in any discharge into the navigable waters, shall provide the licensing or permitting agency a certification from the State in which the discharge origi-

nates or will originate, or, if appropriate, from the interstate water pollution control agency having jurisdiction over the navigable waters at the point where the discharge originates or will originate, that any such discharge will comply with the applicable provisions of sections 301, 302, 303, 306, and 307 of this Act. In the case of any such activity for which there is not an applicable effluent limitation or other limitation under sections 301(b) and 302, and there is not an applicable standard under sections 306 and 307, the State shall so certify, except that any such certification shall not be deemed to satisfy section 511(c) of this Act. Such State or interstate agency shall establish procedures for public notice in the case of all applications for certification by it and, to the extent it deems appropriate, procedures for public hearings in connection with specific applications. In any case where a State or interstate agency has no authority to give such a certification, such certification shall be from the Administrator. If the State, interstate agency, or Administrator, as the case may be, fails or refuses to act on a request for certification, within a reasonable period of time (which shall not exceed one year) after receipt of such request, the certification requirements of this subsection shall be waived with respect to such Federal application. No license or permit shall be granted until the certification required by this section has been obtained or has been waived as provided in the preceding sentence. No license or permit shall be granted if certification has been denied by the State, interstate agency, or the Administrator, as the case may be.

(2) Upon receipt of such application and certification the licensing or permitting agency shall immediately notify the Administrator of such application and certification. Whenever such a discharge may affect, as determined by the Administrator, the quality of the waters of any other State, the Administrator within thirty days of the date of notice of application for such Federal license or permit shall so notify such other State, the licensing or permitting agency, and the applicant. If, within sixty days after receipt of such notification, such other State determines that such discharge will affect the quality of its waters so as to violate any water quality requirement in such State, and within such sixty-day period notifies the Administrator and the licensing or permitting agency in writing of its objection to the issuance of such license or permit and requests a public hearing on such objection, the licensing or permitting agency shall hold such a hearing. The Administrator shall at such hearing submit his evaluation and recommendations with respect to any such objection to the licensing or permitting agency. Such agency, based upon the recommendations of such State, the Administrator, and upon any additional evidence, if any, presented to the agency at the hearing, shall condition such license or permit in such manner as may be necessary to insure compliance with applicable water quality requirements. If the imposition of conditions cannot insure such compliance such agency shall not issue such license or permit.

(3) The certification obtained pursuant to paragraph (1) of this subsection with respect to the construction of any facility shall fulfill the requirements of this subsection with respect to certification in connection with any other Federal license or permit required for the operation of such facility unless, after notice to the certifying State, agency, or Administrator, as the case may be, which shall be

given by the Federal agency to whom application is made for such operating license or permit, the State, or if appropriate, the interstate agency or the Administrator, notifies such agency within sixty days after receipt of such notice that there is no longer reasonable assurance that there will be compliance with the applicable provisions of sections 301, 302, 303, 306, and 307 of this Act because of changes since the construction license or permit certification was issued in (A) the construction or operation of the facility, (B) the characteristics of the waters into which such discharge is made, (C) the water quality criteria applicable to such waters or (D) applicable effluent limitations or other requirements. This paragraph shall be inapplicable in any case where the applicant for such operating license or permit has failed to provide the certifying State, or, if appropriate, the interstate agency or the Administrator, with notice of any proposed changes in the construction or operation of the facility with respect to which a construction license or permit has been granted, which changes may result in violation of section 301, 302, 303, 306, or 307 of this Act.

(4) Prior to the initial operation of any federally licensed or permitted facility or activity which may result in any discharge into the navigable waters and with respect to which a certification has been obtained pursuant to paragraph (1) of this subsection, which facility or activity is not subject to a Federal operating license or permit, the licensee or permittee shall provide an opportunity for such certifying State, or, if appropriate, the interstate agency or the Administrator to review the manner in which the facility or activity shall be operated or conducted for the purposes of assuring that applicable effluent limitations or other limitations or other applicable water quality requirements will not be violated. Upon notification by the certifying State, or if appropriate, the interstate agency or the Administrator that the operation of any such federally licensed or permitted facility or activity will violate applicable effluent limitations or other limitations or other water quality requirements such Federal agency may, after public hearing, suspend such license or permit. If such license or permit is suspended, it shall remain suspended until notification is received from the certifying State, agency, or Administrator, as the case may be, that there is reasonable assurance that such facility or activity will not violate the applicable provisions of section 301, 302, 303, 306, or 307 of this Act.

(5) Any Federal license or permit with respect to which a certification has been obtained under paragraph (1) of this subsection may be suspended or revoked by the Federal agency issuing such license or permit upon the entering of a judgment under this Act that such facility or activity has been operated in violation of the applicable provisions of section 301, 302, 303, 306, or 307 of this Act.

(6) Except with respect to a permit issued under section 402 of this Act, in any case where actual construction of a facility has been lawfully commenced prior to April 3, 1970, no certification shall be required under this subsection for a license or permit issued after April 3, 1970, to operate such facility, except that any such license or permit issued without certification shall terminate April 3, 1973, unless prior to such termination date the person having such license or permit submits to the Federal agency which

issued such license or permit a certification and otherwise meets the requirements of this section.

(b) Nothing in this section shall be construed to limit the authority of any department or agency pursuant to any other provision of law to require compliance with any applicable water quality requirements. The Administrator shall, upon the request of any Federal department or agency, or State or interstate agency, or applicant, provide, for the purpose of this section, any relevant information on applicable effluent limitations, or other limitations, standards, regulations, or requirements, or water quality criteria, and shall, when requested by any such department or agency or State or interstate agency, or applicant, comment on any methods to comply with such limitations, standards, regulations, requirements, or criteria.

(c) In order to implement the provisions of this section, the Secretary of the Army, acting throught the Chief of Engineers, is authorized, if he deems it to be in the public interest, to permit the use of spoil disposal areas under his jurisdiction by Federal licenses or permittees, and to make an appropriate charge for such use. Moneys received from such licensees or permittees shall be deposited in the Treasury as miscellaneous receipts.

(d) Any certification provided under this section shall set forth any effluent limitations and other limitations, and monitoring requirements necessary to assure that any applicant for a Federal license or permit will comply with any applicable effluent limitations and other limitations, under section 301 or 302 of this Act, standard of performance under section 306 of this Act, or prohibition, effluent standard, or pretreatment standard under section 307 of this Act, and with any other appropriate requirement of State law set forth in such certification, and shall become a condition on any Federal license or permit subject to the provisions of this section.

(33 U.S.C. 1341)

NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM

SEC. 402. (a)(1) Except as provided in sections 318 and 404 of this Act, the Administrator may, after opportunity for public hearing, issue a permit for the discharge of any pollutant, or combination of pollutants, notwithstanding section 301(a), upon condition that such discharge will meet either (A) all applicable requirements under sections 301, 302, 306, 307, 308, and 403 of this Act, or (B) prior to the taking of necessary implementing actions relating to all such requirements, such conditions as the Administrator determines are necessary to carry out the provisions of this Act.

(2) The Administrator shall prescribe conditions for such permits to assure compliance with the requirements of paragraph (1) of this subsection, including conditions on data and information collection, reporting, and such other requirements as he deems appropriate.

(3) The permit program of the Administrator under paragraph (1) of this subsection, and permits issued thereunder, shall be subject to the same terms, conditions, and requirements as apply to a State permit program and permits issued thereunder under subsection (b) of this section.

(4) All permits for discharges into the navigable waters issued pursuant to section 13 of the Act of March 3, 1899, shall be deemed to be permits issued under this title, and permits issued under this title shall be deemed to be permits issued under section 13 of the Act of March 3, 1899, and shall continue in force and effect for their term unless revoked, modified, or suspended in accordance with the provisions of this Act.

(5) No permit for a discharge into the navigable waters shall be issued under section 13 of the Act of March 3, 1899, after the date of enactment of this title. Each application for a permit under section 13 of the Act of March 3, 1899, pending on the date of enactment of this Act shall be deemed to be an application for a permit under this section. The Administrator shall authorize a State, which he determines has the capability of administering a permit program which will carry out the objective of this Act, to issue permits for discharges into the navigable waters within the jurisdiction of such State. The Administrator may exercise the authority granted him by the preceding sentence only during the period which begins on the date of enactment of this Act and ends either on the ninetieth day after the date of the first promulgation of guidelines required by section 304(h)(2) of this Act, or the date of approval by the Administrator of a permit program for such State under subsection (b) of this section, whichever date first occurs, and no such authorization to a State shall extend beyond the last day of such period. Each such permit shall be subject to such conditions as the Administrator determines are necessary to carry out the provisions of this Act. No such permit shall issue if the Administrator objects to such issuance.

(b) At any time after the promulgation of the guidelines required by subsection (h)(2) of section 304 of this Act, the Governor of each State desiring to administer its own permit program for discharges into navigable waters within its jurisdiction may submit to the Administrator a full and complete discription of the program it proposes to establish and administer under State law or under an interstate compact. In addition, such State shall submit a statement from the attorney general (or the attorney for those State water pollution control agencies which have independent legal counsel), or from the chief legal officer in the case of an interstate agency, that the laws of such State, or the interstate compact, as the case may be, provide adequate authority to carry out the described program. The Administrator shall approve each such submitted program unless he determines that adequate authority does not exist:

(1) To issue permits which—

(A) apply, and insure compliance with, any applicable requirements of sections 301, 302, 306, 307, and 403;

(B) are for fixed terms not exceeding five years; and

(C) can be terminated or modified for cause including, but not limited to, the following:

(i) violation of any condition of the permit;

(ii) obtaining a permit by misrepresentation, or failure to disclose fully all relevant facts;

(iii) change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge;

(D) control the disposal of pollutants into wells;

(2)(A) To issue permits which apply, and insure compliance with, all applicable requirements of section 308 of this Act, or

(B) To inspect, monitor, enter, and require reports to at least the same extent as required in section 308 of this Act;

(3) To insure that the public, and any other State the waters of which may be affected, receive notice of each application for a permit and to provide an opportunity for public hearing before a ruling on each such application;

(4) To insure that the Administrator receives notice of each application (including a copy thereof) for a permit;

(5) To insure that any State (other than the permitting State), whose waters may be affected by the issuance of a permit may submit written recommendations to the permitting State (and the Administrator) with respect to any permit application and, if any part of such written recommendations are not accepted by the permitting State, that the permitting State will notify such affected State (and the Administrator) in writing of its failure to so accept such recommendations together with its reasons for so doing;

(6) To insure that no permit will be issued if, in the judgment of the Secretary of the Army acting through the Chief of Engineers, after consultation with the Secretary of the department in which the Coast Guard is operating, anchorage and navigation of any of the navigable waters would be substantially impaired thereby;

(7) To abate violations of the permit or the permit program, including civil and criminal penalties and other ways and means of enforcement;

(8) To insure that any permit for a discharge from a publicly owned treatment works includes conditions to require the identification in terms of character and volume of pollutants of any significant source introducing pollutants subject to pretreatment standards under section 307(b) of this Act into such works and a program to assure compliance with such pretreatment standards by each such source, in addition to adequate notice to the permitting agency of (A) new introductions into such works of pollutants from any source which would be a new source as defined in section 306 if such source were discharging pollutants, (B) new introductions of pollutants into such works from a source which would be subject to section 301 if it were discharging such pollutants, or (C) a substantial change in volume or character of pollutants being introduced into such works by a source introducing pollutants into such works at the time of issuance of the permit. Such notice shall include information on the quality and quantity of effluent to be introduced into such treatment works and any anticipated impact of such change in the quantity or quality of effluent to be discharged from such publicly owned treatment works; and

(9) To insure that any industrial user of any publicly owned treatment works will comply with sections 204(b), 307, and 308.

(c)(1) Not later than ninety days after the date on which a State has submitted a program (or revision thereof) pursuant to subsection (b) of this section, the Administrator shall suspend the issuance of permits under subsection (a) of this section as to those discharges subject to such program unless he determines that the State permit program does not meet the requirements of subsection (b) of this section or does not conform to the guidelines issued

under section 304(i)(2) of this Act. If the Administrator so determines, he shall notify the State or any revisons or modifications necessary to conform to such requirements or guidelines.

(2) Any State permit program under this section shall at all times be in accordance with this section and guidelines promulgated pursuant to section 304(h)(2) of this Act.

(3) Whenever the Administrator determines after public hearing that a State is not administering a program approved under this section in accordance with requirements of this section, he shall so notify the State and, if appropriate corrective action is not taken within a reasonable time, not to exceed ninety days, the Administrator shall withdraw approval of such program. The Administrator shall not withdraw approval of any such program unless he shall first have notified the State, and made public, in writing, the reasons for such withdrawal.

(4) LIMITATIONS ON PARTIAL PERMIT PROGRAM RETURNS AND WITHDRAWALS.—A State may return to the Administrator administration, and the Administrator may withdraw under paragraph (3) of this subsection approval, of—

(A) a State partial permit program approved under subsection (n)(3) only if the entire permit program being administered by the State department or agency at the time is returned or withdrawn; and

(B) a State partial permit program approved under subsection (n)(4) only if an entire phased component of the permit program being administered by the State at the time is returned or withdrawn.

(d)(1) Each State shall transmit to the Administrator a copy of each permit application received by such State and provide notice to the Administrator of every action related to the consideration of such permit application, including each permit proposed to be issued by such State.

(2) No permit shall issue (A) if the Administrator within ninety days of the date of his notification under subsection (b)(5) of this section objects in writing to the issuance of such permit, or (B) if the Administrator within ninety days of the date of transmittal of the proposed permit by the State objects in writing to the issuance of such permit as being outside the guidelines and requirements of this Act. Whenever the Administrator objects to the issuance of a permit under this paragraph such written objection shall contain a statement of the reasons for such objection and the effluent limitations and conditions which such permit would include if it were issued by the Administrator.

(3) The Administrator may, as to any permit application, waive paragraph (2) of this subsection.

(4) In any case where, after the date of enactment of this paragraph, the Administrator, pursuant to paragraph (2) of this subsection, objects to the issuance of a permit, on request of the State, a public hearing shall be held by the Administrator on such objection. If the State does not resubmit such permit revised to meet such objection within 30 days after completion of the hearing, or, if no hearing is requested within 90 days after the date of such objection, the Administrator may issue the permit pursuant to subsection (a) of this section for such source in accordance with the guidelines and requirements of this Act.

(e) In accordance with guidelines promulgated pursuant to subsection (h)(2) of section 304 of this Act, the Administrator is authorized to waive the requirements of subsection (d) of this section at the time he approves a program pursuant to subsection (b) of this section for any category (including any class, type, or size within such category) of point sources within the State submitting such program.

(f) The Administrator shall promulgate regulations establishing categories of point sources which he determines shall not be subject to the requirements of subsection (d) of this section in any State with a program approved pursuant to subsection (b) of this section. The Administrator may distinguish among classes, types, and sizes within any category of point sources.

(g) Any permit issued under this section for the discharge of pollutants into the navigable waters from a vessel or other floating craft shall be subject to any applicable regulations promulgated by the Secretary of the Department in which the Coast Guard is operating, establishing specifications for safe transportation, handling, carriage, storage, and stowage of pollutants.

(h) In the event any condition of a permit for discharges from a treatment works (as defined in section 212 of this Act) which is publicly owned is violated, a State with a program approved under subsection (b) of this section or the Administrator, where no State program is approved or where the Administrator determines pursuant to section 309(a) of this Act that a State with an approved program has not commenced appropriate enforcement action with respect to such permit, may proceed in a court of competent jurisdiction to restrict or prohibit the introduction of any pollutant into such treatment works by a source not utilizing such treatment works prior to the finding that such condition was violated.

(i) Nothing in this section shall be construed to limit the authority of the Administrator to take action pursuant to section 309 of this Act.

(j) A copy of each permit application and each permit issued under this section shall be available to the public. Such permit application or permit, or portion thereof, shall further be available on request for the purpose of reproduction.

(k) Compliance with a permit issued pursuant to this section shall be deemed compliance, for purposes of sections 309 and 505, with sections 301, 302, 306, 307, and 403, except any standard imposed under section 307 for a toxic pollutant injurious to human health. Until December 31, 1974, in any case where a permit for discharge has been applied for pursuant to this section, but final administrative disposition of such application has not been made, such discharge shall not be a violation of (1) section 301, 306, or 402 of this Act, or (2) section 13 of the Act of March 3, 1899, unless the Administrator or other plaintiff proves that final administrative disposition of such application has not been made because of the failure of the applicant to furnish information reasonably required or requested in order to process the application. For the 180-day period beginning on the date of enactment of the Federal Water Pollution Control Act Amendments of 1972, in the case of any point source discharging any pollutant or combination of pollutants immediately prior to such date of enactment which source is not subject to section 13 of the Act of March 3, 1899, the dis-

charge by such source shall not be a violation of this Act if such a source applies for a permit for discharge pursuant to this section within such 180-day period.

(l) LIMITATION ON PERMIT REQUIREMENT.—

(1) AGRICULTURAL RETURN FLOWS.—The Administrator shall not require a permit under this section for discharges composed entirely of return flows from irrigated agriculture, nor shall the Administrator directly or indirectly, require any State to require such a permit.

(2) STORMWATER RUNOFF FROM OIL, GAS, AND MINING OPERATIONS.—The Administrator shall not require a permit under this section, nor shall the Administrator directly or indirectly require any State to require a permit, for discharges of stormwater runoff from mining operations or oil and gas exploration, production, processing, or treatment operations or transmission facilities, composed entirely of flows which are from conveyances or systems of conveyances (including but not limited to pipes, conduits, ditches, and channels) used for collecting and conveying precipitation runoff and which are not contaminated by contact with, or do not come into contact with, any overburden, raw material, intermediate products, finished product, byproduct, or waste products located on the site of such operations.

(m) ADDITIONAL PRETREATMENT OF CONVENTIONAL POLLUTANTS NOT REQUIRED.—To the extent a treatment works (as defined in section 212 of this Act) which is publicly owned is not meeting the requirements of a permit issued under this section for such treatment works as a result of inadequate design or operation of such treatment works, the Administrator, in issuing a permit under this section, shall not require pretreatment by a person introducing conventional pollutants identified pursuant to a section 304(a)(4) of this Act into such treatment works other than pretreatment required to assure compliance with pretreatment standards under subsection (b)(8) of this section and section 307(b)(1) of this Act. Nothing in this subsection shall affect the Administrator's authority under sections 307 and 309 of this Act, affect State and local authority under sections 307(b)(4) and 510 of this Act, relieve such treatment works of its obligations to meet requirements established under this Act, or otherwise preclude such works from pursuing whatever feasible options are available to meet its responsibility to comply with its permit under this section.

(n) PARTIAL PERMIT PROGRAM.—

(1) STATE SUBMISSION.—The Governor of a State may submit under subsection (b) of this section a permit program for a portion of the discharges into the navigable waters in such State.

(2) MINIMUM COVERAGE.—A partial permit program under this subsection shall cover, at a minimum, administration of a major category of the discharges into the navigable waters of the State or a major component of the permit program required by subsection (b).

(3) APPROVAL OF MAJOR CATEGORY PARTIAL PERMIT PROGRAMS.—The Administrator may approve a partial permit program covering administration of a major category of discharges under this subsection if—

(A) such program represents a complete permit program and covers all of the discharges under the jurisdiction of a department or agency of the State; and

(B) the Administrator determines that the partial program represents a significant and identifiable part of the State program required by subsection (b).

(4) APPROVAL OF MAJOR COMPONENT PARTIAL PERMIT PROGRAMS.—The Administrator may approve under this subsection a partial and phased permit program covering administration of a major component (including discharge categories) of a State permit program required by subsection (b) if—

(A) the Administrator determines that the partial program represents a significant and identifiable part of the State program required by subsection (b); and

(B) the State submits, and the Administrator approves, a plan for the State to assume administration by phases of the remainder of the State program required by subsection (b) by a specified date not more than 5 years after submission of the partial program under this subsection and agrees to make all reasonable efforts to assume such administration by such date.

(o) ANTI-BACKSLIDING.—

(1) GENERAL PROHIBITION.—In the case of effluent limitations established on the basis of subsection (a)(1)(B) of this section, a permit may not be renewed, reissued, or modified on the basis of effluent guidelines promulgated under section 304(b) subsequent to the original issuance of such permit, to contain effluent limitations which are less stringent than the comparable effluent limitations in the previous permit. In the case of effluent limitations established on the basis of section 301(b)(1)(C) or section 303(d) or (e), a permit may not be renewed, reissued, or modified to contain effluent limitations which are less stringent than the comparable effluent limitations in the previous permit except in compliance with section 303(d)(4).

(2) EXCEPTIONS.—A permit with respect to which paragraph (1) applies may be renewed, reissued, or modified to contain a less stringent effluent limitation applicable to a pollutant if—

(A) material and substantial alterations or additions to the permitted facility occurred after permit issuance which justify the application of a less stringent effluent limitation;

(B)(i) information is available which was not available at the time of permit issuance (other than revised regulations, guidance, or test methods) and which would have justified the application of a less stringent effluent limitation at the time of permit issuance; or

(ii) the Administrator determines that technical mistakes or mistaken interpretations of law were made in issuing the permit under subsection (a)(1)(B);

(C) a less stringent effluent limitation is necessary because of events over which the permittee has no control and for which there is no reasonably available remedy;

(D) the permittee has received a permit modification under section 301(c), 301(g), 301(h), 301(i), 301(k), 301(n), or 316(a); or

(E) the permittee has installed the treatment facilities required to meet the effluent limitations in the previous permit and has properly operated and maintained the facilities but has nevertheless been unable to achieve the previous effluent limitations, in which case the limitations in the reviewed, reissued, or modified permit may reflect the level of pollutant control actually achieved (but shall not be less stringent than required by effluent guidelines in effect at the time of permit renewal, reissuance, or modification).

Subparagraph (B) shall not apply to any revised waste load allocations or any alternative grounds for translating water quality standards into effluent limitations, except where the cumulative effect of such revised allocations results in a decrease in the amount of pollutants discharged into the concerned waters, and such revised allocations are not the result of a discharger eliminating or substantially reducing its discharge of pollutants due to complying with the requirements of this Act or for reasons otherwise unrelated to water quality.

(3) LIMITATIONS.—In no event may a permit with respect to which paragraph (1) applies be renewed, reissued, or modified to contain an effluent limitation which is less stringent than required by effluent guidelines in effect at the time the permit is renewed, reissued, or modified. In no event may such a permit to discharge into waters be renewed, reissued, or modified to contain a less stringent effluent limitation if the implementation of such limitation would result in a violation of a water quality standard under section 303 applicable to such waters.

(p) MUNICIPAL AND INDUSTRIAL STORMWATER DISCHARGES.—

(1) GENERAL RULE.—Prior to October 1, 1994, the Administrator or the State (in the case of a permit program approved under section 402 of this Act) shall not require a permit under this section for discharges composed entirely of stormwater.

(2) EXCEPTIONS.—Paragraph (1) shall not apply with respect to the following stormwater discharges:

(A) A discharge with respect to which a permit has been issued under this section before the date of the enactment of this subsection.

(B) A discharge associated with industrial activity.

(C) A discharge from a municipal separate storm sewer system serving a population of 250,000 or more.

(D) A discharge from a municipal separate storm sewer system serving a population of 100,000 or more but less than 250,000.

(E) A discharge for which the Administrator or the State, as the case may be, determines that the stormwater discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the United States.

(3) PERMIT REQUIREMENTS.—

(A) INDUSTRIAL DISCHARGES.—Permits for discharges associated with industrial activity shall meet all applicable provisions of this section and section 301.

(B) MUNICIPAL DISCHARGE.—Permits for discharges from municipal storm sewers—

(i) may be issued on a system- or jurisdiction-wide basis;

(ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and

(iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.

(4) PERMIT APPLICATION REQUIREMENTS.—

(A) INDUSTRIAL AND LARGE MUNICIPAL DISCHARGES.—Not later than 2 years after the date of the enactment of this subsection, the Administrator shall establish regulations setting forth the permit application requirements for stormwater discharges described in paragraphs (2)(B) and (2)(C). Applications for permits for such discharges shall be filed no later than 3 years after such date of enactment. Not later than 4 year after such date of enactment the Administrator or the State, as the case may be, shall issue or deny each such permit. Any such permit shall provide for compliance as expeditiously as practicable, but in no event later than 3 years after the date of issuance of such permit.

(B) OTHER MUNICIPAL DISCHARGES.—Not later than 4 years after the date of the enactment of this subsection, the Administrator shall establish regulations setting forth the permit application requirements for stormwater discharges described in paragraph (2)(D). Applications for permits for such discharges shall be filed no later than 5 years after such date of enactment. Not later than 6 years after such date of enactment, the Administrator or the State, as the case may be, shall issue or deny each such permit. Any such permit shall provide for compliance as expeditiously as practicable, but in no event later than 3 years after the date of issuance of such permit.

(5) STUDIES.—The Administrator, in consultation with the States, shall conduct a study for the purposes of—

(A) identifying those stormwater discharges or classes of stormwater discharges for which permits are not required pursuant to paragraphs (1) and (2) of this subsection;

(B) determining, to the maximum extent practicable, the nature and extent of pollutants in such discharges; and

(C) establishing procedures and methods to control stormwater discharges to the extent necessary to mitigate impacts on water quality.

Not later than October 1, 1988, the Administrator shall submit to Congress a report on the results of the study described in

subparagraphs (A) and (B). Not later than October 1, 1989, the Administrator shall submit to Congress a report on the results of the study described in subparagraph (C).

(6) REGULATIONS.—Not later than October 1, 1993, the Administrator, in consultation with State and local officials, shall issue regulations (based on the results of the studies conducted under paragraph (5)) which designate stormwater discharges, other than those discharges described in paragraph (2), to be regulated to protect water quality and shall establish a comprehensive program to regulate such designated sources. The program shall, at a minimum, (A) establish priorities, (B) establish requirements for State stormwater management programs, and (C) establish expeditious deadlines. The program may include performance standards, guidelines, guidance, and management practices and treatment requirements, as appropriate.

(q) COMBINED SEWER OVERFLOWS.—

(1) REQUIREMENT FOR PERMITS, ORDERS, AND DECREES.—Each permit, order, or decree issued pursuant to this Act after the date of enactment of this subsection for a discharge from a municipal combined storm and sanitary sewer shall conform to the Combined Sewer Overflow Control Policy signed by the Administrator on April 11, 1994 (in this subsection referred to as the "CSO control policy").

(2) WATER QUALITY AND DESIGNATED USE REVIEW GUIDANCE.—Not later than July 31, 2001, and after providing notice and opportunity for public comment, the Administrator shall issue guidance to facilitate the conduct of water quality and designated use reviews for municipal combined sewer overflow receiving waters.

(3) REPORT.—Not later than September 1, 2001, the Administrator shall transmit to Congress a report on the progress made by the Environmental Protection Agency, States, and municipalities in implementing and enforcing the CSO control policy.

(33 U.S.C. 1342)

OCEAN DISCHARGE CRITERIA

SEC. 403. (a) No permit under section 402 of this Act for a discharge into the territorial sea, the waters of the contiguous zone, or the oceans shall be issued, after promulgation of guidelines established under subsection (c) of this section, except in compliance with such guidelines. Prior to the promulgation of such guidelines, a permit may be issued under such section 402 if the Administrator determines it to be in the public interest.

(b) The requirements of subsection (d) of section 402 of this Act may not be waived in the case of permits for discharges into the territorial sea.

(c)(1) The Administrator shall, within one hundred and eighty days after enactment of this Act (and from time to time thereafter), promulgate guidelines for determining the degradation of the waters of the territorial seas, the contiguous zone, and the oceans, which shall include:

(A) the effect of disposal of pollutants on human health or welfare, including but not limited to plankton, fish, shellfish, wildlife, shorelines, and beaches;

(B) the effect of disposal of pollutants on marine life including the transfer, concentration, and dispersal of pollutants or their byproducts through biological, physical, and chemical processes; changes in marine ecosystem diversity, productivity, and stability; and species and community population changes;

(C) the effect of disposal, of pollutants on esthetic, recreation, and economic values;

(D) the persistence and permanence of the effects of disposal of pollutants;

(E) the effect of the disposal at varying rates, of particular volumes and concentrations of pollutants;

(F) other possible locations and methods of disposal or recycling of pollutants including land-based alternatives; and

(G) the effect on alternate uses of the oceans, such as mineral exploitation and scientific study.

(2) In any event where insufficient information exists on any proposed discharge to make a reasonable judgment on any of the guidelines established pursuant to this subsection no permit shall be issued under section 402 of this Act.

(33 U.S.C. 1343)

PERMITS FOR DREDGED OR FILL MATERIAL

SEC. 404. (a) The Secretary may issue permits, after notice and opportunity for public hearings for the discharge of dredged or fill material into the navigable waters at specified disposal sites. Not later than the fifteenth day after the date an applicant submits all the information required to complete an application for a permit under this subsection, the Secretary shall publish the notice required by this subsection.

(b) Subject to subsection (c) of this section, each such disposal site shall be specified for each such permit by the Secretary (1) through the application of guidelines developed by the Administrator, in conjunction with the Secretary which guidelines shall be based upon criteria comparable to the criteria applicable to the territorial seas, the contiguous zone, and the ocean under section 403(c), and (2) in any case where such guidelines under clause (1) alone would prohibit the specification of a site, through the application additionally of the economic impact of the site on navigation and anchorage.

(c) The Administrator is authorized to prohibit the specification (including the withdrawal of specification) of any defined area as a disposal site, and he is authorized to deny or restrict the use of any defined area for specification (including the withdrawal of specification) as a disposal site, whenever he determines, after notice and opportunity for public hearings, that the discharge of such materials into such area will have an unacceptable adverse effect on municipal water supplies, shellfish beds and fishery areas (including spawning and breeding areas), wildlife, or recreational areas. Before making such determination, the Administrator shall consult with the Secretary. The Administrator shall set forth in writing

and make public his findings and his reasons for making any determination under this subsection.

(d) The term "Secretary" as used in this section means the Secretary of the Army, acting through the Chief of Engineers.

(e)(1) In carrying out his functions relating to the discharge of dredged or fill material under this section, the Secretary may, after notice and opportunity for public hearing, issue general permits on a State, regional, or nationwide basis for any category of activities involving discharges of dredged or fill material if the Secretary determines that the activities in such category are similar in nature, will cause only minimal adverse environmental effects when performed separately, and will have only minimal cumulative adverse effect on the environment. Any general permit issued under this subsection shall (A) be based on the guidelines described in subsection (b)(1) of this section, and (B) set forth the requirements and standards which shall apply to any activity authorized by such general permit.

(2) No general permit issued under this subsection shall be for a period of more than five years after the date of its issuance and such general permit may be revoked or modified by the Secretary if, after opportunity for public hearing, the Secretary determines that the activities authorized by such general permit have an adverse impact on the environment or such activities are more appropriately authorized by individual permits.

(f)(1) Except as provided in paragraph (2) of this subsection, the discharge of dredge or fill material—

(A) from normal farming, silviculture, and ranching activities such as plowing, seeding, cultivating, minor drainage, harvesting for the production of food, fiber, and forest products, or upland soil and water conservation practices;

(B) for the purpose of maintenance, including emergency reconstruction of recently damaged parts, of currently serviceable structures such as dikes, dams, levees, groins, riprap, breakwaters, causeways, and bridge abutments or approaches, and transportation structures;

(C) for the purpose of construction or maintenance of farm or stock ponds or irrigation ditches, or the maintenance of drainage ditches;

(D) for the purpose of construction of temporary sedimentation basins on a construction site which does not include placement of fill material into the navigable waters;

(E) for the purpose of construction or maintenance of farm roads or forest roads, or temporary roads for moving mining equipment, where such roads are constructed and maintained, in accordance with best management practices, to assure that flow and circulation patterns and chemical and biological characteristics of the navigable waters are not impaired, that the reach of the navigable waters is not reduced, and that any adverse effect on the aquatic environment will be otherwise minimized;

(F) resulting from any activity with respect to which a State has an approved program under section 208(b)(4) which meets the requirements of subparagraphs (B) and (C) of such section,

is not prohibited by or otherwise subject to regulation under this section or section 301(a) or 402 of this Act (except for effluent standards or prohibitions under section 307).

(2) Any discharge of dredged or fill material into the navigable waters incidental to any activity having as its purpose bringing an area of the navigable waters into a use to which it was not previously subject, where the flow or circulation of navigable waters may be impaired or the reach of such waters be reduced, shall be required to have a permit under this section.

(g)(1) The Governor of any State desiring to administer its own individual and general permit program for the discharge of dredged or fill material into the navigable waters (other than those waters which are presently used, or are susceptible to use in their natural condition or by reasonable improvement as a means to transport interstate or foreign commerce shoreward to their ordinary high water mark, including all waters which are subject to the ebb and flow of the tide shoreward to their mean high water mark, or mean higher high water mark on the west coast, including wetlands adjacent thereto), within its jurisdiction may submit to the Administrator a full and complete description of the program it proposes to establish and administer under State law or under an interstate compact. In addition, such State shall submit a statement from the attorney general (or the attorney for those State agencies which have independent legal counsel), or from the chief legal officer in the case of an interstate agency, that the laws of such State, or the interstate compact, as the case may be, provide adequate authority to carry out the described program.

(2) Not later than the tenth day after the date of the receipt of the program, and statement submitted by any State under paragraph (1) of this subsection, the Administrator shall provide copies of such program and statement to the Secretary and the Secretary of the Interior, acting through the Director of the United States Fish and Wildlife Service.

(3) Not later than the ninetieth day after the date of the receipt by the Administrator of the program and statement submitted by any State, under paragraph (1) of this subsection, the Secretary and the Secretary of the Interior, acting through the Director of the United States Fish and Wildlife Service, shall submit any comments with respect to such program and statement to the Administrator in writing.

(h)(1) Not later than the one-hundred-twentieth day after the date of the receipt by the Administrator of a program and statement submitted by any State under paragraph (1) of this subsection, the Administrator shall determine, taking into account any comments submitted by the Secretary and the Secretary of the Interior, acting through the Director of the United States Fish and Wildlife Service, pursuant to subsection (g) of this section, whether such State has the following authority with respect to the issuance of permits pursuant to such program:

(A) To issue permits which—

(i) apply, and assure compliance with, any applicable requirements of this section, including, but not limited to, the guidelines established under subsection (b)(1) of this section, and sections 307 and 403 of this Act;

(ii) are for fixed terms not exceeding five years; and

(iii) can be terminated or modified for cause including, but not limited to, the following:

(I) violation of any condition of the permit;

(II) obtaining a permit by misrepresentation, or failure to disclose fully all relevant facts;

(III) change in any condition that requires either a temporary or permanent reduction or elimination of the permitted discharge.

(B) To issue permits which apply, and assure compliance with, all applicable requirements of section 308 of this Act, or to inspect, monitor, enter, and requrie reports to at least the same extent as required in section 308 of this Act.

(C) To assure that the public, and any other State the waters of which may be affected, receive notice of each application for a permit and to provide an opportunity for public hearing before a ruling on each such application.

(D) To assure that the Administrator receives notice of each application (including a copy thereof) for a permit.

(E) To assure that any State (other than the permitting State), whose waters may be affected by the issuance of a permit may submit written recommendation to the permitting State (and the Administrator) with respect to any permit application and, if any part of such written recommendations are not accepted by the permitting State, that the permitting State will notify such affected State (and the Administrator) in writing of its failure to so accept such recommendations together with its reasons for so doing.

(F) To assure that no permit will be issued if, in the judgment of the Secretary, after consultation with the Secretary of the department in which the Coast Guard is operating, anchorage and navigation of any of the navigable waters would be substantially impaired thereby.

(G) To abate violations of the permit or the permit program, including civil and criminal penalties and other ways and means of enforcement.

(H) To assure continued coordination with Federal and Federal-State water-related planning and review processes.

(2) If, with respect to a State program submitted under subsection (g)(1) of this section, the Administrator determines that such State—

(A) has the authority set forth in paragraph (1) of this subsection, the Administrator shall approve the program and so notify (i) such State, and (ii) the Secretary, who upon subsequent notification from such State that it is administering such program, shall suspend the issuance of permits under subsection (a) and (e) of this section for activities with respect to which a permit may be issued pursuant to such State program; or

(B) does not have the authority set forth in paragraph (1) of this subsection, the Administrator shall so notify such State, which notification shall also describe the revisions or modifications necessary so that such State may resubmit such program for a determination by the Administrator under this subsection.

(3) If the Administrator fails to make a determination with respect to any program submitted by a State under subsection (g)(1) of this section within one-hundred-twenty days after the date of the receipt of such program, such program shall be deemed approved pursuant to paragraph (2)(A) of this subsection and the Administrator shall so notify such State and the Secretary who, upon subsequent notification from such State that it is administering such program, shall suspend the issuance of permits under subsection (a) and (e) of this section for activities with respect to which a permit may be issued by such State.

(4) After the Secretary receives notification from the Administrator under paragraph (2) or (3) of this subsection that a State permit program has been approved, the Secretary shall transfer any applications for permits pending before the Secretary for activities with respect to which a permit may be issued pursuant to such State program to such State for appropriate action.

(5) Upon notification from a State with a permit program approved under this subsection that such State intends to administer and enforce the terms and conditions of a general permit issed by the Secretary under subsection (e) of this section with respect to activities in such State to which such general permit applies, the Secretary shall suspend the administration and enforcement of such general permit with respect to such activities.

(i) Whenever the Administrator determines after public hearing that a State is not administering a program approved under section (h)(2)(A) of this section, in accordance with this section, including, but not limited to, the guidelines established under subsection (b)(1) of this section, the Administrator shall so notify the State, and, if appropriate corrective action is not taken within a reasonable time, not to exceed ninety days after the date of the receipt of such notification, the Administrator shall (1) withdraw approval of such program until the Administrator determines such corrective action has been taken, and (2) notify the Secretary that the Secretary shall resume the program for the issuance of permits under subsections (a) and (e) of this section for activities with respect to which the State was issuing permits and that such authority of the Secretary shall continue in effect until such time as the Administrator makes the determination described in clause (1) of this subsection and such State again has an approved program.

(j) Each State which is administering a permit program pursuant to this section shall transmit to the Administrator (1) a copy of each permit application received by such State and provide notice to the Administrator of every action related to the consideration of such permit application, including each permit proposed to be issued by such State, and (2) a copy of each proposed general permit which such State intends to issue. Not later than the tenth day after the date of the receipt of such permit application or such proposed general permit, the Administrator shall provide copies of such permit application or such proposed general permit to the Secretary and the Secretary of the Interior, acting through the Director of the United States Fish and Wildlife Service. If the Administrator intends to provide written comments to such State with respect to such permit application or such proposed general permit, he shall so notify such State not later than the thirtieth day after the date of the receipt of such application or such proposed general

permit and provide such written comments to such State, after consideration of any comments made in writing with respect to such application or such proposed general permit by the Secretary and the Secretary of the Interior, acting through the Director of the United States Fish and Wildlife Service, not later than the ninetieth day after the date of such receipt. If such State is so notified by the Administrator, it shall not issue the proposed permit until after the receipt of such comments from the Administrator, or after such ninetieth day, whichever first occurs. Such State shall not issue such proposed permit after such ninetieth day if it has received such written comments in which the Administrator objects (A) to the issuance of such proposed permit and such proposed permit is one that has been submitted to the Administrator pursuant to subsection (h)(1)(E), or (B) to the issuance of such proposed permit as being outside the requirements of this section, including, but not limited to, the guidelines developed under subsection (b)(1) of this section unless it modifies such proposed permit in accordance with such comments. Whenever the Administrator objects to the issuance of a permit under the preceding sentence such written objection shall contain a statement of the reasons for such objection and the conditions which such permit would include if it were issued by the Administrator. In any case where the Administrator objects to the issuance of a permit, on request of the State, a public hearing shall be held by the Administrator on such objection. If the State does not resubmit such permit revised to meet such objection within 30 days after completion of the hearing or, if no hearing is requested within 90 days after the date of such objection, the Secretary may issue the permit pursuant to subsection (a) or (e) of this section, as the case may be, for such source in accordance with the guidelines and requirements of this Act.

(k) In accordance with guidelines promulgated pursuant to subsection (i)(2) of section 304 of this Act, the Administrator is authorized to waive the requirements of subsection (j) of this section at the time of the approval of a program pursuant to subsection (h)(2)(A) of this section for any category (including any class, type, or size within such category) of discharge within the State submitting such program.

(l) The Administrator shall promulgate regulations establishing categories of discharges which he determines shall not be subject to the requirements of subsection (j) of this section in any State with a program approved pursuant to subsection (h)(2)(A) of this section. The Administrator may distinguish among classes, types, and sizes within any category of discharges.

(m) Not later than the ninetieth day after the date on which the Secretary notifies the Secretary of the Interior, acting through the Director of the United States Fish and Wildlife Service that (1) an application for a permit under subsection (a) of this section has been received by the Secretary, or (2) the Secretary proposes to issue a general permit under subsection (e) of this section, the Secretary of the Interior, acting through the Director of the United States Fish and Wildlife Service, shall submit any comments with respect to such application or such proposed general permit in writing to the Secretary.

(n) Nothing in this section shall be construed to limit the authority of the Administrator to take action pursuant to section 309 of this Act.

(o) A copy of each permit application and each permit issued under this section shall be available to the public. Such permit application or portion thereof, shall further be available on request for the purpose of reproduction.

(p) Compliance with a permit issued pursuant to this section, including any activity carried out pursuant to a general permit issued under this section, shall be deemed compliance, for purposes of sections 309 and 505, with sections 301, 307, and 403.

(q) Not later than the one-hundred-eightieth day after the date of enactment of this subsection, the Secretary shall enter into agreements with the Administrator, the Secretaries of the Departments of Agriculture, Commerce, Interior, and Transportation, and the heads of other appropriate Federal agencies to minimize, to the maximum extent practicable, duplication, needless paperwork, and delays in the issuance of permits under this section. Such agreements shall be developed to assure that, to the maximum extent practicable, a decision with respect to an application for a permit under subsection (a) of this section will be made not later than the ninetieth day after the date the notice of such application is published under subsection (a) of this section.

(r) The discharge of dredged or fill material as part of the construction of a Federal project specifically authorized by Congress, whether prior to or on or after the date of enactment of this subsection, is not prohibited by or otherwise subject to regulation under this section, or a State program approved under this section, or section 301(a) or 402 of the Act (except for effluent standards or prohibitions under section 307), if information on the effects of such discharge, including consideration of the guidelines developed under subsection (b)(1) of this section, is included in an environmental impact statement for such project pursuant to the National Environmental Policy Act of 1969 and such environmental impact statement has been submitted to Congress before the actual discharge of dredged or fill material in connection with the construction of such project and prior to either authorization of such project or an appropriation of funds for each construction.

(s)(1) Whenever on the basis of any information available to him the Secretary finds that any person is in violation of any condition or limitation set forth in a permit issued by the Secretary under this section, the Secretary shall issue an order requiring such persons to comply with such condition or limitation, or the Secretary shall bring a civil action in accordance with paragraph (3) of this subsection.

(2) A copy of any order issued under this subsection shall be sent immediately by the Secretary to the State in which the violation occurs and other affected States. Any order issued under this subsection shall be by personal service and shall state with reasonable specificity the nature of the violation, specify a time for compliance, not to exceed thirty days, which the Secretary determines is reasonable, taking into account the seriousness of the violation and any good faith efforts to comply with applicable requirements. In any case in which an order under this subsection is issued to

a corporation, a copy of such order shall be served on any appropriate corporate officers.

(3) The Secretary is authorized to commence a civil action for appropriate relief, including a permanent or temporary injunction for any violation for which he is authorized to issue a compliance order under paragraph (1) of this subsection. Any action under this paragraph may be brought in the district court of the United States for the district in which the defendant is located or resides or is doing business, and such court shall have jurisdiction to restrain such violation and to require compliance. Notice of the commencement of such acton [1] shall be given immediately to the appropriate State.

(4) Any person who violates any condition or limitation in a permit issued by the Secretary under this section, and any person who violates any order issued by the Secretary under paragraph (1) of this subsection, shall be subject to a civil penalty not to exceed $25,000 per day for each violation. In determining the amount of a civil penalty the court shall consider the seriousness of the violation or violations, the economic benefit (if any) resulting from the violaltion, any history of such violations, any good-faith efforts to comply with the applicable requirements, the economic impact of the penalty on the violator, and such other matters as justice may require.

(t) Nothing in the section shall preclude or deny the right of any State or interstate agency to control the discharge of dredged or fill material in any portion of the navigable waters within the jurisdiction of such State, including any activity of any Federal agency, and each such agency shall comply with such State or interstate requirements both substantive and procedural to control the discharge of dredged or fill material to the same extent that any person is subject to such requirements. This section shall not be construed as affecting or impairing the authority of the Secretary to maintain navigation.

(33 U.S.C. 1344)

DISPOSAL OF SEWAGE SLUDGE

SEC. 405. (a) Notwithstanding any other provision of this Act or of any other law, in the case where the disposal of sewage sludge resulting from the operation of a treatment works as defined in section 212 of this Act (including the removal of in-place sewage sludge from one location and its deposit at another location) would result in any pollutant from such sewage sludge entering the navigable waters, such disposal is prohibited except in accordance with a permit issued by the Administrator under section 402 of this Act.

(b) The Administrator shall issue regulations governing the issuance of permits for the disposal of sewage sludge subject to subsection (a) of this section and section 402 of this Act. Such regulations shall require the application to such disposal of each criterion, factor, procedure, and requirement applicable to a permit issued under section 402 of this title.

(c) Each State desiring to administer its own permit program for disposal of sewage sludge subject to subsection (a) of this sec-

[1] So in law. Probably should be "action".

tion within its jurisdiction may do so in accordance with section 402 of this Act.

(d) REGULATIONS.—

(1) REGULATIONS.—The Administrator, after consultation with appropriate Federal and State agencies and other interested persons, shall develop and publish, within one year after the date of enactment of this subsection and from time to time thereafter, regulations poroviding guidelines for the disposal of sludge and the utilization of sludge for various purposes. Such regulations shall—

(A) identify uses for sludge, including disposal;

(B) specify factors to be taken into account in determining the measures and practices applicable to each such use or disposal (including publication of information on costs);

(C) identify concentrations of pollutants which interfere with each such use or disposal.

The Administrator is authorized to revise any regulation issued under this subsection.

(2) IDENTIFICATION AND REGULATION OF TOXIC POLLUTANTS.—

(A) ON BASIS OF AVAILABLE INFORMATION.—

(i) PROPOSED REGULATIONS.—Not later than November 30, 1986, the Administrator shall identify those toxic pollutants which, on the basis of available information on their toxicity, persistence, concentration, mobility, or potential for exposure, may be present in sewage sludge in concentrations which may adversely affect public health or the environment, and propose regulations specifying acceptable management practices for sewage sludge containing each such toxic pollutant and establishing numerical limitations for each such pollutant for each use identified under paragraph (1)(A).

(ii) FINAL REGULATIONS.—Not later than August 31, 1987, and after opportunity for public hearing, the Administrator shall promulgate the regulations required by subparagraph (A)(i).

(B) OTHERS.—

(i) PROPOSED REGULATIONS.—Not later than July 31, 1987, the Administrator shall identify those toxic pollutants not identified under subparagraph (A)(i) which may be present in sewage sludge in concentrations which may adversely affect public health or the environment, and propose regulations specifying acceptable management practices for sewage sludge containing each such toxic pollutant and establishing numerical limitations for each pollutant for each such use identified under paragraph (1)(A).

(ii) FINAL REGULATIONS.—Not later than June 15, 1988, the Administrator shall promulate the regulations required by subparagraph (B)(i).

(C) REVIEW.—From time to time, but not less often than every 2 years, the Administrator shall review the regulations promulgated under this paragraph for the purpose

of identifying additional toxic pollutants and promulgating regulations for such pollutants consistent with the requirements of this paragraph.

(D) MINIMUM STANDARDS; COMPLIANCE DATE.—The management practices and numerical criteria established under subparagraphs (A), (B), and (C) shall be adequate to protect public health and the environment from any reasonably anticipated adverse effects of each pollutant. Such regulations shall require compliance as expeditiously as practicable but in no case later than 12 months after their publication, unless such regulations require the construction of new pollution control facilities, in which case the regulations shall require compliance as expeditiously as practicable but in no case later than two years from the date of their publication.

(3) ALTERNATIVE STANDARDS.—For purposes of this subsection, if, in the judgment of the Administrator, it is not feasible to prescribe or enforce a numerical limitation for a pollutant identified under paragraph (2), the Administrator may instead promulgate a design, equipment, management practice, or operational standard, or combination thereof, which in the Administrator's judgment is adequate to protect public health and the environment from any reasonably anticipated adverse effects of such pollutant. In the event the Administrator promulgates a design or equipment standard under this subsection, the Administrator shall include as part of such standard such requirements as will assure the proper operation and maintenance of any such element of design or equipment.

(4) CONDITIONS ON PERMITS.—Prior to the promulgation of the regulations required by paragraph (2), the Administrator shall impose conditions in permits issued to publicly owned treatment works under section 402 of this Act or take such other measures as the Administrator deems appropriate to protect public health and the environment from any adverse effects which may occur from toxic pollutants in sewage sludge.

(5) LIMITATION ON STATUTORY CONSTRUCTION.—Nothing in this section is intended to waive more stringent requirements established by this Act or any other law.

(e) MANNER OF SLUDGE DISPOSAL.—The determination of the manner of disposal or use of sludge is a local determination, except that it shall be unlawful for any person to dispose of sludge from a publicly owned treatment works or any other treatment works treating domestic sewage for any use for which regulations have been established pursuant to subsection (d) of this section, except in accordance with such regulations.

(f) IMPLEMENTATION OF REGULATIONS.—

(1) THROUGH SECTION 402 PERMITS.—Any permit issued under section 402 of this Act to a publicly owned treatment works or any other treatment works treating domestic sewage shall include requirements for the use and disposal of sludge that implement the regulations established pursuant to subsection (d) of this section, unless such requirements have been included in a permit issued under the appropriate provisions of subtitle C of the Solid Waste Disposal Act, part C of the Safe Drinking Water Act, the Marine Protection, Research, and

Sanctuaries Act of 1972, or the Clean Air Act, or under State permit programs approved by the Administrator, where the Administrator determines that such programs assure compliance with any applicable requirements of this section. Not later than December 15, 1986, the Administrator shall promulgate procedures for approval of State programs pursuant to this paragraph.

(2) THROUGH OTHER PERMITS.—In the case of a treatment works described in paragraph (1) that is not subject to section 402 of this Act and to which none of the other above listed permit programs nor approved State permit authority apply, the Administrator may issue a permit to such treatment works solely to impose requirements for the use and disposal of sludge that implement the regulations established pursuant to subsection (d) of this section. The Administrator shall include in the permit appropriate requirements to assure compliance with the regulations established pursuant to subsection (d) of this section. The Administrator shall establish procedures for issuing permits pursuant to this paragraph.

(g) STUDIES AND PROJECTS.—

(1) GRANT PROGRAM; INFORMATION GATHERING.—The Administrator is authorized to conduct or initiate scientific studies, demonstration projects, and public information and education projects which are designed to promote the safe and beneficial management or use of sewage sludge for such purposes as aiding the restoration of abandoned mine sites, conditioning soil for parks and recreation areas, agricultural and horticultural uses, and other beneficial purposes. For the purposes of carrying out this subsection, the Administrator may make grants to State water pollution control agencies, other public or nonprofit agencies, institutions, organizations, and individuals. In cooperation with other Federal departments and agencies, other public and private agencies, institutions, and organizations, the Administrator is authorized to collect and disseminate information pertaining to the safe and beneficial use of sewage sludge.

(2) AUTHORIZATION OF APPROPRIATIONS.—For the purposes of carrying out the scientific studies, demonstration projects, and public information and education projects authorized in this section, there is authorized to be appropriated for fiscal years beginning after September 30, 1986, not to exceed $5,000,000.

(33 U.S.C. 1345)

SEC. 406. COASTAL RECREATION WATER QUALITY MONITORING AND NOTIFICATION.

(a) MONITORING AND NOTIFICATION.—

(1) IN GENERAL.—Not later than 18 months after the date of the enactment of this section, after consultation and in cooperation with appropriate Federal, State, tribal, and local officials (including local health officials), and after providing public notice and an opportunity for comment, the Administrator shall publish performance criteria for—

(A) monitoring and assessment (including specifying available methods for monitoring) of coastal recreation wa-

ters adjacent to beaches or similar points of access that are used by the public for attainment of applicable water quality standards for pathogens and pathogen indicators; and

(B) the prompt notification of the public, local governments, and the Administrator of any exceeding of or likelihood of exceeding applicable water quality standards for coastal recreation waters described in subparagraph (A).

(2) LEVEL OF PROTECTION.—The performance criteria referred to in paragraph (1) shall provide that the activities described in subparagraphs (A) and (B) of that paragraph shall be carried out as necessary for the protection of public health and safety.

(b) PROGRAM DEVELOPMENT AND IMPLEMENTATION GRANTS.—

(1) IN GENERAL.—The Administrator may make grants to States and local governments to develop and implement programs for monitoring and notification for coastal recreation waters adjacent to beaches or similar points of access that are used by the public.

(2) LIMITATIONS.—

(A) IN GENERAL.—The Administrator may award a grant to a State or a local government to implement a monitoring and notification program if—

(i) the program is consistent with the performance criteria published by the Administrator under subsection (a);

(ii) the State or local government prioritizes the use of grant funds for particular coastal recreation waters based on the use of the water and the risk to human health presented by pathogens or pathogen indicators;

(iii) the State or local government makes available to the Administrator the factors used to prioritize the use of funds under clause (ii);

(iv) the State or local government provides a list of discrete areas of coastal recreation waters that are subject to the program for monitoring and notification for which the grant is provided that specifies any coastal recreation waters for which fiscal constraints will prevent consistency with the performance criteria under subsection (a); and

(v) the public is provided an opportunity to review the program through a process that provides for public notice and an opportunity for comment.

(B) GRANTS TO LOCAL GOVERNMENTS.—The Administrator may make a grant to a local government under this subsection for implementation of a monitoring and notification program only if, after the 1-year period beginning on the date of publication of performance criteria under subsection (a)(1), the Administrator determines that the State is not implementing a program that meets the requirements of this subsection, regardless of whether the State has received a grant under this subsection.

(3) OTHER REQUIREMENTS.—

(A) REPORT.—A State recipient of a grant under this subsection shall submit to the Administrator, in such for-

mat and at such intervals as the Administrator determines to be appropriate, a report that describes—

(i) data collected as part of the program for monitoring and notification as described in subsection (c); and

(ii) actions taken to notify the public when water quality standards are exceeded.

(B) DELEGATION.—A State recipient of a grant under this subsection shall identify each local government to which the State has delegated or intends to delegate responsibility for implementing a monitoring and notification program consistent with the performance criteria published under subsection (a) (including any coastal recreation waters for which the authority to implement a monitoring and notification program would be subject to the delegation).

(4) FEDERAL SHARE.—

(A) IN GENERAL.—The Administrator, through grants awarded under this section, may pay up to 100 percent of the costs of developing and implementing a program for monitoring and notification under this subsection.

(B) NON-FEDERAL SHARE.—The non-Federal share of the costs of developing and implementing a monitoring and notification program may be—

(i) in an amount not to exceed 50 percent, as determined by the Administrator in consultation with State, tribal, and local government representatives; and

(ii) provided in cash or in kind.

(c) CONTENT OF STATE AND LOCAL GOVERNMENT PROGRAMS.—As a condition of receipt of a grant under subsection (b), a State or local government program for monitoring and notification under this section shall identify—

(1) lists of coastal recreation waters in the State, including coastal recreation waters adjacent to beaches or similar points of access that are used by the public;

(2) in the case of a State program for monitoring and notification, the process by which the State may delegate to local governments responsibility for implementing the monitoring and notification program;

(3) the frequency and location of monitoring and assessment of coastal recreation waters based on—

(A) the periods of recreational use of the waters;

(B) the nature and extent of use during certain periods;

(C) the proximity of the waters to known point sources and nonpoint sources of pollution; and

(D) any effect of storm events on the waters;

(4)(A) the methods to be used for detecting levels of pathogens and pathogen indicators that are harmful to human health; and

(B) the assessment procedures for identifying short-term increases in pathogens and pathogen indicators that are harmful to human health in coastal recreation waters (including increases in relation to storm events);

(5) measures for prompt communication of the occurrence, nature, location, pollutants involved, and extent of any exceeding of, or likelihood of exceeding, applicable water quality standards for pathogens and pathogen indicators to—

(A) the Administrator, in such form as the Administrator determines to be appropriate; and

(B) a designated official of a local government having jurisdiction over land adjoining the coastal recreation waters for which the failure to meet applicable standards is identified;

(6) measures for the posting of signs at beaches or similar points of access, or functionally equivalent communication measures that are sufficient to give notice to the public that the coastal recreation waters are not meeting or are not expected to meet applicable water quality standards for pathogens and pathogen indicators; and

(7) measures that inform the public of the potential risks associated with water contact activities in the coastal recreation waters that do not meet applicable water quality standards.

(d) FEDERAL AGENCY PROGRAMS.—Not later than 3 years after the date of the enactment of this section, each Federal agency that has jurisdiction over coastal recreation waters adjacent to beaches or similar points of access that are used by the public shall develop and implement, through a process that provides for public notice and an opportunity for comment, a monitoring and notification program for the coastal recreation waters that—

(1) protects the public health and safety;

(2) is consistent with the performance criteria published under subsection (a);

(3) includes a completed report on the information specified in subsection (b)(3)(A), to be submitted to the Administrator; and

(4) addresses the matters specified in subsection (c) .

(e) DATABASE.—The Administrator shall establish, maintain, and make available to the public by electronic and other means a national coastal recreation water pollution occurrence database that provides—

(1) the data reported to the Administrator under subsections (b)(3)(A)(i) and (d)(3); and

(2) other information concerning pathogens and pathogen indicators in coastal recreation waters that—

(A) is made available to the Administrator by a State or local government, from a coastal water quality monitoring program of the State or local government; and

(B) the Administrator determines should be included.

(f) TECHNICAL ASSISTANCE FOR MONITORING FLOATABLE MATERIAL.—The Administrator shall provide technical assistance to States and local governments for the development of assessment and monitoring procedures for floatable material to protect public health and safety in coastal recreation waters.

(g) LIST OF WATERS.—

(1) IN GENERAL.—Beginning not later than 18 months after the date of publication of performance criteria under subsection (a), based on information made available to the Administrator,

the Administrator shall identify, and maintain a list of, discrete coastal recreation waters adjacent to beaches or similar points of access that are used by the public that—

(A) specifies any waters described in this paragraph that are subject to a monitoring and notification program consistent with the performance criteria established under subsection (a); and

(B) specifies any waters described in this paragraph for which there is no monitoring and notification program (including waters for which fiscal constraints will prevent the State or the Administrator from performing monitoring and notification consistent with the performance criteria established under subsection (a)).

(2) AVAILABILITY.—The Administrator shall make the list described in paragraph (1) available to the public through—

(A) publication in the Federal Register; and

(B) electronic media.

(3) UPDATES.—The Administrator shall update the list described in paragraph (1) periodically as new information becomes available.

(h) EPA IMPLEMENTATION.—In the case of a State that has no program for monitoring and notification that is consistent with the performance criteria published under subsection (a) after the last day of the 3-year period beginning on the date on which the Administrator lists waters in the State under subsection (g)(1)(B), the Administrator shall conduct a monitoring and notification program for the listed waters based on a priority ranking established by the Administrator using funds appropriated for grants under subsection (i)—

(1) to conduct monitoring and notification; and

(2) for related salaries, expenses, and travel.

(i) AUTHORIZATION OF APPROPRIATIONS.—There is authorized to be appropriated for making grants under subsection (b), including implementation of monitoring and notification programs by the Administrator under subsection (h), $30,000,000 for each of fiscal years 2001 through 2005.

(33 U.S.C. 1346)

TITLE V—GENERAL PROVISIONS

ADMINISTRATION

SEC. 501. (a) The Administrator is authorized to prescribe such regulations as are necessary to carry out his functions under this Act.

(b) The Administrator, with the consent of the head of any other agency of the United States, may utilize such officers and employees of such agency as may be found necessary to assist in carrying out the purposes of this Act.

(c) Each recipient of financial assistance under this Act shall keep such records as the Administrator shall prescribe, including records which fully disclose the amount and disposition by such recipient of the proceeds of such assistance, the total cost of the project or undertaking in connection with which such assistance is given or used, and the amount of that portion of the cost of the

project or undertaking supplied by other sources, and such other records as will facilitate an effective audit.

(d) The Administrator and the Comptroller General of the United States, or any of their duly authorized representatives, shall have access, for the purpose of audit and examination, to any books, documents, papers, and records of the recipients that are pertinent to the grants received under this Act. For the purpose of carrying out audits and examinations with respect to recipients of Federal assistance under this Act, the Administrator is authorized to enter into noncompetitive procurement contracts with independent State audit organizations, consistent with chapter 75 of title 31, United States Code. Such contracts may only be entered into to the extent and in such amounts as may be provided in advance in appropriation Acts.

(e)(1) It is the purpose of this subsection to authorize a program which will provide official recognition by the United States Government to those industrial organizations and political subdivisions of States which during the preceding year demonstrated an outstanding technological achievement or an innovative process, method, or device in their waste treatment and pollution abatement programs. The Administrator shall, in consultation with the appropriate State water pollution control agencies, establish regulations under which such recognition may be applied for and granted, except that no applicant shall be eligible for an award under this subsection if such applicant is not in total compliance with all applicable water quality requirements under this Act, or otherwise does not have a satisfactory record with respect to environmental quality.

(2) The Administrator shall award a certificate or plaque of suitable design to each industrial organization or political subdivision which qualifies for such recognition under regulations established under this subsection.

(3) The President of the United States, the Governor of the appropriate State, the Speaker of the House of Representatives, and the President pro tempore of the Senate shall be notified of the award by the Administrator and the awarding of such recognition shall be published in the Federal Register.

(f) Upon the request of a State water pollution control agency, personnel of the Environmental Protection Agency may be detailed to such agency for the purpose of carrying out the provisions of this Act.

(33 U.S.C. 1361)

GENERAL DEFINITIONS

SEC. 502. Except as otherwise specifically provided, when used in this Act:

(1) The term "State water pollution control agency" means the State agency designated by the Governor having responsibility for enforcing State laws relating to the abatement of pollution.

(2) The term "interstate agency" means an agency of two or more States established by or pursuant to an agreement or compact approved by the Congress, or any other agency of two or more States, having substantial powers or duties pertaining to the control of pollution as determined and approved by the Adminstrator.

(3) The term "State" means a State, the District of Columbia, the Commonwealth of Puerto Rico, the Virgin Islands, Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, and the Trust Territory of the Pacific Islands.

(4) The term "municipality" means a city, town, borough, county, parish, district, association, or other public body created by or pursuant to State law and having jurisdiction over disposal of sewage, industrial wastes, or other wastes, or an Indian tribe or an authorized Indian tribal organization, or a designated and approved management agency under section 208 of this Act.

(5) The term "person" means an individual, corporation, partnership, association, State, municipality, commission, or political subdivision of a State, or any interstate body.

(6) The term "pollutant" means dredged spoil, solid waste, incinerator residue, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials, heat, wrecked or discarded equipment, rock, sand, cellar dirt and industrial, municipal, and agricultural waste discharged into water. This term does not mean (A) "sewage from vessels or a discharge incidental to the normal operation of a vessel of the Armed Forces" within the meaning of section 312 of this Act; or (B) water, gas, or other material which is injected into a well to facilitate production of oil or gas, or water derived in association with oil or gas production and disposed of in a well, if the well used either to facilitate production or for disposal purpose is approved by authority of the State in which the well is located, and if such State determines that such injection or disposal will not result in the degradation of ground or surface water resources.

(7) The term "navigable waters" means the waters of the United States, including the territorial seas.

(8) The term "territorial seas" means the belt of the seas measured from the line of ordinary low water along that portion of the coast which is in direct contact with the open sea and the line marking the seaward limit of inland waters, and extending seaward a distance of three miles.

(9) The term "contiguous zone" means the entire zone established or to be established by the United States under article 24 of the Convention of the Territorial Sea and the Contiguous Zone.

(10) The term "ocean" means any portion of the high seas beyond the contiguous zone.

(11) The term "effluent limitation" means any restriction established by a State or the Administrator on quantities, rates, and concentrations of chemical, physical, biological, and other constituents which are discharged from point sources into navigable waters, the waters of the contiguous zone, or the ocean, including schedules of compliance.

(12) The term "discharge of a pollutant" and the term "discharge of pollutants" each means (A) any addition of any pollutant to navigable waters from any point source, (B) any addition of any pollutant to the waters of the contiguous zone or the ocean from any point source other than a vessel or other floating craft.

(13) The term "toxic pollutant" means those pollutants, or combinations of pollutants, including disease-causing agents, which after discharge and upon exposure, ingestion, inhalation or assimilation into any organism, either directly from the environment or

indirectly by ingestion through food chains, will, on the basis of information available to the Administrator, cause death, disease, behavioral abnormalities, cancer, genetic mutations, physiological malfunctions (including malfunctions in reproduction) or physical deformations, in such organisms or their offspring.

(14) The term "point source" means any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged. This term does not include agricultural stormwater discharges and return flows from irrigated agriculture.

(15) The term "biological monitoring" shall mean the determination of the effects on aquatic life, including accumulation of pollutants in tissue, in receiving waters due to the discharge of pollutants (A) by techniques and procedures, including sampling of organisms representative of appropriate levels of the food chain appropriate to the volume and the physical, chemical, and biological characteristics of the effluent, and (B) at appropriate frequencies and locations.

(16) The term "discharge" when used without qualification includes a discharge of a pollutant, and a discharge of pollutants.

(17) The term "schedule of compliance" means a schedule of remedial measures including an enforceable sequence of actions or operations leading to compliance with an effluent limitation, other limitation, prohibition, or standard.

(18) The term "industrial user" means those industries identified in the Standard Industrial Classification Manual, Bureau of the Budget, 1967, as amended and supplemented, under the category "Division D—Manufacturing" and such other classes of significant waste producers as, by regulation, the Administrator deems appropriate.

(19) The term "pollution" means the man-made or man-induced alteration of the chemical, physical, biological, and radiological integrity of water.

(20) The term "medical waste" means isolation wastes; infectious agents; human blood and blood products; pathological wastes; sharps; body parts; contaminated bedding; surgical wastes and potentially contaminated laboratory wastes; dialysis wastes; and such additional medical items as the Administrator shall prescribe by regulation.

(21) COASTAL RECREATION WATERS.—

(A) IN GENERAL.—The term "coastal recreation waters" means—

(i) the Great Lakes; and

(ii) marine coastal waters (including coastal estuaries) that are designated under section 303(c) by a State for use for swimming, bathing, surfing, or similar water contact activities.

(B) EXCLUSIONS.—The term "coastal recreation waters" does not include—

(i) inland waters; or

(ii) waters upstream of the mouth of a river or stream having an unimpaired natural connection with the open sea.

(22) FLOATABLE MATERIAL.—

(A) IN GENERAL.—The term "floatable material" means any foreign matter that may float or remain suspended in the water column.

(B) INCLUSIONS.—The term "floatable material" includes—

(i) plastic;
(ii) aluminum cans;
(iii) wood products;
(iv) bottles; and
(v) paper products.

(23) PATHOGEN INDICATOR.—The term "pathogen indicator" means a substance that indicates the potential for human infectious disease.

(33 U.S.C. 1362)

WATER POLLUTION CONTROL ADVISORY BOARD

SEC. 503. (a)(1) There is hereby established in the Environmental Protection Agency a Water Pollution Control Advisory Board, composed of the Administrator or his designee, who shall be Chairman, and nine members appointed by the President, none of whom shall be Federal officers or employees. The appointed members, having due regard for the purposes of this Act, shall be selected from among representatives of various State, interstate, and local governmental agencies, of public or private interests contributing to, affected by, or concerned with pollution, and of other public and private agencies, organizations, or groups demonstrating an active interest in the field of pollution prevention and control, as well as other individuals who are expert in this field.

(2)(A) Each member appointed by the President shall hold office for a term of three years, except that (i) any member appointed to fill a vacancy occurring prior to the expiration of the term for which his predecessor was appointed shall be appointed for the remainder of such term, and (ii) the terms of office of the members first taking office after June 30, 1956, shall expire as follows: three at the end of one year after such date, three at the end of two years after such date, and three at the end of three years after such date, as designated by the President at the time of appointment, and (iii) the term of any member under the preceding provisions shall be extended until the date on which his successor's appointment is effective. None of the members appointed by the President shall be eligible for reappointment within one year after the end of his preceding term.

(B) The members of the Board who are not officers or employees of the United States, while attending conferences or meetings of the Board or while otherwise serving at the request of the Administrator, shall be entitled to receive compensation at a rate to be fixed by the Administrator, but not exceeding $100 per diem, including traveltime, and while away from their homes or regular places of business they may be allowed travel expenses, including per diem in lieu of subsistence, as authorized by law (5 U.S.C. 73b–2) for persons in the Government service employed intermittently.

(b) The Board shall advise, consult with, and make recommendations to the Administrator on matters of policy relating to the activities and functions of the Administrator under this Act.

(c) Such clerical and technical assistance as may be necessary to discharge the duties of the Board shall be provided from the personnel of the Environmental Protection Agency.

(33 U.S.C. 1363)

EMERGENCY POWERS

SEC. 504. (a) Notwithstanding any other provision of this Act, the Administrator upon receipt of evidence that a pollution source or combination of sources is presenting an imminent and substantial endangerment to the health of persons or to the welfare of persons where such endangerment is to the livelihood of such persons, such as inability to market shellfish, may bring suit on behalf of the United States in the appropriate district court to immediately restrain any person causing or contributing to the alleged pollution to stop the discharge of pollutants causing or contributing to such pollution or to take such other action as may be necessary.

[Subsection (b) repealed by §304(a) of P.L. 96–510, Dec. 11, 1980, 94 Stat. 2809]

(33 U.S.C. 1364)

CITIZEN SUITS

SEC. 505. (a) Except as provided in subsection (b) of this section and section 309(g)(6), any citizen may commence a civil action on his own behalf—

(1) against any person (including (i) the United States, and (ii) any other governmental instrumentality or agency to the extent permitted by the eleventh amendment to the Constitution) who is alleged to be in violation of (A) an effluent standard or limitation under this Act or (B) an order issued by the Administrator or a State with respect to such a standard or limitation, or

(2) against the Administrator where there is alleged a failure of the Administrator to perform any act or duty under this Act which is not discretionary with the Administrator.

The district courts shall have jurisdiction, without regard to the amount in controversy or the citizenship of the parties, to enforce such an effluent standard or limitation, or such an order, or to order the Administrator to perform such act or duty, as the case may be, and to apply any appropriate civil penalties under section 309(d) of this Act.

(b) No action may be commenced—

(1) under subsection (a)(1) of this section—

(A) prior to sixty days after the plaintiff has given notice of the alleged violation (i) to the Administrator, (ii) to the State in which the alleged violation occurs, and (iii) to any alleged violator of the standard, limitation, or order, or

(B) if the Administrator or State has commenced and is diligently prosecuting a civil or criminal action in a court of the United States, or a State to require compliance with the standard, limitation, or order, but in any such ac-

tion in a court of the United States any citizen may intervene as a matter of right.

(2) under subsection (a)(2) of this section prior to sixty days after the plaintiff has given notice of such action to the Administrator,

except that such action may be brought immediately after such notification in the case of an action under this section respecting a violation of sections 306 and 307(a) of this Act. Notice under this subsection shall be given in such manner as the Administrator shall prescribe by regulation.

(c)(1) Any action respecting a violation by a discharge source of an effluent standard or limitation or an order respecting such standard or limitation may be brought under this section only in the judicial district in which such source is located.

(2) In such action under this section, the Administrator, if not a party, may intervene as a matter of right.

(3) PROTECTION OF INTERESTS OF UNITED STATES.—Whenever any action is brought under this section in a court of the United States, the plaintiff shall serve a copy of the complaint on the Attorney General and the Administrator. No consent judgment shall be entered in an action in which the United States is not a party prior to 45 days following the receipt of a copy of the proposed consent judgment by the Attorney General and the Administrator.

(d) The court, in issuing any final order in any action brought pursuant to this section, may award costs of litigation (including reasonable attorney and expert witness fees) to any prevailing or substantially prevailing party, whenever the court determines such award is appropriate. The court may, if a temporary restraining order or preliminary injunction is sought, require the filing of a bond or equivalent security in accordance with the Federal Rules of Civil Procedure.

(e) Nothing in this section shall restrict any right which any person (or class of persons) may have under any statute or common law to seek enforcement of any effluent standard or limitation or to seek any other relief (including relief against the Administrator or a State agency).

(f) For purposes of this section, the term "effluent standard or limitation under this Act" means (1) effective July 1, 1973, an unlawful act under subsection (a) of section 301 of this Act; (2) an effluent limitation or other limitation under section 301 or 302 of this Act; (3) standard or performance under section 306 of this Act; (4) prohibition, effluent standard or pretreatment standards under section 307 of this Act; (5) certification under section 401 of this Act; (6) a permit or condition thereof issued under section 402 of this Act, which is in effect under this Act (including a requirement applicable by reason of section 313 of this Act); or (7) a regulation under section 405(d) of this Act,.[1]

(g) For the purposes of this section the term "citizen" means a person or persons having an interest which is or may be adversely affected.

(h) A Governor of a State may commence a civil action under subsection (a), without regard to the limitations of subsection (b) of

[1] So in law. See P.L. 100–4, sec. 406(d)(2), 101 Stat. 73.

this section, against the Administrator where there is alleged a failure of the Administrator to enforce an effluent standard or limitation under this Act the violation of which is occurring in another State and is causing an adverse effect on the public health or welfare in his State, or is causing a violation of any water quality requirement in his State.

(33 U.S.C. 1365)

APPEARANCE

SEC. 506. The Administrator shall request the Attorney General to appear and represent the United States in any civil or criminal action instituted under this Act to which the Administrator is a party. Unless the Attorney General notifies the Administrator within a reasonable time, that he will appear in a civil action, attorneys who are officers or employees of the Environmental Protection Agency shall appear and represent the United States in such action.

(33 U.S.C. 1366)

EMPLOYEE PROTECTION

SEC. 507. (a) No person shall fire, or in any other way discriminate against, or cause to be fired or discriminated against, any employee or any authorized representative or employees by reason of the fact that such employee or representative has filed, instituted, or caused to be filed or instituted any proceeding under this Act, or has testified or is about to testify in any proceeding resulting from the administration or enforcement of the provisions of this Act.

(b) Any employee or a representative of employees who believes that he has been fired or otherwise discriminated against by any person in violation of subsection (a) of this section may, within thirty days after such alleged violation occurs, apply to the Secretary of Labor for a review of such firing or alleged discrimination. A copy of the application shall be sent to such person who shall be the respondent. Upon receipt of such application, the Secretary of Labor shall cause such investigation to be made as he deems appropriate. Such investigation shall provide an opportunity for a public hearing at the request of any party to such review to enable the parties to present information relating to such alleged violation. The parties shall be given written notice of the time and place of the hearing at least five days prior to the hearing. Any such hearing shall be of record and shall be subject to section 554 of title 5 of the United States Code. Upon receiving the report of such investigation, the Secretary of Labor shall make findings of fact. If he finds that such violation did occur, he shall issue a decision, incorporating an order therein and his findings, requiring the party committing such violation to take such affirmative action to abate the violation as the Secretary of Labor deems appropriate, including, but not limited to, the rehiring or reinstatement of the employee or representative of employees to his former position with compensation. If he finds that there was no such violation, he shall issue an order denying the application. Such order issued by the Secretary of Labor under this subparagraph shall be subject to ju-

dicial review in the same manner as orders and decisions of the Administrator are subject to judicial review under this Act.

(c) Whenever an order is issued under this section to abate such violation, at the request of the applicant, a sum equal to the aggregate amount of all costs and expenses (including the attorney's fees), as determined by the Secretary of Labor, to have been reasonably incurred by the applicant for, or in connection with, the institution and prosecution of such proceedings, shall be assessed against the person committing such violation.

(d) This section shall have no application to any employee who, acting without direction from his employer (or his agent) deliberately violates any prohibition of effluent limitation or other limitation under section 301 or 302 of this Act, standards of performance under section 306 of this Act, effluent standard, prohibition or pretreatment standard under section 307 of this Act, or any other prohibition or limitation established under this Act.

(e) The Administrator shall conduct continuing evaluations of potential loss or shifts of employment which may result from the issuance of any effluent limitation or order under this Act, including, where appropriate, investigating threatened plant closures or reductions in employment allegedly resulting from such limitation or order. Any employee who is discharged or laid off, threatened with discharge or lay-off, or otherwise discriminated against by any person because of the alleged results of any effluent limitation or order issued under this Act, or any representative of such employee, may request the Administrator to conduct a full investigation of the matter. The Administrator shall thereupon investigate the matter and, at the request of any party, shall hold public hearings on not less than five days notice, and shall at such hearings require the parties, including the employer involved, to present information relating to the actual or potential effect of such limitation or order on employment and on any alleged discharge, lay-off, or other discrimination and the detailed reasons or justification therefor. Any such hearing shall be of record and shall be subject to section 554 of title 5 of the United States Code. Upon receiving the report of such investigation, the Administrator shall make findings of fact as to the effect of such effluent limitation or order on employment and on the alleged discharge, lay-off, or discrimination and shall make such recommendations as he deems appropriate. Such report, findings, and recommendations shall be available to the public. Nothing in this subsection shall be construed to require or authorize the Administrator to modify or withdraw any effluent limitation or order issued under this Act.

(33 U.S.C. 1367)

FEDERAL PROCUREMENT

SEC. 508. (a) No Federal agency may enter into any contract with any person, who has been convicted of any offense under section 309(c) of this Act, for the procurement of goods, materials, and services if such contract is to be performed at any facility at which the violation which gave rise to such conviction occurred, and if such facility is owned, leased, or supervised by such person. The prohibition in the preceding sentence shall continue until the Ad-

ministrator certifies that the condition giving rise to such conviction has been corrected.

(b) The Administrator shall establish procedures to provide all Federal agencies with the notification necessary for the purposes of subsection (a) of this section.

(c) In order to implement the purposes and policy of this Act to protect and enhance the quality of the Nation's water, the President shall, not more than one hundred and eighty days after enactment of this Act, cause to be issued an order (1) requiring each Federal agency authorized to enter into contracts and each Federal agency which is empowered to extend Federal assistance by way of grant, loan, or contract to effectuate the purpose and policy of this Act in such contracting or assistance activities, and (2) setting forth procedures, sanctions, penalties, and such other provisions, as the President determines necessary to carry out such requirement.

(d) The President may exempt any contract, loan, or grant from all or part of the provisions of this section where he determines such exemption is necessary in the paramount interest of the United States and he shall notify the Congress of such exemption.

(e) The President shall annually report to the Congress on measures taken in compliance with the purpose and intent of this section, including, but not limited to, the progress and problems associated with such compliance.

(f)(1) No certification by a contractor, and no contract clause, may be required in the case of a contract for the acquisition of commercial items in order to implement a prohibition or requirement of this section or a prohibition or requirement issued in the implementation of this section.

(2) In paragraph (1), the term "commercial item" has the meaning given such term in section 4(12) of the Office of Federal Procurement Policy Act (41 U.S.C. 403(12)).

(33 U.S.C. 1368)

ADMINISTRATIVE PROCEDURE AND JUDICIAL REVIEW

SEC. 509. (a)(1) For purposes of obtaining information under section 305 of this Act, or carrying out section 507(e) of this Act, the Administrator may issue subpenas for the attendance and testimony of witnesses and the production of relevant papers, books, and documents, and he may administer oaths. Except for effluent data, upon a showing satisfactory to the Administrator that such papers, books, documents, or information or particular part thereof, if made public, would divulge trade secrets or secret processes, the Administrator shall consider such record, report, or information or particular portion thereof confidential in accordance with the purposes of section 1905 of title 18 of the United States Code, except that such paper, book, document, or information may be disclosed to other officers, employees, or authorized representatives of the United States concerned with carrying out this Act, or when relevant in any proceeding under this Act. Witnesses summoned shall be paid the same fees and mileage that are paid witnesses in the courts of the United States. In case of contumacy or refusal to obey a subpena served upon any person under this subsection, the district court of the United States for any district in which such per-

son is found or resides or transacts business, upon application by the United States and after notice to such person, shall have jurisdiction to issue an order requiring such person to appear and give testimony before the Administrator, to appear and produce papers, books, and documents before the Administrator, or both, and any failure to obey such order of the court may be punished by such court as a contempt thereof.

(2) The district courts of the United States are authorized, upon application by the Administrator, to issue subpenas for attendance and testimony of witnesses and the production of relevant papers, books, and documents, for purposes of obtaining information under sections 304 (b) and (c) of this Act. Any papers, books, documents, or other information or part thereof, obtained by reason of such a subpena shall be subject to the same requirements as are provided in paragraph (1) of this subsection.

(b)(1) Review of the Administrator's action (A) in promulgating any standard of performance under section 306, (B) in making any determination pursuant to section 306(b)(1)(C), (C) in promulgating any effluent standard, prohibition, or pretreatment standard under section 307, (D) in making any determination as to a State permit program submitted under section 402(b), (E) in approving or promulgating any effluent limitation or other limitation under sections 301, 302, 306, or 405, (F) in issuing or denying any permit under section 402, and (G) in promulgating any individual control strategy under section 304(l), may be had by any interested person in the Circuit Court of Appeals of the United States for the Federal judicial district in which such person resides or transacts business which is directly affected by such action upon application by such person. Any such application shall be made within 120 days from the date of such determination, approval, promulgation, issuance or denial, or after such date only if such application is based solely on grounds which arose after such 120th day.

(2) Action of the Administrator with respect to which review could have been obtained under paragraph (1) of this subsection shall not be subject to judicial review in any civil or criminal proceeding for enforcement.

(3) AWARD OF FEES.—In any judicial proceeding under this subsection, the court may award costs of litigation (including reasonable attorney and expert witness fees) to any prevailing or substantially prevailing party whenever it determines that such award is appropriate.

(c) In any judicial proceeding brought under subsection (b) of this section in which review is sought of a determination under this Act required to be made on the record after notice and opportunity for hearing, if any party applies to the court for leave to adduce additional evidence, and shows to the satisfaction of the court that such additional evidence is material and that there were reasonable grounds for the failure to adduce such evidence in the proceeding before the Administrator, the court may order such additional evidence (and evidence in rebuttal thereof) to be taken before the Administrator, in such manner and upon such terms and conditions as the court may deem proper. The Administrator may modify his findings as to the facts, or make new findings, by reason of the additional evidence so taken and he shall file such modified or new findings, and his recommendation, if any, for the modification or

setting aside of his original determination with the return of such additional evidence.

(33 U.S.C. 1369)

STATE AUTHORITY

SEC. 510. Except as expressly provided in this Act, nothing in this Act shall (1) preclude or deny the right of any State or political subdivision thereof or interstate agency to adopt or enforce (A) any standard or limitation respecting discharges of pollutants, or (B) any requirement respecting control or abatement of pollution; except that if an effluent limitation, or other limitation, effluent standard, prohibition, pretreatment standard, or standard of performance is in effect under this Act, such State or political subdivision or interstate agency may not adopt or enforce any effluent limitation, or other limitation, effluent standard, prohibition, pretreatment standard, or standard of performance which is less stringent than the effluent limitation, or other limitation, effluent standard prohibition, pretreatment standard, or standard of performance under this Act; or (2) be construed as impairing or in any manner affecting any right or jurisdiction of the States with respect to the waters (including boundary waters) of such States.

(33 U.S.C. 1370)

OTHER AFFECTED AUTHORITY

SEC. 511. (a) This Act shall not be construed as (1) limiting the authority or functions of any officer or agency of the United States under any other law or regulation not inconsistent with this Act; (2) affecting or impairing the authority of the Secretary of the Army (A) to maintain navigation or (B) under the Act of March 3, 1899 (30 Stat. 1112); except that any permit issued under section 404 of this Act shall be conclusive as to the effect on water quality of any discharge resulting from any activity subject to section 10 of the Act of March 3, 1899, or (3) affecting or impairing the provisions of any treaty of the United States.

(b) Discharges of pollutants into the navigable waters subject to the Rivers and Harbors Act of 1910 (36 Stat. 593; 33 U.S.C. 421) and the Supervisory Harbors, Act of 1888 (25 Stat. 209; 33 U.S.C. 441–451b) shall be regulated pursuant to this Act, and not subject to such Act of 1910 and the Act of 1888 except as to effect on navigation and anchorage.

(c)(1) Except for the provision of Federal financial assistance for the purpose of assisting the construction of publicly owned treatment works as authorized by section 201 of this Act, and the issuance of a permit under section 402 of this Act for the discharge of any pollutant by a new source as defined in section 306 of this Act, no action of the Administrator taken pursuant to this Act shall be deemed a major Federal action significantly affecting the quality of the human environment within the meaning of the National Environmental Policy Act of 1969 (83 Stat. 852); and

(2) Nothing in the National Environmental Policy Act of 1969 (83 Stat. 852) shall be deemed to—

(A) authorize any Federal agency authorized to license or permit the conduct of any activity which may result in the discharge of a pollutant into the navigable waters to review any

effluent limitation or other requirement established pursuant to this Act or the adequacy of any certification under section 401 of ths Act; or

(B) authorize any such agency to impose, as a condition precedent to the issuance of any license or permit, any effluent limitation other than any such limitation established pursuant to this Act.

(d) Notwithstanding this Act or any other provisions of law, the Administrator (1) shall not require any State to consider in the development of the ranking in order of priority of needs for the construction of treatment works (as defined in title II of this Act), any water pollution control agreement which may have been entered into between the United States and any other nation, and (2) shall not consider any such agreement in the approval of any such priority ranking.

(33 U.S.C. 1371)

SEPARABILITY

SEC. 512. If any provision of this Act, or the application of any provision of this Act to any person or circumstance, is held invalid, the application of such provision to other persons or circumstances, and the remainder of this Act shall not be affected thereby.

(33 U.S.C. 1251 note)

LABOR STANDARDS

SEC. 513. The Administrator shall take such action as may be necessary to insure that all laborers and mechanics employed by contractors or subcontractors on treatment works for which grants are made under this Act shall be paid wages at rates not less than those prevailing for the same type of work on similar construction in the immediate locality, as determied by the Secretry of Labor, in accordance with the Act of March 3, 1931, as amended, known as the Davis-Bacon Act (46 Stat. 1494; 40 U.S.C., sec. 276a through 276a–5). The Secretary of Labor shall have, with respect to the labor standards specified in this subsection, the authority and functions set forth in Reorganization Plan Numbered 14 of 1950 (15 F.R. 3176) and section 2 of the Act of June 13, 1934, as amended (48 Stat. 948; 40 U.S.C. 276c).

(33 U.S.C. 1372)

PUBLIC HEALTH AGENCY COORDINATION

SEC. 514. The permitting agency under section 402 shall assist the applicant for a permit under such section in coordinating the requirements of this Act with those of the appropriate public health agencies.

(33 U.S.C. 1373)

EFFLUENT STANDARDS AND WATER QUALITY INFORMATION ADVISORY COMMITTEE

SEC. 515. (a)(1) There is established on Effluent Standards and Water Quality Information Advisory Committee, which shall be composed of a Chairman and eight members who shall be ap-

pointed by the Administrator within sixty days after the date of enactment of this Act.

(2) All members of the Committee shall be selected from the scientific community, qualified by education, training, and experience to provide assess, and evaluate scientific and technical information on effluent standards and limitations.

(3) Members of the Committee shall serve for a term of four years, and may be reappointed.

(b)(1) No later than one hundred and eighty days prior to the date on which the Administrator is required to publish any proposed regulations required by section 304(b) of this Act, any proposed standard of performance for new sources required by section 306 of this Act, or any proposed toxic effluent standard required by section 307 of this Act, he shall transmit to the Committee a notice of intent to propose such regulations. The Chairman of the Committee within ten days after receipt of such notice may publish a notice of a public hearing by the Committee, to be held within thirty days.

(2) No later than one hundred and twenty days after receipt of such notice, the Committee shall transmit to the Administrator such scientific and technical information as is in its possession, including that presented at any public hearing, related to the subject matter contained in such notice.

(3) Information so transmitted to the Administrator shall constitute a part of the administrative record and comments on any proposed regulations or standards as information to be considered with other comments and information in making any final determinations.

(4) In preparing information for transmittal, the Committee shall avail itself of the technical and scientific services of any Federal agency, including the United States Geological Survey and any national environmental laboratories which may be established.

(c)(1) The Committee shall appoint and prescribe the duties of a Secretary, and such legal counsel as it deems necessary. The Committee shall appoint such other employees as it deems necessary to exercise and fulfill its powers and responsibilities. The compensation of all employees appointed by the Committee shall be fixed in accordance with chapter 51 and subchapter III of chapter 53 of title V of the United States Code.

(2) Members of the Committee shall be entitled to receive compensation at a rate to be fixed by the President but not in excess of the maximum rate of pay grade for GS–18, as provided in the General Schedule under section 5332 of title V of the United States Code.

(d) Five members of the Committee shall constitute a quorum, and official actions of the Committee shall be taken only on the affirmative vote of at least five members. A special panel composed of one or more members upon order of the Committee shall conduct any hearing authorized by this section and submit the transcript of such hearing to the entire Committee for its action thereon.

(e) The Committee is authorized to make such rules as are necessary for the orderly transaction of its business.

(33 U.S.C. 1374)

REPORTS TO CONGRESS

SEC. 516. The Administrator, in cooperation with the States, including water pollution control agencies and other water pollution control planning agencies, shall make (1) a detailed estimate of the cost of carrying out the provisions of this Act; (2) a detailed estimate, biennially revised, of the cost of construction of all needed publicly owned treatment works in all of the States and of the cost of construction of all needed publicly owned treatment works in each of the States; (3) a comprehensive study of the economic impact on affected units of government of the cost of installation of treatment facilities; and (4) a comprehensive analysis of the national requirements for and the cost of treating municipal, industrial, and other effluent to attain the water quality objectives as established by this Act or applicable State law. The Administrator shall submit such detailed estimate and such comprehensive study of such cost to the Congress no later than February 10 of each odd-numbered year. Whenever the Administrator, pursuant to this subsection, requests and receives an estimate of cost from a State, he shall furnish copies of such estimate together with such detailed estimate to Congress.

(33 U.S.C. 1375)

GENERAL AUTHORIZATION

SEC. 517. There are authorized to be appropriated to carry out this Act, other than sections 104, 105, 106(a), 107, 108, 112, 113, 114, 115, 206, 207, 208 (f) and (h), 209, 304, 311 (c), (d), (i), (l), and (k), 314, 315, and 317, $250,000,000 for the fiscal year ending June 30, 1973, $300,000,000 for the fiscal year ending June 30, 1974, $350,000,000 for the fiscal year ending June 30, 1975, $100,000,000 for the fiscal year ending September 30, 1977, $150,000,000 for the fiscal year ending September 30, 1978, $150,000,000 for the fiscal year ending September 30, 1979, $150,000,000 for the fiscal year ending September 30, 1980, $150,000,000 for the fiscal year ending September 30, 1981, $161,000,000 for the fiscal year ending September 30, 1982, such sums as may be necessary for fiscal years 1983 through 1985, and $135,000,000 per fiscal year for each of the fiscal years 1986 through 1990.

(33 U.S.C. 1376)

SEC. 518. INDIAN TRIBES.

(a) POLICY.—Nothing in this section shall be construed to affect the application of section 101(g) of this Act, and all of the provisions of this section shall be carried out in accordance with the provisions of such section 101(g). Indian tribes shall be treated as States for purposes of such section 101(g).

(b) ASSESSMENT OF SEWAGE TREATMENT NEEDS; REPORT.—The Administrator, in cooperation with the Director of the Indian Health Service, shall assess the need for sewage treatment works to serve Indian tribes, the degree to which such needs will be met through funds allotted to States under section 205 of this Act and priority lists under section 216 of this Act, and any obstacles which prevent such needs from being met. Not later than one year after the date of the enactment of this section, the Administrator shall submit a report to Congress on the assessment under this sub-

section, along with recommendations specifying (1) how the Administrator intends to provide assistance to Indian tribes to develop waste treatment management plans and to construct treatment works under this Act, and (2) methods by which the participation in and administration of programs under this Act by Indian tribes can be maximized.

(c) RESERVATION OF FUNDS.—The Administrator shall reserve each fiscal year beginning after September 30, 1986, before allotments to the States under section 205(e), one-half of one percent of the sums appropriated under section 207. Sums reserved under this subsection shall be available only for grants for the develoment of waste treatment management plans and for the construction of sewage treatment works to serve Indian tribes, as defined in subsection (h) and former Indian reservations in Oklahoma (as determined by the Secretary of the Interior) and Alaska Native Villages as defined in Public Law 92–203.

(d) COOPERATIVE AGREEMENTS.—In order to ensure the consistent implementation of the requirements of this Act, an Indian tribe and the State or States in which the lands of such tribe are located may enter into a cooperative agreement, subject to the review and approval of the Administrator, to jointly plan and administer the requirements of this Act.

(e) TREATMENT AS STATES.—The Administrator is authorized to treat an Indian tribe as a State for purposes of title II and sections 104, 106, 303, 305, 308, 309, 314, 319, 401, 402, 404, and 406 of this Act to the degree necessary to carry out the objectives of this section, but only if—

(1) the Indian tribe has a governing body carrying out substantial governmental duties and powers;

(2) the functions to be exercised by the Indian tribe pertain to the management and protection of water resources which are held by an Indian tribe, held by the United States in trust for Indians, held by a member of an Indian tribe if such property interest is subject to a trust restriction on alienation, or otherwise within the borders of an Indian reservation; and

(3) the Indian tribe is reasonably expected to be capable, in the Administrator's judgment, of carrying out the functions to be exercised in a manner consistent with the terms and purposes of this Act and of all applicable regulations.

Such treatment as a State may include the direct provision of funds reserved under subsection (c) to the governing bodies of Indian tribes, and the determination of priorities by Indian tribes, where not determined by the Administrator in cooperation with the Director of the Indian Health Service. The Administrator, in cooperation with the Director of the Indian Health Service, is authorized to make grants under title II of this Act in an amount not to exceed 100 percent of the cost of a project. Not later than 18 months after the date of the enactment of this section, the Administrator shall, in consultation with Indian tribes, promulgate final regulations which specify how Indian tribes shall be treated as States for purposes of this Act. The Administrator shall, in promulgating such regulations, consult affected States sharing common water bodies and provide a mechanism for the resolution of any unreasonable consequences that may arise as a result of differing water quality standards that may be set by States and Indian

tribes located on common bodies of water. Such mechanism shall provide for explicit consideration of relevant factors including, but not limited to, the effects of differing water quality permit requirements on upstream and downstream dischargers, economic impacts, and present and historical uses and quality of the waters subject to such standards. Such mechanism should provide for the avoidance of such unreasonable consequences in a manner consistent with the objective of this Act.

(f) GRANTS FOR NONPOINT SOURCE PROGRAMS.—The Administrator shall make grants to an Indian tribe under section 319 of this Act as though such tribe was a State. Not more than one-third of one percent of the amount appropriated for any fiscal year under section 319 may be used to make grants under this subsection. In addition to the requirements of section 319, an Indian tribe shall be required to meet the requirements of paragraphs (1), (2), and (3) of subsection (d)[1] of this section in order to receive such a grant.

(g) ALASKA NATIVE ORGANIZATIONS.—No provision of this Act shall be construed to—

(1) grant, enlarge, or diminish, or in any way affect the scope of the governmental authority, if any, of any Alaska Native organization, including any federally-recognized tribe, traditional Alaska Native council, or Native council organized pursuant to the Act of June 18, 1934 (48 Stat. 987), over lands or persons in Alaska;

(2) create or validate any assertion by such organization or any form of governmental authority over lands or persons in Alaska; or

(3) in any way affect any assertion that Indian country, as defined in section 1151 of title 18, United States Code, exists or does not exist in Alaska.

(h) DEFINITIONS.—For purposes of this section, the term—

(1) "Federal Indian reservation" means all land within the limits of any Indian reservation under the jurisdiction of the United States Government, notwithstanding the issuance of any patent, and including rights-of-way running through the reservation; and

(2) "Indian tribe" means any Indian tribe, band, group, or community recognized by the Secretary of the Interior and exercising governmental authority over a Federal Indian reservation.

(33 U.S.C. 1377)

SHORT TITLE

SEC. 519. This Act may be cited as the "Federal Water Pollution Control Act" (commonly referred to as the Clean Water Act).

(33 U.S.C. 1251 note)

[1] Probably should be subsection (e).

TITLE VI—STATE WATER POLLUTION CONTROL REVOLVING FUNDS

SEC. 601. GRANTS TO STATES FOR ESTABLISHMENT OF REVOLVING FUNDS.

(a) GENERAL AUTHORITY.—Subject to the provisions of this title, the Administrator shall make capitalization grants to each State for the purpose of establishing a water pollution control revolving fund for providing assistance (1) for construction of treatment works (as defined in section 212 of this Act) which are publicly owned, (2) for implementing a management program under section 319, and (3) for developing and implementing a conservation and management plan under section 320.

(b) SCHEDULE OF GRANT PAYMENTS.—The Administrator and each State shall jointly establish a schedule of payments under which the Administrator will pay to the State the amount of each grant to be made to the State under this title. Such schedule shall be based on the State's intended use plan under section 606(c) of this Act, except that—

(1) such payments shall be made in quarterly installments, and

(2) such payments shall be made as expeditiously as possible, but in no event later than the earlier of—

(A) 8 quarters after the date such funds were obligated by the State, or

(B) 12 quarters after the date such funds were allotted to the State.

(33 U.S.C. 1381)

SEC. 602. CAPITALIZATION GRANT AGREEMENTS.

(a) GENERAL RULE.—To receive a capitalization grant with funds made available under this title and section 205(m) of this Act, a State shall enter into an agreement with the Administrator which shall include but not be limited to the specifications set forth in subsection (b) of this section.

(b) SPECIFIC REQUIREMENTS.—The Administrator shall enter into an agreement under this section with a State only after the State has established to the satisfaction of the Administrator that—

(1) the State will accept grant payments with funds to be made available under this title and section 205(m) of this Act in accordance with a payment schedule established jointly by the Administrator under section 601(b) of this Act and will deposit all such payments in the water pollution control revolving fund established by the State in accordance with this title;

(2) the State will deposit in the fund from State moneys an amount equal to at least 20 percent of the total amount of all capitalization grants which will be made to the State with funds to be made available under this title and section 205(m) of this Act on or before the date on which each quarterly grant payment will be made to the State under this title;

(3) the State will enter into binding commitments to provide assistance in accordance with the requirements of this title in an amount equal to 120 percent of the amount of each such grant payment within 1 year after the receipt of such grant payment;

(4) all funds in the fund will be expended in an expeditious and timely manner;

(5) all funds in the fund as a result of capitalization grants under this title and section 205(m) of this Act will first be used to assure maintenance of progress, as determined by the Governor of the State, toward compliance with enforceable deadlines, goals, and requirements of this Act, including the municipal compliance deadline;

(6) treatment works eligible under section 603(c)(1) of this Act which will be constructed in whole or in part before fiscal year 1995 with funds directly made available by capitalization grants under this title and section 205(m) of this Act will meet the requirements of, or otherwise be treated (as determined by the Governor of the State) under sections 201(b), 201(g)(1), 201(g)(2), 201(g)(3), 201(g)(5), 201(g)(6), 201(n)(1), 201(o), 204(a)(1), 204(a)(2), 204(b)(1), 204(d)(2), 211, 218, 511(c)(1), and 513 of this Act in the same manner as treatment works constructed with assistance under title II of this Act;

(7) in addition to complying with the requirements of this title, the State will commit or expend each quarterly grant payment which it will receive under this title in accordance with laws and procedures applicable to the commitment or expenditure of revenues of the State;

(8) in carrying out the requirements of section 606 of this Act, the State will use accounting, audit, and fiscal procedures conforming to generally accepted government accounting standards;

(9) the State will require as a condition of making a loan or providing other assistance, as described in section 603(d) of this Act, from the fund that the recipient of such assistance will maintain project accounts in accordance with generally accepted government accounting standards; and

(10) the State will make annual reports to the Administrator on the actual use of funds in accordance with section 606(d) of this Act.

(33 U.S.C. 1382)

SEC. 603. WATER POLLUTION CONTROL REVOLVING LOAN FUNDS.[1]

(a) REQUIREMENTS FOR OBLIGATION OF GRANT FUNDS.—Before a State may receive a capitalization grant with funds made available under this title and section 205(m) of this Act, the State shall first establish a water pollution control revolving fund which complies with the requirements of this section.

(b) ADMINISTRATOR.—Each State water pollution control revolving fund shall be administered by an instrumentality of the State with such powers and limitations as may be required to operate such fund in accordance with the requirements and objectives of this Act.

(c) PROJECTS ELIGIBLE FOR ASSISTANCE.—The amounts of funds available to each State water pollution control revolving fund shall be used only for providing financial assistance (1) to any municipality, intermunicipal, interstate, or State agency for construc-

[1] See section 104B of the Marine Protection, Research and Sanctuaries Act of 1972 (33 U.S.C. 1414G) for additional amounts that are to be deposited into a State's fund and treatment of such deposits.

tion of publicly owned treatment works (as defined in section 212 of this Act), (2) for the implementation of a management program established under section 319 of this Act, and (3) for development and implementation of a conservation and management plan under section 320 of this Act. The fund shall be established, maintained, and credited with repayments, and the fund balance shall be available in perpetuity for providing such financial assistance.[2]

(d) TYPES OF ASSISTANCE.—Except as otherwise limited by State law, a water pollution control revolving fund of a State under this section may be used only—

(1) to make loans, on the condition that—

(A) such loans are made at or below market interest rates, including interest free loans, at terms not to exceed 20 years;

(B) annual principal and interest payments will commence not later than 1 year after completion of any project and all loans will be fully amortized not later than 20 years after project completion;

(C) the recipient of a loan will establish a dedicated source of revenue for repayment of loans; and

(D) the fund will be credited with all payments of principal and interest on all loans;

(2) to buy or refinance the debt obligation of municipalities and intermunicipal and interstate agencies within the State at or below market rates, where such debt obligations were incurred after March 7, 1985;

(3) to guarantee, or purchase insurance for, local obligations where such action would improve credit market access or reduce interest rates;

(4) as a source of revenue or security for the payment of principal and interest on revenue or general obligation bonds issued by the State if the proceeds of the sale of such bonds will be deposited in the fund;

(5) to provide loan guarantees for similar revolving funds established by municipalities or intermunicipal agencies;

(6) to earn interest on fund accounts; and

(7) for the reasonable costs of administering the fund and conducting activities under this title, except that such amounts

---

[2] Section 1006 of the Ocean Dumping Ban Act of 1988 (P.L. 100–688) is as follows:

SEC. 1066. USE OF STATE WATER POLLUTION CONTROL REVOLVING FUND GRANTS FOR DEVELOPING ALTERNATIVE SYSTEMS.

(a) GENERAL REQUIREMENT.—Notwithstanding the provisions of title VI of the Federal Water Pollution Control Act, each of the States of New York and New Jersey shall use 10 percent of the amount of a grant payment made to such State under such title for each of the fiscal years 1990 and 1991 and 10 percent of the State's contribution associated with such grant payment in the 6-month period beginning on the date of receipt of such grant payment for making loans and providing other assistance as described in section 603(d) of the Federal Water Pollution Control Act to any governmental entity in such State which has entered into a compliance agreement or enforcement agreement under section 104B of the Marine Protection, Research, and Sanctuaries Act of 1972 for identifying, developing, and implementing pursuant to such section alternative systems for management of sewage sludge.

(b) LIMITATION.—If, after the last day of the 6-month period beginning on the date of receipt of a grant payment by the State of New York or New Jersey under title VI of the Federal Water Pollution Control Act for each of fiscal years 1990 and 1991, 10 percent of the amount of such grant payment and the State's contribution associated with such grant payment has not been used for providing assistance described in subsection (a) as a result of insufficient applications for such assistance from persons eligible for such assistance, the 10 percent limitations set forth in subsection (a) shall not be applicable with respect to such grant payment and associated State contribution.

shall not exceed 4 percent of all grant awards to such fund under this title.

(e) LIMITATION TO PREVENT DOUBLE BENEFITS.—If a State makes, from its water pollution revolving fund, a loan which will finance the cost of facility planning and the preparation of plans, specifications, and estimates for construction of publicly owned treatment works, the State shall ensure that if the recipient of such loan receives a grant under section 201(g) of this Act for construction of such treatment works and an allowance under section 201(l)(1) of this Act for non-federal funds expended for such planning and preparation, such recipient will promptly repay such loan to the extent of such allowance.

(f) CONSISTENCY WITH PLANNING REQUIREMENTS.—A State may provide financial assistance from its water pollution control revolving fund only with respect to a project which is consistent with plans, if any, developed under sections 205(j), 208, 303(e), 319, and 320 of this Act.

(g) PRIORITY LIST REQUIREMENT.—The State may provide financial assistance from its water pollution control revolving fund only with respect to a project for construction of a treatment works described in subsection (c)(1) if such project is on the State's priority list under section 216 of this Act. Such assistance may be provided regardless of the rank of such project on such list.

(h) ELIGIBILITY OF NON-FEDERAL SHARE OF CONSTRUCTION GRANT PROJECTS.—A State water pollution control revolving fund may provide assistance (other than under subsection (d)(1) of this section) to a municipality or intermunicipal or interstate agency with respect to the non-Federal share of the costs of a treatment works project for which such municipality or agency is receiving assistance from the Administrator under any other authority only if such assistance is necessary to allow such project to proceed.

(33 U.S.C. 1383)

SEC. 604. ALLOTMENT OF FUNDS.

(a) FORMULA.—Sums authorized to be appropriated to carry out this section for each of fiscal years 1989 and 1990 shall be allotted by the Administrator in accordance with section 205(c) of this Act.

(b) RESERVATION OF FUNDS FOR PLANNING.—Each State shall reserve each fiscal year 1 percent of the sums allotted to such State under this section for such fiscal year, or $100,000, whichever amount is greater, to carry out planning under sections 205(j) and 303(e) of this Act.

(c) ALLOTMENT PERIOD.—

(1) PERIOD OF AVAILABILITY FOR GRANT AWARD.—Sums allotted to a State under this section for a fiscal year shall be available for obligation by the State during the fiscal year for which sums are authorized and during the following fiscal year.

(2) REALLOTMENT OF UNOBLIGATED FUNDS.—The amount of any allotment not obligated by the State by the last day of the 2-year period of availability established by paragraph (1) shall be immediately reallotted by the Administrator on the basis of the same ratio as is applicable to sums allotted under title II of this Act for the second fiscal year of such 2-year period.

None of the funds reallotted by the Administrator shall be reallotted to any State which has not obligated all sums allotted to such State in the first fiscal year of such 2-year period.

(33 U.S.C. 1384)

SEC. 605. CORRECTIVE ACTION.

(a) NOTIFICATION OF NONCOMPLIANCE.—If the Administrator determines that a State has not complied with its agreement with the Administrator under section 602 of this Act or any other requirement of this title, the Administrator shall notify the State of such noncompliance and the necessary corrective action.

(b) WITHHOLDING OF PAYMENTS.—If a State does not take corrective action within 60 days after the date a State receives notification of such action under subsection (a), the Administrator shall withhold additional payments to the State until the Administrator is satisfied that the State has taken the necessary corrective action.

(c) REALLOTMENT OF WITHHELD PAYMENTS.—If the Administrator is not satisfied that adequate corrective actions have been taken by the State within 12 months after the State is notified of such actions under subsection (a), the payments withheld from the State by the Administrator under subsection (b) shall be made available for reallotment in accordance with the most recent formula for allotment of funds under this title.

(33 U.S.C. 1385)

SEC. 606. AUDITS, REPORTS, AND FISCAL CONTROLS; INTENDED USE PLAN.

(a) FISCAL CONTROL AND AUDITING PROCEDURES.—Each State electing to establish a water pollution control revolving fund under this title shall establish fiscal controls and accounting procedures sufficient to assure proper accounting during appropriate accounting periods for—

(1) payments received by the fund;

(2) disbursements made by the fund; and

(3) fund balances at the beginning and end of the accounting period.

(b) ANNUAL FEDERAL AUDITS.—The Administrator shall, at least on an annual basis, conduct or require each State to have independently conducted reviews and audits as may be deemed necessary or appropriate by the Administrator to carry out the objectives of this section. Audits of the use of funds deposited in the water pollution revolving fund established by such State shall be conducted in accordance with the auditing procedures of the General Accounting Office, including chapter 75 of title 31, United States Code.

(c) INTENDED USE PLAN.—After providing for public comment and review, each State shall annually prepare a plan identifying the intended uses of the amounts available to its water pollution control revolving fund. Such intended use plan shall include, but not be limited to—

(1) a list of those projects for construction of publicly owned treatment works on the State's priority list developed pursuant to section 216 of this Act and a list of activities eligible for assistance under sections 319 and 320 of this Act;

(2) a description of the short- and long-term goals and objectives of its water pollution control revolving fund;

(3) information on the activities to be supported, including a description of project categories, discharge requirements under titles III and IV of this Act, terms of financial assistance, and communities served;

(4) assurances and specific proposals for meeting the requirements of paragraphs (3), (4), (5), and (6) of section 602(b) of this Act; and

(5) the criteria and method established for the distribution of funds.

(d) ANNUAL REPORT.—Beginning the first fiscal year after the receipt of payments under this title, the State shall provide an annual report to the Administrator describing how the State has met the goals and objectives for the previous fiscal year as identified in the plan prepared for the previous fiscal year pursuant to subsection (c), including identification of loan recipients, loan amounts, and loan terms and similar details on other forms of financial assistance provided from the water pollution control revolving fund.

(e) ANNUAL FEDERAL OVERSIGHT REVIEW.—The Administrator shall conduct an annual oversight review of each State plan prepared under subsection (c), each State report prepared under subsection (d), and other such materials as are considered necessary and appropriate in carrying out the purposes of this title. After reasonable notice by the Administrator to the State or the recipient of a loan from a water pollution control revolving fund, the State or loan recipient shall make available to the Administrator such records as the Administrator reasonably requires to review and determine compliance with this title.

(f) APPLICABILITY OF TITLE II PROVISIONS.—Except to the extent provided in this title, the provisions of title II shall not apply to grants under this title.

(33 U.S.C. 1386)

SEC. 607. AUTHORIZATION OF APPROPRIATIONS.

There is authorized to be appropriated to carry out the purposes of this title the following sums:

(1) $1,200,000,000 per fiscal year for each of fiscal year 1989 and 1990;

(2) $2,400,000,000 for fiscal year 1991;

(3) $1,800,000,000 for fiscal year 1992;

(4) $1,200,000,000 for fiscal year 1993; and

(5) $600,000,000 for fiscal year 1994.

IHP-VI Technical Document in Hydrology N° [in press]
UNESCO Working Series SC-2006/ [in press]

A Preface

This publication dealing with educational aspects linked to ecologically sustainable sanitation (referred to as ecosan) is the result of a substantive collaborative effort between UNESCO's International Hydrological Programme (IHP) and the German Technical Cooperation Agency GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit GmbH, Eschborn). The reader will find below some relevant background information that should prove useful to grasp more clearly the nature and scope of the publication.

Urban water issues have been addressed by the IHP for over twenty years and along with groundwater can be considered one of the oldest topics covered by IHP. However, the initial urban water programmes had little in common with contemporary challenges, which consider the sustainable management of water resources with due consideration of social and institutional issues. The aspects considered by IHP have thus gradually changed so as to arrive to today's approach. This development applies not only to urban water but also, in general, to the whole IHP. With the change of approach of the IHP, new aspects came into the picture, but these constituted an evolution in broadening the thematic scope without lessening the focus on sound science.

This innovative approach needs to be considered in order to fully understand the scope and the spirit in which this report has been conceived. The first historical development concerned the aspects of management since it had become apparent that science and management couldn't be separated. The initial focus, concentrating on scientific aspects, was expanded by adding environmental, particularly ecological, fields. With the introduction of environmental considerations anthropogenic aspects naturally followed. Thus, human attitudes in their eco-sociological context had to be included. A further step was to place the natural system in proper relation with man-made changes and to recognise the vulnerability of natural systems. Risk analysis helped to understand the fragility of nature and to propose remedial actions.

The Sixth Phase of IHP (2002-2007) "Water Interactions: Systems at Risk and Social Challenges", currently under execution, considers five major themes: (1) Global Changes and Water Resources; (2.) Integrated Watershed and Aquifer Dynamics; (3) Land Habitat Hydrology; (4) Water and Society; and (5) Water Education and Training. Theme 3 considers to water management in specific settings including a focal area on "Urban Areas and Rural settlement" which addresses different aspects of urban water management issues through specific projects.

In addition, one major activity channels the technical and scientific elements developed in connection to these urban water related projects into the context of education and training. The purpose is to offer in an integrated fashion the educational tools to enable training activities. The elements thus developed carry a dual purpose, one is to transmit knowledge relevant to a concrete field and the other is to provide the appropriate educational frame for this purpose.

In order to demonstrate the usefulness of this dual approach, a specific area has been selected: that of ecologically sustainable sanitation, ecosan. While ecosan clearly has the potential to become a promising alternative, for the developed and developing world alike, there is still a large gap on transmission of the relevant knowledge and capacity building on how to apply ecologically sustainable sanitation.

In these circumstances, IHP and GTZ identified their common interests and agreed on a joint venture to produce this publication. In this pursuit, IHP, GTZ and other ecosan partners held several meetings (Eschborn, May 2004; Paris, September 2004; Paris, February 2005; Delft, May 2005) and a concluding workshop in Paris, September 2005 in order to prepare this document.

The publication is largely derived from an ecosan source book issued by the GTZ in 2003 with regard to the first three chapters. The chapters on research and development as well as on education and training fully constitute innovation. IHP wishes to recognise a large number of contributors and reviewers but in particular is grateful to the main authors: Dr. A.R. Panesar, Mrs C. Werner, Dr. E. von Münch, Prof. C. Maksimovic, Mrs. A. Scheinberg, Prof. R Schertenleib, Mr. P. Bracken, and Mr. W.H. Gilbrich. The authors themselves wish to express their appreciation for UNESCO's interest and material help by arranging for meetings and consultancies. Mr. J.A. Tejada-Guibert, the project manager on behalf of UNESCO, with the assistance of Mrs. B. Radojevic, took charge of the corresponding technical-administrative duties.

Feedback on a first draft of this publication was given from many members of the wider working group. Detailed comments were received from J. Kalbermatten, A. Cordova, D. Lapid, A. Papa-Fall, N. Raeth, M. E. de la Pena, L. Yang, E. K. Menger-Krug, J. Lehn and C. Kotz. Substantial text contributions were made by Arno Rosmarin and Jan Olof Drangert for Chapter 4 and by John Kalbermatten for the whole text. Final editing of the text has been undertaken by Arne Panesar, Christine Werner, Wilfred Gilbrich and Patrick Bracken.

Material for the Annex came from a large number from organisations, including EcosanRes (Sweden), WASTE (The Netherlands), UNESCO-IHE (The Netherlands), EcosanClub, (Austria), International Ecological Engineering Society (Switzerland), University of Agricultural Sciences (Norway), Technical University Hamburg Harburg (Germany), University of Science and Technology Beijing (China).
A helpful restructuring and mid-way re-editing of the text was undertaken by Anne Scheinberg (WASTE).

UNESCO and GTZ financed in large measure the production of this document. Additional in-kind contributions were made by WASTE, and Eawag/Sandec, EcoSanRes and UNESCO-IHE and are all gratefully acknowledged.

An ecosan-resource CD has been developed parallel to this publication and includes material from a range of organisations. It can be found attached to this publication or obtained via ecosan@gtz.de

For UNESCO the achievement of the sanitation Millenium Development Goals (MDGs) is one of the major challenges for sustainable development in the next decade. With this publication emphasis is put on education and research for ecologically sustainable sanitation to contribute in reaching this goal and to the achievement of the paradigm shift towards a holistic view on sustainable sanitation.

Paris, January 2006

Dr. András Szöllösi-Nagy

Director of UNESCO's division of water sciences
Secretary of UNESCO's International Hydrological Programme (IHP)
Deputy Assistant Director-General of the Natural Sciences Sector of UNESCO

B Table of Content

C Executive Summary

The basic concept of collecting domestic liquid waste in water-borne sewer systems, treating the wastewater in centralised treatment plants and discharging the effluent to surface water bodies became the accepted, conventional approach to sanitation in urban areas in the last century. Although these conventional sewer systems have significantly improved the public health situation in those countries that can afford to install and operate them properly, the large number of people, particularly in the developing world, who still do not have adequate access to adequate sanitation is a clear indication that the conventional approach to sanitation is likely to be unable to meet needs universally.

The conventional sewer system was developed at a time, in regions, and under environmental conditions that made it in many cases an appropriate solution for removing liquid wastes from cities. Today with increased population pressure, changes in consumer habits and increasing pressure on freshwater and other resources, this human waste disposal system is no longer able to meet the pressing global needs and ideas of recycling have been developed.

A few decades ago it thus became a priority to:

- Identify appropriate simple, affordable decentralised sanitation systems and promote their adoption
- Implement appropriate technologies with the participation of the communities to be served, and
- Focus on health and hygiene education so that physical facilities would be properly used and maintained, and that hygienic behaviour would support the improvements brought about by the infrastructure.

Over the years, it became clear however that this health and hygiene driven paradigm shift was still incomplete: In practice faecal sludge management problems where often overlooked, as were negative downstream effects off effluents from sewer systems. Protection of the environment, resource conservation and waste reuse remained secondary concerns at best, or were neglected entirely, and operational problems reduced the health improvements expected of the technologies.

In the concept of ecological sanitation (ecosan) not only health issues but also conservation of water and other resources as well as the protection of aquatic ecosystems are taken into consideration. The ecosan approach places the emphasis on the hygenisation of the contaminated flow streams, and shifts the concept from waste disposal to resource conservation and safe reuse.

In addition to paying particular attention to the health aspects at household level, ecosan also emphasises:

- The destruction of pathogens through flow stream separation, containment and specific treatment.
- Resource conservation through a reduced use of potable water as a transport medium for human waste and by recovering wastewater for irrigation
- The elimination or minimisation of wastewater discharges to the environment
- The need to close the resource loops through the productive use of the nutrients contained in excreta

The modern ecosan concept thus represents the culmination of the paradigm shift initiated in response to satisfying the health needs of unserved, mostly poor population groups.
Education has a clear role to play, both in acknowledging the paradigm shift in sanitation and in incorporating the interdisciplinary theme of innovative sustainable sanitation systems into teaching curricula. Education on ecosan should enable the people to develop, plan and implement eco-sanitation systems that are hygienically safe, socially acceptable, economically feasible, environmentally sound and technically appropriate.

Educational institutions, universities, and technical schools can contribute to the mainstreaming of the new sanitation paradigm by fully integrating the discourse and criteria for sustainability into their curricula. They should make clear that defining criteria for sustainable sanitation is a political act and influences what is the accepted, legitimate form of sanitation, including the impacts from sanitation on other sectors. Sanitation capacity building should take the stakeholders in a sanitation project not as objects, but as partners for jointly developing sustainable sanitation solutions.

The education system has to prepare students to think about urine and faeces and grey/black water as resources. Emphasis has to shift from the simple disposal to the hygienisation of contaminated flow streams, and to resource conservation and safe reuse. Teaching must make clear that health and a healthy environment is a prerequisite for human productivity, and productivity determines economic well being.

Sanitation engineers and practitioners, policymakers, managers, and operators get their ideas and information during their education. Therefore the curricula of universities, continuing education programmes, technical schools, research institutes and training centres have to include the ecosan philosophy. Thus several objectives, such as the improvement of human health, poverty reduction in developing countries, the conservation of natural resources and sustainable water and sanitation management systems in both, industrialised and developing countries may be addressed. Those responsible for the content of curricula should be informed about the new developments in this field.

The present publication therefore constitutes a means of providing educational tools, up grading existing ones, and suggesting revised teaching plans. The educational platform being developed under IHP auspices could serve as an opportunity to include ecosan-related subjects in modernized course curricula.

Many proven technical elements are available for ecological sanitation systems and the number of pilot demonstration and research projects, and of large scale applications is continuously increasing.
The pilot research and demonstration projects should showcase innovative solutions in a variety of climatic, social, cultural, economic and geo-morphological contexts, and should enable the development of a series of model solutions covering the whole range of sanitation needs.

However, given the broad variety of local framework conditions and the large number of open question in this complex interdisciplinary field, there is still a great need to further develop technical and operational solutions and to enlarge the knowledge base with respect to public health, risk management, economics, logistics, material-flow-streams, socio-cultural and many other aspects. Research in these disciplines will require trans-sectoral and interdisciplinary co-operation and inputs from a range of research fields.

Research should concentrate on comparative studies between a range of conventional and innovative solutions comparing them against a set of sustainability criteria. It should also help in developing field tested and proven sustainable sanitation components and systems, and contribute to forming a knowledge base for drawing up technical standards. Documentation and case studies for innovative sanitation solutions should be easily made available in a uniform comprehensive format, and technical information for components of innovative sanitation solutions should be provided to accelerate their dissemination.

The achievement of the sanitation MDGs is one of the major challenges for sustainable development in the next decade. Putting emphasis on education and research for ecologically sustainable sanitation may largely contribute to reaching this goal.

1 Motivation: The new development paradigm - Millennium Development Goals and the Johannesburg Plan

Box 1: Millennium Development Goals and the Johannesburg Plan

The **Millennium Development Goals** aim to:

- Eradicate extreme poverty and hunger
- Achieve universal primary education
- Promote gender equality and empower women
- Reduce child mortality
- Improve maternal health
- Combat HIV / AIDS, malaria and other diseases
- Ensure environmental sustainability
- Develop a global partnership for development

With particular regard to water issues the goal of ensuring environmental stability the United Nations adopted the target of halving the proportion of people without sustainable access to safe drinking water by 2015.

(United Nations 2000: United Nations Millennium Declaration – September 2000)

Johannesburg Plan of Implementation

In the Johannesburg Plan of Implementation the goals of the United Nations Millennium Declaration were reaffirmed and further elaborated. With respect to the MDGs and water supply and sanitation they aim to:

(1) Halve, by 2015, the proportion of people without access to safe drinking water – thus reaffirming the target set in the Millennium Development Goals.

and

(2) Halve, by 2015, the proportion of people who do not have access to basic sanitation.

(United Nations 2002: Key commitments, targets, and timetables from the Johannesburg plan of implementation)

For many years, the international focus has been to provide safe drinking water supply. The Millennium Development Goals (MDGs) however represent a clear commitment to address sanitation with the same priority as water supply.

An analysis of existing data on global sanitation coverage from most recent international reports (e.g.UN 2005) reveals that the backdrop in sanitation provision is highest among the development goals. The UN Millennium Project Task Force on Water and Sanitation's Final Report (UN Millenium Project 2005) urges governments and stakeholders to move the sanitation crisis to the top of the international agenda.

How best to achieve the Millennium Development Goals has been recently discussed in the report “Health, dignity, and development: what will it take?” (UN Millenium Project 2005). Hans Olaf Ibrek, Member of the MDG Task Force on Water and Sanitation points out during the launching of the report: “Efforts to reach Target 10 must focus on sustainable service delivery, rather than construction of facilities alone”.

The world-wide endorsement of the millennium development goals calls for a radical re-thinking of the conventional, accepted approaches to urban infrastructure in general and sanitation in particular. Only a change in the basic paradigm from linear flow streams and disposal towards a cycle oriented management of renewable resources has the potential to deliver the kind and degree of change which the millennium development goals demand. While the new paradigm is partly in place and implemented in solid waste management, energy, and agriculture (to name a few leaders), the process of paradigm shift in sanitation is still in its infancy. Just how difficult it is to change from conventional approaches to better alternatives is demonstrated by the fact that forward looking engineers proposed to move from the linear to circular systems of managing water and wastewater (including excreta, and rainwater) back in the 1970s (Shaeffer and Stevens 1983). Today, 30 odd years later, the circular approach remains the exception.

This paper looks at this paradigm shift in sanitation in three ways. First, the paper focuses on the necessary changes in the sanitation system itself, and presents a vision of the new paradigm and its impact on the sectors related to water and sanitation (e.g. health and hygiene, solid waste and wastewater management, water resources management, natural resources management, environment, agriculture, urban planning, poverty reduction, food security, job creation, micro and macro economic development). The second focus is the education system, especially as it relates to the training of water- and environmental professionals and practitioners, as well as to brief and influence policy makers. The third relates to other aspects of knowledge management besides education: research, case studies, and also to the discourse around sanitation.

2 Introduction: education and the paradigm shift in sanitation

The paradigm shift in sanitation has not yet made structural inroads into the professional and university educational system. There is an urgent need for a different approach to professional and scholarly sanitation education and training, an approach that takes into consideration the need for holistic solutions, thus comprising all dimensions of sustainability, from health and socio-technical aspects to natural resources management, agriculture, micro- and macro-economics and institutional aspects. The current educational and training infrastructure is failing the field of sanitation and development in primarily two ways:

- most institutions uncritically continue to offer curricula in the basics of centralised sewered sanitation and end-of-pipe wastewater treatment and disposal, continuing to turn out sanitation engineers and planners whose education and training has led them to believe that this is the only adequate and serious approach; and
- despite almost 20 years of practice in participatory and holistic interdisciplinary planning approaches, the basic framework of education and training in sanitation (like that in other urban environmental fields) remains narrowly focused on the technical aspects, so that neither students nor scholars are learning the basic process skills to arrive at sustainable solutions.

There are three identifiable problems in relation to sanitation and education.

1. Sanitation is failing in sustainability and in serving the world‘s poor. The current sanitation paradigm delivers neither equity nor sustainability. There are alternatives, but they are neither fully developed nor fully legitimatised.
2. Education is failing in adapting to the required changes in the sanitation system. While the sanitation system is in transition, the educational system remains fixed on the old paradigm, with the result that young professionals look backwards towards 20th century models, rather than forwards towards a sustainable future.
3. Knowledge management in the urban environment is outdated and obsolete. Failures to support the new sanitation paradigm can be found in abundance in the areas of research, development, documentation, and the sanitation discourse – that is, in the area of knowledge management in sanitation. These failures compound and reinforce the failures in the education system, rather than challenging and counteracting them.

Each of these failures is further developed in the section below.

2.1 Sanitation is failing in sustainability

2.1.1 Sanitation and the world water crisis

The problems raised by the decreasing quality and quantity of fresh water resources are becoming increasingly serious. All indicators show that the world is facing a serious world water crisis which will affect all of us, but particularly the poor. The poor suffer most from this decrease in fresh water resources, and bear the brunt of water-related diseases and a damaged environment. This water crisis is in part a direct result of the failure of the current sanitation paradigm. Sewered sanitation, established in the era of European urbanisation in the 1870s, has the status of a widely accepted solution, or scientific truth. There is little discussion about its core problems, which result in health and environmental problems around the world. The fact that our current sanitary systems are, for the most part, directly connected to the water cycle requires that both the sanitation and water crises be considered, before we can begin trying to de-couple them.
A look at some of the figures of both these crises provides an insight into the scale of the problem facing us today:

- The estimated mortality rate as a result of illnesses caused by contaminated drinking water and poor sanitation and hygiene in developing countries is approximately 2.2 million people per year, most of them children under the age of five (WHO/UNICEF JMP 2000)
- An estimated 2.6 billion people, representing almost half of the world population do not have access to adequate sanitation / wastewater treatment facilities (WHO/UNICEF JMP 2005)
- 1.1 billion people do not have access to safe drinking water (WHO/UNICEF JMP 2005)
- In the developing regions of the world between 100% (Africa) and 65% (Asia) of the urban wastewater are not treated appropriately (WHO/UNICEF JMP 2000)
- 80 % of all diseases and 25 % of all deaths in developing countries are caused by polluted water (UN 1992)
- World-wide, over 200 million people were infected with schistosomiasis and intestinal helminths, of which 20 million suffered serious illness, most of them children under the age of 5 (WHO 2003)

The current global population is expected to increase by 2 billion people, to 8 billion, within the next 25 years. Most of these people will be born in developing and emerging market economies and will live in urban areas. Without a concerted effort, many of these people are doomed to poverty and will increase the number of those lacking basic water and sanitation services.

The United Nations Summit on Sustainable Development, held in Johannesburg, South Africa, in autumn of 2002, returned to the targets set by the Millennium Development Goals with regard to water supply and extended it to also include the provision of sanitation. The current international target is therefore to halve the proportion of people without access to safe drinking water and to adequate sanitation by 2015.

2.1.2 Limitations of conventional sanitation systems

Conventional sanitation systems, based on water-borne sewerage, are the accepted manner for removal of human waste from cities. However, in recent years they have proven to be unable to make a significant impact on the backlog of nearly half of the world's population. Moreover, even if a sufficient investment could be made, so that conventional sanitation systems could be provided to address who lack access to adequate sanitation, the resulting sanitation systems would not be sustainable.

In many places, sewered sanitation results in polluted ground and surface waters. It can therefore lead to a whole new series of problems. In India, the idea of every person having their own car brought to the public eye vivid images of a social and environmental catastrophe. Today, the idea of every family having access to a flush toilet evokes images of a much greater disaster, as this would both sharply increase drinking water consumption, and lead to increased water pollution and health hazards (Narain 2004; Werner et al. 2003b).

Water-borne sewer systems

"Modern" water-borne sewer systems are a relatively new technology, which only began to spread in European cities from around the end of the 19th century, when piped water supplies and the use of flush toilets lead to an increased water consumption, and wastewater production. This led to streams and stagnant pools of wastewater in city streets, causing outbreaks of cholera and other diseases. To tackle this problem, sewer systems were gradually introduced. Later, when this was seen to cause serious water pollution, step by step mechanical wastewater treatment plants, biological treatment for the degradation of organic substances, and tertiary treatment for the removal of nutrients were added to reduce the pollution and resulting eutrophication of the receiving water bodies. These now represent the present state-of-the-art in wastewater treatment.

Such wastewater treatment plants have improved the hygienic situation in a large number of urban areas, particularly in those where water is in abundant supply, treated wastewater can be relatively harmlessly disposed of, and the costs of operation and maintenance can be assured. When built and functioning correctly, conventional water-borne sewers and treatment plants allow a relatively well assured hydraulic transport of excreta, used water and rainwater away from urban areas. They also help avoid the pollution of surface waters within urban areas, which are often a source of health and

environmental problems. This very obviously improves the hygienic situation of those inhabitants of urban areas being served by well functioning sewer systems.

However, due mainly to a lack of adequate human and financial resources, these systems cannot be correctly operated in many countries in north and south. As a result, improvements in the sanitary situation in sewered areas of towns (which most often cover the wealthier section of the population) often directly lead to a deterioration in the sanitary situation in surrounding, unsewered, and usually poorer, neighbourhoods, as sewage is often discharged with little or no treatment into water bodies. Poorer communities are often exposed to these contaminated waters in their every-day life, perhaps using them as a source of drinking or washing water or during flooding. These problems become particularly serious when there is a rapid increase in the urban population.

Conventional centralised systems require a huge financial investment, and have relatively high maintenance and operation costs. The difficulties caused by these expenses do not only prevent developing nations from correctly building and operating centralised sanitation systems, but industrialised nations also face huge problems in the maintenance and operation of their sewer systems and treatment plants. In Latin America less than 20% of the wastewater collected is actually treated, whilst in Europe, of 540 major cities, only 79 have advanced tertiary sewage treatment, 223 have secondary treatment, 72 have incomplete primary treatment and 168 cities have no or an unknown form of treatment of their wastewater (EcoSanRes 2005a).

Outside of the cost considerations, conventional water-borne sanitation systems have further fundamental shortcomings. As water is used to transport the wastes, they have a high water-consumption, making them unsuitable in the long term for regions with water scarcity. In many places this has already led to an over-exploitation of the limited renewable water resources. Overuse is resulting in drinking water becoming an expensive good, only available to the better off, who are usually connected to the central water supply and receive piped water at such a low price that flushing it down the toilet does not seem to be a worry. Clean drinking water is too precious a resource to be flushed down the toilet, and the use of flush toilets in areas where the water supply only operates for a few hours per week clearly makes no sense.

Even if such systems contribute to a healthier environment in the cities where they are installed, they do the opposite for those living downstream. When functioning properly, the discharge from conventional wastewater treatment plants is still not safe from a health point of view, failing to meet the quality requirements of bathing water, if the dilution is not sufficient. Conventional treatment plants have been developed for the removal of large particles, biodegradable organic substances and nutrients in order to protect receiving waters. The reduction of pathogenic organisms is, however, insufficient.

The effluent from these plants also contains other potentially dangerous substances. For example, recent research has highlighted the effects of endocrine substances, contained in human excreta, on fish populations, reducing their fertility, and even changing the sex of male trout. The effects of pharmaceutical residues in the effluent and their impact on the environment and humans living downstream who obtain their drinking water from the same river are also being discussed. For combined sewer systems (carrying both storm water and wastewater), a further problem, is that heavy rainfall generally leads to the diluted wastewater being discharged untreated directly into rivers as treatment plants are only designed for a limited influent.

Shortcomings of "conventional" pit toilets

Conventional on-site sanitation systems have been used for centuries to provide excreta disposal at the household level. There are two basic types, dry systems (pit toilets) and water based systems (flush toilets). The former have been used in the “North” until the mid 19th century, when water-borne sewerage started its triumphal march across industrialized nations and became the accepted standard for excreta disposal worldwide. Given the limited financial means of most developing countries, the pit toilet has remained their principal means of excreta disposal except for their well to do classes who are often provided with government subsidised sewerage systems. On-site pour flush toilets are today popular and widely used in South-Asia, especially in India.

Neither pit toilets nor pour flush toilets development included resource recovery as part of their function. Indeed, the health impact of underground waste disposal, particularly its impact on groundwater, was rarely considered. Fortunately, pathogenic organisms as a rule, did not survive in the ground, and in any event did not travel very far. However, the increasing density of populations meanwhile often has led to situations where the required minimum distance between drinking water well and pit toilets can not be respected.

In many densely populated areas, for example in Dakkar, the capital of Senegal, the use of pit toilets has also led to nitrate concentrations in groundwater, which exceed the maximum level recommended by the WHO for drinking water and which have been linked to serious health problems, particularly for babies. This became a concern when low income societies adopted the western custom of bottle feeding their babies, thus exposing them to the danger of methemoglobinemia (blue baby syndrome).

Shallow groundwater is still a major source of water supply in rural and peri-urban areas, especially for the poor. The design of the conventional “drop and store” pit-toilet (and of most other on-plot systems) pollutes this precious groundwater as it deliberately aims to retain only solid matter in the pit and infiltrates as much of the liquids as possible into the subsoil. As these liquids contain all the soluble elements of the excreta as well as viruses and pathogens, this type of sanitation, depending on the hydro-geological situation, can be a highway to groundwater contamination.

Pit toilets should be emptied when they are full, with the content being treated before being put to any other use (e.g. in agriculture). In practice, however, faecal sludge management aspects are often overlooked and old pits are often simply abandoned, with users preferring to dig a new pit toilet than to attempt the unpleasant job of emptying the old one.

For a household, digging a new pit, and providing a new superstructure each time the old pit is full, can prove to be an expensive business. This is added to by the difficulty faced by homeowners living in densely populated areas, where plots are small and tend to already be crowded with old, previously abandoned pits. Many conventional latrines also smell quite badly, are a breeding place for flies, insects and other vectors and are very inconvenient to use, especially for children, women and girls, as they have to be built at a distance from the house, making night-time visits highly undesirable. Added to this are the problems of pit construction in areas with a high groundwater table, or where the ground is rocky, making the use of a pit extremely impractical. Pits are also susceptible to flooding during heavy rainfall and subsequent collapse.

Project Box 1: The Durban experience, South Africa (Macleod 2005)

The Municipality of eThekwini (Durban), South Africa, is aware that emptying full toilet pits is a difficult and costly task. Here the municipality had given the task of emptying pit toilets to a private service provider, however the cost of emptying the pit often exceeded 1.000 Rand (or 135 EUR) per pit toilet. These costs were a result of several factors, including the inaccessibility or precarious location of many of the toilets, and the heterogeneous nature of the contents which included rags, household refuse, and plastic bags, which made pumping extremely difficult. The emptying cost were seen as being unacceptably high as the price of a new pit toilet was between 1.000 and 3.000 Rand.

Figure 1: Emptying conventional pit toilets required special equipment (left picture) and turned out to be extremely costly - often exceeding 1000 Rand per pit. The urine diversion dehydration toilet (right picture) was selected by the communities as preferred solution after extensive awareness raising measures (Macleod 2005).

As a result alternative, innovative sanitation systems, with higher initial installation costs but lower running costs, became increasingly economically interesting. After extensive community education and awareness raising in the peri-urban and rural communities, and after a number of different options of toilet designs were constructed and demonstrated to the communities, they decided upon the “double vault urine-diverting dehydration toilet” (overall construction cost in Durban around 3.500 Rand), with emptying offered by a private service provider for 25 Rand (or 3-4 EUR) per toilet.

The criteria against which the different toilet designs were measured included: (1) Construction and maintenance costs; (2) Ease of emptying by the household, or at an affordable price by a service provider; (3) Environmental sustainability; (4) Compatibility with the available water supply (preferably requiring no water for its effective use); (5) Acceptability to the communities using the toilets.

Over 20.000 double vault urine-diverting dehydration toilets have been installed in eThekwini with some having been in use for a sufficiently long period of time to prove that emptying them is not a problem. Currently research projects are underway to analyse how to make best use of the nutrients collected by the toilets in the given context.

Lack of attention to macro-nutrient cycling

Our conventional wastewater systems are largely linear, end-of-pipe systems where drinking water is misused to transport waste into the water cycle, causing environmental damage and hygienic hazards, and contributing to the water crisis. If we continue to promote these technologies in order to meet the Millennium Development Goals, the overall result could be disastrous as the hygienic situation of our waters would be further deteriorated and even more resources would be dissipated and introduced into water bodies.

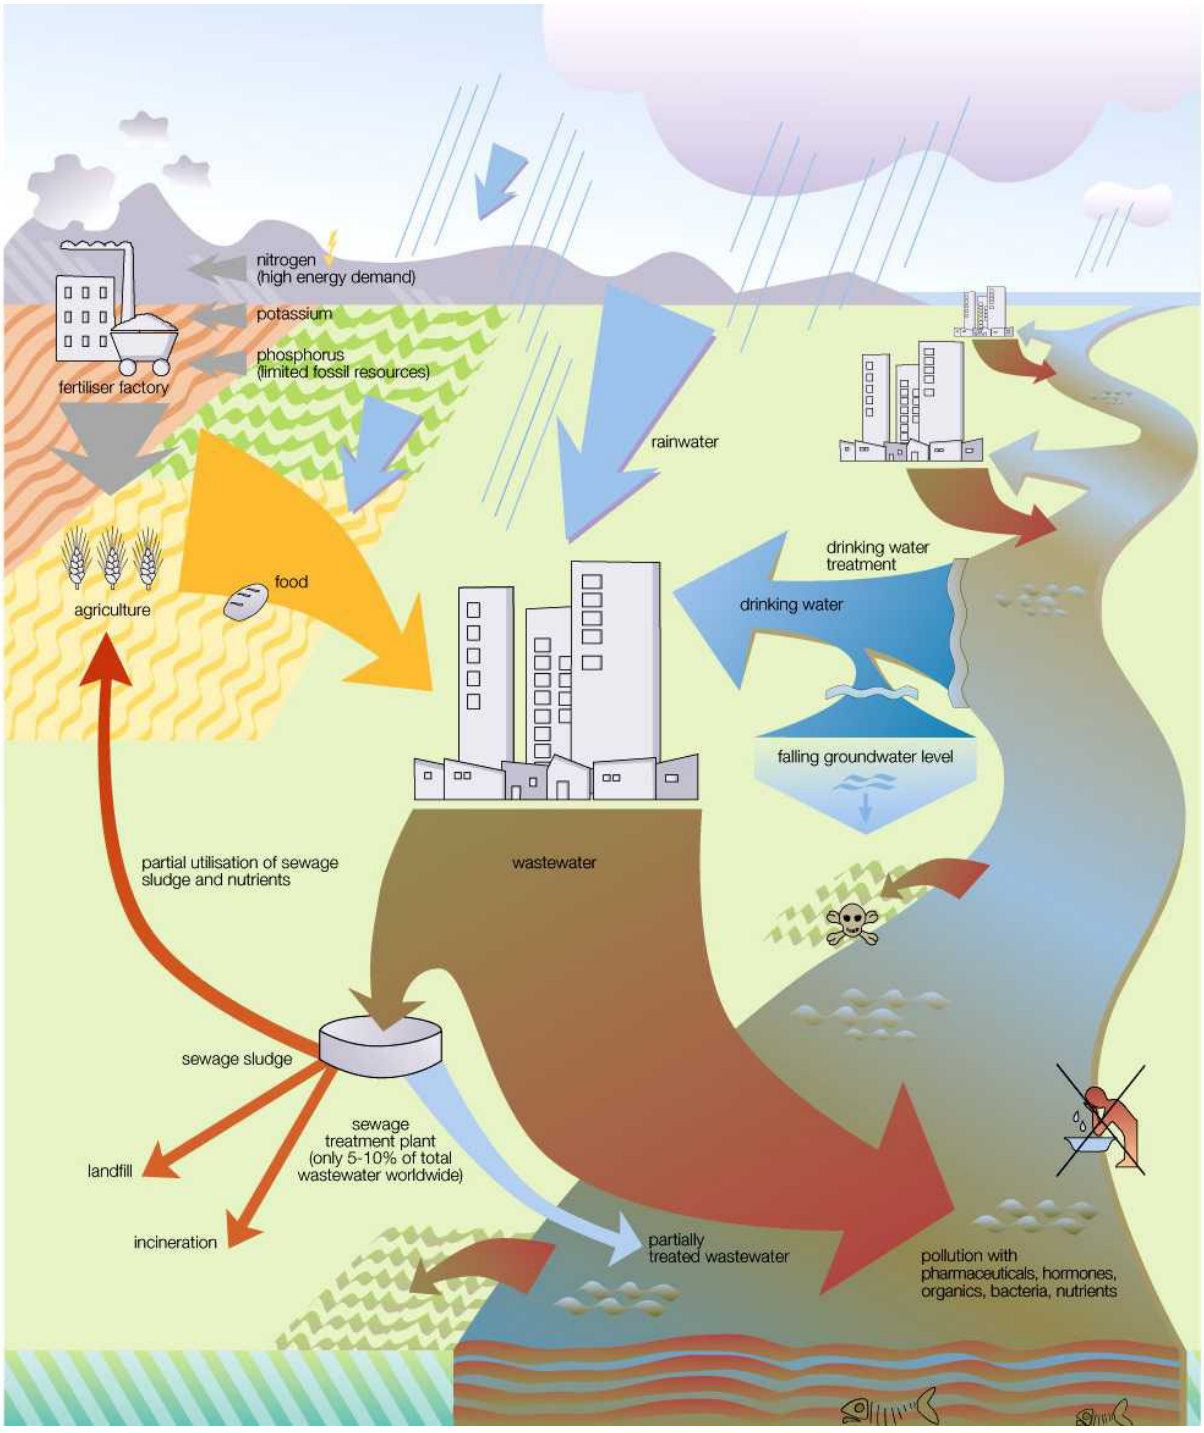

Figure 2: Schematic illustration of the main limitations of conventional wastewater management systems (GTZ)

While the above are serious disadvantages of both water-borne and dry conventional sanitation systems, a far more fundamental problem is that they do not facilitate the reuse of macro and micro nutrients present in excreta and wastewater. This lack of nutrient recovery and -use leads to a linear flow of nutrients from agriculture, via humans to recipient water bodies. The valuable nutrients and trace elements contained in human excrement are very rarely re-channelled back into agriculture in conventional systems. Even when sewage sludge is used in agriculture, only a very small fraction of the nutrients contained in the excrement are reintroduced into the living soil layer. Most are either

destroyed in the treatment process (e.g. by nitrogen elimination) or enter the water cycle, where they pollute the environment, causing the eutrophication of lakes and rivers.

Not returning the nutrients to the soil has led to a situation where there is an increasing demand for chemical fertilisers, in response to the problem of decreasing soil fertility. To produce the required chemical fertilisers, large amounts of energy are needed, and finite mineral resources, such as phosphorous, must be exploited. Current estimates say that phosphorous reserves will be exhausted in between 60 and 130 years at the present rate of consumption (Rosemarin 2004). The relatively inexpensive phosphorous used today will almost certainly cease to exist in the next 50 years. Farmers around the world yearly require 135 Mio. tons of mineral fertiliser for their crops, while at the same time conventional sanitation dumps 50 Mio tons of fertiliser equivalents flows into our water bodies - nutrients with a market value of around 15 Billion US dollars. Figure 2 schematically illustrates the main limitations of conventional wastewater management systems.

2.1.3 Conclusion

The current sanitation paradigm is failing the world, with the poor suffering most, threatening the integrity of fresh water supplies, and in general creating unsustainable linear flows that can ultimately make life on earth difficult or no longer feasible. The problems with conventional sanitation are fundamental, and a radically different approach is needed. Ecological sanitation, presented in Chapter 3, represents a different paradigm, one that offers a path out of the current vicious circles of water over-consumption and undervaluing by the rich, lack of access to safe water and sanitation and high costs for the poor, water and environmental pollution and depletion of nutrients.

2.2 Education is failing the sanitation system

In spite of the serious problems with the conventional sanitation paradigm, educational institutions, universities, and technical schools continue to present it to new generations of students as the only legitimate form of sanitation. The problem is compounded by the fact that the training treats the sanitation system as the focus, and pure removal of faeces and urine (and the water that bears them) as the goal. The users are objectified, and their ideas and preferences are largely ignored. If the users of the sanitation system are considered at all, it is as objects of PR campaigns aimed at “changing behaviour”, “enforcing” payment or use norms, or “stimulating” compliance. The potential users of the recycling products are usually completely neglected (e.g. with regard to their quality and logistical requirements how the products reach the users). The conventional sanitation discourse as presented in engineering and technical schools simply does not accord the system users any status at all in the decision-making process, thus often leading to inappropriate expensive and/or unsustainable solutions.

The current education system also fails in preparing students to think about urine and faeces and grey/black water as resources. The emphasis, as one would expect in a removal-based approach is on their negative or dangerous physical, chemical, and biological characteristics, and not on their resource value as sources of nutrients, energy, or water for irrigation or other purposes. This is the reflection of an education system influenced by the culture of the North, where societies are wealthy and still behave, as if they could afford to have a linear attitude towards resources.

Problems in education for sanitation

Sanitation engineers and practitioners, policymakers, managers, and operators get their ideas and information during the education process. And here is one key problem: Curricula of Universities, continuing education programmes, technical schools, research institutes and training centres mostly continue to present conventional sanitation as the only legitimate approach. Indeed those responsible for the content of curricula are often even unaware of the new developments in this field.

2.3 Knowledge management in the urban environment needs to be updated.

Failures in the areas of research, development, documentation, and the sanitation discourse – that is, in the area of knowledge management in sanitation – compound and reinforce the failures in the education system, rather than challenging and counteracting them.

Research is still concentrated on the optimisation of centralised and unsustainable systems. It is e.g. proposed to burn sludge from centralised treatment facilities, to extract phosphorus from the ashes in a highly energy consuming process - instead of separating streams at the source by collecting phosphorous rich material like urine with urine separating devices (comp. below).

Development and applied research follows the same line. In Europe currently applied research is suggested for acceleration of providing up-to-date systems for the eastern European countries. The danger is that what happened in several cases in East-Germany (uncritical provision of costly and oversized centralised systems) will now be repeated in large scale in Eastern-Europe. Examples of environmental approaches in East-Europe are rare (Samwel and Gabizon 2005). However they illustrate, that neither the science community nor the exporting or local industry are equipped to facilitate the participatory processes necessary for the introduction of innovative sanitation solutions.

Documentation, criteria and case studies for innovative sanitation solutions are therefore urgently needed. A first start for such efforts can be seen in the GTZ-ecosan website, where demonstration projects from all over the world are presented in a uniform comprehensive format, and technical data sheets for components of innovative sanitation solutions are provided to accelerate their standardisation.

Textbooks and scholarly articles usually are restricted to the description of centralised sanitation systems or on-site pit toilets as described above. They usually do not address the interrelation between sanitation, agriculture, food-security and job-creation - hence the inter-sectoral approach needed to address the sanitation crisis in a holistic and sustainable way. A positive exception can be seen e.g. in a Swedish textbook for master students, with references to the Baltic Sea Basin situation (Hultman and Levlin 1999).

The discourse on sanitation in the urban environment, while largely dominated by the discussion of the conventional systems, is slightly changing in the recent years. Some impact can be noted e.g. for the conferences on ecological sanitation held in Bonn, Germany (2000), Nanjing, China (2001), Lübeck, Germany (2003), Durban, South Africa (2005). Holistic approaches to sanitation in Mega-cities get increasing attention, and were discussed e.g. during the meetings of the UN Commission on Sustainable Development (CSD) in 2004 and 2005 as well as during the Stockholm Water Week of the respective years.

Professional associations increasingly start addressing ecosan: The International Water Association (IWA) has since several years a specialist group on ecological sanitation and during the 4th IWA world-congress ecosan was an important topic. The Indian Water Works Association (IWWA) recently organised a larger international ecosan conference in Mumbai (Nov 2005) and is actively engaged in a series of ecosan projects in India. The German Water Association (DWA) has now put up several expert groups to focus on different aspects of ecosan, aiming at the provision of standards and reliable fact sheets for the innovative ecosan approach.

3 The new sanitation paradigm: ecological sanitation (ecosan)

In order to reach the MDGs and achieve sustainability in the field of wastewater management and sanitation, a new paradigm is clearly needed. This was the unanimous conclusion of a group of experts from a wide range of international organisations involved in environmental sanitation that met in February 2000 in Bellagio, Italy. The group called for a radical rethinking of conventional sanitation policies and practices world-wide. This group formulated the four "Bellagio Principles" the basis for a new paradigm and approach in environmental sanitation (SANDEC/WSSCC 2000a).

Box 2: The Bellagio Principles

The Bellagio Principles (2000)

(1) Human dignity, quality of life and environmental security at household level should be at the centre of the new approach, which should be responsive and accountable to needs and demands in the local and national setting.

- solutions should be tailored to the full spectrum of social, economic, health and environmental concerns
- the household and community environment should be protected
- the economic opportunities of waste recovery and use should be harnessed

(2) In line with good governance principles, decision making should involve participation of all stakeholders, especially the consumers and providers of services.

- decision making at all levels should be based on informed choices
- incentives for provision and consumption of services and facilities should be consistent with the overall goal and objective
- rights of consumer and providers should be balanced by responsibilities to the wider human community and environment

(3) Waste should be considered a resource, and its management should be holistic and form part of integrated water resources, nutrient flow and sanitation.

- inputs should be reduced so as to promote efficiency and water and environmental security
- exports of waste should be minimised to promote efficiency and reduce the spread of pollution
- wastewater should be recycled and added to the water budget

(4) The domain in which environmental sanitation problems are resolved should be kept to the minimum practical size (household, community, town, district, catchment, city) and wastes diluted as little as possible.

- waste should be managed as close as possible to the source
- water should be minimally used to transport waste
- additional technologies for waste sanitisation (sic) and reuse should be developed

These principles were endorsed by the members of the WSSCC during its 5th Global Forum in November 2000 in Iguacu, Brazil (SANDEC/WSSCC 2000b).

3.1 Ecosan, the new paradigm

The new paradigm in sanitation must be based on ecosystem approaches and the closure of material flow cycles rather than on linear, expensive and energy intensive end-of-pipe technologies. Sanitation systems are part of several cycles, of which the most important cycles are the pathogen-, water-, nutrient- and energy cycle. In order to ensure public health, sanitation approaches primarily aim at interrupting the life cycle of pathogens. In addition, the new approach is recognising human excreta and water from households not as a waste but as a resource that could be made available for reuse, especially considering that human excreta and manure from husbandry play an essential role in building healthy soils and are providing valuable nutrients for plants. While conventional sanitation restricts health security to the in-house environment and sometimes leads to a disastrous situation in the neighbourhood or the receiving water body, the new approach is aiming at sanitizing the products instead of exporting problems and apply a health oriented multi-barrier concept of treatment, crop-restriction and exposure control.

This approach, mostly addressed as “ecological sanitation” or ecosan offers an alternative to conventional sanitation. It is based on an overall view of material flows as part of an ecologically and economically sustainable sanitation system tailored to the needs of the users and to specific local conditions. It does not favour or promote a specific sanitation technology, but is rather a new philosophy in handling substances that have so far been seen merely as wastewater and water-carried waste for disposal. It carries with it a new approach to sanitation education, a new discourse, and a new way of managing knowledge.

Ecosan systems restore a remarkable natural balance between the quantity of nutrients excreted by one person in one year and that required to produce their food (7.5 kg nitrate, phosphorous and potassium to produce 250 kg of grain) and therefore can greatly help in saving limited resources. This is particularly urgent with regard to fresh water and mineral resources – for example current estimates for phosphorus state that economically extractable reserves risk to be exhausted in the foreseeable future. Ecosan does not favour a particular technology but is rather a philosophy in recycling oriented resource management and offers modern, convenient, gender friendly and desirable solutions, in accordance with the Bellagio Principles as formulated by the WSSCC (Water Supply and Sanitation Collaborative Council) (SANDEC/WSSCC 2000a).

The core principle of ecosan is to close the loop between sanitation and agriculture, enabling and bringing about “agricultural reuse”, along with other means of closing flow cycles.

Box 3: What is “agricultural reuse” in ecologically sustainable sanitation?

Ecosan approaches uniformly strive to close the nutrient loop between sanitation and agriculture, enabling an almost complete recovery of the nutrients, organic material and water discharegd in conventional sanitation systems. Closing nutrient loops and recycling organic material contributes to safeguarding soil fertility and improving its structure and water retention capacity, while providing a natural alternative to chemical fertilisers.

In ecosan, the term “agricultural reuse” refers to a wide range of productive, ecosystem oriented, reuse options. This includes reuse in what could be considered traditional agriculture, i.e. on farmers fields where crops such as cereals are grown, but also in silvaculture (forestry), aquaculture, market gardening, horticulture, etc. It also includes the reuse not only of nutrients but also of grey water, the organic content of wastewater and energy.

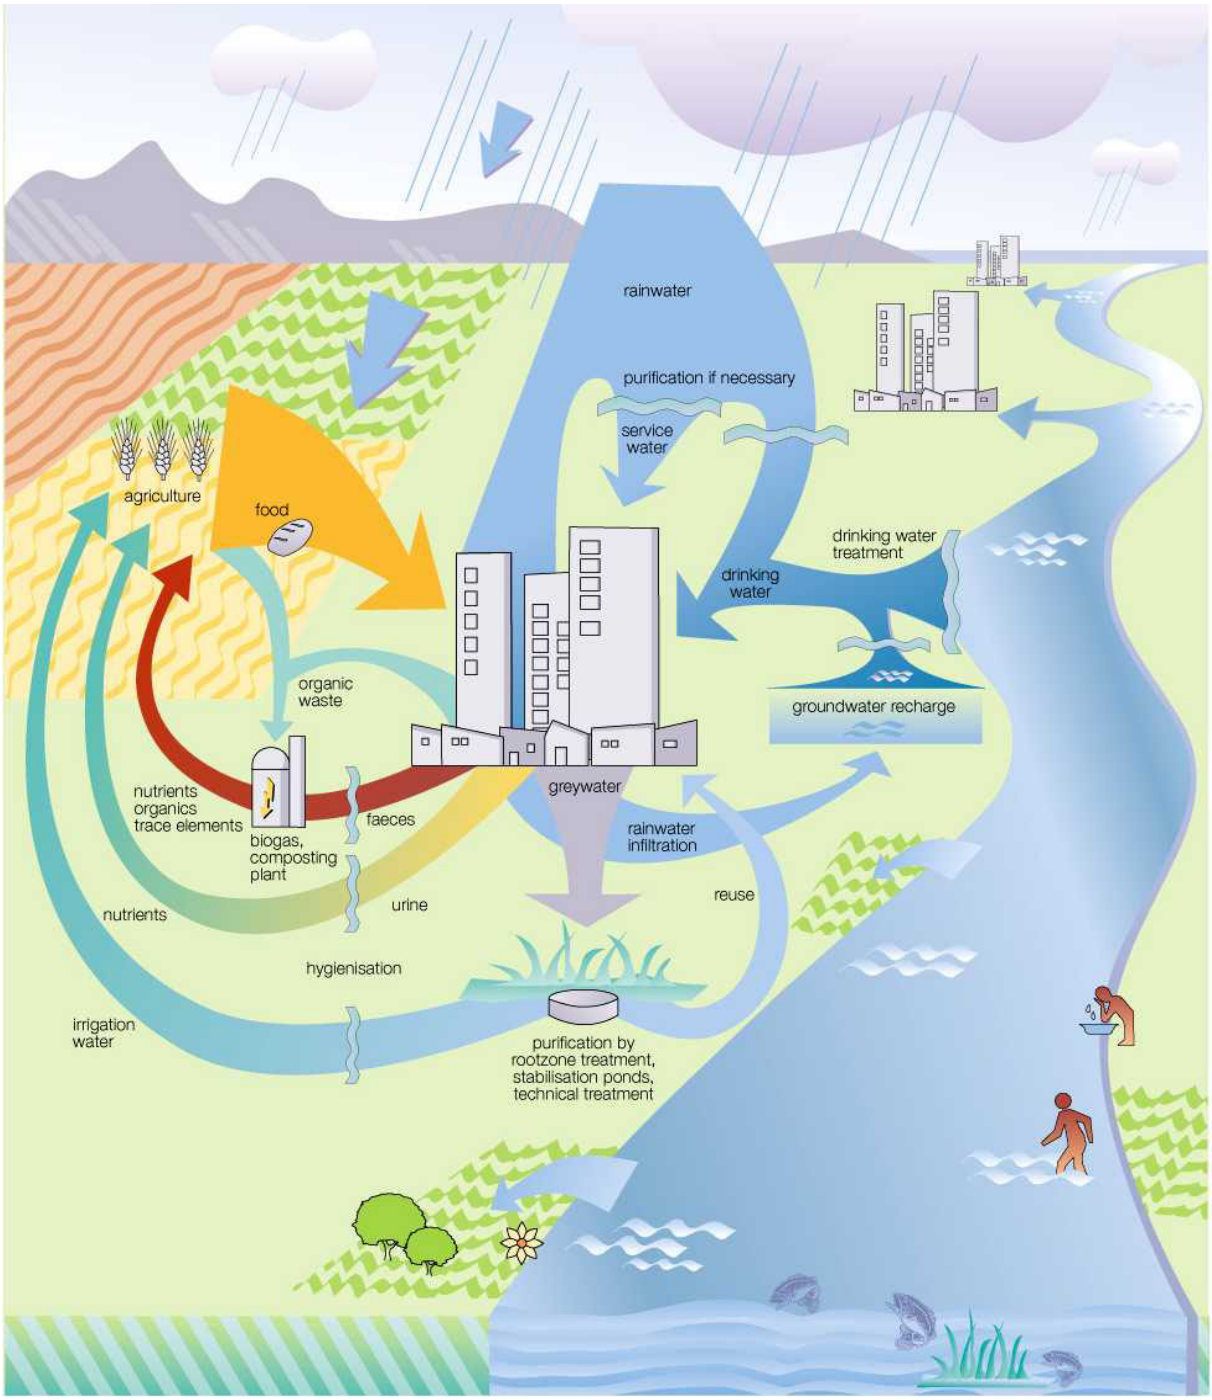

Figure 3: Schematic illustration of the main advantages of ecological sanitation systems (GTZ)

Ecological sanitation systems

In general, sanitation service systems identify several stages in the management of the flow of materials, in which appropriate sanitising and handling of the materials throughout the entire system is essential. Each of these stages can be considered as a specific tactic to deal with specific materials after they have been consumed. Which tactic is applied depends on the requirements needed to fulfil the function of each element in a specific situation. Ecological sanitation systems include the collection – storage – transfer & transport – treatment – and the resource management & reuse stage.

In practice a frequently applied strategy in ecological sanitation management services is to separately collect and treat faeces, urine and grey water, which minimises the volume of valuable drinking water needed to flush away excreta. This has other important advantages as the different fractions have different characteristics and can be treated more easily according to the specific reuse requirements (see Figure 4). Although the recovered material from human excreta is predominantly used in agriculture, urine as direct fertiliser and faeces as organic matter for soil improvement, the reuse options within ecological sanitation are not limited to agriculture only, especially considering grey water. Other reuse options include the domestic reuse of grey water, following suitable treatment, for example for flushing toilets, or possibly its use as service water in industry, or its use to recharge groundwater. Rainwater use could also be incorporated into this, with rainwater possibly being treated and being used for drinking water. Organic material can also be recovered to generate biogas, or perhaps even as a general soil amendment. Biogas production allows to recuperate the energy contained in liquid and solid household wastes, and to put it to an array of uses, such as cooking, electricity generation, heating purposes or even for industrial use.

Considering resource management, the ‘market’ is the major player in the design of the reuse stage. Taking into account this ‘market’ affects the whole design of a sanitation system and means e.g. that there is a need for a product with certain characteristics in terms of chemical and hygienic quality, concentration, volume, liquid or dry status, etc.

Concluding, the split-stream collection, treatment and reuse of different waste(water) flows often offers new possibilities for more specific and cost-efficient solutions and enables a more active involvement of the solid sanitation sector, where there is already a great deal of experience in the logistics, treatment and marketing of discarded resources. However, as stated above: Ecological sanitation does not favour a particular technology but is rather a philosophy in recycling oriented resource management and offers modern, convenient, gender friendly and desirable solutions for all.

3.2 Material cycles in ecological sanitation (ecosan)

Closing local nutrient cycles by recovering and using the nitrogen, phosphorus, potassium, micro nutrients and organic components contained in excrement is important not only because it can help minimise the energy and resource intensive production of mineral fertilisers, but also because it makes such agricultural inputs available even to the poorest farmer. Mineral fertilisers are often too expensive in many parts of the world or are simply unavailable to local farmers, who often turn to using the untreated contents of toilet pits or septic tanks on their crops. The long-term effects of mineral fertilisers on soil and food quality are also in dispute.

Whilst often making treatment easier and less expensive, the separate collection and treatment of the flow stream is however not a prerequisite in ecosan systems, and ecological sanitation is also possible in centralised and combined flow systems.

Separated waste (water) flows can be characterised as follows:

- black water - a mixture of faeces and urine with or without flushing water
- yellow water - urine only or mixed with flushing water
- brown water - black water without urine, with flushing water
- grey water - domestic water without toilet wastewater

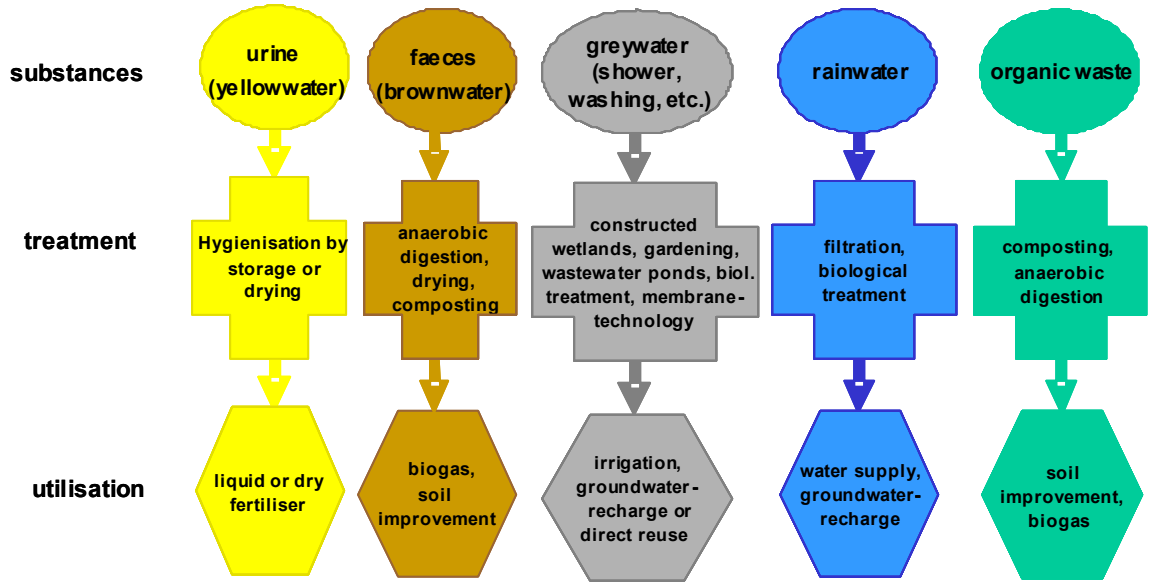

Figure 4: Separation of substances and examples of possible ecosan elements (GTZ)

Ideally, ecosan systems enable an almost complete recovery of all nutrients, trace elements and energy contained in household wastewater and organic waste and their reuse in agriculture. An essential step in this process is the appropriate treatment and handling of materials during the entire treatment and reuse process to ensure a sufficient sanitisation of the excrement and the protection of the public health. Therefore, ecosan systems not only control the direct hygienic risks to the population but also protect the natural environment.

It is the enormous economic potential which makes ecosan so attractive, particularly with respect to the water and energy balance.´

Human faeces obtained after separation, show valuable soil improvement qualities (particular improving the structure of the soil and raising its water retention capacity). If required, they can be treated together with the organic fraction of solid waste and/or animal manure and in a way suited to local conditions (climate, power demand, socio-cultural acceptance etc.) using the processes of aerobic composting, dehydration, stabilisation, or anaerobic digestion. This allows the organics and nutrients contained in faeces to be used in a concentrated and hygienically safe form as a dry fertiliser, compost or a fluid fertiliser. Depending on the type of treatment energy can be produced if necessary in the form of biogas after anaerobic digestion.

Urine, the yellow water, contains approximately 90% of the total nitrogen, 55% of the total phosphorus and a substantial portion of the potassium contained in human excrement. These nutrients are in a form directly available to plants, and can be used as effectively as some mineral fertilisers. A partial flow separation and use of urine is advisable due to its low volume and the high concentration of nutrients in it. In order to obtain the yellow water fraction devices such as urine diversion toilets or waterless urinals can be used.

The water used for domestic purposes such as washing clothes, or from showers is known as grey water. This makes up the largest proportion of the total wastewater flow from homes, but has only a very low nutrient content. It can therefore be fairly easily treated to a high quality using simple techniques such as constructed wetlands, ponds, bio-films or activated sludge processes. For high-tech applications more sophisticated treatments, such as membrane filtration or activated carbon filters, may eventually be added. Treated grey water can be put to particularly good use for agricultural irrigation (especially in water scarce regions), but may also be used for groundwater recharge, industrial or urban reuse or discharged into surrounding watercourses.

Table 1: Characteristics of flow streams

Fraction	General characteristics
1. faeces	• hygienically critical, potentially containing a series/array of pathogens, leading to water-borne diseases (e.g. bacteria, viruses, protozoa, nematodes, worm-eggs) • consists of organics, nutrients and trace elements • improves soil quality and increase its water retention capacity • average production ca. 50 kg/cap/a • consists mainly of organics submitted to decomposition processes and a minor proportion of nutrients
2. urine	• hygienically uncritical • contains the largest proportion of nutrients available to plants • may contain hormones or medical residues • average production ca. 500 l/cap/a • consists mainly of nutrients available to plants and very little organics, therefore no need for stabilisation
3. grey water	• usually of no major hygienic concern • volumetrically the largest portion of wastewater • contains usually almost no nutrients (simplified treatment) • may contain a vast range of various substances • average production 25 – 100 m³/cap/a

Diverse technologies can therefore be used in ecological sanitation systems, from quite simple low-tech to sophisticated high-tech solutions. These currently range from compost toilets or urine-diverting dry toilets, to water-saving vacuum sewage systems, possibly with separate collection and subsequent treatment of urine, faeces and grey water through to membrane technology for material separation and decontamination. Generally, in ecosan systems precedence is given to appropriate modular and decentralised facilities, although in very densely populated areas centralised systems may still be needed.

The essential advantage of the modular components is their flexibility allowing an optimal adaptation to the local social, economic, ecological and climate conditions. As a result, they offer a more rapidly realisable and economic alternative to conventional systems. Another advantage is, that even simple dry ecosan toilets can be constructed directly indoors in very poor areas. These toilets do not require a pit and so do not endanger the stability of the house, and have neither flies nor odour when well managed. Indoor toilets contribute to the security of the user, particularly women and girls who use the toilet at night. They also save a good deal of time, as adults, normally women, can help children, sick, elderly or disabled people to the toilet with only a minimal delay in other activities.

Of particular importance in ecosan approaches are innovative institutional arrangements, financial mechanisms, and logistics to return the nutrients to farmland, marketing strategies for the recovered nutrients and directions for their safe application in agriculture. New ecosan schemes may also entail setting up service enterprises and hence kick starting income generating measures for the construction and easy and safe operation of the installations as well as the collection, treatment and marketing of the recyclates.

3.3 Technologies in ecosan

The technology in ecosan is not necessarily characterised by the development of completely new elements, but by their use in other contexts and functions. The designer of medium and larger scale systems is recommended to make use of existing standardised elements such as pumps, armatures etc. It should be recalled that many parts of ecosan components, although field-tested in pilot projects and described in literature are far from standardisation in their new context. For example in vacuum toilets and vacuum sewers there is a long experience gained from the use of these components in ships and aircrafts. However they have to be adapted for the large-scale use in urban conurbations.

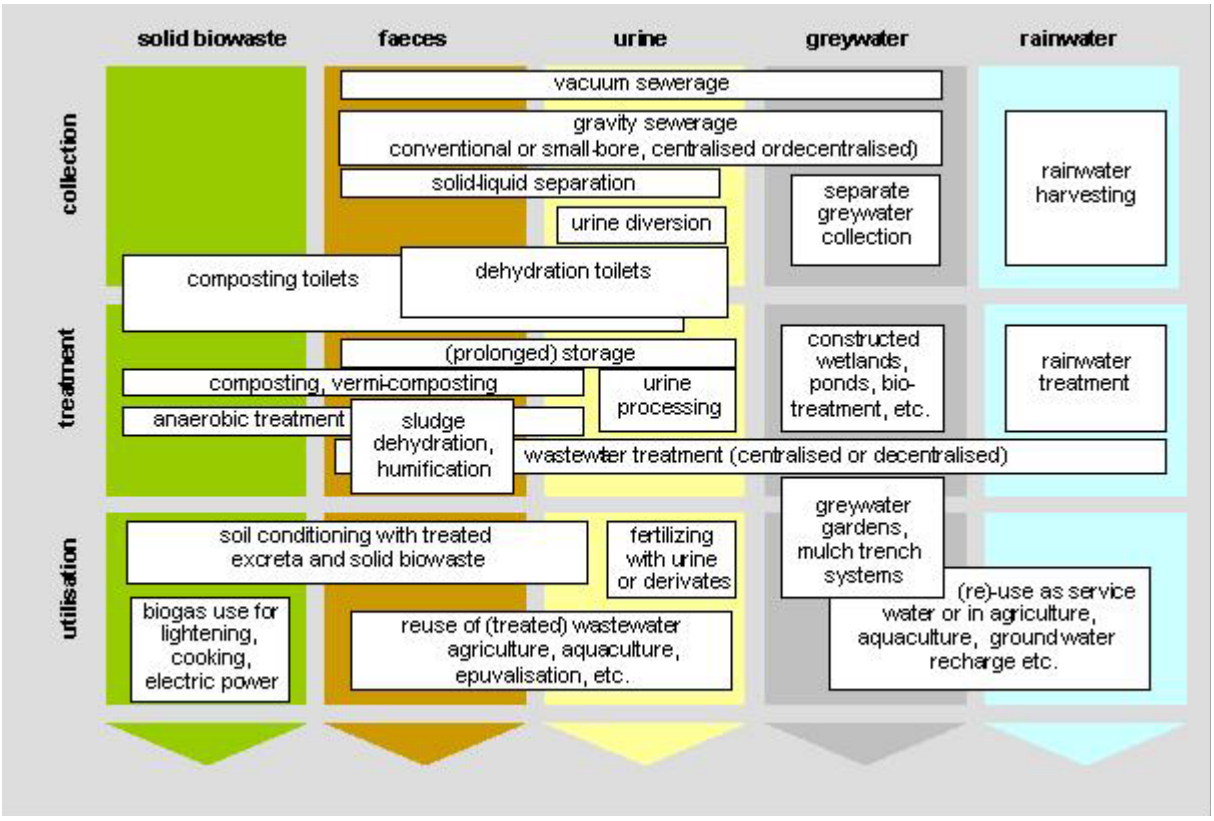

Figure 5: Essential technological components used in ecosan (GTZ)

The GTZ-ecosan sectoral project has started to develop “technical data sheets” as well as “project data sheets”. These contribute to a standardised knowledge management and allow collecting first standard information on components, systems and projects. This shall form the basis for future research on components and systems to get a state-of-the-art design with well defined and reliable parameters (GTZ –technical data sheets 2005, GTZ –project data sheets 2005).

3.4 Tools for the planning and implementation of sustainable sanitation projects

To date most participatory approaches applied in sanitation projects have been developed mainly with a rural context in mind, with similar tools for densely populated urban areas still lacking. As these approaches were developed for, or adapted to, programmes dealing with conventional systems of water supply and sanitation, they require adaptation in order to adequately address issues which are of vital importance in ecosan programmes, such as the hygienically sound reuse of recyclates from household sewage in agriculture, and the needs of the user of the recyclates. In an urban environment one of the few publications dealing directly with participatory approaches are the "Tools to Support Participatory Urban Decision Making", from the United Nations Centre for Human Settlement (UN-Habitat 2001).

While lacking ecosan specific elements, these participatory tools have in many cases shown a great deal of success in water supply and sanitation programmes. They therefore have a proven track record that should not be neglected. These tools should be adapted wherever possible to the specific needs of ecosan programmes enabling them to address the philosophy of a closed loop approach to sanitation.

A relatively new tool for environmental sanitation is seen as being almost ideal for ecosan projects. This is the Household Centred Environmental Sanitation Approach (HCES), a new approach for planning environmental sanitation services, with the promise of correcting current unsustainable practices in planning and resource management by concentrating on the below given two main components (Eawag 2005).

Box 4: The two main components of the HCES

(1) The focal point of environmental sanitation planning should be the household, reversing the customary order of centralised top-down planning. The user of the services should have a deciding voice in their design, and sanitation issues should be dealt with as close as possible to the site where they occur. With the household as the key stakeholder women are provided with a strong voice in the planning process, and the government's role changes from that of provider to that of enabler;

(2) A Circular System of Resource Management should be used emphasising the conservation, recycling and reuse of resources, in contrast to the current linear sanitation service system.

First, planning with a household or neighbourhood-centred approach places the user at the core of the planning process. The HCES responds to the knowledge, needs and demands of the users.

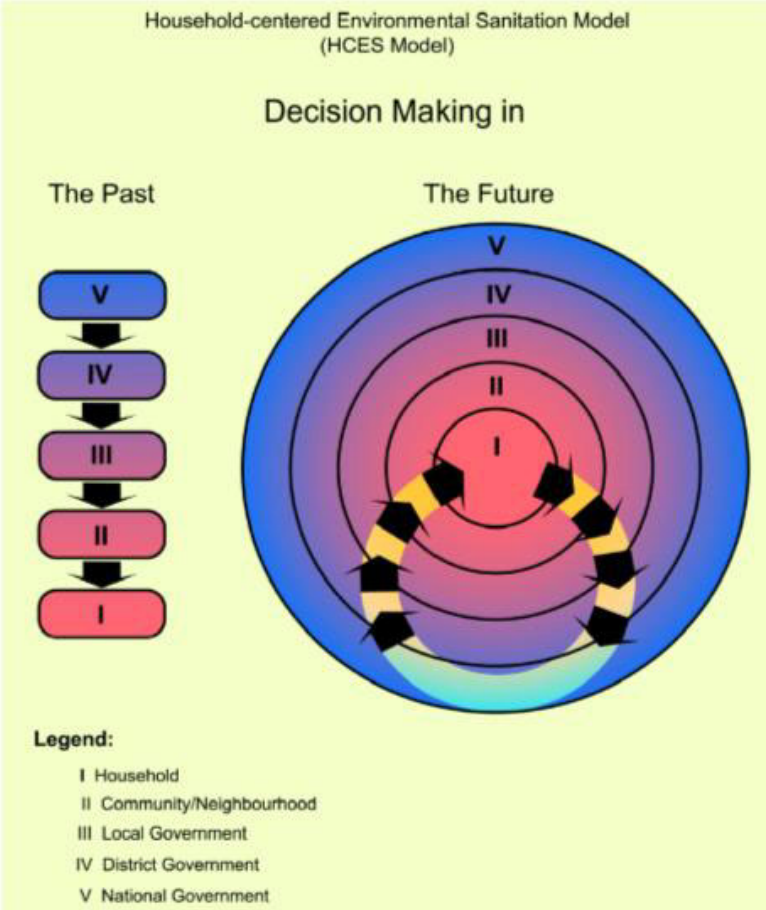

Figure 6: Decision making in the past and in the future according to the HCES (Eawag 2005)

The above figure presents the radical re-think of current planning practices, proposed by the HCES. This approach attempts to avoid the problems resulting from either “top-down” or “bottom-up” planning approaches, by employing both within an integrated framework.

Secondly, HCES is suggesting to minimise the transfer of waste across circle boundaries by reducing waste producing inputs (e.g. water) and by maximising reuse and recycling activities. Ecosan projects are obviously promoting and applying this concept in a very systematic way. The HCES approach refers to the Bellagio principles, but not specifically to the ecosan philosophy. However, the HCES and the Bellagio principles are both fully compatible with the ecosan philosophy. The draft of a guideline for implementation of projects in line with the HCES approach is available now (Eawag 2005). Field testing of the guideline and the collection of feedback are foreseen as the next phase.

A specific adaptation of the HCES for ecosan projects was established in the GTZ ecosan source book (Werner et al. 2003a). As discussed there, certain key tasks and moments in the course of an ecosan project may determine whether and how the programme will continue. The simplified flowchart of the process (see figure below) shows these key moments as being either workshops or reports, although in reality a wide range of different tools and methods could possibly replace them. In our view this flowchart and description of these key moments is useful as it transforms the theoretical steps into an idealised practical example.

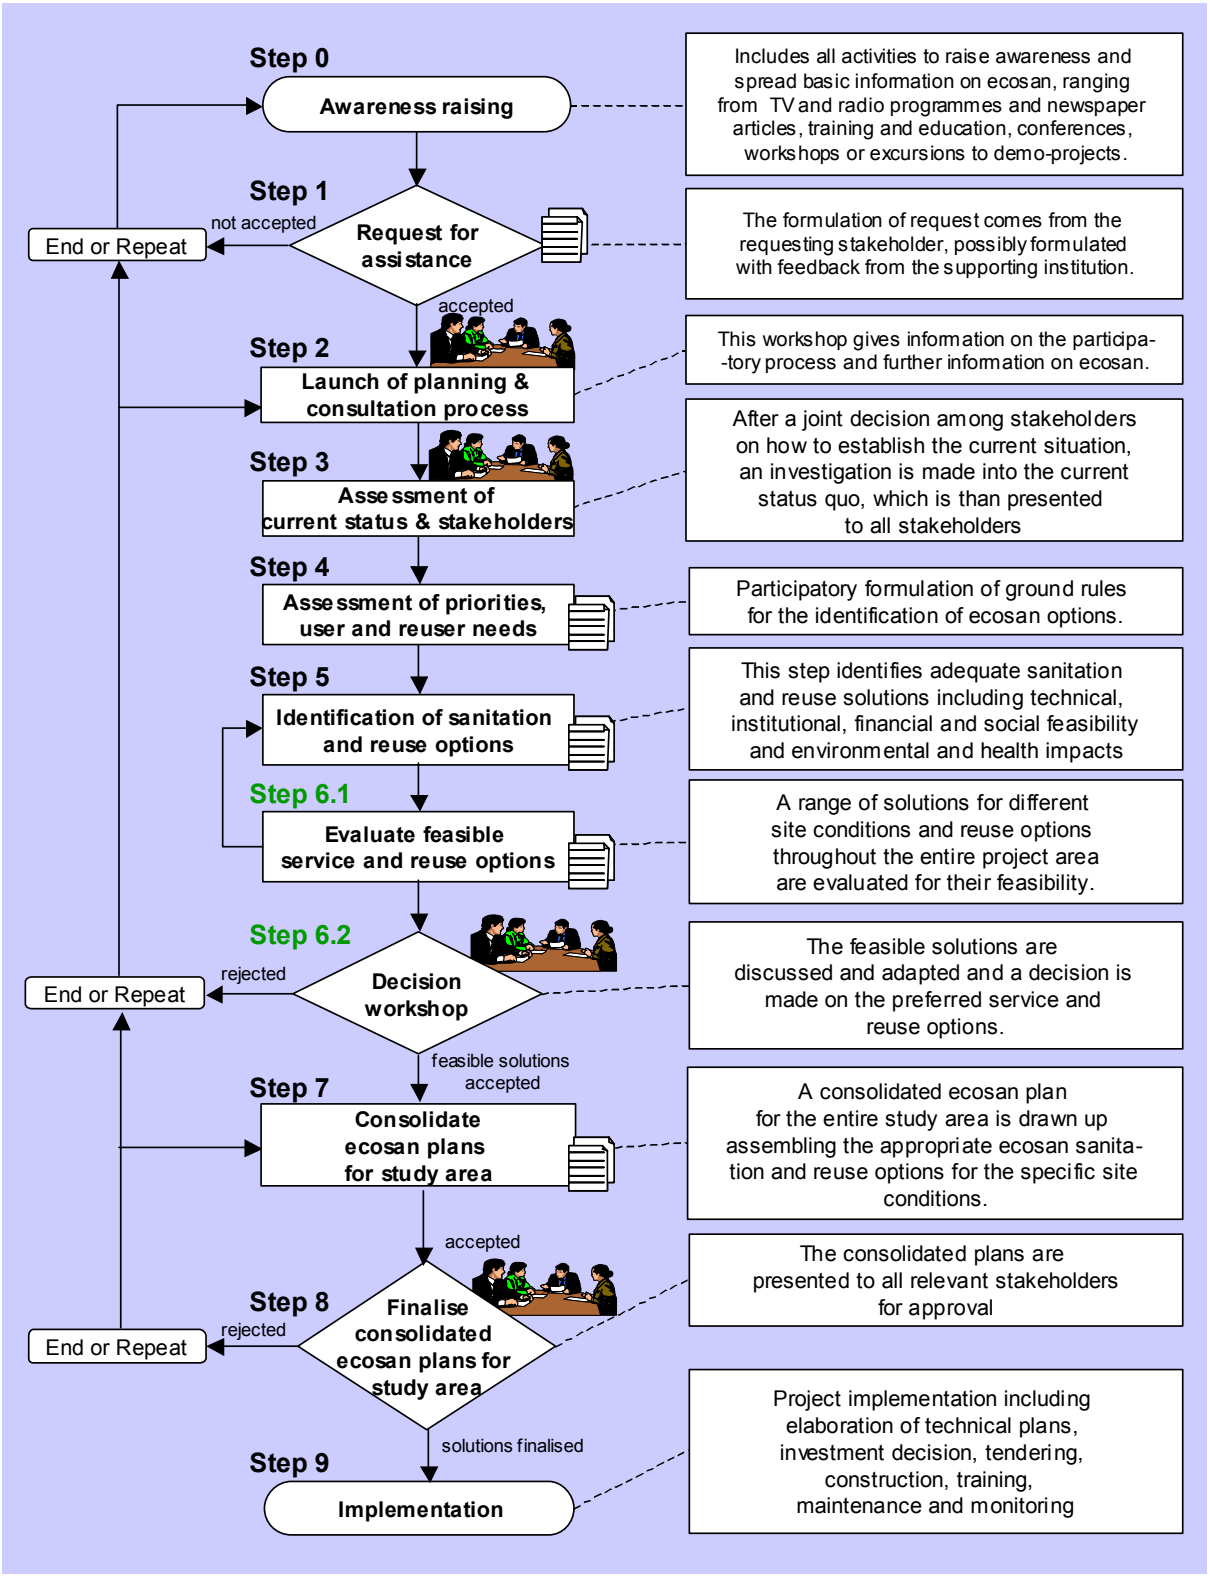

Figure 7: The "ecosan project steps" – key moments, necessary activities and expected results (GTZ)

3.5 Types of ecosan projects and stakeholders involved

Ecosan projects have proven themselves around the world in a rich variety of applications. Environmentally friendly settlements in the temperate climates of northern Europe have employed closed-loop sanitation systems, treating their grey water locally and providing agriculture with fertiliser from urine diversion or from the sludge of biogas plants, as can be seen, for example, in Germany, Norway and Sweden. In China, the combined treatment of human excreta and animal manure in small scale bio-gas plants is common and from 1997 to 2005 around 1.000.000 urine diverting dry toilets have been constructed in a project that started in Guanxi province (Liu and Mi 2003, GTZ –project data sheets 2005-005).

Project Box 2: Urine diverting dehydration toilets in China (GTZ –project data sheets 2005-005)

The "Urine diverting dehydration toilet dissemination programme, Guanxi province, China" was initiated in 1997 by the Chinese Government in co-operation with Sida and UNICEF. The initial demonstration project began with just 70 toilets. There are now more than 1 million installed double vault urine diverting dehydration toilets spread across several provinces.

Figure 8: ecosan urine diversion squatting pan (left); ecosan in-house toilets (middle and right) (SIDA)

A plastic urine-diverting squatting pan is produced locally for approximately 8 EUR.

To improve the dehydration and sanitisation of the faeces, a shovel full of ash is thrown onto the faeces chamber after defecation. When the first chamber of the double vault is full, the squatting pan is turned round, and the second chamber is used. The dried faeces from the vault are removed once or twice a year, depending on the chamber filling cycle. They are applied by digging them into the roots of plants. Urine is collected once or twice a week and applied directly to crops.

The basis of the success and acceptance of this system is the traditional use of urine and excreta in agriculture in China, and the absence of prejudices and questioning of their agricultural value. Other advantages noted by the users include: the system is simple and easy to construct, can be easily adapted to local needs and is affordable. In addition water consumption is reduced, the toilets are clean, do not smell, and have no flies. This allows the toilet to be directly constructed inside homes, making them more comfortable, convenient and safe for families to use, particularly for women and children, and resulting in savings for the construction of an external superstructure, and in a better operation and maintenance.

At present a dry urine diverting system is being installed for 7.000 people in Erdos City in inner Mongolia, whilst in Mexico an ecosan programme began in 2002 to address the sanitation needs of the population of Tepoztlán, an urban centre with approximately 40.000 inhabitants just south of Mexico City. In southern Africa, pre-fabricated dehydration toilets have been available on the local market since 1994, with over 18.000 of this type of decentralised units installed world-wide. Each one of these projects employs a different technology, tailored to the needs of the user and the local market.

Project Box 3: TepozEco municipal ecosan pilot programme, Mexico (GTZ –project data sheets 2005-012)

The town of Tepoztlán, located within a national park in Mexico, has an enormous contrast between poor, indigenous areas and luxurious weekend homes. It also has a special history of environmental activism and has become an important tourism destination.

The objective of the TepozEco project is to establish a functioning example of urban ecological sanitation, including household eco-toilets, a system of communal collection of organic refuse, greywater and organic solid waste management, eco-stations for the secondary treatment of toilet output (urine and dehydrated faeces), and recycling of nutrients for urban agriculture.

The technologies, which have been applied in the project, include urine-diverting dehydration toilets with a dehydrating chamber with two large plastic recipients, a urine collecting container, a vent pipe and fly trap.

Figure 9: Dehydrating chamber with 2 containers and urine collection (left); organoponics (right) (TepozEco)

Low cost shallow pit composting sanitation system prototypes were also installed for poor peri-urban and rural populations (using the arborloo and fossa alterna systems pioneered initially in southern Africa) as well as public and institutional waterless male and female urinals. Reed-bed or mulch greywater filtering systems for mechanical and biological treatment, and rainwater harvesting and filtering systems with sedimentation and volcanic gravel filtration were constructed. To promote urban agriculture and nutrient recycling, a cultivation technique called organoponics was introduced. It works in any type of container or garden bed, which is mostly filled with compacted dry leaves, soaked with fermented human urine, and topped with a layer of soil to produce vegetables and aromatic plants.

The introduction of a reuse system of organic residues in the urban context of Tepoztlán is seen as a strategy for recovering and recycling valuable nutrients to support local agricultural production and to stimulate self-reliance. An additional aim is to conserve water, considering the increasing amount of tourism in the municipality.

The work of the TepozEco project to date has in many cases resulted in the integration of dry toilets into households and a demystification of human waste for use as a fertiliser.

The mix of different framework conditions, technical options, stakeholders involved and motivations, serves to ensure that no two ecosan projects are alike. For the moment therefore, there is no such thing as a typical ecosan project. However, on the basis of experience gained, it is possible to broadly identify four basic types of ecosan projects, and give a general description of the stakeholders involved, their degree of participation in the process, and the activities to be undertaken. This helps with the identification of the tools and instruments that may be necessary, and who may need them, at different stages throughout the project.

The four broad categories of ecosan projects given here are quite general in their description. Projects in reality may not fit so neatly into one of the categories and individual projects may lie somewhere in between two types. The four basic types are therefore mainly intended to provoke reflection on who the stakeholders in a project might be, what their roles and information needs could be, and what tools should be foreseen to encourage their participation.

3.5.1 The 4 basic types of ecosan projects

Project type A (rural upgrade) corresponds to what could be considered as the "classic" ecosan-project. Farming households, in rural areas, receive support to establish ecological sanitation systems either on their compounds or in their houses. The farming households are usually responsible for the handling of the recyclates (most often only urine and faeces), using them on their own fields as fertiliser and soil conditioner. Grey water treatment and reuse, rainwater harvesting, and organic waste management can be integrated into the system, although this is rarely practised in this type of project.

The decision to implement ecosan may result from the initiative of a local NGO or CBO engaged in ecological development. The organisation may start their activities by contacting local opinion leaders, informing them of the ecosan approach and asking for their support. It is hoped that once these people have accepted the system, a broader introduction among the farming households will be facilitated and accelerated.

The decision can also however be made at the political macro-level, for example within the framework of a rural development programme. This would involve a large number of farming households in the project, enabling economies of scale to be made, but possibly complicating the participation process. In this case, information structures (public/private) and appropriate financing methods would generally be provided by the government.

Project type B (peri-urban and urban upgrade) corresponds to ecosan projects implemented in all existing urban or peri-urban areas of cities and towns in the course of renovation or rehabilitation work. Here more or less well functioning existing sanitation systems are converted to closed loop systems. This therefore applies to all areas, from informal settlements to luxury multi-storey apartment or office blocks, where the existing infrastructure is to be upgraded to ecosan systems. The implementation of such projects generally tends to be much more complex than those in areas of new development, for several reasons. The use of the existing infrastructure may still be foreseen in the project, which means that ecosan solutions must be built around this system, which may cause a considerable degree of technical difficulty. Private households may also only reluctantly agree to convert their sanitary facilities to ecosan, as they will most likely have to foot the bill for the change over. Private investors may also not be willing to participate in such projects as there is a considerably smaller opportunity for them to make a profit. Additionally, these built-up areas may have very little space for the installation of decentralised solutions. Projects in this context may therefore have to adopt a long term approach to the completion of an ecosan system, with innovations being introduced gradually over many years.

The ultimate handling and reuse of the recyclates (faeces, urine, grey water, rain water, storm water, organic waste and energy) is carried out, either only partially or for a particular recyclate, by the householders themselves in an urban context (in vegetable gardens, urban agriculture, for toilet flushing etc.). More usually, however, the households may not have the opportunity, or the need, to use the recyclates themselves. In such cases external service providers, working either privately or for the municipality, can be charged with collecting, treating, storing and marketing the recyclates, eventually transporting them to a reuse site, for example in urban parks or to farmers cultivating on the outskirts of the town, for energy production or for producing service water for private or public users.

The initiative for projects of this type can come from a variety of sources. The households concerned may themselves initiate the project on a local level, but it can also come from the macro-level, for example in the case of improvement projects for informal settlements implemented by the municipality or the government. The projects in this case address a large number of households, with the degree of support from the authorities (government/ municipality) being considerably stronger (regulation, financial support) than from local micro-initiatives.

Project Box 4: Gebers collective housing project Sweden (GTZ -project-data sheets 2005-008)

The Gebers collective housing project is located near a nature reserve in Orhem, a suburb of Stockholm. It was promoted by a network of friends and neighbours, who converted a deserted and vandalized building complex into 32 apartments with a total of 80 inhabitants. With the installation of a closed-loop system for toilet- and organic waste, the project contributes to the environmental protection of the reserve.

Figure 10: Gebers apartment building (left); composting of faeces and organic waste (middle); urine application on a barley field (right) (VERNA)

Urine-diverting toilets were installed to separate urine and faeces, which is then further treated before reuse. The urine is flushed with water and piped to polypropylene collection tanks under the house. The faeces are collected without flushing water and fall straight into individual ordinary plastic bins in the cellar. The plastic bins are housed in a special compartment which is constantly under negative pressure through ventilation. This improves dehydration of the faeces and prevents odours from entering homes. The urine tanks are emptied about twice a year by a tanker truck and the treated urine is used as fertiliser in agriculture.

The faeces are composted together with other organic household wastes. The resulting compost has a soil-like appearance. It is planned to use it as a soil conditioner in agriculture to produce horse feed.

Generally the project highlights how motivated the users are able to implement appropriate solutions for a more sustainable lifestyle.

Project type C (new development) is to be found when new dwellings or development areas are being constructed either by the authorities (national, regional or local government) or by private developers (these are normally private businesses, but may sometimes also include citizens groups who wish to build their own homes in an ecological way). The dwellings come equipped with ecosan systems, and these systems are therefore considered from early on in the planning stage, facilitating considerably the consideration of all relevant aspects of town planning, land use, (urban) agriculture, water management and so on, as well as their rapid and comprehensive introduction. They are often sold or rented to a relatively well-off section of the population, if the developers themselves do not occupy them. There is however also the possibility of new development areas with closed-loop ecological sanitation systems being constructed specifically for low-income households. Because of the urban location and the favourable planning conditions, all the treatable resources (urine, faeces, grey water, rain water, storm water and organic waste) may be integrated into these sanitation systems.

Depending on the social status and activities of the users of the sanitary facilities, the handling and reuse of the recyclates may proceed in two ways: (1) they could be collected and treated by a service provider (either private or from the municipality) at a certain cost to the users. The products are then used by a third party (e.g. farmers, city parks etc.) who may have to buy and transport the products or (2) the households themselves collect and reuse the recyclates on their own plots of land (gardens / urban agriculture).

In projects of type C, the initiative to opt for an ecosan system often comes directly from the investors (i.e. the private developers or citizens group) or the local, regional or national government and their respective planners. Householders then first come into contact with the system when they move into

their bought or rented property. They should, at the latest, be informed at this point of the principles and operation of their ecosan system.

Basic types of ecosan-projects

Project-type / Characteristics	A	B	C	D
	 rural upgrading	 urban upgrading	 new development areas	 non-residential (schools, offices ..)
• User of sanitation facilities	household	household / neigbourhood	household / neigbourhood	tourists, employees, pupils ...
• User of the end products (Range: in house / other)	household	household (partly) / farmer, external user (partly)	household (partly) / farmer, external user (partly)	user-institution (partly) / farmer, external user (partly)
• Level of initiative and Decision (min / max)	micro / macro	micro / macro	macro	micro / macro
• Considered resources (minimum / optimum)	faeces + urine only / plus greywater, rainwater harvesting, organic waste	faeces + urine + greywater only / plus rainwater harvesting, stormwater management, organic waste	faeces + urine + greywater + stormwater-manage-ment / plus rainwater harvesting, organic waste	faeces + urine + greywater + stormwater-manage-ment / plus rainwater harvesting, organic waste
• Service provision for operation, transport, treatment and marketing (Range: in house / other)	household	household / public/ private service provider	household / public/ private service provider	user institution / public/ private service provider

Figure 11: The characteristics of the 4 basic types of ecosan projects (GTZ)

Project type D (non-residential) covers all ecosan applications in buildings and areas that are not intended for normal residential use. Examples of these include public institutions, such as schools or hospitals, private establishments, such as banks or offices, as well as hotels or holiday lodges situated in sensitive areas (e.g. in national parks or on islands), or in regions that are not being served by the public sewer network. Projects of this type may address the upgrading or rehabilitation of an existing conventional sanitation system to ecosan or the construction of a new building with a closed-loop sanitation system. Depending on the circumstances, upgrade or new construction, different levels of technical difficulty may be encountered.

All recycling options are possible in such projects, with the integration of grey water, rainwater and organic waste into the system along with the use of faeces and urine. The handling of the recyclates can be carried out either by the users of the building (e.g. employees, pupils etc.) or service providers are engaged, requiring a marketing and transport of the recyclates to the end users.
The decision to use an ecosan system in this case can be taken at the micro level, if the owners of an individual building, for example a hotel, voluntarily opt for closed-loop sanitation. Alternatively, macro level decisions, for example that all schools should implement ecosan or that certain natural resources in a region must be protected, can be taken at governmental level.

3.5.2 Stakeholders in ecosan projects

In general stakeholders are those groups of individuals or organisations who have an interest in the outcome of a particular process. They can range from households and community based organisations to local, regional and national government, and can also include private sector institutions, social services, such as health and education, national and international donor institutions

and civil society at all levels. Relevant stakeholders are those who should be involved in a particular process, as well as those who are mainly affected by it or involved in the related decision making process. The relevant stakeholders in ecosan projects are described below. However, the relevance of a certain stakeholder is dependent on both the type of ecosan project as well as on the project phase, with their roles and tasks varying. Therefore, not all the stakeholders presented in the following stakeholder analysis will always need to participate in the programme.

The number of different stakeholders that may be involved in a project can be quite large, depending on its type and scale, and will include very different individuals, groups, institutions, etc. Even within stakeholder groups there may be smaller sub-groups, who may in turn be sub-divided into even smaller groups. For example a community based organisation may be considered as representing a stakeholder community, however this community consists of different interest groups such as men, women, the elderly, the young, the poor, the wealthy, etc. who may also consist of other small sub-groupings. It is therefore extremely difficult to directly address the needs and concerns of all stakeholders. However, a detailed stakeholder analysis should be carried out at the start of an ecosan project in order to identify who are the individuals, groups or institutions that will be relevant to the process and to work out ways in which large stakeholder groups may be effectively addressed and represented in the process.

The stakeholder analysis given below, aims to give an overview on the possible types of stakeholders who may be involved in a project. This list aims to assist reflection on who the stakeholders might be, by providing a general overview of the types of stakeholder.

- **(I) Users of sanitation facilities:** In many cases the user of the sanitary facilities can be considered as the individual households. In the context of most sanitation projects the term household is generally applied to describe the smallest user unit, composed of different individuals (e.g. women, men, children, the elderly, handicapped people, the rich, the poor, etc.) each with perhaps their own needs and expectations with respect to levels of comfort, hygiene, privacy, ease of use and maintenance, construction and maintenance costs, etc.. Due to the wide range of household types and their different expectations, the role of the household in an ecosan programme varies enormously. In projects of type A (rural upgrading) the households are usually the final decision makers and are often responsible for the construction and maintenance, as well as the collection and treatment of the recyclates, whereas in projects of type B, the households may be only very marginally involved in these processes, with service providers collecting the recyclates, possibly for further treatment, generally against payment. In practice it is often necessary to determine if the user of the facilities in a house is also the homeowner as this may have a decisive impact on the decision to invest in an ecosan system. In urban areas the household may prove to be too small a unit to work with (for example in a large apartment block or neighbourhood). In such cases it may make more sense to consider all the people living in a building or settlement as a single unit and to work with a neighbourhood group.
- **(II) Users of the recyclates:** In some cases, these may be the users of the sanitation facilities (e.g. the households) themselves. In urban areas, the users of the sanitation facilities **may** not be able to fully reuse the recyclates due to their particular situation (confined space, no gardens etc.) and may only be able to partially reuse the different flow-streams (e.g. using of rainwater for washing, grey water for toilet flushing, energy for cooking etc.). Here the majority of the recycled organic material and nutrients will be reused outside of the urban area by external users such as farmers or foresters. They may also be used within the town in urban agriculture, by market gardeners, municipal parks etc. who receive the recyclates from a service provider or directly from the households. Recycled water (including grey water and rainwater) may be used as service water by industry or small businesses, or to irrigate recreational areas, or even in aquaculture.
- **(III) CBOs and self-help groups** are generally formed by user-groups. These organisations may already be in existence before the introduction of ecosan or may be created in response to an ecosan project. CBOs and neighbourhood groups provide the households or other users involved, the opportunity to **exchange** experiences and to obtain advice from their peers. These groups may also support their members to organise the delivery of the different services needed (maintenance, collection, treatment etc.) and the use of the produced fertiliser at the level of the CBO/ neighbourhood-groups. In an ecosan programme CBOs may eventually develop into (market-oriented) service providers (maintenance, collection, treatment etc.)

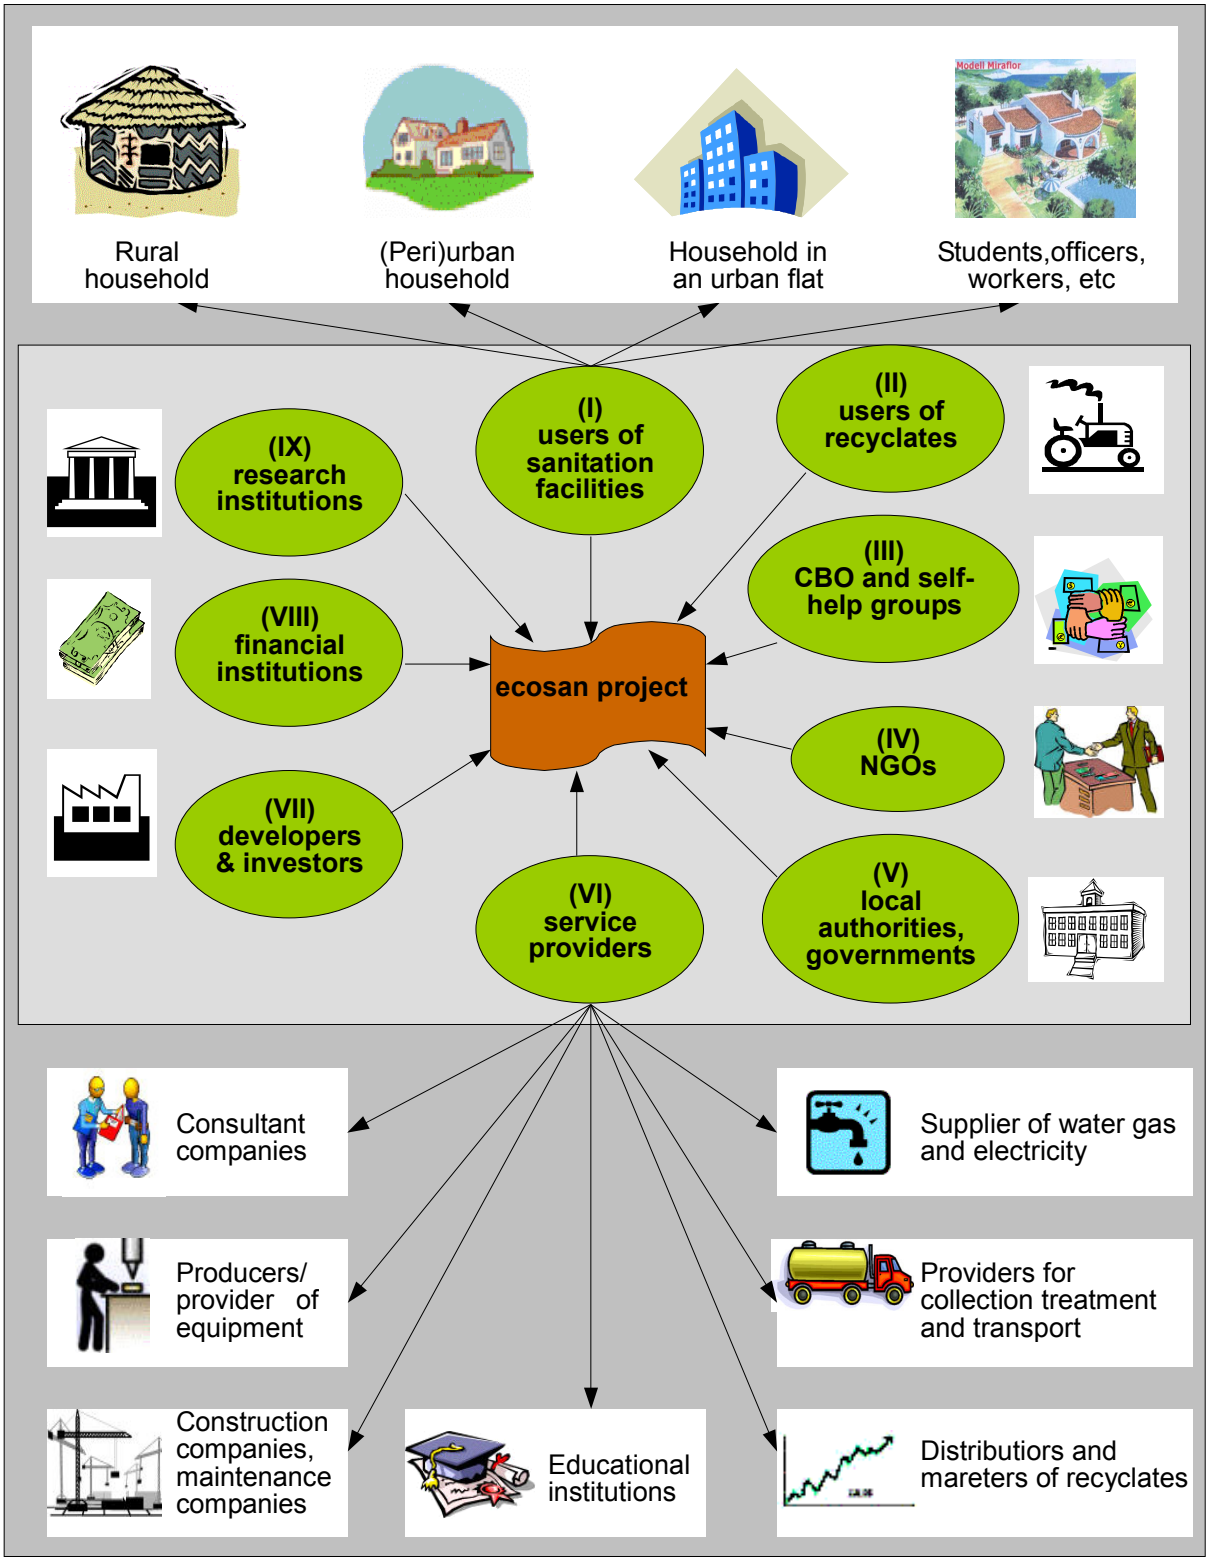

Figure 12: Principal stakeholders in participatory ecosan projects (GTZ)

- **(IV) NGOs** are generally of great importance regarding information and awareness raising among potential users. They also often support the households in forming CBOs and neighbourhood-groups and advising them on the use of eco-sanitation systems, and support (poor) households by connecting them to financing institutions, municipalities, producers of ecosan equipment (bulk-buying) etc.
- **(V) Local authorities** and governmental institutions are responsible for establishing the framework conditions for the implementation of ecosan systems. They can however also be directly involved, for example by initiating local or regional sanitation programmes promoting or even requiring ecosan, providing subsidies to households, collecting user-fees and disseminating information to potential user households. Governments are also responsible for ensuring the creation of a legislative enabling environment making it possible to install and use ecosan systems to their full potential.
- **(VI) Service providers** is a term that encompasses a wide range of diverse stakeholders, engaged in public or private market oriented activities of service provision, for situations where user households are either not willing or unable to carry our certain activities on their own. In an ecosan programme these could include planners, consultants, equipment producers / suppliers, construction companies, academic institutions, utilities providers, and companies involved in recyclate collection, transport, treatment, packaging and marketing services. Service providers carry out their different tasks against payment. Along with being users of the recyclates, farmers could also act as service providers in ecosan projects by collecting and treating excreta from the users of the sanitary facilities.
- **(VII) Developers and investors:** These can be either private or public investors, who initiate the construction of residential units to be sold or rented. The introduction of ecosan is thus tightly related to the demand for houses / flats with such systems anticipated by these investors. In these cases, the developers themselves may be very actively involved in the planning and implementation process of the entire programme.
- **(VIII) Financial institutions:** The introduction of new infrastructure generally requires that the investment and operation costs are secured. Initially in conventional sanitation systems, investment costs for public sewer systems and treatment plants are generally initially covered by local authorities. The costs for both the public part of the system and its operation are however later recovered from the users through fee collection. The private owners of the buildings have to provide the investment and operation costs for the in-house installations and on-plot part of the system (bathroom equipment, house installations, branch and house drains, or on-plot treatment). With the introduction of ecosan, it is assumed, that the total costs of the system (i.e. of the private and public parts together) will be considerably reduced, however the costs to be borne by the private householders may possibly increase (on the other hand, if one were to take into account the initial cost to connect to a conventional sewerage network into the private costs of conventional systems, it quickly becomes apparent that this is also a considerable sum to be covered by private money and ecosan systems may also be cheaper in this regard). In any case, new financing instruments may have to be developed in ecosan projects in order to support these private investments as only a small part of the user households may be able to pay these costs immediately, at the time of the installation of the sanitation system. Large scale application of ecosan sanitation systems may therefore necessitate the introduction of corresponding subsidy or credit schemes, and thus the involvement of financial institutions, such as local or international banks or donor agencies. During the piloting and development stage of new ecosan-systems, additional funds are also needed for the start-up phases of projects, the development and introduction of new technologies, technical, agricultural, environmental and social research, and the market introduction of hardware producers or service providers.
- **(IX) Research institutions:** These may be universities or other research oriented institutions or organisations. They can fulfil different tasks by providing advice to programme initiators, such as developers, municipalities and NGOs. Universities and research institutions can also initiate ecosan programmes for research purposes, usually with external financial assistance. They also have the important role of providing research results regarding their research, which can then be disseminated and used for information, advocacy and lobbying activities among the different stakeholders.

The table below (Table 2) presents some of the factors that may either encourage (motivating factors) or discourage (constraints) different stakeholders to opt for ecosan solutions. The table does not present an exhaustive list of all the motivating and constraining factors all the stakeholders may have, but should serve to provoke thought on what these factors may be. In many cases the motivating factors represent expectations of the stakeholders involved, while the constraints represent their fears. It is important that all stakeholder groups are well informed of how an ecosan system could work for them to avoid unrealistic expectations and groundless fears.

Table 2: Factors motivating and constraining stakeholders to participate in an ecosan programme

Principal stakeholders	Examples of motivating factors	Examples of constraints
I. Users of sanitation facilities households, neighbourhoods tourists, pupils employees, …	• hygiene improvement, • structural stability, • local physical factors (high groundwater table, rocky ground…) • reduced costs, • increased comfort, • improvement of quality of life, • greater security, • interest in recyclates, • prestige, • ecological reasons, • water scarcity, • unreliable water supply, • …	• culture, habits, taboos, • hygiene concerns, • unfamiliarity, • fear of loss of comfort, • unavailability of structural elements, • legislative restrictions, • economic factors (e.g. for start-up etc.), • …
II. User of recyclates	• economic reasons, • local and reliable availability of agricultural inputs (water, nutrients, organics), • increase of crop yields for either the market or for family needs, • improvement of self sufficiency, • ecological reasons, • …	• culture, habits, taboos, • lack of logistics, • fear of negative consumer perception, • fear of negative long term effects on soil, • …
III. CBOs and self-help groups	• failure of conventional / existing sanitation system, • local improvement of quality of life, • Agenda 21, • interest in recyclates, • reduced costs, • local physical factors (high groundwater table, rocky ground…)	• culture, habits, taboos, • lack of information, • insufficient financing, • inappropriate legislation, • influence of interest groups, • hygienic concerns, • …
IV. NGOs	• failure of conventional / existing sanitation systems, • economic reasons, • ecological reasons, • agricultural reuse of recyclates • improve quality of life, • …	• culture, habits, taboos, • lack of information, • insufficient financing, • inappropriate legislation, • influence of interest groups, • hygienic concerns, • …

(continued …)

(…continued)

V. Local authorities, governmental institutions	• political reasons, • economic reasons, • ecological reasons, • Agenda 21, • failure of conventional / existing sanitation system, • possibility of financial support, • sustainability of system, • support regional self-sufficiency, • promotion of (urban) agriculture, • job (and income) creation, • long-term security of social services (water supply etc.), • …	• culture, habits, taboos, • lack of information, • lack of start-up funds / insufficient financing, • monitoring of treatment / handling etc. more difficult for decentralised system, • distrust of alternative systems, • not recognised as state of the art technology, • reluctance to change status quo, • contradiction of existing legal framework / long term plans, • powerful lobby from conventional centralised sanitation industry, • corruption, …
VI. Service providers Planners / consultants; constructors (builders); maintenance service providers; producers of equipment; providers of collection, treatment, transport and marketing of the recyclates	• increase profit, • opening up of a potentially huge new market, • request / need for particular product, • further develop their own know-how, • ethical / ecological reasons • …	• absence of technical knowledge, • absence of products, • inappropriate legislation, • lack of suitable tools, • economic interest of (waste) water monopolies, • fear of failure (economic risk), • not yet recognised as state of the art, • reluctance to make the necessary increase in effort, • lack of experience in decentralised planning / participation, • lack of start-up funds, • fear of reduced profit margins in smaller / decentralised projects, • regulatory obstacles; • …
VII. Developers & Investors	• increase attractiveness of developments (eco-label), • safe and secure “disposal” (especially in tourist areas), • user satisfaction, • economic reasons, • legal requirements, • …	• absence of service logistic, • culture, habits, taboos, • lack of information, • lack of start-up funds, • monitoring of treatment / handling etc. more difficult for decentralised system, • distrust of alternative systems, • not recognised as state of the art technology, • reluctance to change status quo, • contradiction of existing legal framework / long term plans, • powerful lobby from conventional centralised sanitation industry, • corruption, • less«commission»for ecosan projects, • …
VIII. Financial Institutions	• economic reasons, • failure of existing / conventional systems, • improving sustainability, • guarantee repayment of credit, • …	• absence of specific financing instruments, • not recognised as state of the art technology, • need for research and development, • …
IX. Research Institutions	• Need for research and development, • availability of research funds, • ecological reasons, • …	• availability of research funds, • prestige, • …

Both the motivating factors and the constraints of the stakeholders can vary enormously and may not always be obvious to outsiders. It is therefore important in a participatory approach that the stakeholders have the possibility to voice their motivating factors and the reservations they may have about the programme. When these are known for all stakeholders it may then be possible to tailor the ecosan programme to their needs and to adequately address their concerns. It is important and very useful to continually refer to the motivating factors and to confirm that they will be addressed by the project. Equally important is to check that the constraints have been convincingly dealt with. To map the motivations and constraints is therefore an important prerequisite, which should be adapted during the course of the project, becoming increasingly specific.

Most stakeholders will be relatively new to the ecosan approach in the beginning of a programme and will almost certainly require a degree of training in order to familiarise them with it and enable them to complete their task and fulfil their responsibilities. Such training may include the following: instructing the users of the sanitation facilities on the correct use and maintenance of their facilities, informing the users of the recyclates of the correct and safe use of the recyclates, possibly with the aid of agricultural extension agents, training CBOs and NGOs to provide their members or partners with the necessary information for the programme to function correctly, capacity building measures in local and regional authorities governmental institutions to support inter-ministerial and inter-sectoral co-operation and co-ordination, a wide range of training measures for the service providers (including technical training for technicians, such as plumbers, or construction companies), informing developers and investors of the opportunities offered by ecosan systems and their particularities, introducing financial institutions to ecosystem based sanitation and their long-term financial sustainability and highlighting the need for start-up funds and new financing mechanisms for such systems, and informing research institutions of the current state of the art on an international level and the need for locally relevant research.

4 Capacity building - education and training in ecological sanitation

4.1 Purpose of this chapter

The role of this chapter is twofold:

1. to discuss specific aspects of education and training in the field of ecological sanitation as a part of capacity building activities; and

2. to begin to formulate strategies for education and training people in this area.

In this chapter, emphasis will be placed on the methodologies for transferring the paradigm shift in sanitation to the people who need to know about it. Equally important is to transfer that knowledge to the people who will implement the technologies and systems. Special attention will also be given to defining the relevant target groups who are likely to embrace the ecological sanitation concept. These people will have different roles to play in the implementation process: (i) to plan and enable implementation, (ii) to establish the necessary framework (political, social, economic) and (iii) to use these facilities. This publication is designed to assist all these groups and furthermore to be used by professional educators and trainers who will assist in knowledge transfer to all of the above training target groups.

Although this publication is primarily geared towards professionals who would be in charge of implementation of ecological sanitation education and training, it should also prove useful to a broader audience. Indeed a broad audience for this publication is desirable as the concept of ecological sanitation has yet to find its place in the curricula of many different disciplines, levels and forms of education and training, including:

- formal education at the secondary and university level; and
- continuing education and vocational training of special target groups in the form of specialised courses and other means of training and capacity building.

In presenting and promoting the educational concept of ecological sanitation, in this chapter, we do not discuss technical issues, but refer to the technical material presented in the other chapters of this publication.

4.2 The unique challenge

Many of the required measures to integrate ecosan into education and training programmes and curricula can be achieved relatively easily. Several forward looking educational establishments have in fact already started to do this, for example at the UNESCO IHE or in several universities in Sweden, Norway and Germany. However in order to achieve a complete integration of eco-sanitation into curricula and training programmes there are several challenges that need to be overcome. These challenges include:

The highly inter-disciplinary character of ecological sanitation, requiring it to be integrated in curricula not only for engineers and natural scientists but also for many other professions.

- The relative novelty of the closed-loop approach to sanitation is implying that education for ecosan should be a mixture of teaching and promotion at all levels (advocacy). An additional challenge caused by the relative novelty of the approach is that for many contexts every-day practical experience is lacking from which direct lessons can be drawn.
- The majority of practical examples have been implemented on a relatively small scale and there are only a limited number of large-scale examples.

- The existing instruments for design, feasibility assessment, monitoring / performance assessment of sanitation have not yet been adapted to the new paradigm.

As with many new paradigms, education for ecological sanitation should serve as a model for the kinds of processes which are to be encouraged in this new approach to sanitation. Ecological sanitation calls for participatory planning, so education should also be participatory. Ecological sanitation gives special attention to users, as active participants rather than passive recipients in a planning process. So students should also become active players rather than objects of the educational process. This change of attitudes between teacher and pupil is desirable in any case, but of particular importance in topics as complex as ecosan. This places rather challenging demands on the educational system, forcing the educational institution, in effect, to move into a new educational paradigm in order to support the new paradigm in sanitation.

The inter-disciplinary nature of ecological sanitation is depicted in Figure 13. Ecological sanitation draws on a wide range of expertise, including:

- Integrated water management and other natural resources
- Resources protection and recycling
- Sustainable agriculture, soil conditioning and replacement of fertilisers
- Public health enhancement and reduction of children mortality
- Food security
- Job creation and unemployment reduction
- Climate change and variability
- Flood control and management

Changing the conventional sanitation mindset and creating a favourable environment for the implementation of ecological sanitation will not be an easy task. It will require time and will not happen overnight. In order to increases the success rate of ecological sanitation projects and to generate a more positive perception amongst its future users, education and training in all of its aspects must reach a wide range of society members.

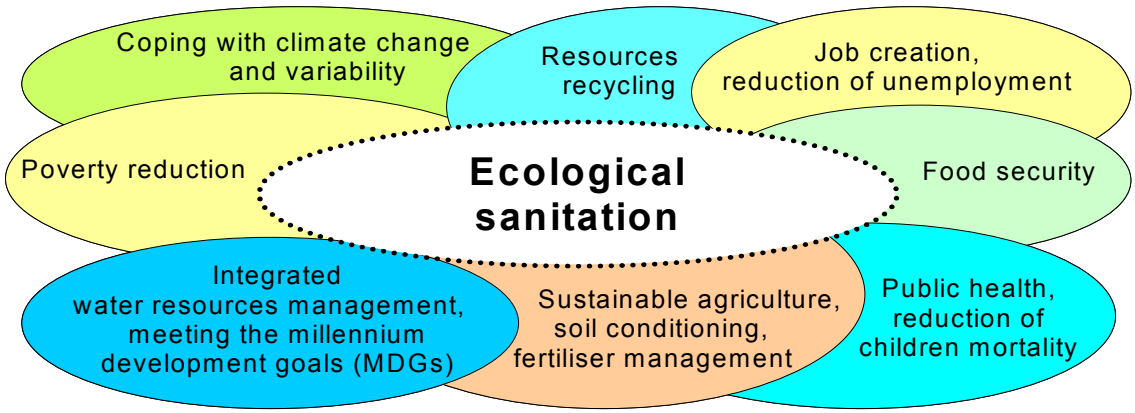

Figure 13: Ecological sanitation is an inter-disciplinary field and is related to many aspects of modern societies in both developed and developing world (GTZ)

The authors believe that here is a growing need and pressure to provide sound educational tools in order to encourage capacity building and to support the world-wide implementation of ecological sanitation. There is also a need for a broad analysis of existing curricula and education systems in both formal education at all levels and continuing education in water and environment related disciplines, with a view to introducing the holistic concept of ecological sanitation.

In the developed world the role of ecological sanitation education and training is to contribute to broader application of its concept, especially in areas where the advantages are directly obvious (e.g.

individual homes or groups of houses in areas where there is no sewer network, in small communities, vacation areas and in other similar contexts).

In developing countries and countries in transition, ecological sanitation education and training is even more important and urgent, especially in the context of achieving the Millennium Development Goals for sanitation and environmental sustainability (see UN Millenium Project 2005).

4.3 Overview of the new training and education content that needs to be conveyed

As has been stated previously the basic principle of ecological sanitation is to close the loop between sanitation and agriculture, enabling reuse and recycling rather than disposal. Therefore, a wider range of disciplines need to be included in education about planning techniques and processes, when compared to planning processes in conventional sanitation. Included in these are, for example, training in techniques for the assessment of the current agricultural situation with respect to soil quality, types of crops cultivated, agricultural practices, water and fertiliser needs, practices concerning the treatment and reuse of manure and so on.

As ecological sanitation solutions also aim at reducing water consumption for sanitation (e.g. by integrating rainwater harvesting systems along with grey water treatment and reuse), water supply systems may often have to be reviewed and modified within an ecological sanitation project. Hence, it is important that teaching integrates sanitation with issues of water supply, water efficiency, and water productivity.

Ecological sanitation solutions ideally lead to the closing of material flow cycles on the minimum practical level (i.e. reuse close to the point of generation of excreta or wastewater). We therefore need to consider aspects of urban planning (e.g. in order to provide space for the integration of a constructed wetland in an urban park, to support urban agriculture or to provide small scale service providers with an area for the treatment and storage of ecological sanitation products in the neighbourhood). Ecological sanitation education therefore should include the methods and theory of integrating the various sectors in urban environmental planning and practice.

The materials that can be recovered in an ecological sanitation system may have a high nitrate concentration and therefore lend themselves to integrated management of water and waste: They can be treated together with the organic kitchen, garden, and animal wastes from households and even paper and cardboard from households, institutions, and businesses. For this reason, it is important to teach the integration of sanitation with certain aspects of solid waste management (especially organic solid waste treatment).

The educational systems need to broaden their content to include a mix of centralised and decentralised, conventional and closed-loop, high-tech and low-tech, traditional and innovative, separate-stream technical solutions. The curriculum for both formal and continuing education needs to be developed so that it familiarises students not only with technical approaches, but also with the corresponding institutional and management solutions. In practice, the huge variety of different technical and operational combinations may represent a considerable challenge for educators.

The consideration of appropriate sanitation solutions (i.e. technology and management system choice) in an ecological sanitation approach will require that students acquire more varied know-how and experience than is currently the case. They should then be able to consider a larger range of technical and service options, rather than focussing the planning process on a narrow range of commonly implemented systems (e.g. sewer networks or pit toilets). Hence, we need to teach methodologies that encourage inclusion of a broad range of sanitation solutions in all planning, feasibility, design, and construction phases of projects.

Classical evaluation criteria currently taught in sanitation curricula also tend to bias the results of decision making processes towards conventional sanitation systems. For example, the criteria for the limiting parameters for discharge into receiving water bodies are no longer applicable in sanitation options based on ecological sanitation techniques, where in many cases, discharge is either zero or

close to it. Therefore, new criteria have to be developed, analysed, field tested and then integrated into curricula for planners and sanitary engineers.

The new evaluation criteria need to adopt a much broader approach to carefully account for all the potential impacts of the sanitation system. Examples of what the new criteria need to consider include access to resources, water reuse efficiency, system energy demand and energy efficiency, resources recovery rates, public health risks [1] (both in ecological sanitation and conventional systems), environmental risks, lifecycle analysis, self-help criteria. Ecological sanitation education hence needs to include the application of new, wide-ranging evaluation criteria for water supply and sanitation services.

Another issue is that students must understand that an entirely different approach will be necessary to supply the relevant information to stakeholders so that they can make an "informed choice". Sanitation professionals of the future need to understand the necessity to focus on the needs of the users of the sanitary facilities and other relevant stakeholders of the sanitation system (particularly the service providers and the end users of the recyclates). On the other hand, of course they also need to have knowledge of the techniques for doing so. This implies creating knowledge on the potential subordination of technical criteria to participatory project preparation and implementation processes.

Students will need to learn how to analyse the context specific options, to provide unbiased performance indicators and to propose viable solutions. We therefore need to teach them about promoting the consideration of smaller planning units and a greater number of decentralised options.

Finally, the requirements of the project preparation and planning process in ecological sanitation as a part of integrated urban water management are comparatively much more demanding than those of conventional sanitation projects. Several guidelines are currently being prepared by various organisations each addressing some of the above mentioned aspects (Eawag 2005, Kvarnstroem and Petersens 2004, Werner et al. 2003a). Students have to learn about the integration of educational, institutional, and capacity building aspects into planning instruments.

4.4 Who needs to be reached?

An ecological sanitation focus in education and training systems produces responsible, realistic professionals whose work supports sustainable sanitation solutions. Such an educational system is focused on creating intellectual and social capacity in relation to the integration of reuse aspects in the assessment of the current sanitary situation and in all the relevant planning activities and conceptual work. Thus, it is aimed at a broad spectrum of individuals and at various groups of stakeholders (described in the Section 3.5). They should have a vested interest in raising the awareness and competence level of various target groups that they deal with so that they can pursue ecological sanitation projects together.

4.4.1 Stakeholders

The educational system, if effective, will change the view or perception towards sanitation amongst the wide range of target groups, which are part of or under the sphere of interest of stakeholders discussed in Section 3.5. Although the principles of ecological sanitation are "universal" (in that they apply to all projects), different stakeholders work with various target groups that have different backgrounds, priorities and abilities to accept the "new paradigm" of ecological sanitation. Accordingly, the stakeholders should encourage, organise and/or endorse education and training programmes in ecological sanitation.

Educators thus need to prepare, for each of the target groups a different educational strategy and a different (target group specific) implementation methodology to be used in this endeavour. Some stakeholders are highly knowledgeable of the ecological sanitation, whilst others would benefit from attending some of the course on the specific topics. Most of the stakeholders likely to undergo the

[1] Public health risks with regards to: in-house hygiene, hygiene of neighbourhood and impacts on receiving water bodies, hygienic aspects of the handling, processing and reuse of the products etc.

education and training process will belong to one of the target group shown in Table 3, so the training programme will be specifically designed with these target groups in mind. However, some new subgroups may emerge in the future.

4.4.2 Target groups

In order to support changes in formal education and training to include ecological sanitation in mainstream curricula, it is necessary to know who the education is for. In Table 3 we identify and describe the major characteristics and features of the six major target groups, each having very specific education and training needs. The boundaries between the target groups are not fixed, and there is therefore a degree of overlapping.

Some of these target groups will be receiving the information for the first time, thus making the design of curricula relatively easy. Others, especially the first two groups, need to understand the critique of conventional sanitation so that they can “unlearn” a great deal, before they are ready to accept the new technology. The target group of professionals (planners and designers with the expertise in conventional sanitation) also requires special attention and “re-training”. Only then will they open themselves up to accept new information (the first stage), accept to treat alternative sanitation options as “equal opportunity options” (the second stage) and to become an active promoter and “implementer” of this approach (the third stage).

With respect to target group 4, the Professional Practitioners, it should be pointed out that it may not always be easy to motivate practising sanitary engineers to attend further training in ecological sanitation. Some individuals or organisations in this group may have a strong bias in favour of conventional water-borne sanitation which they may not readily give up or modify. The institutions which are addressed in this publication could possibly achieve a part of this re-training via their active alumni communities. A variety of “marketing” approaches is needed to invite these practitioners to further their knowledge and at least consider (if not embrace) the alternative approach of ecological sanitation. Again, this will not happen overnight, but is a process that should be set in motion now.

Failures of some pilot systems may also serve to block some stakeholders from accepting the eco-sanitation approach. It will therefore be necessary for educators to analyse the exact causes for these failures and to integrate the lessons learned into their teaching programme, thus acknowledging that closed-loop sanitation systems are, like many other innovative approaches, in need of further optimising. Stakeholders who have already experienced unsuccessful projects will have different issues, and additional effort has to be made in analysing the specific causes of the failure (learning from the past errors) before they are convinced to try it once again.

Table 3: Target groups for education and training in ecological sanitation

Target group	Example	Comments regarding training needs and strategies
Group 1a: **Existing users of the sanitation facilities and general public.** For example this group could include users who have an access to these facilities, are taking part in a demonstration project or a full-scale implementation of ecological sanitation technologies. With respect to the general public, it is included because members may be exposed to an ecological sanitation-compatible toilet if these are incorporated into public toilet blocks for example.	Mr. Smith who has a urine-diversion toilet at his house. After initial teething difficulties with the device it is now functioning perfectly, however he now has difficulties in training his visitors to correctly use it.	**Training needs:** Current users' needs. Existing users have to be given support in the correct use of the toilets facilities and possibly in the collection, treatment and safe use of the products if they are to e used "on-site". Future user's needs: Future clients have to be "educated" in advance. **Training strategy:** should be organised to cover both informing the users of the existing facilities ("making best out of it") and disseminating information on the options and benefits among the potential users and those who are yet to be convinced on the potential benefits.
Group 1b: **Students, and pupils in formal education at primary, secondary or university level (future users of sanitation facilities).** Obviously the teaching methods are going to be very different for the different age groups (teaching children, young adults or adults). Also, the younger children will need more guidance, whereas students can use self-study methods. They will also have more choices in choosing the topic of their future study (with more or less "ecological sanitation content").	A 12-years old girl at primary school who leads a local action to improve sanitation conditions in their school.	Teaching young people about the ecological sanitation paradigms will prepare them for a changing world, where water-borne sanitation will no longer be the scenario that everybody aspires to. Training needs: The needs are big at all levels in all educational institutions in the world, especially in developing countries. **Training strategy:** Use the existing channels for vocational training
Group 2: **Markets and end-users of the recyclates,** e.g. farmers who are using ecological sanitation products as fertilisers on their land.	Mrs. Myambelo owns an organic food production farm and a farm guest house. She is refurbishing her farm house, to introduce eco-sanitation to attract more eco- movements visitors to her "integrated eco-farm" with healthy organic food.	People in this group will mainly be interested in the safety aspects of handling ecological sanitation products and using them in food production and in economic benefits. There is overlap with Group 4 (e.g. agricultural specialist), but Group 2 is meant to be mostly people without a university degree. The consumers of products that have been fertilised with ecological sanitation products are not meant to be part of this group, but rather part of Group 1a (i.e. general public). **Potential needs:** Case by case analysis of the needs to cover all users who are spatially disperses.
Group 3: **CBOs and self-help groups representing users, NGOs**	Church in Kibera Slum in Nairobi. They have a complex challenge of providing advice and support to low income communities. However, they have potential of relying on the access to small international grants and community support in project implementation.	**Training needs:** need to select and train local champions need to train future users of the facilities **Strategy:** Provide the concept of integrated clean-up programmes and decompose it into parts (action plans) that include ecological sanitation.

Target group	Example	Comments regarding training needs and strategies
Group 4: **Professional practitioners: engineers, sociologists, other scientists, and other professionals** who are currently working in the fields of water, environment, civil engineering or related disciplines. To give some general examples, Group 4 would include: Water and environmental specialists (hydrologists, treatment specialists, sanitary-public health engineers, designers, contractors and developers) Planners, landscape architects, biologists, municipal officers Agriculture specialists Researchers and MSc and PhD students[2] Professionals interested in starting-up or upgrading their businesses in the ecological sector	An environmental chief engineer working for an environmental consultancy firm which just got an ecological sanitation project and all his team's past experience was based on the "conventional" technologies.	This is an important target group because they can both promote implementation or create obstacles to implementation of these facilities. For example, consultants might be asked to develop sanitation alternatives but if they have no knowledge of these technologies, they will not offer, or they will oppose, alternatives along these lines. This group would also include "newcomers" i.e. professionals which traditionally had "nothing to do with sanitation" but have realised that time has come when it is important to raise their "green credentials". One of the most important aspects for this group is that the awareness of the ecological sanitation approach needs to be created, because it is likely that during their university studies, they have not been exposed to it to the degree that would guarantee their full commitment to this concept. It is one of the aims of this publication to change this situation and ensure that in the future ecological sanitation gradually becomes a part of the regular curricula in water and environment related study areas. Additionally, there is the need to increase their awareness of the multi-disciplinary nature of ecosan. Particularly the importance of the socio-cultural aspects of sanitation that may have a primary role in the failure of a sanitation system. **Potential needs:** Not continuous, concerted action through professional associations could be helpful. **Strategy:** Short courses should be run frequently, publications
Group 5: **National, provincial and local authorities, top-level decision makers** (managers, politicians, civil servants in leading positions, etc.)	A Minister of Agriculture or Ms Pinzon (medical doctor) Deputy minister or public health. None of them had time to be briefed about ecological sanitation but are ready to give a speech on the topic.	This group does not have much time to undergo lengthy training courses. Therefore, short briefing sessions need to be arranged for them. When planning training sessions or briefings for this group one should also bear in mind that there are laws and regulations by health authorities, which may (unintentionally) limit the use of technologies based on ecological sanitation. **Potential needs:** Deal with the education in the post-election period.
Group 6: Service Providers, MSEs, labourers, technicians and general staff who are in daily contact with installation, operation and management of ecological sanitation-related facilities.	This could be people who build composting toilets, collect faecal matter for processing off-site, manage public toilets, market urine-diversion toilets etc.	This group is also thought to include people working in small to medium enterprises (SME's) who are creating a business in and around the "ecological sanitation market". **Training needs:** There is a need to do search in order to identify the local needs on the case by case basis

[2] Undergraduate students, on the other hand, are thought to be part of Group 1b.

4.5 Education and training methodology

The technical material presented in chapters 1 to 3 of this publication can serve as background literature introducing the basic ecological sanitation concept. However for an in-depth studying of the matter, more comprehensive sources are needed. How the content and methodology of a training course should be tailored to the specific target groups is described below.

4.5.1 Preparatory activities

Any education or training programme has to be carefully planned by knowledgeable people (i.e. the teacher[3]) or by a qualified Education Development Body (e.g. a task force for preparation of the educational material), which is authorised for such activities. Systematic preparations are required to be undertaken, followed by selection of the didactical methodology, teaching/training material, adjusted to the particular target audience and circumstances. At this point, one needs to distinguish between training and education, for which the preparatory activities are described separately as follows:

Preparation for training programmes

In this context, a "training course" is a course that teaches specific aspects of ecological sanitation during a period of several days up to several weeks only. The course duration typically being 1-3 weeks, but possibly spread out over a longer time period if the trainees are studying at their own pace, e.g. the literature provided or some form of distance-learning.

It should be pointed out here that this document is not limited to serve institutions of higher learning. Indeed, there are many technical training and vocational schools for technicians and practitioners who do not aspire to provide university-level courses, but will in fact train the majority of the people "on the ground" who will implement ecological sanitation. This results in a wide variety of needs and level of knowledge of the participants in the training programme.

Preparations for running training programmes may differ from one case to the other, but generally it has to take into account the local socio-economical situation, availability of suitable case studies, availability of qualified trainers, technology level, and public perception. During the preparation, some or all of the following activities have to be carried out:

[3] The word "teacher" is used in what follows, and is understood to be synonymous with "trainer" or "educator".

- Assessment of training needs
- Definition of the training objectives
- Decision on length of programme
- Selection of candidates (if appropriate)
- Planning for provision of resources such as human (lecturers and supporting staff), financial, logistic
- Evaluation of education level of the target audience, i.e. how much prior knowledge exists, and what pace and method of teaching / training would be appropriate
- Design of the curriculum (e.g. selection of content according to the identified level of the students and the assessed training needs)
- Include social and cultural aspects (consult the specialist if needed) to address the local area specific issues
- Selection of training method(s), e.g. up-front teaching, hands-on training, field trips for on-site training, workshops, excursions, discussion fora or other methods
- Relevant content preparation
- Preparation of training material and production of handouts for the participants
- Preparation of rooms, computers, projectors, copiers
- Preparation of field trips, access to the site, local champions, transportation, accommodation and subsistence
- Provision of the safety and hygiene at work
- Preparation for reporting, evaluation, post-training follow-up
- Planning of promotional activities and publishing (if appropriate) and analysis of the feedback

Preparation for educational programmes

Education, in contrast to training, refers less to passing on concrete knowledge (although this is also part of education), but more to teaching people how to think critically and analytically. This is mainly done in formal education institutions, such as schools, colleges, universities. It is about conveying concepts, attitudes and learning methods. It is not advocated here that a separate educational programme for ecological sanitation be created but rather that the closed-loop paradigm is included into the relevant existing educational programmes at all levels of formal education.

Modifying curricula and syllabi is a long process which usually has to be approved by the appropriate governmental institution (university council, ministry of education or equivalent). Accreditation procedures may also slow down the process. Hence, the preparation activities for educational programmes are more difficult to define and carry out than for training programmes. To be implemented they have to be initiated at the appropriate instance and a broader consensus has to be achieved among the members of the initiating body.

4.5.2 Selection of relevant subject areas

Depending on the target audience and the specific circumstances, the teacher should make a careful selection from the following broad range of subjects (see also the following section, which shows a matrix of target groups and subjects to be taught):

Table 4: Range of subjects to be taught in ecological sanitation training and education

1. Introduction to ecological sanitation
Paradigm shift and ancient technologies revisited (source separation) Basic principles, biological, chemical and physical processes involved Benefits to be achieved by ecological sanitation and integrated solutions Advantages and disadvantages of ecological sanitation vs. conventional sanitation systems Resources needs and availability
2. Technologies applied in ecological sanitation
Potential for co-management of liquid and solid waste flows from households; separation at the source Relevant toilet types (e.g. dry/wet sanitation, urine separation, vacuum toilets) Sanitisation of faeces or black water (e.g. anaerobic digestion, composting, dehydration) Storm water management including rain water harvesting, flood management Water saving and water reuse principles and technologies Balance of resources (including energy efficiency)
3. Resources recovery and agricultural reuse (nutrients, organics, water and energy)
Principles and prerequisites Technologies and selection principles Wastewater reuse (principles, technologies, health and safety) Bio-solids, e.g. organic kitchen wastes (recovery, application, disposal) Food safety Energy recovery (small scale – decentralised vs. centralised facilities) Climate and factors affecting suitability and efficiency Marketing of the recyclates in agriculture or other areas
4. Implementation, operation and maintenance management
5. Practical skills for operation and maintenance
6. Environmental and health aspects
Interactions of ecological sanitation with the broader environment Health and safety, including performance verification Hygiene education
7. Economic and financial aspects
Full cost comparison between different ecosan / conventional options; influence of system boundaries, Impact of health related costs, private versus national economy, shadow prices, Micro credit financing schemes, impact on job creation, small scale enterprises, Role of the private sector, potential for cost recovery, infrastructure ownership, fees and charges
8. Social and cultural aspects
Social perception, motivation and obstacles for broader application Cultural issues Gender: sanitation and men, women and children
9. Policy and Legal aspects
Local legal framework affecting implementation of ecological sanitation and reuse Building codes and permits Strategies for the future
10. Institutional and organisational aspects
Institutional framework (stakeholders, relationships, decision making) User management, monitoring, evaluation Participatory principles (with respect to users of services) Implications for bureaucratic attitude towards sanitation New roles for formal institutions
11. Case studies: successes and failures
12. Enabling search for up-to-date information on ecological sanitation (e.g. internet)
13. Interactions of ecological sanitation projects with existing infrastructure
14. Evaluation criteria for sanitation systems
15. Promotion and public awareness

4.5.3 Matrix of subjects and target groups

The following table attempts to select relevant subjects for the six target audience groups defined earlier. This should be seen a guide only. Final selection and shaping of the training programme should be based on a case-by-case investigation taking local conditions into account.

Table 5: Matrix of relevance of subjects for different target groups

Subject	**Group 1a and 1b** Users of facilities and students	**Group 2** Farmers / users of ecological sanitation products	**Group 3** CBOs and NGOs	**Group 4** Profess-ionals	**Group 5** Decision makers	**Group 6** Service providers

4.5.4 Available and emerging education and training tools

The teacher can make use of existing tools, both relating to content and didactical methods, which will enable an "active learning"[4] environment. The resources available to teachers with regards to the content include:

- Conventional educational material such as books, brochures, guidelines, leaflets, posters etc.
- Educational material in electronic (multimedia) form such as text in PDF and Word format, Power Point presentations, video clips etc. Selected sample material that belongs to this group is available on the "ecosan resource CD" (GTZ 2006) and from the organisations mentioned in chapter 8.2 and their webpages.
- Web based material and other on-line training courses and materials (e.g. SDC/myNetworks 2003; EMWater 2005; UNESCO-UWETTT training material [in prep.]).

Possible didactical tools to enable an active learning environment include:

- Lectures / classroom sessions, or briefing sessions with up-front teaching
- Individual or group assignments
- Field trips
- Work with local champions
- Work with local users of the facilities and with local stakeholders' groups
- Case studies - learning by doing (analysis of successes and failures of existing ecological sanitation projects; analysis of interactions with other infrastructure projects)
- Practical workshops
- Role playing games
- Analysis of interactions with other infrastructure projects
- Group work, e.g. technology selection, analysis of sustainability and risks
- Tutorials for preparations for pre-feasibility and feasibility studies

As mentioned before each of the target groups requires the appropriate set of contents and didactical tools to be tailored taking into account local technical, socio-economic and cultural conditions.

4.6 Proposed implementation strategy for modernising the educational and training system in sanitation

Knowledge of ecosan-related issues has increased considerably over the last decade, as has the number of ecosan pilot projects. This period can be seen as a phase of primary advocacy which now needs to move towards a phase of wider dissemination of the latest scientific research results, capacity building and training for a new generation of professionals to prepare them for jobs in the sustainable sanitation sector.

Whilst the academic resource base is currently very limited around the world, it can still be geared towards an effective leverage function for sustainable sanitation activities in institutions in both industrial and developing countries. The academic and professional resource base should focus on inspiring local and national authorities, institutions and other interested parties in both the North and the South to engage in training and research, involving itself intensely with research collaboration and providing inputs to training given by these institutions.

Several international organisations have already begun working in this direction, illustrated by the two examples below:

[4] "Active learning" refers to a mode of learning where the student takes an active role in acquiring the knowledge (See for example http://edweb.sdsu.edu/people/bdodge/Active/ActiveLearning.html)

(1) North-South: Research Partnerships for Mitigating Syndromes of Global Change
Within the framework of the "Swiss National Centre of Competence in Research (NCCR) North-South: Research Partnerships for Mitigating Syndromes of Global Change" which is co-funded by the Swiss Agency for Development and Cooperation (SDC) and the Swiss National Science Foundation, a project on environmental sanitation is managed by Eawag-Sandec. The overall aim of this NCCR is to enhance sustainable development in selected contexts through research partnerships involving institutions within Switzerland as well as their partners in developing countries. Interdisciplinary exchange and transdisciplinary integration and dialogue is promoted in nine geographical Joint Areas of Case Studies (JACS), where concrete efforts are undertaken jointly with local partner institutions. Sandec's Project aims at enhancing knowledge and contribute to the scientific basis for improving environmental sanitation in developing countries, with particular emphasis on the situation of the most vulnerable populations in urban and peri-urban areas. (Morel, Zurbruegg and Schertenleib 2005).

(2) Regional Nodal Development
The second phase of the EcoSanRes Programme, which started in January 2006 will emphasise capacity building and knowledge management through the development of regional nodes in the South. This means working with a series of dynamic institutions that have good regional networks that can provide support in training, research and development, knowledge management, demonstration and pilot projects in order to build regional capacity. The EcoSanRes Programme will provide leadership and stimulate this development in collaboration with several other actors in the North and South. An International Board and Review Panel will provide governance. A global fund for local and regional initiatives is in place, and a series of international Thematic Working Groups ensure that cutting edge knowledge is properly shared among leading specialists and institutions involved in capacity building. (EcosanRes 2006)

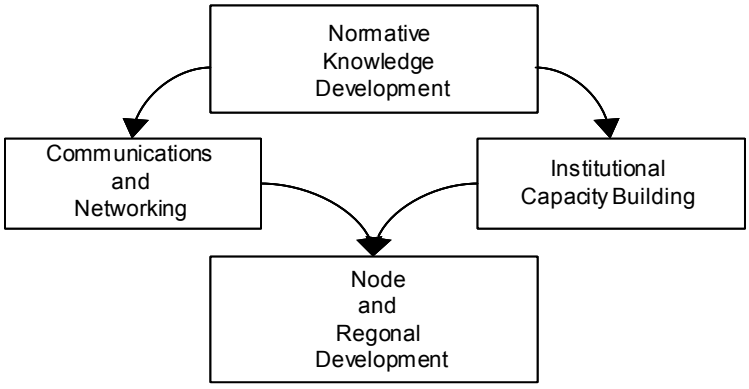

Figure 14: Modus operandi in Nodal Development. (EcoSanRes 2006)

How to accelerate ecological sanitation education and training?
The implementation strategy for ecological sanitation education and training will involve extensive and intensive work with educational and training institutions. The lack of capacity is presently considered as a crucial limiting factor in meeting the increased demand for implementation of ecological sanitation. All actions aimed at encouraging regional, national and local institutions are however limited by this lack of capacity.

In an ad hoc meeting on "Ecological Sanitation Capacity Building" held during the 3rd International Ecological Sanitation Conference in Durban, South Africa (24 May, 2005) it was suggested to establish an international network of interested organisations and training institutions, in order to accelerate the formation of a capacity building initiative for ecological sanitation.

Some institutes have already included or are planning to include ecological sanitation in their regular educational programmes. A non-exhaustive list of examples is given below:

- Sida/EcosanRes (Sweden): Annual course for professionals in two regions alternating between Latin American countries, Africa and Asia
- Norwegian University of Life Sciences: Summer school and courses for students and professionals
- Technical University of Hamburg-Harburg (Germany): ecosan integrated in university degrees
- CREPA: Training courses for sanitary professionals in the West Africa Region
- My Networks: Internet courses on ecosan
- UNESCO-IHE (The Netherlands): Integrated into MSc programmes, e.g. Municipal Water Infrastructure MSc programme (in preparation)
- UNESCO endorsed network of centres for urban drainage / urban water (IRTCID/CUW network)
- German Water Association (DWA): Training courses for professionals (in preparation)
- Order of Syrian Engineers and Architects (OSEA): creating an inter-institutional professional network (IPN) on ecosan for the advancement and dissemination of knowledge and training
- Indian Innovative Ecological Sanitation Network: Regular capacity building workshops and joint pilot case studies
- Centre for Science and Environment, India: Training on water pollution & water-waste management
- Philippines Ecological Sanitation Network: Regular capacity building workshops and joint pilot case studies (e.g. Center for Advanced Philippine Studies: Capacity building and training with Ecosan pilot projects and research; University of the Philippines / Philippine Women's University: Integrated of ecosan into an MSc programme on Enviromental Engineering / Management).
- GTZ-ecosan project (Germany): Local capacity building workshops in the start-up phase of ecological sanitation projects for decision makers, professionals and other stakeholders
- WASTE (The Netherlands): Local capacity building workshops in the start-up phase of ecologicalsanitation projects for decision makers, professionals and other stakeholders
- World Toilet Organisation / World Toilet College: Training of trainers in ecological sanitation

Box 5: Example for a funding programme to strengthen ecosan research capacity

A Funding programme for ecosan related research was started in 2005 by the Swedish International Development Cooperation Agency (Sida), the Stockholm Environment Institute (SEI) and the International Foundation for Science (IFS). (IFS 2005)

In the programme up to US$ 12,000 (EUR 9,600) are being offered in research support for projects on Sustainable Sanitation and Grey-Water Reuse. Grants are intended for citizens of developing countries carrying out research in a developing country, attached to a university or non-profit making research institution in a developing country. The age limit for this programme is 40 (for Chinese applicants 30, for applicants from Sub-Saharan Africa 45).

The topics funded are: (1) Ecological Sanitation

- monitoring the reduction of environmental impact;
- pathogen destruction;
- secondary treatment of excreta and organic waste;
- safe agricultural reuse;
- identification of pollutants (e.g. pharmaceuticals);
- perceptions/attitudes related to excreta reuse in food production;
- economic value of nutrients and humus.
- Other forms of sustainable sanitation
- development of other sustainable sanitation methods;
- monitoring the reduction of environmental impact.

(2) Reuse of grey-water for irrigation

- monitoring improved availability of water for agriculture;
- identification of geographical areas where re-use of grey-water is feasible;
- development of treatment systems;
- identification and reduction of pollutants (e.g. detergents, pesticides, pharmaceuticals);
- public acceptance and management of systems.

One important way to increase capacity is to develop funding programms for research in the new field. A funding programme for ecosan related research has been started in 2005 by the Swedish International Development Cooperation Agency (Sida), the Stockholm Environment Institute (SEI) and the International Foundation for Science (IFS). Its design, topics, and target group of researchers are given in Box 5 above. The funding programme shows what are currently seen as the promising fields for young ecosan researchers in southern countries.

Training of Trainers with a partly e-based approach is needed
Whilst these initiatives are to be welcomed and further encouraged, it is also clear that alone they will not be able to meet demand as long as they continue to reach only a fixed number of participants (e.g. reaching several hundred people per year and courses). An exponential increase in capacity is now required, with training being aimed at trainers, who in turn can pass their knowledge on, establishing a large network for capacity building.

An important target group should therefore be trainers at professional training institutions such as schools of public health, departments of water and sanitation for civil engineers, agriculture and horticulture training institutions, schools of architecture, university departments for social and economic development, etc.

This new direction of capacity building activity requires well designed materials for the training of professionals and students soon to become professionals.

Some material has already been developed for such courses, as can be seen from the examples given in Chapter 7. Most of these materials are to some extent e-based, and many of the courses are divided into two, with one section done by the students in their home countries (preparatory activities, case studies, collection of local background data, introduction into the topic) and another section being carried out with the trainer in a face to face situation (including discussions of the case studies, group work, etc.).

E-based Learning Materials are suitable for ToT-schemes
E-based learning material has particular advantages when being used in Training of Trainer (ToT) schemes: It can be made informative, up-to-date, and presented in a way that catches the teachers' interests. It can include "Power Point" presentations with accompanying text / instruction, film clips, video-taped interviews and lectures, and an extensive reference list. E-learning material can be made available on the web or on a CD for teachers and instructors in recognised institutions for training of professionals in various ecosan-related subjects. Teachers are free to choose the sections which he or she deems relevant for courses they are conducting. The material is thus easy to adapt to the needs of the individual teacher, from a full course to parts to be included in some lectures. The CD / website is easy to update on a periodic basis.

E-learning material is already available that covers the major ecosan management issues, policy, household routines, hygiene and sanitation systems, primary treatment/handling, secondary treatment, reuse in agriculture and energy generation, selection criteria for sanitation systems and systems analysis. It can also include suggestions on how to use the material in learning and gives examples of syllabi for a variety of courses.

Starting a knowledge base for ecosan training and education
As a contribution to the currently available e-learning resources and ecosan knowledge dissemination, GTZ together with several other organisations have collected, assembled and made available published material relevant for education and training purposes on a "ecosan resource CD" (GTZ 2006), which either accompanies this publication, or is also available from ecosan@gtz.de . This CD will be useful for interested teachers to develop their own teaching material. The content of the CD comprises:

- Basic ecological sanitation literature (e.g. the new edition of the EcoSanRes book on ecological sanitation from Winblad and Simpson-Hébert (2004)
- Guidelines (e.g. for the reuse of excreta and grey water, and for project planning)
- Proceedings of ecological sanitation conferences
- Project data sheets and technical data sheets
- Example curricula and Power Point presentations used in existing university courses on ecosan
- Concepts for local capacity building workshops

This CD is seen as the core of the current ecological sanitation knowledge base, and may be used as a starting point for a web-site on education and training material for ecological sanitation capacity building. Further activities in this respect may comprise the exchange of information on ongoing training activities, resource experts, development of a joint e-learning courses etc.

To provide inspiration for the development of your own ecological sanitation courses, a range of samples of ecological sanitation syllabi and workshop contents and an awareness raising presentation are given in Chapter 7 of this publication.

Learning material from all sources shall be used in a joint effort to develop a comprehensive capacity building programme to support sustainable sanitation. This certainly will contribute to the task over the next 10 years to meet the Millennium Development Goals.

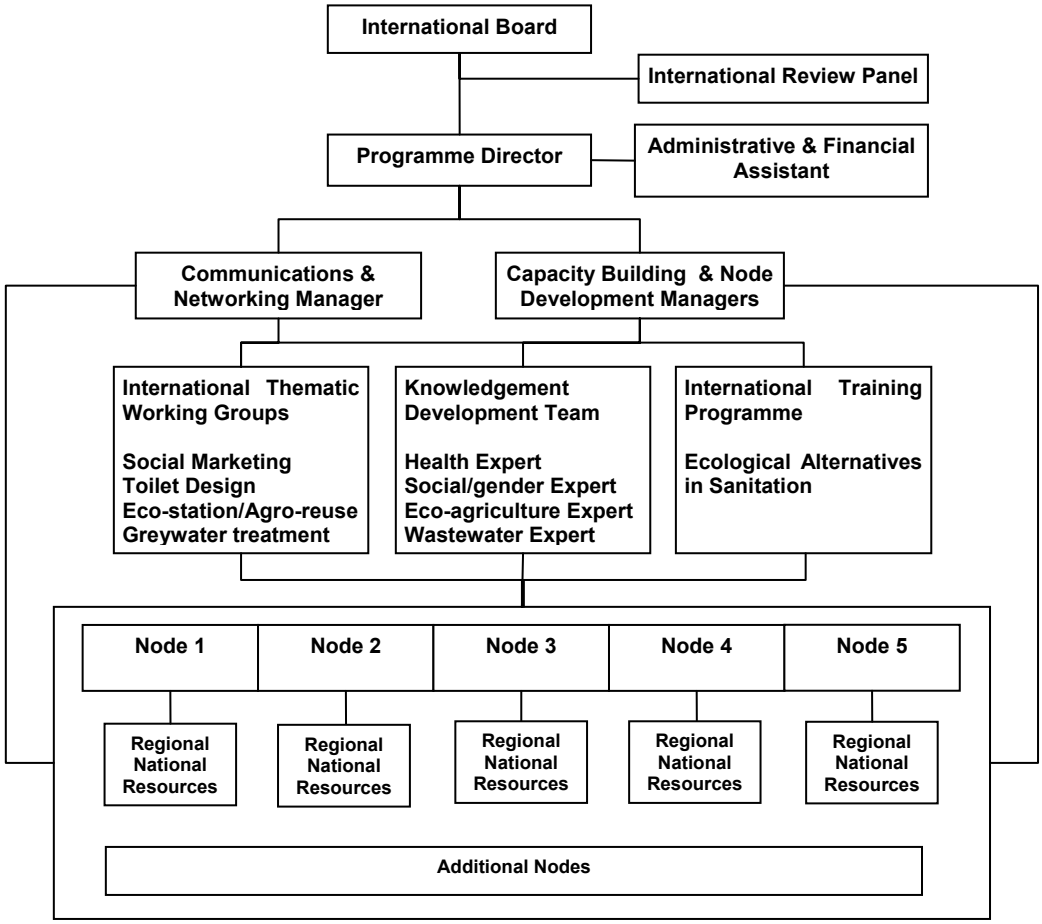

Figure 15: The organisational structure of the "nodal concept for capacity building", as suggested for the EcoSanRes Programme Projectphase 2. (EcoSanRes 2006)

5 Knowledge management, research and development for sustainable sanitation: the need for a change

Many successful, individual examples of ecological sanitation systems can be found in various countries. However there is still a great deal of research and development work needed before ecologically sustainable sanitation systems are broadly accepted and implemented internationally as state of the art solutions. Most of the systems installed to date have been in rural areas, whereas experience in urban and peri-urban areas remains limited. However, faced with rapid urbanisation world-wide there is a pressing need for practicable sanitation solutions in such densely populated areas.

If the Milennium Developments Goals are to be reached, a dramatic acceleration in the rate of progress in sanitation coverage is necessary. If they are to be reached sustainably, knowledge management, research and further development of sustainable sanitation systems with a proven track record and a large potential for multiplication are urgently required. This can be best achieved through a combination of demonstration projects and action research, the development of field-tested standardised systems and the compilation of a broad knowledge base on innovative and sustainable sanitation solutions. Demonstration projects are also needed to illustrate how robust, sustainable ecological sanitation systems can be provided at a high enough rate to make the sanitation targets of the MDGs achievable.

The holistic approach needed for knowledge management, research and development for sustainable sanitation solutions should be multi-facetted. It needs to comprise not only traditional water supply and sanitation issues, but also other disciplines such as agriculture, town planning, public health, environmental protection, resources management, economics, marketing, and sustainability assessment. At the same time the development of sanitation systems should adopt a life-cycle approach. This should be applied to the material flows that enter the system and must subsequently be managed or reused, as well as to the infrastructure itself.

It will not be enough to simply change the topics being researched. The way in which sanitation research is carried will also have to change to an extent, making better use of “learning alliances”, and “action research”. The bridge between academia and practice, or formal and practical knowledge in sanitation also needs to be improved, taking behavioural and cultural aspects and the actual needs of the stakeholders into consideration.

5.1 Historical perspective on sanitation knowledge and experimentation

Most old agricultural societies practised use of night-soil, and lived for centuries in closed loop systems, where the nutrients from liquid and solid household wastes were reused as fertiliser. Using this practice, China managed to keep the soil fertile for several millennia, despite having a relatively high population density. This knowledge however was not based on scientific research, but was rather culturally codified and traditional practical knowledge. In general, historical descriptions on this theme are sparse.

This practical knowledge has been used for water saving, greywater recycling and the reuse of nutrients from excreta. In Yemen, for instance, the separation of urine and excreta was common practice for many centuries resulting in a sanitation system, which required very little water, with the dried faeces eventually being burned. In modern times this traditional sanitation system has been changed with the introduction of water-flush toilets, which appeared to offer a more convenient and “modern” solution. However this has lead to water shortages and a dramatically falling water table in the area of the Yemeni capital city of Sana’a, and to structural damages of the existing multi-storey clay-buildings (Winblad and Simpson-Hébert 2004). In Central Europe human excreta were commonly used together with animal manure in agriculture as a source of nutrients. In many places, including colonial America, fruit trees were planted when an outdoor latrine was moved, and the trees were fertilised by the excreta.

Over the last centuries however, traditional reuse practices have been abandoned, due to the reasons discussed below. Today however, in view of the degrading quality and fertility of our soils, the limited availability of mineral phosphorous reserves and the high energy demands to produce fertiliser, and the need to protect our freshwater reserves, the recognition of excreta and greywater as resources should again be reinforced and systematically implemented, using modern technological and operational solutions, and ensuring maximum health protection.

The practice of using the nutrients in excreta for agriculture was prevalent in Europe until the middle of the 19th Century, and the marketing of fertiliser derived from excreta and organic waste was a thriving small scale business. Farmers were eager to get these fertilisers to increase their yields and the value of human waste was clearly recognised.
In Paris for example, in 1850 urban agriculture was practised on 15% of the citys area and Paris was exporting vegetables, compost and fertiliser from pits to the surrounding regions (Illich 1987, Lange 2002). With the introduction of flush-toilets, the system was no longer able to manage the increased amount of liquid waste leading to overflowing pits and a rise in pollution of the inner cities, and exceeded the transport capacity of the traditional night soil management systems. In addition the dilution of human excreta with flush water decreased the nutrient concentration and thereby the market value of the wastes and the invention of artificial fertilisers finally introduced a cheaper alternative into the market.
All this led to the increased use of existing storm water drains to transport liquid waste out of the city. The concept of the water-borne sewer system quickly became the standard approach to solve the sanitation problems in urban areas of industrialised countries during the second half of the 19th century (van Zon 1986).

With the widespread introduction of flush-toilets and water-borne sewers however, pathogen laden black water entered rivers, lakes, and other surface waters. This pollution problem got worse with increasing population density and the number of inhabitants and industries connected to the sewer system. Consequently these sewage disposal systems had to be successively upgraded with additional sewage treatment plants, increasing investment and operation and maintenance costs.

Waste-water treatment technology has been further refined over the years, targeting different substances and using a variety of physical, biological, mechanical and chemical water treatment technologies. As knowledge of environmental science increased, the aim of these treatment steps has evolved from the simple removal of larger solids to the elimination of oxygen-consuming organic substances, and later the removal of nutrients. Today the need to degrade or remove micro-pollutants, such as hormones and medical residues, is being discussed as a further treatment step. It has taken about a generation to research, invent, develop, test, up-scale, and institutionalise each additional major waste water treatment step.

The refined treatment processes however, resulted in the production of larger quantities of sewage sludge, which again posed problems of handling and disposal. With the replacement of the traditional reuse oriented dry sanitation systems through sewer systems and wastewater treatment plants, the recycling of nutrients now was limited to the small insoluble fraction contained in the sewage sludge, whilst the soluble fraction was either discharged into the water bodies or degraded into volatile substances in energy intensive processes. Making the issue more complicated was the fact that sewage sludge from large centralised systems often were contaminated with toxic substances (e.g. from industries), and therefore had to be disposed of in landfills instead of being reused.

The abandoning of reuse oriented sanitation systems lead to an increased use of mineral fertilisers to maintain soil fertility (although their long-term effects on the soil and on the quality of the food produced are still being debated). Where finances have been limited, for example in developing countries, soil quality and fertility has degraded dramatically, while the misuse of water bodies as a sink for human waste reduces their quality and causes severe hygienic and environmental problems. In addition the consumption of limited natural resources for the production of artificial fertilisers (especially phosphorous) led to a new debate on sustainable reuse oriented sanitation concepts.

After water-borne sanitation became the prevalent approach in the 20th century, the search for efficient reuse-oriented sanitation in industrialised nations basically came to a standstill until the 1970s,

when mainly Scandinavian research on ecological sanitation started with projects on composting toilets, urine separation and reuse (compare figure below). The widespread acceptance and promotion of water-borne systems can be mainly attributed to the following:

- The availability of cheap artificial fertiliser ensured there was no market for the products of human excreta
- Large centralised sewer systems and treatment plants were seen as the state of the art and as the unquestioned modern solution
- Environmental problems had been recognised, but were not perceived with the urgency they are recognised today. One reasen is that the global population and urbanisation were less, and so were the resulting problems.
- Mineral fertilisers were seen as a panacea for soil fertility problems, with the problems that it can cause, (for example the depletion of micro nutrients and organic material from the soil or the contamination of phosphorous fertiliser cadmium and uranium) not being widely known
- The displacement of nutrients and organic material from the soil-sphere to the water bodies was not recognised as a problem
- The discussion on the limitation of natural resources (such as oil and phosphorus) and on the sustainability of our way of life only arose in the 1970s

In many ways development studies and the investigation of failures of the European models in the South have revitalised the interest in alternative solutions to the conventional sanitation approach. Sewered sanitation and centralised waste water treatment were regarded for several decades, and indeed still are by many people, as the most appropriate solution to solve sanitary problems world wide, with the main difficulty being how to finance the required investment. This was followed by the realisation that the implementation and operation of these systems was only possible in rich countries and in high income areas of developing countries, and still required huge subsidies by governments, and resulted in the poor being left to fend for themselves.

Today with greater population pressure and scarce water resources this human waste disposal system is no longer able to meet needs.

In recognition of these shortcomings, a movement towards developing and providing appropriate alternative sanitation began some decades ago. The movement was largely driven by the realisation that the health of unserved, unconnected populations was in dire need of improvement and that these improvements were unlikely to be come through conventional sewerage. It thus became a priority to:

- Identify appropriate simple, affordable decentralised dry and wet sanitation systems, such as VIP-latrines or pond systems and promote their adoption
- Implement appropriate technologies with the participation of the communities to be served, and
- Focus on health and hygiene education so that physical facilities would be properly used and maintained, and that hygienic behaviour would support the improvements brought about by the infrastructure.

Progress in the adoption of appropriate technology was initially slow as it required nothing less than a paradigm shift away from the traditional technology fix to one based on the participation of the intended beneficiaries assisted by multidisciplinary teams of professionals.

Over the years, it became clear, that this health and hygiene driven paradigm shift was incomplete: In practice faecal sludge management problems where often overlooked, as were negative downstream effects. Protection of the environment, resource conservation and waste reuse remained secondary concerns at best, or were neglected entirely, and operational problems reduced the health impact of these technologies.

For many practitioners and researchers this lead to a revival of interest in the reuse of excreta and urine that had been ignored by mainstream research.

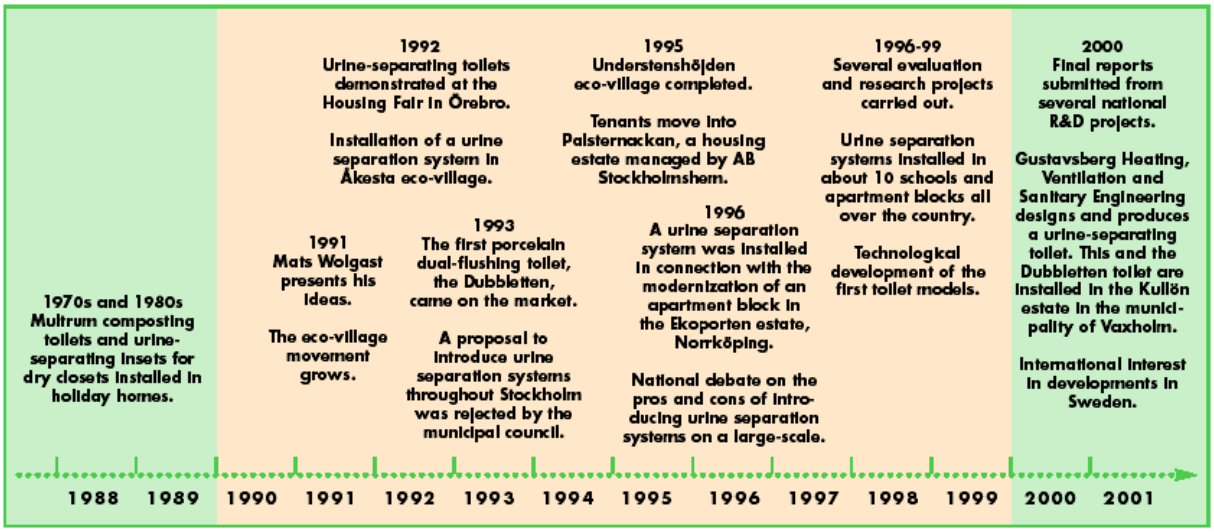

Figure 16: Swedish research on urine separation and reuse in the end of the 20th century (Johansson et al. 2000)

Figure 16 illustrates the increasing number of research and demonstration projects for excreta reuse carried out in Sweden from the 1980s to the early 21st century aimed at developing hygienically safe closed-loop sanitation systems. Similar lines of research began elsewhere, for example in North America (del Porto and Steinfeld 1999), in Africa (Morgan 2005), in the Netherlands (Zeeman and Lettinga 1999, Lettinga 1996), Norway (Jenssen et al. 2004) and Germany (Wilderer et al. 1997, Wilderer, Schroeder and Kopp 2004).

These closed-loop sanitation systems became popular under the name “ecosan”, “dewats”, “desar”, and other abbreviations. They placed their emphasis on the hygenisation of the contaminated flow streams, and shifted the concept from waste disposal to resource conservation and safe reuse.

In addition to paying great attention to the health aspects at the household level they also emphasised:

- The destruction of pathogens through flow stream separation, containment and specific treatment.
- Resource conservation through reducing the use of potable water as a transport medium for human waste and by using wastewater for irrigation
- The elimination or at least the reduction of wastewater discharge to the environment
- The need to close the resource loops through the productive use of the nutrients contained in excreta

The modern ecosan concept thus represents the culmination of the paradigm shift initiated in response to satisfying the health needs of unserved, mostly poor population groups. Ecosan adds resource conservation and waste reuse to improve both the economic conditions and the health of the population served. These two issues are linked, as health is a prerequisite for human productivity, and productivity determines economic well-being. The ecosan paradigm shift thus uniquely contributes to several objectives: the improvement in human health, poverty reduction in developing countries, the conservation of natural resources and sustainable water and sanitation management systems in both, industrialised and developing countries.

Examples for early alternative sanitation initiatives

Historical research on the urbanisation of 19th century Europe sheds some light on the driving forces behind sewered, water-borne sanitation, and end-of-pipe treatment systems in Europe. The historical research of Lange (2002) and some earlier work of van Zon (1986) are useful to help us understand the alternatives that have been discussed and tested, and to gain some preliminary insight as to why these were ultimately rejected or accepted on only a small scale.

Vacuum technology, currently used for sanitation systems in ships, aircraft and trains, as well as in hospitals where patients are exposed to radioactivity, was a major contender to become the sanitation system of choice in Europe in the 20th century. The advantage of vacuum systems is that they use very little water, so that the concentration of organic matter in black water is high enough to allow fermentation and bio-gas production. The low pipe diameter and water volumes also ensure more modest construction and maintenance costs.

Urine diversion and collection was common practice in many cultures and has a long history. For example in Roman times urinals were put up in alleys by laundry services who collected the urine and used it in washing clothes.

In the second half of the 19th century special urinals were developed for saving water, but also for extracting phosphates and nitrates, which were used as fertilisers or for the production as gunpowder and could be sold well until in the 20th century, when saltpetre (an alternative source for nitrates) was discovered in Chile.

Box 6: Urine separation and reuse technology in the 19th century

A patent for waterless urinals was given in 1885 to the Company BEETS from Vienna. In Vienna, as in several other cities, the water consumption of public urinals was too high to be provided with an adequate public supply (over 100 Litres per single urinal stand and hour). Beets' idea was a siphon in which a liquid lighter than urine (oil) formed a layer on top of the urine thus preventing its evaporation and stopping smells. The design of the siphon has since been further developed. In the last 40 years more than 200 000 waterless urinals have been sold, mainly in Switzerland, by the successor of the Beetz Company, which is the Company Ernst. (Lange 2002; Lange and Otterpohl 2000; GTZ-technical data sheets 2005)

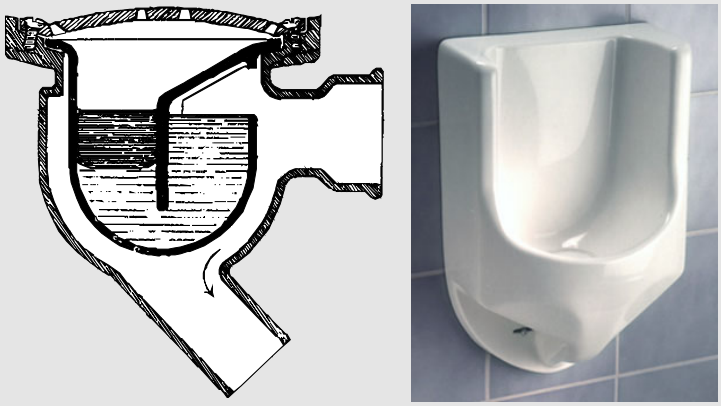

Figure 17: Siphon for waterless urinals invented by Beets, 1885: Oil forms a layer on top of the urine and stops smells (left) (Lange 2002). Modern waterless urinal (right). (GTZ–technical data sheets 2005-01.B2).

Box 7 : Vacuum technology in the 19th century

In 1865, Prince Heinrich der Niederlande had asked T. Charles Lienur to remove the sewage from Castle Luxembourg without polluting the River Elz and without using wagons. The introduction of sewer systems in the second half of the 19th century had provoked hefty discussions on their pros and cons, as treatment plants were not existent (the first German treatment plant was build in 1887 in Frankfurt-Niederrad) and they were resulting in an increasing pollution of surface water bodies.

The system developed by Lienur consisted of two pipes. One carried rainwater, greywater, and industrial water, while the other was what could be considered the ancestor of modern vacuum sanitation systems, and was used to transport blackwater and water from stables and slaughter houses. The vacuum toilets required very little water and the blackwater collected was used to produce “poudrette” (French for dried natural fertiliser from dung or compost).

At that time the industrial production of mineral fertiliser had not yet started (the first factories were built in 1870) and the price for fertiliser was high enough to allow the production and successful marketing of “poudrette”.

In developing areas of Amsterdam in 1906 more than 4 500 vacuum toilets where connected to a Lienur-system. Soon however the production of poudrette was seen as being too costly as prices for industrial mineral fertiliser decreased.

Although some information on Lienurs system is available, a thorough investigation of why the system could not compete with central sewer systems in urban areas, particularly under the specific and very difficult conditions in a city like Amsterdam, has not been carried out (Lange and Otterpohl 2000, Lange 2002).

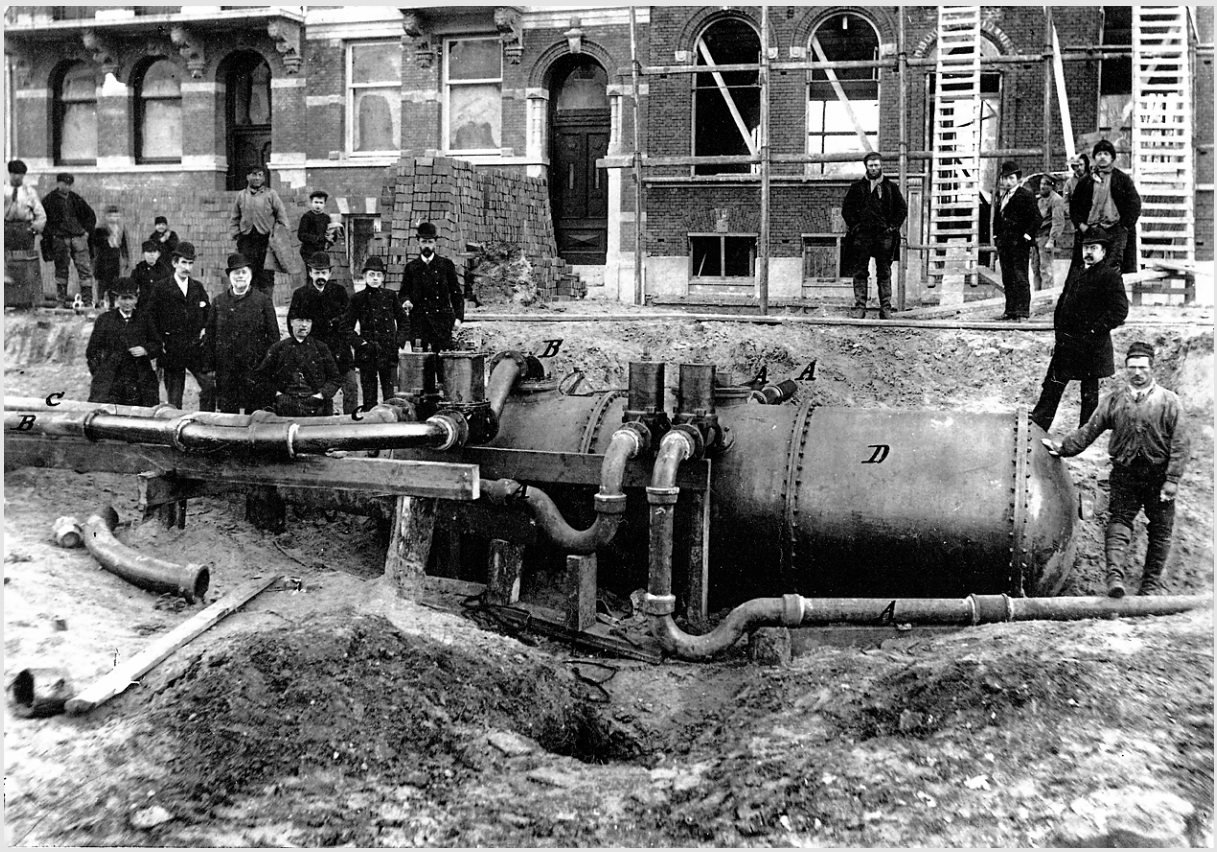

Figure 18: In Amsterdam in 1906 more than 4.500 vacuum toilets were connected to a vacuum based Lienur-system (Lange 2002). (Foto Roediger)

Recent renewed designs

Today vacuum technology, waterless urinals and urine diverting toilets belong to the many technologies available as components of innovative eco-system oriented sanitation systems. Examples for vacuum based ecosan projects include the headquarters of the KFW-Bank in Frankfurt, Germany (comp Box 5 below), or the Building Initiative "Wohnen & Arbeiten", Freiburg, Germany (Panesar and Lange 2004). Waterless urinals are becoming increasingly common in Europe and can be found in many public buildings today. In the new GTZ-Headquarters in Eschborn, near Frankfurt, Germany (comp Box 6 below) for example, waterless urinals are used together with urine diverting toilets for a urine separation and reuse demonstration and research project (GTZ –technical data sheets 2005).

Project Box 5: Vacuum sewerage and greywater recycling at the KfW office building, Germany (GTZ-project data sheets 2005-001)

A recent extension of the headquarters of the KfW Bankengruppe, in Frankfurt, Germany, offers space for around 300 workplaces and has 13 apartments on its two top floors. In the building an innovative water and wastewater management system has been installed that includes vacuum technology and meets economic and ecological requirements.

Figure 19: KfW office building "Ostarkade" (left); Vacuum toilet and pumping unit (right) (KfW)

Office areas and apartments are equipped with vacuum toilets and vacuum urinals which are connected to the central vacuum pumping station in the basement by a vacuum pipe system. Blackwater from toilets and urinals is currently discharged to the communal sewerage system. However it is planned to include on-site anaerobic treatment of the blackwater in the next phase of the project.

Greywater from hand washing, cleaning and kitchens is collected in a separate gravity pipe system. It is treated using compact activate sludge reactors, membrane filtration and UV-light. The treatment guarantees pathogen free water for reuse. The treated greywater is used for toilet flushing and for cleaning.

The innovative sanitation concept is currently repeated in other extensions of the KfW office complex.

Project Box 6: Urine separation and reuse at the GTZ-Headquarters inGermany (GTZ - project-data sheets 2005-016)

During the renovation of the main GTZ office building in Eschborn, a modern, ecologically sustainable concept for the management of the wastewater from toilets is being installed. The main building will be equipped with waterless urinals and water flushed urine diversion (UD) toilets. Through the separate, undiluted collection of urine, the water demand for flushing toilets will be significantly reduced. With this concept, the GTZ not only saves 900 m³ of water per year, but also the load of substances and nutrients from the urine on the water treatment facilities is reduced.

Figure 20: The main building of the GTZ headquarters (left - ttsp-HWP-Seidel); urine diversion toilet (middle - ROEDIGER) and waterless urinal (right; Keramag)

After treatment the urine will be used in agricultural tests carried out as part of a research project. The information collected from the project will also help to improve agricultural production with fertiliser originating from urine. When finished, the system will serve as a model for similar facilities, also in countries where water is scarce and fertiliser is needed in local agriculture. As the bulding recieves thousands of overseas visitors per year from developing countries, a large public relations impact is expected.

For the treatment and reuse of the brownwater originating from the UD-toilets an additional research component is foreseen. Treatment with an activated sludge reactor, followed by membrane filtration, is currently being discussed as one possible technological option.

5.2 Evaluating sustainability in sanitation systems

Overall sustainability has been largely overlooked in decision making processes and in planning and implementation of sanitation systems. Many systems have failed to provide sustainable services with regard to their social, economic and ecological impact, and in their operation. As a recent unofficial figure from the World Bank highlights, currently only 25% of all centralised wastewater treatment plants built in developing countries actually function correctly, as the sustainable operation of these cost intensive facilities is often not feasible. In terms of the social, economic and ecological sustainability and in protecting human health, these systems are failing in most cases.

Current legislation, norms, standards and decision-making procedures for choosing sanitation systems are determined by conventional thinking toward end-of-pipe solutions. They focus on the quality requirements of treatment plant effluent, which initially have been set for not polluting the receiving water bodies beyond their so called self-purification capacities. The decision-making is based largely on the net present value of investment, operation and maintenance cost of the system. However, if a sustainable operation of the system is to be achieved, a more holistic planning and decision making process is needed, geared towards finding sustainable systems. Sanitation decisions therefore need to be made on the basis of a much broader range of criteria than at present. They should include

social, ecological, technical, and economic and health aspects, and respond to long term sustainable resources management needs.

This is an urgent requirement given the current global sanitary crisis and the international commitment to address this, particularly the plan of action to reach the Millennium Development Goals. With this pressing need for action to meet the MDG sanitation target however, there is a huge risk that in developing countries the focus will fall simply on the provision of toilets and sewer connections, overlooking what is needed for a sanitation system and the related services to be sustainable from an overall perspective. That these conventional solutions usually are a subsidy for the rich, leaving the poor without service, was expressed by Sunita Narain, the director of the Indian Centre for Science and environment (CSE) (Narain 2004) (see Box 8).

There is therefore a need to integrate the more holistic considerations of sustainability into current decision making processes for sanitation, from the micro to the macro level.

Box 8: Conventional sewerage leaves the poor unserved

In her key-note speech at the international symposium on ecological sanitation “ecosan - closing the loop” in Luebeck 2003 Sunita Narain, the director of the Indian Centre for Science and environment (CSE) said:

“The political economy of sewers is extremely atrocious in poor developing countries. Hardly any poor city is able to recover its investments in sewer systems. As a result the users of these sewer systems get a subsidy. But almost all users in poor cities are the rich. Thus, sewers only lead to a subsidy for the rich to excrete in convenience. The poor always remain the `unserved´ in this waste disposal paradigm.” (Narain 2004)

One way of guiding decision making processes towards social, economic and ecological sustainability is to use sustainability oriented criteria when comparing and choosing sanitary systems. Such criteria should be used across the entire range of planning, implementation and operation levels – from the macro to the micro level. Developing and using a context-specific list of criteria to indicate the overall sustainability of a sanitation system therefore helps gearing the decision making process towards the issues relevant to the different stakeholders, and away from basic economic and techno-centric discussions. This allows more room for the implementation of innovative sanitation solutions that are tailored to the needs of the system users (Tischner and Schmidt-Bleek 1993).

The use of criteria in order to assess sustainability of sanitation systems has been suggested by several researchers. Larsen and Gujer (1997) underlined the need to focus on the functions the urban water management system should provide in order to be sustainable. Computer-based multi-criteria analysis tools to assess sanitation systems have been proposed by different actors, including the Swedish water and sanitation research group “Urban Water” (Urban Water 2004) and the Dutch researcher van der Vleuten-Balkema (2003).

However, despite this work, the use and usefulness of sustainability criteria in sanitation decision making remains largely unrecognised in real-life project planning and implementation. This may be due to the fact that much of this work has so far been mainly the domain of a relatively small circle of academics. The use of abstract theories and complex computer models may actually be serving to discourage practitioners from using sustainability criteria in their decision making processes.

In literature, many references to sustainable sanitation can be found without any accompanying definition of what this term might actually imply. To identify criteria that can be used to assess the sustainability of sanitary systems, a definition of sustainability with regard to sanitation is needed. However in order to do this, clear boundaries defining the limits of a sanitation system are a prerequisite

These should comprise from the cradle to the final destination all parts of the sanitation system, including: the users and other stakeholders demands and needs, collection, transport, treatment, reuse or final disposal of human excreta and domestic wastewater, organic household wastes, with option to include as well industrial wastewater, storm water, solid waste, animal manure or other agricultural wastes.

This broad definition explicitly recognises that sanitation is more than simply an element contained entirely within the water cycle. These boundary conditions also deliberately include the social aspect of sanitation, the economic and logistical side, and the idea of resource management, as well as any indirect impacts, costs or benefits of the system. Setting the boundaries of the sanitation system sets the basis for the comparison of entire systems, rather than simply comparing different technical elements of the system.

The list of criteria presented below is based on the understanding that a sanitation system that is sustainable, protects and promotes human health, does not contribute to environmental degradation or depletion of the resource base, is technically and institutionally appropriate, economically viable and socially acceptable.

The sustainability assessment of different sanitation systems is a holistic way of comparing systems with regard to their ecological, economic, organisational and societal impacts. This important method to compare conventional and ecosan systems constitutes a research field for itself.

Criteria for comparative sustainability assessment

An example of a general list of sustainability criteria that could be of importance in the assessment of the sustainability of sanitation systems, can be seen in Table 6. This list was first presented by Bracken et al. (2005) and is based to a large extent on criteria/functions/indicators outlined in the literature (van der Vleuten-Balkema 2003; Hellström, Jeppsson and Kärrman 2000; Larsen and Gujer 1997; Larsen and Lienert 2003; Lennartsson 2004, Urban Water 2004).
The criteria in the list are grouped into categories which are an expansion of the conventional triple bottom line usually accepted as the three pillars of sustainability – economy, society and the environment. This table contains five main categories; health, environment, economy, socio-culture, and the technical function. The protection of human health was and is the main aim of providing sanitation. To stress this fact, health has been taken as a category in itself and not as an element of environmental or social considerations. The technical function of the system was also considered an important criteria for sustainable operation, and this could not be satisfactorily addressed under the triple bottom line. The categories are described in more detail after the table.

Table 6: Examples of general sustainability criteria for the evaluation of sanitation systems (modified from Bracken et al. 2005). The contents of this table is intended to assist planners, decision makers and other stakeholders to identify their own context specific sustainability indicators, and not to serve directly as a general checklist for sustainability.

Criteria	Indicators
Health	
Exposure to pathogens and risk of infection related to all system elements including collection, treatment reuse and final destination of products / wastes	Risk assessment or qualitative
Risk of exposure to hazardous substances: heavy metals, medical residues, organic compounds	Risk assessment or qualitative
Health benefits due to improved hygiene, food production, nutrition status, livelihood	Risk assessment or qualitative
Environmental	
Use of natural resources, construction and O&M	
Land (investment, constr. and O&M)	m^2/pe
Energy (constr. and O&M)	MJ/pe
Construction material (constr.)	Type and volume
Chemicals (constr. and O&M)	Type and volume
Fresh water (O&M)	
Discharge to water bodies	
BOD/COD	g/pe/yr
Impact on eutrophication	g/pe/yr of N and P
Hazardous substances: heavy metals, persistent organic compounds, antibiotics/medical residues, hormones	mg/pe/yr
Air emissions	
Contribution to global warming	kg of CO_2 equivalent/yr
Odour	Qualitative
Resources recovered	
Nutrients	% of incoming to the system
Energy	% of the consumption within the system
Organic material	% of incoming to the system
Water	% of incoming to the system
Quality of recycled product (released to soil)	
Hazardous substances: heavy metals, persistent organic compounds, antibiotics/medical residues, hormones	mg/unit
Economic	
Annual costs, including capital and maintenance costs	Cost/pe/yr
Ability to pay – user (% of available income)	Disposable income/pe
Environmental and health costs	Cost/pe/yr or qualitative
Benefits from reuse	Generated income/pe/yr
Local development, business and income-generation effects	Qualitative
Socio-cultural (including user, institutional and policy asepcts)	

Criteria	Indicators
Acceptance by the users and willingness to contribute through work and or money for sanitation services (% of available income)	Reasonable % of time or income – defined by users
Convenience (comfort, personal security, smell, noise, attractiveness, adaptability to different age, gender, and income groups)	Qualitative
Current legal acceptability and institutional compatibility	Qualitative
Appropriateness to current local cultural context (acceptable to use and maintain)	Qualitative
System perception (complexity, compatibility, observability – including aspects of reuse)	Qualitative
Ability to address awareness and information needs	Qualitative
Technical	
System robustness: risk of failure, effect of failure, structural stability,	Qualitative
Robustness against extreme conditions	Qualitative
Robustness of use of system: shock loads, abuse of system	Qualitative
Possibility to use local competence for construction and O&M	Qualitative
Ease of system monitoring	Qualitative
Durability / Lifetime	Qualitative
Complexity of construction and O&M	Qualitative
Compatibility with existing systems	Qualitative
Flexibility / adaptability (to user needs and existing environmental conditions – high groundwater level, geology etc.)	Qualitative

Health
The entire sanitary system should minimise risks and safeguard public health. This covers the use of the sanitary installation, collection, transport, treatment and destination of the treated products. For instance, the risk of being infected through ground water or surface waters, contaminated from leaking sewers, pit toilets, or wastewater disposal should also be considered, as well as the risk of being infected when consuming vegetables from fields irrigated with insufficiently treated wastewater and bathing in lakes or the sea near overflows or waste water treatment plant outlets.

Environment
In many industrialised countries sanitation systems have been further developed to protect the environment against possible detrimental effects of the discharge. When considering the environmental sustainability both emissions to different recipients (water, soil, and air), as well as resource use by different sanitation systems during the construction and operation phase must be accounted for. Moreover it is important to consider the suitability of the treated product for possible reuse in agriculture or aquaculture.

Economy
The ability to pay for sanitation is clearly a decisive factor in choosing the system. Among the users, the ability to pay is an important criterion for sustainability. However in the end it may be their willingness to pay that will define within what range the costs (both for construction and O&M) can vary and services be sustained financially by the population. Some experts argue that the other criteria may eventually be reducible to purely economic considerations. Considerations such as the impact on local development (e.g. local private sector), health benefits etc. might be expressible in monetary terms. However, this reduction of criteria to their estimated economic value is probably not sufficient to allow a thorough consideration of all of the aspects.

Socio-culture
Clearly the objectives of sanitation are to protect human health and the environment, however, sustainability in sanitation cannot be based only on these objectives. There is an obvious need to

include social criteria as they are crucial to the sustainability of the use and the services provided by the system. It is possible to distinguish at least three very different types of important criteria within this category, namely cultural acceptance, institutional requirements, and perceptions of sanitation. Society is more dynamic and flexible than criteria such as human health and the environment and therefore the socio-cultural criteria are subject to a more dynamic change with time than human health and the environmental criteria. How the system is perceived, legislated for and accepted is therefore changeable with time. Although improving human health and protecting the environment are the main objectives for planners and politicians, this might not be enough to sell the sanitation concept to future users. It is also important to recognize that the prime driver for sanitation might be security and status rather than health and environment as recent studies have shown (Holden 2003, Kgomotso et al. 2004). Another sanitation driver could be the possibility of increased food security if the sanitation solution can provide hygienically safe fertilisers.

Technical function
The technical reliability and performance of the system is key to its success and ultimately its sustainability. One of the more important sub-criteria under this category is probably robustness and flexibility, both within the system (to be able to receive varying loads) and externally (to be able to withstand varying extreme environmental conditions as well as user abuse). The technical functioning of the system is seen as perhaps the most flexible group of criteria. In this regard, it is important to adapt technologies to the needs of the situation rather than trying to make a situation comply with the demands of a favoured technology. It is also much easier to adapt a technology to what people need than to adapt people to what a technology requires.

The list of criteria presented here is intended to provide inspiration when trying to identify context specific sustainability criteria. The requirements of sustainability are dictated by context, and can change with time. This list should serve to inspire sanitation planners on all levels to include the concept of sustainability criteria in their planning processes, and to actually define, in a participatory manner with the relevant stakeholders, what criteria their planned sanitation system should fulfil in order to optimise sustainability in the given context. The list presented here should provide certain “core” considerations of sustainability, which should be considered as a minimum in any basic list to assess a sanitation system.

One way in which the criteria may be used would be as the focal point of a multiple criteria decision making process. There is a broad range of techniques which can be employed for this. This does not need to be an extremely complicated process and methods are available that could facilitate this when working with grass roots level groups. In such cases it is often considered appropriate to allot agreed weights to the criteria identified, relative to their importance to the stakeholders, and to use these weighted versions when deciding. Each stakeholder group may have criteria which are of particular importance to them, and different criteria may be of greater relevance at different times in the decision making process.

5.3 Development and field testing of sustainable sanitation systems in the urban context

5.3.1 The need for large series of pilot research and demonstration projects

The highest research priority for sustainable sanitation is to gain experience of implementing innovative, sustainable sanitation systems on small, medium and large scales, in industrialised and developing countries and in countries in transition.

A large series of research and demonstration projects are therefore needed which can serve to further develop and field-test a broad variety of technical and operational sanitation systems in a range of climatic, social, cultural, economic and geo-morphological conditions. In short: pilot systems are needed to develop a series of model solutions to cover the entire range of sanitation needs.

The research needs cover all the following key aspects for the sustainable operation of a sanitation system:

- technical and performance issues
- environmental and health aspects
- financial and economic aspects
- institutional and organisational aspects
- socio-cultural aspects
- policy and legal aspects

Research needs to seriously address:

- technologies for the collection, treatment, storage, transport and use of excreta and greywater
- logistical and operational concepts
- capacity building issues for decision makers, planners, technicians, users and other stakeholders
- development of local service providers to plan, install, operate and maintain the systems and to market the products
- identification of different reuse options
- market analysis for the complete range of products that the system can be recovered
- development of planning, capacity building and management tools
- development and field testing of different financial instruments and models
- assessments of health and environmental impacts
- full cost-benefit analyses of all types of sanitary systems

A great challenge for ecosan research and development is the introduction of reuse systems in urban areas, where the production of excreta or greywater, their treatment and their reuse can rarely occur in the same location and cannot be carried out by the same person. In introducing ecological sanitation in urban areas, it is therefore necessary that research does not only concentrate on purely technical “hardware” issues. Logistical and institutional issues must also be given a high research priority to encourage the development of more sophisticated logistical arrangements by service providers for the collection, transport, and treatment of excreta. Even more critical is economic and health research in the marketing of these products, leading to an increase in their potential for agricultural use, and social acceptance in cultures where the use of treated excreta is not currently considered appropriate for the food chain.

Technical research is of course also needed. System components that have proven successful on a small scale (for example vacuum sewers) need to be up-scaled and new technical components are needed to ensure that eco-sanitation services can be provided in a variety of demographic and geographic settings.

Project Box 7: China-Sweden project of Erdos eco-town in China (Rosemarin et al. 2004)

Erdos is a cluster of cities in a coal mining belt of Inner Mongolia, where a new eco-town is being developed in a suburban area a few kilometres from the city centre of Dong Sheng.

New houses for 7.000 peoples in the eco-town are being equipped with modern porcelain urine-diverting dry toilets. Toilets and related equipment and fixtures are being developed and manufactured in China.

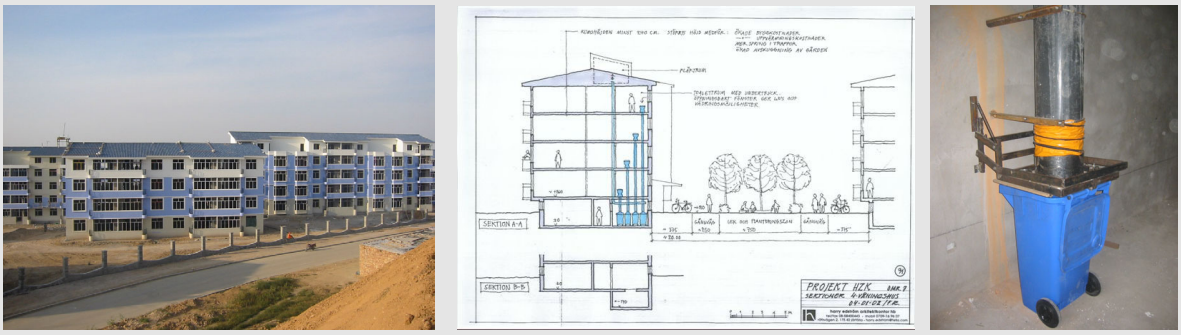

Figure 21: Front view of the apartment buildings (left); straight drop urine diversion toilet design (middle); collection of faeces in cellar containers (right). (EcoSanRes)

Faecal material will be collected in dry form in cellar containers, which will be regularly emptied. The faeces will then be composted together with household organic wastes and used as a soil conditioner. Urine will be collected on site in tanks and used in local agriculture.

Greywater will be collected and treated on site in small aeration and filtration treatment facilities. Organic and other solid wastes will be sorted and collected in eco-stations. Storm water will be collected separately using drains.

The project will undergo a period of development and testing prior to its full-scale implementation. Once in operation the model town will be the object of further performance studies by water and sanitation specialists, urban planners, urban agriculturalists and others.

Urine

Research into the technical and logistical aspect of urine separation in an urban context and the associated management of transport services to return the nutrients to agriculture have been carried out in Sweden. One result of this research was that for a given context, the transport of urine was economically and ecologically sustainable for distances of up to 120 km (Johansson et al. 2000). The institutional and commercial basis for doing this, however, remains largely unexplored, and represents an important challenge.

Rainwater

There are many successful examples for the integration of rainwater management in urban planning, with significant implications for domestic water use, or ground water recharge. Zero run-off concepts and rainwater-collection can make an important contribution to water supply, the replenishment of falling groundwater levels, flood protection and the reduction of costs for storm-water sewers. Green roofs, ponds, and infiltration ditches have a positive impact on the local climate, reduce run-off, and their integration into urban environments can contribute to improving the quality of life for the population.These examples illustrate clearly that rainwater management must be an integral element of urban water and sanitation management systems.

Greywater

The technical and social base for the reuse oriented management of greywater appears to be even more favourable since it can easily be treated and then reused to a large extent near the point of generation, within the same house or housing complex for toilet flushing, irrigation, or groundwater recharge. The municipality of Hamburg is promoting grey water reuse in a pilot programme with the argument that it reduces the consumption of high quality drinking water, and that the innovative treatment system may prove to be a technology ideal for export (comp. Box below).

Box 9: Grey becomes clear: Hamburg, Germany, promotes greywater recycling

"Greywater" is water from showers, wash basins and bathtubs. The most modern recycling technology for this wastewater is smaller than a wardrobe. The treatment and reuse of this water can reduce consumption by approximately 30% and the treated water is of a high enough quality to be used for swimming, bathing, flushing toilets, watering gardens and for washing clothes.

The municipality of Hamburg now provides subsidises of 1 500 Euro per treatment plant, and can subsidise up to 30 plants. "We are doing this for two reasons: (1) Drinking water in Hamburg is of excellent quality and too precious to use as a transport medium for excreta, and (2) Greywater recycling is an innovative approach which could become an important export technology, for example for water scarce regions in the south." said Dr. Herlinde Gundelach, a member of the Hamburg state parliament during a presentation of this new environmental programme – the first one of its kind in Germany. (Stadt Hamburg 2004)

Faeces and blackwater

Large scale experience in the use of urine diverting toilets and the anaerobic digestion of black-water (most usually combined with pig slurry) has been gained in China. In rural and peri-urban of China around 700.000 urine diverting dehydration toilets were installed between 1997 and 2004, and over 10 million of the biogas generating 4-in-1- and 3-in-1- models have been installed (Zhou et al. 2004). These systems have been designed to recover and use the materials at or very close to the point where they have been generated (in agriculture or gardening), and whilst highlighting clearly that ecosan systems can provide sanitation to large numbers of people, they have not provided a great deal of experience with regard to the development of the logistics and infrastructure necessary when ecosan is applied in areas where the materials cannot be directly used.

In the development of this infrastructure efforts should be made to ensure that they enable material flow cycles to be closed on the minimum practical level (i.e. that use can occur close to the point of generation), thus ensuring that transport requirements are minimised, and that any possible export of problems associated with the use of treated excreta and greywater is avoided. This clearly requires urban planners to be involved in the development of the system, and to avail of practical knowledge to enable them to plan appropriately.(e.g. in order to provide space for the integration of a constructed wetland in an urban park, to support urban agriculture or to provide small scale service providers with an area for the treatment and storage of ecosan products in neighbourhoods). In contrast to infrastructure development for conventional, centralised sanitation systems, the required infrastructure for ecosan systems may include the possibility of using smaller planning units and of a greater number of decentralised systems.

The installation of such service structures, and of creating appropriate financing mechanisms to ensure their sustainability, is crucial for the introduction of ecological sanitation in urban areas. This clearly still requires a good degree of research and development to optimise new technical and management solutions.

Research needs to particularly focus on decentralised solutions and systems as integral parts of larger sanitation systems. These systems may consist of combinations of different technologies with services for the transport, storage, distribution, marketing, and safe and sustainable use of the produced materials. Large scale pilot projects are therefore urgently needed, allowing applied research on their performance under different circumstances.

5.3.2 The transition from conventional to closed-loop sanitation systems

The introduction of closed loop concepts in central systems will most probably begin in small pockets, for example in new development areas, where the sanitary system can be designed from scratch and implemented comparatively easily using material flow cycle principles. Such systems provide alternative solutions, which can quickly be used for the sanitation solutions in fast growing cities in developing countries. However, in industrialised nations, where vast sums of money have been invested in centralised water-borne-systems over many years, the transition to closed loop systems will be a much more demanding task. Nevertheless this transition is equally required, probably best being realised during the renovation of the existing infrastructure. For both the installation of new, and the upgrading of existing infrastructure, a step-wise approach will most often offer the best solution. In a first step a series of generic pilot projects can be implemented in a range of typical urban and / or rural settings. These should be both tested in, and adapted to local conditions. In a second step this experience can be repeated and scaled up to eventually cover the whole settled area.

So far very little experience of the transition from end-of-pipe towards closed loop approaches is available. In Europe massive investments have been made in centralised sewers and waste water treatment plants, and a move away from these end-of-pipe systems will prove extremely difficult, as sewers are designed and built to last for several decades. Here, transition towards ecosan solutions will be a slow process, requiring perhaps several generations.

However, in countries where these investments have not yet been made, there is the possibility to avoid the mistakes of the end-of-pipe approach. It will therefore be essential to make any investment decision here on the basis of sustainability, using suitable, context relevant criteria in selecting a sanitation system.

The step-wise transformation of an existing end-of-pipe system will have to take into account the existing structures and making best use of what is available. An example for this approach with a vision for closing the nutrient cycle in an existing central system was developed and described by the Novaquatis –research project, carried out at EAWAG, Zurich, Switzerland (Larsen and Gujer 1996). One of the concepts developed here was to separately collect urine from individual households, and to conveying it to a central collection point using the central system at a specific schedule at night, on dry days, when the system is usually not being used by anybody else.
In the framework of the AKWA 2100 research project, Hiessl and co-workers (2003) developed a series of scenarios for future central, semi-central and decentralised sanitation solutions in an urban context, analysing them both from an economic and a sustainability perspective. In a follow up to this research project it is planned to outline how the transition from the existing situation to the desired future situation can be addressed.

Box 10: Urban ecosan pilot project for 100 new urban houses in southern Germany

In the construction of around 100 new residential buildings in Römerhof, near Knittlingen, southern Germany, a unique form of community water management will be implemented. Advanced technologies will be used, ensuring a sustainable and affordable operation of the entire water infrastructure, supported with 2 Million Euro from the German Federal Ministry for Education and Research.

The project, led by the Stuttgart Fraunhofer Institute for Interfacial Engineering and Biotechnology (IGB), plans to recycle rainwater and nutrients from household wastewater. The black water will be collected by vacuum sewer and transported to a central biological treatment reactor with integrated membrane technology. In this process organic material will be fermented, producing methane ,and phosphorus and nitrogen salts will be converted into agricultural fertiliser. The bio-gas generated will be used to provide the plant with electricity and heat, with surplus electricity being fed into the national grid. The treatment technique is designed to produce minimal volumes of sludge and after treatment the water can simply be infiltrated into the ground.

(IGB 2004)

5.4 Research and development of tools and instruments for sustainable sanitation

As a complex, holistic, and innovative approach, involving disciplines from engineering to public health, and the social sciences, research fields for eco-sanitation are extremely broad and this publication can only try to highlight some of the more pertinent areas where research is needed. Identifying knowledge gaps and posing the appropriate questions to fill them will remain a major task for interdisciplinary research teams in the future.

Research and development is needed within, between and across many different disciplines, addressing topics such as the fertiliser value of the recycled nutrients or the degradation rates of micro pollutants, as well as practice oriented tools and instruments for planning, implementation and operation of reuse-oriented sustainable sanitation systems and marketing strategies for ecosan products.

Some specific areas where there is a need for additional research and development of tools, or instruments related to sanitation planning, implementation and operation are discussed below.

5.4.1 Financial and economic feasibility of sustainable sanitation

One of the difficulties in considering economic aspects in decision making for ecological sanitation systems is that very few economic studies have been carried out so far. The information available is mostly anecdotal or gathered from pilot or demonstration projects, which are notoriously unreliable for cost analysis related to economy of scale (Anschütz, Ijgosse, and Scheinberg 2004). Pilot and demonstration projects generally have unusual expenses, such as those for technology introduction, limited, small scale production of system elements, or initial awareness raising activities. Most existing studies also tend to consider only a particular aspect of the system rather than adopting a holistic analysis. However, first results indicate that; even within studies which have only considered investment, reinvestment and operation and maintenance costs, closed-loop systems have an economic advantage over more conventional systems (see comparative investigation examples in the Boxes 11 and 12 below).

In order to make a fair comparison between the full investment, operation and maintenance costs, there is a need for a comprehensive, dynamic, integrated, cost/benefit or multi-criteria analyses of different types of systems to be performed over life cycles or planning periods.

This will establish the investment, operation and maintenance cost, as well as additional benefits such as improved public health, the fertiliser value of recovered material, the value of improved agricultural production, the energy generated, etc., that are all a result of using the system.

A difficulty with traditional economic appraisals for sanitation is that the setting of the boundaries of the system often leads to many important external costs, or even benefits of the system being overlooked completely. An example of how far these externalities actually reach can be seen by taking a brief look at externalities in relation to centralised wastewater treatment and an ecosan system.

Conventional water-borne sanitation relies on disposing treated wastewater to a surface water body. In addition to the investment, reinvestment and operation and maintenance costs of the sewer network and plant, and the expected health benefits, the environmental externalities arising in the receiving water must be considered, as should the social loss of a recreational area, the possible effect on subsequent drinking water treatment, the loss of natural habitats and effects on coastal areas, the effect of medical residues (hormones, antibiotics etc.) which pass through the treatment works virtually intact, the eventual rehabilitation costs, the impoverishment of soils as a result of nutrient loss, and the costs of using high quality drinking water to flush the system. Each one of these external costs in turn may incur further costs.

Project Box 8: Sanitation for a rural school in Uganda (EcoSan Club, www.ecosan.at)

Kalungu Girls Secondary School, an all girl boarding school with about 350 pupils is nestled in the hilly landscape of Southern Uganda (in Masaka District). A typical problem of this region is that although water is plentiful, water quality is poor. Problems with the water quality led the school administration to ask for support to improve the situation. Due to the shallow ground water level and the location of the soak pits and pit latrines directly upstream of the schools and the nearby villages' water sources the situation was clearly unsatisfactory and potentially dangerous. Additionally the pit latrines were smelled badly and were unhygienic. There was no further wastewater treatment.

The project was implemented in 2003 with 45 dry urine diversion toilets being built for the pupils (mainly outdoor but additionally 2 indoor dry toilets for each dormitory to avoid the pupils having to go out during the night), with treated urine and faces being used in the schools agricultural activities. Additionally a constructed wetland was installed for the biological treatment of greywater, and a dry toilet demonstration unit for teachers and visitors (with a urinal) was constructed.

A special focus was put on training the students, teachers and the O&M personal, to ensure that the newly constructed toilets would not end up in the same state as the old latrines. A main concern was the involvement of the teaching personal, especially the ones responsible for health issues. The design of the demonstration unit was carried out in a participatory way: the details of the unit were developed together with the teachers to create a feeling of ownership and responsibility. The contractor who installed the system was responsible for the education of the students and O&M personal, with a special focus on involving the local technicians from the beginning of the planning/construction process.

Figure 22: Training of students (left); dry toilets with wooden containers for collecting the separated faecal material (middle - view from the back) and demonstration toilet (right). (EcoSan Club)

The toilets are a great success and delegations from all over the country and from abroad come to visit the school toilets. The pupils and the teachers are proud of their well working toilets which are kept clean and well maintained. Since this was such a successful project, visits or families are picking the idea and requests are increasing.

For ecosan systems these external costs may include the necessary transformation costs to adapt the existing sanitary infrastructure, additional awareness raising activities, and the need for continued research and development of different parts of the system.

In contrast to conventional systems, however, ecosan systems offer significant external benefits, which ordinary appraisal tools also fail to capture. These include securing the drinking water supply, through the use of treated greywater and by reducing the discharge of effluent to potential drinking water sources; the improvement of soil structure and fertility; increased access to fertilising agents and phosphates, particularly for poor and for subsistence farmers; reduced energy consumption in the treatment works, and during fertiliser production; nutrient and resource conservation; and the potential for energy production. In order to account for all these externalities the boundaries for evaluating sanitary systems are significantly expanded, and the tools for appraisal need to be expanded accordingly.

Box 11: Examples of cost comparisons - Uganda

School Sanitation in Uganda

In Kalungu Girls Secondary School in Uganda poor sanitation facilities was putting groundwater at risk. This served as the main source of potable water. From February to December 2003, a project was implemented to renew and improve both water supply and sanitation facilities. Additionally a training programme aimed on ensuring an understanding and proper use of the facilities installed.

Prior to deciding on the sanitation scheme to be installed a detailed comparison of costs was conducted and served as one instrument among others in the decision making progress. Two alternative sanitary solutions were compared:

Option 1: Source separation concept: dry urine diversion toilets, sewer line for greywater and a horizontal subsurface flow constructed wetland.

Option 2: Conventional concept: flush toilets for the students, separate sewer system for black water, mechanical pre-treatment, pumping station and a vertical subsurface flow constructed wetland. (EcoSanClub 2004)

The comparison considered investment and reinvestment and operating costs. The calculation was carried out over a 50 year time frame, with reinvestments depending on individual system parts and an interest rate of 8% p.a.(EcoSanClub 2004).

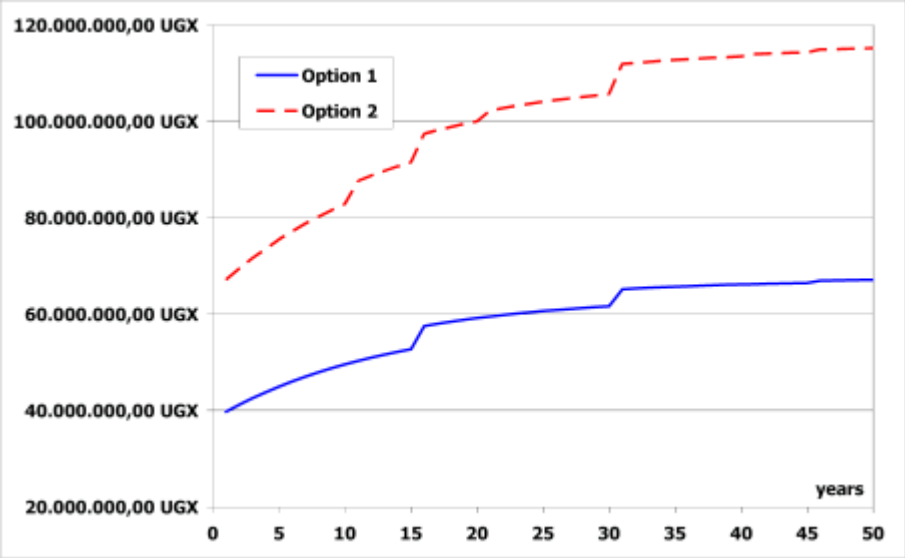

Figure 23: Cost comparison for the installation, operation and maintenance of the two systems for the school (EcoSanClub 2004)

Research is therefore needed to identify and test methods and approaches that can be used in economic analyses to ensure that its boundaries are set wide enough to account for all the expected positive and negative effects of a sanitation system.

The cost comparison in the example from Uganda clearly shows that the safe use option is significantly less expensive. The main difference results from the significantly smaller wastewater treatment system for this option and the pumping station additionally required for the conventional option (EcoSanClub 2004).

Box 12: Examples of cost comparisons – Berlin Brandenburg

New housing estate in Berlin Brandenburg Germany

In Brandenburg near Berlin, Germany, cost comparisons have been made for three different sanitation concepts for a planned new housing estate, where the population is expected to increase from 672 to 5,000 inhabitants within 10 years. The three systems were:

Gravity sewer system (conventional): Flush toilets, normal gravity sewer system, pumping station with transport sewer to the existing sewer network, system operated by the public supplier.

Source separation concept I (gravity, composting of faeces): Gravity separation toilets, collection and storage of urine, transport and agricultural use on a nearby farm, faeces transported in gravity sewer with aerobic treatment in a compost separator, utilisation of compost in horticulture, transport of greywater in gravity sewer system, treatment in a constructed wetland, transport to the receiving water.

Source separation concept II (vacuum, digestion of faeces): Vacuum separation toilets, gravity urine transport, storage of the urine transport and agricultural use on a nearby farm, faeces transported by vacuum sewerage, common treatment with organic waste in a biogas plant, biogas used to produce energy, transport of the digested sludge to the farmer nearby and utilisation in the agriculture, transport of greywater in gravity sewer system, treatment in a constructed wetland, transport to the receiving water.

The three systems were calculated over a lifetime of 50 years, with an annual interest rate of 3.5% p.a. . The results of this cost comparison can be clearly seen in figure 1, for the situation where 5000 inhabitants are served and the local Berlin water company are responsible for the operation of the system. Other service scenarios have been calculated with different population numbers and operational models which also revealed a significant price advantage for the closed-loop systems over the system lifetime. (Peter-Fröhlich et al. 2004).

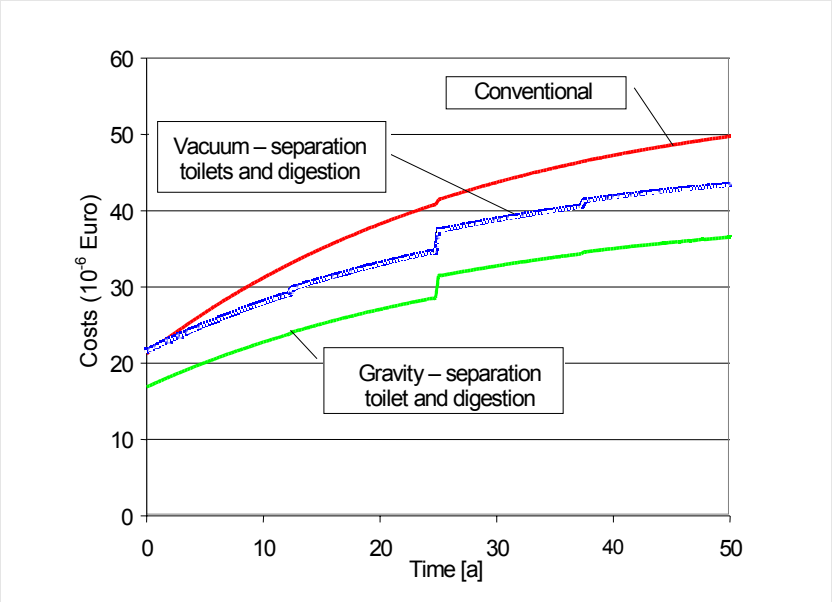

Figure 24: Cost comparison for the installation, operation and maintenance of the three systems for a population of 5000 (Peter-Fröhlich et al. 2003)

Excreta and greywater use projects strongly influence the individual as well as the national economic well-being, since proper management and treatment of excreta and greywater reduces health risks and associated costs for medical care. On the individual (household) level the time gained through reduced illness can be used for education or income generating activities. On the national level monetary and professional resources are relieved from cases of faeco-oral diseases and can be concentrated in other areas. Some of the tools needed to measure these effects are available and

transferable from related disciplines, but require a certain degree of adaptation to sanitation system planning, whilst others need to be developed.

Economic appraisals should also recognise that the real cost or value of an item to a country's economy is not always the same as the price paid for it. For example, foreign exchange may be more valuable than the formal, controlled exchange rate would suggest. On the other hand, the labour of workers who would otherwise be unemployed costs less to the economy than their wages, since no production is lost elsewhere by offering them a job. Economists use a "shadow price" to approximate the "real" value of an item to the national economy. Thus the shadow price of foreign exchange is usually higher, and that of unskilled labour lower, than the rate actually paid for it.

The proper use of shadow prices in this context may also be a relevant research subject. It is thought that reuse oriented systems will perform better than conventional systems when shadow prices are considered for at least two reasons:

- The construction of the system such schemes can most often be carried out using locally available skills, and tradesmen, and using locally available material and thus requires less imported equipment than other processes; at shadow prices, it is more likely to be cheaper.
- The prices of many of the products grown for local consumption are often held below the world market price (if one exists). Whether they are grown for export or for import substitution, a shadow price for foreign exchange will show their true value to the economy.

This however needs research and verification.

Financing mechanisms

Research has a large role to play in developing appropriate financing instruments, putting particular emphasis on the possibility to finance the users' investment for on-site and neighbourhood systems, and recognising that systems to recover and use excreta and greywater have a different cost structure from conventional sanitation systems. This can result in the total costs of the system being less than that of end-of-pipe systems, but the costs that the private households themselves have to pay can increase (see below). Innovative financing alternatives including start-up funds, community based finance programmes, micro-credit programmes and cost recovery mechanisms may therefore be required.

In researching financing mechanisms, allowances should be made not only for the investment, reinvestment, and operation and maintenance of the system but also for the opportunity and environmental costs as well as the systems external impacts on individuals and communities (Cardone and Fonseca 2003). Allowances should also be made for the financing of institutional capacity building and skills training, monitoring and assessment, and policy and the development of an enabling environment for sanitation. The latter includes awareness raising campaigns, hygiene promotion etc. Most of these activities are of a public nature with both the broader community and the individual households benefiting. Financing for sanitation however mainly comes from two sources: the individual or household, and an external source such as government (Evans 2001). Trying to mobilise individual household financial resources for activities targeted to the broader community has however proven difficult. This raises one of the main challenges in developing financing mechanisms for sanitation: How can the needs, interests and finances of individuals and households be effectively co-ordinated and reconciled with those at the community / national level? Ideally this should be achieved in a way to recover costs, but also to ensure equitable access to sanitation, particularly to poorer members of society. This represents quite a challenge to researchers.

Sanitation systems that recover and use excreta and greywater, generally have a different cost structure than conventional systems. This needs to be recognised and practice oriented research should focus on developing appropriate financing mechanisms to support private households in their decision to install them. As shown in Figure 25, the total costs to install such systems tends to be lower than some other for more conventional sanitation systems. This is mainly due to the decentralised, modular nature of source separating systems, which do not require large sanitary infrastructure, such as centralised treatment works, sewerage, or pump stations. In comparison to traditional decentralised sanitation (such as pit latrines or VIPs), they normally provide permanent solutions, and thus do not have to be replaced when full, representing a significant saving over time.

However, although the overall costs are less, those to be covered by the private household may very well increase be higher as a result of having to replace or transform domestic sanitary facilities (for example by installing a urine diversion toilet).

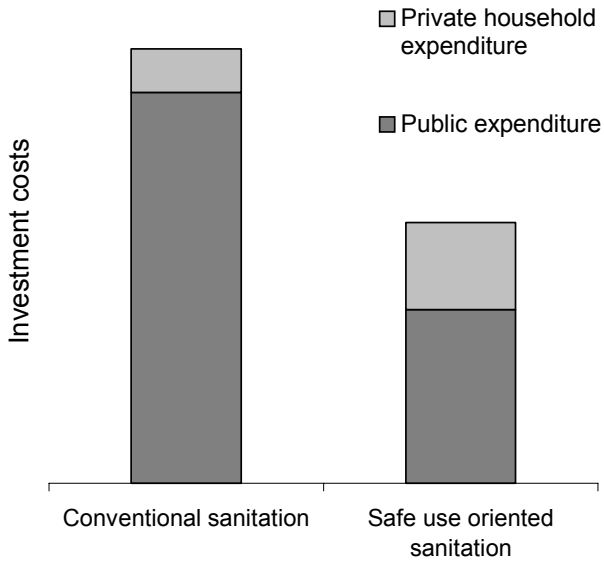

Figure 25: The cost structures of conventional and safe use oriented sanitation systems (GTZ)

Research also needs to examine the possibilities of integrating the local private sector into sanitation provision. The introduction of innovative systems to the market have to be field tested and evaluated.

Further research and demonstration projects are needed in order to develop a variety of viable solutions for densely populated urban areas and obtain results concerning the costs and performances of different systems in both industrialised and developing nations. Generally, for cost and ease of management reasons, a commonly accepted solution must be found based on a participatory planning approach as it is suggested e.g. in the Household-centred Environmental Sanitation approach (Eawag 2005) and taking into account the specific local socio-economic conditions.

Recent international research on the relation between poverty and sanitation indicates that investments in sanitation have a huge positive impact on the national economy, with relatively high cost-benefit ratios, averaging 5.5 for all targeted regions (SEI 2005). The fact that money put into sanitation provides a huge return on investment has also been stressed recently in the joint monitoring report from the WHO / UNICEF MDG Joint Monitoring Programme, where they point out that “access to safe drinking water and basic sanitation will bring dividend many times larger than the investment required.” (WHO/UNICEF JMP 2005)

Meeting the sanitation Millennium Development Goal (MDG) target (halving the proportion of the world’s population in 1990 lacking basic sanitation services by the year 2015) is estimated to cost between US$ 9 billion (Evans 2001) and US$ 15 billion (SEI 2005), but the payback would be an injection of between an extra US$ 65 billion (Evans 2005) and US$ 84 billion (EUR 69.4 billion - WHO/UNICEF JMP (2005)) per year into developing economies – money saved by averted deaths, lower health care costs and productivity gains. Improved water supplies and basic toilets generate returns ranging from 3 to 34 times the original investment, depending on the type of investment and the country, the report says (WHO/UNICEF JMP 2005).

For closed loop sanitation systems the return on investment is expected to be even higher. A recent debate in the magazine of the International Water Magazine, WATER21, on the economics of urine

diverting double vault dehydration toilets with reuse highlighted that such systems not only cover the extra costs that may occur, but that the total investment for the system could be amortised over a ten year period. (Jönsson et al. 2005 ; as part of the discussion on ecosan in Water21 in 2005, see also: McCann 2005, Mara 2005a, Ashworth 2005, Otterpohl 2005 and Mara 2005b)

Further cost comparisons between conventional and eco-sanitation systems have been made and are presented in the table below.

Table 7: Sanitation cost ladder for conventional and ecological sanitation methods (including initial capital cost and O&M for the first year of operation) (SEI 2005)

	Conventional Sanitation (sourced from UN Millennium Project, 2005; original source UNEP, 2004)		**Ecological Sanitation** (various sources see below)	
	Method	Estimated cost per person (USD) incl. operation and maintenance	Estimated actual initial capital cost per person (USD) and household incl. operation and maintenance (hh size is 4.5 unless otherwise given)	Method
Mainly urban	Tertiary wastewater treatment	**800**	340 (1190 per hh) (China, hh size 3.5)* (source: Dong Sheng EcoSanRes Programme)	Urine-diverting high standard porcelain dry toilet (indoor and multistory); piped urine system, dry fecal collection and composting, decentralised piped grey water treated using septic tank, and aeration treatment; local collection and transportation costs included
	Sewer connection and secondary wastewater treatment	**450**	330 (1500 per hh) (Sarawak)* (source: Mamit et al, 2005)	Conventional indoor toilet with sealed conservancy tank, black water collection by truck; local biogas digester; decentralised piped greywater treated using septic tank and vertical biofilm filter technique
	Connection to conventional sewer (assumed without treatment)	**300**	150 (675 per hh) (estimated)	Indoor dry single-vault urine-diverting pedestal toilet; decentralised piped greywater treatment using constructed wetland; local transportation included

(continued …)

(… continued)

Mainly peri-urban	Sewer connection with local labour (assumed without treatment)	**175**	88 (400 per hh) (South Africa) 25 (110 per hh) (Mexico, El Salvador, India, South Africa, Zimbabwe) (source: Morgan, 2005)	Dry single- or double-vault urine diverting squatting pan or pedestal toilet with permanent upper housing structure; greywater treatment using on site infiltration pit; transportation assumed as local labour
	Septic tank latrine	**160**	12 (55 per hh) (source: Lin Jiang, Nanning, Guangxi, China)	Dry single or double-vault urine diverting squatting pan or pedestal toilet (LASF or Skyloo) with permanent upper housing structure; greywater treatment and disposal onsite; local recycling
Mainly rural	Pour-flush latrine	**70**	8 (35 per hh) (West Africa) (source: Klutse & Ahlgren, 2005)	
	Ventilated improved pit latrine Simple pit latrine	**65** **45**	8 (40 per hh) (Zimbabwe, Mozambique) (source Morgan, 2005)	Soil composting pit with cement slab and simple upper housing structure (Arborloo or Fossa Alterna); grey water treatment and disposal onsite; local recycling
	Improved traditional Practice	**10**	3 (10 per hh) (estimated)	soil composting shallow open pit; soil added after each use

* initial cost calculations based on ongoing large scale pilot projects

The authors note that, apart from the data collected as part of the few large projects, mainly in Asia, the costs should be seen as a first indication based on pilot projects of limited size (SEI 2005). Hence, in order to get comprehensive data much more research in this topic is required.

Development, design and marketing of environmentally sound products from recyclates

Products of ecosan schemes may include soil conditioner, plant nutrients, irrigation water, energy from biogas and heat. To complete the cycle in sustainable sanitation systems, further research is required to make sure that these products are safe, to market them and to propose measures that they can better compete in the open market. Marketing will require tailoring the products to local needs, meeting regulations and establishing suitable distribution systems.

Advocates of eco-sanitation make the plausible claim that human excreta have been used to restore soil fertility for centuries. However, that does not mean that the products of ecosan systems are economically, institutionally, or legally marketable in many countries. For this to happen there is a need for research on the use and marketability of excreta products. Do health regulations allow households to use their own excreta for home gardening? If such products are put on the market, what standards do they have to meet? Which government agencies have jurisdiction over these types of questions: ministries of health, ministries of agriculture, ministries of commerce?

Appropriate marketing of ecosan products is essential to ensuring the sustainability of the system, however producers may have problems in finding, stimulating or establishing their market. Research can help in this process by developing tools and methods to assist producers in analysing their markets. An outline of how this can be done is given in “Sustainable Composting – case studies and guidelines” by Ali and Rouse (2004).

5.4.2 Research on ecological sustainability

In addition to safeguarding public health, ecological sanitation is also addressing ecological sustainability by introducing a closed loop approach to water and sanitation. In order to compare the ecological sustainability of different sanitation systems, the impact on natural resources, soil fertility, energy consumption, freshwater resources, climate change, and other risks have to be assessed.

From an ecological perspective end-of-pipe and closed-loop-sanitation systems may be compared through life-cycle analysis, which includes the resource efficiency during operation and maintenance (consumption of water, fossil fuels and other finite resources). As part of this comparison an energy balance should also be carried out. Aspects that must be considered would therefore include:

- Energy requirements for operation of sewer systems (e.g. pumping energy) and treatment plants versus recycling systems and their gain of energy (e.g. through biogas generation, or the recovery of heat energy from wastewater using heat exchangers) and irrigation water for saving water and other natural resources,
- Energy and resource requirements, for example for the production and transport of mineral versus ecosan fertiliser,
- The requirement of high-quality drinking water to transport excreta versus reduced water use, contributing to protection and conserving groundwater and other freshwater resources,
- The degradation of surface water bodies through sewage discharge versus improvement of regional ecological parameters through the application of reuse systems.

In general research should be looking at ways to assess the environmental impact of different sanitation systems on water, soil, air, climate and other natural resources, to enable a fair comparison of their ecological sustainability.

Material Flux Analysis

An additional tool that can be used to analyse the resource use of sanitation systems is a Material Flux Analysis (MFA) (Baccini and Bader 1996, Brunner and Rechberger 2004). This can serve as a tool to protect finite resources and reduce energy consumption, applicable even on a global scale. MFA allows the quantification of different material flow streams, enabling comparisons to be made between different sanitation systems. Modelling material fluxes on a local or regional level can be used to support the optimisation of system design and decision making processes.

Analysis of material flows on a global scale can highlight the resources required for transport and related emissions, for example for phosphorous mined in Morocco, transported to Switzerland, where it is processed to mineral fertiliser, and used in agriculture in Germany, where it may very well end up to a large degree in surface waters and finally in the ocean.

In an MFA, the materials to be considered may include:

- finite and renewable natural resources (water, phosphorous, energy, ...)
- macro- and micro-nutrients, agricultural products
- pollutants (toxic substances, heavy metals, hormones, medical residues)
- substances with relevance for climate change (e.g. CO_2, CH_4, etc)
- construction materials

Current practice in industrialised nations is to remove or destroy the phosphorous and nitrogen in wastewater, using expensive, energy intensive technology, preventing it from entering surface water. This reduces the pollution in receiving waters, but increases the energy consumption and CO_2 emissions, and does not stop the depletion of finite resources. Recognising that phosphorus is a finite resource (EcosanRes 2005b, Rosemarin 2004), current research is focussing on its recovery by a range of different technical processes. A broader approach occurring at the legislative level is being adopted in Sweden, where a law is being proposed to parliament which sets a target of recovering 60% of the phosphorous in wastewater and recycling it to productive land by 2015 (Regeringens proposition 2004).

The material flow in many industrialised nations is also characterised by the import of large quantities of agricultural products. A considerable amount of e.g. fodder-maize imported from Southern countries is used for meet-production in the North. The manure from these and other animals combined with the use of artificial fertilisers, leads in several regions of central Europe to an accumulation of phosphorus in the top-soil and to problems of high nitrate concentrations in groundwater. An overall mass balance could show which areas in central Europe are the end destinations for large volumes of nutrients.

In developing countries however, negative nutrient mass balances can often be found. With farmers having not enough money to pay for artificial fertilisers, and with agricultural products often produced for export, not enough nutrient rich material is returned to the soil in many regions.

Material flux analysis enables the identification of problems and the quantification of the impact of potential measures.

Research is required to establish material flow analyses, taking into account the differences between the situation in the north and in the south. This research may be used to assess the effects of different sanitation concepts on the given material flow situation, and for the identification of the most ecological friendly solution serving best for the long term conservation of resources and the fertility of soils.

Box 13: Example for MFA in Ghana

"In developing countries, demographic and urban growth often results in severe environmental and social problems, including the lack of adequate water supply, environmental sanitation services and food security. Reusing waste products in peri-urban and urban agriculture can contribute to food security and reduce environmental pollution and sanitation costs. A comprehensive method is required to assess the potential and limitations of channelling urban waste products to peri-urban and urban agriculture. Material Flux Analysis is a helpful tool to assess material fluxes in a given system. It allows to identify problems and to quantify the impact of potential measures on resource recovery and environmental pollution. The present study analyses the material/nutrient fluxes of the city of Kumasi, Ghana. Import and export of products into or from the given system are recorded. Processes are identified and material fluxes between these processes are determined. The analysis revealed that households are the key process for material and nutrient fluxes. The groundwater and surface waters receive large amounts of waste products from the households. Reusing organic waste products in peri-urban and urban agriculture could significantly improve the organic matter and nutrient situation of agricultural soils and also protect the environment. However, a treatment process (e.g. co-composting) is required to reduce the health hazards related to the use of waste products." (Forster, Schertenleib and Belevi 2003)

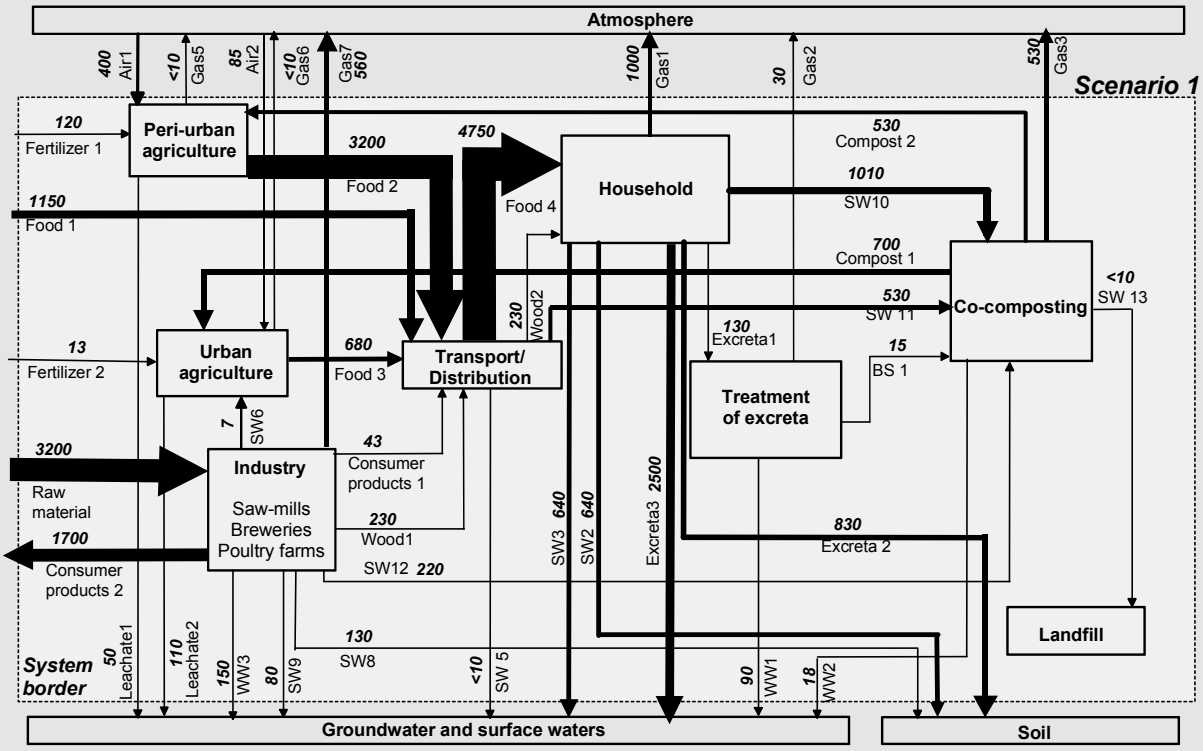

Figure 26: Estimated annual nitrogen flows of Kumasi, Ghana in tons/year for the scenario "reuse of co-composted solid waste and faecal sludge" (Belevi 2002).

Ecosan, urban agriculture, food security and quality of life in the city

Most population growth is now occurring in urban areas. Consequently, the number of poor living in these areas has dramatically increased in recent years. To produce food and generate income many urban residents engage in urban and peri-urban agriculture using space that is available to grow crops or raise livestock. Wastewater or excreta is already often used in urban agriculture as it is readily available in urban areas. For example in Dakar Senegal, more than 60% of the vegetables consumed in the city are grown in urban areas using a mixture of groundwater and wastewater (untreated) (Faruqui, Niang, Redwood 2004). A proportion of vegetables sold in markets in Nairobi, Kenya and Kumasi, Ghana are also raised within the surrounding urban areas and irrigated with wastewater (Cornish and Kielen 2004). In Moscow, urban agricultural activity increased three-fold between 1970 and 1990. In Dar es Salaam it nearly quadrupled from 1968 to 1988, and in Romania it more than tripled (up 333%) from 1990 to 1996. In Argentina home gardening association members grew from 50,000 in 1990 to 550,000 in 1994. In metropolitan areas in the United States, food production increased from 30% in 1988 to 40% in 1996, and from 1994-1996 the number of farmer's markets selling locally-grown produce increased 40%. In great Bangkok 60% of the land is under cultivation. Urban agriculture facilitates the closing of the loop to food security. The demand for food by consumers and water and nutrients by producers reconnects resources and wastes in a safe, non-polluting and economic fashion (Esrey 2001).

FAO estimates that 800 million urban residents (up to two-thirds of all urban households) world-wide grow products for income or for their own consumption (FAO 1999). Urban agriculture can impact food security by increasing the amount, variety, nutritional value and freshness of food available to farming families (FAO, 1999) and provides additional income to purchase food. Some case studies have shown improvements in nutrition, especially in children, in poor urban families that produce their own food (Smit, Ratta and Nasr 1996).

Urban agriculture can be sustainable because it promotes the reuse of excreta, grey water organic wastes (Birley and Lock 1999). By closing nutrient loops and improving soil fertility and structure, yields should be higher per unit space, plants will be healthier and more nutritious, and lower levels of external inputs and less water will be required. Growing food closer to consumers also strengthens local communities. Food production and costs can be reduced by lowering the costs of inputs and producing food closer to where people live. Urban agriculture and home gardening can produce more food per unit space, as food can be grown on roofs, walls and in and around buildings. This in turn improves food security, and when food and non-food products are grown to generate income, food security and nutritional status can also improve. It is well known that women, who dominate the sphere of urban farming and gardening, are more likely to spend their extra income on food than men. Increasing national food availability will help to reduce child malnutrition. (Esrey 2001)

However, urban and peri-urban agriculture is often not adequately regulated to ensure that these activities do not negatively impact human health and the environment (Birley and Lock, 1999). In promoting urban agriculture, the following concerns need to be adequately researched and addressed to protect public health (Smit, Ratta and Nasr, 1996):

- Using best practices for the safe use of excreta and grey water;
- Restricting the use of industrial effluents for irrigation;
- Preventing contamination of crops with chemicals and or pathogens;
- Preventing contamination of drinking water sources;
- Promoting the safe use of pesticides; and
- Managing water and crops to prevent expansion of vector-borne diseases.

Ecosan systems can make considerable amounts of nutrients and irrigation water available, it allows constructed wetlands, urban agriculture and green belts to be systematically integrated into urban planning. The application of ecosan may thereby have clear impacts on nutrition, livelihood, local climate and on quality of life in the city. Research may therefore also need to concentrate on how to best make use of urban agriculture and ecological sanitation for the improvement of livelihood and the quality of living in urban areas. The cross sectoral characteristic of sustainable urban water and

nutrient management will require the development of instruments for the co-operation of different sectors institutions and allow for the participation of all relevant stakeholders.

Project Box 9: ecosan within a natural resource management project in Botswana (GTZ - project-data sheets 2005-009)

In Botswana the village of Paje is affected by strong winds, extreme erosion and soil degradation, whilst the Hanahais settlements are characterised by an extremely dry climate and sandy soil. Water consumption varies between 12 to 340 l/p/d depending on the access to a piped water connection and gardening activities, but mostly waster is used for gardening purposes.

To establish ecosan and other environmentally sound practices in the villages of Paje and east and west Hananhai in Botswana, the GTZ-supported IUCN natural resources management project placed a strong emphasis on participatory approaches and focused on 'learning by seeing'. Raising community and household awareness for the ecosan concept included tangible activities, which were undertaken in all households.

Figure 27: Training workshop (left); traditional hut with ecosan toilet (middle); revised ground structure (right). (IUCN/GTZ)

Following these activities, most of the families chose a urine diverting (UD) toilets to address their sanitation problem when given a choice of several options. In the first pre-pilot step, 20 ecosan single vault urine diverting (UD) dry toilets were implemented and adapted according to the needs of the users. Faeces were collected in 20 or 50 l containers, and 1-3 months later, they were put in a composting unit for further hygienisation. They were composted together with organic waste and animal refuse for 1-2 years to produce a safe soil conditioner.

The urine was collected in 20 l containers and used after about 3 weeks. Some users preferred the application of diluted urine for compost humidification rahter than its direct use on the field.

From pilot trials, it was found that fertilisation with urine and compost led to a 40-50% higher production when compared to unfertilized plots.

Agricultural research

As ecosan systems close the loop between sanitation and agriculture, agricultural research is as important as research into sanitary aspects.

A broad range of topics need to be addressed from an agricultural perspective – ranging from purely technical issues, to aspects of agricultural extension and the dissemination of research results for practical use. Topics to be addresses will include:

- Comparative risk benefit analysis of different types of fertilisers
- Fertiliser value and efficiencies of fertilisers
- Fertilisation strategies and application techniques when using excreta
- Impact of fertilisers quality of agricultural products and soil - and the development of related standards and guidelines
- Contribution of reuse to food security
- Effects of micro nutrients
- Degradation and effects of micro pollutants
- Assessing farmers needs regarding fertiliser
- Extension methodologies for the use of treated excreta

There are gaps in current knowledge concerning the use of urine and faeces as fertilisers. Lack of documented research in this area currently makes the development of standards and norms difficult. However, excreta and wastewater have been used in agriculture since ancient times, and there is a lot of undocumented knowledge based upon practice that needs to be researched and documented and may serve as a basis for modern, risk based standards. (Jönsson et al 2004)

In the urban context, home gardens, allotments and community gardens offer great potential for combined research on urban agriculture and ecosan in closed-loop systems, e.g. in the Philippines allotment gardens have recently been implemented, which use as fertiliser composted organic household wastes from integrated waste management (Universität Freiburg 2004; Holmer at al. 2003). These gardens are now combined with ecosan systems for the reuse of human excreta in the gardens (PUVeP 2005; GTZ-ecosan newsletter 2005-18). “Organoponics”, a system similar to hydroponics has been promoted in Mexico (Sawyer, Arroyo and Delmaire 2003).

Project Box 10: Constructed wetland treatment and wastewater reuse in Haran-Al-Awamied in Syria (GTZ -project-data sheets 2005-015)

The village of Haran Al-Awamied is located south east of Damascus, Syria. The inhabitants are poor; with farming the main source of income. The use of untreated wastewater from the existing gravity sewers for irrigation was common. The specified purpose of the GTZ supported ecosan project in Haran Al-Awamied was therefore to make irrigation with wastewater hygienically safe and to use the fertilising effect of the nutrients contained in the waste water.

Therefore a new combined public sewer system was installed to collect and transport rain and wastewater to the new wastewater treatment plant. The plant consists of bar screens and a sedimentation tank as pre-treatment, two reed beds to treat the wastewater, and one reed bed for sludge soilification. The treated water is collected in a tank for storage, and is pumped from the collection tank to the fields near the plant when needed, with the distribution being organised by the farmers.

Figure 28: Constructed wetland reed beds (left); sludge reed bed (middle); official inauguration of the pilot project (right). (Mohamed)

The improved availability of irrigation water which contains valuable nutrients reduces the expenses of the farmers for commercial fertilisers. It contributes to higher yields in crop production, and increases the number of harvests from one to several per year. The reed plants of the constructed wetland are used for wicker and roof materials The treated sludge is used as soil conditioner.

As the residents get these benefits from the constructed wetland, they provide a great deal of support to ensure its correct functioning.

Other convincing reasons why the reed bed systems were chosen, are its low costs, easy construction and simple operation and maintenance.

Monitoring ecosan systems, quality control and environmental impact assessment

In Germany around 7.000 water works currently treat and discharge the wastewater of 80 Million people. If a closed loop strategy is pursued the number of treatment facilities will sharply increase (compare Thomas 2000), as local, decentralised sanitation systems will be recognised as a convenient, cost-efficient option. The development of systems to monitor this increased number of decentralised facilities will be necessary to minimise any possible adverse effects on human health and the environment. Research should also help develop systems to enable products emanating from eco-sanitation to be standardised, allowing quality control and the assessment of environmental impacts and guaranteeing that the products conform to legal and market requirements.

Project Box 11: Biogas-ecosan-project Waldmichelbacherhof in Germany (GTZ -project-data sheets 2005-006)

For the last ten years, the family-owned farm and restaurant Waldmichelbacher Hof in rural Bavaria, Germany, uses a closed-loop biogas plant system for sanitation and waste management. All nutrients generated on-site are reused on the 200 ha of land. This agricultural land is mainly used for grazing, fodder production, cattle breeding and meat production (the meat is sold at the restaurant and farm shop).

The toilets used in this sanitation system are conventional low flush toilets, as neither dry toilets nor urine diversion toilets were seen to bring any additional benefit to this project, as the black water is digested together with animal manure in a heated anaerobic digester. The resulting product, liquid "digested manure", is easy to apply to the pasture as fertiliser (with no need for dilution). A co-generation plant converts the biogas from the anaerobic digester to produce heat and electricity (excess electricity is sold back to the grid).

Figure 29: Waldmichelbacherhof (left; Schultes); collection channel under the barn floor (right; Wang)

The system is a good example of an on-site ecologically sustainable system in a European rural context. It is a closed-loop system, where only negligible amounts of nutrients are added or removed. Further benefits are that the farmer has observed better yields when using the digested manure as fertiliser compared to non-digested manure. There are also no odour problems when applying the digested manure to the fields.

The development and establishment of an Environmental Management Plan (EMP) will be necessary for ecosan systems. The plan should cover all aspects of the system, which pose a risk to the environment, human and livestock health, and provide a framework to assess its long-term sustainability. The EMP should address a number of issues such as product quality and quantity, storage, site controls, buffer distances if needed, warning signs, application rates and timing, irrigation methods, ground water quality monitoring, salinity controls, soil testing etc. Users of the system may consider the regular monitoring costs as an extra financial burden in addition to the initial cost of infrastructure, and research will be needed to establish how these costs can best be distributed between for example households, users of the products and the state.

Box 14: Learning from organic waste management

9 Million tons of organic wastes are currently recycled into compost in Europe and regarding logistics, system management, market orientation and regulations ecosan systems can profit from these experiences! Josef Barth (2004) provides an overview of the treatment of organic waste in Europe. Many of the points raised are equally valid for ecosan systems. Barth writes “Investigations in Europe indicate that quality and marketing of the end product are the most crucial composting issues. Both producers and users are of the opinion that sustainable recycling of organic wastes demands clear regulations with regard to what is suitable to be recycled and how it should be managed and controlled. Around 15% of the estimated total recoverable potential of 60 million tons of organic waste is presently treated biologically in Europe. The re-use has to meet environmental and market requirements. Therefore, the trend in Europe goes definitely towards source separation of the organic residues from gardens and households. Quality requirements for composts regarding heavy metals, organic pollutants and hygiene allow no other alternative. There is no longer a market for mixed-waste compost. The introduction of source separation and composting must go hand in hand with the introduction of a quality assurance system for compost plants. Assuring compost quality entails more than just fulfilling a number of heavy metal limits. ... ” (Josef Barth 2004). Researchers and educators alike need to consider how the lessons of these systems can be tranferred and applied to eco-sanitation.

5.4.3 Health related risks and benefits

Generally speaking, water supply and sanitation systems can expose the public to two basic types of risk – the risk of infection from water-borne diseases caused by faecal contamination, and the risk of exposure to toxic or harmful substances present in the water or wastewater, for examples heavy metals, toxic organic compounds, medical residues, or hormones.

The prevailing economic, social, and environmental conditions do increase these risks in many countries. Increased temperatures or humidity may for example favour the spread of particular faecal pathogens, which in turn will result in an increased occurrence of diarrhoea; or, severe malnutrition may in turn increase the impact of diseases, so that the otherwise harmless diarrhoea increasingly has lethal consequences.

In many ways ecosan intends to better the situation, for example through a multi-barrier concept and through contributing to the nutrition status of the people.

It is however recognised, that with any sanitation system, there are associated risks, and systems should therefore be designed with the aim of minimising these whilst at the same time maximising the benefits the system can bring to all stakeholders. Such a risk based approach is proposed in the up-coming guidelines from the WHO for the safe use of wastewater in agriculture and aquaculture and the safe use of excreta and greywater. In fact the risks should be lowered to an extent that they do not differ from other everyday risks in a safe way of living.

A method which allows to make such a risk assessment and enables to compare different types of risks is the so called DALYs (Disability Adjusted Life Years) concept (Foege 1994). After accumulating in a first step all years lost to deaths and illnesses for a given population, it is possible to analyse in a second step which risks do contribute how much to this burden. The total burden of disease for the world in 1990 was calculated to be 1.4 billion DALYs lost, or 259 per 1000 population, or 0,26 DALYs per person. (See Box below for further information on the DALYs concept).

For drinking water WHO has set a high safety level and decided to recommend measures which reduce the risk below a level of 10^{-6} DALYs (or 0,00001 DALYs) per person. The same high safety level is now set in the above mentioned forthcoming WHO publications for all risks related to sanitation and reuse systems and the WHO guidelines will describe the measures enabling to reach this safety level.

Box 15: Disability Adjusted Life Years (DALYs)

Disability Adjusted Life Years (DALYs)

DALYs are a measure of the health of a population or burden of disease due to a specific disease or risk factor. DALYs attempt to measure the time lost because of disability or death from a disease compared with a long life free of disability in the absence of the disease. DALYs are calculated by adding the years of life lost to premature death (YLL) to the years lived with a disability (YLD). Years of life lost are calculated from age-specific mortality rates and the standard life expectancies of a given population. YLD are calculated from the number of cases multiplied by the average duration of the disease and a severity factor ranging from 1 (death) to 0 (perfect health) based on the disease (e.g., watery diarrhoea has a severity factor from 0.09 to 0.12 depending on the age group) (Prüss and Havelaar 2001; Murray and Lopez, 1996). DALYs are an important tool for comparing health outcomes because they account for not only acute health effects but also delayed and chronic effects – including morbidity and mortality (Fewtrell and Bartram 2001).

When risk is described in DALYs, different health outcomes (e.g., cancer vs. giardiasis) can be compared and risk management decisions can be prioritized.

Finally, it is possible to use the DALYs approach to allocate research funds. Representatives of three foundations (the Rockefeller Foundation, the John D. and Catherine T. MacArthur Foundation, and the Edna McConnell Clark Foundation) held a meeting in 1993 to determine research priorities in combating global microbial threats. They realized that some disease conditions responsible for major burdens of disease, such as malaria, require significant basic research if better interventions are to be developed. On the other hand, with other diseases (e.g. vaccine-preventable diseases, lower respiratory tract infections, watery diarrhoea), good interventions are available but are not reaching those in need. In such cases, applied research or behavioural research is needed to produce better outcomes (Foege 1994).

However, the reality today is that a high percentage of wastewater world-wide is discharged untreated into the environment. At the same time farmers around the world use untreated wastewater and excreta to secure their livelihoods, often being completely unaware of the related health risks. Ecosan systems do offer the possibility to greatly reduce risks during reuse, improve the efficiency of nutrient recovery, and avoid wastewater discharge.

It is in this context that the WHO is updating guidelines from 1989 (WHO 1989), and is devoting an entire set of books to “the safe use of wastewater in agriculture and aquaculture”, and to “the safe use of excreta and greywater”, using recent research findings and results from practice. A screening of existing epidemiological studies and research on treatment efficiencies has been made for the new edition, which will appear in 2006. Continuous research is required in this field to keep pace with rapid developments. Knowledge management is urgent to disseminate the latest results to the public in an appropriate form.
Health-related research fields should include:

- Sanitisation of excreta and grey water and wastewater
- Comparison of risks from different technologies and system approaches
- Epidemiological studies (given infection rate in a certain environment and social or regional group and its relation to water and sanitation)
- Comparative research on sanitisation effects of different technological components in different climate zones and local conditions (e.g. research on effects of constructed wetlands; on adding of ammonium for the sterilisation of faecal matter; on pH-change and its sterilising effects in urine)
- Health oriented multiple barrier concepts
- Social aspects of crop restriction and exposure control (the use of safety equipment such as boots or shoes, or the use of excreta on cash crops)
- Hygiene education
- Comparative research on toxic substances, and their pathways in the food chain, including metabolites etc. (e.g. comparing effects from heavy metals like cadmium in current artificial fertilisers, with those from hormones in fertiliser from animal manure and from ecosan-systems)
- Effects of the use of the eco-fertilisers on the nutrition and health status especially in poor communities

Project Box 12: Use of reclaimed water in the Jordan Valley in Jordan (GTZ -project-data sheets 2005-013)

The GTZ supported Reclaimed Water Project aims to encourage the use of treated wastewater (reclaimed water) in the Jordan Valley on about 10.000 ha of agricultural land as a substitute for freshwater and in accordance with environmental and public health regulations.

The project area is characterised by a low annual rainfall with a mild winter allowing the off-season production of vegetables under irrigation. As irrigated agriculture consumes about 70 % of the available fresh water resources, which are also urgently needed as drinking water, the use of marginal water resources, such as brackish and reclaimed water for irrigation, is highly desirable.

In the project region, the main source of reclaimed water for irrigation is the countries largest treatment plant with the effluent being distributed through wadis, reservoirs and canals to agricultural areas. Reclaimed water, diluted with surface and rain water is then used for agricultural irrigation. Drip irrigation is most commonly practiced, in combination with a black plastic covering.

Figure 30: Demo plot (left); irrigation and mulching (middle); planting (right). (GTZ)

The Reclaimed Water Project monitors and evaluates agronomic and irrigation practices on 20 selected farm units. Analysis of local practices and comparison with international experience will lead to appropriate and practical guidelines for the use of reclaimed water.

The implementation of crop quality monitoring is difficult because so far governmental agencies do not feel responsible for sampling and analysis of crops irrigated with reclaimed water. Providing guidelines in this field will help clarify and improve the situation. In the beginning, the majority of farmers in the project were not aware of the nutrient content of the reclaimed water but now they are starting to appreciate its quality.

To reduce health risks from handling urine and excreta in agriculture a guideline by Schönning and Stenström (2004) has recently been published. The guideline discusses as main physicochemical and biological factors that affect the survival of micro organisms in the environment: temperature, pH, ammonia, moisture, solar radiation, UV-light, nutrients, and presence of other micro organisms. For the comparatively harmless urine they state that in “small-scale family based systems, the urine may be used directly or after short periods of storage if the crops are intended for family use. The likelihood of transmission is larger between family members than through urine fertilised crops.”

As needs for further research Schönning and Stenström (2004) point out that for large-scale systems additional studies on appropriate handling and use systems are essential, including a systematic microbial risk assessment and epidemiological follow-up investigations. When secondary treatment is applied, different methods need to be considered, including pH elevation with lime and other alkaline chemicals, including urea. For lime, experience from large-scale treatment of sewage sludge exists, and laboratory scale studies with faeces are presently ongoing.

For future studies, it would be valuable to consider a harmonization of treatment methods under different local conditions and using the same type of analytical methods, so that the results easily could be compared. All methods need to be evaluated in a systematic analytical way regarding environmental effects.

5.4.4 Technical and performance aspects of ecological sanitation

Obviously the technical reliability and performance of the system is key to its success and ultimately its sustainability.

Research on technical and performance aspects of ecological sanitation needs to assess system aspects like collection, treatment, transport and use of household wastes and wastewater, the management, maintenance, operation and logistics for large matter fluxes in large cities, or resource and energy efficiency during operation of conventional versus ecological sanitation systems. Researchers should also pay attention when analysing such systems to ensure that what is developed is actually appropriate to the needs and desires of the users. It will be easier to adapt technologies and systems to the needs of the users than to adapt the users to the needs of the system. Researchers also need to consider the robustness and flexibility, both within the system (to be able to receive varying loads) and externally (to be able to withstand varying extreme environmental conditions as well as user abuse).

Research has already begun to adapt and further develop existing innovative technologies, for their use in recycling oriented waste water management schemes.

For example, vacuum systems, commonplace on ships and aircraft, have been adapted, tested and standardised in the domestic context, and have proven successful. Other innovative technologies do not have such proven tracks and may require further development. Membrane technology is one example of this. Following their rapid development over the last decades, membranes are increasingly used in split stream systems and for wastewater treatment. New technologies are continuing to emerge for closed loop systems, for example from NASA and ESA who have developed closed loop sanitation systems for space flight that are designed to function over many years. (CNN 2005, GTZ – ecosan newsletter 2005-16).

Eventually an internationally acceptable set of standardised system components should be developed and established as the state of the art. As development in this area is continuing apace, databases and knowledge management system are of high importance to share new findings and discoveries. The available data should be of a high quality making it attractive to professional associations and ultimately to governments. A series of case studies and of research results emanating from them should allow qualified statements on components and combinations of components answering context specific questions such as:

- Which kind of treatment will result in which kind of fertiliser-quality?
- Which kind of treatment will guarantee which hygienic standard?
- What are the maintenance and operation costs of a certain component? What is the expected life-time of this component in the system?
- What is the best combination of components to solve a specific problem?
- What logistical and institutional arrangements are possible, and to which contexts are they most suitable?
- How suitable are existing standardised devices for their use in ecosan solutions?

However in a field developing as quickly as ecological sanitation a special conflict arises with respect to standardisation:

- On one hand standardisation of a set of modular system elements is urgently needed as planners, constructors and those financing the projects want this kind of “certificate” to insure that reliable and proven elements and systems are implemented.
- On the other hand this standardisation may hinder further development and standard technologies may simply be applied in situations where large-scale research and demonstration projects are still missing, and where new technologies may be needed to correctly address the context.

5.4.5 Socio-cultural aspects of sustainable sanitation

In recent years, there has been a growing realisation that access to sanitation does not increase unless there is demand from the user, and as most expenditure for sanitation is at the household level, where promotional efforts are most needed here. Previous attempts to market sanitation have relied on the promotion of the health benefits that sanitation and hygienic behaviour can bring. Whilst this is clearly the most important reason for promoting sanitation and hygiene from an institutional point of view, it often proves to be much less of a motivating factor for spending money on sanitation at the individual or household level. When households contemplate a shift, other factors may prove to be a greater motivation. Research by the World Bank Water and Sanitation Programme has identified several other factors that serve to motivate even very poor households to invest in sanitation (Cairncross 2004). These include (and see Box 16 for an example of drivers for sanitation from the Philippines):

- Convenience and comfort
- Privacy and safety
- For women and girls, avoidance of sexual harassment and assault
- Less embarrassment with visitors
- Dignity and social status

Box 16: Why people want toilets

The following responses concerning satisfaction with a new toilet were recorded in a survey of rural households conducted in the Philippines. The following reasons for having a toilet were listed in order of preference:

- Lack of flies,
- Cleaner surroundings,
- Privacy,
- Less embarrassment when friends visit, and
- Reduced gastrointestinal disease.

Similar results have been obtained from surveys conducted in other parts of the world, where health is often found to be a less important driver for obtaining sanitation for households than dignity, convenience and social status.

WHO 1997 in WHO/UNICEF JMP 2000.

User views are also related to how hygienically safe the design allows them to be. Hence introducing and operating ecosan installations in rural and urban areas requires a thoughtful combination of technical and managerial aspect fitting the prevailing socio-cultural context. Cordova and Knuth (2005) studied user satisfaction with Dry Toilets (DT's) in 5 urban and peri-urban sites in Mexico. They found high satisfaction rates with different combinations of program style and toilet models, as well as among populations with different motivations, income-levels and previous sanitation history. User satisfaction was influenced by the degree of choice users had in obtaining DT's and their understanding of the benefits of Dry Sanitation (DS), whereas user dissatisfaction was related to technical and programmatic factors. Cordova and Knuth (2005) also found that indoor, aesthetic toilets with a complementary greywater system for the household; maintenance and end-product collection services; and high water supply costs would be incentives for users to accept DS in the long-term. And they suggested that associating DT's with high social status might increase user acceptance of this technology.

Project Box 13: Public toilet project in Rajendar Nagar Slum in Bangalore, India (GTZ-ecosan-newsletter 2005-18)

To meet urgent community needs the Indian NGO ACTS and the Swiss Seecon GmbH established an eco-friendly public toilet centre in Rajendra Nagar Slum, Bangalore, and a co-composting site for faecal matter at the ACTS Rayasandra Campus, serving about 500 to 600 users per day. Although it has successfully been in operation for almost 4 years now, the originally designed logistic system, which was based on the collection of source-separated urine and faecal matter in plastic drums and the transportation of those drums to the processing side at Rayasandra Campus, was often discussed controversially. A socially and culturally more acceptable, sustainable and hygienically safe collection, transportation and processing scheme has therefore been developed and implemented with the support of GTZ.

For the improved system, storage tanks now replace the barrels for collection of urine and faeces. A suction truck, equipped with tanks and a pumping system, evacuates faeces and urine and manual handling is no longer necessary. Urine and faeces are then transported to the treatment site, where urine is stored in large storage tanks and faeces are treated in a biogas plant.

Figure 31: Urine diverting public toilet in Bangalore (left; Heeb); biogas plant (right; Wafler)

The stored urine and digested slurry are used as fertilisers and the biogas is being used for cooking. The biogas plant has a much higher capacity to treat faeces than the previous co-composting system. The higher treatment capacity will allow the extension of the project for further public toilet blocks.

Social marketing techniques are currently seen as an extremely useful tool in promoting sanitation amongst private households. They involve the application of commercial marketing techniques to advance social goals, in this case the safe use of excreta and greywater through appropriate sanitation solutions. Social marketing has been used successfully to increase sanitation coverage in rural India. The marketing side is based on the "four Ps" - Product, Price, Place, and Promotion.

Product
Toilet and sanitary system designs must respond to what people want, rather than what sanitary engineers believe they should have.

Price
Includes all costs (monetary and non-monetary) needs to be affordable, and therefore it is necessary to offer a range of products available at different prices. This is the hardest part of selling sanitation to those who lack it. The poor, who need it most, can least afford it. Hence the need to keep costs down and market a range of products with various price tags.

Place
The product must be delivered to the right place; in particular, a toilet must be installed in the customer's own home. This means that the supply chain has to reach every household.

Promotion
Promotion is communication with consumers about the product or service. This includes advertising, mass media, word of mouth, and anything in between. It can also include many other means to get customers' attention and convince them to buy the product: demonstration toilets, time-limited special offers, coupons and vouchers, competitions and prizes, door-to-door sales, credit sponsored by local traders, and mutual help schemes to help the poorest with the cost and the elderly with the digging.

When designing social marketing campaigns to promote sanitation and the safe use of excreta and greywater, the possible barriers to the promotion and success of the campaign should be identified, explicitly addressed, and integrated into the campaign. With regard to sanitation Simpson-Hébert and Wood (1998) have identified 10 barriers to progress in sanitation, all of which are equally valid for the safe use of excreta and greywater:

- Lack of political will;
- Low prestige, priority and recognition;
- Poor policy at all levels;
- Weak institutional framework and unclear distribution of responsibilities;
- Inadequate and poorly used resources;
- Inappropriate approaches;
- Failure to recognise defects of current excreta management systems;
- Neglect of consumer preferences;
- Ineffective promotion and low public awareness; and
- Women and children last.

Research on sanitation, reuse knowledge and traditions

As stated previously, many sanitation projects have failed due to a poor consideration of the socio-cultural sustainability of the system. For example, in India pit toilets installed during supply driven programmes of the 1980 ended up to a high percentage as being used as store rooms. In the programmes it was ignored that these toilets were culturally disliked as claustrophobic, that people wanted excreta to be deposited at a distance from their homes and not kept under the ground beneath their feet, and that, when the pit was full, it had to be emptied and the content handled – by someone (Black and Talbot 2005). Today several projects in India focus instead on awareness raising campaigns for "zero open defecation" and develop demand driven programmes e.g. with woman self help groups which have a clear interest in well maintained toilet facilities. In general sanitation projects in India should take into account aspects of the "old" history, e.g. the problematic concept of untouchability, as well as those of the "recent" history, during which e.g. Mahatma Ghandi was a ferocious advocate for more hygienic methods of sanitation, and campaigned against the degradation of humanity contained in the concept of untouchability. (Black and Talbot 2005)
Research on sanitation-related socio-cultural aspects and traditions can therefore greatly contribute to the socio-cultural sustainability of sanitation systems. Generally projects and related research have to realise that:

- Defecation is a highly private and intimate topic and related habits may largely differ between regions and cultures
- In some cultures handling of excreta is subject of strong taboos and may be related to aspects of human dignity
- Knowledge and perception of the reuse of excreta largely varies between cultures and regions
- Sanitation practices differ (wet versus dry hygiene, squatting versus sitting, etc.)

Problems to be addressed by research for socio-cultural sustainable sanitation systems include:

- Household motivations to invest in sanitation
- Household expectations from the system
- Lack of awareness of hygienic risks and practices
- Traditional practices which may be wise or may pose severe hygienic risks
- The need to modify existing practices as a result of increasing urbanisation in recent years

All these socio-cultural aspects have a large impact on the required design of sanitation systems, their operation, and the possible reuse of products from waste water and excreta. Therefore research is required in order to take into consideration these aspects during the preparation, implementation and operation of the sanitation systems.

Although social norms may at first complicate the introduction of innovative sanitation systems, research should concentrate on the flexibility of these systems, and determine in what way ecosan systems could most acceptably be introduced to society - for example after seeing the benefits through pilot/demo systems. Social acceptance is not just a simple yes or no, but a flexible parameter that changes with time.

Summarizing the above we can say that no technical sanitation solution can be successful unless it complies with the attitudes, norms and the cultural context. The term “cultural” covers a large spectrum ranging from contemporary habits and perceptions over historical heritage, religious norms, and the often unpronounceable “feelings” of the population. It is obvious that research on these viewpoints is still needed, both in general terms to allow methodologies to assess this to be developed, and in case specific studies, as each project and region has its own individual particularities, and not taking them into account may provide a false picture and lead to project failure. The aims of research are of course to gain knowledge, but also to deliver arguments, since habits may change, and viewpoints so far unknown to the population may meet with a positive interest. To allow an informed choice the decision should be based on a broad pre-selection of sanitation alternatives.

Participatory planning, knowledge management and decision making

Ecosan projects are more complex than conventional systems, being trans-sectoral and including topics ranging from calculating diameters of pipes to the analysis of cultural habits. The stakeholders however should have a central role in these planning processes. Thus a stakeholder analysis, awareness raising, education and information is necessary, to allow an informed choice. Practitioners may therefore require a different set of tools and instruments to make ecosan baseline assessments, to prepare projects, plan, chose technologies, implement, monitor, and evaluate the system. So far mainly the material and social aspects have been addressed.

One of the key challenges in knowledge management and research is to develop or identify these tools, and test them in the sanitation context. A number of tools are available from related disciplines, and can be adapted. Some sanitation-specific planning tools, which are suitable for ecosan, and are based on the model of active participation and stakeholder involvement, have been recently developed and have to be field-tested now. Among others these include the “Household Centred Environmental Sanitation Approach” (HCES) of the WSSCC (Eawag 2005), the adaptation of the HCES for ecosan projects as described in the GTZ-ecosan source book (Werner et al. 2004), and Open planning of sanitation systems developed by EcosanRes (Sweden) by Kvarnström and Petersens (2004)

To date, most planning and implementing systems for conventional sanitation have tended to be highly centralised, hierarchical and bureaucratic, focusing on formal knowledge, and severely limiting opportunities for the participation of a range of stakeholders. Similarly, sanitation policy and legal frameworks are focused on regulating the government organisations or their private sector agents who deliver services, which themselves are often rigidly defined.

The practice of centralised sanitation planning, decision making and financing removes central planners from the daily experience and problems of the users. Steeped as it is in formal knowledge, it creates the illusion that it represents the ultimate in scientific truth, and blinds practitioners to the drawbacks and weaknesses of the system. Sanitation practice, for example, has not significantly changed since the early part of the 20th century, and so, other than the addition of tertiary treatment, it has not benefited from the insights and knowledge of modern environmental management.

In contrast, if planners were more open to and familiar with either environmental management, or traditional knowledge, they might understand that the processes of generation and management of faeces, urine, and are intricately related to social and cultural values and norms. The equipment and treatment used, the necessary maintenance, cultural and religious rules about who may handle excreta and when, the conditions under which these materials may be recycled, and customs and taboos, govern much of behaviour. Elizabeth Shove (2003) bundles these factors under the terms "comfort, cleanliness, and convenience." Sanitation systems, if they are to work for the users, have to take these things into account. In the 21st century, in an age when public utilities are under pressure to match the financial performance of the private sector, such systems also depend on user payments and compliance with rules. This means that they also have to be affordable to the user. If the user is not consulted, there is little likelihood that the resulting systems will meet their needs.

On the system side, sanitation systems have to allow the system provider, whether public, private, or hybrid, to design, build, and maintain (and in some cases dismantle) the system. System providers are dependent on information from users about rate and type of use of equipment and resources; about failure rate; and, more directly, they are dependent on users for paying for the systems themselves. Moreover, system providers depend on the goodwill and local knowledge of users and neighbours when they have to install or repair infrastructure, site facilities, or store equipment and materials. When decisions about infrastructure are made without consultation, the system providers are also operating with partial blinders, depriving themselves of key local knowledge that could make their work more effective.

Participation also adds to the knowledge available for planning. Open channels of communication between users and system providers are a key feature of modernised socio-technical systems, which build an element of user choice and discursive awareness into the planning process (Spaargaren and van Vliet 2000).

The paradigm shift in sanitation depends on the participation of users and other stakeholders, in order to arrive at a collectively acceptable informed choice, so that the sanitary systems are tailored to their needs and demands. Providing for an informed choice generally means inviting potential users and stakeholders to explore alternatives in terms of toilets, storage facilities, transformation of excreta into soil conditioners and fertilisers, and the like. It requires transparency as to the benefits and drawbacks of both conventional and alternative systems, including their financial and economic requirements and benefits. Only in the context of this transparency can users have the room to participate in the decision-making. Then there is still the question of whether the system providers will listen, and will give the users' non-formal knowledge the respect and legitimacy they deserve.

Almost all experience with a participatory approach to planning has given special attention to the differences in practices, preferences, status, and knowledge of women, men, and children. Whereas traditional sewered sanitation is associated with the highly masculinised engineering culture that arose in the middle of the 19th century, alternatives both offer and require more participation of women and children in decision-making, management, and use. This in turn requires a more refined analysis and understanding of the role of the household, the unit of sanitation planning, than has normally been the case. Gender analysis offers both tools and guidelines for this added level of analysis.

Box 17: What is "gender"?

"In all societies men and women play different roles, have different needs, and face different constraints. Gender roles differ from the biological roles of men and women, although they may overlap in nearly all societies. Gender roles are socially constructed. They demarcate responsibilities between men and women, social and economic activities, access to resources, and decision making authority. Biological roles are fixed, but gender roles can and do change with social, economic, and technological change. Social factors underlie and support gender-based disparities." (Fong, Wakeman and Bhushan 1996)

The household is the basic unit of sanitation planning, but even within the household, there are deep differences between children, women and men in terms of behaviour, preferences, power, access to resources, time spent at home, information, and skills (Khabeer 1994).

Addressing gender issues in sanitation means having a closer look at social relationships, to see the different roles of community members and the complicated structure between women and men, girls and boys with regard to decision making, choice and manner of use of technology, hygiene, food security, financial security, crop production and health issues. Participation does not mean merely inviting the men from all types of households to come to a meeting and vote on toilet designs, it requires deliberate and skilled facilitation to elicit this same information from women, servants, and the social or ethnic classes who are given the "dirty work" in any particular society. The people charged with the dirty work have critical knowledge about the workings of the system, but they are frequently ignored as key stakeholders.

Box 18: Who does the dirty work?

In most societies, the dirty work is done by special castes, ethnic groups, or social or age classes. For example, emptying of pit toilets in East Africa is done by extremely poor youths, called "frogs". In India, the Dalit ("untouchable") caste had this and other functions. In Bulgaria and Romania, if there is a need to clean out a sewer or sweep a street or empty a toilet, the answer is 'call a Gypsy' (Roma). In Egypt Coptic Christians (the Zabbaleen) handle the waste; until recently, in North America (like in Victorian England) housecleaning was something only unmarried girls from poor families were called on to do.

Participation in ecosan projects also serves to include appropriately the different interests, needs, priorities, and framework conditions, as well as the economic and organisational potential and limits of the different stakeholders, in the decision making process, insofar as they do not contradict the needs of other participants. If at times in the process no consensus can be achieved, then mediation or other mechanisms to balance the different interests may be necessary, for example majority decisions or decisions made by legal representatives.

Willingness to pay and degree of participation in the system operation and maintenance

When adopting a demand responsive approach to sanitary provision on the basis of a freedom of choice and willingness to pay, the questions "whose demand?" and "whose willingness to pay?" may have to be answered to address equity concerns. "Payment" in this case may include all forms in which the users may contribute, i.e., in cash, in kind, and with time and energy for obtaining, operating, maintaining, and managing services.

Also inherent in this definition is the understanding that "choice" means a lot more than technology or cost options. It can also mean who participates in which choices, i.e., which groups within the communities and households make which of the several key decisions, such as:

- initiation of the projects;
- the type of technologies and service levels;
- the location of the facilities;
- the local management, maintenance, and financing systems; and
- the candidates for training.

The "capacity to pay"can be verified through the process of facilitating informed choice - an essential requirement of the demand-responsive approach. It is not possible to assess "willingness to pay" with any accuracy in the absence of choices and full information about choices being offered and discussed with potential consumers. Both willingness and capacity to pay can be surprisingly elastic, depending on what options are being offered, at what immediate and longer term costs, and how clearly this information is communicated to and discussed with women and men from wealthier, intermediate, and poor groups, who are all potential consumers of services. Gender-sensitive methods play an important role in assessing the overall demand for services.

In researching and establishing demand, researchers will need to investigate and control for incentives in the potential users' environment which may distort their willingness or capacity to pay. For example, if people believe that services might be provided free of charge, they may have an incentive to say that they are too poor to pay. In such cases it may not be possible to get an accurate assessment of demand until the initial stages of project implementation are under way. At this time potential consumers can begin to see the real terms under which the services are finally being provided.

Demands and meeting demands are not static issues. Continued maintenance and use of services and user payments depend on how well the improved facilities continue to match the expectations and resources of the different groups. Users also continually compare how benefits relate to the costs of obtaining them. A close monitoring and documentation of these processes in pilot projects by an accompanying research programme will provide valuable lessons for further implementation of ecosan systems (Mukherjee and van Wijk 2002).

Policy and institutional aspects, enabling environment

In most countries the use of surface and ground water is subject to respective national water laws. Other laws concerning soil, transport of chemicals, utilisation of fertilisers etc. supplement these water laws. The laws which have to be consulted in ecosan-related projects therefore are potentially much wider reaching than for more conventional sanitation systems, for example emission laws, soil protection, groundwater protection, labour regulations, fertiliser regulations, impact of subsidies, and the broad application of health regulations.

As ecological sanitation is still a relatively new approach, these types of sanitation systems are usually not yet included in the respective legal national frameworks. However there are some guidelines available that do create opportunities for ecosan systems, for example the new edition of the 1989 WHO Guidelines on the "Safe Use of Wastewater and Excreta" which are currently under preparation, or the EcoSanRes guidelines (Jönsson et al. 2004), as well as national policies, for example in Sweden (Regeringens proposition 2004).

Irrigation with water from other than natural sources is subject to rigid regulations and here ecosan may encounter legal problems. For example in Germany urine from urine separating toilets is seen legally as wastewater (as long as it is mixed with water), or solid waste (as long as it is not mixed with water). As solid waste the existing legislation applies and urine can not be used as a fertiliser (as it is not included in the list of certified fertilisers). Even struvite - magnesium ammonium phosphate (a substance that contains both N and P with a high fertilising potential) that may be produced from urine by precipitation technologies - meets this problem.

In view of the legal uncertainty concerning ecosan systems they "should be codified into the local, national and international systems of technical standards and norms in order to provide reference for Best Practice and Best Available Technology. The regulatory framework should be verified or adjusted with the aim of authorising and promoting a closed loop with new innovative technologies and management concepts." Furthermore, "Ecosan strategies should be implemented in national and international action plans including the Implementation Plans for the MDGs (Millennium Developments Goals), PRSPs (Poverty Reduction Strategy Papers) and the National Plans of Action within the UNEP GPA (Global Programme of Action for the Protection of the Marine Environment from Land-based Activities). The indicator system for safe and sustainable sanitation provision should be revised to reflect the real risks and dangers to the environment and public health posed by all forms of sanitation." (quoted from GTZ 2003)

A review of existing national and international regulations with respect of the requirements of ecological sanitation systems is needed. This has been started to some extent by a recently published report on sanitation regulatory frameworks (Johansson and Kvarnström 2005), which analysed and compared the frameworks in Mexico, South Africa, Sweden and Uganda. It has become evident, that the present regulatory and legislative set-up in many countries can hinder the introduction of eco-sanitation systems, and do not actively support recycling and sustainable resource management in the water and sanitation sector. Research needs to focus on providing a sound basis for developing legislation, regulation and technical standards that favour recycling oriented wastewater and excreta management, ensuring a high level of public health and environmental and performance standards.

Project Box 14: Vocational training centre "Dalit Shakti Kendra" in India (GTZ-ecosan-newsletter 2005-18)

The Navsarjan Trust was established in 1989 to help eliminate discrimination based on caste and gender and to assure equality of status and opportunities. In cooperation with GTZ and with support of the Swiss Agency for Development and Cooperation SDC, Navsarjan Trust has developed ecologically sound sanitation concepts based on various technological components on different sites.

A vocational training centre for Dalit youth called Dalit Shakti Kendra (DSK) was established in Gujarat in 1999. The DSK comprises an administration and kitchen building, a workshop building, a common toilet centre, a hostel and a community training centre. DSK is used by around 250 students, and a variable number of guests attending meetings and workshops. The sanitation concept comprises the following components: (1) A common toilet block with toilets for men and women, a biogas plant and subsequent treatment of the digested slurry in soilisation fields. The biogas plant also receives the manure of between 5 and 10 buffaloes. Source separated urine from the urinals and the squatting pans, is collected in tanks outside the toilet building. Urine storage and hygienisation tanks (black plastic tanks) are exposed to the sunlight to facilitate hygienisation. (2) Greywater from showers in the hostel and from the kitchen is treated in organic filters for solids removal and reused for surface irrigation; (3) Two double vault urine-separation vermi-toilets are installed. Earth worms facilitate the composting of faeces in the batch-chambers; (4) Urine is collected separately and directed together with water from hand washing to a greywater garden. Leachate from the composting chamber is treated and reused in a special leachate garden. The leachate is applied below surface to avoid public exposure to pathogens.

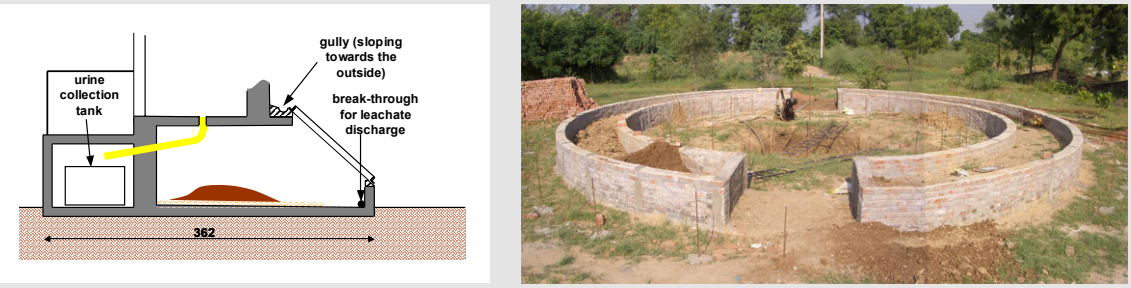

Figure 32: Urine-separation vermi composting toilet (left) and new school toilet block with bio-gas treatment - under construction (right). (GTZ)

(5) Mixed wastewater and blackwater from toilets in the community training centre is treated in organic filters, followed by evapotranspiration/infiltration beds. (6) Some greywater is being separately collected and directly treated and used in mulch trenches which allow a safe reuse of untreated greywater. As organic mulch material decomposes, the trenches have to be restored periodically

Awareness raising

Ecosan systems have the overriding aim of improving public health and hygiene. However, the basic premise of ecosan, of closing the nutrient loop between sanitation and agriculture, means that designers of ecosan systems must consider a much wider range of factors than those of conventional systems. This also leads to the consideration of soil conservation, increased long-term food security, and the sustainable use of resources (in the form of nutrients, organics, water and energy). As ecosan aims to solve sanitation problems and ensure reuse at the lowest possible level, promoters of these systems also have to consider the active engagement of the local private sector, contributing to job creation and poverty reduction.

The phrases "awareness raising" and "public education" came into wide use in the political modernisation of a number of urban environmental and governance systems in the 1990s. Another term, "social advertising", is slightly more accurate, in that all of these terms refer to a process of public relations or propaganda for stakeholders who are outside of – or peripherally related to – the

main decision-making processes. Awareness raising is often a strategy to bring these stakeholders into the process, sometimes as a counterweight to traditional or conventional institutions and experts.

Awareness raising focuses on “elevating the level of knowledge” that the users of a system have, so that they can participate in decision making at a more informed level. It is focused primarily on two kinds of communications: (1) instructions on how to use the system, comply with the rules, or change behaviour to match the needs of the system providers; and (2) information or justification about why this is necessary, desirable, morally appropriate, religiously approved, environmentally sound, or the like. There are a number of classic formulae for awareness raising, among them the “decision-makers guides”, “key sheets”, “decision trees”, SWOT analyses, and “advantages and disadvantages” tables.

The main reason for awareness raising with regard to ecological sanitation is that the ecosan approach and range of alternative technical, logistical, and institutional options are at the moment relatively unknown, not only to (potential) users, but also amongst engineers, planners, decision makers, agriculturists and even sanitation professionals. The role of awareness raising is therefore to spread this knowledge and to raise the profile of ecosan solutions among all stakeholders, with due attention to their power in the process, their tasks, their information needs, and the ways in which this information must be presented.

The strategy of most awareness raising is to de-construct and re-construct a particular discourse about alternatives, bringing in new information, criteria, or factors which weigh differently than those in the conventional approach. In sanitation, for example, the conventional criteria have to do with micro-biology, (in-house) health, and hygiene, whereas ecosan shifts the debate to a discussion (among others) of health and hygiene risks from contaminated surface water and insufficiently treated effluents, on water-intensivity, resource use, poverty reduction, nutrient cycles, and cultural appropriateness. The result of bringing them into the sanitation discussion is to create a demand for comparing conventional with new solutions, and (sometimes) creates a space for decision makers to take different decisions and support alternatives.

Topics of the new discourse are e.g.:

- participation versus top-down approaches
- sanitation only for those who pay for it versus pro poor sanitation
- comparing the money invested in sanitation with the gains for the national economy
- capital cost versus labour cost and job creation
- centralised versus decentralised
- large infrastructure versus modest investment
- end-of-pipe versus closed loop systems
- waste as a resource versus waste as something to be disposed of

6 Conclusion: The role of educational institutions in stimulating and supporting the paradigm shift towards sustainable sanitation

Education has a clear role to play, both in acknowledging the paradigm shift in sanitation and in incorporating the interdisciplinary theme of innovative sustainable sanitation systems into teaching curricula. Education on ecosan should enable the people to develop, plan and implement eco-sanitation systems that are hygienically safe, socially acceptable, economically feasible, environmentally sound and technically appropriate.

Educational institutions, universities, and technical schools can contribute to the mainstreaming of the new sanitation paradigm by fully integrating the discourse and criteria for sustainability into their curricula. They should make clear that defining criteria for sustainable sanitation is a political act and influences what is the accepted, legitimate form of sanitation, including the impacts from sanitation on other sectors. Sanitation capacity building should take the stakeholders in a sanitation project not as objects, but as partners for jointly developing sustainable sanitation solutions.

In response to satisfying especially the health needs of unserved, mostly poor population groups, education and research has to add resource conservation and waste reuse into taught sanitation paradigm, in order to improve economic conditions and the health of the population served, the quality of the environment and the long term availability of natural resources.

Sanitation engineers and practitioners, policymakers, managers, and operators get their ideas and information during their education. Therefore the curricula of universities, continuing education programmes, technical schools, research institutes and training centres have to include the ecosan philosophy. Thus several objectives, such as the improvement of human health, poverty reduction in developing countries, the conservation of natural resources and sustainable water and sanitation management systems in both, industrialised and developing countries may be addressed. Those responsible for the content of curricula should be informed about the new developments in this field.

The education system has to prepare students to think about urine and faeces and grey/black water as resources. Emphasis has to shift from the simple disposal to the hygienisation of contaminated flow streams, and to resource conservation and safe reuse. Teaching must make clear that health and a healthy environment is a prerequisite for human productivity, and productivity determines economic well being.

Many proven technical elements are available for ecological sanitation systems and the number of pilot demonstration and research projects, and of large scale applications, is continuously increasing. However, given the broad variety of local framework conditions and the large number of open questions in this complex interdisciplinary field, there is still a great need to further develop technical and operational solutions and to enlarge the knowledge base with respect to public health, risk management, economics, logistics, material-flow-streams, socio-cultural and many other aspects. Research in these disciplines will require trans-sectoral and interdisciplinary co-operation and inputs from a range of research fields.

Development and applied research should concentrate on a large series of pilot research and demonstration projects which can serve as laboratory for developing and field-testing a broad variety of technical and operational sanitation systems. The pilot research and demonstration projects should showcase innovative solutions in a variety of climatic, social, cultural, economic and geo-morphological contexts, and should enable the development of a series of model solutions covering the whole range of sanitation needs.

Research should concentrate on comparative studies between a range of conventional and innovative solutions comparing them against a set of sustainability criteria. It should also help in developing field tested and proven sustainable sanitation components and systems, and contribute to forming a knowledge base for drawing up technical standards. Documentation and case studies for innovative

sanitation solutions should be easily made available in a uniform comprehensive format, and technical information for components of innovative sanitation solutions should be provided to accelerate their dissemination.

The achievement of the sanitation MDGs is one of the major challenges for sustainable development in the next decade. Putting emphasis on education and research for ecologically sustainable sanitation may largely contribute to reaching this goal.

7 Annex - Examples of workshop contents, curricula outlines and an awareness raising presentation

These examples are demonstrating the broad range of awareness raising, teaching, practical training, and professional networking activities, which may serve as a source for the reader to build his own materials and tools.

Presentations, workshops and curricula have to be strongly tailored to the target group they are meant for. Further more an awareness raising workshop will differ from a project-start-up workshop or a decision-making workshop. Not only the target group in general e.g. secondary school teachers, but as well e.g. the specific geographic and socio-cultural context has to be addressed. Teachers in sub-Sahara countries need different input than those in Sweden. Hence no two presentations, workshops, curricula will be alike, if such differences are well addressed.

The below given examples are not more than a stimulation or first input for those planning to work out their own ecosan teaching-framework, presentation-material, or workshops for their individual context.

The intention is, however, to show the wide range of topics to be covered and groups to be specifically addressed, with the set of examples given below.

More Examples and material are found on the “ecosan resource” CD that is either found at the end of this publication, or can be ordered from ecosan@gtz.de. Information on up-to-date online-versions of this “ecosan resource” CD are found at http://www.unesco.org/water/ihp [search in “publications”] and at www.gtz.de/de/dokumente/en-ecosan-education-resources-2006.pdf.

7.1 Example: A three-minute awareness raising presentation at CSD12

The speech and presentation “ecosan - principles, urban applications and challenges” given by Christine Werner at the 12th session of the UN Commission on Sustainable Development (12 CSD) on ecological sanitation is given as an example for an awareness-raising presentation.

The speech had duration of 3 minutes, provoked a lively discussion at the CSD12 on the topic and was aimed at high ranking political decision makers.

Table 8: Example for a 3-minute awareness raising presentation

Text	Slide of presentation
Ecosan - principles, urban application and challenges Occasion: UN Commission on sustainable development CSD 12th session – New York, 14th to 30th of April 2004	

Text	Slide of presentation
The idea, that human excreta are wastes with no useful purpose is a modern misconception. It has led to the development of so-called “drop and store” or “flush and forget” sanitation solutions, where precious drinking water is used to transport excreta into the water cycle misusing our rivers, oceans and aquifers as a sink for untreated waste.	On the other hand, farmers around the world yearly require 135 Mio tons of mineral fertiliser for their crops, while at the same time conventional sanitation dumps 50 Mio tons of fertiliser equivalents flows into our water bodies - nutrients with a market value of around 15 Billion US dollars.	
In nature however, there is no waste. All products of living things are used as raw materials by others as part of a cycle. Considering the environmental damage, the health risks, and the worsening water crisis, a revolutionary rethink of our current sanitation practises is urgently needed. To solve our self made sanitation problems, ecosan applies the basic natural principal of closing the loop by using modern and safe sanitation and reuse technologies, thereby continuing the historic tradition of recycling human wastes once applied in most farming societies. Eco-sanitation opens up a wider range of sanitation options than those currently considered.	Firstly, flow streams with different characteristics, such as faeces, urine and greywater, are often collected separately. Rainwater harvesting and the treatment of organic waste and animal manure can also be integrated into the concepts.	Secondly, unnecessary dilution of the flow streams is avoided, for example by using dry, low flush or vacuum transport systems. This minimises the consumption of valuable drinking water and produces high concentrations of recyclables.

Text	Slide of presentation
Benefits of ecological sanitation comprise: the protection of human health through safe sanitation, the preservation of clean waters, and a safe and healthy environment	
Benefits of ecological sanitation comprise… the reuse of plant nutrients as valuable fertiliser restoring soil fertility and substituting expensive mineral fertilizers from limited natural resources the reuse of organic matter for improving soil quality, especially its water and nutrient retention capacity	Benefits of ecological sanitation comprise… the recovery of energy contained in excreta and wastewater for example through the production of biogas and the reuse of water for irrigation, service water or groundwater recharge	
Examples of ecosan technologies Initially, when Scandinavian pioneers first began promoting the advantages of urine separation and nutrient recovery in the ‘80’s, the focus was on dry sanitation systems for rural areas only. Since then however, many different technical options have been developed, ranging from low cost systems - such as composting toilets, urine diverting dehydration latrines and constructed wetlands - to high tech water-borne applications - such as vacuum sewers, anaerobic treatment, chemical processing or membrane technology, most suitable for use in densely populated urban areas all over the world.	
Text	Slide of presentation
One of the most recent examples in Germany can be seen at the headquarters of the KfW banking group in Frankfurt, where vacuum technology, best known from trains and aircraft, is used to collect blackwater and greywater is being recycled to flush toilets, while at the GTZ main office, urine separation and agricultural use will be implemented in the course of the ongoing renovation of the building.	
However, there are still some challenges to be faced before ecological sanitation systems are widely adopted: Awareness of the alternatives offered by ecosan has to be increased Resource reuse needs to be integrated into sanitation planning processes from the very beginning Legal frameworks and technical standards need to be revised We need a full cost analysis and comparison of the environmental and health risks of all types of sanitation	
Innovation-friendly investors are required, as well as new financing instruments supporting private households investment	And, most important of all, we need large scale implementation of ecosan projects in urban areas for show casing the technical feasibility and the benefits of this new approach
We all recognise that a “business as usual” approach to provide sanitation will not allow us to meet the MDGs. Despite more than 100 years of experience and trillions of dollars of investment, conventional systems have failed. But we still continue to waste our non-renewable resources as if they were in infinite supply. Due to its huge potential, ecological sanitation must be recognised and introduced as the new promising holistic and sustainable approach to provide safe and decent sanitation, reduce poverty, contribute to food security, preserve our environment and maintain the natural basis of life on earth.	
7.2 Example: Advanced 3 plus 2 weeks ecosan training course in Sweden

This 3 plus 2 weeks advanced ecosan training course by Stockholm Environment Institute and funded by SIDA, Sweden, is designed for professionals (engaged in town planning, water supply, waste management, and socio-economic development), researchers and trainers (in the field of environmental sanitation), and key persons (e.g. engaged in NGOs with projects related to improved sanitation and water supply). It has the following overall objective and long term goal:
Objective: To acquire information and knowledge about new options in sanitation in order to support urban dwellers in reducing environmental health risks, improving their nutritional status and protecting their water sources.
Goal: Lead to better health and well being as well as the protection of the environment.
Duration / Structure / Location:
Part 1: The first 3-weeks introduction to the basics of ecosan takes place in Sweden.
Part 2: Back in their countries of origin, participants work on professional ecosan projects for several months, supported by the course supervisors.
Part 3: A two weeks course takes place in or near the participant's countries of origin. This part is based on the individual projects with discussions and seminars with professionals from the country where the course is given. This regional exchange and cooperation will support regional networking.
Method: A mix of lectures and work in groups. The first three weeks introduce the problem-based learning method.

Table 9: Programme for part 1 (3 weeks, in Sweden) of the advanced Sida/EcosanRes course of ecological alternatives in sanitation

Country	Sweden
Type of activity (Name)	Advanced 3 plus 2 weeks ecosan training course
Dates	14 August – 4 September, 2005
Place	Stockholm
Organizer	Stockholm Environment Institute
Sponsor	SIDA
No. participants	30
Objective	To acquire information and knowledge about new options in sanitation in order to support urban dwellers in reducing environmental health risks, improving their nutritional status and protecting their water sources

Sunday, 14 August

Time	Content	Lecturer/ressources	Base group assignment
18:00	Course opening with joint dinner (+ info on Sweden)	All	-

Day 1: Monday, 15 August

Time	Content	Lecturer/resources	Base group assignment
09:00	Welcome and course description	JOD	
09:30	Welcome by Sida/SEI	Andersson /AR	
10:45	Presentation of course programme Hygiene/food prod./management	JOD+TAS+HJ	
14:00	Introd. to Problem-Based Learning Introductory case	JOD+CS+BV+HK	
19:00	Pre-conceived ideas about ecosan	Individual task	

Day 2: Tuesday, 16 August

Time	Content	Lecturer/resources	Base group assignment
08:30	*"Pathogens & disease transmission"*	TAS+CS	
10:00	Base-group work	JOD+CS+BV+HK	Test case
13:00	Study tour to Skarpnäck (dry toilets)	CS+BV+HK	
16:30	Return to hotel (review in the bus)		

Day 3: Wednesday, 17 August

Time	Content	Lecturer/resources	Base group assignment
08:30	Base-group work	-	Test case cont.
10:00	BG-meeting (present test case +new)	JOD+CS+BV+HK	Start Case I
13:45	*"Indicators and the risk concept"*	CS	-
15:30	Free for shopping & sightseeing		

Day 4: Thursday, 18 August

Time	Content	Lecturer/resources	Base group assignment
08:30	*"Urban groundwater & treatments"*	GJ	Case I cont.
11:30	Base-group work		
14:00	*"Hygienisation of excreta and WHO Guidelines"*	TAS	
15:30	Base-group work		
17:00	Bus to Skansen + ferry to Gamla stan	Guide tour	

Day 5: Friday, 19 August

Time	Content	Lecturer/resources	Base group assignment
08:30	Base-group work	-	Case I cont.
10:30	*"Greywater treatment and use"*	HJ	
13:30	Report of Case I in plenum+comments	JOD+CS+BV+PR	Report Case I
14:30	Greywater in Erdos and Bufallo City	PR	
15:30	BG-meeting	JOD+CS+BV+HK	Start Case II

Saturday, 20 August

Time	Content	Lecturer/ressources	Base group assignment
08:15	Study tour: Building exhibition centre/ Nacka NaturCentrum /Hammarby Sjöstad/Bornsjön Travel to Linköping		-

Sunday, 21 August, Free activities

Day 6: Monday, 22 August

Time	Content	Lecturer/resources	Base group assignment
08:30	*"A holistic house"*	RSh (Nepal)	Case II cont.
11:00	BG-work		
13:00	*"How to produce interview protocols"*	JOD	
14:30	Sanitation experiences from participants' countries (plenum)	All participants 10min/country	

Day 7: Tuesday, 23 August

Time	Content	Lecturer/resources	Base group assignment
08:30	Study visit to Ekoporten		Case II cont.
13:00	"Wetland treatment of wastewater"	KS	
14:30	Sanitation experiences, cont.	Participants	

Day 8: Wednesday, 24 August

Time	Content	Lecturer/resources	Base group assignment
08:15	1/2-group interview training, prep. of individual interview protocol	Video mirroring	Case II cont.
13:00	1/2-group interview training, prep. of individual interview protocol	Video mirroring	

Day 9: Thursday, 25 August

Time	Content	Lecturer/resources	Base group assignment
08:15	Cont. base-group with Case II	-	Case II cont.
10:30	Individual interviews with *users and producers of ecosan*	-	
18:00	Multicultural dinner		

Day 10: Friday, 26 August

Time	Content	Lecturer/resources	Base group assignment
08:30	Report of Case II in plenum+comment	JOD+CS+BV+HK	Report Case II
10:30	BG-meeting	JOD+CS+BV+HK	Start Case III
13:00	"Treatment of excreta"	BV	
15:30	Outstanding issues of Case II	CS	

	introduction to professional project	JOD+CS+BV+HK	

Saturday, 27 August

Time	Content	Lecturer/resources	Base group assignment
08:30	Departure from Linköping Study visit to Enköping with ww irrigation. Travel to Uppsala. "*Small-scale options*" Visit to home garden in Uppsala Arrival at hotel	BV+JOD BV+Muller HJ	

Sunday, 28 August, Free activities

Day 11: Monday, 29 August

Time	Content	Lecturer/resources	Base group assignment
08:30	*"Urine, faeces & solid waste as fertilisers"*	HJ	Case III cont.
10:30	Reports of interviews in plenum	JOD+CS+BV+HK	
13:30	*"Residents' views and wants"*	RS	
15:00	Reports of interviews cont. + summary	JOD+CS+BV+HK	
17:00	*Production of simple ecosan-toilets*	BV+HJ	

Day 12: Tuesday, 30 August

Time	Content	Lecturer/resources	Base group assignment
08:30	*"Fertilisers in urban farming and gardening"*	HJ	Case III cont.
10:00	Base-group work		
13:00	*"Ecosan in practice-technical issues"*	HJ+JOD	
15:15	Discussion of professional project	BV+CS+JOD	
15:45	Base-group work		

Day 13: Wednesday, 31 August

Time	Content	Lecturer/resources	Base group assignment
08:30	*"Evolution of toilet systems (Gender)"*	JOD	Hand in draft of professional project
10:30	Base-group work	(KT)	
13:30	*"Institutional aspects of ecosan"*	JOD	
15:30	Film on dalits in India, Durban, etc.	JOD	

Day 14: Thursday, 1 September

Time	Content	Lecturer/resources	Base group assignment
08:30	"*Systems perspectives* incl. costs and returns of various arrangements"	HJ+JOD	
10:30	Report on Case III in plenum	JOD+CS+BV+HK	Report on Case III
13:00	Evaluation of experience of PBL	JOD+CS+BV+HK	
15:30	General discussion on ecosan		
18:00	Preparation for departure	All	DHL

Day 15: Friday, 2 September

Time	Content	Lecturer/resources	Base group assignment
08:30	Group discussion on planning & discussion of professional projects	All	
10:30	Ecosan in the future (MDG)		

13:00 13:30 19:00	Bengt Johansson, Sida-Natur Evaluation, summing up experiences Farewell dinner	Sida, all All	
Saturday, 3 September, departure			
Sunday, 4 September, departure			

Table 10: Programme for part 3 (2 weeks, regional) of the advanced Sida/EcosanRes course of ecological alternatives in sanitation in or near the participant's countries of origin

Country	African participants meet in S. Africa, Asian participants in India		
Type of activity (Name)	Follow-up course to professional projects		
Dates	13 – 24 February, 2006 (Africa) and March 13 -24 2006 (India)		
Place	variable		
Organizer	Stockholm Environment Institute and a local organiser		
Sponsor	Sida		
No. participants	15 African participants in South Africa, and 15 in India		
Objective	To strengthen the ability to organise and improve ecosan projects		
Day 1: Monday, 13 February			
Time	Content	Lecturer/resources	Base group assignment
09:00 09:30 10:15 13:30 17:00 19:00	Welcome by local organiser Presentation of course programme **Seminar:** *"Sanitation norms & policy"* Presentation of participant projects (20 min for each) Welcome dinner	SM JOD DWAF Each participants	
Day 2: Tuesday, 14 February			
Time	Content	Lecturer/resources	Base group assignment
08:30 11:00 13:15 15:15	Project presentations continue Peri-urban sanitation projects Base-group task: select 2 focus areas Base-group work	Each participant DG JOD+SS Participants	 Case V
Day 3: Wednesday, 15 February			
Time	Content	Lecturer/resources	Base group assignment
08:00 11:30 13:00 14:15	Study visit to periurban sanitation units Follow-up of visit e.g. "An array of technical solutions" **Workshop A:** "*Fit or misfit of technical systems in the urban context"*	Schoman, Booysen JOD Base group A DG	 Report 1 of Case V Team 2

[… continued]

Day 4: Thursday, 16 February

Time	Content	Lecturer/resources	Base group assignment
08:30	e.g. "Monitoring activities"	Base group B	Report 2 of Case V
09:15	*"Work in communities. Promotion & monitoring strategies for ecosan"*	SM	
13:15	Practical task: produce info material for toilet/greywater use and maintenance	Local professional & work in groups	

Day 5: Friday, 17 February

Time	Content	Lecturer/resources	Base group assignment
08:30	Presentation of information material	Participants	Reports
10:00	Base-group task: "Sanitation matters"	JOD+SS	Case VI
13:30	Preparation of individual interviews	JOD	
14:15	Preparation continue in small groups	Participants	

Saturday, 18 February

Time	Content	Lecturer/resources	Base group assignment
24:00	"Ghost" tour in town?		

Sunday, 19 February, Free activities

Day 6: Monday, 20 February

Time	Content	Lecturer/resources	Base group assignment
08:30	**Workshop B:** *"Reuse of greywater, urine and dried faecal matter"*	CB, HJ	Case VI cont., Team 3
13:00	*"Prevention is better than cure"*	T-A Stenström	
14:30	Individual interview in town	Participants	

Day 7: Tuesday, 21 February

Time	Content	Lecturer/resources	Base group assignment
08:00	Study visit to small ecosan projects	Henk	Case VI cont.
11:00	Follow-up of visit and lessons learnt	TAS	
11:30	**Workshop C:** *" A sanitary city"*	AA	
15:30	Preparation of presentations by groups	Participants	

Day 8: Wednesday, 22 February

Time	Content	Lecturer/resources	Base group assignment
08:30	Presentation of interviews in groups with similar informants. Discussion.	JOD+SS	Case VI cont.
10:30	" "	Still open slot	
13:30	*Base-group work*	Participants	
14:30	*"Systems Analysis and an algorithm"*	JOD+ HJ	

Day 9: Thursday, 23 February

Time	Content	Lecturer/resources	Base group assignment
08:30	Presentation of ideas for future work	Participants	Case VI cont.
10:30	Working groups on future work	Participants+some former	
13:15	Cont.		
15:00	Presentation of Case VI	Participants	Report of Case VI

[… continued]
Day 10: Friday, 24 February

Time	Content	Lecturer/resources	Base group assignment
08:30	Establishing local and country working groups. Plans for networking	Participants	
11:00	Oral evaluation of course	JOD	
13:30	Evaluation cont.		
14:30	Closure of the training programme	Invited guest	
18:00	Farewell dinner

7.3 Example: Schedule of a 5-day ecosan introduction course in Norway

The Agricultural University of Norway (NLH) offers different courses which include ecological sanitation in their curricula. The course schedule presented below refers to the course “Appropriate sanitation in the developing world” which is a 5-day course for both, professionals and students.
Focus: The focus of this course is to explore ecological solutions for developing countries. Specifically, recycling and natural waste treatment systems are examined. Case-studies are presented by sanitation specialists, followed by analysis of associated issues – both technical and social. The range of case studies covers Asia, Africa and Latin America. And the scope of analysis offered by engineers, scientists, and public officials is wide and timely.

Target group: The course is designed for both the professional and student. Its purpose is two-fold: (1) to illustrate how ecological sanitation is applied in developing countries, and (2) to explain, in-depth, the principles of ecological engineering. Participants are expected to include professionals from consulting firms (e.g. civil engineers), NGO personnel (field and administrative), public officials (e.g. health and foreign services), research scientists, and students from various disciplines.

Table 11: Schedule of a 5-day ecosan introduction course in Norway

Country	Norway
Type of activity (Name)	5-day ecosan introduction course
Dates	Every year; e.g. from 24 to 28 May, 2004
Place	Agricultural University of Norway, Ås, (30 km from Oslo)
Organizer	Agricultural University of Norway (NLH)
Sponsor	Financed by fees, limited number of scholarships available
No. participants	30
Objective	Explore ecological solutions for developing countries

Day 1: Monday, 24 May (Fundamentals of ecological sanitation)

Time	Content	Presenter
09:30 – 09:40	Welcome	
09:40 – 10:20	Ecological sanitation an option for all	P. D. Jenssen
10:20 – 10:40	The UN goals for water and sanitation	M. Svelle
10:40 – 11:00	Coffee break	
11:00 – 11:10	Welcome to the University	O.J. Skjelhaugen
11:10 – 11:35	The wastewater resource	P. D. Jenssen
11:35 – 12:15	Ecological sanitation in developing countries	H.P. Mang
12:15 – 13:15	Lunch	
13:15 – 14:00	Composting and dry sanitation toilets	P.D. Jenssen
14:15 – 15:00	Vacuum toilets and vacuum transport	K. Haddal
15:15 – 16:00	From blackwater and organic waste to fertilizer	J. Morken
16:15 – 17:00	Demonstrations: toilet options for the future, greywater treatment and slurry injection	J. Morken, P.D. Jenssen

Day 2: Tuesday, 25 May (Sanitation under stress - Agricultural aspects)

Time	Content	Presenter
08:30	Sanitation under stress: scenarios, challenges -experiences after Tsunami	A. Koestler
	Case study - input parameters: New settlements along tsunami affected coast lines	A. Koestler
	Case study exercise - group work A	Koestler/P.D. Jenssen/ H.P. Mang
12:15	Presentation and discussion of students work	A. Koestler/P.D. Jenssen/ H.P. Mang
12:15 – 13:15	Lunch	
13:15 – 14:00	Summary and formulation of future tasks and challenges - what is really needed in disasters!	A. Koestler/ P.D. Jenssen/ H.P. Mang
14:15 – 15:00	Urine diverting systems - an overview	E. Kvärnström
15:15 – 17:00	Agricultural aspects of ecological sanitation with practical demonstrations	E. Kvärnström

Day 3: Wednesday, 26 May (Natural systems – Health aspects)

Time	Content	Presenter
08:30 – 10:00	Soil for groundwater protection and wastewater treatment	P.D. Jenssen/ S. Jonasson
	Coffee break	
10:15 – 11:00	Soil for groundwater protection and wastewater treatment	P.D. Jenssen/ S. Jonasson
11:15 – 12:15	Greywater treatment and reuse	P.D. Jenssen
12:15 – 13:15	Lunch	
13:15 – 14:00	Health aspects of ecological sanitation	T.A. Stenström
14:15 – 15:00	Health aspects of ecological sanitation	T.A. Stenström

15:15 – 16:00	WHO guidelines for excreta and greywater reuse	T.A. Stenström
16:15 – 17:00	Energy aspects and co-treatment of waste	P.H. Heyerdahl
19:00	Garden party	

Day 4: Thursday, 27 May (Energy – Wetlands, ponds and aquaculture for wastewater treatment – Participant presentations)

Time	Content	Presenter
08:30 – 09:45	Biogas systems	H.P. Mang
09:45 – 10:00	Coffee break	
10:00 – 10:45	Wetlands and ponds an overview	P.D. Jenssen
10:45 – 11:30	From pit latrines to constructed wetlands-peri urban solutions near Colombo Sri Lanka	A. Heistad
11:30 – 12:15	Ecological Sanitation for Megacities: Calcutta Wetlands and other examples	B. Guterstam
12:30 – 13:15	Lunch	
13:15 – 13:45	Experience from an ecovillage in Denmark	D. Wulfson
13:45 – 14:30	Ecosan examples	H. P. Mang
14:30 – 14:45	Coffee break	
14:45 –17:00	Participants presentations	
18:00	Excursion to the Klosterenga urban greywater treatment system in Oslo - dinner and sightseeing	

Day 5: Friday, 28 May (Social and economic issues related to sanitation)

Time	Content	Presenter
08:30 – 09:15	Organizing decentralized systems – a GIS based tool	H. Borch
09:30 – 10:00	Socioeconomic issues related to ecological sanitation	O. Hanserud
10:00 – 10:15	Coffee/tea	
10:30 – 12:30	Case Bangalore: Eco-san public toilets Starting an economic spiral Generating employment Grassroot involvement for success Economy and gender aspects The influence of religion	K. Gnanakan, J. Heeb
12:30 – 13:15	Lunch	
13:15 – 14:00	Case Bangalore continued	
14:00 – 15:00	Discussions and summing up	J. Heeb/H.P. Mang/ P.D. Jenssen
15:00	Adjourn	

7.4 Example: Workshop in the frame of the large urban ecosan project in Erdos, China

Erdos represents a cluster of cities in a coal mining belt of Inner Mongolia. The ecosan project undertaken by EcosanRes and the Chinese Government takes place in a new eco-town which is being developed as a suburb a few kilometres from the city centre of Dongsheng.

The outline below refers to an awareness raising workshop, undertaken with government officials and various experts. Its aim was to introduce the ecosan concept and to identify an appropriate innovative solution for its local application in the eco-town.

Table 12: Schedule of a 4-day ecosan training course in China

Country	China	
Type of activity (Name)	4-day ecosan training course	
Dates	17-22 July 2003	
Place	Dongsheng, Inner Mongolia	
Organizer	China-Sweden Erdos Eco-town Project	
Sponsor	Swedish International Development Agency	
No. participants	n.a.	
Objective	Introduce ecosan concept and discuss future adaptation at local level	
Day 1: Thursday, 17 July		
Structure	Content	Presenter
Lecture 1	The current situation and the challenge of the UN Millennium Goals: globally and in China Issues: environment, costs, awareness and institutions Conventional solutions: pit toilets and flush toilets	Q. Zhu
Lecture 2	The vision: a systems approach to the management of human excreta; closing-the-loop vs. a linear approach Basic principles: diversion, containment, sanitization and recycling	U. Winblad
Groupwork 1	Read training material; discuss existing sanitation systems in Inner Mongolia, advantages, disadvantages, what people want. (For example 20 min group discussions, 5 min presentations/discussions - 5 groups.)	J. Xiao
Lecture 3	Excreta management and public health: - excreta related diseases - barriers - how pathogens die	J. Xiao
Lecture 4	Stepwise pathogen destruction: - divert urine - prevent dispersal of faeces - reduce volume and weight - kill pathogens - primary and secondary treatment	U. Winblad
Groupwork 2	Read training material; discuss public health aspects of existing sanitation systems in Erdos Municipality. Formulate questions to be answered / discussed by resource persons and participants.	J. Xiao
Lecture 5	Urine and faeces - amounts and properties Examples of urine diversion	J. Xiao U. Winblad

Day 2: Friday, 18 July		
Structure	Content	Presenter
Lecture 6	Check Peter Morgan's writings - reports and website; Stockholm Water report "Urine Separation -closing the nutrient cycle"; Esrey et.al. "Closing the Loop"; Reports by Hakan Johnsson/ Recycling: - waste or resource? - advantages of recycling - recycling of urine - recycling of faeces	Q. Zhu
Groupwork 3	Discuss recycling of human urine and sanitized faeces in Erdos Municipality	J. Xiao
Lecture 7	Examples of ecological toilets based on dehydration: south China "open toilet", Vietnam, Guangxi, Mexico, Sweden, solar heated, Yemen, Ladakh	U. Winblad
Lecture 8	Examples of ecological toilets based on decomposition: Clivus Multrum, Mexican solar heated, Norway, Kerala, Sweden (Kalmar University)	U. Winblad
Day 3: Monday, 21 July		
Structure	Content	Presenter
Groupwork 4 continued	Build a mock-up model of the ecological toilet designed by the group.	Q. Zhu, J. Xiao, U. Winblad
Lecture 9	Design and management features: - urine diversion vs combined processing - dehydration vs decomposition - multiple vaults - anal cleaning material and absorbents - solar heater - ventilation	U. Winblad
Lecture 10	What can go wrong? - Troubleshooting: - lack of participation - lack of knowledge - poor design - defective materials and workmanship - improper maintenance	J. Xiao
Lecture 11	Greywater: - concept and terminology - controlling quantity and quality - processing - utilization	Q. Zhu
Groupwork 5	Discuss different possibilities of handling greywater in the HZK project.	Q. Zhu

Day 4: Tuesday, 22 July		
Sturcture	Content	Presenter
Lecture 12	Large-scale applications, ecostations: - when and where to apply ecological sanitation? - concept and role of ecostations - source separation and community participation - collection and processing	Q. Zhu U. Winblad
Groupwork 6	Discuss the application of the ecostation concept in Erdos.	Q. Zhu J. Xiao
Plenary discussion	Ecological urban development in Erdos Municipality	Q. Zhu J. Xiao U. Winblad
Closing remarks	The Sida-funded R&D project in Erdos Municipality	A. Rosemarin

7.5 Example: Schedule of a 2-day ecosan workshop in Eritrea

The following table shows the schedule of a 2-day ecosan workshop conducted by the GTZ in Eritrea in 2005, which may serve as an example for a 2-day awareness-raising workshop.
The workshop was aimed principally for representatives from the Water Resources Department under the Ministry of Land, Water and Environment (MoLWE), but was also attended by representatives from the Ministry of Agriculture, the Ministry of Health and other local authorities. The workshop was planned to be a forum for presenting the roles and responsibilities of the different authorities on national level in regard of sanitation, discussing the overlap of roles about sanitation issues. It addressed the existing sanitation situation in the country, and promoted the ecosan concept as a possible solution to improve the current situation, by the same time saving and protecting the scarce natural resources.

Table 13: Schedule of a 2-day ecosan workshop in Eritrea

Country	Eritrea	
Type of workshop (Name)	2 days in depth workshop on ecological sanitation program	
Dates	7-8 May, 2005	
Place	Asmara, Eritrea	
Organizer	Water Resource Department (WRD), GTZ	
Sponsor	GTZ	
No.participants	40	
Objective	The workshop was planned to be a forum for presenting the roles and responsibilities of WRD, MoH and MoA in the promotion of sanitation system on a national basis, presenting the existing sanitation situation in Eritrea, discussing the significant overlap of roles about sanitation issues amongst governmental organisations, and training in great detail the concept of ecosan, so that the participants can share and incorporate it in their sanitation planned activities.	
Day 1: Saturday, 7 May		
Time / Activity	Content	Presenter
8.30 – 8.45 9.00 – 9.30 Presentation 9.30 – 10.30 Presentation 10.30 – 11.00 11.00 – 13.00 Presentation 13.00 – 13.30 Discussion 13.30 – 14.15 14.15 – 15.45 Presentation 15.45 – 16.15 16.15 – 17.45 Discussion in groups	Introduction of participants Participant expectations and key questions The role and activities of the Water Resources Department in sanitation Assessment of the existing sanitation situation in Eritrea Tea break An introduction to ecological sanitation – concept, technologies and case studies The National sanitation framework (reponsibility) Who is involved in sanitation in Eritrea (ministries, departments etc.)? What co-operation exists between those responsible and what is needed? Lunch Agricultural aspects of ecological sanitation Health aspects of ecological sanitation Tea break Opportunities and obstacles for ecological sanitation – next steps in Eritrea: What steps are now needed for adoption on a national and individual level?	 WRD Local Consultant, GTZ GTZ, ecosan Program Participants GTZ, ecosan Program
Day 2: Sunday, 8 May		
Time / Activity	Content	Presenter
9.00 – 9.20 Presentation 9.20 – 9.40 Presentation 9.40 – 10.00 Presentation 10.00 – 11.00 Presentation 11.00 – 11.30 11.00 – 12.15 Closing session	Summary of day 1 Urban agriculture in Eritrea Public health and sanitation in Eritrea Planning for ecological sanitation Tea break Refer back to expectations and questions and check if they have been achieved. Summing up.	 Min. of Agriculture Min. of Public Health GTZ, ecosan Program

7.6 Example: Schedule of a 3-day ecosan symposium in Syria

The symposium on ecosan was organised by the Syrian order of engineers, the University of Damascus, and the GTZ for water professionals in 2005.

It gives a general introduction in ecosan, it draws on local experience, e.g. from wetlands designed to produce hygienic safe irrigation water from waste water, and includes a case study excursion.

The main objective of this symposium is the capacity building for ecological sanitation and the identification of further activities, which could be realized in order to implement ecosan projects in Syria and other countries of the region.

Table 14: Schedule of a 3-day ecosan symposium in Syria

Country	Syria	
Type of workshop (Name)	Ecological Sanitation Symposium	
Dates	11-13 December, 2005	
Place	Damascus, Syria	
Organizer	Order of Syrian Engineers and Architects (OSEA) and German Technical Cooperation (GTZ), University of Damascus	
Sponsor	GTZ- Water Programme and Order of Syrian Engineers and Architects (OSEA)	
No.participants	500	
Objective	Capacity building for ecological sanitation and identification of further activities for implementing ecosan projects in Syria and other Arab countries.	
Day 1 : Sunday, 11 December (Introduction and Syrian situation)		
Time / Activity	Content	Presenter
08:00 - 08:30	Registration	
08:30 – 09:00	Opening Ceremonies (Moderation Saad Ahmad, OSEA)	Mr. Hassan Majed Ali (OSEA); Prof. Wael Mualla (President of Damascus University) Mr. Volkmar Wenzel (Ambassador Germany)
09:00 – 09.20 Presentation	Syrian-German cooperation in the water sector	Mr. Harald Heidtmann (GTZ Syria)
09:20 – 09:40 Presentation	Future vision for the drinking water supply and sewage sector within the 10th five year investment plan	Dr. Kamal Al-Sheikha (MoHC)
09:40 – 10:00 Presentation	Water pollution and environmental situation in Syria	Mrs. Reem Abdrabo (MLAE)
10:00 – 10:30	Discussion	Mr. Saad Ahmed (OSEA)
10:30 – 11:00	Tea / Coffee break	
11:00 – 11:45 Presentation	Introduction to ecological sanitation	Mrs. Christine Werner (GTZ, Germany)
11:45 – 12:30 Presentation	Overview of ecosan technologies	Prof. Dr. Petter Jenssen (Norwegian University of Life Sciences)
12:30 – 14:00	Tea / Coffee break	
14:00 – 14:45 Presentation	Experiences from a one-year training course for the management of sewage treatment plants in Germany	Mr.Jamal Jarad Mr. Hesham Al-Fandi
14:45 –15:30 Presentation	International experiences in ecological sanitation / Project examples	Mrs.Christine Werner (GTZ, Germany)

[… continued]		
Day 2: Monday, 12 December (Experience Exchange)		
Time / Activity	Content	Presenter
08:30 - 08:45	Summary of the previous day and presentation of the present day	
08:45 - 09:30 Presentation	Present wastewater and reuse standard in Syria and practices	Mrs.Intesar Mardini (MoHC)
09:30 – 10:15 Presentation	International Guidelines WHO, FAO and Sweden: health and agriculture aspect	Mrs. Christine Werner (GTZ, Germany)
10:15 – 10:45	Tea / Coffee break	
10:45 – 11:30 Presentation	Anaerobic systems for biological treatment in ecological sanitation systems (ecosan) for biogas and fertilizer production	Mr.Michael Köttner (Int. Biogas and Bioenergy Centre of Competence)
11:30 – 12:15 Presentation	Demonstration of anaerobic technology for cost-effective municipal wastewater treatment and reuse - experience from Germany and Egypt	Dr. Walid Abdel-Halim (Housing and Building Nat. Res. Center, Inst. of Env. Eng., Cairo, Egypt)
12:15 – 13:00 Presentation	Constructed wetlands for the provision of irrigation water- and the production of regrowing raw products	Dr. Roland Müller (UFZ-Centre for Env. Research Leipzig/ Germany)
13:00 – 13:30	Tea / Coffee break	
13:30 – 14:15	Wastewater reuse experience in Jordan	Mr. Artur Vallentin (GTZ)
14:15 – 14:45 Presentation	Greywater treatment and reuse	Prof. Dr. Petter Jenssen (Norwegian Univ. LifeSc.)
14:45 – 15:30 Presentation	Reuse of greywater in the Kingdom of Saudi Arabia	Mr. Jäger (BIOCLEAN GmbH)
15:30 – 17:30	Lunch / or Dinner	
Day 3: Friday, 13 December		
Time / Activity	Content	Presenter
08:30 - 08:45	Summary of the previous day and presentation of the present day	
08:45 - 09:30 Presentation	German Association for Water, Wastewater and Waste (DWA)- standards, capacity building and networking	Mr. Roland Knitschky (DWA)
09:30 – 10:15 Presentation	Batch humification of sewage sludge in grass beds	Dr. Holger Pabsch (IPP,Hildesheim)
10:15 – 10:45 Presentation	Constructed wetlands – experiences from a pilot project in Syria	Dr. Abir Mohamed (MoHC, Syria)
10:45 – 11:15	Tea / Coffee break	
11:15 – 12:00 Presentation	Planning process of WWTP for small communities in Syria, overview of difficulties and solutions	Dr. George Zahr (Damascus University)
11:15 – 12:15 Discussion	Future developments	Mr. H. Heidtmann (GTZ); Dr. A. Mohamed (MoHC)
12:15 – 12:30	Closing remarks	Mr. Saad Ahmed
12:30 – 16:30 Excursion	Excursion to Haran Al-Awamied	Dr. Abir Mohamed (MoHC, Syria)

7.7 Example: Schedule of a 3-day ecosan workshop in Zambia

This 3-day workshop was meant as a first awareness raising and capacity building workshop for experts and decision-makers in water supply and sanitation in Zambia. At the same time, it served to support regional networking between ecosan initiatives and pilot projects in Southern African countries.

Table 15: Schedule of a 3-day ecosan workshop in Zambia

Country	Zambia	
Type of workshop (Name)	1st International Workshop on Ecological sanitation	
Dates	21-23 January, 2004	
Place	Lusaka, Zambia	
Organizer	GTZ-Lusaka and WASAZA	
Sponsor	GTZ-ecosan	
No. participants	n.a.	
Objective	To provide a forum for discussion on ecological sanitation among decision/policy makers, organisations and other donor agencies. The workshop will be the starting point for the promotion of ecological sanitation in Zambia.	
Day 1: Wednesday, 21 January (Introduction, official opening, pilot case studies, hygiene considerations)		
Time / Activity	Content	Presenter
08:00 – 09:00	Registration	
09:00 – 09:15	Introductions	Simataa Nakamboa (GKW Consult, Zambia)
09:15 – 10:00 Presentation	Overview of the National Environmental Sanitation Strategy	C. Mulambo (MLGH/DISS, Zambia)
10:00 – 10:45 Presentation	Toilets and Urban Agriculture infrastructure / Ethiopia	Gunder Edström (SUDEA, Ethiopia)
10:45 – 11:30 Presentation	Water-borne ecological sanitation technologies/ closing the loop on-site – experience in Lesotho	Mantopi Lebofa (DED, Lesotho)
11:30 – 12:00	Tea / Coffee break	
12:00 – 12:25 Presentation	Ecological sanitation concept – an introduction	Heinz-Peter Mang (GTZ-ecosan, Germany)
12:30 – 13:00	Official Opening Address	Levi Zulu (WASAZA, Germany) Martina Bergschneider (GTZ Country Director) Sylvia Masebo (Minister of Local Government and Housing, Zambia)
13:00-13:15	Ecological sanitation concept – an introduction cont'd after the speeches	Heinz-Peter Mang (GTZ-ecosan, Germany)
13:15 - 14:15	Lunch	
14:15 – 15:00 Presentation	Experiences in piloting ecosan projects in Zambia	Ernest Hamalila (WaterAid, Zambia)
15:00 – 15:45 Presentation 15:45 – 16:30 Presentation	"CBNRM-missing link"-piloting ecological sanitation in Botswana Institutional and implementation aspects of ecosan in Ouagadougou, Burkina Faso	Catherine Wirbelauer (IUCN, Botswana) Patrick Bracken (GTZ-ecosan, Germany)
16:30 – 17:00	Tea / Coffee Break	
17:00 – 17:45 Presentation	Diseases linked to poor sanitation and their prevention	Dr. M. Mbewe (UTH, Zambia)
17:45 – 18:30 Presentation	Health aspect of ecological sanitation	Aussie Austin (CSIR, South Africa)
18:30 – 20:00	Cocktails, discussion and open market space for ecological sanitation components – with invited companies	

[… continued]

Day 2: Thursday, 22 January (Overview of different aspects of ecosan)

Time / Activity	Content	Presenter
08:30 – 08:45	Summary of the previous day and presentation of the present day	Simataa Nakamboa (GKW Consult, Zambia)
08:45 – 09:30 Presentation	Urban ecological sanitation experiences in Uganda	Austin Ali Tushabe (Directorate of Water Development, Uganda)
09:30 – 10:15 Presentation	Effects of urban expansion on groundwater quality	H. Mpamba (Department of Water Affairs, Zambia)
10:15 – 10:45	Tea / Coffee break	
10:45 – 11:30 Presentation	Urban Integrated Sustainable Resource Management	Gert de Bruijne (WASTE –NL)
11:30 – 12:15 Presentation	Design of feasible ecological sanitation toilets	Aussie Austin (CSIR, South Africa)
12:15 – 13:00 Presentation	Selling the ideas and gender aspect of ecosan	Almaz Terrefe (SUDEA, Ethiopia)
13:00 – 14:00	Lunch	
14:00 – 14:30 Presentation	Agricultural aspects of ecological sanitation	Heinz-Peter Mang (GTZ-ecosan, Germany)
14:30 – 15:30 Presentation	Technical components for ecological sanitation systems - world-wide examples	Heinz-Peter Mang (GTZ-ecosan, Germany)
15:30 – 15:45 Group work	Introduction in group work	Simataa Nakamboa (GWK Consult, Zambia), Patrick Bracken (GTZ-ecosan, Germany), Catherine Wirbelauer (IUCN, Botswana)
15:45 – 16:15	Tea / Coffee Break	
16:15 – 18:00 Group discussions	Three themes	

Day 3: Friday, 23 January (The way forward for ecosan in Zambia)

Time / Activity	Content	Presenter
09:00 – 09:30	Summary of the previous day and presentation of the present day	Simataa Nakamboa (GWK Consult)
09:30 – 10:15 Presentation	Ecological sanitation in peri-urban areas – main opportunities and constraints	Brian Hangoma (SWSC)
10:15 – 10:45	Tea / Coffee break	
10:45 – 11:30 Presentation	The Regulator and issues of ecological sanitation	O. M. Chanda (NWASCO)
11:30 – 12:15 Presentation	The general way forward for ecological sanitation in Zambia	Pamela Chisanga (WaterAid Zambia)
12:15 – 13:00 Presentation from participants	Group presentation and Recommendations from workshop participants on ecological sanitation development in Zambia	Participants
13:00 – 14:00	Closing remarks	Heinz-Peter Mang (GTZ-ecosan, Germany) Gert de Bruijne (WASTE – NL) T. C. Chanda stood in for P. Lubambo (MLGH/DISS) Simataa Nakamboa (GKW Consult)

7.8 Example: Schedule of a 3-day ecosan workshop in Botswana

The Ecosan approach, tested by the IUCN-PTB "Missing Link" project (funded by GTZ) in Botswana consists of small-scale integrated natural resources management activities around the households and within the communities. The schedule presented below is from a workshop held in the frame of this project. It was held to present and discuss the results of the first phase of the project, and dicussed options for up-scaling ecosan on to the national level.

Table 16: Schedule of a 3-day ecosan workshop in Botswana

Country	Botswana	
Type of workshop (Name)	Awareness Raising Workshop on Ecological Sanitation	
Dates	2nd – 4th September, 2003	
Place	Maharaja, Gaborone, Botswana	
Organizer	IUCN, GTZ, DSWM	
Sponsor	IUCN, GTZ	
No.participants	48	
Objective	Awareness raising fort the ecosan concept; discussion of results from agricultural research and pilot activities and of potential for up-scaling	
Day 1: Tuesday, 2 September (Introduction and pilot case studies)		
Time / Activity	Content	Presenter
8:15 – 8:30	Registration	
8:30 – 8:45	Opening remarks/introductions	K.A. Selotlegeng (DSWM)
8:45 – 9:15 Presentation	Closed loop oriented wastewater and waste management	Heinz-Peter Mang (GTZ-ecosan, Germany)
9:15 – 10:00 Presentation	National Master Plan for Wastewater and Sanitation ("The Need for Integrated Sanitation Services")	Neil Mudge (SMEC International)
10:00 – 10:30	Tea / Coffee break	
10:30 – 10:55 Presentation	Effects of urban expansion on groundwater quality in Francistown	Benjamin Mafa (Geological Survey)
10:55 – 11:20 Presentation	Effects of urban expansion on groundwater quality in Ramotswa	Dr. Horst Vogel (Geological Survey)
11:20 – 11:45 Presentation	The CBNRM Missing Link – Piloting Ecological Sanitation in Botswana	Cathrine Wirbelauer (IUCN/DED, Botswana)
11:45 – 12:10 Presentation	Vacuum sewer system in Shoshong	Michael Buxton-Tetteh (CPP, Gaborone)
12:10 – 12:35 Presentation	Health and safety aspects of ecosan and excreta handling	Aussie Austin (CSIR, South Africa)
12:35 – 14:00	Lunch	
14:00 – 14:30 Presentation	Experiences in piloting composting toilets in Botswana	Gaba Moanakwene (RIIC)
14:30 – 15:00 Presentation	Example on water-borne closed loop sanitation systems in Maseru	Alice Leuta (DED, Lesotho)
15:00 – 15:30	Tea Break	
15:30 – 16:00 Presentation	Decentralised Wastewater Treatment Systems/CBS	Christopher Kellner (FEDINA-BORDA)
16:00 – 16:30 Presentation	Water saving devices and low flush technology	Johannes Selke (Orbit pumps/Roediger, Germany)
16:30 – 17:00	Design of ecosan systems and the urine	Aussie Austin

Presentation	diversion component	(CSIR, South Africa)
17:00 – 19:00	Cocktail discussion	
Day 2: Wednesday, 3 September (Experience Exchange)		
Time / Activity	Content	Presenter
8:30 – 8:45 Presentation	Summary of the previous day and presentation of the present day	Cathrine Wirbelauer (IUCN/DED, Botswana)
8:45 – 9:15 Presentation	Acceptance and awareness for ecological sanitation	Elisabeth-Maria Huba (GTZ-ecosan/ FRUXOTIC, Germany)
9:15 – 9:45 Presentation	Gardening and agriculture with ecosan subproducts	Tobias Hanke (GTZ-ecosan, Germany)
9:45 – 10:15 Presentation	Multiple strategies for ecological sanitation	Heinz-Peter Mang (GTZ-ecosan, Germany)
10:15 – 10:45	Tea / Coffee break	
10:45 – 12:30 Group work	Working Groups	Two or three groups
12:30 – 13:30	Lunch	
13:30 – 16:30 Excursion	Site visits to ecosan facilities around Gaborone (Kgatleng District)	DSWM/KDC
16:30 – 18:00 Exposition	Open market space for ecosan component companies from Botswana, SA, Swaziland and Germany	
Day 3: Thursday, 4 September (Introduction and pilot case studies)		
Time / Activity	Content	Presenter
8:30 – 8:45	Summary of the previous day and presentation of the present day	Cathrine Wirbelauer (IUCN/DED, Botswana)
8:45 – 10:00 Group work	Report back from the groups, Recommendations	Groups
10:00 – 10:30	Tea / Coffee break	
10:30 – 11:30 Presentation	Overview on technical components and worldwide strategies and Planning procedures for an ecosan project	Heinz-Peter Mang (GTZ-ecosan, Germany)
11:30 – 12:00 Presentation	National Master Plan for Wastewater and Sanitation: “On-site Sanitation-The Way Forward”	Neil Mudge (SMEC International)
12:00 – 12:30 Presentation	General Way Forward for ecological sanitation in Botswana	Kentlafetse Mokokwe (DSWM/IUCN)
12:30 – 12:45	Closing remarks	Rapelang Mojaphoko (UNDP)
13:00 – 14:00	Lunch	

7.9 Example: Schedule of a 4-day ecosan workshop in El Salvador

This is an example of a 4-day ecosan workshop organized by Oikos and WASTE in co-operation with GTZ and others to consolidate the link between organisations, which have realized ecosan projects and activities in Latin-America.

The programme was designed to expose each day different components of an ecosan system so those, which are not familiarized with the topic, could get a clear idea about the principles of ecological sanitation and the problems of conventional systems. It combined expositions about experiences in ecosan and practical exercises.

Table 17: Schedule of a 4-day ecosan workshop in El Salvador

Country	El Salvador	
Type of workshop (Name)	Ecological Sanitation Workshop (Taller de Saneamiento Ecológico)	
Dates	27-31 October, 2003	
Place	El Tránsito, El Salvador	
Organizer	WASTE and Oikos	
Sponsor	WASTE, Cordaid, GTZ and UNDP	
No.participants	42	
Objective	Introduce formal knowledge about the importance of sustainable and ecological sanitation, the exchange of experiences and interests and the creation of alliances and compromises between the participants on developing specific actions in the region.	
Day 1: Monday, 27 October		
Time / Activity	Content	Presenter
Presentation	Participatory diagnosis on ecological sanitation	Alberto Isunza Ogazón (Mexico)
Presentation	Some principles and questions on ecological sanitation	Gert de Bruijne (WASTE)
Presentation	Ecological sanitation in intervention areas	Vicente Hernández (OIKOS)
Presentation	Situation of the environmental health in El Salvador	Herbert Aparicio (Ministry of Health of El Salvador)
Presentation	Presentation on the present situation of standards on latrines	Jorge Soto
Day 2: Tuesday, 28 October		
Time / Activity	Content	Presenter
Presentation	Environmental Sanitation and Health	Alberto Isunza Ogazón
Presentation	Evaluation of the fertilizing family solar latrines (LAFS) in El Salvador	Christine Moe/ R. Izurieta
Presentation	Latrinisation and parasite infections in rural areas in El Salvador	Lana Corrales
Day 3: Wednesday, 29 October		
Time / Activity	Content	Aim / Presenter
Presentation	Cultural and gender aspects in ecological sanitation	Silvia Diaz Urdanivia
Presentation	Improvement of the nutritional security and sanitation in peri-urban areas: City of Pachacutec Ventanilla - Peru	Oswaldo Cáceres L
Presentation	Nutrients recycling 1 & 2	Francisco Arroyo
Presentation	Holistic and Sustainable Management of Waste - Acepesa - UWEP	Victoria Rudin
Presentation	Implementation of approaches on ecological sanitation aspects in Cuba	Viviana Avendaño
Presentation	Experiences on the introduction of the ecological sanitation concept in Ecuador	Jenny Aragundi
Presentation	The integrated microsystem of alternative sanitation, Ecodess, an ecological sanitation instrument in Lima - Perú	Juan Carlos Calizaza (Peru)
Presentation	Experiences and projects of the GTZ	Heinz-Peter Mang (Germany)

Day 4:

Time / Activity	Content	Aim / Presenter
Presentation	Tepoz-Eco- pilot project on urban ecological sanitation for the municipality of Tepoztlán	Ron Sawyer (Mexico)
Presentation	Feasibility study in the archipelago of San Andrés, Providencia and Santa Catalina	Patrick Newball

Other activities taking place during the four-day workshop

Time / Activity	Content	Presenter
Exercise	Sanitation Ladder	Ron Sawyer and participants
Exercise	Groups to be interviewed and question guide	
Exercise	Guidelines for solar latrines with urine separation These guidelines are taken from the project developed in Palestina by the Palestinian Hydrology group (PHG)	
Exercise	Decision Tree This tree or decision diagram was developed by the Ministry of Health from El Salvador within the project of norms for latrines	
Exercise	Health Educational Model and Environmental Sanitation in the community and schools in El Salvador – Educational Methodology SARAR.	Ministry of Public Health and Social Security of El Salvador
Exercise	General Questionnaire for Sanitation Practical Questionnaire, which can be used to evaluate the current situation of the sanitation and water system in the population	
Contribution of participants	Aspects to consider or to use to generate public awareness	J.Carlos Calizaya/Patrick Newball
Contribution of participants	Aspects which should be included in a presentation on ecological sanitation	Oscar Murga
Contribution of participants	Presentation on Environmental Awareness	Patrick Newball
Discussion	Diagnosis on sanitation- field trip	Alberto Isunza (Mexico)
Discussion	Revison on the Ecological Santitation Concept	Viviana Avendano and Jenny Aragundi/ Participants
Discussion	MISD (Holistic and Sustainable Management of waste)	Participants
Discussion	Regional Cooperation – Network Forum	
Discussion	Particular discussions (30-31 October)	
Discussion	Comments on presentations 1 and 2	
Drawing contest	The Environment and I	OIKOS and WASTE

7.10 Example: Schedule of a 2-day ecosan workshop in Turkey

This 2-day workshop took place in early 2004 in Turkey in the frame of an erosion control and desertification programme in collaboration between German and Turkish institutions.
The aim of this workshop was to introduce the assistants to decentralised sanitation and ecological sanitation, in order to analyse the possibilities of the sustainable use water, wastewater and nutrients. The programme included as well an introduction to constructed wetlands and biogas generated from agricultural residues.

Table 18: Schedule of a 2-day ecosan workshop in Turkey

Country	Turkey	
Type of workshop (Name)	Wastewater Management and Nutrients Recovery in rural areas in Turkey	
Dates	14-15 February, 2004	
Place	Ankara, Turkey	
Organizer	TEMA, GTZ	
Sponsor	GTZ	
No.participants	80	
Objective	Introducing ecological sanitation including the sustainable use of wastewater, nutrients and agricultural residues into the turkish-german programm of erosion control and disertification in Turkey.	
Day 1: morning, Saturday, 14 February (Overview Presentations)		
Time / Activity	Content	Presenter
09:00 – 09:45	Opening	Köy Hizmetleri TEMA GTZ
09:45 – 10:15 Presentation	Overview of the wastewater system in rural areas in Turkey	Prof. Dr. Celal Ferdi Gökcay (Middle East Technical University)
10:15 – 10:30	Discussion	
10:30 – 11:00	Break	
11:00 – 11:25 Presentation	Natural Wastewater Treatment Systems	
11:25 – 11:30	Questions – Answers	
11:30 – 11:55 Presentation	Wastewater Management and Nutrients cycle in rural areas	Michael Köttner (IBBK)
11:55 – 12:00	Questions – Answers	
12:00 – 12:25 Presentation	Nutrients' Close Cycle: The Ecosan Concept	Christine Werner (GTZ – ecosan, Germany)
12:25 – 12:45	Discussion	
12:45 – 14:00	Lunch Break	
Day 1: afternoon, Saturday, 14 February (Goals and legal framework)		
Time / Activity	Content	Presenter
14:00 – 14:20 Presentation	Legal Framework in Turkey: The actual situation and the necessary modifications	Fevzi Isbilir Cevre Yonetimi Genel Müdür Yardimcisi (Representative of the General directive for Environmental Management of the Ministry of the Environment and Forestry)
14:20 – 14:30	Discussion	

14:30 – 14:50 Presentation	The legal framework of Wastewater Management in Germany	Wolfgang Holleis (Regional Authority for Water Pollution Control of Bavaria, Germany)
14:50 – 15:00	Discussion	
15:00 – 15:20 Presentation	Qualification of municipal services in the wastewater field	Dieter Blome (GTZ- Project "Qualification of municipal services")
15:20 – 15:30	Discussion	
15:30 – 16:00	Break	
16:00 – 16:20 Presentation	Conditions for a successful implementation of a decentralized wastewater system	Johannes Biener
16:20 – 16:30	Discussion	
16:30 – 16:50 Presentation	Canalisation system in rural areas	Istanbul Technical University, Turkey
16:50 – 17:00	Discussion	

Day 2: morning, Sunday, 15 February (Technical Solution Approaches)

Time / Activity	Content	Presenter
09:00 – 09:20 Presentation	Low-cost solutions in Turkey: Proposals for the Bayburt-Project	Prof. Dr. Omer Saygin (Bosphorus University, Turkey)
09:20 – 09:30	Discussion	
09:30 – 09:50 Presentation	Adequate alternatives for the clarification of wastewater in rural areas	Vahap Balman Nava (ING, Turkey)
09:50 – 10:00	Discussion	
10:00 – 10:15		
10:15 – 10:30 Presentation	Wastewater clarification in wet areas	Dr. Kemal Günes (Marmara Research Center, TÜBITAK, Turkey)
10:30 – 10:45	Discussion	
10:45 – 11:15	Break	
11:15 – 11:30 Presentation	Anaerobic Systems and Biogas	Prof. Dr. Izzet Öztürk (Istanbul Technical University, Turkey)
11:30 – 11:40	Discussion	
11:40 – 11:55 Presentation	One-tank wastewater treatment plants: The Sequencing Batch Reactor	Ralf Weber (Fa. Biogest)
11:55 – 12:00	Discussion	
12:00 – 12:15 Presentation	Reuse of sludge as a fertilizer in agriculture	Nesteren Bilgrin (Research Institute of the Department of Provision of Rural Services, Turkey)
12:15 – 12:20	Discussion	
12:20 – 12:35		
12:35 – 12:40	Discussion	

Day 2: afternoon, Sunday, 15 February (Development of the project)

Time / Activity	Content	Presenter
12:40 – 12:55	Total Village System	Jason Gondron (Global Water INC.)
12:55 – 13:00	Discussion	
13:00 – 14:00	Lunch Break	
14:00 – 14:20 Presentation	Possibilities of support of the Iller-Bank in rural areas in Turkey	Figen Ildir (Iller Bankasi, Turkey)
14:20 – 14:30	Discussion	
14:30 – 14:50	Break	

14:50 – 15:00 Presentation	The activities of the "Kreditanstalt für Wiederbau" (KfW) in the wastewater field in Turkey	Burghard Hinz (German Development Bank, KfW, Germany)
15:00 – 15:15	Discussion	
15:15 – 17:00 Discussion	Working Group Project Development (Wastewater Management, based on the aproaches of the Bayburt-project)	Discussion coordination and moderator: Dr. Hartlieb Euler

7.11 Example: 2-day workshop held in the frame of an Indian ecosan network

A series of regional workshops has been organised by the Innovative Ecological Sanitation Project India (IESNI) with support from Norway, Sweden, the Netherlands, Switzerland and Germany aiming at introducing ecological sanitation, initialising pilot projects, and supporting capacity building and networking in ecological sanitation in India.

The following table shows the schedule of one of these workshops.

Table 19: Schedule of a 2-day ecosan workshop in India

Country	India	
Type of workshop (Name)	2nd Workshop on Ecological Sanitation	
Dates	1-2 March, 2005	
Place	Pune, India	
Organizer	Innovative Ecological Sanitation Network India (IESNI) in cooperation with GTZ	
Sponsor	GTZ	
No.participants	80	
Objective	Introducing ecological sanitation, initialising pilot projects and supporting capacity building and networking in ecological sanitation in India.	
Day 1: Tuesday, 1 March		
Time / Activity	Content	Presenter
10.00-12.00 Presentation	Introductory general overview about ecosan	H. Bartels/C. Werner and IESNI (Mr. Patankar)
13.30-16.00	Status reports about ongoing IESNI projects	
Presentation	- Bangalore project	K. Gnanakan (ACTS, India)
Presentation	- DSK/Navsarjan project	M. Mcwan (Navsarjan project, India)
Presentation	- Khopoli/Nagpur project	M. Wafler (GTZ, India)
16.30-18.30	Information panel about other ongoing and upcoming activities	
Presentation	GoI Total Sanitation Campaign etc.	GoI-Representative
Presentation	Linking with Sulabh India	Sulabh-Representative
Presentation	Mumbai project idea	ACTS – Rotary Mumbai Rotary-member
Presentation	Chennai project idea	IIT-Representative
Presentation	Water for Billions	C. Werner (GTZ-ecosan, Germany)
Presentation	Reconstruction in South India	K. Gnanakan (ACTS, India)
Presentation	BMBF/Megacity	C. Werner (GTZ-ecosan, Germany)

Presentation	UNICEF School Projects	Unicef Representative
Presentation	Trivandrum Projects	P. Calvert
	Further	WB, EU, WASTE, BORDA, SIDA, Gramalya, etc.
Day 2:2nd of March, 2005		
Time / Activity	Content	Presenter
08.30-10.30	Presentation and Discussion of several Aspects of Relevance	
Presentation	Guideline for agricultural use of ecosan products	B. Vinneras (SLU, Sweden)
Presentation	Nitrogen based hygenization	B.Vinneras (SLU, Sweden)
Presentation	Vermicomposting	GoM Agri Dept.-Representative
Presentation	Vacuum technology	U. Mosel (GTZ)
Presentation	Development of Urine Separation Squatting Toilet	Moderator
	Further	
11.00-12.30	Communication and Information	
Presentation	Introduction to myNetWorks	J. Heeb (SEECON, Switzerland)
Presentation	E-Learning on ecosan with Bangladesh	H. Bartels (GTZ, India)
Presentation	ecosan courses and local networking aspects (website, etc)	J. Heeb (SEECON, Switzerland)
Presentation	Information/awareness campaign	Mr Patankar/ Sulabh-Representative
Presentation	SIDA funded ecosan course in India	SIDA-Representative
Presentation	Durban ecosan conference	C. Werner (GTZ ecosan, Germany)
14.00-16.00	Planning next Steps, “to do’s”	

7.12 Example: Expert meetings held in the Netherlands on a shift in the sanitation paradigm

In January – March 2005, a total of four expert meetings were held to discuss the relationship between sustainable sanitation and integrated urban planning. During these meetings, Dutch participants from various professions were encouraged to look beyond the boundaries of their discipline and the borders of the Netherlands. Their observations lead to a critical evaluation of the sustainability of current sanitation systems and to a series of recommendations to ensure the implementation of sustainable and efficient approaches now and in the future.

“At the End of the pipe” aimed to accelerate the policy dialogue in the Netherlands towards the adoption of integrated urban sanitation planning, a strategic approach, which should enable a more effective response to the current environmental challenges facing decision-makers. The programme also sought to develop a number of concrete proposals for increasing the sustainability of sanitation provision to present to the 13th CSD meeting in New York in April 2005.

“At the End of the pipe” consisted of three closed informal discussion meetings and concluded with one public debate. The informal meetings each highlighted one element of sanitation systems. The first informal discussion meeting focussed on planning and demand, the second meeting on management, while the last meeting focussed on resource management of human excreta. The public

debate expanded upon the ideas and statements that were generated during the informal discussion meetings and prioritised the actions and measures identified.

The series of expert meetings and the public debate, offer an example of how to accelerate the policy dialogue to move towards an integrated approach to urban sanitation planning which responds to current environmental challenges.

Full documentation of the workshop and its results is available online (www.ecosan.nl). The proceedings and all presentations given during the meetings can be downloaded from this website as pdf-files. Below an overview is given on the programmes of the expert meetings and public debate.

Table 20: programme expert meetings

Country	The Netherlands
Type of workshop (Name)	"At the End of the Pipe" expert meetings held in the Netherlands on a shift in the sanitation paradigm
Dates	January – March , 2005
Place	The Hague
Organizer	WASTE
Contributions by	NCDO, Habitat Platform, Netherlands Water Partnership (NWP) and Partners for Water-
No.participants	65
Objective	• To evaluate existing sanitation systems as part of urban environmental infrastructure in the Netherlands • To bring different sectors and stakeholders together and evaluate existing sanitation approaches as part of urban environmental infrastructure. • To exchange and compare experiences in the development and management of sanitation facilities between developing countries and the Netherlands. • To familiarise stakeholders with the social, environmental, institutional, legal, and financial aspects of sustainable sanitation approaches developed outside the Netherlands. • To accelerate the policy dialogue in the Netherlands and to move towards an integrated approach to urban sanitation planning which responds to current environmental challenges. • To discuss current sanitation problems from the point of view of worldwide sanitation demand, management and resource recovery in order to formulate concrete recommendations about required initiatives and stakeholders that need to participate in these initiatives. Programme recommendations include recommendations for policy makers at the 13th session of the Commission for Sustainable Development (CSD-13) and recommendations for actions needed for the implementation of the goals of the European Union Water Frame Directive ('Europese Kaderrichtlijn Water').

[… continued]	
Thursday, 20 January	**Meeting 1: Problems with sanitation planning**
Time / Location	Content
9.30 - 12.00 VROM, The Hague	The problems, policy and developments with respect to sanitation in the Netherlands as well as in South Africa and Kenya (city of Nakuru) – will be presented. Special attention is given to the social aspects of the transformation towards sustainable sanitation planning
	Participants
	Host: Ton Boon von Ochssee invited – Dutch Ambassador for Sustainable Development, Ministry of Foreign Affairs Moderator: André Frijters – Board member of WASTE; Directorate-general for Public Works and Water Management from the Dutch Ministry of Transport and Public Works Speakers: Harm Baten – Water Control Board district Rijnland, the Netherlands Adriaan Mels – Lettinga Associates Foundation, the Netherlands Aussie Austin – CSIR Building and Construction Technology, South Africa Moses Ochola Otieno – WASTE-IHE, Nakuru
Thursday, 27 January	**Meeting 2: Municipal management of sanitation systems**
Time / Location	Content
9.30 - 12.00 Partners for Water, The Hague	Insight is given how cities in Germany, India and the Philippines are dealing with problems of current sanitation systems with respect to management of human excreta in the context of urban development
	Participants
	Host: Wouter J. Veening, Director Institute for Environmental Security Moderator: Ron Spreekmeester, Habitat Platform Speakers: Harald Hiessl – Fraunhofer ISI, Germany Anton Peter-Fröhlich – Berliner Wasserbetriebe, Germany Viju James - Pragmatix Research & Advisory Services Pvt. Ltd., India Dan Lapid – CAPS-Centre for Advanced Philippine Studies, the Philippines
Thursday, 3 February	**Meeting 3: Treatment and resource management**
Time / Location	Content
9.30 - 12.00 LNV, The Hague	What motivates Sweden and China (Guangxi) to search for sanitation options in which resource management is one of the key words? How to deal with safety issues and recycling issues in agriculture?
	Participants
	Host: René van Veenhuizen, ETC-UA (ETC-Foundation, Urban Agriculture Programme) Moderator: Jaap Warners – Amongst others former council of Environment from the city of Gouda, and chairman of the Task Force Wind Energy Speakers: Pascal Karlsson – Municipality of Göteborg, Sweden Lin Jiang – Guangxi Committee JiuSan Society, China Caroline Schönning – Swedisch Institute for Infections Disease Control, Sweden

Table 21: programme public debate

Country	The Netherlands	
Type of workshop (Name)	"At the End of the Pipe" Programme public debate "Are we connected?"	
Dates	3. March 2005	
Place	Habitat Platform – VNG, Nassaulaan 12, The Hague	
Organizer	WASTE	
Contribuions by	NCDO, Habitat Platform, Netherlands Water Partnership (NWP) and Partners for Water	
No.participants	40	
Objective	• Bringing different sectors and stakeholders together and evaluating the existing sanitation approaches as part of the urban environmental infrastructure. • To exchange experiences with sanitation options in developing countries and in the Netherlands. • To discuss the main sanitation problems from a point of view of sanitation demand, management and resource recovery worldwide in order to formulate concrete recommendations towards required initiatives and identified actors. The recommendations include among others recommendations for policy makers at the 13th session of the Commission for Sustainable Development in order to achieve the Millennium Development Goals (MDG's) and recommendations for actions needed for the implementation of the goals set in the Water policy in the European Union ('Europese Kaderrichtlijn Water').	
Moderator: Ron Spreekmeester – Habitat Platform		
Time / Activity	Content	Presenter / Participants
14.00 Opening	Presentation of the background and the objectives of the debate	Gert de Bruijne, WASTE
14.10 Opening speech	Introduction on the subject from international and national perspective	Joep Bijlmer, DGIS, Dutch Ministry of Foreign Affairs
14.20 – 16.00 Presentations	Sharing of sanitation experiences between North – South	
14.20	Demand for improved sanitation: Insight in the sanitation demand in the Ukraine	Anna Tsvetkova, Mama 86, Ukraine
14.45	Management of sanitation systems: Case from Mexico which elaborates on decentralisation of management of sanitation in relation to decentralisation of the functioning of sanitation systems	Ron Sawyer, Sarar Transformación SC, Mexico
15.10	Management of resources in sanitation systems: Insight in the global nutrient balance focussing on the geopolitics of phosphorous	Arno Rosemarin, Stockholm Environment Institute, Sweden
15.35 Break		
16.00 Plenary discussion	Main obstacles and successes for a transition towards sustainable sanitation approaches	plenary
16.45 - 17.30	Recommended actions	
16.45 Working groups	Prioritisation of formulated concrete actions: Prioritisation of actions in order to come to up scaling of sustainable sanitation approaches	

	(recommendations for CSD 13 and implementation of European Water Policy)	
17.15	Break	
17.30 Judgement by the jury of the considered most relevant actions	Presenting the results of the prioritisation by the working groups and remark on this result by the jury	Jury: Ralf Otterpohl (Chair), Hamburg University of Technology, Germany Anna Tsvetkova, Mama 86, Ukraine Ron Sawyer, Sarar Transformación SC, Mexico Arno Rosemarin, Stockholm Environment Institute, Sweden
18.00 Closing	Closing and follow-up of the meeting	Joep Bijlmer, DGIS, Dutch Ministry of Foreign Affairs
18.15	Informal Reception	

7.13 Example: Schedule of an ecosan e-course

The internet has a high potential for capacity building and e-learning becomes more and more important for distributing innovative knowledge. Use of the internet allows reaching people all over the globe without costs for travelling. It allows pupils to do their individual tasks in their home environment and in their rhythm. In several of the courses presented in this Annex, distance learning is part of the preparatory phase, which is then followed by a face to face phase. However, the below given schedule is an example for a five day e-courses on ecosan.

Table 22: Schedule of a 5-day e-course on ecosan

Day 1: Monday, 6 December, 2004 (Ecosan - Concept)		
Day- Place/Tool	Activity/Material	Tutors
12:00 to 12:30 Classroom	Welcome chat Material: Manual of myNetWork	Johannes Heeb and Marieke Slob
12:30 to 13:30 Classroom	Chat on the concept of ecosan Material: Read course material for course 1	Johannes Heeb and Christine Werner
Discussion-forum ecosan-concept	Starting up discussion-forum ecosan-concept	
Day 2: Tuesday, 7 December, 2004 (Ecosan -Tools and Experiences)		
Day- Place/Tool	Activity/Material	Tutors
12:00 to 13:00 Classroom	Chat on the ecosan tools and experiences Material: Read course material for course 2	Johannes Heeb and Petter Jennsen
13:00to 13:30 Classroom Talk	Introduction to assignments Material: assignment.doc	Johannes Heeb and Marieke Slob
Discussion-forum tools and experiences	Starting up discussion-forum ecosan tools and experiences	
Day 3: Wednesday, 8 December 2004 (Ecosan - Health and Security, Agricultural and Social Aspects)		
Day- Place/Tool	Activity/Material	Tutors
12:00 to 13:30 Classroom Talk	Chat on the specific ecosan aspects Material: Read course material for course	Johannes Heeb and Ken Gnanakan
Discussion-forum health and security, agricultural and social	Starting up discussion-forum health and security, agricultural and social aspects	

aspects		
Day 4: Thursday, 9 December, 2004 (Aquaculture Day)		
Day- Place/Tool	Activity/Material	Tutors
12:00 to 13:00 Classroom Talk	Chat on the ecosan tools Material: Read course material for course 4	BB Jana and crew
Discussion-forum aquaculture	Starting up discussion-forums aquaculture	
Day 5: Friday, 10 December, 2004 (Ecosan - Summing up, Assignments)		
Day- Place/Tool	Activity/Material	Tutors
12:00 – 13:00 Classroom Talk	Summing up, discussion of open questions and assignments Material: Read course material for course 5	Johannes Heeb and Merieke Slob
13:00 – 13:30	Good bye chat	Johannes Heeb and Merieke Slob

7.14 Example: General set of interactive modules produced for teaching ecosan, including PowerPoint-presentations

A SDC (Swiss Agency for Development and Cooperation) funded project has been undertaken with the aim to process the available ecosan material, to present it in a professional way, and to structure the knowledge into modules.

Target groups of the resulting materials are:
- University and college teachers and students
- Planners, architects, engineers, investors
- Decision making bodies such as communities, public administration, NGOs, development cooperation etc.

Each module consists of:
- Power-Point Files which can be used as independent tutorials for students (e-learning courses, independent study etc.). They contain explanatory text, images, links, further reading material. The files themselves are linked to further reading material as well as other resource material (see below). Navigation inside the modules and inter-linkages are accessible with the help of buttons.
- Power-point Presentations which can be used as ready-made and adaptable lectures
- Further readings (state of the art literature)
- Videos (if available)
- Links to relevant institutions, programs, websites, etc.
- Exercises
- Assignments
- Furthermore, there is a comprehensive link list to ecosan relevant websites.

Knowledge Based on:
- Existing training experiences and training material of authors and other experts
- State of the art literature
- Existing expert knowledge
- Evaluated case study based experience
- Further material (Videos, product information, etc.)

The training material can be used for face to face courses and e-learning (2-3 credit points).

In the tables below is given a general overview on all modules and a more detailed example of the content of on sub-module.

Table 23: Content of integrated ecosan training material - overview

Module	Name	Goal
M1	Water and Sanitation in Regard to the Millennium Development Goals	Clarifying the relevance of sustainable sanitation options in relation to the Millennium Development Goals.
M2	Overview of Household and Community Based Sanitation and Wastewater Treatment Systems	Providing an overview about sanitation systems: toilet systems, collection systems, treatment systems and reuse systems are described to give readers an overview
M3	ecosan - an Approach to Human Dignity, Health and Food Security	Clarifying the role of ecosan in closing nutrient and water loops, improving community health and human dignity and thus acting as an essential promoter for development.
M4	ecosan Systems and Technology Components	Providing an overview about individual ecosan technology components and the referring technical, operational and biological processes. Clarifying advantages and disadvantages of each system depending on the enabling environment and context.
M5	Management: Planning, implement-ation and operation	Providing basic knowledge for a successful planning and implementation of ecosan projects; covering socio-cultural aspects; gender aspects; institutional aspects and options; economic aspects and options; health, hygiene and education; awareness building and monitoring; agricultural aspects and options.
M6	Case studies (India, Africa, Central America, China)	Providing a set of good practices examples reflecting the content of M1-5.

Table 24 below shows the structure of one of the sub-modules of M5 (Management, Planning, implementation and operation). In the second row, the subchapters of the modules are specified; the third row gives a selection of the resource materials used for this Module.

Table 24: Content of integrated ecosan training material – example gender aspects

Module 5-3	Subchapters:	Selection of Used Resource Material (not complete)
Gender aspects	Gender Perspectives on Ecological Sanitation Urban Agriculture and Women Gender Issues in Latrine Design Management Roles Involvement in Decision Making Processes Sanitation and Education Gender Mainstreaming in Community Water & Sanitation Projects Gender Mainstreaming in Community Water & Sanitation Projects Making Gender Roles Visible The way forward	• Bolt, E. 7.15 Example: ecosan as part of a M.Sc. curriculum for students of environmental science and engineering at the University of Science and Technology Beijing, China

Here an example of the ecosan part of a M.Sc. curriculum for Students of environmental science and engineering at the University of Science and Technology Beijing, China is given. The full program for master studies has a duration of five semesters. The ecosan part, as elective course, is given in the 2nd semester as weekly activity of 2 hours and has a total duration of 30 hours. Along with the course a related text book is being prepared for the students. The course includes an exam and runs for the first time in 2006.

Table 25: ecosan curriculum description

1.	History of sanitation and sewerage system development (1 hour)
2.	Conventional sanitation and sewerage system (2 hours)
2.1	Problems of conventional sewerage system (1 hour)
2.2	Possible solution (1 hour)
3.	Water and environmental problems in the world (2 hours)
4.	Alternative concept - ecosan (2 hours)
4.1	Principals and advantages of ecosan
4.2	Development and approaches for ecosan
4.3	ecosan for developing and emerging countries, countries in transition, and developed countries
5.	ecosan Technologies (8 hours)
5.1	Types of toilet
5.2	Collection system
5.3	Treatment system
5.4	Purposes for reuse
6.	Case study (4 hours)
6.1	Rural or underdeveloped areas
6.2	Suburban areas
6.3	Urban areas
6.4	Holiday spaces, public buildings
6.5	School & public toilets
7.	Financial and economic aspects (2 hours)
8.	Environmental and health risk assessment (4 hours)
9.	Socio-cultural aspects (2 hours)
10.	Policy and legal aspects of ecosan (2 hours)
11.	Discussions (1 hour)

7.16 Example: Description of a 1 week ecosan course in China for alumni

This course is an example provided by UNESCO-IHE Institute for Water Education for a training course that was funded by the Dutch fellowship programme Nuffic (www.nuffic.nl). The course was offered in September 2005 to alumni from UNESCO-IHE who live and work in Asia. These types of courses are called “refresher courses” by Nuffic because they are meant to refresh and bring up to date the knowledge that the participants gained while they completed their MSc degree at UNESCO-IHE with funding from the Dutch government (in Environmental Science and Technology, Water and Environmental Resources Management, Municipal Water Infrastructure, Sanitary Engineering). These alumni graduated several years ago (MEng or MSc degree) and have reached senior positions by now.

The course brochure describes the aims and objectives of the course as follows:

“The aim of this course is to provide active water managers from Asia with new views and insights of sustainable sanitation concepts and re-use of water and nutrients in a multi-disciplinary, multi-stakeholder setting. The general objective of this Refresher Course is to provide theoretical background and practical expertise in the field of ecosan, and to explain in some detail the closed-loop nature of this approach (including reuse and energy recovery aspects). The specific objectives of this course are to:

- Familiarise the participants with ecosan principles, which should be considered in all aspects of planning of sanitation systems;
- Enable the participant to make a first assessment of a given situation and to be familiar with the wide range of options that need to be considered;
- Provide tools to the participant so that he/she can make an in-depth assessment of the sanitation needs of a community or commercial facility and develop recommendations for appropriate technologyand systems;
- Encourage longer-term collaboration among resource managers using internet-based knowledge platforms and the formation of a Community of Practice (CoP).”

The course consisted of one week of face-to-face teaching in Nanjing, China (the local counterpart was Hohai University), preceded by six weeks of preparation by the participants in a distance-learning mode. Details for the content of both phases are provided in Table 26 and 27.

Table 26: Schedule for home country preparation for the ecosan alumni course in Nanjing China (Hohai University)

Schedule for preparatory phase in home countries (6 weeks, using the internet)	
Week	Activity
1	Registration to the platform Instructions about the use of the platform
2	Participants introduce themselves by providing a short CV and information about employer and about their work responsibilities
3	Preparation of a short powerpoint presentation (10 slides) to describe current sanitation situation in home region (issues and challenges)
4	Continuation of preparation of powerpoint presentation
5	Continuation of preparation of powerpoint presentation (if possible: describe ecosan activities in the home region, if known)
6	Continuation and finalisation of the presentation Presentation will be published on the platform

Table 27: Schedule for 6-day ecosan alumni course in Nanjing China (Hohai University)

Schedule for 6-day course in Nanjing China (Hohai University)	
Day	Activity
1	Registration, opening, workshop introduction Overview of sanitation issues and options Introduction to relevant Millennium Development Goals Conventional sanitation versus ecosan Nutrient cycles Welcome reception: staff, participants, resource persons
2	Technologies that can form part of ecosan concept: • Toilet devices (dry/wet, urine diversion, no diversion) • Anaerobic digestion, energy recovery • Composting • Constructed wetlands • Others Time for preparations of country presentations
3	Reuse of greywater and of nutrients in agriculture Closing nutrient cycles Ecosan in urban, rural and per-urban settings Introduction to case study Country presentations Use of the internet, platform, alumni facilities etc.
4	Case study: field trip Eco-city in Changzhou (decentralised wastewater treatment) Country presentations
5	Discussions from field trip Social and legal aspects Health risks and hygiene education Exercise: application of ecosan concept to participant's home region Preparation for reporting on exercise
6	Reporting by participants about exercise outcomes, followed by group discussion Evaluation and closing, farewell dinner

7.17 Example: Introducing ecosan concepts into a M.Sc. programme

In the following, one example is provided from UNESCO-IHE (The Netherlands) a post-graduate educational institution, which operates with the following mandate:

- Strengthen and mobilise the global educational and knowledge base for integrated water resources management; and
- Contribute to meeting the water-related capacity building needs of the developing countries and countries in transition.

Within this mandate the mission is defined as follows:
The mission of the Institute is to contribute to the education and training of professionals and to build the capacity of sector organisations, knowledge centres and other institutions active in the fields of water, the environment and infrastructure, in developing countries and countries in transition.

To achieve this mission, the institute teaches mid-career professionals from developing countries and countries in transition in five different MSc programmes (all connection to the study field of "water"). As an example, we now look at the MSc programme called "Municipal Water Infrastructure". This is structured as 12 months of taught programme, followed by six months of research (the MSc thesis). Provided below is the current curriculum overview for the MWI programme, showing the four specialisations on offer. The figure also includes suggested changes to this curriculum to embed the ecological sanitation paradigm firmly into this curriculum. Hence, it presents the situation "before and after" the introduction of ecological sanitation content into the MSc programme.

Table 28: MSc programme structure for MSc in Municipal Water and Infrastructure (with four specialisation options) for a 12-month taught programme, showing proposed inclusion of ecosan subjects within existing 3-week modules [see note below the figure for further explanation].

<table>
<tr><th colspan="4">Municipal Water and Infrastructure</th></tr>
<tr><th>Water Supply Engineering</th><th>Sanitary Engineering</th><th>Integrated Urban Engineering</th><th>Water Services Management</th></tr>

</table>

The bold numbers **[in brackets]** refer to the ecological sanitation subjects listed below (for details see Table 4 in Section 4.5.2):

1. Introduction to ecological sanitation
2. Technologies applied in ecological sanitation
3. Resources recovery and agricultural reuse (nutrients, organics, water and energy)
4. Implementation, operation and maintenance management
5. Environmental and health aspects
6. Economic and financial aspects
7. Social and cultural aspects
8. Policy and Legal aspects
9. Institutional and organisational aspects
10. Case studies: successes and failures
11. Enabling search for up-to-date information on ecological sanitation (e.g. internet)
12. Interactions of ecological sanitation projects with existing infrastructure
13. Evaluation criteria for sanitation systems
14. Promotion and public awareness

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -project data sheet (2005-001): " Vacuum sewerage and greywater recycling, office building "Ostarkade"of the KfW Bankengruppe Frankfurt am Main, Germany". – data sheets for ecosan projects 001 by the ecosan team, GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany , digitally available at:
http: //www.gtz.de/de/dokumente/en-ecosan-pds-001-germany-frankfurt-kfW-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -project data sheet (2005-005): " Urine diverting dry toilets dissemination programme Guanxi province, China." - data sheets for ecosan projects 005 by the GTZ ecosan team; GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany, digitally available at:
http: //www.gtz.de/de/dokumente/en-ecosan-pds-005-china-guanxi-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -project data sheet (2005-006): " Biogas-ecosan project, Waldmichelbacherhof, Bessenbach, Germany." – data sheets for ecosan projects 006 by the GTZ ecosan team, GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany , digitally available at:
http: //www.gtz.de/de/dokumente/en-ecosan-pds-006-germany-waldmichelbacherhof-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -project data sheet (2005-008): "Gebers collective

housing project, Orhem, Sweden". – data sheets for ecosan projects 008 by the GTZ ecosan team, GTZ-ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany , digitally available at:
http: //www.gtz.de/de/dokumente/en-ecosan-pds-008-sweden-gebers-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -project data sheet (2005-009): " ecosan within the community based natural resources management project, Hanahai and Paje, Botswana." – data sheets for ecosan projects 009 by Wirbelauer, C and the GTZ ecosan team, GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany , digitally available at:
http: //www.gtz.de/de/dokumente/en-ecosan-pds-009-botswana-hanahai-paje-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -project data sheets (2005-012): "TepozEco – urban ecosan pilot program, Tepoztlán, Mexico." – data sheets for ecosan projects 012 by Sawyer, R.and the GTZ ecosan team, GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany , digitally available at:
http://www.gtz.de/de/dokumente/en-ecosan-pds-012-mexico-tepoz-eco-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -project data sheet (2005-013): " Use of reclaimed water in the Jordan Valley, Jordan". – data sheets for ecosan projects 013 by Vallentin, Artur and the GTZ ecosan team, GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany , digitally available at:
http: //www.gtz.de/de/dokumente/en-ecosan-pds-013-jordan-valley-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -project data sheet (2005-015): " Constructed wetland, Haran-Al-Awamied,Syria". – data sheets for ecosan projects 015 by the GTZ ecosan team, GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany , digitally available at:
http: //www.gtz.de/de/dokumente/en-ecosan-pds-015-syria-haran-al-awamied-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -project data sheet (2005-016): "Urine separation and reuse project at the main building of GTZ GmbH." – data sheets for ecosan projects 016 by the GTZ ecosan team, GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany , digitally available at:
http: //www.gtz.de/de/dokumente/en-ecosan-pds-016-germany-gtz-eschborn-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -technical data sheets (2005): "Technical data sheets for ecosan." – GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany, digitally available at:
GTZ themes > Environment and infrastructure > Water > ecosan > Further Information
http: //www.gtz.de/en/themen/umwelt-infrastruktur/wasser/9397.htm

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) -technical data sheet (2005-01.B2): "01.B2 Urine diversion - Waterless urinals." - Technical data sheets for ecosan 01.B2 by the GTZ ecosan team, GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany, digitally available at:
http: //www.gtz.de/de/dokumente/en-ecosan-tds-01-b2-urine-diversion-waterless-urinals-2005.pdf

GTZ (Deutsche Gesellschaft für Technische Zusammenarbeit) (2006): "ecosan resource CD" - GTZ- ecosan program, Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany, available on request from ecosan@gtz.de Infomation on on-line-version at
www.gtz.de/de/dokumente/en-ecosan-education-resources-2006.pdf

Hellström D., Jeppsson U. and Kärrman E. (2000): "A framework for systems analysis of sustainable urban water management". - Environmental Impact Assessment Review, vol. 20, no. 3, pp. 311-322

Hiessl, H., Toussaint, D., Becker, M., Dyrbusch, A., Geisler, S., Herbst, H., Prager, J.U. (2003): "Alternativen der kommunalen Wasserversorgung und Abwasserentsorgung - AKWA 2100." – Springer Verlag, Reihe: Technik, Wirtschaft und Politik, Band 53, Berlin, Germany

Holden, R. (2004): "Factors which have influenced the acceptance of ecosan in South Africa and development of a marketing strategy". – p.167-174 - In: Werner et al. [eds.]. 2004: "ecosan - closing the loop. Proceedings of the 2nd international symposium on ecological sanitation (…), 7th – 11th April 2003, Lübeck, Germany", Deutsche Gesellschaft für Technische Zusammenarbeit (GTZ), Eschborn, Germany, digitally available at:

9 Glossary and Abbreviations

9.1 Glossary

Agricultural use in relation to sanitation	Use of recyclates produced from liquid and solid household waste. Includes other forms of use - e.g. in horticulture, aquaculture, forestry, ...
Aquifer	An underground water source. Porous water bearing layers of sand, gravel and rock below the earth surface,
Black water	Water that contains excreta from humans and/or animals
Capacity building	Strengthening of skills
Curriculum	The subjects that are studied or prescribed for study in a school, university
DALYs	Disability Adjusted Life Years; a method to quantify risks, by translating them into years, lost or spend ill, by the people of a given target group
Digestion	The breaking down of organic substances under aerobic or anaerobic conditions
Diversion, diversion systems	The process of separating materials at their source, or point of generation. Diversion systems are systems, like urine-diverting toilets (or recycling separation containers) that stimulate users to separate waste streams at source.
Ecosan	Abbreviation for ecological sanitation.
Effluent	Liquids discharged out of a tank or sewage works
Excreta	Emitted human and animal wastes: faeces and urine
Faeces	Human and animal waste matter discharged from the bowels, containing undigested foods, bacteria, mucus, and dead cells.
Gender sensitive planning	Planning that includes the fact, that in all societies community members (e.g. men and women, young and old, rich and poor) play different roles, have different needs, and face different constraints. Gender roles differ from the biological roles of men and women, as they are socially constructed. They demarcate responsibilities between men and women, social and economic activities, access to resources, and decision-making authority. Biological roles are fixed, but gender roles can and do change with social, economic, and technological change. Social factors underlie and support gender-based disparities. (Adapted from: Fong, M. S., Wakeman, W. and Bhushan, A. (1996). Toolkit on Gender in Water and Sanitation. The World Bank)
Grey water	Household wastewater without input of human and /or animal excreta, including sources from baths, showers, hand basins, washing machines, dishwashers, laundries and kitchen sinks (also called 'sullage'). Eventually kitchen waste water may also be treated separately, or together with black water, as it may contain larger concentrations of organic matter, oil, etc.
Hormone	Chemical substances produced by the body that has specific effects on the activity or function of a certain organ.
Leachate	Liquids draining from sewers, pits or waste collection chambers.
Nightsoil	Fresh human excreta with or without anal cleaning material, which are deposited in

	a bucket or other receptacle for manual removal (often taking place at night).
Nutrients	In this document used as: Essential chemical elements and minerals, assimilated by plants and micro-organisms that stimulate growth and remain, through decomposition and other biochemical processes in the ecosystem
Pathogens	Organisms that create diseases in host organisms
Pharmaceutical residues	Residues consisting of/or containing pharmaceuticals
PRA	Participatory Rapid Assessment, an assessment methodology that includes sets of participatory techniques, includes integrated approaches and aims at facilitating poor, uneducated, or disempowered groups to take charge of their own development processes, and become subjects, rather than objects, of development and urban planning interventions.
Poudrette	French word for dried natural fertiliser from human excreta, manure or compost.
Rainwater harvesting	The capture and use of runoff from rainfall.
Recovery	The process of separation and collection of recyclable material from a waste stream
Recyclates	Recovered materials. In the sanitation sector this specific term is usually limited to products made from urine, faeces, and grey water.
Recycling	The reuse of materials, not necessarily in their original forms
Sanitation	Interventions to reduce people's exposure to diseases by providing a clean environment in which to live; measures to break down the cycle of disease. Sanitation involves both behaviours and facilities, which work together to form a hygienic environment.
Sanitation management system	The sum of several stages in the management of the flow of human waste and grey water within the city and the region
Sanitation, conventional	Sanitation systems based on collection, end-of-pipe treatment and disposal of excreta and wastewater, not considering reuse of water and nutrients
Sanitation, ecological	Holistic eco-system oriented approach towards hygienic safe, ecologically and economically sound sanitation; a concept where human waste is considered a resource and its management forms part of an integrated water resources, nutrient flows and waste management processes. Usually ecological sanitation systems are summarized under the term "ecosan". Other terms, which partly or fully comply with ecosan principles, include "wastewater reclamation and reuse", DESAR (Decentralised Sanitation and Reuse) or DEWATS (Decentralised Wastewater Systems).
Sanitation, environmental	Interventions to reduce peoples' exposure to disease by providing a clean environment in which to live, with measures to break the cycle of disease. This usually includes hygienic management of human and animal excreta, refuse, wastewater, storm water, the control of disease vectors, and the provision of washing facilities for personal and domestic hygiene. Environmental Sanitation involves both behaviours and facilities which work together to form a hygienic environment
Sewage	The spent or used water from a community that contains dissolved or suspended matter.
Sewage sludge	Sludge resulting from the treatment of raw wastewater.

Stakeholders	A person or an organisation that has a stake, an interest in a certain case
Strategic planning	A process of involving stakeholders in the articulation of problems, the setting of priorities, and the designating of desired actions and interventions to change the situation in relation to urban infrastructure, specifically sanitation, in the short-, medium- and long term.
Toilet	Place for defecation and urination
Urine	A pale-yellow fluid secreted as waste from the blood by the kidney, stored in the bladder, and discharged through the urethra
Waste	'Unwanted' for the person who discards it; a product or material that does not have a value for the first user and is therefore thrown away.
Wastewater	All types of domestic wastewater, commercial and industrial effluent as well as storm water runoff

Appropriate Wastewater Treatment in Developing Countries: Experiences with CEPT*

Donald R. F. Harleman†, Susan Murcott‡ and Frédéric Chagnon§

†Ford Professor of Environmental Engineering, Emeritus; ‡Lecturer; §Research Assistant
Department of Civil and Environmental Engineering
Massachusetts Institute of Technology

Abstract

Water-borne diseases remain a rampant impediment to economic development in densely populated urban areas of developing countries. Most attempts to mitigate this problem of paramount importance have not succeeded. In devising policy to alleviate the public health problems related with wastewater, an important issue that needs to be addressed is whether the developing world should follow the model of using the municipal wastewater treatment technology of Western Europe and North America, or whether there is an alternative "sustainable sanitation" approach?

This short paper presents some of the authors' experiences with wastewater treatment related issues in cities of the developing world. Specifically, we relate our experiences concerning the simple and cost-effective technology of chemically enhanced primary treatment (CEPT). CEPT relies on small doses (i. e., $\leqslant$ 50 mg/L) of metal salts, which act to enhance particle settling by coagulation, and therefore treatment effectiveness. A short primer on CEPT is attached. Based on these experiences, we believe that the development of sustainable wastewater-related infrastructure in cities of the developing world is necessary, and we believe that CEPT should be considered as the first stage technology of choice because it is the lowest cost treatment technology that permits effective disinfection of the effluent.

Introduction

A committee of the U.S. National Research Council [NRC, 1996] reported on "sustainable water and sanitation services for mega-cities in the developing world". The authors indicate that "water and sanitation professionals must take a broader view of sanitation to

*Parts of this article have appeared in Harleman and Murcott [2001].

prevent disease resulting from a wide range of activities and multiple exposure routes." On the role of treatment technology, the authors state that "technical innovation should be based on carefully considered performance criteria appropriate to maintaining a healthy environment." While it is true that some cities (e. g., Jakarta) lack a sewage collection system, most urban areas have extensive sewerage systems that discharge untreated wastewater and contaminate adjacent rivers, shallow embayments or coastal waters. Only a small fraction of collected wastewater is treated, usually in "token" secondary plants with conventional primary settling and activated sludge. Such plants frequently suffer from poor performance due to inadequate funds for maintenance and operator training or to biological upsets caused by toxic industrial inputs. While the goals of industrialized world treatment are laudable, we believe that they are unrealistic in the near-term, and they do not address the most pressing need of disinfection. Rather than prescribing an effluent objective and its corresponding level of advanced treatment, it is more useful to define the most efficient and cost-effective first stage level of treatment needed to protect public health.

This short paper relates some of the authors' experiences with wastewater treatment in developing countries. Specifically, we present our experiences concerning the simple and cost-effective technology of chemically enhanced primary treatment (CEPT). It is our experience that most wastewater treatment objectives in developing country cities fall into two categories:

- need to upgrade existing conventional primary treatment plants
- new plant

In most instances, upgrades to existing overloaded conventional primary treatment plants and new plant designs have made use of biological treatment. Our perspectives on Mexico city and Brazil are outlined below; from these experiences, we conclude that a strategy of staged wastewater treatment implementation is the best path to follow. The goal should be one of treating and disinfecting all the wastewater produced in a given urban area, otherwise treated and untreated effluents are co-mingled in the receiving water with no public health benefit.

Mexico City — A Perspective on Mega-city Needs

The Valley of Mexico, with 21 million inhabitants, covers an area of 1,300 km^2. The city lies on an old lake bed on a high plateau with no natural drainage or source of fresh water. Most of the drinking water is pumped from deep ground water wells or from distant lower surface water sources. The city produces an average of 75 m^3/s of wastewater and this raw sewage is used to irrigate 85,000 ha of agricultural land in the neighboring state of Hidalgo. These crops feed and provide income for the local population. The raw sewage is high in organic matter, nitrogen and phosphorus nutrients, as well as in fecal coliforms and

helminth eggs, a debilitating parasite, in concentrations as high as 250 eggs/L. Because the soil in the valley is poor, the organic material, nitrogen and phosphorus in the wastewater have greatly improved crop yields — corn production has increased 150%, onion 100%, tomato 94%, etc. [Landa *et al.*, 1997]. The irrigated area receives over 80 kg/ha of nitrogen per year.

The critical issue in Mexico City's use of raw sewage for irrigation is the high prevalence of enteric and parasitic disease among the more than 100,000 agricultural workers in the irrigated areas [Comisión Nacional del Agua, 1995]. Mexico City's pressing need is to find a level of treatment that will protect the workers through helminth egg removal and pathogen inactivation, while allowing continued use of the organics and nutrients for irrigation. Okun [1996] advocates reuse of sewage for agriculture, but immediately couples it with the need for secondary treatment prior to disinfection. This is consistent with the thinking of most Western environmental planners and engineers. However, it must be questioned whether the capital and operating costs for full secondary treatment of the wastewater of Mexico City, given its other infrastructure needs, is a necessary or feasible option.

During visits to Mexico City in 1993—1995, the authors (DRFH & SM) urged the National Water Authority to consider and test chemically enhanced primary treatment (CEPT), as a single-stage treatment process that would result in a high level of suspended solids removal, including helminth eggs, and would thereby produce an effluent that could be effectively and economically disinfected. This proposal became the basis for a number of pilot and full-scale tests in Mexico City [Murcott *et al.*, 1996]. Additional pilot plant studies on the use of CEPT alone and in combination with high-rate sand filters have been completed [Landa *et al.*, 1997].

CEPT is very effective in removing helminth eggs to a range of 2∼5 eggs/L. Polishing sand filters were added to ensure an effluent with less than 1 egg/L. The Mexican authorities made a cost evaluation of CEPT treatment in comparison with conventional primary plus activated sludge treatment for a number of proposed plants [Comisión Nacional del Agua, 1995]. For example, for the proposed El Salto plant (15 m^3/s treatment capacity and 5.2 m^3/s mean flow), the construction cost (including sludge disposal) of the CEPT plant was estimated at US$70 million, while the conventional primary plus activated sludge facility cost was higher by a factor of 1.85. Annual operating costs were US$4 million for CEPT and US$7 million for the primary plus secondary plant. The annual cost of the CEPT chemicals is more than offset by the high energy cost for secondary aeration tanks.

Brazil — A Country-Wide Perspective

Bench-scale and full-plant CEPT demonstration tests have been successfully completed, first in São Paulo, under the sponsorship of the state wastewater agency [SABESP, 1996].

Next, in Rio de Janeiro, in 1997, the World Bank requested a demonstration of CEPT technology at an existing treatment plant. The objective was to show whether CEPT technology should be used in future treatment plants designed to solve severe eutrophication problems within Guanabara Bay. One of the major treatment objectives is low-cost phosphorus removal, the limiting nutrient controlling the large algal blooms that cause oxygen depletion and odors in the Bay. Tests of CEPT showed that it is possible to remove about 90% of the phosphate as well as high levels of TSS and BOD [Harleman and Murcott, 1998]. The first two CEPT treatment plants in Rio have been constructed by CEDAE, the state agency.

In l998 it was decided to use the Brazil CEPT experience to provide Master of Engineering thesis opportunities for Massachusetts Institute of Technology students. Site visits to design, test and collect data on innovative treatment processes were made. The focus was on municipalities which have overloaded and poorly functioning plants. In Brazil, most wastewater treatment in medium size cities is by open lagoons at the edge of the urban area. The usual method of upgrading existing lagoon performance and treatment capacity is by cleaning and reconstructing the lagoons and installing surface aeration units. However, in addition to the initial costs, most cities cannot afford the large annual costs to run and maintain the aerators.

Students obtained data on anaerobic and facultative lagoons serving a coastal community having a large variation in seasonal population. A numerical model Ferrara and Harleman [1980] was used to predict the performance of the wastewater treatment lagoons. The calibrated model was then used to design two treatment upgrade alternatives for a city which had planned to upgrade existing lagoons by installing aerators [Chagnon, 1999].

In the first treatment upgrade alternative, a small CEPT tank is placed in front of the first lagoon. This reduces the solids and BOD load on the lagoons and eliminates the need for aerators. The second alternative used an in-lagoon CEPT concept whereby chemical coagulants are added directly at the inlet of the first lagoon, again eliminating aerators. This type of CEPT lagoon, first successfully used in Scandinavia [Hanaeus, 1991], would be expected to perform better in the warmer climate of Brazil. A comparative cost study showed that both alternatives were less expensive, in capital and O&M costs, than the original aerated lagoon design [Cabral *et al.*, 2000].

Lessons Learned

Public health is the major water-related environmental concern in urban areas of the developing world. In many instances, drinking water and receiving water sources are contaminated by raw or inadequately treated wastewater effluents. Even when conventional primary treatment exists, its effluent cannot be effectively disinfected.

The objective of first-stage wastewater treatment investments or upgrades of existing treat-

ment facilities should be a high-flow rate, low-cost treatment technology that provides a high level of suspended solids removal, thereby permitting effective pathogen inactivation by disinfection. Chemically enhanced primary treatment is the most cost-effective first step; it can always be followed at a later stage by more advanced biological treatment processes if they can be justified and afforded.

ACKNOWLEDGEMENTS

Writing this book was a team effort and the team included a number of colleagues whose names do not appear on the title page. We are grateful to all friends and colleagues for their help. Special thanks are due to Ingvar Andersson and Bengt Johansson of the Swedish International Development Cooperation Agency (Sida) for their support to the earlier SanRes R&D programme (1993–2001) and the current EcoSanRes programme (2002–ongoing).

A key role has been played by all those people in the field who are responsible for implementing ecological sanitation projects in urban and rural communities around the world. In addition to those listed in the first edition of the book we acknowledge our debt to Ms Li Lingling and Mr Lin Jiang in Guangxi Autonomous Region, China. Thanks to their spirited work and the support from the NPHCC and the Ministry of Public Health in Beijing a small pilot project for 70 households in Tianyang County in Guangxi, carried out in 1997–98 as part of the SanRes programme, has now spread to 685,000 households in 17 provinces.

Thanks are also due to government and agency officials in other parts of the world for supporting and facilitating the development of ecological sanitation. In the first edition of the book we listed them. Since then there has been such a rapid development in a large number of countries that we can no longer provide a comprehensive list.

Finally we wish to acknowledge the contribution made by Steve Esrey. He played an important role in the development of the concept of ecological sanitation and in the drafting of the first edition of this book. Those of us who were there will never forget his inspiring opening speech at the First International Conference on Ecological Sanitation in Nanning, China, in November 2001. He was unable to come to Nanning due to the illness that a month later led to his death, but nontheless he prepared a wonderful, voiced powerpoint presentation for the opening session. The results of this very successful conference have been incorporated into this book.

CONTENTS

FOREWORD

Sida has a long-standing commitment to the development of water and sanitation services for all people. Early on Sida recognized that shortages of water resources and financial resources in many parts of the world are among the main barriers to progress. Thus, in the early 1990s, Sida put its support behind a new effort, a new way of thinking about this challenge, and the development of new concepts. In sanitation the new approach was to think in terms of developing systems that would save water, prevent water pollution and recycle the nutrients in human excreta. These new solutions should also save money and optimise the meagre financial resources of many cities, towns and government agencies around the world. The idea was to find solutions that were ecologically sound and would improve the environment while putting up barriers to water-borne diseases. Today we call this new approach "ecological sanitation."

Sweden put its resources behind this effort because Sweden, a country with abundant water resources, was in fact polluting its fresh and salt waters. As early as the 1960s, Swedish researchers, inventors and planners were seeking new approaches to sanitation that would prevent this pollution. Ideas began to emerge that looked promising and this stimulated interest in further research and development of sustainable systems. Perhaps some of these ideas and experiences could be further developed and then shared with other countries? Perhaps ideas and experiences from other countries could be shared through a wider joint effort?

This book presents the findings of over ten years of research and development in ecological sanitation supported by Sida. We are grateful to the small group of dedicated professionals who have written the book.

Since 2000, the UN's Millennium Development Goals and its targets for water supply and sanitation have reaffirmed that the development community, and agencies such as Sida, need to continue to search for more viable and sustainable solutions to sanitation. This book contributes to that search and presents proven solutions.

We hope that this book will inspire different actors such as government agencies, NGO's, private sector, water companies, municipal authorities and individuals to work with ecological sanitation systems. It can be used in developed as well as developing countries and aims also at stimulating different actors to include ecological sanitation systems in all their activities in the water and sanitation sector.

Chapter 1
INTRODUCTION

1.1 Challenges

This book is about sanitation for the future, in a world where most people will live in towns and cities. Over the next 25 years the world's population is expected to reach 8 billion, with 5 billion living in urban areas. More than half of the 8 billion will face water shortages and 40% of the urban population might be living in slums.[1] Already today billions of people, in urban as well as in rural areas, have no proper sanitation.

With this in mind, an international group of planners, architects, engineers, ecologists, biologists, agronomists and social scientists have developed an approach to sanitation that saves water, does not pollute and returns the nutrients in human excreta to the soil. We call this approach 'ecological sanitation', or 'eco-san' for short.

The major global challenges faced by the sanitation sector are the many people without sanitation, the health effects of poor sanitation, water shortage and pollution, food insecurity, urban growth and the inadequacy of current sanitation options.

People without sanitation
An often quoted figure is that the total number of unserved is about 40% of all people in the world.[2] If present trends continue, the number of unserved is going to increase.

Health effects of poor sanitation
Approximately 6000 children die every day from diarrhoeal diseases related to inadequate sanitation and hygiene.[3] About 1 billion people worldwide, mostly children, are infested with intestinal worms and as a result suffer nutritional deficiencies and poor growth.[4] Both of these groups of diseases are transmitted through human faeces in the environment.

Water shortage
Already today many areas are suffering from chronic freshwater shortages and the demand for freshwater has tripled in the past 50 years. By 2030 more than half the world's population will face a shortage of water.[5]

Water pollution
Sewage discharges from centralized, water-borne collection systems are a major component of water pollution all over the world. Only about 300 million people in the world today have end-of-pipe treatment of sewage to a secondary level (see 2.4) before the sewage is discharged into open bodies of water.[6] Pollutants also leak into groundwater from sewers, septic tanks, pit toilets and cesspools.[7]

Food insecurity
In today's urban societies the flow of plant nutrients is linear: nutrients are taken up from the soil by the crop, transported to the market, eaten, excreted and discharged. In a sustainable society the production of food must be based on returning the plant nutrients to the soil. The use of chemical fertilizers is not sustainable, since their production relies on non-renewable resources.

Urban growth
Over the next 25 years 90% of the world's population growth will be absorbed by the urban areas of the less developed regions, where the population will increase by 2 billion. Today 50% of the urban population live in cities of under 500,000 people. These smaller cities have less in the way of sanitation facilities and development than larger cities. Cities in developed countries have, according to UN-Habitat, 32 times as much money per person to spend on infrastructure and other urban services as cities in least developed countries.[8]

Inadequacy of current options
The sanitation practices promoted today are either based on hiding human excreta in deep pits ('drop-and-store') or on flushing them away and diluting them in rivers, lakes and the sea ('flush-and-discharge').

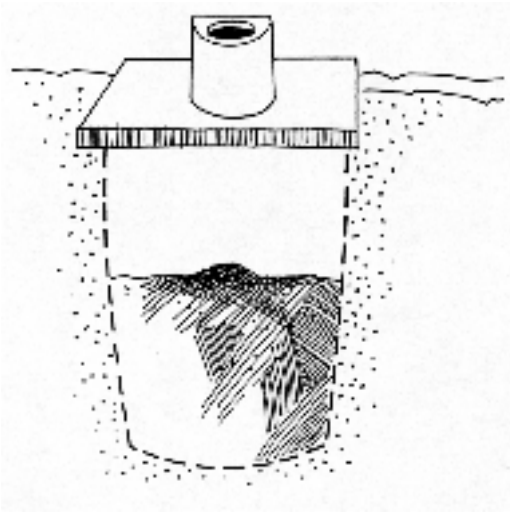

Figure 1.1 *Drop-and-store.*

Drop-and-store systems can be simple and relatively low-cost but have many drawbacks. Often they cannot be used at all in crowded areas, on rocky ground, where the groundwater level is high or in areas periodically flooded. They require access to open ground and the digging of new pits every few years.

Flush-and-discharge systems require large amounts of water for flushing, and for many municipalities unaffordable investments in pipe networks and treatment plants. Over a year for each person some 400-500 litres of urine and 50 litres of faeces are flushed away with 15,000 litres of pure water. Water from bath, kitchen and laundry may add up to another 15,000-30,000 litres for each person.

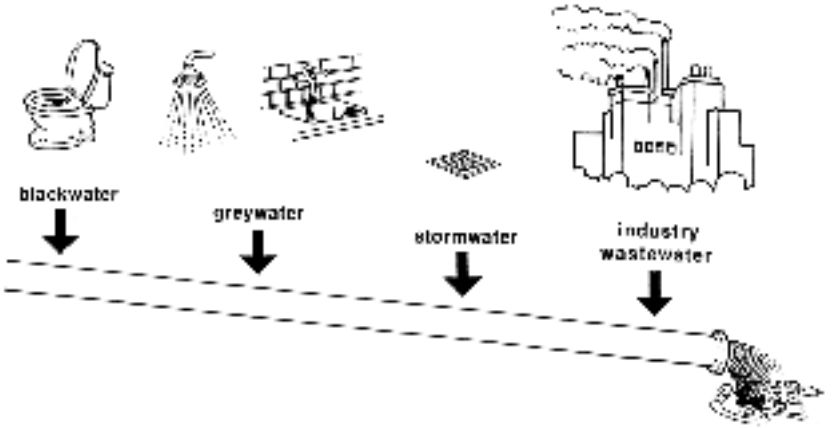

Figure 1.2 *Flush-and-discharge.*

Further down the pipe rainwater from streets and rooftops and wastewater from industries are often added. Thus at each step in the flush-and-discharge process the problem is magnified: the really dangerous component, the 50 litres of faeces, is allowed to contaminate not only the relatively harmless urine but also the huge amount of pure water used for flushing and an equal or even larger amount of greywater.

Leaders, professionals and communities are currently faced with two options: expand existing sanitation approaches, with all their limitations and weaknesses, or seek entirely new solutions. Existing approaches to sanitation are not viable or affordable to the vast majority of people, neither do they offer people an approach towards a sustainable society.

1.2 Response

Ecological sanitation is based on three fundamental principles: preventing pollution rather than attempting to control it after we pollute; sanitizing the urine and the faeces; and using the safe products for agricultural purposes. This approach can be characterized as 'sanitize-and-recycle'.

This approach is a cycle – a sustainable, closed-loop system. It treats human excreta as a resource. Urine and faeces are stored and processed on site and then, if necessary, further processed off site until they are free of disease organisms. The nutrients contained in the excreta are then recycled by using them in agriculture.

An essential part of eco-san is to contain and sanitize human excreta before they are recovered and reused. Human faeces, rather than urine, are responsible for most diseases spread by human excreta. Thus, a method is needed to sanitize faeces. Two methods are discussed in this book: dehydration and decomposition. Dehydration, or drying, of faeces is easier if they are not first mixed with urine and water. When faeces decompose, the pathogens in them die and are broken down. Thus, with either method, viruses, bacteria and worm eggs are destroyed. It is only then that faeces can be recycled. Urine is usually safe enough to be used in agriculture without further treatment, either directly or after a short period of storage.

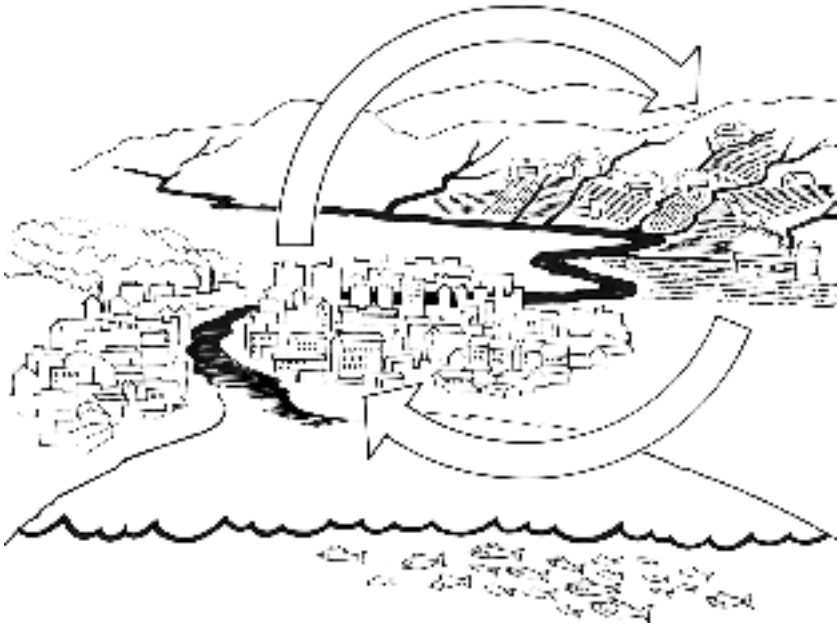

Figure 1.3 *Ecological sanitation replicates nature by returning the plant nutrients in human urine and faeces to the soil. Instead of polluting the environment, human urine and faeces are used to improve soil structure and supply nutrients.*

In summary, key features of eco-san are prevention of pollution and disease caused by human excreta, management of human urine and faeces as resources rather than as waste, and recovery and recycling of the nutrients. In the natural world, excreta from humans and other animals play an essential role in building healthy soils and providing valuable nutrients for plants. Conventional approaches to sanitation misplace these nutrients, dispose of them and turn the cycle into a linear flow.

Box 1.1 *A new public health revolution* [9]

"Ecological sanitation could be the beginning of a new public health revolution. During the 20th century we have witnessed several public health revolutions including universal childhood immunizations, the eradication of smallpox, improved water supplies, the green revolution with its improved food yields and expansion of primary health care. The one public health problem that has proved intractable this past decade has been a lack of sanitation for about half the population of the world."

1.3 Criteria

Sanitation is a key determinant of both equity in society and society's ability to sustain itself. If we cannot meet the sanitation challenges described above, we will not be able to provide for the needs of the present generation without hindering that of future generations. Thus, sanitation approaches must be resource minded, not waste minded. Similarly, there can be no equity as long as half the world's population goes without even basic sanitation.

A system of sanitation that contributes towards the goals of equity and a sustainable society must meet or at least go some way towards meeting the following criteria:

Disease prevention
A sanitation system must be capable of destroying or isolating faecal pathogens.

Environment protection
A sanitation system must prevent pollution and conserve valuable water resources.

Nutrient recycling
A sanitation system should return nutrients to the soil.

Affordability
A sanitation system must be accessible to the world's poorest people.

Acceptability
A sanitation system must be aesthetically inoffensive and consistent with cultural and social values.

Simplicity
A sanitation system must be robust enough to be easily maintained with the limitations of the local technical capacity, institutional framework and economic resources.

Successful implementation of these criteria requires an understanding of sanitation as a system. The criteria also require that all the components of the system are considered together, not just one or two, when designing and making sanitation systems work. The main components of that system are nature, society, process and device.

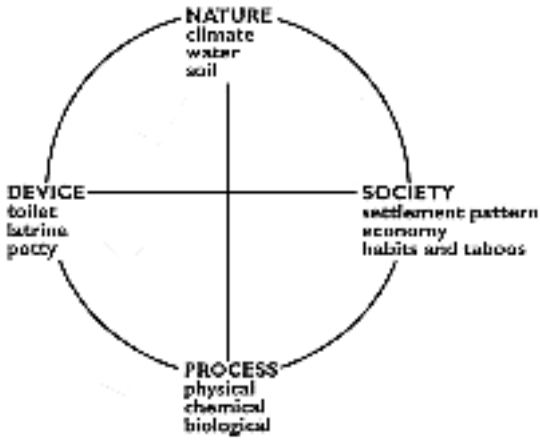

Figure 1.4 *Sanitation is a system where the main components are nature, society, process and device. All these components must be considered together.*

- The most relevant **nature** variables are climate (temperature, humidity), water (amount available, groundwater level), and soil (stability, permeability, pickability).
- **Society** includes settlement pattern (concentrated/dispersed, low/high rise), attitudes (faecophobic/faecophilic), habits (washers/wipers), beliefs and taboos related to human excreta as well as the economic status of the community in question.
- By **process** we mean the physical, chemical and biological processes by which human excreta are turned into a non-dangerous, inoffensive, useful product. In this book we discuss two such processes: dehydration and decomposition.
- By **device** we mean the on-site structures specifically built for defecation and urination. Much of the literature on sanitation is focused on devices, without relating them to the other components of the sanitation system.

The principles underlying eco-san are not novel. In different cultures sanitation systems based on ecological principles have been used for hundreds of years. Eco-san systems are still widely used in parts of East and South-East Asia. In Western countries this option was largely abandoned as flush-and-discharge became the norm, but with a growing realization that conventional sewerage is unsustainable there is now a revival of interest in ecological approaches to sanitation.

Applying the criteria above and developing and implementing a systems approach to sanitation requires a change in our thinking. We must move away from an approach based on disposal to one aimed at zero-discharge and recycling.

1.4 This book

This book does four major things: it treats sanitation as part of a larger ecological system, it systematizes experience from different parts of the world, it describes how to proceed when developing and implementing eco-san approaches, and it provides a vision for urban applications of the eco-san concept.

In this first chapter we have explored the global challenges that we are facing in the next 25 years and how eco-san can help meet those challenges. We have also introduced the criteria for an eco-san system. In Chapter 2 we explain how human excreta can be sanitized in a two-step process to render it safe for re-use in agriculture. In Chapter 3 we introduce a great variety of eco-toilets and eco-san systems suitable for rural homesteads and urban residential areas. In Chapter 4 we go into the details of the design and management of eco-san systems. In Chapter 5 we report on recent and on-going research on the re-use of excretal nutrients in agriculture and how they affect plant growth and crop production. In Chapter 6 we turn our attention to handling greywater. Chapter 7 discusses the important area of planning, promotion and support to ensure the success of new projects. And finally Chapter 8 provides a vision for the future, describes how ecological sanitation could work in urban areas, and summarizes its advantages over conventional approaches.

This book is neither a technical nor a policy manual although it does deal with technical and policy issues. It is rather a down-to-earth discussion of the options available. The eco-san concept is particularly relevant to cities where water and money are scarce. But it should not be regarded as a second-rate solution only for the poor. Eco-san options are available for a whole range of socio-economic conditions, as clearly shown in the wide variety of examples offered in Chapter 3.

Chapter 2
SANITIZING HUMAN EXCRETA

One of the main goals of ecological sanitation is to capture the nutrients present in human excreta and recycle them back to agriculture. Thus a key part of an eco-san system is the destruction of most or all disease-producing organisms before re-use of excreta products. Results from scientific studies of pathogen destruction in eco-san systems are now providing us with guidelines for the treatment of urine and faeces before re-use as fertilizer.[1]

2.1 Urine

Urine contains few disease-producing organisms, while faeces may contain many. Storing undiluted urine for one month will render urine safe for use in agriculture. Undiluted urine provides a harsher environment for micro-organisms, increases the die-off rate of pathogens and prevents the breeding of mosquitoes.[1,2]

At the homestead level, where crops are intended for the household's own consumption, urine can be used directly. It is recommended, however, that there should be 1 month between urine application and harvesting.

When urine is collected from many urban households and transported for re-use in agriculture, the recommended storage time at temperatures of 4–20 °C varies between 1 and 6 months depending on the type of crop to be fertilized.

Box 2.1 *Recommended Swedish guideline storage times for urine mixture* [a] *based on estimated pathogen content* [b] *and recommended crop for larger systems* [c].[1]

Storage temperature	Storage time	Possible pathogens in the urine mixture after storage	Recommended crops
4°C	>1month	Viruses, protozoa	Food and fodder crops that are to be processed
4°C	>6 month	Viruses	Food crops that are to be processed, fodder crops[d]
20°C	>1 month	Viruses	Food crops that are to beprocessed, fodder crops[d]
20°C	>1 month	Probably none	All crops[e]

[a] Urine or urine and water. When diluted it is assumed that the urine mixture has at least pH 8.8 and a nitrogen concentration of at least 1 g/l.

[b] Gram-positive bacteria and spore-forming bacteria are not included in the underlying risk assessments, but are not normally recognized as causing any of the infections of concern.

[c] A larger system in this case is a system where the urine mixture is used to fertilize crops that will be consumed by individuals other than members of the household from which the urine was collected.

[d] Not grasslands for production of fodder.

[e] For food crops that are consumed raw it is recommended that the urine be applied at least 1 month before harvesting and that it be incorporated into the ground if the edible parts grow above the soil surface.

2.2 Faeces

The main concerns about the safety of excreta are with the faeces. The most important pathways for the transmission of diseases from faeces are hands, flies, water, soil as well as food that have been contaminated by any of the first four factors. The F-diagram below summarizes these main pathways. (Each of these factors has been given a name beginning with the letter 'F' in order to make it more easily remembered.)

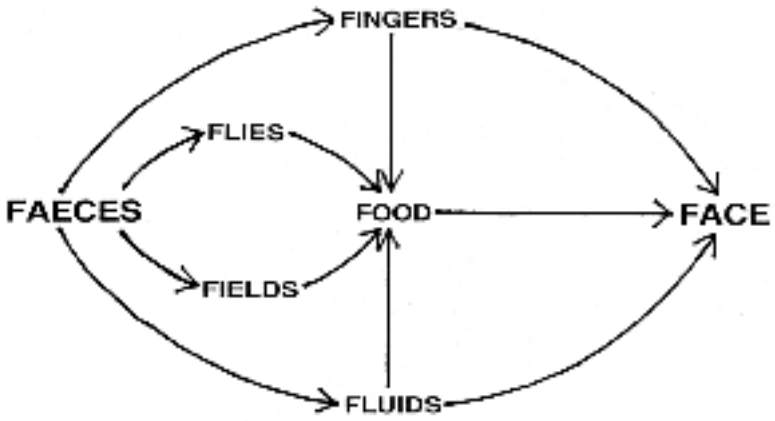

Figure 2.1 *The F-diagram summarizes the main ways faecal pathogens are spread by contaminating fingers, flies, fields, food and fluids and then eventually being swallowed.*

One purpose of an eco-san system is to form a set of barriers between faeces and flies, fields and fluids. This is done by containment of the faeces in a processing chamber or shallow pit where pathogens are reduced to an acceptable level before re-use. Then the contents may be removed for further secondary treatment to make them even safer.

Every eco-san system should also include a device for hand washing in order to block this remaining important pathway for faecal-oral transmission. Every eco-san educational campaign must emphasize not only proper use and management of toilets but also the importance of hand washing after defecation, after helping a child who defecates and before preparing food or feeding a child. (This is of course not unique to eco-san. Hand washing is as important in the use of conventional sanitation facilities.)

2.3 What kills pathogens in faeces?

A number of environmental factors are known to kill off faecal disease organisms. These are increases in storage time, temperature, dryness, pH, ultraviolet radiation, and competing natural soil organisms.

Table 2.1 *Physiochemical and biological factors that affect the survival of micro-organisms in the environment.*[4]

Temperature	Most micro-organisms survive well at low temperatures (below 5°C) and die off rapidly at high temperatures (above 40° C). This is the case in water, soil and sewage and on crops. At temperatures of 55–65°C all types of pathogens (except bacterial spores) die within hours.
pH	Highly alkaline conditions will inactivate micro-organisms. Inactivation is rapid at pH 12 but takes longer at pH 9.
Ammonia	Pathogens in excreta can be inactivated by the addition of ammonia.
Dryness	Moist soil favours the survival of micro-organisms. Dehydration of faeces in an eco-toilet processing chamber will decrease the number of pathogens.
Solar radiation	The survival time of pathogens on soil and crop surfaces will be reduced by UV radiation.
Presence of other organisms	The survival time of micro-organisms may be shortened by the presence of other organisms. Different types of organisms affect each other by predation, release of antagonistic substances or competition for nutrients.
Nutrients	Bacteria adapted to living in the gut are not always capable of competing with other organisms in the general environment for scarce nutrients. This may limit the ability of faecal bacteria to reproduce and survive in the environment.
Oxygen	Most enteric bacteria are anaerobic and thus are likely to be out-competed by other organisms in an aerobic environment.

2.4 Primary and secondary processing

Eco-san systems are designed to use some of the physiochemical and biological factors listed in Table 2.1 to kill disease organisms in faeces. This occurs usually in two steps: primary processing and secondary processing.

Primary processing
The purpose of primary processing is to reduce the volume and weight of faecal material to facilitate storage, transport and further (secondary) treatment. Primary processing takes place in chambers below the toilet (Figure 2.2). Here the faeces are kept ('contained') for a certain period. During this containment the number of pathogens will be reduced as a result of storage time (6–12 months), decomposition, dehydration (ventilation and the addition of dry material), and increased pH (addition of ash, lime, urea) as well as the presence of other organisms and competition for nutrients.

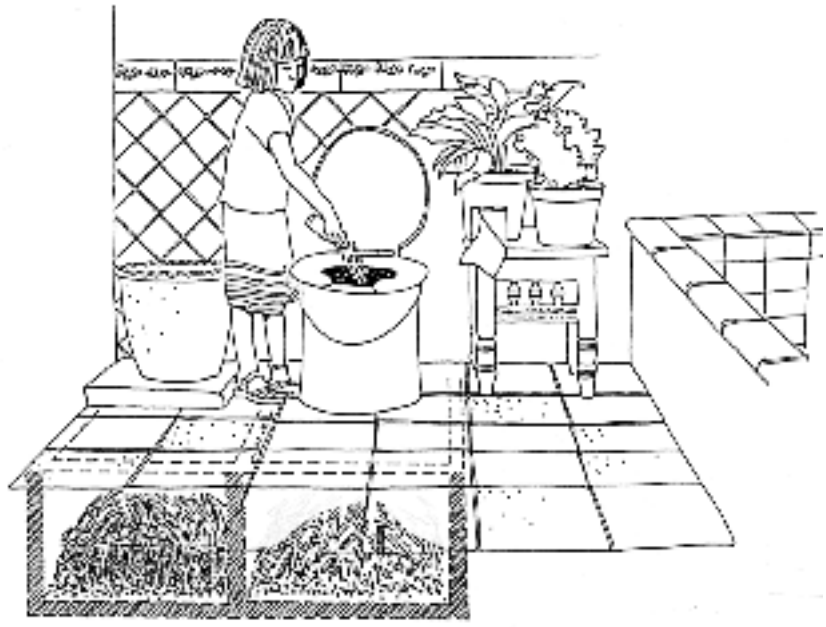

Figure 2.2 *An eco-toilet with processing chambers. The toilet has a moveable seat-riser with urine collector. The processing chambers below the bathroom floor can be emptied from outside. (Design: César Añorve, Cuernavaca, Mexico, 1992).*

In some of the basic models developed in Zimbabwe the processing takes place in a shallow pit beneath the eco-toilet (Figure 2.3).

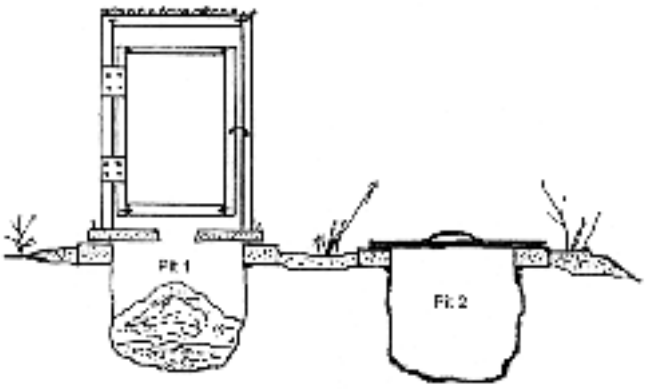

Figure 2.3 *A basic eco-toilet from Zimbabwe with processing chambers in the form of shallow pit. During the first year the squatting slab and superstructure are mounted over Pit 1. Next year they are shifted to Pit 2 (see also 3.1.4). (Design: Peter Morgan, Harare, Zimbabwe, 1998).*

Secondary processing

The purpose of secondary processing is to make human faeces safe enough to return to the soil. Secondary processing takes place either on site – in the garden, or off site – at an eco-station. This step includes further treatment by high temperature composting or pH increase by the addition of urea or lime as well as longer storage time. If a completely sterile end product is required the secondary processing could be carbonization or incineration.

In areas where ambient temperatures reach up to 20 °C , a total storage time of 1.5 to 2 years (including the time stored during primary treatment) will eliminate most bacterial pathogens (if kept dry) and will substantially reduce viruses, protozoa and parasites. Some soil-borne parasite eggs may persist. In areas where the ambient temperatures reach up to 35 °C , a total storage period of 1 year will achieve the same result, as pathogen die-off is faster at higher temperatures.[1]

Where high temperature composting, 50–60 °C , can be carried out, either in an open compost or in a mechanical composting bin (see Figure 8.2) the storage period could be further reduced.

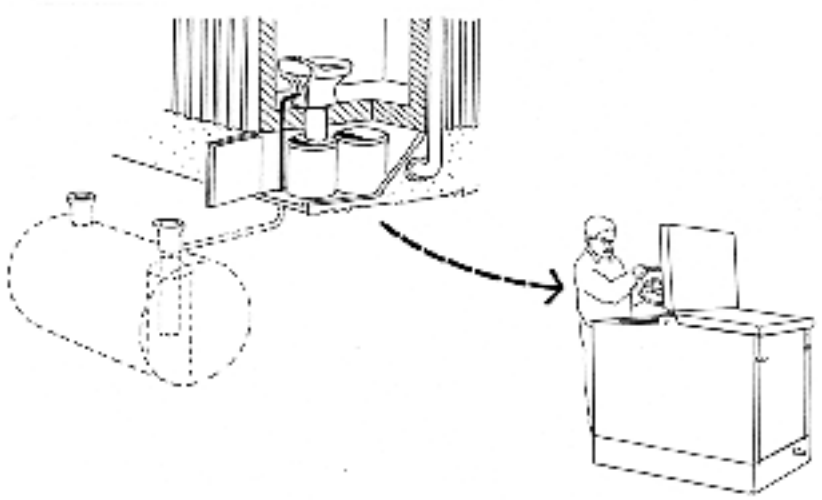

Figure 2.4 *Primary processing in a chamber directly under the urine-diverting eco-toilet followed by secondary processing at an eco-station.*

Treatment with alkaline materials also requires time for pathogens to die off to an acceptable level. A pH over 9 for at least 6 months to 1 year is sufficient in most climates to kill most pathogenic organisms. For additional safety the material can be bagged (in sacks) and stored for a further period. Where there is concern about the persistence of intestinal worm eggs, carbonization or incineration as the secondary treatment will ensure a sterile product.

2.5 Dehydration and composting

Before explaining these pathogen destruction systems in detail, we must step back and explain at this point that there are three main eco-san systems that operate in slightly different ways to achieve more or less the same result. These are dehydrating systems, composting systems, and soil composting systems. These three, and the different toilet designs that go with them, are exemplified in Chapter 3. For now, to understand how pathogens are destroyed, it is only necessary to understand the broad outlines of these systems. Figures 2.4–2.6 show the key points of the three systems.

Dehydration

In a dehydrating system, like those described in Chapter 3, we direct urine away from faeces to keep the processing chamber contents dry and the volume of material small. This also makes it possible for us to use the urine separately as a fertilizer. Faeces are dropped into a processing chamber where they are safely kept out of the environment for a period of 6–12 months, and ash, lime or urea is added after each defecation to lower the moisture content and raise the pH to 9 or higher. The system thus creates conditions of dryness, raised pH and time for pathogen die-off. The partly treated faecal material is then removed from the processing chamber and subjected to one of the four secondary treatments (high temperature composting, alkaline treatment, further storage, carbonization/incineration).

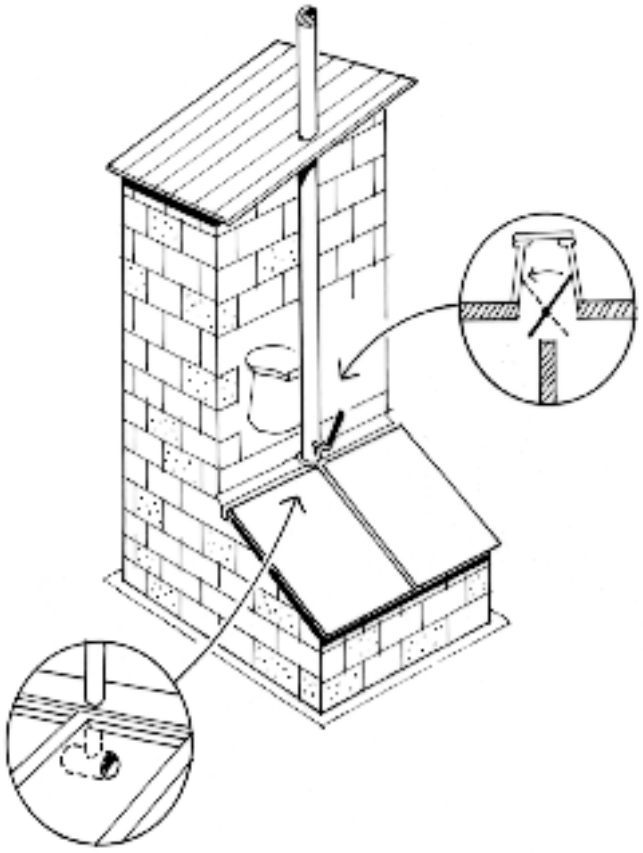

Figure 2.5 *A double-vault composting toilet in Cancun, Mexico [2], see 3.13 Composting toilets – Mexico. (Design: Uno Winblad, Stockholm, Sweden, 1980).*

Composting
In a composting toilet human faeces, or in some cases faeces plus urine, are deposited in a processing chamber along with organic household and garden refuse and bulking agents (straw, peat moss, wood shavings, twigs, etc).

A variety of organisms in the pile break down the solid into humus – just as eventually happens to all organic materials in the natural environment. Temperature, airflow, moisture, carbon materials and other factors are controlled to varying degrees to promote optimal conditions for decomposition. After a certain retention time (normally 6–8 months) the partly decomposed material can be moved to a garden compost or an eco-station for secondary processing through high temperature composting.

Soil composting
In a soil composting system faeces, in some cases faeces and urine, are deposited in a processing chamber together with a liberal amount of soil. There are two main sub-types with slightly different processes: with a shallow pit or a raised processing chamber (see 3.1.4). Ordinary soil is added after each defecation, often with wood ash as well. Most pathogenic bacteria are destroyed within 3–4 months as a result of competition with soil-based organisms and unfavourable environmental conditions.[3] The material is then removed and can be subjected to any one of the same four secondary treatments or, within one family homestead, can be directly spread on fields and worked into the existing soil. A period of 12 months of composting in shallow pits is recommended before application to gardens. There further pathogen die-off occurs because of UV radiation, dryness and competition with other soil organisms. After 1 month, crops that are not eaten raw can be sown with relative safety.[4]
