## Contents

About this book	vii
Who should use this book	vii
How this book is structured.	vii
Highlighting conventions	viii
How to read the syntax diagrams	ix
Chapter 1, Command line processor	
(CLP)	1
Command line processor features	••• 2
db? - Command line processor invocation	. 2
Command line processor options	10
Command line processor return codes	. 18
Invoking command help from the command line	
processor	. 19
Invoking message help from the command line	
processor	. 19
Chapter 2. Using command line SQL	~
statements and XQuery statements	21
Chanter 3 Command line processor	
nue (CI PPlue)	20
Installing CLEPPius on existing IPM data compose	25
clionte	20
Starting CI PPlus	· 29 29
CLPPLUS command	. 27
CLPPlus console types.	. 33
Connecting to DSN aliases in CLPPlus	. 33
Connecting to DSN aliases using Kerberos	
authentication in CLPPlus	. 35
Running a script file in CLPPlus	. 36
Bind variables in CLPPlus	. 38
CLPPlus traces and record logging	. 39
DB2 commands supported by CLPPlus	. 40
CLPPlus restrictions	. 40
CLPPlus troubleshooting hints and tips	. 41
Chapter 4. How to read command	
syntax help	43
Chapter 5. CLP commands	47
ACTIVATE DATABASE	. 48
ADD CONTACT	. 50
ADD CONTACTGROUP	. 51
	. 52
ADD XMLSCHEMA DOCUMENT	. 55
	60
	62
BACKUP DATABASE	65
BIND	. 74
CATALOG DATABASE	. 94

CATALOG DCS DATABASE	. 97
CATALOG LDAP DATABASE	. 99
CATALOG LDAP NODE	. 102
CATALOG LOCAL NODE	. 103
CATALOG NAMED PIPE NODE	. 105
CATALOG ODBC DATA SOURCE	. 107
CATALOG TCPIP/TCPIP4/TCPIP6 NODE	. 109
CHANGE DATABASE COMMENT	. 113
CHANGE ISOLATION LEVEL	. 115
COMPLETE XMLSCHEMA.	. 117
CREATE DATABASE	. 118
CREATE TOOLS CATALOG	. 137
DEACTIVATE DATABASE	. 139
DECOMPOSE XML DOCUMENT	. 141
DECOMPOSE XML DOCUMENTS	143
DEREGISTER	146
DESCRIBE	147
DESCRIDE	157
	158
	150
	160
	. 100
DROP DDPARTITIONNUM VERIFT	. 162

Chapter 7. System commands	673
dasauto - Autostart DB2 administration server	. 674

	< <b>TF</b>
dascrt - Create a DB2 administration server	675
dasdrop - Remove a DB2 administration server	676
dasmigr - Migrate the DB2 administration server	677
dasupdt - Update DAS	679
db2_deinstall - Uninstall DB2 database products,	
features, or languages	681
db2 install - Install DB2 database product	684
db2 local ps - DB2 process status for Linux/UNIX	687
db <sup>2</sup> addicons - Create main menu entries for DB <sup>2</sup>	
tools	689
db?admin - DB? administration server	690
db?adutl - Managing DB? objects within TSM	692
db2advis - DB2 design advisor	700
db2audit Audit facility administrator tool	700
db2audit - Audit fachity aufinistrator tool	707
dD2Datch - Denchmark tool.	716
db2acsutil - Manage DB2 snapshot backup objects	726
db2bfd - Bind file description tool	730
db2ca - Start the Configuration Assistant	731
db2caem - Capture activity event monitor data tool	732
db2cap - CLI/ODBC static package binding tool	736
db2cat - System catalog analysis	738
db2cc - Start control center	740
db2cfexp - Connectivity configuration export tool	742
db2cfimp - Connectivity configuration import tool	744
db2chglibpath - Modify the embedded runtime	
library search path	745
db2chgpath - Change embedded runtime path	747
db2ckbkp - Check backup	749
db <sup>2</sup> ckmig - Database pre-migration	753
db <sup>2</sup> ckrst - Check incremental restore image	
sequence	754
db2ckupgrade - Check database for upgrade	756
dhadi DR2 interactive CLL	750
db2cmd Open DB2 command window	760
db2cmtae Install or undate DP2 HA scripts	762
db2cptsa - Install or update Db2 HA scripts	763
db2dart - Database analysis and reporting tool	764
db2daslevel - Show DAS level	769
db2dclgn - Declaration generator	770
db2diag - db2diag logs analysis tool	773
db2drdat - DRDA trace	788
db2drvmp - DB2 database drive map	790
db2empfa - Enable multipage file allocation	792
db2envar.bat - Set environment of the current	
command window	793
db2eva - Event analyzer	794
db2evmon - Event monitor productivity tool	796
db2evtbl - Generate event monitor target table	
definitions	798
db2exfmt - Explain table format	800
db2exmig - Migrate explain tables	803
db2expln - SOL and XOuery Explain	804
db2extsec - Set permissions for DR2 objects	813
as consection of permissions for DD2 objects	010

db2flsn - Find log sequence number	. 815
db2tm - DB2 tault monitor	. 817
db2fmcu - DB2 fault monitor controller	. 819
db2fodc - DB2 first occurrence data collection .	. 821
db2fopt - specify parameters for use by the query	
optimizer	. 827
db2ts - First steps	. 829
db2gct - Control DB2 instance	. 830
db2gov - DB2 governor	. 833
db2govlg - DB2 governor log query	. 835
db2gpmap - Get distribution map	. 836
db2has - DB2 Health Advisor Service data collecto	or 837
Sample db2has resource file (db2has.res)	. 843
db2hc - Start health center	. 846
db2iauto - Autostart instance	. 847
db2iclus - Microsoft cluster server	. 848
db2icrt - Create Instance.	. 851
db2ldantifyTyma1 Tyma 1 inday identification too	. 800
db2iliet List instances	01 007 860
db2imigr Migrate instances	. 000
db2inidb Initialize a mirrored database	. 001
db2incpf Earmat inspect results	. 805
db2inguna Reduce installation image size	. 865
db2isotup Start instance creation interface	. 000
db2isetup - Start instance creation interface	. 000
db2iuparada Ungrada instance	. 009
db2idbchind DB2 IDBC package hinder	. 073
db2ldcfg - Configure LDAP environment	. 070
db2lavel - Show DB2 service level	. 070
db2licm - License management tool	880
db2listvolumes - Display GUIDs for all disk	. 000
volumes	. 882
db2logsforrfwd - List logs required for rollforward	1
recovery	. 883
db2look - DB2 statistics and DDL extraction tool	884
db2ls - List installed DB2 products and features	894
db2move - Database movement tool	. 896
db2mqlsn - MQ listener	. 905
db2mscs - Set up Windows failover utility	. 909
db2mtrk - Memory tracker	. 913
db2nchg - Change database partition server	
configuration	. 917
db2ncrt - Add database partition server to an	
instance	. 919
db2ndrop - Drop database partition server from a	n
instance	. 921
db2nrcfg - Non-root install configuration tool .	. 922
db2rfe - Enable root features for non-root install	923
db2nrupdt - Non-root-installed instance update	925
db2nrupgrade - Upgrade non-root instance	. 926
db2osconf - Utility for kernel parameter values .	. 927
db2pd - Monitor and troubleshoot DB2 database	930
db2pdcfg - Configure DB2 database for problem	1000
determination behavior.	. 1003
ab2pertc - Keset database performance values	1008
ub2perfi - Performance counters registration	1010
	. 1010
db2whind _ Dohind _ 11 === lise ===	1012
db2rolocatodh Polocato database	. 1012
ub2relocatedb - Kelocate database	. 1014

db2rfpen - Reset rollforward pending state	1019
db2rmicons - Remove DB2 tools from main menu	1020
db2rspgn - Response file generator	1021
db2sampl - Create sample database	1022
db2schex - Active Directory schema extension	1025
db2set - DB2 profile registry	1027
db2setup - Install DB2	1030
db2sqljbind - SQLJ profile binder	1032
db2sqljcustomize - SOLJ profile customizer	1038
db2sqljprint - SOLJ profile printer	1051
db2start - Start DB2	1052
db2stat - DB2 process status for Windows	1053
db2stop - Stop DB2	1054
db <sup>2</sup> support - Problem analysis and environment	
collection tool	1055
db2swtch - Switch default DB2 copy and database	1000
client interface copy	1065
db2svnc - Start DB2 svnchronizer	1067
db2systray - Start DB2 system tray	1068
db2tapemgr - Manage log files on tape	1070
db2tbst - Get table space state	1073
db2tdbmgr - Migrate tools catalog database	1074
db2top - DB2 monitoring tool	1075
db2trc - Trace	1080
db <sup>2</sup> unins - Uninstall DB <sup>2</sup> database products	1000
features or languages	1091
db <sup>2</sup> untag - Release container tag	1093
$db^2undv^{97}$ - Undate database to Version 9.7 fix	1075
nack	109/
dh?undsorry Chow product undates	1094
db2updserv - Show product updates	1090
db2val - Db2 copy validation tool	1097
db2xdbmig - Migrate XSK objects	1099
db2xprt - Format trap file	1100
disable_MQFunctions - Disable WebSphere MQ	1101
functions	1101
doce_deinstall - Uninstall DB2 Information Center	1102
doce_install - Install DB2 Information Center	1103
enable_MQFunctions - Enable WebSphere MQ	
functions	1105
installDSDriver - extract Data Server Driver	
components	1108
installFixPack - Update installed DB2 database	
products	1109
setup - Install DB2	1113
sqlj - SQLJ translator	1115

## Chapter 8. DB2 Text Search

## About this book

This book provides information about the use of system commands and the IBM<sup>®</sup> DB2<sup>®</sup> command line processor (CLP) to execute database administrative functions.

## Who should use this book

It is assumed that the reader has an understanding of database administration and a knowledge of Structured Query Language (SQL).

## How this book is structured

This book provides the reference information needed to use the CLP, system, and DB2 Text Search commands.

The major subject areas discussed in the chapters of this book are as follows:

#### Using the command line processor (CLP)

- Chapter 1, "Command line processor (CLP)," explains how to invoke and use the command line processor, and describes the CLP options.
- Chapter 2, "Using command line SQL statements and XQuery statements," provides information on how to use SQL statements from the command line.

#### Using the command line processor plus (CLPPlus)

• Chapter 3, "Command line processor plus (CLPPlus)," describes how to install, invoke, and use the command line processor plus interface.

#### Command usage help

• Chapter 4, "How to read command syntax help," describes how to invoke command help screens and explains the command help screen syntax conventions that are employed.

#### **CLP** commands

• Chapter 5, "CLP commands," describes all of the database manager commands, listed alphabetically.

#### CLPPlus commands

• Chapter 6, "CLPPlus commands," alphabetically lists and describes all of the commands that can be used in the CLPPlus interface.

#### System commands

• Chapter 7, "System commands," describes all of the commands, listed alphabetically, that can be entered at an operating system command prompt or in a shell script to access the database manager.

#### DB2 Text Search commands

• Chapter 8, "DB2 Text Search commands," describes all of the Text Search commands, listed alphabetically, that can be entered at an operating system command prompt prefixed with db2ts.

#### Appendixes

• Appendix A, "Naming conventions," describes the conventions used to name objects such as databases and tables.

• Appendix B, "File type modifiers and delimiters," describes the file type modifiers for the load, import and export utilities. In addition, delimiter considerations for moving data is also presented.

## **Highlighting conventions**

The following highlighting conventions are used in this book.

Bold	Indicates commands keywords and other items whose names are
Dold	predefined by the system Commands written in uppercase are CLP
	commanda subaraga commanda suritton in lassaraga ara sustam commanda
	commanus, whereas commanus written in lowercase are system commanus.
Italics	Indicates one of the following:
	<ul> <li>Names or values (variables) that must be supplied by the user</li> </ul>
	• General emphasis
	• The introduction of a new term
	A reference to another source of information
Monospace	Indicates one of the following:
	• Files and directories
	• Information that you are instructed to type at a command prompt or in a window
	• Examples of specific data values
	• Examples of text similar to what might be displayed by the system
	• Examples of system messages
	Samples of programming code

## How to read the syntax diagrams

SQL syntax is described using the structure defined as follows:

Read the syntax diagrams from left to right and top to bottom, following the path of the line.

The ►►— symbol indicates the beginning of a syntax diagram.

The  $\longrightarrow$  symbol indicates that the syntax is continued on the next line.

The ---- symbol indicates that the syntax is continued from the previous line.

The  $\rightarrow$  symbol indicates the end of a syntax diagram.

Syntax fragments start with the — symbol and end with the — symbol.

Required items appear on the horizontal line (the main path).

▶▶—required\_item——

Optional items appear below the main path.

► — required\_item —

If an optional item appears above the main path, that item has no effect on execution, and is used only for readability.

► required\_item \_\_\_\_\_

If you can choose from two or more items, they appear in a stack.

If you *must* choose one of the items, one item of the stack appears on the main path.

► required\_item required\_choice1 required\_choice2

If choosing one of the items is optional, the entire stack appears below the main path.

▶──required\_item─

-optional\_choice1--optional\_choice2-

#### How to read the syntax diagrams

If one of the items is the default, it will appear above the main path, and the remaining choices will be shown below.

An arrow returning to the left, above the main line, indicates an item that can be repeated. In this case, repeated items must be separated by one or more blanks.

If the repeat arrow contains a comma, you must separate repeated items with a comma.

A repeat arrow above a stack indicates that you can make more than one choice from the stacked items or repeat a single choice.

Keywords appear in uppercase (for example, FROM). They must be spelled exactly as shown. Variables appear in lowercase (for example, column-name). They represent user-supplied names or values in the syntax.

If punctuation marks, parentheses, arithmetic operators, or other such symbols are shown, you must enter them as part of the syntax.

Sometimes a single variable represents a larger fragment of the syntax. For example, in the following diagram, the variable parameter-block represents the whole syntax fragment that is labeled **parameter-block**:

▶ — *required\_item* | parameter-block |-----

#### parameter-block:

naramator1	
purumeteri	
parameter2parameter3	·
└─parameter4─┘	

Adjacent segments occurring between "large bullets" (•) may be specified in any sequence.

▶ — required\_item—item1 — ● -item2 — ● -item3 — ● -item4 — ▶ ◄

The above diagram shows that item2 and item3 may be specified in either order. Both of the following are valid:

required\_item item1 item2 item3 item4
required\_item item1 item3 item2 item4

How to read the syntax diagrams

Chapter 1. Command line processor (CLP)

## **Command line processor features**

The command line processor operates as follows:

- The CLP command (in either case) is typed at the command prompt.
- The command is sent to the command shell by pressing the ENTER key.
- Output is automatically directed to the standard output device.
- Piping and redirection are supported.
- The user is notified of successful and unsuccessful completion.
- Following execution of the command, control returns to the operating system command prompt, and the user can enter more commands.
- When the CLP is called with a file input option, it will automatically set the CLIENT APPLNAME special register to CLP *filename*.

You can start the command line processor by either:

- typing the db2 command, or,
- on Linux<sup>®</sup> operating systems, click **Main Menu** and, select **IBM DB2** → **Command Line Processor**.

Certain CLP commands and SQL statements require that the server instance is running and a database connection exists. Connect to a database by doing one of the following:

• Issue the SQL statement:

db2 connect to  ${\it database}$ 

• Establish an implicit connection to the default database defined by the DB2 registry variable **DB2DBDFT**.

If a command exceeds the character limit allowed at the command prompt, a backslash (\) can be used as the line continuation character. When the command line processor encounters the line continuation character, it reads the next line and concatenates the characters contained on both lines. Alternatively, the **-t** option can be used to set a different line termination character.

The command line processor recognizes a string called NULL as a null string. Fields that have been set previously to some value can later be set to NULL. For example,

db2 update database manager configuration using tm\_database NULL

sets the **tm\_database** field to NULL. This operation is case sensitive. A lowercase null is not interpreted as a null string, but rather as a string containing the letters null.

#### **Customizing the Command Line Processor**

It is possible to customize the interactive input prompt by using the **DB2\_CLPPROMPT** registry variable. This registry variable can be set to any text string of maximum length 100 and can contain the tokens %i, %ia, %d, %da and %n. Specific values will be substituted for these tokens at run-time.

Table 1. DB2\_CLPPROMPT tokens and run-time values

DB2_CLPPROMPT token	Value at run-time
%ia	Authorization ID of the current instance attachment

DB2_CLPPROMPT token	Value at run-time
%i	Local alias of the currently attached instance. If no instance attachment exists, the value of the <b>DB2INSTANCE</b> registry variable. On Windows <sup>®</sup> platforms only, if the <b>DB2INSTANCE</b> registry variable is not set, the value of the <b>DB2INSTDEF</b> registry variable.
%da	Authorization ID of the current database connection
%d	Local alias of the currently connected database. If no database connection exists, the value of the <b>DB2DBDFT</b> registry variable.
%n	New line

Table 1. DB2\_CLPPROMPT tokens and run-time values (continued)

- If any token has no associated value at runtime, the empty string is substituted for that token.
- The interactive input prompt will always present the authorization IDs, database names, and instance names in uppercase, so as to be consistent with the connection and attachment information displayed at the prompt.
- If the DB2\_CLPPROMPT registry variable is changed within CLP interactive mode, the new value of DB2\_CLPPROMPT will not take effect until CLP interactive mode has been closed and reopened.

You can specify the number of commands to be stored in the command history by using the **DB2\_CLPHISTSIZE** registry variable. The HISTORY command lets you access the contents of the command history that you run within a CLP interactive mode session.

You can also specify the editor that is opened when you issue the EDIT command by using the **DB2\_CLP\_EDITOR** registry variable. From a CLP interactive session, the EDIT command opens an editor preloaded with a user-specified command which can then be edited and run.

## **Examples**

If **DB2\_CLPPROMPT** is defined as (%ia@%i, %da@%d), the input prompt will have the following values:

• No instance attachment and no database connection. **DB2INSTANCE** set to DB2. **DB2DBDFT** is not set.

(@DB2, @)

- (Windows) No instance attachment and no database connection. DB2INSTANCE and DB2DBDFT not set. DB2INSTDEF set to DB2.
   (@DB2, @)
- No instance attachment and no database connection. DB2INSTANCE set to DB2. DB2DBDFT set to "SAMPLE".
   (@DB2, @SAMPLE)
- Instance attachment to instance "DB2" with authorization ID "keon14". DB2INSTANCE set to DB2. DB2DBDFT set to "SAMPLE". (KEON14@DB2, @SAMPLE)
- Database connection to database "sample" with authorization ID "horton7". DB2INSTANCE set to DB2. DB2DBDFT set to SAMPLE. (@DB2, HORTON7@SAMPLE)

 Instance attachment to instance "DB2" with authorization ID "keon14". Database connection to database "sample" with authorization ID "horton7".
 DB2INSTANCE set to DB2. DB2DBDFT not set. (KE0N14@DB2, HORTON7@SAMPLE)

## Using the Command Line Processor in command files

CLP requests to the database manager can be imbedded in a shell script command file. The following example shows how to enter the CREATE TABLE statement in a shell script command file:

db2 "create table mytable (name VARCHAR(20), color CHAR(10))"

For more information about commands and command files, see the appropriate operating system manual.

## **Command Line Processor design**

The command line processor consists of two processes: the front-end process (the DB2 command), which acts as the user interface, and the back-end process (db2bp), which maintains a database connection.

#### Maintaining database connections

Each time that db2 is invoked, a new front-end process is started. The back-end process is started by the first db2 invocation, and can be explicitly terminated with TERMINATE. All front-end processes with the same parent are serviced by a single back-end process, and therefore share a single database connection.

For example, the following db2 calls from the same operating system command prompt result in separate front-end processes sharing a single back-end process, which holds a database connection throughout:

- db2 'connect to sample',
- db2 'select \* from org',
- . foo (where foo is a shell script containing DB2 commands), and
- db2 -tf myfile.clp

The following invocations from the same operating system prompt result in separate database connections because each has a distinct parent process, and therefore a distinct back-end process:

- foo
- . foo &
- foo &
- sh foo

#### Communication between front-end and back-end processes

The front-end process and back-end processes communicate through three message queues: a request queue, an input queue, and an output queue.

#### **Environment variables**

The following environment variables offer a means of configuring communication between the two processes:

Variable	Minimum	Maximum	Default
DB2BQTIME	1 second	5294967295	1 second
DB2BQTRY	0 tries	5294967295	60 tries
DB2RQTIME	1 second	5294967295	5 seconds
DB2IQTIME	1 second	5294967295	5 seconds

#### **DB2BQTIME**

When the command line processor is invoked, the front-end process checks if the back-end process is already active. If it is active, the front-end process reestablishes a connection to it. If it is not active, the front-end process activates it. The front-end process then idles for the duration specified by the **DB2BQTIME** variable, and checks again. The front-end process continues to check for the number of times specified by the **DB2BQTRY** variable, after which, if the back-end process is still not active, it times out and returns an error message.

#### **DB2BQTRY**

Works in conjunction with the **DB2BQTIME** variable, and specifies the number of times the front-end process tries to determine whether the back-end process is active.

The values of **DB2BQTIME** and **DB2BQTRY** can be increased during peak periods to optimize query time.

#### **DB2RQTIME**

Once the back-end process has been started, it waits on its request queue for a request from the front-end. It also waits on the request queue between requests initiated from the command prompt.

The **DB2RQTIME** variable specifies the length of time the back-end process waits for a request from the front-end process. At the end of this time, if no request is present on the request queue, the back-end process checks whether the parent of the front-end process still exists, and terminates itself if it does not exist. Otherwise, it continues to wait on the request queue.

#### **DB2IQTIME**

When the back-end process receives a request from the front-end process, it sends an acknowledgment to the front-end process indicating that it is ready to receive input via the input queue. The back-end process then waits on its input queue. It also waits on the input queue while a batch file (specified with the **-f** option) is executing, and while the user is in interactive mode.

The **DB2IQTIME** variable specifies the length of time the back-end process waits on the input queue for the front-end process to pass the commands. After this time has elapsed, the back-end process checks whether the front-end process is active, and returns to wait on the request queue if the front-end process no longer exists. Otherwise, the back-end process continues to wait for input from the front-end process.

To view the values of these environment variables, use LIST COMMAND OPTIONS.

The back-end environment variables inherit the values set by the front-end process at the time the back-end process is initiated. However, if the front-end environment variables are changed, the back-end process will not inherit these changes. The back-end process must first be terminated, and then restarted (by issuing the db2 command) to inherit the changed values.

An example of when the back-end process must be terminated is provided by the following scenario:

- 1. User A logs on, issues some CLP commands, and then logs off without issuing TERMINATE.
- 2. User B logs on using the same window.
- **3**. When user B issues certain CLP commands, they fail with message DB21016 (system error).

The back-end process started by user A is still active when user B starts using the CLP, because the parent of user B's front-end process (the operating system window from which the commands are issued) is still active. The back-end process attempts to service the new commands issued by user B; however, user B's front-end process does not have enough authority to use the message queues of the back-end process, because it needs the authority of user A, who created that back-end process. A CLP session must end with a TERMINATE command before a user starts a new CLP session using the same operating system window. This creates a fresh back-end process for each new user, preventing authority problems, and setting the correct values of environment variables (such as **DB2INSTANCE**) in the new user's back-end process.

### CLP usage notes

Commands can be entered either in uppercase or in lowercase from the command prompt. However, parameters that are case sensitive to DB2 must be entered in the exact case desired. For example, the *comment-string* in the **WITH** clause of the CHANGE DATABASE COMMENT command is a case sensitive parameter.

Delimited identifiers are allowed in SQL statements.

Special characters, or metacharacters (such as \$ & \* (); <>? \ '") are allowed within CLP commands. If they are used outside the CLP interactive mode, or the CLP batch input mode, these characters are interpreted by the operating system shell. Quotation marks or an escape character are required if the shell is not to take any special action.

For example, when executed inside an AIX<sup>®</sup> Korn shell environment,

db2 select \* from org where division > 'Eastern'

is interpreted as "select <the names of all files> from org where division". The result, an SQL syntax error, is redirected to the file Eastern. The following syntax produces the correct output:

db2 "select \* from org where division > 'Eastern'"

Special characters vary from platform to platform. In the AIX Korn shell, the above example could be rewritten using an escape character (\), such as  $\times$ , >, or  $\cdot$ .

Most operating system environments allow input and output to be redirected. For example, if a connection to the SAMPLE database has been made, the following request queries the STAFF table, and sends the output to a file named staflist.txt in the mydata directory:

db2 "select \* from staff" > mydata/staflist.txt

For environments where output redirection is not supported, CLP options can be used. For example, the request can be rewritten as

db2 -r mydata\staflist.txt "select \* from staff"

db2 -z mydata\staflist.txt "select \* from staff"

The command line processor is not a programming language. For example, it does not support host variables, and the statement,

db2 connect to :HostVar in share mode

is syntactically incorrect, because :HostVar is not a valid database name.

The command line processor represents SQL NULL values as hyphens (-). If the column is numeric, the hyphen is placed at the right of the column. If the column is not numeric, the hyphen is at the left.

To correctly display the national characters for single byte (SBCS) languages from the DB2 command line processor window, a True Type font must be selected. For example, in a Windows environment, open the command window properties notebook and select a font such as Lucinda Console.

The command line processor does not support national language support (NLS) characters in file path names. This particularly affects commands such as IMPORT, EXPORT, and REGISTER XMLSCHEMA, where problematic file path names would most frequently be encountered.

Piping the output of a command line processor command into another command line processor command is supported. For example: db2 -x <SQL\_statement> | db2 +p -tv. This support is limited only by the pipe buffer size. Pipe buffer sizes are not configurable. If the pipe buffer size is exceeded by the first command, the command line processor might hang or fail when attempting to write the output to the pipe buffer. If the second command is not a command line processor command, for example a UNIX<sup>®</sup> shell command, a hang or failure will not occur due to the pipe buffer size limitation.

## db2 - Command line processor invocation

The db2 command starts the command line processor (CLP). The CLP is used to execute database utilities, SQL statements and online help. It offers a variety of command options, and can be started in:

- Interactive input mode, characterized by the db2 => input prompt
- · Command mode, where each command must be prefixed by db2
- Batch mode, which uses the -f file input option.

On Windows operating systems, db2cmd opens the CLP-enabled DB2 window, and initializes the DB2 command line environment. Issuing this command is equivalent to clicking on the *DB2 Command Window* icon.

QUIT stops the command line processor. TERMINATE also stops the command line processor, but removes the associated back-end process and frees any memory that is being used. It is recommended that a TERMINATE be issued prior to every STOP DATABASE MANAGER (db2stop) command. It might also be necessary for a TERMINATE to be issued after database configuration parameters have been changed, in order for these changes to take effect. Existing connections should be reset before terminating the CLP.

The shell command (!), allows operating system commands to be executed from the interactive or the batch mode on UNIX based systems, and on Windows operating systems (!1s on UNIX, and !dir on Windows operating systems, for example).

#### Command Syntax

#### option-flag

Specifies a CLP option flag.

#### db2-command

Specifies a DB2 command.

#### sql-statement

Specifies an SQL statement.

? Requests CLP general help.

#### ? phrase

Requests the help text associated with a specified command or topic. If the database manager cannot find the requested information, it displays the general help screen.

#### db2 - Command line processor invocation

? options requests a description and the current settings of the CLP options. ? help requests information about reading the online help syntax diagrams.

#### ? message

Requests help for a message specified by a valid SQLCODE (? sql10007n, for example).

#### ? sqlstate

Requests help for a message specified by a valid SQLSTATE.

#### ? class-code

Requests help for a message specified by a valid class-code.

#### -- comment

Input that begins with the comment characters -- is treated as a comment by the command line processor.

In each case, a blank space must separate the question mark (?) from the variable name.

## Command line processor options

The CLP command options can be specified by setting the command line processor DB2OPTIONS environment variable (which must be in uppercase), or with command line flags.

Users can set options for an entire session using DB2OPTIONS.

View the current settings for the option flags and the value of DB2OPTIONS using LIST COMMAND OPTIONS. Change an option setting from the interactive input mode or a command file using UPDATE COMMAND OPTIONS.

The command line processor sets options in the following order:

- 1. Sets up default options.
- 2. Reads DB2OPTIONS to override the defaults.
- 3. Reads the command line to override DB2OPTIONS.
- 4. Accepts input from UPDATE COMMAND OPTIONS as a final interactive override.

Table 3 summarizes the CLP option flags. These options can be specified in any sequence and combination. To turn an option on, prefix the corresponding option letter with a minus sign (-). To turn an option off, either prefix the option letter with a minus sign and follow the option letter with another minus sign, or prefix the option letter with a plus sign (+). For example, -c turns the auto-commit option on, and either -c- or +c turns it off. These option letters are not case sensitive, that is, -a and -A are equivalent.

Option Flag	Description	Default Setting
-a	This option tells the command line processor to display SQLCA data.	OFF
-с	This option tells the command line processor to automatically commit SQL statements.	ON
-d	This option tells the command line processor to retrieve and display XML declarations of XML data.	OFF
-e{c s}	This option tells the command line processor to display SQLCODE or SQLSTATE. These options are mutually exclusive.	OFF
-f filename	This option tells the command line processor to read command input from a file instead of from standard input.	OFF
-i	This option tells the command line processor to 'pretty print' the XML data with proper indentation. This option will only affect the result set of XQuery statements.	OFF
-1 filename	This option tells the command line processor to log commands in a history file.	OFF
-m	This option tells the command line processor to print the number of rows affected for INSERT/DELETE/UPDATE/MERGE.	OFF
-n	Removes the new line character within a single delimited token. If this option is not specified, the new line character is replaced with a space. This option must be used with the -t option.	OFF

Table 3. CLP Command Options

Option Flag	Description	Default Setting
-0	This option tells the command line processor to display output data and messages to standard output.	ON
-р	This option tells the command line processor to display a command line processor prompt when in interactive input mode.	ON
-q	This option tells the command line processor to preserve whitespaces and linefeeds in strings delimited with single or double quotation marks. When option q is 0N, option n is ignored.	OFF
-r filename	This option tells the command line processor to write the report generated by a command to a file.	OFF
-S	This option tells the command line processor to stop execution if errors occur while executing commands in a batch file or in interactive mode.	OFF
-t	This option tells the command line processor to use a semicolon (;) as the statement termination character.	OFF
-tdx or -tdxx	This option tells the command line processor to define and to use $x$ or $xx$ as the statement termination character or characters (1 or 2 characters in length).	OFF
-V	This option tells the command line processor to echo command text to standard output.	OFF
-W	This option tells the command line processor to display FETCH/SELECT warning messages.	ON
-x	This option tells the command line processor to return data without any headers, including column names. This flag will not affect all commands. It applies to SQL statements and some commands that are based on SQL statements such as LIST TABLES.	OFF
-z filename	This option tells the command line processor to redirect all output to a file. It is similar to the -r option, but includes any messages or error codes with the output.	OFF

Table 3. CLP Command Options (continued)

#### Example

The AIX command:

export DB20PTIONS='+a -c +ec -o -p'

sets the following default settings for the session:

```
Display SQLCA - off
Auto Commit - on
Display SQLCODE - off
Display Output - on
Display Prompt - on
```

The following is a detailed description of these options:

#### Show SQLCA Data Option (-a):

Displays SQLCA data to standard output after executing a DB2 command or an SQL statement. The SQLCA data is displayed instead of an error or success message. The default setting for this command option is OFF (+a or -a-).

The -o and the -r options affect the -a option; see the option descriptions for details.

#### Auto-commit Option (-c):

This option specifies whether each command or statement is to be treated independently. If set ON (-c), each command or statement is automatically committed or rolled back. If the command or statement is successful, it and all successful commands and statements that were issued before it with autocommit OFF (+c or -c-) are committed. If, however, the command or statement fails, it and all successful commands and statements that were issued before it with autocommit OFF are rolled back. If set OFF (+c or -c-), COMMIT or ROLLBACK must be issued explicitly, or one of these actions will occur when the next command with autocommit ON (-c) is issued.

The default setting for this command option is ON.

The auto-commit option does not affect any other command line processor option.

**Example:** Consider the following scenario:

- 1. db2 create database test
- 2. db2 connect to test
- 3. db2 +c "create table a (c1 int)"
- 4. db2 select c2 from a

The SQL statement in step 4 fails because there is no column named C2 in table A. Since that statement was issued with auto-commit ON (default), it rolls back not only the statement in step 4, but also the one in step 3, because the latter was issued with auto-commit OFF. The command:

db2 list tables

then returns an empty list.

#### XML Declaration Option (-d):

The -d option tells the command line processor whether to retrieve and display XML declarations of XML data.

If set ON (-d), the XML declarations will be retrieved and displayed. If set OFF (+d or -d-), the XML declarations will not be retrieved and displayed. The default setting for this command option is OFF.

The XML declaration option does not affect any other command line processor options.

#### Display SQLCODE/SQLSTATE Option (-e):

The  $-e\{c|s\}$  option tells the command line processor to display the SQLCODE (-ec) or the SQLSTATE (-es) to standard output. Options -ec and -es are not valid in CLP interactive mode.

The default setting for this command option is OFF (+e or -e-).

The -o and the -r options affect the -e option; see the option descriptions for details.

The display SQLCODE/SQLSTATE option does not affect any other command line processor option.

**Example:** To retrieve SQLCODE from the command line processor running on AIX, enter:

sqlcode=`db2 -ec +o db2-command`

#### Read from Input File Option (-f):

The -f *filename* option tells the command line processor to read input from a specified file, instead of from standard input. *Filename* is an absolute or relative file name which can include the directory path to the file. If the directory path is not specified, the current directory is used.

When the CLP is called with a file input option, it will automatically set the CLIENT APPLNAME special register to CLP *filename*.

When other options are combined with option -f, option -f must be specified last. For example:

db2 -tvf filename

This option cannot be changed from within the interactive mode.

The default setting for this command option is 0FF (+f or -f-).

Commands are processed until the QUIT command or TERMINATE command is issued, or an end-of-file is encountered.

If both this option and a database command are specified, the command line processor does not process any commands, and an error message is returned.

Input file lines which begin with the comment characters -- are treated as comments by the command line processor. Comment characters must be the first non-blank characters on a line.

Input file lines which begin with (= are treated as the beginning of a comment block. Lines which end with =) mark the end of a comment block. The block of input lines that begins at (= and ends at =) is treated as a continuous comment by the command line processor. Spaces before (= and after =) are allowed. Comments may be nested, and may be used nested in statements. The command termination character (;) cannot be used after =).

If the -f *filename* option is specified, the -p option is ignored.

The read from input file option does not affect any other command line processor option.

#### Pretty Print Option (-i):

The -i option tells the command line processor to 'pretty print' the XML data with proper indentation. This option will only affect the result set of XQuery statements.

The default setting for this command option is OFF (+i or -i-).

The pretty print option does not affect any other command line processor options.

#### Log Commands in History File Option (-l):

The -1 *filename* option tells the command line processor to log commands to a specified file. This history file contains records of the commands executed and their completion status. *Filename* is an absolute or relative file name which can include the directory path to the file. If the directory path is not specified, the current directory is used. If the specified file or default file already exists, the new log entry is appended to that file.

When other options are combined with option -1, option -1 must be specified last. For example:

db2 -tvl filename

The default setting for this command option is 0FF (+1 or -1-).

The log commands in history file option does not affect any other command line processor option.

#### Display Number of Rows Affected Option (-m):

The -m option tells the command line processor whether or not to print the number of rows affected for INSERT, DELETE, UPDATE, or MERGE.

If set ON (-m), the number of rows affected will be displayed for the statement of INSERT/DELETE/UPDATE/MERGE. If set OFF (+m or -m-), the number of rows affected will not be displayed. For other statements, this option will be ignored. The default setting for this command option is OFF.

The -o and the -r options affect the -m option; see the option descriptions for details.

#### Remove New Line Character Option (-n):

Removes the new line character within a single delimited token. If this option is not specified, the new line character is replaced with a space. This option cannot be changed from within the interactive mode.

The default setting for this command option is 0FF (+n or -n-).

This option must be used with the -t option; see the option description for details.

#### **Display Output Option (-o):**

The -o option tells the command line processor to send output data and messages to standard output.

The default setting for this command option is ON.

The interactive mode start-up information is not affected by this option. Output data consists of report output from the execution of the user-specified command, and SQLCA data (if requested).

The following options might be affected by the +0 option:

- -r *filename*: Interactive mode start-up information is not saved.
- -e: SQLCODE or SQLSTATE is displayed on standard output even if +o is specified.
- -a: No effect if +o is specified. If -a, +o and -r*filename* are specified, SQLCA information is written to a file.

If both -o and -e options are specified, the data and either the SQLCODE or the SQLSTATE are displayed on the screen.

If both -0 and -v options are specified, the data is displayed, and the text of each command issued is echoed to the screen.

The display output option does not affect any other command line processor option.

#### **Display DB2 Interactive Prompt Option (-p):**

The -p option tells the command line processor to display the command line processor prompt when the user is in interactive mode.

The default setting for this command option is ON.

Turning the prompt off is useful when commands are being piped to the command line processor . For example, a file containing CLP commands could be executed by issuing:

db2 +p < myfile.clp

The -p option is ignored if the -f *filename* option is specified.

The display DB2 interactive prompt option does not affect any other command line processor option.

#### Preserve Whitespaces and Linefeeds Option (-q):

The -q option tells the command line processor to preserve whitespaces and linefeeds in strings delimited with single or double quotation marks.

The default setting for this command option is 0FF (+q or -q-).

If option -q is ON, option -n is ignored.

#### Save to Report File Option (-r):

The -r *filename* option causes any output data generated by a command to be written to a specified file, and is useful for capturing a report that would otherwise scroll off the screen. Messages or error codes are not written to the file. *Filename* is an absolute or relative file name which can include the directory path to the file. If the directory path is not specified, the current directory is used. New report entries are appended to the file.

The default setting for this command option is OFF (+r or -r-).

If the -a option is specified, SQLCA data is written to the file.

The -r option does not affect the -e option. If the -e option is specified, SQLCODE or SQLSTATE is written to standard output, not to a file.

If -r *filename* is set in DB2OPTIONS, the user can set the +r (or -r-) option from the command line to prevent output data for a particular command invocation from being written to the file.

The save to report file option does not affect any other command line processor option.

#### Stop Execution on Command Error Option (-s):

When commands are issued in interactive mode, or from an input file, and syntax or command errors occur, the -s option causes the command line processor to stop execution and to write error messages to standard output.

The default setting for this command option is 0FF (+s or -s-). This setting causes the command line processor to display error messages, continue execution of the remaining commands, and to stop execution only if a system error occurs (return code 8).

The following table summarizes this behavior:

Table 4. CLP	' Return	Codes	and	Command	Execution
Table 4. CLP	Return	Codes	and	Command	Execution

Return Code	-s Option Set	+s Option Set
0 (success)	execution continues	execution continues
1 (0 rows selected)	execution continues	execution continues
2 (warning)	execution continues	execution continues
4 (DB2 or SQL error)	execution stops	execution continues
8 (System error)	execution stops	execution stops

#### Statement Termination Character Options (-t and -td*x* or -td*xx*):

The -t option tells the command line processor to use a semicolon (;) as the statement termination character, and disables the backslash ( $\setminus$ ) line continuation character. This option cannot be changed from within the interactive mode.

The default setting for this command option is 0FF (+t or -t-).

**Note:** If you use the CLP to issue XQuery statements, it is best to choose a termination character other than the semicolon. This ensures that statements or queries that use namespace declarations are not misinterpreted, since namespace declarations are also terminated by a semicolon.

To define termination characters 1 or 2 characters in length, use -td followed by the chosen character or characters. For example, -td%% sets %% as the statement termination characters. Alternatively, use the --#SET TERMINATOR directive in an input file to set the statement termination characters. For example:

db2 -td%% -f file1.txt

or db2 -f file2.txt

where file2.txt contains the following as the first statement in the file: --#SET TERMINATOR %%

The default setting for this command option is OFF.

The termination character or characters cannot be used to concatenate multiple statements from the command line, since checks for a termination symbol are performed on only the last one or two non-blank characters of each input line.

The statement termination character options do not affect any othercommand line processor option.

#### Verbose Output Option (-v):

The -v option causes the command line processor to echo (to standard output) the command text entered by the user prior to displaying the output, and any messages from that command. ECHO is exempt from this option.

The default setting for this command option is OFF (+v or -v-).

The -v option has no effect if +o (or -o-) is specified.

The verbose output option does not affect any other command line processor option.

#### Show Warning Messages Option (-w):

The -w option instructs the command line processor on whether or not to display warning messages that may occur during a query

(FETCH/SELECT). Warnings can occur during various stages of the query execution which may result in the messages being displayed before, during or after the data is returned. To ensure the data returned does not contain warning message text this flag can be used.

The default setting for this command option is ON.

#### Suppress Printing of Column Headings Option (-x):

The -x option tells the command line processor to return data without any headers, including column names. This flag will not affect all commands. It applies to SQL statements and some commands that are based on SQL statements such as LIST TABLES.

The default setting for this command option is 0FF.

#### Save all Output to File Option (-z):

The -z *filename* option causes all output generated by a command to be written to a specified file, and is useful for capturing a report that would otherwise scroll off the screen. It is similar to the -r option; in this case, however, messages, error codes, and other informational output are also written to the file. *Filename* is an absolute or relative file name which can include the directory path to the file. If the directory path is not specified, the current directory is used. New report entries are appended to the file.

The default setting for this command option is 0FF (+z or -z-).

If the -a option is specified, SQLCA data is written to the file.

The -z option does not affect the -e option. If the -e option is specified, SQLCODE or SQLSTATE is written to standard output, not to a file.

If -z *filename* is set in DB2OPTIONS, the user can set the +z (or -z-) option from the command line to prevent output data for a particular command invocation from being written to the file.

The save all output to file option does not affect any other command line processor option.

## Command line processor return codes

When the command line processor finishes processing a command or an SQL statement, it returns a return (or exit) code. These codes are transparent to users executing CLP functions from the command line, but they can be retrieved when those functions are executed from a shell script.

For example, the following Bourne shell script executes the GET DATABASE MANAGER CONFIGURATION command, then inspects the CLP return code:

```
db2 get database manager configuration
if [ "$?" = "0" ]
then echo "OK!"
fi
```

The return code can be one of the following:

#### Code Description

- 0 DB2 command or SQL statement executed successfully
- 1 SELECT or FETCH statement returned no rows
- 2 DB2 command or SQL statement warning
- 4 DB2 command or SQL statement error
- 8 Command line processor system error

The command line processor does not provide a return code while a user is executing statements from interactive mode, or while input is being read from a file (using the -f option).

A return code is available only after the user quits interactive mode, or when processing of an input file ends. In these cases, the return code is the logical OR of the distinct codes returned from the individual commands or statements executed to that point.

For example, if a user in interactive mode issues commands resulting in return codes of 0, 1, and 2, a return code of 3 will be returned after the user quits interactive mode. The individual codes 0, 1, and 2 are not returned. Return code 3 tells the user that during interactive mode processing, one or more commands returned a 1, and one or more commands returned a 2.

A return code of 4 results from a negative SQLCODE returned by aDB2 command or an SQL statement. A return code of 8 results only if the command line processor encounters a system error.

If commands are issued from an input file or in interactive mode, and the command line processor experiences a system error (return code 8), command execution is halted immediately. If one or more DB2 commands or SQL statements end in error (return code 4), command execution stops if the -s (Stop Execution on Command Error) option is set; otherwise, execution continues.

## Invoking command help from the command line processor

Command help explains the syntax of commands in the command line processor.

To invoke command help, open the command line processor and enter: ? *command* 

where *command* represents a keyword or the entire command. For example, ? catalog displays help for all of the CATALOG commands, while ? catalog database displays help only for the CATALOG DATABASE command.

## Invoking message help from the command line processor

Message help describes the cause of a message and describes any action you should take in response to the error.

To invoke message help, open the command line processor and enter: ? *XXXnnnnn* 

where *XXXnnnnn* represents a valid message identifier. For example, ? SQL30081 displays help about the SQL30081 message. Invoking message help from the command line processor

# Chapter 2. Using command line SQL statements and XQuery statements

This section provides information about using Structured Query Language (SQL) statements from the command line. These statements can be executed directly from an operating system command prompt, and can be used to define and manipulate information stored in a database table, index, or view in much the same way as if the commands were written into an application program. Information can be added, deleted, or updated, and reports can be generated from the contents of tables.

You can use SQL statements from the command line, and you can use a stored procedure (SYSPROC.ADMIN\_CMD()) to run some CLP commands through SQL. For more information on how to use this stored procedure, refer to the SQL Administrative Routines.

To issue XQuery statements in CLP, prefix the statements with the XQUERY keyword.

**Note:** If you use the CLP to issue XQuery statements, it is best to choose a termination character other than the semicolon (-t option). This ensures that statements or queries that use namespace declarations are not misinterpreted, since namespace declarations are also terminated by a semicolon.

All SQL statements that can be executed through the command line processor are listed in the CLP column of Table 5 on page 25. The syntax of all the SQL statements, whether executed from the command line or embedded in a source program, is described in the SQL Reference. The syntax of many embedded SQL statements and CLP SQL statements is identical. However, host variables, parameter markers, descriptor names, and statement names are applicable only to embedded SQL. The syntax of CALL, CLOSE, CONNECT, DECLARE CURSOR, FETCH, and OPEN *does* depend on whether these statements are embedded or executed through the CLP. The CLP syntax of these statements is provided below:

CALL

►►—CLOSE—cursor-name-

CONNECT

## Using command line SQL statements and XQuery statements

►►—CONNECT—	İ		•4
	_TOserver_name_		
		└┥ lock-block ┝┘ └┥ authorization ┝┘	
	- KLSLI	(1)	
	authorization	<sup> </sup>	

#### authorization:

USED authorization name	
	•

	SINGnassword_		
_0.	51NG—pussworu–		
		└─NEW── <i>password</i> ──CONFIRM── <i>password</i> ─┘	
	ANGE PASSWORD		

#### lock-block:

#### Notes:

1 This form is only valid if implicit connect is enabled.

#### **DECLARE CURSOR**

►► DECLARE cursor-name URSOR
WITH HOLD
▶
DATABASE—dbname—
└─USER <i>──user─</i> ─USING <i>──password</i> ─┘
►-FORselect-statement
└─XQUERY <i>──xquery-statement</i> ─┘
FETCH
►► FETCH cursor-name ►
LOB——COLUMN———ALL—INTO— <i>filename</i> ———APPEND————

-APPEND -NEW-----OVERWRITE-

►►—OPEN—cursor-name-

#### Note:

- 1. When CALL is issued:
  - An expression must be used for each IN or INOUT parameter of the procedure. For an INOUT parameter, the expression must be a single literal value. The INOUT XML parameters must be either NULL (if nullable) or in the following format: XMLPARSE(DOCUMENT *string*). Note that the *string* in the argument for XMLPARSE must be a string literal and is subject to the CURRENT IMPLICIT XMLPARSE OPTION special register. It cannot be an expression.
  - A question mark (?) must be used for each OUT parameter of the procedure.
  - The stored procedure must be cataloged. If an uncataloged procedure is called, a SQL0440N error message is returned.

The following CLP script creates a procedure called PROC4 after it creates a table with an XML column *C1*. It uses three XML parameters: IN (*PARM1*), INOUT (*PARM2*) and OUT (*PARM3*), and returns a result set with XML data.

```
CREATE TABLE TAB4(C1 XML)
CREATE PROCEDURE PROC4(IN PARM1 XML, INOUT PARM2 XML, OUT PARM3 XML)
LANGUAGE SQL
BFGIN
   DECLARE STMT CLOB(1M) DEFAULT '';
   DECLARE C1 CURSOR WITH RETURN FOR S1;
   SET STMT = 'SELECT C1 FROM TAB4';
   /* INSERT PARM1 */
   INSERT INTO TAB4 VALUES(PARM1);
   /* MANIPULATE PARM2 */
   /* SET PARM3 AND INSERT */
   SET PARM3 = XMLPARSE(DOCUMENT '<a>333</a>');
   INSERT INTO TAB4 VALUES(PARM3);
   /* RETURN A RESULT SET WITH XML DATA */
   PREPARE S1 FROM STMT;
   OPEN C1;
END
```

To call the procedure PROC4 from the command line processor, issue a CALL statement:

CALL PROC4(XMLPARSE(DOCUMENT '<a>111</a>'), XMLPARSE(DOCUMENT '<a>222</a>'), ?)

**2**. The CLP version of CONNECT permits the user to change the password, using the following parameters:

#### **NEW** password

Specifies the new password that is to be assigned to the user name. Passwords can be up to 18 characters in length. The system on which the password will be changed depends on how user authentication has been set up.

#### **CONFIRM** *password*

A string that must be identical to the new password. This parameter is used to catch entry errors.

#### **CHANGE PASSWORD**

If this option is specified, the user is prompted for the current

password, a new password, and for confirmation of the new password. Passwords are not displayed at entry.

- **3**. The DATABASE clause in the DECLARE CURSOR statement is only applicable when the cursor is being used for a subsequent load from cursor operation.
- 4. To use the DECLARE CURSOR statement with an XQuery statement, users must prefix the XQuery statement with the keyword XQUERY explicitly.
- 5. When FETCH is issued through the command line processor, decimal and floating-point numbers are displayed with the territory's decimal delimiter, that is, a period (.) in the U.S., Canada, and the U.K.; a comma (,) in most other countries/regions. However, when INSERT, UPDATE, CALL, and other SQL statements are issued through the command line processor to update tables, a period must be used as the decimal delimiter, even in countries/regions that use a comma for that purpose.
- 6. When FETCH is issued through the command line processor, null values are typically displayed as a hyphen (-). For databases configured with DFT\_SQLMATHWARN YES, expressions that result in an arithmetic error are processed as null values. Such arithmetic error nulls are displayed as a plus (+).

For example, create and populate table t1 as follows:

create table t1 (i1 int , i2 int); insert into t1 values (1,1),(2,0),(3,null);

The statement: select i1/i2 from t1 generates the following result:

```
1
---
1
+
-
3 records selected
```

- 7. A new LOB option has been added to FETCH. If the LOB clause is specified, only the next row is fetched:
  - When SELECT is issued through the command line processor to query tables containing LOB columns, all columns are truncated to 8KB in the output.
  - Each LOB column value is fetched into a file with the name *filename.xxx*, where *filename* is specified in the LOB clause, and *xxx* is a file extension from 001 to 999 (001 is the first LOB column in the select list of the corresponding DECLARE CURSOR statement, 002 is the second LOB column, and 999 is the 999th column). The maximum number of LOB columns that can be fetched into files is 999.
  - Names of the files containing the data are displayed in the LOB columns.
  - **8**. The command line processor displays BLOB columns in hexadecimal representation.
  - **9**. SQL statements that contain references to structured type columns cannot be issued if an appropriate transform function is not available.
- **10.** A CLP imposed limit of 64K for SQL statements and for CLP commands that contain SQL statement components has now been removed.
- 11. XML data, retrieved via SELECT, CALL or XQuery, is truncated to 4000 bytes in the output.

To change the way that the CLP displays data (when querying databases using SQL statements through the CLP), rebind the CLP bind files against the database being queried. For example, to display date and time in ISO format, do the following:

- 1. Create a text file containing the names of the CLP bind files. This file is used as the list file for binding multiple files with one BIND command. In this example the file is named clp.lst, and its contents are:
  - db2clpcs.bnd + db2clprr.bnd + db2clpur.bnd + db2clprs.bnd + db2clpns.bnd
- 2. Connect to the database.
- **3**. Issue the following command:

db2 bind @clp.lst collection nullid datetime iso

Table 5. SQL Statements (DB2) (continued)

Notes:

- 1. You can code all statements in this list as static SQL, but only those marked with X as dynamic SQL.
- 2. You cannot execute this statement.
- 3. An X indicates that you can execute this statement using either SQLExecDirect() or SQLPrepare() and SQLExecute(). If there is an equivalent DB2 CLI function, the function name is listed.
- 4. Although this statement is not dynamic, with DB2 CLI you can specify this statement when calling either SQLExecDirect(), or SQLPrepare() and SQLExecute().
- 5. You can only use this within CREATE TRIGGER statements.
- 6. You can only use the SQL DESCRIBE statement to describe output, whereas with DB2 CLI you can also describe input (using the SQLDescribeParam() function).
- 7. You can only use the SQL FETCH statement to fetch one row at a time in one direction, whereas with the DB2 CLI SQLExtendedFetch() and SQLFetchScroll() functions, you can fetch into arrays. Furthermore, you can fetch in any direction, and at any position in the result set.
- 8. The DESCRIBE SQL statement has a different syntax than that of the CLP DESCRIBE command.
- 9. Statement is supported only for federated database servers.
- 10. SQL procedures can only issue CREATE and DROP statements for indexes, tables, and views.

# Chapter 3. Command line processor plus (CLPPlus)

Command line processor plus (CLPPlus) provides a command line user interface that you can use to connect databases and to define, edit, and run statements, scripts, and commands.

CLPPlus includes the following features:

- Support for establishing connections to databases when a database user ID and password are provided.
- A buffer that can be used to store scripts, script fragments, SQL statements, SQL PL statements, or PL/SQL statements for editing and then execution. Text in the buffer can be listed, printed, edited, or run as a batch script.
- A comprehensive set of processor commands can be used to define variables and strings that can be stored in the buffer.
- A set of commands that retrieve information about the database and database objects.
- Ability to store buffers or buffer output to a file.
- Multiple options for formatting the output of scripts and queries.
- Support for executing system-defined routines.
- Support for executing operating system commands.
- Option for recording the output of executed commands, statements, or scripts.

The CLPPlus provides a complement to the functions provided by the command line processor (CLP).

## Installing CLPPlus on existing IBM data server clients

CLPPlus, is not installed on all IBM data server clients by default. If your IBM data server client installation did not include CLPPlus, you can install and configure it later.

Ensure that an SDK or a JRE for Java<sup>™</sup>, Version 1.5.0 or later, is installed. For all IBM data server clients except IBM Data Server Runtime Client and IBM Data Server Driver Package, the IBM data server client installation process automatically installs the SDK for Java, Version 5.

To install and configure CLPPlus on an existing IBM data server client:

- 1. Ensure that the **JAVA\_HOME** environment variable is set to the Java installation directory on your system.
- 2. Ensure that the **PATH** environment variable setting includes the *Java installation directory*/bin directory on your system.
- 3. Add the clpplus.jar, jline-0.9.93.jar and db2jcc.jar files to the **CLASSPATH** environment variable setting. If CLPPlus fails to find these files, it displays error messages for the files and does not start.

## Starting CLPPlus

CLPPlus must be started before any CLPPlus commands can be run.

## Starting CLPPlus

- CLPPlus might not be installed and set up on an existing IBM data server client. CLPPlus is set up for use with all other DB2 V9.7 products.
- Read the CLPPLUS command topic.

To start CLPPlus, use one of the following:

- On Windows, Linux, or UNIX operating systems, use a command:
  - 1. In the command line processor (CLP) or DB2 Command Window, run the CLPPLUS command without specifying a password. For example, to start CLPPlus and attempt to connect to a database named SAMPLE on the local host by using user ID db2admin and port number 50000, issue the following command:

clpplus db2admin@localhost:50000/sample

- 2. Enter your password. Using the command in 1) as an example, if a valid password for db2admin is entered, the following is displayed: C:\DB2\9.7\db2 > clpplus db2admin@localhost:50000/sample Connected to SAMPLE v 9.7 AS db2admin SQL>
- On Windows operating systems, use a menu option:
  - 1. Click Start > IBM DB2 > CLPPlus.
  - 2. Specify your user ID and connection information.
- On Linux operating systems, use a menu option:
  - 1. Click Main Menu → IBM DB2 → Command Line Processor Plus.
  - 2. Specify your user ID and connection information.

The CLPPlus prompt (SQL>) is available, and you are connected to the specified database.

You can now use CLPPlus commands and related features. Specify the commands at the CLPPlus prompt.

To end the CLPPLus session, issue the EXIT or QUIT CLPPlus command.

## **CLPPLUS** command

Starts command line processor plus (CLPPlus). After starting CLPPlus, you can issue CLPPlus commands, connect to databases, define and run SQL statements and database commands, and run scripts that contain SQL statement and commands.

### Invocation

You must run this command from the operating system command prompt.

### Authorization

None

#### **Required connection**

None

### **Command Syntax**

#### connection\_identifier:

### **Command parameters**

#### -verbose

Sets verbose on. When verbose is set on all CLPPlus messages are printed to the console.

#### -nw

Specifies that the CLPPlus session will be started in the current command line window.

/ Specifies the current operating system login user ID is used to connect to the database.

#### user

Specifies the user ID to connect to the database.

#### password

Specifies the password that corresponds to the user ID.

#### hostname

Specifies the name of the computer on which the database is located. For example, for a computer named ascender, specify @ascender.

port

Specifies the port number receiving connections on the computer where the database server is installed. The default is 50000.

database

Specifies the database name to which the connection is made. The default is SAMPLE.

dsn\_alias

Specifies that the database connection information be picked up from the db2dsdriver.cfg file from the dsn with alias name *dsn\_alias*. If the specified *dsn\_alias* is not found in the db2dsdriver.cfg file, the string *dsn\_alias* is used as a database name and all other connection parameters are obtained interactively.

script-name

Specifies the name of a script file. If the file is not in the current working directory, you must also include the fully qualified path to the location of the file. The script file can contain SQL statements that are automatically run after you start CLPPlus and establish a database connection.

#### Example

The following examples show how you can use the CLPPLUS command to start the CLPPlus processor and optionally connect to databases.

The following command starts CLPPlus in client mode: clpplus

No database connection is attempted. After issuing this command, to connect to a database, use the CONNECT CLPPlus command.

The following command starts CLPPlus and attempts to connect to a database named SAMPLE on a local host with user ID db2admin and port number 50000: clpplus db2admin@localhost:50000/sample

The following command starts CLPPlus and prompts for a password for the user ID db2admin. If the password is valid, CLPPlus attempts to connect to a database named SAMPLE, which is the default database name.

clpplus db2admin

The following command starts CLPPlus and attempts to connect to a database named SAMPLE with user ID db2admin and password mypassw0rd. If the user ID and password are valid, a database connection is established. The drawback to specifying a password is that the password is displayed on the screen. clpplus db2admin/mypassw0rd

The following command starts CLPPlus and attempts to connect to a database named SAMPLE on the remote machine ascender using port 50000, user ID dbadmin, and password mypassw0rd. If these values are valid, a database connection is established.

clpplus db2admin/mypassw0rd@ascender:50000/sample

The following command starts CLPPlus and attempts to connect to a database named DB on the local computer with user ID db2admin, password mypassw0rd, and the default port number, which is 50000:

clpplus db2admin/mypassw0rd@localhost/db

The following command starts CLPPlus and attempts to connect to a database by first locating a db2dsdriver.cfg file. If one is found, the default\_dsn is read for the host, port, and database values. The current log on ID is used in the connection attempt. If no db2dsdriver.cfg file is found, all required parameters are requested interactively.

clpplus /

The following command starts CLPPlus and attempts to connect to a database by first locating a db2dsdriver.cfg file. If one is found, the default\_dsn is read for the host, port, and database values. The db2admin ID is used in the connection attempt. If no db2dsdriver.cfg file is found, all required parameters are requested interactively.

clpplus db2admin

The following command starts CLPPlus and attempts to connect to a database by fetching the parameters from the data\_dsn alias in the db2dsdriver.cfg file. Since no user ID is specified, the current log on user ID is used. Any parameters that cannot be read are requested interactively.

clpplus /@data\_dsn

The following command starts CLPPlus and attempts to connect to a database by fetching the parameters from the data\_dsn alias in the db2dsdriver.cfg file. The db2admin user ID is used in the connection. Any parameters that cannot be read are requested interactively.

clpplus db2admin@data\_dsn

## CLPPlus console types

As of V9.7 Fix Pack 2, CLPPlus adds a new widow mode to the traditional command line console.

#### Window mode

The new console introduced in V9.7 Fix Pack 2 is a window styled console. When CLPPlus is started with the CLPPLUS command, the window mode console is spawned by default. This new console window has better command editing capabilities. As such, when using CLPPlus in an interactive mode, this window mode might be the preferred console choice.

### Non-window mode

CLPPlus still includes the option of using the non-window mode or traditional command line console. When CLPPlus is started with the CLPPLUS command and the -nw option is specified, the current command line environment is used, that is, no new window is spawned. This might be a preferred choice if you are calling a script file and do not require a spawned console window.

## Connecting to DSN aliases in CLPPlus

As of V9.7 Fix Pack 2, CLPPlus supports connecting to DSN aliases defined in the ds driver configuration file. Prior to this support, only interactive connects were allowed in the CLPPlus interface.

The ds driver configuration file, db2dsdriver.cfg, is an XML file that contains a list of DSN aliases and their properties. It is used to store connection details in one

#### Connecting to DSN aliases in CLPPlus

place. CLPPlus can use that information to automatically connect to a data source instead of interactively asking for all the connection details on every connect attempt.

You can set the *DB2DSDRIVER\_CFG\_PATH* environment variable to point to the db2dsdriver.cfg file.

If *DB2DSDRIVER\_CFG\_PATH* is not set, CLPPlus will search for the configuration file automatically in install-directory/cfg/.

If a configuration file is found and it is readable, CLPPlus will start using it on the subsequent connect attempts.

At this point, a user who attempts a connect is asked for a database name. That database name is treated as a DSN alias and searched in the configuration file. If that DSN alias is found, the connection attributes are read and a password is requested to complete the connection. If the DSN alias is not found, then the host name, port number, user name, and password are requested interactively to go with the original database name, and all information gathered is used to attempt a connection.

### Example

Consider the following db2dsdriver.cfg file contents:

```
<configuration>
<DSN_Collection>
<dsn alias="S" name="SAMPLE" host="9.121.221.159" port="50000">
</dsn>
</DSN_Collection>
<databases>
<databases name="SAMPLE" host="9.121.221.159" port="50000">
<parameter name="UserID" value="john"/>
</database>
</databases>
</configuration>
```

This example shows a connection being established using the contents of the db2dsdriver.cfg file.

First the user sets DB2DSDRIVER\_CFG\_PATH. C:\>set DB2DSDRIVER CFG PATH="C:\john\clpplus\dsdriver.cfg"

Then the user starts a CLPPlus session and attempts a connection to the DSN alias "S".

C:\>clpplus CLPPlus: Version 1.1 Copyright (c) 2009, IBM CORPORATION. All rights reserved.

SQL> connect

Enter Database Name: S Enter Password: \*\*\*\*\*\*\*

```
Local database alias = SAMPLE
Port = 50000
```

SQL>

This next example shows a connection being established when the database name entered is not found as an alias in the db2dsdriver.cfg file.

SQL>

Since "sample" is not found as a DSN alias in the configuration file, the remaining values are requested interactively by CLPPlus and then a connection attempt is made.

## Connecting to DSN aliases using Kerberos authentication in CLPPlus

As of V9.7 Fix Pack 2, CLPPlus supports connecting to DSN aliases using Kerberos authentication as defined in the ds driver configuration file. Prior to this support, only interactive connects were allowed in the CLPPlus interface.

The ds driver configuration file, db2dsdriver.cfg, is an XML file that contains a list of DSN aliases and their properties. If the **Authentication** property is read for the DSN alias in question, it will be read, and if the value is *kerberos* the Kerberos authentication mechanism will be attempted. For more details on connecting to DSN aliases in CLPPlus, see: "Connecting to DSN aliases in CLPPlus" on page 33.

CLPPlus will not request a Kerberos TGT ticket on its own. It will use the ticket already obtained by the user using other applications or tools.

### Example

Consider the following db2dsdriver.cfg file contents:

```
<configuration>
<DSN_Collection>
<dsn alias="S" name="SAMPLE" host="9.121.221.159" port="50000">
</dsn>
</DSN_Collection>
<databases>
<database name="SAMPLE" host="9.121.221.159" port="50000">
<parameter name="UserID" value="john"/>
</database>
</database>
```

#### Connecting to DSN aliases using Kerberos authentication in CLPPlus

```
<parameters>
  <parameter name="Authentication" value="KERBEROS"/>
  </parameters>
</configuration>
```

This example shows a connection being established using the contents of the db2dsdriver.cfg file which includes reading the **Authentication** parameter value.

The user starts a CLPPlus session and attempts a connection to the DSN alias "S".

```
Database server = DB2/NT SQL09071
SQL authorization ID = john
Local database alias = SAMPLE
Port = 50000
```

```
SQL>
```

## Running a script file in CLPPlus

In CLPPlus, a script file can be run in many ways. You can provide the name of a script file that contains database commands and SQL commands as a token for the CLPPLUS command. You can run a script file using the START CLPPlus command. You can also run a script by copying its contents into the CLPPlus SQL buffer using the GET CLPPlus command and then issuing the RUN CLPPlus command.

This task shows how to run a script with the CLPPLUS command. For other methods, see the related links.

To run a script with the CLPPLUS command:

Run the CLPPLUS command, specifying a script name. For example, consider a script file named dept\_query.sql:

SET PAGESIZE 9999 SET ECHO ON SELECT \* FROM DEPT; EXIT

To run the dept\_query.sql script on the default SAMPLE database on port 50000 with a user name of **db2user** and password **passw0rd**, issue the following command:

clpplus db2user/passw0rd @dept\_query

The dept\_query.sql script file is run after the user connects to the database. When the script is run, the commands SET PAGESIZE and SET ECHO ON and the statement SELECT \* FROM are issued.

The output of the script is as follows. ECHO ON displays the statement that was issued in the script file, and the values of DEPT are displayed up to a page limit of 9999.

C:\DB2\9.7\db2 > clpplus db2user/passw0rd @dept\_query.sql Connected to DB2 v 9.7 (localhost:5444/db2sampl) AS db2user

SQL> SELECT *	FROM dept;	
DEPT	NODNAME	LOC
10	ACCOUNTING	NEW YORK
20	RESEARCH	DALLAS
30	SALES	CHICAGO
4	OPERATIONS	BOSTON
SQL >		

EXIT

## Bind variables in CLPPlus

Bind variables are used in place of literal values. If you issue SQL statements multiple times, you can use bind variables to reduce the number of literal values.

### Authorization

No special authorization is required.

### Declaration

A bind variable can be declared using the following syntax:

►►—VARIABLE—*name*—datatype;—

name

Specifies the name of the bind variable.

#### datatype

Specifies the datatype associated with the bind variable. This can be one of: BOOLEAN, CHARACTER, DATE, DECIMAL, DOUBLE, FLOAT, INTEGER, REAL, SMALLINT, or VARCHAR. As of V9.7 Fix Pack 2 the REFCURSOR datatype is also supported.

-

REFCURSOR is used to receive the **OUT** parameter values of type **CURSOR** in procedures, functions, and anonymous PL/SQL blocks.

#### Scope

Bind variables persist over the duration of a user's CLPPlus session. Once a CLPPlus session has started, bind variables can be declared and used for the duration of that session. When a CLPPlus session is ended, any bind variables are cleared.

### Restrictions

When used in an SQL statement or an anonymous PL/SQL block, a bind variable can appear only once. If the bind variable is used more than once an error from the database server will be returned.

This restrictions applies to the EXECUTE CLPPlus command as well.

#### Example

The following examples show how you can define, initialize, and use bind variables.

The following example declares a bind variable named **:id** with datatype INTEGER:

VARIABLE id INTEGER;

The following example shows a bind variable named **:id** being initialized in a PL/SQL block:

```
BEGIN
:id = 100;
END;
/
```

The following example shows bind variables **:id** and **:lname** being used in a PL/SQL block:

```
BEGIN
SELECT lastname INTO lname FROM employee
WHERE empno = :id;
DBMS_OUTPUT_PUT_LINE('Hello ' || :lname);
END;
/
```

The following example uses the EXECUTE CLPPlus command to execute a single PL/SQL statement to initialize a bind variable named **:id** : EXECUTE :id := 100;

The following example shows the variable **:id** being initialized from a substitution variable *a* (*a* is defined using the DEFINE CLPPlus command): EXECUTE :id := &a;

The following example shows the **:id** bind variable being used in a SELECT statement:

SELECT lastname FROM employee WHERE empno = :id;

The following example shows the **:id** and **:lname** bind variables being used in an UPDATE statement:

UPDATE employee SET lastname = :lname WHERE empno = :id;

## CLPPlus traces and record logging

CLPPlus provides mechanisms for file traces and record logging. CLPPlus supports logging or traces from the CLPPlus client layer and JDBC driver layer.

The IBM Data Server Driver for JDBC and SQLJ and IBM Data Server Driver for ODBC and CLI offer comprehensive tracing facilities. These facilities have been extended to CLPPlus. Trace facilities generate text log files whenever an application accesses a specified driver (CLPPLus Client layer or JDBC Driver layer) using the SET command. These log files provide detailed information about the CLPPlus Client and JDBC:

- functions called by an application
- function contents; including input and output parameters passed to and received from
- function return codes and any error or warning messages generated.

To configure the CLPPlus trace facilities, issue the **SET** command from a CLPPlus command prompt. To enable client layer or driver layer traces, set the **LOGMODE** parameter:

CLPPlus> SET LOGMODE logmode-value

where *logmode-value* indicates whether to perform tracing and for which layer. The default value is NONE, which indicates no tracing is done. Other valid values are CLPPLUS, which traces the client layer, JCC, which traces the JDBC layer, and BOTH, which traces both the client and JDBC layers.

To perform more detailed JDBC tracing, set *logmode-value* to JCC or BOTH, and specify the **JCCLOGMODE** parameter: SET LOGMODE JCC SET JCCLOGMODE *jcclogmode\_value* 

where *jcclogmode\_value* indicates the features to be traced and logged. For more information on valid *jcclogmode\_value* settings, see "SET" on page 659.

## DB2 commands supported by CLPPlus

CLPPlus supports a subset of DB2 commands for database and database manager administration, tuning, and maintenance.

The following supported DB2 commands for CLPPlus include:

- GET DATABASE CONFIGURATION
- GET DATABASE MANAGER CONFIGURATION
- UPDATE DATABASE CONFIGURATION
- UPDATE DATABASE MANAGER CONFIGURATION
- RESET DATABASE CONFIGURATION
- RESET DATABASE MANAGER CONFIGURATION
- LIST PACKAGES
- IMPORT
- EXPORT
- LOAD

## **CLPPlus restrictions**

CLPPlus has certain connection, command, and statement restrictions.

CLPPlus cannot establish database connections with the following DB2 database products:

- DB2 for IBM i
- DB2 Express-C

CLPPlus has the following restrictions on PL/SQL support:

- PL/SQL statement compilation and execution on DB2 Personal Edition is not supported.
- PL/SQL functions and triggers cannot be created in a partitioned database environment.
- The NCLOB data type is not supported for use in PL/SQL statements or in PL/SQL contexts when the database is not defined as a Unicode database. In Unicode databases, the NCLOB data type is mapped to a DB2 DBCLOB data type.
- The XMLTYPE data type is not supported.
- TYPE declaration is not supported in a function, procedure, trigger, or anonymous block.
- The FOR EACH STATEMENT option is not supported for PL/SQL triggers.

CLPPlus Feature	DB2 LUW	DB2 z/OS	IDS
Variable REFCURSOR	Yes	No	No
SERVEROUTPUT	Yes	No	No
EXECUTE	Yes	No	No
LIST PACKAGES	Yes	Yes	No
SHOW ERRORS	Yes	No	No
UPDATE/GET/ RESET DB CFG	Yes	No	No
UPDATE/GET/ RESET DBM CFG	Yes	No	No
EXPORT	Yes	No	No
IMPORT	Yes	No	No
LOAD	Yes	No	No

Table 7. Starting CLPPlus: Issues and solutions (continued)

# Chapter 4. How to read command syntax help

There may be occasions in which you forget the options that are valid for a particular command. All Command Line Processor (CLP) commands can invoke a help screen at the CLP prompt by preceding the command keyword(s) with a question mark (?). For many of the system commands, a summarizing help screen can be displayed by issuing the command keyword followed by a *help* option. The useful command help screen output appearing in the command window uses a syntax convention which is explained here.

## **Invoking help**

#### CLP commands

To display a CLP command help screen, preface the command keyword(s) with a question mark at the db2 interactive mode prompt (db2 =>), as shown in the example below for the BACKUP DATABASE command: db2 => ? backup database

or, outside the 'db2' interactive mode, preface each command help screen invocation with db2, as shown below for the BACKUP DATABASE command:

=> db2 ? backup database

#### System commands

Most of the system commands can display a command help screen by entering the system command keyword followed by a *help* option. Many system commands use a common *help* option, while other system commands may use different and/or additional *help* options. For the first attempts, without having to search for a command's forgotten *help* option just yet, try the following most common options which are likely to result in successfully invoking the command help screen:

*Help* **options** 

- -h
- -?
- -help
- nothing entered after the command keyword.

**Note:** When nothing is entered after the command keyword, in some cases this could actually execute the command if options are not required.

### Help screen syntax conventions

- [] Encloses optional parameters
- { } Encloses mandatory parameters
- Separates two or more items, only one of which may be chosen
- ... Indicates a repeatable parameter
- () Repeatable parameter delimiter (not always used)

Command KEYWORDS appear in uppercase

variables, that require you to determine and enter the appropriate input, appear in lowercase

Example command help screen output

The following is the CLP command help screen for the UPDATE MONITOR SWITCHES command: db2 => ? update monitor

UPDATE MONITOR SWITCHES USING {switch-name {ON | OFF} ...} [AT DBPARTITIONNUM db-partition-number | GLOBAL]

switch-name: BUFFERPOOL, LOCK, SORT, STATEMENT, TABLE, TIMESTAMP, UOW

The following is the system command help screen for the db2look command which, in this case, was not invoked by its specified -h help option:

C:\Program Files\IBM\SQLLIB\BIN>db2look

[-wrapper WrapperName] [-server ServerName][-fedonly] [-nofed]

db2look [-h]

-d: Database Name: This must be specified

-e: Extract DDL file needed to duplicate database

-xs: Export XSR objects and generate a script containing DDL statements

-xdir: Path name: the directory in which XSR objects will be placed

- -u: Creator ID: If -u and -a are both not specified then \$USER will be used
- -z: Schema name: If -z and -a are both specified then -z will be ignored
- -t: Generate statistics for the specified tables
- -tw: Generate DDLs for tables whose names match the pattern criteria (wildcard characters) of the table name
- -ap: Generate AUDIT USING Statements
- -wlm: Generate WLM specific DDL Statements
  - -h: More detailed help message
  - -o: Redirects the output to the given file name
  - -a: Generate statistics for all creators
  - -m: Run the db2look utility in mimic mode -c: Do not generate COMMIT statements for mimic -r: Do not generate RUNSTATS statements for mimic
  - -1: Generate Database Layout: Database partition groups, Bufferpools and Tablespaces
  - -x: Generate Authorization statements DDL excluding the original definer of the object

-xd: Generate Authorization statements DDL including the original definer of the object

-f: Extract configuration parameters and environment variables

-td: Specifies x to be statement delimiter (default is semicolon(;))

-i: User ID to log on to the server where the database resides

-w: Password to log on to the server where the database resides

-noview: Do not generate CREATE VIEW ddl statements

-wrapper: Generates DDLs for federated objects that apply to this wrapper

-server: Generates DDLs for federated objects that apply to this server

- -FEDONLY: Only created Federated DDL Statements
- -nofed: Do not generate Federated DDL
  - -fd: Generates db2fopt statements for opt\_buffpage and opt\_sortheap along with other cfg and env parameters.
  - -v: Generate DDL for view only, this option is ignored when -t is specified
  - -dp: Generate DROP statement before CREATE statement
  - -ct: Generate DDL Statements by object creation time

**Note:** In general, a system command help screen tends to provide more detailed information than a CLP command help screen.

### Example command inputs

Using the UPDATE MONITOR SWITCHES command help screen as an example, db2 => ? update monitor UPDATE MONITOR SWITCHES USING {switch-name {ON | OFF} ...}

```
switch-name:
BUFFERPOOL, LOCK, SORT, STATEMENT, TABLE, TIMESTAMP, UOW
```

[AT DBPARTITIONNUM db-partition-number | GLOBAL]

the following command inputs are valid, UPDATE MONITOR SWITCHES USING LOCK OFF UPDATE MONITOR SWITCHES USING LOCK OFF TIMESTAMP ON UPDATE MONITOR SWITCHES USING STATEMENT ON AT DBPARTITIONNUM 1 UPDATE MONITOR SWITCHES USING SORT ON GLOBAL

while the following command inputs are invalid: UPDATE MONITOR SWITCHES LOCK OFF UPDATE MONITOR SWITCHES USING LOCK GLOBAL UPDATE MONITOR SWITCHES USING STATEMENT ON AT DBPARTITIONNUM 1 GLOBAL

### Reminder

To remind yourself about the command help screen syntax conventions without searching the online Information Center, issue the following command at the CLP prompt: db2 => ? help

or, at the system command prompt, enter the following: => db2 ? help

How to read command syntax help

Chapter 5. CLP commands

## ACTIVATE DATABASE

Activates the specified database and starts up all necessary database services, so that the database is available for connection and use by any application.

### Scope

This command activates the specified database on all nodes within the system. If one or more of these nodes encounters an error during activation of the database, a warning is returned. The database remains activated on all nodes on which the command has succeeded.

### Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint

## **Required connection**

None

### Command syntax

### **Command parameters**

### database-alias

Specifies the alias of the database to be started.

**USER** username

Specifies the user starting the database.

**USING** *password* 

Specifies the password for the user name.

#### Usage notes

If a database has not been started, and a CONNECT TO (or an implicit connect) is issued in an application, the application must wait while the database manager starts the required database, before it can do any work with that database. However, once the database is started, other applications can simply connect and use it without spending time on its start up.

Database administrators can use ACTIVATE DATABASE to start up selected databases. This eliminates any application time spent on database initialization.

Databases initialized by ACTIVATE DATABASE can be shut down using the DEACTIVATE DATABASE command, or using the db2stop command.

If a database was started by a CONNECT TO (or an implicit connect) and subsequently an ACTIVATE DATABASE is issued for that same database, then DEACTIVATE DATABASE must be used to shut down that database. If ACTIVATE DATABASE was not used to start the database, the database will shut down when the last application disconnects.

ACTIVATE DATABASE behaves in a similar manner to a CONNECT TO (or an implicit connect) when working with a database requiring a restart (for example, database in an inconsistent state). The database will be restarted before it can be initialized by ACTIVATE DATABASE. Restart will only be performed if the database is configured to have AUTORESTART ON.

The application issuing the ACTIVATE DATABASE command cannot have an active database connection to any database.

The database can be inaccessible if the database was not explicitly activated, a client application performs frequent reconnections, or the time interval between issuing the DEACTIVATE DATABASE and ACTIVATE DATABASE commands is very short. Activate the database by issuing the ACTIVATE DATABASE command and then attempt to connect to the database.

## ADD CONTACT

Adds a contact to the contact list which can be either defined locally on the system or in a global list. Contacts are users to whom processes such as the Scheduler and Health Monitor send messages.

The setting of the Database Administration Server (DAS) **contact\_host** configuration parameter determines whether the list is local or global.

### Authorization

None

#### **Required connection**

None. Local execution only: this command cannot be used with a remote connection.

### Command syntax

## **Command parameters**

#### ADD CONTACT name

The name of the contact that will be added. By default the contact will be added in the local system, unless the DB2 administration server configuration parameter **contact\_host** points to another system.

TYPE Method of contact, which must be one of the following two:

#### EMAIL

This contact wishes to be notified by e-mail at (**ADDRESS**).

**PAGE** This contact wishes to be notified by a page sent to **ADDRESS**.

#### MAXIMUM PAGE LENGTH pg-length

If the paging service has a message-length restriction, it is specified here in characters.

The notification system uses the SMTP protocol to send the notification to the mail server specified by the DB2 Administration Server configuration parameter **smtp\_server**. It is the responsibility of the SMTP server to send the e-mail or call the pager.

#### **ADDRESS** recipients-address

The SMTP mailbox address of the recipient. For example, joe@somewhere.org. The **smtp\_server** DAS configuration parameter must be set to the name of the SMTP server.

#### **DESCRIPTION** contact description

A textual description of the contact. This has a maximum length of 128 characters.

## ADD CONTACTGROUP

Adds a new contact group to the list of groups defined on the local system. A contact group is a list of users and groups to whom monitoring processes such as the Scheduler and Health Monitor can send messages.

The setting of the Database Administration Server (DAS) **contact\_host** configuration parameter determines whether the list is local or global.

## Authorization

None

## **Required connection**

None. Local execution only: this command cannot be used with a remote connection.

## **Command Syntax**

\_\_\_\_DESCRIPTION\_\_\_\_group description\_\_

## **Command Parameters**

### ADD CONTACTGROUP name

Name of the new contact group, which must be unique among the set of groups on the system.

### **CONTACT** name

Name of the contact which is a member of the group. A contact can be defined with the ADD CONTACT command after it has been added to a group.

#### **GROUP** name

Name of the contact group of which this group is a member.

#### **DESCRIPTION** group description

Optional. A textual description of the contact group.

## ADD DBPARTITIONNUM

Adds a database partition to a database partition server.

### Scope

This command only affects the database partition server on which it is executed.

## Authorization

One of the following:

- sysadm
- sysctrl

## **Required connection**

None

## **Command syntax**

►►—ADD DBPARTITIONNUM-

LIKE DBPARTITIONNUM—*db-partition-number*-WITHOUT TABLESPACES—

## **Command parameters**

#### LIKE DBPARTITIONNUM db-partition-number

Specifies that the containers for the new system temporary table spaces are the same as the containers of the database at the database partition server specified by *db-partition-number*. The database partition server specified must already be defined in the db2nodes.cfg file.

For system temporary table spaces that are defined to use automatic storage (in other words, system temporary table spaces that were created with the MANAGED BY AUTOMATIC STORAGE clause of the CREATE TABLESPACE statement or where no MANAGED BY CLAUSE was specified at all), the containers will not necessarily match those from the partition specified. Instead, containers will automatically be assigned by the database manager based on the storage paths that are associated with the database. This may or may not result in the same containers being used on these two partitions.

#### WITHOUT TABLESPACES

Specifies that containers for the system temporary table spaces are not created for any of the database partitions. The ALTER TABLESPACE statement must be used to add system temporary table space containers to each database partition before the database can be used.

If no option is specified, containers for the system temporary table spaces will be the same as the containers on the catalog partition for each database. The catalog partition can be a different database partition for each database in the partitioned database environment. This option is ignored for system temporary table spaces that are defined to use automatic storage (in other words, system temporary table spaces that were created with the MANAGED BY AUTOMATIC STORAGE clause of the CREATE TABLESPACE statement or where no MANAGED BY CLAUSE was specified at all).

For these table spaces, there is no way to defer container creation. Containers will automatically be assigned by the database manager based on the storage paths that are associated with the database.

### Usage notes

This command should only be used if a database partition server is added to an environment that has one database and that database is not cataloged at the time of the add partition operation. In this situation, because the database is not cataloged, the add partition operation does not recognize the database, and does not create a database partition for the database on the new database partition server. Any attempt to connect to the database must first be cataloged before the ADD DBPARTITIONNUM command can be used to create the database partition for the database partition server.

This command should not be used if the environment has more than one database and at least one of the databases is cataloged at the time of the add partition operation. In this situation, use the AT DBPARTITIONNUM parameter of the CREATE DATABASE command to create a database partition for each database that was not cataloged at the time of the add partition operation. Each uncataloged database must first be cataloged before the CREATE DATABASE command can be used to create the database partition for the database on the new database partition server.

Before adding a new database partition, ensure that there is sufficient storage for the containers that must be created.

The add database partition server operation creates an empty database partition for every database that exists in the instance. The configuration parameters for the new database partitions are set to the default values.

**Note:** Any uncataloged database is not recognized when adding a new database partition. The uncataloged database will not be present on the new database partition. An attempt to connect to the database on the new database partition returns the error message SQL1013N.

If an add database partition server operation fails while creating a database partition locally, it enters a clean-up phase, in which it locally drops all databases that have been created. This means that the database partitions are removed only from the database partition server being added. Existing database partitions remain unaffected on all other database partition servers. If the clean-up phase fails, no further clean up is done, and an error is returned.

The database partitions on the new database partition cannot contain user data until after the ALTER DATABASE PARTITION GROUP statement has been used to add the database partition to a database partition group.

This command will fail if a create database or a drop database operation is in progress. The command can be reissued once the competing operation has completed.

To determine whether or not a database is enabled for automatic storage, ADD DBPARTITIONNUM has to communicate with the catalog partition for each of the databases in the instance. If automatic storage is enabled then the storage path definitions are retrieved as part of that communication. Likewise, if system

### ADD DBPARTITIONNUM

temporary table spaces are to be created with the database partitions, ADD DBPARTITIONNUM might have to communicate with another database partition server to retrieve the table space definitions for the database partitions that reside on that server. The **start\_stop\_time** database manager configuration parameter is used to specify the time, in minutes, by which the other database partition server must respond with the automatic storage and table space definitions. If this time is exceeded, the command fails. If this situation occurs, increase the value of **start\_stop\_time**, and reissue the command.

## Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

## ADD XMLSCHEMA DOCUMENT

Adds one or more XML schema documents to an existing but incomplete XML schema before completing registration.

### Authorization

The following authority is required:

• The user ID must be the owner of the XSR object as recorded in the catalog view SYSCAT.XSROBJECTS.

### **Required connection**

Database

### **Command syntax**

► → ADD XMLSCHEMA DOCUMENT—TO—relational-identifier—

### Description

#### **TO** relational-identifier

Specifies the relational name of a registered but incomplete XML schema to which additional schema documents are added.

#### ADD document-URI

Specifies the uniform resource identifier (URI) of an XML schema document to be added to this schema, as the document would be referenced from another XML document.

#### **FROM** content-URI

Specifies the URI where the XML schema document is located. Only a file scheme URI is supported.

#### **WITH** properties-URI

Specifies the URI of a properties document for the XML schema. Only a file scheme URI is supported.

### COMPLETE

Indicates that there are no more XML schema documents to be added. If specified, the schema is validated and marked as usable if no errors are found.

#### **WITH** schema-properties-URI

Specifies the URI of a properties document for the XML schema. Only a file scheme URI is supported.

#### **ENABLE DECOMPOSITION**

Specifies that this schema is to be used for decomposing XML documents.

## Example

ADD XMLSCHEMA DOCUMENT TO JOHNDOE.PRODSCHEMA ADD 'http://myPOschema/address.xsd' FROM 'file:///c:/TEMP/address.xsd'

# **ARCHIVE LOG**

Closes and truncates the active log file for a recoverable database.

## Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- dbadm

## **Required connection**

None. This command establishes a database connection for the duration of the command.

## **Command syntax**

## **Command parameters**

**DATABASE** database-alias

Specifies the alias of the database whose active log is to be archived.

**USER** *username* 

Identifies the user name under which a connection will be attempted.

#### **USING** password

Specifies the password to authenticate the user name.

#### ON ALL DBPARTITIONNUMS

Specifies that the command should be issued on all database partitions in the db2nodes.cfg file. This is the default if a database partition number clause is not specified.

#### EXCEPT

Specifies that the command should be issued on all database partitions in the db2nodes.cfg file, except those specified in the database partition number list.

#### ON DBPARTITIONNUM | ON DBPARTITIONNUMS

Specifies that the logs should be archived for the specified database on a set of database partitions.

#### db-partition-number

Specifies a database partition number in the database partition number list.

**TO** *db-partition-number* 

Used when specifying a range of database partitions for which the logs should be archived. All database partitions from the first database partition number specified up to and including the second database partition number specified are included in the database partition number list.

#### Usage notes

This command can be used to collect a complete set of log files up to a known point. The log files can then be used to update a standby database.

This command can only be executed when the invoking application or shell does not have a database connection to the specified database. This prevents a user from executing the command with uncommitted transactions. As such, the ARCHIVE LOG command will not forcibly commit the user's incomplete transactions. If the invoking application or shell already has a database connection to the specified database, the command will terminate and return an error. If another application has transactions in progress with the specified database when this command is executed, there will be a slight performance degradation since the command flushes the log buffer to disk. Any other transactions attempting to write log records to the buffer will have to wait until the flush is complete.

If used in a partitioned database environment, a subset of database partitions can be specified by using a database partition number clause. If the database partition number clause is not specified, the default behavior for this command is to close and archive the active log on all database partitions.

Using this command will use up a portion of the active log space due to the truncation of the active log file. The active log space will resume its previous size when the truncated log becomes inactive. Frequent use of this command can drastically reduce the amount of the active log space available for transactions.

The ARCHIVE LOG command is asynchronous. When you issue the ARCHIVE LOG command, the log is closed, making it viable for archiving. The log is not archived immediately; there might be a delay between the time when you submit the command and the time when the log is archived. Archiving itself of the log is done by the db2logmgr process. This delay is particularly apparent if you deactivate a database immediately after issuing the ARCHIVE LOG command. The
log may not archive until the next database activation.

# Compatibilities

For compatibility with versions earlier than Version 8:

- The keyword NODE can be substituted for DBPARTITIONNUM.
- The keyword NODES can be substituted for DBPARTITIONNUMS.

# ATTACH

Enables an application to specify the instance at which instance-level commands (CREATE DATABASE and FORCE APPLICATION, for example) are to be executed. This instance can be the current instance, another instance on the same workstation, or an instance on a remote workstation.

## Authorization

None

# **Required connection**

None. This command establishes an instance attachment.

## Command syntax

►►—ATTACH—	ename	
►USER—username	_USING—password—	
		J

# **Command parameters**

#### **TO** nodename

Alias of the instance to which the user wants to attach. This instance must have a matching entry in the local node directory. The only exception to this is the local instance (as specified by the **DB2INSTANCE** environment variable) which can be specified as the object of an attach, but which cannot be used as a node name in the node directory.

#### **USER** username

Specifies the authentication identifier. When attaching to a DB2 database instance on a Windows operating system, the user name can be specified in a format compatible with Microsoft<sup>®</sup> Security Account Manager (SAM). The qualifier must be a flat-style (NetBIOS-like) name, which has a maximum length of 15 characters. For example, *domainname\username*.

#### **USING** password

Specifies the password for the user name. If a user name is specified, but a password is *not* specified, the user is prompted for the current password. The password is not displayed at entry.

#### **NEW** password

Specifies the new password that is to be assigned to the user name. The system on which the password will be changed depends on how user authentication has been set up. The DB2 database system provides support for changing passwords on AIX, Linux and Windows operating systems, and supports up to 255 characters for your own written plugins. See *Password rules* for additional information about passwords.

#### **CONFIRM** password

A string that must be identical to the new password. This parameter is used to catch entry errors.

### **CHANGE PASSWORD**

If this option is specified, the user is prompted for the current password, a new password, and for confirmation of the new password. Passwords are not displayed at entry.

# Examples

Catalog two remote nodes:

db2 catalog tcpip node nodel remote freedom server server1 db2 catalog tcpip node node2 remote flash server server1

Attach to the first node, force all users, and then detach:

```
db2 attach to node1
db2 force application all
db2 detach
```

Attach to the second node, and see who is on:

db2 attach to node2
db2 list applications

After the command returns agent IDs 1, 2 and 3, force 1 and 3, and then detach:

```
db2 force application (1, 3)
db2 detach
```

Attach to the current instance (not necessary, will be implicit), force all users, then detach (AIX only):

```
db2 attach to $DB2INSTANCE
db2 force application all
db2 detach
```

# **Usage notes**

If *nodename* is omitted from the command, information about the current state of attachment is returned.

If ATTACH has not been executed, instance-level commands are executed against the current instance, specified by the **DB2INSTANCE** environment variable.

# AUTOCONFIGURE

Calculates and displays initial values for the buffer pool size, database configuration and database manager configuration parameters, with the option of applying these recommended values.

# **Authorization**

SYSADM

## **Required connection**

Database

## Command syntax

# **Command parameters**

**USING** input-keyword param-value

Table 8. Valid input keywords and parameter values

		Default	
Keyword	Valid values	value	Explanation
mem_percent	1–100	25	Percentage of instance memory that is assigned to the database. However, if the CREATE DATABASE command invokes the configuration advisor and you do not specify a value for <b>mem_percent</b> , the percentage is calculated based on memory usage in the instance and the system up to a maximum of 25% of the instance memory.
workload_type	simple, mixed, complex	mixed	Simple workloads tend to be I/O intensive and mostly transactions, whereas complex workloads tend to be CPU intensive and mostly queries.
num_stmts	1-1 000 000	10	Number of statements per unit of work
tpm	1-200 000	60	Transactions per minute
admin_priority	performance, recovery, both	both	Optimize for better performance (more transactions per minute) or better recovery time
is_populated	yes, no	yes	Is the database populated with data?
num_local_apps	0-5 000	0	Number of connected local applications
num_remote_ apps	0-5 000	10	Number of connected remote applications

Keyword	Valid values	Default value	Explanation
isolation	RR, RS, CS, UR	RR	Maximum isolation level of applications connecting to this database (Repeatable Read, Read Stability, Cursor Stability, Uncommitted Read). It is only used to determine values of other configuration parameters. Nothing is set to restrict the applications to a particular isolation level and it is safe to use the default value.
bp_resizeable	yes, no	yes	Are buffer pools resizeable?

Table 8. Valid input keywords and parameter values (continued)

#### APPLY

## **DB ONLY**

Displays the recommended values for the database configuration and the buffer pool settings based on the current database manager configuration. Applies the recommended changes to the database configuration and the buffer pool settings.

## DB AND DBM

Displays and applies the recommended changes to the database manager configuration, the database configuration, and the buffer pool settings.

#### NONE

Displays the recommended changes, but does not apply them.

#### **ON CURRENT NODE**

In a partitioned database environment, the Configuration Advisor updates the database configuration on all nodes by default. Running with the **ON CURRENT NODE** option makes the advisor apply the recommended database configuration to the coordinator (connection) node only.

The buffer pool changes are always applied to the system catalogs. Thus, all nodes are affected. The **ON CURRENT NODE** option does not matter for buffer pool recommendations.

## Usage notes

- This command makes configuration recommendations for the currently connected database and assumes that the database is the only active database on the instance. If you have not enabled the self tuning memory manager and you have more than one active database on the instance, specify a **mem\_percent** value that reflects the database memory distribution. For example, if you have two active databases on the instance that should use 80% of the instance memory and should share the resources equally, specify 40% (80% divided by 2 databases) as the **mem\_percent** value.
- If you have multiple instances on the same computer and the self tuning memory manager is not enabled, you should set a fixed value for instance\_memory on each instance or specify a mem\_percent value that reflects the database memory distribution. For example, if all active databases should use 80% of the computer memory and there are 4 instances each with one database, specify 20% (80% divided by 4 databases) as the mem\_percent value.

 When explicitly invoking the Configuration Advisor with the AUTOCONFIGURE command, the setting of the DB2\_ENABLE\_AUTOCONFIG\_DEFAULT registry variable will be ignored.

# AUTOCONFIGURE

• Running the AUTOCONFIGURE command on a database will recommend enablement of the Self Tuning Memory Manager. However, if you run the AUTOCONFIGURE command on a database in an instance where **sheapthres** is not zero, sort memory tuning (**sortheap**) will not be enabled automatically. To enable sort memory tuning (**sortheap**), you must set **sheapthres** equal to zero using the UPDATE DATABASE MANAGER CONFIGURATION command. Note that changing the value of **sheapthres** may affect the sort memory usage in your previously existing databases.

# **BACKUP DATABASE**

Creates a backup copy of a database or a table space.

For information on the backup operations supported by DB2 database systems between different operating systems and hardware platforms, see "Backup and restore operations between different operating systems and hardware platforms".

# Scope

In a partitioned database environment, if no database partitions are specified, this command affects only the database partition on which it is executed.

If the option to perform a partitioned backup is specified, the command can be called only on the catalog node. If the option specifies that all database partition servers are to be backed up, it affects all database partition servers that are listed in the db2nodes.cfg file. Otherwise, it affects the database partition servers that are specified on the command.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

# **Required connection**

Database. This command automatically establishes a connection to the specified database.

**Note:** If a connection to the specified database already exists, that connection will be terminated and a new connection established specifically for the backup operation. The connection is terminated at the completion of the backup operation.

# **Command syntax**

# **BACKUP DATABASE**

## Partition number(s):

## **Open sessions:**

## **Options:**

## **Command parameters**

DATABASE | DB database-alias

Specifies the alias of the database to back up.

### **USER** *username*

Identifies the user name under which to back up the database.

## **USING** password

The password used to authenticate the user name. If the password is omitted, the user is prompted to enter it.

#### **ON** Backup the database on a set of database partitions.

**DBPARTITIONNUM** *db-partition-number1* Specifies a database partition number in the database partition list.

**DBPARTITIONNUMS** *db-partition-number1* **TO** *db-partition-number2* Specifies a range of database partition numbers, so that all partitions from *db-partition-number1* up to and including *db-partition-number2* are included in the database partition list.

### ALL DBPARTITIONNUMS

Specifies that the database is to be backed up on all partitions specified in the db2nodes.cfg file.

#### EXCEPT

Specifies that the database is to be backed up on all partitions specified in the db2nodes.cfg file, except those specified in the database partition list.

**DBPARTITIONNUM** *db-partition-number1* 

Specifies a database partition number in the database partition list.

### **DBPARTITIONNUMS** db-partition-number1 **TO**

#### *db-partition-number2*

Specifies a range of database partition numbers, so that all partitions from *db-partition-number1* up to and including *db-partition-number2* are included in the database partition list.

## **TABLESPACE** tablespace-name

A list of names used to specify the table spaces to be backed up.

### ONLINE

Specifies online backup. The default is offline backup. Online backups are only available for databases configured with **logretain** or **userexit** enabled. During an online backup, DB2 obtains IN (Intent None) locks on all tables existing in SMS table spaces as they are processed. S (share locks) are no longer held on LOB data in SMS table spaces during online backup.

## INCREMENTAL

Specifies a cumulative (incremental) backup image. An incremental backup image is a copy of all database data that has changed since the most recent successful, full backup operation.

#### DELTA

Specifies a non-cumulative (delta) backup image. A delta backup image is a copy of all database data that has changed since the most recent successful backup operation of any type.

#### USE

- **TSM** Specifies that the backup is to use Tivoli<sup>®</sup> Storage Manager (TSM) output.
- **XBSA** Specifies that the XBSA interface is to be used. Backup Services APIs (XBSA) are an open application programming interface for applications or facilities needing data storage management for backup or archiving purposes.

## SNAPSHOT

Specifies that a snapshot backup is to be taken.

You cannot use the **SNAPSHOT** parameter with any of the following parameters:

- TABLESPACE
- INCREMENTAL
- WITH num-buffers BUFFERS

- BUFFER
- PARALLELISM
- COMPRESS
- UTIL\_IMPACT\_PRIORITY
- SESSIONS

The default behavior for a snapshot backup is a FULL DATABASE OFFLINE backup of all paths that make up the database including all containers, local volume directory, database path (**DBPATH**), and primary log and mirror log paths (**INCLUDE LOGS** is the default for all snapshot backups unless **EXCLUDE LOGS** is explicitly stated).

## LIBRARY library-name

Integrated into IBM Data Server is a DB2 ACS API driver for the following storage hardware:

- IBM TotalStorage® SAN Volume Controller
- IBM Enterprise Storage Server<sup>®</sup> Model 800
- IBM System Storage<sup>®</sup> DS6000<sup>™</sup>
- IBM System Storage DS8000<sup>®</sup>
- IBM System Storage N Series
- NetApp V-series
- NetApp FAS

If you have other storage hardware, and a DB2 ACS API driver for that storage hardware, you can use the **LIBRARY** parameter to specify the DB2 ACS API driver.

The value of the **LIBRARY** parameter is a fully-qualified library file name.

### **OPTIONS**

"options-string"

Specifies options to be used for the backup operation. The string will be passed exactly as it was entered, without the double quotation marks.

@ file-name

Specifies that the options to be used for the backup operation are contained in a file located on the DB2 server. The string will be passed to the vendor support library. The file must be a fully qualified file name.

You cannot use the **vendoropt** database configuration parameter to specify vendor-specific options for snapshot backup operations. You must use the **OPTIONS** parameter of the backup utilities instead.

#### **OPEN** num-sessions **SESSIONS**

The number of I/O sessions to be created between DB2 and TSM or another backup vendor product. This parameter has no effect when backing up to tape, disk, or other local device.

## TO dir | dev

A list of directory or tape device names. The full path on which the directory resides must be specified. If **USE TSM**, **TO**, and **LOAD** are

omitted, the default target directory for the backup image is the current working directory of the client computer. This target directory or device must exist on the database server.

In a partitioned database, the target directory or device must exist on all database partitions, and can optionally be a shared path. The directory or device name may be specified using a database partition expression. For more information about database partition expressions, see "Automatic storage databases".

This parameter can be repeated to specify the target directories and devices that the backup image will span. If more than one target is specified (target1, target2, and target3, for example), target1 will be opened first. The media header and special files (including the configuration file, table space table, and history file) are placed in target1. All remaining targets are opened, and are then used in parallel during the backup operation. Because there is no general tape support on Windows operating systems, each type of tape device requires a unique device driver.

Use of tape devices or floppy disks might generate messages and prompts for user input. Valid response options are:

- **c** Continue. Continue using the device that generated the warning message (for example, when a new tape has been mounted)
- **d** Device terminate. Stop using *only* the device that generated the warning message (for example, when there are no more tapes)
- t Terminate. Abort the backup operation.

If the tape system does not support the ability to uniquely reference a backup image, it is recommended that multiple backup copies of the same database not be kept on the same tape.

### LOAD library-name

The name of the shared library (DLL on Windows operating systems) containing the vendor backup and restore I/O functions to be used. It can contain the full path. If the full path is not given, it will default to the path on which the user exit program resides.

## WITH num-buffers BUFFERS

The number of buffers to be used. DB2 will automatically choose an optimal value for this parameter unless you explicitly enter a value. However, when creating a backup to multiple locations, a larger number of buffers can be used to improve performance.

## **BUFFER** buffer-size

The size, in 4 KB pages, of the buffer used when building the backup image. DB2 will automatically choose an optimal value for this parameter unless you explicitly enter a value. The minimum value for this parameter is 8 pages.

If using tape with variable block size, reduce the buffer size to within the range that the tape device supports. Otherwise, the backup operation might succeed, but the resulting image might not be recoverable.

With most versions of Linux, using DB2's default buffer size for backup operations to a SCSI tape device results in error SQL2025N, reason code 75. To prevent the overflow of Linux internal SCSI buffers, use this formula:

bufferpages <= ST\_MAX\_BUFFERS \* ST\_BUFFER\_BLOCKS / 4</pre>

where *bufferpages* is the value you want to use with the **BUFFER** parameter, and ST\_MAX\_BUFFERS and ST\_BUFFER\_BLOCKS are defined in the Linux kernel under the drivers/scsi directory.

## PARALLELISM n

Determines the number of table spaces which can be read in parallel by the backup utility. DB2 will automatically choose an optimal value for this parameter unless you explicitly enter a value.

## DEDUP\_DEVICE

Optimizes the format of the backup images for target storage devices that support data deduplication. Available in Version 9.7 Fix Pack 3 and later fix packs.

## **UTIL\_IMPACT\_PRIORITY** priority

Specifies that the backup will run in throttled mode, with the priority specified. Throttling allows you to regulate the performance impact of the backup operation. Priority can be any number between 1 and 100, with 1 representing the lowest priority, and 100 representing the highest priority. If the UTIL\_IMPACT\_PRIORITY keyword is specified with no priority, the backup will run with the default priority of 50. If UTIL\_IMPACT\_PRIORITY is not specified, the backup will run in unthrottled mode. An impact policy must be defined by setting the util impact lim configuration parameter for a backup to run in throttled

**util\_impact\_lim** configuration parameter for a backup to run in throttled mode.

## COMPRESS

Indicates that the backup is to be compressed.

## **COMPRLIB** name

Indicates the name of the library to be used to perform the compression (for example, db2compr.dll for Windows; libdb2compr.so for Linux or UNIX systems). The name must be a fully qualified path referring to a file on the server. If this parameter is not specified, the default DB2 compression library will be used. If the specified library cannot be loaded, the backup will fail.

#### **EXCLUDE**

Indicates that the compression library will not be stored in the backup image.

#### **COMPROPTS** string

Describes a block of binary data that will be passed to the initialization routine in the compression library. DB2 will pass this string directly from the client to the server, so any issues of byte reversal or code page conversion will have to be handled by the compression library. If the first character of the data block is '@', the remainder of the data will be interpreted by DB2 as the name of a file residing on the server. DB2 will then replace the contents of string with the contents of this file and will pass this new value to the initialization routine instead. The maximum length for *string* is 1024 bytes.

### EXCLUDE LOGS

Specifies that the backup image should not include any log files. When performing an offline backup operation, logs are excluded whether or not this option is specified, with the exception of snapshot backups.

## **INCLUDE LOGS**

Specifies that the backup image should include the range of log files required to restore and roll forward this image to some consistent point in time. This option is not valid for an offline backup, with the exception of snapshot backups where this option is the default unless explicitly told to exclude.

### WITHOUT PROMPTING

Specifies that the backup will run unattended, and that any actions which normally require user intervention will return an error message.

#### Note:

- 1. If the backup command indicates which partitions in a partitioned database are to be backed up, the backup operation is implicitly performed **WITHOUT PROMPTING**.
- Options that are specified on the BACKUP DATABASE command in a partitioned database environment will be applied on each partition individually. For example, if a backup operation is specified to USE TSM OPEN 3 SESSIONS, DB2 will open three TSM sessions on each partition.

## **Examples**

1. In the following example, the database WSDB is defined on all 4 database partitions, numbered 0 through 3. The path /dev3/backup is accessible from all database partitions. Database partition 0 is the catalog partition. To perform an offline backup of all the WSDB database partitions to /dev3/backup, issue the following command from database partition 0:

db2 BACKUP DATABASE wsdb ON ALL DBPARTITIONNUMS TO /dev3/backup

The backup is performed simultaneously on all partitions. All four database partition backup images will be stored in the /dev3/backup directory, which can be a shared directory accessible from more than one partition, or a locally-mounted directory accessible from each partition individually, or a combination of both.

2. In the following example database SAMPLE is backed up to a TSM server using two concurrent TSM client sessions. DB2 calculates the optimal buffer size for this environment.

db2 backup database sample use tsm open 2 sessions with 4 buffers

**3**. In the following example, a table space-level backup of table spaces (syscatspace, userspace1) of database payroll is done to tapes.

db2 backup database payroll tablespace (syscatspace, userspace1) to /dev/rmt0, /dev/rmt1 with 8 buffers without prompting

4. The USE TSM OPTIONS keywords can be used to specify the TSM information to use for the backup operation. The following example shows how to use the USE TSM OPTIONS keywords to specify a fully qualified file name:

db2 backup db sample use TSM options @/u/dmcinnis/myoptions.txt

The file myoptions.txt contains the following information: -fromnode=bar -fromowner=dmcinnis

5. Following is a sample weekly incremental backup strategy for a recoverable database. It includes a weekly full database backup operation, a daily non-cumulative (delta) backup operation, and a mid-week cumulative (incremental) backup operation:

(Sun) db2 backup db sample use tsm (Mon) db2 backup db sample online incremental delta use tsm (Tue) db2 backup db sample online incremental delta use tsm (Wed) db2 backup db sample online incremental use tsm (Thu) db2 backup db sample online incremental delta use tsm (Fri) db2 backup db sample online incremental delta use tsm (Sat) db2 backup db sample online incremental use tsm

6. In the following example, three identical target directories are specified for a backup operation on database SAMPLE. You might want to do this if the target file system is made up of multiple physical disks.

db2 backup database sample to /dev3/backup, /dev3/backup, /dev3/backup

The data will be concurrently backed up to the three target directories, and three backup images will be generated with extensions .001, .002, and .003.

7. In the following example, the database WSDB is defined on all 4 database partitions, numbered 0 through 3. Database partition 0 is the catalog partition. To perform an online backup of table space USERSPACE1 on database partitions 1 and 2, with the backup image to be stored on a TSM server, issue the following command from partition 0:

db2 BACKUP DATABASE wsdb ON DBPARTITIONNUMS (1, 2) TABLESPACE (USERSPACE1) ONLINE USE TSM

8. Sample output generated to indicate the sqlcode returned by each partition.

#### Example 1

All partitions are successful (sqlcode  $\geq = 0$ )

```
Backup successful. The timestamp for this backup image is : 20040908010203
```

#### Example 2

One or more partitions fail (sqlcode < 0)

\$ db2 backup db foo on all dbpartitionnums to /backups

Part Result

0000 SQL2001N The utility was interrupted. The output data may be

incomplete. 0001 SQL2419N The target disk "/backups" has become full.

SQL2429N The database backup failed. The following database partitions returned errors: "1".

- 9. The following backups will include the log directories in the image created: db2 backup db sample use snapshot
  - db2 backup db sample online use snapshot
  - db2 backup db sample use snapshot INCLUDE LOGS
  - db2 backup db sample online use snapshot INCLUDE LOGS
- **10**. The following backups will NOT include the log directories in the image created:
  - db2 backup db sample use snapshot EXCLUDE LOGS

db2 backup db sample online use snapshot EXCLUDE LOGS

# **Usage notes**

The data in a backup cannot be protected by the database server. Make sure that backups are properly safeguarded, particularly if the backup contains LBAC-protected data.

When backing up to tape, use of a variable block size is currently not supported. If you must use this option, ensure that you have well tested procedures in place that enable you to recover successfully, using backup images that were created with a variable block size.

When using a variable block size, you must specify a backup buffer size that is less than or equal to the maximum limit for the tape devices that you are using. For optimal performance, the buffer size must be equal to the maximum block size limit of the device being used.

Snapshot backups should be complemented with regular disk backups in case of failure in the filer/storage system.

As you regularly backup your database, you might accumulate very large database backup images, many database logs and load copy images, all of which might be taking up a large amount of disk space. Refer to "Managing recovery objects" for information on how to manage these recovery objects.

You can use the **OPTIONS** parameter to enable backup operations in TSM environments supporting proxy nodes. For more information, see the "Configuring a Tivoli Storage Manager client" topic.

Invokes the bind utility, which prepares SQL statements stored in the bind file generated by the precompiler, and creates a package that is stored in the database.

# Scope

This command can be issued from any database partition in db2nodes.cfg. It updates the database catalogs on the catalog database partition. Its effects are visible to all database partitions.

# Authorization

One of the following authorizations:

- *dbadm* authority
- If EXPLAIN ONLY is specified, EXPLAIN authority or an authority that implicitly includes EXPLAIN is sufficient.
- If a package does not exist, BINDADD authority and:
  - If the schema name of the package does not exist, IMPLICIT\_SCHEMA authority on the database.
  - If the schema name of the package does exist, CREATEIN privilege on the schema.
- If the package exists, one of the following privileges:
  - ALTERIN privilege on the schema
  - BIND privilege on the package

In addition, if capturing explain information using the EXPLAIN or the EXPLSNAP clause, one of the following authorizations is required:

- INSERT privilege on the explain tables
- DATAACCESS authority

The user also needs all privileges required to compile any static SQL statements in the application. Privileges granted to groups are not used for authorization checking of static statements.

# **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established.

# **Command syntax**

For DB2 for Linux, UNIX and Windows

►►—BIND—filename-

VALIDATE-BIND-	STRDEL-	APOSTROPHE		
L_RUN				

## Notes:

- 1 If the server does not support the DATETIME DEF option, it is mapped to DATETIME ISO.
- 2 The DEGREE option is only supported by DRDA<sup>®</sup> Level 2 Application Servers.
- 3 DRDA defines the EXPLAIN option to have the value YES or NO. If the server does not support the EXPLAIN YES option, the value is mapped to EXPLAIN ALL.

## **Command parameters**

#### filename

Specifies the name of the bind file that was generated when the application program was precompiled, or a list file containing the names of several bind files. Bind files have the extension .bnd. The full path name can be specified.

If a list file is specified, the @ character must be the first character of the list file name. The list file can contain several lines of bind file names. Bind files listed on the same line must be separated by plus (+) characters, but a + cannot appear in front of the first file listed on each line, or after the last bind file listed. For example,

/u/smith/sqllib/bnd/@all.lst

is a list file that contains the following bind files:

```
mybind1.bnd+mybind.bnd2+mybind3.bnd+
    mybind4.bnd+mybind5.bnd+
    mybind6.bnd+
    mybind7.bnd
```

#### ACTION

Indicates whether the package can be added or replaced.

**ADD** Indicates that the named package does not exist, and that a new package is to be created. If the package already exists, execution stops, and a diagnostic error message is returned.

#### REPLACE

Indicates that the existing package is to be replaced by a new one with the same package name and creator. This is the default value for the ACTION option.

#### RETAIN

Indicates whether BIND and EXECUTE authorities are to be preserved when a package is replaced. If ownership of the package changes, the new owner grants the BIND and EXECUTE authority to the previous package owner.

- **NO** Does not preserve BIND and EXECUTE authorities when a package is replaced. This value is not supported by DB2.
- **YES** Preserves BIND and EXECUTE authorities when a package is replaced. This is the default value.

## **REPLVER** version-id

Replaces a specific version of a package. The version identifier specifies which version of the package is to be replaced. If the specified version does not exist, an error is returned. If the REPLVER option of REPLACE is not specified, and a package already exists that matches the package name, creator, and version of the package being bound, that package will be replaced; if not, a new package will be added.

#### APREUSE

Specifies whether static SQL access plans are to be reused. When this option is enabled, the query compiler will attempt to reuse the access plans for the statement in any existing packages during the bind and during future implicit and explicit rebinds.

- **YES** The query compiler will attempt to reuse the access plans for the statements in the package. If there is an existing package, the query compiler will attempt to reuse the access plan for every statement that can be matched with a statement in the new bind file. For a statement to match, the statement text must be identical and the section number for the statement in the existing package must match what the section number will be for the statement in the new package.
- **NO** The query compiler will not attempt to reuse access plans for the statements in the package. This is the default setting.

## BLOCKING

Specifies the type of row blocking for cursors. The blocking of row data that contains references to LOB column data types is also supported in partitioned database environments.

ALL For cursors that are specified with the FOR READ ONLY clause or cursors not specified as FOR UPDATE, blocking occurs.

Ambiguous cursors are treated as read-only.

**NO** Blocking does not occur for any cursor.

For the definition of a read-only cursor and an ambiguous cursor, refer to *DECLARE CURSOR statement*.

Ambiguous cursors are treated as updatable.

#### UNAMBIG

For cursors that are specified with the FOR READ ONLY clause, blocking occurs.

Cursors that are not declared with the FOR READ ONLY or FOR UPDATE clause which are not ambiguous and are read-only will be blocked. Ambiguous cursors will not be blocked.

Ambiguous cursors are treated as updatable.

#### **CCSIDG** *double-ccsid*

An integer specifying the coded character set identifier (CCSID) to be used for double byte characters in character column definitions (without a specific CCSID clause) in CREATE and ALTER TABLE SQL statements. This option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.

## **CCSIDM** mixed-ccsid

An integer specifying the coded character set identifier (CCSID) to be used for mixed byte characters in character column definitions (without a specific CCSID clause) in CREATE and ALTER TABLE SQL statements. This option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.

## **CCSIDS** *sbcs-ccsid*

An integer specifying the coded character set identifier (CCSID) to be used for single byte characters in character column definitions (without a specific CCSID clause) in CREATE and ALTER TABLE SQL statements. This option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.

## CHARSUB

Designates the default character sub-type that is to be used for column definitions in CREATE and ALTER TABLE SQL statements. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows.

**BIT** Use the FOR BIT DATA SQL character sub-type in all new character columns for which an explicit sub-type is not specified.

## DEFAULT

Use the target system defined default in all new character columns for which an explicit sub-type is not specified.

#### MIXED

Use the FOR MIXED DATA SQL character sub-type in all new character columns for which an explicit sub-type is not specified.

**SBCS** Use the FOR SBCS DATA SQL character sub-type in all new character columns for which an explicit sub-type is not specified.

#### **CLIPKG** cli-packages

An integer between 3 and 30 specifying the number of CLI large packages to be created when binding CLI bind files against a database.

#### **CNULREQD**

This option is related to the LANGLEVEL precompile option. It is valid only if the bind file is created from a C or a C++ application. This bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows.

- **NO** The application was coded on the basis of the LANGLEVEL SAA1 precompile option with respect to the null terminator in C string host variables.
- **YES** The application was coded on the basis of the LANGLEVEL MIA precompile option with respect to the null terminator in C string host variables.

#### **COLLECTION** schema-name

Specifies a 128-byte collection identifier for the package. If not specified, the authorization identifier for the user processing the package is used.

### CONCURRENTACCESSRESOLUTION

Specifies the concurrent access resolution to use for statements in the package.

## USE CURRENTLY COMMITTED

Specifies that the database manager can use the currently committed version of the data for applicable scans when it is in the process of being updated or deleted. Rows in the process of being inserted can be skipped. This clause applies when the isolation level in effect is Cursor Stability or Read Stability (for Read Stability it skips uncommited inserts only) and is ignored otherwise. Applicable scans include read-only scans that can be part of a read-only statement as well as a non read-only statement. The settings for the registry variables

DB2\_EVALUNCOMMITTED, DB2\_SKIPDELETED, and DB2\_SKIPINSERTED do not apply to scans using currently committed. However, the settings for these registry variables still apply to scans that do not use currently committed.

## WAIT FOR OUTCOME

Specifies Cursor Stability and higher scans to wait for the commit or rollback when encountering data in the process of being updated. Rows in the process of being inserted or deleted rows are not skipped. The settings for the registry variables DB2\_EVALUNCOMMITTED, DB2\_SKIPDELETED, and DB2\_SKIPINSERTED no longer apply.

## DATETIME

Specifies the date and time format to be used.

- **DEF** Use a date and time format associated with the territory code of the database.
- **EUR** Use the IBM standard for Europe date and time format.
- **ISO** Use the date and time format of the International Standards Organization.
- JIS Use the date and time format of the Japanese Industrial Standard.
- **LOC** Use the date and time format in local form associated with the territory code of the database.
- **USA** Use the IBM standard for U.S. date and time format.

## DBPROTOCOL

Specifies what protocol to use when connecting to a remote site that is identified by a three-part name statement. Supported by DB2 for OS/390<sup>®</sup> only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

- **DEC** Specifies the maximum precision to be used in decimal arithmetic operations. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.
  - 15 15-digit precision is used in decimal arithmetic operations.
  - 31 31-digit precision is used in decimal arithmetic operations.

#### DECDEL

Designates whether a period (.) or a comma (.) will be used as the decimal point indicator in decimal and floating point literals. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.

COMMA

Use a comma (,) as the decimal point indicator.

## PERIOD

Use a period (.) as the decimal point indicator.

## DEGREE

Specifies the degree of parallelism for the execution of static SQL statements in an SMP system. This option does not affect CREATE INDEX parallelism.

1 The execution of the statement will not use parallelism.

degree-of-parallelism

Specifies the degree of parallelism with which the statement can be executed, a value between 2 and 32 767 (inclusive).

**ANY** Specifies that the execution of the statement can involve parallelism using a degree determined by the database manager.

## **DYNAMICRULES**

Defines which rules apply to dynamic SQL at run time for the initial setting of the values used for authorization ID and for the implicit qualification of unqualified object references.

- **RUN** Specifies that the authorization ID of the user executing the package is to be used for authorization checking of dynamic SQL statements. The authorization ID will also be used as the default package qualifier for implicit qualification of unqualified object references within dynamic SQL statements. This is the default value.
- **BIND** Specifies that all of the rules that apply to static SQL for authorization and qualification are to be used at run time. That is, the authorization ID of the package owner is to be used for authorization checking of dynamic SQL statements, and the default package qualifier is to be used for implicit qualification of unqualified object references within dynamic SQL statements.

## DEFINERUN

If the package is used within a routine context, the authorization ID of the routine definer is to be used for authorization checking and for implicit qualification of unqualified object references within dynamic SQL statements within the routine.

If the package is used as a standalone application, dynamic SQL statements are processed as if the package were bound with DYNAMICRULES RUN.

## DEFINEBIND

If the package is used within a routine context, the authorization ID of the routine definer is to be used for authorization checking and for implicit qualification of unqualified object references within dynamic SQL statements within the routine.

If the package is used as a standalone application, dynamic SQL statements are processed as if the package were bound with DYNAMICRULES BIND.

## INVOKERUN

If the package is used within a routine context, the current statement authorization ID in effect when the routine is invoked is

to be used for authorization checking of dynamic SQL statements and for implicit qualification of unqualified object references within dynamic SQL statements within that routine.

If the package is used as a standalone application, dynamic SQL statements are processed as if the package were bound with DYNAMICRULES RUN.

## INVOKEBIND

If the package is used within a routine context, the current statement authorization ID in effect when the routine is invoked is to be used for authorization checking of dynamic SQL statements and for implicit qualification of unqualified object references within dynamic SQL statements within that routine.

If the package is used as a standalone application, dynamic SQL statements are processed as if the package were bound with DYNAMICRULES BIND.

Because dynamic SQL statements will be using the authorization ID of the package owner in a package exhibiting bind behavior, the binder of the package should not have any authorities granted to them that the user of the package should not receive. Similarly, when defining a routine that will exhibit define behavior, the definer of the routine should not have any authorities granted to them that the user of the package should not receive since a dynamic statement will be using the authorization ID of the routine's definer.

The following dynamically prepared SQL statements cannot be used within a package that was not bound with DYNAMICRULES RUN: GRANT, REVOKE, ALTER, CREATE, DROP, COMMENT ON, RENAME, SET INTEGRITY, and SET EVENT MONITOR STATE.

## ENCODING

Specifies the encoding for all host variables in static statements in the plan or package. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

## EXPLAIN

Stores information in the Explain tables about the access plans chosen for each SQL statement in the package.

- **NO** Explain information will not be captured.
- **YES** Explain tables will be populated with information about the chosen access plan at prep/bind time for static statements and at run time for incremental bind statements.

If the package is to be used for a routine and the package contains incremental bind statements, then the routine must be defined as MODIFIES SQL DATA. If this is not done, incremental bind statements in the package will cause a run time error (SQLSTATE 42985).

## REOPT

Explain information for each reoptimizable incremental bind SQL statement is placed in the explain tables at run time. In addition, explain information is gathered for reoptimizable dynamic SQL statements at run time, even if the CURRENT EXPLAIN MODE register is set to NO.

If the package is to be used for a routine, the routine must be defined as MODIFIES SQL DATA, otherwise incremental bind and dynamic statements in the package will cause a run time error (SQLSTATE 42985).

- **ONLY** The ONLY option allows you to explain statements without having the privilege to execute them. The explain tables are populated but no persistent package is created. If an existing package with the same name and version is encountered during the bind process, the existing package is neither dropped nor replaced even if you specified ACTION REPLACE. If an error occurs during population of the explain tables, explain information is not added for the statement that returned the error and for any statements that follow it.
- ALL Explain information for each eligible static SQL statement will be placed in the Explain tables at prep/bind time. Explain information for each eligible incremental bind SQL statement will be placed in the Explain tables at run time. In addition, Explain information will be gathered for eligible dynamic SQL statements at run time, even if the CURRENT EXPLAIN MODE register is set to N0.

If the package is to be used for a routine, the routine must be defined as MODIFIES SQL DATA, otherwise incremental bind and dynamic statements in the package will cause a run time error (SQLSTATE 42985).

## EXPLSNAP

Stores Explain Snapshot information in the Explain tables.

- **NO** An Explain Snapshot will not be captured.
- **YES** An Explain Snapshot for each eligible static SQL statement will be placed in the Explain tables at prep/bind time for static statements and at run time for incremental bind statements.

If the package is to be used for a routine and the package contains incremental bind statements, then the routine must be defined as MODIFIES SQL DATA or incremental bind statements in the package will cause a run time error (SQLSTATE 42985).

# REOPT

Explain snapshot information for each reoptimizable incremental bind SQL statement is placed in the explain tables at run time. In addition, explain snapshot information is gathered for reoptimizable dynamic SQL statements at run time, even if the CURRENT EXPLAIN SNAPSHOT register is set to NO.

If the package is to be used for a routine, the routine must be defined as MODIFIES SQL DATA, otherwise incremental bind and dynamic statements in the package will cause a run time error (SQLSTATE 42985).

ALL An Explain Snapshot for each eligible static SQL statement will be placed in the Explain tables at prep/bind time. Explain snapshot information for each eligible incremental bind SQL statement will be placed in the Explain tables at run time. In addition, explain snapshot information will be gathered for eligible dynamic SQL statements at run time, even if the CURRENT EXPLAIN SNAPSHOT register is set to N0. If the package is to be used for a routine, then the routine must be defined as MODIFIES SQL DATA, otherwise incremental bind and dynamic statements in the package will cause a run time error (SQLSTATE 42985).

### EXTENDEDINDICATOR

Enables the recognition of extended indicator variable values during the execution of the associated plan or package.

- **NO** Extended indicator variable values are not recognized. Indicator variables are normal indicator variables; negative indicator variable values imply null, and positive or zero values imply non-null. This is the default condition.
- YES Extended indicator variable values are recognized. Using any non-recognized indicator variable values, or using the default or unassigned indicator variable-based values in a non-supported location will cause DB2 database manager to generate an error message during execution of the bound statement.

#### FEDERATED

Specifies whether a static SQL statement in a package references a nickname or a federated view. If this option is not specified and a static SQL statement in the package references a nickname or a federated view, a warning is returned and the package is created.

- **NO** A nickname or federated view is not referenced in the static SQL statements of the package. If a nickname or federated view is encountered in a static SQL statement during the prepare or bind phase of this package, an error is returned and the package is *not* created.
- **YES** A nickname or federated view can be referenced in the static SQL statements of the package. If no nicknames or federated views are encountered in static SQL statements during the prepare or bind of the package, no errors or warnings are returned and the package is created.

#### FEDERATED\_ASYNCHRONY

Specifies the maximum number of asynchrony table queues (ATQs) that the federated server supports in the access plan for programs that use embedded SQL.

- ANY The optimizer determines the number of ATQs for the access plan. The optimizer assigns an ATQ to all eligible SHIP or remote pushdown operators in the plan. The value that is specified for DB2\_MAX\_ASYNC\_REQUESTS\_PER\_QUERY server option limits the number of asynchronous requests.
- *number\_of\_atqs\_in\_the\_plan* The number of ATQs in the plan. You specify a number in the range 0 to 32767.

#### FUNCPATH

Specifies the function path to be used in resolving user-defined distinct types and functions in static SQL. If this option is not specified, the default function path is "SYSIBM", "SYSFUN", USER where USER is the value of the USER special register.

schema-name

An SQL identifier, either ordinary or delimited, which identifies a

schema that exists at the application server. No validation that the schema exists is made at precompile or at bind time. The same schema cannot appear more than once in the function path. The schema name SYSPUBLIC cannot be specified for the function path. The number of schemas that can be specified is limited by the length of the resulting function path, which cannot exceed 2048 bytes. The schema SYSIBM does not need to be explicitly specified; it is implicitly assumed to be the first schema if it is not included in the function path.

### **GENERIC** "string"

Supports the binding of new options that are defined in the target database. Do not use this option to pass bind options that *are* defined in BIND or PRECOMPILE. The syntax is as follows:

generic "option1 value1 option2 value2 ..."

Each option and value must be separated by one or more blank spaces. For example, one could use the following to bind each of the OPT1, OPT2, and OPT3 options:

generic "opt1 value1 opt2 value2 opt3 value3"

The maximum length of the string is 4096 bytes. The maximum length of each option name in the string is 255 bytes.

## GRANT

**Note:** If more than one of the GRANT, GRANT\_GROUP, GRANT\_USER, and GRANT\_ROLE options are specified, only the last option specified is executed.

*authid* Grants EXECUTE and BIND privileges to a specified user name, role name or group ID. The SQL GRANT statement and its rules are used to determine the type of authid when none of USER, GROUP, or ROLE is provided to specify the type of the grantee on a GRANT statement. For the rules, see *GRANT* (*Role*) statement.

#### PUBLIC

Grants EXECUTE and BIND privileges to PUBLIC.

#### **GRANT\_GROUP** group-name

Grants EXECUTE and BIND privileges to a specified group name.

#### **GRANT\_USER** *user-name*

Grants EXECUTE and BIND privileges to a specified user name.

#### **GRANT\_ROLE** role-name

Grants EXECUTE and BIND privileges to a specified role name.

#### **INSERT**

Allows a program being precompiled or bound against a DB2 Enterprise Server Edition server to request that data inserts be buffered to increase performance.

- **BUF** Specifies that inserts from an application should be buffered.
- **DEF** Specifies that inserts from an application should not be buffered.

#### **ISOLATION**

Determines how far a program bound to this package can be isolated from the effect of other executing programs.

**CS** Specifies Cursor Stability as the isolation level.

- NC No Commit. Specifies that commitment control is not to be used. This isolation level is not supported by DB2 Database for Linux, UNIX, and Windows.
- **RR** Specifies Repeatable Read as the isolation level.
- **RS** Specifies Read Stability as the isolation level. Read Stability ensures that the execution of SQL statements in the package is isolated from other application processes for rows read and changed by the application.
- **UR** Specifies Uncommitted Read as the isolation level.

## IMMEDWRITE

Indicates whether immediate writes will be done for updates made to group buffer pool dependent pagesets or database partitions. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

## **KEEPDYNAMIC**

Specifies whether dynamic SQL statements are to be kept after commit points. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

## **MESSAGES** *message-file*

Specifies the destination for warning, error, and completion status messages. A message file is created whether the bind is successful or not. If a message file name is not specified, the messages are written to standard output. If the complete path to the file is not specified, the current directory is used. If the name of an existing file is specified, the contents of the file are overwritten.

# OPTHINT

Controls whether query optimization hints are used for static SQL. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

## **OPTPROFILE** *optimization-profile-name*

Specifies the name of an existing optimization profile to be used for all static statements in the package. The default value of the option is an empty string. The value also applies as the default for dynamic preparation of DML statements for which the CURRENT OPTIMIZATION PROFILE special register is null. If the specified name is unqualified, it is an SQL identifier, which is implicitly qualified by the QUALIFIER bind option.

The BIND command does not process the optimization file, but only validates that the name is syntactically valid. Therefore if the optimization profile does not exist or is invalid, an SQL0437W warning with reason code 13 will not occur until a DML statement is optimized using that optimization profile.

## OS400NAMING

Specifies which naming option is to be used when accessing DB2 for System  $i^{(0)}$  data. Supported by DB2 for System i only. For a list of supported option values, refer to the documentation for DB2 for System i.

Because of the slashes used as separators, a DB2 utility can still report a syntax error at execution time on certain SQL statements which use the System i system naming convention, even though the utility might have been precompiled or bound with the OS400NAMING SYSTEM option. For example, the Command Line Processor will report a syntax error on an

SQL CALL statement if the System i system naming convention is used, whether or not it has been precompiled or bound using the OS400NAMING SYSTEM option.

**OWNER** authorization-id

Designates a 128-byte authorization identifier for the package owner. The owner must have the privileges required to execute the SQL statements contained in the package. Only a user with DBADM authority can specify an authorization identifier other than the user ID. The default value is the authorization ID of the invoker of the precompile/bind process. SYSIBM, SYSCAT, and SYSSTAT are not valid values for this option. The *authorization-id* must be a user. A role or a group cannot be specified using the OWNER option.

**PATH** Specifies the function path to be used in resolving user-defined distinct types and functions in static SQL. If this option is not specified, the default function path is "SYSIBM", "SYSFUN", USER where USER is the value of the USER special register.

#### schema-name

An SQL identifier, either ordinary or delimited, which identifies a schema that exists at the application server. No validation that the schema exists is made at precompile or at bind time.

#### **QUALIFIER** qualifier-name

Provides a 128-byte implicit qualifier for unqualified objects contained in the package. The default is the owner's authorization ID, whether or not **owner** is explicitly specified.

#### **QUERYOPT** optimization-level

Indicates the desired level of optimization for all static SQL statements contained in the package. The default value is 5. The SET CURRENT QUERY OPTIMIZATION statement describes the complete range of optimization levels available.

#### RELEASE

Indicates whether resources are released at each COMMIT point, or when the application terminates. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows.

#### COMMIT

Release resources at each COMMIT point. Used for dynamic SQL statements.

#### DEALLOCATE

Release resources only when the application terminates.

## SORTSEQ

Specifies which sort sequence table to use on System i. Supported by DB2 for System i only. For a list of supported option values, refer to the documentation for DB2 for System i.

#### **SQLERROR**

Indicates whether to create a package or a bind file if an error is encountered.

#### CHECK

Specifies that the target system performs all syntax and semantic checks on the SQL statements being bound. A package will not be created as part of this process. If, while binding, an existing

## CONTINUE

Creates a package, even if errors occur when binding SQL statements. Those statements that failed to bind for authorization or existence reasons can be incrementally bound at execution time if VALIDATE RUN is also specified. Any attempt to execute them at run time generates an error (SQLCODE -525, SQLSTATE 51015).

### NOPACKAGE

A package or a bind file is not created if an error is encountered.

#### REOPT

Specifies whether to have DB2 determine an access path at run time using values for host variables, parameter markers, global variables, and special registers. Valid values are:

## NONE

The access path for a given SQL statement containing host variables, parameter markers, global variables, or special registers will not be optimized using real values. The default estimates for the these variables is used, and the plan is cached and will be used subsequently. This is the default value.

**ONCE** The access path for a given SQL statement will be optimized using the real values of the host variables, parameter markers, global variables, or special registers when the query is first executed. This plan is cached and used subsequently.

## ALWAYS

The access path for a given SQL statement will always be compiled and reoptimized using the values of the host variables, parameter markers, global variables, or special registers that are known each time the query is executed.

## **REOPT | NOREOPT VARS**

These options have been replaced by REOPT ALWAYS and REOPT NONE; however, they are still supported for previous compatibility. Specifies whether to have DB2 determine an access path at run time using values for host variables, global variables, parameter markers, and special registers. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

## SQLWARN

Indicates whether warnings will be returned from the compilation of dynamic SQL statements (via PREPARE or EXECUTE IMMEDIATE), or from describe processing (via PREPARE...INTO or DESCRIBE).

- **NO** Warnings will not be returned from the SQL compiler.
- YES Warnings will be returned from the SQL compiler.

SQLCODE +236, +237 and +238 are exceptions. They are returned regardless of the SQLWARN option value.

#### STATICREADONLY

Determines whether static cursors will be treated as being READ ONLY or INSENSITIVE.

**NO** All static cursors will take on the attributes as would normally be

Chapter 5. CLP commands 89

generated given the statement text and the setting of the LANGLEVEL precompile option. This is the default value.

**YES** Any static cursor that does not contain the FOR UPDATE or FOR READ ONLY clause will be considered READ ONLY.

## INSENSITIVE

Any static cursor that does not contain the FOR UPDATE clause will be considered READ ONLY and INSENSITIVE.

### STRDEL

Designates whether an apostrophe (') or double quotation marks (") will be used as the string delimiter within SQL statements. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.

## APOSTROPHE

Use an apostrophe (') as the string delimiter.

## QUOTE

Use double quotation marks (") as the string delimiter.

## **TEXT** label

The description of a package. Maximum length is 255 characters. The default value is blanks. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows.

# TRANSFORM GROUP

Specifies the transform group name to be used by static SQL statements for exchanging user-defined structured type values with host programs. This transform group is not used for dynamic SQL statements or for the exchange of parameters and results with external functions or methods.

### groupname

An SQL identifier of up to 18 bytes in length. A group name cannot include a qualifier prefix and cannot begin with the prefix SYS since this is reserved for database use. In a static SQL statement that interacts with host variables, the name of the transform group to be used for exchanging values of a structured type is as follows:

- The group name in the TRANSFORM GROUP bind option, if any
- The group name in the TRANSFORM GROUP prep option as specified at the original precompilation time, if any
- The DB2\_PROGRAM group, if a transform exists for the given type whose group name is DB2\_PROGRAM
- No transform group is used if none of the above conditions exist.

The following errors are possible during the bind of a static SQL statement:

- SQLCODE yyyyy, SQLSTATE xxxxx: A transform is needed, but no static transform group has been selected.
- SQLCODE yyyyy, SQLSTATE xxxxx: The selected transform group does not include a necessary transform (TO SQL for input variables, FROM SQL for output variables) for the data type that needs to be exchanged.

• SQLCODE yyyyy, SQLSTATE xxxxx: The result type of the FROM SQL transform is not compatible with the type of the output variable, or the parameter type of the TO SQL transform is not compatible with the type of the input variable.

In these error messages, *yyyyy* is replaced by the SQL error code, and *xxxxx* by the SQL state code.

## VALIDATE

Determines when the database manager checks for authorization errors and object not found errors. The package owner authorization ID is used for validity checking.

- **BIND** Validation is performed at precompile/bind time. If all objects do not exist, or all authority is not held, error messages are produced. If SQLERROR CONTINUE is specified, a package/bind file is produced despite the error message, but the statements in error are not executable.
- **RUN** Validation is attempted at bind time. If all objects exist, and all authority is held, no further checking is performed at execution time.

If all objects do not exist, or all authority is not held at precompile/bind time, warning messages are produced, and the package is successfully bound, regardless of the SQLERROR CONTINUE option setting. However, authority checking and existence checking for SQL statements that failed these checks during the precompile/bind process can be redone at execution time.

# **Examples**

The following example binds myapp.bnd (the bind file generated when the myapp.sqc program was precompiled) to the database to which a connection has been established:

db2 bind myapp.bnd

Any messages resulting from the bind process are sent to standard output.

# Usage notes

Binding a package using the REOPT option with the ONCE or ALWAYS value specified might change the static and dynamic statement compilation and performance.

Binding can be done as part of the precompile process for an application program source file, or as a separate step at a later time. Use BIND when binding is performed as a separate process.

The name used to create the package is stored in the bind file, and is based on the source file name from which it was generated (existing paths or extensions are discarded). For example, a precompiled source file called myapp.sql generates a default bind file called myapp.bnd and a default package name of MYAPP. However, the bind file name and the package name can be overridden at precompile time by using the BINDFILE and the PACKAGE options.

Binding a package with a schema name that does not already exist results in the implicit creation of that schema. The schema owner is SYSIBM. The CREATEIN privilege on the schema is granted to PUBLIC.

BIND executes under the transaction that was started. After performing the bind, BIND issues a COMMIT or a ROLLBACK to terminate the current transaction and start another one.

Binding stops if a fatal error or more than 100 errors occur. If a fatal error occurs, the utility stops binding, attempts to close all files, and discards the package.

When a package exhibits bind behavior, the following will be true:

- 1. The implicit or explicit value of the BIND option OWNER will be used for authorization checking of dynamic SQL statements.
- The implicit or explicit value of the BIND option QUALIFIER will be used as the implicit qualifier for qualification of unqualified objects within dynamic SQL statements.
- **3.** The value of the special register CURRENT SCHEMA has no effect on qualification.

In the event that multiple packages are referenced during a single connection, all dynamic SQL statements prepared by those packages will exhibit the behavior as specified by the DYNAMICRULES option for that specific package and the environment they are used in.

Parameters displayed in the SQL0020W message are correctly noted as errors, and will be ignored as indicated by the message.

If an SQL statement is found to be in error and the BIND option SQLERROR CONTINUE was specified, the statement will be marked as invalid. In order to change the state of the SQL statement, another BIND must be issued . Implicit and explicit rebind will not change the state of an invalid statement. In a package bound with VALIDATE RUN, a statement can change from static to incremental bind or incremental bind to static across implicit and explicit rebinds depending on whether or not object existence or authority problems exist during the rebind.

The privileges from the roles granted to the authorization identifier used to bind the package (the value of the OWNER bind option) or to PUBLIC, are taken into account when binding a package. Roles acquired through groups, in which the authorization identifier used to bind the package is a member, will not be used.

For an embedded SQL program, if the bind option is not explicitly specified the static statements in the package are bound using the FEDERATED\_ASYNC configuration parameter. If the FEDERATED\_ASYNCHRONY bind option is specified explicitly, that value is used for binding the packages and is also the initial value of the special register. Otherwise, the value of the database manager configuration parameter is used as the initial value of the special register. The FEDERATED\_ASYNCHRONY bind option influences dynamic SQL only when it is explicitly set.

The value of the FEDERATED\_ASYNCHRONY bind option is recorded in the FEDERATED\_ASYNCHRONY column in the SYSCAT.PACKAGES catalog table. When the bind option is not explicitly specified, the value of FEDERATED\_ASYNC configuration parameter is used and the catalog shows a value of -2 for the FEDERATED\_ASYNCHRONY column.

If the FEDERATED\_ASYNCHRONY bind option is not explicitly specified when a package is bound, and if this package is implicitly or explicitly rebound, the package is rebound using the current value of the FEDERATED\_ASYNC configuration parameter.

# CATALOG DATABASE

Stores database location information in the system database directory. The database can be located either on the local workstation or on a remote database partition server.

## Scope

In a partitioned database environment, when cataloging a local database into the system database directory, this command must be issued from a database partition on the server where the database resides.

# Authorization

One of the following:

- SYSADM
- SYSCTRL

# **Required connection**

None. Directory operations affect the local directory only.

## **Command syntax**

—WITH—*"comment-string"*—<sup>↓</sup>

# **Command parameters**

#### **DATABASE** database-name

Specifies the name of the database to catalog.

AS alias

Specifies an alias as an alternate name for the database being cataloged. If an alias is not specified, the database manager uses *database-name* as the alias.

## **ON** path | drive

Specifies the path on which the database being cataloged resides. On Windows operating systems, may instead specify the letter of the drive on which the database being cataloged resides (if it was created on a drive, not on a specific path).
### AT NODE nodename

Specifies the name of the database partition server where the database being cataloged resides. This name should match the name of an entry in the node directory. If the node name specified does not exist in the node directory, a warning is returned, but the database is cataloged in the system database directory. The node name should be cataloged in the node directory if a connection to the cataloged database is desired.

### AUTHENTICATION

The authentication value is stored for remote databases (it appears in the output from the LIST DATABASE DIRECTORY command) but it is not stored for local databases.

Specifying an authentication type can result in a performance benefit.

#### SERVER

Specifies that authentication takes place on the database partition server containing the target database.

#### CLIENT

Specifies that authentication takes place on the database partition server where the application is invoked.

#### SERVER\_ENCRYPT

Specifies that authentication takes place on the database partition server containing the target database, and that user IDs and passwords are encrypted at the source. User IDs and passwords are decrypted at the target, as specified by the authentication type cataloged at the source.

### **KERBEROS**

Specifies that authentication takes place using Kerberos Security Mechanism.

### TARGET PRINCIPAL principalname

Fully qualified Kerberos principal name for the target server; that is, the fully qualified Kerberos principal of the DB2 instance owner in the form of name/instance@REALM. For Windows 2000, Windows XP, and Windows Server 2003, this is the logon account of the DB2 server service in the form of *userid@DOMAIN*, *userid@xxx.xxx.com* or *domain\userid*.

## DATA\_ENCRYPT

Specifies that authentication takes place on the database partition server containing the target database, and that connections must use data encryption.

#### GSSPLUGIN

Specifies that authentication takes place using an external GSS API-based plug-in security mechanism.

#### SERVER\_ENCRYPT\_AES

Specifies that authentication takes place on the database partition server containing the target database, and that user IDs and passwords are encrypted with an Advanced Encryption Standard (AES) encryption algorithm at the source and decrypted at the target.

#### WITH "comment-string"

Describes the database or the database entry in the system database

## CATALOG DATABASE

directory. The maximum length of a comment string is 30 characters. A carriage return or a line feed character is not permitted. The comment text must be enclosed by double quotation marks.

## Examples

db2 catalog database sample on /databases/sample
 with "Sample Database"

## Usage notes

Use CATALOG DATABASE to catalog databases located on local or remote database partition servers, recatalog databases that were uncataloged previously, or maintain multiple aliases for one database (regardless of database location).

DB2 automatically catalogs databases when they are created. It catalogs an entry for the database in the local database directory and another entry in the system database directory. If the database is created from a remote client (or a client which is executing from a different instance on the same machine), an entry is also made in the system database directory at the client instance.

If neither path nor database partition server name is specified, the database is assumed to be local, and the location of the database is assumed to be that specified in the database manager configuration parameter **dftdbpath**.

Databases on the same database partition server as the database manager instance are cataloged as *indirect* entries. Databases on other database partition servers are cataloged as *remote* entries.

CATALOG DATABASE automatically creates a system database directory if one does not exist. The system database directory is stored on the path that contains the database manager instance that is being used, and is maintained outside of the database.

List the contents of the system database directory using the LIST DATABASE DIRECTORY command. To list the contents of the local database directory use the LIST DATABASE DIRECTORY **ON** *path*, where *path* is where the database was created.

If directory caching is enabled, database, node and DCS directory files are cached in memory. To see if directory caching is enabled, check the value for the *dir\_cache* directory cache support configuration parameter in the output from the GET DATABASE MANAGER CONFIGURATION command. An application's directory cache is created during its first directory lookup. Since the cache is only refreshed when the application modifies any of the directory files, directory changes made by other applications might not be effective until the application has restarted.

To refresh the CLP's directory cache, use the TERMINATE command. To refresh the database manager's shared cache, stop (db2stop) and then restart (db2start) the database manager. To refresh the directory cache for another application, stop and then restart that application.

# CATALOG DCS DATABASE

Stores information about remote host or System i databases in the Database Connection Services (DCS) directory.

These databases are accessed through an Application Requester (AR), such as DB2 Connect<sup>TM</sup>. Having a DCS directory entry with a database name matching a database name in the system database directory invokes the specified AR to forward SQL requests to the remote server where the database resides.

# Authorization

One of the following:

- SYSADM
- SYSCTRL

# **Required connection**

None

# Command syntax

# **Command parameters**

## **DATABASE** database-name

Specifies the alias of the target database to catalog. This name should match the name of an entry in the database directory that is associated with the remote database partition server.

#### AS target-database-name

Specifies the name of the target host or System i database to catalog.

### **AR** *library-name*

Specifies the name of the Application Requester library that is loaded and used to access a remote database listed in the DCS directory.

If using the DB2 Connect AR, do not specify a library name. The default value will cause DB2 Connect to be invoked.

If not using DB2 Connect, specify the library name of the AR, and place that library on the same path as the database manager libraries. On Windows operating systems, the path is *drive*:\sqllib\bin. On Linux and UNIX operating systems, the path is *\$HOME*/sqllib/lib of the instance owner.

### PARMS "parameter-string"

Specifies a parameter string that is to be passed to the AR when it is invoked. The parameter string must be enclosed by double quotation marks.

WITH "comment-string"

Describes the DCS directory entry. Any comment that helps to describe the database cataloged in this directory can be entered. Maximum length is 30 characters. A carriage return or a line feed character is not permitted. The comment text must be enclosed by double quotation marks.

# **Examples**

The following example catalogs information about the DB1 database, which is a DB2 for  $z/OS^{(i)}$  database, into the DCS directory:

```
db2 catalog dcs database db1 as dsn_db_1
with "DB2/z/OS location name DSN_DB_1"
```

# **Usage notes**

The DB2 Connect program provides connections to DRDA Application Servers such as:

- DB2 for OS/390 or z/OS databases on System/370 and System/390<sup>®</sup> architecture host computers.
- DB2 for VM and VSE databases on System/370 and System/390 architecture host computers.
- System i databases on Application System/400<sup>®</sup> (System i) and System i computers.

The database manager creates a Database Connection Services directory if one does not exist. This directory is stored on the path that contains the database manager instance that is being used. The DCS directory is maintained outside of the database.

The database must also be cataloged as a remote database in the system database directory .

List the contents of the DCS directory using the LIST DCS DIRECTORY command.

If directory caching is enabled, database, node, and DCS directory files are cached in memory. An application's directory cache is created during its first directory lookup. Since the cache is only refreshed when the application modifies any of the directory files, directory changes made by other applications might not be effective until the application has restarted.

To refresh the CLP's directory cache, use the TERMINATE command. To refresh DB2's shared cache, stop (db2stop) and then restart (db2start) the database manager. To refresh the directory cache for another application, stop and then restart that application.

# CATALOG LDAP DATABASE

Registers the database in Lightweight Directory Access Protocol (LDAP).

# Authorization

None

# **Required connection**

None

# **Command syntax**

►►—CATALOG LDAP—_DATABASEdatabase-nameAS—alias_
►AT NODE—nodenameGWNODE—gateway-node
►PARMS—"parameter-string"AR—library-name
AUTHENTICATION SERVER -CLIENT -SERVER_ENCRYPT -SERVER_ENCRYPT_AES -KERBEROS TARGET PRINCIPAL—principalname -DATA_ENCRYPT -GSSPLUGIN
WITH—"comments"USER—usernamePASSWORD—password

# **Command parameters**

## **DATABASE** database-name

Specifies the name of the database to catalog.

## AS alias

Specifies an alias as an alternate name for the database being cataloged. If an alias is not specified, the database name is used as the alias.

## **AT NODE** *nodename*

Specifies the LDAP node name for the database server on which the database resides. This parameter must be specified when registering a database on a remote server.

## **GWNODE** gateway-node

Specifies the LDAP node name for the gateway server.

## PARMS "parameter-string"

Specifies a parameter string that is passed to the Application Requester (AR) when accessing DCS databases. The change password *sym\_dest\_name* should not be specified in the parameter string. Use the keyword **CHGPWDLU** to specify the change password LU name when registering the DB2 server in LDAP.

#### **AR** library-name

Specifies the name of the Application Requester library that is loaded and used to access a remote database listed in the DCS directory.

If using the DB2 Connect AR, do not specify a library name. The default value will cause DB2 Connect to be invoked.

If not using DB2 Connect, specify the library name of the AR, and place that library on the same path as the database manager libraries. On Windows operating systems, the path is drive:\sqllib\dll. On UNIX operating systems, the path is \$HOME/sqllib/lib of the instance owner.

#### AUTHENTICATION

Specifies the authentication level. Valid values are:

#### SERVER

Specifies that authentication takes place on the node containing the target database.

#### CLIENT

Specifies that authentication takes place on the node from which the application is invoked.

### SERVER\_ENCRYPT

Specifies that authentication takes place on the database partition server containing the target database, and that user IDs and passwords are encrypted at the source. User IDs and passwords are decrypted at the target, as specified by the authentication type cataloged at the source.

#### SERVER\_ENCRYPT\_AES

Specifies that authentication takes place on the database partition server containing the target database, and that user IDs and passwords are encrypted with an Advanced Encryption Standard (AES) encryption algorithm at the source and decrypted at the target.

#### **KERBEROS**

Specifies that authentication takes place using Kerberos Security Mechanism.

#### TARGET PRINCIPAL principalname

Fully qualified Kerberos principal name for the target server; that is, the logon account of the DB2 server service in the form of *userid*@xxx.xxx.com or *domain\userid*.

## DATA\_ENCRYPT

Specifies that authentication takes place on the node containing the target database, and that connections must use data encryption.

#### GSSPLUGIN

Specifies that authentication takes place using an external GSS API-based plug-in security mechanism.

### WITH "comments"

Describes the DB2 server. Any comment that helps to describe the server registered in the network directory can be entered. Maximum length is 30 characters. A carriage return or a line feed character is not permitted. The comment text must be enclosed by double quotation marks.

#### **USER** username

Specifies the user's LDAP distinguished name (DN). The LDAP user DN

must have sufficient authority to create the object in the LDAP directory. If the user's LDAP DN is not specified, the credentials of the current logon user will be used. If the user's LDAP DN and password have been specified using db2ldcfg, the user name and password do not have to be specified here.

## **PASSWORD** password

Account password. If the user's LDAP DN and password have been specified using db2ldcfg, the user name and password do not have to be specified here.

## Usage notes

If the node name is not specified, DB2 will use the first node in LDAP that represents the DB2 server on the current machine.

It might be necessary to manually register (catalog) the database in LDAP if:

- The database server does not support LDAP. The administrator must manually register each database in LDAP to allow clients that support LDAP to access the database without having to catalog the database locally on each client machine.
- The application wants to use a different name to connect to the database. In this case, the administrator can catalog the database using a different alias name.
- The database resides at the host or System i database server. In this case, the administrator can register the database in LDAP and specify the gateway node through the **GWNODE** parameter.
- During CREATE DATABASE IN LDAP the database name already exists in LDAP. The database is still created on the local machine (and can be accessed by local applications), but the existing entry in LDAP will not be modified to reflect the new database. In this case, the administrator can:
  - Remove the existing database entry in LDAP and manually register the new database in LDAP.
  - Register the new database in LDAP using a different alias name.

# CATALOG LDAP NODE

Catalogs a new node entry in Lightweight Directory Access Protocol (LDAP).

## Authorization

None

## **Required connection**

None

# **Command syntax**

►►—CATALOG LDAP—NODE—nodename—AS—nodealias

-PASSWORD—password—

# **Command parameters**

**NODE** nodename

Specifies the LDAP node name of the DB2 server.

AS nodealias

Specifies a new alias name for the LDAP node entry.

#### **USER** username

Specifies the user's LDAP distinguished name (DN). The LDAP user DN must have sufficient authority to create the object in the LDAP directory. If the user's LDAP DN is not specified, the credentials of the current logon user will be used.

### **PASSWORD** password

Account password.

## Usage notes

The CATALOG LDAP NODE command is used to specify a different alias name for the node that represents the DB2 server.

# CATALOG LOCAL NODE

Creates a local alias for an instance that resides on the same machine. A local node should be cataloged when there is more than one instance on the same workstation to be accessed from the user's client. Interprocess Communications (IPC) is used to access the local node.

# **Authorization**

One of the following:

- sysadm
- sysctrl

# **Required connection**

None

# Command syntax

►►—CATALOG—LOCAL M	NODE—nodename— INSTANCE—instancename
SYSTEM—system-name	► STYPE—operating-system-type
►	

# **Command parameters**

# ADMIN

Specifies that a local administration server node is to be cataloged.

**INSTANCE** *instancename* 

Name of the local instance to be accessed.

**SYSTEM** system-name

Specifies the DB2 system name that is used to identify the server machine.

**OSTYPE** operating-system-type

Specifies the operating system type of the server machine. Valid values are: AIX, WIN, HPUX, SUN, OS390, OS400, VM, VSE, SNI, SCO, LINUX and DYNIX.

# **Examples**

Workstation A has two server instances, inst1 and inst2. To create databases at both instances from a single CLP session, issue the following sequence of commands (assume the DB2INSTANCE environment variable is set to inst1):

1. Create a local database at inst1:

db2 create database mydb1

2. Catalog another server instance on this workstation:

db2 catalog local node mynode2 instance inst2

3. Create a database at mynode2:

db2 attach to mynode2 db2 create database mydb2

# Usage notes

If directory caching is enabled, database, node, and DCS directory files are cached in memory. An application's directory cache is created during its first directory lookup. Since the cache is only refreshed when the application modifies any of the directory files, directory changes made by other applications might not be effective until the application has restarted.

To refresh the CLP's directory cache, use TERMINATE. To refresh DB2's shared cache, stop (db2stop) and then restart (db2start) the database manager. To refresh the directory cache for another application, stop and then restart that application.

# CATALOG NAMED PIPE NODE

Adds a named pipe node entry to the node directory. The named pipe is used to access the remote node.

This command is available on Windows only.

# **Authorization**

One of the following:

- sysadm
- sysctrl

# **Required connection**

None

# **Command syntax**

►►—CATALOG—NPIPE NODE—nodename—REMOTE—computername—	
►-INSTANCE—instancename—	>
►	<b>►</b> ∢

# **Command parameters**

## ADMIN

Specifies that an NPIPE administration server node is to be cataloged.

#### **REMOTE** computername

The computer name of the node on which the target database resides. Maximum length is 15 characters.

#### **INSTANCE** *instancename*

Name of the server instance on which the target database resides. Identical to the name of the remote named pipe, which is used to communicate with the remote node.

**SYSTEM** system-name

Specifies the DB2 system name that is used to identify the server machine.

**OSTYPE** operating-system-type

Specifies the operating system type of the server machine. Valid values are: AIX, WIN, HPUX, SUN, OS390, OS400, VM, VSE, SNI, SCO, and LINUX.

## **Examples**

db2 catalog npipe node db2np1 remote nphost instance db2inst1
 with "A remote named pipe node."

# **Usage notes**

The database manager creates the node directory when the first node is cataloged (that is, when the first CATALOG...NODE command is issued). On a Windows

## CATALOG NAMED PIPE NODE

client, it stores and maintains the node directory in the instance subdirectory where the client is installed. On an AIX client, it creates the node directory in the DB2 installation directory.

List the contents of the local node directory using the LIST NODE DIRECTORY command.

If directory caching is enabled (see the configuration parameter **dir\_cache** in the GET DATABASE MANAGER CONFIGURATION command), database, node, and DCS directory files are cached in memory. An application's directory cache is created during its first directory lookup. Since the cache is only refreshed when the application modifies any of the directory files, directory changes made by other applications might not be effective until the application has restarted.

To refresh the CLP's directory cache, use the TERMINATE command. To refresh DB2's shared cache, stop (db2stop) and then restart (db2start) the database manager. To refresh the directory cache for another application, stop and then restart that application.

# CATALOG ODBC DATA SOURCE

Catalogs a user or system ODBC data source.

A *data source*, in ODBC (Open Database Connectivity) terminology, is a user-defined name for a specific database or file system. That name is used to access the database or file system through ODBC APIs. Either user or system data sources can be cataloged. A user data source is only visible to the user who cataloged it, whereas a system data source is visible to and can be used by all other users.

This command is available on Windows platforms only.

# Authorization

None

# **Required connection**

None

# **Command syntax**

# **Command parameters**

USER Catalog a user data source. This is the default if no keyword is specified.

## SYSTEM

Catalog a system data source.

## **DATA SOURCE** *data-source-name*

Specifies the name of the data source to be cataloged. The name of the data source and the name of the database must be the same. Therefore, the name of the data source is limited to the maximum length for a database name.

## ALL DATA SOURCES

Specifies to catalog all local database aliases as ODBC data sources (DSNs).

# **Usage notes**

On Microsoft Windows Vista or later versions, you must execute the CATALOG SYSTEM ODBC DATA SOURCE command from a DB2 command window running with full administrator privileges.

Specifying the ALL DATA SOURCES parameter will not update an existing ODBC DSN that has set its dbalias parameter to a value that matches the alias of a database in the local database directory

## Example 1

# CATALOG ODBC DATA SOURCE

Assume there is an existing ODBC DSN named "MyProdDatabase". The dbalias parameter is set to "PRODDB". Assume there is also a database in the local directory with the alias "PRODDB". Executing the CATALOG ODBC DATA SOURCE myproddatabase command or the CATALOG ODBC ALL DATA SOURCES command will not alter the "MyProdDatabase" DSN because the DSN does not match the database alias. Instead, an ODBC DSN entry is created for "PRODDB" with the dbalias set to "PRODDB". If there is an existing ODBC DSN with the same name as the database alias, the existing ODBC DSN's dbalias parameter will be updated with the database alias. All associated CLI parameters and values will remain unchanged.

## Example 2

Assume there is an existing DSN called "MYDB" that has the dbalias parameter set to "salesdb". If there is a database in the local directory named "MYDB" then executing the CATALOG ODBC DATA SOURCE mydb command or the CATALOG ODBC ALL DATA SOURCES command will change the DSN's dbalias parameter to "MYDB".

# CATALOG TCPIP/TCPIP4/TCPIP6 NODE

Adds a Transmission Control Protocol/Internet Protocol (TCP/IP) database partition server entry to the node directory. The TCP/IP communications protocol is used to access the remote database partition server. The CATALOG TCPIP/TCPIP4/TCPIP6 NODE command is run on a client.

# Authorization

One of the following:

- SYSADM
- SYSCTRL

# **Required connection**

None. Directory operations affect the local directory only.

# **Command syntax**

# **Command parameters**

## ADMIN

Specifies that a TCP/IP administration server node is to be cataloged. This parameter cannot be specified if the **SECURITY SOCKS** parameter is specified.

## **TCPIP NODE** nodename

The nodename of the TCPIP, TCPIP4, or TCPIP6 database partition server represents a local nickname you can set for the machine that contains the database you want to catalog. Only specify **TCPIP4** when specifying an IPv4 IP address, and only specify **TCPIP6** when specifying an IPv6 IP address.

## **REMOTE** *hostname* | *IPv4 address* | *IPv6 address*

The hostname or the IP address of the node where the target database resides. *IP address* can be an IPv4 or IPv6 address. The hostname is the name of the database partition server that is known to the TCP/IP network. The maximum length of the hostname is 255 characters.

## **SERVER** service-name | port number

Specifies the service name or the port number of the server database manager instance. The maximum length is 14 characters. This parameter is case sensitive. If a service name is specified, the services file on the client is used to map the service name to a port number. A service name is specified in the server's database manager configuration file, and the services file on the server is used to map this service name to a port number. The port number on the client and the server must match.

A port number, instead of a service name, can be specified in the database manager configuration file on the server, but this is not recommended. If a port number is specified, no service name needs to be specified in the local services file.

This parameter must not be specified for ADMIN nodes, but is mandatory for non-ADMIN nodes. The value on ADMIN nodes is always 523.

### SECURITY SOCKS

Specifies that the node will be SOCKS-enabled. This parameter is only supported for IPv4. If CATALOG TCPIP NODE is used and **SECURITY SOCKS** is specified, the DB2 database product will use IPv4 to establish the connection. This parameter cannot be specified if the **ADMIN** parameter is specified.

The following environment variables are mandatory and *must* be set to enable SOCKS:

## SOCKS\_NS

The Domain Name Server for resolving the host address of the SOCKS server. This should be a hostname or IPv4 address.

### SOCKS\_SERVER

The fully qualified hostname or IPv4 address of the SOCKS server. If the SOCKSified IBM Data Server Client is unable to resolve the fully qualified hostname, it assumes that an IPv4 address has been entered.

One of the following conditions should be true:

- The SOCKS server is reachable via the domain name server.
- The hostname is listed in the hosts file. The location of this file is described in the TCP/IP documentation.
- An IPv4 address is specified.

If this command is issued after a db2start, it is necessary to issue a TERMINATE command to have the command take effect.

## SECURITY SSL

Specifies that the node is SSL enabled. You cannot specify the **SECURITY SSL** clause if you also specify the **ADMIN** parameter.

### **REMOTE\_INSTANCE** *instance-name*

Specifies the name of the server instance where the database resides, and to which an attachment or connection is being made.

#### **SYSTEM** system-name

Specifies the DB2 system name that is used to identify the server machine. This is the name of the physical machine, server system, or workstation.

#### **OSTYPE** operating-system-type

Specifies the operating system type of the server machine. Valid values are: AIX, WIN, HPUX, SUN, OS390, OS400, VM, VSE, and LINUX.

#### **WITH** *comment-string*

Describes the database entry in the database directory. Any comment that

## CATALOG TCPIP/TCPIP4/TCPIP6 NODE

helps to describe the database can be entered. Maximum length is 30 characters. A carriage return or a line feed character is not permitted. The comment text must be enclosed by single or double quotation marks.

## Examples

To specify a hostname using the CATALOG TCPIP NODE command, issue:

db2 catalog tcpip node db2tcp1 remote hostname server db2inst1 with "Look up IPv4 or IPv6 address from hostname"

To specify an IPv4 address using the CATALOG TCPIP4 NODE command, issue: db2 catalog tcpip4 node db2tcp2 remote 192.0.32.67 server db2inst1 with "Look up IPv4 address from 192.0.32.67"

This example specifies an IPv4 address. You should not specify an IPv6 address in the CATALOG TCPIP4 NODE command. The catalog will not fail if you do, but a subsequent attach or connect will fail because an invalid address was specified during cataloging.

To specify an IPv6 address using the CATALOG TCPIP6 NODE command, issue: db2 catalog tcpip6 node db2tcp3 1080:0:0:0:8:800:200C:417A server 50000 with "Look up IPv6 address from 1080:0:0:0:8:800:200C:417A"

This example specifies an IPv6 address and a port number for **SERVER**. You should not specify an IPv6 address in the CATALOG TCPIP4 NODE command. The catalog will not fail if you do, but a subsequent attach or connect will fail because an invalid address was specified during cataloging.

The following example catalogs a node for an SSL connection (the server hostname is *hostname*, and *ssl\_port* is the port number at which this database server waits for communication from remote client nodes using the SSL protocol):

db2 catalog tcpip node db2tcp4 remote *hostname* server *ssl\_port* 

#### Usage notes

The database manager creates the node directory when the first node is cataloged (that is, when the first CATALOG...NODE command is issued). On a Windows client, it stores and maintains the node directory in the instance subdirectory where the client is installed. On an AIX client, it creates the node directory in the DB2 installation directory.

List the contents of the local node directory using the LIST NODE DIRECTORY command.

If directory caching is enabled, database, node, and DCS directory files are cached in memory. An application's directory cache is created during its first directory lookup. Since the cache is only refreshed when the application modifies any of the directory files, directory changes made by other applications might not be effective until the application has restarted.

To refresh the CLP's directory cache, use the TERMINATE command. To refresh DB2's shared cache, stop (db2stop) and then restart (db2start) the database manager. To refresh the directory cache for another application, stop and then restart that application.

# CATALOG TCPIP/TCPIP4/TCPIP6 NODE

To get the DB2 database manager to listen on IPv6, the operating system and server must first be configured for IPv6. Speak to your system administrator to ensure this configuration has been done before cataloging an IPv6 TCPIP node. Follow Upgrading to IPv6 with IPv4 configured to see how this can be done on AIX 5.3.

# CHANGE DATABASE COMMENT

Changes a database comment in the system database directory or the local database directory. New comment text can be substituted for text currently associated with a comment.

# Scope

This command only affects the database partition on which it is executed.

# Authorization

One of the following:

- sysadm
- sysctrl

# **Required connection**

None

# **Command syntax**

# **Command parameters**

DATABASE database-alias

Specifies the alias of the database whose comment is to be changed. To change the comment in the system database directory, specify the alias for the database. To change the comment in the local database directory, specify the path where the database resides (with the *path* parameter), and enter the name (not the alias) of the database.

# **ON** path | drive

Specifies the path on which the database resides, and changes the comment in the local database directory. If a path is not specified, the database comment for the entry in the system database directory is changed. On Windows operating systems, may instead specify the letter of the drive on which the database resides (if it was created on a drive, not on a specific path).

## WITH "comment-string"

Describes the entry in the system database directory or the local database directory. Any comment that helps to describe the cataloged database can be entered. The maximum length of a comment string is 30 characters. A carriage return or a line feed character is not permitted. The comment text must be enclosed by double quotation marks.

# CHANGE DATABASE COMMENT

# **Examples**

The following example changes the text in the system database directory comment for the SAMPLE database from "Test 2 - Holding" to "Test 2 - Add employee inf rows":

```
db2 change database sample comment
with "Test 2 - Add employee inf rows"
```

# **Usage notes**

New comment text replaces existing text. To append information, enter the old comment text, followed by the new text.

Only the comment for an entry associated with the database alias is modified. Other entries with the same database name, but with different aliases, are not affected.

If the path is specified, the database alias must be cataloged in the local database directory. If the path is not specified, the database alias must be cataloged in the system database directory.

# CHANGE ISOLATION LEVEL

Changes the way that DB2 isolates data from other processes while a database is being accessed.

# **Authorization**

None

# **Required connection**

None

# **Command syntax**

# **Command parameters**

то

- **CS** Specifies cursor stability as the isolation level.
- **NC** Specifies no commit as the isolation level. Not supported by DB2.
- **RR** Specifies repeatable read as the isolation level.
- **RS** Specifies read stability as the isolation level.
- **UR** Specifies uncommitted read as the isolation level.

# **Usage notes**

DB2 uses isolation levels to maintain data integrity in a database. The isolation level defines the degree to which an application process is isolated (shielded) from changes made by other concurrently executing application processes.

If a selected isolation level is not supported by a database, it is automatically escalated to a supported level at connect time.

Isolation level changes are not permitted while connected to a database with a type 1 connection. The back end process must be terminated before isolation level can be changed:

db2 terminate db2 change isolation to ur db2 connect to sample

Changes are permitted using a type 2 connection, but should be made with caution, because the changes will apply to every connection made from the same command line processor back-end process. The user assumes responsibility for remembering which isolation level applies to which connected database.

In the following example, a user is in DB2 interactive mode following creation of the SAMPLE database:

# **CHANGE ISOLATION LEVEL**

update command options using c off catalog db sample as sample2 set client connect 2 connect to sample connect to sample2 change isolation to cs set connection sample declare c1 cursor for select \* from org open c1 fetch c1 for 3 rows change isolation to rr fetch c1 for 2 rows

An SQL0514N error occurs because c1 is not in a prepared state for this isolation level.

change isolation to cs set connection sample2 fetch c1 for 2 rows

- An SQL0514N error occurs because c1 is not in a prepared state for this database. declare c1 cursor for select division from org
- A DB21029E error occurs because cursor c1 has already been declared and opened. set connection sample fetch c1 for 2 rows

This works because the original database (SAMPLE) was used with the original isolation level (CS).

# **COMPLETE XMLSCHEMA**

Completes the process of registering an XML schema in the XML schema repository (XSR).

# Authorization

• The user ID must be the owner of the XSR object as recorded in the catalog view SYSCAT.XSROBJECTS.

# **Required connection**

Database

# **Command syntax**

►►—COMPLETE XMLSCHEMA—relational-identifier-

└─WITH—schema-properties-URI─┘

-ENABLE DECOMPOSITION

# Description

relational-identifier

Specifies the relational name of an XML schema previously registered with the REGISTER XMLSCHEMA command. The relational name can be specified as a two-part SQL identifier, consisting of the SQL schema and the XML schema name, having the following format: *SQLschema.name*. The default SQL schema, as defined in the CURRENT SCHEMA special register, is used if no schema is specified.

## **WITH** schema-properties-URI

Specifies the uniform resource identifier (URI) of a properties document for the XML schema. Only a local file, specified by a file scheme URI, is supported. A schema property document can only be specified during the completion stage of XML schema registration.

## ENABLE DECOMPOSITION

Indicates that the schema can be used for decomposing XML instance documents.

# Example

COMPLETE XMLSCHEMA user1.POschema WITH 'file:///c:/TEMP/schemaProp.xml'

# **Usage notes**

An XML schema cannot be referenced or used for validation or annotation until the XML schema registration process has been completed. This command completes the XML schema registration process for an XML schema that was begun with the REGISTER XMLSCHEMA command.

# CREATE DATABASE

Initializes a new database with an optional user-defined collating sequence, creates the three initial table spaces, creates the system tables, and allocates the recovery log file. When you initialize a new database, the AUTOCONFIGURE command is issued by default.

**Note:** When the instance and database directories are created by the DB2 database manager, the permissions are accurate and should not be changed.

When the CREATE DATABASE command is issued, the Configuration Advisor also runs automatically. This means that the database configuration parameters are automatically tuned for you according to your system resources. In addition, Automated Runstats is enabled. To disable the Configuration Advisor from running at database creation, refer to the

**DB2\_ENABLE\_AUTOCONFIG\_DEFAULT** registry variable. To disable Automated Runstats, refer to the **auto\_runstats** database configuration parameter.

Adaptive Self Tuning Memory is also enabled by default for single partition databases. To disable Adaptive Self Tuning Memory by default, refer to the **self\_tuning\_mem** database configuration parameter. For multi-partition databases, Adaptive Self Tuning Memory is disabled by default.

If no code set is specified on the CREATE DATABASE command, then the collations allowed are: SYSTEM, IDENTITY\_16BIT, UCA400\_NO, UCA400\_LSK, UCA400\_LTH, *language-aware-collation*, and *locale-aware-collation* (SQLCODE -1083). The default code set for a database is UTF-8. If a particular code set and territory is needed for a database, the desired code set and territory should be specified in the CREATE DATABASE command.

This command is not valid on a client.

## Scope

In a partitioned database environment, this command affects all database partitions that are listed in the db2nodes.cfg file.

The database partition from which this command is issued becomes the catalog database partition for the new database.

## Authorization

You must have one of the following:

- SYSADM
- SYSCTRL

# **Required connection**

Instance. To create a database at another (remote) database partition server, you must first attach to that server. A database connection is temporarily established by this command during processing.

# **CREATE DATABASE**

# **Command syntax**

# **CREATE DATABASE**

## Note:

- 1. The combination of the code set and territory values must be valid.
- 2. Not all collating sequences are valid with every code set and territory combination.
- **3**. The table space definitions specified on CREATE DATABASE apply to all database partitions on which the database is being created. They cannot be specified separately for each database partition. If the table space definitions are to be created differently on particular database partitions, the CREATE TABLESPACE statement must be used.

When defining containers for table spaces, \$N can be used. \$N will be replaced by the database partition number when the container is actually created. This is required if the user wants to specify containers in a multiple logical partition database.

4. The AUTOCONFIGURE option requires SYSADM authority.

### Command parameters

#### **DATABASE** *database-name*

A name to be assigned to the new database. This must be a unique name that differentiates the database from any other database in either the local database directory or the system database directory. The name must conform to naming conventions for databases. Specifically, the name must not contain any space characters.

## AT DBPARTITIONNUM

Specifies that the database is to be created only on the database partition that issues the command. You do not specify this option when you create a new database. You can use it to recreate a database partition that you dropped because it was damaged. After you use the CREATE DATABASE command with the **AT DBPARTITIONNUM** option, the database at this database partition is in the restore-pending state. You must immediately restore the database on this database partition server. This parameter is not intended for general use. For example, it should be used with RESTORE DATABASE command if the database partition at a database partition

server was damaged and must be recreated. Improper use of this parameter can cause inconsistencies in the system, so it should only be used with caution.

If this parameter is used to recreate a database partition that was dropped (because it was damaged), the database at this database partition will be in the restore-pending state. After recreating the database partition, the database must immediately be restored on this database partition.

### AUTOMATIC STORAGE NO | YES

Specifies that automatic storage is being explicitly disabled or enabled for the database. The default value is YES. If the **AUTOMATIC STORAGE** clause is not specified, automatic storage is implicitly enabled by default.

NO Automatic storage is not being enabled for the database.

**YES** Automatic storage is being enabled for the database.

#### **ON** path or drive

The meaning of this option depends on the value of the **AUTOMATIC STORAGE** option.

- If AUTOMATIC STORAGE NO is specified, automatic storage is disabled for the database. In this case, only one path can be included as part of the ON option, and it specifies the path on which to create the database. If a path is not specified, the database is created on the default database path that is specified in the database manager configuration file (dftdbpath parameter). This behavior matches that of DB2 Universal Database<sup>™</sup> Version 8.2 and earlier.
- Otherwise, automatic storage is enabled for the database by default. In this case, multiple paths may be listed here, each separated by a comma. These are referred to as storage paths and are used to hold table space containers for automatic storage table spaces. For multi-partition databases the same storage paths will be used on all partitions.

The **DBPATH ON** option specifies on which paths to create the database. If the **DBPATH ON** option is not specified, the database is created on the first path listed in the **ON** option. If no paths are specified with the **ON** option, the database is created on the default database path that is specified in the database manager configuration file (**dftdbpath** parameter). This will also be used as the location for the single storage path associated with the database.

The database path is the location where a hierarchical directory structure is created. The structure holds the following files needed for the operation of the database:

- Buffer pool information
- Table space information
- Storage path information
- Database configuration information
- History file information regarding backups, restores, loading of tables, reorganization of tables, altering of table spaces, and other database changes
- Log control files with information about active logs

The **DBPATH ON** option can be used to place these files and information in a directory that is separate from the storage paths where the database data is kept. It is suggested that the **DBPATH ON** option

be used when automatic storage is enabled to keep the database information separate from the database data.

The maximum length of a path is 175 characters.

For MPP systems, a database should not be created in an NFS-mounted directory. If a path is not specified, ensure that the **dftdbpath** database manager configuration parameter is not set to an NFS-mounted path (for example, on UNIX operating systems, it should not specify the \$HOME directory of the instance owner). The path specified for this command in an MPP system cannot be a relative path. Also, all paths specified as part of the **ON** option must exist on all database partitions.

A given database path or storage path must exist and be accessible on each database partition.

#### **DBPATH ON** path or drive

If automatic storage is enabled, the **DBPATH ON** option specifies the path on which to create the database. If automatic storage is enabled and the **DBPATH ON** option is not specified, the database is created on the first path listed with the **ON** option.

The maximum length of a database path is 215 characters and the maximum length of a storage path is 175 characters.

#### ALIAS database-alias

An alias for the database in the system database directory. If no alias is provided, the specified database name is used.

#### **USING CODESET** codeset

Specifies the code set to be used for data entered into this database. After you create the database, you cannot change the specified code set.

#### **TERRITORY** *territory*

Specifies the territory identifier or locale identifier to be used for data entered into this database. After you create the database, you cannot change the specified territory. The combination of the code set and territory or locale values must be valid.

### COLLATE USING

Identifies the type of collating sequence to be used for the database. Once the database has been created, the collating sequence cannot be changed.

In a Unicode database, the catalog tables and views are always created with the IDENTITY collation, regardless of the collation specified in the COLLATE USING clause. In non-Unicode databases, the catalog tables and views are created with the database collation.

#### COMPATIBILITY

The DB2 Version 2 collating sequence. Some collation tables have been enhanced. This option specifies that the previous version of these tables is to be used.

#### IDENTITY

Identity collating sequence, in which strings are compared byte for byte.

### **IDENTITY\_16BIT**

CESU-8 (Compatibility Encoding Scheme for UTF-16: 8-Bit) collation sequence as specified by the Unicode Technical Report

#26, which is available at the Unicode Consortium Web site (www.unicode.org). This option can only be specified when creating a Unicode database.

### UCA400\_NO

The UCA (Unicode Collation Algorithm) collation sequence that is based on the Unicode Standard version 4.0.0 with normalization implicitly set to ON. Details of the UCA can be found in the Unicode Technical Standard #10, which is available at the Unicode Consortium Web site (www.unicode.org). This option can only be used when creating a Unicode database.

### UCA400\_LSK

The UCA (Unicode Collation Algorithm) collation sequence based on the Unicode Standard version 4.0.0 but will sort Slovak characters in the appropriate order. Details of the UCA can be found in the Unicode Technical Standard #10, which is available at the Unicode Consortium Web site (www.unicode.org). This option can only be used when creating a Unicode database.

### UCA400\_LTH

The UCA (Unicode Collation Algorithm) collation sequence that is based on the Unicode Standard version 4.0.0 but will sort all Thai characters according to the Royal Thai Dictionary order. Details of the UCA can be found in the Unicode Technical Standard #10 available at the Unicode Consortium Web site (www.unicode.org). This option can only be used when creating a Unicode database. This collator might order Thai data differently from the NLSCHAR collator option.

## language-aware-collation

This option can only be used for Unicode databases. The database collating sequence is based on the SYSTEM collation for a non-Unicode database. This string must be of the format SYSTEM\_codepage\_territory. If the string supplied is invalid, the create database will fail (SQLCODE -204; object not found). See "Language-aware collations for Unicode data" for more information and for the naming of system based collations.

**Note:** When the CREATE DATABASE command is performed against a Version 9.0 server, this option cannot be used. By default, a Unicode database on such a server will be created with SYSTEM collation.

#### locale-sensitive-collation

This option can only be used for Unicode databases. See "Unicode Collation Algorithm based collations" for more information and for the naming of locale-sensitive UCA-based collations. If the collation name provided is invalid, the CREATE DATABASE command execution will fail (SQLCODE -204).

#### NLSCHAR

System-defined collating sequence using the unique collation rules for the specific code set/territory.

This option can only be used with the Thai code page (CP874). If this option is specified in non-Thai environments, the command will fail and return the error SQL1083N with Reason Code 4.

#### SYSTEM

This is the default option when creating a database. For non-Unicode databases, the collating sequence is based on the database territory. For Unicode databases, this option maps to a language-aware collation, based on the client code set and territory. If an appropriate language-aware collation is unavailable, then the IDENTITY collation is used.

## **PAGESIZE** integer

Specifies the page size of the default buffer pool along with the initial table spaces (SYSCATSPACE, TEMPSPACE1, USERSPACE1) when the database is created. This also represents the default page size for all future CREATE BUFFERPOOL and CREATE TABLESPACE statements. The valid values for integer without the suffix K are 4 096, 8 192, 16 384, or 32 768. The valid values for integer with the suffix K are 4, 8, 16, or 32. At least one space is required between the integer and the suffix K. The default is a page size of 4 096 bytes (4 K).

#### **NUMSEGS** *numsegs*

Specifies the number of directories (table space containers) that will be created and used to store the database table files for any default SMS table spaces. This parameter does not affect automatic storage table spaces, DMS table spaces, any SMS table spaces with explicit creation characteristics (created when the database is created), or any SMS table spaces explicitly created after the database is created.

### **DFT\_EXTENT\_SZ** *dft\_extentsize*

Specifies the default extent size of table spaces in the database.

#### RESTRICTIVE

If the **RESTRICTIVE** option is present it causes the **restrict\_access** database configuration parameter to be set to YES and no privileges or authorities are automatically granted to PUBLIC. If the **RESTRICTIVE** option is not present then the **restrict\_access** database configuration parameter is set to NO and privileges are automatically granted to PUBLIC. For information about privileges, see: "Default privileges granted on creating a database".

## **CATALOG TABLESPACE** *tblspace-defn*

Specifies the definition of the table space that will hold the catalog tables, SYSCATSPACE. If not specified and automatic storage is not enabled for the database, SYSCATSPACE is created as a System Managed Space (SMS) table space with **NUMSEGS** number of directories as containers, and with an extent size of **DFT\_EXTENTSIZE**. For example, the following containers would be created if **NUMSEGS** were specified to be 5:

/u/smith/smith/NODE0000/SQL00001/SQLT0000.0 /u/smith/smith/NODE0000/SQL00001/SQLT0000.1 /u/smith/smith/NODE0000/SQL00001/SQLT0000.2 /u/smith/smith/NODE0000/SQL00001/SQLT0000.3 /u/smith/smith/NODE0000/SQL00001/SQLT0000.4

If not specified and automatic storage is enabled for the database, SYSCATSPACE is created as an automatic storage table space with its containers created on the defined storage paths. The extent size of this table space is 4. Appropriate values for **AUTORESIZE**, **INITIALSIZE**, **INCREASESIZE**, and **MAXSIZE** are set automatically.

See "CREATE TABLESPACE statement" for more information on the table space definition fields.

In a partitioned database environment, the catalog table space is only created on the catalog database partition, the database partition on which the CREATE DATABASE command is issued.

### **USER TABLESPACE** *tblspace-defn*

Specifies the definition of the initial user table space, USERSPACE1. If not specified and automatic storage is not enabled for the database, USERSPACE1 is created as an SMS table space with **NUMSEGS** number of directories as containers and with an extent size of **DFT\_EXTENTSIZE**. For example, the following containers would be created if **NUMSEGS** were specified to be 5:

/u/smith/smith/NODE0000/SQL00001/SQLT0001.0 /u/smith/smith/NODE0000/SQL00001/SQLT0002.1 /u/smith/smith/NODE0000/SQL00001/SQLT0002.2 /u/smith/smith/NODE0000/SQL00001/SQLT0002.3 /u/smith/smith/NODE0000/SQL00001/SQLT0002.4

If not specified and automatic storage is enabled for the database, USERSPACE1 is created as an automatic storage table space with its containers created on the defined storage paths. The extent size of this table space will be **DFT\_EXTENTSIZE**. Appropriate values for **AUTORESIZE**, **INITIALSIZE**, **INCREASESIZE**, and **MAXSIZE** are set automatically.

See "CREATE TABLESPACE statement" for more information on the table space definition fields.

#### **TEMPORARY TABLESPACE** *tblspace-defn*

Specifies the definition of the initial system temporary table space, TEMPSPACE1. If not specified and automatic storage is not enabled for the database, TEMPSPACE1 is created as an SMS table space with **NUMSEGS** number of directories as containers and with an extent size of **DFT\_EXTENTSIZE**. For example, the following containers would be created if **NUMSEGS** were specified to be 5:

/u/smith/smith/NODE0000/SQL00001/SQLT0002.0 /u/smith/smith/NODE0000/SQL00001/SQLT0001.1 /u/smith/smith/NODE0000/SQL00001/SQLT0001.2 /u/smith/smith/NODE0000/SQL00001/SQLT0001.3 /u/smith/smith/NODE0000/SQL00001/SQLT0001.4

If not specified and automatic storage is enabled for the database, TEMPSPACE1 is created as an automatic storage table space with its containers created on the defined storage paths. The extent size of this table space is **DFT\_EXTENTSIZE**.

See "CREATE TABLESPACE statement" for more information on the table space definition fields.

#### tblspace-defn

Various table space definitions can be specified through the following command parameters.

#### MANAGED BY

#### **SYSTEM USING** container-string

Specifies that the table space is to be an SMS table space. When the type of table space is not specified, the default behavior is to create a regular table space. For an SMS table space, identifies one or more containers that will belong to the table space and in which the table space data will be stored. The *container-string* cannot exceed 240 bytes in length.

Each *container-string* can be an absolute or relative directory name.

The directory name, if not absolute, is relative to the database directory, and can be a path name alias (a symbolic link on UNIX operating systems) to storage that is not physically associated with the database directory. For example, *dbdir*/work/c1 could be a symbolic link to a separate file system.

If any component of the directory name does not exist, it is created by the database manager. When a table space is dropped, all components created by the database manager are deleted. If the directory identified by *container-string* exists, it must not contain any files or subdirectories (SQLSTATE 428B2).

The format of *container-string* is dependent on the operating system. On Windows operating systems, an absolute directory path name begins with a drive letter and a colon (:); on UNIX operating systems, an absolute path name begins with a forward slash (/). A relative path name on any platform does not begin with an operating system-dependent character.

Remote resources (such as LAN-redirected drives or NFS-mounted file systems) are currently only supported when using Network Appliance Filers, IBM iSCSI, IBM Network Attached Storage, Network Appliance iSCSI, NEC iStorage S2100, S2200, or S4100, or NEC Storage NS Series with a Windows DB2 server. Note that NEC Storage NS Series is only supported with the use of an uninterrupted power supply (UPS); continuous UPS (rather than standby) is recommended. An NFS-mounted file system on AIX must be mounted in uninterruptible mode using the **-o** nointr option.

## DATABASE USING

Specifies that the table space is to be a DMS table space. When the type of table space is not specified, the default behavior is to create a large table space.

For a DMS table space, identifies one or more containers that will belong to the table space and in which the table space data will be stored. The type of the container (either FILE or DEVICE) and its size (in PAGESIZE pages) are specified. A mixture of FILE and DEVICE containers can be specified. The *container-string* cannot exceed 254 bytes in length.

Remote resources (such as LAN-redirected drives or NFS-mounted file systems) are currently only supported when using Network Appliance Filers, IBM iSCSI, IBM Network Attached Storage, Network Appliance iSCSI, NEC iStorage S2100, S2200, or S4100, or NEC Storage NS Series with a Windows DB2 server. Note that NEC Storage NS Series is only supported with the use of an uninterrupted power supply (UPS); continuous UPS (rather than standby) is recommended.

All containers must be unique across all databases. A container can belong to only one table space. The size of the containers can differ; however, optimal performance is achieved when all containers are the same size. The exact format of *container-string* is dependent on the operating system.

### FILE container-string number-of-pages

For a FILE container, *container-string* must be an absolute or relative file name. The file name, if not absolute, is relative to the database directory. If any component of the directory name does not exist, it is created by the database manager. If the file does not exist, it will be created and initialized to the specified size by the database manager. When a table space is dropped, all components created by the database manager are deleted.

**Note:** If the file exists, it is overwritten, and if it is smaller than specified, it is extended. The file will not be truncated if it is larger than specified.

## **DEVICE** container-string number-of-pages

For a DEVICE container, *container-string* must be a device name. The device must already exist.

## AUTOMATIC STORAGE

Specifies that the table space is to be an automatic storage table space. If automatic storage is not defined for the database, an error is returned (SQLSTATE 55060).

An automatic storage table space is created as either a system managed space (SMS) table space or a database managed space (DMS) table space. When DMS is chosen and the type of table space is not specified, the default behavior is to create a large table space. With an automatic storage table space, the database manager determines which containers are to be assigned to the table space, based upon the storage paths that are associated with the database.

## **EXTENTSIZE** *number-of-pages*

Specifies the number of **PAGESIZE** pages that will be written to a container before skipping to the next container. The extent size value can also be specified as an integer value followed by K (for kilobytes) or M (for megabytes). If specified in this way, the floor of the number of bytes divided by the page size is used to determine the value for the extent size. The database manager cycles repeatedly through the containers as data is stored.

The default value is provided by the **dft\_extent\_sz** database configuration parameter, which has a valid range of 2-256 pages.

#### **PREFETCHSIZE** *number-of-pages*

Specifies the number of **PAGESIZE** pages that will be read from the table space when data prefetching is being performed. The prefetch size value can also be specified as an integer value followed by K (for kilobytes), M (for megabytes), or G (for gigabytes). If specified in this way, the floor of the number of bytes divided by the page size is used to determine the number of pages value for prefetch size.

### **OVERHEAD** number-of-milliseconds

Specifies the I/O controller overhead and disk seek and latency time. This value is used to determine the cost of I/O during query optimization. The value of *number-of-milliseconds* is any numeric literal (integer, decimal, or floating point). If this value is not the same for all containers, the number should be the average for all containers that belong to the table space.

For a database that was created in Version 9 or later, the default I/O controller overhead and disk seek and latency time is 7.5 milliseconds. For a database that was upgraded from a previous version of DB2 to Version 9 or later, the default is 12.67 milliseconds.

## **TRANSFERRATE** number-of-milliseconds

Specifies the time to read one page into memory. This value is used to determine the cost of I/O during query optimization. The value of *number-of-milliseconds* is any numeric literal (integer, decimal, or floating point). If this value is not the same for all containers, the number should be the average for all containers that belong to the table space.

For a database that was created in Version 9 or later, the default time to read one page into memory is 0.06 milliseconds. For a database that was upgraded from a previous version of DB2 to Version 9 or later, the default is 0.18 milliseconds.

## NO FILE SYSTEM CACHING

Specifies that all I/O operations are to bypass the file system-level cache. See "Table spaces without file system caching" for more details. This is the default option on most configurations. See "File system caching configurations" for details.

## FILE SYSTEM CACHING

Specifies that all I/O operations in the target table space are to be cached at the file system level. See "Table spaces without file system caching" for more details. This is the default option on some configurations. See "File system caching configurations" for details.

#### AUTORESIZE

Specifies whether or not the auto-resize capability of a DMS table space or an automatic storage table space is to be enabled. Auto-resizable table spaces automatically

increase in size when they become full. The default is NO for DMS table spaces and YES for automatic storage table spaces.

- **NO** Specifies that the auto-resize capability of a DMS table space or an automatic storage table space is to be disabled.
- **YES** Specifies that the auto-resize capability of a DMS table space or an automatic storage table space is to be enabled.

## **INITIALSIZE** integer

Specifies the initial size, per database partition, of an automatic storage table space. This option is only valid for automatic storage table spaces. The integer value must be followed by K (for kilobytes), M (for megabytes), or G (for gigabytes). Note that the actual value used might be slightly smaller than what was specified, because the database manager strives to maintain a consistent size across containers in the table space. Moreover, if the table space is auto-resizable and the initial size is not large enough to contain meta-data that must be added to the new table space, the database manager will continue to extend the table space by the value of INCREASESIZE until there is enough space. If the INITIALSIZE clause is not specified, the database manager determines an appropriate value. The value for integer must be at least 48 K.

- **K** K (for kilobytes).
- M M (for megabytes).
- **G** G (for gigabytes).

## **INCREASESIZE** *integer*

Specifies the amount, per database partition, by which a table space that is enabled for auto-resize will automatically be increased when the table space is full, and a request for space has been made. The integer value must be followed by either:

- PERCENT to specify the amount as a percentage of the table space size at the time that a request for space is made. When PERCENT is specified, the integer value must be between 0 and 100 (SQLSTATE 42615).
- K (for kilobytes), M (for megabytes), or G (for gigabytes) to specify the amount in bytes

Note that the actual value used might be slightly smaller or larger than what was specified, because the database manager strives to maintain consistent growth across containers in the table space. If the table space is auto-resizable, but the **INCREASESIZE** clause is not specified, the database manager determines an appropriate value.

## PERCENT

Percent from 0 to 100.

- K K (for kilobytes).
- M M (for megabytes).
- **G** G (for gigabytes).

#### MAXSIZE

Specifies the maximum size to which a table space that is enabled for auto-resize can automatically be increased. If the table space is auto-resizable, but the **MAXSIZE** clause is not specified, the default is NONE.

### NONE

Specifies that the table space is to be allowed to grow to file system capacity, or to the maximum table space size.

- *integer* Specifies a hard limit on the size, per database partition, to which a DMS table space or an automatic storage table space can automatically be increased. The integer value must be followed by K (for kilobytes), M (for megabytes), or G (for gigabytes). Note that the actual value used might be slightly smaller than what was specified, because the database manager strives to maintain consistent growth across containers in the table space.
  - K K (for kilobytes).
  - M M (for megabytes).
  - **G** G (for gigabytes).

## **WITH** *comment-string*

Describes the database entry in the database directory. Any comment that helps to describe the database can be entered. Maximum length is 30 characters. A carriage return or a line feed character is not permitted. The comment text must be enclosed by single or double quotation marks.

#### AUTOCONFIGURE

Based on user input, calculates the recommended settings for buffer pool size, database configuration, and database manager configuration and optionally applies them. The Configuration Advisor is run by default when the CREATE DATABASE command is issued. The **AUTOCONFIGURE** option is needed only if you want to tweaks the recommendations.

USING input-keyword param-value
## **CREATE DATABASE**

Keyword	Valid values	Default value	Explanation
mem_percent	1–100	25	Percentage of instance memory that is assigned to the database. However, if the CREATE DATABASE command invokes the configuration advisor and you do not specify a value for <b>mem_percent</b> , the percentage is calculated based on memory usage in the instance and the system up to a maximum of 25% of the instance memory.
workload_type	simple, mixed, complex	mixed	Simple workloads tend to be I/O intensive and mostly transactions, whereas complex workloads tend to be CPU intensive and mostly queries.
num_stmts	1-1 000 000	25	Number of statements per unit of work
tpm	1-200 000	60	Transactions per minute
admin_priority	performance, recovery, both	both	Optimize for better performance (more transactions per minute) or better recovery time
num_local_apps	0–5 000	0	Number of connected local applications
num_remote_apps	0-5 000	100	Number of connected remote applications
isolation	RR, RS, CS, UR	RR	Isolation level of applications connecting to this database (Repeatable Read, Read Stability, Cursor Stability, Uncommitted Read)
bp_resizeable	yes, no	yes	Are buffer pools resizeable?

Tahle 9	Valid innu	keywords	and	narameter	values
Tuble 0.	vana mpa	noynorao	unu	paramotor	valuoo

### APPLY

#### **DB ONLY**

Displays the recommended values for the database

configuration and the buffer pool settings based on the current database manager configuration. Applies the recommended changes to the database configuration and the buffer pool settings.

#### DB AND DBM

Displays and applies the recommended changes to the database manager configuration, the database configuration, and the buffer pool settings.

#### NONE

Disables the Configuration Advisor (it is enabled by default).

- If the AUTOCONFIGURE keyword is specified with the CREATE DATABASE command, the DB2\_ENABLE\_AUTOCONFIG\_DEFAULT variable value is not considered. Adaptive Self Tuning Memory and Auto Runstats will be enabled and the Configuration Advisor will tune the database configuration and database manager configuration parameters as indicated by the APPLY DB or APPLY DBM options.
- Specifying the AUTOCONFIGURE option with the CREATE DATABASE command on a database will recommend enablement of the Self Tuning Memory Manager. However, if you run the AUTOCONFIGURE command on a database in an instance where sheapthres is not zero, sort memory tuning (sortheap) will not be enabled automatically. To enable sort memory tuning (sortheap), you must set sheapthres equal to zero using the UPDATE DATABASE MANAGER CONFIGURATION command. Note that changing the value of sheapthres may affect the sort memory usage in your previously existing databases.

#### Examples

Here are several examples of the CREATE DATABASE command:

Example 1: CREATE DATABASE TESTDB3 AUTOMATIC STORAGE YES

Database TESTDB3 is created on the drive that is the value of database manager configuration parameter **dftdbpath**. Automatic storage is enabled with a single storage path that also has the value of **dftdbpath**.

Example 2: CREATE DATABASE TESTDB7 ON C:,D:

Database TESTDB7 is created on drive C: (first drive in storage path list). Automatic storage is implicitly enabled and the storage paths are C: and D:.

Example 3: CREATE DATABASE TESTDB15 AUTOMATIC STORAGE YES ON C:,D: DBPATH ON E:

Database TESTDB15 is created on drive E: (explicitly listed as **DBPATH**). Automatic storage is explicitly enabled and the storage paths are C: and D:.

## **Usage notes**

The CREATE DATABASE command:

- Creates a database in the specified subdirectory. In a partitioned database environment, creates the database on all database partitions listed in db2nodes.cfg, and creates a \$DB2INSTANCE/NODExxxx directory under the specified subdirectory at each database partition. In a single partition database environment, creates a \$DB2INSTANCE/NODE0000 directory under the specified subdirectory.
- Creates the system catalog tables and recovery log.
- Catalogs the database in the following database directories:
  - Server's local database directory on the path indicated by *path* or, if the path is not specified, the default database path defined in the database manager system configuration file by the **dftdbpath** parameter. A local database directory resides on each file system that contains a database.
  - Server's system database directory for the attached instance. The resulting directory entry will contain the database name and a database alias.

If the command was issued from a remote client, the client's system database directory is also updated with the database name and an alias.

Creates a system or a local database directory if neither exists. If specified, the comment and code set values are placed in both directories.

**Note:** If the change the database by path configuration parameter **newlogpath** is not set, the default for the location of log files configuration parameter **logpath** is the path shown by the **DBPATH ON** option. It is suggested that the **DBPATH ON** option be used when automatic storage is enabled to keep the database information separate from the database data.

- Stores the specified code set, territory, and collating sequence. A flag is set in the database configuration file if the collating sequence consists of unique weights, or if it is the identity sequence.
- Creates the schemas called SYSCAT, SYSFUN, SYSIBM, and SYSSTAT with SYSIBM as the owner. The database partition server on which this command is issued becomes the catalog database partition for the new database. Two database partition groups are created automatically: IBMDEFAULTGROUP and IBMCATGROUP.
- Binds the previously defined database manager bind files to the database (these are listed in the utilities bind file list, db2ubind.lst). If one or more of these files do not bind successfully, CREATE DATABASE returns a warning in the SQLCA, and provides information about the binds that failed. If a bind fails, the user can take corrective action and manually bind the failing file. The database is created in any case. A schema called NULLID is implicitly created when performing the binds with CREATEIN privilege granted to PUBLIC, if the **RESTRICTIVE** option is not selected.

The utilities bind file list contains two bind files that cannot be bound against previous version of the server:

- db2ugtpi.bnd cannot be bound against DB2 Version 2 servers.
- db2dropv.bnd cannot be bound against DB2 Parallel Edition Version 1 servers.

If db2ubind.lst is bound against a server which is not at the latest level, warnings pertaining to these two files are returned, and can be disregarded.

• Creates SYSCATSPACE, TEMPSPACE1, and USERSPACE1 table spaces. The SYSCATSPACE table space is only created on the catalog database partition.

#### **CREATE DATABASE**

• For information about privileges granted when creating a database, see: "Default privileges granted on creating a database".

**Note:** If the **RESTRICTIVE** option is present it causes the **restrict\_access** database configuration parameter to be set to YES and no privileges or authorities are automatically granted to PUBLIC. For additional information, see the RESTRICTIVE option of the CREATE DATABASE command.

Automatic storage is a collection of storage paths associated with a database on which table spaces can be created without having to explicitly specify container definitions (see the "CREATE TABLESPACE statement" for more information). Automatic storage is enabled by default, but can be explicitly disabled for a database when it is created. Automatic storage can be disabled at database creation time by specifying the **AUTOMATIC STORAGE** NO option.

It is important to note that automatic storage can only be enabled at database creation time, it cannot be enabled after the database has been created. Also, automatic storage cannot be disabled once a database has been defined to use it.

When free space is calculated for an automatic storage path for a given database partition, the database manager will check for the existence of the following directories or mount points within the storage path and will use the first one that is found. In doing this, file systems can be mounted at a point beneath the storage path and the database manager will recognize that the actual amount of free space available for table space containers may not be the same amount that is associated with the storage path directory itself.

- 1. storage\_path/instance\_name/NODE####/database\_name
- 2. storage\_path/instance\_name/NODE####
- 3. storage\_path/instance\_name
- 4. storage\_path/

#### Where

- *storage\_path* is a storage path associated with the database.
- *instance\_name* is the instance under which the database resides.
- *NODE*#### corresponds to the database partition number (for example NODE0000 or NODE0001).
- *database\_name* is the name of the database.

Consider the example where two logical database partitions exist on one physical machine and the database is being created with a single storage path: /db2data. Each database partition will use this storage path but the user may want to isolate the data from each partition within its own file system. In this case, a separate file system can be created for each partition and be mounted at /db2data/*instance*/*NODE####*. When creating containers on the storage path and determining free space, the database manager will know not to retrieve free space information for /db2data, but instead retrieve it for the corresponding /db2data/*instance/NODE####* directory.

In general, the same storage paths must be used for each partition in a multi-partition database and they must all exist prior to executing the CREATE DATABASE command. One exception to this is where database partition expressions are used within the storage path. Doing this allows the database partition number to be reflected in the storage path such that the resulting path name is different on each partition.

You use the argument " \$N" ([blank]\$N) to indicate a database partition expression. A database partition expression can be used anywhere in the storage path, and multiple database partition expressions can be specified. Terminate the database partition expression with a space character; whatever follows the space is appended to the storage path after the database partition expression is evaluated. If there is no space character in the storage path after the database partition expression, it is assumed that the rest of the string is part of the expression. The argument can only be used in one of the following forms:

Operators are evaluated from left to right. % represents the modulus operator. The database partition number in the examples is assumed to be 10.

Syntax	Example	Value
[blank]\$N	" \$N"	10
[blank]\$N+[number]	" \$N+100"	110
[blank]\$N%[number]	" \$N%5"	0
[blank]\$N+[number]%[number]	" \$N+1%5"	1
[blank]\$N%[number]+[number]	" \$N%4+2"	4
<sup>a</sup> % is modulus.		

In an MPP environment, the database manager creates a subdirectory, \$DB2INSTANCE/NODExxxx, under the specified or default path on all database partitions. The xxxx is the database partition number as defined in the db2nodes.cfg file (that is, database partition 0 becomes NODE0000). Subdirectories SQL00001 through SQL*nnnnn* will reside on this path. This ensures that the database objects associated with different database partitions are stored in different directories (even if the subdirectory \$DB2INSTANCE under the specified or default path is shared by all database partitions).

If LDAP (Lightweight Directory Access Protocol) support is enabled on the current machine, the database will be automatically registered in the LDAP directory. If a database object of the same name already exists in the LDAP directory, the database is still created on the local machine, but a warning message is returned, indicating that there is a naming conflict. In this case, the user can manually catalog an LDAP database entry by using the CATALOG LDAP DATABASE command.

CREATE DATABASE will fail if the application is already connected to a database.

When a database is created, a detailed deadlocks event monitor is created. As with any monitor, there is some overhead associated with this event monitor. You can drop the deadlocks event monitor by issuing the DROP EVENT MONITOR command.

Use CATALOG DATABASE to define different alias names for the new database.

The combination of the code set and territory values must be valid. For a list of the supported combinations, see "Supported territory codes and code pages".

To specify a database path (instead of a drive) on a Windows operating system, you need to set the DB2 registry variable: DB2\_CREATE\_DB\_ON\_PATH=YES.

### **CREATE DATABASE**

# Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword **NODE** can be substituted for **DBPARTITIONNUM**.

## **CREATE TOOLS CATALOG**

Creates the DB2 tools catalog tables in a new or existing database. The database must be local.

The tools catalog contains information about the administrative tasks that you configure with such tools as the Task Center and Control Center.

This command will optionally force all applications and stop and restart the database manager if new table spaces are created for the tools catalog. It will also update the DB2 Administration Server (DAS) configuration and activate the scheduler.

This command is not valid on a IBM Data Server Client.

### Scope

The node from which this command is issued becomes the catalog node for the new database.

## Authorization

One of the following:

- sysadm
- sysctrl

The user must also have DASADM authority to update the DB2 administration server configuration parameters.

## **Required connection**

A database connection is temporarily established by this command during processing. This command will optionally stop and restart the database manager if new table spaces are created.

### **Command syntax**

► CREATE TOOLS CATALOG—catalog-name	
►CREATE NEW DATABASE—database-name USE EXISTINGDATABASE—database-name TABLESPACE—tablespace-nameIN	>
►	<b></b> ►4

# Command parameters

#### **CATALOG** *catalog-name*

A name to be used to uniquely identify the DB2 tools catalog. The catalog tables are created under this schema name.

#### **NEW DATABASE** database-name

A name to be assigned to the new database. This must be a unique name that differentiates the database from any other database in either the local database directory or the system database directory. The name must conform to naming conventions for databases.

#### **EXISTING DATABASE** database-name

The name of an existing database to host the tools catalog. It must be a local database.

#### **EXISTING TABLESPACE** tablespace-name

A name to be used to specify the existing 32K page table space used to create the DB2 tools catalog tables. A 32K page size temporary table space must also exist for the tables to be created successfully.

#### FORCE

When you create a tools catalog in a new table space, the database manager must be restarted, which requires that no applications be connected. Use the FORCE option to ensure that no applications are connected to the database. If applications are connected, the tools catalog creation will fail unless you specify an existing table space.

#### **KEEP INACTIVE**

This option will not update the DB2 administration server configuration parameters or enable the scheduler.

#### Examples

db2 create tools catalog cc create new database toolsdb

- db2 create tools catalog catalog1 use existing database toolsdb force
- db2 create tools catalog foobar use existing tablespace user32Ksp in database toolsdb

db2 create tools catalog toolscat use existing database toolsdb keep inactive

#### Usage notes

- The tools catalog tables require two 32K page table spaces (regular and temporary). In addition, unless you specify existing table spaces, a new 32K buffer pool is created for the table spaces. This requires a restart of the database manager. If the database manager must be restarted, all existing applications must be forced off. The new table spaces are created with a single container each in the default database directory path.
- If an active catalog with this name exists before you execute this command, it is deactivated and the new catalog becomes the active catalog.
- Multiple DB2 tools catalogs can be created in the same database and are uniquely identified by the catalog name.
- The jdk\_path configuration parameter must be set in the DB2 administration server (DAS) configuration to the minimum supported level of the SDK for Java.
- Updating the DAS configuration parameters requires *dasadm* authority on the DB2 administration server.
- Unless you specify the KEEP INACTIVE option, this command updates the local DAS configuration parameters related to the DB2 tools catalog database configuration and enables the scheduler at the local DAS server.
- The jdk\_64\_path configuration parameter must be set if you are creating a tools catalog against a 64-bit instance on one of the platforms that supports both 32-and 64-bit instances (AIX, HP-UX, and Solaris).
- In partitioned database environments, the 32KB REGULAR table space must exist on the catalog partition, otherwise the command (such as the one shown below) will fail when a table space is specified:

db2 create tools catalog foobar use existing tablespace user32Ksp in database toolsdb

## **DEACTIVATE DATABASE**

Stops the specified database.

### Scope

In an MPP system, this command deactivates the specified database on all database partitions in the system. If one or more of these database partitions encounters an error, a warning is returned. The database will be successfully deactivated on some database partitions, but might continue to be active on the nodes encountering the error.

## Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint

### **Required connection**

None

### Command syntax

### **Command parameters**

**DATABASE** database-alias

Specifies the alias of the database to be stopped.

**USER** username

Specifies the user stopping the database.

**USING** *password* 

Specifies the password for the user ID.

#### Usage notes

Databases initialized by ACTIVATE DATABASE can be shut down by DEACTIVATE DATABASE or by db2stop. If a database was initialized by ACTIVATE DATABASE, the last application disconnecting from the database will not shut down the database, and DEACTIVATE DATABASE must be used. (In this case, db2stop will also shut down the database.)

The application issuing the DEACTIVATE DATABASE command cannot have an active database connection to any database.

## DEACTIVATE DATABASE

The database can be inaccessible if the database was not explicitly activated, a client application performs frequent reconnections, or the time interval between issuing the DEACTIVATE DATABASE and ACTIVATE DATABASE commands is very short. Activate the database by issuing the ACTIVATE DATABASE command and then attempt to connect to the database.

# DECOMPOSE XML DOCUMENT

This command invokes a stored procedure to decompose a single XML document using a registered and decomposition-enabled XML schema..

## Authorization

One of the following groups of privileges or authorities is required:

- One of the following authorizations:
  - CONTROL privilege on all target tables referenced in the set of annotated schema documents
  - DATAACCESS authority
- All of the following privileges:
  - INSERT privileges on the target table, as required for the operation specified in the action file
  - SELECT, INSERT, UPDATE, or DELETE privilege, as applicable, on any table referenced by the db2-xdb:expression or db2-xdb:condition annotation

If the VALIDATE option is specified, USAGE privilege on the XML schema is also required.

## **Required connection**

Database

## **Command syntax**

► DECOMPOSE XML DOCUMENT—xml-document-name—XMLSCHEMA—xml-schema-name

\_\_\_\_\_\_\_\_

## **Command parameters**

#### **DECOMPOSE XML DOCUMENT** *xml-document-name*

*xml-document-name* is the file path and file name of the input XML document to be decomposed.

#### **XMLSCHEMA** *xml-schema-name*

*xml-schema-name* is the name of an existing XML schema registered with the XML schema repository to be used for document decomposition. *xml-schema-name* is a qualified SQL identifier consisting of an optional SQL schema name followed by a period and the XML schema name. If the SQL schema name is not specified, it is assumed to be the value of the DB2 special register CURRENT SCHEMA.

#### VALIDATE

This parameter indicates that the input XML document is to be validated first, then decomposed only if the document is valid. If VALIDATE is not specified, the input XML document will not be validated before decomposition.

## **Examples**

The following example specifies that the XML document ./gb/document1.xml is to be validated and decomposed with the registered XML schema DB2INST1.GENBANKSCHEMA.

DECOMPOSE XML DOCUMENT ./gb/document1.xml XMLSCHEMA DB2INST1.GENBANKSCHEMA VALIDATE

The following example specifies that the XML document ./gb/document2.xml is to be decomposed without validation with the registered XML schema DB2INST2."GENBANK SCHEMA1", on the assumption that the value of the DB2 special register CURRENT SCHEMA is set to DB2INST2.

DECOMPOSE XML DOCUMENT ./gb/document2.xml XMLSCHEMA "GENBANK SCHEMA1"

## **DECOMPOSE XML DOCUMENTS**

Decomposes XML documents stored in a database column. The data from the XML documents is stored in columns of relational tables based on annotations specified in an XML schema.

The DECOMPOSE XML DOCUMENTS command invokes the XDB\_DECOMP\_XML\_FROM\_QUERY stored procedure to decompose one or more XML documents from a binary or XML column using a registered and decomposition-enabled XML schema.

### Authorization

One of the following groups of privileges is required:

- All of the following privileges:
  - INSERT privilege on all target tables referenced in the annotated schema
  - SELECT privilege on the table, alias, or view containing the column holding the input documents
  - SELECT, INSERT, UPDATE, or DELETE privilege, as applicable, on any table referenced by the db2-xdb:expression or db2-xdb:condition annotation
- One of the following authorizations:
  - CONTROL privilege on all tables referenced in the set of annotated schema documents and on the table, alias, or view containing the column holding the input documents
  - DATAACCESS authority

If the VALIDATE option is specified, USAGE privilege on the XML schema is also required.

### **Required connection**

Database

### **Command syntax**

► DECOMPOSE XML DOCUMENTS IN—select-statement—XMLSCHEMA—xml-schema-name

		ALLOW N	NO ACCESS			
	VALIDATE	ALLOW A	ACCESS		COMMITCOUNTinteger	
▶-	1					<b>&gt;</b>
	CONTINUE_ON_E	ERROR_	-MESSAGES	—n	nessage-file_	

## **Command parameters**

#### DECOMPOSE XML DOCUMENTS IN select-statement

The *select-statement* conforms to the rules of an SQL SELECT statement, and must return a result set containing 2 columns. The first column is the document identifier. Each document identifier uniquely identifies an XML document to be decomposed. The column must be of character type or be castable to character type. The second column contains the XML documents to

#### DECOMPOSE XML DOCUMENTS

be decomposed. The supported types for the document column are XML, BLOB, VARCHAR FOR BIT DATA, and LONG VARCHAR FOR BIT DATA. The column containing the XML documents must resolve to a column of an underlying base table, the column cannot be a generated column.

For example, the DOCID column in the following SELECT statement contains the unique identifiers for the XML documents stored in SALESDOC column. SELECT DOCID, SALESDOC FROM SALESTAB

#### XMLSCHEMA xml-schema-name

*xml-schema-name* is the name of an existing XML schema registered with the XML schema repository to be used for document decomposition. *xml-schema-name* is a qualified SQL identifier consisting of an optional SQL schema name followed by a period and the XML schema name. If the SQL schema name is not specified, it is assumed to be the value of the DB2 special register CURRENT SCHEMA.

#### VALIDATE

Specifies that each input XML document is to be validated against *xml-schema-name*, then decomposed if the document is valid. If VALIDATE is not specified, input XML documents are not validated before decomposition.

If VALIDATE is not specified, it is the user's responsibility to validate the documents before calling the command. For example, the user can use XMLVALIDATE when inserting the XML documents into the column, or use an XML processor before inserting the documents. If an input XML document is not valid and VALIDATE is not specified, the decomposition results are undefined. See the related reference at the end of this topic for information about XML validation.

#### ALLOW

Specifies whether access to the target tables specified in the XML Schema *xml-schema-name* are allowed during decomposition. ALLOW NO ACCESS is the default value.

#### ALLOW ACCESS

If ALLOW ACCESS is specified, when acquiring locks on the target table, the DECOMPOSE operation will wait and possibly timeout.

#### ALLOW NO ACCESS

If ALLOW NO ACCESS specified or used as the default value, the DECOMPOSE operation will acquire an exclusive lock (X) on all tables which have mappings specified in the XML schema. Not all target tables will necessarily participate during the decomposition of each document, but all target tables will be locked to lower the possibility of deadlock during a long unit of work.

#### **COMMITCOUNT** integer

Specifies that after every *integer* successful document decompositions, a COMMIT is performed. A value of 0, or if the option is not specified, means that no COMMIT will ever be performed by the DECOMPOSE operation.

#### CONTINUE\_ON\_ERROR

Specifies that the DECOMPOSE operation continues to the next document if a document-specific error occurs. Any changes to the database caused by an unsuccessfully decomposed document is undone before proceeding to the next document. If CONTINUE\_ON\_ERROR is not specified, the DECOMPOSE operation stops on the first document that cannot be successfully decomposed.

The DECOMPOSE operation does not continue on fatal errors and non-document specific errors even if the CONTINUE\_ON\_ERROR option is specified.

**MESSAGES** message-file

The DECOMPOSE operation generates a UTF-8 encoded XML document that lists the input XML documents that were not successfully decomposed, along with the reason for their failure. The document containing the decomposition errors is generated only if there is at least one XML document that could not be successfully decomposed. Messages are translated according to server locale. *message-file* is the file that contains the XML document containing the decomposition information. If *message-file* is specified the file will be created on the system from where the CLP command is invoked. If the complete path of the file is not specified, it will be created in the current directory.

If this option is not specified, the decomposition information will be written to standard output.

Information about the decomposition of XML documents is displayed as an XML document that can optionally be sent to *message-file* specified by the parameter **MESSAGES**. The format of the XML document in *message-file* is as follows:

The documentId value *sssss* is the value from the first column specified by *select-statement*. The value identifies the XML document that was not successfully decomposed. The errorMsg value *qqqqq* is the error encountered during the attempt to decompose the document.

#### Example

You could insert XML documents to be decomposed into a relational table, for example: ABC.SALESTAB. All the documents correspond to an XML schema registered as ABC.SALES, and the schema has been annotated with decomposition information and enabled for decomposition. Assuming the column name into which the documents are inserted is SALESDOC, and the corresponding ID is inserted into DOCID, invoke the DECOMPOSE XML DOCUMENTS command as follows:

DECOMPOSE XML DOCUMENTS IN 'SELECT DOCID, SALESDOC FROM SALESTAB' XMLSCHEMA ABC.SALES MESSAGES /home/myid/errors/errorreport.xml

## DEREGISTER

Deregisters the DB2 server from the network directory server.

#### Authorization

None

#### **Required connection**

None

### **Command syntax**

►► DEREGISTER	
►-LDAP-NODE-nodename-USER-username-	
PASSWORD—password—	

### **Command parameters**

**IN** Specifies the network directory server from which to deregister the DB2 server. The valid value is LDAP for an LDAP (Lightweight Directory Access Protocol) directory server.

#### **USER** username

This is the user's LDAP distinguished name (DN). The LDAP user DN must have sufficient authority to delete the object from the LDAP directory. The user name is optional when deregistering in LDAP. If the user's LDAP DN is not specified, the credentials of the current logon user will be used.

#### **PASSWORD** password

Account password.

**NODE** nodename

The node name is the value that was specified when the DB2 server was registered in LDAP.

#### Usage notes

This command can only be issued for a remote machine when in the LDAP environment. When issued for a remote machine, the node name of the remote server must be specified.

The DB2 server is automatically deregistered when the instance is dropped.

## DESCRIBE

The DESCRIBE command displays metadata about the columns, indexes, and data partitions of tables or views. This command can also display metadata about the output of SELECT, CALL, or XQuery statements.

Use the DESCRIBE command to display information about any of the following items:

- Output of a SELECT, CALL, or XQuery statement
- Columns of a table or a view
- Indexes of a table or a view
- Data partitions of a table or view

### Authorization

The authorization required depends on the type of information you want to display using the DESCRIBE command.

• If the SYSTOOLSTMPSPACE table space exists, one of the authorities shown in the following table is required.

Object to display information about	Privileges or authorities required
Output of a SELECT statement or XQuery statement	Any of the following privileges or authorities for each table or view referenced in the SELECT statement:
	SELECT privilege
	DATAACCESS authority
	DBADM authority
	SQLADM authority
	EXPLAIN authority
Output of a CALL statement	Any of the following privileges or authorities:
	DATAACCESS authority
	• EXECUTE privilege on the stored procedure

### DESCRIBE

Object to display information about	Privileges or authorities required
Columns of a table or a view	Any of the following privileges or authorities for the SYSCAT.COLUMNS system catalog table:
	SELECT privilege
	ACCESSCTRL authority
	DATAACCESS authority
	DBADM authority
	SECADM authority
	SQLADM authority
	If you want to use the <b>SHOW DETAIL</b> parameter, you also require any of these privileges or authorities on the SYSCAT.DATAPARTITIONEXPRESSION system catalog table. Because PUBLIC has all the privileges over declared temporary tables, you can use the command to display information about any declared temporary table that exists within
	your connection.
Indexes of a table or a view	Any of the following privileges or authorities on the SYSCAT.INDEXES system catalog table:
	• SELECT privilege
	ACCESSCI RL authority
	DATAACCESS authority     DRADM authority
	• SECADM authority
	SQLADM authority
	If you want to use the <b>SHOW DETAIL</b> parameter, you also require EXECUTE privilege on the GET_INDEX_COLNAMES() UDF.
	Because PUBLIC has all the privileges over declared temporary tables, you can use the command to display information about any declared temporary table that exists within your connection.

Object to display information about	Privileges or authorities required
Data partitions of a table or view	Any of the following privileges or authorities on the SYSCAT.DATAPARTITIONS system catalog table:
	SELECT privilege
	ACCESSCTRL authority
	DATAACCESS authority
	DBADM authority
	SECADM authority
	SQLADM authority
	Because PUBLIC has all the privileges over declared temporary tables, you can use the command to display information about any declared temporary table that exists within your connection.

• If the SYSTOOLSTMPSPACE table space does not exist, SYSADM or SYSCTRL authority is also required in addition to the one of the above authorities.

## **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established.

## **Command syntax**

## **Command parameters**

### OUTPUT

Indicates that the output of the statement should be described. This keyword is optional.

select-statement | call-statement | XQUERY XQuery-statement

Identifies the statement about which information is wanted. The statement is automatically prepared by CLP. To identify an XQuery statement, precede the statement with the keyword **XQUERY**. A DESCRIBE OUTPUT statement only returns information about an implicitly hidden column if the column is explicitly specified as part of the SELECT list of the final result table of the query described.

#### TABLE table-name

Specifies the table or view to be described. The fully qualified name in the form *schema.table-name* must be used. An alias for the table cannot be used in place of the actual table. Information about implicitly hidden columns is returned.

The DESCRIBE TABLE command lists the following information about each column:

- Column name
- Type schema
- Type name
- Length
- Scale
- Nulls (yes/no)

#### **INDEXES FOR TABLE** table-name

Specifies the table or view for which indexes need to be described. You can use the fully qualified name in the form *schema.table-name* or you can just specify the *table-name* and default schema will be used automatically. An alias for the table cannot be used in place of the actual table.

The DESCRIBE INDEXES FOR TABLE command lists the following information about each index of the table or view:

- Index schema
- Index name
- Unique rule
- Number of columns
- Index type

If the DESCRIBE INDEXES FOR TABLE command is specified with the **SHOW DETAIL** option, the index name is truncated when the index name is greater than 18 bytes. If no index type option is specified, information for all index types is listed: relational data index, index over XML data, and Text Search index. The output includes the following additional information:

- Index ID for a relational data index, an XML path index, an XML regions index, or an index over XML data
- Data Type for an index over XML data
- · Hashed for an index over XML data
- Max VARCHAR Length for an index over XML data
- XML Pattern specified for an index over XML data
- Codepage for a text search index
- Language for a text search index
- Format specified for a text search index
- Update minimum for a text search index
- Update frequency for a text search index
- · Collection directory for a text search index
- Column names

Specify an index type to list information for only a specific index type. Specifying multiple index types is not supported.

#### **RELATIONAL DATA**

If the RELATIONAL DATA index type option is specified without the **SHOW DETAIL** option, only the following information is listed:

- Index schema
- Index name
- Unique rule
- Number of columns

If **SHOW DETAIL** is specified, the column names information is also listed.

#### XML DATA

If the XML DATA index type option is specified without the SHOW DETAIL option, only the following information is listed:

- Index schema
- Index name
- Unique rule
- Number of columns
- Index type

If **SHOW DETAIL** is specified, the following information for an index over XML data is also listed:

- Index ID
- Data type
- Hashed
- Max Varchar length
- XML Pattern
- Column names

#### **TEXT SEARCH**

If the **TEXT SEARCH** index type option is specified without the **SHOW DETAIL** option, only the following information is listed:

- Index schema
- Index name

If **SHOW DETAIL** is specified, the following text search index information is also listed:

- Column name
- Codepage
- Language
- Format
- Update minimum
- Update frequency
- Collection directory

If the **TEXT SEARCH** option is specified and a text search option is not installed or not properly configured, an error (SQLSTATE 42724) is returned.

See DB2 Text Search for information listed in the columns.

#### **DATA PARTITIONS FOR TABLE** *table-name*

Specifies the table or view for which data partitions need to be described.

The information displayed for each data partition in the table includes; the partition identifier and the partitioning intervals. Results are ordered according to the partition identifier sequence. The fully qualified name in the form *schema.table-name* must be used. An alias for the table cannot be used in place of the actual table. The *schema* is the user name under which the table or view was created.

For the DESCRIBE DATA PARTITIONS FOR TABLE command, specifies that output include a second table with the following additional information:

- Data partition sequence identifier
- Data partition expression in SQL

#### SHOW DETAIL

For the DESCRIBE TABLE command, specifies that output include the following additional information

- Whether a CHARACTER, VARCHAR or LONG VARCHAR column was defined as FOR BIT DATA
- Column number
- Distribution key sequence
- Code page
- Default
- Table partitioning type (for tables partitioned by range this output appears below the original output)
- Partitioning key columns (for tables partitioned by range this output appears below the original output)
- Identifier of table space used for the index

### Examples

#### Describing the output of a SELECT Statement

The following example shows how to describe a SELECT statement:

db2 describe output select \* from staff

Column Information

Number of columns: 7

Data	а Туре	Length	Column Name	Name Length
500	SMALLINT	2	ID	2
449	VARCHAR	9	NAME	4
501	SMALLINT	2	DEPT	4
453	CHARACTER	5	JOB	3
501	SMALLINT	2	YEARS	5
485	DECIMAL	7,2	SALARY	6
485	DECIMAL	7,2	СОММ	4

#### Describing the output of a CALL Statement

Given a stored procedure created with the statement:

CREATE PROCEDURE GIVE\_BONUS (IN EMPNO INTEGER, IN DEPTNO INTEGER, OUT CHEQUE INTEGER, INOUT BONUS DEC(6,0))

. . .

The following example shows how to describe the output of a CALL statement: db2 describe output call give bonus(123456, 987, ?, 15000.)

Column Information

Number of Columns: 2

Data	Туре	Length	Column Name	Name Length
497	INTEGER	4	CHEQUE	6
485	DECIMAL	6,0	BONUS	5

If the procedure has one or more parameters of an array type, the output from the DESCRIBE command has one additional column, that indicates the maximum cardinality of array parameters. An empty value indicates that the parameter is not an array.

Given the array type and procedure created with the statements:

CREATE TYPE PRODUCT\_LIST AS INTEGER ARRAY[100] CREATE TYPE CUSTOMER\_LIST AS INTEGER ARRAY[1000] CREATE PROCEDURE DISCONTINUE\_PROD (IN PROD\_LIST PRODUCT\_LIST, IN EFFECTIVE\_DATE DATE, OUT NUM\_PENDING\_ORDERS INTEGER, OUT CUST\_LIST CUSTOMER\_LIST)

•••

The following example shows how to describe the output of a CALL statement with array parameters. The only format difference with the previous example is the Max cardinality column.

db2 describe output call discontinue\_prod(ARRAY[12, 34, 26], '04/13/2006',?)

Column Information

Number of Columns: 2

SQL	type	Type length	Column name	Name length	Max cardinality
497	INTEGER	4	NUM_PENDING_ORDERS	17	1000
497	INTEGER	10	CUSTOMER_LIST	13	

#### Describing the output of an XQuery Statement

Given a table named CUSTOMER that has a column named INFO of the XML data type, the following example shows how to describe an XQuery statement:

db2 describe xquery for \$cust in db2-fn:xmlcolumn("CUSTOMER.INFO") return \$cust Column Information

Number of Columns: 1

SQL t	уре	Type length	Column name	Name length
998	XML	Θ	1	1

If the keyword **XQUERY** is not specified, SQL0104N is returned.

db2 describe for \$cust in db2-fn:xmlcolumn("CUSTOMER.INFO") return \$cust SQL0104N An unexpected token "for" was found following "DESCRIBE". Expected tokens may include: "OUTPUT". SQLSTATE=42601 If the DESCRIBE XQUERY command is issued against a downlevel server that does not support the **XQUERY** option, the message DB21108E is returned to indicate that the functionality is not supported by the downlevel server.

#### Describing a Table

The following example shows how to describe a table:

db2 describe table user1.department

Table: USER1.DEPARTMENT

Column name	Type schema	Type name	Length	Scale	Nulls
AREA	SYSIBM	SMALLINT	2	0	No
DEPT	SYSIBM	CHARACTER	3	0	No
DEPTNAME	SYSIBM	CHARACTER	20	0	Yes

The following example shows how to describe a table with details. If the table is partitioned, as in this example, additional details appear below the existing output. For a non-partitioned table, the additional table heading is not displayed:

db2 describe table user1.employee show detail

Column	Type	Column	Type	Length
name	schema	number	name	
FIRST	SYSIBM	0	CHARACTER	10
LAST	SYSIBM	1	CHARACTER	10

Table is partitioned by range (ordered on the following column/s): LAST FIRST

#### **Describing a Table Index**

The following examples shows how to describe a table index. This command lists two relational data indexes, six xml data indexes, two text search indexes, and the system indexes:

db2 describe indexes for table user1.department

		indexes for cas	e user 1. depar en	
Index schema	Index name	Unique rule	Number of columns	Index type
SCHEMA SYSIBM SYSIBM USER1 USER1 SYSIBM USER1 SYSIBM USER1 SYSIBM USER1 SYSIBM	SQL070531145253450 SQL070531145253620 RELIDX1 RELIDX2 SQL070531145253650 XMLIDX1 SQL070531154625650 XMLIDX2 SQL070531154626000 XMLIDX3 SQL070531154626090	Pure D D D D D D D D D D D D D D D D		XML DATA - REGIONS XML DATA - PATH RELATIONAL DATA RELATIONAL DATA RELATIONAL DATA XML DATA - VALUES LOGICAL XML DATA - VALUES LOGICAL XML DATA - VALUES LOGICAL XML DATA - VALUES PHYSICAL XML DATA - VALUES PHYSICAL XML DATA - VALUES PHYSICAL
USERI SYSIBM USER1 SYSIBM USER1 SYSIBM USER1 USER1	XMLIDX4 SQL070531154626190 XMLIDX5 SQL070531154626290 XMLIDX6 SQL070531154626400 TXTIDX1 TXTIDX1 TXTIDX2	D D D D D D	1 1 1 1 1 1 1 1	XML DATA - VALUES LOGICAL XML DATA - VALUES PHYSICAL XML DATA - VALUES LOGICAL XML DATA - VALUES PHYSICAL XML DATA - VALUES LOGICAL XML DATA - VALUES PHYSICAL TEXT SEARCH TEXT SEARCH

The following command lists the relational data indexes for table USER1.DEPARTMENT:

db2 describe relational data indexes for table user1.department

Index schema	Index name	Unique rule	Number of columns
SYSIBM	SQL070531145253650	Р	1
USER1	RELIDX1	D	1
USER1	RELIDX2	D	2

The following command lists the indexes over XML data for table USER1.DEPARTMENT:

db2 describe xml data indexes for table user1.department

Index schema	Index name	Unique rule	Number of columns	Index type
	COL 070521145252450			
2121BM	SQL0/0531145253450	D	-	XML DATA - REGIUNS
SYSIBM	SQL070531145253620	U	1	XML DATA – PATH
USER1	XMLIDX1	D	1	XML DATA - VALUES LOGICAL
SYSIBM	SQL070531154625650	D	1	XML DATA - VALUES PHYSICAL
USER1	XMLIDX2	D	1	XML DATA - VALUES LOGICAL
SYSIBM	SQL070531154626000	D	1	XML DATA - VALUES PHYSICAL
USER1	XMLIDX3	D	1	XML DATA - VALUES LOGICAL
SYSIBM	SQL070531154626090	D	1	XML DATA - VALUES PHYSICAL
USER1	XMLIDX4	D	1	XML DATA - VALUES LOGICAL
SYSIBM	SQL070531154626190	D	1	XML DATA - VALUES PHYSICAL
USER1	XMLIDX5	D	1	XML DATA - VALUES LOGICAL
SYSIBM	SQL070531154626290	D	1	XML DATA - VALUES PHYSICAL
USER1	XMLIDX6	D	1	XML DATA - VALUES LOGICAL
SYSIBM	SQL070531154626400	D	1	XML DATA - VALUES PHYSICAL

The following command lists the text search index information for table USER1.DEPARTMENT:

 db2
 describe text search indexes for table user1.department

 Index
 Index

 schema
 name

 ----- ----- 

 USER1
 TXTIDX1

 USER1
 TXTIDX2

The following command lists information about both partitioned and nonpartitioned indexes on the partitioned table myDpartT:

db2 describe indexes for table myDPartT

Index schema	Index name	Unique rule	Number of columns	Index P	artitioning
NEWTON	IDXNDP	D	1		N
NEWTON	IDXDP	D	1		P

#### **Describing Data Partitions**

The following example shows how to describe data partitions:

db2 describe data partitions for table user1.sales

PartitionId	Inclusive (y/n) Low Value	Inclusive (y/n) High Value	
0 Y 1 N	2001,1 2001,3	Y Y Y	2001,3 2001,6

Describing the data partitions with details returns the same output, as in the previous example, and includes an additional table showing the Partition ID and table space where the data for the data partition is stored, and the ID of the table space where the index is stored:

db2 describe data partitions for table user1.employee show detail

PartitionId	Inclusive ( Low Value	y/n)	Inclusive (y High Value	/n)		
6 1 2 3	Y MINVALUE, N 'beck','k Y 'treece', Y 'zyzyck',	MINVALUE evin' 'jeff' MINVALUE	Y 'beck','k N 'treece', Y 'zhang',' Y MAXVALUE,	evin' 'jeff' liping' MAXVALUE		
PartitionId	PartitionName	TableSpId	LongTblSpId	IndexTblSpId	AccessMode	Status
0	PARTx	3	43	50	F	
1	PARTNew	13	13	13	Ν	А
2	PART3	31	33	35	F	
3	PART4	23	34	23	Ν	А

▶∢

# DETACH

Removes the logical DBMS instance attachment, and terminates the physical communication connection if there are no other logical connections using this layer.

## Authorization

None

## **Required connection**

None. Removes an existing instance attachment.

### **Command syntax**

►►—DETACH—

## **Command parameters**

None

## **DROP CONTACT**

Removes a contact from the list of contacts defined on the local system. A contact is a user to whom the Scheduler and Health Monitor send messages. The setting of the Database Administration Server (DAS) **contact\_host** configuration parameter determines whether the list is local or global.

### Authorization

None

### **Required connection**

None. Local execution only: this command cannot be used with a remote connection.

### **Command syntax**

►►—DROP CONTACT—name—

### **Command parameters**

**CONTACT** name

The name of the contact that will be dropped from the local system.

## **DROP CONTACTGROUP**

Removes a contact group from the list of contacts defined on the local system. A contact group contains a list of users to whom the Scheduler and Health Monitor send messages. The setting of the Database Administration Server (DAS) **contact\_host** configuration parameter determines whether the list is local or global.

## Authorization

None

### **Required Connection**

None

### **Command Syntax**

►►—DROP CONTACTGROUP—name—

## **Command Parameters**

### **CONTACTGROUP** name

The name of the contact group that will be dropped from the local system.

## DROP DATABASE

Deletes the database contents and all log files for the database, uncatalogs the database, and deletes the database subdirectory.

#### Scope

By default, this command affects all database partitions that are listed in the db2nodes.cfg file.

#### Authorization

One of the following:

- sysadm
- sysctrl

#### **Required connection**

Instance. An explicit attachment is not required. If the database is listed as remote, an instance attachment to the remote database partition server is established for the duration of the command.

### Command syntax

#### **Command parameters**

#### **DATABASE** database-alias

Specifies the alias of the database to be dropped. The database must be cataloged in the system database directory.

#### AT DBPARTITIONNUM

Specifies that the database is to be deleted only on the database partition that issued the DROP DATABASE command. This parameter is used by utilities supplied withDB2 Warehouse Edition, can be used in partitioned database environments, and is not intended for general use. Improper use of this parameter can cause inconsistencies in the system, so it should only be used with caution.

#### **Examples**

The following example deletes the database referenced by the database alias SAMPLE:

db2 drop database sample

#### Usage notes

DROP DATABASE deletes all user data and log files, as well as any backup and restore history for the database. If the log files are needed for a roll-forward recovery after a restore operation, or the backup history required to restore the database, these files should be saved prior to issuing this command.

The database must not be in use; all users must be disconnected from the database before the database can be dropped.

To be dropped, a database must be cataloged in the system database directory. Only the specified database alias is removed from the system database directory. If other aliases with the same database name exist, their entries remain. If the database being dropped is the last entry in the local database directory, the local database directory is deleted automatically.

If DROP DATABASE is issued from a remote client (or from a different instance on the same machine), the specified alias is removed from the client's system database directory. The corresponding database name is removed from the server's system database directory.

### Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

## DROP DBPARTITIONNUM VERIFY

Verifies if a database partition exists in the database partition groups of any databases, and if an event monitor is defined on the database partition. This command should be used prior to dropping a database partition from a partitioned database environment.

#### Scope

This command only affects the database partition on which it is issued.

### Authorization

sysadm

#### **Command syntax**

►►—DROP DBPARTITIONNUM VERIFY—

## **Command parameters**

None

#### **Usage notes**

If a message is returned, indicating that the database partition is not in use, use the STOP DATABASE MANAGER command with DROP DBPARTITIONNUM to remove the entry for the database partition from the db2nodes.cfg file, which removes the database partition from the database system.

If a message is returned, indicating that the database partition is in use, the following actions should be taken:

- If the database partition contains data, redistribute the data to remove it from the database partition using REDISTRIBUTE DATABASE PARTITION GROUP. Use either the DROP DBPARTITIONNUM option on the REDISTRIBUTE DATABASE PARTITION GROUP command or on the ALTER DATABASE PARTITION GROUP statement to remove the database partition from any database partition groups for the database. This must be done for each database that contains the database partition in a database partition group.
- 2. Drop any event monitors that are defined on the database partition.
- **3**. Rerun DROP DBPARTITIONNUM VERIFY to ensure that the database is no longer in use.

### Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

## **DROP TOOLS CATALOG**

Drops the DB2 tools catalog tables for the specified catalog in the given database. This command is not valid on a IBM Data Server Client.

**Warning:** If you drop the active tools catalog, you can no longer schedule tasks and scheduled tasks are not executed. To activate the scheduler, you must activate a previous tools catalog or create a new one.

### Scope

This command affects the database.

### Authorization

One of the following:

- sysadm
- sysctrl

The user must also have DASADM authority to update the DB2 administration server (DAS) configuration parameters.

## **Required connection**

A database connection is temporarily established by this command during processing.

## **Command syntax**

► → DROP TOOLS CATALOG—catalog-name—IN DATABASE—database-name

FORCE

## **Command parameters**

#### **CATALOG** catalog-name

A name to be used to uniquely identify the DB2 tools catalog. The catalog tables are dropped from this schema.

DATABASE database-name

A name to be used to connect to the local database containing the catalog tables.

#### FORCE

The force option is used to force the DB2 administration server's scheduler to stop. If this is not specified, the tools catalog will not be dropped if the scheduler cannot be stopped.

### **Examples**

db2 drop tools catalog cc in database toolsdb db2 drop tools catalog in database toolsdb force

### Usage notes

• The **jdk\_path** configuration parameter must be set in the DB2 administration server (DAS) configuration to the minimum supported level of the SDK for Java.

• This command will disable the scheduler at the local DAS and reset the DAS configuration parameters related to the DB2 tools catalog database configuration.

▶∢

# **ECHO**

Permits the user to write character strings to standard output.

## Authorization

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

*character-string* Any character string.

## **Usage notes**

If an input file is used as standard input, or comments are to be printed without being interpreted by the command shell, the ECHO command will print character strings directly to standard output.

One line is printed each time that ECHO is issued.

The ECHO command is not affected by the verbose (-v) option.

## EDIT

Launches a user-specified editor with a specified command for editing. When the user finishes editing, saves the contents of the editor and exits the editor, permits the user to execute the command in CLP interactive mode.

#### Scope

This command can only be run within CLP interactive mode. Specifically, it cannot be run from the CLP command mode or the CLP batch mode.

### Authorization

None

#### **Required connection**

None

#### Command syntax

EDIT\_\_\_\_EDITOR\_editor\_\_\_Lnum\_\_\_

### **Command parameters**

#### EDITOR

Launch the editor specified for editing. If this parameter is not specified, the editor to be used is determined in the following order:

- 1. the editor specified by the DB2\_CLP\_EDITOR registry variable
- 2. the editor specified by the VISUAL environment variable
- 3. the editor specified by the EDITOR environment variable
- 4. On Windows operating systems, the Notepad editor; on UNIX operating systems, the vi editor
- *num* If *num* is positive, launches the editor with the command corresponding to *num*. If *num* is negative, launches the editor with the command corresponding to *num*, counting backwards from the most recent command in the command history. Zero is not a valid value for *num*. If this parameter is not specified, launches the editor with the most recently run command. (This is equivalent to specifying a value of -1 for *num*.)

#### Usage notes

- 1. The editor specified must be a valid editor contained in the PATH of the operating system.
- **2.** You can view a list of the most recently run commands available for editing by executing the HISTORY command.
- **3**. The EDIT command will never be recorded in the command history. However, if you choose to run a command that was edited using the EDIT command, this command will be recorded in the command history.
# **EXPORT**

Exports data from a database to one of several external file formats. The user specifies the data to be exported by supplying an SQL SELECT statement, or by providing hierarchical information for typed tables.

Quick link to "File type modifiers for the export utility" on page 172.

# Authorization

One of the following:

- DATAACCESS authority
- CONTROL or SELECT privilege on each participating table or view

# **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established. Utility access to Linux, UNIX, or Windows database servers from Linux, UNIX, or Windows clients must be a direct connection through the engine and not through a DB2 Connect gateway or loop back environment.

# **Command syntax**

## traversal-order-list:

## **Command parameters**

#### **HIERARCHY** traversal-order-list

Export a sub-hierarchy using the specified traverse order. All sub-tables must be listed in PRE-ORDER fashion. The first sub-table name is used as the target table name for the SELECT statement.

#### **HIERARCHY STARTING** sub-table-name

Using the default traverse order (OUTER order for ASC, DEL, or WSF files, or the order stored in PC/IXF data files), export a sub-hierarchy starting from *sub-table-name*.

#### **LOBFILE** *filename*

Specifies one or more base file names for the LOB files. When name space is exhausted for the first name, the second name is used, and so on. This will implicitly activate the LOBSINFILE behavior.

When creating LOB files during an export operation, file names are constructed by appending the current base name from this list to the current path (from *lob-path*), and then appending a 3-digit sequence number to start and the three character identifier lob. For example, if the current LOB path is the directory /u/foo/lob/path/, and the current LOB file name is bar, the LOB files created will be /u/foo/lob/path/ bar.001.lob, /u/foo/lob/path/bar.002.lob, and so on. The 3-digit sequence number in the LOB file name will grow to 4-digits once 999 is used, 4-digits will grow to 5-digits once 9999 is used, and so on.

#### LOBS TO lob-path

Specifies one or more paths to directories in which the LOB files are to be stored. There will be at least one file per LOB path, and each file will contain at least one LOB. The maximum number of paths that can be specified is 999. This will implicitly activate the LOBSINFILE behavior.

#### **MESSAGES** message-file

Specifies the destination for warning and error messages that occur during an export operation. If the file already exists, the export utility appends the information. If *message-file* is omitted, the messages are written to standard output.

#### METHOD N column-name

Specifies one or more column names to be used in the output file. If this parameter is not specified, the column names in the table are used. This parameter is valid only for WSF and IXF files, but is not valid when exporting hierarchical data.

#### **MODIFIED BY** *filetype-mod*

Specifies file type modifier options. See "File type modifiers for the export utility" on page 172.

## **OF** *filetype*

Specifies the format of the data in the output file:

- DEL (delimited ASCII format), which is used by a variety of database manager and file manager programs.
- WSF (work sheet format), which is used by programs such as: Lature<sup>®</sup>  $1.2.2^{®}$ 
  - Lotus<sup>®</sup> 1-2-3<sup>®</sup>

## – Lotus Symphony<sup>™</sup>

When exporting BIGINT or DECIMAL data, only values that fall within the range of type DOUBLE can be exported accurately. Although values that do not fall within this range are also exported, importing or loading these values back might result in incorrect data, depending on the operating system.

**Note:** Support for the WSF file format is deprecated and might be removed in a future release. It is recommended that you start using a supported file format instead of WSF files before support is removed.

• IXF (Integration Exchange Format, PC version) is a proprietary binary format.

## select-statement

Specifies the SELECT or XQUERY statement that will return the data to be exported. If the statement causes an error, a message is written to the message file (or to standard output). If the error code is one of SQL0012W, SQL0347W, SQL0360W, SQL0437W, or SQL1824W, the export operation continues; otherwise, it stops.

#### **TO** filename

Specifies the name of the file to which data is to be exported. If the complete path to the file is not specified, the export utility uses the current directory and the default drive as the destination.

If the name of a file that already exists is specified, the export utility overwrites the contents of the file; it does not append the information.

### **XMLFILE** *filename*

Specifies one or more base file names for the XML files. When name space is exhausted for the first name, the second name is used, and so on.

When creating XML files during an export operation, file names are constructed by appending the current base name from this list to the current path (from *xml-path*), appending a 3-digit sequence number, and appending the three character identifier xml. For example, if the current XML path is the directory /u/foo/xml/path/, and the current XML file name is bar, the XML files created will be /u/foo/xml/path/bar.001.xml, /u/foo/xml/path/bar.002.xml, and so on.

## XML TO xml-path

Specifies one or more paths to directories in which the XML files are to be stored. There will be at least one file per XML path, and each file will contain at least one XQuery Data Model (XDM) instance. If more than one path is specified, then XDM instances are distributed evenly among the paths.

## **XMLSAVESCHEMA**

Specifies that XML schema information should be saved for all XML columns. For each exported XML document that was validated against an XML schema when it was inserted, the fully qualified SQL identifier of that schema will be stored as an (SCH) attribute inside the corresponding XML Data Specifier (XDS). If the exported document was not validated against an XML schema or the schema object no longer exists in the database, an SCH attribute will not be included in the corresponding XDS.

The schema and name portions of the SQL identifier are stored as the "OBJECTSCHEMA" and "OBJECTNAME" values in the row of the SYSCAT.XSROBJECTS catalog table corresponding to the XML schema.

The **XMLSAVESCHEMA** option is not compatible with XQuery sequences that do not produce well-formed XML documents.

#### Examples

The following example shows how to export information from the STAFF table in the SAMPLE database to the file myfile.ixf. The output will be in IXF format. You must be connected to the SAMPLE database before issuing the command. The index definitions (if any) will be stored in the output file except when the database connection is made through DB2 Connect.

```
db2 export to myfile.ixf of ixf messages msgs.txt select * from staff
```

The following example shows how to export the information about employees in Department 20 from the STAFF table in the SAMPLE database. The output will be in IXF format and will go into the awards.ixf file. You must first connect to the SAMPLE database before issuing the command. Also, the actual column name in the table is 'dept' instead of 'department'.

```
db2 export to awards.ixf of ixf messages msgs.txt select * from staff where dept = 20
```

The following example shows how to export LOBs to a DEL file:

```
db2 export to myfile.del of del lobs to mylobs/
lobfile lobs1, lobs2 modified by lobsinfile
select * from emp_photo
```

The following example shows how to export LOBs to a DEL file, specifying a second directory for files that might not fit into the first directory:

```
db2 export to myfile.del of del
  lobs to /db2exp1/, /db2exp2/ modified by lobsinfile
  select * from emp_photo
```

The following example shows how to export data to a DEL file, using a single quotation mark as the string delimiter, a semicolon as the column delimiter, and a comma as the decimal point. The same convention should be used when importing data back into the database:

```
db2 export to myfile.del of del
  modified by chardel'' coldel; decpt,
  select * from staff
```

## Usage notes

- Be sure to complete all table operations and release all locks before starting an export operation. This can be done by issuing a COMMIT after closing all cursors opened WITH HOLD, or by issuing a ROLLBACK.
- Table aliases can be used in the SELECT statement.
- The messages placed in the message file include the information returned from the message retrieval service. Each message begins on a new line.
- The export utility produces a warning message whenever a character column with a length greater than 254 is selected for export to DEL format files.
- PC/IXF import should be used to move data between databases. If character data containing row separators is exported to a delimited ASCII (DEL) file and processed by a text transfer program, fields containing the row separators will shrink or expand.
- The file copying step is not necessary if the source and the target databases are both accessible from the same client.

- DB2 Connect can be used to export tables from DRDA servers such as DB2 for OS/390, DB2 for VM and VSE, and DB2 for OS/400<sup>®</sup>. Only PC/IXF export is supported.
- When exporting to the IXF format, if identifiers exceed the maximum size supported by the IXF format, the export will succeed but the resulting datafile cannot be used by a subsequent import operation using the CREATE mode. SQL27984W will be returned.
- When exporting to a diskette on Windows, and the table that has more data than the capacity of a single diskette, the system will prompt for another diskette, and multiple-part PC/IXF files (also known as multi-volume PC/IXF files, or logically split PC/IXF files), are generated and stored in separate diskettes. In each file, with the exception of the last, there is a DB2 CONTINUATION RECORD (or "AC" Record in short) written to indicate the files are logically split and where to look for the next file. The files can then be transferred to an AIX system, to be read by the import and load utilities. The export utility will not create multiple-part PC/IXF files when invoked from an AIX system. For detailed usage, see the IMPORT command or LOAD command.
- The export utility will store the NOT NULL WITH DEFAULT attribute of the table in an IXF file if the SELECT statement provided is in the form SELECT \* FROM tablename.
- When exporting typed tables, subselect statements can only be expressed by specifying the target table name and the **WHERE** clause. Fullselect and *select-statement* cannot be specified when exporting a hierarchy.
- For file formats other than IXF, it is recommended that the traversal order list be specified, because it tells DB2 how to traverse the hierarchy, and what sub-tables to export. If this list is not specified, all tables in the hierarchy are exported, and the default order is the OUTER order. The alternative is to use the default order, which is the order given by the OUTER function.
- Use the same traverse order during an import operation. The load utility does not support loading hierarchies or sub-hierarchies.
- When exporting data from a table that has protected rows, the LBAC credentials held by the session authorization id might limit the rows that are exported. Rows that the session authorization ID does not have read access to will not be exported. No error or warning is given.
- If the LBAC credentials held by the session authorization id do not allow reading from one or more protected columns included in the export then the export fails and an error (SQLSTATE 42512) is returned.
- When running Data Movement utilities such as export and db2move, the query compiler might determine that the underlying query will run more efficiently against an MQT than the base table or tables. In this case, the query will execute against a refresh deferred MQT, and the result of the utilities might not accurately represent the data in the underlying table.
- Export packages are bound using DATETIME ISO format, thus, all date/time/timestamp values are converted into ISO format when cast to a string representation. Since the CLP packages are bound using DATETIME LOC format (locale specific format), you may see inconsistent behavior between CLP and export if the CLP DATETIME format is different from ISO. For instance, the following SELECT statement may return expected results:

db2 select col2 from tab1 where char(col2)='05/10/2005'; COL2 \_\_\_\_\_\_ 05/10/2005 05/10/2005 05/10/2005 3 record(s) selected.

But an export command using the same select clause will not:

```
db2 export to test.del of del select col2 from test
where char(col2)='05/10/2005';
   Number of rows exported: 0
```

Now, replacing the LOCALE date format with ISO format gives the expected results:

```
db2 export to test.del of del select col2 from test
where char(col2)='2005-05-10';
Number of rows exported: 3
```

# File type modifiers for the export utility

Table 10. Valid file type modifiers for the export utility: All file formats

Modifier	Description
lobsinfile	<i>lob-path</i> specifies the path to the files containing LOB data.
	Each path contains at least one file that contains at least one LOB pointed to by a Lob Location Specifier (LLS) in the data file. The LLS is a string representation of the location of a LOB in a file stored in the LOB file path. The format of an LLS is <i>filename.ext.nnn.mmm/</i> , where <i>filename.ext</i> is the name of the file that contains the LOB, <i>nnn</i> is the offset in bytes of the LOB within the file, and <i>mmm</i> is the length of the LOB in bytes. For example, if the string db2exp.001.123.456/ is stored in the data file, the LOB is located at offset 123 in the file db2exp.001, and is 456 bytes long.
	If you specify the <b>lobsinfile</b> modifier when using EXPORT, the LOB data is placed in the locations specified by the <b>LOBS TO</b> clause. Otherwise the LOB data is sent to the data file directory. The <b>LOBS TO</b> clause specifies one or more paths to directories in which the LOB files are to be stored. There will be at least one file per LOB path, and each file will contain at least one LOB. The <b>LOBS TO</b> or <b>LOBFILE</b> options will implicitly activate the LOBSINFILE behavior.
	To indicate a null LOB, enter the size as -1. If the size is specified as 0, it is treated as a 0 length LOB. For null LOBS with length of -1, the offset and the file name are ignored. For example, the LLS of a null LOB might be db2exp.001.71/.
xmlinsepfiles	Each XQuery Data Model (XDM) instance is written to a separate file. By default, multiple values are concatenated together in the same file.
lobsinsepfiles	Each LOB value is written to a separate file. By default, multiple values are concatenated together in the same file.
xmlnodeclaration	XDM instances are written without an XML declaration tag. By default, XDM instances are exported with an XML declaration tag at the beginning that includes an encoding attribute.
xmlchar	XDM instances are written in the character codepage. Note that the character codepage is the value specified by the codepage file type modifier, or the application codepage if it is not specified. By default, XDM instances are written out in Unicode.
xmlgraphic	If the xmlgraphic modifier is specified with the EXPORT command, the exported XML document will be encoded in the UTF-16 code page regardless of the application code page or the codepage file type modifier.

Table 11. Valid file type modifiers for the export utility: DEL (delimited ASCII) file format

Modifier	Description
chardelx	<pre>x is a single character string delimiter. The default value is a double quotation mark ("). The specified character is used in place of double quotation marks to enclose a character string.<sup>2</sup> If you want to explicitly specify the double quotation mark as the character string delimiter, it should be specified as follows: modified by chardel""</pre>
	The single quotation mark (') can also be specified as a character string delimiter as follows:
	modified by chardel''
codepage= <i>x</i>	x is an ASCII character string. The value is interpreted as the code page of the data in the output data set. Converts character data to this code page from the application code page during the export operation.
	For pure DBCS (graphic), mixed DBCS, and EUC, delimiters are restricted to the range of x00 to x3F, inclusive. The codepage modifier cannot be used with the lobsinfile modifier.
coldelx	x is a single character column delimiter. The default value is a comma (,). The specified character is used in place of a comma to signal the end of a column. <sup>2</sup>
	In the following example, coldel; causes the export utility to use the semicolon character (;) as a column delimiter for the exported data:
	<pre>db2 "export to temp of del modified by coldel; select * from staff where dept = 20"</pre>
decplusblank	Plus sign character. Causes positive decimal values to be prefixed with a blank space instead of a plus sign (+). The default action is to prefix positive decimal values with a plus sign.
decptx	<i>x</i> is a single character substitute for the period as a decimal point character. The default value is a period (.). The specified character is used in place of a period as a decimal point character. <sup>2</sup>
nochardel	Column data will not be surrounded by character delimiters. This option should not be specified if the data is intended to be imported or loaded using DB2. It is provided to support vendor data files that do not have character delimiters. Improper usage might result in data loss or corruption.
	This option cannot be specified with chardelx or nodoubledel. These are mutually exclusive options.
nodoubledel	Suppresses recognition of double character delimiters. <sup>2</sup>
striplzeros	Removes the leading zeros from all exported decimal columns.
	Consider the following example:
	db2 create table decimalTable ( c1 decimal( 31, 2 ) ) db2 insert into decimalTable values ( 1.1 )
	db2 export to data of del select * from decimalTable
	db2 export to data of del modified by STRIPLZEROS select * from decimalTable
	In the first export operation, the content of the exported file data will be +00000000000000000000000001.10. In the second operation, which is identical to the first except for the striplzeros modifier, the content of the exported file data will be +1.10.

# **EXPORT**

Modifier	Description
Modifier timestampformat="x"	Description         x is the format of the time stamp in the source file. <sup>4</sup> Valid time stamp elements are:         YYYY - Year (four digits ranging from 0000 - 9999)         M - Month (one or two digits ranging from 1 - 12)         MM - Month (two digits ranging from 01 - 12; mutually exclusive with M and MMM)         MMM - Month (three-letter case-insensitive abbreviation for the month name; mutually exclusive with M and MM)
	D - Day (one or two digits ranging from 1 - 31) DD - Day (two digits ranging from 1 - 31; mutually exclusive with D) DDD - Day of the year (three digits ranging from 001 - 366; mutually exclusive with other day or month elements) H - Hour (one or two digits ranging from 0 - 12
	<pre>for a 12 hour system, and 0 - 24 for a 24 hour system) HH - Hour (two digits ranging from 0 - 12</pre>
	number of digits with each digit ranging from 0 to 9 TT - Meridian indicator (AM or PM) Following is an example of a time stamp format: "YYYY/MM/DD HH:MM:SS.UUUUUUU" The MMM element will produce the following values: 'Jan', 'Feb', 'Mar', 'Apr', 'May', 'Jun', 'Jul', 'Aug', 'Sep', 'Oct', 'Nov', and 'Dec'. 'Jan' is equal to month 1, and 'Dec' is equal to month 12.
	The following example illustrates how to export data containing user-defined time stamp formats from a table called 'schedule': db2 export to delfile2 of del modified by timestampformat="yyyy.mm.dd hh:mm tt" select * from schedule

Table 11. Valid file type modifiers for the export utility: DEL (delimited ASCII) file format (continued)

Table 12.	Valid file	type modifiers	for the export	utility: IXF file	format
-----------	------------	----------------	----------------	-------------------	--------

Modifier	Description
codepage=x	<ul><li><i>x</i> is an ASCII character string. The value is interpreted as the code page of the data in the output data set. Converts character data from this code page to the application code page during the export operation.</li><li>For pure DBCS (graphic), mixed DBCS, and EUC, delimiters are restricted to the range of x00 to x3F, inclusive.</li></ul>

Modifier	Description
1	Creates a WSF file that is compatible with Lotus 1-2-3 Release 1, or Lotus 1-2-3 Release 1a. <sup>5</sup> This is the default.

Modifier	Description
2	Creates a WSF file that is compatible with Lotus Symphony Release $1.0.^5$
3	Creates a WSF file that is compatible with Lotus 1-2-3 Version 2, or Lotus Symphony Release $1.1.^{5}$
4	Creates a WSF file containing DBCS characters.

Table 13. Valid file type modifiers for the export utility: WSF file format<sup>6</sup> (continued)

## Note:

- 1. The export utility does not issue a warning if an attempt is made to use unsupported file types with the **MODIFIED BY** option. If this is attempted, the export operation fails, and an error code is returned.
- 2. *Delimiter considerations for moving data* lists restrictions that apply to the characters that can be used as delimiter overrides.
- 3. The export utility normally writes
  - date data in YYYYMMDD format
  - char(date) data in "YYYY-MM-DD" format
  - time data in "HH.MM.SS" format
  - time stamp data in "YYYY-MM-DD-HH.MM.SS.uuuuuu" format

Data contained in any datetime columns specified in the SELECT statement for the export operation will also be in these formats.

4. For time stamp formats, care must be taken to avoid ambiguity between the month and the minute descriptors, since they both use the letter M. A month field must be adjacent to other date fields. A minute field must be adjacent to other time fields. Following are some ambiguous time stamp formats:

```
"M" (could be a month, or a minute)
"M:M" (Which is which?)
"M:YYYY:M" (Both are interpreted as month.)
"S:M:YYYY" (adjacent to both a time value and a date value)
```

In ambiguous cases, the utility will report an error message, and the operation will fail.

Following are some unambiguous time stamp formats:

"M:YYYY" (Month) "S:M" (Minute) "M:YYYY:S:M" (Month....Minute) "M:H:YYYY:M:D" (Minute....Month)

- 5. These files can also be directed to a specific product by specifying an L for Lotus 1-2-3, or an S for Symphony in the *filetype-mod* parameter string. Only one value or product designator can be specified. Support for the WSF file format is deprecated and might be removed in a future release. It is recommended that you start using a supported file format instead of WSF files before support is removed.
- 6. The WSF file format is not supported for XML columns. Support for this file format is deprecated and might be removed in a future release. It is recommended that you start using a supported file format instead of WSF files before support is removed.
- 7. All XDM instances are written to XML files that are separate from the main data file, even if neither the **XMLFILE** nor the **XML TO** clause is specified. By default, XML files are written to the path of the exported data file. The default base name for XML files is the name of the exported data file with the extension ".xml" appended to it.

- 8. All XDM instances are written with an XML declaration at the beginning that includes an encoding attribute, unless the XMLNODECLARATION file type modifier is specified.
- **9**. By default, all XDM instances are written in Unicode unless the XMLCHAR or XMLGRAPHIC file type modifier is specified.
- 10. The default path for XML data and LOB data is the path of the main data file. The default XML file base name is the main data file. The default LOB file base name is the main data file. For example, if the main data file is: /mypath/myfile.del

the default path for XML data and LOB data is: /mypath"

the default XML file base name is: myfile.del

and the default LOB file base name is:

myfile.del

The LOBSINFILE file type modifier must be specified in order to have LOB files generated.

 The export utility appends a numeric identifier to each LOB file or XML file. The identifier starts as a 3 digit, 0 padded sequence value, starting at: .001

After the 999th LOB file or XML file, the identifier will no longer be padded with zeroes (for example, the 1000th LOG file or XML file will have an extension of:

.1000

Following the numeric identifier is a three character type identifier representing the data type, either:

.lob

or

.xml

For example, a generated LOB file would have a name in the format: myfile.del.001.lob

and a generated XML file would be have a name in the format: myfile.del.001.xml

**12**. It is possible to have the export utility export XDM instances that are not well-formed documents by specifying an XQuery. However, you will not be able to import or load these exported documents directly into an XML column, since XML columns can only contain complete documents.

# FORCE APPLICATION

Forces local or remote users or applications off the system to allow for maintenance on a server.

**Attention:** If an operation that cannot be interrupted (RESTORE DATABASE, for example) is forced, the operation must be successfully re-executed before the database becomes available.

## Scope

This command affects all database partitions that are listed in the \$HOME/sqllib/db2nodes.cfg file.

In a partitioned database environment, this command does not have to be issued from the coordinator database partition of the application being forced. It can be issued from any node (database partition server) in the partitioned database environment.

## Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

## **Required connection**

Instance. To force users off a remote server, it is first necessary to attach to that server. If no attachment exists, this command is executed locally.

# **Command syntax**

## **Command parameters**

## FORCE APPLICATION

ALL All applications will be disconnected from the database.

application-handle

Specifies the agent to be terminated. List the values using the LIST APPLICATIONS command.

#### MODE ASYNC

The command does not wait for all specified users to be terminated before returning; it returns as soon as the function has been successfully issued or an error (such as invalid syntax) is discovered.

This is the only mode that is currently supported.

# **Examples**

The following example forces two users, with *application-handle* values of 41408 and 55458, to disconnect from the database:

db2 "force application ( 41408, 55458 )"

## Usage notes

The database manager remains active so that subsequent database manager operations can be handled without the need for db2start.

To preserve database integrity, only users who are idling or executing interruptible database operations can be terminated.

The following types of users and applications cannot be forced:

- users creating a database
- system applications

In order to successfully force these types of users and applications, the database must be deactivated and/or the instance restarted.

After a FORCE APPLICATION has been issued, the database will still accept requests to connect. Additional forces might be required to completely force all users off.

# **GET ADMIN CONFIGURATION**

Returns the values of individual DB2 Administration Server (DAS) configuration parameter values on the administration node of the system. The DAS is a special administrative tool that enables remote administration of DB2 servers For a list of the DAS configuration parameters, see the description of the UPDATE ADMIN CONFIGURATION command.

### Scope

This command returns information about DAS configuration parameters on the administration node of the system to which you are attached or that you specify in the FOR NODE option.

## Authorization

None

## **Required connection**

Node. To display the DAS configuration for a remote system, first connect to that system or use the FOR NODE option to specify the administration node of the system.

## **Command syntax**

## **Command parameters**

FOR NODE node-name

Enter the name of a the administration node to view DAS configuration parameters there.

**USER** username **USING** password

If connection to the node requires user name and password, enter this information.

## Examples

The following is sample output from GET ADMIN CONFIGURATION: Admin Server Configuration

Authentication Type DAS	(AUTHENTICATION)	=	SERVER_ENCRYPT
DAS Administration Authority Group Name	e (DASADM_GROUP)	=	ADMINISTRATORS
DAS Discovery Mode Name of the DB2 Server System	(DISCOVER) (DB2SYSTEM)	=	SEARCH swalkty

Java Development Kit Installation Path DAS (JDK\_PATH) = e:\sqllib\java\jdk

DAS Code Page	(DAS_CODEPAGE)	= 0
DAS Territory	(DAS_TERRITORY)	= 0
LOCATION OF CONTACT LIST	(CONTACT_HOST)	= hostA.1Dm.ca
Execute Expired Tasks	(EXEC_EXP_TASK)	= NO
Scheduler Mode	(SCHED_ENABLE)	= ON
SMTP Server	(SMTP_SERVER)	<pre>smtp1.ibm.ca</pre>
Tools Catalog Database	(TOOLSCAT_DB)	= CCMD
Tools Catalog Database Instance	(TOOLSCAT_INST)	= DB2
Tools Catalog Database Schema	(TOOLSCAT_SCHEMA)	= TOOLSCAT
Scheduler User ID	-	= db2admin

# **Usage notes**

If an error occurs, the information returned is not valid. If the configuration file is invalid, an error message is returned. The user must install the DAS again to recover.

To set the configuration parameters to the default values shipped with the DAS, use the RESET ADMIN CONFIGURATION command.

Returns the alert configuration settings for health indicators for a particular instance.

**Important:** This command or API has been deprecated and might be removed in a future release because the health monitor has been deprecated in Version 9.7. For more information, see the "Health monitor has been deprecated" topic in the *What's New for DB2 Version 9.7* book.

## Authorization

None

## **Required connection**

Instance. An explicit attachment is not required.

# **Command syntax**

## **Command parameters**

## DATABASE MANAGER

Retrieves alert settings for the database manager.

## DATABASES

Retrieves alert settings for all databases managed by the database manager. These are the settings that apply to all databases that do not have custom settings. Custom settings are defined using the DATABASE ON *database alias* clause.

#### **CONTAINERS**

Retrieves alert settings for all table space containers managed by the database manager. These are the settings that apply to all table space containers that do not have custom settings. Custom settings are defined using the CONTAINER *name* ON *database alias* clause.

## TABLESPACES

Retrieves alert settings for all table spaces managed by the database

manager. These are the settings that apply to all table spaces that do not have custom settings. Custom settings are defined using the TABLESPACE *name* ON *database alias* clause.

#### DEFAULT

Specifies that the install defaults are to be retrieved.

#### **DATABASE ON** database alias

Retrieves the alert settings for the database specified using the ON *database alias* clause. If this database does not have custom settings, then the settings for all databases for the instance will be returned, which is equivalent to using the DATABASES parameter.

#### **CONTAINER** name **FOR** tablespace-id **ON** database alias

Retrieves the alert settings for the table space container called *name*, for the table space specified using the FOR *tablespace-id* clause, on the database specified using the ON *database alias* clause. If this table space container does not have custom settings, then the settings for all table space containers for the database will be returned, which is equivalent to using the CONTAINERS parameter.

#### TABLESPACE name ON database alias

Retrieves the alert settings for the table space called *name*, on the database specified using the ON *database alias* clause. If this table space does not have custom settings, then the settings for all table spaces for the database will be returned, which is equivalent to using the TABLESPACES parameter.

#### **USING** health indicator name

Specifies the set of health indicators for which alert configuration information will be returned. Health indicator names consist of a two-letter object identifier followed by a name that describes what the indicator measures. For example: db.sort\_privmem\_util. This is an optional clause, meaning that if it is not used, all health indicators for the specified object or object type will be returned.

## Examples

The following is typical output resulting from a request for database manager information:

```
DB2 GET ALERT CFG FOR DBM
```

Alert Configuration	
Indicator Name	= db2.db2 op status
Default	= Yes
Туре	= State-based
Sensitivity	= 0
Formula	= db2.db2 status;
Actions	= Disabled
Threshold or State checking	= Enabled
Indicator Name	<pre>= db2.sort_privmem_util</pre>
Default	= Yes
Туре	= Threshold-based
Warning	= 90
Alarm	= 100
Unit	= %
Sensitivity	= 0
Formula	<pre>= ((db2.sort_heap_allocated/sheapthres)     *100);</pre>
Actions	= Disabled
Threshold or State checking	= Enabled

Indicator Name	<pre>= db2.mon_heap_util</pre>
Default	= Yes
Туре	= Threshold-based
Warning	= 85
Alarm	= 95
Unit	= %
Sensitivity	= 0
Formula	<pre>= ((db2.mon_heap_cur_size/</pre>
Actions Threshold or State checking	= Disabled = Enabled

The following is typical output resulting from a request for configuration information:

Alert Configuration Indicator Name Default Type Sensitivity Formula Actions Threshold or State checking	<pre>= db.db_op_status = Yes = State-based = 0 = db.db_status; = Disabled = Enabled</pre>
Indicator Name Default Type Warning Alarm Unit Sensitivity Formula Actions Threshold or State checking	<pre>= db.sort_shrmem_util = Yes = Threshold-based = 70 = 85 = % = 0 = ((db.sort_shrheap_allocated/sheapthres_shr) *100); = Disabled = Enabled</pre>
Indicator Name Default Type Warning Alarm Unit Sensitivity Formula Actions Threshold or State checking	<pre>= db.spilled_sorts = Yes = Threshold-based = 30 = 50 = % = 0 = ((delta(db.sort_overflows,10))/ (delta(db.total_sorts,10)+1)*100); = Disabled = Enabled</pre>

# **GET CLI CONFIGURATION**

Lists the contents of the db2cli.ini file. This command can list the entire file, or a specified section.

The db2cli.ini file is used as the DB2 call level interface (CLI) configuration file. It contains various keywords and values that can be used to modify the behavior of the DB2 CLI and the applications using it. The file is divided into sections, each section corresponding to a database alias name.

## Authorization

None

## **Required connection**

None

# **Command syntax**

-FOR SECTION-section-name

## **Command parameters**

#### AT GLOBAL LEVEL

Displays the default CLI configuration parameters in the LDAP directory. This parameter is only valid on Windows operating systems.

## FOR SECTION section-name

Name of the section whose keywords are to be listed. If not specified, all sections are listed.

## Examples

The following sample output represents the contents of a db2cli.ini file that has two sections:

```
[tstcli1x]
uid=userid
pwd=password
autocommit=0
TableType="'TABLE','VIEW','SYSTEM TABLE'"
[tstcli2x]
```

## SchemaList="'OWNER1','OWNER2',CURRENT SQLID"

## Usage notes

The section name specified on this command is not case sensitive. For example, if the section name in the db2cli.ini file (delimited by square brackets) is in lowercase, and the section name specified on the command is in uppercase, the correct section will be listed.

## **GET CLI CONFIGURATION**

The value of the PWD (password) keyword is never listed; instead, five asterisks (\*\*\*\*\*) are listed.

When LDAP (Lightweight Directory Access Protocol) is enabled, the CLI configuration parameters can be set at the user level, in addition to the machine level. The CLI configuration at the user level is maintained in the LDAP directory. If the specified section exists at the user level, the CLI configuration for that section at the user level is returned; otherwise, the CLI configuration at the machine level is returned.

The CLI configuration at the user level is maintained in the LDAP directory and cached on the local machine. When reading the CLI configuration at the user level, DB2 always reads from the cache. The cache is refreshed when:

- The user updates the CLI configuration.
- The user explicitly forces a refresh of the CLI configuration using the REFRESH LDAP command.

In an LDAP environment, users can configure a set of default CLI settings for a database catalogued in the LDAP directory. When an LDAP catalogued database is added as a Data Source Name (DSN), either by using the Configuration Assistant (CA) or the CLI/ODBC configuration utility, any default CLI settings, if they exist in the LDAP directory, will be configured for that DSN on the local machine. The AT GLOBAL LEVEL clause must be specified to display the default CLI settings.

# **GET CONNECTION STATE**

Displays the connection state. Possible states are:

- Connectable and connected
- Connectable and unconnected
- Unconnectable and connected
- Implicitly connectable (if implicit connect is available).

This command also returns information about:

- the database connection mode (SHARE or EXCLUSIVE)
- the alias and name of the database to which a connection exists (if one exists)
- the host name and service name of the connection if the connection is using  $\ensuremath{\text{TCP/IP}}$

## Authorization

None

## **Required connection**

None

## **Command syntax**

►►—GET CONNECTION STATE——

# **Command parameters**

None

# **Examples**

The following is sample output from GET CONNECTION STATE:

Database Connection State

Connection state	=	Connectable	and	Connected
Connection mode	=	SHARE		
Local database alias	=	SAMPLE		
Database name	=	SAMPLE		
Hostname	=	montero		
Service name	=	29384		

# **Usage notes**

This command does not apply to type 2 connections.

# **GET CONTACTGROUP**

Returns the contacts included in a single contact group that is defined on the local system. A contact is a user to whom the Scheduler and Health Monitor send messages. You create named groups of contacts with the ADD CONTACTGROUP command.

## Authorization

None

## **Required connection**

None. Local execution only: this command cannot be used with a remote connection.

## **Command syntax**

►► GET CONTACTGROUP—name—

## **Command parameters**

**CONTACTGROUP** name

The name of the group for which you would like to retrieve the contacts.

## Examples

GET CONTACTGROUP support

Description -----Foo Widgets broadloom support unit

Name	Туре
joe	contact
support	contact group
joline	contact

# **GET CONTACTGROUPS**

The command provides a list of contact groups, which can be either defined locally on the system or in a global list. A contact group is a list of addresses to which monitoring processes such as the Scheduler and Health Monitor can send messages. The setting of the Database Administration Server (DAS) **contact\_host** configuration parameter determines whether the list is local or global. You create named groups of contacts with the ADD CONTACTGROUP command.

# Authorization

None

## **Required Connection**

None

# **Command Syntax**

► GET CONTACTGROUPS

# **Command Parameters**

None

# **Examples**

In the following example, the command GET CONTACTGROUPS is issued. The result is as follows:

Name	Description
support	Foo Widgets broadloom support unit
service	Foo Widgets service and support unit

# **GET CONTACTS**

Returns the list of contacts defined on the local system. Contacts are users to whom the monitoring processes such as the Scheduler and Health Monitor send notifications or messages.

To create a contact, use the ADD CONTACT command.

## **Authorization**

None

## **Required connection**

None

## **Command syntax**

► GET CONTACTS

# **Command parameters**

None

# **Examples**

## GET CONTACTS

Name	Туре	Address	Max Page Length	Description
joe	e-mail	joe@somewhere.com	-	-
joline	e-mail	joline@	-	-
		somewhereelse.com		
john	page	john@relay.org	50	Support 24x7

Returns the values of individual entries in a specific database configuration file.

## Scope

This command returns information only for the database partition on which it is executed.

# Authorization

None

# **Required connection**

Instance. An explicit attachment is not required, but a connection to the database is required when using the SHOW DETAIL clause. If the database is listed as remote, an instance attachment to the remote node is established for the duration of the command.

# **Command syntax**

-SHOW DETAIL

# **Command parameters**

## FOR database-alias

Specifies the alias of the database whose configuration is to be displayed. You do not need to specify the alias if a connection to the database already exists.

## SHOW DETAIL

Displays detailed information showing the current value of database configuration parameters as well as the value of the parameters the next time you activate the database. This option lets you see the result of dynamic changes to configuration parameters.

This is a default clause when operating in the CLPPlus interface. SHOW DETAIL need not be called when using CLPPlus processor.

# **Examples**

## Note:

- 1. Output on different platforms might show small variations reflecting platform-specific parameters.
- 2. Parameters with keywords enclosed by parentheses can be changed by the UPDATE DATABASE CONFIGURATION command.
- **3**. Fields that do not contain keywords are maintained by the database manager and cannot be updated.

The following is sample output from GET DATABASE CONFIGURATION (issued on Windows):

Database Configuration for Database

## Usage notes

If an error occurs, the information returned is not valid. If the configuration file is invalid, an error message is returned. The database must be restored from a backup version.

To set the database configuration parameters to the database manager defaults, use the RESET DATABASE CONFIGURATION command.

To retrieve information from all database partitions, use the SYSIBMADM.DBCFG administrative view.

Returns the values of individual entries in the database manager configuration file.

## **Authorization**

None

## **Required connection**

None or instance. An instance attachment is not required to perform local DBM configuration operations, but is required to perform remote DBM configuration operations. To display the database manager configuration for a remote instance, it is necessary to first attach to that instance. The SHOW DETAIL clause requires an instance attachment.

## **Command syntax**

## **Command parameters**

#### SHOW DETAIL

Displays detailed information showing the current value of database manager configuration parameters as well as the value of the parameters the next time you start the database manager. This option lets you see the result of dynamic changes to configuration parameters.

This is a default clause when operating in the CLPPlus interface. SHOW DETAIL need not be called when using CLPPlus processor.

## **Examples**

Both node type and platform determine which configuration parameters are listed.

The following is sample output from GET DATABASE MANAGER CONFIGURATION (issued on Windows):

Database Manager Configuration

Node type = Enterprise Server Edition with local and remote clients

### **Usage notes**

- If an attachment to a remote instance or a different local instance exists, the database manager configuration parameters for the attached server are returned; otherwise, the local database manager configuration parameters are returned.
- If an error occurs, the information returned is invalid. If the configuration file is invalid, an error message is returned. The user must drop and recreate the instance to recover.
- To set the configuration parameters to the default values shipped with thedatabase manager , use the RESET DATABASE MANAGER CONFIGURATION command.
- The AUTOMATIC values indicated on GET DATABASE MANAGER CONFIGURATION SHOW DETAIL for FCM\_NUM\_BUFFERS and FCM\_NUM\_CHANNELS are the initial values at instance startup time and do not reflect any automatic increasing/decreasing that might have occurred during runtime.
- Configuration parameters **max\_connections**, **max\_coordagents** and **num\_poolagents** are set to AUTOMATIC.
- Configuration parameters **maxagents** and **maxcagents** are deprecated. The following deprecated functions are the result:
  - CLP and the db2CfgSet API will tolerate updates to these parameters, however these updates will be ignored by DB2.
  - CLP will no longer display these database configuration parameters when the client and server are on the DB2 v9.5 code base. If the server is DB2 v9.5, earlier version clients will see a value of 0 output for these parameters. If the client is DB2 v9.5, but the server is prior to DB2 v9.5, these parameters will be displayed with the assigned values.
  - db2CfgGet API will tolerate requests for SQLF\_KTN\_MAXAGENTS and SQLF\_KTN\_MAXCAGENTS, but they will return 0 if the server is DB2 v9.5.
  - The behavior of the db2AutoConfig API will depend on the db2VersionNumber passed in to the API. If the version is DB2 v9.5 or beyond, maxagents will not be returned, but for versions prior to this it will.

# **GET DATABASE MANAGER CONFIGURATION**

- The AUTOCONFIGURE CLP command will display a value for maxagents with requests from an earlier version client (current and recommended value of 0). For current version client requests, maxagents will be displayed with an appropriate value.
- The AUTOCONFIGURE ADMIN\_CMD will not return information about **maxagents** when the server is DB2 v9.5 and beyond.
- Updates to **maxagents** or **maxcagents** through the ADMIN\_CMD will return successfully but have no effect on the server if the server is DB2 v9.5 or later.
- Queries of database manager configuration parameters using the DBMCFG administrative view will not return rows for **maxagents** or **maxcagents** if the server is DB2 v9.5 or beyond.

In a future release, these configuration parameters may be removed completely.

# **GET DATABASE MANAGER MONITOR SWITCHES**

Displays the status of the database system monitor switches. Monitor switches instruct the database system manager to collect database activity information. Each application using the database system monitor interface has its own set of monitor switches. A database manager-level switch is on when any of the monitoring applications has turned it on. This command is used to determine if the database system monitor is currently collecting data for any monitoring application.

# Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

# **Required connection**

Instance or database:

- If there is neither an attachment to an instance, nor a connection to a database, a default instance attachment is created.
- If there is both an attachment to an instance, and a database connection, the instance attachment is used.

To display the settings for a remote instance, or for a different local instance, it is necessary to first attach to that instance.

# **Command syntax**

```
AT DBPARTITIONNUM—db-partition-number-
GLOBAL
```

# **Command parameters**

#### **AT DBPARTITIONNUM** *db-partition-number*

Specifies the database partition for which the status of the database manager monitor switches is to be displayed.

### GLOBAL

Returns an aggregate result for all database partitions in a partitioned database environment.

# Examples

The following is sample output from GET DATABASE MANAGER MONITOR SWITCHES:

DBM System Monitor Information Collected

Switch list for db partition number 1						
Buffer Pool Activity Information	(BUFFERPOOL) = ON	06-11-2003	10:11:01.738377			
Lock Information	(LOCK) = OFF					
Sorting Information	(SORT) = ON	06-11-2003	10:11:01.738400			
SQL Statement Information	(STATEMENT) = OFF					
Table Activity Information	(TABLE) = OFF					
Take Timestamp Information	(TIMESTAMP) = ON	06-11-2003	10:11:01.738525			
Unit of Work Information	(UOW) = ON	06-11-2003	10:11:01.738353			

# **Usage notes**

The recording switches BUFFERPOOL, LOCK, SORT, STATEMENT, TABLE, and UOW are off by default, but can be switched on using the UPDATE MONITOR SWITCHES command. If any of these switches are on, this command also displays the time stamp for when the switch was turned on.

The recording switch TIMESTAMP is on by default, but can be switched off using UPDATE MONITOR SWITCHES. When this switch is on the system issues timestamp calls when collecting information for timestamp monitor elements. Examples of these elements are:

- agent\_sys\_cpu\_time
- agent\_usr\_cpu\_time
- appl\_con\_time

- uow\_start\_time
- uow\_stop\_time

If the TIMESTAMP switch is off, timestamp operating system calls are not issued to determine these elements and these elements will contain zero. Turning this switch off becomes important as CPU utilization approaches 100%; when this occurs, the CPU time required for issuing timestamps increases dramatically.

# Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

# GET DESCRIPTION FOR HEALTH INDICATOR

Returns a description for the specified health indicator. A Health Indicator measures the healthiness of a particular state, capacity, or behavior of the database system. The state defines whether or not the database object or resource is operating normally.

### Authorization

None

### **Required connection**

Instance. If there is no instance attachment, a default instance attachment is created.

To obtain a snapshot of a remote instance, it is necessary to first attach to that instance.

### **Command syntax**

▶ — GET DESCRIPTION FOR HEALTH INDICATOR—shortname—

# **Command parameters**

#### **HEALTH INDICATOR** shortname

The name of the health indicator for which you would like to retrieve the description. Health indicator names consist of a two- or three-letter object identifier followed by a name which describes what the indicator measures. For example:

db.sort\_privmem\_util

### **Examples**

The following is sample output from the GET DESCRIPTION FOR HEALTH INDICATOR command.

GET DESCRIPTION FOR HEALTH INDICATOR db2.sort\_privmem\_util

DESCRIPTION FOR db2.sort\_privmem\_util

Sorting is considered healthy if there is sufficient heap space in which to perform sorting and sorts do not overflow unnecessarily. This indicator tracks the utilization of the private sort memory. If db2.sort\_heap\_allocated (system monitor data element) >= SHEAPTHRES (DBM configuration parameter), sorts may not be getting full sort heap as defined by the SORTHEAP parameter and an alert may be generated. The indicator is calculated using the formula: (db2.sort heap allocated / SHEAPTHRES) \* 100. The Post Threshold Sorts snapshot monitor element measures the number of sorts that have requested heaps after the sort heap threshold has been exceeded. The value of this indicator, shown in the Additional Details, indicates the degree of severity of the problem for this health indicator. The Maximum Private Sort Memory Used snapshot monitor element maintains a private sort memory high-water mark for the instance. The value of this indicator, shown in the Additional Information, indicates the maximum amount of private sort memory that has been in use at any one point in time since the instance was last recycled. This value can be used to help determine an appropriate value for SHEAPTHRES.

# **GET HEALTH NOTIFICATION CONTACT LIST**

Returns the list of contacts and contact groups that are notified about the health of an instance. A contact list consists of e-mail addresses or pager Internet addresses of individuals who are to be notified when non-normal health conditions are present for an instance or any of its database objects.

# Authorization

None

# **Required Connection**

Instance. An explicit attachment is not required.

# **Command Syntax**

► GET HEALTH NOTIFICATION CONTACT LIST

# **Command Parameters**

None

# **Examples**

Issuing the command GET NOTIFICATION LIST results in a report similar to the following:

Name	Туре		
Joe Brown	Contact	-	
Support	Contact grou	р	

# **GET HEALTH SNAPSHOT**

Retrieves the health status information for the database manager and its databases. The information returned represents a snapshot of the health state at the time the command was issued.

**Important:** This command or API has been deprecated and might be removed in a future release because the health monitor has been deprecated in Version 9.7. For more information, see the "Health monitor has been deprecated" topic in the *What's New for DB2 Version 9.7* book.

### Scope

In a partitioned database environment, this command can be invoked from any database partition defined in the db2nodes.cfg file. By default it acts on the database partition from which it was invoked. If you use the GLOBAL option, it will extract consolidated information from all of the database partitions.

### Authorization

None

### **Required connection**

Instance. If there is no instance attachment, a default instance attachment is created.

To obtain a snapshot of a remote instance, it is necessary to first attach to that instance.

# **Command syntax**

-WITH FULL COLLECTION-

# **Command parameters**

#### DATABASE MANAGER

Provides statistics for the active database manager instance.

#### ALL DATABASES

Provides health states for all active databases on the current database partition.

#### ALL ON *database-alias*

Provides health states and information about all table spaces and buffer pools for a specified database.

DATABASE ON database-alias

**TABLESPACES ON** *database-alias* 

Provides information about table spaces for a specified database.

#### AT DBPARTITIONNUM db-partition-number

Returns results for the database partition specified.

#### GLOBAL

Returns an aggregate result for all database partitions in a partitioned database environment.

#### SHOW DETAIL

Specifies that the output should include the historical data for each health monitor data element in the form of {(Timestamp, Value, Formula)}, where the bracketed parameters (Timestamp, Value, Formula), will be repeated for each history record that is returned. For example,

(03-19-2002 13:40:24.138865,50,((1-(4/8))\*100)), (03-19-2002 13:40:13.1386300,50,((1-(4/8))\*100)), (03-19-2002 13:40:03.1988858,0,((1-(3/3))\*100))

Collection object history is returned for all collection objects in ATTENTION or AUTOMATE FAILED state.

The SHOW DETAIL option also provides additional contextual information that can be useful to understanding the value and alert state of the associated Health Indicator. For example, if the table space storage utilization Health Indicator is being used to determine how full the table space is, the rate at which the table space is growing will also be provided by SHOW DETAIL.

### WITH FULL COLLECTION

Specifies that full collection information for all collection state-based health indicators is to be returned. This option considers both the name and size filter criteria. If a user requests a health snapshot with full collection, the report will show all tables that meet the name and size criteria in the policy. This can be used to validate which tables will be evaluated in a given refresh cycle. The output returned when this option is specified is for collection objects in NORMAL, AUTOMATED, ATTENTION, or AUTOMATE FAILED state. This option can be specified in conjunction with the SHOW DETAIL option.

Without this option, only tables that have been evaluated for automatic reorganization and require manual intervention (that is, manual reorg or automation failed) will be displayed in a get health snapshot report.

# **Examples**

The following is typical output resulting from a request for database manager information:

D:\>DB2 GET HEALTH SNAPSHOT FOR DBM

Database Manager Health Snapshot

Node name Node type

Enterprise Server Edition with local and remote clients

# **GET HEALTH SNAPSHOT**

Instance name	= DB2
Snapshot timestamp	= 02/17/2004 12:39:44.818949
Number of database partitions in DB2 instance	= 1
Start Database Manager timestamp	= 02/17/2004 12:17:21.000119
Instance highest severity alert state	= Normal
Health Indicators:	
Indicator Name	= db2.db2_op_status
Value	= 0
Evaluation timestamp	= 02/17/2004 12:37:23.393000
Alert state	= Normal
Indicator Name Value Unit Evaluation timestamp Alert state	<pre>= db2.sort_privmem_util = 0 = % = 02/17/2004 12:37:23.393000 = Normal</pre>
Indicator Name Value Unit Evaluation timestamp Alert state	<pre>= db2.mon_heap_util = 6 = % = 02/17/2004 12:37:23.393000 = Normal</pre>

### **Usage notes**

When the GET HEALTH SNAPSHOT command returns a recommendation to reorganize the data or index on a data partitioned table, the recommendation is only at the table level and not specific to any individual partitions of the table. Starting with DB2 Version 9.7 Fix Pack 1, the data or the partitioned indexes of a specific data partition can be reorganized using the REORG INDEXES/TABLE command or the db2Reorg API. To determine if only specific data partitions of a data partitioned table need to be reorganized, use the REORGCHK command to retrieve statistics and reorganization recommendations for the data partitions of the data partitioned table. Use the REORG TABLE or REORG INDEXES ALL command with the ON DATA PARTITION clause to reorganize the data or the partitioned indexes of a specific data partition.

▶◀

# **GET INSTANCE**

Returns the value of the **DB2INSTANCE** environment variable.

## Authorization

None

# **Required connection**

None

# **Command syntax**

► GET INSTANCE

# **Command parameters**

None

# Examples

The following is sample output from GET INSTANCE: The current database manager instance is: smith

# **GET MONITOR SWITCHES**

Displays the status of the database system monitor switches for the current session. Monitor switches instruct the database system manager to collect database activity information. Each application using the database system monitor interface has its own set of monitor switches. This command displays them. To display the database manager-level switches, use the GET DBM MONITOR SWITCHES command.

### Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

### **Required connection**

Instance. If there is no instance attachment, a default instance attachment is created.

To display the settings for a remote instance, or for a different local instance, it is necessary to first attach to that instance.

### **Command syntax**

►►-GET MONITOR SWITCHES-

AT DBPARTITIONNUM—*db-partition-number*-

▶∢

### **Command parameters**

#### AT DBPARTITIONNUM db-partition-number

Specifies the database partition for which the status of the monitor switches is to be displayed.

### GLOBAL

Returns an aggregate result for all database partitions in a partitioned database environment.

### Examples

The following is sample output from GET MONITOR SWITCHES:

Monitor Recording Switches

Switch list for db partition number 1						
Buffer Pool Activity Information	(BUFFERPOOL)	=	ON	02-20-2003	16:04:30.070073	
Lock Information	(LOCK)	=	0FF			
Sorting Information	(SORT)	=	0FF			
SQL Statement Information	(STATEMENT)	=	ON	02-20-2003	16:04:30.070073	
Table Activity Information	(TABLE)	=	0FF			
Take Timestamp Information	(TIMESTAMP)	=	ON	02-20-2003	16:04:30.070073	
Unit of Work Information	(UOW)	=	ON	02-20-2003	16:04:30.070073	

# **Usage notes**

The recording switch TIMESTAMP is on by default, but can be switched off using UPDATE MONITOR SWITCHES. When this switch is on the system issues timestamp calls when collecting information for timestamp monitor elements.

The recording switch TIMESTAMP is on by default, but can be switched off using UPDATE MONITOR SWITCHES. If this switch is off, this command also displays the time stamp for when the switch was turned off. When this switch is on the system issues timestamp calls when collecting information for timestamp monitor elements. Examples of these elements are:

- agent\_sys\_cpu\_time
- agent\_usr\_cpu\_time
- appl\_con\_time
- con\_elapsed\_time
- con\_response\_time
- conn\_complete\_time
- db\_conn\_time
- elapsed\_exec\_time
- gw\_comm\_error\_time
- gw\_con\_time
- gw\_exec\_time
- host\_response\_time
- last\_backup
- last\_reset
- lock\_wait\_start\_time
- network\_time\_bottom
- network\_time\_top
- prev\_uow\_stop\_time
- rf\_timestamp
- ss\_sys\_cpu\_time
- ss\_usr\_cpu\_time
- status\_change\_time
- stmt\_elapsed\_time
- stmt\_start
- stmt\_stop
- stmt\_sys\_cpu\_time
- stmt\_usr\_cpu\_time
- uow\_elapsed\_time
- uow\_start\_time
- uow\_stop\_time

If the TIMESTAMP switch is off, timestamp operating system calls are not issued to determine these elements and these elements will contain zero. Turning this switch off becomes important as CPU utilization approaches 100%; when this occurs, the CPU time required for issuing timestamps increases dramatically.

# Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

# GET RECOMMENDATIONS FOR HEALTH INDICATOR

Returns descriptions of recommendations for improving the health of the aspect of the database system that is monitored by the specified health indicator. Recommendations can be returned for a health indicator that is in an alert state on a specific object, or the full set of recommendations for a given health indicator can be queried.

**Important:** This command or API has been deprecated and might be removed in a future release because the health monitor has been deprecated in Version 9.7. For more information, see the "Health monitor has been deprecated" topic in the *What's New for DB2 Version 9.7* book.

# Scope

In a partitioned database environment, this command can be invoked from any database partition defined in the db2nodes.cfg file. It acts only on that database partition unless the GLOBAL parameter is specified.

# **Authorization**

None

# **Required connection**

Instance. If there is no instance attachment, a default instance attachment is created. To retrieve recommendations for a remote instance, it is necessary to first attach to that instance.

# **Command syntax**

► GET RECOMMENDATIONS FOR HEALTH INDICATOR—health-indicator-name FORDBM	<b>&gt;</b>
AT DBPARTITIONNUM—db-partition-number—	<b>&gt;</b> 4

# **Command parameters**

#### HEALTH INDICATOR health-indicator-name

The name of the health indicator for which you would like to retrieve the recommendations. Health indicator names consist of a two- or three-letter object identifier followed by a name that describes what the indicator measures.

**DBM** Returns recommendations for a database manager health indicator that has entered an alert state.

#### **TABLESPACE**tblspacename

Returns recommendation for a health indicator that has entered an alert state on the specified table space and database.

#### **CONTAINER** containername

Returns recommendation for a health indicator that has entered an alert state on the specified container in the specified table space and database.

#### DATABASE

Returns recommendations for a health indicator that has entered an alert state on the specified database.

#### **ON** database-alias

Specifies a database.

#### AT DBPARTITIONNUM

Specifies the database partition number at which the health indicator has entered an alert state. If a database partition number is not specified and GLOBAL is not specified, the command will return information for the currently connected database partition.

#### GLOBAL

Retrieves recommendations for the specified health indicator across all database partitions. In cases where the recommendations are the same on different database partitions, those recommendations are returned as a single set of recommendations that solve the health indicator on the affected database partitions.

### Examples

db2 get recommendations for health indicator db.db\_heap\_util for database on sample

Problem:

Indicator Name	= db.db_heap_util
Value	= 42
Evaluation timestamp	= 11/25/2003 19:04:54
Alert state	= Alarm
Additional information	=

Recommendations:

Recommendation: Increase the database heap size. Rank: 1

Increase the database configuration parameter dbheap sufficiently to move utilization to normal operating levels. To increase the value, set the new value of dbheap to be equal to (pool\_cur\_size / (4096\*U)) where U is the desired utilization rate. For example, if your desired utilization rate is 60% of the warning threshold level, which you have set at 75%, then U = 0.6 \* 0.75 = 0.45 (or 45%).

Take one of the following actions:

Execute the following scripts at the DB2 server:

CONNECT TO SAMPLE; UPDATE DB CFG USING DBHEAP 149333; CONNECT\_RESET;

Launch DB2 tool: Database Configuration Window

The Database Configuration window can be used to view and update database configuration parameters.

To open the Database Configuration window:

- 1. From the Control Center, expand the object tree until you find the databases folder.
- 2. Click the databases folder. Any existing database are displayed in the contents pane on the right side of the window.
- Right-click the database that you want in the contents pane, and click Configure Parameters in the pop-up menu. The Database Configuration window opens.

On the Performance tab, update the database heap size parameter as suggested and click OK to apply the update.

Recommendation: Investigate memory usage of database heap. Rank: 2

There is one database heap per database and the database manager uses it on behalf of all applications connected to the database. The data area is expanded as needed up to the maximum specified by dbheap.

For more information on the database heap, refer to the DB2 Information Center.

Investigate the amount of memory that was used for the database heap over time to determine the most appropriate value for the database heap configuration parameter. The database system monitor tracks the highest amount of memory that was used for the database heap.

Take one of the following actions:

Launch DB2 tool: Memory Visualizer

The Memory Visualizer is used to monitor memory allocation within a DB2 instance. It can be used to monitor overall memory usage, and to update configuration parameters for individual memory components.

To open the Memory Visualizer:

- 1. From the Control Center, expand the object tree until you find the instances folder.
- 2. Click the instances folder. Any existing instances are displayed in the contents pane on the right side of the window.
- Right-click the instance that you want in the contents pane, and click View Memory Usage in the pop-up menu. The Memory Visualizer opens.

To start the Memory Visualizer from the command line issue the db2memvis command.

The Memory Visualizer displays a hierarchical list of memory pools for the database manager. Database Heap is listed under the Database Manager Memory group for each database. On Windows, it is listed under the Database Manager Shared Memory group.

Click the check box on the Show Plot column for the Database Heap row to add the element to the plot.

### Usage notes

The GET RECOMMENDATIONS FOR HEALTH INDICATOR command can be used in two different ways:

• Specify only the health indicator to get an informational list of all possible recommendations. If no object is specified, the command will return a full listing of all recommendations that can be used to resolve an alert on the given health indicator.

# GET RECOMMENDATIONS FOR HEALTH INDICATOR

• Specify an object to resolve a specific alert on that object. If an object (for example, a database or a table space) is specified, the recommendations returned will be specific to an alert on the object identified. In this case, the recommendations will be more specific and will contain more information about resolving the alert. If the health indicator identified is not in an alert state on the specified object, no recommendations will be returned.

When the GET RECOMMENDATIONS FOR HEALTH INDICATOR command returns a recommendation to reorganize the data or index on a data partitioned table, the recommendation is only at the table level and not specific to any individual data partitions of the table. Starting with DB2 Version 9.7 Fix Pack 1, the data or the partitioned indexes of a specific data partition can be reorganized using the REORG INDEXES/TABLE command or the db2Reorg API. To determine if only specific data partitions of a data partitioned table need to be reorganized, use the REORGCHK command to retrieve statistics and reorganization recommendations for the data partitions of the data partitioned table. Use the REORG TABLE or REORG INDEXES ALL command with the ON DATA PARTITION clause to reorganize the data or the partitioned indexes of a specific data partition.

# **GET ROUTINE**

Retrieves a routine SQL Archive (SAR) file for a specified SQL routine.

# Authorization

EXECUTE privilege on SYSFUN.GET\_ROUTINE\_SAR procedure

# **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established.

# **Command syntax**

GET POUTINE_INTOfile nameEPOM		outine name
der Könnte into jute_name i Kön	I NOCEDUNE /	
	-SPECIFIC-	

LHIDE BODY

# **Command parameters**

#### **INTO** *file\_name*

Names the file where routine SQL archive (SAR) is stored.

#### FROM

Indicates the start of the specification of the routine to be retrieved.

### SPECIFIC

The specified routine name is given as a specific name.

### PROCEDURE

The routine is an SQL procedure.

#### routine\_name

The name of the procedure. If SPECIFIC is specified then it is the specific name of the procedure. If the name is not qualified with a schema name, the CURRENT SCHEMA is used as the schema name of the routine. The *routine-name* must be an existing procedure that is defined as an SQL procedure.

#### **HIDE BODY**

Specifies that the body of the routine must be replaced by an empty body when the routine text is extracted from the catalogs.

This does not affect the compiled code; it only affects the text.

### **Examples**

GET ROUTINE INTO procs/proc1.sar FROM PROCEDURE myappl.proc1;

### **Usage notes**

If a GET ROUTINE or a PUT ROUTINE operation (or their corresponding procedure) fails to execute successfully, it will always return an error (SQLSTATE 38000), along with diagnostic text providing information about the cause of the failure. For example, if the procedure name provided to GET ROUTINE does not identify an SQL procedure, diagnostic "-204, 42704" text will be returned, where

# **GET ROUTINE**

"-204" and "42704" are the SQLCODE and SQLSTATE, respectively, that identify the cause of the problem. The SQLCODE and SQLSTATE in this example indicate that the procedure name provided in the GET ROUTINE command is undefined.

# **GET SNAPSHOT**

Collects status information and formats the output for the user. The information returned represents a *snapshot* of the database manager operational status at the time the command was issued.

# Scope

In a partitioned database environment, this command can be invoked from any database partition defined in the db2nodes.cfg file. It acts only on that database partition.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT
- SYSMON

# **Required connection**

Instance. If there is no instance attachment, a default instance attachment is created.

To obtain a snapshot of a remote instance, it is necessary to first attach to that instance.

# **Command syntax**

—AT DBPARTITIONNUM—db-partition-number—	

The monitor switches must be turned on in order to collect some statistics.

# **Command parameters**

#### DATABASE MANAGER

Provides statistics for the active database manager instance.

#### ALL DATABASES

GLOBAL------

Provides general statistics for all active databases on the current database partition.

#### ALL APPLICATIONS

Provides information about all active applications that are connected to a database on the current database partition.

#### **ALL BUFFERPOOLS**

Provides information about buffer pool activity for all active databases.

#### **APPLICATION APPLID** appl-id

Provides information only about the application whose ID is specified. To get a specific application ID, use the LIST APPLICATIONS command.

#### **APPLICATION AGENTID** appl-handle

Provides information only about the application whose application handle is specified. The application handle is a 32-bit number that uniquely identifies an application that is currently running. Use the LIST APPLICATIONS command to get a specific application handle.

#### FCM FOR ALL DBPARTITIONNUMS

Provides Fast Communication Manager (FCM) statistics between the database partition against which the GET SNAPSHOT command was issued and the other database partitions in the partitioned database environment.

### LOCKS FOR APPLICATION APPLID appl-id

Provides information about all locks held by the specified application, identified by application ID.

### LOCKS FOR APPLICATION AGENTID appl-handle

Provides information about all locks held by the specified application, identified by application handle.

#### ALL REMOTE\_DATABASES

Provides general statistics about all active remote databases on the current database partition.

#### ALL REMOTE\_APPLICATIONS

Provides information about all active remote applications that are connected to the current database partition.

#### ALL ON database-alias

Provides general statistics and information about all applications, tables, table spaces, buffer pools, and locks for a specified database.

#### **DATABASE ON** *database-alias*

Provides general statistics for a specified database.

#### **APPLICATIONS ON** *database-alias*

Provides information about all applications connected to a specified database.

#### **TABLES ON** database-alias

Provides information about tables in a specified database. This will include only those tables that have been accessed since the TABLE recording switch was turned on.

#### TABLESPACES ON database-alias

Provides information about table spaces for a specified database.

#### LOCKS ON database-alias

Provides information about every lock held by each application connected to a specified database.

#### **BUFFERPOOLS ON** database-alias

Provides information about buffer pool activity for the specified database.

#### **REMOTE\_DATABASES ON** database-alias

Provides general statistics about all active remote databases for a specified database.

#### **REMOTE\_APPLICATIONS ON** database-alias

Provides information about remote applications for a specified database.

#### **DYNAMIC SQL ON** database-alias

Returns a point-in-time picture of the contents of the SQL statement cache for the database.

#### WRITE TO FILE

Specifies that snapshot results are to be stored in a file at the server, as well as being passed back to the client. This command is valid only over a

database connection. The snapshot data can then be queried through the table function SYSFUN.SQLCACHE\_SNAPSHOT over the same connection on which the call was made.

- **DCS** Depending on which clause it is specified, this keyword requests statistics about:
  - A specific DCS application currently running on the DB2 Connect Gateway
  - All DCS applications
  - All DCS applications currently connected to a specific DCS database
  - A specific DCS database
  - All DCS databases.

#### **AT DBPARTITIONNUM** *db-partition-number*

Returns results for the database partition specified.

#### GLOBAL

Returns an aggregate result for all database partitions in a partitioned database environment.

### **Examples**

 To request snapshot information about the database manager, issue: get snapshot for database manager

The following is a sample output listing from the above command:

#### Database Manager Snapshot

Node name Node type Instance name Number of database partitions in DB2 instance Database manager status	<pre>= = Enterprise Server Edition with local and remote clients = DB2 = 1 = Active</pre>

10	1	1		Active

# Usage notes

10

• When write suspend is ON against a database, snapshots cannot be issued against that database until write suspend is turned OFF. When a snapshot is issued against a database for which write suspend was turned ON, a diagnostic probe is written to the db2diag log file and that database is skipped.

1

Active

- To obtain a snapshot from a remote instance (or a different local instance), it is necessary to first attach to that instance. If an alias for a database residing at a different instance is specified, an error message is returned.
- To obtain some statistics, it is necessary that the database system monitor switches are turned on. If the recording switch TIMESTAMP has been set to OFF, timestamp related elements will report "Not Collected".
- No data is returned following a request for table information if any of the following is true:
  - The TABLE recording switch is turned off.
  - No tables have been accessed since the switch was turned on.
  - No tables have been accessed since the last RESET MONITOR command was issued.

However, if a REORG TABLE is being performed or has been performed during this period, some information is returned although some fields are not displayed. For a partitioned table, information for each reorganized data partition is returned.

To obtain snapshot information from all database partitions (which is different than the aggregate result of all partitions), the snapshot administrative views should be used.

# **GET SNAPSHOT**

- In a partitioned database environment, specifying the command with the **GLOBAL** option will return a value for the High water mark for connections parameter which represents the greatest high water mark for connections among all the nodes and not the sum of the individual high water marks of all the nodes. For example:
  - Node A has 5 applications connected currently and the high water mark for connections is 5.
  - Node B has 4 applications connected currently and the high water mark for connections is 6.

In the above example, the High water mark for connections value is 6, and the Applications connected currently value is 9.

# Compatibilities

For compatibility with versions earlier than Version 8:

- The keyword **NODE** can be substituted for **DBPARTITIONNUM**.
- The keyword **NODES** can be substituted for **DBPARTITIONNUMS**.
- The new registry variable in Version 9.5,

**DB2\_SYSTEM\_MONITOR\_SETTINGS** impacts the behavior of monitoring the CPU usage on Linux. If you need to use the method of reading CPU usage that returns both system and user CPU usage times on Linux, perform one of the following actions.

On Linux on RHEL4 and SLES9: db2set DB2\_SYSTEM\_MONITOR\_SETTINGS=DISABLE\_CPU\_USAGE:TRUE

On Linux on RHEL5 and SLES10: db2set DB2\_SYSTEM\_MONITOR\_SETTINGS=OLD\_CPU\_USAGE:TRUE
# HELP

Permits the user to invoke help from the Information Center.

This command is not available on UNIX operating systems.

# Authorization

None

# **Required connection**

None

# **Command syntax**

►►—HELP—

# **Examples**

The following example shows how to use the HELP command:

• db2 help

This command opens the *DB2 Information Center*, which contains information about DB2 divided into categories, such as tasks, reference, books, and so on. This is equivalent to invoking the db2ic command with no parameters.

# **Usage notes**

The command line processor will not know if the command succeeds or fails, and cannot report error conditions.

# HISTORY

Displays the history of commands run within a CLP interactive mode session.

#### Scope

This command can only be run within CLP interactive mode. Specifically, it cannot be run from the CLP command mode or the CLP batch mode.

## Authorization

None

## **Required connection**

None

# **Command syntax**

# **Command parameters**

### **REVERSE** | **R**

Displays the command history in reverse order, with the most-recently run command listed first. If this parameter is not specified, the commands are listed in chronological order, with the most recently run command listed last.

*num* Displays only the most recent *num* commands. If this parameter is not specified, a maximum of 20 commands are displayed. However, the number of commands that are displayed is also restricted by the number of commands that are stored in the command history.

## Usage notes

- 1. The value of the DB2\_CLP\_HISTSIZE registry variable specifies the maximum number of commands to be stored in the command history. This registry variable can be set to any value between 1 and 500 inclusive. If this registry variable is not set or is set to a value outside the valid range, a maximum of 20 commands is stored in the command history.
- Since the HISTORY command will always be listed in the command history, the maximum number of commands displayed will always be one greater than the user-specified maximum.
- **3**. The command history is not persistent across CLP interactive mode sessions, which means that the command history is not saved at the end of an interactive mode session.
- 4. The command histories of multiple concurrently running CLP interactive mode sessions are independent of one another.

Inserts data from an external file with a supported file format into a table, hierarchy, view or nickname. LOAD is a faster alternative, but the load utility does not support loading data at the hierarchy level.

Quick link to "File type modifiers for the import utility" on page 258.

# Authorization

- IMPORT using the INSERT option requires one of the following:
  - DATAACCESS authority
  - CONTROL privilege on each participating table, view, or nickname
  - INSERT and SELECT privilege on each participating table or view
- IMPORT to an existing table using the **INSERT\_UPDATE** option, requires one of the following:
  - DATAACCESS authority
  - CONTROL privilege on each participating table, view, or nickname
  - INSERT, SELECT, UPDATE and DELETE privilege on each participating table or view
- IMPORT to an existing table using the **REPLACE** or **REPLACE\_CREATE** option, requires one of the following:
  - DATAACCESS authority
  - CONTROL privilege on the table or view
  - INSERT, SELECT, and DELETE privilege on the table or view
- IMPORT to a new table using the **CREATE** or **REPLACE\_CREATE** option, requires one of the following:
  - DBADM authority
  - CREATETAB authority on the database and USE privilege on the table space, as well as one of:
    - IMPLICIT\_SCHEMA authority on the database, if the implicit or explicit schema name of the table does not exist
    - CREATEIN privilege on the schema, if the schema name of the table refers to an existing schema
- IMPORT to a hierarchy that does not exist using the **CREATE**, or the **REPLACE\_CREATE** option, requires one of the following:
  - DBADM authority
  - CREATETAB authority on the database and USE privilege on the table space and one of:
    - IMPLICIT\_SCHEMA authority on the database, if the schema name of the table does not exist
    - CREATEIN privilege on the schema, if the schema of the table exists
    - CONTROL privilege on every sub-table in the hierarchy, if the **REPLACE\_CREATE** option on the entire hierarchy is used
- IMPORT to an existing hierarchy using the **REPLACE** option requires one of the following:
  - DATAACCESS authority
  - CONTROL privilege on every sub-table in the hierarchy

- To import data into a table that has protected columns, the session authorization ID must have LBAC credentials that allow write access to all protected columns in the table. Otherwise the import fails and an error (SQLSTATE 42512) is returned.
- To import data into a table that has protected rows, the session authorization ID must hold LBAC credentials that meet these criteria:
  - It is part of the security policy protecting the table
  - It was granted to the session authorization ID for write access

The label on the row to insert, the user's LBAC credentials, the security policy definition, and the LBAC rules determine the label on the row.

- If the **REPLACE** or **REPLACE\_CREATE** option is specified, the session authorization ID must have the authority to drop the table.
- To import data into a nickname, the session authorization ID must have the privilege to access and use a specified data source in pass-through mode.

# **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established. Utility access to Linux, UNIX, or Windows database servers from Linux, UNIX, or Windows clients must be a direct connection through the engine and not through a DB2 Connect gateway or loop back environment.

# **Command syntax**

## Ignore and Map parameters:

## hierarchy description:

### sub-table-list:

## traversal-order-list:

### tblspace-specs:

# **Command parameters**

### ALL TABLES

An implicit keyword for hierarchy only. When importing a hierarchy, the default is to import all tables specified in the traversal order.

## ALLOW NO ACCESS

Runs import in the offline mode. An exclusive (X) lock on the target table is acquired before any rows are inserted. This prevents concurrent applications from accessing table data. This is the default import behavior.

### ALLOW WRITE ACCESS

Runs import in the online mode. An intent exclusive (IX) lock on the target table is acquired when the first row is inserted. This allows concurrent readers and writers to access table data. Online mode is not compatible with the **REPLACE**, **CREATE**, or **REPLACE\_CREATE** import options. Online mode is not supported in conjunction with buffered inserts. The import operation will periodically commit inserted data to prevent lock escalation to a table lock and to avoid running out of active log space. These commits will be performed even if the **COMMITCOUNT** option was not used. During each commit, import will lose its IX table lock, and will attempt to reacquire it after the commit. This parameter is required when you import to a nickname and **COMMITCOUNT** must be specified with a valid number (AUTOMATIC is not considered a valid option).

## AS ROOT TABLE

Creates one or more sub-tables as a stand-alone table hierarchy.

## **COMMITCOUNT** *n* | **AUTOMATIC**

Performs a COMMIT after every n records are imported. When a number n is specified, import performs a COMMIT after every n records are imported. When compound inserts are used, a user-specified commit frequency of n is rounded up to the first integer multiple of the compound count value. When AUTOMATIC is specified, import internally determines when a commit needs to be performed. The utility will commit for either one of two reasons:

- to avoid running out of active log space
- to avoid lock escalation from row level to table level

If the **ALLOW WRITE ACCESS** option is specified, and the **COMMITCOUNT** option is not specified, the import utility will perform commits as if **COMMITCOUNT** AUTOMATIC had been specified.

The ability of the import operation to avoid running out of active log space is affected by the DB2 registry variable **DB2\_FORCE\_APP\_ON\_MAX\_LOG**:

# DB2\_FORCE\_APP\_ON\_MAX\_LOG:

- If DB2\_FORCE\_APP\_ON\_MAX\_LOG is set to FALSE and the COMMITCOUNT AUTOMATIC command option is specified, the import utility will be able to automatically avoid running out of active log space.
- If DB2\_FORCE\_APP\_ON\_MAX\_LOG is set to FALSE and the COMMITCOUNT *n* command option is specified, the import utility will attempt to resolve the log full condition if it encounters an SQL0964C (Transaction Log Full) while inserting or updating a record. It will perform an unconditional commit and then will reattempt to insert or update the record. If this does not help resolve the issue (which would be the case when the log full is attributed to other activity on the database), then the IMPORT command will fail as expected, however the number of rows committed may not be a multiple of the COMMITCOUNT *n* value. To avoid processing the rows that were already committed when you retry the import operation, use the RESTARTCOUNT or SKIPCOUNT command parameters.

• If DB2\_FORCE\_APP\_ON\_MAX\_LOG is set to TRUE (which is the default), the import operation will fail if it encounters an SQL0964C while inserting or updating a record. This can occur irrespective of whether you specify COMMITCOUNT AUTOMATIC or COMMITCOUNT *n*.

The application is forced off the database and the current unit of work is rolled back. To avoid processing the rows that were already committed when you retry the import operation, use the **RESTARTCOUNT** or **SKIPCOUNT** command parameters.

## CREATE

**Note:** The **CREATE** parameter is deprecated and may be removed in a future release. For additional details, see "IMPORT command options **CREATE** and **REPLACE\_CREATE** are deprecated".

Creates the table definition and row contents in the code page of the database. If the data was exported from a DB2 table, sub-table, or hierarchy, indexes are created. If this option operates on a hierarchy, and data was exported from DB2, a type hierarchy will also be created. This option can only be used with IXF files.

This parameter is not valid when you import to a nickname.

**Note:** If the data was exported from an MVS<sup>™</sup> host database, and it contains LONGVAR fields whose lengths, calculated on the page size, are more than 254, **CREATE** might fail because the rows are too long. See "Imported table re-creation" for a list of restrictions. In this case, the table should be created manually, and IMPORT with **INSERT** should be invoked, or, alternatively, the LOAD command should be used.

## **DEFAULT** schema-sqlid

This option can only be used when the **USING XDS** parameter is specified. The schema specified through the **DEFAULT** clause identifies a schema to use for validation when the XML Data Specifier (XDS) of an imported XML document does not contain an SCH attribute identifying an XML Schema.

The **DEFAULT** clause takes precedence over the **IGNORE** and **MAP** clauses. If an XDS satisfies the **DEFAULT** clause, the **IGNORE** and **MAP** specifications will be ignored.

### **FROM** filename

Specifies the file that contains the data to be imported. If the path is omitted, the current working directory is used.

### HIERARCHY

Specifies that hierarchical data is to be imported.

### **IGNORE** schema-sqlid

This option can only be used when the **USING XDS** parameter is specified. The **IGNORE** clause specifies a list of one or more schemas to ignore if they are identified by an SCH attribute. If an SCH attribute exists in the XML Data Specifier for an imported XML document, and the schema identified by the SCH attribute is included in the list of schemas to ignore, then no schema validation will occur for the imported XML document.

If a schema is specified in the **IGNORE** clause, it cannot also be present in the left side of a schema pair in the **MAP** clause.

The **IGNORE** clause applies only to the XDS. A schema that is mapped by the **MAP** clause will not be subsequently ignored if specified by the **IGNORE** clause.

#### **IN** tablespace-name

Identifies the table space in which the table will be created. The table space must exist, and must be a REGULAR table space. If no other table space is specified, all table parts are stored in this table space. If this clause is not specified, the table is created in a table space created by the authorization ID. If none is found, the table is placed into the default table space USERSPACE1. If USERSPACE1 has been dropped, table creation fails.

#### **INDEX IN** tablespace-name

Identifies the table space in which any indexes on the table will be created. This option is allowed only when the primary table space specified in the **IN** clause is a DMS table space. The specified table space must exist, and must be a REGULAR or LARGE DMS table space.

**Note:** Specifying which table space will contain an index can only be done when the table is created.

#### insert-column

Specifies the name of a column in the table or the view into which data is to be inserted.

#### INSERT

Adds the imported data to the table without changing the existing table data.

#### **INSERT\_UPDATE**

Adds rows of imported data to the target table, or updates existing rows (of the target table) with matching primary keys.

## **INTO** table-name

Specifies the database table into which the data is to be imported. This table cannot be a system table, a created temporary table, a declared temporary table, or a summary table.

One can use an alias for **INSERT**, **INSERT\_UPDATE**, or **REPLACE**, except in the case of an earlier server, when the fully qualified or the unqualified table name should be used. A qualified table name is in the form: *schema.tablename*. The *schema* is the user name under which the table was created.

### LOBS FROM lob-path

Specifies one or more paths that store LOB files. The names of the LOB data files are stored in the main data file (ASC, DEL, or IXF), in the column that will be loaded into the LOB column. The maximum number of paths that can be specified is 999. This will implicitly activate the LOBSINFILE behavior.

This parameter is not valid when you import to a nickname.

#### LONG IN tablespace-name

Identifies the table space in which the values of any long columns (LONG VARCHAR, LONG VARGRAPHIC, LOB data types, or distinct types with any of these as source types) will be stored. This option is allowed only if the primary table space specified in the **IN** clause is a DMS table space. The table space must exist, and must be a LARGE DMS table space.

## MAP schema-sqlid

This option can only be used when the **USING XDS** parameter is specified. Use the **MAP** clause to specify alternate schemas to use in place of those specified by the SCH attribute of an XML Data Specifier (XDS) for each imported XML document. The **MAP** clause specifies a list of one or more schema pairs, where each pair represents a mapping of one schema to another. The first schema in the pair represents a schema that is referred to by an SCH attribute in an XDS. The second schema in the pair represents the schema that should be used to perform schema validation.

If a schema is present in the left side of a schema pair in the MAP clause, it cannot also be specified in the IGNORE clause.

Once a schema pair mapping is applied, the result is final. The mapping operation is non-transitive, and therefore the schema chosen will not be subsequently applied to another schema pair mapping.

A schema cannot be mapped more than once, meaning that it cannot appear on the left side of more than one pair.

### **MESSAGES** *message-file*

Specifies the destination for warning and error messages that occur during an import operation. If the file already exists, the import utility appends the information. If the complete path to the file is not specified, the utility uses the current directory and the default drive as the destination. If *message-file* is omitted, the messages are written to standard output.

## METHOD

L Specifies the start and end column numbers from which to import data. A column number is a byte offset from the beginning of a row of data. It is numbered starting from 1.

**Note:** This method can only be used with ASC files, and is the only valid option for that file type.

N Specifies the names of the columns in the data file to be imported. The case of these column names must match the case of the corresponding names in the system catalogs. Each table column that is not nullable should have a corresponding entry in the METHOD N list. For example, given data fields F1, F2, F3, F4, F5, and F6, and table columns C1 INT, C2 INT NOT NULL, C3 INT NOT NULL, and C4 INT, method N (F2, F1, F4, F3) is a valid request, while method N (F2, F1) is not valid.

Note: This method can only be used with IXF files.

**P** Specifies the field numbers of the input data fields to be imported.

**Note:** This method can only be used with IXF or DEL files, and is the only valid option for the DEL file type.

## **MODIFIED BY** *filetype-mod*

Specifies file type modifier options. See "File type modifiers for the import utility" on page 258.

## NOTIMEOUT

Specifies that the import utility will not time out while waiting for locks. This option supersedes the **locktimeout** database configuration parameter. Other applications are not affected.

## NULL INDICATORS null-indicator-list

This option can only be used when the **METHOD L** parameter is specified. That is, the input file is an ASC file. The null indicator list is a comma-separated list of positive integers specifying the column number of each null indicator field. The column number is the byte offset of the null indicator field from the beginning of a row of data. There must be one entry in the null indicator list for each data field defined in the **METHOD L** parameter. A column number of zero indicates that the corresponding data field always contains data.

A value of Y in the NULL indicator column specifies that the column data is NULL. Any character *other than* Y in the NULL indicator column specifies that the column data is not NULL, and that column data specified by the **METHOD L** option will be imported.

The NULL indicator character can be changed using the **MODIFIED BY** option, with the nullindchar file type modifier.

### **OF** *filetype*

Specifies the format of the data in the input file:

- ASC (non-delimited ASCII format)
- DEL (delimited ASCII format), which is used by a variety of database manager and file manager programs
- WSF (work sheet format), which is used by programs such as:
  - Lotus 1-2-3
  - Lotus Symphony
- IXF (Integration Exchange Format, PC version) is a binary format that is used exclusively by DB2.

**Important:** Support for the WSF file format is deprecated and might be removed in a future release. It is recommended that you start using a supported file format instead of WSF files before support is removed.

The WSF file type is not supported when you import to a nickname.

### REPLACE

Deletes all existing data from the table by truncating the data object, and inserts the imported data. The table definition and the index definitions are not changed. This option can only be used if the table exists. If this option is used when moving data between hierarchies, only the data for an entire hierarchy, not individual subtables, can be replaced.

This parameter is not valid when you import to a nickname.

This option does not honor the CREATE TABLE statement's NOT LOGGED INITIALLY (NLI) clause or the ALTER TABLE statement's ACTIVE NOT LOGGED INITIALLY clause.

If an import with the **REPLACE** option is performed within the same transaction as a CREATE TABLE or ALTER TABLE statement where the NLI clause is invoked, the import will not honor the NLI clause. All inserts will be logged.

### Workaround 1

Delete the contents of the table using the DELETE statement, then invoke the import with INSERT statement

### Workaround 2

Drop the table and recreate it, then invoke the import with INSERT statement.

This limitation applies to DB2 Universal Database Version 7 and DB2 UDB Version 8

## REPLACE\_CREATE

**Note:** The **REPLACE\_CREATE** parameter is deprecated and may be removed in a future release. For additional details, see "IMPORT command options CREATE and REPLACE\_CREATE are deprecated".

If the table exists, deletes all existing data from the table by truncating the data object, and inserts the imported data without changing the table definition or the index definitions.

If the table does not exist, creates the table and index definitions, as well as the row contents, in the code page of the database. See *Imported table re-creation* for a list of restrictions.

This option can only be used with IXF files. If this option is used when moving data between hierarchies, only the data for an entire hierarchy, not individual subtables, can be replaced.

This parameter is not valid when you import to a nickname.

#### **RESTARTCOUNT** *n*

Specifies that an import operation is to be started at record *n*+1. The first *n* records are skipped. This option is functionally equivalent to **SKIPCOUNT**. **RESTARTCOUNT** and **SKIPCOUNT** are mutually exclusive.

### **ROWCOUNT** *n*

Specifies the number n of physical records in the file to be imported (inserted or updated). Allows a user to import only n rows from a file, starting from the record determined by the **SKIPCOUNT** or **RESTARTCOUNT** options. If the **SKIPCOUNT** or **RESTARTCOUNT** options are not specified, the first n rows are imported. If **SKIPCOUNT** m or **RESTARTCOUNT** m is specified, rows m+1 to m+n are imported. When compound inserts are used, user specified **ROWCOUNT** n is rounded up to the first integer multiple of the compound count value.

### SKIPCOUNT n

Specifies that an import operation is to be started at record *n*+1. The first *n* records are skipped. This option is functionally equivalent to **RESTARTCOUNT**. **SKIPCOUNT** and **RESTARTCOUNT** are mutually exclusive.

### **STARTING** *sub-table-name*

A keyword for hierarchy only, requesting the default order, starting from *sub-table-name*. For PC/IXF files, the default order is the order stored in the input file. The default order is the only valid order for the PC/IXF file format.

### sub-table-list

For typed tables with the **INSERT** or the **INSERT\_UPDATE** option, a list of sub-table names is used to indicate the sub-tables into which data is to be imported.

### traversal-order-list

For typed tables with the **INSERT**, **INSERT\_UPDATE**, or the **REPLACE** 

option, a list of sub-table names is used to indicate the traversal order of the importing sub-tables in the hierarchy.

#### **UNDER** *sub-table-name*

Specifies a parent table for creating one or more sub-tables.

#### WARNINGCOUNT n

Stops the import operation after n warnings. Set this parameter if no warnings are expected, but verification that the correct file and table are being used is desired. If the import file or the target table is specified incorrectly, the import utility will generate a warning for each row that it attempts to import, which will cause the import to fail. If n is zero, or this option is not specified, the import operation will continue regardless of the number of warnings issued.

#### XML FROM *xml-path*

Specifies one or more paths that contain the XML files.

#### XMLPARSE

Specifies how XML documents are parsed. If this option is not specified, the parsing behavior for XML documents will be determined by the value of the CURRENT XMLPARSE OPTION special register.

#### STRIP WHITESPACE

Specifies to remove whitespace when the XML document is parsed.

## PRESERVE WHITESPACE

Specifies not to remove whitespace when the XML document is parsed.

#### XMLVALIDATE

Specifies that XML documents are validated against a schema, when applicable.

# USING XDS

XML documents are validated against the XML schema identified by the XML Data Specifier (XDS) in the main data file. By default, if the **XMLVALIDATE** option is invoked with the **USING XDS** clause, the schema used to perform validation will be determined by the SCH attribute of the XDS. If an SCH attribute is not present in the XDS, no schema validation will occur unless a default schema is specified by the **DEFAULT** clause.

The **DEFAULT**, **IGNORE**, and **MAP** clauses can be used to modify the schema determination behavior. These three optional clauses apply directly to the specifications of the XDS, and not to each other. For example, if a schema is selected because it is specified by the **DEFAULT** clause, it will not be ignored if also specified by the **IGNORE** clause. Similarly, if a schema is selected because it is specified as the first part of a pair in the MAP clause, it will not be re-mapped if also specified in the second part of another **MAP** clause pair.

#### **USING SCHEMA** schema-sqlid

XML documents are validated against the XML schema with the specified SQL identifier. In this case, the SCH attribute of the XML Data Specifier (XDS) will be ignored for all XML columns.

## USING SCHEMALOCATION HINTS

XML documents are validated against the schemas identified by XML schema location hints in the source XML documents. If a

schemaLocation attribute is not found in the XML document, no validation will occur. When the **USING SCHEMALOCATION HINTS** clause is specified, the SCH attribute of the XML Data Specifier (XDS) will be ignored for all XML columns.

See examples of the XMLVALIDATE option below.

## **Examples**

#### Example 1

The following example shows how to import information from myfile.ixf to the STAFF table:

db2 import from myfile.ixf of ixf messages msg.txt insert into staff

SQL3150N The H record in the PC/IXF file has product "DB2  $\,$  01.00", date "19970220", and time "140848".

SQL3153N The T record in the PC/IXF file has name "myfile", qualifier " ", and source " ".

SQL3109N The utility is beginning to load data from file "myfile".

 ${\rm SQL3110N}$  The utility has completed processing. "58" rows were read from the input file.

SQL3221W ...Begin COMMIT WORK. Input Record Count = "58".

SQL3222W ...COMMIT of any database changes was successful.

SQL3149N "58" rows were processed from the input file. "58" rows were successfully inserted into the table. "0" rows were rejected.

### Example 2 (Importing into a table with an identity column)

TABLE1 has 4 columns:

- C1 VARCHAR(30)
- C2 INT GENERATED BY DEFAULT AS IDENTITY
- C3 DECIMAL(7,2)
- C4 CHAR(1)

TABLE2 is the same as TABLE1, except that C2 is a GENERATED ALWAYS identity column.

Data records in DATAFILE1 (DEL format):

```
"Liszt"
"Hummel",,187.43, H
"Grieg",100, 66.34, G
"Satie",101, 818.23, I
```

Data records in DATAFILE2 (DEL format):

```
"Liszt", 74.49, A
"Hummel", 0.01, H
"Grieg", 66.34, G
"Satie", 818.23, I
```

The following command generates identity values for rows 1 and 2, since no identity values are supplied in DATAFILE1 for those rows. Rows 3 and 4, however, are assigned the user-supplied identity values of 100 and 101, respectively.

db2 import from datafile1.del of del replace into table1

To import DATAFILE1 into TABLE1 so that identity values are generated for all rows, issue one of the following commands:

```
db2 import from datafile1.del of del method P(1, 3, 4)
  replace into table1 (c1, c3, c4)
db2 import from datafile1.del of del modified by identityignore
  replace into table1
```

To import DATAFILE2 into TABLE1 so that identity values are generated for each row, issue one of the following commands:

```
db2 import from datafile2.del of del replace into table1 (c1, c3, c4)
db2 import from datafile2.del of del modified by identitymissing
   replace into table1
```

If DATAFILE1 is imported into TABLE2 without using any of the identity-related file type modifiers, rows 1 and 2 will be inserted, but rows 3 and 4 will be rejected, because they supply their own non-NULL values, and the identity column is GENERATED ALWAYS.

## Examples of using the XMLVALIDATE clause

### Example 1 (XMLVALIDATE USING XDS)

For the following XMLVALIDATE clause: XMLVALIDATE USING XDS IGNORE (S1.SCHEMA\_A) MAP ((S1.SCHEMA\_A, S2.SCHEMA\_B))

The import would fail due to invalid syntax, since the **IGNORE** of S1.SCHEMA\_A would conflict with the **MAP** of S1.SCHEMA\_A to S2.SCHEMA\_B.

#### Example 2 (XMLVALIDATE USING XDS)

For the following **XMLVALIDATE** clause:

XMLVALIDATE USING XDS DEFAULT S8.SCHEMA\_H IGNORE (S9.SCHEMA\_I, S10.SCHEMA\_J) MAP ((S1.SCHEMA\_A, S2.SCHEMA\_B), (S3.SCHEMA\_C, S5.SCHEMA\_E), (S6.SCHEMA\_F, S3.SCHEMA\_C), (S4.SCHEMA\_D, S7.SCHEMA\_G))

For an XML column that contains the following XDS: <XDS FIL='xmlfile.001.xml' />

The XML schema with SQL identifier "S8.SCHEMA\_H" is used to validate the document in file "xmlfile.001.xml", since "S8.SCHEMA\_H" was specified as the default schema to use.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.002.xml' OFF='10' LEN='500' SCH='S10.SCHEMA J' />

No schema validation occurs for the document in file "xmlfile.002.xml", since although the XDS specifies "S10.SCHEMA\_J" as the schema to use, that schema is

part of the **IGNORE** clause. The document contents can be found at byte offset 10 in the file (meaning the 11th byte), and is 500 bytes long.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.003.xml' SCH='S6.SCHEMA F' />

The XML schema with SQL identifier "S3.SCHEMA\_C" is used to validate the document in file "xmlfile.003.xml". This is because the **MAP** clause specifies that schema "S6.SCHEMA\_F" should be mapped to schema "S3.SCHEMA\_C". Note that further mapping does not take place, therefore the mapping of schema "S3.SCHEMA\_C" to schema "S5.SCHEMA\_E" does not apply in this case.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.004.xml' SCH='S11.SCHEMA K' />

The XML schema with SQL identifier "S11.SCHEMA\_K" is used to validate the document in file "xmlfile.004.xml". Note that none of the **DEFAULT**, **IGNORE**, or **MAP** specifications apply in this case.

### Example 3 (XMLVALIDATE USING XDS)

For the following **XMLVALIDATE** clause:

XMLVALIDATE USING XDS DEFAULT S1.SCHEMA\_A IGNORE (S1.SCHEMA\_A)

For an XML column that contains the following XDS: <XDS FIL='xmlfile.001.xml' />

The XML schema with SQL identifier "S1.SCHEMA\_A" is used to validate the document in file "xmlfile.001.xml", since "S1.SCHEMA\_1" was specified as the default schema to use.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.002.xml' SCH='S1.SCHEMA A' />

No schema validation occurs for the document in file "xmlfile.002", since although the XDS specifies "S1.SCHEMA\_A" as the schema to use, that schema is part of the **IGNORE** clause.

### Example 4 (XMLVALIDATE USING XDS)

For the following XMLVALIDATE clause: XMLVALIDATE USING XDS DEFAULT S1.SCHEMA\_A MAP ((S1.SCHEMA\_A, S2.SCHEMA\_B), (S2.SCHEMA\_B, S1.SCHEMA\_A))

For an XML column that contains the following XDS: <XDS FIL='xmlfile.001.xml' />

The XML schema with SQL identifier "S1.SCHEMA\_A" is used to validate the document in file "xmlfile.001.xml", since "S1.SCHEMA\_1" was specified as the default schema to use. Note that since the **DEFAULT** clause was applied, the **MAP** clause is not subsequently applied. Therefore the mapping of schema "S1.SCHEMA\_A" to schema "S2.SCHEMA\_B" does not apply in this case.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.002.xml' SCH='S1.SCHEMA\_A' />

The XML schema with SQL identifier "S2.SCHEMA\_B" is used to validate the document in file "xmlfile.002.xml". This is because the **MAP** clause specifies that schema "S1.SCHEMA\_A" should be mapped to schema "S2.SCHEMA\_B". Note that further mapping does not take place, therefore the mapping of schema "S2.SCHEMA\_B" to schema "S1.SCHEMA\_A" does not apply in this case.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.003.xml' SCH='S2.SCHEMA\_B' />

The XML schema with SQL identifier "S1.SCHEMA\_A" is used to validate the document in file "xmlfile.003.xml". This is because the **MAP** clause specifies that schema "S2.SCHEMA\_B" should be mapped to schema "S1.SCHEMA\_A". Note that further mapping does not take place, therefore the mapping of schema "S1.SCHEMA\_A" to schema "S2.SCHEMA\_B" does not apply in this case.

## Example 5 (XMLVALIDATE USING SCHEMA)

For the following **XMLVALIDATE** clause: XMLVALIDATE USING SCHEMA S2.SCHEMA B

For an XML column that contains the following XDS: <XDS FIL='xmlfile.001.xml' />

The document in file xmlfile.001.xml is validated using the XML schema with SQL identifier "S2.SCHEMA\_B".

For an XML column that contains the following XDS: <XDS FIL='xmlfile.002.xml' SCH='S1.SCHEMA\_A' />

The document in file "xmlfile.002.xml" is validated using the XML schema with SQL identifier "S2.SCHEMA\_B". Note that the SCH attribute is ignored, since validation is being performed using a schema specified by the **USING SCHEMA** clause.

### Example 6 (XMLVALIDATE USING SCHEMALOCATION HINTS)

For an XML column that contains the following XDS: <XDS FIL='xmlfile.001.xml' />

The XML schema used is determined by the schemaLocation attribute in the document contents, and no validation would occur if one is not present.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.002.xml' SCH='S1.SCHEMA A' />

The XML schema used is determined by the schemaLocation attribute in the document contents, and no validation would occur if one is not present. Note that the SCH attribute is ignored, since validation is being performed using **SCHEMALOCATION HINTS**.

# **Usage notes**

Be sure to complete all table operations and release all locks before starting an import operation. This can be done by issuing a COMMIT after closing all cursors opened WITH HOLD, or by issuing a ROLLBACK.

The import utility adds rows to the target table using the SQL INSERT statement. The utility issues one INSERT statement for each row of data in the input file. If an INSERT statement fails, one of two actions result:

- If it is likely that subsequent INSERT statements can be successful, a warning message is written to the message file, and processing continues.
- If it is likely that subsequent INSERT statements will fail, and there is potential for database damage, an error message is written to the message file, and processing halts.

The utility performs an automatic COMMIT after the old rows are deleted during a **REPLACE** or a **REPLACE\_CREATE** operation. Therefore, if the system fails, or the application interrupts the database manager after the table object is truncated, all of the old data is lost. Ensure that the old data is no longer needed before using these options.

If the log becomes full during a **CREATE**, **REPLACE**, or **REPLACE\_CREATE** operation, the utility performs an automatic COMMIT on inserted records. If the system fails, or the application interrupts the database manager after an automatic COMMIT, a table with partial data remains in the database. Use the **REPLACE** or the **REPLACE\_CREATE** option to rerun the whole import operation, or use **INSERT** with the **RESTARTCOUNT** parameter set to the number of rows successfully imported.

Updates from the IMPORT command will always be committed at the end of an IMPORT task. The IMPORT command can also perform automatic commits during its execution to reduce the size of the lock list and the active log space. The IMPORT command will rollback if the active log becomes full during IMPORT processing.

- By default, automatic commits are not performed for the **INSERT** or the **INSERT\_UPDATE** option. They are, however, performed if the **COMMITCOUNT** parameter is not zero.
- Offline import does not perform automatic COMMITs if any of the following conditions are true:
  - The target is a view, not a table
  - Compound inserts are used
  - Buffered inserts are used
- By default, online import performs automatic commit to free both the active log space and the lock list. Automatic commits are not performed only if a **COMMITCOUNT** value of zero is specified.

Whenever the import utility performs a COMMIT, two messages are written to the message file: one indicates the number of records to be committed, and the other is written after a successful COMMIT. When restarting the import operation after a failure, specify the number of records to skip, as determined from the last successful COMMIT.

The import utility accepts input data with minor incompatibility problems (for example, character data can be imported using padding or truncation, and numeric data can be imported with a different numeric data type), but data with major incompatibility problems is not accepted.

You cannot **REPLACE** or **REPLACE\_CREATE** an object table if it has any dependents other than itself, or an object view if its base table has any dependents (including itself). To replace such a table or a view, do the following:

- 1. Drop all foreign keys in which the table is a parent.
- 2. Run the import utility.
- 3. Alter the table to recreate the foreign keys.

If an error occurs while recreating the foreign keys, modify the data to maintain referential integrity.

Referential constraints and foreign key definitions are not preserved when recreating tables from PC/IXF files. (Primary key definitions *are* preserved if the data was previously exported using SELECT \*.)

Importing to a remote database requires enough disk space on the server for a copy of the input data file, the output message file, and potential growth in the size of the database.

If an import operation is run against a remote database, and the output message file is very long (more than 60 KB), the message file returned to the user on the client might be missing messages from the middle of the import operation. The first 30 KB of message information and the last 30 KB of message information are always retained.

Importing PC/IXF files to a remote database is much faster if the PC/IXF file is on a hard drive rather than on diskettes.

The database table or hierarchy must exist before data in the ASC, DEL, or WSF file formats can be imported; however, if the table does not already exist, IMPORT **CREATE** or IMPORT **REPLACE\_CREATE** creates the table when it imports data from a PC/IXF file. For typed tables, IMPORT **CREATE** can create the type hierarchy and the table hierarchy as well.

PC/IXF import should be used to move data (including hierarchical data) between databases. If character data containing row separators is exported to a delimited ASCII (DEL) file and processed by a text transfer program, fields containing the row separators will shrink or expand. The file copying step is not necessary if the source and the target databases are both accessible from the same client.

The data in ASC and DEL files is assumed to be in the code page of the client application performing the import. PC/IXF files, which allow for different code pages, are recommended when importing data in different code pages. If the PC/IXF file and the import utility are in the same code page, processing occurs as for a regular application. If the two differ, and the **FORCEIN** option is specified, the import utility assumes that data in the PC/IXF file has the same code page as the application performing the import. This occurs even if there is a conversion table for the two code pages. If the two differ, the **FORCEIN** option is not specified, and there is a conversion table, all data in the PC/IXF file will be converted from the file code page to the application code page. If the two differ,

the **FORCEIN** option is not specified, and there is no conversion table, the import operation will fail. This applies only to PC/IXF files on DB2 clients on the AIX operating system.

For table objects on an 8 KB page that are close to the limit of 1012 columns, import of PC/IXF data files might cause DB2 to return an error, because the maximum size of an SQL statement was exceeded. This situation can occur only if the columns are of type CHAR, VARCHAR, or CLOB. The restriction does not apply to import of **DEL** or **ASC** files. If PC/IXF files are being used to create a new table, an alternative is use db2look to dump the DDL statement that created the table, and then to issue that statement through the CLP.

DB2 Connect can be used to import data to DRDA servers such as DB2 for OS/390, DB2 for VM and VSE, and DB2 for OS/400. Only PC/IXF import (**INSERT** option) is supported. The **RESTARTCOUNT** parameter, but not the **COMMITCOUNT** parameter, is also supported.

When using the **CREATE** option with typed tables, create every sub-table defined in the PC/IXF file; sub-table definitions cannot be altered. When using options other than **CREATE** with typed tables, the traversal order list enables one to specify the traverse order; therefore, the traversal order list must match the one used during the export operation. For the PC/IXF file format, one need only specify the target sub-table name, and use the traverse order stored in the file.

The import utility can be used to recover a table previously exported to a PC/IXF file. The table returns to the state it was in when exported.

Data cannot be imported to a system table, a created temporary table, a declared temporary table, or a summary table.

Views cannot be created through the import utility.

Importing a multiple-part PC/IXF file whose individual parts are copied from a Windows system to an AIX system is supported. Only the name of the first file must be specified in the IMPORT command. For example, IMPORT FROM data.ixf OF IXF INSERT INTO TABLE1. The file data.002, etc should be available in the same directory as data.ixf.

On the Windows operating system:

- Importing logically split PC/IXF files is not supported.
- Importing bad format PC/IXF or WSF files is not supported.

Security labels in their internal format might contain newline characters. If you import the file using the DEL file format, those newline characters can be mistaken for delimiters. If you have this problem use the older default priority for delimiters by specifying the delprioritychar file type modifier in the IMPORT command.

# **Federated considerations**

When using the IMPORT command and the **INSERT**, **UPDATE**, or **INSERT\_UPDATE** command parameters, you must ensure that you have CONTROL privilege on the participating nickname. You must ensure that the nickname you want to use when doing an import operation already exists. There are also several restrictions you should be aware of as shown in the IMPORT command parameters section.

Some data sources, such as ODBC, do not support importing into nicknames.

# File type modifiers for the import utility

Table 14. Valid file type modifiers for the import utility: All file formats

Modifier	Description
compound=x	x is a number between 1 and 100 inclusive. Uses nonatomic compound SQL to insert the data, and $x$ statements will be attempted each time.
	If this modifier is specified, and the transaction log is not sufficiently large, the import operation will fail. The transaction log must be large enough to accommodate either the number of rows specified by <b>COMMITCOUNT</b> , or the number of rows in the data file if <b>COMMITCOUNT</b> is not specified. It is therefore recommended that the <b>COMMITCOUNT</b> option be specified to avoid transaction log overflow.
	This modifier is incompatible with <b>INSERT_UPDATE</b> mode, hierarchical tables, and the following modifiers: usedefaults, identitymissing, identityignore, generatedmissing, and generatedignore.
generatedignore	This modifier informs the import utility that data for all generated columns is present in the data file but should be ignored. This results in all values for the generated columns being generated by the utility. This modifier cannot be used with the generatedmissing modifier.
generatedmissing	If this modifier is specified, the utility assumes that the input data file contains no data for the generated columns (not even NULLs), and will therefore generate a value for each row. This modifier cannot be used with the generatedignore modifier.
identityignore	This modifier informs the import utility that data for the identity column is present in the data file but should be ignored. This results in all identity values being generated by the utility. The behavior will be the same for both GENERATED ALWAYS and GENERATED BY DEFAULT identity columns. This means that for GENERATED ALWAYS columns, no rows will be rejected. This modifier cannot be used with the identitymissing modifier.
identitymissing	If this modifier is specified, the utility assumes that the input data file contains no data for the identity column (not even NULLs), and will therefore generate a value for each row. The behavior will be the same for both GENERATED ALWAYS and GENERATED BY DEFAULT identity columns. This modifier cannot be used with the identityignore modifier.
lobsinfile	<i>lob-path</i> specifies the path to the files containing LOB data.
	Each path contains at least one file that contains at least one LOB pointed to by a Lob Location Specifier (LLS) in the data file. The LLS is a string representation of the location of a LOB in a file stored in the LOB file path. The format of an LLS is <i>filename.ext.nnn.mmm/</i> , where <i>filename.ext</i> is the name of the file that contains the LOB, <i>nnn</i> is the offset in bytes of the LOB within the file, and mmm is the length of the LOB in bytes. For example, if the string db2exp.001.123.456/ is stored in the data file, the LOB is located at offset 123 in the file db2exp.001, and is 456 bytes long.
	The <b>LOBS FROM</b> clause specifies where the LOB files are located when the "lobsinfile" modifier is used. The <b>LOBS FROM</b> clause will implicitly activate the LOBSINFILE behavior. The <b>LOBS FROM</b> clause conveys to the IMPORT utility the list of paths to search for the LOB files while importing the data.
	To indicate a null LOB, enter the size as -1. If the size is specified as 0, it is treated as a 0 length LOB. For null LOBS with length of -1, the offset and the file name are ignored. For example, the LLS of a null LOB might be db2exp.001.71/.

Table 14. Valid file type modifiers for the import utility: All file formats (continued)

Modifier	Description
no_type_id	Valid only when importing into a single sub-table. Typical usage is to export data from a regular table, and then to invoke an import operation (using this modifier) to convert the data into a single sub-table.
nodefaults	If a source column for a target table column is not explicitly specified, and the table column is not nullable, default values are not loaded. Without this option, if a source column for one of the target table columns is not explicitly specified, one of the following occurs:
	<ul> <li>If the column is nullable, and a default value cannot be specified for that column, a NULL is loaded</li> </ul>
	• If the column is not nullable, and a default value cannot be specified, an error is returned, and the utility stops processing.
norowwarnings	Suppresses all warnings about rejected rows.
rowchangetimestampignore	This modifier informs the import utility that data for the row change timestamp column is present in the data file but should be ignored. This results in all ROW CHANGE TIMESTAMP being generated by the utility. The behavior will be the same for both GENERATED ALWAYS and GENERATED BY DEFAULT columns. This means that for GENERATED ALWAYS columns, no rows will be rejected. This modifier cannot be used with the rowchangetimestampmissing modifier.
rowchangetimestampmissing	If this modifier is specified, the utility assumes that the input data file contains no data for the row change timestamp column (not even NULLs), and will therefore generate a value for each row. The behavior will be the same for both GENERATED ALWAYS and GENERATED BY DEFAULT columns. This modifier cannot be used with the rowchangetimestampignore modifier.
seclabelchar	Indicates that security labels in the input source file are in the string format for security label values rather than in the default encoded numeric format. IMPORT converts each security label into the internal format as it is loaded. If a string is not in the proper format the row is not loaded and a warning (SQLSTATE 01H53) is returned. If the string does not represent a valid security label that is part of the security policy protecting the table then the row is not loaded and a warning (SQLSTATE 01H53, SQLCODE SQL3243W)) is returned. This modifier cannot be specified if the seclabelname modifier is specified,
	otherwise the import fails and an error (SQLCODE SQL3525N) is returned.
seclabelname	Indicates that security labels in the input source file are indicated by their name rather than the default encoded numeric format. IMPORT will convert the name to the appropriate security label if it exists. If no security label exists with the indicated name for the security policy protecting the table the row is not loaded and a warning (SQLSTATE 01H53, SQLCODE SQL3244W) is returned. This modifier cannot be specified if the seclabelchar modifier is specified, otherwise the import fails and an error (SQLCODE SQL3525N) is returned. <b>Note:</b> If the file type is ASC, any spaces following the name of the security label will be interpreted as being part of the name. To avoid this use the striptblanks file type and file type to make give the space are removed.

Table 14.	Valid file type	modifiers for the	import utility	: All file formats	(continued)
					100

Modifier	Description
usedefaults	If a source column for a target table column has been specified, but it contains no data for one or more row instances, default values are loaded. Examples of missing data are:
	• For DEL files: two adjacent column delimiters (",,") or two adjacent column delimiters separated by an arbitrary number of spaces (", ,") are specified for a column value.
	<ul> <li>For DEL/ASC/WSF files: A row that does not have enough columns, or is not long enough for the original specification.</li> <li>Note: For ASC files, NULL column values are not considered explicitly missing, and a default will not be substituted for NULL column values. NULL column values are represented by all space characters for numeric, date, time, and /timestamp columns, or by using the NULL INDICATOR for a column of any type to indicate the column is NULL.</li> </ul>
	Without this option, if a source column contains no data for a row instance, one of the following occurs:
	• For DEL/ASC/WSF files: If the column is nullable, a NULL is loaded. If the column is not nullable, the utility rejects the row.

Table 15. Valid file type modifiers for the import utility: ASCII file formats (ASC/DEL)

Modifier	Description			
codepage= <i>x</i>	<i>x</i> is an ASCII character string. The value is interpreted as the code page of the data in the input data set. Converts character data from this code page to the application code page during the import operation.			
	The following rules apply:			
	• For pure DBCS (graphic) mixed DBCS, and EUC, delimiters are restricted to the range of x00 to x3F, inclusive.			
	• nullindchar must specify symbols included in the standard ASCII set between code points x20 and x7F, inclusive. This refers to ASCII symbols and code points.			
	Note:			
	1. The codepage modifier cannot be used with the lobsinfile modifier.			
	2. If data expansion occurs when the code page is converted from the application code page to the database code page, the data might be truncated and loss of data can occur.			
dateformat="x"	x is the format of the date in the source file. <sup>2</sup> Valid date elements are:			
	<pre>YYYY - Year (four digits ranging from 0000 - 9999) M - Month (one or two digits ranging from 1 - 12) MM - Month (two digits ranging from 1 - 12;</pre>			
	A default value of 1 is assigned for each element that is not specified. Some examples of date formats are: "D-M-YYYY" "MM.DD.YYYY" "YYYYDDD"			

Table 15. Valid file type modifiers for the import utility: ASCII file formats (ASC/DEL) (continued)

Modifier	Description
implieddecimal	The location of an implied decimal point is determined by the column definition; it is no longer assumed to be at the end of the value. For example, the value 12345 is loaded into a DECIMAL(8,2) column as 123.45, <i>not</i> 12345.00.
timeformat="x"	<pre>x is the format of the time in the source file.<sup>2</sup> Valid time elements are: H - Hour (one or two digits ranging from 0 - 12 for a 12 hour system, and 0 - 24 for a 24 hour system) HH - Hour (two digits ranging from 0 - 12 for a 12 hour system; mutually exclusive with H) M - Minute (one or two digits ranging from 0 - 59) MM - Minute (two digits ranging from 0 - 59; mutually exclusive with M) S - Second (one or two digits ranging from 0 - 59) SS - Second (two digits ranging from 0 - 59; mutually exclusive with S) SSSSS - Second of the day after midnight (5 digits ranging from 00000 - 86399; mutually exclusive with other time elements) TT - Meridian indicator (AM or PM) A default value of 0 is assigned for each element that is not specified. Some examples of time formats are: "HH:MM:SS" "HH.MM TT" "SSSSS"</pre>

Table 15. V	/alid file type i	modifiers for th	ne import	utility: ASC	II file formats	(ASC/DEL)	(continued)
	21					\ /	

Modifier	Description
Modifier timestampformat="x"	<pre>Description x is the format of the time stamp in the source file.<sup>2</sup> Valid time stamp elements are: YYYY - Year (four digits ranging from 0000 - 9999) M - Month (one or two digits ranging from 1 - 12) MM - Month (two digits ranging from 01 - 12;</pre>
	<pre>U (1 to 12 times) - Fractional seconds(number of occurrences of U represent the</pre>

Table 15. Valid file type modifiers for the import utility: ASCII file formats (ASC/DEL) (continued)

Modifier	Description
usegraphiccodepage	If usegraphiccodepage is given, the assumption is made that data being imported into graphic or double-byte character large object (DBCLOB) data fields is in the graphic code page. The rest of the data is assumed to be in the character code page. The graphic code page is associated with the character code page. IMPORT determines the character code page through either the codepage modifier, if it is specified, or through the code page of the application if the codepage modifier is not specified.
	This modifier should be used in conjunction with the delimited data file generated by drop table recovery only if the table being recovered has graphic data.
	Restrictions
	The usegraphiccodepage modifier MUST NOT be specified with DEL files created by the EXPORT utility, as these files contain data encoded in only one code page. The usegraphiccodepage modifier is also ignored by the double-byte character large objects (DBCLOBs) in files.
xmlchar	Specifies that XML documents are encoded in the character code page.
	This option is useful for processing XML documents that are encoded in the specified character code page but do not contain an encoding declaration.
	For each document, if a declaration tag exists and contains an encoding attribute, the encoding must match the character code page, otherwise the row containing the document will be rejected. Note that the character codepage is the value specified by the codepage file type modifier, or the application codepage if it is not specified. By default, either the documents are encoded in Unicode, or they contain a declaration tag with an encoding attribute.
xmlgraphic	Specifies that XML documents are encoded in the specified graphic code page.
	This option is useful for processing XML documents that are encoded in a specific graphic code page but do not contain an encoding declaration.
	For each document, if a declaration tag exists and contains an encoding attribute, the encoding must match the graphic code page, otherwise the row containing the document will be rejected. Note that the graphic code page is the graphic component of the value specified by the codepage file type modifier, or the graphic component of the application code page if it is not specified. By default, documents are either encoded in Unicode, or they contain a declaration tag with an encoding attribute. <b>Note:</b> If the xmlgraphic modifier is specified with the IMPORT command, the XML document to be imported must be encoded in the UTF-16 code page. Otherwise, the XML document may be rejected with a parsing error, or it may be imported into the table with data corruption.

Table 16	Valid file t	tvpe modifiers	for the impo	ort utility: ASC	C (non-delimited	ASCII) file	format
10010 101	vana mo i	spo moamoro	ioi uno impe		, non aominicoa	, 1001, 1110	ronnat

Modifier	Description
nochecklengths	If nochecklengths is specified, an attempt is made to import each row, even if the source data has a column definition that exceeds the size of the target table column. Such rows can be successfully imported if code page conversion causes the source data to shrink; for example, 4-byte EUC data in the source could shrink to 2-byte DBCS data in the target, and require half the space. This option is particularly useful if it is known that the source data will fit in all cases despite mismatched column definitions.

Modifier	Description
nullindchar=x	<i>x</i> is a single character. Changes the character denoting a null value to <i>x</i> . The default value of <i>x</i> is $Y$ . <sup>3</sup>
	This modifier is case sensitive for EBCDIC data files, except when the character is an English letter. For example, if the null indicator character is specified to be the letter N, then n is also recognized as a null indicator.
reclen= <i>x</i>	<i>x</i> is an integer with a maximum value of 32 767. <i>x</i> characters are read for each row, and a new-line character is not used to indicate the end of the row.
striptblanks	Truncates any trailing blank spaces when loading data into a variable-length field. If this option is not specified, blank spaces are kept.
	In the following example, striptblanks causes the import utility to truncate trailing blank spaces:
	db2 import from myfile.asc of asc modified by striptblanks method l (1 10, 12 15) messages msgs.txt insert into staff
	This option cannot be specified together with striptnulls. These are mutually exclusive options. This option replaces the obsolete t option, which is supported for earlier compatibility only.
striptnulls	Truncates any trailing NULLs (0x00 characters) when loading data into a variable-length field. If this option is not specified, NULLs are kept.
	This option cannot be specified together with striptblanks. These are mutually exclusive options. This option replaces the obsolete padwithzero option, which is supported for earlier compatibility only.

Table 16. Valid file type modifiers for the import utility: ASC (non-delimited ASCII) file format (continued)

Table 17. Valid file type modifiers for the import utility: DEL (delimited ASCII) file format

Modifier	Description
chardelx	<i>x</i> is a single character string delimiter. The default value is a double quotation mark ("). The specified character is used in place of double quotation marks to enclose a character string. <sup>34</sup> If you want to explicitly specify the double quotation mark as the character string delimiter, it should be specified as follows:
	modified by chardel""
	The single quotation mark (') can also be specified as a character string delimiter. In the following example, chardel'' causes the import utility to interpret any single quotation mark (') it encounters as a character string delimiter:
	db2 "import from myfile.del of del modified by chardel'' method p (1, 4) insert into staff (id, years)"
coldelx	x is a single character column delimiter. The default value is a comma (,). The specified character is used in place of a comma to signal the end of a column. <sup>34</sup>
	In the following example, coldel; causes the import utility to interpret any semicolon (;) it encounters as a column delimiter:
	db2 import from myfile.del of del modified by coldel; messages msgs.txt insert into staff
decplusblank	Plus sign character. Causes positive decimal values to be prefixed with a blank space instead of a plus sign (+). The default action is to prefix positive decimal values with a plus sign.

Table 17. Valid file type modifiers for the import utility: DEL (delimited ASCII) file format (continued)

Modifier	Description
decptx	x is a single character substitute for the period as a decimal point character. The default value is a period (.). The specified character is used in place of a period as a decimal point character. <sup>34</sup>
	In the following example, decpt; causes the import utility to interpret any semicolon (;) it encounters as a decimal point:
	db2 "import from myfile.del of del modified by chardel'' decpt; messages msgs.txt insert into staff"
delprioritychar	The current default priority for delimiters is: record delimiter, character delimiter, column delimiter. This modifier protects existing applications that depend on the older priority by reverting the delimiter priorities to: character delimiter, record delimiter, column delimiter. Syntax:
	db2 import modified by delprioritychar
	For example, given the following DEL data file:
	"Smith, Joshua",4000,34.98 <row delimiter=""> "Vincent,<row delimiter="">, is a manager",  4005,44.37<row delimiter=""></row></row></row>
	With the delprioritychar modifier specified, there will be only two rows in this data file. The second <row delimiter=""> will be interpreted as part of the first data column of the second row, while the first and the third <row delimiter=""> are interpreted as actual record delimiters. If this modifier is <i>not</i> specified, there will be three rows in this data file, each delimited by a <row delimiter="">.</row></row></row>
keepblanks	Preserves the leading and trailing blanks in each field of type CHAR, VARCHAR, LONG VARCHAR, or CLOB. Without this option, all leading and trailing blanks that are not inside character delimiters are removed, and a NULL is inserted into the table for all blank fields.
nochardel	The import utility will assume all bytes found between the column delimiters to be part of the column's data. Character delimiters will be parsed as part of column data. This option should not be specified if the data was exported using DB2 (unless nochardel was specified at export time). It is provided to support vendor data files that do not have character delimiters. Improper usage might result in data loss or corruption.
	This option cannot be specified with chardelx, delprioritychar or nodoubledel. These are mutually exclusive options.
nodoubledel	Suppresses recognition of double character delimiters.

Table 18.	Valid file type	modifiers for the	import utility: I.	XF file format
-----------	-----------------	-------------------	--------------------	----------------

Modifier	Description
forcein	Directs the utility to accept data despite code page mismatches, and to suppress translation between code pages.
	Fixed length target fields are checked to verify that they are large enough for the data. If nochecklengths is specified, no checking is done, and an attempt is made to import each row.
indexixf	Directs the utility to drop all indexes currently defined on the existing table, and to create new ones from the index definitions in the PC/IXF file. This option can only be used when the contents of a table are being replaced. It cannot be used with a view, or when a <i>insert-column</i> is specified.

Modifier	Description
indexschema= <i>schema</i>	Uses the specified <i>schema</i> for the index name during index creation. If <i>schema</i> is not specified (but the keyword indexschema <i>is</i> specified), uses the connection user ID. If the keyword is not specified, uses the schema in the IXF file.
nochecklengths	If nochecklengths is specified, an attempt is made to import each row, even if the source data has a column definition that exceeds the size of the target table column. Such rows can be successfully imported if code page conversion causes the source data to shrink; for example, 4-byte EUC data in the source could shrink to 2-byte DBCS data in the target, and require half the space. This option is particularly useful if it is known that the source data will fit in all cases despite mismatched column definitions.
forcecreate	Specifies that the table should be created with possible missing or limited information after returning SQL3311N during an import operation.

Table 18. Valid file type modifiers for the import utility: IXF file format (continued)

Tahle	19	IMPORT	hehavior	when	usina	codenade	and	usearanhica	odenade
Table	19.	INFORT	Denavior	wiieli	using	couepaye	anu	useyiapiiicu	Juepaye

codepage=N	usegraphiccodepage	IMPORT behavior
Absent	Absent	All data in the file is assumed to be in the application code page.
Present	Absent	All data in the file is assumed to be in code page N.
		<b>Warning:</b> Graphic data will be corrupted when imported into the database if N is a single-byte code page.
Absent	Present	Character data in the file is assumed to be in the application code page. Graphic data is assumed to be in the code page of the application graphic data.
		If the application code page is single-byte, then all data is assumed to be in the application code page.
		<b>Warning:</b> If the application code page is single-byte, graphic data will be corrupted when imported into the database, even if the database contains graphic columns.
Present	Present	Character data is assumed to be in code page N. Graphic data is assumed to be in the graphic code page of N.
		If N is a single-byte or double-byte code page, then all data is assumed to be in code page N.
		<b>Warning:</b> Graphic data will be corrupted when imported into the database if N is a single-byte code page.

## Note:

- 1. The import utility does not issue a warning if an attempt is made to use unsupported file types with the **MODIFIED BY** option. If this is attempted, the import operation fails, and an error code is returned.
- 2. Double quotation marks around the date format string are mandatory. Field separators cannot contain any of the following: a-z, A-Z, and 0-9. The field separator should not be the same as the character delimiter or field delimiter in the DEL file format. A field separator is optional if the start and end

positions of an element are unambiguous. Ambiguity can exist if (depending on the modifier) elements such as D, H, M, or S are used, because of the variable length of the entries.

For time stamp formats, care must be taken to avoid ambiguity between the month and the minute descriptors, since they both use the letter M. A month field must be adjacent to other date fields. A minute field must be adjacent to other time fields. Following are some ambiguous time stamp formats:

"M" (could be a month, or a minute)
"M:M" (Which is which?)
"M:YYYY:M" (Both are interpreted as month.)
"S:M:YYYY" (adjacent to both a time value and a date value)

In ambiguous cases, the utility will report an error message, and the operation will fail.

Following are some unambiguous time stamp formats:

```
"M:YYYY" (Month)
"S:M" (Minute)
"M:YYYY:S:M" (Month....Minute)
"M:H:YYYY:M:D" (Minute....Month)
```

Some characters, such as double quotation marks and back slashes, must be preceded by an escape character (for example,  $\)$ .

**3**. Character values provided for the chardel, coldel, or decpt file type modifiers must be specified in the code page of the source data.

The character code point (instead of the character symbol), can be specified using the syntax xJJ or 0xJJ, where JJ is the hexadecimal representation of the code point. For example, to specify the # character as a column delimiter, use one of the following:

```
... modified by coldel# ...
... modified by coldel0x23 ...
... modified by coldelX23 ...
```

- 4. *Delimiter considerations for moving data* lists restrictions that apply to the characters that can be used as delimiter overrides.
- 5. The following file type modifiers are not allowed when importing into a nickname:
  - indexixf
  - indexschema
  - dldelfiletype
  - nodefaults
  - usedefaults
  - no\_type\_idfiletype
  - generatedignore
  - generatedmissing
  - identityignore
  - identitymissing
  - lobsinfile
- 6. The WSF file format is not supported for XML columns. Support for this file format is also deprecated and might be removed in a future release. It is recommended that you start using a supported file format instead of WSF files before support is removed
- 7. The **CREATE** mode is not supported for XML columns.

- 8. All XML data must reside in XML files that are separate from the main data file. An XML Data Specifier (XDS) (or a NULL value) must exist for each XML column in the main data file.
- **9**. XML documents are assumed to be in Unicode format or to contain a declaration tag that includes an encoding attribute, unless the XMLCHAR or XMLGRAPHIC file type modifier is specified.
- 10. Rows containing documents that are not well-formed will be rejected.
- 11. If the XMLVALIDATE option is specified, documents that successfully validate against their matching schema will be annotated with the schema information as they are inserted. Rows containing documents that fail to validate against their matching schema will be rejected. To successfully perform the validation, the privileges held by the user invoking the import must include at least one of the following:
  - DBADM authority
  - USAGE privilege on the XML schema to be used in the validation
- 12. When importing into a table containing an implicitly hidden row change timestamp column, the implicitly hidden property of the column is not honoured. Therefore, the rowchangetimestampmissing file type modifier *must be* specified in the import command if data for the column is not present in the data to be imported and there is no explicit column list present.

# INITIALIZE TAPE

Initializes tapes for backup and restore operations to streaming tape devices. This command is only supported on Windows operating systems.

## **Authorization**

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

# **Required connection**

None

## **Command syntax**

►►—INITIALIZE TAPE-

-ON—device\_\_\_\_USING—blksize\_\_

## **Command parameters**

**ON** device

Specifies a valid tape device name. The default value is \\.\TAPE0.

## **USING** blksize

Specifies the block size for the device, in bytes. The device is initialized to use the block size specified, if the value is within the supported range of block sizes for the device.

The buffer size specified for the BACKUP DATABASE command and for RESTORE DATABASE must be divisible by the block size specified here.

If a value for this parameter is not specified, the device is initialized to use its default block size. If a value of zero is specified, the device is initialized to use a variable length block size; if the device does not support variable length block mode, an error is returned.

When backing up to tape, use of a variable block size is currently not supported. If you must use this option, ensure that you have well tested procedures in place that enable you to recover successfully, using backup images that were created with a variable block size.

When using a variable block size, you must specify a backup buffer size that is less than or equal to the maximum limit for the tape devices that you are using. For optimal performance, the buffer size must be equal to the maximum block size limit of the device being used.

# INSPECT

Inspect database for architectural integrity, checking the pages of the database for page consistency. The INSPECT command checks that the structures of table objects and structures of table spaces are valid. Cross object validation conducts an online index to data consistency check.

# Scope

In a single partition database environment, the scope is that single partition only. In a partitioned database environment, it is the collection of all logical partitions defined in db2nodes.cfg. For partitioned tables, the CHECK DATABASE and CHECK TABLESPACE options include individual data partitions and non-partitioned indexes. The CHECK TABLE option is also available for a partitioned table, however it will check all data partitions and indexes in a table, rather than checking a single data partition or index.

# Authorization

For INSPECT CHECK, one of the following:

- sysadm
- dbadm
- sysctrl
- sysmaint
- CONTROL privilege if single table.

# **Required Connection**

Database

# **Command Syntax**

## **Check Clause:**

# **Row Compression Estimate Clause:**

## Level Clause:

## **Cross Object Checking Clause:**

## **Command Parameters**

#### CHECK

Specifies check processing.

### DATABASE

Specifies whole database.

#### **BEGIN TBSPACEID** n

Specifies processing to begin from table space with given table space ID number.

#### **OBJECTID** n

Specifies processing to begin from table with given table space ID number and object ID number.

## TABLESPACE

**NAME** *tablespace-name* 

Specifies single table space with given table space name.

#### **TBSPACEID** n

Specifies single table space with given table space ID number.

### **BEGIN OBJECTID** *n*

Specifies processing to begin from table with given object ID number.

#### TABLE

NAME table-name

Specifies table with given table name.

#### **SCHEMA** *schema-name*

Specifies schema name for specified table name for single table operation.

#### **TBSPACEID** *n* **OBJECTID** *n*

Specifies table with given table space ID number and object ID number.

### ROWCOMPESTIMATE

Estimates the effectiveness of row compression for a table. You can also specify which database partition(s) this operation is to be done on.

This tool is capable of taking a sample of the table data, and building a dictionary from it. This dictionary can then be used to test compression against the records contained in the sample. From this test compression, data is be gathered from which the following estimates are made:

- · Percentage of bytes saved from compression
- Percentage of pages saved from compression
- Compression dictionary size
- Expansion dictionary size

INSPECT will insert the dictionary built for gathering these compression estimates if the COMPRESS YES attribute is set for this table, and a dictionary does not already exist for this table. INSPECT will attempt to insert the dictionary concurrent to other applications accessing the table. Dictionary insert requires an Exclusive Table Alter lock and an Intent on Exclusive Table lock. INSPECT will only insert a dictionary into tables that support data row compression. For partitioned tables, a separate dictionary is built and inserted on each partition.

When sampling table row data and building a compression dictionary for a table, the INSPECT command supports only the table row data in the table object. If the table contains XML columns, data is not sampled and a compression dictionary is not built for the XML data in the XML storage object of the table. Use the table function instead.

The ROWCOMPESTIMATE option does not provide an index compression estimate. Use the table function instead.

#### RESULTS

Specifies the result output file. The file will be written out to the diagnostic data directory path. If there is no error found by the check processing, this result output file will be erased at the end of the INSPECT operation. If there are errors found by the check processing, this result output file will not be erased at the end of the INSPECT operation.

**KEEP** Specifies to always keep the result output file.

#### file-name

Specifies the name for the result output file. The file has to be created in the diagnostic data directory path.

## ALL DBPARTITIONNUMS

Specifies that operation is to be done on all database partitions specified in the db2nodes.cfg file. This is the default if a node clause is not specified.

#### EXCEPT

Specifies that operation is to be done on all database partitions specified in the db2nodes.cfg file, except those specified in the node list.

## ON DBPARTITIONNUM | ON DBPARTITIONNUMS

Perform operation on a set of database partitions.

#### db-partition-number1

Specifies a database partition number in the database partition list.

## db-partition-number2

Specifies the second database partition number, so that all database partitions from *db-partition-number1* up to and including *db-partition-number2* are included in the database partition list.

# FOR ERROR STATE ALL

For table object with internal state already indicating error state, the check will just report this status and not scan through the object. Specifying this option will have the processing scan through the object even if internal state already lists error state.

When used with the INDEXDATA option, as long as the index or data object is in an error state, the online index to data consistency checking will not be performed.

## LIMIT ERROR TO n

Number of pages in error for an object to which reporting is limited. When this limit of the number of pages in error for an object is reached, the processing will discontinue the check on the rest of the object. When used with the INDEXDATA option, n represents the number of errors to which reporting is limited during the online index to data consistency checking.

### LIMIT ERROR TO DEFAULT

Default number of pages to limit error reporting for an object. This value is the extent size of the object. This parameter is the default.

When used with the INDEXDATA option, DEFAULT represents the default number of errors to which reporting is limited during the online index to data consistency checking.

#### LIMIT ERROR TO ALL

No limit on number of pages in error reported.

When used with the INDEXDATA option, ALL represents no limit on the number of errors reported during the online index to data consistency checking.

### EXTENTMAP

#### NORMAL

Specifies processing level is normal for extent map. Default.

#### NONE

Specifies processing level is none for extent map.

LOW Specifies processing level is low for extent map.

# DATA

#### NORMAL

Specifies processing level is normal for data object. Default.

#### NONE

Specifies processing level is none for data object.

LOW Specifies processing level is low for data object.

#### BLOCKMAP

#### NORMAL

Specifies processing level is normal for block map object. Default.

#### NONE

Specifies processing level is none for block map object.

LOW Specifies processing level is low for block map object.

#### INDEX

#### NORMAL

Specifies processing level is normal for index object. Default.

#### NONE

Specifies processing level is none for index object.

LOW Specifies processing level is low for index object.

## LONG

#### NORMAL

Specifies processing level is normal for long object. Default.

#### NONE

Specifies processing level is none for long object.

**LOW** Specifies processing level is low for long object.
LOB

### NORMAL

Specifies processing level is normal for LOB object. Default.

### NONE

Specifies processing level is none for LOB object.

LOW Specifies processing level is low for LOB object.

# XML

# NORMAL

Specifies processing level is normal for XML column object. Default. Pages of XML object will be checked for most inconsistencies. Actual XML data will not be inspected.

### NONE

Specifies processing level is none for XML column object. XML object will not be inspected at all.

**LOW** Specifies processing level is low for XML column object. Pages of XML object will be checked for some inconsistencies. Actual XML data will not be inspected.

### INDEXDATA

Specified in order to perform an index to data consistency check. INDEXDATA checking is not performed by default.

# **Examples**

• To perform an index to data consistency check that allows read/write access to all objects, even the object inspected at the moment, issue the following command:

inspect check table name fea3 indexdata results keep fea3high.out

- To perform an index to data consistency check that allows read or write access to all objects, including the object that is being currently inspected, issue: INSPECT CHECK TABLE NAME car SCHEMA vps INDEXDATA RESULTS KEEP table1.out
- To estimate how much storage space will be saved if the data in a table named EMPLOYEE is compressed, issue:

INSPECT ROWCOMPESTIMATE TABLE NAME car SCHEMA vps RESULTS table2.out

# **Usage Notes**

- 1. For CHECK operations on table objects, the level of processing can be specified for the objects. The default is NORMAL level, specifying NONE for an object excludes it. Specifying LOW will do subset of checks that are done for NORMAL.
- **2**. The CHECK DATABASE option can be specified to start from a specific table space or from a specific table by specifying the ID value to identify the table space or the table.
- **3**. The CHECK TABLESPACE option can be specified to start from a specific table by specifying the ID value to identify the table.
- 4. The processing of table spaces will affect only the objects that reside in the table space. The exception is when the INDEXDATA option is used. INDEXDATA will check index to data consistency as long as the index object resides in the table space. This means:

- If the data object resides in a different table space than the specified table space to be inspected where the index object resides, it can still benefit from the INDEXDATA checking.
- For a partitioned table, each index can reside in a different table space. Only those indexes that reside in the specified table space will benefit from the index to data checking. If you want to inspect all the indexes against one table, please use the CHECK TABLE option or the CHECK DATABASE option.
- 5. The online inspect processing will access database objects using isolation level uncommitted read. COMMIT processing will be done during INSPECT processing. It is advisable to end the unit of work by issuing a COMMIT or ROLLBACK before invoking INSPECT.
- 6. The online inspect check processing will write out unformatted inspection data results to the results file specified. The file will be written out to the diagnostic data directory path. If there is no error found by the check processing, this result output file will be erased at the end of INSPECT operation. If there are errors found by the check processing, this result output file will not be erased at the end of INSPECT operation. After check processing completes, to see inspection details, the inspection result data will require to be formatted out with the utility db2inspf. The results file will have file extension of the database partition number.
- 7. In a partitioned database environment, each database partition will generate its own results output file with extension corresponding to its database partition number. The output location for the results output file will be the database manager diagnostic data directory path. If the name of a file that already exists is specified, the operation will not be processed, the file will have to be removed before that file name can be specified.
- 8. Normal online inspect processing will access database objects using isolation level uncommitted read. Inserting a compression dictionary into the table will attempt to acquire write locks. Please refer to the ROWCOMPESTIMATE option for details on dictionary insert locking. Commit processing will be done during the inspect processing. It is advisable to end the unit of work by issuing a COMMIT or ROLLBACK before starting the inspect operation.
- **9**. The INDEXDATA option only examines the logical inconsistency between index and data. Therefore, it is recommended that you first run INDEX and DATA checking separately, to rule out any physical corruption, before running INDEXDATA checking.
- 10. The INSPECT command, specified with the INDEXDATA parameter, performs an index to data consistency check while allowing read/write access to all objects/tables, even the one being inspected at the moment. The INSPECT INDEXDATA option includes the following inspections:
  - the existence of the data row for a given index entry.
  - a key to data value verification.

When the INDEXDATA option is specified:

- by default, only the values of explicitly specified level clause options will be used. For any level clause options which are not explicitly specified, the default levels will be overwritten from NORMAL to NONE. For instance, when INDEXDATA is the only level clause option specified, by default, only index to data checking will be performed.
- **11**. The BLOCKMAP option returns information that includes whether a block has been reclaimed for use by the table space following a reorganization to reclaim multidimensional clustering (MDC) table blocks that were empty.

# LIST ACTIVE DATABASES

Displays a subset of the information listed by the GET SNAPSHOT FOR ALL DATABASES command. An active database is available for connection and use by any application. For each active database, this command displays the following:

- Database name
- · Number of applications currently connected to the database
- Database path.

### Scope

This command can be issued from any database partition that is listed in \$HOME/sqllib/db2nodes.cfg. It returns the same information from any of these database partitions.

# Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

# Command syntax

►►—LIST ACTIVE DATABASES-

-AT DBPARTITIONNUM-db-partition-number-GLOBAL-

# **Command parameters**

### **AT DBPARTITIONNUM** *db-partition-number*

Specifies the database partition for which the status of the monitor switches is to be displayed.

### GLOBAL

Returns an aggregate result for all nodes in a partitioned database environment.

### Examples

Following is sample output from the LIST ACTIVE DATABASES command:

#### Active Databases

Database name Applications connected currently Database path	<pre>= TEST = 0 = /home/smith/smith/NODE0000/SQL00002/</pre>
Database name Applications connected currently Database path	<pre>= SAMPLE = 1 = /home/smith/smith/NODE0000/SQL00001/</pre>

# Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

# LIST APPLICATIONS

Displays to standard output the application program name, authorization ID (user name), application handle, application ID, and database name of all active database applications. This command can also optionally display an application's sequence number, status, status change time, and database path.

## Scope

This command only returns information for the database partition on which it is issued.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT
- SYSMON

# **Required connection**

Instance. To list applications for a remote instance, it is necessary to first attach to that instance.

# **Command syntax**

# **Command parameters**

#### FOR DATABASE database-alias

Information for each application that is connected to the specified database is to be displayed. Database name information is not displayed. If this option is not specified, the command displays the information for each application that is currently connected to any database at the database partition to which the user is currently attached.

The default application information is comprised of the following:

- Authorization ID
- Application name
- Application handle
- Application ID
- Database name
- · Number of agents

#### **AT DBPARTITIONNUM** *db-partition-number*

Specifies the database partition for which the status of the monitor switches is to be displayed.

#### GLOBAL

Returns an aggregate result for all database partitions in a partitioned database environment.

#### SHOW DETAIL

Some of the additional output information will include:

- CONNECT Auth ID
- Sequence number
- Coordinating DB partition number
- Coordinator pid or thread
- Status
- Status change time
- Node
- Database path

If this option is specified, it is recommended that the output be redirected to a file, and that the report be viewed with the help of an editor. The output lines might wrap around when displayed on the screen.

#### **Examples**

To list detailed information about the applications connected to the SAMPLE database, issue:

list applications for database sample show detail

#### Usage notes

The database administrator can use the output from this command as an aid to problem determination. In addition, this information is required if the database administrator wants to use the GET SNAPSHOT command or the FORCE APPLICATION command in an application.

To list applications at a remote instance (or a different local instance), it is necessary to first attach to that instance. If **FOR DATABASE** is specified when an attachment exists, and the database resides at an instance which differs from the current attachment, the command will fail.

LIST APPLICATIONS only shows user applications while LIST APPLICATIONS SHOW DETAIL shows all applications including the system applications. Event monitors are an example of system applications. System applications usually appear in snapshot output with application names beginning "db2" (for example, db2stmm, db2taskd).

### Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

▶∢

# LIST COMMAND OPTIONS

Lists the current settings for the environment variables:

- DB2BQTIME
- DB2DQTRY
- DB2RQTIME
- DB2IQTIME
- DB2OPTIONS.

# Authorization

None

# **Required connection**

None

# **Command syntax**

►►—LIST COMMAND OPTIONS——

# **Command parameters**

None

# Examples

The following is sample output from LIST COMMAND OPTIONS:

Command Line Processor Option Settings

Backend process wait time (seconds)	(DB2BQTIME) = 1
No. of retries to connect to backend	(DB2BQTRY) = 60
Request queue wait time (seconds)	(DB2RQTIME) = 5
Input queue wait time (seconds)	(DB2IQTIME) = 5
Command options	(DB2OPTIONS) =

Option	Description	Current Setting
-a	Display SQLCA	OFF
- C	Auto-Commit	ON
-d	XML declarations	OFF
-e	Display SQLCODE/SQLSTATE	OFF
<b>-</b> f	Read from input file	OFF
-1	Log commands in history file	OFF
-n	Remove new line character	OFF
-0	Display output	ON
-p	Display interactive input prompt	ON
-r	Save output to report file	OFF
- S	Stop execution on command error	OFF
-t	Set statement termination character	OFF
- V	Echo current command	OFF
-w	Display FETCH/SELECT warning messages	ON
-Z	Save all output to output file	OFF

# LIST DATABASE DIRECTORY

Lists the contents of the system database directory. If a path is specified, the contents of the local database directory are listed.

#### Scope

If this command is issued without the ON *path* parameter, the system database directory is returned. This information is the same at all database partitions.

If the ON *path* parameter is specified, the local database directory on that path is returned. This information is not the same at all database partitions.

#### Authorization

None

# **Required connection**

None. Directory operations affect the local directory only.

### **Command syntax**

### **Command parameters**

**ON** path | drive

Specifies the local database directory from which to list information. If not specified, the contents of the system database directory are listed. Note that the instance name is implied in the path. Please do not specify the instance name as part of the path.

### Examples

The following shows sample output for a system database directory:

System Database Directory

Number of entries in the directory = 2

Database 1 entry:	
Database alias	= SAMPLE
Database name	= SAMPLE
Local database directory	= /home/smith
Database release level	= 8.00
Comment	=
Directory entry type	= Indirect
Catalog database partition number	= 0
Alternate server hostname	= montero
Alternate server port number	= 29384
Database 2 entry:	
Database 2 entry.	- TCOO/OOO
	- 1004000
Database name	= 10004000
Node name	= PRINODE
Database release level	= a.00

Comment	=
Directory entry type	= LDAP
Catalog database partition number	= -1
Gateway node name	= PRIGW
Alternate server node name	=
Alternate server gateway node name	= ALTGW

The following shows sample output for a local database directory:

Local Database Directory on /u/smith Number of entries in the directory = 1 Database 1 entry: Database alias = SAMPLE Database name = SAMPLE Database directory = SQL00001 Database release level = 8.00 Comment = Directory entry type = Home Catalog database partition number = 0 Database partition number = 0

These fields are identified as follows:

#### Database alias

The value of the *alias* parameter when the database was created or cataloged. If an alias was not entered when the database was cataloged, the database manager uses the value of the *database-name* parameter when the database was cataloged.

#### Database name

The value of the *database-name* parameter when the database was cataloged. This name is usually the name under which the database was created.

### Local database directory

The path on which the database resides. This field is filled in only if the system database directory has been scanned.

#### **Database directory**

The name of the directory where the database resides. This field is filled in only if the local database directory has been scanned.

#### Node name

The name of the remote node. This name corresponds to the value entered for the *nodename* parameter when the database and the node were cataloged.

#### Database release level

The release level of the database manager that can operate on the database.

#### Comment

Any comments associated with the database that were entered when it was cataloged.

#### Directory entry type

- The location of the database:
- A *Remote* entry describes a database that resides on another node.
- An *Indirect* entry describes a database that is local. Databases that reside on the same node as the system database directory are thought to indirectly reference the home entry (to a local database directory), and are considered indirect entries.

- A *Home* entry indicates that the database directory is on the same path as the local database directory.
- An *LDAP* entry indicates that the database location information is stored on an LDAP server.

All entries in the system database directory are either remote or indirect. All entries in local database directories are identified in thesystem database directory as indirect entries.

#### Authentication

The authentication type cataloged at the client.

#### Principal name

Specifies a fully qualified Kerberos principal name.

#### Catalog database partition number

Specifies which node is the catalog database partition. This is the database partition on which the CREATE DATABASE command was issued.

#### Database partition number

Specifies the number that is assigned in db2nodes.cfg to the node where the command was issued.

#### Alternate server hostname

Specifies the host name or the IP address for the alternate server to be used when there is communication failure on the connection to the database. This field is displayed only for the system database directory.

#### Alternate server port number

Specifies the port number for the alternate server to be used when there is communication failure on the connection to the database. This field is displayed only for the system database directory.

#### Alternate server node name

If the directory entry type is LDAP, specifies the node name for the alternate server to be used when there is communication failure on the connection to the database.

#### Alternate server gateway node name

If the directory entry type is LDAP, specifies the gateway node name for the alternate gateway to be used when there is communication failure on the connection to the database.

# **Usage notes**

There can be a maximum of eight opened database directory scans per process. To overcome this restriction for a batch file that issues more than eight LIST DATABASE DIRECTORY commands within a single DB2 session, convert the batch file into a shell script. The "db2" prefix generates a new DB2 session for each command.

# LIST DATABASE PARTITION GROUPS

Lists all database partition groups associated with the current database.

### Scope

This command can be issued from any database partition that is listed in \$HOME/sqllib/db2nodes.cfg. It returns the same information from any of these database partitions.

# Authorization

For the system catalogs SYSCAT.DBPARTITIONGROUPS and SYSCAT.DBPARTITIONGROUPDEF, one of the following is required:

- sysadm
- sysctrl
- sysmaint
- sysmon
- dbadm
- CONTROL privilege
- SELECT privilege.

### **Required connection**

Database

### **Command syntax**

►►—LIST DATABASE PARTITION GROUPS-

-SHOW DETAIL

# **Command parameters**

### SHOW DETAIL

Specifies that the output should include the following information:

- Distribution map ID
- Database partition number
- In-use flag

## **Examples**

Following is sample output from the LIST DATABASE PARTITION GROUPS command:

```
DATABASE PARTITION GROUP NAME
IBMCATGROUP
IBMDEFAULTGROUP
```

```
2 record(s) selected.
```

Following is sample output from the LIST DATABASE PARTITION GROUPS SHOW DETAIL command:

-

DATABASE PARTITION	GROUP NAME	PMAP_ID	DATABASE	PARTITION	NUMBER	IN_USE
IBMCATGROUP IBMDEFAULTGROUP		0 1			0 0	Ү Ү Ү

2 record(s) selected.

The fields are identified as follows:

## DATABASE PARTITION GROUP NAME

The name of the database partition group. The name is repeated for each database partition in the database partition group.

#### PMAP\_ID

The ID of the distribution map. The ID is repeated for each database partition in the database partition group.

#### DATABASE PARTITION NUMBER

The number of the database partition.

#### IN\_USE

One of four values:

- **Y** The database partition is being used by the database partition group.
- **D** The database partition is going to be dropped from the database partition group as a result of a REDISTRIBUTE DATABASE PARTITION GROUP operation. When the operation completes, the database partition will not be included in reports from LIST DATABASE PARTITION GROUPS.
- A The database partition has been added to the database partition group but is not yet added to the distribution map. The containers for the table spaces in the database partition group have been added on this database partition. The value is changed to Y when the REDISTRIBUTE DATABASE PARTITION GROUP operation completes successfully.
- T The database partition has been added to the database partition group, but is not yet added to the distribution map. The containers for the table spaces in the database partition group have not been added on this database partition. Table space containers must be added on the new database partition for each table space in the database partition group. The value is changed to A when containers have successfully been added.

# **Compatibilities**

For compatibility with versions earlier than Version 8:

• The keyword NODEGROUPS can be substituted for DATABASE PARTITION GROUPS.

# LIST DBPARTITIONNUMS

Lists all database partitions associated with the current database.

# Scope

This command can be issued from any database partition that is listed in \$HOME/sqllib/db2nodes.cfg. It returns the same information from any of these database partitions.

# Authorization

None

# **Required connection**

Database

# **Command syntax**

►►—LIST DBPARTITIONNUMS—

# **Command parameters**

None

# **Examples**

Following is sample output from the LIST DBPARTITIONNUMS command: DATABASE PARTITION NUMBER

0 2 5 7 9

5 record(s) selected.

# Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODES can be substituted for DBPARTITIONNUMS.

# LIST DCS APPLICATIONS

Displays to standard output information about applications that are connected to host databases via DB2 Connect Enterprise Edition.

### Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

### **Required connection**

Instance. To list the DCS applications at a remote instance, it is necessary to first attach to that instance.

-

# **Command syntax**

►►—LIST DCS APPLICATIONS-

```
-SHOW DETAIL-
EXTENDED------
```

## **Command parameters**

### LIST DCS APPLICATIONS

The default application information includes:

- Host authorization ID (username)
- Application program name
- Application handle
- Outbound application ID (*luwid*).

#### SHOW DETAIL

Specifies that output include the following additional information:

- Client application ID
- Client sequence number
- Client database alias
- Client node name (*nname*)
- Client release level
- Client code page
- Outbound sequence number
- Host database name
- Host release level.

### EXTENDED

Generates an extended report. This report includes all of the fields that are listed when the SHOW DETAIL option is specified, plus the following additional fields:

- DCS application status
- Status change time

- Client platform
- Client protocol
- Client code page
- Process ID of the client application
- Host coded character set ID (CCSID).

## Note:

1. The application status field contains one of the following values:

### connect pending - outbound

Denotes that the request to connect to a host database has been issued, and that DB2 Connect is waiting for the connection to be established.

### waiting for request

Denotes that the connection to the host database has been established, and that DB2 Connect is waiting for an SQL statement from the client application.

# waiting for reply

Denotes that the SQL statement has been sent to the host database.

2. The status change time is shown only if the System Monitor UOW switch was turned on during processing. Otherwise, Not Collected is shown.

# **Usage notes**

The database administrator can use this command to match client application connections *to* the gateway with corresponding host connections *from* the gateway.

The database administrator can also use agent ID information to force specified applications off a DB2 Connect server.

# LIST DCS DIRECTORY

Lists the contents of the Database Connection Services (DCS) directory.

### Authorization

None

### **Required connection**

None

# **Command syntax**

►►—LIST DCS DIRECTORY——

# **Command parameters**

None

### **Examples**

The following is sample output from LIST DCS DIRECTORY:

Database Connection Services (DCS) Directory

Number of entries in the directory = 1

DCS 1 entry:

Local database name	= DB2
Target database name	= DSN_DB_1
Application requestor name	=
DCS parameters	=
Comment	= DB2/MVS Location name DSN DB 1
DCS directory release level	= 0x0100

These fields are identified as follows:

#### Local database name

Specifies the local alias of the target host database. This corresponds to the *database-name* parameter entered when the host database was cataloged in the DCS directory.

#### Target database name

Specifies the name of the host database that can be accessed. This corresponds to the *target-database-name* parameter entered when the host database was cataloged in the DCS directory.

#### Application requester name

Specifies the name of the program residing on the application requester or server.

#### DCS parameters

String that contains the connection and operating environment parameters to use with the application requester. Corresponds to the parameter string entered when the host database was cataloged. The string must be enclosed by double quotation marks, and the parameters must be separated by commas.

#### Comment

Describes the database entry.

#### DCS directory release level

Specifies the version number of the Distributed Database Connection Services<sup>®</sup> program under which the database was created.

## **Usage notes**

The DCS directory is created the first time that the CATALOG DCS DATABASE command is invoked. It is maintained on the path/drive where DB2 was installed, and provides information about host databases that the workstation can access if the DB2 Connect program has been installed. The host databases can be:

- DB2 databases on OS/390 and z/OS host
- DB2 databases on System i hosts
- DB2 databases on VSE & VM hosts

# LIST DRDA INDOUBT TRANSACTIONS

Provides a list of transactions that are indoubt between DRDA requesters and DRDA servers. If DRDA commit protocols are being used, lists indoubt transactions between DRDA sync point managers.

# **Authorization**

None

# **Required connection**

Instance

# **Command syntax**

►►-LIST DRDA INDOUBT TRANSACTIONS-

└─WITH PROMPTING─┘

# **Command parameters**

### WITH PROMPTING

Indicates that indoubt transactions are to be processed. If this parameter is specified, an interactive dialog mode is initiated, permitting the user to commit or roll back indoubt transactions. If this parameter is not specified, indoubt transactions are written to the standard output device, and the interactive dialog mode is not initiated.

A forget option is not supported. Once the indoubt transaction is committed or rolled back, the transaction is automatically forgotten.

Interactive dialog mode permits the user to:

- List all indoubt transactions (enter 1)
- List indoubt transaction number *x* (enter 1, followed by a valid transaction number)
- Quit (enter q)
- Commit transaction number *x* (enter c, followed by a valid transaction number)
- Roll back transaction number *x* (enter r, followed by a valid transaction number).

A blank space must separate the command letter from its argument.

Before a transaction is committed or rolled back, the transaction data is displayed, and the user is asked to confirm the action.

# Usage notes

DRDA indoubt transactions occur when communication is lost between coordinators and participants in distributed units of work. A distributed unit of work lets a user or application read and update data at multiple locations within a single unit of work. Such work requires a two-phase commit.

The first phase requests all the participants to prepare for a commit. The second phase commits or rolls back the transactions. If a coordinator or participant becomes unavailable after the first phase, the distributed transactions are indoubt.

# LIST DRDA INDOUBT TRANSACTIONS

Before issuing the LIST DRDA INDOUBT TRANSACTIONS command, the application process must be connected to the DB2 sync point manager (SPM) instance. Use the **spm\_name** database manager configuration parameter as the *dbalias* on the CONNECT statement.

TCP/IP connections, using the SPM to coordinate commits, use DRDA two-phase commit protocols.

# LIST HISTORY

Lists entries in the database history records. The database history records contain a record of recovery and administrative events. Recovery events include full database and table space level backup, incremental backup, restore, and rollforward operations. Additional logged events include create, alter, drop, or rename table space, reorganize table, drop table, and load.

The LIST HISTORY command only returns history information for the database partition it is issued on. To list the history on multiple partitions, you can either issue the LIST HISTORY command from each individual database partition, or use the db2\_all prefix to run the LIST HISTORY command on all database partitions.

### Authorization

None

# **Required connection**

Instance. You must attach to any remote database in order to run this command against it. For a local database, an explicit attachment is not required.

### **Command syntax**

### **Command parameters**

### HISTORY

Lists all events that are currently logged in the database history records.

#### BACKUP

Lists backup and restore operations.

#### ROLLFORWARD

Lists rollforward operations.

#### **DROPPED TABLE**

Lists dropped table records. A dropped table record is created only when the table is dropped and the table space containing it has the DROPPED TABLE RECOVERY option enabled. Returns the CREATE TABLE syntax for partitioned tables and indicates which table spaces contained data for the table that was dropped.

#### LOAD

Lists load operations.

### CREATE TABLESPACE

Lists table space create and drop operations.

#### **RENAME TABLESPACE**

Lists table space renaming operations.

#### REORG

Lists reorganization operations. Includes information for each reorganized data partition of a partitioned table.

#### ALTER TABLESPACE

Lists alter table space operations.

#### ARCHIVE LOG

Lists archive log operations and the archived logs.

**ALL** Lists all entries of the specified type in the database history records.

#### **SINCE** *timestamp*

A complete time stamp (format *yyyymmddhhmmss*), or an initial prefix (minimum *yyyy*) can be specified. All entries with time stamps equal to or greater than the time stamp provided are listed.

#### **CONTAINING** *schema.object\_name*

This qualified name uniquely identifies a table.

### **CONTAINING** *object\_name*

This unqualified name uniquely identifies a table space.

#### **FOR DATABASE** *database-alias*

Used to identify the database whose recovery database history records are to be listed.

#### **Examples**

The following examples show different uses of the LIST HISTORY command:

db2 list history since 19980201 for sample

db2 list history backup containing userspace1 for sample

db2 list history dropped table all for db sample

#### Example 1

The following sample output shows two entries, one for a Load (L) operation and another one for a backup (B) operation:

db2 list history all for SAMPLE

List History File for sample

```
Number of matching file entries = 2
```

"USERNAME"."T1" resides in 1 tablespace(s):

00001 USERSPACE1

```
Comment: DB2
Start Time: 20100106133005
End Time: 20100106133006
```

Status: A

EID: 3 Location: /home/hotel19/username/mydatafile.del

	Stat	tus:	A							

#### Example 3

Use the db2\_all prefix to run the LIST HISTORY command on all database partitions:

db2 all "db2 list history since 20010601 for sample"

### **Usage notes**

The SYSIBMADM.DB\_HISTORY administrative view can be used to retrieves data from all database partitions.

The report generated by this command contains the following symbols: Operation

- A Create table space
- B Backup
- C Load copy
- D Drop table
- F Rollforward
- G Reorganize
- L Load
- N Rename table space
- 0 Drop table space
- Q Quiesce
- R Restore

# LIST HISTORY

- T Alter table space
- U Unload
- X Archive log

#### Object

- D Database
- I Index
- P Table space
- T Table
- R Partitioned table

#### Туре

Alter table space operation types:

- C Add container
- R Rebalance

Archive log operation types:

- F Failover archive path
- M Secondary (mirror) log path
- N Archive log command
- P Primary log path
- 1 Primary log archive method
- 2 Secondary log archive method

Backup and restore operation types:

- D Delta offline
- E Delta online
- F Offline
- I Incremental offline
- N Online
- 0 Incremental online
- R Rebuild

Load operation types:

- I Insert
- R Replace

Rollforward operation types:

- E End of logs
- P Point-in-time

Quiesce operation types:

- S Quiesce share
- U Quiesce update
- X Quiesce exclusive
- Z Quiesce reset

#### History entry status flag:

- A Active
- D Deleted
- E Expired
- I Inactive
- N Not yet committed
- X Do not delete
- a Incomplete active
- i Incomplete inactive

# LIST INDOUBT TRANSACTIONS

Provides a list of transactions that are indoubt. The user can interactively commit, roll back, or forget the indoubt transactions.

The two-phase commit protocol comprises:

- 1. The PREPARE phase, in which the resource manager writes the log pages to disk, so that it can respond to either a COMMIT or a ROLLBACK primitive
- 2. The COMMIT (or ROLLBACK) phase, in which the transaction is actually committed or rolled back.

Forgetting a transaction releases resources held by a heuristically completed transaction (that is, one that has been committed or rolled back heuristically). An indoubt transaction is one which has been prepared, but not yet committed or rolled back.

### Scope

This command returns a list of indoubt transactions on the executed node.

# Authorization

None

# **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established.

### Command syntax

►►—LIST INDOUBT TRANSACTIONS—

└─WITH PROMPTING─┘

### **Command parameters**

#### WITH PROMPTING

Indicates that indoubt transactions are to be processed. If this parameter is specified, an interactive dialog mode is initiated, permitting the user to commit, roll back, or forget indoubt transactions. If this parameter is not specified, indoubt transactions are written to the standard output device, and the interactive dialog mode is not initiated.

Interactive dialog mode permits the user to:

- List all indoubt transactions (enter 1)
- List indoubt transaction number *x* (enter 1, followed by a valid transaction number)
- Quit (enter q)
- Commit transaction number *x* (enter c, followed by a valid transaction number)
- Roll back transaction number *x* (enter r, followed by a valid transaction number)

• Forget transaction number *x* (enter f, followed by a valid transaction number).

A blank space must separate the command letter from its argument.

Before a transaction is committed, rolled back, or forgotten, the transaction data is displayed, and the user is asked to confirm the action.

The LIST INDOUBT TRANSACTIONS command returns *type* information to show the role of the database in each indoubt transaction:

- **TM** Indicates the indoubt transaction is using the database as a transaction manager database.
- **RM** Indicates the indoubt transaction is using the database as a resource manager, meaning that it is one of the databases participating in the transaction, but is not the transaction manager database.

### Usage notes

An indoubt transaction is a global transaction that was left in an indoubt state. This occurs when either the Transaction Manager (TM) or at least one Resource Manager (RM) becomes unavailable after successfully completing the first phase (that is, the PREPARE phase) of the two-phase commit protocol. The RMs do not know whether to commit or to roll back their branch of the transaction until the TM can consolidate its own log with the indoubt status information from the RMs when they again become available. An indoubt transaction can also exist in an MPP environment.

If LIST INDOUBT TRANSACTIONS is issued against the currently connected database, the command returns the information on indoubt transactions in that database.

Only transactions whose status is indoubt (i), or missing commit acknowledgment (m), or missing federated commit acknowledgment (d) can be committed.

Only transactions whose status is indoubt (i), missing federated rollback acknowledgment (b), or ended (e) can be rolled back.

Only transactions whose status is committed (c), rolled back (r), missing federated commit acknowledgment (d), or missing federated rollback acknowledgment (b) can be forgotten.

In the commit phase of a two-phase commit, the coordinator node waits for commit acknowledgments. If one or more nodes do not reply (for example, because of node failure), the transaction is placed in missing commit acknowledgment state.

Indoubt transaction information is valid only at the time that the command is issued. Once in interactive dialog mode, transaction status might change because of external activities. If this happens, and an attempt is made to process an indoubt transaction which is no longer in an appropriate state, an error message is displayed.

After this type of error occurs, the user should quit (q) the interactive dialog and reissue the LIST INDOUBT TRANSACTIONS WITH PROMPTING command to refresh the information shown.

# LIST NODE DIRECTORY

Lists the contents of the node directory.

### Authorization

None

### **Required connection**

None

# **Command syntax**

# **Command parameters**

### ADMIN

Specifies administration server nodes.

### SHOW DETAIL

Specifies that the output should include the following information:

- Remote instance name
- System
- Operating system type

## Examples

The following is sample output from LIST NODE DIRECTORY:

Node Directory

Number of entries in the directory = 2

Node 1 entry:

Node name Comment Directory entry type Protocol Hostname Service name	<pre>= LANNODE = = LDAP = TCPIP = LAN.db2ntd3.torolab.ibm.com = 50000</pre>
Node 2 entry:	
Node name Comment Directory entry type Protocol Hostname Service name	= TLBA10ME = = LOCAL = TCPIP = t1ba10me = 447

The following is sample output from LIST ADMIN NODE DIRECTORY:

Node Directory

Number of entries in the directory = 2

Node 1 entry:

Node name Comment Directory entry type Protocol Hostname Service name	= LOCALADM = = LOCAL = TCPIP = jaguar = 523
Node 2 entry:	
Node name	= MYDB2DAS
Comment	=
Directory entry type	= LDAP
Protocol	= TCPIP
Hostname	<pre>= peng.torolab.ibm.com</pre>
Service name	= 523

The common fields are identified as follows:

#### Node name

The name of the remote node. This corresponds to the name entered for the *nodename* parameter when the node was cataloged.

#### Comment

A comment associated with the node, entered when the node was cataloged. To change a comment in the node directory, uncatalog the node, and then catalog it again with the new comment.

### Directory entry type

LOCAL means the entry is found in the local node directory file. LDAP means the entry is found on the LDAP server or LDAP cache.

#### Protocol

The communications protocol cataloged for the node.

For information about fields associated with a specific node type, see the applicable CATALOG...NODE command.

#### Usage notes

A node directory is created and maintained on each IBM Data Server Runtime Client. It contains an entry for each remote workstation having databases that the client can access. The DB2 client uses the communication end point information in the node directory whenever a database connection or instance attachment is requested.

The database manager creates a node entry and adds it to the node directory each time it processes a CATALOG...NODE command. The entries can vary, depending on the communications protocol being used by the node.

The node directory can contain entries for the following types of nodes:

- LDAP
- Local
- Named pipe
- TCPIP
- TCPIP4
- TCPIP6

# LIST ODBC DATA SOURCES

Lists all available user or system ODBC data sources.

A *data source*, in ODBC (Open Database Connectivity) terminology, is a user-defined name for a specific database. That name is used to access the database or file system through ODBC APIs. On Windows, either user or system data sources can be cataloged. A user data source is only visible to the user who cataloged it, whereas a system data source is visible to and can be used by all other users.

This command is available on Windows only.

# Authorization

None

# **Required connection**

None

# **Command syntax**

# **Command parameters**

**USER** List only user ODBC data sources. This is the default if no keyword is specified.

### SYSTEM

List only system ODBC data sources.

# Examples

The following is sample output from the LIST ODBC DATA SOURCES command: User ODBC Data Sources

Data source name	Description
SAMPLE	IBM DB2 ODBC DRIVER

# LIST PACKAGES/TABLES

Lists packages or tables associated with the current database.

# Authorization

For the system catalog SYSCAT.PACKAGES (LIST PACKAGES) and SYSCAT.TABLES (LIST TABLES), one of the following is required:

- sysadm
- sysctrl
- sysmaint
- sysmon
- dbadm
- CONTROL privilege
- SELECT privilege.

# **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established.

# **Command syntax**

# **Command parameters**

- **FOR** If the FOR clause is not specified, the packages or tables for USER are listed.
  - ALL Lists all packages or tables in the database.

### **SCHEMA** schema-name

Lists all packages or tables in the database for the specified schema only.

#### SYSTEM

- Lists all system packages or tables in the database.
- **USER** Lists all user packages or tables in the database for the current user.

### SHOW DETAIL

If this option is chosen with the LIST TABLES command, the full table name and schema name are displayed. If this option is not specified, the table name is truncated to 30 characters, and the ">" symbol in the 31st column represents the truncated portion of the table name; the schema name is truncated to 14 characters and the ">" symbol in the 15th column represents the truncated portion of the schema name. If this option is chosen with the LIST PACKAGES command, the full package schema (creator), version and bound by authid are displayed, and the package unique\_id (consistency token shown in hexadecimal form). If this option is not specified, the schema name and bound by ID are truncated to 8 characters and the ">" symbol in the 9th column represents the truncated portion of the schema or bound by ID; the version is truncated to 10 characters and the ">" symbol in the 11th column represents the truncated portion of the version.

### Examples

#### The following is sample output from LIST PACKAGES:

Package	Schema	Version	Bound by	Total sections		Valid	Format	Isolation level	Blocking
F4INS	USERA	VER1	SNOWBELL		221	Y	0	CS	U
F4INS	USERA	VER2.0	SNOWBELL		201	Y	0	RS	U
F4INS	USERA	VER2.3	SNOWBELL		201	Ν	3	CS	U
F4INS	USERA	VER2.5	SNOWBELL		201	Y	0	CS	U
PKG12	USERA		USERA		12	Y	3	RR	В
PKG15	USERA		USERA		42	Y	3	RR	В
SALARY	USERT	YEAR2000	USERT		15	Y	3	CS	Ν

The following is sample output from LIST TABLES:

Table/View	Schema	Туре	Creation time
DEPARTMENT EMP_ACT EMP_PHOTO EMP_RESUME EMPLOYEE ORG PROJECT SALES	SMITH SMITH SMITH SMITH SMITH SMITH SMITH	T T T T T T T	1997-02-19-13.32.25.971890 1997-02-19-13.32.27.851115 1997-02-19-13.32.29.953624 1997-02-19-13.32.37.837433 1997-02-19-13.32.26.348245 1997-02-19-13.32.24.478021 1997-02-19-13.32.29.300304
STAFF	SMITH	T	1997-02-19-13.32.25.156337

9 record(s) selected.

### Usage notes

LIST PACKAGES and LIST TABLES commands are available to provide a quick interface to the system tables.

The following SELECT statements return information found in the system tables. They can be expanded to select the additional information that the system tables provide.

```
select tabname, tabschema, type, create_time
from syscat.tables
order by tabschema, tabname;
select pkgname, pkgschema, pkgversion, unique_id, boundby, total_sect,
   valid, format, isolation, blocking
from syscat.packages
order by pkgschema, pkgname, pkgversion;
select tabname, tabschema, type, create_time
from syscat.tables
where tabschema = 'SYSCAT'
order by tabschema, tabname;
select pkgname, pkgschema, pkgversion, unique_id, boundby, total_sect,
   valid, format, isolation, blocking
from syscat.packages
where pkgschema = 'NULLID'
```

order by pkgschema, pkgname, pkgversion;

select tabname, tabschema, type, create\_time
from syscat.tables
where tabschema = USER
order by tabschema, tabname;

select pkgname, pkgschema, pkgversion, unique\_id, boundby, total\_sect, valid, format, isolation, blocking from syscat.packages where pkgschema = USER order by pkgschema, pkgname, pkgversion;

# LIST TABLESPACE CONTAINERS

Lists containers for the specified table space.

**Important:** This command or API has been deprecated and might be removed in a future release. You can use the MON\_GET\_TABLESPACE and the MON\_GET\_CONTAINER table functions instead which return more information. For more information, see the "LIST TABLESPACES and LIST TABLESPACE CONTAINERS commands have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

The table space snapshot contains all of the information displayed by the LIST TABLESPACE CONTAINERS command.

### Scope

This command returns information only for the node on which it is executed.

# **Authorization**

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon
- dbadm

# **Required connection**

Database

# **Command syntax**

►► LIST TABLESPACE CONTAINERS FOR—*tablespace-id*\_\_\_\_\_SHOW DETAIL\_\_\_\_

### **Command parameters**

#### FOR tablespace-id

An integer that uniquely represents a table space used by the current database. To get a list of all the table spaces used by the current database, use the LIST TABLESPACES command.

#### SHOW DETAIL

If this option is not specified, only the following basic information about each container is provided:

- Container ID
- Name
- Type (file, disk, or path).

If this option is specified, the following additional information about each container is provided:

Total number of pages

- Number of usable pages
- Accessible (yes or no).

# **Examples**

The following is sample output from LIST TABLESPACE CONTAINERS FOR 0: Tablespace Containers for Tablespace 0

Container ID	= 0
Name	<pre>= /home/smith/smith/NODE0000/SQL00001/SQLT0000.0</pre>
Туре	= Path

The following is sample output from LIST TABLESPACE CONTAINERS FOR 0 SHOW DETAIL specified:

Tablespace Containers for Tablespace 0

Container ID	= 0
Name	<pre>= /home/smith/smith/NODE0000/SQL00001/SQLT0000.0</pre>
Туре	= Path
Total pages	= 895
Useable pages	= 895
Accessible	= Yes

# LIST TABLESPACES

Lists table spaces and information about table spaces for the current database.

**Important:** This command or API has been deprecated and might be removed in a future release. You can use the MON\_GET\_TABLESPACE and the MON\_GET\_CONTAINER table functions instead which return more information. For more information, see the "LIST TABLESPACES and LIST TABLESPACE CONTAINERS commands have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

Information displayed by this command is also available in the table space snapshot.

### Scope

This command returns information only for the database partition on which it is executed.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT
- SYSMON
- DBADM
- · LOAD authority

### **Required connection**

Database

# **Command syntax**

►►—LIST TABLESPACES-

-SHOW DETAIL-

# **Command parameters**

#### SHOW DETAIL

If this option is not specified, only the following basic information about each table space is provided:

- Table space ID
- Name
- Type (system managed space or database managed space)
- Contents (any data, long or index data, or temporary data)
- State, a hexadecimal value indicating the current table space state. The externally visible state of a table space is composed of the hexadecimal sum of certain state values. For example, if the state is "quiesced: EXCLUSIVE" and "Load pending", the value is 0x0004 + 0x0008, which is 0x000c. The db2tbst (Get Tablespace State) command can be used to

obtain the table space state associated with a given hexadecimal value. Following are the bit definitions listed in sqlutil.h:

0x0	Normal
0x1	Quiesced: SHARE
0x2	Quiesced: UPDATE
0x4	Quiesced: EXCLUSIVE
0x8	Load pending
0x10	Delete pending
0x20	Backup pending
0x40	Roll forward in progress
0x80	Roll forward pending
0x100	Restore pending
0x100	Recovery pending (not used)
0x200	Disable pending
0x400	Reorg in progress
0x800	Backup in progress
0x1000	Storage must be defined
0x2000	Restore in progress
0x4000	Offline and not accessible
0x8000	Drop pending
0x20000	Load in progress
0x2000000	Storage may be defined
0x4000000	StorDef is in 'final' state
0x8000000	StorDef was change prior to roll forward
0x10000000	DMS rebalance in progress
0x20000000	Table space deletion in progress
0x40000000	Table space creation in progress

If this option is specified, the following additional information about each table space is provided:

- Total number of pages
- Number of usable pages
- Number of used pages
- Number of free pages
- High water mark (in pages)
- Page size (in bytes)
- Extent size (in pages)
- Prefetch size (in pages)
- Number of containers
- Minimum recovery time (displayed only if not zero)
- State change table space ID (displayed only if the table space state is "load pending" or "delete pending")
- State change object ID (displayed only if the table space state is "load pending" or "delete pending")
- Number of quiescers (displayed only if the table space state is "quiesced: SHARE", "quiesced: UPDATE", or "quiesced: EXCLUSIVE")
- Table space ID and object ID for each quiescer (displayed only if the number of quiescers is greater than zero).

# **Examples**

The following are two sample outputs from LIST TABLESPACES SHOW DETAIL.

Tablespaces for Current DatabaseTablespace ID= 0Name= SYSCATSPACEType= Database managed space

## **Usage notes**

In a partitioned database environment, this command does not return all the table spaces in the database. To obtain a list of all the table spaces, query SYSCAT.TABLESPACES.

During a table space rebalance, the number of usable pages includes pages for the newly added container, but these new pages are not reflected in the number of free pages until the rebalance is complete. When a table space rebalance is not in progress, the number of used pages plus the number of free pages equals the number of usable pages.

There are currently at least 25 table or table space states supported by the IBM DB2 database product. These states are used to control access to data under certain circumstances, or to elicit specific user actions, when required, to protect the integrity of the database. Most of them result from events related to the operation of one of the DB2 database utilities, such as the load utility, or the backup and restore utilities.

The following table describes each of the supported table space states. The table also provides you with working examples that show you exactly how to interpret and respond to states that you might encounter while administering your database. The examples are taken from command scripts that were run on AIX; you can copy, paste and run them yourself. If you are running the DB2 database product on a system that is not UNIX, ensure that any path names are in the correct format for your system. Most of the examples are based on tables in the SAMPLE database that comes with the DB2 database product. A few examples require scenarios that are not part of the SAMPLE database, but you can use a connection to the SAMPLE database as a starting point.

Table 20.	Supported	table	space	states
-----------	-----------	-------	-------	--------

State	Hexadecimal state value	Description	Examples
Backup Pending	0x20	A table space is in this state after a point-in-time table space rollforward operation, or after a load operation (against a recoverable database) that specifies the COPY NO option. The table space (or, alternatively, the entire database) must be backed up before the table space can be used. If the table space is not backed up, tables within that table space can be queried, but not updated. <b>Note:</b> A database must also be backed up immediately after it is enabled for rollforward recovery. A database is recoverable if the <b>logretain</b> database configuration parameter is set to RECOVERY, or the <b>userexit</b> database configuration parameter is set to YES. You cannot activate or connect to such a database until it has been backed up, at which time the value of the <b>backup_pending</b> informational database configuration parameter is set to NO.	<pre>1. Given load input file staff_data.del with content: 11,"Melnyk",20,"Sales",10,70000,15000: update db cfg for sample using logretain recovery; backup db sample; connect to sample; load from staff_data.del of del messages load.msg insert into staff copy no; update staff set salary = 69000 where id = 11; 2. update db cfg for sample using logretain recovery; connect to sample;</pre>
Backup in Progress	0x800	This is a transient state that is only in effect during a backup operation.	<pre>Issue an online BACKUP DATABASE command: backup db sample online; While the backup operation is running, execute the following script from another session: connect to sample; 1. list tablespaces show detail; or 2. get snapshot for tablespaces on sample; connect reset; Information returned for USERSPACE1 shows that this table space is in Backup in Progress state.</pre>

## LIST TABLESPACES

State	Hexadecimal	Description	Framples
DMS Rebalance in Progress	0x10000000	This is a transient state that is only in effect during a data rebalancing operation. When new containers are added to a table space that is defined as database managed space (DMS), or existing containers are extended, a rebalancing of the table space data might occur. <i>Rebalancing</i> is the process of moving table space extents from one location to another in an attempt to keep the data striped. An <i>extent</i> is a unit of container space (measured in pages), and a stripe is a layer of extents <i>across the set of</i> <i>containers</i> for a table space.	Given load input file staffdata.del with a substantial amount of data (for example, 20000 or more records): connect to sample; create tablespace ts1 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /ts1c1' 1024); create table newstaff like staff in ts1; load from staffdata.del of del insert into newstaff nonrecoverable; alter tablespace ts1 add (file '/home/melnyk/melnyk /NODE0000/SQL00001/ts1c2' 1024); list tablespaces; connect reset; Information returned for TS1 shows that this table space is in DMS Rebalance in Progress state.
Disable Pending	0x200	A table space may be in this state during a database rollforward operation and should no longer be in this state by the end of the rollforward operation. The state is triggered by conditions that result from a table space going offline and compensation log records for a transaction not being written. The appearance and subsequent disappearance of this table space state is transparent to users.	An example illustrating this table space state is beyond the scope of this document.
Drop Pending	0x8000	A table space is in this state if one or more of its containers is found to have a problem during a database restart operation. (A database must be restarted if the previous session with this database terminated abnormally, such as during a power failure, for example.) If a table space is in Drop Pending state, it will not be available, and can only be dropped.	An example illustrating this table space state is beyond the scope of this document.

Table 20. Supported table space states (continued)

<b>0</b>	Hexadecimal		
State	state value	Description	Examples
Load in Progress	0x20000	This is a transient state that is only in effect during a load operation (against a recoverable database) that specifies the COPY NO option. See also Load in Progress table state.	<pre>Given load input file staffdata.del with a substantial amount of data (for example, 20000 or more records): update db cfg for sample using logretain recovery; backup db sample; connect to sample; create table newstaff like staff; load from staffdata.del of del insert into newstaff copy no; connect reset; While the load operation is running, execute the following script from another session: connect to sample; list tablespaces; connect reset; Information returned for USERSPACE1 shows that this table space is in Load in Progress (and Backup Pending) </pre>
Normal	0x0	A table space is in Normal state if it is not in any of the other (abnormal) table space states. Normal state is the initial state of a table space after it is created.	<pre>connect to sample; create tablespace ts1 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /tsc1' 1024); list tablespaces show detail;</pre>
Offline and Not Accessible	0x4000	A table space is in this state if there is a problem with one or more of its containers. A container might be inadvertently renamed, moved, or damaged. After the problem has been rectified, and the containers that are associated with the table space are accessible again, this abnormal state can be removed by disconnecting all applications from the database and then reconnecting to the database. Alternatively, you can issue an ALTER TABLESPACE statement, specifying the SWITCH ONLINE clause, to remove the Offline and Not Accessible state from the table space without disconnecting other applications from the database.	<pre>connect to sample; create tablespace ts1 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /tsc1' 1024); alter tablespace ts1 add (file '/home/melnyk/melnyk /NODE0000/SQL00001/tsc2' 1024); export to st_data.del of del select * from staff; create table stafftemp like staff in ts1; import from st_data.del of del insert into stafftemp; connect reset; Rename table space container tsc1 to tsc3 and then try to query the STAFFTEMP table: connect to sample; select * from stafftemp; The query returns SQL0290N (table space access is not allowed), and the LIST TABLESPACES command returns a state value of 0x4000 (Offline and Not Accessible) for TS1. Rename table space container tsc3 back to tsc1. This time the query runs successfully. </pre>

Table 20. Supported table space states (continued)

## LIST TABLESPACES

State	Hexadecimal state value	Description	Examples
Quiesced Exclusive	0x4	A table space is in this state when the application that invokes the table space quiesce function has exclusive (read or write) access to the table space. You can put a table space in Quiesced Exclusive state explicitly by issuing the QUIESCE TABLESPACES FOR TABLE command.	Ensure that the table space state is Normal before setting it to Quiesced Exclusive. connect to sample; quiesce tablespaces for table staff reset; quiesce tablespaces for table staff exclusive; connect reset; Execute the following script from another session: connect to sample; select * from staff where id=60; update staff set salary=50000 where id=60; list tablespaces; connect reset; Information returned for USERSPACE1 shows that this table space is in Quiesced Exclusive state.
Quiesced Share	0x1	A table space is in this state when both the application that invokes the table space quiesce function and concurrent applications have read (but not write) access to the table space. You can put a table space in Quiesced Share state explicitly by issuing the QUIESCE TABLESPACES FOR TABLE command.	Ensure that the table space state is Normal before setting it to Quiesced Share. connect to sample; quiesce tablespaces for table staff reset; quiesce tablespaces for table staff share; connect reset; Execute the following script from another session: connect to sample; select * from staff where id=40; update staff set salary=50000 where id=40; list tablespaces; connect reset; Information returned for USERSPACE1 shows that this table space is in Quiesced Share state.
Quiesced Update	0x2	A table space is in this state when the application that invokes the table space quiesce function has exclusive write access to the table space. You can put a table space in Quiesced Update state explicitly by issuing the QUIESCE TABLESPACES FOR TABLE command.	Ensure that the table space state is Normal before setting it to Quiesced Update. connect to sample; quiesce tablespaces for table staff reset; quiesce tablespaces for table staff intent to update; connect reset; Execute the following script from another session: connect to sample; select * from staff where id=50; update staff set salary=50000 where id=50; list tablespaces; connect reset; Information returned for USERSPACE1 shows that this table space is in Quiesced Update state.

Table 20. Supported table space states (continued)

State	Hexadecimal state value	Description	Examples
Reorg in Progress	0x400	This is a transient state that is only in effect during a reorg operation.	Issue a REORG TABLE command: connect to sample; reorg table staff; connect reset; While the reorg operation is running, execute the following script from another session: connect to sample; 1. list tablespaces show detail; or 2. get snapshot for tablespaces on sample; connect reset; Information returned for USERSPACE1 shows that this table space is in Reorg in Progress state. Note: Table reorganization operations involving the SAMPLE database are likely to complete in a short period of time and, as a result, it may be difficult to observe the Reorr in Progress state using this approach
Restore Pending	0x100	Table spaces for a database are in this state after the first part of a redirected restore operation (that is, before the SET TABLESPACE CONTAINERS command is issued). The table space (or the entire database) must be restored before the table space can be used. You cannot connect to the database until the restore operation has been successfully completed, at which time the value of the <b>restore_pending</b> informational database configuration parameter is set to NO.	When the first part of the redirected restore operation in Storage May be Defined completes, all of the table spaces are in Restore Pending state.

## Table 20. Supported table space states (continued)

## LIST TABLESPACES

_	Hexadecimal		
State	state value	Description	Examples
Restore in Progress	0x2000	This is a transient state that is only in effect during a restore operation.	update db cfg for sample using logretain recovery; backup db sample; backup db sample tablespace (userspace1);
			The timestamp for this backup image is:
			20040611174124
			restore db sample tablespace (userspace1) online taken at 20040611174124;
			While the restore operation is running, execute the following script from another session:
			connect to sample;
			1.
			list tablespaces show detail;
			or
			2.
			get snapshot for tablespaces on sample; connect reset;
			Information returned for USERSPACE1 shows that this table space is in Restore in Progress state.
Roll Forward Pending	0x80	A table space is in this state after a restore operation against a recoverable database. The table space (or the entire database) must be rolled forward before the table space can be used. A database is recoverable if the <b>logretain</b> database configuration parameter is set to RECOVERY, or the <b>userexit</b> database configuration parameter is set to YES. You cannot activate or connect to the database until a rollforward operation has been successfully completed, at which time the value of the <b>rollfwd_pending</b> informational database configuration parameter is set to NO.	When the online table space restore operation in Restore in Progress completes, the table space USERSPACE1 is in Roll Forward Pending state.

able 20. Supported table space states (continued)	Table 20.	Supported	table	space	states	(continued)
---	-----------	-----------	-------	-------	--------	-------------

State	Hexadecimal	Description	Framples
Roll Forward in Progress	0x40	This is a transient state that is only in effect during a rollforward operation.	Given load input file staffdata.del with a substantial amount of data (for example, 20000 or more records): update db cfg for sample using logretain recovery; backup db sample.
		<pre>connect to sample; create tablespace ts1 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /ts1c1' 1024);</pre>	
			create table newstaff like staff in ts1; connect reset; backup db sample tablespace (ts1) online;
			The timestamp for this backup image is:
			20040630000715
			<pre>connect to sample; load from staffdata.del of del insert into newstaff copy yes to /home/melnyk/backups;</pre>
			connect reset; restore db sample tablespace (ts1) online taken at 20040630000715; rollforward db sample to end of logs and stop tablespace (ts1) online;
			While the rollforward operation is running, execute the following script from another session:
			connect to sample;
			1.
			list tablespaces show detail;
			or
			2.
			get snapshot for tablespaces on sample; connect reset;
			Information returned for TS1 shows that this table space is in Roll Forward in Progress state.
Storage May be	0x2000000	Table spaces for a database are in this state after the	backup db sample;
Defined		first part of a redirected restore operation (that is, before the SET TABLESPACE CONTAINERS command	Assuming that the timestamp for this backup image is 20040613204955:
			restore db sample taken at 20040613204955 redirect; list tablespaces;
		is issued). This allows you to redefine the containers, if you wish.	Information returned by the LIST TABLESPACES command shows that all of the table spaces are in Storage May be Defined and Restore Pending state.

Table 20. Supported table space states (continued)

## LIST TABLESPACES

State	Hexadecimal	Description	Framples
Storage Must be Defined	0x1000	Table spaces for a database are in this state during a redirected restore operation to a new database if the set table space containers phase is omitted or if, during the set table space containers phase, the specified containers cannot be acquired. The latter can occur if, for example, an invalid path name has been specified, or there is insufficient disk space.	backup db sample; Assuming that the timestamp for this backup image is 20040613204955: restore db sample taken at 20040613204955 into mydb redirect; set tablespace containers for 2 using (path 'ts2c1'); list tablespaces; Information returned by the LIST TABLESPACES command shows that table space SYSCATSPACE and table space TEMPSPACE1 are in Storage Must be Defined, Storage May be Defined, and Restore Pending state. Storage Must be Defined state takes precedence over Storage May be Defined state.
Table Space Creation in Progress	0x4000000	This is a transient state that is only in effect during a create table space operation.	<pre>connect to sample; create tablespace ts1 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /tsc1' 1024); create tablespace ts2 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /tsc2' 1024); create tablespace ts3 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /tsc3' 1024); While the create table space operations are running, execute the following script from another session: connect to sample; 1. list tablespaces show detail; or 2. get snapshot for tablespaces on sample; connect reset; Information returned for TS1, TS2, and TS3 shows that these table spaces are in Table Space Creation in Progress</pre>

Table 20. Supported table space states (continued)

State	Hexadecimal state value	Description	Examples
Table Space Deletion in Progress	0x20000000	This is a transient state that is only in effect during a delete table space operation.	<pre>connect to sample; create tablespace ts1 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /tsc1' 1024); create tablespace ts2 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /tsc2' 1024); create tablespace ts3 managed by database using (file '/home/melnyk/melnyk/NODE0000/SQL00001 /tsc3' 1024); drop tablespace ts1; drop tablespace ts2; drop tablespace ts3; While the drop table space operations are running, execute the following script from another session: connect to sample; 1. list tablespaces show detail; or 2. get snapshot for tablespaces on sample; connect reset; Information returned for TS1, TS2, and TS3 shows that these table spaces are in Table Space Deletion in Progress state.</pre>

Table 20. Supported table space states (continued)

# LIST UTILITIES

Displays to standard output the list of active utilities on the instance. The description of each utility can include attributes such as start time, description, throttling priority (if applicable), as well as progress monitoring information (if applicable).

## Scope

This command returns information for all database partitions.

## Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

## **Required connection**

Instance

## Command syntax

►►\_\_LIST UTILITIES\_\_\_\_\_\_\_

## **Command parameters**

#### SHOW DETAIL

Displays detailed progress information for utilities that support progress monitoring.

## Examples

A RUNSTATS invocation on table some\_table: LIST UTILITIES

= 1
= RUNSTATS
= PROD
<pre>= krrose.some_table</pre>
= 12/19/2003 11:54:45.773215
= 10

Monitoring the performance of an offline database backup: LIST UTILITIES SHOW DETAIL

ID = 2 Type = BACKUP Database Name = SAMPLE Description = offline db Start Time = 10/30/2003 12:55:31.786115 Priority = 0 Progress Monitoring:

```
Phase Number [CURRENT] = 1

Description =

Work Metric = BYTES

Total Work Units = 20232453

Completed Work Units = 230637

Start Time = 10/30/2003 12:55:31.786115
```

## Usage notes

Use this command to monitor the status of running utilities. For example, you might use this utility to monitor the progress of an online backup. In another example, you might investigate a performance problem by using this command to determine which utilities are running. If the utility is suspected to be responsible for degrading performance then you might elect to throttle the utility (if the utility supports throttling). The ID from the LIST UTILITIES command is the same ID used in the SET UTIL\_IMPACT\_PRIORITY command.

The LIST UTILITIES command can be used to monitor the progress of deferred cleanup of indexes by asynchronous index cleanup.

Starting with DB2 Version 9.7 Fix Pack 1, the LIST UTILITIES command can be used to monitor the progress of the completion of a detach of a data partition from a partitioned table by the asynchronous partition detach task. Detaching a data partition from a data partitioned table is initiated by issuing a ALTER TABLE statement with the DETACH PARTITION clause.

# LOAD

Loads data into a DB2 table.

Data residing on the server can be in the form of a file, tape, or named pipe. Data residing on a remotely connected client can be in the form of a fully qualified file or named pipe. Data can also be loaded from a user-defined cursor or by using a user-written script or application. If the COMPRESS attribute for the table is set to YES, the data loaded will be subject to compression on every data and database partition for which a dictionary already exists in the table, including data in the XML storage object of the table.

Quick link to "File type modifiers for the load utility" on page 352.

## Restrictions

The load utility does not support loading data at the hierarchy level. The load utility is not compatible with range-clustered tables. The load utility does not support the NOT LOGGED INITIALLY parameter for the CREATE TABLE or ALTER TABLE statements.

## Scope

This command can be issued against multiple database partitions in a single request.

## **Authorization**

One of the following:

- DATAACCESS
- LOAD authority on the database and
  - INSERT privilege on the table when the load utility is invoked in INSERT mode, TERMINATE mode (to terminate a previous load insert operation), or RESTART mode (to restart a previous load insert operation)
  - INSERT and DELETE privilege on the table when the load utility is invoked in REPLACE mode, TERMINATE mode (to terminate a previous load replace operation), or RESTART mode (to restart a previous load replace operation)
  - INSERT privilege on the exception table, if such a table is used as part of the load operation.
- To load data into a table that has protected columns, the session authorization ID must have LBAC credentials that allow write access to all protected columns in the table. Otherwise the load fails and an error (SQLSTATE 5U014) is returned.
- To load data into a table that has protected rows, the session authorization id must hold a security label that meets these criteria:
  - It is part of the security policy protecting the table
  - It was granted to the session authorization ID for write access or for all access

If the session authorization id does not hold such a security label then the load fails and an error (SQLSTATE 5U014) is returned. This security label is used to protect a loaded row if the session authorization ID's LBAC credentials do not allow it to write to the security label that protects that row in the data. This does not happen, however, when the security policy protecting the table was created

with the RESTRICT NOT AUTHORIZED WRITE SECURITY LABEL option of the CREATE SECURITY POLICY statement. In this case the load fails and an error (SQLSTATE 42519) is returned.

- If the REPLACE option is specified, the session authorization ID must have the authority to drop the table.
- If the LOCK WITH FORCE option is specified, SYSADM authority is required.

Since all load processes (and all DB2 server processes, in general) are owned by the instance owner, and all of these processes use the identification of the instance owner to access needed files, the instance owner must have read access to input data files. These input data files must be readable by the instance owner, regardless of who invokes the command.

## **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established.

Instance. An explicit attachment is not required. If a connection to the database has been established, an implicit attachment to the local instance is attempted.

## **Command syntax**

## Ignore and Map parameters:

## **Redirect Input/Output parameters:**

		-
I	REDIRECT INPUT FROM BUFFER—input-buffer FILE—input-file— OUTPUT TO FILE—output-file— OUTPUT TO FILE—output-file—	

## Notes:

- 1 These keywords can appear in any order.
- 2 Each of these keywords can only appear once.

## **Command parameters**

## CLIENT

Specifies that the data to be loaded resides on a remotely connected client. This option is ignored if the load operation is not being invoked from a remote client. This option is ignored if specified in conjunction with the CURSOR file type.

## Note:

- 1. The **dumpfile** and **lobsinfile** modifiers and the **XML FROM** option refer to files on the server even when the **CLIENT** keyword is specified.
- 2. Code page conversion is not performed during a remote load operation. If the code page of the data is different from that of the server, the data code page should be specified using the codepage modifier.

In the following example, a data file (/u/user/data.del) residing on a remotely connected client is to be loaded into MYTABLE on the server database:

db2 load client from /u/user/data.del of del modified by codepage=850 insert into mytable

## **FROM** filename | pipename | device | cursorname

Specifies the file, pipe, device, or cursor referring to an SQL statement that contains the data being loaded. If the input source is a file, pipe, or device, it must reside on the database partition where the database resides, unless the **CLIENT** option is specified.

If several names are specified, they will be processed in sequence. If the last item specified is a tape device, the user is prompted for another tape. Valid response options are:

- **c** Continue. Continue using the device that generated the warning message (for example, when a new tape has been mounted).
- **d** Device terminate. Stop using the device that generated the warning message (for example, when there are no more tapes).
- t Terminate. Terminate all devices.

## Note:

1. It is recommended that the fully qualified file name be used. If the server is remote, the fully qualified file name must be used. If the database resides on the same database partition as the caller, relative paths can be used.

- 2. If data is exported into a file using the EXPORT command using the ADMIN\_CMD procedure, the data file is owned by the fenced user ID. This file is not usually accessible by the instance owner. To run the LOAD from CLP or the ADMIN\_CMD procedure, the data file must be accessible by the instance owner ID, so read access to the data file must be granted to the instance owner.
- **3**. Loading data from multiple IXF files is supported if the files are physically separate, but logically one file. It is *not* supported if the files are both logically and physically separate. (Multiple physical files would be considered logically one if they were all created with one invocation of the EXPORT command.)
- 4. If loading data that resides on a client machine, the data must be in the form of either a fully qualified file or a named pipe.
- 5. When loading XML data from files into tables in a partitioned database environment, the XML data files must be read-accessible to all the database partitions where loading is taking place.

## **OF** *filetype*

Specifies the format of the data:

- ASC (non-delimited ASCII format)
- DEL (delimited ASCII format)
- IXF (Integration Exchange Format, PC version) is a binary format that is used exclusively by DB2 databases.
- CURSOR (a cursor declared against a SELECT or VALUES statement).

**Note:** When using a CURSOR file type to load XML data into a table in a distributed database environment, the PARTITION\_ONLY and LOAD\_ONLY modes are not supported.

## LOBS FROM lob-path

The path to the data files containing LOB values to be loaded. The path must end with a slash. If the **CLIENT** option is specified, the path must be fully qualified. The names of the LOB data files are stored in the main data file (ASC, DEL, or IXF), in the column that will be loaded into the LOB column. The maximum number of paths that can be specified is 999. This will implicitly activate the **LOBSINFILE** behavior.

This option is ignored when specified in conjunction with the CURSOR file type.

## **MODIFIED BY** *file-type-mod*

Specifies file type modifier options. See "File type modifiers for the load utility" on page 352.

## METHOD

L

Specifies the start and end column numbers from which to load data. A column number is a byte offset from the beginning of a row of data. It is numbered starting from 1. This method can only be used with ASC files, and is the only valid method for that file type.

## NULL INDICATORS null-indicator-list

This option can only be used when the **METHOD L** parameter is specified; that is, the input file is an ASC file). The null indicator list is a comma-separated list of positive integers specifying the column number of each null indicator field. The column number is the byte offset of the

null indicator field from the beginning of a row of data. There must be one entry in the null indicator list for each data field defined in the **METHOD L** parameter. A column number of zero indicates that the corresponding data field always contains data.

A value of Y in the NULL indicator column specifies that the column data is NULL. Any character *other than* Y in the NULL indicator column specifies that the column data is not NULL, and that column data specified by the **METHOD L** option will be loaded.

The NULL indicator character can be changed using the **MODIFIED BY** option.

- N Specifies the names of the columns in the data file to be loaded. The case of these column names must match the case of the corresponding names in the system catalogs. Each table column that is not nullable should have a corresponding entry in the METHOD N list. For example, given data fields F1, F2, F3, F4, F5, and F6, and table columns C1 INT, C2 INT NOT NULL, C3 INT NOT NULL, and C4 INT, method N (F2, F1, F4, F3) is a valid request, while method N (F2, F1) is not valid. This method can only be used with file types IXF or CURSOR.
- P Specifies the field numbers (numbered from 1) of the input data fields to be loaded. Each table column that is not nullable should have a corresponding entry in the METHOD P list. For example, given data fields F1, F2, F3, F4, F5, and F6, and table columns C1 INT, C2 INT NOT NULL, C3 INT NOT NULL, and C4 INT, method P (2, 1, 4, 3) is a valid request, while method P (2, 1) is not valid. This method can only be used with file types IXF, DEL, or CURSOR, and is the only valid method for the DEL file type.

## XML FROM xml-path

Specifies one or more paths that contain the XML files. XDSs are contained in the main data file (ASC, DEL, or IXF), in the column that will be loaded into the XML column.

#### **XMLPARSE**

Specifies how XML documents are parsed. If this option is not specified, the parsing behavior for XML documents will be determined by the value of the CURRENT XMLPARSE OPTION special register.

#### STRIP WHITESPACE

Specifies to remove whitespace when the XML document is parsed.

#### PRESERVE WHITESPACE

Specifies not to remove whitespace when the XML document is parsed.

## XMLVALIDATE

Specifies that XML documents are validated against a schema, when applicable.

#### USING XDS

XML documents are validated against the XML schema identified by the XML Data Specifier (XDS) in the main data file. By default, if the **XMLVALIDATE** option is invoked with the **USING XDS** clause, the schema used to perform validation will be determined by the SCH attribute of the XDS. If an SCH attribute is not present in the XDS, no schema validation will occur unless a default schema is specified by the **DEFAULT** clause.

The **DEFAULT**, **IGNORE**, and **MAP** clauses can be used to modify the schema determination behavior. These three optional clauses apply directly to the specifications of the XDS, and not to each other. For example, if a schema is selected because it is specified by the **DEFAULT** clause, it will not be ignored if also specified by the **IGNORE** clause. Similarly, if a schema is selected because it is specified as the first part of a pair in the **MAP** clause, it will not be re-mapped if also specified in the second part of another **MAP** clause pair.

#### **USING SCHEMA** schema-sqlid

XML documents are validated against the XML schema with the specified SQL identifier. In this case, the SCH attribute of the XML Data Specifier (XDS) will be ignored for all XML columns.

#### USING SCHEMALOCATION HINTS

XML documents are validated against the schemas identified by XML schema location hints in the source XML documents. If a schemaLocation attribute is not found in the XML document, no validation will occur. When the **USING SCHEMALOCATION HINTS** clause is specified, the SCH attribute of the XML Data Specifier (XDS) will be ignored for all XML columns.

See examples of the XMLVALIDATE option below.

#### **IGNORE** schema-sqlid

This option can only be used when the **USING XDS** parameter is specified. The **IGNORE** clause specifies a list of one or more schemas to ignore if they are identified by an SCH attribute. If an SCH attribute exists in the XML Data Specifier for a loaded XML document, and the schema identified by the SCH attribute is included in the list of schemas to ignore, then no schema validation will occur for the loaded XML document.

#### Note:

If a schema is specified in the **IGNORE** clause, it cannot also be present in the left side of a schema pair in the **MAP** clause.

The **IGNORE** clause applies only to the XDS. A schema that is mapped by the **MAP** clause will not be subsequently ignored if specified by the **IGNORE** clause.

#### **DEFAULT** schema-sqlid

This option can only be used when the **USING XDS** parameter is specified. The schema specified through the **DEFAULT** clause identifies a schema to use for validation when the XML Data Specifier (XDS) of a loaded XML document does not contain an SCH attribute identifying an XML Schema.

The **DEFAULT** clause takes precedence over the **IGNORE** and **MAP** clauses. If an XDS satisfies the **DEFAULT** clause, the **IGNORE** and **MAP** specifications will be ignored.

#### MAP schema-sqlid

This option can only be used when the **USING XDS** parameter is specified. Use the **MAP** clause to specify alternate schemas to use in place

of those specified by the SCH attribute of an XML Data Specifier (XDS) for each loaded XML document. The **MAP** clause specifies a list of one or more schema pairs, where each pair represents a mapping of one schema to another. The first schema in the pair represents a schema that is referred to by an SCH attribute in an XDS. The second schema in the pair represents the schema that should be used to perform schema validation.

If a schema is present in the left side of a schema pair in the **MAP** clause, it cannot also be specified in the **IGNORE** clause.

Once a schema pair mapping is applied, the result is final. The mapping operation is non-transitive, and therefore the schema chosen will not be subsequently applied to another schema pair mapping.

A schema cannot be mapped more than once, meaning that it cannot appear on the left side of more than one pair.

#### **SAVECOUNT** *n*

Specifies that the load utility is to establish consistency points after every n rows. This value is converted to a page count, and rounded up to intervals of the extent size. Since a message is issued at each consistency point, this option should be selected if the load operation will be monitored using LOAD QUERY. If the value of n is not sufficiently high, the synchronization of activities performed at each consistency point will impact performance.

The default value is zero, meaning that no consistency points will be established, unless necessary.

This option is ignored when specified in conjunction with the CURSOR file type or when loading a table containing an XML column.

#### **ROWCOUNT** *n*

Specifies the number of *n* physical records in the file to be loaded. Allows a user to load only the first *n* rows in a file.

## WARNINGCOUNT n

Stops the load operation after *n* warnings. Set this parameter if no warnings are expected, but verification that the correct file and table are being used is desired. If the load file or the target table is specified incorrectly, the load utility will generate a warning for each row that it attempts to load, which will cause the load to fail. If *n* is zero, or this option is not specified, the load operation will continue regardless of the number of warnings issued. If the load operation is stopped because the threshold of warnings was encountered, another load operation can be started in RESTART mode. The load operation will automatically continue from the last consistency point. Alternatively, another load operation can be initiated in REPLACE mode, starting at the beginning of the input file.

#### **MESSAGES** *message-file*

Specifies the destination for warning and error messages that occur during the load operation. If a message file is not specified, messages are written to standard output. If the complete path to the file is not specified, the load utility uses the current directory and the default drive as the destination. If the name of a file that already exists is specified, the utility appends the information.

The message file is usually populated with messages at the end of the load operation and, as such, is not suitable for monitoring the progress of the operation.

## **TEMPFILES PATH** *temp-pathname*

Specifies the name of the path to be used when creating temporary files during a load operation, and should be fully qualified according to the server database partition.

Temporary files take up file system space. Sometimes, this space requirement is quite substantial. Following is an estimate of how much file system space should be allocated for all temporary files:

- 136 bytes for each message that the load utility generates
- 15 KB overhead if the data file contains long field data or LOBs. This quantity can grow significantly if the **INSERT** option is specified, and there is a large amount of long field or LOB data already in the table.

## INSERT

One of four modes under which the load utility can execute. Adds the loaded data to the table without changing the existing table data.

## REPLACE

One of four modes under which the load utility can execute. Deletes all existing data from the table, and inserts the loaded data. The table definition and index definitions are not changed. If this option is used when moving data between hierarchies, only the data for an entire hierarchy, not individual subtables, can be replaced.

## **KEEPDICTIONARY**

An existing compression dictionary is preserved across the LOAD REPLACE operation. Provided the table COMPRESS attribute is YES, the newly replaced data is subject to being compressed using the dictionary that existed prior to the invocation of the load. If no dictionary previously existed in the table, a new dictionary is built using the data that is being replaced into the table as long as the table COMPRESS attribute is YES. The amount of data that is required to build the compression dictionary in this case is subject to the policies of ADC. This data is populated into the table as uncompressed. Once the dictionary is inserted into the table, the remaining data to be loaded is subject to being compressed with this dictionary. This is the default parameter. For summary, see Table 1 below.

Table 21. LOAD REPLACE KEEPDICTIONARY

Compress	Table row data dictionary exists	XML storage object dictionary exists <sup>1</sup>	Compression dictionary	Data compression
YES	YES	YES	Preserve table row data and XML dictionaries.	Data to be loaded is subject to compression.
YES	YES	NO	Preserve table row data dictionary and build a new XML dictionary.	Table row data to be loaded is subject to compression. After XML dictionary is built, remaining XML data to be loaded is subject to compression.
YES	NO	YES	Build table row data dictionary and preserve XML dictionary.	After table row data dictionary is built, remaining table row data to be loaded is subject to compression. XML data to be loaded is subject to compression.

Compress	Table row data dictionary exists	XML storage object dictionary exists <sup>1</sup>	Compression dictionary	Data compression
YES	NO	NO	Build new table row data and XML dictionaries.	After dictionaries are built, remaining data to be loaded is subject to compression.
NO	YES	YES	Preserve table row data and XML dictionaries.	Data to be loaded is not compressed.
NO	YES	NO	Preserve table row data dictionary.	Data to be loaded is not compressed.
NO	NO	YES	No effect on table row dictionary. Preserve XML dictionary.	Data to be loaded is not compressed.
NO	NO	NO	No effect.	Data to be loaded is not compressed.

Table 21. LOAD REPLACE KEEPDICTIONARY (continued)

## Note:

1. A compression dictionary can be created for the XML storage object of a table only if the XML columns are added to the table in DB2 Version 9.7 or later, or if the table is migrated using an online table move.

## RESETDICTIONARY

This directive instructs LOAD REPLACE processing to build a new dictionary for the table data object provided that the table COMPRESS attribute is YES. If the COMPRESS attribute is NO and a dictionary was already present in the table it will be removed and no new dictionary will be inserted into the table. A compression dictionary can be built with just one user record. If the loaded data set size is zero and if there is a preexisting dictionary, the dictionary will not be preserved. The amount of data required to build a dictionary with this directive is not subject to the policies of ADC. For summary, see Table 2 below.

Table 22. LOAD REPLACE RESETDICTIONARY

Compress	Table row data dictionary exists	XML storage object dictionary exists <sup>1</sup>	Compression dictionary	Data compression
YES	YES	YES	Build new dictionaries <sup>2</sup> . If the DATA CAPTURE CHANGES option is enabled on the CREATE TABLE or ALTER TABLE statements, the current table row data dictionary is kept (and referred to as the <i>historical</i> <i>compression dictionary</i> ).	After dictionaries are built, remaining data to be loaded is subject to compression.

# LOAD

Compress	Table row data dictionary exists	XML storage object dictionary exists <sup>1</sup>	Compression dictionary	Data compression
YES	YES	NO	Build new dictionaries <sup>2</sup> . If the DATA CAPTURE CHANGES option is enabled on the CREATE TABLE or ALTER TABLE statements, the current table row data dictionary is kept (and referred to as the <i>historical</i> <i>compression dictionary</i> ).	After dictionaries are built, remaining data to be loaded is subject to compression.
YES	NO	YES	Build new dictionaries.	After dictionaries are built, remaining data to be loaded is subject to compression.
YES	NO	NO	Build new dictionaries.	After dictionaries are built, remaining data to be loaded is subject to compression.
NO	YES	YES	Remove dictionaries.	Data to be loaded is not compressed.
NO	YES	NO	Remove table row data dictionary.	Data to be loaded is not compressed.
NO	NO	YES	Remove XML storage object dictionary.	Data to be loaded is not compressed.
NO	NO	NO	No effect.	All table data is not compressed.

Table 22. LOAD REPLACE RESETDICTIONARY	(continued)
--	-------------

## Notes:

- 1. A compression dictionary can be created for the XML storage object of a table only if the XML columns are added to the table in DB2 Version 9.7 or later, or if the table is migrated using an online table move.
- 2. If a dictionary exists and the compression attribute is enabled, but there are no records to load into the table partition, a new dictionary cannot be built and the **RESETDICTIONARY** operation will not keep the existing dictionary.

## TERMINATE

One of four modes under which the load utility can execute. Terminates a previously interrupted load operation, and rolls back the operation to the point in time at which it started, even if consistency points were passed. The states of any table spaces involved in the operation return to normal, and all table objects are made consistent (index objects might be marked as invalid, in which case index rebuild will automatically take place at next access). If the load operation being terminated is a LOAD REPLACE, the table will be truncated to an empty table after the LOAD TERMINATE operation. If the load operation being terminated is a LOAD INSERT, the table will retain all of its original records after the LOAD TERMINATE operation. For summary of dictionary management, see Table 3 below.

The LOAD **TERMINATE** option will not remove a backup pending state from table spaces.

### RESTART

One of four modes under which the load utility can execute. Restarts a previously interrupted load operation. The load operation will automatically continue from the last consistency point in the load, build, or delete phase. For summary of dictionary management, see Table 4 below.

#### **INTO** table-name

Specifies the database table into which the data is to be loaded. This table cannot be a system table, a declared temporary table, or a created temporary table. An alias, or the fully qualified or unqualified table name can be specified. A qualified table name is in the form *schema.tablename*. If an unqualified table name is specified, the table will be qualified with the CURRENT SCHEMA.

#### insert-column

Specifies the table column into which the data is to be inserted.

The load utility cannot parse columns whose names contain one or more spaces. For example,

db2 load from delfile1 of del noheader method P (1, 2, 3, 4, 5, 6, 7, 8, 9) insert into table1 (BLOB1, S2, I3, Int 4, I5, I6, DT7, I8, TM9)

will fail because of the Int 4 column. The solution is to enclose such column names with double quotation marks:

db2 load from delfile1 of del noheader method P (1, 2, 3, 4, 5, 6, 7, 8, 9) insert into table1 (BLOB1, S2, I3, "Int 4", I5, I6, DT7, I8, TM9)

### FOR EXCEPTION table-name

Specifies the exception table into which rows in error will be copied. Any row that is in violation of a unique index or a primary key index is copied. If an unqualified table name is specified, the table will be qualified with the CURRENT SCHEMA.

Information that is written to the exception table is *not* written to the dump file. In a partitioned database environment, an exception table must be defined for those database partitions on which the loading table is defined. The dump file, otherwise, contains rows that cannot be loaded because they are invalid or have syntax errors.

When loading XML data, using the **FOR EXCEPTION** clause to specify a load exception table is not supported in the following cases:

- When using label-based access control (LBAC).
- When loading data into a partitioned table.

## NORANGEEXC

Indicates that if a row is rejected because of a range violation it will not be inserted into the exception table.

## NOUNIQUEEXC

Indicates that if a row is rejected because it violates a unique constraint it will not be inserted into the exception table.

#### STATISTICS USE PROFILE

Instructs load to collect statistics during the load according to the profile defined for this table. This profile must be created before load is executed. The profile is created by the RUNSTATS command. If the profile does not exist and load is instructed to collect statistics according to the profile, a warning is returned and no statistics are collected.

During load, distribution statistics are not collected for columns of type XML.

## STATISTICS NO

Specifies that no statistics are to be collected, and that the statistics in the catalogs are not to be altered. This is the default.

#### **COPY NO**

Specifies that the table space in which the table resides will be placed in backup pending state if forward recovery is enabled (that is, **logretain** or **userexit** is on). The **COPY NO** option will also put the table space state into the Load in Progress table space state. This is a transient state that will disappear when the load completes or aborts. The data in any table in the table space cannot be updated or deleted until a table space backup or a full database backup is made. However, it is possible to access the data in any table by using the SELECT statement.

LOAD with **COPY NO** on a recoverable database leaves the table spaces in a backup pending state. For example, performing a LOAD with **COPY NO** and **INDEXING MODE DEFERRED** will leave indexes needing a refresh. Certain queries on the table might require an index scan and will not succeed until the indexes are refreshed. The index cannot be refreshed if it resides in a table space which is in the backup pending state. In that case, access to the table will not be allowed until a backup is taken. Index refresh is done automatically by the database when the index is accessed by a query. If one of **COPY NO**, **COPY YES**, or **NONRECOVERABLE** is not specified, and the database is recoverable (**logretain** or **logarchmeth1** is enabled), then **COPY NO** is the default.

### **COPY YES**

Specifies that a copy of the loaded data will be saved. This option is invalid if forward recovery is disabled.

#### USE TSM

Specifies that the copy will be stored using Tivoli Storage Manager (TSM).

#### **OPEN** *num-sess* **SESSIONS**

The number of I/O sessions to be used with TSM or the vendor product. The default value is 1.

#### **TO** *device/directory*

Specifies the device or directory on which the copy image will be created.

## LOAD lib-name

The name of the shared library (DLL on Windows operating systems) containing the vendor backup and restore I/O functions to be used. It can contain the full path. If the full path is not given, it will default to the path where the user exit programs reside.

#### NONRECOVERABLE

Specifies that the load transaction is to be marked as nonrecoverable and that it will not be possible to recover it by a subsequent roll forward action. The roll forward utility will skip the transaction and will mark the table into which data was being loaded as "invalid". The utility will also ignore any subsequent transactions against that table. After the roll forward operation is completed, such a table can only be dropped or restored from a backup (full or table space) taken after a commit point following the completion of the non-recoverable load operation.

With this option, table spaces are not put in backup pending state following the load operation, and a copy of the loaded data does not have to be made during the load operation. If one of **COPY NO**, **COPY YES**, or **NONRECOVERABLE** is not specified, and the database is not recoverable (**logretain** or **logarchmeth1** is not enabled), then **NONRECOVERABLE** is the default.

## WITHOUT PROMPTING

Specifies that the list of data files contains all the files that are to be loaded, and that the devices or directories listed are sufficient for the entire load operation. If a continuation input file is not found, or the copy targets are filled before the load operation finishes, the load operation will fail, and the table will remain in load pending state.

If this option is not specified, and the tape device encounters an end of tape for the copy image, or the last item listed is a tape device, the user is prompted for a new tape on that device.

## DATA BUFFER buffer-size

Specifies the number of 4 KB pages (regardless of the degree of parallelism) to use as buffered space for transferring data within the utility. If the value specified is less than the algorithmic minimum, the minimum required resource is used, and no warning is returned.

This memory is allocated directly from the utility heap, whose size can be modified through the **util\_heap\_sz** database configuration parameter. Beginning in version 9.5, the value of the DATA BUFFER option of the LOAD command can temporarily exceed **util\_heap\_sz** if more memory is available in the system. In this situation, the utility heap is dynamically increased as needed until the **database\_memory** limit is reached. This memory will be released once the load operation completes.

If a value is not specified, an intelligent default is calculated by the utility at run time. The default is based on a percentage of the free space available in the utility heap at the instantiation time of the loader, as well as some characteristics of the table.

## **SORT BUFFER** buffer-size

This option specifies a value that overrides the **sortheap** database configuration parameter during a load operation. It is relevant only when loading tables with indexes and only when the **INDEXING MODE** parameter is not specified as DEFERRED. The value that is specified cannot exceed the value of **sortheap**. This parameter is useful for throttling the sort memory that is used when loading tables with many indexes without changing the value of **sortheap**, which would also affect general query processing.

## **CPU\_PARALLELISM** *n*

Specifies the number of processes or threads that the load utility will create for parsing, converting, and formatting records when building table objects. This parameter is designed to exploit the number of processes running per database partition. It is particularly useful when loading presorted data, because record order in the source data is preserved. If the value of this parameter is zero, or has not been specified, the load utility uses an intelligent default value (usually based on the number of CPUs available) at run time.

- 1. If this parameter is used with tables containing either LOB or LONG VARCHAR fields, its value becomes one, regardless of the number of system CPUs or the value specified by the user.
- 2. Specifying a small value for the **SAVECOUNT** parameter causes the loader to perform many more I/O operations to flush both data and table metadata. When **CPU\_PARALLELISM** is greater than one, the flushing operations are asynchronous, permitting the loader to exploit the CPU. When **CPU\_PARALLELISM** is set to one, the loader waits on I/O during consistency points. A load operation with **CPU\_PARALLELISM** set to two, and **SAVECOUNT** set to 10 000, completes faster than the same operation with **CPU\_PARALLELISM** set to one, even though there is only one CPU.

## **DISK\_PARALLELISM** *n*

Specifies the number of processes or threads that the load utility will create for writing data to the table space containers. If a value is not specified, the utility selects an intelligent default based on the number of table space containers and the characteristics of the table.

## FETCH\_PARALLELISM YES | NO

When performing a load from a cursor where the cursor is declared using the **DATABASE** keyword, or when using the API sqlu\_remotefetch\_entry media entry, and this option is set to YES, the load utility attempts to parallelize fetching from the remote data source if possible. If set to NO, no parallel fetching is performed. The default value is YES. For more information, see "Moving data using the CURSOR file type".

## **INDEXING MODE**

Specifies whether the load utility is to rebuild indexes or to extend them incrementally. Valid values are:

## AUTOSELECT

The load utility will automatically decide between REBUILD or INCREMENTAL mode. The decision is based on the amount of data being loaded and the depth of the index tree. Information relating to the depth of the index tree is stored in the index object. RUNSTATS is not required to populate this information. AUTOSELECT is the default indexing mode.

## REBUILD

All indexes will be rebuilt. The utility must have sufficient resources to sort all index key parts for both old and appended table data.

## INCREMENTAL

Indexes will be extended with new data. This approach consumes index free space. It only requires enough sort space to append index keys for the inserted records. This method is only supported in cases where the index object is valid and accessible at the start of a load operation (it is, for example, not valid immediately following a load operation in which the DEFERRED mode was specified). If this mode is specified, but not supported due to the state of the index, a warning is returned, and the load operation continues in REBUILD mode. Similarly, if a load restart operation is begun in the load build phase, INCREMENTAL mode is not supported.

## DEFERRED

The load utility will not attempt index creation if this mode is

specified. Indexes will be marked as needing a refresh. The first access to such indexes that is unrelated to a load operation might force a rebuild, or indexes might be rebuilt when the database is restarted. This approach requires enough sort space for all key parts for the largest index. The total time subsequently taken for index construction is longer than that required in REBUILD mode. Therefore, when performing multiple load operations with deferred indexing, it is advisable (from a performance viewpoint) to let the last load operation in the sequence perform an index rebuild, rather than allow indexes to be rebuilt at first non-load access.

Deferred indexing is only supported for tables with non-unique indexes, so that duplicate keys inserted during the load phase are not persistent after the load operation.

#### ALLOW NO ACCESS

Load will lock the target table for exclusive access during the load. The table state will be set to Load In Progress during the load. **ALLOW NO ACCESS** is the default behavior. It is the only valid option for LOAD REPLACE.

When there are constraints on the table, the table state will be set to Set Integrity Pending as well as Load In Progress. The SET INTEGRITY statement must be used to take the table out of Set Integrity Pending state.

#### ALLOW READ ACCESS

Load will lock the target table in a share mode. The table state will be set to both Load In Progress and Read Access. Readers can access the non-delta portion of the data while the table is being load. In other words, data that existed before the start of the load will be accessible by readers to the table, data that is being loaded is not available until the load is complete. LOAD TERMINATE or LOAD RESTART of an **ALLOW READ ACCESS** load can use this option; LOAD TERMINATE or LOAD RESTART of an **ALLOW NO ACCESS** load cannot use this option. Furthermore, this option is not valid if the indexes on the target table are marked as requiring a rebuild.

When there are constraints on the table, the table state will be set to Set Integrity Pending as well as Load In Progress, and Read Access. At the end of the load, the table state Load In Progress will be removed but the table states Set Integrity Pending and Read Access will remain. The SET INTEGRITY statement must be used to take the table out of Set Integrity Pending. While the table is in Set Integrity Pending and Read Access states, the non-delta portion of the data is still accessible to readers, the new (delta) portion of the data will remain inaccessible until the SET INTEGRITY statement has completed. A user can perform multiple loads on the same table without issuing a SET INTEGRITY statement. Only the original (checked) data will remain visible, however, until the SET INTEGRITY statement is issued.

ALLOW READ ACCESS also supports the following modifiers:

#### **USE** *tablespace-name*

If the indexes are being rebuilt, a shadow copy of the index is built in table space *tablespace-name* and copied over to the original table space at the end of the load during an INDEX COPY PHASE. Only system temporary table spaces can be used with this option. If not specified then the shadow index will be created in the same table space as the index object. If the shadow copy is created in the same table space as the index object, the copy of the shadow index object over the old index object is instantaneous. If the shadow copy is in a different table space from the index object a physical copy is performed. This could involve considerable I/O and time. The copy happens while the table is offline at the end of a load during the INDEX COPY PHASE.

Without this option the shadow index is built in the same table space as the original. Since both the original index and shadow index by default reside in the same table space simultaneously, there might be insufficient space to hold both indexes within one table space. Using this option ensures that you retain enough table space for the indexes.

This option is ignored if the user does not specify **INDEXING MODE REBUILD** or **INDEXING MODE AUTOSELECT**. This option will also be ignored if **INDEXING MODE AUTOSELECT** is chosen and load chooses to incrementally update the index.

#### SET INTEGRITY PENDING CASCADE

If LOAD puts the table into Set Integrity Pending state, the **SET INTEGRITY PENDING CASCADE** option allows the user to specify whether or not Set Integrity Pending state of the loaded table is immediately cascaded to all descendents (including descendent foreign key tables, descendent immediate materialized query tables and descendent immediate staging tables).

### IMMEDIATE

Indicates that Set Integrity Pending state is immediately extended to all descendent foreign key tables, descendent immediate materialized query tables and descendent staging tables. For a LOAD INSERT operation, Set Integrity Pending state is not extended to descendent foreign key tables even if the **IMMEDIATE** option is specified.

When the loaded table is later checked for constraint violations (using the IMMEDIATE CHECKED option of the SET INTEGRITY statement), descendent foreign key tables that were placed in Set Integrity Pending Read Access state will be put into Set Integrity Pending No Access state.

#### DEFERRED

Indicates that only the loaded table will be placed in the Set Integrity Pending state. The states of the descendent foreign key tables, descendent immediate materialized query tables and descendent immediate staging tables will remain unchanged.

Descendent foreign key tables might later be implicitly placed in Set Integrity Pending state when their parent tables are checked for constraint violations (using the IMMEDIATE CHECKED option of the SET INTEGRITY statement). Descendent immediate materialized query tables and descendent immediate staging tables will be implicitly placed in Set Integrity Pending state when one of its underlying tables is checked for integrity violations. A query of a table that is in the Set Integrity Pending state might succeed if an eligible materialized query table that is not in the Set Integrity Pending state is accessed by the query instead of the specified table. A warning (SQLSTATE 01586) will be issued to indicate that descendent tables have been placed in Set Integrity Pending state. See the Notes<sup>®</sup> section of the SET INTEGRITY statement in the SQL Reference for when these descendent tables will be put into Set Integrity Pending state.

If the SET INTEGRITY PENDING CASCADE option is not specified:

• Only the loaded table will be placed in Set Integrity Pending state. The state of descendent foreign key tables, descendent immediate materialized query tables and descendent immediate staging tables will remain unchanged, and can later be implicitly put into Set Integrity Pending state when the loaded table is checked for constraint violations.

If LOAD does not put the target table into Set Integrity Pending state, the **SET INTEGRITY PENDING CASCADE** option is ignored.

### LOCK WITH FORCE

The utility acquires various locks including table locks in the process of loading. Rather than wait, and possibly timeout, when acquiring a lock, this option allows load to force off other applications that hold conflicting locks on the target table. Applications holding conflicting locks on the system catalog tables will not be forced off by the load utility. Forced applications will roll back and release the locks the load utility needs. The load utility can then proceed. This option requires the same authority as the FORCE APPLICATIONS command (SYSADM or SYSCTRL).

ALLOW NO ACCESS loads might force applications holding conflicting locks at the start of the load operation. At the start of the load the utility can force applications that are attempting to either query or modify the table.

ALLOW READ ACCESS loads can force applications holding conflicting locks at the start or end of the load operation. At the start of the load the load utility can force applications that are attempting to modify the table. At the end of the load operation, the load utility can force applications that are attempting to either query or modify the table.

#### **SOURCEUSEREXIT** *executable*

Specifies an executable filename which will be called to feed data into the utility.

## REDIRECT

#### INPUT FROM

#### **BUFFER** input-buffer

The stream of bytes specified in *input-buffer* is passed into the STDIN file descriptor of the process executing the given executable.

#### **FILE** *input-file*

The contents of this client-side file are passed into the STDIN file descriptor of the process executing the given executable.

## OUTPUT TO

#### FILE output-file

The STDOUT and STDERR file descriptors are captured to the fully qualified server-side file specified.

#### PARALLELIZE

Increases the throughput of data coming into the load utility by

invoking multiple user exit processes simultaneously. This option is only applicable in multi-partition database environments and is ignored in single-partition database environments.

For more information, see "Moving data using a customized application (user exit)".

#### PARTITIONED DB CONFIG partitioned-db-option

Allows you to execute a load into a table distributed across multiple database partitions. The **PARTITIONED DB CONFIG** parameter allows you to specify partitioned database-specific configuration options. The *partitioned-db-option* values can be any of the following:

PART FILE LOCATION x OUTPUT DBPARTNUMS x PARTITIONING DBPARTNUMS x MODE x MAX NUM PART AGENTS x ISOLATE PART ERRS x STATUS INTERVAL x PORT RANGE x CHECK TRUNCATION MAP FILE INPUT x MAP FILE OUTPUT x TRACE x NEWLINE DISTFILE x OMIT HEADER RUN STAT DBPARTNUM x

Detailed descriptions of these options are provided in "Load configuration options for partitioned database environments".

## RESTARTCOUNT

Reserved.

USING directory Reserved.

## Examples

#### Example 1

TABLE1 has 5 columns:

- COL1 VARCHAR 20 NOT NULL WITH DEFAULT
- COL2 SMALLINT
- COL3 CHAR 4
- COL4 CHAR 2 NOT NULL WITH DEFAULT
- COL5 CHAR 2 NOT NULL

## ASCFILE1 has 7 elements:

- ELE1 positions 01 to 20
- ELE2 positions 21 to 22
- ELE3 positions 23 to 23
- ELE4 positions 24 to 27
- ELE5 positions 28 to 31
- ELE6 positions 32 to 32
- ELE7 positions 33 to 40

Data Records:

```
1...5....10....15....20....25....30....35....40
Test data 1 XXN 123abcdN
Test data 2 and 3 QQY wxyzN
Test data 4,5 and 6 WWN6789 Y
```

The following command loads the table from the file:

```
db2 load from ascfile1 of asc modified by striptblanks reclen=40
  method L (1 20, 21 22, 24 27, 28 31)
  null indicators (0,0,23,32)
  insert into table1 (col1, col5, col2, col3)
```

## Note:

- 1. The specification of **striptblanks** in the **MODIFIED BY** parameter forces the truncation of blanks in VARCHAR columns (COL1, for example, which is 11, 17 and 19 bytes long, in rows 1, 2 and 3, respectively).
- 2. The specification of **reclen=40** in the **MODIFIED BY** parameter indicates that there is no newline character at the end of each input record, and that each record is 40 bytes long. The last 8 bytes are not used to load the table.
- **3**. Since COL4 is not provided in the input file, it will be inserted into TABLE1 with its default value (it is defined NOT NULL WITH DEFAULT).
- 4. Positions 23 and 32 are used to indicate whether COL2 and COL3 of TABLE1 will be loaded NULL for a given row. If there is a Y in the column's null indicator position for a given record, the column will be NULL. If there is an N, the data values in the column's data positions of the input record (as defined in L(.....)) are used as the source of column data for the row. In this example, neither column in row 1 is NULL; COL2 in row 2 is NULL; and COL3 in row 3 is NULL.
- 5. In this example, the NULL INDICATORS for COL1 and COL5 are specified as 0 (zero), indicating that the data is not nullable.
- 6. The NULL INDICATOR for a given column can be anywhere in the input record, but the position must be specified, and the Y or N values must be supplied.

## Example 2 (Loading LOBs from Files)

TABLE1 has 3 columns:

- COL1 CHAR 4 NOT NULL WITH DEFAULT
- LOB1 LOB
- LOB2 LOB

ASCFILE1 has 3 elements:

- ELE1 positions 01 to 04
- ELE2 positions 06 to 13
- ELE3 positions 15 to 22

The following files reside in either /u/user1 or /u/user1/bin:

- ASCFILE2 has LOB data
- ASCFILE3 has LOB data
- ASCFILE4 has LOB data
- ASCFILE5 has LOB data
- ASCFILE6 has LOB data

ASCFILE7 has LOB data

Data Records in ASCFILE1:

```
1...5....10...15...20...25...30.
REC1 ASCFILE2 ASCFILE3
REC2 ASCFILE4 ASCFILE5
REC3 ASCFILE6 ASCFILE7
```

The following command loads the table from the file:

```
db2 load from ascfile1 of asc
  lobs from /u/user1, /u/user1/bin
  modified by lobsinfile reclen=22
  method L (1 4, 6 13, 15 22)
  insert into table1
```

Note:

- 1. The specification of **lobsinfile** in the **MODIFIED BY** parameter tells the loader that all LOB data is to be loaded from files.
- 2. The specification of **reclen=22** in the **MODIFIED BY** parameter indicates that there is no newline character at the end of each input record, and that each record is 22 bytes long.
- 3. LOB data is contained in 6 files, ASCFILE2 through ASCFILE7. Each file contains the data that will be used to load a LOB column for a specific row. The relationship between LOBs and other data is specified in ASCFILE1. The first record of this file tells the loader to place REC1 in COL1 of row 1. The contents of ASCFILE2 will be used to load LOB1 of row 1, and the contents of ASCFILE3 will be used to load LOB2 of row 1. Similarly, ASCFILE4 and ASCFILE5 will be used to load LOB1 and LOB2 of row 2, and ASCFILE6 and ASCFILE7 will be used to load the LOBs of row 3.
- 4. The LOBS FROM parameter contains 2 paths that will be searched for the named LOB files when those files are required by the loader.
- 5. To load LOBs directly from ASCFILE1 (a nondelimited ASCII file), without the **lobsinfile** modifier, the following rules must be observed:
  - The total length of any record, including LOBs, cannot exceed 32 KB.
  - LOB fields in the input records must be of fixed length, and LOB data padded with blanks as necessary.
  - The **striptblanks** modifier must be specified, so that the trailing blanks used to pad LOBs can be removed as the LOBs are inserted into the database.

#### Example 3 (Using Dump Files)

Table FRIENDS is defined as: table friends "( c1 INT NOT NULL, c2 INT, c3 CHAR(8) )"

If an attempt is made to load the following data records into this table,

23, 24, bobby , 45, john 4,, mary

the second row is rejected because the first INT is NULL, and the column definition specifies NOT NULL. Columns which contain initial characters that are not consistent with the DEL format will generate an error, and the record will be rejected. Such records can be written to a dump file. DEL data appearing in a column outside of character delimiters is ignored, but does generate a warning. For example: 22,34,"bob" 24,55,"sam" sdf

The utility will load "sam" in the third column of the table, and the characters "sdf" will be flagged in a warning. The record is not rejected. Another example: 22 3, 34, "bob"

The utility will load 22,34, "bob", and generate a warning that some data in column one following the 22 was ignored. The record is not rejected.

## Example 4 (Loading a Table with an Identity Column)

TABLE1 has 4 columns:

- C1 VARCHAR(30)
- C2 INT GENERATED BY DEFAULT AS IDENTITY
- C3 DECIMAL(7,2)
- C4 CHAR(1)

TABLE2 is the same as TABLE1, except that C2 is a GENERATED ALWAYS identity column.

Data records in DATAFILE1 (DEL format):

```
"Liszt"
"Hummel",,187.43, H
"Grieg",100, 66.34, G
"Satie",101, 818.23, I
```

Data records in DATAFILE2 (DEL format):

"Liszt", 74.49, A "Hummel", 0.01, H "Grieg", 66.34, G "Satie", 818.23, I

#### Note:

1. The following command generates identity values for rows 1 and 2, since no identity values are supplied in DATAFILE1 for those rows. Rows 3 and 4, however, are assigned the user-supplied identity values of 100 and 101, respectively.

db2 load from datafile1.del of del replace into table1

**2**. To load DATAFILE1 into TABLE1 so that identity values are generated for all rows, issue one of the following commands:

db2 load from datafile1.del of del method P(1, 3, 4)
replace into table1 (c1, c3, c4)
db2 load from datafile1.del of del modified by identityignore
replace into table1

**3**. To load DATAFILE2 into TABLE1 so that identity values are generated for each row, issue one of the following commands:

db2 load from datafile2.del of del replace into table1 (c1, c3, c4) db2 load from datafile2.del of del modified by identitymissing replace into table1

4. To load DATAFILE1 into TABLE2 so that the identity values of 100 and 101 are assigned to rows 3 and 4, issue the following command:

db2 load from datafile1.del of del modified by identityoverride replace into table2

In this case, rows 1 and 2 will be rejected, because the utility has been instructed to override system-generated identity values in favor of user-supplied values. If user-supplied values are not present, however, the row must be rejected, because identity columns are implicitly not NULL.

5. If DATAFILE1 is loaded into TABLE2 without using any of the identity-related file type modifiers, rows 1 and 2 will be loaded, but rows 3 and 4 will be rejected, because they supply their own non-NULL values, and the identity column is GENERATED ALWAYS.

#### Example 5 (Loading a Table with a Row Change Timestamp Column)

TABLE1 has 4 columns:

- C1 VARCHAR(30)
- C2 ROW CHANGE TIMESTAMP GENERATED BY DEFAULT
- C3 DECIMAL(7,2)
- C4 CHAR(1)

TABLE2 is the same as TABLE1, except that C2 is a GENERATED ALWAYS column.

Data records in DATAFILE1 (DEL format):

```
"Liszt"
"Hummel",,187.43, H
"Grieg", 2006-05-23-15.55.53.209971, 66.34, G
"Satie", 2006-05-22-19.34.14.947681, 818.23, I
```

Data records in DATAFILE2 (DEL format):

"Liszt", 74.49, A "Hummel", 0.01, H "Grieg", 66.34, G "Satie", 818.23, I

#### Note:

- The following command generates ROW CHANGE TIMESTAMP values for rows 1 and 2, since no ROW CHANGE TIMESTAMP values are supplied in DATAFILE1 for those rows. Rows 3 and 4, however, are assigned the user-supplied ROW CHANGE TIMESTAMP values of 2006-05-23-15.55.53.209971 and 2006-05-22-19.34.14.947681, respectively. db2 load from datafile1.del of del replace into table1
- **2**. To load DATAFILE1 into TABLE1 so that ROW CHANGE TIMESTAMP values are generated for all rows, issue one of the following commands:

db2 load from datafile1.del of del method P(1, 3, 4) replace into table1 (c1, c3, c4)

db2 load from datafile1.del of del modified by rowchangetimestampignore replace into table1

 To load DATAFILE2 into TABLE1 so that ROW CHANGE TIMESTAMP values are generated for each row, issue one of the following commands: db2 load from datafile2.del of del replace into table1 (c1, c3, c4)

db2 load from datafile2.del of del modified by rowchangetimestampmissing replace into table1
4. To load DATAFILE1 into TABLE2 so that the ROW CHANGE TIMESTAMP values of 2006-05-23-15.55.53.209971 and 2006-05-22-19.34.14.947681 are assigned to rows 3 and 4, issue the following command: db2 load from datafile1.del of del modified by rowchangetimestampoverride replace into table2 In this case, rows 1 and 2 will be rejected, because the utility has been

In this case, rows 1 and 2 will be rejected, because the utility has been instructed to override system-generated ROW CHANGE TIMESTAMP values in favor of user-supplied values. If user-supplied values are not present, however, the row must be rejected, because row change timestamp columns are implicitly not NULL.

5. If DATAFILE1 is loaded into TABLE2 without using any of the ROW CHANGE related file type modifiers, rows 1 and 2 will be loaded, but rows 3 and 4 will be rejected, because they supply their own non-NULL values, and the row change timestamp column is GENERATED ALWAYS.

#### Example 6 (Loading using the CURSOR file type)

Table ABC.TABLE1 has 3 columns: ONE INT TWO CHAR(10) THREE DATE

Table ABC.TABLE2 has 3 columns: ONE VARCHAR TWO INT THREE DATE

Executing the following commands will load all the data from ABC.TABLE1 into ABC.TABLE2:

db2 declare mycurs cursor for select two,one,three from abc.table1 db2 load from mycurs of cursor insert into abc.table2

If ABC.TABLE1 resides in a database different from the database ABC.TABLE2 is in, the DATABASE, USER, and USING options of the DECLARE CURSOR statement can be used to perform the load. For example, if ABC.TABLE1 resides in database DB1, and the user ID and password for DB1 are user1 and pwd1 respectively, executing the following commands will load all the data from ABC.TABLE1 into ABC.TABLE2:

db2 declare mycurs cursor database DB1 user user1 using pwd1 for select two,one,three from abc.table1

db2 load from mycurs of cursor insert into abc.table2

# Examples of loading data from XML documents

#### Loading XML data

#### Example 1

The user has constructed a data file with XDS fields to describe the documents that are to be inserted into the table. It might appear like this :

```
1, "<XDS FIL=""file1.xml"" />"
2, "<XDS FIL='file2.xml' OFF='23' LEN='45' />"
```

For the first row, the XML document is identified by the file named file1.xml. Note that since the character delimiter is the double quote character, and double quotation marks exist inside the XDS, the double quotation marks contained within the XDS are doubled. For the second row, the XML document is identified by the file named file2.xml, and starts at byte offset 23, and is 45 bytes in length.

#### Example 2

The user issues a load command without any parsing or validation options for the XML column, and the data is loaded successfully:

LOAD FROM data.del of DEL INSERT INTO mytable

#### Loading XML data from CURSOR

Loading data from cursor is the same as with a regular relational column type. The user has two tables, T1 and T2, each of which consist of a single XML column named C1. To LOAD from T1 into T2, the user will first declare a cursor: DECLARE X1 CURSOR FOR SELECT C1 FROM T1;

Next, the user may issue a LOAD using the cursor type: LOAD FROM X1 of CURSOR INSERT INTO T2

Applying the XML specific LOAD options to the cursor type is the same as loading from a file.

## Examples of using the XMLVALIDATE clause

#### XMLVALIDATE USING XDS

#### Example 1

#### USING XDS DEFAULT schema-sqlid

The user would like to validate according to the schema indicated in the XDS. If there are any XDS values without SCH attributes, these documents will be validated against the schema that is used in this clause.

XMLVALIDATE USING XDS DEFAULT S1.SCHEMA\_B

#### Example 2

The user would like to validate but IGNORE certain schemas that are mentioned in the XDS.

XMLVALIDATE USING XDS IGNORE S1.SCHEMA\_C

#### Example 3

The user would like to validate but remap some of the schemas in the XDS. XMLVALIDATE USING XDS MAP( (S1.SCHEMA\_A, S2.SCHEMA\_B), (S3.SCHEMA\_C, S5.SCHEMA\_E))

Given the above XDS, any document with an SCH attribute of S1.SCHEMA\_A will be validated against S2.SCHEMA\_B. Also, any document with an SCH attribute of S3.SCHEMA\_C will be validated against S5.SCHEMA\_E.

Example 4

The user would like to use a combination of the **DEFAULT**, **IGNORE**, and **MAP** options:

```
XMLVALIDATE USING XDS
DEFAULT S8.SCHEMA_H
IGNORE (S9.SCHEMA_I, S10.SCHEMA_J)
MAP ((S1.SCHEMA_A, S2.SCHEMA_B), (S3.SCHEMA_C, S5.SCHEMA_E),
(S6.SCHEMA_F, S3.SCHEMA_C), (S4.SCHEMA_D, S7.SCHEMA_G))
```

For an XML column that contains the following XDS: <XDS FIL='xmlfile.001.xml' />

The XML schema with SQL identifier "S8.SCHEMA\_H" is used to validate the document in file xmlfile.001.xml, since "S8.SCHEMA\_H" was specified as the default schema to use.

```
For an XML column that contains the following XDS:
<XDS FIL='xmlfile.002.xml' OFF='10' LEN='500' SCH='S10.SCHEMA J' />
```

No schema validation occurs for the document in file xmlfile.002.xml, since although the XDS specifies "S10.SCHEMA\_J" as the schema to use, that schema is part of the **IGNORE** clause. The document contents can be found at byte offset 10 in the file (meaning the 11th byte), and is 500 bytes long.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.003.xml' SCH='S6.SCHEMA\_F' />

The XML schema with SQL identifier "S3.SCHEMA\_C" is used to validate the document in file xmlfile.003.xml. This is because the **MAP** clause specifies that schema "S6.SCHEMA\_F" should be mapped to schema "S3.SCHEMA\_C". Note that further mapping does not take place, therefore the mapping of schema "S3.SCHEMA\_C" to schema "S5.SCHEMA\_E" does not apply in this case.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.004.xml' SCH='S11.SCHEMA\_K' />

The XML schema with SQL identifier "S11.SCHEMA\_K" is used to validate the document in file xmlfile.004.xml. Note that none of the **DEFAULT**, **IGNORE**, or **MAP** specifications apply in this case.

#### XMLVALIDATE USING SCHEMA

The user wants to validate all XML documents according to a single SCHEMA. For the following **XMLVALIDATE** clause: XMLVALIDATE USING SCHEMA S2.SCHEMA B

For an XML column that contains the following XDS: <XDS FIL='xmlfile.001.xml' />

The document in file xmlfile.001.xml is validated using the XML schema with SQL identifier "S2.SCHEMA\_B".

For an XML column that contains the following XDS: <XDS FIL='xmlfile.002.xml' SCH='S1.SCHEMA\_A' />

SQL identifier "S2.SCHEMA\_B". Note that the SCH attribute is ignored, since validation is being performed using a schema specified by the **USING SCHEMA** clause.

### XMLVALIDATE USING SCHEMALOCATION HINTS

The user would like to validate against schema information located within the document itself. For the following **XMLVALIDATE** clause: XMLVALIDATE USING SCHEMALOCATION HINTS

For an XML column that contains the following XDS: <XDS FIL='xmlfile.001.xml' />

The XML schema used is determined by the schemaLocation attribute in the document contents, and no validation would occur if one is not present.

For an XML column that contains the following XDS: <XDS FIL='xmlfile.002.xml' SCH='S1.SCHEMA\_A' />

The XML schema used is determined by the schemaLocation attribute in the document contents, and no validation would occur if one is not present. Note that the SCH attribute is ignored, since validation is being performed using **SCHEMALOCATION HINTS**.

# Usage notes

- Data is loaded in the sequence that appears in the input file. If a particular sequence is desired, the data should be sorted before a load is attempted. If preservation of the source data order is not required, consider using the **ANYORDER** file type modifier, described below in the "File type modifiers for the load utility" section.
- The load utility builds indexes based on existing definitions. The exception tables are used to handle duplicates on unique keys. The utility does not enforce referential integrity, perform constraints checking, or update materialized query tables that are dependent on the tables being loaded. Tables that include referential or check constraints are placed in Set Integrity Pending state. Summary tables that are defined with REFRESH IMMEDIATE, and that are dependent on tables being loaded, are also placed in Set Integrity Pending state. Issue the SET INTEGRITY statement to take the tables out of Set Integrity Pending state. Load operations cannot be carried out on replicated materialized query tables.
- If a clustering index exists on the table, the data should be sorted on the clustering index prior to loading. Data does not need to be sorted prior to loading into a multidimensional clustering (MDC) table, however.
- If you specify an exception table when loading into a protected table, any rows that are protected by invalid security labels will be sent to that table. This might allow users that have access to the exception table to access to data that they would not normally be authorized to access. For better security be careful who you grant exception table access to, delete each row as soon as it is repaired and copied to the table being loaded, and drop the exception table as soon as you are done with it.
- Security labels in their internal format might contain newline characters. If you load the file using the DEL file format, those newline characters can be mistaken

for delimiters. If you have this problem use the older default priority for delimiters by specifying the **delprioritychar** file type modifier in the LOAD command.

- For performing a load using the CURSOR file type where the DATABASE keyword was specified during the DECLARE CURSOR statement, the user ID and password used to authenticate against the database currently connected to (for the load) will be used to authenticate against the source database (specified by the DATABASE option of the DECLARE CURSOR statement). If no user ID or password was specified for the connection to the loading database, a user ID and password for the source database must be specified during the DECLARE CURSOR statement.
- Loading a multiple-part PC/IXF file whose individual parts are copied from a Windows system to an AIX system is supported. The names of all the files must be specified in the LOAD command. For example, LOAD FROM DATA.IXF, DATA.002 OF IXF INSERT INTO TABLE1. Loading to the Windows operating system from logically split PC/IXF files is not supported.
- When restarting a failed LOAD, the behavior will follow the existing behavior in that the BUILD phase will be forced to use the REBUILD mode for indexes.
- Loading XML documents between databases is not supported and returns error message SQL1407N.
- The LOAD utility does not support loading into tables that contain columns that reference fenced procedures. If you issue the LOAD command on such table, you will receive error message SQL1376N. To work around this restriction, you can redefine the routine to be unfenced, or use the import utility.

# Summary of LOAD TERMINATE and LOAD RESTART dictionary management

The following chart summarizes the compression dictionary management behavior for LOAD processing under the **TERMINATE** directive.

Table COMPRESS attribute	Does table row data dictionary exist prior to LOAD?	XML storage object dictionary exists prior to LOAD <sup>1</sup>	TERMINATE: LOAD REPLACE KEEPDICTIONARY or LOAD INSERT	TERMINATE: LOAD REPLACE RESETDICTIONARY
YES	YES	YES	Keep existing dictionaries.	Neither dictionary is kept. <sup>2</sup>
YES	YES	NO	Keep existing dictionary.	Nothing is kept. <sup>2</sup>
YES	NO	YES	Keep existing dictionary.	Nothing is kept.
YES	NO	NO	Nothing is kept.	Nothing is kept.
NO	YES	YES	Keep existing dictionaries.	Nothing is kept.
NO	YES	NO	Keep existing dictionary.	Nothing is kept.
NO	NO	YES	Keep existing dictionary.	Nothing is kept.
NO	NO	NO	Do nothing.	Do nothing.

Table 23. LOAD TERMINATE dictionary management

#### Note:

1. A compression dictionary can be created for the XML storage object of a table only if the XML columns are added to the table in DB2 Version 9.7 or later, or if the table is migrated using an online table move.

2. In the special case that the table has data capture enabled, the table row data dictionary is kept.

LOAD RESTART truncates a table up to the last consistency point reached. As part of LOAD RESTART processing, a compression dictionary will exist in the table if it was present in the table at the time the last LOAD consistency point was taken. In that case, LOAD RESTART will not create a new dictionary. For a summary of the possible conditions, see Table 4 below.

Table COMPRESS Attribute	Table row datadictionary existprior to LOADconsistencypoint?1	XML Storage object dictionary existed prior to last LOAD? <sup>2</sup>	RESTART: LOAD REPLACE KEEPDICTIONARY or LOAD INSERT	RESTART: LOAD REPLACE RESETDICTIONARY
YES	YES	YES	Keep existing dictionaries.	Keep existing dictionaries.
YES	YES	NO	Keep existing table row data dictionary and build XML dictionary subject to ADC.	Keep existing table row data dictionary and build XML dictionary.
YES	NO	YES	Build table row data dictionary subject to ADC. Keep existing XML dictionary.	Build table row data dictionary. Keep existing XML dictionary.
YES	NO	NO	Build table row data and XML dictionaries subject to ADC.	Build table row data and XML dictionaries.
NO	YES	YES	Keep existing dictionaries.	Remove existing dictionaries.
NO	YES	NO	Keep existing table row data dictionary.	Remove existing table row data dictionary.
NO	NO	YES	Keep existing XML dictionary.	Remove existing XML dictionary.
NO	NO	NO	Do nothing.	Do nothing.

Table 24. LOAD RESTART dictionary management

### Notes:

- 1. The **SAVECOUNT** option is ignored when loading XML data, load operations that fail during the load phase restart from the beginning of the operation.
- 2. A compression dictionary can be created for the XML storage object of a table only if the XML columns are added to the table in DB2 Version 9.7 or later, or if the table is migrated using an online table move.

# File type modifiers for the load utility

Table 25. Valid file type modifiers for the load utility: All file formats

Modifier	Description
anyorder	This modifier is used in conjunction with the <b>cpu_parallelism</b> parameter. Specifies that the preservation of source data order is not required, yielding significant additional performance benefit on SMP systems. If the value of <b>cpu_parallelism</b> is 1, this option is ignored. This option is not supported if <b>SAVECOUNT</b> > 0, since crash recovery after a consistency point requires that data be loaded in sequence.

Table 25. Valid file type modifiers for the load utility: All file formats (continued)

Modifier	Description
generatedignore	This modifier informs the load utility that data for all generated columns is present in the data file but should be ignored. This results in all generated column values being generated by the utility. This modifier cannot be used with either the <b>generatedmissing</b> or the <b>generatedoverride</b> modifier.
generatedmissing	If this modifier is specified, the utility assumes that the input data file contains no data for the generated column (not even NULLs). This results in all generated column values being generated by the utility. This modifier cannot be used with either the <b>generatedignore</b> or the <b>generatedoverride</b> modifier.
generatedoverride	This modifier instructs the load utility to accept user-supplied data for all generated columns in the table (contrary to the normal rules for these types of columns). This is useful when migrating data from another database system, or when loading a table from data that was recovered using the <b>RECOVER DROPPED TABLE</b> option on the ROLLFORWARD DATABASE command. When this modifier is used, any rows with no data or NULL data for a non-nullable generated column will be rejected (SQL3116W). When this modifier is used, the table will be placed in Set Integrity Pending state. To take the table out of Set Integrity Pending state without verifying the user-supplied values, issue the following command after the load operation: SET INTEGRITY FOR <i>table-name</i> GENERATED COLUMN IMMEDIATE UNCHECKED To take the table out of Set Integrity Pending state and force verification of the user-supplied values, issue the following command after the load operation: SET INTEGRITY FOR <i>table-name</i> IMMEDIATE CHECKED. When this modifier is specified and there is a generated column in any of the partitioning keys, dimension keys or distribution keys, then the LOAD command will automatically convert the modifier to <b>generatedignore</b> and proceed with the load. This will have the effect of regenerating all of the generated column values.
	This modifier cannot be used with either the <b>generatedmissing</b> or the <b>generatedignore</b> modifier.
identityignore	This modifier informs the load utility that data for the identity column is present in the data file but should be ignored. This results in all identity values being generated by the utility. The behavior will be the same for both GENERATED ALWAYS and GENERATED BY DEFAULT identity columns. This means that for GENERATED ALWAYS columns, no rows will be rejected. This modifier cannot be used with either the <b>identitymissing</b> or the <b>identityoverride</b> modifier.
identitymissing	If this modifier is specified, the utility assumes that the input data file contains no data for the identity column (not even NULLs), and will therefore generate a value for each row. The behavior will be the same for both GENERATED ALWAYS and GENERATED BY DEFAULT identity columns. This modifier cannot be used with either the <b>identityignore</b> or the <b>identityoverride</b> modifier.
identityoverride	This modifier should be used only when an identity column defined as GENERATED ALWAYS is present in the table to be loaded. It instructs the utility to accept explicit, non-NULL data for such a column (contrary to the normal rules for these types of identity columns). This is useful when migrating data from another database system when the table must be defined as GENERATED ALWAYS, or when loading a table from data that was recovered using the <b>DROPPED TABLE RECOVERY</b> option on the ROLLFORWARD DATABASE command. When this modifier is used, any rows with no data or NULL data for the identity column will be rejected (SQL3116W). This modifier cannot be used with either the <b>identitymissing</b> or the <b>identityignore</b> modifier. The load utility will not attempt to maintain or verify the uniqueness of values in the table's identity column when this option is used.

Table 25. Valid file type modifiers for the load utility: All file formats (continued)

Modifier	Description
indexfreespace=x	<i>x</i> is an integer between 0 and 99 inclusive. The value is interpreted as the percentage of each index page that is to be left as free space when load rebuilds the index. Load with <b>INDEXING MODE INCREMENTAL</b> ignores this option. The first entry in a page is added without restriction; subsequent entries are added to maintain the percent free space threshold. The default value is the one used at CREATE INDEX time. This value takes precedence over the PCTFREE value specified in the CREATE INDEX statement. The <b>indexfreespace</b> option affects index leaf pages only.
lobsinfile	<i>lob-path</i> specifies the path to the files containing LOB data. The ASC, DEL, or IXF load input files contain the names of the files having LOB data in the LOB column. This option is not supported in conjunction with the CURSOR filetype. The LOBS FROM clause specifies where the LOB files are located when the lobsinfile modifier is used. The LOBS FROM clause will implicitly activate the lobsinfile behavior. The LOBS FROM clause conveys to the LOAD utility the list of paths to search for the LOB files while loading the data.
	Each path contains at least one file that contains at least one LOB pointed to by a Lob Location Specifier (LLS) in the data file. The LLS is a string representation of the location of a LOB in a file stored in the LOB file path. The format of an LLS is <i>filename.ext.nnn.mm/</i> , where <i>filename.ext</i> is the name of the file that contains the LOB, <i>nnn</i> is the offset in bytes of the LOB within the file, and <i>mmm</i> is the length of the LOB in bytes. For example, if the string db2exp.001.123.456/ is stored in the data file, the LOB is located at offset 123 in the file db2exp.001, and is 456 bytes long.
	To indicate a null LOB, enter the size as -1. If the size is specified as 0, it is treated as a 0 length LOB. For null LOBS with length of -1, the offset and the file name are ignored. For example, the LLS of a null LOB might be db2exp.001.71/.
noheader	Skips the header verification code (applicable only to load operations into tables that reside in a single-partition database partition group). If the default MPP load (mode PARTITION_AND_LOAD) is used against a table residing in a single-partition database partition group, the file is not expected to have a header. Thus the <b>noheader</b> modifier is not needed. If the LOAD_ONLY mode is used, the file is expected to have a header. The only circumstance in which you should need to use the <b>noheader</b> modifier is if you wanted to perform LOAD_ONLY operation using a file that does not have a header.
norowwarnings	Suppresses all warnings about rejected rows.
pagefreespace=x	<i>x</i> is an integer between 0 and 100 inclusive. The value is interpreted as the percentage of each data page that is to be left as free space. If the specified value is invalid because of the minimum row size, (for example, a row that is at least 3 000 bytes long, and an <i>x</i> value of 50), the row will be placed on a new page. If a value of 100 is specified, each row will reside on a new page. The PCTFREE value of a table determines the amount of free space designated per page. If a <b>pagefreespace</b> value on the load operation or a PCTFREE value on a table have not been set, the utility will fill up as much space as possible on each page. The value set by <b>pagefreespace</b> overrides the PCTFREE value specified for the table.

Table 25. Valid file type modifiers for the load utility: All file formats (continued)

Modifier	Description
rowchangetimestampignore	This modifier informs the load utility that data for the row change timestamp column is present in the data file but should be ignored. This results in all ROW CHANGE TIMESTAMPs being generated by the utility. The behavior will be the same for both GENERATED ALWAYS and GENERATED BY DEFAULT columns. This means that for GENERATED ALWAYS columns, no rows will be rejected. This modifier cannot be used with either the <b>rowchangetimestampmissing</b> or the <b>rowchangetimestampoverride</b> modifier.
rowchangetimestampmissing	If this modifier is specified, the utility assumes that the input data file contains no data for the row change timestamp column (not even NULLs), and will therefore generate a value for each row. The behavior will be the same for both GENERATED ALWAYS and GENERATED BY DEFAULT columns. This modifier cannot be used with either the <b>rowchangetimestampignore</b> or the <b>rowchangetimestampoverride</b> modifier.
rowchangetimestampoverride	This modifier should be used only when a row change timestamp column defined as GENERATED ALWAYS is present in the table to be loaded. It instructs the utility to accept explicit, non-NULL data for such a column (contrary to the normal rules for these types of row change timestamp columns). This is useful when migrating data from another database system when the table must be defined as GENERATED ALWAYS, or when loading a table from data that was recovered using the <b>DROPPED TABLE RECOVERY</b> option on the ROLLFORWARD DATABASE command. When this modifier is used, any rows with no data or NULL data for the ROW CHANGE TIMESTAMP column will be rejected (SQL3116W). This modifier cannot be used with either the <b>rowchangetimestampmissing</b> or the <b>rowchangetimestampignore</b> modifier. The load utility will not attempt to maintain or verify the uniqueness of values in the table's row change timestamp column when this option is used.
seclabelchar	Indicates that security labels in the input source file are in the string format for security label values rather than in the default encoded numeric format. LOAD converts each security label into the internal format as it is loaded. If a string is not in the proper format the row is not loaded and a warning (SQLSTATE 01H53, SQLCODE SQL3242W) is returned. If the string does not represent a valid security label that is part of the security policy protecting the table then the row is not loaded and a warning (SQLSTATE 01H53, SQLCODE SQL3243W) is returned. This modifier cannot be specified if the <b>seclabelname</b> modifier is specified, otherwise the load fails and an error (SQLCODE SQL3525N) is returned. If you have a table consisting of a single DB2SECURITYLABEL column, the data file might look like this: "CONFIDENTIAL:ALPHA:G2" "CONFIDENTIAL;SIGMA:G2" "TOP SECRET:ALPHA:G2" To load or import this data, the <b>seclabelchar</b> file type modifier must be used: LOAD FROM input.del OF DEL MODIFIED BY SECLABELCHAR INSERT INTO t1

Table 25. Valid file type modifiers for the load utility: All file formats (continued)

Modifier	Description
seclabelname	Indicates that security labels in the input source file are indicated by their name rather than the default encoded numeric format. LOAD will convert the name to the appropriate security label if it exists. If no security label exists with the indicated name for the security policy protecting the table the row is not loaded and a warning (SQLSTATE 01H53, SQLCODE SQL3244W) is returned.
	This modifier cannot be specified if the <b>seclabelchar</b> modifier is specified, otherwise the load fails and an error (SQLCODE SQL3525N) is returned.
	If you have a table consisting of a single DB2SECURITYLABEL column, the data file might consist of security label names similar to:
	"LABEL1" "LABEL1" "LABEL2"
	To load or import this data, the <b>seclabelname</b> file type modifier must be used: LOAD FROM input.del OF DEL MODIFIED BY SECLABELNAME INSERT INTO t1
	<b>Note:</b> If the file type is ASC, any spaces following the name of the security label will be interpreted as being part of the name. To avoid this use the <b>striptblanks</b> file type modifier to make sure the spaces are removed.
totalfreespace= <i>x</i>	x is an integer greater than or equal to 0. The value is interpreted as the percentage of the total pages in the table that is to be appended to the end of the table as free space. For example, if $x$ is 20, and the table has 100 data pages after the data has been loaded, 20 additional empty pages will be appended. The total number of data pages for the table will be 120. The data pages total does not factor in the number of index pages in the table. This option does not affect the index object. If two loads are done with this option specified, the second load will not reuse the extra space appended to the end by the first load.
usedefaults	If a source column for a target table column has been specified, but it contains no data for one or more row instances, default values are loaded. Examples of missing data are:
	• For DEL files: two adjacent column delimiters (",,") or two adjacent column delimiters separated by an arbitrary number of spaces (", ,") are specified for a column value.
	• For DEL/ASC/WSF files: A row that does not have enough columns, or is not long enough for the original specification. For ASC files, NULL column values are not considered explicitly missing, and a default will not be substituted for NULL column values. NULL column values are represented by all space characters for numeric, date, time, and /timestamp columns, or by using the NULL INDICATOR for a column of any type to indicate the column is NULL.
	Without this option, if a source column contains no data for a row instance, one of the following occurs:
	• For DEL/ASC/WSF files: If the column is nullable, a NULL is loaded. If the column is not nullable, the utility rejects the row.

Table 26. Valid file type modifiers for the load utility: ASCII file formats (ASC/DEL)

Modifier	Description
codepage=x	<i>x</i> is an ASCII character string. The value is interpreted as the code page of the data in the input data set. Converts character data (and numeric data specified in characters) from this code page to the database code page during the load operation.
	The following rules apply:
	• For pure DBCS (graphic), mixed DBCS, and EUC, delimiters are restricted to the range of x00 to x3F, inclusive.
	• For DEL data specified in an EBCDIC code page, the delimiters might not coincide with the shift-in and shift-out DBCS characters.
	• <b>nullindchar</b> must specify symbols included in the standard ASCII set between code points x20 and x7F, inclusive. This refers to ASCII symbols and code points. EBCDIC data can use the corresponding symbols, even though the code points will be different.
	This option is not supported in conjunction with the CURSOR filetype.
dateformat="x"	x is the format of the date in the source file. <sup>1</sup> Valid date elements are:
	<pre>YYYY - Year (four digits ranging from 0000 - 9999) M - Month (one or two digits ranging from 1 - 12) MM - Month (two digits ranging from 1 - 12;</pre>
	A default value of 1 is assigned for each element that is not specified. Some examples of date formats are:
	"D-M-YYYY" "MM.DD.YYYY" "YYYYDDD"
dumpfile = x	<pre>x is the fully qualified (according to the server database partition) name of an exception file to which rejected rows are written. A maximum of 32 KB of data is written per record. Following is an example that shows how to specify a dump file: db2 load from data of del modified by dumpfile = /u/user/filename insert into table_name</pre>
	The file will be created and owned by the instance owner. To override the default file permissions, use the <b>dumpfileaccessall</b> file type modifier. <b>Note:</b>
	1. In a partitioned database environment, the path should be local to the loading database partition, so that concurrently running load operations do not attempt to write to the same file.
	<ol> <li>The contents of the file are written to disk in an asynchronous buffered mode. In the event of a failed or an interrupted load operation, the number of records committed to disk cannot be known with certainty, and consistency cannot be guaranteed after a LOAD RESTART. The file can only be assumed to be complete for a load operation that starts and completes in a single pass.</li> <li>If the specified file already exists, it will not be recreated, but it will be truncated.</li> </ol>

Modifier	Description	
dumpfileaccessall	Grants read access to 'OTHERS' when a dump file is created.	
	This file type modifier is only valid when:	
	1. it is used in conjunction with <b>dumpfile</b> file type modifier	
	2. the user has SELECT privilege on the load target table	
	3. it is issued on a DB2 server database partition that resides on a UNIX operating system	
	If the specified file already exists, its permissions will not be changed.	
fastparse	Use with caution. Reduces syntax checking on user-supplied column values, and enhances performance. Tables are guaranteed to be architecturally correct (the utility performs sufficient data checking to prevent a segmentation violation or trap), however, the coherence of the data is not validated. Only use this option if you are certain that your data is coherent and correct. For example, if the user-supplied data contains an invalid timestamp column value of :1>0-00-20-07.11.12.000000, this value is inserted into the table if <b>fastparse</b> is specified, and rejected if <b>fastparse</b> is not specified.	
implieddecimal	The location of an implied decimal point is determined by the column definition; it is no longer assumed to be at the end of the value. For example, the value 12345 is loaded into a DECIMAL(8,2) column as 123.45, <i>not</i> 12345.00.	
	This modifier cannot be used with the <b>packeddecimal</b> modifier.	
timeformat="x"	x is the format of the time in the source file. <sup>1</sup> Valid time elements are:	
	<ul> <li>H - Hour (one or two digits ranging from 0 - 12 for a 12 hour system, and 0 - 24 for a 24 hour system)</li> <li>HH - Hour (two digits ranging from 0 - 12 for a 12 hour system; mutually exclusive with H)</li> <li>M - Minute (one or two digits ranging from 0 - 59)</li> <li>MM - Minute (two digits ranging from 0 - 59; mutually exclusive with M)</li> <li>S - Second (one or two digits ranging from 0 - 59)</li> <li>SS - Second (two digits ranging from 0 - 59; mutually exclusive with S)</li> <li>SSSSS - Second of the day after midnight (5 digits ranging from 00000 - 86399; mutually exclusive with other time elements)</li> <li>TT - Meridian indicator (AM or PM)</li> <li>A default value of 0 is assigned for each element that is not specified. Some</li> </ul>	
	examples of time formats are: "HH:MM:SS" "HH.MM TT" "SSSSS"	

Table 26. Valid file type modifiers for the load utility: ASCII file formats (ASC/DEL) (continued)

Table 26. Valid file type modifiers for the load utility: ASCII file formats (ASC/DEL) (continued)

Modifier	Description
timestampformat="x"	x is the format of the time stamp in the source file. <sup>1</sup> Valid time stamp elements
	<pre>are: YYYY - Year (four digits ranging from 0000 - 9999) M - Month (one or two digits ranging from 1 - 12) MM - Month (two digits ranging from 01 - 12; mutually exclusive with M and MMM) MMM - Month (three-letter case-insensitive abbreviation for the month name; mutually exclusive with M and MM) D - Day (one or two digits ranging from 1 - 31) DD - Day (two digits ranging from 1 - 31; mutually exclusive with D) DDD - Day of the year (three digits ranging from 001 - 366; mutually exclusive with other day or month elements) H - Hour (one or two digits ranging from 0 - 12 for a 12 hour system, and 0 - 24 for a 24 hour system) HH - Hour (two digits ranging from 0 - 12 for a 12 hour system, and 0 - 24 for a 24 hour system; mutually exclusive with H) M - Minute (one or two digits ranging from 0 - 59; mutually exclusive with M, minute) S - Second (one or two digits ranging from 0 - 59; mutually exclusive with M, minute) S - Second (two digits ranging from 0 - 59; mutually exclusive with S) SSSSS - Second of the day after midnight (5 digits ranging from 00000 - 86399; mutually exclusive with other time elements) U (1 to 12 times) - Fractional seconds(number of occurrences of U represent the number of digits with each digit ranging from 0 to 9 TT - Meridian indicator (AM or PM)</pre>
timestampformat="x" (Continued)	A default value of 1 is assigned for unspecified YYYY, M, MM, D, DD, or DDD elements. A default value of 'Jan' is assigned to an unspecified MMM element. A default value of 0 is assigned for all other unspecified elements. Following is an example of a time stamp format: "YYYY/MM/DD HH:MM:SS.UUUUUU" The valid values for the MMM element include: 'jan', 'feb', 'mar', 'apr', 'may', 'jun', 'jul', 'aug', 'sep', 'oct', 'nov' and 'dec'. These values are case insensitive. If the <b>timestampformat</b> modifier is not specified, the load utility formats the timestamp field using one of two possible formats: YYYY-MM-DD-HH.MM.SS YYYY-MM-DD-HH.MM.SS The load utility chooses the format by looking at the separator between the DD and HH. If it is a dash '-', the load utility uses the regular dashes and dots format (YYYY-MM-DD-HH.MM.SS). If it is a blank space, then the load utility expects a colon ':' to separate the HH, MM and SS. In either format, if you include the microseconds field (UUUUUU), the load utility expects the dot '.' as the separator. Either YYYY-MM-DD- HH.MM.SS.UUUUUU or YYYY-MM-DD HH:MM:SS.UUUUUU are acceptable. The following example illustrates how to load data containing user defined date and time formats into a table called schedule: db2 load from delfile2 of del modified by timestampformat="yyyy.mm.dd hh:mm tt" insert into schedule

Modifier	Description
usegraphiccodepage	If <b>usegraphiccodepage</b> is given, the assumption is made that data being loaded into graphic or double-byte character large object (DBCLOB) data field(s) is in the graphic code page. The rest of the data is assumed to be in the character code page. The graphic codepage is associated with the character code page. LOAD determines the character code page through either the <b>codepage</b> modifier, if it is specified, or through the code page of the database if the <b>codepage</b> modifier is not specified.
	This modifier should be used in conjunction with the delimited data file generated by drop table recovery only if the table being recovered has graphic data.
	Restrictions
	The <b>usegraphiccodepage</b> modifier MUST NOT be specified with DEL files created by the EXPORT utility, as these files contain data encoded in only one code page. The <b>usegraphiccodepage</b> modifier is also ignored by the double-byte character large objects (DBCLOBs) in files.
xmlchar	Specifies that XML documents are encoded in the character code page.
	This option is useful for processing XML documents that are encoded in the specified character code page but do not contain an encoding declaration.
	For each document, if a declaration tag exists and contains an encoding attribute, the encoding must match the character code page, otherwise the row containing the document will be rejected. Note that the character codepage is the value specified by the <b>codepage</b> file type modifier, or the application codepage if it is not specified. By default, either the documents are encoded in Unicode, or they contain a declaration tag with an encoding attribute.
xmlgraphic	Specifies that XML documents are encoded in the specified graphic code page.
	This option is useful for processing XML documents that are encoded in a specific graphic code page but do not contain an encoding declaration.
	For each document, if a declaration tag exists and contains an encoding attribute, the encoding must match the graphic code page, otherwise the row containing the document will be rejected. Note that the graphic code page is the graphic component of the value specified by the <b>codepage</b> file type modifier, or the graphic component of the application code page if it is not specified. By default, documents are either encoded in Unicode, or they contain a declaration tag with an encoding attribute.

Table 26. Valid file type modifiers for the load utility: ASCII file formats (ASC/DEL) (continued)

Table 27. Valid file type modifiers for the load utility: ASC file formats (Non-delimited ASCII)

Modifier	Description
binarynumerics	Numeric (but not DECIMAL) data must be in binary form, not the character representation. This avoids costly conversions.
	This option is supported only with positional ASC, using fixed length records specified by the <b>reclen</b> option.
	The following rules apply:
	• No conversion between data types is performed, with the exception of BIGINT, INTEGER, and SMALLINT.
	• Data lengths must match their target column definitions.
	• FLOATs must be in IEEE Floating Point format.
	• Binary data in the load source file is assumed to be big-endian, regardless of the platform on which the load operation is running.
	NULLs cannot be present in the data for columns affected by this modifier. Blanks (normally interpreted as NULL) are interpreted as a binary value when this modifier is used.
nochecklengths	If <b>nochecklengths</b> is specified, an attempt is made to load each row, even if the source data has a column definition that exceeds the size of the target table column. Such rows can be successfully loaded if code page conversion causes the source data to shrink; for example, 4-byte EUC data in the source could shrink to 2-byte DBCS data in the target, and require half the space. This option is particularly useful if it is known that the source data will fit in all cases despite mismatched column definitions.
nullindchar=x	<i>x</i> is a single character. Changes the character denoting a NULL value to <i>x</i> . The default value of <i>x</i> is $Y^2$ .
	This modifier is case sensitive for EBCDIC data files, except when the character is an English letter. For example, if the NULL indicator character is specified to be the letter N, then n is also recognized as a NULL indicator.
packeddecimal	Loads packed-decimal data directly, since the <b>binarynumerics</b> modifier does not include the DECIMAL field type.
	This option is supported only with positional ASC, using fixed length records specified by the <b>reclen</b> option.
	Supported values for the sign nibble are:
	+ = $0xC  0xA  0xE  0xF$ - = $0xD  0xB$
	NULLs cannot be present in the data for columns affected by this modifier. Blanks (normally interpreted as NULL) are interpreted as a binary value when this modifier is used.
	Regardless of the server platform, the byte order of binary data in the load source file is assumed to be big-endian; that is, when using this modifier on Windows operating systems, the byte order must not be reversed.
	This modifier cannot be used with the <b>implieddecimal</b> modifier.
reclen=x	x is an integer with a maximum value of 32 767. $x$ characters are read for each row, and a newline character is not used to indicate the end of the row.

Modifier	Description
striptblanks	Truncates any trailing blank spaces when loading data into a variable-length field. If this option is not specified, blank spaces are kept.
	This option cannot be specified together with <b>striptnulls</b> . These are mutually exclusive options. This option replaces the obsolete <b>t</b> option, which is supported for earlier compatibility only.
striptnulls	Truncates any trailing NULLs (0x00 characters) when loading data into a variable-length field. If this option is not specified, NULLs are kept.
	This option cannot be specified together with <b>striptblanks</b> . These are mutually exclusive options. This option replaces the obsolete <b>padwithzero</b> option, which is supported for earlier compatibility only.
zoneddecimal	Loads zoned decimal data, since the <b>binarynumerics</b> modifier does not include the DECIMAL field type. This option is supported only with positional ASC, using fixed length records specified by the <b>reclen</b> option.
	Half-byte sign values can be one of the following:
	$\begin{array}{rcl} + &= & 0 \times C & 0 \times A & 0 \times E & 0 \times F \\ - &= & 0 \times D & 0 \times B \end{array}$
	Supported values for digits are 0x0 to 0x9.
	Supported values for zones are 0x3 and 0xF.

Table 27. Valid file type modifiers for the load utility: ASC file formats (Non-delimited ASCII) (continued)

Tahle 28	Valid file type	modifiers	for the load	1 utility, DEL	file formate	(Delimited ASCII	)
10010 20.	vana me type	mounters	ior the load	1 uunity. DEE	nic ionnais		/

Modifier	Description
chardelx	<pre>x is a single character string delimiter. The default value is a double quotation mark ("). The specified character is used in place of double quotation marks to enclose a character string.<sup>23</sup> If you want to explicitly specify the double quotation mark (") as the character string delimiter, you should specify it as follows: modified by chardel"" The single quotation mark (') can also be specified as a character string delimiter as follows: modified by chardel''</pre>
coldelx	x is a single character column delimiter. The default value is a comma (,). The specified character is used in place of a comma to signal the end of a column. <sup>23</sup>
decplusblank	Plus sign character. Causes positive decimal values to be prefixed with a blank space instead of a plus sign (+). The default action is to prefix positive decimal values with a plus sign.
decptx	x is a single character substitute for the period as a decimal point character. The default value is a period (.). The specified character is used in place of a period as a decimal point character. <sup>23</sup>

Table 28. Valid file type modifiers for the load utility: DEL file formats (Delimited ASCII) (continued)

Modifier	Description
delprioritychar	The current default priority for delimiters is: record delimiter, character delimiter, column delimiter. This modifier protects existing applications that depend on the older priority by reverting the delimiter priorities to: character delimiter, record delimiter, column delimiter. Syntax:
	db2 load modified by delprioritychar
	For example, given the following DEL data file:
	"Smith, Joshua",4000,34.98 <row delimiter=""> "Vincent,<row delimiter="">, is a manager",  4005,44.37<row delimiter=""></row></row></row>
	With the <b>delprioritychar</b> modifier specified, there will be only two rows in this data file. The second <row delimiter=""> will be interpreted as part of the first data column of the second row, while the first and the third <row delimiter=""> are interpreted as actual record delimiters. If this modifier is <i>not</i> specified, there will be three rows in this data file, each delimited by a <row delimiter="">.</row></row></row>
keepblanks	Preserves the leading and trailing blanks in each field of type CHAR, VARCHAR, LONG VARCHAR, or CLOB. Without this option, all leading and trailing blanks that are not inside character delimiters are removed, and a NULL is inserted into the table for all blank fields.
	The following example illustrates how to load data into a table called TABLE1, while preserving all leading and trailing spaces in the data file:
	db2 load from delfile3 of del modified by keepblanks insert into table1
nochardel	The load utility will assume all bytes found between the column delimiters to be part of the column's data. Character delimiters will be parsed as part of column data. This option should not be specified if the data was exported using a DB2 database system (unless <b>nochardel</b> was specified at export time). It is provided to support vendor data files that do not have character delimiters. Improper usage might result in data loss or corruption.
	This option cannot be specified with <b>chardel</b> <i>x</i> , <b>delprioritychar</b> or <b>nodoublede</b> <i>l</i> . These are mutually exclusive options.
nodoubledel	Suppresses recognition of double character delimiters.

Table 29.	Valid file	type	modifiers	for the	load	utility:	IXF	file	format
		.,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,							

Modifier	Description
forcein	Directs the utility to accept data despite code page mismatches, and to suppress translation between code pages.
	Fixed length target fields are checked to verify that they are large enough for the data. If <b>nochecklengths</b> is specified, no checking is done, and an attempt is made to load each row.
nochecklengths	If <b>nochecklengths</b> is specified, an attempt is made to load each row, even if the source data has a column definition that exceeds the size of the target table column. Such rows can be successfully loaded if code page conversion causes the source data to shrink; for example, 4-byte EUC data in the source could shrink to 2-byte DBCS data in the target, and require half the space. This option is particularly useful if it is known that the source data will fit in all cases despite mismatched column definitions.

1. Double quotation marks around the date format string are mandatory. Field separators cannot contain any of the following: a-z, A-Z, and 0-9. The field separator should not be the same as the character delimiter or field delimiter in the DEL file format. A field separator is optional if the start and end positions of an element are unambiguous. Ambiguity can exist if (depending on the modifier) elements such as D, H, M, or S are used, because of the variable length of the entries.

For time stamp formats, care must be taken to avoid ambiguity between the month and the minute descriptors, since they both use the letter M. A month field must be adjacent to other date fields. A minute field must be adjacent to other time fields. Following are some ambiguous time stamp formats:

```
"M" (could be a month, or a minute)
"M:M" (Which is which?)
"M:YYYY:M" (Both are interpreted as month.)
"S:M:YYYY" (adjacent to both a time value and a date value)
```

In ambiguous cases, the utility will report an error message, and the operation will fail.

Following are some unambiguous time stamp formats:

"M:YYYY" (Month) "S:M" (Minute) "M:YYYY:S:M" (Month....Minute) "M:H:YYYY:M:D" (Minute....Month)

Some characters, such as double quotation marks and back slashes, must be preceded by an escape character (for example,  $\)$ .

2. Character values provided for the **chardel**, **coldel**, or **decpt** file type modifiers must be specified in the code page of the source data.

The character code point (instead of the character symbol), can be specified using the syntax xJJ or 0xJJ, where JJ is the hexadecimal representation of the code point. For example, to specify the # character as a column delimiter, use one of the following:

```
... modified by coldel# ...
... modified by coldel0x23 ...
... modified by coldelX23 ...
```

- **3**. "Delimiter considerations for moving data" lists restrictions that apply to the characters that can be used as delimiter overrides.
- 4. The load utility does not issue a warning if an attempt is made to use unsupported file types with the **MODIFIED BY** option. If this is attempted, the load operation fails, and an error code is returned.
- 5. When importing into a table containing an implicitly hidden row change timestamp column, the implicitly hidden property of the column is not honoured. Therefore, the **rowchangetimestampmissing** file type modifier *must be* specified in the IMPORT command if data for the column is not present in the data to be imported and there is no explicit column list present.

codepage=N	usegraphiccodepage	LOAD behavior
Absent	Absent	All data in the file is assumed to be in the database code page, not the application code page, even if the <b>CLIENT</b> option is specified.
Present	Absent	All data in the file is assumed to be in code page N.
		<b>Warning:</b> Graphic data will be corrupted when loaded into the database if $N$ is a single-byte code page.

Table 30. LOAD behavior when using codepage and usegraphiccodepage

Table 30. LOAD behavior when using codepage and usegraphiccodepage (continued)

codepage=N	usegraphiccodepage	LOAD behavior
Absent	PresentCharacter data in the file is assumed to be in th database code page, even if the CLIENT option specified. Graphic data is assumed to be in the page of the database graphic data, even if the C option is specified.If the database code page is single-byte, then al assumed to be in the database code page.	
		<b>Warning:</b> Graphic data will be corrupted when loaded into a single-byte database.
Present	Present	Character data is assumed to be in code page N. Graphic data is assumed to be in the graphic code page of N.
		If N is a single-byte or double-byte code page, then all data is assumed to be in code page N.
		Warning: Graphic data will be corrupted when loaded into the database if N is a single-byte code page.

# LOAD QUERY

Checks the status of a load operation during processing and returns the table state. If a load is not processing, then the table state alone is returned.

A connection to the same database, and a separate CLP session are also required to successfully invoke this command. It can be used either by local or remote users.

#### Authorization

None

#### **Required connection**

Database

#### Command syntax

-SHOWDELTA

#### Command parameters

#### NOSUMMARY

Specifies that no load summary information (rows read, rows skipped, rows loaded, rows rejected, rows deleted, rows committed, and number of warnings) is to be reported.

#### SHOWDELTA

Specifies that only new information (pertaining to load events that have occurred since the last invocation of the LOAD QUERY command) is to be reported.

#### SUMMARYONLY

Specifies that only load summary information is to be reported.

#### TABLE table-name

Specifies the name of the table into which data is currently being loaded. If an unqualified table name is specified, the table will be qualified with the CURRENT SCHEMA.

#### **TO** *local-message-file*

Specifies the destination for warning and error messages that occur during the load operation. This file cannot be the *message-file* specified for the LOAD command. If the file already exists, all messages that the load utility has generated are appended to it.

## **Examples**

A user loading a large amount of data into the STAFF table in the BILLYBOB database, wants to check the status of the load operation. The user can specify:

db2 connect to billybob

db2 load query table staff to /u/mydir/staff.tempmsg

The output file /u/mydir/staff.tempmsg might look like the following: SQL3501W The table space(s) in which the table resides will not be placed in backup pending state since forward recovery is disabled for the database. SQL3109N The utility is beginning to load data from file "/u/mydir/data/staffbig.del" SQL3500W The utility is beginning the "LOAD" phase at time "03-21-2002 11:31:16.597045". SQL3519W Begin Load Consistency Point. Input record count = "0". SQL3520W Load Consistency Point was successful. SQL3519W Begin Load Consistency Point. Input record count = "104416". SQL3520W Load Consistency Point was successful. SQL3519W Begin Load Consistency Point. Input record count = "205757". SQL3520W Load Consistency Point was successful. SQL3519W Begin Load Consistency Point. Input record count = "307098". SQL3520W Load Consistency Point was successful. SQL3519W Begin Load Consistency Point. Input record count = "408439". SQL3520W Load Consistency Point was successful. SQL3532I The Load utility is currently in the "LOAD" phase. = 453376 Number of rows read Number of rows skipped = () Number of rows loaded = 453376 Number of rows rejected = 0 Number of rows deleted = 0 Number of rows committed = 408439 = 0 Number of warnings

Tablestate: Load in Progress

#### Usage notes

In addition to locks, the load utility uses table states to control access to the table. The LOAD QUERY command can be used to determine the table state; LOAD QUERY can be used on tables that are not currently being loaded. For a partitioned table, the state reported is the most restrictive of the corresponding visible data partition states. For example, if a single data partition is in the Read Access Only state and all other data partitions are in Normal state, the load query operation returns the Read Access Only state. A load operation will not leave a subset of data partitions in a state different from the rest of the table. The table states described by LOAD QUERY are as follows:

#### Normal

A table is in Normal state if it is not in any of the other (abnormal) table states. Normal state is the initial state of a table after it is created.

#### Set Integrity Pending

The table has constraints which have not yet been verified. Use the SET INTEGRITY statement to take the table out of Set Integrity Pending state.

The load utility places a table in Set Integrity Pending state when it begins a load operation on a table with constraints.

#### Load in Progress

This is a transient state that is only in effect during a load operation.

#### Load Pending

A load operation has been active on this table but has been aborted before the data could be committed. Issue a LOAD TERMINATE, LOAD RESTART, or LOAD REPLACE command to bring the table out of this state.

#### **Read Access Only**

A table is in this state during a load operation if the ALLOW READ ACCESS option was specified. Read Access Only is a transient state that allows other applications and utilities to have read access to data that existed prior to the load operation.

#### **Reorg Pending**

A REORG command recommended ALTER TABLE statement has been executed on the table. A classic REORG must be performed before the table is accessible again.

#### Unavailable

The table is unavailable. The table can only be dropped or restored from a backup. Rolling forward through a non-recoverable load operation will place a table in the unavailable state.

#### Not Load Restartable

The table is in a partially loaded state that will not allow a load restart operation. The table will also be in load pending state. Issue a LOAD TERMINATE or a LOAD REPLACE command to bring the table out of the not load restartable state. A table is placed in not load restartable state when a rollforward operation is performed after a failed load operation that has not been successfully restarted or terminated, or when a restore operation is performed from an online backup that was taken while the table was in load in progress or load pending state. In either case, the information required for a load restart operation is unreliable, and the not load restartable state prevents a load restart operation from taking place.

#### Unknown

The LOAD QUERY command is unable to determine the table state.

There are currently at least 25 table or table space states supported by the IBM DB2 database product. These states are used to control access to data under certain circumstances, or to elicit specific user actions, when required, to protect the integrity of the database. Most of them result from events related to the operation of one of the DB2 database utilities, such as the load utility, or the backup and restore utilities.

Although dependent table spaces are no longer quiesced (a quiesce is a persistent lock) prior to a load operation, the Load in Progress table space state prevents the backup of dependent tables during a load operation. The Load in Progress table space state is different from the Load in Progress table state: All load operations use the Load in Progress table state, but load operations (against a recoverable database) with the COPY NO option specified also use the Load in Progress table space state.

The following table describes each of the supported table states. The table also provides you with working examples that show you exactly how to interpret and respond to states that you might encounter while administering your database. The examples are taken from command scripts that were run on AIX; you can copy, paste and run them yourself. If you are running the DB2 database product on a system that is not UNIX, ensure that any path names are in the correct format for your system. Most of the examples are based on tables in the SAMPLE database that comes with the DB2 database product. A few examples require scenarios that are not part of the SAMPLE database, but you can use a connection to the SAMPLE database as a starting point.

Table 31. Supported table states

State	Examples
Load Pending	Given load input file staffdata.del with a substantial amount of data (for example, 20000 or more records), create a small table space that contains the target table of the load operation, a new table called NEWSTAFF:
	<pre>connect to sample; create tablespace ts1 managed by database using (file '/home/melnyk/melnyk/NODE0000 /SQL00001/ts1c1' 256); create table newstaff like staff in ts1; load from staffdata.del of del insert into newstaff; load query table newstaff; load from staffdata.del of del terminate into newstaff; load query table newstaff; connect reset;</pre>
	Information returned by the LOAD QUERY command shows that the NEWSTAFF table is in Load Pending state; after a load terminate operation, the table is in Normal state.
Load in Progress	Given load input file staffdata.del with a substantial amount of data (for example, 20000 or more records):
	connect to sample; create table newstaff like staff; load from staffdata.del of del insert into newstaff;
	While the load operation is running, execute the following script from another session:
	connect to sample; load query table newstaff; connect reset;
	Information returned by the LOAD QUERY command shows that the NEWSTAFF table is in Load in Progress state.
Normal	connect to sample; create table newstaff like staff; load query table newstaff;
	Information returned by the LOAD QUERY command shows that the NEWSTAFF table is in Normal state.

# LOAD QUERY

Table 31. Supported table states (continued)

State	Examples
Not Load Restartable	Given load input file staffdata.del with a substantial amount of data (for example, 20000 or more records):
	update db cfg for sample using logretain recovery; backup db sample;
	connect to sample; create tablespace ts1 managed by database using (file '/home/melnyk/melnyk/NODE0000 /SOL00001/ts1c1' 256):
	create table newstaff like staff in ts1; connect reset;
	backup db sample;
	The timestamp for this backup image is: 20040629205935 connect to sample:
	<pre>load from staffdata.del of del insert into newstaff copy yes to /home/melnyk/backups; connect reset;</pre>
	restore db sample taken at 20040629205935; rollforward db sample to end of logs and stop; connect to sample:
	load query table newstaff; connect reset;
	Information returned by the LOAD QUERY command shows that the NEWSTAFF table is in Not Load Restartable and Load Pending state.
	<pre>connect to sample; load from staffdata.del of del terminate into newstaff copy yes to /home/melnyk/backups; load query table newstaff; connect reset;</pre>
	Information returned by the LOAD QUERY command shows that the NEWSTAFF table is now in Normal state.
Read Access Only	Given load input file staffdata.del with a substantial amount of data (for example, 20000 or more records):
	<pre>connect to sample; export to st_data.del of del select * from staff; create table newstaff like staff;</pre>
	<pre>import from st_data.del of del insert into newstaff; load from staffdata.del of del insert into newstaff allow read access;</pre>
	While the load operation is running, execute the following script from another session:
	<pre>connect to sample; load query table newstaff; select * from newstaff; connect reset;</pre>
	Information returned by the LOAD QUERY command shows that the NEWSTAFF table is in Read Access Only and Load in Progress state. The query returns only the exported contents of the STAFF table, data that existed in the NEWSTAFF table prior to the load operation.
Set Integrity Pending	Given load input file staff_data.del with content:
I chang	11,"Melnyk",20,"Sales",10,70000,15000:
	<pre>connect to sample; alter table staff add constraint max_salary check (100000 - salary &gt; 0); load from staff_data.del of del insert into staff; load query table staff;</pre>
	Information returned by the LOAD QUERY command shows that the STAFF table is in Set Integrity Pending state.

Table 31. Supported table states (continued)

State	Examples
Unavailable	Given load input file staff_data.de1 with content:
	11,"Melnyk",20,"Sales",10,70000,15000:
	update db cfg for sample using logretain recovery; backup db sample;
	The timestamp for this backup image is: 20040629182012
	<pre>connect to sample; load from staff_data.del of del insert into staff nonrecoverable; connect reset;</pre>
	restore db sample taken at 20040629182012; rollforward db sample to end of logs and stop;
	load query table staff; connect reset;
	Unavailable state.

The progress of a load operation can also be monitored with the LIST UTILITIES command.

# **MIGRATE DATABASE**

Converts a previous version of a DB2 database to the formats corresponding to the release run by the instance. This command is deprecated and will be discontinued in a future release. You should use the UPGRADE DATABASE command instead.

# Authorization

sysadm

# **Required connection**

This command establishes a database connection.

# **Command syntax**

# **Command parameters**

#### **DATABASE** database-alias

Specifies the alias of the database to be migrated to the currently installed version of the database manager.

#### **USER** username

Identifies the user name under which the database is to be migrated.

#### **USING** password

The password used to authenticate the user name. If the password is omitted, but a user name was specified, the user is prompted to enter it.

#### Usage notes

Refer to the UPGRADE DATABASE command documentation.

# PING

Tests the network response time of the underlying connectivity between a client and a connected database server.

# Authorization

None

# **Required connection**

Database

# **Command syntax**

# **Command parameters**

db\_alias

Specifies the database alias for the database on a DRDA server that the ping is being sent to. This parameter, although mandatory, is not currently used. It is reserved for future use. Any valid database alias name can be specified.

## **REQUEST** packet\_size

Specifies the size, in bytes, of the packet to be sent to the server. The size must be between 0 and 32767 inclusive. The default is 10 bytes. This option is only valid on servers running DB2 Database for Linux, UNIX, and Windows Version 8 or later, or DB2 Universal Database for z/OS Version 8 or later.

#### **RESPONSE** *packet\_size*

Specifies the size, in bytes, of the packet to be returned back to client. The size must be between 0 and 32767 inclusive. The default is 10 bytes. This option is only valid on servers running DB2 Database for Linux, UNIX, and Windows Version 8 or later, or DB2 UDB for z/OS Version 8 or later.

### number\_of\_times

Specifies the number of iterations for this test. The value must be between 1 and 32767 inclusive. The default is 1. One timing will be returned for each iteration.

# **Examples**

Example 1

To test the network response time for the connection to the host database hostdb once:

db2 ping hostdb 1 or db2 ping hostdb

The command will display output that looks like this:

Elapsed time: 7221 microseconds

Example 2

To test the network response time for the connection to the host database hostdb 5 times:

```
db2 ping hostdb 5
or
db2 ping hostdb 5 times
```

The command will display output that looks like this:

Elapsed time: 8412 microseconds Elapsed time: 11876 microseconds Elapsed time: 7789 microseconds Elapsed time: 10124 microseconds Elapsed time: 10988 microseconds

Example 3

To test the network response time for a connection to the host database hostdb, with a 100-byte request packet and a 200-byte response packet:

```
db2 ping hostdb request 100 response 200 or
```

db2 ping hostdb request 100 response 200 1 time

# **Usage notes**

A database connection must exist before invoking this command, otherwise an error will result.

The elapsed time returned is for the connection between the IBM Data Server Client and the DB2 server.

This command will not work when it is used from a DB2 Universal Database Version 7 client through a DB2 Connect Version 8 to a connected DB2 host database server.

Processes an application program source file containing embedded SQL statements. A modified source file is produced, containing host language calls for the SQL statements and, by default, a package is created in the database.

# Scope

This command can be issued from any database partition in db2nodes.cfg. In a partitioned database environment, it can be issued from any database partition server defined in the db2nodes.cfg file. It updates the database catalogs on the catalog database partition. Its effects are visible to all database partitions.

# Authorization

One of the following authorizations:

- *dbadm* authority
- If EXPLAIN ONLY is specified, EXPLAIN authority or an authority that implicitly includes EXPLAIN is sufficient.
- If a package does not exist, BINDADD authority and:
  - If the schema name of the package does not exist, IMPLICIT\_SCHEMA authority on the database.
  - If the schema name of the package does exist, CREATEIN privilege on the schema.
- If the package exists, one of the following privileges:
  - ALTERIN privilege on the schema
  - BIND privilege on the package

In addition, if capturing explain information using the EXPLAIN or the EXPLSNAP clause, one of the following authorizations is required:

- INSERT privilege on the explain tables
- DATAACCESS authority

The user also needs all privileges required to compile any static SQL statements in the application. Privileges granted to groups are not used for authorization checking of static statements.

# **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established.

# **Command syntax**

For DB2 Database for Linux, UNIX, and Windows

–PRECOMPILE–*–filename*-PREP-

#### Notes:

- 1 NO is the default for 32 bit systems and for 64 bit Windows systems where long host variables can be used as declarations for INTEGER columns. YES is the default for 64 bit UNIX systems.
- 2 SYNTAX is a synonym for SQLERROR(CHECK).

#### For DB2 Database on servers other than Linux, UNIX and Windows

#### Notes:

- 1 If the server does not support the DATETIME DEF option, it is mapped to DATETIME ISO.
- 2 The DEGREE option is only supported by DRDA Level 2 Application Servers.
- 3 NO is the default for 32 bit systems and for 64 bit Windows systems where long host variables can be used as declarations for INTEGER columns. YES is the default for 64 bit UNIX systems.

### **Command parameters**

#### filename

Specifies the source file to be precompiled. An extension of:

- .sqc must be specified for C applications (generates a .c file)
- .sqx (Windows operating systems), or .sqC (UNIX and Linux operating systems) must be specified for C++ applications (generates a .cxx file on Windows operating systems, or a .C file on UNIX and Linux operating systems)
- .sqb must be specified for COBOL applications (generates a .cbl file)
- .sqf must be specified for FORTRAN applications (generates a .for file on Windows operating systems, or a .f file on UNIX and Linux operating systems).

The preferred extension for C++ applications containing embedded SQL on UNIX and Linux operating systems is sqC; however, the sqx convention, which was invented for systems that are not case sensitive, is tolerated by UNIX and Linux operating systems.

#### ACTION

Indicates whether the package can be added or replaced.

**ADD** Indicates that the named package does not exist, and that a new package is to be created. If the package already exists, execution stops, and a diagnostic error message is returned.

#### REPLACE

Indicates that the existing package is to be replaced by a new one with the same package name and creator. This is the default value for the ACTION option.

#### RETAIN

Indicates whether EXECUTE authorities are to be preserved when a package is replaced. If ownership of the package changes, the new owner grants the BIND and EXECUTE authority to the previous package owner.

- **NO** Does not preserve EXECUTE authorities when a package is replaced. This value is not supported by DB2.
- **YES** Preserves EXECUTE authorities when a package is replaced. This is the default value.

#### **REPLVER** version-id

Replaces a specific version of a package. The version identifier specifies which version of the package is to be replaced. If the specified version does not exist, an error is returned. If the REPLVER option of REPLACE is not specified, and a package already exists that matches the package name and version of the package being precompiled, that package will be replaced; if not, a new package will be added.

#### APREUSE

Specifies whether static SQL access plans are to be reused. When this option is enabled, the query compiler will attempt to reuse the access plans for the statement in any existing packages during the bind and during future implicit and explicit rebinds.

- **YES** The query compiler will attempt to reuse the access plans for the statements in the package. If there is an existing package, the query compiler will attempt to reuse the access plan for every statement that can be matched with a statement in the new bind file. For a statement to match, the statement text must be identical and the section number for the statement in the existing package must match what the section number will be for the statement in the new package.
- **NO** The query compiler will not attempt to reuse access plans for the statements in the package. This is the default setting.

#### **BINDFILE**

Results in the creation of a bind file. A package is not created unless the

package option is also specified. If a bind file is requested, but no package is to be created, as in the following example:

db2 prep sample.sqc bindfile

object existence and authorization SQLCODEs will be treated as warnings instead of errors. This will allow a bind file to be successfully created, even if the database being used for precompilation does not have all of the objects referred to in static SQL statements within the application. The bind file can be successfully bound, creating a package, once the required objects have been created.

#### **USING** *bind-file*

The name of the bind file that is to be generated by the precompiler. The file name must have an extension of .bnd. If a file name is not entered, the precompiler uses the name of the program (entered as the *filename* parameter), and adds the .bnd extension. If a path is not provided, the bind file is created in the current directory.

#### BLOCKING

Specifies the type of row blocking for cursors. The blocking of row data that contains references to LOB column data types is also supported in partitioned database environments.

**ALL** For cursors that are specified with the FOR READ ONLY clause or cursors not specified as FOR UPDATE, blocking occurs.

Ambiguous cursors are treated as read-only.

**NO** Blocking does not occur for any cursor.

For the definition of a read-only cursor and an ambiguous cursor, refer to *DECLARE CURSOR statement*.

Ambiguous cursors are treated as updatable.

#### UNAMBIG

For cursors that are specified with the FOR READ ONLY clause, blocking occurs.

Cursors that are not declared with the FOR READ ONLY or FOR UPDATE clause which are not ambiguous and are read-only will be blocked. Ambiguous cursors will not be blocked.

Ambiguous cursors are treated as updatable.

#### CALL\_RESOLUTION

If set, the CALL\_RESOLUTION DEFERRED option indicates that the CALL statement will be executed as an invocation of the deprecated sqleproc() API. If not set or if IMMEDIATE is set, the CALL statement will be executed as a normal SQL statement. SQL0204 will be issued if the precompiler fails to resolve the procedure on a CALL statement with CALL\_RESOLUTION IMMEDIATE.

#### **CCSIDG** *double-ccsid*

An integer specifying the coded character set identifier (CCSID) to be used for double byte characters in character column definitions (without a specific CCSID clause) in CREATE and ALTER TABLE SQL statements. This option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.
## **CCSIDM** mixed-ccsid

An integer specifying the coded character set identifier (CCSID) to be used for mixed byte characters in character column definitions (without a specific CCSID clause) in CREATE and ALTER TABLE SQL statements. This option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.

#### **CCSIDS** *sbcs-ccsid*

An integer specifying the coded character set identifier (CCSID) to be used for single byte characters in character column definitions (without a specific CCSID clause) in CREATE and ALTER TABLE SQL statements. This option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.

#### CHARSUB

Designates the default character sub-type that is to be used for column definitions in CREATE and ALTER TABLE SQL statements. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows.

**BIT** Use the FOR BIT DATA SQL character sub-type in all new character columns for which an explicit sub-type is not specified.

## DEFAULT

Use the target system defined default in all new character columns for which an explicit sub-type is not specified.

## MIXED

Use the FOR MIXED DATA SQL character sub-type in all new character columns for which an explicit sub-type is not specified.

**SBCS** Use the FOR SBCS DATA SQL character sub-type in all new character columns for which an explicit sub-type is not specified.

## CNULREQD

This option is related to the LANGLEVEL precompile option. It is valid only if the bind file is created from a C or a C++ application. This bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows.

- **NO** The application was coded on the basis of the LANGLEVEL SAA1 precompile option with respect to the null terminator in C string host variables.
- **YES** The application was coded on the basis of the LANGLEVEL MIA precompile option with respect to the null terminator in C string host variables.

## **COLLECTION** schema-name

Specifies a 128-byte collection identifier for the package. If not specified, the authorization identifier for the user processing the package is used.

## CONCURRENTACCESSRESOLUTION

Specifies the concurrent access resolution to use for statements in the package.

#### **USE CURRENTLY COMMITTED**

Specifies that the database manager can use the currently committed version of the data for applicable scans when it is in the process of being updated or deleted. Rows in the process of being inserted can be skipped. This clause applies when the isolation level in effect is Cursor Stability or Read Stability (for Read Stability it skips uncommited inserts only) and is ignored otherwise. Applicable scans include read-only scans that can be part of a read-only statement as well as a non read-only statement. The settings for the registry variables

DB2\_EVALUNCOMMITTED, DB2\_SKIPDELETED, and DB2\_SKIPINSERTED do not apply to scans using currently committed. However, the settings for these registry variables still apply to scans that do not use currently committed.

## WAIT FOR OUTCOME

Specifies Cursor Stability and higher scans to wait for the commit or rollback when encountering data in the process of being updated. Rows in the process of being inserted or deleted rows are not skipped. The settings for the registry variables DB2\_EVALUNCOMMITTED, DB2\_SKIPDELETED, and DB2\_SKIPINSERTED no longer apply.

#### CONNECT

- 1 Specifies that a CONNECT statement is to be processed as a type 1 CONNECT.
- 2 Specifies that a CONNECT statement is to be processed as a type 2 CONNECT.

## DATETIME

Specifies the date and time format to be used.

- **DEF** Use a date and time format associated with the territory code of the database.
- EUR Use the IBM standard for Europe date and time format.
- **ISO** Use the date and time format of the International Standards Organization.
- **JIS** Use the date and time format of the Japanese Industrial Standard.
- **LOC** Use the date and time format in local form associated with the territory code of the database.
- **USA** Use the IBM standard for U.S. date and time format.

## DBPROTOCOL

Specifies what protocol to use when connecting to a remote site that is identified by a three-part name statement. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

- **DEC** Specifies the maximum precision to be used in decimal arithmetic operations. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.
  - 15 15-digit precision is used in decimal arithmetic operations.
  - 31 31-digit precision is used in decimal arithmetic operations.

#### DECDEL

Designates whether a period (.) or a comma (,) will be used as the decimal point indicator in decimal and floating point literals. This precompile/bind

option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.

#### COMMA

Use a comma (,) as the decimal point indicator.

#### PERIOD

Use a period (.) as the decimal point indicator.

#### DEFERRED\_PREPARE

Provides a performance enhancement when accessing DB2 common server databases or DRDA databases. This option combines the SQL PREPARE statement flow with the associated OPEN, DESCRIBE, or EXECUTE statement flow to minimize inter-process or network flow.

- **NO** The PREPARE statement will be executed at the time it is issued.
- **YES** Execution of the PREPARE statement will be deferred until the corresponding OPEN, DESCRIBE, or EXECUTE statement is issued.

The PREPARE statement will not be deferred if it uses the INTO clause, which requires an SQLDA to be returned immediately. However, if the PREPARE INTO statement is issued for a cursor that does not use any parameter markers, the processing will be optimized by pre-OPENing the cursor when the PREPARE is executed.

ALL Same as YES, except that a PREPARE INTO statement is also deferred. If the PREPARE statement uses the INTO clause to return an SQLDA, the application must not reference the content of this SQLDA until the OPEN, DESCRIBE, or EXECUTE statement is issued and returned.

#### DEGREE

Specifies the degree of parallelism for the execution of static SQL statements in an SMP system. This option does not affect CREATE INDEX parallelism.

1 The execution of the statement will not use parallelism.

#### degree-of-parallelism

Specifies the degree of parallelism with which the statement can be executed, a value between 2 and 32 767 (inclusive).

**ANY** Specifies that the execution of the statement can involve parallelism using a degree determined by the database manager.

## DISCONNECT

## AUTOMATIC

Specifies that all database connections are to be disconnected at commit.

## CONDITIONAL

Specifies that the database connections that have been marked RELEASE or have no open WITH HOLD cursors are to be disconnected at commit.

#### EXPLICIT

Specifies that only database connections that have been explicitly marked for release by the RELEASE statement are to be disconnected at commit.

## DYNAMICRULES

Defines which rules apply to dynamic SQL at run time for the initial setting of the values used for authorization ID and for the implicit qualification of unqualified object references.

- **RUN** Specifies that the authorization ID of the user executing the package is to be used for authorization checking of dynamic SQL statements. The authorization ID will also be used as the default package qualifier for implicit qualification of unqualified object references within dynamic SQL statements. This is the default value.
- **BIND** Specifies that all of the rules that apply to static SQL for authorization and qualification are to be used at run time. That is, the authorization ID of the package owner is to be used for authorization checking of dynamic SQL statements, and the default package qualifier is to be used for implicit qualification of unqualified object references within dynamic SQL statements.

#### DEFINERUN

If the package is used within a routine context, the authorization ID of the routine definer is to be used for authorization checking and for implicit qualification of unqualified object references within dynamic SQL statements within the routine.

If the package is used as a standalone application, dynamic SQL statements are processed as if the package were bound with DYNAMICRULES RUN.

#### DEFINEBIND

If the package is used within a routine context, the authorization ID of the routine definer is to be used for authorization checking and for implicit qualification of unqualified object references within dynamic SQL statements within the routine.

If the package is used as a standalone application, dynamic SQL statements are processed as if the package were bound with DYNAMICRULES BIND.

#### **INVOKERUN**

If the package is used within a routine context, the current statement authorization ID in effect when the routine is invoked is to be used for authorization checking of dynamic SQL statements and for implicit qualification of unqualified object references within dynamic SQL statements within that routine.

If the package is used as a standalone application, dynamic SQL statements are processed as if the package were bound with DYNAMICRULES RUN.

#### **INVOKEBIND**

If the package is used within a routine context, the current statement authorization ID in effect when the routine is invoked is to be used for authorization checking of dynamic SQL statements and for implicit qualification of unqualified object references within dynamic SQL statements within that routine. If the package is used as a standalone application, dynamic SQL statements are processed as if the package were bound with DYNAMICRULES BIND.

Because dynamic SQL statements will be using the authorization ID of the package owner in a package exhibiting bind behavior, the binder of the package should not have any authorities granted to them that the user of the package should not receive. Similarly, when defining a routine that will exhibit define behavior, the definer of the routine should not have any authorities granted to them that the user of the package should not receive since a dynamic statement will be using the authorization ID of the routine's definer.

The following dynamically prepared SQL statements cannot be used within a package that was not bound with DYNAMICRULES RUN: GRANT, REVOKE, ALTER, CREATE, DROP, COMMENT ON, RENAME, SET INTEGRITY, and SET EVENT MONITOR STATE.

## **ENCODING**

Specifies the encoding for all host variables in static statements in the plan or package. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

## **EXPLAIN**

Stores information in the Explain tables about the access plans chosen for each SQL statement in the package.

- **NO** Explain information will not be captured.
- **YES** Explain tables will be populated with information about the chosen access plan at prep/bind time for static statements and at run time for incremental bind statements.

If the package is to be used for a routine and the package contains incremental bind statements, then the routine must be defined as MODIFIES SQL DATA. If this is not done, incremental bind statements in the package will cause a run time error (SQLSTATE 42985).

## REOPT

Explain information for each reoptimizable incremental bind SQL statement will be placed in the Explain tables at run time. In addition, Explain information will be gathered for reoptimizable dynamic SQL statements at run time, even if the CURRENT EXPLAIN MODE special register is set to NO.

If the package is to be used for a routine, then the routine must be defined as MODIFIES SQL DATA, otherwise incremental bind and dynamic statements in the package will cause a run time error (SQLSTATE 42985).

**ONLY** The ONLY option allows you to explain statements without having the privilege to execute them. The explain tables are populated but no persistent package is created. If an existing package with the same name and version is encountered during the bind process, the existing package is neither dropped nor replaced even if you specified ACTION REPLACE. If an error occurs during population of the explain tables, explain information is not added for the statement that returned the error and for any statements that follow it. ALL Explain information for each eligible static SQL statement will be placed in the Explain tables at prep/bind time. Explain information for each eligible incremental bind SQL statement will be placed in the Explain tables at run time. In addition, Explain information will be gathered for eligible dynamic SQL statements at run time, even if the CURRENT EXPLAIN MODE special register is set to N0.

If the package is to be used for a routine, then the routine must be defined as MODIFIES SQL DATA, otherwise incremental bind and dynamic statements in the package will cause a run time error (SQLSTATE 42985).

## EXPLSNAP

Stores Explain Snapshot information in the Explain tables.

- **NO** An Explain Snapshot will not be captured.
- **YES** An Explain Snapshot for each eligible static SQL statement will be placed in the Explain tables at prep/bind time for static statements and at run time for incremental bind statements.

If the package is to be used for a routine and the package contains incremental bind statements, then the routine must be defined as MODIFIES SQL DATA or incremental bind statements in the package will cause a run time error (SQLSTATE 42985).

## REOPT

Explain Snapshot information for each reoptimizable incremental bind SQL statement will be placed in the Explain tables at run time. In addition, Explain Snapshot information will be gathered for reoptimizable dynamic SQL statements at run time, even if the CURRENT EXPLAIN SNAPSHOT special register is set to NO.

If the package is to be used for a routine, then the routine must be defined as MODIFIES SQL DATA, otherwise incremental bind and dynamic statements in the package will cause a run time error (SQLSTATE 42985).

ALL An Explain Snapshot for each eligible static SQL statement will be placed in the Explain tables at prep/bind time. Explain Snapshot information for each eligible incremental bind SQL statement will be placed in the Explain tables at run time. In addition, Explain Snapshot information will be gathered for eligible dynamic SQL statements at run time, even if the CURRENT EXPLAIN SNAPSHOT special register is set to N0.

If the package is to be used for a routine, then the routine must be defined as MODIFIES SQL DATA, or incremental bind and dynamic statements in the package will cause a run time error (SQLSTATE 42985).

## EXTENDEDINDICATOR

Enables the recognition of extended indicator variable values during the execution of the associated plan or package.

- **NO** Extended indicator variable values are not recognized. Indicator variables are normal indicator variables; negative indicator variable values imply null, and positive or zero values imply non-null. This is the default condition.
- **YES** Extended indicator variable values are recognized. Using any

non-recognized indicator variable values, or using the default or unassigned indicator variable-based values in a non-supported location will cause DB2 database manager to generate an error message during execution of the bound statement.

#### FEDERATED

Specifies whether a static SQL statement in a package references a nickname or a federated view. If this option is not specified and a static SQL statement in the package references a nickname or a federated view, a warning is returned and the package is created.

- **NO** A nickname or federated view is not referenced in the static SQL statements of the package. If a nickname or federated view is encountered in a static SQL statement during the prepare or bind phase of this package, an error is returned and the package is *not* created.
- **YES** A nickname or federated view can be referenced in the static SQL statements of the package. If no nicknames or federated views are encountered in static SQL statements during the prepare or bind of the package, no errors or warnings are returned and the package is created.

## FEDERATED\_ASYNCHRONY

Specifies the maximum number of asynchrony table queues (ATQs) that the federated server supports in the access plan for programs that use embedded SQL.

- **ANY** The optimizer determines the number of ATQs for the access plan. The optimizer assigns an ATQ to all eligible SHIP or remote pushdown operators in the plan. The value that is specified for DB2\_MAX\_ASYNC\_REQUESTS\_PER\_QUERY server option limits the number of asynchronous requests.
- number\_of\_atqs\_in\_the\_plan

The number of ATQs in the plan. You specify a number in the range 0 to 32767.

#### FUNCPATH

Specifies the function path to be used in resolving user-defined distinct types and functions in static SQL. If this option is not specified, the default function path is "SYSIBM", "SYSFUN", USER where USER is the value of the USER special register.

#### schema-name

An SQL identifier, either ordinary or delimited, which identifies a schema that exists at the application server. No validation that the schema exists is made at precompile or at bind time. The same schema cannot appear more than once in the function path. The schema name SYSPUBLIC cannot be specified for the function path. The number of schemas that can be specified is limited by the length of the resulting function path, which cannot exceed 2048 bytes. The schema SYSIBM does not need to be explicitly specified; it is implicitly assumed to be the first schema if it is not included in the function path.

#### INSERT

Allows a program being precompiled or bound against a DB2 Enterprise Server Edition server to request that data inserts be buffered to increase performance.

- **BUF** Specifies that inserts from an application should be buffered.
- **DEF** Specifies that inserts from an application should not be buffered.

#### **GENERIC** "string"

Supports the binding of new options that are defined in the target database. Do not use this option to pass bind options that *are* defined in BIND or PRECOMPILE. The syntax is as follows:

generic "option1 value1 option2 value2 ..."

Each option and value must be separated by one or more blank spaces. For example, one could use the following to bind each of the OPT1, OPT2, and OPT3 options:

generic "opt1 value1 opt2 value2 opt3 value3"

The maximum length of the string is 4096 bytes. The maximum length of each option name in the string is 255 bytes.

## **IMMEDWRITE**

Indicates whether immediate writes will be done for updates made to group buffer pool dependent pagesets or database partitions. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

## ISOLATION

Determines how far a program bound to this package can be isolated from the effect of other executing programs.

- **CS** Specifies Cursor Stability as the isolation level.
- **NC** No Commit. Specifies that commitment control is not to be used. This isolation level is not supported by DB2.
- **RR** Specifies Repeatable Read as the isolation level.
- **RS** Specifies Read Stability as the isolation level. Read Stability ensures that the execution of SQL statements in the package is isolated from other application processes for rows read and changed by the application.
- **UR** Specifies Uncommitted Read as the isolation level.

## LANGLEVEL

Specifies the SQL rules that apply for both the syntax and the semantics for both static and dynamic SQL in the application.

- MIA Select the ISO/ANS SQL92 rules as follows:
  - To support error SQLCODE or SQLSTATE checking, an SQLCA must be declared in the application code.
  - C null-terminated strings are padded with blanks and always include a null-terminating character, even if truncation occurs.
  - The FOR UPDATE clause is optional for all columns to be updated in a positioned UPDATE.
  - A searched UPDATE or DELETE requires SELECT privilege on the object table of the UPDATE or DELETE statement if a column of the object table is referenced in the search condition or on the right hand side of the assignment clause.
  - A column function that can be resolved using an index (for example MIN or MAX) will also check for nulls and return warning SQLSTATE 01003 if there were any nulls.

- An error is returned when a duplicate unique constraint is included in a CREATE or ALTER TABLE statement.
- An error is returned when no privilege is granted and the grantor has no privileges on the object (otherwise a warning is returned).
- SAA1 Select the common IBM DB2 rules as follows:
  - To support error SQLCODE or SQLSTATE checking, an SQLCA must be declared in the application code.
  - C null-terminated strings are not terminated with a null character if truncation occurs.
  - The FOR UPDATE clause is required for all columns to be updated in a positioned UPDATE.
  - A searched UPDATE or DELETE will not require SELECT privilege on the object table of the UPDATE or DELETE statement unless a fullselect in the statement references the object table.
  - A column function that can be resolved using an index (for example MIN or MAX) will not check for nulls and warning SQLSTATE 01003 is not returned.
  - A warning is returned and the duplicate unique constraint is ignored.
  - An error is returned when no privilege is granted.

## SQL92E

Defines the ISO/ANS SQL92 rules as follows:

- To support checking of SQLCODE or SQLSTATE values, variables by this name can be declared in the host variable declare section (if neither is declared, SQLCODE is assumed during precompilation).
- C null-terminated strings are padded with blanks and always include a null-terminating character, even if truncation occurs.
- The FOR UPDATE clause is optional for all columns to be updated in a positioned UPDATE.
- A searched UPDATE or DELETE requires SELECT privilege on the object table of the UPDATE or DELETE statement if a column of the object table is referenced in the search condition or on the right hand side of the assignment clause.
- A column function that can be resolved using an index (for example MIN or MAX) will also check for nulls and return warning SQLSTATE 01003 if there were any nulls.
- An error is returned when a duplicate unique constraint is included in a CREATE or ALTER TABLE statement.
- An error is returned when no privilege is granted and the grantor has no privileges on the object (otherwise a warning is returned).

## **KEEPDYNAMIC**

Specifies whether dynamic SQL statements are to be kept after commit points. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

**LEVEL** consistency-token

Defines the level of a module using the consistency token. The consistency

token is any alphanumeric value up to 8 characters in length. The RDB package consistency token verifies that the requester's application and the relational database package are synchronized. This option is not recommended for general use.

## LONGERROR

Indicates whether long host variable declarations will be treated as an error. For portability, sqlint32 can be used as a declaration for an INTEGER column in precompiled C and C++ code.

- NO Does not generate errors for the use of long host variable declarations. This is the default for 32 bit systems and for 64 bit Windows systems where long host variables can be used as declarations for INTEGER columns. The use of this option on 64 bit UNIX platforms will allow long host variables to be used as declarations for BIGINT columns.
- **YES** Generates errors for the use of long host variable declarations. This is the default for 64 bit UNIX systems.

#### **MESSAGES** *message-file*

Specifies the destination for warning, error, and completion status messages. A message file is created whether the bind is successful or not. If a message file name is not specified, the messages are written to standard output. If the complete path to the file is not specified, the current directory is used. If the name of an existing file is specified, the contents of the file are overwritten.

#### **NOLINEMACRO**

Suppresses the generation of the #line macros in the output .c file. Useful when the file is used with development tools which require source line information such as profiles, cross-reference utilities, and debuggers. This precompile option is used for the  $C/C^{++}$  programming languages only.

#### **OPTHINT**

Controls whether query optimization hints are used for static SQL. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

# OPTLEVEL

Indicates whether the C/C++ precompiler is to optimize initialization of internal SQLDAs when host variables are used in SQL statements. Such optimization can increase performance when a single SQL statement (such as FETCH) is used inside a tight loop.

- **0** Instructs the precompiler not to optimize SQLDA initialization.
- 1 Instructs the precompiler to optimize SQLDA initialization. This value should not be specified if the application uses:
  - pointer host variables, as in the following example:

exec sql begin declare section; char (\*name)[20]; short \*id; exec sql end declare section;

• C++ data members directly in SQL statements.

## **OPTPROFILE** *optimization-profile-name*

Specifies the name of an existing optimization profile to be used for all static statements in the package. The default value of the option is an empty string. The value also applies as the default for dynamic preparation of DML statements for which the CURRENT OPTIMIZATION PROFILE

special register is null. If the specified name is unqualified, it is an SQL identifier, which is implicitly qualified by the QUALIFIER bind option.

The BIND command does not process the optimization file, but only validates that the name is syntactically valid. Therefore if the optimization profile does not exist or is invalid, an SQL0437W warning with reason code 13 will not occur until a DML statement is optimized using that optimization profile.

## **OUTPUT** filename

Overrides the default name of the modified source file produced by the compiler. It can include a path.

## **OS400NAMING**

Specifies which naming option is to be used when accessing DB2 for System i data. Supported by DB2 for System i only. For a list of supported option values, refer to the documentation for DB2 for System i.

Because of the slashes used as separators, a DB2 utility can still report a syntax error at execution time on certain SQL statements which use the System i system naming convention, even though the utility might have been precompiled or bound with the OS400NAMING SYSTEM option. For example, the Command Line Processor will report a syntax error on an SQL CALL statement if the System i system naming convention is used, whether or not it has been precompiled or bound using the OS400NAMING SYSTEM option.

#### **OWNER** authorization-id

Designates a 128-byte authorization identifier for the package owner. The owner must have the privileges required to execute the SQL statements contained in the package. Only a user with DBADM authority can specify an authorization identifier other than the user ID. The default value is the primary authorization ID of the precompile/bind process. SYSIBM, SYSCAT, and SYSSTAT are not valid values for this option. The *authorization-id* can only be a user (cannot be a role or a group).

#### PACKAGE

Creates a package. If neither PACKAGE, BINDFILE, nor SYNTAX is specified, a package is created in the database by default.

#### **USING** *package-name*

The name of the package that is to be generated by the precompiler. If a name is not entered, the name of the application program source file (minus extension and folded to uppercase) is used. Maximum length is 128 bytes.

#### **PREPROCESSOR** "preprocessor-command"

Specifies the preprocessor command that can be executed by the precompiler before it processes embedded SQL statements. The preprocessor command string (maximum length 1024 bytes) must be enclosed either by double or by single quotation marks.

This option enables the use of macros within the declare section. A valid preprocessor command is one that can be issued from the command line to invoke the preprocessor without specifying a source file. For example,

x1c -P -DMYMACRO=0

#### **QUALIFIER** qualifier-name

Provides an 128-byte implicit qualifier for unqualified objects contained in the package. The default is the owner's authorization ID, whether or not **owner** is explicitly specified.

#### **QUERYOPT** optimization-level

Indicates the desired level of optimization for all static SQL statements contained in the package. The default value is 5. The SET CURRENT QUERY OPTIMIZATION statement describes the complete range of optimization levels available.

#### RELEASE

Indicates whether resources are released at each COMMIT point, or when the application terminates. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows.

#### COMMIT

Release resources at each COMMIT point. Used for dynamic SQL statements.

#### DEALLOCATE

Release resources only when the application terminates.

#### REOPT

Specifies whether to have DB2 optimize an access path using values for host variables, parameter markers, global variables, and special registers. Valid values are:

## NONE

The access path for a given SQL statement containing host variables, parameter markers, global variables, or special registers will not be optimized using real values for these variables. The default estimates for the these variables will be used instead, and this plan is cached and used subsequently. This is the default behavior.

**ONCE** The access path for a given SQL statement will be optimized using the real values of the host variables, parameter markers, global variables, or special registers when the query is first executed. This plan is cached and used subsequently.

## ALWAYS

The access path for a given SQL statement will always be compiled and reoptimized using the values of the host variables, parameter markers, global variables, or special registers known at each execution time.

## **REOPT | NOREOPT VARS**

These options have been replaced by REOPT ALWAYS and REOPT NONE; however, they are still supported for compatibility with previous releases. Specifies whether to have DB2 determine an access path at run time using values for host variables, global variables, parameter markers, and special registers. Supported by DB2 for OS/390 only. For a list of supported option values, refer to the documentation for DB2 for OS/390.

#### **SQLCA**

For FORTRAN applications only. This option is ignored if it is used with other languages.

#### NONE

Specifies that the modified source code is not consistent with the SAA definition.

**SAA** Specifies that the modified source code is consistent with the SAA definition.

## SQLERROR

Indicates whether to create a package or a bind file if an error is encountered.

## CHECK

Specifies that the target system performs all syntax and semantic checks on the SQL statements being bound. A package will not be created as part of this process. If, while binding, an existing package with the same name and version is encountered, the existing package is neither dropped nor replaced even if ACTION REPLACE was specified.

## CONTINUE

Creates a package, even if errors occur when binding SQL statements. Those statements that failed to bind for authorization or existence reasons can be incrementally bound at execution time if VALIDATE RUN is also specified. Any attempt to execute them at run time generates an error (SQLCODE -525, SQLSTATE 51015).

## NOPACKAGE

A package or a bind file is not created if an error is encountered.

## SQLFLAG

Identifies and reports on deviations from the SQL language syntax specified in this option.

A bind file or a package is created only if the BINDFILE or the PACKAGE option is specified, in addition to the SQLFLAG option.

Local syntax checking is performed only if one of the following options is specified:

- BINDFILE
- PACKAGE
- SQLERROR CHECK
- SYNTAX

If SQLFLAG is not specified, the flagger function is not invoked, and the bind file or the package is not affected.

## SQL92E SYNTAX

The SQL statements will be checked against ANSI or ISO SQL92 Entry level SQL language format and syntax with the exception of syntax rules that would require access to the database catalog. Any deviation is reported in the precompiler listing.

## MVSDB2V23 SYNTAX

The SQL statements will be checked against MVS DB2 Version 2.3 SQL language syntax. Any deviation from the syntax is reported in the precompiler listing.

#### MVSDB2V31 SYNTAX

The SQL statements will be checked against MVS DB2 Version 3.1 SQL language syntax. Any deviation from the syntax is reported in the precompiler listing.

## MVSDB2V41 SYNTAX

The SQL statements will be checked against MVS DB2 Version 4.1 SQL language syntax. Any deviation from the syntax is reported in the precompiler listing.

#### SORTSEQ

Specifies which sort sequence table to use on the System i system. Supported by DB2 for System i only. For a list of supported option values, refer to the documentation for DB2 for System i.

#### **SQLRULES**

Specifies:

- Whether type 2 CONNECTs are to be processed according to the DB2 rules or the Standard (STD) rules based on ISO/ANS SQL92.
- How an application specifies the format of LOB columns in the result set.

#### DB2

- Permits the SQL CONNECT statement to switch the current connection to another established (*dormant*) connection.
- This default setting allows an application to specify whether LOB values or LOB locators are retrieved only during the first fetch request. Subsequent fetch requests must use the same format for the LOB columns.

## STD

- Permits the SQL CONNECT statement to establish a *new* connection only. The SQL SET CONNECTION statement must be used to switch to a dormant connection.
- The application can change between retrieving LOB values and LOB locators with each fetch request. This means that cursors with one or more LOB columns cannot be blocked, regardless of the BLOCKING bind option setting.

#### SQLWARN

Indicates whether warnings will be returned from the compilation of dynamic SQL statements (via PREPARE or EXECUTE IMMEDIATE), or from describe processing (via PREPARE...INTO or DESCRIBE).

- **NO** Warnings will not be returned from the SQL compiler.
- **YES** Warnings will be returned from the SQL compiler.

SQLCODE +238 is an exception. It is returned regardless of the **sqlwarn** option value.

#### STATICREADONLY

Determines whether static cursors will be treated as being READ ONLY or INSENSITIVE.

- **NO** All static cursors will take on the attributes as would normally be generated given the statement text and the setting of the LANGLEVEL precompile option. This is the default value.
- **YES** Any static cursor that does not contain the FOR UPDATE or FOR READ ONLY clause will be considered READ ONLY.

#### INSENSITIVE

Any static cursor that does not contain the FOR UPDATE clause will be considered READ ONLY and INSENSITIVE.

### STRDEL

Designates whether an apostrophe (') or double quotation marks (") will be used as the string delimiter within SQL statements. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows. The DRDA server will use a system defined default value if this option is not specified.

## APOSTROPHE

Use an apostrophe (') as the string delimiter.

#### QUOTE

Use double quotation marks (") as the string delimiter.

## **SYNCPOINT**

Specifies how commits or rollbacks are to be coordinated among multiple database connections. This command parameter is ignored and is only included here for backward compatibility.

## NONE

Specifies that no Transaction Manager (TM) is to be used to perform a two-phase commit, and does not enforce single updater, multiple reader. A COMMIT is sent to each participating database. The application is responsible for recovery if any of the commits fail.

## **ONEPHASE**

Specifies that no TM is to be used to perform a two-phase commit. A one-phase commit is to be used to commit the work done by each database in multiple database transactions.

## TWOPHASE

Specifies that the TM is required to coordinate two-phase commits among those databases that support this protocol.

#### SYNTAX

Suppresses the creation of a package or a bind file during precompilation. This option can be used to check the validity of the source file without modifying or altering existing packages or bind files. SYNTAX is a synonym for SQLERROR CHECK.

If SYNTAX is used together with the PACKAGE option, PACKAGE is ignored.

#### TARGET

Instructs the precompiler to produce modified code tailored to one of the supported compilers on the current platform.

#### IBMCOB

On AIX, code is generated for the IBM COBOL Set for AIX compiler.

#### MFCOB

Code is generated for the Micro Focus COBOL compiler. This is the default if a TARGET value is not specified with the COBOL precompiler on all Linux, UNIX and Windows operating systems.

#### ANSI\_COBOL

Code compatible with the ANS X3.23-1985 standard is generated.

**C** Code compatible with the C compilers supported by DB2 on the current platform is generated.

## **CPLUSPLUS**

Code compatible with the C++ compilers supported by DB2 on the current platform is generated.

#### FORTRAN

Code compatible with the FORTRAN compilers supported by DB2 on the current platform is generated.

#### **TEXT** label

The description of a package. Maximum length is 255 characters. The default value is blanks. This precompile/bind option is not supported by the server for DB2 Database for Linux, UNIX, and Windows.

#### **TRANSFORM GROUP**

Specifies the transform group name to be used by static SQL statements for exchanging user-defined structured type values with host programs. This transform group is not used for dynamic SQL statements or for the exchange of parameters and results with external functions or methods.

#### groupname

An SQL identifier of up to 128 bytes in length. A group name cannot include a qualifier prefix and cannot begin with the prefix SYS since this is reserved for database use. In a static SQL statement that interacts with host variables, the name of the transform group to be used for exchanging values of a structured type is as follows:

- The group name in the TRANSFORM GROUP bind option, if any
- The group name in the TRANSFORM GROUP prep option as specified at the original precompilation time, if any
- The DB2\_PROGRAM group, if a transform exists for the given type whose group name is DB2\_PROGRAM
- No transform group is used if none of the above conditions exist.

The following errors are possible during the bind of a static SQL statement:

- SQLCODE yyy, SQLSTATE xxxxx: A transform is needed, but no static transform group has been selected.
- SQLCODE yyy, SQLSTATE xxxxx: The selected transform group does not include a necessary transform (TO SQL for input variables, FROM SQL for output variables) for the data type that needs to be exchanged.
- SQLCODE yyy, SQLSTATE xxxxx: The result type of the FROM SQL transform is not compatible with the type of the output variable, or the parameter type of the TO SQL transform is not compatible with the type of the input variable.

In these error messages, *yyyyy* is replaced by the SQL error code, and *xxxxx* by the SQL state code.

## VALIDATE

Determines when the database manager checks for authorization errors and object not found errors. The package owner authorization ID is used for validity checking.

**BIND** Validation is performed at precompile/bind time. If all objects do not exist, or all authority is not held, error messages are produced.

If SQLERROR CONTINUE is specified, a package/bind file is produced despite the error message, but the statements in error are not executable.

**RUN** Validation is attempted at bind time. If all objects exist, and all authority is held, no further checking is performed at execution time.

If all objects do not exist, or all authority is not held at precompile/bind time, warning messages are produced, and the package is successfully bound, regardless of the SQLERROR CONTINUE option setting. However, authority checking and existence checking for SQL statements that failed these checks during the precompile/bind process can be redone at execution time.

#### VERSION

Defines the version identifier for a package. If this option is not specified, the package version will be "" (the empty string).

#### version-id

Specifies a version identifier that is any alphanumeric value, \$, #, @, \_, -, or ., up to 64 characters in length.

#### AUTO

The version identifier will be generated from the consistency token. If the consistency token is a timestamp (it will be if the LEVEL option is not specified), the timestamp is converted into ISO character format and is used as the version identifier.

#### WCHARTYPE

Specifies the format for graphic data.

#### CONVERT

Host variables declared using the wchar\_t base type will be treated as containing data in wchar\_t format. Since this format is not directly compatible with the format of graphic data stored in the database (DBCS format), input data in wchar\_t host variables is implicitly converted to DBCS format on behalf of the application, using the ANSI C function wcstombs(). Similarly, output DBCS data is implicitly converted to wchar\_t format, using mbstowcs(), before being stored in host variables.

## NOCONVERT

Host variables declared using the wchar\_t base type will be treated as containing data in DBCS format. This is the format used within the database for graphic data; it is, however, different from the native wchar\_t format implemented in the C language. Using NOCONVERT means that graphic data will not undergo conversion between the application and the database, which can improve efficiency. The application is, however, responsible for ensuring that data in wchar\_t format is not passed to the database manager. When this option is used, wchar\_t host variables should not be manipulated with the C wide character string functions, and should not be initialized with wide character literals (*L-literals*).

## Usage notes

A modified source file is produced, which contains host language equivalents to the SQL statements. By default, a package is created in the database to which a

## PRECOMPILE

connection has been established. The name of the package is the same as the file name (minus the extension and folded to uppercase), up to a maximum of 8 characters. Although the maximum length of a package name is 128 bytes, unless the PACKAGE USING option is specified, only the first 8 characters of the file name are used to maintain compatibility with previous versions of DB2.

Following connection to a database, PREP executes under the transaction that was started. PREP then issues a COMMIT or a ROLLBACK to terminate the current transaction and start another one.

Creating a package with a schema name that does not already exist results in the implicit creation of that schema. The schema owner is SYSIBM. The CREATEIN privilege on the schema is granted to PUBLIC.

During precompilation, an Explain Snapshot is not taken unless a package is created and EXPLSNAP has been specified. The snapshot is put into the Explain tables of the user creating the package. Similarly, Explain table information is only captured when EXPLAIN is specified, and a package is created.

Precompiling stops if a fatal error or more than 100 errors occur. If a fatal error occurs, the utility stops precompiling, attempts to close all files, and discards the package.

When a package exhibits bind behavior, the following will be true:

- 1. The implicit or explicit value of the BIND option OWNER will be used for authorization checking of dynamic SQL statements.
- The implicit or explicit value of the BIND option QUALIFIER will be used as the implicit qualifier for qualification of unqualified objects within dynamic SQL statements.
- **3**. The value of the special register CURRENT SCHEMA has no effect on qualification.

In the event that multiple packages are referenced during a single connection, all dynamic SQL statements prepared by those packages will exhibit the behavior as specified by the DYNAMICRULES option for that specific package and the environment they are used in.

If an SQL statement was found to be in error and the PRECOMPILE option SQLERROR CONTINUE was specified, the statement will be marked as invalid and another PRECOMPILE must be issued in order to change the state of the SQL statement. Implicit and explicit rebind will not change the state of an invalid statement in a package bound with VALIDATE RUN. A statement can change from static to incremental bind or incremental bind to static across implicit and explicit rebinds depending on whether or not object existence or authority problems exist during the rebind.

Binding a package with REOPT ONCE or REOPT ALWAYS might change static and dynamic statement compilation and performance.

For an embedded SQL program, if the FEDERATED\_ASYNCHRONY precompile option is not explicitly specified the static statements in the package are bound using the FEDERATED\_ASYNC configuration parameter. If the FEDERATED\_ASYNCHRONY option is specified explicitly, that value is used for binding the packages and is also the initial value of the special register. Otherwise, the value of the database manager configuration parameter is used as the initial value of the special register. The FEDERATED\_ASYNCHRONY precompile option influences dynamic SQL only when it is explicitly set.

# PRUNE HISTORY/LOGFILE

Used to delete entries from the recovery history file or to delete log files from the active log file path. Deleting entries from the recovery history file might be necessary if the file becomes excessively large and the retention period is high.

In a partitioned environment, the PRUNE HISTORY command only performs on the database partition it is issued on. To prune the history on multiple partitions, you can either issue the PRUNE HISTORY command from each individual database partition, or use the db2\_all prefix to run the PRUNE HISTORY command on all database partitions.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT
- DBADM

# **Required connection**

Database

# **Command syntax**

# **Command parameters**

#### **HISTORY** timestamp

Identifies a range of entries in the recovery history file that will be deleted. A complete time stamp (in the form *yyyymmddhhmmss*), or an initial prefix (minimum *yyyy*) can be specified. All entries with time stamps equal to or less than the time stamp provided are deleted from the recovery history file.

#### WITH FORCE OPTION

Specifies that the entries will be pruned according to the time stamp specified, even if some entries from the most recent restore set are deleted from the file. A restore set is the most recent full database backup including any restores of that backup image. If this parameter is not specified, all entries from the backup image forward will be maintained in the history.

## AND DELETE

Specifies that the associated log archives will be physically deleted (based on the location information) when the history file entry is removed. This option is especially useful for ensuring that archive storage space is recovered when log archives are no longer needed. If you are archiving logs via a user exit program, the logs cannot be deleted using this option. If you set the **auto\_del\_rec\_obj** database configuration parameter to ON, calling PRUNE HISTORY with the **AND DELETE** parameter will also physically delete backup images and load copy images if their history file entry is pruned.

## LOGFILE PRIOR TO log-file-name

Specifies a string for a log file name, for example S0000100.LOG. All log files prior to (but not including) the specified log file will be deleted. The **logretain** database configuration parameter must be set to RECOVERY or CAPTURE.

## **Examples**

To remove the entries for all restores, loads, table space backups, and full database backups taken before and including December 1, 1994 from the recovery history file, enter:

db2 prune history 199412

199412 is interpreted as 19941201000000.

## Usage notes

If the **WITH FORCE OPTION** is used, you might delete entries that are required for automatic restoration of databases. Manual restores will still work correctly. Use of this command can also prevent the db2ckrst utility from being able to correctly analyze the complete chain of required backup images. Using the PRUNE HISTORY command without the **WITH FORCE OPTION** prevents required entries from being deleted.

Those entries with status DB2HISTORY\_STATUS\_DO\_NOT\_DELETE will not be pruned. If the **WITH FORCE OPTION** is used, then objects marked as DB2HISTORY\_STATUS\_DO\_NOT\_DELETE will still be pruned or deleted. You can set the status of recovery history file entries to DB2HISTORY\_STATUS\_DO\_NOT\_DELETE using the UPDATE HISTORY command, the ADMIN\_CMD with UPDATE\_HISTORY, or the db2HistoryUpdate API. You can use the DB2HISTORY\_STATUS\_DO\_NOT\_DELETE status to prevent key recovery history file entries from being pruned and to prevent associated recovery objects from being deleted.

You can prune snapshot backup database history file entries using the PRUNE HISTORY command, but you cannot delete the related physical recovery objects using the **AND DELETE** parameter. The only way to delete snapshot backup object is to use the db2acsutil command.

# PUT ROUTINE

Uses the specified routine SQL Archive (SAR) file to define a routine in the database.

## Authorization

*dbadm*. This authority must be granted directly to the user and not inherited via a role.

## **Required connection**

Database. If implicit connect is enabled, a connection to the default database is established.

## Command syntax

# **Command parameters**

#### **FROM** file-name

Names the file where routine SQL archive (SAR) is stored.

#### **OWNER** new-owner

Specifies a new authorization name that will be used for authorization checking of the routine. The new owner must have the necessary privileges for the routine to be defined. If the OWNER clause is not specified, the authorization name that was originally defined for the routine is used.

#### **USE REGISTERS**

Indicates that the CURRENT SCHEMA and CURRENT PATH special registers are used to define the routine. If this clause is not specified, the settings for the default schema and SQL path are the settings used when the routine is defined. CURRENT SCHEMA is used as the schema name for unqualified object names in the routine definition (including the name of the routine) and CURRENT PATH is used to resolve unqualified routines and data types in the routine definition.

## **Examples**

PUT ROUTINE FROM procs/proc1.sar;

## Usage notes

No more than one procedure can be concurrently installed under a given schema.

If a GET ROUTINE or a PUT ROUTINE operation (or their corresponding procedure) fails to execute successfully, it will always return an error (SQLSTATE 38000), along with diagnostic text providing information about the cause of the failure. For example, if the procedure name provided to GET ROUTINE does not identify an SQL procedure, diagnostic "-204, 42704" text will be returned, where "-204" and "42704" are the SQLCODE and SQLSTATE, respectively, that identify the cause of the problem. The SQLCODE and SQLSTATE in this example indicate that the procedure name provided in the GET ROUTINE command is undefined.

# **QUERY CLIENT**

Returns current connection settings for an application process.

# Authorization

None

# **Required connection**

None

# **Command syntax**

► — QUERY CLIENT —

# **Command parameters**

None

# **Examples**

The following is sample output from QUERY CLIENT:

The current connection settings of the application process are:

CONNECT	= 1
DISCONNECT	= EXPLICIT
MAX_NETBIOS_CONNECTIONS	= 1
SQLRULES	= DB2
SYNCPOINT	= ONEPHASE
CONNECT_DBPARTITIONNUM	= CATALOG_DBPARTITIONNUM
ATTACH_DBPARTITIONNUM	= -1

If CONNECT\_DBPARTITIONNUM and ATTACH\_DBPARTITIONNUM are not set using the SET CLIENT command, these parameters have values identical to that of the environment variable DB2NODE. If the displayed value of the CONNECT\_DBPARTITIONNUM or the ATTACH\_DBPARTITIONNUM parameter is -1, the parameter has not been set; that is, either the environment variable DB2NODE has not been set, or the parameter was not specified in a previously issued SET CLIENT command.

# **Usage notes**

The connection settings for an application process can be queried at any time during execution.

# QUIESCE

Forces all users off the specified instance and database and puts it into a quiesced mode.

While the database or database instance is in quiesced mode, you can perform administrative tasks on it. After administrative tasks are complete, use the UNQUIESCE command to activate the instance and database and allow other users to connect to the database but avoid having to shut down and perform another database start.

In this mode, only users with authority in this restricted mode are allowed to attach or connect to the instance or database. Users with SYSADM, SYSMAINT, and SYSCTRL authority always have access to an instance while it is quiesced, and users with SYSADM and DBADM authority always have access to a database while it is quiesced.

## Scope

QUIESCE DATABASE results in all objects in the database being in the quiesced mode. Only the allowed user or group and SYSADM, SYSMAINT, DBADM, or SYSCTRL will be able to access the database or its objects.

QUIESCE INSTANCE *instance-name* means the instance and the databases in the instance *instance-name* will be in quiesced mode. The instance will be accessible just for SYSADM, SYSMAINT, and SYSCTRL and allowed user or group.

If an instance is in quiesced mode, a database in the instance cannot be put in quiesced mode.

## Authorization

One of the following:

For database level quiesce:

- SYSADM
- DBADM

For instance level quiesce:

- SYSADM
- SYSCTRL

# **Required connection**

Database

(Database connection is not required for an instance quiesce.)

## Command syntax

# QUIESCE

# **Command parameters**

## DEFER

Wait for applications until they commit the current unit of work.

## WITH TIMEOUT minutes

Specifies a time, in minutes, to wait for applications to commit the current unit of work. If no value is specified, in a single-partition database environment, the default value is 10 minutes. In a partitioned database environment the value specified by the **start\_stop\_time** database manager configuration parameter will be used.

## IMMEDIATE

Do not wait for the transactions to be committed, immediately rollback the transactions.

## FORCE CONNECTIONS

Force the connections off.

#### DATABASE

Quiesce the database. All objects in the database will be placed in quiesced mode. Only specified users in specified groups and users with SYSADM, SYSMAINT, and SYSCTRL authority will be able to access to the database or its objects.

## **INSTANCE** instance-name

The instance *instance-name* and the databases in the instance will be placed in quiesced mode. The instance will be accessible only to users with SYSADM, SYSMAINT, and SYSCTRL authority and specified users in specified groups.

The databases within the quiesced instance will be activated to do authorization checking for all connect attempts to the database. This is necessary to determine if the connecting user ID has DBADM authority; this authority is stored in the database catalog and the database must be activated to determine if the user ID has it. To prevent this authorization checking from happening, specify the **RESTRICTED ACCESS** option.

## **USER** user-name

Specifies the name of a user who will be allowed access to the instance while it is quiesced.

#### **GROUP** group-name

Specifies the name of a group that will be allowed access to the instance while the instance is quiesced.

#### **RESTRICTED ACCESS**

Specify this option to prevent authorization checking for all connect attempts to the databases of a quiesced instance to determine if the user ID has DBADM authority. Instance-level authorization checking can still occur; checking a user ID for SYSADM, SYSCTRL, or SYSMAINT authority does not require a database to be activated.

**Note:** This command option is available in DB2 Version 9.7 Fix Pack 2 and later fix packs.

## Examples

In the following example, the default behavior is to force connections, so it does not need to be explicitly stated and can be removed from this example. db2 quiesce instance crankarm user frank immediate force connections

The following example forces off all users with connections to the database. db2 quiesce db immediate

• The first example will quiesce the instance crankarm, while allowing user frank to continue using the database.

The second example will quiesce the database you are attached to, preventing access by all users except those with one of the following authorities: SYSADM, SYSMAINT, SYSCTRL, or DBADM.

- This command will force all users off the database or instance if **FORCE CONNECTIONS** option is supplied. **FORCE CONNECTIONS** is the default behavior; the parameter is allowed in the command for compatibility reasons.
- The command will be synchronized with the **FORCE CONNECTIONS** and will only complete once the **FORCE CONNECTIONS** has completed.

## **Usage notes**

- After QUIESCE INSTANCE, only users with SYSADM, SYSMAINT, or SYSCTRL authority or a user name and group name provided as parameters to the command can connect to the instance.
- The RESTRICTED ACCESS option will prevent the databases within the quiesced instance from being activated to do authorization checking. Any user ID trying to connect to a database, which has DBADM authority or QUIESCE\_CONNECT privilege on the database, will not be allowed to connect. Only user IDs which have SYSADM, SYSCTRL, or SYSMAINT authority and the user or group specified with the command will be allowed to connect to the database.
- The **RESTRICTED ACCESS** option should be used when there is a need to have exclusive connections to a database within the quiesced instance. Such cases can include making an offline backup or performing other maintenance activities.
- After QUIESCE DATABASE, users with SYSADM, SYSMAINT, SYSCTRL, or DBADM authority, and GRANT or REVOKE privileges can designate who will be able to connect. This information will be stored permanently in the database catalog tables.

For example,

grant quiesce\_connect on database to *username/groupname* revoke quiesce\_connect on database from *username/groupname* 

# QUIESCE TABLESPACES FOR TABLE

Quiesces table spaces for a table. There are three valid quiesce modes: share, intent to update, and exclusive.

There are three possible states resulting from the quiesce function:

- Quiesced: SHARE
- Quiesced: UPDATE
- Quiesced: EXCLUSIVE

# Scope

In a single-partition environment, this command quiesces all table spaces involved in a load operation in exclusive mode for the duration of the load operation. In a partitioned database environment, this command acts locally on a database partition. It quiesces only that portion of table spaces belonging to the database partition on which the load operation is performed. For partitioned tables, all of the table spaces listed in SYSDATAPARTITIONS.TBSPACEID and SYSDATAPARTITIONS.LONG\_TBSPACEID associated with a table and with a status of normal, attached or detached, (for example, SYSDATAPARTITIONS.STATUS of "", 'A' or 'D', respectively) are quiesced.

## Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT
- DBADM
- LOAD

## **Required connection**

Database

## Command syntax

## **Command parameters**

## TABLE

tablename

Specifies the unqualified table name. The table cannot be a system catalog table.

schema.tablename

Specifies the qualified table name. If *schema* is not provided, the CURRENT SCHEMA will be used. The table cannot be a system catalog table.

## SHARE

Specifies that the quiesce is to be in share mode.

When a "quiesce share" request is made, the transaction requests intent share locks for the table spaces and a share lock for the table. When the transaction obtains the locks, the state of the table spaces is changed to QUIESCED SHARE. The state is granted to the quiescer only if there is no conflicting state held by other users. The state of the table spaces, along with the authorization ID and the database agent ID of the quiescer, are recorded in the table space table, so that the state is persistent. The table cannot be changed while the table spaces for the table are in QUIESCED SHARE state. Other share mode requests to the table and table spaces are allowed. When the transaction commits or rolls back, the locks are released, but the table spaces for the table remain in QUIESCED SHARE state until the state is explicitly reset.

## INTENT TO UPDATE

Specifies that the quiesce is to be in intent to update mode.

When a "quiesce intent to update" request is made, the table spaces are locked in intent exclusive (IX) mode, and the table is locked in update (U) mode. The state of the table spaces is recorded in the table space table.

#### EXCLUSIVE

Specifies that the quiesce is to be in exclusive mode.

When a "quiesce exclusive" request is made, the transaction requests super exclusive locks on the table spaces, and a super exclusive lock on the table. When the transaction obtains the locks, the state of the table spaces changes to QUIESCED EXCLUSIVE. The state of the table spaces, along with the authorization ID and the database agent ID of the quiescer, are recorded in the table space table. Since the table spaces are held in super exclusive mode, no other access to the table spaces is allowed. The user who invokes the quiesce function (the quiescer) has exclusive access to the table and the table spaces.

#### RESET

Specifies that the state of the table spaces is to be reset to normal. A quiesce state cannot be reset if the connection that issued the quiesce request is still active.

# Example

db2 quiesce tablespaces for table staff share db2 quiesce tablespaces for table boss.org intent to update

# **Usage notes**

This command is not supported for declared temporary tables.

A quiesce is a persistent lock. Its benefit is that it persists across transaction failures, connection failures, and even across system failures (such as power failure, or reboot).

A quiesce is owned by a connection. If the connection is lost, the quiesce remains, but it has no owner, and is called a *phantom quiesce*. For example, if a power outage caused a load operation to be interrupted during the delete phase, the table spaces for the loaded table would be left in delete pending, quiesce exclusive state. Upon

# QUIESCE TABLESPACES FOR TABLE

database restart, this quiesce would be an unowned (or phantom) quiesce. The removal of a phantom quiesce requires a connection with the same user ID used when the quiesce mode was set.

To remove a phantom quiesce:

- 1. Connect to the database with the same user ID used when the quiesce mode was set.
- **2**. Use the LIST TABLESPACES command to determine which table space is quiesced.
- 3. Re-quiesce the table space using the current quiesce state. For example: db2 quiesce tablespaces for table mytable exclusive

Once completed, the new connection owns the quiesce, and the load operation can be restarted.

There is a limit of five quiescers on a table space at any given time.

A quiescer can upgrade the state of a table space from a less restrictive state to a more restrictive one (for example, S to U, or U to X). If a user requests a state lower than one that is already held, the original state is returned. States are not downgraded.

-

# QUIT

Exits the command line processor interactive input mode and returns to the operating system command prompt. If a batch file is being used to input commands to the command line processor, commands are processed until QUIT, TERMINATE, or the end-of-file is encountered.

# Authorization

None

# **Required connection**

None

# **Command syntax**

►►—QUIT—

# **Command parameters**

None

# **Usage notes**

QUIT does not terminate the command line processor back-end process or break a database connection. CONNECT RESET breaks a connection, but does not terminate the back-end process. The TERMINATE command does both.

# REBIND

Allows the user to recreate a package stored in the database without the need for a bind file.

## Authorization

One of the following:

- *dbadm* authority
- ALTERIN privilege on the schema
- BIND privilege on the package.

The authorization ID logged in the BOUNDBY column of the SYSCAT.PACKAGES system catalog table, which is the ID of the most recent binder of the package, is used as the binder authorization ID for the rebind, and for the default *schema* for table references in the package. This default qualifier can be different from the authorization ID of the user executing the rebind request. REBIND will use the same bind options that were specified when the package was created.

## **Required connection**

Database. If no database connection exists, and if implicit connect is enabled, a connection to the default database is made.

## Command syntax

# **Command parameters**

#### **PACKAGE** *package-name*

The qualified or unqualified name that designates the package to be rebound.

## **VERSION** version-name

The specific version of the package to be rebound. When the version is not specified, it is taken to be "" (the empty string).

#### RESOLVE

Specifies whether rebinding of the package is to be performed with or without conservative binding semantics. This affects whether new objects that use the SQL path for resolution are considered during resolution on static DML statements in the package. This option is not supported by DRDA. Valid values are:

**ANY** All possible matches in the SQL path are considered for resolving references to any objects that use the SQL path for object resolution. Conservative binding semantics are not used. This is the default.

## CONSERVATIVE

Only those objects in the SQL path that were defined before the last explicit bind time stamp are considered for resolving references to any objects that use the SQL path for object resolution. Conservative binding semantics are used. This option is not supported for an inoperative package.

## APREUSE

Specifies whether static SQL access plans are to be reused. When this option is enabled, the query compiler will attempt to reuse the access plans for static SQL statements in the existing package during the rebind and during future implicit and explicit rebinds. The default is the value used during the previous invocation of the BIND or REBIND command or the ALTER PACKAGE statement. To determine the value, query the APREUSE column for the package in SYSCAT.PACKAGES.

- **YES** The query compiler will attempt to reuse the access plans for the statements in the package.
- **NO** The query compiler will not attempt to reuse access plans for the statements in the package.

## REOPT

Specifies whether to have DB2 optimize an access path using values for host variables, parameter markers, global variables, and special registers.

## NONE

The access path for a given SQL statement containing host variables, parameter markers, global variables, or special registers will not be optimized using real values for these variables. The default estimates for these variables will be used instead, and this plan is cached and used subsequently. This is the default behavior.

**ONCE** The access path for a given SQL statement will be optimized using the real values of the host variables, parameter markers, global variables, or special registers when the query is first executed. This plan is cached and used subsequently.

# ALWAYS

The access path for a given SQL statement will always be compiled and re-optimized using the values of the host variables, parameter markers, global variables, or special registers known at each execution time.

# **Usage notes**

REBIND does not automatically commit the transaction following a successful rebind. The user must explicitly commit the transaction. This enables "what if" analysis, in which the user updates certain statistics, and then tries to rebind the package to see what changes. It also permits multiple rebinds within a unit of work.

The REBIND command *will* commit the transaction if auto-commit is enabled.

## This command:

• Provides a quick way to recreate a package. This enables the user to take advantage of a change in the system without a need for the original bind file. For example, if it is likely that a particular SQL statement can take advantage of a newly created index, the REBIND command can be used to recreate the

package. REBIND can also be used to recreate packages after RUNSTATS has been executed, thereby taking advantage of the new statistics.

- Provides a method to recreate inoperative packages. Inoperative packages must be explicitly rebound by invoking either the bind utility or the rebind utility. A package will be marked inoperative (the VALID column of the SYSCAT.PACKAGES system catalog will be set to X) if a function instance on which the package depends is dropped.
- Gives users control over the rebinding of invalid packages. Invalid packages will be automatically (or implicitly) rebound by the database manager when they are executed. This might result in a noticeable delay in the execution of the first SQL request for the invalid package. It may be desirable to explicitly rebind invalid packages, rather than allow the system to automatically rebind them, in order to eliminate the initial delay and to prevent unexpected SQL error messages which might be returned in case the implicit rebind fails. For example, following database upgrade, all packages stored in the database will be invalidated by the UPGRADE DATABASE command. Given that this might involve a large number of packages, it may be desirable to explicitly rebind all of the invalid packages at one time. This explicit rebinding can be accomplished using BIND, REBIND, or the db2rbind tool).

If multiple versions of a package (many versions with the same package name and creator) exist, only one version can be rebound at once. If not specified in the VERSION option, the package version defaults to be "". Even if there exists only one package with a name that matches, it will not be rebound unless its version matches the one specified or the default.

The choice of whether to use BIND or REBIND to explicitly rebind a package depends on the circumstances. It is recommended that REBIND be used whenever the situation does not specifically require the use of BIND, since the performance of REBIND is significantly better than that of BIND. BIND *must* be used, however:

- When there have been modifications to the program (for example, when SQL statements have been added or deleted, or when the package does not match the executable for the program).
- When the user wishes to modify any of the bind options as part of the rebind. REBIND does not support any bind options. For example, if the user wishes to have privileges on the package granted as part of the bind process, BIND must be used, since it has a GRANT option.
- When the package does not currently exist in the database.
- When detection of *all* bind errors is desired. REBIND only returns the first error it detects, whereas the BIND command returns the first 100 errors that occur during binding.

REBIND is supported by DB2 Connect.

If REBIND is executed on a package that is in use by another user, the rebind will not occur until the other user's logical unit of work ends, because an exclusive lock is held on the package's record in the SYSCAT.PACKAGES system catalog table during the rebind.

When REBIND is executed, the database manager recreates the package from the SQL statements stored in the SYSCAT.STATEMENTS system catalog table.

If REBIND encounters an error, processing stops, and an error message is returned.

REBIND will re-explain packages that were created with the EXPLSNAP bind option set to YES or ALL (indicated in the EXPLAIN\_SNAPSHOT column in the SYSCAT.PACKAGES catalog table entry for the package) or with the EXPLAIN bind option set to YES or ALL (indicated in the EXPLAIN\_MODE column in the SYSCAT.PACKAGES catalog table entry for the package). The Explain tables used are those of the REBIND requester, not the original binder.

If an SQL statement was found to be in error and the BIND option SQLERROR CONTINUE was specified, the statement will be marked as invalid even if the problem has been corrected. REBIND will not change the state of an invalid statement. In a package bound with VALIDATE RUN, a statement can change from static to incremental bind or incremental bind to static across a REBIND depending on whether or not object existence or authority problems exist during the REBIND.

Rebinding a package with REOPT ONCE | ALWAYS might change static and dynamic statement compilation and performance.

If REOPT is not specified, REBIND will preserve the existing REOPT value used at precompile or bind time.

# **RECOVER DATABASE**

Restores and rolls forward a database to a particular point in time or to the end of the logs.

## Scope

In a partitioned database environment, this command can only be invoked from the catalog partition. A database recover operation to a specified point in time affects all database partitions that are listed in the db2nodes.cfg file. A database recover operation to the end of logs affects the database partitions that are specified. If no partitions are specified, it affects all database partitions that are listed in the db2nodes.cfg file.

# Authorization

To recover an existing database, one of the following:

- sysadm
- sysctrl
- sysmaint

To recover to a new database, one of the following:

- sysadm
- sysctrl

## **Required connection**

To recover an existing database, a database connection is required. This command automatically establishes a connection to the specified database and will release the connection when the recover operation finishes. To recover to a new database, an instance attachment and a database connection are required. The instance attachment is required to create the database.

# **Command syntax**

## **RECOVER DATABASE**

→ history-file—ON DBPARTITIONNUM—db-partition-number1

## **Command parameters**

DATABASE database-alias

The alias of the database that is to be recovered.

**USER** username

The user name under which the database is to be recovered.

**USING** password

The password used to authenticate the user name. If the password is omitted, the user is prompted to enter it.

#### то

*isotime* The point in time to which all committed transactions are to be recovered (including the transaction committed precisely at that time, as well as all transactions committed previously).

This value is specified as a time stamp, a 7-part character string that identifies a combined date and time. The format is *yyyy-mm-dd-hh.mm.ss.nnnnn* (year, month, day, hour, minutes, seconds, microseconds). The time stamp in a backup image is based on the local time at which the backup operation started. The CURRENT TIMEZONE special register specifies the difference between UTC and local time at the application server. The difference is represented by a time duration (a decimal number in which the first two digits represent the number of hours, the next two digits represent the number of minutes, and the last two digits

represent the number of seconds). Subtracting CURRENT TIMEZONE from a local time converts that local time to UTC.

#### USING LOCAL TIME

Specifies the point in time to which to recover. This option allows the user to recover to a point in time that is the server's local time rather than UTC time. This is the default option.

#### Note:

- 1. If the user specifies a local time for recovery, all messages returned to the user will also be in local time. All times are converted on the server, and in partitioned database environments, on the catalog database partition.
- 2. The timestamp string is converted to UTC on the server, so the time is local to the server's time zone, not the client's. If the client is in one time zone and the server in another, the server's local time should be used. This is different from the local time option from the Control Center, which is local to the client.
- **3**. If the timestamp string is close to the time change of the clock due to daylight saving time, it is important to know if the stop time is before or after the clock change, and specify it correctly.

#### USING UTC TIME

Specifies the point in time to which to recover.

#### END OF LOGS

Specifies that all committed transactions from all online archive log files listed in the database configuration parameter **logpath** are to be applied.

#### **ON ALL DBPARTITIONNUMS**

Specifies that transactions are to be rolled forward on all database partitions specified in the db2nodes.cfg file. This is the default if a database partition clause is not specified.

#### EXCEPT

Specifies that transactions are to be rolled forward on all database partitions specified in the db2nodes.cfg file, except those specified in the database partition list.

#### ON DBPARTITIONNUM | ON DBPARTITIONNUMS

Roll the database forward on a set of database partitions.

#### db-partition-number1

Specifies a database partition number in the database partition list.

**TO** *db*-partition-number2

Specifies the second database partition number, so that all database partitions from *db-partition-number1* up to and including *db-partition-number2* are included in the database partition list.

## **USING HISTORY FILE** history-file

#### history-file **ON DBPARTITIONNUM**

In a partitioned database environment, allows a different history file

#### **OVERFLOW LOG PATH** log-directory

Specifies an alternate log path to be searched for archived logs during recovery. Use this parameter if log files were moved to a location other than that specified by the **logpath** database configuration parameter. In a partitioned database environment, this is the (fully qualified) default

overflow log path *for all database partitions*. A relative overflow log path can be specified for single-partition databases.

The OVERFLOW LOG PATH command parameter will overwrite the value (if any) of the database configuration parameter **overflowlogpath**.

#### **COMPRLIB** *lib-name*

Indicates the name of the library to be used to perform the decompression. The name must be a fully qualified path referring to a file on the server. If this parameter is not specified, DB2 will attempt to use the library stored in the image. If the backup was not compressed, the value of this parameter will be ignored. If the specified library cannot be loaded, the restore operation will fail.

#### **COMPROPTS** options-string

Describes a block of binary data that is passed to the initialization routine in the decompression library. The DB2 database system passes this string directly from the client to the server, so any issues of byte reversal or code page conversion are handled by the decompression library. If the first character of the data block is "@", the remainder of the data is interpreted by the DB2 database system as the name of a file residing on the server. The DB2 database system will then replace the contents of *string* with the contents of this file and pass the new value to the initialization routine instead. The maximum length for the string is 1 024 bytes.

#### RESTART

The RESTART keyword can be used if a prior RECOVER operation was interrupted or otherwise did not complete. Starting in V9.1, a subsequent RECOVER command will attempt to continue the previous RECOVER, if possible. Using the RESTART keyword forces RECOVER to start with a fresh restore and then rollforward to the PIT specified.

#### log-directory ON DBPARTITIONNUM

In a partitioned database environment, allows a different log path to override the default overflow log path for a specific database partition.

## **Examples**

In a single-partition database environment, where the database being recovered currently exists, and the most recent version of the history file is available in the **dftdbpath**:

1. To use the latest backup image and rollforward to the end of logs using all default values:

RECOVER DB SAMPLE

- To recover the database to a PIT, issue the following. The most recent image that can be used will be restored, and logs applied until the PIT is reached. RECOVER DB SAMPLE TO 2001-12-31-04.00.00
- **3.** To recover the database using a saved version of the history file, issue the following. For example, if the user needs to recover to an extremely old PIT which is no longer contained in the current history file, the user will have to provide a version of the history file from this time period. If the user has saved a history file from this time period, this version can be used to drive the recover.

RECOVER DB SAMPLE TO 1999-12-31-04.00.00 USING HISTORY FILE (/home/user/old1999files/db2rhist.asc)

## **RECOVER DATABASE**

In a single-partition database environment, where the database being recovered does not exist, you must use the USING HISTORY FILE clause to point to a history file.

 If you have not made any backups of the history file, so that the only version available is the copy in the backup image, the recommendation is to issue a RESTORE followed by a ROLLFORWARD. However, to use RECOVER, you would first have to extract the history file from the image to some location, for example /home/user/fromimage/db2rhist.asc, and then issue this command. (This version of the history file does not contain any information about log files that are required for rollforward, so this history file is not useful for RECOVER.)

RECOVER DB SAMPLE TO END OF LOGS USING HISTORY FILE (/home/user/fromimage/db2rhist.asc)

2. If you have been making periodic or frequent backup copies of the history, the USING HISTORY FILE clause should be used to point to this version of the history file. If the file is /home/user/myfiles/db2rhist.asc, issue the command:

```
RECOVER DB SAMPLE TO PIT
```

USING HISTORY FILE (/home/user/myfiles/db2rhist.asc)

(In this case, you can use any copy of the history file, not necessarily the latest, as long as it contains a backup taken before the point-in-time (PIT) requested.)

In a partitioned database environment, where the database exists on all database partitions, and the latest history file is available on **dftdbpath** on all database partitions:

- To recover the database to a PIT on all nodes. DB2 will verify that the PIT is reachable on all nodes before starting any restore operations.
   RECOVER DB SAMPLE TO 2001-12-31-04.00.00
- To recover the database to this PIT on all nodes. DB2 will verify that the PIT is reachable on all nodes before starting any restore operations. The RECOVER operation on each node is identical to a single-partition RECOVER. RECOVER DB SAMPLE TO END OF LOGS
- 3. Even though the most recent version of the history file is in the dftdbpath, you might want to use several specific history files. Unless otherwise specified, each database partition will use the history file found locally at /home/user/oldfiles/db2rhist.asc. The exceptions are nodes 2 and 4. Node 2 will use: /home/user/node2files/db2rhist.asc, and node 4 will use: /home/user/node4files/db2rhist.asc.
  - RECOVER DB SAMPLE TO 1999-12-31-04.00.00 USING HISTORY FILE (/home/user/oldfiles/db2rhist.asc, /home/user/node2files/db2rhist.asc ON DBPARTITIONNUM 2, /home/user/node4files/db2rhist.asc ON DBPARTITIONNUM 4)
- 4. It is possible to recover a subset of nodes instead of all nodes, however a PIT RECOVER can not be done in this case, the recover must be done to EOL. RECOVER DB SAMPLE TO END OF LOGS ON DBPARTITIONNUMS (2 TO 4, 7, 9)

In a partitioned database environment, where the database does not exist:

 If you have not made any backups of the history file, so that the only version available is the copy in the backup image, the recommendation is to issue a RESTORE followed by a ROLLFORWARD. However, to use RECOVER, you would first have to extract the history file from the image to some location, for example, /home/user/fromimage/db2rhist.asc, and then issue this command. (This version of the history file does not contain any information about log files that are required for rollforward, so this history file is not useful for the recover.)

RECOVER DB SAMPLE TO PIT USING HISTORY FILE (/home/user/fromimage/db2rhist.asc)

2. If you have been making periodic or frequent backup copies of the history, the USING HISTORY FILE clause should be used to point to this version of the history file. If the file is /home/user/myfiles/db2rhist.asc, you can issue the following command:

```
RECOVER DB SAMPLE TO END OF LOGS
USING HISTORY FILE (/home/user/myfiles/db2rhist.asc)
```

## **Usage notes**

- Recovering a database might require a load recovery using tape devices. If prompted for another tape, the user can respond with one of the following:
  - **c** Continue. Continue using the device that generated the warning message (for example, when a new tape has been mounted).
  - **d** Device terminate. Stop using the device that generated the warning message (for example, when there are no more tapes).
  - t Terminate. Terminate all devices.
- If there is a failure during the restore portion of the recover operation, you can reissue the RECOVER DATABASE command. If the restore operation was successful, but there was an error during the rollforward operation, you can issue a ROLLFORWARD DATABASE command, since it is not necessary (and it is time-consuming) to redo the entire recover operation.
- In a partitioned database environment, if there is an error during the restore portion of the recover operation, it is possible that it is only an error on a single database partition. Instead of reissuing the RECOVER DATABASE command, which restores the database on all database partitions, it is more efficient to issue a RESTORE DATABASE command for the database partition that failed, followed by a ROLLFORWARD DATABASE command.

# **REDISTRIBUTE DATABASE PARTITION GROUP**

Redistributes data across all partitions in a database partition group. This command affects all objects present in the database partition group and cannot be restricted to one object alone.

This command can only be issued from the catalog database partition. Use the LIST DATABASE DIRECTORY command to determine which database partition is the catalog database partition for each database.

## Scope

This command affects all database partitions in the database partition group.

## Authorization

One of the following authorities is required:

- SYSADM
- SYSCTRL
- DBADM

In addition, one of the following groups of authorizations is also required:

- DELETE, INSERT, and SELECT privileges on all tables in the database partition group being redistributed
- DATAACCESS authority

## **Command syntax**

▶ REDISTRIBUTE DATABASE PARTITION GROUP—*db-partition-group* 

└─NOT ROLLFORWARD RECOVERABLE─┘

#### Add/Drop DB partition:

## **Redistribute options:**

## **Command parameters**

#### **DATABASE PARTITION GROUP** db-partition-group

The name of the database partition group. This one-part name identifies a database partition group described in the SYSCAT.DBPARTITIONGROUPS catalog table. The database partition group cannot currently be undergoing redistribution.

**Note:** Tables in the IBMCATGROUP and the IBMTEMPGROUP database partition groups cannot be redistributed.

#### NOT ROLLFORWARD RECOVERABLE

When this option is used, the REDISTRIBUTE DATABASE PARTITION GROUP command is not roll forward recoverable.

- Data is moved in bulk instead of by internal insert and delete operations. This reduces the number of times that a table must be scanned and accessed, which results in better performance.
- Log records are no longer required for each of the insert and delete operations. This means that you no longer need to manage large amounts of active log space and log archiving space in your system when performing data redistribution. This is particularly beneficial if, in the past, large active log space and storage requirements forced you to break a single data redistribution operation into multiple smaller redistribution tasks, which might have resulted in even more time required to complete the end-to-end data redistribution operation.
- When using the REDISTRIBUTE DATABASE PARTITION GROUP command with the **NOT ROLLFORWARD RECOVERABLE** option, the redistribute operation uses the **INDEXING MODE DEFERRED** option for tables that contain XML columns. If a table does not contain an XML column, the redistribute operation uses the indexing mode specified when issuing the command.

When this option is *not* used, extensive logging of all row movement is performed such that the database can be recovered later in the event of any interruptions, errors, or other business need.

#### **UNIFORM**

Specifies that the data is uniformly distributed across hash partitions (that

is, every hash partition is assumed to have the same number of rows), but the same number of hash partitions do not map to each database partition. After redistribution, all database partitions in the database partition group have approximately the same number of hash partitions.

#### **USING DISTFILE** distfilename

If the distribution of distribution key values is skewed, use this option to achieve a uniform redistribution of data across the database partitions of a database partition group.

Use the *distfilename* to indicate the current distribution of data across the 32 768 hash partitions.

Use row counts, byte volumes, or any other measure to indicate the amount of data represented by each hash partition. The utility reads the integer value associated with a partition as the weight of that partition. When a *distfilename* is specified, the utility generates a target distribution map that it uses to redistribute the data across the database partitions in the database partition group as uniformly as possible. After the redistribution, the weight of each database partition in the database partition is approximately the same (the weight of a database partition is the sum of the weights of all hash partitions that map to that database partition).

For example, the input distribution file might contain entries as follows:

In the example, hash partition 2 has a weight of 112000, and partition 3 (with a weight of 0) has no data mapping to it at all.

The *distfilename* should contain 32 768 positive integer values in character format. The sum of the values should be less than or equal to 4 294 967 295.

If the path for *distfilename* is not specified, the current directory is used.

## **USING TARGETMAP** targetmapfilename

The file specified in *targetmapfilename* is used as the target distribution map. Data redistribution is done according to this file. If the path is not specified, the current directory is used.

If a database partition, included in the target map, is not in the database partition group, an error is returned. Issue ALTER DATABASE PARTITION GROUP ADD DBPARTITIONNUM statement before running REDISTRIBUTE DATABASE PARTITION GROUP command.

If a database partition, excluded from the target map, *is* in the database partition group, that database partition will not be included in the partitioning. Such a database partition can be dropped using ALTER DATABASE PARTITION GROUP DROP DBPARTITIONNUM statement either before or after the REDISTRIBUTE DATABASE PARTITION GROUP command.

#### CONTINUE

Continues a previously failed or stopped REDISTRIBUTE DATABASE PARTITION GROUP operation. If none occurred, an error is returned.

#### ABORT

Aborts a previously failed or stopped REDISTRIBUTE DATABASE PARTITION GROUP operation. If none occurred, an error is returned.

#### ADD

#### **DBPARTITIONNUM** *n*

#### **TO** *m*

*n* or *n* **TO** *m* specifies a list or lists of database partition numbers which are to be added into the database partition group. Any specified partition must not already be defined in the database partition group (SQLSTATE 42728). This is equivalent to executing the ALTER DATABASE PARTITION GROUP statement with ADD DBPARTITIONNUM clause specified.

#### **DBPARTITIONNUMS** *n*

#### **TO** *m*

*n* or *n* **TO** *m* specifies a list or lists of database partition numbers which are to be added into the database partition group. Any specified partition must not already be defined in the database partition group (SQLSTATE 42728). This is equivalent to executing the ALTER DATABASE PARTITION GROUP statement with ADD DBPARTITIONNUM clause specified.

**Note:** When a database partition is added using this option, containers for table spaces are based on the containers of the corresponding table space on the lowest numbered existing partition in the database partition group. If this would result in a naming conflict among containers, which could happen if the new partitions are on the same physical machine as existing containers, this option should not be used. Instead, the ALTER DATABASE PARTITION GROUP statement should be used with the WITHOUT TABLESPACES option prior to issuing the REDISTRIBUTE DATABASE PARTITION GROUP command. Table space containers can then be created manually specifying appropriate names.

#### DROP

#### **DBPARTITIONNUM** *n*

#### **TO** *m*

*n* or *n* **TO** *m* specifies a list or lists of database partition numbers which are to be dropped from the database partition group. Any specified partition must already be defined in the database partition group (SQLSTATE 42729). This is equivalent to executing the ALTER DATABASE PARTITION GROUP statement with the DROP DBPARTITIONNUM clause specified.

## **DBPARTITIONNUMS** *n*

#### **TO** *m*

*n* or *n* **TO** *m* specifies a list or lists of database partition numbers which are to be dropped from the database partition group. Any specified partition must already be defined in the database partition group (SQLSTATE 42729). This is equivalent to executing

the ALTER DATABASE PARTITION GROUP statement with the DROP DBPARTITIONNUM clause specified.

#### TABLE tablename

Specifies a table order for redistribution processing.

- **ONLY** If the table order is followed by the **ONLY** keyword (which is the default), then, only the specified tables will be redistributed. The remaining tables can be later processed by subsequent REDISTRIBUTE CONTINUE commands. This is the default.
- **FIRST** If the table order is followed by the **FIRST** keyword, then, the specified tables will be redistributed with the given order and the remaining tables in the database partition group will be redistributed with random order.

#### **INDEXING MODE**

This parameter specifies how indexes are maintained during redistribution when the **NOT ROLLFORWARD RECOVERABLE** option is specified. Valid values are:

#### REBUILD

Indexes will be rebuilt from scratch. Indexes do not have to be valid to use this option. As a result of using this option, index pages will be clustered together on disk.

#### DEFERRED

Redistribute will not attempt to maintain any indexes. Indexes will be marked as needing a refresh. The first access to such indexes may force a rebuild, or indexes may be rebuilt when the database is restarted.

**Note:** For non-MDC tables, if there are invalid indexes on the tables, the REDISTRIBUTE DATABASE PARTITION GROUP command automatically rebuilds them if you do not specify **INDEXING MODE DEFERRED**. For an MDC table, even if you specify **INDEXING MODE DEFERRED**, a composite index that is invalid is rebuilt before table redistribution begins because the utility needs the composite index to process an MDC table.

#### DATA BUFFER n

Specifies the number of 4 KB pages to use as buffered space for transferring data within the utility. If the value specified is lower than the minimum supported value, the minimum value is used and no warning is returned. If a DATA BUFFER value is not specified, an intelligent default is calculated by the utility at runtime at the beginning of processing each table. Specifically, the default is to use 50% of the memory available in the utility heap at the time redistribution of the table begins and to take into account various table properties as well.

This memory is allocated directly from the utility heap, whose size can be modified through the **util\_heap\_sz** database configuration parameter. Beginning in version 9.5, the value of the DATA BUFFER option of the REDISTRIBUTE DATABASE PARTITION GROUP command can temporarily exceed **util\_heap\_sz** if more memory is available in the system.

#### **STOP AT** *local-isotime*

When this option is specified, before beginning data redistribution for each table, the *local-isotime* is compared with the current local timestamp. If the

## **REDISTRIBUTE DATABASE PARTITION GROUP**

specified *local-isotime* is equal to or earlier than the current local timestamp, the utility stops with a warning message. Data redistribution processing of tables in progress at the stop time will complete without interruption. No new data redistribution processing of tables begins. The unprocessed tables can be redistributed using the **CONTINUE** option. This *local-isotime* value is specified as a time stamp, a 7-part character string that identifies a combined date and time. The format is *yyyy-mm-dd-hh.mm.ss.nnnnn* (year, month, day, hour, minutes, seconds, microseconds) expressed in local time.

#### STATISTICS

This option specifies that the utility should collect statistics for the tables that have a statistics profile. Specifying this option is more efficient than separately issuing the RUNSTATS command after the data redistribution is completed.

#### **USE PROFILE**

Statistics will be collected for the tables with a statistics profile. For tables without a statistics profile, nothing will be done. This is the default.

#### NONE

Statistics will not be collected for tables.

## Examples: Redistribute steps

You may want to add or drop node from node group. Following is the step for adding new node to a node group and redistribute the data. Added database partition is not in the distribution map, but the containers for the table spaces in the database partition group have been created; the database partition is added to the distribution map when a redistribute database partition group operation has completed successfully.

- 1. Identify the nodegroups that will require redistribution. In this document, the node group that needs to be redistributed is "sampleNodegrp".
- 2. Identify objects that should be disabled or removed before redistribute .
  - a. Replicate MQTs: This type of MQT is not supported as part of the REDISTRIBUTE utility. They need to be dropped before running redistribute and recreated afterward.

```
SELECT tabschema, tabname
FROM syscat.tables
WHERE partition mode = 'R'
```

b. Write-to-table event monitors: You should disable any automatically activated write-to-table event monitors that have a table that resides in the database partition group to be redistributed.

```
SELECT distinct evmonname
FROM syscat.eventtables E
JOIN syscat.tables T on T.tabname = E.tabname
AND T.tabschema = E.tabschema
JOIN syscat.tablespaces S on S.tbspace = T.tbspace
AND S.ngname = 'sampleNodegrp'
```

- **c.** Explain tables: It is recommended to create the explain tables in a single partition nodegroup. However, if they are defined in a nodegroup that requires redistribution, you may consider dropping them before the redistribute and redefining them once redistribute is complete, if the data generated to date does not need to be maintained.
- d. Table access mode and load state: Ensure that all tables in the node groups to be redistributed are in full access mode and have no load pending or load in progress state.

```
SELECT DISTINCT TRIM(T.OWNER) || \'.\' || TRIM(T.TABNAME)
AS NAME, T.ACCESS_MODE, A.LOAD_STATUS
FROM SYSCAT.TABLES T, SYSCAT.DBPARTITIONGROUPS
N, SYSIBMADM.ADMINTABINFO A
WHERE T.PMAP_ID = N.PMAP_ID
AND A.TABSCHEMA = T.OWNER
AND A.TABSCHEMA = T.OWNER
AND A.TABNAME = T.TABNAME
AND N.DBPGNAME = 'sampleNodegrp'
AND (T.ACCESS MODE <> 'F' OR A.LOAD STATUS IS NOT NULL)
```

e. Statistics profiles: Table statistics can be updated as part of the redistribution process if a statistics profile is defined for the table. Having the REDISTRIBUTE utility update a table's statistics reduces I/O as all the data is scanned for the redistribute and no additional scan of the data is needed for RUNSTATS.

```
RUNSTATS on table schema.table
USE PROFILE runstats_profile
SET PROFILE ONLY
```

- Review the database configuration. util\_heap\_sz is critical to the data movement processing between database partitions – allocate as much memory as possible to util\_heap\_sz for the duration of the redistribution. Sufficient sortheap is required, if index rebuild is done as part of the redistribution. Increase util\_heap\_sz and sortheap as necessary to improve redistribute performance.
- 4. Retrieve the database configuration settings to be used for the new database partitions. When adding database partitions, a default database configuration is used. As a result, it's important to update the database configuration on the new nodes before the REDISTRIBUTE command is issued to ensure that the configuration is balanced across the entire warehouse.

```
SELECT name,
  CASE WHEN deferred value flags = 'AUTOMATIC'
    THEN deferred value flags
    ELSE substr(deferred value,1,20)
    END
  AS deferred_value
  FROM sysibmadm.dbcfg
  WHERE dbpartitionnum = existing-node
    AND deferred value != ''
    AND name NOT IN ('hadr_local_host', 'hadr_local_svc', 'hadr_peer_window',
                  'hadr_remote_host', 'hadr_remote_inst', 'hadr_remote_svc',
                  'hadr_syncmode', 'hadr_timeout', 'backup_pending', 'codepage',
                  'codeset', 'collate info', 'country', 'database_consistent',
                  'database_level', 'hadr_db_role', 'log_retain_status',
                  'loghead', 'logpath', 'multipage_alloc', 'numsegs', 'pagesize',
                  'release', 'restore_pending', 'restrict_access',
                  'rollfwd pending', 'territory', 'user exit status',
                  'number compat', 'varchar2_compat', 'database_memory')
```

- 5. Backup the database (or the table spaces in nodegroups that will be redistributed), before starting the redistribution process to ensure a recent recovery point.
- 6. Define the new data BCUs in DB2 by updating the db2nodes.cfg file and adding the new data BCU database partition specifications and define the new database partitions to DB2 using the ADD NODE WITHOUT TABLESPACES command.

```
db2start nodenum x export DB2NODE=x db2 add node without tablespaces db2stop nodenum x
```

**Note:** If it is not the first logical port on the data BCU, then execute a start and stop of the first logical port number before and after the above sequence of commands for subsequent logical ports.

7. Define system temporary table space containers on the newly defined database partitions.

ALTER TABLESPACE tablespace\_name ADD container\_information ON dbpartitionnums (x to y)

**8**. Add the new logical database partitions to the database partition groups that span the data BCUs.

```
ALTER DATABASE PARTITION GROUP partition_group_name
ADD dbpartitionnums (x to y)
WITHOUT TABLESPACES
```

**9**. Define permanent data table space containers on the newly defined database partitions.

ALTER TABLESPACE tablespace\_name ADD container\_information ON dbpartitionnums (x to y)

- **10**. Apply the database configuration settings retrieved in step 4 to the new database partitions (or issue a single UPDATE DB CFG command against all database partitions using the new DB2 9.5 single view of configuration support).
- **11**. Capture the definition of and then drop any replicated MQTs existing in the database partition groups to be redistributed.

db2look -d dbname -e -z
 schema -t replicated\_MQT\_table\_names
 -o repMQTs.clp

**12**. Disable any write-to-table event monitors that exist in the database partition groups to be redistributed.

SET EVENT MONITOR monitor\_name STATE 0

**13**. Run the REDISTRIBUTE utility to redistribute uniformly across all database partitions. Following shows the simple redistribute command:

REDISTRIBUTE DATABASE PARTITION GROUP sampleNodegrp NOT ROLLFORWARD RECOVERABLE uniform;

User also should consider specifying a table list as input to the REDISTRIBUTE command to enforce the order that the tables will be processed. The REDISTRIBUTE utility will move the data (compressed and compacted). Optionally, indexes will be rebuilt and statistics updated if statistics profiles are defined. Therefore instead of previous command, the following script can be run:

REDISTRIBUTE DATABASE PARTITION GROUP sampleNodegrp NOT ROLLFORWARD RECOVERABLE uniform

TABLE (tab1, tab2,...) FIRST;

# Consequences of using the NOT ROLLFORWARD RECOVERABLE option

When the REDISTRIBUTE DATABASE PARTITION GROUP command is issued and the **NOT ROLLFORWARD RECOVERABLE** option is specified, a minimal logging strategy is used that minimizes the writing of log records for each moved row. This type of logging is important for the usability of the redistribute operation since an approach that fully logs all data movement could, for large systems, require an impractical amount of active and permanent log space and would generally have poorer performance characteristics. It is important, however, for users to be aware that as a result of this minimal logging model, the

## **REDISTRIBUTE DATABASE PARTITION GROUP**

REDISTRIBUTE DATABASE PARTITION GROUP command is *not* rollforward recoverable. This means that any operation that results in the database rolling forward through a redistribute operation results in all tables touched by the redistribution operation being left in the UNAVAILABLE state. Such tables can only be dropped, which means there is no way to recover the data in these tables. This is why, for recoverable databases, the REDISTRIBUTE DATABASE PARTITION GROUP utility when issued with the NOT ROLLFORWARD RECOVERABLE option puts all table spaces it touches into the BACKUP PENDING state, forcing the user to backup all redistributed table spaces at the end of a successful redistribute operation. With a backup taken after the redistribute operation itself.

There is one very important consequence of the redistribute utility's lack of rollforward recoverability of which the user should be aware: If the user chooses to allow updates to be made against tables in the database (even tables outside the database partition group being redistributed) while the redistribute operation is running, including the period at the end of redistribute where the table spaces touched by redistribute are being backed up by the user, such updates can be lost in the event of a serious failure, for example, a database container is destroyed. The reason that such updates can be lost is that the redistribute operation is not rollforward recoverable. If it is necessary to restore the database from a backup taken prior to the redistribution operation, then it will not be possible to rollforward through the logs in order to replay the updates that were made during the redistribution operation without also rolling forward through the redistribute which, as was described above, leaves the redistributed tables in the UNAVAILABLE state. Thus, the only thing that can be done in this situation is to restore the database from the backup taken prior to redistribute without rolling forward. Then the redistribute operation can be performed again. Unfortunately, all the updates that occurred during the original redistribute operation are lost.

The importance of this point cannot be overemphasized. In order to be certain that there will be no lost updates during a redistribution operation, one of the following must be true:

- The user avoids making updates during the operation of the REDISTRIBUTE DATABASE PARTITION GROUP command, including the period after the command finishes where the affected table spaces are being backed up.
- Updates that are applied during the redistribute operation come from a repeatable source, meaning that they can be applied again at any time. For example, if the source of updates is data that is stored in a file and the updates are applied during batch processing, then clearly even in the event of a failure requiring a database restore, the updates would not be lost since they could simply be applied again at any time.

With respect to allowing updates to the database during the redistribution operation, the user must decide whether such updates are appropriate or not for their scenario based on whether or not the updates can be repeated after a database restore, if necessary.

**Note:** Not every failure during operation of the REDISTRIBUTE DATABASE PARTITION GROUP command results in this problem. In fact, most do not. The REDISTRIBUTE DATABASE PARTITION GROUP command is fully restartable, meaning that if the utility fails in the middle of its work, it can be easily continued or aborted with the **CONTINUE** or **ABORT** options. The failures mentioned above are failures that require the user to restore from the backup taken prior to the redistribute operation.

## **Usage notes**

- Before starting a redistribute operation, ensure that the tables are in normal state and not in load pending state or reorg pending state. Table states can be checked by using the LOAD QUERY command.
- When the **NOT ROLLFORWARD RECOVERABLE** option is specified and the database is a recoverable database, the first time the utility accesses a table space, it is put into the BACKUP PENDING state. All the tables in that table space will become read-only until the table space is backed-up, which can only be done when all tables in the table space have finished being redistributed.
- When a redistribution operation is running, it produces an event log file containing general information about the redistribution operation and information such as the starting and ending time of each table processed. This event log file is written to:
  - The homeinst/sqllib/redist directory on Linux and UNIX operating systems, using the following format for subdirectories and file name: database-name.database-partition-group-name.timestamp.log.
  - The DB2INSTPROF\instance\redist directory on Windows operating systems (where DB2INSTPROF is the value of the DB2INSTPROF registry variable), using the following format for subdirectories and file name: database-name.database-partition-group-name.timestamp.log.
  - The time stamp value is the time when the command was issued.
- This utility performs intermittent COMMITs during processing.
- All packages having a dependency on a table that has undergone redistribution are invalidated. It is recommended to explicitly rebind such packages after the redistribute database partition group operation has completed. Explicit rebinding eliminates the initial delay in the execution of the first SQL request for the invalid package. The redistribute message file contains a list of all the tables that have undergone redistribution.
- By default, the redistribute utility will update the statistics for those tables that have a statistics profile. For the tables without a statistics profile, it is recommended that you separately update the table and index statistics for these tables by calling the db2Runstats API or by issuing the RUNSTATS command after the redistribute operation has completed.
- Database partition groups containing replicated materialized query tables or tables defined with DATA CAPTURE CHANGES cannot be redistributed.
- Redistribution is not allowed if there are user temporary table spaces with existing declared temporary tables or created temporary tables in the database partition group.
- Options such as **INDEXING MODE** are ignored on tables, on which they do not apply, without warning. For example, **INDEXING MODE** will be ignored on tables without indexes.
- The REDISTRIBUTE DATABASE PARTITION GROUP command might fail (SQLSTATE 55071) if an add database partition server request is either pending or in progress. This command might also fail (SQLSTATE 55077) if a new database partition server is added online to the instance and not all applications are aware of the new database partition server.

# Compatibilities

Tables containing XML columns that use the DB2 Version 9.5 or earlier XML record format cannot be redistributed. Use the ADMIN\_MOVE\_TABLE stored procedure to migrate the table to the new format.

For compatibility with versions earlier than Version 8:

• The keyword **NODEGROUP** can be substituted for **DATABASE PARTITION GROUP**.

# **REFRESH LDAP**

Refreshes the cache on a local machine with updated information when the information in Lightweight Directory Access Protocol (LDAP) has been changed.

## Authorization

None

## **Required connection**

None

## Command syntax

## **Command parameters**

#### CLI CFG

Specifies that the CLI configuration is to be refreshed. This parameter is not supported on AIX or the Solaris operating system.

#### DB DIR

Specifies that the database directory is to be refreshed.

## NODE DIR

Specifies that the node directory is to be refreshed.

#### IMMEDIATE

Specifies that the local database and node directories are to be refreshed immediately.

**ALL** Specifies that all database and node entries contained within the LDAP server are to be added into the local database and node directories.

## Usage notes

If the object in LDAP is removed during refresh, the corresponding LDAP entry on the local machine is also removed. If the information in LDAP is changed, the corresponding LDAP entry is modified accordingly. If the DB2CLI.INI file is manually updated, the REFRESH LDAP CLI CFG command must be run to update the cache for the current user.

The REFRESH LDAP DB DIR and REFRESH LDAP NODE DIR commands remove the LDAP database or node entries found in the local database or node directories. The database or node entries will be added to the local database or node directories again when the user connects to a database or attaches to an instance found in LDAP, and DB2LDAPCACHE is either not set or set to YES.

The REFRESH LDAP IMMEDIATE command updates entries from the local database and node directories using the latest information found in LDAP. This update occurs immediately and regardless if DB2LDAPCACHE is enabled or not.

## **REFRESH LDAP**

Only database and node entries that originated from LDAP will be updated. Entries that were added manually remain unchanged.

The REFRESH LDAP IMMEDIATE ALL command immediately populates the local database and node directories with all the information found in LDAP. If an entry found in LDAP matches an existing local entry, the command will update the entry. This update will only occur if the local entry originated from LDAP. Entries that were added manually remain unchanged. This update is performed regardless if DB2LDAPCACHE is enabled or not.

When LDAP is disabled, performing either REFRESH LDAP IMMEDIATE or REFRESH LDAP IMMEDIATE ALL will result in SQLCODE -3279 (The command did not complete successfully because LDAP is disabled).

# REGISTER

Registers the DB2 server in the network directory server.

## Authorization

None

## **Required connection**

None

## **Command syntax**

►			 ⊣ IDAP nath	L
NEWISTER	B2_SERVER	LIN		

## LDAP path:

## **Command parameters**

**IN** Specifies the network directory server on which to register the DB2 server. The valid value is: LDAP for an LDAP (Lightweight Directory Access Protocol) directory server.

#### ADMIN

Specifies that an administration server node is to be registered.

NODE | AS nodename

Specify a short name to represent the DB2 server in LDAP. A node entry will be cataloged in LDAP using this node name. The client can attach to the server using this node name. The protocol associated with this LDAP node entry is specified through the PROTOCOL parameter.

#### PROTOCOL

Specifies the protocol type associated with the LDAP node entry. Since the database server can support more than one protocol type, this value specifies the protocol type used by the client applications. The DB2 server must be registered once per protocol. Valid values are: TCPIP, TCPIP4, TCPIP6, and NPIPE. Specify NPIPE to use Windows Named Pipes. NPIPE is only supported on Windows operating systems.

#### **HOSTNAME** *hostname*

Specifies the TCP/IP host name (or IP address). IP address can be an IPv4 or IPv6 address when using protocol, TCPIP. IP address must be an IPv4 address when using protocol, TCPIP4. IP address must be an IPv6 address when using protocol, TCPIP6.

#### **SVCENAME** *svcename*

Specifies the TCP/IP service name or port number.

#### SECURITY SOCKS

Specifies that TCP/IP SOCKS is to be used. This parameter is only supported with IPv4. When protocol TCPIP is specified, the underlying protocol used will be IPv4.

#### **REMOTE** computer-name

Specifies the computer name of the machine on which the DB2 server resides. Specify this parameter only if registering a remote DB2 server in LDAP. The value must be the same as the value specified when adding the server machine to LDAP. For Windows operating systems, this is the computer name. For UNIX based systems, this is the TCP/IP host name.

#### **INSTANCE** instance

Specifies the instance name of the DB2 server. The instance name must be specified for a remote instance (that is, when a value for the REMOTE parameter has been specified).

#### NODETYPE

Specifies the node type for the database server. Valid values are:

#### SERVER

Specify the SERVER node type for a DB2 Enterprise Server Edition. This is the default.

- **MPP** Specify the MPP node type for a DB2 Enterprise Server Edition Extended (partitioned database) server.
- DCS Specify the DCS node type when registering a host database server.

#### **OSTYPE** ostype

Specifies the operating system type of the server machine. Valid values are: AIX, NT, HPUX, SUN, MVS, OS400, VM, VSE and LINUX. If an operating system type is not specified, the local operating system type will be used for a local server and no operating system type will be used for a remote server.

#### WITH "comment-string"

Describes the DB2 server. Any comment that helps to describe the server registered in the network directory can be entered. Maximum length is 30 characters. A carriage return or a line feed character is not permitted. The comment text must be enclosed by double quotation marks.

## Usage notes

Register the DB2 server once for each protocol that the server supports.

The REGISTER command should be issued once for each DB2 server instance to publish the server in the directory server. If the communication parameter fields are reconfigured, or the server network address changes, update the DB2 server on the network directory server.

To update the DB2 server in LDAP, use the UPDATE LDAP NODE command after the changes have been made.

If any protocol configuration parameter is specified when registering a DB2 server locally, it will override the value specified in the database manager configuration file.

If the REGISTER command is used to register a local DB2 instance in LDAP, and one or both of NODETYPE and OSTYPE are specified, they will be replaced with the values retrieved from the local system. If the REGISTER command is used to register a remote DB2 instance in LDAP, and one or both of NODETYPE and OSTYPE are not specified, the default value of SERVER and Unknown will be used, respectively.

If the REGISTER command is used to register a remote DB2 server in LDAP, the computer name and the instance name of the remote server must be specified along with the communication protocol for the remote server.

When registering a host database server, a value of DCS must be specified for the NODETYPE parameter.

# **REGISTER XMLSCHEMA**

Registers an XML schema with the XML schema repository (XSR).

## Authorization

One of the following:

- DBADM
- IMPLICIT\_SCHEMA database authority if the SQL schema does not exist
- · CREATEIN privilege if the SQL schema exists

## **Required connection**

Database

## **Command syntax**

► — REGISTER XMLSCHEMA— <i>schema-URI</i> —FROM— <i>content-URI</i>	
►WITH—properties-URIAS—relational-identifier	
▶ xml-document-subclause	
COMPLETE WITH—schema-properties-URI ENABLE DECOMPOSITION-	

#### xml-document-subclause:

## **Command parameters**

#### schema-URI

Specifies the URI, as referenced by XML instance documents, of the XML schema being registered.

#### FROM content-URI

Specifies the URI where the XML schema document is located. Only a local file specified by a file scheme URI is supported.

#### **WITH** properties-URI

Specifies the URI of a properties document for the XML schema. Only a local file specified by a file scheme URI is supported.

#### AS relational-identifier

Specifies a name that can be used to refer to the XML schema being registered. The relational name can be specified as a two-part SQL identifier, consisting of the SQL schema and the XML schema name, having the following format: SQLschema.name. The default relational schema, as defined in the CURRENT SCHEMA special register, is used if no schema is specified. If no name is provided, a unique value is generated.

## COMPLETE

Indicates that there are no more XML schema documents to be added. If specified, the schema is validated and marked as usable if no errors are found.

## **WITH** *schema-properties-URI*

Specifies the URI of a properties document for the XML schema. Only a local file specified by a file scheme URI is supported.

#### ENABLE DECOMPOSITION

Specifies that this schema is to be used for decomposing XML documents.

#### ADD document-URI

Specifies the URI of an XML schema document to be added to this schema, as the document would be referenced from another XML document.

#### FROM content-URI

Specifies the URI where the XML schema document is located. Only a local file specified by a file scheme URI is supported.

#### **WITH** properties-URI

Specifies the URI of a properties document for the XML schema. Only a local file specified by a file scheme URI is supported.

## **Examples**

```
REGISTER XMLSCHEMA 'http://myPOschema/PO.xsd'
FROM 'file:///c:/TEMP/PO.xsd'
WITH 'file:///c:/TEMP/schemaProp.xml'
AS user1.POschema
```

## **Usage notes**

- Before an XML schema document can be referenced and be available for validation and annotation, it must first be registered with the XSR. This command performs the first step of the XML schema registration process, by registering the primary XML schema document. The final step of the XML schema registration process requires that the COMPLETE XMLSCHEMA command run successfully for the XML schema. Alternatively, if there are no other XML schema documents to be included, issue the REGISTER XMLSCHEMA command with the **COMPLETE** keyword to complete registration in one step.
- When registering an XML schema in the database, a larger application heap (**applheapsz**) may be required depending on the size of the XML schema. The recommended size is 1024 but larger schemas will require additional memory.

# **REGISTER XSROBJECT**

Registers an XML object in the database catalogs. Supported objects are DTDs and external entities.

## Authorization

One of the following:

- dbadm
- · IMPLICIT\_SCHEMA database authority if the SQL schema does not exist
- CREATEIN privilege if the SQL schema exists

## **Required connection**

Database

## Command syntax

## **Command parameters**

#### system-ID

Specifies the system ID that is specified in the XML object declaration.

**PUBLIC** *public-ID* 

Specifies an optional PUBLIC ID in the XML object declaration.

FROM content-URI

Specifies the URI where the content of an XML schema document is located. Only a local file specified by a file scheme URI is supported.

AS relational-identifier

Specifies a name that can be used to refer to the XML object being registered. The relational name can be specified as a two-part SQL identifier consisting of the relational schema and name separated by a period, for example "JOHNDOE.EMPLOYEEDTD". If no relational schema is specified, the default relational schema defined in the special register CURRENT SCHEMA is used. If no name is specified, one is generated automatically.

**DTD** Specifies that the object being registered is a Data Type Definition document (DTD).

#### EXTERNAL ENTITY

Specifies that the object being registered is an external entity.

## Examples

1. Given this sample XML document which references an external entity:

```
<?xml version="1.0" standalone="no" ?>
<!DOCTYPE copyright [
    <!ELEMENT copyright (#PCDATA)>
]>
```

<copyright>c</copyright>

Before this document can be successfully inserted into an XML column, the external entity needs to be registered. The following command registers an entity where the entity content is stored locally in C:\TEMP:

REGISTER XSROBJECT 'http://www.xmlwriter.net/copyright.xml' FROM 'c:\temp\copyright.xml' EXTERNAL ENTITY

2. Given this XML document fragment which references a DTD:

```
<!--inform the XML processor
that an external DTD is referenced-->
<?xml version="1.0" standalone="no" ?>
<!--define the location of the
external DTD using a relative URL address-->
<!DOCTYPE document SYSTEM "http://www.xmlwriter.net/subjects.dtd">
<document>
ctitle>Subjects available in Mechanical Engineering.</title>
csubjectID>2.303</subjectID>
csubjectname>Fluid Mechanics</subjectname>
...
```

Before this document can be successfully inserted into an XML column, the DTD needs to be registered. The following command registers a DTD where the DTD definition is stored locally in C:\TEMP and the relational identifier to be associated with the DTD is "TEST.SUBJECTS":

REGISTER XSROBJECT 'http://www.xmlwriter.net/subjects.dtd' FROM 'file:///c:/temp/subjects.dtd' AS TEST.SUBJECTS DTD

3. Given this sample XML document which references a public external entity:

```
<?xml version="1.0" standalone="no" ?>
<!DOCTYPE copyright [
    <!ELEMENT copyright (#PCDATA)>
```

]>

<copyright>c</copyright>

Before this document can be successfully inserted into an XML column, the public external entity needs to be registered. The following command registers an entity where the entity content is stored locally in C:\TEMP:

REGISTER XSROBJECT 'http://www.w3.org/xmlspec/copyright.xml'

```
PUBLIC '-//W3C//TEXT copyright//EN' FROM 'file:///c:/temp/copyright.xml'
EXTERNAL ENTITY
```

# **REORG INDEXES/TABLE**

Reorganizes an index or a table.

You can reorganize all indexes defined on a table by rebuilding the index data into unfragmented, physically contiguous pages. On a data partitioned table, you can reorganize a specific nonpartitioned index on a partitioned table, or you can reorganize all the partitioned indexes on a specific data partition.

If you specify the **CLEANUP ONLY** option of the index clause, cleanup is performed without rebuilding the indexes. This command cannot be used against indexes on declared temporary tables or created temporary tables (SQLSTATE 42995).

The table option reorganizes a table by reconstructing the rows to eliminate fragmented data, and by compacting information. On a partitioned table, you can reorganize a single partition.

## Scope

This command affects all database partitions in the database partition group.

## Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT
- DBADM
- SQLADM
- CONTROL privilege on the table.

## **Required connection**

Database

## **Command syntax**

►►REORG	
► TABLE—table-name Table clause Index= name Index= name	Index clause
TABLE — mdc-table-name — RECLAIM EXTENTS ONLY —	ALLOW WRITE ACCESS ALLOW READ ACCESS ALLOW NO ACCESS
▶ Table partitioning clause   Database	e partition clause ⊣

#### Table clause:

## **REORG INDEXES/TABLE**

## Index clause:

#### Table partitioning clause:

DADTITION partition name	
raciiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiiii	

#### Database partition clause:

## **Command parameters**

#### **INDEXES ALL FOR TABLE** *table-name*

Specifies the table whose indexes are to be reorganized. The table can be in a local or a remote database.

#### **INDEX** index-name

Specifies an individual index to be reorganized on a data partitioned table. Reorganization of individual indexes are *only* supported for nonpartitioned indexes on a partitioned table. This parameter is not supported for block indexes.

#### FOR TABLE table-name

Specifies the name of the table on which the nonpartitioned index *index-name* is created. This parameter is optional, given that index names are unique across the database.

## ALLOW NO ACCESS

For REORG INDEXES, specifies that no other users can access the table while the indexes are being reorganized. If the **ON DATA PARTITION** clause is specified for a partitioned table, only the specified partition is restricted to the access mode level.

For REORG INDEX, specifies that no other users can access the table while the nonpartitioned index is being reorganized.

#### ALLOW READ ACCESS

For REORG INDEXES, specifies that other users can have read-only access to the table while the indexes are being reorganized. ALLOW READ ACCESS mode is not supported for REORG INDEXES of a partitioned table unless the CLEANUP ONLY option or ON DATA PARTITION clause is specified. If the ON DATA PARTITION clause is specified for a partitioned table, only the specified partition is restricted to the access mode level.

For REORG INDEX, specifies that can have read-only access to the table while the nonpartitioned index is being reorganized.

#### ALLOW WRITE ACCESS

For REORG INDEXES, specifies that other users can read from and write to the table while the indexes are being reorganized. ALLOW WRITE ACCESS mode is not supported for a partitioned table unless the CLEANUP ONLY option or ON DATA PARTITION clause is specified. If the ON DATA PARTITION clause is specified for a partitioned table, only the specified partition is restricted to the access mode level.

For REORG INDEX, specifies that can read from and write to the table while the nonpartitioned index is being reorganized.

ALLOW WRITE ACCESS mode is not supported for multidimensional clustering (MDC) tables or extended indexes unless the CLEANUP ONLY option is specified.

The following items apply for a data partitioned table when the **ON DATA PARTITION** clause is specified with the REORG INDEXES ALL command:

• Only the specified data partition is restricted to the access mode level. Users are allowed to read from and write to the other partitions of the table while the partitioned indexes of a specified partition are being reorganized.

The following table lists the access modes supported and the concurrent access allowed on other partitions of the table when the **ON DATA PARTITION** clause is specified:

Table 32. Access modes supported and concurrent access allowed when the ON DATA PARTITION clause is specified with REORG INDEXES ALL

Access mode	Concurrent access allowed on the specified partition	Concurrent access allowed on other partitions
ALLOW NO ACCESS	No access	Read and write access
ALLOW READ ACCESS	Read on the partition up until index is updated	Read and write access
ALLOW WRITE ACCESS	Read and write access on the partition up until index is updated	Read and write access

• Only the partitioned indexes for the specified partition are reorganized. The nonpartitioned indexes on the partitioned table are not reorganized.

If there are any nonpartitioned indexes on the table marked "invalid" or "for rebuild", all indexes marked "invalid" or "for rebuild" are rebuilt before reorganization. Otherwise, only the partitioned indexes on the specified partition are reorganized or rebuilt if the index object is marked "invalid" or "for rebuild".

• Only partitioned indexes for the specified partition are cleaned when the **CLEANUP ONLY** option is also specified.

The following table lists the supported access modes for index reorganization of partitioned and nonpartitioned tables:

		Table partitioning	Additional parameters specified for	
Command	Table type	clause	index clause	Supported access mode
REORG INDEXES	Nonpartitioned table	Not applicable	Any	ALLOW NO ACCESS, ALLOW READ ACCESS <sup>1</sup> , ALLOW WRITE ACCESS
REORG INDEX	Partitioned table	Not applicable	Any	ALLOW READ ACCESS <sup>1</sup>
REORG INDEXES	Partitioned table	None	None specified	ALLOW NO ACCESS <sup>1</sup>
REORG INDEXES	Partitioned table	ON DATA Partition	None specified	ALLOW NO ACCESS, ALLOW READ ACCESS <sup>1</sup> , ALLOW WRITE ACCESS
REORG INDEXES	Partitioned table	With or without the ON DATA PARTITION clause	CLEANUP ONLY specified	ALLOW NO ACCESS, ALLOW READ ACCESS <sup>1</sup> , ALLOW WRITE ACCESS

Table 33. Supported access modes for index reorganization on partitioned and nonpartitioned table

Note:

1. Default mode when an access clause is not specified.

#### CLEANUP ONLY

When **CLEANUP ONLY** is requested, a cleanup rather than a full reorganization will be done. The indexes will not be rebuilt and any pages freed up will be available for reuse by indexes defined on this table only.

The **CLEANUP ONLY PAGES** option will search for and free committed pseudo empty pages. A committed pseudo empty page is one where all the keys on the page are marked as deleted and all these deletions are known to be committed. The number of pseudo empty pages in an indexes can be determined by running RUNSTATS and looking at the NUM EMPTY LEAFS column in SYSCAT.INDEXES. The **PAGES** option will clean the NUM EMPTY LEAFS if they are determined to be committed.

The **CLEANUP ONLY ALL** option will free committed pseudo empty pages, as well as remove committed pseudo deleted keys from pages that are not pseudo empty. This option will also try to merge adjacent leaf pages if doing so will result in a merged leaf page that has at least PCTFREE free space on the merged leaf page, where PCTFREE is the percent free space defined for the index at index creation time. The default PCTFREE is ten percent. If two pages can be merged, one of the pages will be freed. The number of pseudo deleted keys in an index , excluding those on pseudo empty pages, can be determined by running RUNSTATS and then selecting the NUMRIDS DELETED from SYSCAT.INDEXES. The **ALL** option will clean the NUMRIDS DELETED and the NUM EMPTY LEAFS if they are determined to be committed.

ALL Specifies that indexes should be cleaned up by removing committed pseudo deleted keys and committed pseudo empty pages.

#### PAGES

Specifies that committed pseudo empty pages should be removed from the index tree. This will not clean up pseudo deleted keys on pages that are not pseudo empty. Since it is only checking the pseudo empty leaf pages, it is considerably faster than using the **ALL** option in most cases.

#### CONVERT

Converts type-1 indexes to type-2 index. If the index is already type 2, this option has no effect.

In Version 9.7, type-1 indexes are discontinued and all indexes that are created are type-2 indexes. As a result, the **CONVERT** option is deprecated.

All indexes created prior to Version 8 are type-1 indexes. Prior to Version 9.7, all indexes created by Version 8 and later are type-2 indexes, except when you create an index on a table that already has a type-1 index. In this case, the new index was also of type 1. This is no longer the case in Version 9.7 because all indexes created are type 2.

Use the ALLOW READ ACCESS or ALLOW WRITE ACCESS option to allow other transactions either read-only or read-write access to the table while the indexes are being reorganized. While ALLOW READ ACCESS and ALLOW WRITE ACCESS allow access to the table, during the period in which the reorganized copies of the indexes are made available, no access to the table is allowed.

#### TABLE mdc-table-name RECLAIM EXTENTS ONLY

Specifies the multidimensional clustering (MDC) table to reorganize to reclaim extents that are not being used. The name or alias in the form: *schema.table-name* can be used. The *schema* is the user name under which the table was created. If you omit the schema name, the default schema is assumed.

For REORG TABLE RECLAIM EXTENTS ONLY when the **ON DATA PARTITION** clause is specified, the access clause only applies to the named partition. Users can read from and write to the rest of the table while the extents on the specified partition are being reclaimed. This situation also applies to the default access levels.

#### ALLOW NO ACCESS

For REORG TABLE RECLAIM EXTENTS ONLY, specifies that no other users can access the table while the extents are being reclaimed.

#### ALLOW READ ACCESS

For REORG TABLE RECLAIM EXTENTS ONLY, specifies that other users can have read-only access to the table while the extents are being reclaimed.

#### ALLOW WRITE ACCESS

For REORG TABLE RECLAIM EXTENTS ONLY, specifies that other users can read from and write to the table while the extents are being reclaimed.

#### **TABLE** table-name

Specifies the table to reorganize. The table can be in a local or a remote database. The name or alias in the form: *schema.table-name* can be used. The

*schema* is the user name under which the table was created. If you omit the schema name, the default schema is assumed.

For typed tables, the specified table name must be the name of the hierarchy's root table.

You cannot specify an index for the reorganization of a multidimensional clustering (MDC) table. In place reorganization of tables cannot be used for MDC tables.

When the **ON DATA PARTITION** clause is specified for a table reorganization of a data partitioned table, only the specified data partition is reorganized:

- If there are no nonpartitioned indexes (except system-generated XML path indexes) defined on the table, the access mode applies only to the specified partition, users are allowed to read from and write to the other partitions of the table.
- If there are nonpartitioned indexes defined on the table (excluding system-generated XML path indexes), the ALLOW NO ACCESS mode is the default and only supported access mode. In this case, the table is placed in ALLOW NO ACCESS mode. If ALLOW READ ACCESS is specified, SQL1548N is returned (SQLSTATE 5U047).

	-				
Table 21	Supported accord	a mada far tabla	roorgonization or	nonnortitionad an	d partitionad tabla
1 aute 54.	Subboned acces	s mode for lable	reorganization or	ו ווטווטמונונוטוופט מוו	

Command	Table type	Table partitioning clause	Supported access mode
REORG TABLE	Nonpartitioned table	Not applicable	ALLOW NO ACCESS, ALLOW READ ACCESS <sup>1</sup>
REORG TABLE	Partitioned table	Not specified	ALLOW NO ACCESS <sup>1</sup>
REORG TABLE (There are no indexes or only partitioned indexes defined on the table.)	Partitioned table	ON DATA PARTITION	ALLOW NO ACCESS, ALLOW READ ACCESS <sup>1</sup>
REORG TABLE (there are nonpartitioned indexes defined on the table, excluding system-generated XML path indexes.)	Partitioned table	ON DATA PARTITION	ALLOW NO ACCESS <sup>1</sup>

#### Note:

1. Default mode when an access clause is not specified.

For a data partitioned table, a table reorganization rebuilds the nonpartitioned indexes and partitioned indexes on the table after reorganizing the table. If the **ON DATA PARTITION** clause is used to reorganize a specific data partition of a data partitioned table, a table reorganization rebuilds the nonpartitioned indexes and partitioned indexes only for the specified partition.

#### **INDEX** *index-name*

Specifies the index to use when reorganizing the table. If you do not specify the fully qualified name in the form: *schema.index-name*, the default schema is assumed. The *schema* is the user name under which the index was created. The database manager uses the index to physically reorder the records in the table it is reorganizing.

For an in place table reorganization, if a clustering index is defined on the table and an index is specified, it must be clustering index. If the in place option is not specified, any index specified will be used. If you do not specify the name of an index, the records are reorganized without regard to order. If the table has a clustering index defined, however, and no index is specified, then the clustering index is used to cluster the table. You cannot specify an index if you are reorganizing an MDC table.

If a table reorganization uses both the **INDEX** and **ON DATA PARTITION** clauses, only the specified partition is reorganized using the index *index-name*.

#### ALLOW NO ACCESS

Specifies that no other users can access the table while the table is being reorganized.

The ALLOW NO ACCESS mode is the default and only supported access mode when reorganizing a partitioned table without the ON DATA PARTITION clause.

If the **ON DATA PARTITION** clause is specified for a data partitioned table, only the specified data partition is reorganized:

- If there are no nonpartitioned indexes defined on the table (except system-generated XML path indexes), only the specified partition is restricted to the **ALLOW NO ACCESS** mode. Users are allowed to read from and write to the other partitions of the table.
- If there are nonpartitioned indexes defined on the table (except system-generated XML path indexes), the ALLOW NO ACCESS mode is the default and only supported access mode. In this case, the table is placed in ALLOW NO ACCESS mode.

## ALLOW READ ACCESS

Allow only read access to the table during reorganization.

The **ALLOW READ ACCESS** mode is the default mode for a nonpartitioned table.

If the **ON DATA PARTITION** clause is specified for a data partitioned table, only the specified data partition is reorganized:

- If there are no nonpartitioned indexes defined on the table (except system-generated XML path indexes), the **ALLOW READ ACCESS** mode is the default mode and only the specified partition is restricted to the access mode level. Users are allowed to read from and write to the other partitions of the table.
- If there are nonpartitioned indexes defined on the table (except system-generated XML path indexes), the ALLOW READ ACCESS mode is not supported. If ALLOW READ ACCESS is specified in this case, SQL1548N is returned (SQLSTATE 5U047)

#### INPLACE

Reorganizes the table while permitting user access.

In place table reorganization is allowed only on nonpartitioned and non-MDC tables with type-2 indexes, but without extended indexes and with no indexes defined over XML columns in the table. In place table reorganization can only be performed on tables that are at least three pages in size.

In place table reorganization takes place asynchronously, and might not be effective immediately.

#### ALLOW READ ACCESS

Allow only read access to the table during reorganization.

#### ALLOW WRITE ACCESS

Allow write access to the table during reorganization. This is the default behavior.

#### NOTRUNCATE TABLE

Do not truncate the table after in place reorganization. During truncation, the table is S-locked.

#### START

Start the in place REORG processing. Because this is the default, this keyword is optional.

**STOP** Stop the in place REORG processing at its current point.

#### PAUSE

Suspend or pause in place REORG for the time being.

#### RESUME

Continue or resume a previously paused in place table reorganization. When an online reorganization is resumed and you want the same options as when the reorganization was paused, you must specify those options again while resuming.

#### **USE** *tbspace-name*

Specifies the name of a system temporary table space in which to store a temporary copy of the table being reorganized. If you do not provide a table space name, the database manager stores a working copy of the table in the table spaces that contain the table being reorganized.

For an 8 KB, 16 KB, or 32 KB table object, if the page size of the system temporary table space that you specify does not match the page size of the table spaces in which the table data resides, the DB2 database product will try to find a temporary table space of the correct size of the LONG/LOB objects. Such a table space must exist for the reorganization to succeed.

For partitioned tables, the temporary table space is used as temporary storage for the reorganization of data partitions in the table. Reorganization of the entire partitioned table reorganizes a single data partition at a time. The temporary table space must be able to hold the largest data partition in the table, and not the entire table. When the **ON DATA PARTITION** clause is specified, the temporary table space must be able to hold the specified partition.

If you do not supply a table space name for a partitioned table, the table space where each data partition is located is used for temporary storage of that data partition. There must be enough free space in each data partition's table space to hold a copy of the data partition.

#### INDEXSCAN

For a clustering REORG an index scan will be used to re-order table records. Reorganize table rows by accessing the table through an index. The default method is to scan the table and sort the result to reorganize the table, using temporary table spaces as necessary. Even though the index keys are in sort order, scanning and sorting is typically faster than fetching rows by first reading the row identifier from an index.

#### LONGLOBDATA

Long field and LOB data are to be reorganized.

This is not required even if the table contains long or LOB columns. The default is to avoid reorganizing these objects because it is time consuming and does not improve clustering. However, running a reorganization with the **LONGLOBDATA** option on tables with XML columns will reclaim unused space and thereby reduce the size of the XML storage object.

This parameter is required when converting existing LOB data into inlined LOB data.

#### **USE** *longtbspace-name*

This is an optional parameter, which can be used to specify the name of a temporary table space to be used for rebuilding long data. If no temporary table space is specified for either the table object or for the long objects, the objects will be constructed in the table space they currently reside. If a temporary table space is specified for the table but this parameter is not specified, then the table space used for base reorg data will be used, unless the page sizes differ. In this situation, the DB2 database system will attempt to choose a temporary container of the appropriate page size to create the long objects in.

If **USE** *longtbspace-name* is specified, **USE** *tbspace-name* must also be specified. If it is not, the *longtbspace-name* argument is ignored.

#### **KEEPDICTIONARY**

If the COMPRESS attribute for the table is YES and the table has a compression dictionary then no new dictionary is built. All the rows processed during reorganization are subject to compression using the existing dictionary. If the COMPRESS attribute is YES and a compression dictionary doesn't exist for the table, a dictionary will only be created (and the table compressed) in this scenario if the table is of a certain size (approximately 1 to 2 MB) and sufficient data exists within this table. If, instead, you explicitly state REORG RESETDICTIONARY, then a dictionary is built as long as there is at least 1 row in the table. If the COMPRESS attribute for the table is N0 and the table has a compression dictionary, then reorg processing will preserve the dictionary and all the rows in the newly reorganized table will be in noncompressed format. It is not possible to compress some data such as LOB data not stored in the base table row.

When the **LONGLOBDATA** option is not specified, only the table row data is reorganized. The following table describes the behavior of **KEEPDICTIONARY** syntax in REORG command when the **LONGLOBDATA** option is not specified.

TADIE 55. TILOTIG NELI DIOTIONATTI	Table 35.	REORG	KEEPDIC	TIONARY
------------------------------------	-----------	-------	---------	---------

Compress	Dictionary Exists	Result; outcome
Y	Y	Preserve dictionary; rows compressed.
Y	N	Build dictionary; rows compressed

Table 35. REORG KEEPDICTIONARY (continued)

Compress	Dictionary Exists	Result; outcome
N	Y	Preserve dictionary; all rows uncompressed
N	Ν	No effect; all rows uncompressed

The following table describes the behavior of **KEEPDICTIONARY** syntax in REORG command when the **LONGLOBDATA** option is specified.

Table 36. REORG KEEPDICTIONARY when LONGLOBDATA option is specified.

Compress	Table row data dictionary exists	XML storage object dictionary exists <sup>1</sup>	Compression dictionary	Data compression
Y	Y	Y	Preserve dictionaries.	Existing data is compressed. New data will be compressed.
Y	Y	N	Preserve table row dictionary and create an XML storage object dictionary.	Existing data is compressed. New data will be compressed.
Y	N	Y	Create table row dictionary and preserve the XML dictionary.	Existing data is compressed. New data will be compressed.
Y	N	N	Create table row and XML dictionaries.	Existing data is compressed. New data will be compressed.
N	Y	Y	Preserve table row and XML dictionaries.	Table data is uncompressed. New data will be not be compressed.
N	Y	N	Preserve table row dictionary.	Table data is uncompressed. New data will be not be compressed.
N	N	Y	Preserve XML dictionary.	Table data is uncompressed. New data will be not be compressed.
N	N	N	No effect.	Table data is uncompressed. New data will be not be compressed.

## Note:

 A compression dictionary can be created for the XML storage object of a table only if the XML columns are added to the table in DB2 V9.7 or later, or if the table is migrated using the ONLINE\_TABLE\_MOVE stored procedure.

For any reinitialization or truncation of a table (such as for a replace operation), if the compress attribute for the table is NO, the dictionary is discarded if one exists. Conversely, if a dictionary

exists and the compress attribute for the table is YES then a truncation will save the dictionary and not discard it. The dictionary is logged in its entirety for recovery purposes and for future support with data capture changes (that is, replication).

#### RESETDICTIONARY

If the COMPRESS attribute for the table is YES then a new row compression dictionary is built. All the rows processed during reorganization are subject to compression using this new dictionary. This dictionary replaces any previous dictionary. If the COMPRESS attribute for the table is N0 and the table does have an existing compression dictionary then reorg processing will remove the dictionary and all rows in the newly reorganized table will be in noncompressed format. It is not possible to compress some data such as LOB data not stored in the base table row.

If the **LONGLOBDATA** option is not specified, only the table row data is reorganized. The following table describes the behavior of **RESETDICTIONARY** syntax in REORG command when the **LONGLOBDATA** option is not specified.

Compress	Dictionary Exists	Result; outcome	
Y	Y	Build new dictionary*; rows compressed. If DATA CAPTURE CHANGES option is specified on the CREATE TABLE or ALTER TABLE statements, the current dictionary is kept (referred to as the <i>historical compression</i> <i>dictionary</i> ).	
Y	Ν	Build new dictionary; rows compressed	
N	Y	Y Remove dictionary; all rows uncompressed. If the DATA CAPTURE NONE option is specified on the CREATE TABLE or ALTER TABLE statements, the <i>historical compression dictionary</i> is also removed for the specified table.	
N	Ν	No effect; all rows uncompressed	

Table 37. REORG RESETDICTIONARY

\* - If a dictionary exists and the compression attribute is enabled but there currently isn't any data in the table, the

**RESETDICTIONARY** operation will keep the existing dictionary. Rows which are smaller in size than the internal minimum record length and rows which do not demonstrate a savings in record length when an attempt is made to compress them are considered "insufficient" in this case.

The following table describes the behavior of **RESETDICTIONARY** syntax in REORG command when the **LONGLOBDATA** option is specified.
Compress	Table row data dictionary exists	XML storage object dictionary exists <sup>1</sup>	Data dictionary	Data compression
Y	Y	Y	Build dictionaries <sup>2 3</sup> .	Existing data is compressed. New data will be compressed.
Y	Y	N	Build new table row dictionary and create a new XML dictionary <sup>3</sup> .	Existing data is compressed. New data will be compressed.
Y	N	Y	Create table row data dictionary and build a new XML dictionary.	Existing data is compressed. New data will be compressed.
Y	N	N	Create dictionaries.	Existing data is compressed. New data will be compressed.
N	Y	Y	Remove dictionaries. Existing and new data is not compressed.	Existing table data is uncompressed. New data will be not be compressed.
N	Y	N	Remove table row dictionary. All data is uncompressed.	Existing table data is uncompressed. New data will be not be compressed.
N	N	Y	Remove XML storage object dictionary.	Existing table data is uncompressed. New data will be not be compressed.
N	N	N	No effect.	Existing table data is uncompressed. New data will be not be compressed.

Table 38. REORG RESETDICTIONARY when LONGLOBDATA option is specified.

### Note:

- 1. A compression dictionary can be created for the XML storage object of a table only if the XML columns are added to the table in DB2 V9.7 or later, or if the table is migrated using an online table move.
- 2. If a dictionary exists and the compression attribute is enabled but there currently isn't any data in the table, the **RESETDICTIONARY** operation will keep the existing dictionary. Rows which are smaller in size than the internal minimum record length and rows which do not demonstrate a savings in record length when an attempt is made to compress them are considered insufficient in this case.
- **3.** If DATA CAPTURE CHANGES option is specified on the CREATE TABLE or ALTER TABLE statements, the current data dictionary is kept (referred to as the *historical compression dictionary*).

# **ON DATA PARTITION** partition-name

For data partitioned tables, specifies the data partition for the reorganization.

For DB2 V9.7 Fix Pack 1 and later releases, the clause can be used with the REORG INDEXES ALL command to reorganize the partitioned indexes on a specific partition and the REORG TABLE command to reorganize data of a specific partition.

When using the clause with a REORG TABLE or REORG INDEXES ALL command on a partitioned table, the reorganization fails and returns SQL2222N with reason code 1 if the partition *partition-name* does not exist for the specified table. The reorganization fails and returns SQL2222N with reason code 3 if the partition *partition-name* is in the attached or detached state.

If the REORG INDEX command is issued with the **ON DATA PARTITION** clause, the reorganization fails and returns SQL2222N with reason code 2.

The REORG TABLE command fails and returns SQL1549N (SQLSTATE 5U047) if the partitioned table is in the reorg pending state and there are nonpartitioned indexes defined on the table.

### ALL DBPARTITIONNUMS

Specifies that operation is to be done on all database partitions specified in the db2nodes.cfg file. This is the default if a node clause is not specified.

#### EXCEPT

Specifies that operation is to be done on all database partitions specified in the db2nodes.cfg file, except those specified in the node list.

### ON DBPARTITIONNUM | ON DBPARTITIONNUMS

Perform operation on a set of database partitions.

#### db-partition-number1

Specifies a database partition number in the database partition list.

*db-partition-number2* 

Specifies the second database partition number, so that all database partitions from *db-partition-number1* up to and including *db-partition-number2* are included in the database partition list.

# Examples

To reorganize a table to reclaim space and use the temporary table space mytemp1, enter the following command:

db2 reorg table homer.employee use mytemp1

To reorganize tables in a partition group consisting of nodes 1, 2, 3, and 4 of a four-node system, you can enter either of the following commands:

db2 reorg table employee index empid on dbpartitionnum (1,3,4)

```
db2 reorg table homer.employee index homer.empid on all dbpartitionnums except dbpartitionnum (2)
```

To clean up the pseudo deleted keys and pseudo empty pages in all the indexes on the EMPLOYEE table while allowing other transactions to read and update the table, enter:

db2 reorg indexes all for table homer.employee allow write access cleanup only  $% \left( {\left( {{{\mathbf{x}}_{i}} \right)_{i}} \right)$ 

To clean up the pseudo empty pages in all the indexes on the EMPLOYEE table while allowing other transactions to read and update the table, enter:

db2 reorg indexes all for table homer.employee allow write access cleanup only pages

To reorganize the EMPLOYEE table using the system temporary table space TEMPSPACE1 as a work area, enter:

db2 reorg table homer.employee use tempspace1

To start, pause, and resume an in place reorg of the EMPLOYEE table with the default schema HOMER, which is specified explicitly in previous examples, enter the following commands:

db2 reorg table employee index empid inplace start db2 reorg table employee inplace pause db2 reorg table homer.employee inplace allow read access notruncate table resume

The command to resume the reorg contains additional keywords to specify read access only and to skip the truncation step, which share-locks the table.

# Usage notes

Restrictions:

- The REORG utility does not support the use of nicknames.
- The REORG TABLE command is not supported for declared temporary tables or created temporary tables.
- The REORG TABLE command cannot be used on views.
- Reorganization of a table is not compatible with range-clustered tables, because the range area of the table always remains clustered.
- REORG TABLE cannot be used on a partitioned table in a DMS table space while an online backup of ANY table space in which the table resides, including LOBs and indexes, is being performed.
- REORG TABLE cannot use an index that is based on an index extension.
- If a table is in reorg pending state, an inplace reorg is not allowed on the table.
- Concurrent table reorganization sharing the same temporary DMS table space is not supported.
- For data partitioned tables:
  - The table must have an ACCESS\_MODE in SYSCAT.TABLES of Full Access.
  - Reorganization skips data partitions that are in a restricted state due to an attach or detach operation. If the ON DATA PARTITION clause is specified, that partition must be fully accessible.
  - If an error occurs during table reorganization, some indexes or index partitions might be left invalid. The nonpartitioned indexes of the table will be marked invalid if the reorganization has reached or passed the replace phase for the first data partition. The index partitions for any data partition that has already reached or passed the replace phase will be marked invalid. Indexes will be rebuilt on the next access to the table or data partition.
  - If an error occurs during index reorganization when the ALLOW NO ACCESS mode is used, some indexes on the table might be left invalid. For nonpartitioned RID indexes on the table, only the index that is being reorganized at the time of the failure will be left invalid. For MDC tables with nonpartitioned block indexes, one or more of the block indexes might be left invalid if an error occurs. For partitioned indexes, only the index object on the data partition being reorganized will be left invalid. Any indexes marked invalid will be rebuilt on the next access to the table or data partition.

# **REORG INDEXES/TABLE**

- When a data partitioned table with only partitioned indexes defined on the table is in the reorg pending state, issuing a REORG TABLE command with the ON DATA PARTITION clause brings only the specified data partition out of the reorg pending state. To bring the remaining partitions of the table out of the reorg pending state, either issue REORG TABLE command on the entire table (without the ON DATA PARTITION clause), or issue a REORG TABLE command with the ON DATA PARTITION clause for each of the remaining partitions.

Information about the current progress of table reorganization is written to the history file for database activity. The history file contains a record for each reorganization event. To view this file, execute the LIST HISTORY command for the database that contains the table you are reorganizing.

You can also use table snapshots to monitor the progress of table reorganization. Table reorganization monitoring data is recorded regardless of the Database Monitor Table Switch setting.

If an error occurs, an SQLCA dump is written to the history file. For an inplace table reorganization, the status is recorded as PAUSED.

When an indexed table has been modified many times, the data in the indexes might become fragmented. If the table is clustered with respect to an index, the table and index can get out of cluster order. Both of these factors can adversely affect the performance of scans using the index, and can impact the effectiveness of index page prefetching. REORG INDEX or REORG INDEXES can be used to reorganize one or all of the indexes on a table. Index reorganization will remove any fragmentation and restore physical clustering to the leaf pages. Use the REORGCHK command to help determine if an index needs reorganizing. Be sure to complete all database operations and release all locks before invoking index reorganization. This can be done by issuing a COMMIT after closing all cursors opened WITH HOLD, or by issuing a ROLLBACK.

A classic table reorganization (offline reorganization) rebuilds the indexes during the last phase of the reorganization. When more than one temporary table space exists, it is possible that a temporary table space in addition to the one specified on the REORG TABLE command may be utilized for additional sorts that can accompanying table reorg processing. However, the inplace table reorganization (online reorganization) does not rebuild the indexes. It is recommended that you issue a REORG INDEXES command after the completion of an inplace table reorganization. An inplace table reorganization is asynchronous, therefore care must be taken to ensure that the inplace table reorganization is complete before issuing the REORG INDEXES command. Issuing the REORG INDEXES command before the inplace table reorganization is complete, might cause the reorganization to fail (SQLCODE -2219).

Tables that have been modified so many times that data is fragmented and access performance is noticeably slow are candidates for the REORG TABLE command. You should also invoke this utility after altering the inline length of a structured type column in order to benefit from the altered inline length. Use the REORGCHK command to determine whether a table needs reorganizing. Be sure to complete all database operations and release all locks before invoking REORG TABLE. This can be done by issuing a COMMIT after closing all cursors opened WITH HOLD, or by issuing a ROLLBACK. After reorganizing a table, use RUNSTATS to update the table statistics, and REBIND to rebind the packages that use this table. The reorganize utility will implicitly close all the cursors.

With DB2 V9.7 Fix Pack 1 and later, REORG TABLE commands and REORG INDEXES ALL commands can be issued on a data partitioned table to concurrently reorganize different data partitions or partitioned indexes on a partition. When concurrently reorganizing data partitions or the partitioned indexes on a partition, users can access the unaffected partitions but cannot access the affected partitions. All the following criteria must be met to issue REORG commands that operate concurrently on the same table:

- Each REORG command must specify a different partition with the **ON DATA PARTITION** clause.
- Each REORG command must use the **ALLOW NO ACCESS** mode restrict access to the data partitions.
- The partitioned table must have only partitioned indexes if issuing REORG TABLE commands. No nonpartitioned indexes (except system-generated XML path indexes) can be defined on the table.

For a partitioned table T1 with no nonpartitioned indexes (except system-generated XML path indexes) and with partitions P1, P2, P3, and P4, the following REORG commands can run concurrently:

```
REORG INDEXES ALL ALLOW NO ACCESS ON DATA PARTITION P1
REORG TABLE ALLOW NO ACCESS ON DATA PARTITION P2
REORG INDEXES ALL ALLOW NO ACCESS ON DATA PARTITION P3
```

Operations such as the following are not supported when using concurrent REORG commands:

- Using a REORG command without the **ON DATA PARTITION** clause on the table.
- Using an ALTER TABLE statement on the table to add, attach, or detach a data partition.
- Loading data into the table.
- Performing an online backup that includes the table.

If the table contains mixed row format because the table value compression has been activated or deactivated, an offline table reorganization can convert all the existing rows into the target row format.

If the table is distributed across several database partitions, and the table or index reorganization fails on any of the affected database partitions, only the failing database partitions will have the table or index reorganization rolled back.

If the reorganization is not successful, temporary files should not be deleted. The database manager uses these files to recover the database.

If the name of an index is specified, the database manager reorganizes the data according to the order in the index. To maximize performance, specify an index that is often used in SQL queries. If the name of an index is *not* specified, and if a clustering index exists, the data will be ordered according to the clustering index.

The PCTFREE value of a table determines the amount of free space designated per page. If the value has not been set, the utility will fill up as much space as possible on each page.

To complete a table space roll-forward recovery following a table reorganization, both regular and large table spaces must be enabled for roll-forward recovery.

# **REORG INDEXES/TABLE**

If the table contains LOB columns that do not use the **COMPACT** option, the LOB DATA storage object can be significantly larger following table reorganization. This can be a result of the order in which the rows were reorganized, and the types of table spaces used (SMS or DMS).

Indexes over XML data may be recreated by the REORG INDEXES/TABLE command. For details, see "Recreation of indexes over XML data".

# REORGCHK

Calculates statistics on the database to determine if tables or indexes, or both, need to be reorganized or cleaned up.

# Scope

This command can be issued from any database partition in the db2nodes.cfg file. It can be used to update table and index statistics in the catalogs.

# Authorization

One of the following:

- SYSADM or DBADM authority
- CONTROL privilege on the table.

# **Required connection**

Database

# **Command syntax**

# **Command parameters**

## UPDATE STATISTICS

Calls the RUNSTATS routine to update table and index statistics, and then uses the updated statistics to determine if table or index reorganization is required.

If a portion of the table resides on the database partition where REORGCHK has been issued, the utility executes on this database partition. If the table does not exist on this database partition, the request is sent to the first database partition in the database partition group that holds a portion of the table. RUNSTATS then executes on this database partition.

### CURRENT STATISTICS

Uses the current table statistics to determine if table reorganization is required.

# **ON SCHEMA** schema-name

Checks all the tables created under the specified schema.

# ON TABLE

**USER** Checks the tables that are owned by the run time authorization ID.

#### SYSTEM

Checks the system tables.

ALL Checks all user and system tables.

#### table-name

Specifies the table to check. The fully qualified name or alias in the form: *schema.table-name* must be used. The *schema* is the user name under which the table was created. If the table specified is a system catalog table, the *schema* is SYSIBM. For typed tables, the specified table name must be the name of the hierarchy's root table.

# Examples

Issue the following command against the SAMPLE database: db2 reorgchk update statistics on table system

In the resulting output, the terms for the table statistics (formulas 1-3) mean:

#### CARD

(CARDINALITY) Number of rows in base table.

**OV** (OVERFLOW) Number of overflow rows.

- **NP** (NPAGES) Number of pages that contain data.
- **FP** (FPAGES) Total number of pages.
- ACTBLK

Total number of active blocks for a multidimensional clustering (MDC) table. This field is only applicable to tables defined using the ORGANIZE BY clause. It indicates the number of blocks of the table that contain data.

**TSIZE** Table size in bytes. Calculated as the product of the number of rows in the table (CARD) and the average row length. The average row length is computed as the sum of the average column lengths (AVGCOLLEN in SYSCOLUMNS) plus 10 bytes of row overhead. For long fields and LOBs only the approximate length of the descriptor is used. The actual long field or LOB data is not counted in TSIZE.

### TABLEPAGESIZE

Page size of the table space in which the table data resides.

#### NPARTITIONS

Number of partitions if this is a partitioned table, otherwise 1.

- **F1** Results of Formula 1.
- F2 Results of Formula 2.
- **F3** Results of Formula 3. This formula indicates the amount of space that is wasted in a table. This is measured in terms of the number of empty pages and the number of pages that include data that exists in the pages of a table. In multidimensional clustering (MDC) tables, the number of empty blocks and the number of blocks that include data is measured.

#### REORG

Each hyphen (-) displayed in this column indicates that the calculated results were within the set bounds of the corresponding formula, and each asterisk (\*) indicates that the calculated results exceeded the set bounds of its corresponding formula.

- - or \* on the left side of the column corresponds to F1 (Formula 1)
- - or \* in the middle of the column corresponds to F2 (Formula 2)
- - or \* on the right side of the column corresponds to F3 (Formula 3).

Table reorganization is suggested when the results of the calculations exceed the bounds set by the formula.

For example, --- indicates that, since the formula results of F1, F2, and F3 are within the set bounds of the formula, no table reorganization is suggested. The notation \*-\* indicates that the results of F1 and F3 suggest table reorganization, even though F2 is still within its set bounds. The notation \*-- indicates that F1 is the only formula exceeding its bounds.

The table name is truncated to 30 characters, and the ">" symbol in the thirty-first column represents the truncated portion of the table name. An "\*" suffix to a table name indicates it is an MDC table. An "\*" suffix to an index name indicates it is an MDC dimension index.

The terms for the index statistics (formulas 4-8) mean:

### INDCARD

(INDEX CARDINALITY) Number of index entries in the index. This could be different than table cardinality for some indexes. For example, for indexes on XML columns the index cardinality is likely greater than the table cardinality.

**LEAF** Total number of index leaf pages (NLEAF).

#### ELEAF

Number of pseudo empty index leaf pages (NUM\_EMPTY\_LEAFS)

A pseudo empty index leaf page is a page on which all the RIDs are marked as deleted, but have not been physically removed.

**NDEL** Number of pseudo deleted RIDs (NUMRIDS\_DELETED)

A pseudo deleted RID is a RID that is marked deleted. This statistic reports pseudo deleter RIDs on leaf pages that are not pseudo empty. It does not include RIDs marked as deleted on leaf pages where all the RIDs are marked deleted.

**KEYS** Number of unique index entries that are not marked deleted (FULLKEYCARD)

### LEAF\_RECSIZE

Record size of the index entry on a leaf page. This is the average size of the index entry excluding any overhead and is calculated from the average column length of all columns participating in the index.

#### NLEAF\_RECSIZE

Record size of the index entry on a non-leaf page. This is the average size of the index entry excluding any overhead and is calculated from the average column length of all columns participating in the index except any INCLUDE columns.

#### LEAF\_PAGE\_OVERHEAD

Reserved space on the index leaf page for internal use.

### NLEAF\_PAGE\_OVERHEAD

Reserved space on the index non-leaf page for internal use.

### INDEXPAGESIZE

Page size of the table space in which the index resides, specified at the time of index or table creation. If not specified, INDEXPAGESIZE has the same value as TABLEPAGESIZE.

LVLS Number of index levels (NLEVELS)

### PCTFREE

Specifies the percentage of each index page to leave as free space, a value that is assigned when defining the index. Values can range from 0 to 99. The default value is 10.

### LEAF\_RECSIZE\_OVERHEAD

Index record overhead on a leaf page. For indexes on tables in LARGE table spaces the overhead is 11 for partitioned tables and 9 for other tables. For indexes on tables in REGULAR table spaces these values are 9 for partitioned tables and 7 for others. The only exception to these rules are XML paths and XML regions indexes where the overhead is always 9. This information is also available in the table below for easy reference.

### NLEAF\_RECSIZE\_OVERHEAD

Index record overhead on a non-leaf page. For indexes on tables in LARGE table spaces the overhead is 14 for partitioned tables and 12 for other tables. For indexes on tables in REGULAR table spaces these values are 12 for partitioned tables and 10 for others. The only exception to these rules are XML paths and XML regions indexes where the overhead is always 12. This information is also available in the table below for easy reference.

### DUPKEYSIZE

Size of duplicate keys on index leaf pages. For indexes on tables in LARGE table spaces the DUPKEYSIZE is 9 for partitioned tables and 7 for other tables. For indexes on tables in REGULAR table spaces these values are 7 for partitioned tables and 5 for others. The only exception to these rules are XML paths and XML regions indexes where the DUPKEYSIZE is always 7. This information is also available in the table below for easy reference.

Table 39. LEAF\_RECSIZE\_OVERHEAD, NLEAF\_RECSIZE\_OVERHEAD, and DUPKEYSIZE values are a function of index type, table partitioning, and table space type

Variable	Data in I	REGULAR ta	ble space	Data in LARGE table space**			
	Regula	r Table	Partitioned Table	Regula	Partitioned Table		
	XML paths or regions index	All other indexes	All indexes	XML paths or regions index	All other indexes	All indexes	
LEAF_RECSIZE_OVERHEAD	9	7	9	9	9	11	
NLEAF_RECSIZE_OVERHEAD	12	10	12	12	12	14	
DUPKEYSIZE	7	5	7	7	7	9	

\*\* For indexes on tables in large table spaces the indexes will be assumed to have large RIDs. This may cause some of the formulas to give inaccurate results if the table space of the table was converted to large but the indexes have not yet been recreated or reorganized.

- F4 Results of Formula 4.
- **F5** Results of Formula 5. The notation +++ indicates that the result exceeds 999, and is invalid. Rerun REORGCHK with the **UPDATE STATISTICS** option, or issue RUNSTATS, followed by the REORGCHK command.
- F6 Results of Formula 6. The notation +++ indicates that the result exceeds 999, and might be invalid. Rerun REORGCHK with the **UPDATE STATISTICS** option, or issue RUNSTATS, followed by the REORGCHK command. If the statistics are current and valid, you should reorganize.

- **F7** Results of Formula 7.
- **F8** Results of Formula 8.

### REORG

Each hyphen (-) displayed in this column indicates that the calculated results were within the set bounds of the corresponding formula, and each asterisk (\*) indicates that the calculated result exceeded the set bounds of its corresponding formula.

- - or \* on the left column corresponds to F4 (Formula 4)
- - or \* in the second from left column corresponds to F5 (Formula 5)
- - or \* in the middle column corresponds to F6 (Formula 6).
- or \* in the second column from the right corresponds to F7 (Formula 7)
- - or \* on the right column corresponds to F8 (Formula 8).

Index reorganization advice is as follows:

- If the results of the calculations for Formula 1, 2 and 3 do not exceed the bounds set by the formula and the results of the calculations for Formula 4, 5 or 6 do exceed the bounds set, then index reorganization is recommended.
- If only the results of the calculations Formula 7 exceed the bounds set, but the results of Formula 1, 2, 3, 4, 5 and 6 are within the set bounds, then cleanup of the indexes using the **CLEANUP ONLY** option of index reorganization is recommended.
- If the only calculation result to exceed the set bounds is the that of Formula 8, then a cleanup of the pseudo empty pages of the indexes using the **CLEANUP ONLY PAGES** option of index reorganization is recommended.

On a partitioned table the results for formulas (5 to 8) can be misleading depending on when the statistics are collected. When data partitions are detached, the index keys for the detached partition are not cleaned up immediately. Instead, the cleanup is deferred and eventually the keys are removed by index cleaners which operate asynchronously in the background (this is known as Asynchronous Index Cleanup or AIC). While the index keys pending cleanup exist in the index, they will not be counted as part of the keys in the statistics because they are invisible and no longer part of the table. As a result, statistics collected before asynchronous index cleanup is run will be misleading. If the REORGCHK command is issued before asynchronous index cleanup completes, it will likely generate a false alarm for index reorganization or index cleanup is run, all the index keys that still belong to detached data partitions which require cleanup will be removed and this may eliminate the need for index reorganization.

For partitioned tables, you are encouraged to issue the REORGCHK after an asynchronous index cleanup has completed in order to generate accurate index statistics in the presence of detached data partitions. To determine whether or not there are detached data partitions in the table, you can check the status field in the SYSCAT.DATAPARTITIONS catalog view and look for the value I (index cleanup), L (logically detached), or D (detached with dependent MQT).

# **Usage notes**

This command does not display statistical information for declared temporary tables or created temporary tables.

This utility does not support the use of nicknames.

A new server release might introduce new table and index features. These new features might impact REORGCHK logic, that is, how REORGCHK computes REORG recommendations. If REORGCHK is issued from a client not at the same level as the server, it might report different results than those reported from a client at the same level as the server. REORGCHK is a client application, therefore, REORGCHK should be run from a client running the same level as the server. Doing so ensures the most accurate report is generated. For server administrative work, in general, use a client and a server at the same level.

Unless you specify the **CURRENT STATISTICS** option, REORGCHK gathers statistics on all columns using the default options only. Specifically, column group are not gathered and if LIKE statistics were previously gathered, they are not gathered by REORGCHK. The statistics gathered depend on the kind of statistics currently stored in the catalog tables:

- If detailed index statistics are present in the catalog for any index, table statistics and detailed index statistics (without sampling) for all indexes are collected.
- If detailed index statistics are not detected, table statistics as well as regular index statistics are collected for every index.
- If distribution statistics are detected, distribution statistics are gathered on the table. If distribution statistics are gathered, the number of frequent values and quantiles are based on the database configuration parameter settings.

REORGCHK calculates statistics obtained from eight different formulas to determine if performance has deteriorated or can be improved by reorganizing a table or its indexes. When a table uses less than or equal to (NPARTITIONS \* 1 extent size) of pages, no table reorganization is recommended based on each formula. More specifically,

- For non-partitioned tables (NPARTITIONS =1), the threshold is: (FPAGES <= 1 extent size)</li>
- For partitioned tables, it is:

```
(FPAGES <= NPARTITIONS * 1 extent size)
```

• In a multi-partitioned database, after the number of database partitions in a database partition group of the table is considered, this threshold for not recommending table reorganization changes to:

```
FPAGES <= 'number of database partitions in a database partition group
    of the table' * NPARTITIONS * 1 extent size</pre>
```

Long field or LOB data is not accounted for while calculating TSIZE.

REORGCHK uses the following formulas to analyze the physical location of rows and the size of the table:

• Formula F1:

100\*OVERFLOW/CARD < 5

The total number of overflow rows in the table should be less than 5 percent of the total number of rows. Overflow rows can be created when rows are updated

and the new rows contain more bytes than the old ones (VARCHAR fields), or when columns are added to existing tables.

• Formula F2:

For regular tables:

100\*TSIZE / ((100-TPCTFREE)/100 \* (FPAGES-NPARTITIONS) \* (TABLEPAGESIZE-68)) > 70 The table size in bytes (TSIZE) should be more than 70 percent of the total space allocated for the table. (There should be less than 30% free space.) The total space allocated for the table depends upon the page size of the table space in which the table resides (minus an overhead of 68 bytes). Because the last page allocated in the data object is not usually filled, 1 is subtracted from FPAGES for each partition (which is the same as FPAGES-NPARTITIONS).

For MDC tables:

100\*TSIZE / ((ACTBLK-FULLKEYCARD) \* EXTENTSIZE \* (TABLEPAGESIZE-68)) > 70

FULLKEYCARD represents the cardinality of the composite dimension index for the MDC table. Extentsize is the number of pages per block. The formula checks if the table size in bytes is more than the 70 percent of the remaining blocks for a table after subtracting the minimum required number of blocks.

• Formula F3:

100\*NPAGES/FPAGES > 80

The number of pages that contain no rows at all should be less than 20 percent of the total number of pages. (Pages can become empty after rows are deleted.) As noted above, no table reorganization is recommended when (FPAGES <= NPARTITIONS \* 1 extent size). Therefore, F3 is not calculated. For non-partitioned tables, NPARTITIONS = 1. In a multi-partitioned database, this condition changes to FPAGES = 'number of database partitions in a database partition group of the table' \* NPARTITIONS \* 1 extent size.

For MDC tables, the formula is:

100 \* activeblocks / ( ( fpages / ExtentSize ) - 1 )

REORGCHK uses the following formulas to analyze the indexes and their the relationship to the table data:

- Formula F4:
  - For non-partitioned tables:

CLUSTERRATIO or normalized CLUSTERFACTOR > 80

The global CLUSTERFACTOR and CLUSTERRATIO take into account the correlation between the index key and distribution key. The clustering ratio of an index should be greater than 80 percent. When multiple indexes are defined on one table, some of these indexes have a low cluster ratio. (The index sequence is not the same as the table sequence.) This cannot be avoided. Be sure to specify the most important index when reorganizing the table. The cluster ratio is usually not optimal for indexes that contain many duplicate keys and many entries.

- For partitioned tables:

AVGPARTITION\_CLUSTERRATIO or normalized AVGPARTITION\_CLUSTERFACTOR > 80 AVGPARTITION\_CLUSTERFACTOR and AVGPARITITON\_CLUSTERRATIO values reflect how clustered data is within a data partition with respect to an index key. A partitioned table can be perfectly clustered for a particular index key within each data partition, and still have a low value for the CLUSTERFACTOR and CLUSTERRATIO because the index key is not a prefix of the table partitioning key. Design your tables and indexes using the most important index keys as a prefix of the table partitioning key. In addition, because the optimizer uses the global clusteredness values to make decisions about queries that span multiple data partitions, it is possible to perform a clustering reorganization and have the optimizer still not choose the clustering index when the keys do not agree.

- Formula F5:
  - For a single database partition:

100\*(KEYS\*(LEAF\_RECSIZE+LEAF\_RECSIZE\_OVERHEAD)+(INDCARD-KEYS)\*DUPKEYSIZE)
/ ((NLEAF-NUM\_EMPTY\_LEAFS-1)\* (INDEXPAGESIZE-LEAF\_PAGE\_OVERHEAD))
> MIN(50,(100-PCTFREE))

The space in use at the leaf level of the index should be greater than the minimum of 50 and 100-PCTFREE percent (only checked when NLEAF > 1).

- For a multi-partition database environment:

100\*(KEYS\*(LEAF\_RECSIZE+LEAF\_RECSIZE\_OVERHEAD)+(INDCARD-KEYS)\*DUPKEYSIZE)
/ ((NLEAF-NUM\_EMPTY\_LEAFS-NPARTITIONS)\*(INDEXPAGESIZE-LEAF\_PAGE\_OVERHEAD))
> MIN(50,(100-PCTFREE))

• Formula F6:

( 100-PCTFREE ) \* ((FLOOR((100 - LEVEL2PCTFREE) / 100 \* (INDEXPAGESIZE-NLEAF\_PAGE\_OVERHEAD)/(NLEAF\_RECSIZE+NLEAF\_RECSIZE\_OVERHEAD)))\* (FLOOR((100-MIN(10, LEVEL2PCTFREE))/100\*(INDEXPAGESIZE-NLEAF\_PAGE\_OVERHEAD)/ (NLEAF\_RECSIZE+NLEAF\_RECSIZE\_OVERHEAD)) \*\* (NLEVELS-3)) \* (INDEXPAGESIZE-LEAF\_PAGE\_OVERHEAD))/(KEYS\*(LEAF\_RECSIZE+LEAF\_RECSIZE\_OVERHEAD)+ (INDCARD-KEYS) \* DUPKEYSIZE)) < 100</pre>

To determine if recreating the index would result in a tree having fewer levels. This formula checks the ratio between the amount of space in an index tree that has one less level than the current tree, and the amount of space needed. If a tree with one less level could be created and still leave PCTFREE available, then a reorganization is recommended. The actual number of index entries should be more than (100-PCTFREE) percent of the number of entries an NLEVELS-1 index tree can handle (only checked if NLEVELS>2). In the case where NLEVELS = 2, the other REORGCHK formulas should be relied upon to determine if the index should be reorganized.

In simplified form, formula F6 can be rewritten as the following:

Amount of space needed for an index if it was one level smaller

Amount of space needed for all the entries in the index

When the above left part is > 1, it means all index entries in the existing index can fit into an index that is one level smaller than the existing index. In this case, a reorg index is recommended.

The amount of space needed for an NLEVELS-1 index is calculated by:

(The max number of leaf pages that a NLEVELS-1 index can have) \* (Amount of space available to store index entries per leaf page)

where,

```
The max number of leaf pages that a NLEVELS-1 index can have =

(No. of entries a level 2 index page can have) *

(No. of entries per page on levels greater than 2) **

(No. of levels in the intended index - 2) =

(100 - LEVEL2PCTFREE)

{ FLOOR( [------] *

100

(PageSize - Overhead)

[------] ) *

(Avg. size of each nonleaf index entry)

(100 - MIN(10, LEVEL2PCTFREE))

FLOOR([-----] *
```

# REORGCHK

100

```
(PageSize - Overhead)
[-------])**
(Avg. size of each nonleaf index entry)
(NLEVELS-3) }
(100 - LEVEL2PCTFREE) is the percentage of used space on level 2 of the index.
Level 2 is the level immediately above the leaf level.
(100 - MIN(10, LEVEL2PCTFREE)) is the percentage of used space on all levels
above the second level.
NLEVELS is the number of index levels in the existing index.
The amount of space available to store index entries per leaf page =
((100-PCTFREE)/100 * (INDEXPAGESIZE - LEAF_PAGE_OVERHEAD)) =
( Used space per page * (PageSize - Overhead) )
```

The amount of space needed for all index entries: KEYS \* (LEAF\_RECSIZE + LEAF\_RECSIZE\_OVERHEAD) + (INDCARD - KEYS) \* DUPKEYSIZE

(KEYS \* (LEAF\_RECSIZE + LEAF\_RECSIZE\_OVERHEAD)) represents the space used for the first occurrence of each key value in the index and ((INDCARD -KEYS) \* DUPKEYSIZE) represents the space used for subsequent (duplicate) occurrences of a key value.

• Formula F7:

```
100 * (NUMRIDS DELETED / (NUMRIDS DELETED + INDCARD)) < 20
```

The number of pseudo-deleted RIDs on non-pseudo-empty pages should be less than 20 percent.

• Formula F8:

100 \* (NUM EMPTY LEAFS/NLEAF) < 20

The number of pseudo-empty leaf pages should be less than 20 percent of the total number of leaf pages.

Running statistics on many tables can take time, especially if the tables are large.

# Usage notes for index compression

Formula F5 determines the ratio between the amount of space needed by the keys and the amount of space allocated. Formula F6 determines if recreating the index would result in a tree having fewer levels. The following formula checks the ratio between the amount of space in an index tree that has one less level than the current tree, and the amount of space needed. This formula relies on the amount of space needed for all index entries. Both formulae use the amount of space needed for all index entries.

The amount of space needed for all index entries in an uncompressed index is as follows:

KEYS \* (LEAF\_RECSIZE + LEAF\_RECSIZE\_OVERHEAD) +
(INDCARD - KEYS) \* DUPKEYSIZE

where LEAF\_RECSIZE is the average size of index key and DUPKEYSIZE is the size of a RID.

# REORGCHK

In a compressed index, LEAF\_RECSIZE is affected by prefix compression. DUPKEYSIZE is not a reliable way to measure the size of duplicate keys on indexes. The amount of space needed in a compressed index is the amount of space needed for all uncompressed index entries multiplied by the index compression ratio.

(KEYS \* (LEAF\_RECSIZE + LEAF\_RECSIZE\_OVERHEAD) + (INDCARD - KEYS) \* DUPKEYSIZE) \* COMPRESSION\_RATIO

where COMPRESSION\_RATIO is the estimated index compression ratio in the index. The COMPRESSION\_RATIO is calculated as: (100 - PCT\_PAGES\_SAVED) / 100

where PCT\_PAGES\_SAVED is the estimated percentage of leaf pages saved from index compression. This value is taken from the catalogs. If statistics are not collected, PCT\_PAGES\_SAVED is -1 in the catalogs, and COMPRESSION\_RATIO is 1.

Both the REORGCHK command and the REORGCHK\_IX\_STATS procedure show the PCT\_PAGES\_SAVED value.

# Usage notes for partitioned tables

For a data partitioned table, REORGCHK returns statistics and reorganization recommendations for the table and the data partitions of the table.

For table statistics and reorganization recommendations, REORGCHK lists the table information that contains the SCHEMA.NAME for the table, the table level statistics, and reorg recommendation. After the table information, the information for each data partition information is listed. For each partition, the information includes the SCHEMA.NAME for the table, the partition name, the table statistics for the partition, and reorganization recommendation for the partition.

For index statistics and reorganization recommendations, REORGCHK returns the SCHEMA.NAME for each table followed by the fully qualified index name and index statistics and index reorganization recommendation for each nonpartitioned index on the table. If the table has partitioned indexes, REORGCHK returns the information for partitioned indexes after the nonpartitioned indexes. REORGCHK returns the following information for each data partition of the table, the fully qualified index name, the partition name, index statistics for the partition, and index reorganization recommendations for the partition.

To provide better data availability to a data partitioned table, a reorganization of a specific data partition can be performed if recommended. REORG TABLE with the **ON DATA PARTITION** clause supports reorganizing a partition of a table.

For partitioned indexes, index reorganization of all indexes for a specific data partition can be performed using REORG INDEXES ALL with the **ON DATA PARTITION** clause if recommended.

The REORG INDEX command can be used to reorganized a nonpartitioned index on a data partitioned table.

See the REORG column for information about reorganization recommendations for data partitioned tables.

The following sample table statistics output is for the partitioned table MYDPARTT1. The table has three data partitions with default partition names PART0, PART1, and PART2.

### Table statistics:

SCHEMA.NAME	CARD	٥V	NP	FP ACTBLK	TSIZE	F1	F2	F3 REORG
Table: USER1.MYDPARTT1								
Table: USER1.MYDPARTT1 Data Partition: PARTO	-	-	-		-	-	-	
Table: USER1.MYDPARTT1	-	-	-		-	-	-	
Data Partition: PART1	-	-	-		-	_	_	
Table: USER1.MYDPARTT1 Data Partition: PART2								
	-	-	-		-	-	-	

The following sample index statistics output is a partitioned table MYDPARTT1. The table has three data partitions, one nonpartitioned index MYNONPARTIDX1, and one partitioned index MYDPARTIDX1.

Index statistics:

SCHEMA.NAME	INDCARD	LEAF	ELEAF	LVLS	NDEL	KEYS .	F	4 F	5 F6	F7	F8 REORG
Table: USER1.MYDPARTT1 Index: USER1.MYNONPARTIDX1						•••					
Index: USER1.MYDPARTIDX1 Data Partition: PARTO	-	-	-	-	-		••	-		-	
Index: USER1.MYDPARTIDX1 Data Partition: PART1	-	-	-	-	-		••	-		-	
Index: USER1.MYDPARTIDX1 Data Partition: PART2	-	-	-	-	-		••	-		-	
	-	-	-	-	-			-			

# **RESET ADMIN CONFIGURATION**

Resets entries in the DB2 Administration Server (DAS) configuration file on the node to which you are connected. The DAS is a special administrative tool that enables remote administration of DB2 servers. The values are reset by node type, which is always a server with remote clients. For a list of DAS parameters, see the description of the UPDATE ADMIN CONFIGURATION command.

# Scope

This command resets the DAS configuration file on the administration node of the system to which you are connected.

# Authorization

dasadm

# **Required connection**

Partition. To reset the DAS configuration for a remote system, specify the system using the FOR NODE option with the administration node name.

# **Command syntax**

••-		
►	FOR NODE—node-name USER—username—USING—password—	

# **Command parameters**

FOR NODE node-name

Enter the name of an administrator node to reset DAS configuration parameters there.

**USER** username **USING** password

If connection to the remote system requires user name and password, enter this information.

# Usage notes

To reset the DAS configuration parameters on a remote system, specify the system using the administrator node name as an argument to the FOR NODE option and specify the user name and password if the connection to that node requires username and password authorization.

To view or print a list of the DAS configuration parameters, use the GET ADMIN CONFIGURATION command. To change the value of an admin parameter, use the UPDATE ADMIN CONFIGURATION command.

Changes to the DAS configuration parameters that can be updated on-line take place immediately. Other changes become effective only after they are loaded into memory when you restart the DAS with the db2admin command. If an error occurs, the DAS configuration file does not change.

The DAS configuration file cannot be reset if the checksum is invalid. This might occur if you edit the DAS configuration file manually and do not use the appropriate command. If the checksum is invalid, you must drop and recreate the DAS to reset the its configuration file.

# **RESET ALERT CONFIGURATION**

Resets the health indicator settings for specific objects to the current defaults for that object type or resets the current default health indicator settings for an object type to the install defaults.

**Important:** This command or API has been deprecated and might be removed in a future release because the health monitor has been deprecated in Version 9.7. For more information, see the "Health monitor has been deprecated" topic in the *What's New for DB2 Version 9.7* book.

# Authorization

One of the following:

- SYSADM
- SYSMAINT
- SYSCTRL

# **Required connection**

Instance. An explicit attachment is not required.

# **Command syntax**

► RESET ALERT CONFIGURATION FOR CONFIG	
DATABASE MANAGER     DBM     DBM     CONTAINERS     OATABASES     TABLESPACES     TABLESPACES     TABLESPACE     TABLESPACE-name—FOR—tblspace-name     USING—health-indicator-name	

# **Command parameters**

### DATABASE MANAGER | DB MANAGER | DBM

Resets alert settings for the database manager.

#### **CONTAINERS**

Resets default alert settings for all table space containers managed by the database manager to the install default. These are the settings that apply to all table space containers that do not have custom settings. Custom settings are defined using the **CONTAINER** *container-name* **FOR** *tblspace-name* **ON** *database-alias* clause.

# DATABASES

Resets alert settings for all databases managed by the database manager. These are the settings that apply to all databases that do not have custom settings. Custom settings are defined using the **DATABASE ON** *database-alias* clause.

#### **TABLESPACES**

Resets default alert settings for all table spaces managed by the database manager to the install default. These are the settings that apply to all table spaces that do not have custom settings. Custom settings are defined using the **TABLESPACE** *tblspace-name* **ON** *database-alias* clause.

### **CONTAINER** container-name **FOR** tblspace-name **ON** database-alias

Resets the alert settings for the table space container called *container-name*, for the table space specified using the **FOR** *tblspace-name* clause, on the database specified using the **ON** *database-alias* clause. If this table space container has custom settings, then these settings are removed and the current table space containers default is used.

### **DATABASE ON** *database-alias*

Resets the alert settings for the database specified using the **ON** *database-alias* clause. If this database has custom settings, then these settings are removed and the install default is used.

### TABLESPACE tblspace-name ON database-alias

Resets the alert settings for the table space called *tblspace-name*, on the database specified using the **ON** *database-alias* clause. If this table space has custom settings, then these settings are removed and the install default is used.

### **USING** *health-indicator-name*

Specifies the set of health indicators for which alert configuration will be reset. Health indicator names consist of a two-letter object identifier followed by a name that describes what the indicator measures. For example:

db.sort\_privmem\_util

If you do not specify this option, all health indicators for the specified object or object type will be reset.

# **RESET DATABASE CONFIGURATION**

Resets the configuration of a specific database to the system defaults.

### Scope

This command updates all database partitions by default, except when **DBPARTITIONNUM** is specified to reset only one database partition.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

# **Required connection**

Instance. An explicit attachment is not required. If the database is listed as remote, an instance attachment to the remote node is established for the duration of the command.

# **Command syntax**

—DBPARTITIONNUM*—db-partition-num*—<sup>1</sup>

# **Command parameters**

#### FOR database-alias

Specifies the alias of the database whose configuration is to be reset to the system defaults.

### **DBPARTITIONNUM** db-partition-num

If a database configuration reset is to be applied to a specific database partition, this parameter may be used. If this parameter is not provided, the reset will take effect on all database partitions.

# Example

#### Reset the database configuration on a multi-partition instance

A user has a partitioned database environment that has 4 database partitions as defined in the db2nodes.cfg:

10 gilera 0 20 gilera 1 30 motobi 0 40 motobi 1

The user has created the SAMPLE database on the instance. The catalog partition for SAMPLE is on database partition number 10. Let's assume the user is logged on to system motobi.

The following command will reset all the database configuration values for database SAMPLE on all database partitions: db2 reset db cfg for sample

The following commands will reset all the database configuration values for database SAMPLE, only at database partition number 30: db2 reset db cfg for sample dbpartitionnum 30

or export DB2NODE=30 db2 reset db cfg for sample

# Usage notes

To view or print a list of the database configuration parameters, use the GET DATABASE CONFIGURATION command.

To change the value of a configurable parameter, use the UPDATE DATABASE CONFIGURATION command.

Changes to the database configuration file become effective only after they are loaded into memory. All applications must disconnect from the database before this can occur.

If an error occurs, the database configuration file does not change.

The database configuration file cannot be reset if the checksum is invalid. This might occur if the database configuration file is changed without using the appropriate command. If this happens, the database must be restored to reset the database configuration file.

The RESET DATABASE CONFIGURATION command will reset the database configuration parameters to the documented default configuration values, where **auto\_runstats** will be ON. **Self\_tuning\_mem** will be reset to ON on non-partitioned database environments and to OFF on partitioned database environments.

# **RESET DATABASE MANAGER CONFIGURATION**

Resets the parameters in the database manager configuration file to the system defaults. The values are reset by node type.

# **Authorization**

SYSADM

# **Required connection**

None or instance. An instance attachment is not required to perform local database manager configuration operations, but is required to perform remote database manager configuration operations. To update the database manager configuration for a remote instance, it is necessary to first attach to that instance. To update a configuration parameter online, it is also necessary to first attach to the instance.

# **Command syntax**

# **Command parameters**

None

# **Usage notes**

This command resets all parameters set by the installation program. This could cause error messages to be returned when restarting DB2. For example, if the **svcename** parameter is reset, the user will receive the SQL5043N error message when trying to restart DB2.

Before running this command, save the output from the GET DATABASE MANAGER CONFIGURATION command to a file so that you can refer to the existing settings. Individual settings can then be updated using the UPDATE DATABASE MANAGER CONFIGURATION command.

It is not recommended that the **svcename** parameter, set by the installation program, be modified by the user.

To view or print a list of the database manager configuration parameters, use the GET DATABASE MANAGER CONFIGURATION command. To change the value of a configurable parameter, use the UPDATE DATABASE MANAGER CONFIGURATION command.

For more information about these parameters, refer to the summary list of configuration parameters and the individual parameters.

Some changes to the database manager configuration file become effective only after they are loaded into memory. For more information on which parameters are configurable on-line and which ones are not, see the configuration parameter summary. Server configuration parameters that are not reset immediately are reset during execution of db2start. For a client configuration parameter, parameters are

# **RESET DATABASE MANAGER CONFIGURATION**

reset the next time you restart the application. If the client is the command line processor, it is necessary to invoke TERMINATE.

If an error occurs, the database manager configuration file does not change.

The database manager configuration file cannot be reset if the checksum is invalid. This might occur if you edit the configuration file manually and do not use the appropriate command. If the checksum is invalid, you must recreate the instance.

# **RESET MONITOR**

Resets the internal database system monitor data areas of a specified database, or of all active databases, to zero. The internal database system monitor data areas include the data areas for all applications connected to the database, as well as the data areas for the database itself.

# **Authorization**

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

# **Required connection**

Instance. If there is no instance attachment, a default instance attachment is created.

To reset the monitor switches for a remote instance (or a different local instance), it is necessary to first attach to that instance.

# Command syntax

### **Command parameters**

**ALL** This option indicates that the internal counters should be reset for all databases.

### FOR DATABASE database-alias

This option indicates that only the database with alias *database-alias* should have its internal counters reset.

- **DCS** Depending on which clause it is specified, this keyword resets the internal counters of:
  - All DCS databases
  - A specific DCS database.

#### **AT DBPARTITIONNUM** *db-partition-number*

Specifies the database partition for which the status of the monitor switches is to be displayed.

#### GLOBAL

Returns an aggregate result for all database partitions in a partitioned database environment.

# **Usage notes**

Each process (attachment) has its own private view of the monitor data. If one user resets, or turns off a monitor switch, other users are not affected. Change the setting of the monitor switch configuration parameters to make global changes to the monitor switches.

If ALL is specified, some database manager information is also reset to maintain consistency of the returned data, and some database partition-level counters are reset.

# Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

# **RESTART DATABASE**

Restarts a database that has been abnormally terminated and left in an inconsistent state. At the successful completion of RESTART DATABASE, the application remains connected to the database if the user has CONNECT privilege.

# Scope

This command affects only the node on which it is executed.

# Authorization

None

# **Required connection**

This command establishes a database connection.

# **Command syntax**

# **Command parameters**

### DATABASE database-alias

Identifies the database to restart.

**USER** username

Identifies the user name under which the database is to be restarted.

#### **USING** *password*

The password used to authenticate *username*. If the password is omitted, the user is prompted to enter it.

#### **DROP PENDING TABLESPACES** tablespace-name

Specifies that the database restart operation is to be successfully completed even if table space container problems are encountered.

If a problem occurs with a container for a specified table space during the restart process, the corresponding table space will not be available (it will be in drop-pending state) after the restart operation. If a table space is in the drop-pending state, the only possible action is to drop the table space.

In the case of circular logging, a troubled table space will cause a restart failure. A list of troubled table space names can found in the

administration notification log if a restart database operation fails because of container problems. If there is only one system temporary table space in the database, and it is in drop pending state, a new system temporary table space must be created immediately following a successful database restart operation.

### WRITE RESUME

Allows you to force a database restart on databases that failed while I/O writes were suspended. Before performing crash recovery, this option will resume I/O writes by removing the SUSPEND\_WRITE state from every table space in the database.

The WRITE RESUME option can also be used in the case where the connection used to suspend I/O writes is currently hung and all subsequent connection attempts are also hanging. When used in this circumstance, RESTART DATABASE will resume I/O writes to the database without performing crash recovery. RESTART DATABASE with the WRITE RESUME option will only perform crash recovery when you use it after a database crash. The WRITE RESUME parameter can only be applied to the primary database, not to mirrored databases.

# **Usage notes**

Execute this command if an attempt to connect to a database returns an error message, indicating that the database must be restarted. This action occurs only if the previous session with this database terminated abnormally (due to power failure, for example).

On a partitioned database system, in order to resolve the indoubt transactions, the RESTART DATABASE command should be issued on all nodes, as in the example below:

db2\_all "db2 restart database database-alias"

If the database is only restarted on a single node within an MPP system, a message might be returned on a subsequent database query indicating that the database needs to be restarted. This occurs because the database partition on a node on which the query depends must also be restarted. Restarting the database on all nodes solves the problem.

# **RESTORE DATABASE**

The RESTORE DATABASE command recreates a damaged or corrupted database that has been backed up using the DB2 backup utility. The restored database is in the same state that it was in when the backup copy was made.

This utility can also perform the following:

- Overwrite a database with a different image or restore the backup copy to a new database.
- Restore backup images in DB2 Version 9.7 that were backed up on DB2 Universal Database Version 8, DB2 Version 9.1, or DB2 Version 9.5.
  - If a database upgrade is required, it will be invoked automatically at the end of the restore operation.
- If, at the time of the backup operation, the database was enabled for rollforward recovery, the database can be brought to its previous state by invoking the rollforward utility after successful completion of a restore operation.
- Restore a table space level backup.
- Transport a set of table spaces and SQL schemas from database backup image to a database using the TRANSPORT option (starting in DB2 Version 9.7 Fix Pack 2).

For information on the restore operations supported by DB2 database systems between different operating systems and hardware platforms, see "Backup and restore operations between different operating systems and hardware platforms" in the *Data Recovery and High Availability Guide and Reference*.

Incremental images and images only capturing differences from the time of the previous capture (called a "delta image") cannot be restored when there is a difference in operating systems or word size (32-bit or 64-bit).

Following a successful restore operation from one environment to a different environment, no incremental or delta backups are allowed until a non-incremental backup is taken. (This is not a limitation following a restore operation within the same environment.)

Even with a successful restore operation from one environment to a different environment, there are some considerations: packages must be rebound before use (using the BIND command, the REBIND command, or the db2rbind utility); SQL procedures must be dropped and recreated; and all external libraries must be rebuilt on the new platform. (These are not considerations when restoring to the same environment.)

A restore operation run over an existing database and existing containers reuses the same containers and table space map.

A restore operation run against a new database reacquires all containers and rebuilds an optimized table space map. A restore operation run over an existing database with one or more missing containers also reacquires all containers and rebuilds an optimized table space map.

# Scope

This command only affects the node on which it is executed.

# Authorization

To restore to an existing database, one of the following:

- sysadm
- sysctrl
- sysmaint

To restore to a new database, one of the following:

- sysadm
- sysctrl

# **Required connection**

The required connection will vary based on the type of restore action:

- You require a database connection, to restore to an existing database. This command automatically establishes an exclusive connection to the specified database.
- You require an instance and a database connection, to restore to a new database. The instance attachment is required to create the database.

To restore to a new database at an instance different from the current instance, it is necessary to first attach to the instance where the new database will reside. The new instance can be local or remote. The current instance is defined by the value of the DB2INSTANCE environment variable.

• For snapshot restore, *instance* and *database* connections are required.

# **Command syntax**

# restore-options:

USER—username USING—password	<b>&gt;</b>
REBUILD WITH       ALL TABLESPACES IN DATABASE         ALL TABLESPACES IN IMAGE       EXCEPT         rebuild-tablespace-clause         TABLESPACE         (	

# **RESTORE DATABASE**

### rebuild-tablespace-clause:

#### open-sessions:

# **Command parameters**

**DATABASE** *source-database-alias* 

Alias of the source database from which the backup was taken.

### CONTINUE

Specifies that the containers have been redefined, and that the final step in a redirected restore operation should be performed.

#### ABORT

This parameter:

• Stops a redirected restore operation. This is useful when an error has occurred that requires one or more steps to be repeated. After RESTORE DATABASE with the ABORT option has been issued, each step of a

redirected restore operation must be repeated, including RESTORE DATABASE with the REDIRECT option.

• Terminates an incremental restore operation before completion.

# **USER** username

Identifies the user name under which the database is to be restored.

### **USING** password

The password used to authenticate the user name. If the password is omitted, the user is prompted to enter it.

# **REBUILD WITH ALL TABLESPACES IN DATABASE**

Restores the database with all the table spaces known to the database at the time of the image being restored. This restore overwrites a database if it already exists.

### **REBUILD WITH ALL TABLESPACES IN DATABASE EXCEPT**

### rebuild-tablespace-clause

Restores the database with all the table spaces known to the database at the time of the image being restored except for those specified in the list. This restore overwrites a database if it already exists.

### **REBUILD WITH ALL TABLESPACES IN IMAGE**

Restores the database with only the table spaces in the image being restored. This restore overwrites a database if it already exists.

### **REBUILD WITH ALL TABLESPACES IN IMAGE EXCEPT** rebuild-tablespace-

*clause* Restores the database with only the table spaces in the image being restored except for those specified in the list. This restore overwrites a database if it already exists.

### **REBUILD WITH** *rebuild-tablespace-clause*

Restores the database with only the list of table spaces specified. This restore overwrites a database if it already exists.

# **TABLESPACE** *tablespace-name*

A list of names used to specify the table spaces that are to be restored.

Table space names are required when the TRANSPORT option is specified.

### **SCHEMA** schema-name

A list of names used to specify the schemas that are to be restored.

Schema names are required if the TRANSPORT option is specified. The SCHEMA option is only valid when the TRANSPORT option is specified.

### **ONLINE**

This keyword, applicable only when performing a table space-level restore operation, is specified to allow a backup image to be restored online. This means that other agents can connect to the database while the backup image is being restored, and that the data in other table spaces will be available while the specified table spaces are being restored.

# HISTORY FILE

This keyword is specified to restore only the history file from the backup image.

### **COMPRESSION LIBRARY**

This keyword is specified to restore only the compression library from the backup image. If the object exists in the backup image, it will be restored into the database directory. If the object does not exist in the backup image, the restore operation will fail.

**LOGS** This keyword is specified to restore only the set of log files contained in the backup image. If the backup image does not contain any log files, the restore operation will fail. If this option is specified, the LOGTARGET option must also be specified.

### INCREMENTAL

Without additional parameters, INCREMENTAL specifies a manual cumulative restore operation. During manual restore the user must issue each restore command manually for each image involved in the restore. Do so according to the following order: last, first, second, third and so on up to and including the last image.

### **INCREMENTAL AUTOMATIC/AUTO**

Specifies an automatic cumulative restore operation.

### **INCREMENTAL ABORT**

Specifies abortion of an in-progress manual cumulative restore operation.

USE

- **TSM** Specifies that the database is to be restored from output managed by Tivoli Storage Manager.
- **XBSA** Specifies that the XBSA interface is to be used. Backup Services APIs (XBSA) are an open application programming interface for applications or facilities needing data storage management for backup or archiving purposes.

# **SNAPSHOT**

Specifies that the data is to be restored from a snapshot backup.

You cannot use the SNAPSHOT parameter with any of the following parameters:

- INCREMENTAL
- TO
- ON
- DBPATH ON
- INTO
- NEWLOGPATH
- WITH *num-buffers* BUFFERS
- BUFFER
- REDIRECT
- REPLACE HISTORY FILE
- COMPRESSION LIBRARY
- PARALLELISM
- COMPRLIB
- OPEN num-sessions SESSIONS
- HISTORY FILE
- LOGS

Also, you cannot use the SNAPSHOT parameter with any restore operation that involves a table space list, which includes the REBUILD WITH option.

The default behavior when restoring data from a snapshot backup image will be a FULL DATABASE OFFLINE restore of all paths that make up the database including all containers, local volume directory, database path (DBPATH), primary log and mirror log paths of the most recent snapshot backup if no timestamp is provided (INCLUDE LOGS is the default for all snapshot backups unless EXCLUDE LOGS is explicitly stated). If a timestamp is provided, then that snapshot backup image will be restored.

### **LIBRARY** *library-name*

Integrated into IBM Data Server is a DB2 ACS API driver for the following storage hardware:

- IBM TotalStorage SAN Volume Controller
- IBM Enterprise Storage Server Model 800
- IBM System Storage DS6000
- IBM System Storage DS8000
- IBM System Storage N Series
- NetApp V-series
- NetApp FAS

If you have other storage hardware, and a DB2 ACS API driver for that storage hardware, you can use the LIBRARY parameter to specify the DB2 ACS API driver.

The value of the LIBRARY parameter is a fully-qualified library file name.

### **OPTIONS**

### "options-string"

Specifies options to be used for the restore operation. The string will be passed exactly as it was entered, without the double quotation marks.

### @file-name

Specifies that the options to be used for the restore operation are contained in a file located on the DB2 server. The string will be passed to the vendor support library. The file must be a fully qualified file name.

You cannot use the **VENDOROPT** database configuration parameter to specify vendor-specific options for snapshot restore operations. You must use the OPTIONS parameter of the restore utilities instead.

### **OPEN** *num-sessions* **SESSIONS**

Specifies the number of I/O sessions that are to be used with TSM or the vendor product.

### **FROM** *directory/device*

The fully qualified path name of the directory or device on which the backup image resides. If USE TSM, FROM, and LOAD are omitted, the default value is the current working directory of the client machine. This target directory or device must exist on the target server/instance.

If several items are specified, and the last item is a tape device, the user is prompted for another tape. Valid response options are:

**c** Continue. Continue using the device that generated the warning message (for example, continue when a new tape has been mounted).

- **d** Device terminate. Stop using *only* the device that generated the warning message (for example, terminate when there are no more tapes).
- t Terminate. Abort the restore operation after the user has failed to perform some action requested by the utility.

### LOAD shared-library

The name of the shared library (DLL on Windows operating systems) containing the vendor backup and restore I/O functions to be used. The name can contain a full path. If the full path is not given, the value defaults to the path on which the user exit program resides.

# TAKEN AT date-time

The time stamp of the database backup image. The time stamp is displayed after successful completion of a backup operation, and is part of the path name for the backup image. It is specified in the form *yyyymmddhhmmss*. A partial time stamp can also be specified. For example, if two different backup images with time stamps 20021001010101 and 20021002010101 exist, specifying 20021002 causes the image with time stamp 20021002010101 to be used. If a value for this parameter is not specified, there must be only one backup image on the source media.

# **TO** *target-directory*

This parameter states the target database directory. This parameter is ignored if the utility is restoring to an existing database. The drive and directory that you specify must be local. If the backup image contains a database that is enabled for automatic storage then only the database directory changes, the storage paths associated with the database do not change.

# **DBPATH ON** target-directory

This parameter states the target database directory. This parameter is ignored if the utility is restoring to an existing database. The drive and directory that you specify must be local. If the backup image contains a database that is enabled for automatic storage and the ON parameter is not specified then this parameter is synonymous with the TO parameter and only the database directory changes, the storage paths associated with the database do not change.

# **ON** path-list

This parameter redefines the storage paths associated with an automatic storage database. Using this parameter with a database that is not enabled for automatic storage results in an error (SQL20321N). The existing storage paths as defined within the backup image are no longer used and automatic storage table spaces are automatically redirected to the new paths. If this parameter is not specified for an automatic storage database then the storage paths remain as they are defined within the backup image.

One or more paths can be specified, each separated by a comma. Each path must have an absolute path name and it must exist locally. If the database does not already exist on disk and the DBPATH ON parameter is not specified then the first path is used as the target database directory.

For a multi-partition database the ON *path-list* option can only be specified on the catalog partition. The catalog partition must be restored before any other partitions are restored when the ON option is used. The restore of the catalog-partition with new storage paths will place all non-catalog
nodes in a RESTORE\_PENDING state. The non-catalog nodes can then be restored in parallel without specifying the ON clause in the restore command.

In general, the same storage paths must be used for each partition in a multi-partition database and they must all exist prior to executing the RESTORE DATABASE command. One exception to this is where database partition expressions are used within the storage path. Doing this allows the database partition number to be reflected in the storage path such that the resulting path name is different on each partition.

You use the argument " \$N" ([blank]\$N) to indicate a database partition expression. A database partition expression can be used anywhere in the storage path, and multiple database partition expressions can be specified. Terminate the database partition expression with a space character; whatever follows the space is appended to the storage path after the database partition expression is evaluated. If there is no space character in the storage path after the database partition expression, it is assumed that the rest of the string is part of the expression. The argument can only be used in one of the following forms:

Table 40 Operators are evaluated from left to right. % represents the modulus operator.
The database partition number in the examples is assumed to be 10.

Syntax	Example	Value
[blank]\$N	" \$N"	10
[blank]\$N+[number]	" \$N+100"	110
[blank]\$N%[number]	" \$N%5"	0
[blank]\$N+[number]%[number]	" \$N+1%5"	1
[blank]\$N%[number]+[number]	" \$N%4+2"	4
<sup>a</sup> % is modulus.		

You cannot use the **ON** parameter to re-define storage paths for schema transport. Schema transport will use existing storage paths on the target database.

## **INTO** *target-database-alias*

The target database alias. If the target database does not exist, it is created.

When you restore a database backup to an existing database, the restored database inherits the alias and database name of the existing database. When you restore a database backup to a nonexistent database, the new database is created with the alias and database name that you specify. This new database name must be unique on the system where you restore it.

## **TRANSPORT INTO** target-database-alias

Specifies the existing target database alias for a transport operation. The table spaces and schemas being transported are added to the database.

The TABLESPACE and SCHEMA options must specify table space names and schema names that define a valid transportable set or the transport operation fails. SQLCODE=SQL2590N rc=1

The system catalogs cannot be transported. SQLCODE=SQL2590N rc=4.

After the schemas have been validated by the RESTORE command, the system catalog entries describing the objects in the table spaces being

transported are created in the target database. After completion of the schema recreation, the target database takes ownership of the physical table space containers.

The physical and logical objects contained in the table spaces being restored are re-created in the target database and the table space definitions and containers are added to the target database. Failure during the creation of an object, or the replay of the DDL returns an error.

## **STAGE IN** staging-database

Specifies the name of a temporary staging database for the backup image that is the source for the transport operation. If the STAGE IN option is specified, the temporary database is not dropped after the transport operation completes. The database is no longer required after the transport has completed and can be dropped by the DBA.

The following is true if the STAGE IN option is not specified:

- The database name is of the form SYSTG*xxx* where *xxx* is an integer value.
- The temporary staging database is dropped after the transport operation completes.

## **LOGTARGET** *directory*

Non-snapshot restores:

The absolute path name of an existing directory on the database server, to be used as the target directory for extracting log files from a backup image. If this option is specified, any log files contained within the backup image will be extracted into the target directory. If this option is not specified, log files contained within a backup image will not be extracted. To extract only the log files from the backup image, specify the LOGS option.

## Snapshot restores:

## INCLUDE

Restore log directory volumes from the snapshot image. If this option is specified and the backup image contains log directories, then they will be restored. Existing log directories and log files on disk will be left intact if they do not conflict with the log directories in the backup image. If existing log directories on disk conflict with the log directories in the backup image, then an error will be returned.

## EXCLUDE

Do not restore log directory volumes. If this option is specified, then no log directories will be restored from the backup image. Existing log directories and log files on disk will be left intact if they do not conflict with the log directories in the backup image. If a path belonging to the database is restored and a log directory will implicitly be restored because of this, thus causing a log directory to be overwritten, an error will be returned.

## FORCE

Allow existing log directories in the current database to be overwritten and replaced when restoring the snapshot image. Without this option, existing log directories and log files on disk which conflict with log directories in the snapshot image will cause the restore to fail. Use this option to indicate that the restore can overwrite and replace those existing log directories. **Note:** Use this option with caution, and always ensure that you have backed up and archived all logs that might be required for recovery.

**Note:** If LOGTARGET is not specified non-snapshot restores, then the default LOGTARGET directory is LOGTARGET EXCLUDE.

## **NEWLOGPATH** *directory*

The absolute pathname of a directory that will be used for active log files after the restore operation. This parameter has the same function as the **newlogpath** database configuration parameter, except that its effect is limited to the restore operation in which it is specified. The parameter can be used when the log path in the backup image is not suitable for use after the restore operation; for example, when the path is no longer valid, or is being used by a different database.

# WITH num-buffers BUFFERS

The number of buffers to be used. The DB2 database system will automatically choose an optimal value for this parameter unless you explicitly enter a value. A larger number of buffers can be used to improve performance when multiple sources are being read from, or if the value of PARALLELISM has been increased.

## **BUFFER** buffer-size

The size, in pages, of the buffer used for the restore operation. The DB2 database system will automatically choose an optimal value for this parameter unless you explicitly enter a value. The minimum value for this parameter is 8 pages.

The restore buffer size must be a positive integer multiple of the backup buffer size specified during the backup operation. If an incorrect buffer size is specified, the buffers are allocated to be of the smallest acceptable size.

## **REPLACE HISTORY FILE**

Specifies that the restore operation should replace the history file on disk with the history file from the backup image.

## **REPLACE EXISTING**

If a database with the same alias as the target database alias already exists, this parameter specifies that the restore utility is to replace the existing database with the restored database. This is useful for scripts that invoke the restore utility, because the command line processor will not prompt the user to verify deletion of an existing database. If the WITHOUT PROMPTING parameter is specified, it is not necessary to specify REPLACE EXISTING, but in this case, the operation will fail if events occur that normally require user intervention.

## REDIRECT

Specifies a redirected restore operation. To complete a redirected restore operation, this command should be followed by one or more SET TABLESPACE CONTAINERS commands, and then by a RESTORE DATABASE command with the CONTINUE option. All commands associated with a single redirected restore operation must be invoked from the same window or CLP session.

## **GENERATE SCRIPT** script

Creates a redirect restore script with the specified file name. The script name can be relative or absolute and the script will be generated on the client side. If the file cannot be created on the client side, an error message (SQL9304N) will be returned. If the file already exists, it will be overwritten. Please see the examples below for further usage information.

## WITHOUT ROLLING FORWARD

Specifies that the database is not to be put in rollforward pending state after it has been successfully restored.

If, following a successful restore operation, the database is in rollforward pending state, the ROLLFORWARD command must be invoked before the database can be used again.

If this option is specified when restoring from an online backup image, error SQL2537N will be returned.

If backup image is of a recoverable database then WITHOUT ROLLING FORWARD cannot be specified with REBUILD option.

## PARALLELISM n

Specifies the number of buffer manipulators that are to be created during the restore operation. The DB2 database system will automatically choose an optimal value for this parameter unless you explicitly enter a value.

## **COMPRLIB** name

Indicates the name of the library to be used to perform the decompression (e.g., db2compr.dll for Windows; libdb2compr.so for Linux/UNIX systems). The name must be a fully qualified path referring to a file on the server. If this parameter is not specified, the DB2 database system will attempt to use the library stored in the image. If the backup was not compressed, the value of this parameter will be ignored. If the specified library cannot be loaded, the restore operation will fail.

## **COMPROPTS** string

Describes a block of binary data that is passed to the initialization routine in the decompression library. The DB2 database system passes this string directly from the client to the server, so any issues of byte reversal or code page conversion are handled by the decompression library. If the first character of the data block is "@", the remainder of the data is interpreted by the DB2 database system as the name of a file residing on the server. The DB2 database system will then replace the contents of *string* with the contents of this file and pass the new value to the initialization routine instead. The maximum length for the string is 1 024 bytes.

## WITHOUT PROMPTING

Specifies that the restore operation is to run unattended. Actions that normally require user intervention will return an error message. When using a removable media device, such as tape or diskette, the user is prompted when the device ends, even if this option is specified.

# **Examples**

1. In the following example, the database WSDB is defined on all 4 database partitions, numbered 0 through 3. The path /dev3/backup is accessible from all database partitions. The following offline backup images are available from /dev3/backup:

wsdb.0.db2inst1.NODE0000.CATN0000.20020331234149.001 wsdb.0.db2inst1.NODE0001.CATN0000.20020331234427.001 wsdb.0.db2inst1.NODE0002.CATN0000.20020331234828.001 wsdb.0.db2inst1.NODE0003.CATN0000.20020331235235.001 To restore the catalog partition first, then all other database partitions of the WSDB database from the /dev3/backup directory, issue the following commands from one of the database partitions:

db2\_all '<<+0< db2 RESTORE DATABASE wsdb FROM /dev3/backup TAKEN AT 20020331234149 INTO wsdb REPLACE EXISTING' db2\_all '<<+1< db2 RESTORE DATABASE wsdb FROM /dev3/backup TAKEN AT 20020331234427 INTO wsdb REPLACE EXISTING' db2\_all '<<+2< db2 RESTORE DATABASE wsdb FROM /dev3/backup TAKEN AT 20020331234828 INTO wsdb REPLACE EXISTING' db2\_all '<<+3< db2 RESTORE DATABASE wsdb FROM /dev3/backup TAKEN AT 20020331235235 INTO wsdb REPLACE EXISTING'

The db2\_all utility issues the restore command to each specified database partition. When performing a restore using db2\_all, you should always specify REPLACE EXISTING and/or WITHOUT PROMPTING. Otherwise, if there is prompting, the operation will look like it is hanging. This is because db2\_all does not support user prompting.

- 2. Following is a typical redirected restore scenario for a database whose alias is MYDB:
  - a. Issue a RESTORE DATABASE command with the REDIRECT option.

restore db mydb replace existing redirect

After successful completion of step 1, and before completing step 3, the restore operation can be aborted by issuing:

restore db mydb abort

b. Issue a SET TABLESPACE CONTAINERS command for each table space whose containers must be redefined. For example:

set tablespace containers for 5 using
 (file 'f:\ts3con1' 20000, file 'f:\ts3con2' 20000)

To verify that the containers of the restored database are the ones specified in this step, issue the LIST TABLESPACE CONTAINERS command.

c. After successful completion of steps 1 and 2, issue:

restore db mydb continue

This is the final step of the redirected restore operation.

- d. If step 3 fails, or if the restore operation has been aborted, the redirected restore can be restarted, beginning at step 1.
- **3**. Following is a sample weekly incremental backup strategy for a recoverable database. It includes a weekly full database backup operation, a daily non-cumulative (delta) backup operation, and a mid-week cumulative (incremental) backup operation:

(Sun) backup db mydb use tsm (Mon) backup db mydb online incremental delta use tsm (Tue) backup db mydb online incremental delta use tsm (Wed) backup db mydb online incremental use tsm (Thu) backup db mydb online incremental delta use tsm (Fri) backup db mydb online incremental delta use tsm (Sat) backup db mydb online incremental use tsm

For an automatic database restore of the images created on Friday morning, issue:

restore db mydb incremental automatic taken at (Fri)

For a manual database restore of the images created on Friday morning, issue:

```
restore db mydb incremental taken at (Fri)
restore db mydb incremental taken at (Sun)
restore db mydb incremental taken at (Wed)
restore db mydb incremental taken at (Thu)
restore db mydb incremental taken at (Fri)
```

4. To produce a backup image, which includes logs, for transportation to a remote site:

backup db sample online to /dev3/backup include logs

To restore that backup image, supply a LOGTARGET path and specify this path during ROLLFORWARD:

restore db sample from /dev3/backup logtarget /dev3/logs

- rollforward db sample to end of logs and stop overflow log path /dev3/logs
- To retrieve only the log files from a backup image that includes logs: restore db sample logs from /dev3/backup logtarget /dev3/logs
- 6. The USE TSM OPTIONS keywords can be used to specify the TSM information to use for the restore operation. On Windows platforms, omit the -fromowner option.
  - Specifying a delimited string:
  - restore db sample use TSM options '"-fromnode=bar -fromowner=dmcinnis"'
  - Specifying a fully qualified file: restore db sample use TSM options @/u/dmcinnis/myoptions.txt

The file myoptions.txt contains the following information: -fromnode=bar -fromowner=dmcinnis

- 7. The following is a simple restore of a multi-partition automatic storage enabled database with new storage paths. The database was originally created with one storage path, /myPath0:
  - On the catalog partition issue: restore db mydb on /myPath1,/myPath2
  - On all non-catalog partitions issue: restore db mydb
- A script output of the following command on a non-auto storage database: restore db sample from /home/jseifert/backups taken at 20050301100417 redirect generate script SAMPLE\_NODE0000.clp

would look like this:

```
-- ** automatically created redirect restore script
UPDATE COMMAND OPTIONS USING S ON Z ON SAMPLE NODE0000.out V ON;
SET CLIENT ATTACH DBPARTITIONNUM 0;
SET CLIENT CONNECT DBPARTITIONNUM 0;
-- ** initialize redirected restore
RESTORE DATABASE SAMPLE
-- USER '<username>
-- USING '<password>'
FROM '/home/jseifert/backups'
TAKEN AT 20050301100417
-- DBPATH ON '<target-directory>'
INTO SAMPLE
-- NEWLOGPATH '/home/jseifert/jseifert/NODE0000/SQL00001/SQL0GDIR/'
-- WITH <num-buff> BUFFERS
```

**10**. The following are examples of the RESTORE DB command using the SNAPSHOT option:

Restore log directory volumes from the snapshot image and do not prompt. db2 restore db sample use snapshot LOGTARGET INCLUDE without prompting

Do not restore log directory volumes and do not prompt.

db2 restore db sample use snapshot LOGTARGET EXCLUDE without prompting

Do not restore log directory volumes and do not prompt. When LOGTARGET is not specified, then the default is LOGTARGET EXCLUDE.

db2 restore db sample use snapshot without prompting

Allow existing log directories in the current database to be overwritten and replaced when restoring the snapshot image containing conflicting log directories, without prompting.

db2 restore db sample use snapshot LOGTARGET EXCLUDE FORCE without prompting Allow existing log directories in the current database to be overwritten and replaced when restoring the snapshot image containing conflicting log directories, without prompting.

db2 restore db sample use snapshot LOGTARGET INCLUDE FORCE without prompting

If the parameter **AT DBPARTITIONNUM** is used to recreate a database partition that was dropped (because it was damaged), the database at this database partition will be in the restore-pending state. After recreating the database partition, the database must immediately be restored on this database partition.

# **Usage notes**

- A RESTORE DATABASE command of the form db2 restore db <name> will perform a full database restore with a database image and will perform a table space restore operation of the table spaces found in a table space image. A RESTORE DATABASE command of the form db2 restore db <name> tablespace performs a table space restore of the table spaces found in the image. In addition, if a list of table spaces is provided with such a command, the explicitly listed table spaces are restored.
- Following the restore operation of an online backup, you must perform a roll-forward recovery.
- You can use the **OPTIONS** parameter to enable restore operations in TSM environments supporting proxy nodes. For more information, see the "Configuring a Tivoli Storage Manager client" topic.
- If a backup image is compressed, the DB2 database system detects this and automatically decompresses the data before restoring it. If a library is specified

on the db2Restore API, it is used for decompressing the data. Otherwise, a check is made to see if a library is stored in the backup image and if the library exists, it is used. Finally, if there is not library stored in the backup image, the data cannot be decompressed and the restore operation fails.

- If the compression library is to be restored from a backup image (either explicitly by specifying the COMPRESSION LIBRARY option or implicitly by performing a normal restore of a compressed backup), the restore operation must be done on the same platform and operating system that the backup was taken on. If the platform the backup was taken on is not the same as the platform that the restore is being done on, the restore operation will fail, even if the DB2 database system normally supports cross-platform restores involving the two systems.
- A backed up SMS table space can only be restored into a SMS table space. You cannot restore it into a DMS table space, or vice versa.
- To restore log files from the backup image that contains them, the LOGTARGET option must be specified, providing the fully qualified and valid path that exists on the DB2 server. If those conditions are satisfied, the restore utility will write the log files from the image to the target path. If a LOGTARGET is specified during a restore of a backup image that does not include logs, the restore operation will return an error before attempting to restore any table space data. A restore operation will also fail with an error if an invalid, or read-only, LOGTARGET path is specified.
- If any log files exist in the LOGTARGET path at the time the RESTORE DATABASE command is issued, a warning prompt will be returned to the user. This warning will not be returned if WITHOUT PROMPTING is specified.
- During a restore operation where a LOGTARGET is specified, if any log file cannot be extracted, the restore operation will fail and return an error. If any of the log files being extracted from the backup image have the same name as an existing file in the LOGTARGET path, the restore operation will fail and an error will be returned. The restore database utility will not overwrite existing log files in the LOGTARGET directory.
- You can also restore only the saved log set from a backup image. To indicate that only the log files are to be restored, specify the LOGS option in addition to the LOGTARGET path. Specifying the LOGS option without a LOGTARGET path will result in an error. If any problem occurs while restoring log files in this mode of operation, the restore operation will terminate immediately and an error will be returned.
- During an automatic incremental restore operation, only the log files included in the target image of the restore operation will be retrieved from the backup image. Any log files included in intermediate images referenced during the incremental restore process will not be extracted from those intermediate backup images. During a manual incremental restore operation, the LOGTARGET path should only be specified with the final restore command to be issued.
- Offline full database backups as well as offline incremental database backups can be restored to a later database version, whereas online backups cannot. For multi-partition databases, the catalog partition must first be restored individually, followed by the remaining database partitions (in parallel or serial). However, the implicit database upgrade done by the restore operation can fail. In a multi-partition database it can fail on one or more database partitions. In this case, you can follow the RESTORE DATABASE command with a single UPGRADE DATABASE command issued from the catalog partition to upgrade the database successfully.

## **Snapshot restore**

## **RESTORE DATABASE**

Like a traditional (non-snapshot) restore, the default behavior when restoring a snapshot backup image will be to NOT restore the log directories —LOGTARGET EXCLUDE.

If the DB2 database manager detects that any log directory's group ID is shared among any of the other paths to be restored, then an error is returned. In this case, LOGTARGET INCLUDE or LOGTARGET INCLUDE FORCE must be specified, as the log directories must be part of the restore.

The DB2 database manager will make all efforts to save existing log directories (primary, mirror and overflow) before the restore of the paths from the backup image takes place.

If you wish the log directories to be restored and the DB2 database manager detects that the pre-existing log directories on disk conflict with the log directories in the backup image, then the DB2 database manager will report an error. In such a case, if you have specified LOGTARGET INCLUDE FORCE, then this error will be suppressed and the log directories from the image will be restored, deleting whatever existed beforehand.

There is a special case in which the LOGTARGET EXCLUDE option is specified and a log directory path resides under the database directory (for example, /NODExxxx/SQLxxxx/SQLOGDIR/). In this case, a restore would still overwrite the log directory as the database path, and all of the contents beneath it, would be restored. If the DB2 database manager detects this scenario and log files exist in this log directory, then an error will be reported. If you specify LOGTARGET EXCLUDE FORCE, then this error will be suppressed and those log directories from the backup image will overwrite the conflicting log directories on disk.

## Transporting table spaces and schemas

The complete list of table spaces and schemas must be specified.

The target database must be active at the time of transport.

If an online backup image is used, then the staging database is rolled forward to the end of the backup. If an offline backup image is used, then no rollforward processing is performed.

A staging database consisting of the system catalog table space from the backup image is created under the path specified by the **dftdbpath** database parameter. This database is dropped when the RESTORE DATABASE command completes. The staging database is required to extract the DDL used to regenerate the objects in the table spaces being transported.

When transporting table spaces, the DB2 database manager attempts to assign the first available buffer pool of matching page size to the table space that is transported. If the target database does not have buffer pools that are of matching page size of table spaces transported, then a hidden buffer pool might be assigned. Hidden buffer pools are temporary place holders for transported table spaces. You can check buffer pools assigned to transported table spaces after transport completes. You can issue the ALTER TABLESPACE command to update buffer pools.

If database rollforward detects a table space schema transport log record, the corresponding transported table space will be taken offline and moved into drop

# **RESTORE DATABASE**

pending state. This is because database does not have complete logs of transported table spaces to rebuild transported table spaces and their contents. You can take a full backup of the target database after transport completes, so subsequent rollforward does not pass the point of schema transport in the log stream.

# **REWIND TAPE**

Rewinds tapes for backup and restore operations to streaming tape devices. This command is only supported on Windows operating systems.

# **Authorization**

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

# **Required connection**

None

# **Command syntax**

►►---REWIND TAPE-

L\_ON\_device\_

# **Command parameters**

**ON** device

Specifies a valid tape device name. The default value is \\.\TAPE0.

•

# **ROLLFORWARD DATABASE**

Recovers a database by applying transactions recorded in the database log files. Invoked after a database or a table space backup image has been restored, or if any table spaces have been taken offline by the database due to a media error. The database must be recoverable (that is, the **logarchmeth1** or **logarchmeth2** database configuration parameters must be set to a value other than OFF) before the database can be recovered with rollforward recovery.

# Scope

In a partitioned database environment, this command can only be invoked from the catalog partition. A database or table space rollforward operation to a specified point in time affects all database partitions that are listed in the db2nodes.cfg file. A database or table space rollforward operation to the end of logs affects the database partitions that are specified. If no database partitions are specified, it affects all database partitions that are listed in the db2nodes.cfg file; if rollforward recovery is not needed on a particular partition, that partition is ignored.

For partitioned tables, you are also required to roll forward related table spaces to the same point in time. This applies to table spaces containing data partitions of a table. If a single table space contains a portion of a partitioned table, rolling forward to the end of the logs is still allowed.

It is not possible to roll forward through log files created on a previous DB2 database release version. This is an important consideration when upgrading to a new DB2 database release version.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

# **Required connection**

None. This command establishes a database connection.

# **Command syntax**

►		
	_USER_username	
—	USING—password—	

# **ROLLFORWARD DATABASE**

## **On Database Partition clause:**

_ALL DRPARTITIONNUMS_	_					
NEE DDI ARTITIONNONS				_		
	└─EXCEPT—	Database	Partition Li	st clause	$\square$	
						1
 — Database Partition	List clause					L

## **Database Partition List clause:**

## Log Overflow clause:

# **Command parameters**

## **DATABASE** database-alias

The alias of the database that is to be rollforward recovered.

## **USER** username

The user name under which the database is to be rollforward recovered.

## **USING** password

The password used to authenticate the user name. If the password is omitted, you will be prompted to enter it.

*isotime* The point in time to which all committed transactions are to be rolled forward (including the transaction committed precisely at that time, as well as all transactions committed previously).

This value is specified as a time stamp, a 7-part character string that identifies a combined date and time. The format is *yyyy-mm-dd-hh.mm.ss* (year, month, day, hour, minutes, seconds), expressed in Coordinated Universal Time (UTC, formerly known as GMT). UTC helps to avoid having the same time stamp associated with different logs (because of a change in time associated with daylight savings time, for example). The time stamp in a backup image is based on the local time at which the backup operation started. The CURRENT TIMEZONE special register specifies the difference between UTC and local time at the application server. The difference is represented by a time duration (a decimal number in which the first two digits represent the number of hours, the next two digits represent the number of minutes, and the last two digits represent the number of seconds). Subtracting CURRENT TIMEZONE from a local time converts that local time to UTC.

#### **USING UTC TIME**

Allows you to rollforward to a point in time that is specified as UTC time. This is the default option.

## USING LOCAL TIME

Allows you to rollforward to a point in time that is the server's local time rather than UTC time.

#### Note:

- 1. If you specify a local time for rollforward, all messages returned to you will also be in local time. All times are converted on the server, and in partitioned database environments, on the catalog database partition.
- 2. The timestamp string is converted to UTC on the server, so the time is local to the server's time zone, not the client's. If the client is in one time zone and the server in another, the server's local time should be used. This is different from the local time option from the Control Center, which is local to the client.
- **3**. If the timestamp string is close to the time change of the clock due to daylight savings, it is important to know if the stop time is before or after the clock change, and specify it correctly.
- 4. Subsequent ROLLFORWARD commands that cannot specify the **USING LOCAL TIME** clause will have all messages returned to you in local time if this option is specified.
- 5. It is important to choose the USING LOCAL TIME or the USING UTC TIME (formerly known as GMT time) correctly. If not specified, the default is USING UTC TIME. Any mistake in the selection may cause rollforward to reach a different point in time than expected and truncate the logs after that point in time. Mistaking a local timestamp as a UTC timestamp may cause the required logs to be truncated undesirably and prevent further rollforwards to a point later than the mistaken time.

## END OF LOGS

Specifies that all committed transactions from all online archive log files listed in the database configuration parameter **logpath** are to be applied.

#### END OF BACKUP

Specifies that all partitions in the partitioned database should be rolled forward to the *minimum recovery time*. See Examples section below for an example.

## ALL DBPARTITIONNUMS | ON ALL DBPARTITIONNUMS

Specifies that transactions are to be rolled forward on all database partitions specified in the db2nodes.cfg file. This is the default if a database partition clause is not specified.

## EXCEPT

Specifies that transactions are to be rolled forward on all database partitions specified in the db2nodes.cfg file, except those specified in the database partition list.

## ON DBPARTITIONNUM | ON DBPARTITIONNUMS

Roll the database forward on a set of database partitions.

#### *db-partition-number1*

Specifies a database partition number in the database partition list.

#### db-partition-number2

Specifies the second database partition number, so that all database partitions from *db-partition-number1* up to and including *db-partition-number2* are included in the database partition list.

## COMPLETE | STOP

Stops the rolling forward of log records, and completes the rollforward recovery process by rolling back any incomplete transactions and turning off the rollforward pending state of the database. This allows access to the database or table spaces that are being rolled forward. These keywords are equivalent; specify one or the other, but not both. The keyword **AND** permits specification of multiple operations at once; for example, db2 rollforward db sample to end of logs and complete. When rolling table spaces forward to a point in time, the table spaces are placed in backup pending state.

## CANCEL

Cancels the rollforward recovery operation. This puts the database or one or more table spaces on all database partitions on which forward recovery has been started in restore pending state:

- If a *database* rollforward operation is not in progress (that is, the database is in rollforward pending state), this option puts the database in restore pending state.
- If a *table space* rollforward operation is not in progress (that is, the table spaces are in rollforward pending state), a table space list must be specified. All table spaces in the list are put in restore pending state.
- If a table space rollforward operation *is* in progress (that is, at least one table space is in rollforward in progress state), all table spaces that are in rollforward in progress state are put in restore pending state. If a table space list is specified, it must include all table spaces that are in rollforward in progress state. All table spaces on the list are put in restore pending state.

- If rolling forward to a point in time, any table space name that is passed in is ignored, and all table spaces that are in rollforward in progress state are put in restore pending state.
- If rolling forward to the end of the logs with a table space list, only the table spaces listed are put in restore pending state.

This option cannot be used to cancel a rollforward operation *that is actually running*. It can only be used to cancel a rollforward operation that is in progress but not actually running at the time. A rollforward operation can be in progress but not running if:

- It terminated abnormally.
- The **STOP** option was not specified.
- An error caused it to fail. Some errors, such as rolling forward through a non-recoverable load operation, can put a table space into restore pending state.

Use this option with caution, and only if the rollforward operation that is in progress cannot be completed because some of the table spaces have been put in rollforward pending state or in restore pending state. When in doubt, use the LIST TABLESPACES command to identify the table spaces that are in rollforward in progress state, or in rollforward pending state.

## **QUERY STATUS**

Lists the log files that the database manager has rolled forward, the next archive file required, and the time stamp (in UTC) of the last committed transaction since rollforward processing began. In a partitioned database environment, this status information is returned for each database partition. The information returned contains the following fields:

## Database partition number

#### **Rollforward status**

Status can be: database or table space rollforward pending, database or table space rollforward in progress, database or table space rollforward processing STOP, or not pending.

## Next log file to be read

A string containing the name of the next required log file. In a partitioned database environment, use this information if the rollforward utility fails with a return code indicating that a log file is missing or that a log information mismatch has occurred.

## Log files processed

A string containing the names of processed log files that are no longer needed for recovery, and that can be removed from the directory. If, for example, the oldest uncommitted transaction starts in log file x, the range of obsolete log files will not include x; the range ends at x - 1. This field is not updated in case of a table space rollforward recovery operation.

## Last committed transaction

A string containing a time stamp in ISO format

(*yyyy-mm-dd-hh.mm.ss*) suffixed by either "UTC" or "Local" (see **USING LOCAL TIME**). This time stamp marks the last transaction committed after the completion of rollforward recovery. The time stamp applies to the database. For table space rollforward recovery, it is the time stamp of the last transaction committed to the database.

**QUERY STATUS** is the default value if the **TO**, **STOP**, **COMPLETE**, or **CANCEL** clauses are omitted. If **TO**, **STOP**, or **COMPLETE** was specified, status information is displayed if the command has completed successfully. If individual table spaces are specified, they are ignored; the status request does not apply only to specified table spaces.

## TABLESPACE

This keyword is specified for table space-level rollforward recovery.

#### tablespace-name

Mandatory for table space-level rollforward recovery to a point in time. Allows a subset of table spaces to be specified for rollforward recovery to the end of the logs. In a partitioned database environment, each table space in the list does not have to exist at each database partition that is rolling forward. If it *does* exist, it must be in the correct state.

For partitioned tables, point in time roll-forward of a table space containing any piece of a partitioned table must also roll-forward all of the other table spaces in which that table resides to the same point in time. The table spaces containing the index partitions are included in the list of pieces of a partitioned table. Roll-forward to the end of the logs for a single table space containing a piece of a partitioned table is still allowed.

If a partitioned table has any attached or detached data partitions, then PIT rollforward must include all table spaces for these data partitions as well. To determine if a partitioned table has any attached, detached, or dropped data partitions, query the Status field of the SYSDATAPARTITIONS catalog table.

Because a partitioned table can reside in multiple table spaces, it will generally be necessary to roll forward multiple table spaces. Data that is recovered via dropped table recovery is written to the export directory specified in the ROLLFORWARD DATABASE command. It is possible to roll forward all table spaces in one command, or do repeated roll forward operations for subsets of the table spaces involved. If the ROLLFORWARD DATABASE command is done for one or a few table spaces, then all data from the table that resided in those table spaces will be recovered. A warning will be written to the notify log if the ROLLFORWARD DATABASE command did not specify the full set of the table spaces necessary to recover all the data for the table. Allowing rollforward of a subset of the table spaces makes it easier to deal with cases where there is more data to be recovered than can fit into a single export directory.

#### **ONLINE**

This keyword is specified to allow table space-level rollforward recovery to be done online. This means that other agents are allowed to connect while rollforward recovery is in progress.

## **OVERFLOW LOG PATH** log-directory

Specifies an alternate log path to be searched for archived logs during recovery. Use this parameter if log files were moved to a location other than that specified by the **logpath** database configuration parameter. In a partitioned database environment, this is the (fully qualified) default overflow log path *for all database partitions*. A relative overflow log path can be specified for single-partition databases. The **OVERFLOW LOG PATH** command parameter will overwrite the value (if any) of the database configuration parameter overflowlogpath.

## log-directory ON DBPARTITIONNUM

In a partitioned database environment, allows a different log path to override the default overflow log path for a specific database partition.

#### NORETRIEVE

Allows you to control which log files are to be rolled forward on the standby machine by allowing you to disable the retrieval of archived logs. The benefits of this are:

- By controlling the log files to be rolled forward, you can ensure that the standby machine is *X* hours behind the production machine, to avoid affecting both the systems.
- If the standby system does not have access to archive (for example, if TSM is the archive, it only allows the original machine to retrieve the files)
- It might also be possible that while the production system is archiving a file, the standby system is retrieving the same file, and it might then get an incomplete log file. **NORETRIEVE** would solve this problem.

#### **RECOVER DROPPED TABLE** drop-table-id

Recovers a dropped table during the rollforward operation. The table ID can be obtained using the LIST HISTORY command, in the Backup ID column of the output listing. For partitioned tables, the *drop-table-id* identifies the table as a whole, so that all data partitions of the table can be recovered in a single roll-forward command.

## **TO** *export-directory*

Specifies a directory to which files containing the table data are to be written. The directory must be accessible to all database partitions.

# **Examples**

#### Example 1

The ROLLFORWARD DATABASE command permits specification of multiple operations at once, each being separated with the keyword **AND**. For example, to roll forward to the end of logs, and complete, the separate commands:

```
db2 rollforward db sample to end of logs
db2 rollforward db sample complete
```

can be combined as follows:

db2 rollforward db sample to end of logs and complete

Although the two are equivalent, it is recommended that such operations be done in two steps. It is important to verify that the rollforward operation has progressed as expected, before stopping it and possibly missing logs. This is especially important if a bad log is found during rollforward recovery, and the bad log is interpreted to mean the "end of logs". In such cases, an undamaged backup copy of that log could be used to continue the rollforward operation through more logs. However if the rollforward **AND STOP** option is used, and the rollforward encounters an error, the error will be returned to you. In this case, the only way to force the rollforward to stop and come online despite the error (that is, to come online at that point in the logs before the error) is to issue the ROLLFORWARD STOP command.

## Example 2

Roll forward to the end of the logs (two table spaces have been restored):

db2 rollforward db sample to end of logs db2 rollforward db sample to end of logs and stop

These two statements are equivalent. Neither **AND STOP** or **AND COMPLETE** is needed for table space rollforward recovery to the end of the logs. Table space names are not required. If not specified, all table spaces requiring rollforward recovery will be included. If only a subset of these table spaces is to be rolled forward, their names must be specified.

## Example 3

After three table spaces have been restored, roll one forward to the end of the logs, and the other two to a point in time, both to be done online:

db2 rollforward db sample to end of logs tablespace(TBS1) online

```
db2 rollforward db sample to 1998-04-03-14.21.56 and stop tablespace(TBS2, TBS3) online
```

Two rollforward operations cannot be run concurrently. The second command can only be invoked after the first rollforward operation completes successfully.

## Example 4

After restoring the database, roll forward to a point in time, using **OVERFLOW LOG PATH** to specify the directory where the user exit saves archived logs:

```
db2 rollforward db sample to 1998-04-03-14.21.56 and stop overflow log path (/logs)
```

#### Example 5 (partitioned database environments)

There are three database partitions: 0, 1, and 2. Table space TBS1 is defined on all database partitions, and table space TBS2 is defined on database partitions 0 and 2. After restoring the database on database partition 1, and TBS1 on database partitions 0 and 2, roll the database forward on database partition 1: db2 rollforward db sample to end of logs and stop

This returns warning SQL1271 ("Database is recovered but one or more table spaces are off-line on database partition(s) 0 and 2."). db2 rollforward db sample to end of logs

This rolls TBS1 forward on database partitions 0 and 2. The clause **TABLESPACE(TBS1)** is optional in this case.

#### Example 6 (partitioned database environments)

After restoring table space TBS1 on database partitions 0 and 2 only, roll TBS1 forward on database partitions 0 and 2: db2 rollforward db sample to end of logs

Database partition 1 is ignored. db2 rollforward db sample to end of logs tablespace(TBS1)

This fails, because TBS1 is not ready for rollforward recovery on database partition 1. Reports SQL4906N.

db2 rollforward db sample to end of logs on dbpartitionnums (0, 2)
 tablespace(TBS1)

This completes successfully.

db2 rollforward db sample to 1998-04-03-14.21.56 and stop tablespace(TBS1)

This fails, because TBS1 is not ready for rollforward recovery on database partition 1; all pieces must be rolled forward together. With table space rollforward to a point in time, the database partition clause is not accepted. The rollforward operation must take place on all the database partitions on which the table space resides.

After restoring TBS1 on database partition 1: db2 rollforward db sample to 1998-04-03-14.21.56 and stop tablespace(TBS1)

This completes successfully.

#### Example 7 (partitioned database environment)

After restoring a table space on all database partitions, roll forward to point in time 2, but do not specify **AND STOP**. The rollforward operation is still in progress. Cancel and roll forward to point in time 1:

db2 rollforward db sample to pit2 tablespace(TBS1)
db2 rollforward db sample cancel tablespace(TBS1)

\*\* restore TBS1 on all database partitions \*\*

db2 rollforward db sample to pit1 tablespace(TBS1)
db2 rollforward db sample stop tablespace(TBS1)

#### Example 8 (partitioned database environments)

Rollforward recover a table space that resides on eight database partitions (3 to 10) listed in the db2nodes.cfg file:

db2 rollforward database dwtest to end of logs tablespace (tssprodt)

This operation to the end of logs (not point in time) completes successfully. The database partitions on which the table space resides do not have to be specified. The utility defaults to the db2nodes.cfg file.

#### Example 9 (partitioned database environment)

Rollforward recover six small table spaces that reside on a single-partition database partition group (on database partition 6):

db2 rollforward database dwtest to end of logs on dbpartitionnum (6)
 tablespace(tsstore, tssbuyer, tsstime, tsswhse, tsslscat, tssvendor)

This operation to the end of logs (not point in time) completes successfully.

#### Example 10 (partitioned database environment)

You can use the **TO END OF BACKUP** clause with the ROLLFORWARD command to roll forward all partitions in a partitioned database to the minimum recovery time. The minimum recovery time is the earliest point in time during a rollforward when a database is consistent (when the objects listed in the database catalogs match the objects that physically exist on disk). Manually determining the correct point in time to which to roll forward a database is difficult, particularly for a partitioned database. The **END OF BACKUP** option makes it easy.

## **ROLLFORWARD DATABASE**

db2 rollforward db sample to end of backup and complete

## Usage notes

If restoring from an image that was created during an online backup operation, the specified point in time for the rollforward operation must be later than the time at which the online backup operation completed. If the rollforward operation is stopped before it passes this point, the database is left in rollforward pending state. If a table space is in the process of being rolled forward, it is left in rollforward in progress state.

If one or more table spaces is being rolled forward to a point in time, the rollforward operation must continue at least to the minimum recovery time, which is the last update to the system catalogs for this table space or its tables. The minimum recovery time (in Coordinated Universal Time, or UTC) for a table space can be retrieved using the LIST TABLESPACES SHOW DETAIL command.

Rolling databases forward might require a load recovery using tape devices. If prompted for another tape, you can respond with one of the following:

- **c** Continue. Continue using the device that generated the warning message (for example, when a new tape has been mounted)
- **d** Device terminate. Stop using the device that generated the warning message (for example, when there are no more tapes)
- **t** Terminate. Take all affected table spaces offline, but continue rollforward processing.

If the rollforward utility cannot find the next log that it needs, the log name is returned in the SQLCA, and rollforward recovery stops. If no more logs are available, use the **STOP** option to terminate rollforward recovery. Incomplete transactions are rolled back to ensure that the database or table space is left in a consistent state.

If database rollforward detects a table space schema transport log record, the corresponding transported table space will be taken offline and moved into drop pending state. This is because database does not have complete logs of transported table spaces to rebuild transported table spaces and their contents. You can take a full backup of the target database after transport completes, so subsequent rollforward does not pass the point of schema transport in the log stream.

**Note:** Rolling forward through a redistribute operation cannot restore the database content since log records are not recorded for data redistribution. See the "REDISTRIBUTE DATABASE PARTITION GROUP command".

## Compatibilities

For compatibility with versions earlier than Version 8:

- The keyword NODE can be substituted for DBPARTITIONNUM.
- The keyword NODES can be substituted for DBPARTITIONNUMS.
- Point in time rollforward is not supported with pre-V9.1 clients due to V9.1 support for partitioned tables.

# RUNCMD

Executes a specified command from the CLP interactive mode command history.

# Scope

This command can only be run within CLP interactive mode. Specifically, it cannot be run from the CLP command mode or the CLP batch mode.

# Authorization

None

# **Required connection**

The required connection will depend on the command being executed.

# **Command syntax**

# **Command parameters**

*num* If *num* is positive, executes the command corresponding to *num* in the command history. If *num* is negative, executes the command corresponding to *num*, counting backwards from the most recent command in the command history. Zero is not a valid value for *num*. If this parameter is not specified, executes the most recently run command. (This is equivalent to specifying a value of -1 for *num*).

# **Usage notes**

- 1. Typically, you would execute the HISTORY command to see a list of recently executed commands and then execute the RUNCMD to execute a command from this list.
- 2. The RUNCMD command is not recorded in the command history, but the command executed by the RUNCMD command is recorded in the command history.

# RUNSTATS

Updates statistics about the characteristics of a table and/or associated indexes, or statistical views. These characteristics include number of records, number of pages, and average record length. The optimizer uses these statistics when determining access paths to the data.

For a table, this utility should be called when the table has had many updates, or after reorganizing the table. For a statistical view, this utility should be called when changes to underlying tables have substantially affected the rows returned by the view. The view must have been previously enabled for use in query optimization using the ALTER VIEW statement.

# Scope

This command can be issued from any database partition in the db2nodes.cfg file. It can be used to update the catalogs on the catalog database partition.

For tables, this command collects statistics for a table on the database partition from which it is invoked. If the table does not exist on that database partition, the first database partition in the database partition group is selected.

For views, this command collects statistics using data from tables on all participating database partitions.

# Authorization

For tables, one of the following:

- SYSADM
- SYSCTRL
- SYSMAINT
- DBADM
- SQLADM
- CONTROL privilege on the table
- · LOAD authority

You do not need any explicit privilege to use this command on any declared temporary table that exists within its connection.

For statistical views, one of the following:

- SYSADM
- SYSCTRL
- SYSMAINT
- DBADM
- SQLADM
- CONTROL privilege on the statistical view

# **Required connection**

## **Default Dist Option:**

## **Frequency Option:**

## **Quantile Option:**

## **Column Option:**

# **Command parameters**

## object-name

Identifies the table or statistical view on which statistics are to be collected. It must not be a hierarchy table. For typed tables, *object-name* must be the name of the root table of the table hierarchy. The fully qualified name or alias in the form: *schema.object-name* must be used. The schema is the user name under which the table was created.

## index-name

Identifies an existing index defined on the table. The fully qualified name in the form *schema.index-name* must be used. This option cannot be used for views.

## **USE PROFILE**

This option allows RUNSTATS to employ a previously stored statistics profile to gather statistics for a table or statistical view. The statistics profile is created using the **SET PROFILE** options and is updated using the **UPDATE PROFILE** options.

## **UNSET PROFILE**

Specify this option to remove an existing statistics profile. For example, RUNSTATS ON tablemyschema.mytable UNSET PROFILE

## FOR INDEXES

Collects and updates statistics for the indexes only. If no table statistics had been previously collected on the table, basic table statistics are also collected. These basic statistics do not include any distribution statistics. This option cannot be used for views.

## AND INDEXES

Collects and updates statistics for both the table and the indexes. This option cannot be used for views.

## DETAILED

Calculates extended index statistics. These are the CLUSTERFACTOR and PAGE\_FETCH\_PAIRS statistics that are gathered for relatively large indexes. This option cannot be used for views.

## SAMPLED

This option, when used with the **DETAILED** option, allows RUNSTATS to employ a CPU sampling technique when compiling the extended index statistics. If the option is not specified, every entry in the index is examined to compute the extended index statistics. This option cannot be used for views.

## ON ALL COLUMNS

To collect statistics on all eligible columns, use the **ON ALL COLUMNS** clause. Columns can be specified either for basic statistics collection (On Cols clause) or in conjunction with the **WITH DISTRIBUTION** clause (On Dist Cols clause). The **ON ALL COLUMNS** specification is the default option if neither of the column specific clauses are specified.

If it is specified in the On Cols clause, all columns will have only basic column statistics collected unless specific columns are chosen as part of the **WITH DISTRIBUTION** clause. Those columns specified as part of the **WITH DISTRIBUTION** clause will also have basic and distribution statistics collected.

If the **WITH DISTRIBUTION ON ALL COLUMNS** is specified both basic statistics and distribution statistics are collected for all eligible columns. Anything specified in the 0n Cols clause is redundant and therefore not necessary.

## **ON COLUMNS**

This clause allows the user to specify a list of columns for which to collect statistics. If you specify group of columns, the number of distinct values for the group will be collected. When you run RUNSTATS on a table without gathering index statistics, and specify a subset of columns for which statistics are to be gathered, then:

- 1. Statistics for columns not specified in the RUNSTATS command but which are the first column in an index are NOT reset.
- 2. Statistics for all other columns not specified in the RUNSTATS command are reset.

This clause can be used in the On Cols clause and the On Dist Cols clause. Collecting distribution statistics for a group of columns is not currently supported.

If XML type columns are specified in a column group, the XML type columns will be ignored for the purpose of collecting distinct values for the group. However, basic XML column statistics will be collected for the XML type columns in the column group.

## EXCLUDING XML COLUMNS

This clause allows you to omit all XML type columns from statistics collection. This clause facilitates the collection of statistics on non-XML columns because the inclusion of XML data can require greater system resources. The **EXCLUDING XML COLUMNS** clause takes precedence over other clauses that specify XML columns for statistics collection. For example, if you use the **EXCLUDING XML COLUMNS** clause, and you also specify XML type columns with the **ON COLUMNS** clause or you use the **ON ALL COLUMNS** clause, all XML type columns will be ignored during statistics collection. For DB2 V9.7 Fix Pack 1 and later releases, distribution statistics over XML type columns are not collected when this clause is specified.

## ON KEY COLUMNS

Instead of listing specific columns, you can choose to collect statistics on columns that make up all the indexes defined on the table. It is assumed here that critical columns in queries are also those used to create indexes on the table. If there are no indexes on the table, it is as good as an empty list and no column statistics will be collected. It can be used in the 0n Cols clause or the 0n Dist Cols clause. It is redundant in the 0n Cols clause if specified in both clauses since the **WITH DISTRIBUTION** clause is used to specify collection of both basic and distribution statistics. XML type columns are by definition not a key column and will not be included for statistics collection by the **ON KEY COLUMNS** clause. This option cannot be used for views.

#### column-name

Name of a column in the table or statistical view. If you specify the name

of an ineligible column for statistics collection, such as a nonexistent column or a mistyped column name, error (-205) is returned. Two lists of columns can be specified, one without distribution and one with distribution. If the column is specified in the list that is not associated with the **WITH DISTRIBUTION** clause only basic column statistics will be collected. If the column appears in both lists, distribution statistics will be collected (unless **NUM\_FREQVALUES** and **NUM\_QUANTILES** are set to zero).

## NUM\_FREQVALUES

Defines the maximum number of frequency values to collect. It can be specified for an individual column in the **ON COLUMNS** clause. If the value is not specified for an individual column, the frequency limit value will be picked up from that specified in the **DEFAULT** clause. If it is not specified there either, the maximum number of frequency values to be collected will be what is set in the **num\_freqvalues** database configuration parameter.

#### NUM\_QUANTILES

Defines the maximum number of distribution quantile values to collect. It can be specified for an individual column in the **ON COLUMNS** clause. If the value is not specified for an individual column, the quantile limit value will be picked up from that specified in the **DEFAULT** clause. If it is not specified there either, the maximum number of quantile values to be collected will be what is set in the **num\_quantiles** database configuration parameter.

For DB2 V9.7 Fix Pack 1 and later releases, distribution statistics for each index over XML data uses a maximum of 250 quantiles as the default. The default can be changed by specifying the **NUM\_QUANTILES** parameter in the **ON COLUMNS** or the **DEFAULT** clause. The **num\_quantiles** database configuration parameter is ignored while collecting XML distribution statistics.

## WITH DISTRIBUTION

This clause specifies that both basic statistics and distribution statistics are to be collected on the columns. If the **ON COLUMNS** clause is not specified, distribution statistics are collected on all the columns of the table or statistical view (excluding columns that are ineligible such as CLOB and LONG VARCHAR). If the **ON COLUMNS** clause is specified, distribution statistics are collected only on the column list provided (excluding those ineligible for statistics collection). If the clause is not specified, only basic statistics are collected.

Collection of distribution statistics on column groups is currently not supported; distribution statistics will not be collected when column groups are specified in the **WITH DISTRIBUTION ON COLUMNS** clause.

## DEFAULT

If **NUM\_FREQVALUES** or **NUM\_QUANTILES** are specified, these values will be used to determine the maximum number of frequency and quantile statistics to be collected for the columns, if these are not specified for individual columns in the **ON COLUMNS** clause. If the **DEFAULT** clause is not specified, the values used will be those in the corresponding database configuration parameters.

## LIKE STATISTICS

When this option is specified additional column statistics are collected. These statistics are the SUB\_COUNT and the SUB\_DELIM\_LENGTH statistics in

SYSSTAT.COLUMNS. The statistics are collected for columns of type CHAR and VARCHAR with a code page attribute of single-byte character set (SBCS), FOR BIT DATA, or UTF-8. They are used by the query optimizer to improve the selectivity estimates for predicates of the type "column LIKE '%xyz'" and "column LIKE '%xyz%'".

## ALLOW WRITE ACCESS

Specifies that other users can read from and write to the tables while statistics are calculated. For statistical views, these are the base tables referenced in the view definition.

The ALLOW WRITE ACCESS option is not recommended for tables that will have a lot of inserts, updates or deletes occurring concurrently. The RUNSTATS command first performs table statistics and then performs index statistics. Changes in the table's state between the time that the table and index statistics are collected might result in inconsistencies. Although having up-to-date statistics is important for the optimization of queries, it is also important to have consistent statistics. Therefore, statistics should be collected at a time when inserts, updates or deletes are at a minimum.

## ALLOW READ ACCESS

Specifies that other users can have read-only access to the tables while statistics are calculated. For statistical views, these are the base tables referenced in the view definition.

## TABLESAMPLE BERNOULLI

This option allows RUNSTATS to collect statistics on a sample of the rows from the table or statistical view. *Bernoulli sampling* considers each row individually, including that row with probability *P*/100 (where *P* is the value of numeric-literal) and excluding it with probability 1-*P*/100. Thus, if the numeric-literal were evaluated to be the value 10, representing a 10 percent sample, each row would be included with probability 0.1 and be excluded with probability 0.9. Unless the optional **REPEATABLE** clause is specified, each execution of RUNSTATS will usually yield a different such sample of the table. All data pages will be retrieved through a table scan but only the percentage of rows as specified through the numeric-literal parameter will be used for the statistics collection.

## TABLESAMPLE SYSTEM

This option allows RUNSTATS to collect statistics on a sample of the data pages from the tables. *System sampling* considers each page individually, including that page with probability P/100 (where P is the value of numeric-literal) and excluding it with probability 1-P/100. Unless the optional **REPEATABLE** clause is specified, each execution of RUNSTATS will usually yield a different such sample of the table. The size of the sample is controlled by the numeric-literal parameter in parentheses, representing an approximate percentage P of the table to be returned. Only a percentage of the data pages as specified through the numeric-literal parameter will be retrieved and used for the statistics collection.

On statistical views, system sampling is restricted to views whose definitions are a select over a single base table. If the view contains multiple tables, SYSTEM sampling is also possible if:

- the tables are joined using equality predicates on all the primary key and foreign key columns included in a referential integrity constraint defined between the tables,
- no search condition filters rows in any parent tables in the relationship, and

• a single child table, that is also not a parent table, can be identified among all the tables.

If the statistical view does not meet those conditions, Bernoulli sampling will be used instead and a warning will be returned (SQL2317W).

#### **REPEATABLE** (*integer-literal*)

Adding the **REPEATABLE** clause to the **TABLESAMPLE** clause ensures that repeated executions of RUNSTATS return the same sample. The *integer-literal* parameter is a non-negative integer representing the seed to be used in sampling. Passing a negative seed will result in an error (SQL1197N). The sample set might still vary between repeatable RUNSTATS invocations if activity against the table or statistical view resulted in changes to the table or statistical view data since the last time **TABLESAMPLE REPEATABLE** was run. Also, the method by which the sample was obtained as specified by the **BERNOULLI** or **SYSTEM** keyword, must also be the same to ensure consistent results.

#### numeric-literal

The numeric-literal parameter specifies the size of the sample to be obtained, as a percentage *P*. This value must be a positive number that is less than or equal to 100, and can be between 1 and 0. For example, a value of 0.01 represents one one-hundredth of a percent, such that 1 row in 10,000 would be sampled, on average. A value of 0 or 100 will be treated by the DB2 database system as if sampling was not specified, regardless of whether **TABLESAMPLE BERNOULLI** or **TABLESAMPLE SYSTEM** is specified. A value greater than 100 or less than 0 will be treated as an error (SQL1197N) by the DB2 database system.

#### SET PROFILE NONE

Specifies that no statistics profile will be set for this RUNSTATS invocation.

#### SET PROFILE

Allows RUNSTATS to generate and store a specific statistics profile in the system catalog tables and executes the RUNSTATS command options to gather statistics.

## SET PROFILE ONLY

Allows RUNSTATS to generate and store a specific statistics profile in the system catalog tables without running the RUNSTATS command options.

## **UPDATE PROFILE**

Allows RUNSTATS to modify an existing statistics profile in the system catalog tables, and runs the RUNSTATS command options of the updated statistics profile to gather statistics. You cannot use the UPDATE PROFILE option to remove clauses that are in a statistics profile.

## UPDATE PROFILE ONLY

Allows RUNSTATS to modify an existing statistics profile in the system catalog tables without running the RUNSTATS command options of the updated statistics profile. You cannot use the UPDATE PROFILE ONLY option to remove clauses that are in a statistics profile.

#### **UTIL\_IMPACT\_PRIORITY** priority

Specifies that RUNSTATS will be throttled at the level specified by *priority*. *priority* is a number in the range of 1 to 100, with 100 representing the highest priority and 1 representing the lowest. The priority specifies the amount of throttling to which the utility is subjected. All utilities at the same priority undergo the same amount of throttling, and utilities at lower priorities are throttled more than those at higher priorities. If *priority* is not

specified, the RUNSTATS will have the default priority of 50. Omitting the UTIL\_IMPACT\_PRIORITY keyword will invoke the RUNSTATS utility without throttling support. If the UTIL\_IMPACT\_PRIORITY keyword is specified, but the util\_impact\_lim configuration parameter is set to 100, then the utility will run unthrottled. This option cannot be used for views.

In a partitioned database, when used on tables, the RUNSTATS command collects the statistics on only a single database partition. If the database partition from which the RUNSTATS command is executed has a partition of the table, then the command executes on that database partition. Otherwise, the command executes on the first database partition in the database partition group across which the table is partitioned.

# **Examples**

1. Collect statistics on the table only, on all columns without distribution statistics:

RUNSTATS ON TABLE db2user.employee

**2**. Collect statistics on the table only, on columns empid and empname with distribution statistics:

RUNSTATS ON TABLE db2user.employee WITH DISTRIBUTION ON COLUMNS (empid, empname)

**3**. Collect statistics on the table only, on all columns with distribution statistics using a specified number of frequency limit for the table while picking the **num\_quantiles** from the configuration setting:

RUNSTATS ON TABLE db2user.employee WITH DISTRIBUTION DEFAULT NUM\_FREQVALUES 50

- Collect statistics on a set of indexes: RUNSTATS ON TABLE db2user.employee for indexes db2user.empl1, db2user.empl2
- Collect basic statistics on all indexes only: RUNSTATS ON TABLE db2user.employee FOR INDEXES ALL
- 6. Collect basic statistics on the table and all indexes using sampling for the detailed index statistics collection:

RUNSTATS ON TABLE db2user.employee AND SAMPLED DETAILED INDEXES ALL

7. Collect statistics on table, with distribution statistics on columns empid, empname and empdept and the two indexes Xempid and Xempname. Distribution statistics limits are set individually for empdept, while the other two columns use a common default:

RUNSTATS ON TABLE db2user.employee WITH DISTRIBUTION ON COLUMNS (empid, empname, empdept NUM\_FREQVALUES 50 NUM\_QUANTILES 100) DEFAULT NUM\_FREQVALUES 5 NUM\_QUANTILES 10 AND INDEXES db2user.Xempid, db2user.Xempname

- 8. Collect statistics on all columns used in indexes and on all indexes: RUNSTATS ON TABLE db2user.employee ON KEY COLUMNS AND INDEXES ALL
- 9. Collect statistics on all indexes and all columns without distribution except for one column. Consider T1 containing columns c1, c2, ...., c8

RUNSTATS ON TABLE db2user.T1 WITH DISTRIBUTION ON COLUMNS (c1, c2, c3 NUM\_FREQVALUES 20 NUM\_QUANTILES 40, c4, c5, c6, c7, c8) DEFAULT NUM\_FREQVALUES 0, NUM\_QUANTILES 0 AND INDEXES ALL

RUNSTATS ON TABLE db2user.T1 WITH DISTRIBUTION ON COLUMNS (c3 NUM\_FREQVALUES 20 NUM\_QUANTILES 40) AND INDEXES ALL **10**. Collect statistics on table T1 for the individual columns c1 and c5 as well as on the column combinations (c2, c3) and (c2, c4). Multicolumn cardinality is very useful to the query optimizer when it estimates filter factors for predicates on columns in which the data is correlated.

RUNSTATS ON TABLE db2user.T1 ON COLUMNS (c1, (c2, c3), (c2, c4), c5)

**11**. Collect statistics on table T1 for the individual columns c1 and c2. For column c1 also collect the LIKE predicate statistics.

```
RUNSTATS ON TABLE db2user.T1 ON COLUMNS (c1 LIKE STATISTICS, c2)
```

12. Register a statistics profile to collect statistics on the table only, on all columns with distribution statistics using a specified number of frequency limit for the table while picking the **num\_quantiles** from the configuration setting. The command also updates the statistics as specified.

RUNSTATS ON TABLE db2user.employee WITH DISTRIBUTION DEFAULT NUM\_FREQVALUES 50 SET PROFILE

13. Register a statistics profile to collect statistics on the table only, on all columns with distribution statistics using a specified number of frequency limit for the table while picking the num\_quantiles from the configuration setting. Statistics are not collected.

RUNSTATS ON TABLE db2user.employee WITH DISTRIBUTION DEFAULT NUM\_FREQVALUES 50 SET PROFILE ONLY

 Modify the previously registered statistics profile by changing the NUM\_FREQVALUES value from 50 to 30. The command also updates the statistics as specified.

RUNSTATS ON TABLE db2user.employee WITH DISTRIBUTION DEFAULT NUM\_FREQVALUES 30 UPDATE PROFILE

15. Modify the previously registered statistics profile by changing the **NUM\_FREQVALUES** value from 50 to 30. Statistics are not collected.

RUNSTATS ON TABLE db2user.employee WITH DISTRIBUTION DEFAULT NUM\_FREQVALUES 30 UPDATE PROFILE ONLY

16. Modify the previously registered statistics profile by adding column empl\_address and column group (empl\_title, empl\_salary) options. The command also updates the statistics as specified.

```
RUNSTATS ON TABLE db2user.employee
ON COLUMNS (empl_address, (empl_title, empl_salary))
UPDATE PROFILE
```

 Modify the previously registered statistics profile by adding column empl\_address and column group (empl\_title, empl\_salary) options. Statistics are not collected.

RUNSTATS ON TABLE db2user.employee ON COLUMNS (empl\_address, (empl\_title, empl\_salary)) UPDATE PROFILE ONLY

**18**. Collect statistics on a table using the options recorded in the statistics profile for that table:

RUNSTATS ON TABLE db2user.employee USE PROFILE

- 19. Query the RUNSTATS command options corresponding to the previously registered statistics profile stored in the catalogs of the table: SELECT STATISTICS\_PROFILE FROM SYSCAT.TABLES WHERE TABNAME = 'EMPLOYEE'
- 20. Collect statistics, including distribution statistics, on 30 percent of the rows: RUNSTATS ON TABLE db2user.employee WITH DISTRIBUTION TABLESAMPLE BERNOULLI(30)

**21.** To control the sample set on which statistics will be collected and to be able to repeatedly use the same sample set, you can do so as follows:

```
RUNSTATS ON TABLE db2user.employee WITH DISTRIBUTION
TABLESAMPLE BERNOULLI(30) REPEATABLE(4196)
```

Issuing the same statement as above will result in the same set of statistics as long as the data has not changed in the interim.

- 22. Collect index statistics as well as table statistics on 1.5 percent of the data pages. Only table data pages and not index pages are sampled. In this example 1.5 percent of table data pages are used for the collection of table statistics, while for index statistics all the index pages will be used: RUNSTATS ON TABLE db2user.employee AND INDEXES ALL TABLESAMPLE SYSTEM(1.5)
- **23**. Collect statistics for a statistical view, on all columns, without distribution statistics:

RUNSTATS ON TABLE salesdb.product\_sales\_view

24. Collect statistics for a statistical view, with distribution statistics on the columns category, type and product\_key. Distribution statistics limits are set for the category column, while the other columns use a common default: RUNSTATS ON TABLE salesdb.product\_sales\_view
RUNSTATS ON TABLE salesdb.product\_sales\_view

```
WITH DISTRIBUTION ON COLUMNS (category NUM_FREQVALUES 100 NUM_QUANTILES 100,
type, product_key) DEFAULT NUM_FREQVALUES 50 NUM_QUANTILES 50
```

- 25. Collect statistics, including distribution statistics, on 10 percent of the rows using row level sampling: RUNSTATS ON TABLE db2user.daily\_sales WITH DISTRIBUTION TABLESAMPLE BERNOULLI (10)
- 26. Collect statistics, including distribution statistics, on 2.5 percent of the rows using data page level sampling. Additionally, specify the repeated use of the same sample set. For this command to succeed, the query must be such that the DB2 database system can successfully push data page sampling down to one or more tables. Otherwise, an error (SQL 20288N) is issued.

RUNSTATS ON TABLE db2user.daily\_sales WITH DISTRIBUTION TABLESAMPLE SYSTEM (2.5)

**27**. Register a statistics profile to collect statistics on the view and on all columns with distribution statistics as specified:

RUNSTATS ON TABLE salesdb.product\_sales\_view WITH DISTRIBUTION DEFAULT NUM\_FREQVALUES 50 NUM\_QUANTILES 50 SET PROFILE

**28**. Modify the previously registered statistics profile. This command also updates the statistics as specified:

RUNSTATS ON TABLE salesdb.product\_sales\_view WITH DISTRIBUTION DEFAULT NUM\_FREQVALUES 25 NUM\_QUANTILES 25 UPDATE PROFILE

# **Usage notes**

1. When there are detached partitions on a partitioned table, index keys that still belong to detached data partitions which require cleanup will not be counted as part of the keys in the statistics. These keys are not counted because they are invisible and no longer part of the table. They will eventually get removed from the index by asynchronous index cleanup. As a result, statistics collected before asynchronous index cleanup is run will be misleading. If the RUNSTATS command is issued before asynchronous index cleanup completes, it will likely generate a false alarm for index reorganization or index cleanup based on the inaccurate statistics. Once asynchronous index cleanup is run, all
the index keys that still belong to detached data partitions which require cleanup will be removed and this may eliminate the need for index reorganization.

For partitioned tables, you are encouraged to issue the RUNSTATS command after an asynchronous index cleanup has completed in order to generate accurate index statistics in the presence of detached data partitions. To determine whether or not there are detached data partitions in the table, you can check the status field in the SYSCAT.DATAPARTITIONS catalog view and look for the value L (logically detached), I (index cleanup), or D (detached with dependent MQT).

The RUNSTATS command collects statistics for all index partitions of a partitioned index. Statistics in the SYSTAT.INDEXES view for the partitioned index represent an index partition, except for FIRSTKEYCARD, FIRST2KEYCARD, FIRST3KEYCARD, FIRST4KEYCARD, and FULLKEYCARD statistics. Because these statistics are used in cardinality estimates, they are for the entire index and not for an index partition. Distribution statistics (frequent values and quantiles) are not collected for partitioned indexes, but are gathered if RUNSTATS is run on the table. Statistics on the leading columns of a partitioned index might not be as accurate as statistics on the leading columns of a nonpartitioned index.

- 2. It is recommended to run the RUNSTATS command:
  - On tables that have been modified considerably (for example, if a large number of updates have been made, or if a significant amount of data has been inserted or deleted or if LOAD has been done without the statistics option during LOAD).
  - On tables that have been reorganized (using REORG, REDISTRIBUTE DATABASE PARTITION GROUP).
  - On tables which have been row compressed.
  - When a new index has been created.
  - Before binding applications whose performance is critical.
  - When the prefetch quantity is changed.
  - On statistical views whose underlying tables have been modified substantially so as to change the rows that are returned by the view.
  - After LOAD has been executed with the **STATISTICS** option, use the RUNSTATS utility to collect statistics on XML columns. Statistics for XML columns are never collected during LOAD, even when LOAD is executed with the **STATISTICS** option. When RUNSTATS is used to collect statistics for XML columns only, existing statistics for non-XML columns that have been collected by LOAD or a previous execution of the RUNSTATS utility are retained. In the case where statistics on some XML columns have been collected previously, the previously collected statistics for an XML column will either be dropped if no statistics on that XML column are collected by the current command.
- **3**. The options chosen must depend on the specific table and the application. In general:
  - If the table is a very critical table in critical queries, is relatively small, or does not change too much and there is not too much activity on the system itself, it might be worth spending the effort on collecting statistics in as much detail as possible.
  - If the time to collect statistics is limited, if the table is relatively large, or if the table is updated frequently, it might be beneficial to execute RUNSTATS

limited to the set of columns that are used in predicates. This way, you will be able to execute the RUNSTATS command more often.

- If time to collect statistics is very limited and the effort to tailor the RUNSTATS command on a table by table basis is a major issue, consider collecting statistics for the "KEY" columns only. It is assumed that the index contains the set of columns that are critical to the table and are most likely to appear in predicates.
- If time to collect statistics is very limited and table statistics are to be gathered, consider using the **TABLESAMPLE** option to collect statistics on a subset of the table data.
- If there are many indexes on the table and **DETAILED** (extended) information on the indexes might improve access plans, consider the **SAMPLED** option to reduce the time it takes to collect statistics.
- If there is skew in certain columns and predicates of the type "column = constant", it might be beneficial to specify a larger NUM\_FREQVALUES value for that column
- Collect distribution statistics for all columns that are used in equality predicates and for which the distribution of values might be skewed.
- For columns that have range predicates (for example "column >= constant", "column BETWEEN constant1 AND constant2") or of the type "column LIKE '%xyz'", it might be beneficial to specify a larger NUM\_QUANTILES value.
- If storage space is a concern and one cannot afford too much time on collecting statistics, do not specify high NUM\_FREQVALUES or NUM\_QUANTILES values for columns that are not used in predicates.
- If index statistics are requested, and statistics have never been run on the table containing the index, statistics on both the table and indexes are calculated.
- If statistics for XML columns in the table are not required, the **EXCLUDING XML COLUMNS** option can be used to exclude all XML columns. This option takes precedence over all other clauses that specify XML columns for statistics collection.
- 4. After the command is run note the following:
  - A COMMIT should be issued to release the locks.
  - To allow new access plans to be generated, the packages that reference the target table must be rebound.
  - Executing the command on portions of the table could result in inconsistencies as a result of activity on the table since the command was last issued. In this case a warning message is returned. Issuing RUNSTATS on the table only might make table and index level statistics inconsistent. For example, you might collect index level statistics on a table and later delete a significant number of rows from the table. If you then issue RUNSTATS on the table only, the table cardinality might be less than FIRSTKEYCARD, which is an inconsistency. In the same way, if you collect statistics on a new index when you create it, the table level statistics might be inconsistent.
- 5. The RUNSTATS command will drop previously collected distribution statistics if table statistics are requested. For example, RUNSTATS ON TABLE, or RUNSTATS ON TABLE ... AND INDEXES ALL will cause previously collected distribution statistics to be dropped. If the command is run on indexes only then previously collected distribution statistics are retained. For example, RUNSTATS ON TABLE ... FOR INDEXES ALL will cause the previously

collected distribution statistics to be retained. If the RUNSTATS command is run on XML columns only, then previously collected basic column statistics and distribution statistics are retained. In the case where statistics on some XML columns have been collected previously, the previously collected statistics for an XML column will either be dropped if no statistics on that XML column are collected by the current command, or be replaced if statistics on that XML column are collected by the current command.

- 6. For DB2 V9.7 Fix Pack 1 and later releases, distribution statistics are collected on indexes over XML data defined on an XML column. When the RUNSTATS command is run on a table with the **WITH DISTRIBUTION** clause, the following apply to the collection of distribution statistics on a column of type XML:
  - Distribution statistics are collected for each index over XML data specified on an XML column.
  - The RUNSTATS command must collect both distribution statistics and table statistics to collect distribution statistics for indexes over XML data defined on an XML column. Table statistics must be gathered in order for distribution statistics to be collected since XML distribution statistics are stored with table statistics.

An index clause is not required to collect XML distribution statistics. Specifying only an index clause does not collect XML distribution statistics By default, XML distribution statistics use a maximum of 250 quantiles for each index over XML data. When collecting distribution statistics on an XML column, you can change the maximum number of quantiles by specifying a value with **NUM\_QUANTILES** parameter in the **ON COLUMNS** or the **DEFAULT** clause.

- Distribution statistics are collected for indexes over XML data of type VARCHAR, DOUBLE, TIMESTAMP, and DATE. Distribution statistics are not collected over indexes of type VARCHAR HASHED.
- Distribution statistics are not collected for partitioned indexes over XML data defined on a partitioned table.
- 7. For range-clustered tables, there is a special system-generated index in the catalog tables which represents the range ordering property of range-clustered tables. When statistics are collected on this type of table, if the table is to be included as part of the statistics collection, statistics will also be collected for the system-generated index. The statistics reflect the fast access of the range lookups by representing the index as a two-level index with as many pages as the base data table, and having the base data clustered perfectly along the index order.
- 8. In the On Dist Cols clause of the command syntax, the Frequency Option and Quantile Option parameters are currently not supported for column GROUPS. These options are supported for single columns.
- 9. There are three prefetch statistics that cannot be computed when working in DMS mode. When looking at the index statistics in the index catalogs, you will see a -1 value for the following statistics:
  - AVERAGE\_SEQUENCE\_FETCH\_PAGES
  - AVERAGE SEQUENCE FETCH GAP
  - AVERAGE RANDOM FETCH PAGES
- 10. RUNSTATS sampling through **TABLESAMPLE** only occurs with table data pages and not index pages. When index statistics as well as sampling is requested, all the index pages are scanned for statistics collection. It is only in the collection of table statistics where **TABLESAMPLE** is applicable. However,

a more efficient collection of detailed index statistics is available through the **SAMPLED DETAILED** option. This is a different method of sampling than that employed by **TABLESAMPLE** and only applies to the detailed set of index statistics.

- 11. A statistics profile can be set or updated for the table or statistical view specified in the RUNSTATS command, by using the set profile or update profile options. The statistics profile is stored in a visible string format, which represents the RUNSTATS command, in the STATISTICS\_PROFILE column of the SYSCAT.TABLES system catalog table.
- 12. Statistics collection on XML type columns is governed by two DB2 database system registry values: DB2\_XML\_RUNSTATS\_PATHID\_K and DB2\_XML\_RUNSTATS\_PATHVALUE\_K. These two parameters are similar to the NUM\_FREQVALUES parameter in that they specify the number of frequency values to collect. If not set, a default of 200 will be used for both parameters.
- **13.** RUNSTATS acquires an IX table lock on SYSTABLES and a U lock on the row for the table on which statistics are being gathered at the beginning of RUNSTATS. Operations can still read from SYSTABLES including the row with the U lock. Write operations are also possible, providing they do not occur against the row with the U lock. However, another reader or writer will not be able acquire an S lock on SYSTABLES because of RUNSTATS' IX lock.
- 14. Statistics are not collected for columns with structured types. If they are specified, columns with these data types are ignored.
- **15**. Only AVGCOLLEN and NUMNULLS are collected for columns with LOB or LONG data types.
- **16.** AVGCOLLEN represents the average space in bytes when the column is stored in database memory or a temporary table. This value represents the length of the data descriptor for LOB or LONG data types, except when LOB data is inlined on the data page.

**Note:** The average space required to store the column on disk may be different than the value represented by this statistic.

# SET CLIENT

Specifies connection settings for the back-end process.

### Authorization

None

### **Required connection**

None

### **Command syntax**

ATTACH DBPARTITIONNUM—db-partition-number-

### **Command parameters**

### CONNECT

- 1 Specifies that a CONNECT statement is to be processed as a type 1 CONNECT.
- 2 Specifies that a CONNECT statement is to be processed as a type 2 CONNECT.

### DISCONNECT

### EXPLICIT

Specifies that only database connections that have been explicitly marked for release by the RELEASE statement are to be disconnected at commit.

#### CONDITIONAL

Specifies that the database connections that have been marked RELEASE or have no open WITH HOLD cursors are to be disconnected at commit.

### AUTOMATIC

Specifies that all database connections are to be disconnected at commit.

### **SQLRULES**

- **DB2** Specifies that a type 2 CONNECT is to be processed according to theDB2 rules.
- **STD** Specifies that a type 2 CONNECT is to be processed according to the Standard (STD) rules based on ISO/ANS SQL92.

### SYNCPOINT

Specifies how commits or rollbacks are to be coordinated among multiple database connections. This command parameter is ignored and is only included here for backward compatibility.

#### **ONEPHASE**

Specifies that no transaction manager (TM) is to be used to perform a two-phase commit. A one-phase commit is to be used to commit the work done by each database in multiple database transactions.

#### TWOPHASE

Specifies that the TM is required to coordinate two-phase commits among those databases that support this protocol.

#### NONE

Specifies that no TM is to be used to perform a two-phase commit, and does not enforce single updater, multiple reader. A COMMIT is sent to each participating database. The application is responsible for recovery if any of the commits fail.

#### CONNECT\_DBPARTITIONNUM (partitioned database environment only)

#### db-partition-number

Specifies the database partition to which a connect is to be made. A value between zero and 999, inclusive. Overrides the value of the environment variable DB2NODE.

### CATALOG\_DBPARTITIONNUM

Specifying this value permits the client to connect to the catalog database partition of the database without knowing the identity of that database partition in advance.

# ATTACH\_DBPARTITIONNUM *db-partition-number* (partitioned database environment only)

Specifies the database partition to which an attach is to be made. A value between zero and 999, inclusive. Overrides the value of the environment variable DB2NODE.

For example, if database partitions 1, 2, and 3 are defined, the client only needs to be able to access one of these database partitions. If only database partition 1 containing databases has been cataloged, and this parameter is set to 3, then the next attach attempt will result in an attachment at database partition 3, after an initial attachment at database partition 1.

### **Examples**

To set specific values:

db2 set client connect 2 disconnect automatic sqlrules std syncpoint twophase

To change SQLRULES back to DB2, but keep the other settings: db2 set client sqlrules db2 The connection settings revert to default values after the TERMINATE command is issued.

### Usage notes

SET CLIENT cannot be issued if one or more connections are active.

If SET CLIENT is successful, the connections in the subsequent units of work will use the connection settings specified. If SET CLIENT is unsuccessful, the connection settings of the back-end process are unchanged.

In a partitioned database environment, the connection settings could have an impact on acquiring trusted connections. For example, if the CONNECT\_DBPARTITIONNUM option is set to a node such that the establishment of a connection on that node requires going through an intermediate node (a hop node), it is the IP address of that intermediate node and the communication protocol used to communicate between the hop node and the connection node that are considered when evaluating this connection in order to determine whether or not it can be marked as a trusted connection. In other words, it is not the original node from which the connection was initiated that is considered. Rather, it is the hop node that is considered.

### Compatibilities

For compatibility with versions earlier than Version 8:

- The keyword CONNECT\_NODE can be substituted for CONNECT\_DBPARTITIONNUM.
- The keyword CATALOG\_NODE can be substituted for CATALOG\_DBPARTITIONNUM.
- The keyword ATTACH\_NODE can be substituted for ATTACH\_DBPARTITIONNUM.

# SET RUNTIME DEGREE

Sets the maximum run time degree of intra-partition parallelism for SQL statements for specified active applications.

### Scope

This command affects all database partitions that are listed in the \$HOME/sqllib/db2nodes.cfg file.

### Authorization

One of the following:

- sysadm
- sysctrl

### **Required connection**

Instance. To change the maximum run time degree of intra-partition parallelism on a remote server, it is first necessary to attach to that server. If no attachment exists, the SET RUNTIME DEGREE command fails.

### Command syntax

### **Command parameters**

#### FOR

ALL The specified degree will apply to all applications.

application-handle

Specifies the agent to which the new degree applies. List the values using the LIST APPLICATIONS command.

**TO** degree

The maximum run time degree of intra-partition parallelism.

### **Examples**

The following example sets the maximum run time degree of parallelism for two users, with *application-handle* values of 41408 and 55458, to 4:

db2 SET RUNTIME DEGREE FOR ( 41408, 55458 ) TO 4

### Usage notes

This command provides a mechanism to modify the maximum degree of parallelism for active applications. It can be used to override the value that was determined at SQL statement compilation time.

The run time degree of intra-partition parallelism specifies the maximum number of parallel operations that will be used when the statement is executed. The degree of intra-partition parallelism for an SQL statement can be specified at statement compilation time using the CURRENT DEGREE special register or the DEGREE bind option. The maximum run time degree of intra-partition parallelism for an active application can be specified using the SET RUNTIME DEGREE command. The *max\_querydegree* database manager configuration parameter specifies the maximum run time degree for any SQL statement executing on this instance of the database manager.

The actual run time degree will be the lowest of:

- the **max\_querydegree** configuration parameter
- the application run time degree
- the SQL statement compilation degree.

## SET SERVEROUTPUT

Specifies whether output from the DBMS\_OUTPUT message buffer is redirected to standard output.

#### Authorization

EXECUTE privilege on the DBMS\_OUTPUT module.

### **Required connection**

Database

### Command syntax

► SET SERVEROUTPUT ON

### Command parameters

#### ON

Specifies that messages in the message buffer are redirected to standard output.

#### OFF

Specifies that messages in the message buffer are not redirected to standard output.

#### Examples

To redirect messages in the DBMS\_OUTPUT message buffer to standard output, specify SET SERVEROUTPUT ON. In this example, the PUT procedure adds partial lines to the DBMS\_OUTPUT message buffer. When proc1 runs, because SET SERVEROUTPUT ON is specified, the text stored in the DBMS\_OUTPUT message buffer is displayed.

SET SERVEROUTPUT ON@

```
DROP PROCEDURE proc1@
CREATE PROCEDURE proc1()
BEGIN
 CALL DBMS_OUTPUT.PUT( 'p1 = ' || p1 );
CALL DBMS_OUTPUT.PUT( 'p2 = ' || p2 );
  CALL DBMS_OUTPUT.NEW_LINE;
END@
CALL proc1( 10, 'Peter' )@
SET SERVEROUTPUT OFF@
This example results in the following output:
SET SERVEROUTPUT ON
DB20000I The SET SERVEROUTPUT command completed successfully.
DROP PROCEDURE PROC1
DB20000I The SQL command completed successfully.
CREATE PROCEDURE proc1()
BEGIN
  CALL DBMS OUTPUT.PUT( 'p1 = ' || p1 );
```

```
CALL DBMS_OUTPUT.PUT( 'p2 = ' || p2 );

CALL DBMS_OUTPUT.NEW_LINE;

END@

DB20000I The SQL command completed successfully.

CALL proc1( 10, 'Peter' )@

Return Status = 0

p1 = 10

p2 = Peter

SET SERVEROUTPUT OFF

DB20000I The SET SERVEROUTPUT command completed successfully.
```

### **Usage notes**

Messages are added to the DBMS\_OUTPUT message buffer by the PUT, PUT\_LINE, and NEW\_LINE procedures.

When the command SET SERVEROUTPUT ON executes, it calls the DBMS\_OUTPUT.ENABLE procedure with the default buffer size of 20000 bytes and sets an internal flag in the client application. When this flag is enabled, the client application calls the GET\_LINES procedure after executing each SELECT or CALL statement, and redirects the messages from the message buffer to standard output. To increase the DBMS\_OUTPUT buffer size, call DBMS\_OUTPUT.ENABLE procedure with a larger buffer size after executing SET SERVER OUTPUT ON, for example: CALL DBMS\_OUTPUT.ENABLE( 50000 );

When the command SET SERVEROUTPUT OFF executes: it calls the DBMS\_OUTPUT.DISABLE procedure, messages that are in the message buffer are discarded, and calls to PUT, PUT\_LINE, and NEW\_LINE procedures are ignored. The DBMS\_OUTPUT.GET\_LINES procedure will not be called after each SELECT or CALL statement.

# SET TABLESPACE CONTAINERS

A *redirected restore* is a restore in which the set of table space containers for the restored database is different from the set of containers for the original database at the time the backup was done. This command permits the addition, change, or removal of table space containers for a database that is to be restored. If, for example, one or more containers become inaccessible for any reason, the restore fails if it is not redirected to different containers.

This command can be used to convert existing regular or large database managed table spaces to use automatic storage. It can also be used to re-stripe existing automatic storage table spaces more evenly over the storage paths available to the database.

### Authorization

One of the following:

- sysadm
- sysctrl

### **Required connection**

Database

### **Command syntax**

►►—SET TABLESPACE CONTAINERS FOR—tablespace-id

### **Command parameters**

#### **FOR** *tablespace-id*

An integer that uniquely represents a table space used by the database being restored.

#### **REPLAY ROLLFORWARD CONTAINER OPERATIONS**

Specifies that any ALTER TABLESPACE operation issued against this table space since the database was backed up is to be redone during a subsequent roll forward of the database.

#### IGNORE ROLLFORWARD CONTAINER OPERATIONS

Specifies that ALTER TABLESPACE operations in the log are to be ignored when performing a roll forward.

#### USING PATH "container-string"

For an SMS table space, identifies one or more containers that will belong to the table space and into which the table space data will be stored. It is an absolute or relative directory name. If the directory name is not absolute, it is relative to the database directory. The string cannot exceed 240 bytes in length.

### **USING FILE** | **DEVICE** "container-string" number-of-pages

For a DMS table space, identifies one or more containers that will belong to the table space and into which the table space data will be stored. The container type (either FILE or DEVICE) and its size are specified. A mixture of file and device containers can be specified. The string cannot exceed 254 bytes in length.

For a file container, the string must be an absolute or relative file name. If the file name is not absolute, it is relative to the database directory.

For a device container, the string must be a device name. The device must already exist.

#### USING AUTOMATIC STORAGE

Specifies that the table space should be converted to use automatic storage and that the database will create new containers on its available storage paths. Once a table space has been redirected to use automatic storage, no container operations can be applied to the table space.

This option can be used to provide better striping across existing storage paths by redefining the containers of table spaces that are already managed by automatic storage.

Note: The table space will be offline while being restored.

This option is not supported for system managed table spaces.

### Examples

See the example in RESTORE DATABASE.

### Usage notes

A backup of a database, or one or more table spaces, keeps a record of all the table space containers in use by the table spaces being backed up. During a restore, all containers listed in the backup are checked to see if they currently exist and are accessible. If one or more of the containers is inaccessible for any reason, the restore will fail. In order to allow a restore in such a case, the redirecting of table space containers is supported during the restore. This support includes adding, changing, or removing of table space containers. It is this command that allows the user to add, change or remove those containers.

The IGNORE/REPLAY ROLLFORWARD CONTAINER OPERATIONS option is ignored when specified with the USING AUTOMATIC STORAGE option.

A redirected restore of a table space in a multi-partition environment using the USING AUTOMATIC STORAGE option of the SET TABLESPACE CONTAINERS

### SET TABLESPACE CONTAINERS

command will only convert the table space to automatic storage on the partition being restored. It will not redefine the containers on any other database partition.

**Note:** By not redefining the containers on other database partitions, the definition of the table space differs on each partition. Later, when adding a database partition, use the ADD DBPARTITIONNUM command with the LIKE DBPARTITIONNUM option. Depending on the database partition chosen in this option, the new database partition will have either the table space defined with automatic storage or the table space defined without automatic storage. To remove both the inconsistency in the definitions of the table spaces and the need to decide between the definition is the same on all database partitions. For example, if all of the database partitions were subject to a redirected restore followed by using the USING AUTOMATIC STORAGE option of the SET TABLESPACE CONTAINERS command, then the table space will be converted to automatic storage on all the database partitions. Adding another database partition later will have the same definition for the table space as that found on the other database partitions.

# SET TAPE POSITION

Sets the positions of tapes for backup and restore operations to streaming tape devices. This command is only supported on Windows operating systems.

### Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

### **Required connection**

None

### **Command syntax**

►►—SET	TAPE	POSITION-		-TO—position—	
			—ON—device—		

### **Command parameters**

**ON** device

Specifies a valid tape device name. The default value is \\.\TAPE0.

**TO** position

Specifies the mark at which the tape is to be positioned. DB2 for Windows writes a tape mark after every backup image. A value of 1 specifies the first position, 2 specifies the second position, and so on. If the tape is positioned at tape mark 1, for example, archive 2 is positioned to be restored.

# SET UTIL\_IMPACT\_PRIORITY

Changes the impact setting for a running utility. Using this command, you can:

- · throttle a utility that was invoked in unthrottled mode
- unthrottle a throttled utility (disable throttling)
- reprioritize a throttled utility (useful if running multiple simultaneous throttled utilities)

#### Scope

### Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

### **Required connection**

Instance. If there is more than one partition on the local machine, the attachment should be made to the correct partition. For example, suppose there are two partitions and a LIST UTILITIES command resulted in the following output:

```
ID = 2
Type = BACKUP
Database Name = IWZ
Partition Number = 1
Description = online db
Start Time = 07/19/2007 17:32:09.622395
State = Executing
Invocation Type = User
Throttling:
Priority = Unthrottled
Progress Monitoring:
Estimated Percentage Complete = 10
Total Work = 97867649689 bytes
Completed Work = 10124388481 bytes
```

The instance attachment must be made to partition 1 in order to issue a SET UTIL\_IMPACT\_PRIORITY command against the utility with ID 2. To do this, set DB2NODE=1 in the environment and then issue the instance attachment command.

### Command syntax

►►—SET UTIL IMPACT PRIORITY FOR—utility-id—TO—priority—

### **Command parameters**

#### utility-id

ID of the utility whose impact setting will be updated. IDs of running utilities can be obtained with the LIST UTILITIES command.

#### **TO** priority

Specifies an instance-level limit on the impact associated with running a

utility. A value of 100 represents the highest priority and 1 represents the lowest priority. Setting *priority* to 0 will force a throttled utility to continue unthrottled. Setting *priority* to a non-zero value will force an unthrottled utility to continue in throttled mode.

### Examples

The following example unthrottles the utility with ID 2.

SET UTIL\_IMPACT\_PRIORITY FOR 2 TO 0

The following example throttles the utility with ID 3 to priority 10. If the priority was 0 before the change then a previously unthrottled utility is now throttled. If the utility was previously throttled (priority had been set to a value greater than zero), then the utility has been reprioritized.

SET UTIL\_IMPACT\_PRIORITY FOR 3 TO 10

# Relationship between UTIL\_IMPACT\_LIM and UTIL\_IMPACT\_PRIORITY settings

The database manager configuration parameter **util\_impact\_lim** sets the limit on the impact throttled utilities can have on the overall workload of the machine. 0-99 is a throttled percentage, 100 is no throttling.

The SET UTIL\_IMPACT\_PRIORITY command sets the priority that a particular utility has over the resources available to throttled utilities as defined by the **util\_impact\_lim** configuration parameter. (0 = unthrottled)

Using the backup utility as an example, if the **util\_impact\_lim**=10, all utilities can have no more than a 10% average impact upon the total workload as judged by the throttling algorithm. Using two throttled utilities as an example:

- Backup with util\_impact\_priority 70
- Runstats with util\_impact\_priority 50

Both utilities combined should have no more than a 10% average impact on the total workload, and the utility with the higher priority will get more of the available workload resources. For both the backup and runstats operations, it is also possible to declare the impact priority within the command line of that utility. If you do not issue the SET UTIL\_IMPACT\_PRIORITY command, the utility will run unthrottled (irrespective of the setting of **util\_impact\_lim**).

To view the current priority setting for the utilities that are running, you can use the LIST UTILITIES command.

### Usage notes

Throttling requires having an impact policy defined by setting the **util\_impact\_lim** configuration parameter.

# SET WORKLOAD

Specifies the workload to which the database connection is to be assigned. This command can be issued prior to connecting to a database or it can be used to reassign the current connection once the connection has been established. If the connection has been established, the workload reassignment will be performed at the beginning of the next unit of work.

### Authorization

None, but see usage notes

### **Required connection**

None

#### Command syntax

► SET WORKLOAD TO SYSDEFAULTADMWORKLOAD

### **Command parameters**

#### AUTOMATIC

Specifies that the database connection will be assigned to a workload chosen by the workload evaluation that is performed automatically by the server.

#### SYSDEFAULTADMWORKLOAD

Specifies that the database connection will be assigned to the SYSDEFAULTADMWORKLOAD, allowing users with *accessctrl*, *dataaccess*, *wlmadm*, *secadm* or *dbadm* authority to bypass the normal workload evaluation.

#### Examples

To assign the connection to the SYSDEFAULTADMWORKLOAD: SET WORKLOAD TO SYSDEFAULTADMWORKLOAD

To reset the workload assignment so that it uses the workload that is chosen by the workload evaluation performed by the server: SET WORKLOAD TO AUTOMATIC

### Usage notes

If the session authorization ID of the database connection does not have *accessctrl*, *dataaccess*, *wlmadm*, *secadm* or *dbadm* authority, the connection cannot be assigned to the SYSDEFAULTADMWORKLOAD and an SQL0552N error will be returned. If the SET WORKLOAD TO SYSDEFAULTADMWORKLOAD command is issued prior to connecting to a database, the SQL0552N error will be returned after the database connection has been established, at the beginning of the first unit of work. If the command is issued when the database connection has been established, the SQL0552N error will be returned at the beginning of the next unit of work, when the workload reassignment is supposed to take place.

## SET WRITE

The SET WRITE command allows a user to suspend I/O writes or to resume I/O writes for a database. Typical use of this command is for splitting a mirrored database. This type of mirroring is achieved through a disk storage system.

This new state, SUSPEND\_WRITE, is visible from the Snapshot Monitor. All table spaces must be in a NORMAL state for the command to execute successfully. If any one table space is in a state other than NORMAL, the command will fail.

### Scope

This command only affects the database partition on which it is executed.

### Authorization

This command only affect the node on which it is executed. The authorization of this command requires the issuer to have one of the following privileges:

- sysadm
- sysctrl
- sysmaint

### **Required Connection**

Database

### **Command Syntax**

### **Command Parameters**

#### **SUSPEND**

Suspending I/O writes will put all table spaces into a new state SUSPEND\_WRITE state. Writes to the logs are also suspended by this command. All database operations, apart from online backup and restore, should function normally while database writes are suspended. However, some operations can wait while attempting to flush dirty pages from the buffer pool or log buffers to the logs. These operations will resume normally once the database writes are resumed.

#### RESUME

Resuming I/O writes will remove the SUSPEND\_WRITE state from all of the table spaces and make the table spaces available for update.

### Usage notes

It is suggested that I/O writes be resumed from the same connection from which they were suspended. Ensuring that this connection is available to resume I/O writes involves not performing any operations from this connection until database writes are resumed. Otherwise, some operations can wait for I/O writes to be resumed if dirty pages must be flushed from the buffer pool or from log buffers to the logs. Furthermore, subsequent connection attempts might hang if they require flushing dirty pages from the buffer pool to disk. Subsequent connections will complete successfully once database I/O resumes. If your connection attempts are hanging, and it has become impossible to resume I/O from the connection that you used to suspend I/O, then you will have to run the RESTART DATABASE command with the WRITE RESUME option. When used in this circumstance, the RESTART DATABASE command will resume I/O writes without performing crash recovery. The RESTART DATABASE command with the WRITE RESUME option will only perform crash recovery when you use it after a database crash.

# START DATABASE MANAGER

Starts the current database manager instance background processes on a single database partition or on all the database partitions defined in a multi-partitioned database environment.

This command is not valid on a client.

### Scope

In a multi-partitioned database environment, this command affects all database partitions that are listed in the \$HOME/sqllib/db2nodes.cfg file, unless the DBPARTITIONNUM parameter is used.

### Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint

The ADD DBPARTITIONNUM start option requires either *sysadm* or *sysctrl* authority.

You must meet Windows operating system requirements for starting a service. If Extended Security is disabled, you must be a member of the Administrators, Server Operators or Power Users group. If Extended Security is enabled, you must be a member of either the Administrators group or the DB2ADMNS group to start the database.

### **Required connection**

None

### **Command syntax**

### START DATABASE MANAGER

DBPARTITIONNUM—db	<i>partition-number</i> start options
remote options:	
ADMINNODE—nodence HOSTNAME—hostnam	me——USER—username—USING—password————————————————————————————————————
start options:	
-ADD DBPARTITIONNU -STANDALONE -RESTART	M—  add dbpartitionnum options
add dbpartitionnum —HOSTNAME—hostname-	options: —PORT—logical-port—COMPUTER—computer-name
USER—username—	PASSWORD—password— NETNAME—netname—
LIKE DBPARTITIONNU	IM—db-partition-number—
restart options:	
HOSTNAME—hostnam	nePORTlogical-portCOMPUTERcomputername
•	

### **Command parameters**

- /D Allows the DB2 product installation on Windows to be run as a process.
- **REMOTE** [INSTANCE] instancename

Specifies the name of the remote instance you want to start.

#### **ADMINNODE** *nodename*

With REMOTE, or REMOTE INSTANCE, specifies the name of the administration node.

#### **HOSTNAME** *hostname*

With REMOTE, or REMOTE INSTANCE, specifies the name of the host node.

#### **USER** username

With REMOTE, or REMOTE INSTANCE, specifies the name of the user.

#### **USING** *password*

With REMOTE, or REMOTE INSTANCE, and USER, specifies the password of the user.

#### ADMIN MODE

Starts the instance in quiesced mode for administration purposes. This is equivalent to the QUIESCE INSTANCE command except in this case the instance is not already "up", and therefore there is no need to force the connections OFF.

If the **ADMIN MODE** option is specified alone, the databases within the quiesced instance will be activated to do authorization checking for all connect attempts to the database. This is necessary to determine if the connecting user ID has *dbadm* authority; this authority is stored in the database catalog and the database must be activated to determine if the user ID has it. To prevent this authorization checking from happening, specify the **RESTRICTED ACCESS** option.

#### **USER** username

With ADMIN MODE, specifies the name of the user.

**GROUP** groupname

With ADMIN MODE, specifies the name of the group.

#### **RESTRICTED ACCESS**

Specify this option to prevent authorization checking for all connect attempts to the databases of a quiesced instance to determine if the user ID has *dbadm* authority. Instance-level authorization checking can still occur; checking a user ID for *sysadm*, *sysctrl*, or *sysmaint* authority does not require a database to be activated.

**Note:** This command option is available in DB2 Version 9.7 Fix Pack 2 and later fix packs.

All of the following parameters are valid in an Enterprise Server Edition (ESE) environment only.

#### **PROFILE** *profile*

Specifies the name of the profile file to be executed at each database partition to define the DB2 environment. This file is executed before the database partitions are started. The profile file must reside in the sqllib directory of the instance owner. The environment variables in the profile file are not necessarily all defined in the user session.

#### **DBPARTITIONNUM** *db-partition-number*

Specifies the database partition to be started. If no other options are specified, a normal startup is done at this database partition.

Valid values are from 0 to 999 inclusive. If ADD DBPARTITIONNUM is not specified, the value must already exist in the db2nodes.cfg file of the instance owner. If no database partition number is specified, all database partitions defined in the configuration file are started.

#### ADD DBPARTITIONNUM

Specifies that the new database partition server is added to the db2nodes.cfg file of the instance owner with the *hostname* and *logical-port* values.

Ensure that the combination of *hostname* and *logical-port* is unique.

### START DATABASE MANAGER

The add database partition server utility is executed internally to create all existing databases on the database server partition being added. The new database partition server is automatically added to the db2nodes.cfg file.

**Note:** Any uncataloged database is not recognized when adding a new database partition. The uncataloged database will not be present on the new database partition. An attempt to connect to the database on the new database partition returns the error message SQL1013N.

If the ADD request is made in an environment that has two or more active database partition servers, the new database partition server is visible to the environment when the ADD processing completes.

If the ADD request is made in an environment that has one database partition server and it is active, after ADD processing completes, the new database partition server is inactive. The instance must be restarted by using db2stop and db2start before the new database partition server can participate in the partitioned database environment. If the ADD request is made in an environment that has one database partition server and it is inactive, after ADD processing completes, the new database partition server (or servers, if more than one is added) is active. Only the original database partition server needs to be started.

A newly added database partition is configured during ADD processing as follows:

- 1. In a multipartition environment, the new database partition is configured using the database configuration parameter values from a noncatalog database partition.
- 2. In a single-partition environment, the new database partition is configured using the database configuration parameter values from the catalog partition.
- **3**. If a problem occurs in copying the database configuration parameter values to the new database partition, the new database partition is configured using the default database configuration parameter values.

#### **HOSTNAME** *hostname*

With ADD DBPARTITIONNUM, specifies the host name to be added to the db2nodes.cfg file.

#### **PORT** logical-port

With ADD DBPARTITIONNUM, specifies the logical port to be added to the db2nodes.cfg file. Valid values are from 0 to 999.

#### **COMPUTER** computername

The computer name for the machine on which the new database partition is created. This parameter is mandatory on Windows, but is ignored on other operating systems.

#### **USER** username

The user name for the account on the new database partition. This parameter is mandatory on Windows, but is ignored on other operating systems.

#### **PASSWORD** password

The password for the account on the new database partition. This parameter is mandatory on Windows, but is ignored on other operating systems.

#### **NETNAME** *netname*

Specifies the *netname* to be added to the db2nodes.cfg file. If not specified, this parameter defaults to the value specified for *hostname*.

#### LIKE DBPARTITIONNUM db-partition-number

Specifies that the containers for the system temporary table spaces will be the same as the containers on the specified *db-partition-number* for each database in the instance. The database partition specified must be a database partition that is already in the db2nodes.cfg file. For system temporary table spaces that are defined to use automatic storage (in other words, system temporary table spaces that were created with the MANAGED BY AUTOMATIC STORAGE clause of the CREATE TABLESPACE statement or where no MANAGED BY CLAUSE was specified at all), the containers will not necessarily match those from the partition specified. Instead, containers will automatically be assigned by the database manager based on the storage paths that are associated with the database. This may or may not result in the same containers being used on these two partitions.

#### WITHOUT TABLESPACES

Specifies that containers for the system temporary table spaces are not created for any of the databases. The ALTER TABLESPACE statement must be used to add system temporary table space containers to each database before the database can be used. This option is ignored for system temporary table spaces that are defined to use automatic storage (in other words, system temporary table spaces that were created with the MANAGED BY AUTOMATIC STORAGE clause of the CREATE TABLESPACE statement or where no MANAGED BY CLAUSE was specified at all). For these table spaces, there is no way to defer container creation. Containers will automatically be assigned by the database manager based on the storage paths that are associated with the database.

#### STANDALONE

Specifies that the database partition is to be started in stand-alone mode. FCM does not attempt to establish a connection to any other database partition. This option is used when adding a database partition.

#### RESTART

Starts the database manager after a failure. Other database partitions are still operating, and this database partition attempts to connect to the others. If neither the *hostname* nor the *logical-port* parameter is specified, the database manager is restarted using the *hostname* and *logical-port* values specified in db2nodes.cfg. If either parameter is specified, the new values are sent to the other database partitions when a connection is established. The db2nodes.cfg file is updated with this information.

#### **HOSTNAME** *hostname*

You can use the HOSTNAME option with the RESTART parameter to restart a database partition on a different machine than is specified in the database partition configuration file, db2nodes.cfg.

#### **Restriction:**

When you are using the DB2 High Availability Feature, you should not use the HOSTNAME option with the RESTART parameter to restart a database partition on a different machine. To restart or move a database partition from one machine in a cluster to another machine, use DB2 High Availability Instance Configuration Utility (db2haicu).

#### **PORT** logical-port

With RESTART, specifies the logical port number to be used to override that in the database partition configuration file. If not specified, this parameter defaults to the *logical-port* value that corresponds to the *num* value in the db2nodes.cfg file. Valid values are from 0 to 999.

#### **COMPUTER** computername

The computer name for the machine on which the new database partition is created. This parameter is mandatory on Windows, but is ignored on other operating systems.

#### **USER** username

The user name for the account on the new database partition. This parameter is mandatory on Windows, but is ignored on other operating systems.

#### **PASSWORD** password

The password for the account on the new database partition. This parameter is mandatory on Windows, but is ignored on other operating systems.

#### **NETNAME** netname

Specifies the *netname* to override that specified in the db2nodes.cfg file. If not specified, this parameter defaults to the *netname* value that corresponds to the *db-partition-number* value in the db2nodes.cfg file.

### Examples

The following is sample output from db2start issued on a three-database partition system with database partitions 10, 20, and 30:

04-07-1997 10:33:05 10 0 SQL1063N DB2START processing was successful. 04-07-1997 10:33:07 20 0 SQL1063N DB2START processing was successful. 04-07-1997 10:33:07 30 0 SQL1063N DB2START processing was successful. SQL1063N DB2START processing was successful.

### **Usage notes**

On Microsoft Windows Vista or later versions, you must execute this command from a DB2 command window running with full administrator privileges.

It is not necessary to issue this command on a client node. It is provided for compatibility with older clients, but it has no effect on the database manager.

Once started, the database manager instance runs until the user stops it, even if all application programs that were using it have ended.

If the database manager starts successfully, a successful completion message is sent to the standard output device. If an error occurs, processing stops, and an error message is sent to the standard output device. In a partitioned database environment, messages are returned on the database partition that issued the START DATABASE MANAGER command. If no parameters are specified in a partitioned database environment, the database manager is started on all parallel nodes using the parameters specified in the database partition configuration file.

If a START DATABASE MANAGER command is in progress, ensure that the applicable database partitions have started *before* issuing a request to the database.

The db2cshrc file is not supported and cannot be used to define the environment.

You can start an instance in a quiesced state. You can do this by using one of the following choices:

db2start admin mode

or

db2start admin mode user username

or

db2start admin mode group groupname

The **RESTRICTED ACCESS** option will prevent the databases within the quiesced instance from being activated to do authorization checking. Any user ID trying to connect to a database, which has *dbadm* authority or *quiesce\_connect* privilege on the database, will not be allowed to connect. Only user IDs which have *sysadm*, *sysctrl*, or *sysmaint* authority and the user or group specified with the command will be allowed to connect to the database.

The **RESTRICTED ACCESS** option should be used when there is a need to have exclusive connections to a database within the quiesced instance. Such cases can include making an offline backup or performing other maintenance activities.

When adding a new database partition server, START DATABASE MANAGER must determine whether or not each database in the instance is enabled for automatic storage. This is done by communicating with the catalog partition for each database. If automatic storage is enabled then the storage path definitions are retrieved as part of that communication. Likewise, if system temporary table spaces are to be created with the database partitions, START DATABASE MANAGER might have to communicate with another database partition server to retrieve the table space definitions for the database partitions that reside on that server. The **start\_stop\_time** database manager configuration parameter is used to specify the time, in minutes, by which the other database partitions. If this time is exceeded, the command fails. If this situation occurs, increase the value of **start\_stop\_time**, and reissue the command.

A new database partition server cannot be added when any of the following commands, statements, or operations are in progress. Otherwise SQL6074N is returned.

- QUIESCE INSTANCE
- UNQUIESCE INSTANCE
- STOP DB2 (db2stop)
- STOP DATABASER MANAGER DBPARTITIONNUM
- START DB2 (db2start)
- START DATABASE MANAGER DBPARTITIONNUM
- START DATABASE MANAGER with restart options

- CREATE DATABASE
- DROP DATABASE
- QUIESCE DATABASE
- UNQUIESCE DATABASE
- ACTIVATE DATABASE
- DEACTIVATE DATABASE
- A Z lock on a database object
- Backing up the database on all database partition servers
- Restoring the database
- ALTER, ALTER, or DROP of a table space
- Updating of automatic storage paths

On UNIX platforms, the START DATABASE MANAGER command supports the SIGINT signal. It is issued if CTRL+C is pressed. If this signal occurs, all in-progress startups are interrupted and a message (SQL1044N) is returned from each interrupted database partition to the HOME/sqllib/log/db2start. *timestamp*.log error log file. Database partitions that are already started are not affected. If CTRL+C is pressed on a database partition that is starting, db2stop must be issued on that database partition before an attempt is made to start it again.

On Windows operating systems, neither the db2start command nor the NET START command returns warnings if any communication subsystem failed to start. The database manager in a Windows environment is implemented as a service, and does not return an error if the service is started successfully. Be sure to examine the Event Log or the db2diag log file for any errors that might have occurred during the running of db2start.

### Compatibilities

For compatibility with versions earlier than Version 8:

- The keywords LIKE NODE can be substituted for LIKE DBPARTITIONNUM.
- The keyword ADDNODE can be substituted for ADD DBPARTITIONNUM.
- The keyword NODENUM can be substituted for DBPARTITIONNUM.

# START HADR

Starts HADR operations for a database.

### Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint

### **Required connection**

Instance. The command establishes a database connection if one does not exist, and closes the database connection when the command completes.

### **Command syntax**

### **Command parameters**

DATABASE database-alias

Identifies the database on which HADR operations are to start.

**USER** user-name

Identifies the user name under which the HADR operations are to be started.

**USING** password

The password used to authenticate *user-name*.

### **AS PRIMARY**

Specifies that HADR primary operations are to be started on the database.

### **BY FORCE**

Specifies that the HADR primary database will not wait for the standby database to connect to it. After a start BY FORCE, the primary database will still accept valid connections from the standby database whenever the standby later becomes available. When BY FORCE is used, the database will perform crash recovery if necessary, regardless of the value of database configuration parameter **AUTORESTART**. Other methods of starting a primary database (such as non-forced START HADR command, ACTIVATE DATABASE command, or client connection) will respect the **AUTORESTART** setting.

**Caution:** Use the START HADR command with the AS PRIMARY BY FORCE option with caution. If the standby database has been changed to a primary and the original primary database is restarted by issuing the START HADR command with the AS PRIMARY BY FORCE option, both copies of your database will be operating independently as primaries. (This is sometimes referred to as *split brain* or *dual primary*.) In this case, each primary database can accept connections and perform transactions, and neither receives and replays the updates made by the other. As a result, the two copies of the database will become inconsistent with each other.

### AS STANDBY

Specifies that HADR standby operations are to be started on the database. The standby database will attempt to connect to the HADR primary database until a connection is successfully established, or until the connection attempt is explicitly rejected by the primary. (The connection might be rejected by the primary database if an HADR configuration parameter is set incorrectly or if the database copies are inconsistent, both conditions for which continuing to retry the connection is not appropriate.)

### **Usage notes**

The following table shows database behavior in various conditions:

Database status	Behavior upon START HADR command with the AS PRIMARY option	Behavior upon START HADR command with the AS STANDBY option
Inactive standard database	Activated as HADR primary database.	Database starts as an standby database if it is in rollforward-pending mode (which can be the result of a restore or a split mirror) or in rollforward in-progress mode. Otherwise, an error is returned.
Active standard database	Database enters HADR primary role.	Error message returned.
Inactive primary database	Activated as HADR primary database.	After a failover, this reintegrates the failed primary into the HADR pair as the new standby database. Some restrictions apply.
Active primary database	Warning message issued.	Error message returned.
Inactive standby database	Error message returned.	Starts the database as the standby database.
Active standby database	Error message returned.	Warning message issued.

When issuing the START HADR command, the corresponding error codes might be generated: SQL1767N, SQL1769N, or SQL1770N with a reason code of 98. The reason code indicates that there is no installed license for HADR on the server where the command was issued. To correct the problem, install a valid HADR license using the db2licm or install a version of the server that contains a valid HADR license as part of its distribution.

# STOP DATABASE MANAGER

Stops the current database manager instance. Unless explicitly stopped, the database manager continues to be active. This command does not stop the database manager instance if any applications are connected to databases. If there are no database connections, but there are instance attachments, it forces the instance attachments and stops the database manager. This command also deactivates any outstanding database activations before stopping the database manager.

In a partitioned database environment, this command stops the current database manager instance on a database partition or on all database partitions. When it stops the database manager on all database partitions, it uses the db2nodes.cfg configuration file to obtain information about each database partition.

This command can also be used to drop a database partition from the db2nodes.cfg file (partitioned database environments only).

This command is not valid on a client.

### Scope

By default, and in a partitioned database environment, this command affects all database partitions that are listed in the db2nodes.cfg file.

### Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint

### **Required connection**

None

### **Command syntax**

►► STOP- db2stop	DATABASE MANAGER DB MANAGER DBM p	
	IONNUM—db-partition-number— ARTITIONNUM—db-partition-number— —DBPARTITIONNUM—db-partition-number—	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

### **Command parameters**

**PROFILE** profile

Partitioned database environments only. Specifies the name of the profile file that was executed at startup to define the DB2 environment for those database partitions that were started. If a profile for the START

DATABASE MANAGER command was specified, the same profile must be specified here. The profile file must reside in the sqllib directory of the instance owner.

#### **DBPARTITIONNUM** *db-partition-number*

Partitioned database environments only. Specifies the database partition to be stopped.

Valid values are from 0 to 999 inclusive, and must be in the db2nodes.cfg file. If no database partition number is specified, all database partitions defined in the configuration file are stopped.

#### **DROP DBPARTITIONNUM** *db*-partition-number

Partitioned database environments only. Specifies the database partition to be dropped from the db2nodes.cfg file.

Before using this parameter, run the DROP DBPARTITIONNUM VERIFY command to ensure that there is no user data on this database partition.

When this option is specified, all database partitions in the db2nodes.cfg file are stopped.

#### FORCE

Specifies to use FORCE APPLICATION ALL when stopping the database manager at each database partition.

#### **DBPARTITIONNUM** *db-partition-number*

Partitioned database environments only. Specifies the database partition to be stopped after all applications on that database partition have been forced to stop. If the FORCE option is used without this parameter, all applications on all database partitions are forced before all the database partitions are stopped.

#### Examples

The following is sample output from db2stop issued on a three-partition system with database partitions 10, 20, and 30:

04-07-1997 10:32:53 10 0 SQL1064N DB2STOP processing was successful. 04-07-1997 10:32:54 20 0 SQL1064N DB2STOP processing was successful. 04-07-1997 10:32:55 30 0 SQL1064N DB2STOP processing was successful. SQL1064N DB2STOP processing was successful.

#### Usage notes

On Microsoft Windows Vista or later versions, you must execute this command from a DB2 command window running with full administrator privileges.

It is not necessary to issue this command on a client node. It is provided for compatibility with older clients, but it has no effect on the database manager.

Once started, the database manager instance runs until the user stops it, even if all application programs that were using it have ended.

If the database manager is stopped, a successful completion message is sent to the standard output device. If an error occurs, processing stops, and an error message is sent to the standard output device.

If the database manager cannot be stopped because application programs are still connected to databases, use the FORCE APPLICATION command to disconnect all users first, or reissue the STOP DATABASE MANAGER command with the FORCE option.

The following information applies to partitioned database environments only:

- If no parameters are specified, the database manager is stopped on each database partition listed in the configuration file. The administration notification log might contain messages to indicate that other database partitions are shutting down.
- Any database partitions added to the partitioned database environment since the previous STOP DATABASE MANAGER command was issued will be updated in the db2nodes.cfg file.
- On UNIX platforms, if the value specified for the **start\_stop\_time**database manager configuration parameter is reached, all in-progress stops are interrupted, and message SQL6037N is returned from each interrupted database partition to the \$HOME/sqllib/log/db2stop. *timestamp*.log error log file. Database partitions that are already stopped are not affected.
- The db2cshrc file is not supported and cannot be specified as the value for the PROFILE parameter.

**Attention:** The UNIX kill command should *not* be used to terminate the database manager because it will abruptly end database manager processes without controlled termination and cleanup processing.

# **STOP HADR**

Stops HADR operations for a database.

### Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint

### **Required connection**

Instance. The command establishes a database connection if one does not exist, and closes the database connection when the command completes.

### **Command syntax**

### **Command parameters**

**DATABASE** database-alias

Identifies the database on which HADR operations are to stop.

**USER** user-name

Identifies the user name under which the HADR operations are to be stopped.

**USING** password

The password used to authenticate *user-name*.

### Usage notes

The following table shows database behavior in various conditions:

Database status	Behavior upon STOP HADR command
Inactive standard database	Error message returned.
Active standard database	Error message returned.
Inactive primary database	Database role changes to standard. Database configuration parameter <b>hadr_db_role</b> is updated to STANDARD. Database remains offline. At the next restart, enters standard role.

Database status	Behavior upon STOP HADR command	
Active primary database	Stops shipping logs to the HADR standby database and shuts down all HADR EDUs on the HADR primary database. Database role changes to standard and database remains online. Database remains in standard role until an explicit START HADR command with the AS PRIMARY option is issued. Open sessions and transactions are not affected by the STOP HADR command. You can repeatedly issue STOP HADR and START HADR commands while the database remains online. These commands take effect dynamically.	
Inactive standby database	Database role changes to standard. Database configuration parameter <b>hadr_db_role</b> is updated to STANDARD. Database remains offline. Database is put into rollforward pending mode.	
Active standby database	Error message returned: Deactivate the standby database before attempting to convert it to a standard database.	

When issuing the STOP HADR command, the corresponding error codes might be generated: SQL1767N, SQL1769N, or SQL1770N with a reason code of 98. The reason code indicates that there is no installed license for HADR on the server where the command was issued. To correct the problem, install a valid HADR license using the db2licm or install a version of the server that contains a valid HADR license as part of its distribution.

# TAKEOVER HADR

Instructs an HADR standby database to take over as the new HADR primary database for the HADR pair.

### Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint

### **Required connection**

Instance. The command establishes a database connection if one does not exist, and closes the database connection when the command completes.

### **Command syntax**

### **Command parameters**

#### **DATABASE** database-alias

Identifies the current HADR standby database that should take over as the HADR primary database.

#### **USER** user-name

Identifies the user name under which the takeover operation is to be started.

#### **USING** password

The password used to authenticate *user-name*.

#### **BY FORCE**

Specifies that the database will not wait for confirmation that the original HADR primary database has been shut down. This option is required if the HADR pair is not in peer state.

#### PEER WINDOW ONLY

When this option is specified, there will not be any committed transaction loss if the command succeeds and the primary database is brought down before the end of the peer window period (set the database configuration parameter **HADR\_PEER\_WINDOW** to a non-zero value). Not bringing down the primary database, before the peer window expires, will result in *split brain*. If the TAKEOVER BY FORCE PEER WINDOW ONLY command is executed when the HADR pair is not in a peer or disconnected peer state (the peer window has expired), an error is returned.
**Note:** The takeover operation with the PEER WINDOW ONLY option may behave incorrectly if the primary database clock and the standby database clock are not synchronized to within 5 seconds of each other. That is, the operation may succeed when it should fail, or fail when it should succeed. You should use a time synchronization service (e.g., NTP) to keep the clocks synchronized to the same source.

## **Usage notes**

The following table shows the behavior of the TAKEOVER HADR command when issued on an active standby database for each possible state and option combination. An error message is returned if this command is issued on an inactive standby database.

	BY FORCE		
Standby state	option used	Takeover behavior	
Disconnected peer	No	NOT ALLOWED (SQL1770N)	
Disconnected peer	Yes, just BY FORCE	ALLOWED - NO ASSURANCE OF DATA CONSISTENCY <b>Note:</b> A "no transaction loss" takeover is also possible using the TAKEOVER BY FORCE command without the PEER WINDOW ONLY option, i.e., unconditional failover, as long as the necessary conditions hold. Such a failover can be executed even long after the expiration of the peer window that was in effect when the primary failed.	
Disconnected peer	Yes, BY FORCE PEER WINDOW ONLY	<ul> <li>ALLOWED - GREATER DEGREE OF DATA CONSISTENCY</li> <li>There are situations in which data loss can still happen:</li> <li>If the primary database remains active past the time when the peer window expires, and if the primary database still has no connection to the standby database, the primary database will move out of disconnected peer state and resume processing</li> </ul>	
		<ul> <li>transactions independently.</li> <li>In NEARSYNC mode, if the standby database fails after acknowledging receipt of transaction logs from the primary database but before writing that transaction log information to disk, then that transaction log information, in the log receive buffer, might be lost.</li> </ul>	
Local catchup or remote catchup	No	Error message returned	
Local catchup or remote catchup	Yes	Error message returned	

# TAKEOVER HADR

Standby state	BY FORCE option used	Takeover behavior			
Peer	No	Primary database and standby database switch roles.			
		If no failure is encountered during takeover, there will be no data loss. However, if failures are encountered during takeover, data loss might occur and the roles of the primary and standby might or might not have been changed. The following is a guideline for handling failures during a takeover in which the primary and standby switch roles:			
		1. If a failure occurs during a takeover operation, the roles of the HADR databases might or might not have been changed. If possible, make sure both databases are online. Check the HADR role of the available database or databases using the Snapshot Monitor, or by checking the value of the database configuration parameter hadr_db_role.			
		2. If the intended new primary is still in standby role, and takeover is still desired, re-issue the TAKEOVER HADR command (see the next guideline regarding the BY FORCE option).			
		3. It is possible to end up with both databases in standby role. In that case, the TAKEOVER HADR command with the BY FORCE option can be issued at whichever node should now become the primary. The BY FORCE option is required in this case because the two standbys cannot establish the usual HADR primary-standby connection.			
Peer	Yes	Old primary marked as invalid, preventing it from writing any more logs or committing any more transactions.			
		The next log write attempt brings down the database. However, if sessions on the old primary only run read-only queries, the old primary might stay up indefinitely. Existing client connections stay open as long as they perform read-only operations and new client connections might be accepted.			
		To avoid a situation of dual-primary, it is recommended that you stop transaction processing on old primary first before issuing a TAKEOVER HADR command with the BY FORCE option.			
Remote catchup pending	No	Error message returned.			
Remote catchup pending	Yes	The standby becomes a primary.			

When issuing the TAKEOVER HADR command, the corresponding error codes might be generated: SQL1767N, SQL1769N, or SQL1770N with a reason code of 98. The reason code indicates that there is no installed license for HADR on the server where the command was issued. To correct the problem, install a valid HADR license using the db2licm or install a version of the server that contains a valid HADR license as part of its distribution.

When you issue the TAKEOVER BY FORCE PEER WINDOW ONLY command, and it succeeds (you called it while the primary was disconnected from the standby, but still within the peer window), then there will not be any transaction information on the primary database that was not already copied to the standby database.

If you have reads on standby enabled, any user application currently connected to the standby will be disconnected to allow the takeover to proceed. Depending on the number of readers that are active on the standby, the takeover operation can take slightly longer to complete than it would if there were no readers on the standby. New connections will not be allowed during the role switch. Any attempt to connect to the HADR standby during the role switch on takeover will receive an error (SQL1776N).

# TERMINATE

Explicitly terminates the command line processor's back-end process.

#### Authorization

None

#### **Required connection**

None

# **Command syntax**

►►—TERMINATE—

# **Command parameters**

None

### Usage notes

If an application is connected to a database, or a process is in the middle of a unit of work, TERMINATE causes the database connection to be lost. An internal commit is then performed.

Although TERMINATE and CONNECT RESET both break the connection to a database, only TERMINATE results in termination of the back-end process.

It is recommended that TERMINATE be issued prior to executing the db2stop command. This prevents the back-end process from maintaining an attachment to adatabase manager instance that is no longer available.

Back-end processes in MPP systems must also be terminated when the DB2NODE environment variable is updated in the session. This environment variable is used to specify the coordinator database partition number within an MPP multiple logical node configuration.

# **UNCATALOG DATABASE**

Deletes a database entry from the database directory.

# Authorization

One of the following:

- sysadm
- sysctrl

# **Required connection**

None. Directory operations affect the local directory only.

# **Command syntax**

►► UNCATALOG DATABASE database-alias

# **Command parameters**

DATABASE *database-alias* Specifies the alias of the database to uncatalog.

# **Usage notes**

Only entries in the local database directory can be uncataloged. Entries in the system database directory can be deleted using the DROP DATABASE command.

To recatalog the database on the instance, use the UNCATALOG DATABASE and CATALOG DATABASE commands. command. To list the databases that are cataloged on a node, use the LIST DATABASE DIRECTORY command.

The authentication type of a database, used when communicating with an earlier server, can be changed by first uncataloging the database, and then cataloging it again with a different type.

If directory caching is enabled, database, node, and DCS directory files are cached in memory. See the information for the configuration parameter **dir\_cache** in the GET DATABASE MANAGER CONFIGURATION command. An application's directory cache is created during its first directory lookup. Because the cache is only refreshed when the application modifies any of the directory files, directory changes made by other applications might not be effective until the application has restarted.

To refresh the CLP's directory cache, use the TERMINATE command. To refresh the database manager's shared cache, stop (db2stop) and then restart (db2start) the database manager. To refresh the directory cache for another application, stop and then restart that application.

**Note:** When you add a database partition to the system, all existing databases in the instance are expanded to the new database partition. However, any uncataloged database is not recognized when adding a new database partition. The uncataloged database will not be present on the new database partition. An

# UNCATALOG DATABASE

attempt to connect to the database on the new database partition returns the error message SQL1013N.

# UNCATALOG DCS DATABASE

Deletes an entry from the Database Connection Services (DCS) directory.

# **Authorization**

One of the following:

- sysadm
- sysctrl

# **Required connection**

None. Directory operations affect the local directory only.

# **Command syntax**

►►─UNCATALOG DCS──DATABASE──database-alias──

# **Command parameters**

**DATABASE** database-alias

Specifies the alias of the DCS database to uncatalog.

# Usage notes

DCS databases are also cataloged in the system database directory as remote databases and can be uncataloged using the UNCATALOG DATABASE command.

To recatalog a database in the DCS directory, use the UNCATALOG DCS DATABASE and CATALOG DCS DATABASE commands. To list the DCS databases that are cataloged on a node, use the LIST DCS DIRECTORY command.

If directory caching is enabled, database, node, and DCS directory files are cached in memory. See the information provided for the configuration parameter **dir\_cache** in the output of the GET DATABASE MANAGER CONFIGURATION command. An application's directory cache is created during its first directory lookup. Since the cache is only refreshed when the application modifies any of the directory files, directory changes made by other applications might not be effective until the application has restarted.

To refresh the CLP's directory cache, use the TERMINATE command. To refresh DB2's shared cache, stop (db2stop) and then restart (db2start) the database. To refresh the directory cache for another application, stop and then restart that application.

# UNCATALOG LDAP DATABASE

Used to deregister the database from Lightweight Directory Access Protocol (LDAP).

### Authorization

None

#### **Required connection**

None

#### Command syntax

# **Command parameters**

#### **DATABASE** dbalias

Specifies the alias of the LDAP database to uncatalog.

#### **USER** username

Specifies the user's LDAP distinguished name (DN). The LDAP user DN must have sufficient authority to delete the object from the LDAP directory. If the user's LDAP DN is not specified, the credentials of the current logon user will be used.

#### **PASSWORD** password

Account password.

## **Usage notes**

When a database is dropped, the database object is removed from LDAP. The database is also automatically deregistered from LDAP when the database server that manages the database is deregistered from LDAP. It might, however, be necessary to manually uncatalog the database from LDAP if:

- The database server does not support LDAP. The administrator must manually uncatalog each database from LDAP after the database is dropped.
- During DROP DATABASE, the database object cannot be removed from LDAP (because LDAP cannot be accessed). In this case, the database is still removed from the local machine, but the existing entry in LDAP is not deleted.

# UNCATALOG LDAP NODE

Uncatalogs a node entry in Lightweight Directory Access Protocol (LDAP).

# Authorization

None

# **Required connection**

None

# **Command syntax**

►►UNCATALOG I DAPNODEnodename	i		
e ononineou ebni nobe nouename	1055		
	-USER-username-		
		└─PASSWORD—password—	

# **Command parameters**

#### **NODE** *nodename*

Specifies the name of the node to uncatalog.

#### **USER** username

Specifies the user's LDAP distinguished name (DN). The LDAP user DN must have sufficient authority to delete the object from the LDAP directory. If the user's LDAP DN is not specified, the credentials of the current logon user will be used.

#### **PASSWORD** password

Account password.

## **Usage notes**

The LDAP node is automatically uncataloged when the DB2 server is deregistered from LDAP.

# UNCATALOG NODE

Deletes an entry from the node directory.

#### Authorization

One of the following:

- sysadm
- sysctrl

## **Required connection**

None. Directory operations affect the local directory only.

#### Command syntax

►►—UNCATALOG NODE—nodename—

## **Command parameters**

**NODE** *nodename* Specifies the node entry being uncataloged.

## Usage notes

UNCATALOG NODE can be executed on any type of node, but only the local directory is affected, even if there is an attachment to a remote instance, or a different local instance.

If directory caching is enabled, database, node, and DCS directory files are cached in memory. To see if directory caching is enabled, check the value for the dir\_cache directory cache support configuration parameter in the output from the GET DATABASE MANAGER CONFIGURATION command. An application's directory cache is created during its first directory lookup. Since the cache is only refreshed when the application modifies any of the directory files, directory changes made by other applications might not be effective until the application has restarted.

To refresh the CLP's directory cache, use the TERMINATE command. To refresh the database manager's shared cache, stop (db2stop) and then restart (db2start) the database manager. To refresh the directory cache for another application, stop and then restart that application.

# UNCATALOG ODBC DATA SOURCE

Uncatalogs a user or system ODBC data source.

A *data source*, in ODBC (Open Database Connectivity) terminology, is a user-defined name for a specific database. That name is used to access the database through ODBC APIs. On Windows, either user or system data sources can be uncataloged. A user data source is only visible to the user who cataloged it, whereas a system data source is visible to and can be used by all other users.

This command is available on Windows only.

# Authorization

None

# **Required connection**

None

# **Command syntax**

# **Command parameters**

**USER** Uncatalog a user data source. This is the default if no keyword is specified.

#### **SYSTEM**

Uncatalog a system data source.

#### **ODBC DATA SOURCE** data-source-name

Specifies the name of the data source to be uncataloged. Maximum length is 32 characters.

### Usage notes

On Microsoft Windows Vista or later versions, you must execute the UNCATALOG SYSTEM ODBC DATA SOURCE command from a DB2 command window running with full administrator privileges.

# UNQUIESCE

Restores user access to instances or databases which have been quiesced for maintenance or other reasons.UNQUIESCE restores user access without necessitating a shutdown and database restart.

Unless specifically designated, no user except those with SYSADM, SYSMAINT, or SYSCTRL has access to a database while it is quiesced. Therefore an UNQUIESCE is required to restore general access to a quiesced database.

### Scope

UNQUIESCE DB restores user access to all objects in the quiesced database.

UNQUIESCE INSTANCE *instance-name* restores user access to the instance and the databases in the instance *instance-name*.

To stop the instance and unquiesce it and all its databases, issue the db2stop command. Stopping and restarting DB2 will unquiesce all instances and databases.

### Authorization

One of the following:

For database level unquiesce:

- SYSADM
- DBADM

For instance level unquiesce:

- SYSADM
- SYSCTRL

### Command syntax

►► UNQUIESCE DB INSTANCE—instance-name

# **Required connection**

Database

(Database connection is not required for an instance unquiesce.)

#### **Command parameters**

**DB** Unquiesce the database. User access will be restored to all objects in the database.

#### **INSTANCE** instance-name

Access is restored to the instance *instance-name* and the databases in the instance.

-

# Examples

# Unquiescing a Database

db2 unquiesce db

This command will unquiesce the database that had previously been quiesced.

# UPDATE ADMIN CONFIGURATION

Modifies specified entries in the DB2 Administration Server (DAS) configuration file. The DAS is a special administrative tool that enables remote administration of DB2 servers.

When you install the DAS, a blank copy of the configuration file is stored on each physical database partition. You must create entries in each copy. You can specify the following DAS configuration parameters to be used the next time you start the DAS:

- Name of the DB2 Server System db2system
- DAS Administration Authority Group Name dasadm\_group
- Scheduler Mode sched\_enable
- Tools Catalog Database Instance toolscat\_inst
- Tools Catalog Database toolscat\_db
- Tools Catalog Database Schema toolscat\_schema
- Execute Expired Tasks exec\_exp\_task
- Scheduler User ID sched\_userid
- Authentication Type DAS authentication

The following DAS configuration parameters can be specified originally and then later changed while the DAS is online:

- DAS Discovery Mode discover
- SMTP Server smtp\_server
- Java Development Kit Installation Path DAS jdk\_path
- Location of Contact List contact\_host
- DAS Code Page das\_codepage
- DAS Territory das\_territory
- Diagnostic error capture level diaglevel

For more information about these parameters, see individual parameter descriptions.

# Scope

Issue this command from each administration node to specify or change parameter settings for that node.

# Authorization

dasadm

## **Required connection**

Node. To update the DAS configuration for a remote system, use the FOR NODE option with the administrator node name.

# **Command syntax**

# UPDATE ADMIN CONFIGURATION

# **Command parameters**

#### **USING** config-keyword-value

Specifies the admin configuration parameter to be updated.

FOR NODE

Enter the name of an administration node to update the DAS configuration parameters there.

**USER** username **USING** password

If connection to the administration node requires user name and password authorization, enter this information.

### **Usage notes**

To view or print a list of the DAS configuration parameters, use GET ADMIN CONFIGURATION. To reset the DAS configuration parameters to the recommended DAS defaults, use RESET ADMIN CONFIGURATION.

When configuration parameters take effect depends on whether you change a standard configuration parameter or one of the parameters that can be reset online. Standard configuration parameter values are reset when you execute the db2admin command.

If an error occurs, the DAS configuration file is not changed.

In order to update the DAS configuration using UPDATE ADMIN CONFIGURATION, you must use the command line processor from an instance that is at the same installed level as the DAS.

The DAS configuration file cannot be updated if the checksum is invalid. This might occur if you change the DAS configuration file manually, without using the appropriate command. If this happens, you must drop and re-create the DAS to reset its configuration file.

# UPDATE ALERT CONFIGURATION

Updates the alert configuration settings for health indicators.

**Important:** This command or API has been deprecated and might be removed in a future release because the health monitor has been deprecated in Version 9.7. For more information, see the "Health monitor has been deprecated" topic in the *What's New for DB2 Version* 9.7 book.

### Authorization

One of the following:

- SYSADM
- SYSMAINT
- SYSCTRL

# **Required Connection**

Instance. An explicit attachment is not required.

## **Command Syntax**

#### Add Script Details:

►-WORKING DIRECTORY—pathname

#### State and User Details:

# **Command Parameters**

#### DATABASE MANAGER

Updates alert settings for the database manager.

#### DATABASES

Updates alert settings for all databases managed by the database manager. These are the settings that apply to all databases that do not have custom settings. Custom settings are defined using the **DATABASE ON** *database-alias* clause.

#### **CONTAINERS**

Updates alert settings for all table space containers managed by the database manager. These are the settings that apply to all table space containers that do not have custom settings. Custom settings are defined using the **CONTAINER** *container-name* **ON** *database-alias* clause.

#### TABLESPACES

Updates alert settings for all table spaces managed by the database manager. These are the settings that apply to all table spaces that do not have custom settings. Custom settings are defined using the **TABLESPACE** *tblspace-name* **ON** *database-alias* clause.

#### DATABASE ON database-alias

Updates the alert settings for the database specified using the **ON** *database-alias* clause. If this database has custom settings, then they override the settings for all databases for the instance, which is specified using the **DATABASES** parameter.

#### **CONTAINER** container-name **FOR** tblspace-name **ON** database-alias

Updates the alert settings for the table space container called *container-name*, for the table space specified using the **FOR** *tblspace-name* clause, on the database specified using the **ON** *database-alias* clause. If this table space container has custom settings, then they override the settings for all table space containers for the database, which is specified using the **CONTAINERS** parameter.

#### TABLESPACE tblspace-name ON database-alias

Updates the alert settings for the table space called *name*, on the database specified using the **ON** *database-alias* clause. If this table space has custom settings, then they override the settings for all table spaces for the database, which is specified using the **TABLESPACES** parameter.

#### **USING** *health-indicator-name*

Specifies the set of health indicators for which alert configuration will be updated. Health indicator names consist of a two-letter object identifier followed by a name which describes what the indicator measures. For example:

db.sort\_privmem\_util

# **UPDATE ALERT CONFIGURATION**

#### **SET** parameter-name value

Updates the alert configuration element, *parameter-name*, of the health indicator to the specified value. *parameter-name* must be one of the following:

- ALARM: the *value* is a health indicator unit.
- WARNING: the *value* is a health indicator unit.
- SENSITIVITY: the *value* is in seconds.
- ACTIONSENABLED: the *value* can be either YES or NO.
- THRESHOLDSCHECKED: the *value* can be either YES or NO.

# UPDATE ACTION SCRIPT *pathname* ON [WARNING | ALARM | ALLALERT | ATTENTION *state*]

Specifies that the script attributes of the predefined script with absolute path name *pathname* will be updated according to the following clause:

**SET** *parameter-name value* 

Updates the script attribute, *parameter-name*, to the specified value. *parameter-name* must be one of the following:

• SCRIPTTYPE

OS or DB2 are the valid types.

- WORKINGDIR
- TERMCHAR
- CMDLINEPARMS

The command line parameters that you specify for the operating system script will precede the default supplied parameters . The parameters that are sent to the operating system script are:

- List of user supplied parameters
- Health indicator short name
- Fully qualified object name
- Health indicator value
- Alert state
- USERID
- PASSWORD
- SYSTEM

#### **UPDATE ACTION TASK** *task-name* **ON [WARNING | ALARM | ALLALERT | ATTENTION** *state*]

Specifies that the task attributes of the task with name *name* will be updated according to the following clause:

**SET** *parameter-name value* 

Updates the task attribute, *parameter-name*, to the specified value. *parameter-name* must be one of the following:

- USERID
- PASSWORD
- SYSTEM

# DELETE ACTION SCRIPT *pathname* ON [WARNING | ALARM | ALLALERT | ATTENTION *state*]

Removes the action script with absolute path name *pathname* from the list of alert action scripts.

# DELETE ACTION TASK task-name ON [WARNING | ALARM | ALLALERT | ATTENTION state]

Removes the action task called *name* from the list of alert action tasks.

# ADD ACTION SCRIPT *pathname* ON [WARNING | ALARM | ALLALERT | ATTENTION state]

Specifies that a new action script with absolute path name *pathname* is to be added, the attributes of which are given by the following:

- **TYPE** An action script must be either a DB2 Command script or an operating system script:
  - DB2
  - OPERATING SYSTEM

If it is a DB2 Command script, then the following clause allows one to optionally specify the character, *character*, that is used in the script to terminate statements:

STATEMENT TERMINATION CHARACTER ;

If it is an operating system script, then the following clause allows one to optionally specify the command-line parameters, *parms*, that would be passed to the script upon invocation: **COMMAND LINE PARAMETERS** *parms* 

#### **WORKING DIRECTORY** pathname

Specifies the absolute path name, *pathname*, of the directory in which the script will be executed.

#### **USER** username **USING** password

Specifies the user account, *username*, and associated password, *password*, under which the script will be executed.

# ADD ACTION TASK name ON [WARNING | ALARM | ALLALERT | ATTENTION state]

Specifies that a new task, called *name*, is to be added to be run **ON** the specified condition.

#### ON [WARNING | ALARM | ALLALERT | ATTENTION state]

Specifies the condition on which the action or task will run. For threshold-based health indicators (HIs), this is **WARNING** or **ALARM**. For state-based HIs, this will be a numeric state as documented for each state-based HI (for example, for the ts.ts\_op\_status health indicator, refer to the **tablespace\_state** monitor element for table space states). **ALLALERTS** handles any changes in the state for threshold-based HIs and state-based HIs (for example, the state changes from warning to normal).

#### **ATTENTION** *state*

Valid numerical values for some of the database health indicator states are given below as an example for the ADD ACTION SCRIPT CLP command option:

- 0 Active; Normal (ACTIVE)
- 1 Quiesce pending (QUIESCE\_PEND)
- 2 Quiesced (QUIESCED)
- 3 Rollforward (ROLLFWD)

Additional state-based health indicators are defined in the header files sqlmon.h and sqlutil.h.

## **Usage notes**

For the ADD ACTION option, the supplied *username* and *password* may be exposed in various places where SQL statement text is captured:

• the network (username/password are passed over the wire unencrypted)

# **UPDATE ALERT CONFIGURATION**

- db2diag log file
- trace files
- dump file
- snapshot monitor (dynamic SQL snapshot)
- system monitor snapshots
- a number of event monitors (statement, deadlock)
- query patroller
- explain tables
- db2pd output (package cache and lock timeout mechanisms, among others)
- DB2 audit records

# UPDATE ALTERNATE SERVER FOR DATABASE

Updates the alternate server for a database alias in the system database directory.

### Scope

This command only affects the database partition on which it is executed.

# Authorization

One of the following:

- sysadm
- sysctrl

# **Required connection**

None

# **Command syntax**

▶▶—	-UPDATE	ALTERNATE	SERVER	FOR-	—DATABASE—	—database-alias—	-USING	•
				L	—DB			

►-HOSTNAME—hostname—PORT—port-number—

# **Command parameters**

#### **DATABASE** database-alias

Specifies the alias of the database where the alternate server is to be updated.

#### **HOSTNAME** hostname

Specifies a fully qualified host name or the IP address of the node where the alternate server for the database resides.

**PORT** port-number

Specifies the port number of the alternate server of the database manager instance.

## **Examples**

The following example updates the alternate server for the SAMPLE database using host name montero and port 20396:

db2 update alternate server for database sample using hostname montero port 20396

The following two examples reset the alternate server for the SAMPLE database: db2 update alternate server for database sample using hostname NULL port NULL

or

db2 update alternate server for database sample using hostname "" port NULL

#### Usage notes

• This command is only applied to the system database directory.

# UPDATE ALTERNATE SERVER FOR DATABASE

- This command should only be used on a server instance. If it is issued on a client instance, it is ignored and message SQL1889W is returned.
- If Lightweight Directory Access Protocol (LDAP) support is enabled on the machine on which the command is issued, the alternate server for the database will be automatically registered in the LDAP directory.

# UPDATE ALTERNATE SERVER FOR LDAP DATABASE

Updates the alternate server for a database in Lightweight Directory Access Protocol (LDAP).

### Authorization

Read/write access to the LDAP server.

#### **Required connection**

None

#### **Command syntax**

►►—UPDAT	E ALTERNATE	SERVER FOR	LDAP-DATAI	BASEdataba	se-alias——	
►-USING	NODEnode 	?vnode	USER—username	PASSWORD-	–password–	

## **Command parameters**

#### **DATABASE** database-alias

Specifies the alias of the database to be updated.

#### NODE node

Specifies the node name where the alternate server for the database resides.

#### **GWNODE** gwnode

Specifies the node name where the alternate gateway for the database resides.

#### **USER** username

Specifies the user's LDAP distinguished name (DN). The LDAP user DN must have sufficient authority to create the object in the LDAP directory. If the user's LDAP DN is not specified, the credentials of the current logon user will be used.

If the user's LDAP DN and password have been specified using db2ldcfg, the user name and password do not have to be specified here.

#### **PASSWORD** *password*

Account password.

If the user's LDAP DN and password have been specified using db2ldcfg, the user name and password do not have to be specified here.

# UPDATE CLI CONFIGURATION

Updates the contents of a specified section in the db2cli.ini file.

The db2cli.ini file is used as the DB2 call level interface (CLI) configuration file. It contains various keywords and values that can be used to modify the behavior of the DB2 CLI and the applications using it. The file is divided into sections, each section corresponding to a database alias name.

# Authorization

None

### **Required connection**

None

## **Command syntax**

# **Command parameters**

#### FOR SECTION section-name

Name of the section whose keywords are to be updated. If the specified section does not exist, a new section is created.

#### AT GLOBAL LEVEL

Specifies that the CLI configuration parameter is to be updated at the global level. This parameter is only applicable when LDAP support is enabled.

#### AT USER LEVEL

Specifies that the CLI configuration parameter is to be updated at the user level. If LDAP support is enabled, this setting will be consistent when logging on to different machines with the same LDAP user ID. If LDAP support is disabled, this setting will be consistent only when logging on to the same machine with the same operating system user ID.

#### **USING** keyword value

Specifies the CLI/ODBC parameter to be updated.

## **Usage notes**

The section name and the keywords specified on this command are not case sensitive. However, the keyword values *are* case sensitive.

If a keyword value is a string containing single quotation marks or imbedded blanks, the entire string must be delimited by double quotation marks. For example:

```
db2 update cli cfg for section tstcli1x
    using TableType "'TABLE','VIEW','SYSTEM TABLE'"
```

When the AT USER LEVEL keywords are specified, the CLI configuration parameters for the specified section are updated only for the current user; otherwise, they are updated for all users on the local machine. The CLI configuration at the user level is maintained in the LDAP directory and cached on the local machine. When reading the CLI configuration, DB2 always reads from the cache. The cache is refreshed when:

- The user updates the CLI configuration.
- The user explicitly forces a refresh of the CLI configuration using the REFRESH LDAP command.

In an LDAP environment, users can configure a set of default CLI settings for a database catalogued in the LDAP directory. When an LDAP cataloged database is added as a DSN (Data Source Name), either by using the CA (Configuration Assistant) or the ODBC configuration utility, any default CLI settings, if they exist in the LDAP directory, will be configured for that DSN on the local machine. The AT GLOBAL LEVEL clause must be specified to configure a CLI parameter as a default setting.

# UPDATE COMMAND OPTIONS

Sets one or more command options during an interactive session, or from a batch input file. The settings revert to system defaults (or the system default overrides in DB2OPTIONS) when the interactive session or batch input file ends.

# **Authorization**

None

# **Required connection**

None

# **Command syntax**

# **Command parameters**

**USING** option-letter

The following option-letters can be set:

- a Display SQLCA
- c Auto-commit SQL statements
- d Display the XML declarations of XML data
- e Display SQLCODE/SQLSTATE
- i Display XQuery results with proper indentation
- 1 Log commands in a history file
- **m** Display the number of rows affected by INSERT, DELETE, UPDATE or MERGE statements.
- n Remove new line character
- o Display to standard output
- **p** Display DB2 interactive prompt
- **q** Preserve whitespace and line feeds in strings delimited with single or double quotation marks.
- **r** Save output report to a file
- s Stop execution on command error
- **v** Echo current command
- **w** Show SQL statement warning messages
- **z** Redirect all output to a file.

**ON** value

The e, l, r, and z options require a value if they are turned on. For the e option, *value* can be c to display the SQLCODE, or s to display the

SQLSTATE. For the 1, r, and z options, *value* represents the name to be used for the history file or the report file. No other options accept a value.

# **Usage notes**

These settings override system defaults, settings in DB2OPTIONS, and options specified using the command line option flags.

The file input option (-f) and the statement termination option (-t) cannot be updated using this command.

To view the current option settings, use the LIST COMMAND OPTIONS command.

# UPDATE CONTACT

Updates the attributes of a contact that is defined on the local system. A contact is a user to whom the Scheduler and Health Monitor send messages.

To create a contact, use the ADD CONTACT command. The setting of the Database Administration Server (DAS) **contact\_host** configuration parameter determines whether the list is local or global.

#### Authorization

None

# **Required connection**

None. Local execution only: this command cannot be used with a remote connection.

#### **Command syntax**

# **Command parameters**

#### **UPDATE CONTACT** name

The name of the contact that will be updated.

#### **USING** keyword value

Specifies the contact parameter to be updated (*keyword*) and the value to which it will be set (*value*). The valid set of keywords is:

#### ADDRESS

The e-mail address that is used by the SMTP server to send the notification.

**TYPE** Whether the address is for an e-mail address or a pager.

#### MAXPAGELEN

The maximum number of characters that the pager can accept.

#### DESCRIPTION

A textual description of the contact. This has a maximum length of 128 characters.

# **UPDATE CONTACTGROUP**

Updates the attributes of a contact group that is defined on the local system. A contact group is a list of users who should be notified by the Scheduler and the Health Monitor.

The setting of the Database Administration Server (DAS) **contact\_host** configuration parameter determines whether the list is local or global.

# Authorization

None

# **Required Connection**

None

# **Command Syntax**

# **Command Parameters**

#### **CONTACTGROUP** name

Name of the contact group which will be updated.

#### ADD CONTACT name

Specifies the name of the new contact to be added to the group. A contact can be defined with the ADD CONTACT command after it has been added to a group.

#### DROP CONTACT name

Specifies the name of a contact in the group that will be dropped from the group.

#### ADD GROUP name

Specifies the name of the new contact group to be added to the group.

#### DROP GROUP name

Specifies the name of a contact group that will be dropped from the group.

#### **DESCRIPTION** *new description*

Optional. A new textual description for the contact group.

# UPDATE DATABASE CONFIGURATION

Modifies individual entries in a specific database configuration file. A database configuration file resides on every database partition on which the database has been created.

### Scope

This command updates all database partitions by default, except when DBPARTITIONNUM is specified to update only one database partition.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

### **Required connection**

Instance. An explicit attachment is not required, but a database connection is recommended when the database is active. If the database is listed as remote, an instance attachment to the remote node is established for the duration of the command. To change a parameter online, you must be connected to the database.

## **Command syntax**

# **Command parameters**

#### AUTOMATIC

Some configuration parameters can be set to AUTOMATIC, allowing DB2 to automatically adjust these parameters to reflect the current resource requirements. For a list of configuration parameters that support the **AUTOMATIC** keyword, refer to the configuration parameters summary. If a value is specified along with the **AUTOMATIC** keyword, it might influence the automatic calculations. For specific details about this behavior, refer to the documentation for the configuration parameter.

#### DEFERRED

Make the changes only in the configuration file, so that the changes take effect the next time you reactivate the database.

FOR database-alias

Specifies the alias of the database whose configuration is to be updated. Specifying the database alias is not required when a database connection has already been established. You can update the configuration file for another database residing under the same database instance. For example, if you are connected only to database db11, and issue update db config for alias db22 using .... immediate:

- If there is no active connection on db22, the update will be successful because only the configuration file needs to be updated. A new connection (which will activate the database) will see the new change in memory.
- If there are active connections on db22 from other applications, the update will work on disk but not in memory. You will receive a warning saying that the database needs to be restarted.

#### **DBPARTITIONNUM** *db-partition-num*

If a database configuration update is to be applied to a specific database partition, this parameter may be used. If this parameter is not provided, the update will take effect on all database partitions.

#### IMMEDIATE

Make the changes immediately, while the database is running. **IMMEDIATE** is the default action, but it requires a database connection to be effective.

This is a default clause when operating in the CLPPlus interface as well. **IMMEDIATE** need not be called when using CLPPlus processor.

#### MANUAL

Disables automatic tuning for the configuration parameter. The parameter is set to its current internal value and is no longer updated automatically.

**USING** config-keyword value

*config-keyword* specifies the database configuration parameter to be updated. *value* specifies the value to be assigned to the parameter.

#### **Examples**

# Update database configuration on partitioned database environment (multi-partition) instance

This example demonstrates how to update database configuration parameter **MAXAPPLS** from 10 to 50 for a database named SAMPLE.

In a partitioned database environment, a user has an instance that has 4 partitions as defined in the db2nodes.cfg:

10 gilera 0 20 gilera 1 30 motobi 0 40 motobi 1

The user has created the SAMPLE database on the instance. The catalog partition for SAMPLE is on dbpartitionnum 10. Let's assume the user is logged on to system motobi.

#### UPDATE DATABASE CONFIGURATION

Since the default behavior for an instance in a partitioned database environment is to update the database configurations on all database partitions, the following command issued by users will result in the same value for **MAXAPPLS** across all database partitions:

db2 update db cfg for sample using maxappls 50

To update **MAXAPPLS** only on dbpartitionnum 30, the following command may be issued:

db2 update db cfg for sample dbpartitionnum 30 using maxappls 50

### **Usage notes**

To view or print a list of the database configuration parameters, use the GET DATABASE CONFIGURATION command.

To reset all the database configuration parameters to the recommended defaults, use the RESET DATABASE CONFIGURATION command.

To change a database configuration parameter, use the UPDATE DATABASE CONFIGURATION command. For example, to change the logging mode to "archival logging" on a single-partition database environment containing a database called ZELLMART, use:

db2 update db cfg for zellmart using logretain recovery

To check that the **logretain** configuration parameter has changed, use: db2 get db cfg for zellmart

For example, to change the logging mode to "archival logging" on all partitions (provided the registry variable **DB2\_UPDDBCFG\_SINGLE\_DBPARTITION** is set, by default, to NULL or FALSE) in a multiple-partitioned database environment containing a database called "zellmart", use:

db2 update db cfg for zellmart using logretain recovery

To check that the **logretain** configuration parameter has changed on all database partitions, use:

db2\_all ";db2 get db cfg for zellmart"

Using the same example as above, but to update the logging mode to only one specific partition (30), use:

db2 update db cfg for zellmart dbpartitionnum 30 using logretain recovery

Optionally, you can leverage the SYSIBMADM.DBCFG view to get data from all partitions without having to use db2\_all.

If you are working on a UNIX operating system, and you have the grep command, you can use the following command to view only the **logretain** values: db2\_all ";db2 get db cfg for zellmart | grep -i logretain"

For more information about DB2 configuration parameters and the values available for each type of database node, see the individual configuration parameter descriptions. The values of these parameters differ for each type of database node configured (server, client, or server with remote clients).

Not all parameters can be updated.

#### UPDATE DATABASE CONFIGURATION

Some changes to the database configuration file become effective only after they are loaded into memory. All applications must disconnect from the database before this can occur. For more information on which parameters are configurable online and which ones are not, see summary list of configuration parameters.

For example, to change the **sortheap** database configuration parameter online for the SALES database, enter the following commands:

db2 connect to sales db2 update db cfg using sortheap 1000 db2 connect reset

If an error occurs, the database configuration file does not change. The database configuration file cannot be updated if the checksum is invalid. This might occur if the database configuration file is changed without using the appropriate command. If this happens, the database must be restored to reset the database configuration file.

# UPDATE DATABASE MANAGER CONFIGURATION

Modifies individual entries in the database manager configuration file.

# Authorization

SYSADM

## **Required connection**

None or instance. An instance attachment is not required to perform local DBM configuration operations, but is required to perform remote DBM configuration operations. To update the database manager configuration for a remote instance, it is necessary to first attach to that instance. To update a configuration parameter online, it is also necessary to first attach to the instance.

## **Command syntax**

# **Command parameters**

#### AUTOMATIC

Some configuration parameters can be set to AUTOMATIC, allowing DB2 to automatically adjust these parameters to reflect the current resource requirements. For a list of configuration parameters that support the **AUTOMATIC** keyword, refer to the configuration parameters summary. If a value is specified along with the **AUTOMATIC** keyword, it might influence the automatic calculations. For specific details about this behavior, refer to the documentation for the configuration parameter.

#### Note:

#### DEFERRED

Make the changes only in the configuration file, so that the changes take effect when the instance is restarted.

This is a default clause when operating in the CLPPlus interface. **DEFERRED** need not be called when using CLPPlus processor.

#### IMMEDIATE

Make the changes right now, dynamically, while the instance is running. **IMMEDIATE** is the default, but it requires an instance attachment to be effective.

#### MANUAL

Disables automatic tuning for the configuration parameter. The parameter is set to its current internal value and is no longer updated automatically.

#### **USING** config-keyword value

Specifies the database manager configuration parameter to be updated. For a list of configuration parameters, refer to the configuration parameters summary. *value* specifies the value to be assigned to the parameter.

#### Usage notes

To view or print a list of the database manager configuration parameters, use the GET DATABASE MANAGER CONFIGURATION command. To reset the database manager configuration parameters to the recommended database manager defaults, use the RESET DATABASE MANAGER CONFIGURATION command. For more information about database manager configuration parameters and the values of these parameters appropriate for each type of database node configured (server, client, or server with remote clients), see individual configuration parameter descriptions.

Not all parameters can be updated.

Some changes to the database manager configuration file become effective only after they are loaded into memory. For more information on which parameters are configurable online and which ones are not, see the configuration parameter summary. Server configuration parameters that are not reset immediately are reset during execution of db2start. For a client configuration parameter, parameters are reset the next time you restart the application. If the client is the command line processor, it is necessary to invoke TERMINATE.

For example, to change the **DIAGLEVEL** database manager configuration parameter online for the eastern instance of the database manager, enter the following command:

db2 attach to eastern db2 update dbm cfg using DIAGLEVEL 1 db2 detach

If an error occurs, the database manager configuration file does not change.

The database manager configuration file cannot be updated if the checksum is invalid. This can occur if you edit database manager configuration file and do not use the appropriate command. If the checksum is invalid, you must reinstall the database manager to reset the database manager configuration file.

When you update the **SVCENAME**, or **TPNAME** database manager configuration parameters for the current instance, if LDAP support is enabled and there is an LDAP server registered for this instance, the LDAP server is updated with the new value or values.

# UPDATE HEALTH NOTIFICATION CONTACT LIST

Updates the contact list for notification about health alerts issued by an instance.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

# **Required Connection**

Instance. An explicit attachment is not required.

# **Command Syntax**

# **Command Parameters**

#### ADD GROUP name

Add a new contact group that will notified of the health of the instance.

#### ADD CONTACT name

Add a new contact that will notified of the health of the instance.

#### **DROP GROUP** name

Removes the contact group from the list of contacts that will notified of the health of the instance.

## DROP CONTACT name

Removes the contact from the list of contacts that will notified of the health of the instance.
## **UPDATE HISTORY**

Updates the location, device type, comment, or status in a database history records entry.

## **Authorization**

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT
- DBADM

## **Required connection**

Database

## **Command syntax**

## **Command parameters**

#### FOR object-part

Specifies the identifier for the history entry to be updated. It is a time stamp with an optional sequence number from 001 to 999. This parameter cannot be used to update the entry status. To update the entry status, specify an EID instead.

### EID eid

Specifies the history entry ID.

## **LOCATION** new-location

Specifies the new physical location of a backup image. The interpretation of this parameter depends on the device type.

## **DEVICE TYPE** *new-device-type*

Specifies a new device type for storing the backup image. Valid device types are:

- D Disk
- K Diskette
- T Tape
- A Tivoli Storage Manager
- F Snapshot backup
- U User exit
- P Pipe
- N Null device

- X XBSA
- **Q** SQL statement
- O Other
- **COMMENT** new-comment

Specifies a new comment to describe the entry.

#### **STATUS** new-status

Specifies a new status for an entry. Only backup entries can have their status updated. Valid values are:

- A Active. The backup image is on the active log chain. Most entries are active.
- I Inactive. Backup images that no longer correspond to the current log sequence, also called the current log chain, are flagged as inactive.
- E Expired. Backup images that are no longer required, because there are more than NUM\_DB\_BACKUPS active images, are flagged as expired.
- **D** Deleted. Backup images that are no longer available for recovery should be marked as having been deleted.
- X Do not delete. Recovery database history records file entries that are marked DB2HISTORY\_STATUS\_DO\_NOT\_DELETE will not be pruned by calls to the PRUNE HISTORY command, running the ADMIN\_CMD procedure with PRUNE HISTORY, calls to the db2Prune API, or automated recovery database history records pruning. You can use the DB2HISTORY\_STATUS\_DO\_NOT\_DELETE status to protect key recovery file entries from being pruned and the recovery objects associated with them from being deleted. Only log files, backup images, and load copy images can be marked as DB2HISTORY\_STATUS\_DO\_NOT\_DELETE.

## Example

To update the database history records entry for a full database backup taken on April 13, 1997 at 10:00 a.m., enter:

```
db2 update history for 19970413100000001 with location /backup/dbbackup.1 device type d
```

### Usage notes

The primary purpose of the database history records is to record information, but the data contained in the history is used directly by automatic restore operations. During any restore where the **AUTOMATIC** option is specified, the history of backup images and their locations will be referenced and used by the restore utility to fulfill the automatic restore request. If the automatic restore function is to be used and backup images have been relocated since they were created, it is recommended that the database history record for those images be updated to reflect the current location. If the backup image location in the database history is not updated, automatic restore will not be able to locate the backup images, but manual restore commands can still be used successfully.

## UPDATE LDAP NODE

Updates the protocol information associated with a node entry that represents the DB2 server in Lightweight Directory Access Protocol (LDAP).

## Authorization

None

## **Required connection**

None

## **Command syntax**

► UPDATE LDAP—NODE—nodename—	
HOSTNAME	
_	hostname
	IP address_
▶	→
▶	▶◀
LISER—username	
PASSWORD_password_	
1100110110 - pubblichu	

## **Command parameters**

#### **NODE** nodename

Specifies the node name when updating a remote DB2 server. The node name is the value specified when registering the DB2 server in LDAP.

## **HOSTNAME** *hostname* | *IP address*

Specifies the TCP/IP host name or IP address.

- If it is a TCPIP node, the host name will be resolved to an IPv4 or IPv6 address.
- If it is a TCPIP4 node, the host name will be resolved to an IPv4 address only.
- If it is a TCPIP6 node, the host name will be resolved to an IPv6 address only.

## **SVCENAME** sucename

Specifies the TCP/IP service name or port number.

#### WITH "comments"

Describes the DB2 server. Any comment that helps to describe the server registered in the network directory can be entered. Maximum length is 30 characters. A carriage return or a line feed character is not permitted. The comment text must be enclosed by double quotation marks.

#### **USER** username

Specifies the user's LDAP distinguished name (DN). The LDAP user DN must have sufficient authority to create and update the object in the LDAP directory. If the user's LDAP DN is not specified, the credentials of the current logon user will be used.

## **UPDATE LDAP NODE**

PASSWORD *password* Account password.

## **UPDATE MONITOR SWITCHES**

Turns one or more database monitor recording switches on or off. When the database manager starts, the settings of the six switches are determined by the **dft\_mon** database manager configuration parameter.

The database monitor records a base set of information at all times. Users who require more than this basic information can turn on the appropriate switches, but at a cost to system performance. The amount of information available in output from the GET SNAPSHOT command reflects which, if any, switches are on.

## Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

## **Required connection**

Instance or database:

- If there is neither an attachment to an instance, nor a connection to a database, a default instance attachment is created.
- If there is both an attachment to an instance, and a database connection, the instance attachment is used.

To update the monitor switches at a remote instance (or a different local instance), it is necessary to first attach to that instance.

## **Command syntax**

## **Command parameters**

**USING** switch-name

-GLOBAL-

The following switch names are available:

#### BUFFERPOOL

Buffer pool activity information

- LOCK Lock information
- SORT Sorting information

#### STATEMENT

SQL statement information

## TABLE

Table activity information

## TIMESTAMP

Monitoring timestamp information

**UOW** Unit of work information.

#### **AT DBPARTITIONNUM** *db-partition-number*

Specifies the database partition for which the status of the monitor switches is to be displayed.

#### GLOBAL

Returns an aggregate result for all database partitions in a partitioned database environment.

## **Usage notes**

Information is collected by the database manager only after a switch is turned on. The switches remain set until db2stop is issued, or the application that issued the UPDATE MONITOR SWITCHES command terminates. To clear the information related to a particular switch, set the switch off, then on.

Updating switches in one application does not affect other applications.

To view the switch settings, use the GET MONITOR SWITCHES command.

## **Compatibilities**

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

## **UPDATE XMLSCHEMA**

Updates one XML schema with another in the XML schema repository (XSR).

## Authorization

One of the following:

- dbadm
- SELECT privilege on the catalog views SYSCAT.XSROBJECTS and SYSCAT.XSROBJECTCOMPONENTS and one of the following sets of privileges:
  - ALTERIN privilege on the XML schema to be updated and DROPIN privilege on the new XML schema, if the DROP NEW SCHEMA option is specified.
  - OWNER of the XML schema specified by xmlschema1.

## **Required connection**

Database

## **Command syntax**

►►—UPDATE XMLSCHEMA—*xmlschema1*—WITH—*xmlschema2*-

LDROP NEW SCHEMA

## **Command parameters**

## UPDATE XMLSCHEMA xmlschema1

Specifies the SQL identifier for the original XML schema to be updated.

### WITH xmlschema2

Specifies the SQL identifier for the new XML schema that will be used to update the original XML schema.

### DROP NEW SCHEMA

Indicates that the new XML schema should be dropped after it is used to update the original XML schema.

## Example

UPDATE XMLSCHEMA JOHNDOE.OLDPROD WITH JOHNDOE.NEWPROD DROP NEW SCHEMA

The contents of the XML schema JOHNDOE.OLDPROD is updated with the contents of JOHNDOE.NEWPROD, and the XML schema JOHNDOE.NEWPROD is dropped.

## **Usage notes**

- The original and new XML schema must be compatible. For details about the compatibility requirements, see "Compatibility requirements for evolving an XML schema".
- Before an XML schema can be updated, both the original an the new schema must be registered in the XML schema repository (XSR).

## UPGRADE DATABASE

Converts a DB2 database of the previous version to the formats corresponding to the release run by the instance.

The db2ckupgrade command must be issued prior to upgrading the instance to verify that your databases are ready for upgrade. The db2iupgrade command implicitly calls the db2ckupgrade. Backup all databases prior to upgrade, and prior to the installation of the current version of DB2 database product on Windows operating systems.

### Authorization

SYSADM

## **Required connection**

This command establishes a database connection.

### Command syntax

USER—username—\_\_\_\_\_USING—password\_\_\_\_

## **Command parameters**

#### **DATABASE** database-alias

Specifies the alias of the database to be upgraded to the currently installed version of the database manager.

**USER** username

Identifies the user name under which the database is to be upgraded.

**USING** password

The password used to authenticate the user name. If the password is omitted, but a user name was specified, the user is prompted to enter it.

## Examples

The following example upgrades the database cataloged under the database alias sales:

db2 UPGRADE DATABASE sales

#### Usage notes

This command will only upgrade a database to a newer version, and cannot be used to convert an upgraded database to its previous version.

The database must be cataloged before upgrade.

If an error occurs during upgrade, it might be necessary to issue the TERMINATE command before attempting the suggested user response. For example, if a log full error occurs during upgrade (SQL1704: Database upgrade failed. Reason code "3".),

## **UPGRADE DATABASE**

it will be necessary to issue the TERMINATE command before increasing the values of the database configuration parameters **logprimary** and **logfilsiz**. The CLP must refresh its database directory cache if the upgrade failure occurs after the database has already been relocated (which is likely to be the case when a "log full" error returns).

## **UPGRADE DATABASE**

# **Chapter 6. CLPPlus commands**

The CLPPlus feature includes many commands which provide extensive user control, customization, and personalization.

**Note:** Unless otherwise specified, CLPPlus command names and parameters are not case-sensitive; you can specify uppercase or lowercase letters.

The . CLPPlus command is similar to a No Operation Performed (NOOP or NOP) machine language command. It is ignored when entered on its own with no other CLPPlus command.

## Invocation

You must run this command from the CLPPlus interface or from within a CLPPlus script file.

•

## **Authorization**

None

## **Required connection**

None

## **Command syntax**

The / CLPPlus command reruns the last command run in the current CLPPlus session.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

1

## **Required connection**

None

## **Command syntax**

▶▶—/-

## Example

The following example shows the / command rerunning the last SELECT statement run within CLPPlus:

-

The @ CLPPlus command is an alias for the START CLPPlus command. It can be used to run a CLPPlus script file.

### Invocation

You must run this command from the CLPPlus interface.

### Authorization

None

## **Required connection**

None

#### Command syntax

▶ — @ — script-file —

## **Command parameters**

script-file

Specifies the script file name that contains SQL statements and commands to run.

### Example

A script called employee\_count.sql contains the following lines:

ACCEPT dept\_id PROMPT "Enter Department ID code : " SELECT COUNT(\*) FROM employee WHERE workdept = &dept\_id;

The @ command can be used to run the script as follows:

```
SQL> @ employee_count
Enter Department ID code : 'E21'
```

```
Original statement:SELECT AVG(salary) FROM employee WHERE workdept = &dept_id
New statement with substitutions:SELECT AVG(salary) FROM employee WHERE workdept = 'E21'
1
```

@

## @@

The @@ CLPPlus command is an alias for the START CLPPlus command. It can only be used from within a CLPPlus script file to call and run another CLPPlus script file.

## Invocation

You must run this command from within a CLPPlus script.

## Authorization

None

## **Required connection**

None

## **Command syntax**

▶ — @@—script-file-

## **Command parameters**

script-file

Specifies the script file name that contains SQL statements and commands to run.

## Example

A script called dept\_details.sql calls another script called employee\_count.sql. The contents of dept\_details.sql follows:

ACCEPT dept\_id PROMPT "Enter Department ID code : " 00 employee\_count &dept\_id

▶∢

## ACCEPT

The ACCEPT CLPPlus command creates a variable with a specified name. Values can be assigned to this variable interactively in the CLPPlus interface or via a parameter read as part of a script being run. The ACCEPT command is useful for storing values that you commonly use in SQL statements or in the SQL buffer.

Output of the command is by default displayed to the standard output of the CLPPlus interface.

## Invocation

You must run this command from the CLPPlus interface or from within a CLPPlus script file.

## Authorization

None

## **Required connection**

None

## Command syntax

## **Command parameters**

#### variable-name

Defines the variable name. You cannot use special symbols and characters such as the forward slash (/) or at sign (@).

When you issue the ACCEPT command, you are prompted for the value of *variable-name*.

#### **FORMAT** format-string

Defines the format assigned to the variable. The value you attempt to assign to the variable must follow the format outlined.

#### **DEFAULT** default-value

The default value defined with this option is assigned to the variable when a user hits the ENTER key and does not provide any value when prompted.

#### **PROMPT** text

The value defined with this option is displayed in the prompt when the ACCEPT command is entered.

#### HIDE

When **HIDE** is specified, the value entered by the user is not echoed on the console.

## Example

In the following example, the ACCEPT command creates a variable named my\_name and prompts for a value. The value John Smith is stored in this variable. The DEFINE command displays the value of the variable.

SQL> ACCEPT my\_name Enter value for my\_name: John Smith SQL> DEFINE my\_name DEFINE my\_name = "John Smith"

The following example shows all the options used in the ACCEPT command.

SQL> ACCEPT lname FORMAT A10 DEFAULT 'Joy' PROMPT 'Enter Last Name [Joy]:' HIDE

The **FORMAT** option specifies that the value for lname is alphanumeric and 10 characters in length. The **DEFAULT** used if the user does not provide a value when prompted and instead hits the ENTER key is JOY. The prompt at the command line when the ACCEPT command is issued is as defined: Enter Last Name [JOY]:. In this case the default is included as part of the prompt. The **HIDE** option does not echo what the user enters as the value for lname on the console.

The following example shows the ACCEPT command being used in a CLPPlus script file and the different methods in which a value can be assigned to the defined variable. Consider the following script named average\_salary.sql which finds the average salary of an employee in the given department:

ACCEPT dept\_id PROMPT "Enter Department ID code : " SELECT AVG(salary) FROM employee WHERE workdept = &dept\_id;

The script can be called in two different ways, with and without arguments.

When called with arguments, the variable is assigned the value of the argument passed at the time of invocation:

SQL> start average\_salary 'E21'

Original statement:SELECT AVG(salary) FROM employee WHERE workdept = &dept\_id New statement with substitutions:SELECT AVG(salary) FROM employee WHERE workdept = 'E21'

```
47086.666666666666666666666666666666
```

When called without arguments, the user interaction is required to assign a value to the variable:

SQL> start average\_salary Enter Department ID code : 'E21'

Original statement:SELECT AVG(salary) FROM employee WHERE workdept = &dept\_id New statement with substitutions:SELECT AVG(salary) FROM employee WHERE workdept = 'E21'

```
1
```

## APPEND

The APPEND CLPPLus command adds text to the end of the current line in the SQL buffer. You can use this command to build commands and statements in the SQL buffer.

## Invocation

This is a line editor command and can be used to build commands in the SQL buffer.

## Authorization

None

### **Required connection**

None

#### Command syntax

## **Command parameters**

text-string

Specifies a string of characters to append. The string can include spaces and special characters. The case of the string is preserved.

#### Examples

In the following example, the APPEND command appends the string this text is appended. to the end of the current line in the SQL buffer: APPEND this text is appended.

The following example shows how you can use the APPEND command to build a SELECT statement in the SQL buffer. Two spaces are placed between the APPEND command and the WHERE clause to separate DEPT and WHERE by one space in the SQL buffer.

```
SQL> APPEND SELECT * FROM DEPT
SQL> LIST
1* SELECT * FROM DEPT
SQL> APPEND WHERE DEPTNO = 10
SQL> LIST
1* SELECT * FROM DEPT WHERE DEPTNO = 10
```

The LIST command displays the contents of the SQL buffer as the SQL statement is being built.

## BREAK

The BREAK CLPPlus command inserts a page break or blank lines at the specified point in a result set.

## Invocation

You must run this command from the CLPPlus interface.

## **Authorization**

None

## **Required connection**

You must be connected to a database.

## **Command syntax**

## **Command parameters**

```
column-name
```

Specifies the column used to determine a break.

### **SKIP PAGE** | *number-of-lines*

Where *number-of-lines* is an integer.

When **SKIP PAGE** is appended to the command the output breaks and continues on the next page. When **SKIP** *number-of-lines* is appended to the command, the output breaks and blanks lines equal to the *number-of-lines* specified are inserted in the result set.

## Example

In the following example, when the SELECT statement is invoked and the value of WORKDEPT changes from one row to another, the BREAK command is invoked and the action specified is performed. In this case, since **SKIP PAGE** was specified, the next row will be printed on the next page skipping the remainder of the current page.

```
SQL> BREAK ON WORKDEPT SKIP PAGE;
SQL> SELECT * FROM EMPLOYEE ORDER BY WORKDEPT;
```

In the following example, in addition to the behavior of the preceding example, every time the value in the JOB column changes, 2 blank lines are printed on the display.

SQL> BREAK ON WORKDEPT SKIP PAGE; SQL> BREAK ON JOB SKIP 2; SQL> SELECT \* FROM EMPLOYEE ORDER BY WORKDEPT, JOB;

## BTITLE

The BTITLE CLPPlus command inserts text at the bottom of each page displayed.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

### **Required connection**

None

## Command syntax

## **Command parameters**

#### text

Specifies the text to be displayed.

#### CENTER

Specifies the display will center justify the text on each page. If neither **CENTER**, **LEFT**, or **RIGHT** is specified, center justification is the default behavior.

### LEFT

Specifies the display will left justify the text on each page.

#### RIGHT

Specifies the display will right justify the text on each page.

#### PGNO

Specifies the current page number.

#### variable-name

Specifies a user defined variable that will follow the *text* field.

#### **SKIP** integer-value

The *integer-value* value specifies the number of blank lines displayed after the bottom title.

### Example

In the following example, the DEPT: (with the variable contents), CONFIDENTIAL, and Page No: (with the current page number) is displayed across the bottom of every page. Three blank lines follows the bottom title.

SQL> BREAK ON workdept SKIP PAGE;

SQL> COLUMN workdept OLD\_VALUE old\_dept;

SQL> BTITLE LEFT 'DEPT: ' old\_dept, CENTER 'CONFIDENTIAL, RIGHT 'Page No: ' PGNO SKIP 3;

In the following example, the Page No: title (with the current page number) is displayed across the bottom of every page with right justification. Two blank lines follow the bottom title.

SQL> BTITLE RIGHT 'Page No: ' PGNO SKIP 2;

## CHANGE

The CHANGE CLPPlus command modifies specified content in the SQL buffer. If you set the buffer reader to a specific line in the buffer, the command modifies only the specified content in that line.

#### Invocation

This is a line-editor command used to modify fields in the SQL buffer.

#### Authorization

None

#### **Required connection**

None

### **Command syntax**

## **Command parameters**

#### search-string

Defines the text in the SQL buffer to be replaced or deleted. If the buffer contains more than one line of text, specify the line to be modified by entering the line number at the prompt before you run the CHANGE command.

If the text to search for contains an asterisk (\*), enclose the asterisk in single quotation marks.

#### replacement-string

Specifies the replacement text or specifies that text is to be removed. If you specify a value for *replacement-string*, the first occurrence of the value of *search-string* is replaced with the value of *replacement-string*. If you do not specify a value for *replacement-string*, the first occurrence of the value of *search-string* is removed.

If the replacement text contains an asterisk (\*), enclose the asterisk in single quotation marks.

#### Examples

In the following example, the LIST command displays the contents of the buffer. At the SQL prompt, 3 is entered to move the buffer reader to the start of the third line in the buffer. The third line becomes the new current line, as indicated by an asterisk. The CHANGE command then replaces the occurrence of the string 20 with the string 30. The LIST command then displays the modified text within the buffer.

```
SQL> LIST
1 SELECT EMPNO, ENAME, JOB, SAL, COMM
2 FROM EMP
3 WHERE DEPTNO = 20
4* ORDER by EMPNO
SQL> 3
3* WHERE deptno = 20
```

SQL> CHANGE /20/30/ 3\* WHERE DEPTNO = 30 SQL> LIST 1 SELECT EMPNO, ENAME, JOB, SAL, COMM 2 FROM EMP 3\* WHERE DEPTNO = 30 4 ORDER by EMPNO

In the following example, the buffer contains the following single statement: SQL> SELECT EMPNO FROM EMPLOYEE

To change the statement so that EMPNO is replaced with \*, 1 is entered to move the buffer reader to the start of the first line in the buffer. The following CHANGE command is issued:

SQL> CHANGE /empno/'\*'/

The output of the command is as follows:

1\* SELECT \* FROM EMPLOYEE

The command output displays the line number followed by the new content for that line.

## CLEAR

The CLEAR CLPPlus command removes the contents of the SQL buffer, deletes all column definitions set by the COLUMN command, or clears the screen.

## Invocation

You must run this command from the CLPPlus interface.

### Authorization

None

## **Required connection**

None

#### Command syntax

	SCREEN	
<b>&gt;&gt;</b>	 	
	-BREAKS	
	-BREONcolumn	
	BUFFER	
	-BUF	
	COL	
	-COMPUTES	
	-COMP	
	-VARIABLES	
	L_VAR	

## **Command parameters**

#### SCREEN | SCR

Removes all SQL commands, data currently displayed, and CLPPlus messages from the screen. When the CLEAR command is entered with no options, the default behavior clears the screen.

## BREAKS | BRE ON column

Clears all breaks when no column is specified. When a column is specified, the break associated with that column is cleared, all other breaks are left intact.

#### BUFFER | BUF and SQL

Deletes all text in the SQL buffer. You must specify both the **BUFFER** parameter (or the **BUF** parameter) and the **SQL** parameter.

#### COLUMNS | COL

Removes column definitions in the SQL buffer.

### **COMPUTES | COMP ON** column

Clears all compute definitions when no column is specified. When a column is

specified, the compute definition associated with that column is cleared, all other compute definitions are left intact.

## VARIABLES | VAR

Clears all defined bind variables.

## COLUMN

The COLUMN CLPPlus command specifies character and numeric output formats for columns in a table. Formats set by the COLUMN command remain in effect only for the duration of the current session. You can change or clear format settings for the same column more than once in the current session.

When you issue COLUMN for a specified column in a database, format settings are by default displayed using the standard output of the CLPPlus interface.

#### Invocation

This command must be executed from the CLPPlus interface.

## Authorization

None

#### **Required connection**

None

## Command syntax

## **Command parameters**

column

Specifies the name of a table column to which formats are applied. If you do not specify any parameters after *column*, default format settings apply. If you do not specify any parameters after *column*, and you have set parameters for the same column previously in this session, the last set of parameters assigned to the column are again used.

#### **ALIAS** alias-name

Specifies and alias name for *column*. The maximum length of *alias-name* is 255 characters. The alias can be used in other commands such as: COMMAND, COMPUTE, and COLUMN.

#### CLEAR | CLE

Changes all formatting settings for the specified column to their default values. If you specify **CLEAR**, you cannot specify any parameters other than *column*.

#### **FORMAT** | **FOR** spec

Specifies the formats to apply to the specified column. There are two types of columns: character columns and numeric columns.

For a character column, the value of *spec* is *An*, where *n* specifies the number of characters that can be used to display the column. The data wraps if it is wider than the specified width.

For numeric columns, the value of *spec* can be one or more of the following characters:

- **\$** Displays a leading dollar sign.
- Displays a comma at the indicated position.
- Displays a decimal point at the indicated position.
- **0** Displays a zero at the indicated position.
- 9 Displays a significant digit at the indicated position.

If loss of significant digits occurs due to overflow of the format settings, the # character will be displayed.

#### **HEADING** | **HEA** text

Specifies a heading for the specified column.

#### FOLD\_BEFORE

Before printing the values for the specified column, new line feed and carriage return are provided for each row.

#### FOLD\_AFTER

After printing the values for the specified column, new line feed and carriage return are provided for each row.

#### **LIKE** source-column

The format and display attributes of *source-column* are applied to *column*.

#### NEWLINE

A synonym of **FOLD\_AFTER**. After printing the values for the specified column, new line feed and carriage return are provided for each row.

#### **NEW\_VALUE** variable\_name

Defines a variable that can hold the new value for a break column defined using the BREAK command. The variable can be used with page top title TTITLE command. The break column must be defined with the SKIP PAGE action.

#### NULL text

When the value for the specified column is NULL, the value specified for *text* is printed. The maximum length of *text* is 255 characters.

#### **OLD\_VALUE** variable\_name

Defines a variable that can hold the old value for a break column defined using the BREAK command. The variable can be used with page bottom title BTITLE command. The break column must be defined with the SKIP PAGE action.

#### PRINT | NOPRINT

Specifies whether console printing of a specified column is enabled or disabled.

#### WRAPPED | TRUNCATED

Specifies if column data is wrapped or truncated in the CLPPlus output if it exceeds the specified format.

#### JUSTIFY [LEFT | RIGHT | CENTER]

Specifies column justification to be either LEFT, RIGHT, or CENTER.

#### OFF

Changes the formatting options to the default values. The values that you previously specified for the column in the session are saved and still available for use later in the session.

#### ON

Changes the formatting options to the values applied to the specified column the last time that you ran COLUMN.

## Examples

In the following example, the SET PAGESIZE command sets the maximum page length to 9999, and the COLUMN command changes the display width of the JOB column to five characters. The SELECT statement then prints specified columns in the table.

```
SQL> SET PAGESIZE 9999
SQL> COLUMN JOB FORMAT A5
SQL> COLUMN JOB
COLUMN
          JOB
                  ON
FORMAT
          Α5
WRAPPED
SQL> SELECT EMPNO, ENAME, JOB FROM EMP;
EMPNO ENAME
                   JOB
-----
                  ____
 7369
       SMITH
                   CLERK
 7499 ALLEN
                   SALES
                   MAN
 7521 WARD
                  SALES
                   MAN
 7566 JONES
                   MANAG
                   ER
 7654 MARTING
                   SALES
                   MAN
 7698 BLAKE
                   MANAG
                   ER
 7782 CLARK
                   MANAG
                   FR
 7788 SCOTT
                   ANALY
                   ST
 7839 KING
                   PRESI
                   DENT
 7844 TURNER
                   SALES
                   MAN
 7876 ADAMS
                   CLERK
       JAMES
 7900
                   CLERK
 7902 FORD
                   ANALY
                   ST
 7934 MILLER
                   CLERK
```

14 rows received.

In the following example, the COLUMN command applies a numeric format to the SAL column:

## COLUMN

SQL> COLUMN SAL FORMAT \$99,999.00 SQL> COLUMN COLUMN JOB ON FORMAT Α5 WRAPPED COLUMN SAL ON FORMAT \$99,999.00 WRAPPED SQL> SELECT EMPNO, ENAME, JOB, SAL FROM EMP; JOB EMPNO ENAME SAL ----- ------7369 SMITH CLERK \$800.00 7499 ALLEN SALES \$1,600.00 MAN 7521 WARD SALES \$1,250.00 MAN 7566 JONES MANAG \$2,975.00 ER 7654 MARTIN SALES \$1,250.00 MAN MANAG 7698 BLAKE \$2,850.00 ER 7782 CLARK MANAG \$2,450.00 ER 7788 SCOTT ANALY \$3,000.00 ST 7839 KING PRESI \$5,000.00 DENT 7844 TURNER SALES \$1,500.00 MAN 7876 ADAMS CLERK \$1,100.00 7900 JAMES CLERK \$950.00 7902 FORD ANALY \$3,000.00 ST 7934 MILLER CLERK \$1,300.00

14 rows retrieved.

## COMPUTE

The COMPUTE CLPPlus command executes a specified function on the aggregate values of a defined column. The command works in conjunction with the BREAK CLPPlus command.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

You must be connected to a database.

## Command syntax

## **Command parameters**

## SUM

The SUM function adds the aggregate values on the column specified.

#### MIN

The MIN function returns the smallest of the aggregate values on the column specified.

#### MAX

The MAX function returns the largest of the aggregate values on the column specified.

### AVG

The AVG function returns the average of the aggregate values on the column specified.

#### COUNT

The COUNT function counts the number of non-null values on the column specified.

#### NUM

The NUM function returns the number of aggregate rows processed on the column specified.

#### STD

The STD function returns the standard deviation of the aggregate values on the column specified.

## VAR

The VAR function returns the variance of the aggregate values on the column specified.

### LABEL text

Defines the text label that precedes the output of the function specified.

#### column1

Specifies the column on which the function is executed.

#### column2

Specifies the column on which the BREAK command is executed against.

### Example

The following example highlights the usage of the COMPUTE command in conjunction with the BREAK command.

```
SQL> BREAK ON WORKDEPT SKIP 2;
SQL> COMPUTE AVG LABEL "Average" OF SALARY ON WORKDEPT;
SQL> COMPUTE MAX LABEL "Maximum" OF SALARY ON WORKDEPT;
SQL> SELECT WORKDEPT, EMPNO, SALARY FROM EMPLOYEE ORDER BY WORKDEPT;
```

Here is the output of the commands in the example.

WORKDEPT	EMPNO	SALARY
A01	00100	75000.00
A01	00101	80000.00
A01	00102	70000.00
******		
Average		75000.00
Maximum		80000.00
A02	00103	80000.00
A02	0010/	00000 00
	00104	90000.00
A02	00104	85000.00
A02 *******	00105	90000.00 85000.00
A02 ******* Average	00104	85000.00

## CONNECT

The CONNECT CLPPlus command changes the user ID connected to a database, connects to a different database, or does both. The command also displays the result of the change.

### Invocation

This command can be executed from the CLPPlus interface.

#### Authorization

None

### **Required connection**

None

#### **Command syntax**

### connection\_identifier:

## **Command parameters**

Do not include spaces between any of the parameters.

user

Specifies the user ID to connect to the database.

#### password

Specifies the password that corresponds to the user ID.

#### hostname

Specifies the name of the computer on which the database is located. For example, for a computer named ascender, specify @ascender.

#### port

Specifies the port number receiving connections on the computer where the database server is installed. The default is 50000.

database

Specifies the database name to which the connection is made. The default is SAMPLE.

/ Specifies the current operating system login user ID is used to connect to the database.

dsn\_alias

Specifies that the database connection information be picked up from the db2dsdriver.cfg file from the dsn with alias name *dsn\_alias*. If the specified

*dsn\_alias* is not found in the db2dsdriver.cfg file, the string *dsn\_alias* is used as a database name and all other connection parameters are obtained interactively.

## Examples

In the following example, the database connection is changed to database DB2 on the local host at port 5445 with user name smith:

```
SQL> CONNECT smith/mypassword@localhost:5445/db2
Connected to CLPlus 1.1.0.10 (localhost:5445/db2) AS smith
```

In the same session, the connection is changed to username CLPPlus. For this connection, localhost, 5444, and DB2 are maintained as the host, port, and database values respectively.

```
SQL> CONNECT CLPPlus/password
Connected to CLPPlus 1.1.0.10 (localhost:5444/db2) AS CLPPlus
```

The following example attempts to connect to a database by first locating a db2dsdriver.cfg file. If one is found, the default\_dsn is read for the host, port, and database values. The current log on ID is used in the connection attempt. If no db2dsdriver.cfg file is found, all required parameters are requested interactively. SQL> CONNECT /

The following example attempts to connect to a database by fetching the parameters from the data\_dsn alias in the db2dsdriver.cfg file. The db2admin user ID is used in the connection. Any parameters that cannot be read are requested interactively.

SQL> CONNECT db2admin@data\_dsn

## COPY

The COPY CLPPlus command copies data from a source database and table to a target database and table.

## Invocation

You must run this command from the CLPPlus interface or from within a CLPPlus script file.

## Authorization

None

## **Required connection**

None

### **Command Syntax**

#### srcdb, destdb:

connection\_identifier:

## **Command parameters**

#### FROM srcdb

Defines the connection details and database name from which the data will be copied.

**Note:** Either one, or both, of the FROM or TO parameters must be specified in the COPY command. If FROM is not specified, and TO is specified, the database you are currently connected to, if a connection exists, will be used for the source database.

#### TO destdb

Defines the connection details and database name which the data will be copied into.

**Note:** Either one, or both, of the FROM or TO parameters must be specified in the COPY command. If TO is not specified, and FROM is specified, the database you are currently connected to, if a connection exists, will be used for the target database.

#### APPEND

Inserts data into the *dest\_table*. If *dest\_table* does not exist, the table is created and the data is inserted.

#### CREATE

Creates *dest\_table* and inserts the data. If *dest\_table* already exists, an error is returned.

#### INSERT

Inserts data into the *dest\_table*. If *dest\_table* does not exist, an error is returned.

#### REPLACE

If *dest\_table* exists, it will be dropped, recreated, and then data is inserted.

#### dest\_table

Target database table into which data is inserted.

#### query

The SQL query used to get the data from the source database.

#### user

Specifies the user ID to connect to the database.

#### password

Specifies the password that corresponds to the user ID.

#### hostname

Specifies the name of the computer on which the database is located. For example, for a computer named ascender, specify @ascender.

#### port

Specifies the port number receiving connections on the computer where the database server is installed. The default is 50000.

#### database

Specifies the database name to which the connection is made. The default is SAMPLE.

#### dsn\_alias

Specifies that the database connection information be picked up from the db2dsdriver.cfg file from the dsn with alias name *dsn\_alias*. If the specified *dsn\_alias* is not found in the db2dsdriver.cfg file, the string *dsn\_alias* is used as a database name and all other connection parameters are obtained interactively.

## Example

The following command copies the rows in the emp table in the db1 database into the emp table in the db2 database.

COPY FROM u1@db1 TO u2@db2 INSERT emp USING SELECT \* FROM emp;

## DEFINE

The DEFINE CLPPlus command creates a user variable, also called a substitution variable, and specifies its value. The command also displays the value of one or more user variables.

### Invocation

This command must be executed from the CLPPlus interface.

#### Authorization

None

#### **Required connection**

None

### **Command syntax**

## **Command parameters**

variable

Specifies the name of a variable. If you specify *variable* without *text*, the name of the variable and its value are displayed. If you do not specify *variable*, the names of all variables and their values are displayed.

text

Specifies text to assign to the variable specified by *variable*. If the text contains spaces, you must enclose it in double or single quotation marks. If the text does not contain spaces, quotation marks are optional.

## Example

In the following example, the DEFINE command defines the DB2, DEPT, and NAME variables and then displays the values of all variables:

SQL> DEFINE DEPT = 20 SQL> DEFINE NAME = 'John Smith' SQL> DEFINE NAME = 'localhost:5445/edb' SQL> DEFINE DEFINE DB2 = "localhost:5445/edb" DEFINE DEPT = "20" DEFINE NAME = "John Smith"
The DEL command deletes one or more lines from the SQL buffer.

## Invocation

This command must be executed from the CLPPlus interface.

### Authorization

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

You can use the parameters to specify the start and end of a range of lines to delete from the SQL buffer. If you do not specify any parameters, the current line is deleted.

*n* Specifies a line number.

n m

Specifies two line numbers, where the value of m is greater than the value of n.

\* Indicates the current line.

### LAST | L

Indicates the last line in the SQL buffer.

## Example

In the following example, the fifth line, containing column SAL, and the sixth line, containing column COMM, are deleted from the SELECT statement in the SQL buffer:

SQL> LIST 1 SELECT 2 EMPNO 3 ,ENAME 4 ,JOB 5 ,SAL 6 ,COMM 7 ,DEPTNO 8\* FROM EMP SQL> DEL 5 6 SQL> LIST 1 SELECT 2 EMPNO 3 ,ENAME 4 ,JOB 5 ,DEPTNO 6\* FROM EMP

The contents of line 7 becomes the contents of line 5, and the contents of line 8 becomes the contents of line 6. The contents of the current line have not changed, but the current line, marked with an asterisk, has changed from line 8 to line 6.

# DESCRIBE

The DESCRIBE CLPPlus command displays a list of columns and their data types and lengths for a table view; a list of parameters for a procedure or function; or a list of procedures and functions and their parameters for a package.

## Invocation

You can run this command from the CLPPlus interface.

## **Authorization**

None

## **Required connection**

You must be connected to a database.

## **Command syntax**

## **Command parameters**

schema

Specifies the name of the schema containing an object to be described.

object

Specifies the name of a table, view, procedure, function, or package to be described.

# DISCONNECT

The DISCONNECT CLPPlus command closes the current database connection but does not exit the CLPPlus session.

▶∢

## Invocation

You can run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

You must be connected to a database.

## **Command syntax**

►►\_\_\_DISCONNECT\_\_\_

# EDIT

The EDIT CLPPlus command invokes an external editor to make large changes to the contents of a file or the SQL buffer.

CLPPlus reads the **EDITOR** and **PATH** system environment variables to establish which external editor is used when the EDIT command is invoked. Any editor of your choice can specified in the **EDITOR** system environment variable provided it is installed on the system. The location of the binary for the external editor specified in the **EDITOR** system environment variable location must be included in your **PATH** system environment variable. If these variables are not set or not set properly, the default editor used on Windows operating systems is Notepad, and on UNIX and Linux operating systems it is vi.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

filename

Specifies the name of the file to open. If you do not specify a file extension, the .sql extension is used. If you do not specify the *filename* parameter, the contents of the SQL buffer are brought into the editor.

# EXECUTE

The EXECUTE CPPPlus command executes a procedure defined in the database to which a connection is currently established. For a DB2 database connection, when you run this command, a DB2 CALL statement is issued.

#### Invocation

You must run this command from the CLPPlus interface.

#### Authorization

The privileges held by the authorization ID of the statement must include at least one of the following:

- EXECUTE privilege on the procedure
- DATAACCESS authority

If a matching procedure exists that the authorization ID of the statement is not authorized to run, an error is returned (SQLSTATE 42501).

### **Required connection**

You must be connected to a database.

### Command syntax

#### argument:

### **Command parameters**

#### procedure-name

Specifies the procedure to call. The procedure must be cataloged. For DB2 data servers, you can qualify the name with a schema name, a module name, or both a schema name and a module name. The procedure to invoke is chosen using procedure resolution. For DB2 databases, the execution of the EXECUTE command, including procedure resolution, is the same as that of the DB2 CALL statement.

argument

#### parameter-name

For DB2 data servers only, specifies the name of the parameter to which a value is assigned. If you assign a value to a parameter by name, all subsequent value assignments must also be by name.

All named parameters that you use to run the procedure must exist in the DB2 procedure definition.

Parameter names must be unique.

You cannot use named parameters to run uncataloged DB2 procedures.

value

Specifies the value associated with a parameter. The *n*th unnamed value corresponds to the *n*th parameter defined in the CREATE PROCEDURE statement for the procedure. Named values correspond to the same named parameter, regardless of the order in which you specify them.

expression

Passes a user-specified list of parameter values to the procedure being called.

#### NULL

Passes NULL as the parameter value.

#### DEFAULT

If a default value is defined in the CREATE PROCEDURE statement, passes that default value as the parameter value; otherwise, passes NULL.

For DB2 databases, you must specify a value for each parameter that is not defined to have a default value (SQLSTATE 428HF). Also, for DB2 databases, each value must be compatible with the corresponding parameter in the procedure definition, as follows:

- IN parameter
  - The value must be assignable to the parameter.
  - The assignment of a string argument uses the storage assignment rules.
- OUT parameter
  - The value must be a single variable or parameter marker (SQLSTATE 42886).
  - The value must be assignable to the parameter.
  - The assignment of a string value uses the retrieval assignment rules.

**Note:** You cannot display the following output data type values in the CLPPlus interface: row, array, associative array, and Boolean.

- INOUT parameter
  - The value must be a single variable or parameter marker (SQLSTATE 42886).
  - The value must be assignable to the parameter.
  - The assignment of a string value uses the storage assignment rules on invocation and the retrieval assignment rules on return.

## Example

In this example, the CREATE PROCEDURE statement creates a procedure called save\_tester\_details\_PROC. The EXECUTE command runs this procedure.

```
> CREATE PROCEDURE save_tester_details_PROC
 (tno, IN integer, tname IN varchar, tadd IN varchar)
AS
 BEGIN
 INSERT INTO tester1 VALUES
 (tno, tname, tadd);
 END;
 /
```

- > The SQL command completed successfully.
- EXECUTE save\_tester\_details\_PROC(1, 'John Smith', 'Address1'); The SQL command completed successfully. >
- >

# EXIT

The EXIT CLPPlus command ends the CLPPlus session and returns control to the operating system. This command is synonymous with the QUIT command.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

### SUCCESS

Returns an operating system-dependant return code indicating success.

### FAILURE

Returns an operating system-dependant return code indicating failure.

### WARNING

Returns an operating system-dependant return code indicating a warning.

#### value

Specifies a variable created by the DEFINE command whose value is returned as the return code.

### COMMIT

Specifies that uncommitted updates are committed when the CLPPlus session ends.

### ROLLBACK

Specifies that uncommitted updates are rolled back when the CLPPlus session ends.

# GET

The GET CLPPlus command loads the contents of a text file into the CLPPlus SQL buffer.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

### filename

Specifies the name of the file to load into the SQL buffer. If you do not specify a file extension, the .sql extension is used.

#### LIST | LIS

Displays the contents of the SQL buffer after the file is loaded.

#### NOLIST | NOL

Prevents the contents of the SQL buffer from being displayed after the file is loaded.

# HELP

The HELP command displays an index of topics for CLPPlus or it displays help for a specific CLPPlus topic.

## Invocation

You must run this command from the CLPPlus interface.

## **Authorization**

None

## **Required connection**

None

## **Command syntax**

# **Command parameters**

## INDEX

Displays an index all CLPPlus help topics.

topic

Displays help for a specific CLPPlus subject, for example, ACCEPT.

# HOST

The HOST CLPPlus command runs an operating-system command in the CLPPlus interface.

•

## Invocation

You must run this command in the CLPPlus interface.

## **Authorization**

None

## **Required connection**

None.

## **Command syntax**

►► HOST os\_command-

# **Command parameters**

os\_command

Specifies an operating-system command.

# INPUT

The INPUT line-editor command adds a line of text to the SQL buffer after the current line.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

text

Specifies the text to be inserted into the SQL buffer.

## Example

In the following example, the sequence of INPUT commands constructs a SELECT statement, which is displayed by the LIST command:

SQL> INPUT SELECT empno, ename, job, sal, comm SQL> INPUT FROM emp SQL> INPUT WHERE deptno = 20 SQL> INPUT ORDER BY empno SQL> LIST 1 SELECT empno, ename, job, sal, comm 2 FROM emp 3 WHERE deptno = 20 4\* ORDER BY empno

# LIST

The LIST line-editor command displays all of the lines or a range of lines in the SQL buffer.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

- *n* Displays the specified line in the SQL buffer.
- n m

Displays the specified range of lines in the SQL buffer, where the value of m is greater than the value of n.

\* Displays the current line in the SQL buffer.

## LAST | L

Displays the last line in the SQL buffer.

# PAUSE

The PAUSE CLPPlus command suspends CLPPlus processing, optionally displays a message, and waits to resume processing until the ENTER key is pressed.

## Invocation

You must run this command in the CLPPlus interface.

## **Authorization**

None

## **Required connection**

You must be connected to a database.

## **Command syntax**

► \_\_\_\_PAUSE\_\_\_\_optional-text\_\_\_\_\_

## **Command parameters**

optional-text

Specifies a message. The message is a string of characters that can include spaces and special characters. If you use quotation marks around the message, it is included in the command output or statement output. The character case specified as **optional-text** is maintained as entered.

## PRINT

The PRINT CLPPLus command displays the value of a bind variable. Bind variables are used in place of literal values. If you issue a SELECT statement multiple times, you can use bind variables to reduce the number of literal values.

### Invocation

You can run this command in the CLPPlus interface.

### Authorization

None

### **Required connection**

You must be connected to a database.

## **Command syntax**

► PRINT bind-variable-name PRINT bind-variable-name

## **Command parameters**

bind-variable-name

Specifies a string of characters that can include spaces and special characters. If you do not specify *bind-variable-name*, the values of all bind variables are printed.

>-

If *bind-variable-name* is of the datatype **REFCURSOR**, the result set pointed to by *bind-variable-name* will be read in its entirety and all the rows will be printed following the report formatting specified in the current CLPPlus session.

# PROMPT

The PROMPT CLPPlus command prints a line to the display.

Output of the PROMPT command is displayed in CLPPlus output.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

optional-text

Specifies a message. The message is a string of characters that can include spaces and special characters. If you use quotation marks around the message, it is included in the command output or statement output. The case of letters is maintained.

# QUIT

The QUIT CLPPlus command ends the CLPPlus session and returns control to the operating system. This command is synonymous with the EXIT command.

### Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

### **Command syntax**

### **Command parameters**

#### SUCCESS

Returns an operating system-dependant return code indicating success.

#### FAILURE

Returns an operating system-dependant return code indicating failure.

#### WARNING

Returns an operating system-dependant return code indicating a warning.

#### value

Specifies a variable created by the DEFINE command whose value is returned as the return code.

#### sub-variable

Specifies a substitution variable that can be used to return information.

#### COMMIT

Specifies that uncommitted updates are committed when the CLPPlus session ends.

#### ROLLBACK

Specifies that uncommitted updates are rolled back when the CLPPlus session ends.

•

# REMARK

The REMARK CLPPlus command allows for the coding of a comment in a script. This is similar to a comment line coded with two dashes.

### Invocation

You must run this command from the CLPPlus interface. It can only be included in CLPPlus scripts.

## **Authorization**

None

## **Required connection**

None

## **Command syntax**

►►——REMARK——optional-text— \_\_\_\_\_\_\_\_\_\_

## **Command parameters**

optional-text

Specifies a string of characters that can include spaces and special characters. You can use the convention shown in the following example.

/\*
 \* This is a three-line comment
\*/

## REPFOOTER

The REPFOOTER CLPPlus command prints a report footer at the end of a report.

## Invocation

You must run this command from the CLPPlus interface.

### Authorization

None

#### **Required connection**

None

### Command syntax

### Command parameters

#### text

Specifies the text displayed at the end of a report.

#### CENTER

Specifies the display will center justify the report footer. If neither **CENTER**, **LEFT**, or **RIGHT** is specified, center justification is the default behavior.

#### LEFT

Specifies the display will left justify the text for the report footer.

#### RIGHT

Specifies the display will right justify the text for the report footer.

#### SKIP PAGE

Specifies the report footer is displayed on the next new page.

number-of-lines

Specifies the number of lines to skip.

## Example

In the following example, the report footer END SALARY REPORT is displayed with center justification at the end of the report on the next new page.

SQL> REPFOOTER CENTER 'END SALARY REPORT' SKIP PAGE;

In the following example, the report footer Company Name is displayed, two lines are skipped, then End of Report is displayed all with center justification on the next new page.

SQL> REPFOOTER CENTER "Company Name" SKIP 2, CENTER "End of Report" SKIP PAGE

# REPHEADER

The REPHEADER CLPPlus command prints a report heading once at the beginning of a report.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

text

Specifies the text displayed for the report header.

#### CENTER

Specifies the display will center justify the report header. If neither **CENTER**, **LEFT**, or **RIGHT** is specified, center justification is the default behavior.

### LEFT

Specifies the display will left justify the text for the report header.

### RIGHT

Specifies the display will right justify the text for the report header.

## SKIP

#### PAGE

Specifies the report header is displayed and the report data starts on the next new page.

number-of-lines

Specifies the number of lines to skip.

## Example

In the following example, the report header SALARY REPORT is displayed with left justification and the report data starts on the next new page.

SQL> REPHEADER LEFT 'SALARY REPORT' SKIP PAGE;

## REPHEADER

In the following example, the report header COMPANY NAME is displayed, two lines are skipped, and then SALARY REPORT is displayed all with center justification. The report data starts on the next new page.

SQL> REPHEADER CENTER 'COMPANY NAME' SKIP 2, CENTER 'SALARY REPORT' SKIP PAGE;

•

# RUN

The RUN CLPPlus command runs queries stored in the SQL buffer. Because an SQL buffer can store commands and statements on multiple lines, the command or statement at the current line in the buffer is run.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

You must be connected to a database.

## **Command syntax**

►►—RUN-

## Example

In the following example, the contents of the current line in the SQL buffer is SELECT EMPNP FROM EMP. The RUN command issues the statement to select the values of the EMPNO column from the EMP table:

```
SQL> run
1* SELECT EMPNO FROM EMP
```

The output is as follows:

```
EMPNO
000010
000020
...
```

# SAVE

The **SAVE** line-editor command stores the contents of the SQL buffer in a new or existing file.

### Invocation

You must run this command from the CLPPlus interface.

### Authorization

None

## **Required connection**

None

### **Command syntax**

## **Command parameters**

#### filename

Specifies the name and path name of a file to which the buffer contents are written. If you do not provide a file extension, the .sql extension is used.

#### CREATE | CRE

Creates the specified file if it does not exist.

#### **REPLACE | REP**

Overwrites the specified file.

#### APPEND | APP

Adds the contents of the SQL buffer to the end of the specified file.

The SET CLPPlus command controls a session level variable.

### **Important:**

- For each command, you can specify only one of the options for the SET command.
- In a batch script, you can issue several SET commands in series.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

## Syntax Diagram

►►-SET-LAUTO--DUPLICATES--ЕСНО--0N--FEEDBACK-FEED--FLUSH-LFLU -HEADING--HEAD-L-HEA--HEADSEP-CHEADS-L<sub>LIN</sub>-L<sub>NEWP</sub> PAGES--SQLCASE-

•

## Command parameters

#### **ARRAYSIZE** integer-value

Defines the number of rows fetched at a time from the server. This option can be used to tune query performance. The default value is 10. Valid values range from 1 to 10,000.

### AUTOCOMMIT | AUTO

Controls the commit behavior of SQL statements in CLPPlus. CLPPlus always automatically commits DDL statements.

### ON | IMMEDIATE

Enables automatic commitment of SQL statements.

#### OFF

Disables automatic commitment of SQL statements except for DDL statements.

#### **COLSEP** column-separator

Places the specified delimiter between columns in a table. The delimiter must be a character, including a special character or a space (the default value).

### DUPLICATES

Controls the printing of duplicate column values for the break columns specified when using the BREAK command.

#### ON

Enables the printing of duplicate column values.

### OFF

Disables the printing of duplicate column values.

#### ECHO

Controls whether all commands and their respective outputs are displayed in the standard output of the CLPPlus interface.

### ON

Enables the display of commands and their output.

### OFF

Disables the display of commands and their output.

### FEEDBACK | FEED

Controls the display of interactive information after you issue an SQL statement.

### ON

Enables the display of interactive information. This is the default action.

### OFF

Disables the display of interactive information.

#### row-threshold

Specifies the minimum number of rows required to enable feedback.

### FLUSH | FLU

Controls whether the output buffer is accessible to external programs. **FLUSH** is still active while the output buffer is being appended to. The process creates overhead when you call statements or run commands, however.

### ON

Makes the buffer accessible to external programs.

#### OFF

Prevents the buffer from being available to external programs. .

Determines whether column headings are displayed for SELECT statements.

#### ON

Enables the display of column headings.

# OFF

Disables the display of column headings.

#### **HEADSEP | HEADS**

Sets the heading separator character used by the COLUMN HEADING command. The default character is 1.

#### **LOGMODE** *logmode-value*

Controls tracing and logging for the CLPPlus client layer and JDBC driver layer (JCC).

#### CLPPLUS

Performs tracing and logging for the CLPPlus client layer only.

#### JCC

Performs tracing and logging for the JDBC client layer only.

#### BOTH

Performs tracing and logging for the CLPPlus client layer and JDBC client layer.

#### NONE

Disables all tracing and logging.

#### **JCCLOGMODE** *jcclogmode-value*

Specifies what JCC client layer features should be traced, logged, or both. To use *jcclogmode-value*, you must set **LOGMODE** to 1 or 2.

- 0 (TRACE\_NONE)
- 1 (TRACE\_CONNECTION\_CALLS)
- 2 (TRACE\_STATEMENT\_CALLS)
- 4 (TRACE\_RESULT\_SET\_CALLS)
- 16 (TRACE\_DRIVER\_CONFIGURATION)
- 32 (TRACE\_CONNECTS)
- 64 (TRACE\_DRDA\_FLOWS)

#### 128

(TRACE\_RESULT\_SET\_META\_DATA)

#### 256

(TRACE\_PARAMETER\_META\_DATA)

#### 512

(TRACE\_DIAGNOSTICS)

#### 1024

(TRACE\_SQLJ)

#### 2048

(TRACE\_XA\_CALLS)

-1 (TRACE\_ALL). By default, the -1 setting is used, meaning that all layers are traced.

#### **LINESIZE** | **LIN** *width-of-line*

The keyword LINESIZE and its abbreviation LIN can be used interchangeably. LINESIZE specifies the width of a line in characters.

Its value is the width of a line in characters with a valid range of 1 to 32767. By default, it is set to 80.

#### LOGPATH

LOGPATH sets a path name for the file where log records are to be written on the database server.

#### log-path

The path of a file name used to keep logging records of traces using LOGMODE and JCCLOGMODE.

#### LONG integer-value

Defines the number of characters displayed for large text objects such as CLOB and XML. The default value is 50. The valid range is 1 to 2,147,483,647 characters.

### NEWPAGE | NEWP

NEWPAGE controls how many blank lines are printed after a page break.

#### lines-per-page

An integer value that does not include negative numbers or values greater than 100. By default it is set to 1 to indicate one blank line is printed after a page break. The command SET NEWPAGE *0* prints a form-feed at the start of each new page.

#### NULL

The keyword NULL is the string that is displayed when showing a null value for a displayed column value in the output buffer.

#### null-string

A string of characters that can include spaces and special characters. By default it is set to a space. The use of quotation marks around *null-string* has no affect on its value. The case of letters is maintained.

#### **NUMFORMAT** format-string

Sets the default format string used for displaying numbers. The supported formats are the same as those for COLUMN FORMAT *format-string*.

#### **NUMWIDTH** *integer-value*

Sets the default width used to display numbers. The default value is 10.

#### **PAGESIZE** | **PAGES** *lines-per-page*

Sets the number of printed lines that fit on a page. By default it is set to 14. Valid values can be 0, or between 2 and 50000.

#### SQLCASE | SQLC

Controls whether the characters in SQL statements that are transmitted to the server are converted to uppercase or lowercase letters.

#### MIXED | MIX

Specifies that a string of characters can contain uppercase and lowercase letters.

#### UPPER | UP

Specifies that a string of characters can contain only uppercase letters.

#### LOWER | LO

Specifies that a string of characters can contain only lowercase letters.

#### PAUSE | PAU

Determines whether to stop a process before each page break. If the output cannot be displayed in one page, you are prompted with the message Hit ENTER to continue before each page break.

#### ON

Pauses the display of output.

### OFF

Displays the output without pausing.

#### RECSEP

Specifies whether the record separating character set with the RECSEPCHAR option is displayed after printing each record in the result set.

#### ON

The record separating character is printed following each record in the result set.

#### OFF

The record separating character is not printed.

#### **RECSEPCHAR** character

Specifies the record separating character used in conjunction with the RECSEP option. A single character is accepted as the value for this option.

#### SERVEROUTPUT

Specifies whether output messages from server-side procedures are retrieved and displayed on the client console.

#### ON

Server-side procedure output messages are retrieved and displayed.

#### OFF

Server-side procedure output messages are not retrieved and displayed.

#### **SQLPROMPT** | **SQLP** prompt

Specifies the prompt in the CLPPlus interface. By default, the prompt is SQL>. The prompt must be a string, which can include special characters and spaces. The use of quotation marks around the string has no affect on its value; the case of letters is maintained.

#### TERMOUT | TERM

Determines if output is displayed on the standard output of the CLPPlus interface.

#### ON

Displays the output on the screen.

#### OFF

No output is displayed.

#### TIMING | TIMI

Controls whether elapsed time is displayed for each SQL statement after it is issued.

#### ON

Specifies that elapsed time is displayed.

#### OFF

Specifies that elapsed time is not displayed.

#### UNDERLINE

Specifies if column headings are underlined.

ON

Column headings are underlined.

OFF

Column headings are not underlined.

#### VERBOSE

Determines whether all CLPPlus messages are printed to the console. The default value is OFF.

#### ON

Specifies that all CLPPlus messages are printed to the console.

#### OFF

Specifies that only a subset of messages are printed to the console.

#### VERIFY | VER

Determines whether the old and new values of an SQL statement are displayed when a substitution variable is encountered.

#### ON

Specifies that the old and new values are displayed.

### OFF

Specifies that the old and new values are not displayed.

#### WRAP

Sets the default alignment used when displaying column values.

### ON

Column values exceeding the column width are wrapped.

#### OFF

Column values exceeding the column width are truncated.

# SPOOL

The SPOOL CLPPlus command echoes and logs CLPPlus output to a file.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

### **Required connection**

None

### **Command syntax**

## **Command parameters**

### output-file

The variable *output-file*, when set, turns SPOOL on. It includes a file name and a path to the file name. The standard output of the CLPPlus interface displays command output which is now echoed and logged in the specified *output-file*.

#### OFF

The keyword option OFF turns SPOOL off and restores the default which sends all output to the standard output of the CLPPlus interface.

# SHOW

The SHOW CLPPlus command displays the current settings of session-level variables in the CLPPlus interface or errors returned from server-side procedures. The settings are controlled using the SET command.

## Invocation

You must run this command from the CLPPlus interface.

## **Authorization**

None

## **Required connection**

None

## **Command syntax**

## **Command parameters**

### setting

Displays the name and setting of the specified session-level variable.

## ALL

Displays the names and settings of all session-level variables.

### ERRORS

Displays the errors for all server-side procedures run in the current CLPPlus session.

### procedure-name

When appended to the SHOW ERRORS command, shows only the errors for *procedure-name*.

# **START**

The START CLPPlus command runs a CLPPlus script file.

## Invocation

You must run this command from the CLPPlus interface.

## **Authorization**

None

## **Required connection**

None

## **Command syntax**

►► START script-file START START

## **Command parameters**

script-file

Specifies the script file name that contains SQL statements and commands to run.

# TTITLE

The TTITLE CLPPlus command inserts text at the top of each page displayed.

## Invocation

You must run this command from the CLPPlus interface.

## Authorization

None

## **Required connection**

None

## **Command syntax**

## Command parameters

#### text

Specifies the text to be displayed.

#### CENTER

Specifies the display will center justify the text on each page. If neither **CENTER**, **LEFT**, or **RIGHT** is specified, center justification is the default behavior.

### LEFT

Specifies the display will left justify the text on each page.

### RIGHT

Specifies the display will right justify the text on each page.

### **PGNO**

Specifies the current page number.

#### variable-name

Specifies a user defined variable that will follow the *text* field.

#### **SKIP** integer-value

The *integer-value* value specifies the number of blank lines displayed after the bottom title.

## Example

In the following example, the DEPT: (with the variable contents), CONFIDENTIAL, and Page No: (with the current page number) is displayed across the top of every page. One blank line follows the top title.

SQL> BREAK ON workdept SKIP PAGE;

SQL> COLUMN workdept NEW\_VALUE new\_dept; SQL> TTITLE LEFT 'DEPT: ' new\_dept, CENTER 'CONFIDENTIAL', RIGHT 'Page No: ' PGNO SKIP 1;

In the following example, the Page No: title (with the current page number) is displayed across the top of every page with right justification. Two blank lines follow the top title.

SQL> TTITLE RIGHT 'Page No: ' PGNO SKIP 2;
# UNDEFINE

The UNDEFINE CLPPlus command clears and deletes a variable created by the DEFINE CLPPlus command.

# Invocation

You must run this command from the CLPPlus interface.

# Authorization

None

# **Required connection**

You must be connected to a database.

# **Command syntax**

# **Command parameters**

variable-name

Specifies the name of the variable to clear and delete.

# UNDEFINE

Chapter 7. System commands

# dasauto - Autostart DB2 administration server

Enables or disables autostarting of the DB2 administration server.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

This command is available on Linux and UNIX systems only. It is located in the DB2DIR/das/adm directory, where DB2DIR is the location where the current version of the DB2 database product is installed.

# Authorization

dasadm

# **Required connection**

None

# **Command syntax**

# **Command parameters**

- -h | -? Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed.
- **-on** Enables autostarting of the DB2 administration server. The next time the system is restarted, the DB2 administration server will be started automatically.
- **-off** Disables autostarting of the DB2 administration server. The next time the system is restarted, the DB2 administration server will not be started automatically.

# dascrt - Create a DB2 administration server

The DB2 administration server (DAS) provides support services for DB2 tools such as the Control Center and the Configuration Assistant. If a system does not have a DAS, you can use this command to manually generate it.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

The dascrt command is located in the *DB2DIR*/instance directory, where *DB2DIR* is the location where the current version of the DB2 database product is installed.

This command is available on Linux and UNIX operating systems only. On Windows operating systems, you can use the db2admin create command for the same purpose.

## Authorization

Root user authority

# **Required connection**

None

# **Command syntax**

# **Command parameters**

-u DASuser

*DASuser* is the user ID under which the DAS will be created. The DAS will be created under the /home/*DASuser*/das directory.

The following restrictions apply:

- If existing IDs are used to create DB2 DAS, make sure that the IDs are not locked and do not have expired passwords.
- -d Enters debug mode, for use with DB2 Service.

# **Usage notes**

• On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.

# dasdrop - Remove a DB2 administration server

On Linux and UNIX operating systems only, removes the DB2 Administration Server (DAS).

The Administration Server provides support services for DB2 tools such as the Control Center and the Configuration Assistant. On Windows operating systems, you can use the db2admin drop command for the same purpose.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

# Authorization

Root user authority

## **Required connection**

None

# **Command syntax**

►►—dasdrop-

# **Command parameters**

-d-

-d Enters debug mode, for use with DB2 Service.

## Usage notes

- The dasdrop command is located in the *DB2DIR*/instance directory, where *DB2DIR* is the location where the current version of the DB2 database product is installed.
- On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.

# dasmigr - Migrate the DB2 administration server

Migrates the DB2 Administration Server (DAS) on the system from a previous version of DB2 database system (supported for migration to the current version of DB2 database system) to the current version of DB2 database system at the DB2 database level related to the path where the dasmigr is issued.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

To move the DAS from one DB2 database system installation location to another within the same version of DB2 database system, the dasupdt command should be used. A DAS at a previous version of a DB2 database system can not be used to administer instances in the current version of DB2 database system.

On Linux and UNIX operating systems, this utility is located in the *DB2DIR*/instance directory. On Windows operating systems, it is located in the *DB2DIR*\bin directory. *DB2DIR* represents the installation location where the current version of the DB2 database system is installed.

# Authorization

Root user authority on UNIX operating systems or Local Administrator authority on Windows operating systems

# **Required connection**

None

# **Command syntax**

For Linux and UNIX operating systems

▶▶—dasmigr—\_\_\_\_\_\_

## For Windows operating systems

▶→—dasmigr—\_\_\_\_\_h\_\_\_\_\_p*—path override*\_\_

# **Command parameters**

For Linux and UNIX operating systems:

-d Enters debug mode, for use with DB2 database support.

For Windows operating systems:

-h Displays usage information.

### **-p** *path\_override*

Indicates that the DAS profile should be moved as well. *path\_override* is a user specified path to be used instead of the default DAS profile path.

# Example

On Linux and UNIX operating systems: *DB2DIR*/instance/dasmigr

On Windows operating systems: *DB2DIR*\bin\dasmigr

## Usage notes

• On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.

# dasupdt - Update DAS

On Linux and UNIX operating systems, updates the DB2 Administration Server (DAS) if the related DB2 database system installation is updated. On Linux, UNIX, and Windows operating systems, you can also use this utility to move the DAS from one installation location to another if both are at the same version of DB2 database system.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

This utility is located in the *DB2DIR*/instance directory on Linux and UNIX operating systems, where *DB2DIR* is the location where the current version of the DB2 database product is installed. On Windows operating systems, the dasupdt command is located in the *DB2DIR*\bin directory.

On Windows operating systems, this command updates the DAS from one DB2 copy to another within the same DB2 database version. To upgrade a DAS from an older version, use the dasmigr command. With dasupdt, the DAS will be updated to the DB2 copy that the dasupdt command is executed from.

After the installation of a fix pack, the dasupdt command is executed automatically, if the DAS on the system is related to the DB2 database product installation path updated by installFixPack.

# **Authorization**

Root user authority on Linux and UNIX operating systems or Local Administrator authority on Windows operating systems

# **Required connection**

None

# **Command syntax**

For Linux and UNIX operating systems

▶►dacundt				
-uasuput-				
	└_b_┘	└DJ	<b>⊢_h</b> —	
	~	2		
			<u> </u>	

## For Windows operating systems

► dasupdt\_\_\_\_h\_\_\_p\_*path override*\_\_\_\_

# **Command parameters**

For Linux and UNIX operating systems

- -d Sets the debug mode, which is used for problem analysis.
- -D Moves the DAS from a higher code level on one path to a lower code level installed on another path.
- -h | -? Displays usage information.

## For Windows operating systems

- -h Displays usage information.
- -p path\_override

Indicates that the DAS profile should be moved as well. *path\_override* is a user specified path to be used instead of the default DAS profile path.

# Example

If a DAS is running in one DB2 database product installation path and you want to move the DAS to another installation path at a lower level (but the two installation paths are at the same version of DB2 database system), issue the following command from the installation path at the lower level: dasupdt -D

# **Usage notes**

• On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.

# db2\_deinstall - Uninstall DB2 database products, features, or languages

Uninstalls DB2 database products, features, or languages, depending on the command parameters and the location where the db2\_deinstall command is run. The command is only available on Linux and UNIX operating systems.

The db2\_deinstall command is located at *DB2DIR*/install, where *DB2DIR* is the location where the current version of the DB2 database product is installed. The db2\_deinstall command is also available on DB2 database product media. The db2\_deinstall command can be used to uninstall only the DB2 database products related to the installation path.

- If db2\_deinstall is run from a particular DB2 database installation path, then it can uninstall everything, or a particular feature or language, from the same path.
- If db2\_deinstall is run from DB2 database product media, then you need to specify a path using the **-b** option. It can then uninstall everything, or a particular feature or language, from that install path.

# Authorization

Root installations require root user authority. For non-root installations, you must log on with the user ID that owns the non-root installation.

## **Required Connection**

None

# **Command syntax**

## **Command parameters**

-F feature-name

Specifies the removal of one feature. To indicate uninstallation of multiple features, specify this parameter multiple times. For example, -F *feature1* -F *feature2*.

Cannot be used in combination with **-a**, except in one case. When the feature being removed is the IBM Tivoli System Automation for

## db2\_deinstall - Uninstall DB2 database products, features, or languages

Multiplatforms, TSAMP, and you have root user authority, you can use **-F** TSAMP and **-a** in combination, which removes both TSAMP and DB2 database products together.

Can be used in combination with **-r**, except in one case. When the feature being removed is the IBM Tivoli System Automation for Multiplatforms, TSAMP, you cannot use **-F** TSAMP and **-r** in combination.

The DB2 database uninstaller will automatically update the related DB2 instances after it removed some DB2 features. If instance update failed as reported in the log file, you need to manually update the related DB2 instances with the db2iupdt (root instances) or db2nrupdt (non-root instance) command.

### -f sqllib

This option is only valid for non-root install. When it is used with **-a**, the instance top directory and anything underneath will be removed.

-a

Removes all installed DB2 database products in the current location. Cannot be used in combination with **-F**, except in one case. When the feature being removed is the IBM Tivoli System Automation for Multiplatforms, TSAMP, and you have root user authority, you can use **-F** TSAMP and **-a** in combination, which removes both TSAMP and DB2 database products together.

Cannot be combined with the **-r** parameter.

In a non-root install, **-a** used with **-f** sqllib will also remove the non-root instance, which includes removal of the \$HOME/sqllib directory.

## -r response-file

Performs an uninstallation of products, features, or languages based on what is specified in the response file. For example, db2\_deinstall -r db2un.rsp.

Cannot be combined with the **-a** parameter.

Can be combined with the **-F** parameter, except in one case. When the feature being removed is the IBM Tivoli System Automation for Multiplatforms, TSAMP, you cannot use **-F** TSAMP and **-r** in combination.

If both the **-r** and **-F** parameters are specified, the DB2 features specified in the **-F** parameter override the **REMOVE\_COMP** keywords in the response file.

The DB2 database uninstaller will automatically update the related DB2 instances after it removed some DB2 features. If instance update failed as reported in the log file, you need to manually update the related DB2 instances with the db2iupdt (root instances) or db2nrupdt (non-root instance) command.

-b

This option is valid if the command is run from the DB2 database product media. It specifies the absolute path where the DB2 database product was installed and will be uninstalled. The command will prompt for the path if the option is not specified.

-1 log-file

# db2\_deinstall - Uninstall DB2 database products, features, or languages

Specifies the log file. For root installations, the default log file is /tmp/db2\_deinstall.log.\$\$, where \$\$ represents the process ID of the DB2 installer.

For non-root installations, the default log file is /tmp/ db2\_deinstall\_userID.log, where userID represents the user ID that owns the non-root installation. When the feature being removed is the IBM Tivoli System Automation for Multiplatforms, TSAMP, the install log file for SA MP will be located in the same directory as DB2 database log files.

-t trace-file

Turns on the debug mode. The debug information is written to the file name specified as *trace-file*.

-h | -?

Displays help information.

# Example

To uninstall all the DB2 database products that are installed in a location (*DB2DIR*), issue the db2\_deinstall command located in the *DB2DIR*/install directory:

DB2DIR/install/db2\_deinstall -a

# **Usage notes**

- If you run db2\_deinstall -a -f sqllib, the \$HOME/sqllib directory will be removed. Be certain to backup any files, that require saving, from this directory prior to running the command.
- If you have DB2 Text Search installed and run db2\_deinstall –f, if DB2 Text Search is running on any instances related to the DB2 copy, you will receive an error message indicating you must first stop the DB2 Text Search instance service. Stop the DB2 Text Search instance service, then rerun the command.

# db2\_install - Install DB2 database product

Installs all features of a DB2 database product to the given path. This command is available only on Linux and UNIX operating systems.

## Authorization

Root installations require root user authority. For non-root installations, you must log on with the user ID that owns the non-root installation.

## **Required Connection**

None

## **Command syntax**

••	—db2_install b— <i>install-path</i> f NOTSAMPf <i>—nobackup</i>
▶-	└fignoreType1 └_pproductShortName └cNLPACK_location
•-	└_n」 └_m」 └_L_language_ └_1_log-file_ └_t_trace-file_
•-	└──h─ └──?─

# **Command parameters**

-b install-path

Specifies the path where the DB2 database product is to be installed. *install-path* must be a full path name and its maximum length is limited to 128 characters. This parameter is mandatory when the **-n** parameter is specified.

The **-b** option is not required for a non-root installation of the DB2 database product, but it is still mandatory for a root installation, if the **-n** option is used. If **-b** is used in a non-root install, the path must be valid, which has to be the user's \$HOME/sqllib. For both root and non-root install, the length of the absolute installation path is limited to 128 bytes.

### -f NOTSAMP

Specifies that the SA MP should not be either installed or updated.

-f nobackup

This applies to the non-root upgrade only. Forces db2\_install to not backup installation files when the components are updated. If you choose not to backup the files, the space requirement of the installation directory is reduced. However, choosing not to backup the files also means that if any errors occur, the DB2 database installer will not be able to perform a rollback operation. In this case, you will need to manually clean up the files and reinstall the product.

-f ignoreType1

This applies to the non-root upgrade only. Forces db2\_install to ignore type-1 indexes when checking the database status.

-p productShortName

Specifies the DB2 database product to be installed. This parameter is case insensitive and is mandatory when the **-n** parameter is specified. The product short name (*productShortName*) can be found in the file ComponentList.htm (under the product full name) located in the db2/*plat* subdirectory on your media where *plat* is the platform name that you are installing on. You can only install one product at a time.

-c NLPACK\_location

Specifies the absolute path location of the related DB2 National Language Pack (NLPACK). This parameter is mandatory when **-n** is specified. The DB2 NLPACK location needs to be provided explicitly if all of the following conditions are met:

- The **-n** option is specified.
- The installation requires National Language (non-English) support.
- The DB2 NLPACK is neither inside the DB2 database product image nor in the same subdirectory as the DB2 database product image.
- -n Specifies noninteractive mode. When specified, you must also specify -b, -p, and/or -c.
- This option applies to non-root installation only. Specifies upgrade of a non-root copy. During upgrade, all preexisting DB2 database products in the current path are removed. Upgrade installs the specified product. Following the upgrade, other DB2 database products need to be installed separately.
- -L language

Specifies national language support. You can install a non-English version of a DB2 database product. However, you must run this command from the product CD, not the National Language pack CD. By default, English is always installed, therefore, English does not need to be specified. When more than one language is required, this parameter is mandatory. To indicate multiple languages, specify this parameter multiple times. For example, to install both French and German, specify -L FR -L DE. This parameter is case insensitive.

-1 log-file

Specifies the log file. For root installations, the default log file is /tmp/db2\_install.log\$\$, where \$\$ represents the process ID. For non-root installations, the default log file is /tmp/db2\_install\_userID.log, where userID represents the user ID that owns the non-root installation. If the IBM Tivoli System Automation for Multiplatforms (SA MP) is being installed or updated with the db2\_install command, the corresponding log file will be located in the same directory as DB2 database log files.

-t trace-file

Turns on the debug mode. The debug information is written to the file name specified as *trace-file*.

-h | -? Displays usage information.

# Example

• To install from an image in /mnt/cdrom, and to be prompted for all needed input, or to install DB2 Enterprise Server Edition from an image in /mnt/cdrom, issue:

```
cd /mnt/cdrom
./db2_install
```

• To install DB2 Enterprise Server Edition to /db2/newlevel, from an image in /mnt/cdrom, non-interactively in English, issue:

```
cd /mnt/cdrom
./db2_install -p ese -b /db2/newlevel -n
```

# **Usage notes**

Default log and trace filenames for a non-root DB2 database installation includes the user ID so as not to overwrite files resulting from root installations of DB2 database products.

The default file names for non-root install will be as follows (the *userID* is the username of the non-root user who performs the non-root installation):

- /tmp/db2\_install\_userID.log
- /tmp/db2\_install\_userID.err
- /tmp/db2\_install\_userID.trc

After the non-root installation is complete, the log file will be copied to *\$DB2DIR*/install/logs directory, which is the same directory as for a root installation.

For additional information, see the -l logfile command parameter.

# db2\_local\_ps - DB2 process status for Linux/UNIX

On Linux and UNIX systems, all of the DB2 processes running under an instance can be displayed using the db2\_local\_ps command.

## Authorization

None

## **Required connection**

None

# **Command syntax**

▶ — db2\_local\_ps —

# **Command parameters**

db2\_local\_ps

Outputs all of the DB2 processes running under an instance.

## Examples

# Usage notes

Note that processes will not be shown if the instance is stopped. Run the db2start command if processes are not listed.

# db2addicons - Create main menu entries for DB2 tools

Creates main menu entries for DB2 tools.

On Linux operating systems, the db2addicons command creates main menu entries for DB2 tools for the current user. The main menu entries for DB2 tools are created by manually running the db2addicons command. For the DB2 instance owner, the menu entries are created automatically by instance utilities when the DB2 instance was created, updated or upgraded. If the main menu entries are needed on the desktop of another user, the db2addicons command can be run as that specific user, but the instance environment must first be set within that user's environment before running the command.

# Authorization

None

# **Command syntax**

►►--db2addicons

#### <u>\_\_</u>

# **Command parameters**

-h Displays usage information.

# db2admin - DB2 administration server

This utility is used to manage the DB2 Administration Server (DAS). If no parameters are specified, and the DAS exists, this command returns the name of the DAS.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

On Linux and UNIX based systems, the executable file for the db2admin command can be found in the DASHOME/das/bin directory, where DASHOME is the home directory of the DAS user. On Windows operating systems, the db2admin executable is found under the DB2PATH\bin directory where DB2PATH is the location where the DB2 copy is installed.

### Authorization

dasadm on UNIX operating systems but not associated with a 64-bit instance.

Local administrator on Windows operating systems.

## **Required connection**

None

## **Command syntax**

▶ — db2admin-

-	
-START	
/FORCE	
CREATE /USER, user account /DASSWORD, user password	
-DROP	
-SETID-user-account-user-password-	
-SETSCHEDID—sched-user—sched-password—	

## **Command parameters**

### START

Start the DAS.

#### **STOP /FORCE**

Stop the DAS. The force option is used to force the DAS to stop, regardless of whether or not it is in the process of servicing any requests.

#### **CREATE** /USER: user-account /PASSWORD: user-password

Create the DAS. If a user name and password are specified, the DAS will be associated with this user account. If the specified values are not valid, the utility returns an authentication error. The pecified user account must be a valid SQL identifier, and must exist in the security database. It is recommended that a user account be specified to ensure that all DAS functions can be accessed. To create a DAS on UNIX operating systems, use the dascrt command.

- **DROP** Deletes the DAS. To drop a DAS on UNIX operating systems you must use the dasdrop command.
- **SETID** *user-account/user-password* Establishes or modifies the user account associated with the DAS.
- **SETSCHEDID** *sched-user/sched-password*

Establishes the logon account used by the scheduler to connect to the tools catalog database. Only required if the scheduler is enabled and the tools catalog database is remote to the DAS. For more information about the scheduler, see the *Administration Guide*.

- -? Display help information. When this option is specified, all other options are ignored, and only the help information is displayed.
- -q Run the db2admin command in quiet mode. No messages will be displayed when the command is run. This option can be combined with any of the other command options.

# db2adutl - Managing DB2 objects within TSM

Allows users to query, extract, verify, and delete backup images, logs, and load copy images that are saved using Tivoli Storage Manager (TSM). Also allows users to grant and revoke access to objects on a TSM server.

On UNIX operating systems, this utility is located in the sqllib/adsm directory. On Windows operating systems, it is located in sqllib/bin.

# Authorization

## **Command parameters**

### QUERY

Queries the TSM server for DB2 objects.

### EXTRACT

Copies DB2 objects from the TSM server to the current directory on the local machine.

### DELETE

Either deactivates backup objects or deletes log archives on the TSM server.

#### VERIFY

Performs consistency checking on the backup copy that is on the server. This parameter causes the entire backup image to be transferred over the network.

ALL Displays all available information.

### CHECK

Displays results of checkbits and checksums.

DMS Displays information from headers of DMS table space data pages.

#### **HEADER**

Displays the media header information.

#### HEADERONLY

Displays the same information as HEADER but only reads the 4 K media header information from the beginning of the image. It does not validate the image.

**LFH** Displays the log file header (LFH) data.

### OBJECT

Displays detailed information from the object headers.

### PAGECOUNT

Displays the number of pages of each object type found in the image.

**SGF** Displays the automatic storage paths in the image.

### SGFONLY

Displays only the automatic storage paths in the image but does not validate the image.

#### TABLESPACES

Displays the table space details, including container information, for the table spaces in the image.

### TABLESPACESONLY

Displays the same information as TABLESPACES but does not validate the image.

### TABLESPACE

Includes only table space backup images.

FULL Includes only full database backup images.

### NONINCREMENTAL

Includes only non-incremental backup images.

#### INCREMENTAL

Includes only incremental backup images.

#### DELTA

Includes only incremental delta backup images.

### LOADCOPY

Includes only load copy images.

LOGS Includes only log archive images

### BETWEEN sn1 AND sn2

Specifies that the logs between log sequence number 1 and log sequence number 2 are to be used.

#### CHAIN n

Specifies the chain ID of the logs to be used.

#### SHOW INACTIVE

Includes backup objects that have been deactivated.

#### SUBSET

Extracts pages from an image to a file. To extract pages, you will need an input and an output file. The default input file is called extractPage.in. You can override the default input file name by setting the DB2LISTFILE environment variable to a full path. The format of the input file is as follows:

For SMS table spaces:

\$ <tbspID> <objID> <objType> <startPage> <numPages>

### Note:

1. <startPage> is an object page number that is object-relative.

For DMS table spaces:

D <tbspID> <objType> <startPage> <numPages>

### Note:

- 1. <objType> is only needed if verifying DMS load copy images.
- 2. <startPage> is an object page number that is pool-relative.

#### For log files:

L <log num> <startPos> <numPages>

For other data (for example, initial data):

0 <objType> <startPos> <numBytes>

The default output file is extractPage.out. You can override the default output file name by setting the DB2EXTRACTFILE environment variable to a full path.

### TAKEN AT timestamp

Specifies a backup image by its time stamp.

### KEEP n

Deactivates all objects of the specified type except for the most recent n by time stamp.

## **OLDER THAN** *timestamp* or *n* days

Specifies that objects with a time stamp earlier than *timestamp* or *n* days will be deactivated.

## **COMPRLIB** decompression-library

Indicates the name of the library to be used to perform the decompression. The name must be a fully qualified path referring to a file on the server. If this parameter is not specified, DB2 will attempt to use the library stored in the image. If the backup was not compressed, the value of this parameter will be ignored. If the specified library cannot be loaded, the operation will fail.

### **COMPROPTS** *decompression-options*

Describes a block of binary data that will be passed to the initialization routine in the decompression library. DB2 will pass this string directly from the client to the server, so any issues of byte reversal or code page conversion will have to be handled by the decompression library. If the first character of the data block is '@', the remainder of the data will be interpreted by DB2 as the name of a file residing on the server. DB2 will then replace the contents of the data block with the contents of this file and will pass this new value to the initialization routine instead. The maximum length for this string is 1024 bytes.

### **DATABASE** database\_name

Considers only those objects associated with the specified database name.

### **DBPARTITIONNUM** db-partition-number

Considers only those objects created by the specified database partition number.

### **OPTIONS** "tsm\_options"

Specifies options to be passed to the TSM server during the initialization of the TSM session. *OPTIONS* is passed to the to the TSM server exactly as it was entered, without the double quotation marks. When you use the **OPTIONS** parameter, the db2adutl command returns any errors generated by the TSM server. This parameter is available starting in Version 9.7 Fix Pack 2 and later fix packs.

### **PASSWORD** password

Specifies the TSM client password for this node, if required. If a database is specified and the password is not provided, the value specified for the *tsm\_password* database configuration parameter is passed to TSM; otherwise, no password is used.

## **NODENAME** *node\_name*

Considers only those images associated with a specific TSM node name.

**Important:** The **NODENAME** parameter and the **OPTIONS** parameter with the -asnodename value are not compatible and cannot be used at the same time. You should use the **OPTIONS** "-asnodename" parameter for TSM environments supporting proxy nodes configurations, and use the **NODENAME** parameter for other types of TSM configurations.

### **OWNER** owner

Considers only those objects created by the specified owner.

**Important:** The **OWNER** parameter and the **OPTIONS** parameter with the -asnodename value are not compatible and cannot be used at the same time. You should use the **OPTIONS** "-asnodename" parameter for TSM environments supporting proxy nodes configurations, and use the **OWNER** parameter for other types of TSM configurations.

## WITHOUT PROMPTING

The user is not prompted for verification before objects are deleted.

## VERBOSE

Displays additional file information.

#### **GRANT ALL** | **USER** user\_name

Adds access rights to the TSM files on the current TSM node to all users or to the users specified. Granting access to users gives them access for all current and future files related to the database specified.

#### **REVOKE ALL** | **USER** user\_name

Removes access rights to the TSM files on the current TSM node from all users or to the users specified.

#### QUERYACCESS

Retrieves the current access list. A list of users and TSM nodes is displayed.

ON ALL | NODENAME node\_name

Specifies the TSM node for which access rights will be changed.

FOR ALL | DATABASE database\_name

Specifies the database to be considered.

### Examples

1. The following is sample output from the command db2 backup database rawsampl use tsm

Backup successful. The timestamp for this backup is : 20031209184503

The following is sample output from the command db2adut1 query issued following the backup operation:

Query for database RAWSAMPL

Retrieving FULL DATABASE BACKUP information. 1 Time: 20031209184403, Oldest log: S0000050.LOG, Sessions: 1

Retrieving INCREMENTAL DATABASE BACKUP information. No INCREMENTAL DATABASE BACKUP images found for RAWSAMPL

Retrieving DELTA DATABASE BACKUP information. No DELTA DATABASE BACKUP images found for RAWSAMPL

- Retrieving TABLESPACE BACKUP information. No TABLESPACE BACKUP images found for RAWSAMPL
- Retrieving INCREMENTAL TABLESPACE BACKUP information. No INCREMENTAL TABLESPACE BACKUP images found for RAWSAMPL
- Retrieving DELTA TABLESPACE BACKUP information. No DELTA TABLESPACE BACKUP images found for RAWSAMPL

Retrieving LOCAL COPY information. No LOCAL COPY images found for RAWSAMPL

Retrieving log archive information. Log file: S0000050.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.46.13 Log file: S0000051.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.46.43 Log file: S0000052.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.47.12 Log file: S0000053.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.50.14 Log file: S0000054.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.50.56 Log file: S0000055.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.50.56

### db2adutl - Managing DB2 objects within TSM

 The following is sample output from the command db2adutl delete full taken at 20031209184503 db rawsampl

Query for database RAWSAMPL Retrieving FULL DATABASE BACKUP information. Taken at: 20031209184503 DB Partition Number: 0 Sessions: 1 Do you want to delete this file (Y/N)? y Are you sure (Y/N)? y Retrieving INCREMENTAL DATABASE BACKUP information. NO INCREMENTAL DATABASE BACKUP images found for RAWSAMPL Retrieving DELTA DATABASE BACKUP information. NO DELTA DATABASE BACKUP images found for RAWSAMPL

The following is sample output from the command db2adut1 query issued following the operation that deleted the full backup image. Note the timestamp for the backup image.

Query for database RAWSAMPL Retrieving FULL DATABASE BACKUP information. 1 Time: 20031209184403, Oldest log: S0000050.LOG, Sessions: 1 Retrieving INCREMENTAL DATABASE BACKUP information. No INCREMENTAL DATABASE BACKUP images found for RAWSAMPL Retrieving DELTA DATABASE BACKUP information. No DELTA DATABASE BACKUP images found for RAWSAMPL Retrieving TABLESPACE BACKUP information. No INCREMENTAL TABLESPACE BACKUP images found for RAWSAMPL Retrieving DELTA TABLESPACE BACKUP information. No DELTA TABLESPACE BACKUP images found for RAWSAMPL Retrieving LOCAL COPY information. No LOCAL COPY images found for RAWSAMPL Retrieving log archive information. Log file: S0000050.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.46.13 Log file: S0000051.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.46.43 Log file: S0000052.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.47.12 Log file: S0000053.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.50.14 Log file: S0000054.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.50.56 Log file: S0000055.LOG, Chain Num: 0, DB Partition Number: 0, Taken at 2003-12-09-18.52.39

The following is sample output from the command db2adutl queryaccess for all

Node	User	Database Name	type
bar2	jchisan	sample	В

<all> <all> test B Access Types: B - Backup images L - Logs A - both

## **Usage notes**

One parameter from each group below can be used to restrict what backup images types are included in the operation:

#### Granularity:

- FULL include only database backup images.
- TABLESPACE include only table space backup images.

## **Cumulativeness:**

- NONINCREMENTAL include only non-incremental backup images.
- INCREMENTAL include only incremental backup images.
- DELTA include only incremental delta backup images.

When using proxy nodes in TSM environments, in order to see the backup images or the log archives taken when the proxy node was used, you must specify the **OPTIONS** parameter with the shared TSM proxy node value using the asnodename option (for example OPTIONS "-asnodename=cluster1"). The **OPTIONS** parameter is available starting in Version 9.7 Fix Pack 2 and later fix packs.

## Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODE can be substituted for DBPARTITIONNUM.

# db2advis - DB2 design advisor

The DB2 Design Advisor advises users on the creation of materialized query tables (MQTs) and indexes, the repartitioning of tables, the conversion to multidimensional clustering (MDC) tables, and the deletion of unused objects.

The recommendations are based on one or more SQL statements provided by the user. A group of related SQL statements is known as a *workload*. Users can rank the importance of each statement in a workload and specify the frequency at which each statement in the workload is to be executed. The Design Advisor outputs a DDL CLP script that includes CREATE INDEX, CREATE SUMMARY TABLE (MQT), and CREATE TABLE statements to create the recommended objects.

Structured type columns are not considered when this command is executed.

## Authorization

Read access to the database. Read and write access to the explain tables. If materialized query tables (MQTs) are used, you must have CREATE TABLE authorization, and read and write access to the MQTs.

# **Required connection**

None. This command establishes a database connection.

# **Command syntax**

w—workload-name s—"statement"—							_
i—filename—— g— ap—							
Lstart-time	Lend-time_						
vim—evmonname—	workloadna	workloadna	me		∟start-time∙	Lend-time_	ſ
		superclass	, subclo	issname_			
a—userid—/pa	sswd_	—advise-type—	L_x_ L_u_	L-1—disk	-limit L	-t—max-advise-	time_
<high< td=""><td>f_</td><td>L-n—schema-nai</td><td>me_ L-q_sch</td><td>nema-name</td><td>L-b—tables</td><td>oace-name</td><td></td></high<>	f_	L-n—schema-nai	me_ L-q_sch	nema-name	L-b—tables	oace-name	

# **Command parameters**

### -a userid/passwd

Name and password used to connect to the database. The slash (/) must be included if a password is specified. A password should not be specified if the **-**x option is specified.

-b tablespace-name

Specifies the name of a table space in which new MQTs will be created. If not specified, the advisor will select the table spaces from the set of table spaces that exist.

-c tablespace-name

Specifies the name of a table space (where the table space can be of any type, for example, use a file name or directory) in which to create the simulation catalog tables. This table space must only be created on the catalog database partition group. The default is USERSPACE1.

It is recommended that the user create the table space employed for the simulation instead of using the default USERSPACE1. In addition, the ALTER TABLESPACE DROPPED TABLE RECOVERY OFF statement should be run on this table space to improve the performance of the db2advis utility. When the utility completes, turn the history back on for the table space. In a partitioned database environment, this option is required as USERSPACE1 is usually created across all partition groups.

-d database-name

Specifies the name of the database to which a connection is to be established.

-delim char

Indicates the statement delimiter character *char* in a workload file input. Default is ';'.

- -f Drops previously existing simulated catalog tables.
- -g Specifies the retrieval of the SQL statements from a dynamic SQL snapshot. If combined with the -p command parameter, the SQL statements are kept in the ADVISE\_WORKLOAD table. This option cannot be specified with the -i, -s, -qp, or -w options.
- -h Display help information. When this option is specified, all other options are ignored, and only the help information is displayed.
- -i filename

Specifies the name of an input file containing one or more SQL statements. The default is standard input. Identify comment text with two hyphens at the start of each line; that is, *-- comment*. Statements must be delimited by semicolons.

The frequency at which each statement in the workload is to be executed can by changed by inserting the following line into the input file: --#SET FREQUENCY *x* 

The frequency can be updated any number of times in the file. This option cannot be specified with the **-g**, **-s**, **-qp**, or **-w** options.

-k Specifies to what degree the workload will be compressed. Compression is done to allow the advisor to reduce the complexity of the advisor's execution while achieving similar results to those the advisor could provide when the full workload is considered. HIGH indicates the advisor will concentrate on a small subset of the workload. MED indicates the advisor will concentrate on a medium-sized subset of the workload. LOW indicates the advisor will concentrate on a larger subset of the workload. OFF indicates that no compression will occur and every query is considered. The default is MED.

### -l disk-limit

Specifies the number of megabytes available for all recommended indexes and materialized views in the existing schema. Specify **-1** to use the maximum possible size. The default value is 20% of the total database size.

#### -m advise-type

Specifies the type of recommendation the advisor will return. Any combination of I, M, C, and P (in upper- or lowercase) can be specified. For example, db2advis -m PC will recommend partitioning and MDC tables. If **-m** P or **-m** M are used in a partitioned database environment, the advise\_partition table is populated with the final partition recommendation. The choice of possible values are:

- I Recommends new indexes. This is the default.
- **M** Recommends new materialized query tables (MQTs) and indexes on the MQTs. In partitioned database environments, partitioning on MQTs is also recommended.
- **C** Recommendation to convert standard tables to multidimensional clustering (MDC) tables; or, to create a clustering index on the tables.
- **P** Recommends the repartitioning of existing tables.

#### -mdcpctinflation percent

Specifies the maximum percentage that the table disk size can increase in an MDC recommendation. For example, it indicates that a table is allowed to increase to 1+*percent*/100 times its original size when it is converted to a MDC table. *percent* is a floating point number with a default value of 10.

#### -n schema-name

Specifies the qualifying name of simulation catalog tables, and the qualifier for the new indexes and MQTs. The default schema name is the caller's user ID, except for catalog simulation tables where the default schema name is SYSTOOLS. The default is for new indexes to inherit the schema name of the index's base.

### -nogen

Indicates that generated columns are not to be included in multidimensional clustering recommendations.

#### -o outfile

Saves the script to create the recommended objects in *outfile*.

-p Keeps the plans that were generated while running the tool in the explain tables. The -p command parameter causes the workload for -qp and -g to be saved in the ADVISE\_WORKLOAD table and saves the workload query plans that use the final recommendation in the explain tables.

#### -q schema-name

Specifies the qualifying name of unqualified names in the workload. It serves as the schema name to use for CURRENT SCHEMA when db2advis executes. The default schema name is the user ID of the person executing the command.

-qp Specifies that the workload is coming from DB2 Query Patroller. The *start-time* and *end-time* options are timestamps used to check against the time\_completed field of the DB2QP.TRACK\_QUERY\_INFO table. If no *start-time* and *end-time* timestamps are given, all rows are given "D" (for done) in the completion\_status column of the table. If only *start-time* is given, the rows returned are those with TIME\_COMPLETED greater than

or equal to the *start-time* value. In addition, if the *end-time* value is given, the rows returned are also restricted by TIME\_COMPLETED less than or equal to the *end-time* value. This option cannot be used with the **-w**, **-wlm**, **-s**, **-i**, or **-g** options.

start-time

Specifies the start timestamp.

end-time

Specifies the end timestamp. This parameter is optional.

-r Specifies that detailed statistics should be used for the virtual MQTs and for the partitioning selection. If this option is not specified, the default is to use optimizer statistics for MQTs. Although the detailed statistics might be more accurate, the time to derive them will be significant and will cause the db2advis execution time to be greater. The -r command parameter uses sampling to obtain relevant statistics for MQTs and partitioning. For MQTs, when the sample query either fails or returns no rows, the optimizer estimates are used.

### -s "statement"

Specifies the text of a single SQL statement to be assessed and have indexes suggested by the Design Advisor. The statement must be enclosed by double quotation marks. This option cannot be specified with the **-g**, **-i**, **-qp**, or **-w** options.

-t max-advise-time

Specifies the maximum allowable time, in minutes, to complete the operation. If no value is specified for this option, the operation will continue until it is completed. To specify an unlimited time enter a value of zero. The default is zero.

-tables table-predicate-clause

Indicates that only a subset of all existing tables should be considered. The *table-predicate-clause* must be a predicate that can be used in the WHERE clause of a query on SYSCAT.TABLES. The tables considered by db2advis will be the intersection of the tables from this query and the tables in the workload.

This command parameter does not apply to recommendations about new MQTs.

-u Specifies that the advisor will consider the recommendation of deferred MQTs. Incremental MQTs will not be recommended. When this option is specified, comments in the DDL CLP script indicate which of the MQTs could be converted to immediate MQTs. If immediate MQTs are recommended in a partitioned database environment, the default distribution key is the implied unique key for the MQT.

### -w workload-name

Specifies the name of the workload to be assessed and have indexes suggested by the Design Advisor. This name is used in the ADVISE\_WORKLOAD table. This option cannot be specified with the **-g**, **-i**, **-qp**, or **-s** options.

#### -wlm evmonname

Specifies to get the table names corresponding to the ACTIVITY and ACTIVITYSTMT logical data groups from SYSCAT.EVENTTABLES for event name *evmonname*, and joins them together on ACTIVATE\_TIMESTAMP, ACTIVITY\_ID and ACTIVITY\_SECONDARY\_ID for records that have PARTIAL RECORD = 0 (completed transactions). An

optional *start-time* and *end-time* timestamp can be added to get statements on or after the *start-time* and, optionally, on or before the *end-time*. *start-time* and *end-time* are with respect to the TIME\_COMPLETED column from the ACTIVITY tables.

workloadname | wl workloadname

Specifies the *workloadname* that is searched for in SYSCAT.WORKLOADS. The ACTIVITY event monitor table is joined with SYSCAT.WORKLOADS on the workload id to obtain these statements.

**serviceclass** | **sc** *superclassname* 

Specifies the service class information which comes from SYSCAT.SERVICECLASSES. When no subclass is given, all statements for a service superclass is retrieved, which is basically the PARENTSERVICECLASS in SYSCAT.SERVICECLASSES. The ACTIVITY event monitor table is joined with SYSCAT.SERVICECLASSES on the service class id to obtain these statements.

,subclassname

Specifies the *subclassname* if a *superclassname* is specified; separated by a comma. This parameter is optional.

start-time

Specifies the start timestamp.

end-time

Specifies the end timestamp. This parameter is optional.

-x Specifies that the password will be read from the terminal or through user input.

## **Examples**

1. In the following example, the utility connects to database PROTOTYPE, and recommends indexes for table ADDRESSES without any constraints on the solution:

```
db2advis -d prototype -s "select * from addresses a
where a.zip in ('93213', '98567', '93412')
and (company like 'IBM%' or company like '%otus')"
```

2. In the following example, the utility connects to database PROTOTYPE, and recommends indexes that will not exceed 53 MB for queries in table ADVISE\_WORKLOAD. The workload name is equal to "production". The maximum allowable time for finding a solution is 20 minutes.

```
db2advis -d prototype -w production -1 53 -t 20
```

**3**. In the following example, the input file db2advis.in contains SQL statements and a specification of the frequency at which each statement is to be executed:

```
--#SET FREQUENCY 100
SELECT COUNT(*) FROM EMPLOYEE;
SELECT * FROM EMPLOYEE WHERE LASTNAME='HAAS';
--#SET FREQUENCY 1
SELECT AVG(BONUS), AVG(SALARY) FROM EMPLOYEE
GROUP BY WORKDEPT ORDER BY WORKDEPT;
```

The utility connects to database SAMPLE, and recommends indexes for each table referenced by the queries in the input file. The maximum allowable time for finding a solution is 5 minutes:

db2advis -d sample -i db2advis.in -t 5

4. In the following example, MQTs are created in table space SPACE1 and the simulation table space is SPACE2. The qualifying name for unqualified names in the workload is SCHEMA1, and the schema name in which the new MQTs will be recommended is SCHEMA2. The workload compression being used is HIGH and the disk space is unlimited. Sample statistics are used for the MQTs. Issuing the following command will recommend MQTs and, in a partitioned database environment, indexes and partitioning will also be recommended.

```
db2advis -d prototype -w production -l -l -m M -b spacel -c space2 -k
HIGH -q schemal -n schema2 -r
```

To get the recommended MQTs, as well as indexes, partitioning and MDCs on both MQT and base tables, issue the command specifying a value of IMCP for the **-m** option as follows:

```
db2advis -d prototype -w production -l -1 -m IMCP -b spacel -c space2 -k
HIGH -q schemal -n schema2 -r
```

5. In the following example, the utility connects to database SAMPLE, and recommends MDC for tables for EMPLOYEE and DEPT where MDC candidates are allowed to grow by 30.5% of their original size.

db2advis -d sample -type C -disklimit 100 -i db2advis.in -tables "TABNAME IN ('EMPLOYEE','DEPT')" -mdcpctinflation 30.5

## Usage notes

Because these features must be set up before you can run the DDL CLP script, database partitioning, multidimensional clustering, and clustered index recommendations are commented out of the DDL CLP script that is returned. It is up to you to transform your tables into the recommended DDL. One example of doing this is to use the ALTER TABLE stored procedure but there are restrictions associated with it in the same way the RENAME statement is restricted.

Starting with Version 9.7, the Design Advisor will not recommend partitioned indexes. All indexes will be recommended with the NOT PARTITIONED clause. With this recommendation, it is your choice whether to use PARTITIONED (the default) or NOT PARTITIONED to create indexes based on their application scenarios and on the benefit that partitioned index can provide.

For dynamic SQL statements, the frequency with which statements are executed can be obtained from the monitor as follows:

1. Issue the command:

db2 reset monitor for database database-alias

Wait for an appropriate interval of time.

2. Issue the command:

db2advis -g other-options

If the **-p** parameter is used with the **-g** parameter, the dynamic SQL statements obtained will be placed in the ADVISE\_WORKLOAD table with a generated workload name that contains a timestamp.

The default frequency for each SQL statement in a workload is 1, and the default importance is also 1. The generate\_unique() function assigns a unique identifier to the statement, which can be updated by the user to be a more meaningful description of that SQL statement.

Any db2advis error information can also be found in the db2diag log file.

When the advisor begins running, the ADVISE\_INSTANCE table will contain a row that identifies the advisor. The main advisor row is identified by the START\_TIME showing when the advisor began its run. This row's STATUS is "STARTED".

If issuing the db2advis command results in an error saying "Cannot insert into DB2ADVIS\_INSTANCE", you will need to bind db2advis.bnd and run the db2advis command with the -l option. The bind operation can be performed by issuing the command:

db2 bind db2advis.bnd blocking all grant public

When the advisor is completed, you can check the associated row with the appropriate START\_TIME in the ADVISE\_INSTANCE table. If STATUS is "COMPLETED", the advisor executed successfully. If STATUS is still "STARTED" and there is no db2advis process running, the advisor has terminated prematurely. If STATUS has an "EX", you are also shown an "SQLCODE" to determine how the advisor failed.

If the **-1** *disk-limit* option is not specified, you must have at least one of SYSADM, SYSCTRL, SYSMAINT, or SYSMON authority to determine the maximum database size using the GET\_DBSIZE\_INFO stored procedure.

The*table-predicate-clause* in the **-tables** parameter is used to query SYSCAT.TABLES and determine the tables that the advisor will consider. Only base tables or existing MQTs can be considered, but aliases and logical views can be used in the *table-predicate-clause* to return the list of base table names or MQTs. For example, to specify the subset of tables that have views that start with 'TV', specify -tables "(tabname, tabschema) in (SELECT bname, bschema FROM SYSCAT.TABDEP WHERE TABNAME LIKE 'TV%')".

As of Version 9.7, the query optimizer measures the cost of the I/O savings and the cost of decompressing key values and RIDs in the cost model. As such, the Index advisor is capable of estimating the compressed index size.
# db2audit - Audit facility administrator tool

DB2 database systems provide an audit facility to assist in the detection of unknown or unanticipated access to data. The DB2 audit facility generates and permits the maintenance of an audit trail for a series of predefined database events.

The records generated from this facility are kept in audit log files. The analysis of these records can reveal usage patterns which would identify system misuse. Once identified, actions can be taken to reduce or eliminate such system misuse. The audit facility acts at both the instance and database levels, independently recording all activities in separate logs based on either the instance or the database.

DB2 database systems provide the ability to independently audit at both the instance and at the individual database level. The db2audit tool is used to configure audit at the instance level as well as control when such audit information is collected. The AUDIT SQL statement is used to configure and control the audit requirements for an individual database. The db2audit tool can be used to archive both instance and database audit logs as well as to extract from archived logs of either type.

When working in a partitioned database environment, many of the auditable events occur at the database partition at which the user is connected (the coordinator partition) or at the catalog partition (if they are not the same database partition). The implication of this is that audit records can be generated by more than one database partition. Part of each audit record contains information on the coordinator partition and originating database partition identifiers.

The instance audit log (db2audit.instance.log.node\_number[.timestamp]) is located in the instance's security/auditdata subdirectory, and the audit configuration file (db2audit.cfg) is located in the instance's security subdirectory. The database audit log is named db2audit.db.dbname.log.node\_number[.timestamp]. At the time you create an instance, read/write permissions are set on these files, where possible, by the operating system. By default, the permissions are read/write for the instance owner only. It is recommended that you do not change these permissions.

Authorized users of the audit facility can control the following actions within the audit facility, using db2audit:

- Start recording auditable events within the DB2 instance. This does not include database level activities.
- Stop recording auditable events within the DB2 instance.
- Configure the behavior of the audit facility at the instance level only.
- Select the categories of the auditable events to be recorded at the instance level only.
- Request a description of the current audit configuration for the instance.
- Flush any pending audit records from the instance and write them to the audit log.
- Archive audit records from the current audit log for either the instance or a database under the instance.
- Extract audit records from an archived audit log by formatting and copying them to a flat file or ASCII delimited file. Extraction is done in preparation for analysis of log records.

# Authorization

SYSADM

# **Required Connection**

None

# **Command syntax**

# Audit Configuration:

## Audit Log Archive:

databasedatabase-name	node	->
		-

# **Command parameters**

## configure

This parameter allows the modification of the db2audit.cfg configuration file in the instance's security subdirectory. Updates to this file can occur even when the instance is stopped. Updates, occurring when the instance is active, dynamically affect the auditing being done by the DB2 instance. The configure action on the configuration file causes the creation of an audit record if the audit facility has been started and the **audit** category of auditable events is being audited. All configure options, except the data path and archive path, only apply to instance level audit events, and not to database level audit events. The path options apply to the instance and all databases within the instance.

The following are the possible actions on the configuration file:

- **reset** This action causes the configuration file to revert to the initial configuration (where **scope** is all of the categories except context, **status** for each category is failure, **errortype** is normal, and the auditing of instance level events is off). This action will create a new audit configuration file if the original has been lost or damaged. The audit data path and archive path will be blank. This option does not reset any of the audit policies or use of those policies at the database level.
- **scope** This action specifies which categories will be audited, and the status of each of those categories.

status This action specifies whether only successful or failing

events, or both successful and failing events, should be logged. **status** has the following options:

**both** Successful and failing events will be audited.

**none** No events for this category will be audited.

failure

Only failing events will be audited.

### success

Only successful events will be audited.

Only the categories specified on the configure statement will be modified. All other categories will have their status preserved.

### Note:

- The default **scope** is all categories except **context** and may result in records being generated rapidly. In conjunction with the mode (synchronous or asynchronous), the selection of the categories may result in a significant performance reduction and significantly increased disk requirements. It is recommended that the number and type of events being logged be limited as much as possible, otherwise the size of the audit log will grow rapidly. This action also allows a particular focus for auditing and reduces the growth of the log.
- **context** events occur before the status of an operation is known. Therefore, such events are logged regardless of the value associated with this parameter, unless the **status** is none.
- If the same category is repeated, or categories are also specified with the all keyword, a syntax error will be returned.

#### errortype

This action specifies whether audit errors are returned to the user or are ignored. The value for this parameter can be:

**audit** All errors including errors occurring within the audit facility are managed by DB2 database and all negative SQLCODEs are reported back to the caller.

#### normal

Any errors generated by db2audit are ignored and only the SQLCODEs for the errors associated with the operation being performed are returned to the application.

### datapath audit-data-path

This is the directory to which the audit logs produced by the DB2 database system will be written. The default is sqllib/security/auditdata (*instance path\instance\security\* auditdata on Windows). This parameter affects all auditing within an instance, including database level auditing. This must be a fully qualified path and not a relative path. The instance owner must have write permission on this directory. On Windows, the user issuing a local instance command, for example, db2start, db2audit, and db2 update dbm cfg, must also have write permission on this directory does not need to be an NFS shared directory, although that is possible. A non-shared directory will result in increased performance as each node is

writing to a unique disk. The maximum length of the path is 971 bytes for UNIX or Linux and 208 bytes for Windows operating systems.

If the path is provided as "", then the path will be updated to be the default. db2audit describe will show no path as being set and the default path will be used. Note, to prevent the shell from interpreting the quotes, they will generally need to be escaped, for example

db2audit configure datapath ""

The data path must exist. In a partitioned database environment, the same data path will be used on each node. There is no way to specify a unique set of data paths for a particular node unless database partition expressions are used as part of the data path name. Doing this allows the node number to be reflected in the storage path such that the resulting path name is different on each database partition.

### archivepath audit-archive-path

This is the default directory for the archive and extract options. In a partitioned database environment, it is recommended that this directory be an NFS shared directory accessible by all nodes. The default is sqllib/security/auditdata (sqllib/*instance*/security/ auditdata on Windows). This must be a fully qualified path and not a relative path. The instance owner must have write permission on this directory. The maximum length of the path is 971 bytes for UNIX or Linux and 208 bytes for Windows operating systems.

The archive path must exist, and database partition expressions are NOT allowed for the archive path.

### describe

This parameter displays to standard output the current instance level audit configuration information and status.

The following items are displayed:

- If audit is active.
- The status for each category.
- The error type in the form of whether or not an SQLCA is returned on errors.
- The data and archive paths.

This is an example of what the **describe** output looks like: DB2 AUDIT SETTINGS:

```
Audit active: "FALSE "
Log audit events: "SUCCESS"
Log checking events: "FAILURE"
Log object maintenance events: "BOTH"
Log security maintenance events: "BOTH "
Log system administrator events: "NONE"
Log validate events: "FAILURE"
Log context events: "FAILURE"
Log context events: "NONE"
Return SQLCA on audit error: "TRUE "
Audit Data Path: "/auditdata"
Audit Archive Path: "/auditarchive"
```

AUD0000I Operation succeeded.

extract This parameter allows the movement of audit records from the audit log to

an indicated destination. The audit log will be created in the database code page. All of the fields will be converted to the current application code page when extract is run.

The following are the options that can be used when extracting:

### file output-file

The extracted audit records are placed in *output-file*. If the directory is not specified, *output-file* is written to the current working directory. If the file already exists the output will be appended to it. If a file name is not specified, records are written to the db2audit.out file in the archive path specified in the audit configuration file.

### delasc

The extracted audit records are placed in a delimited ASCII format suitable for loading into DB2 database relational tables. The output is placed in separate files, one for each category. In addition, the file auditlobs will also be created to hold any lobs that are included in the audit data. The filenames are:

- audit.del
- checking.del
- objmaint.del
- secmaint.del
- sysadmin.del
- validate.del
- context.del
- execute.del
- auditlobs

If the files already exist the output will be appended to them. The auditlobs file will be created if the **context** or **execute** categories are extracted. LOB Location Specifiers are included in the .del files to reference the LOBS in the auditlobs file.

### **delimiter** *load-delimiter*

Allows you to override the default audit character string delimiter, which is the double quote ("), when extracting from the audit log. You would use **delimiter** followed by the new delimiter that you want to use in preparation for loading into a table that will hold the audit records. The new load delimiter can be either a single character (such as !) or a four-character string representing a hexadecimal number (such as 0xff).

#### **to** *delasc-path*

Allows you to specify the path to which the delimited files are written. If it is not specified, then the files are written to the directory indicated by the audit archive path option specified in the audit configuration file.

### category

The audit records for the specified categories of audit events are to be extracted. If not specified, all categories are eligible for extraction.

#### status

The audit records for the specified status are to be extracted. If not specified, all records are eligible for extraction.

#### path

The path to the location of the archived audit logs. If this is not specified, the archive path in the audit configuration will be used. The path is not used if the filename contains a fully qualified path.

### files

The list of audit log files that will be extracted. This may be a single file or a list of files. These files are not altered during an extract. The filenames will be combined with **path** to get the fully qualified filenames if they are not already fully qualified. The list may included standard shell wild cards to specify multiple files.

**flush** This parameter forces any pending audit records to be written to the audit log. Also, the audit state is reset from "unable to log" to a state of "ready to log" if the audit facility is in an error state.

### archive

This parameter moves the current audit log for either an individual database or the instance to a new location for archiving and later extraction. The current timestamp will be appended to the filename. All records that are currently being written to the audit log will complete before the log is archived to ensure full records are not split apart. All records that are created while the archive is in progress will be written to the current audit log, and not the archived log, once the archive has finished.

The following are the options that can be used when archiving:

### database database-name

The name of the database for which you would like to archive the audit log. If the database name is not supplied, then the instance level audit log is archived.

### node

Indicates that the archive command is to only be run on the current node, and that the **node\_number** monitor element will indicate what the current node is. This is only required on a partitioned database environment.

current-node-number

Informs the db2audit executable about which node it is currently running on. This parameter is required if the **DB2NODE** environment variable does not contain the current node.

### to archive-path

The directory where the archived audit log should be created. The directory must exist and the instance owner must have create permission on this directory. If this is not provided, the archive path in the audit configuration will be used.

The format of the filename that is created is:

- db2audit.instance.log.node\_number[.YYYYMMDDHHMMSS] for the instance log
- db2audit.db.dbname.log.node\_number[.YYYYMMDDHHMMSS] for the database log

where *YYYY* is the year, *MM* is the month, *DD* is the day, *HH* is the hour, *MM* is the minute, and *SS* is the seconds. The time will be the local time. The database name portion will not be present for instance audit logs. The

node number in a non-partitioned database environment will be 0. If the file already exists, an append will be performed.

The timestamp will not reflect the last record in the log with 100% accuracy. The timestamp represents when the archive command was run. Entries that are currently being written to the log file must finish before it can be moved, and these entries may have timestamps that are later than the timestamp given to the filename.

If the **node** option is not specified, then the audit log on all nodes will be archived. The database server must be started in this case. If the database server has not been started, then archive must be run on each node, and the **node** option must be specified to indicate on which node **archive** is to be run (AUD0029).

The **archive** option will output the result and names of the files from each node that archive was run on.

- start This parameter causes the audit facility to begin auditing events based on the contents of the db2audit.cfg file for the instance only. In a partitioned DB2 database instance, auditing will begin for instance and client level activities on all database partitions when this clause is specified. If the **audit** category of events has been specified for auditing, then an audit record will be logged when the audit facility is started. This has no effect on database level auditing, which is controlled through the AUDIT DDL statement.
- **stop** This parameter causes the audit facility to stop auditing events for the instance only. In a partitioned DB2 database instance, auditing will be stopped for instance and client level activities on all database partitions when this clause is specified. If the **audit** category of events has been specified for auditing, then an audit record will be logged when the audit facility is stopped. This has no effect on database level auditing, which is controlled through the AUDIT DDL statement.
- ? This parameter displays the help information for the db2audit command.

# Examples

This is a typical example of how to archive and extract a delimited ASCII file in a partitioned database environment. The Windows remove (rm) command deletes the old delimited ASCII files.

rm /auditdelasc/\*.del
db2audit flush
db2audit archive database mydb to /auditarchive

(files will be indicated for use in next step) db2audit extract delasc to /auditdelasc from files /auditarchive /db2audit.db.mydb.log.\*.20070514102856

Load the .del files into a DB2 table.

# Usage notes

- Database level auditing is controlled with the AUDIT statement.
- The instance level audit facility must be stopped and started explicitly. When starting, the audit facility uses existing audit configuration information. Since the audit facility is independent of the DB2 database server, it will remain active even if the instance is stopped. In fact, when the instance is stopped, an audit record may be generated in the audit log.

- Ensure that the audit facility has been turned on by issuing the db2audit start command before using the audit utilities.
- There are different categories of audit records that may be generated. In the description of the categories of events available for auditing (below), you should notice that following the name of each category is a one-word keyword used to identify the category type. The categories of events available for auditing are:
  - Audit (audit). Generates records when audit settings are changed or when the audit log is accessed.
  - Authorization Checking (checking). Generates records during authorization checking of attempts to access or manipulate DB2 database objects or functions.
  - Object Maintenance (**objmaint**). Generates records when creating or dropping data objects.
  - Security Maintenance (secmaint). Generates records when granting or revoking: object or database privileges, or DBADM authority. Records are also generated when the database manager security configuration parameters sysadm\_group,sysctrl\_group, or sysmaint\_group are modified.
  - System Administration (**sysadmin**). Generates records when operations requiring SYSADM, SYSMAINT, or SYSCTRL authority are performed.
  - User Validation (validate). Generates records when authenticating users or retrieving system security information.
  - Operation Context (context). Generates records to show the operation context when an instance operation is performed. This category allows for better interpretation of the audit log file. When used with the log's event correlator field, a group of events can be associated back to a single database operation.
  - You can audit failures, successes, both or none.
- Any operation on the instance may generate several records. The actual number of records generated and moved to the audit log depends on the number of categories of events to be recorded as specified by the audit facility configuration. It also depends on whether successes, failures, or both, are audited. For this reason, it is important to be selective of the events to audit.
- To clean up and/or view audit logs, run **archive** on a regular basis, then run **extract** on the archived file to save what is useful. The audit logs can then be deleted with standard file system delete commands.

# db2batch - Benchmark tool

Reads SQL statements and XQuery statements from either a flat file or standard input, dynamically prepares and describes the statements, and returns an answer set.

This tool can work in both a single partition database and in a multiple partition database.

Through the tool's optional parameters you are able to control the number of rows to be fetched from the answer set, the number of fetched rows to be sent to the output file or standard output, and the level of performance information to be returned.

The output default is to use standard output. You can name the output file for the results summary.

# Authorization

The same authority level as that required by the SQL statements or the XQuery statements to be read.

## **Required connection**

None. This command establishes a database connection.

## **Command syntax**

# **Command parameters**

-d dbname

An alias name for the database against which SQL statements and XQuery statements are to be applied. If this option is not specified, the value of the DB2DBDFT environment variable is used.

## -f file\_name

Name of an input file containing SQL statements and XQuery statements. The default is standard input.

Identify comment text by adding two hyphens in front of the comment text, that is, *--comment*. All text following the two hyphens until the end of the line is treated as a comment. Strings delimited with single or double quotation marks may contain two adjacent hyphens, and are treated as string constants rather than comments. To include a comment in the output, mark it as follows: *--#COMMENT comment*.

A *block* is a group of SQL statements and XQuery statements that are treated as one. By default, information is collected for all of the statements in the block at once, rather than one at a time. Identify the beginning of a block of queries as follows: --#BGBLK. Identify the end of a block of queries as follows: --#EOBLK. Blocks of queries can be included in a repeating loop by specifying a repeat count when defining the block, as follows: --#BGBLK *repeat\_count*. Statements in the block will be prepared only on the first iteration of the loop.

You can use #PARAM directives or a parameter file to specify the parameter values for a given statement and a given iteration of a block. See the -m option below for details.

Specify one or more control options as follows: --#SET *control option value*. Valid control options are:

## **ROWS\_FETCH**

Number of rows to be fetched from the answer set. Valid values are -1 to *n*. The default value is -1 (all rows are to be fetched).

## ROWS\_OUT

Number of fetched rows to be sent to output. Valid values are -1 to *n*. The default value is -1 (all fetched rows are to be sent to output).

## **PERF\_DETAIL** *perf\_detail*

Specifies the level of performance information to be returned. Valid values are:

- **0** Do not return any timing information or monitoring snapshots.
- 1 Return elapsed time only.
- 2 Return elapsed time and a snapshot for the application.
- **3** Return elapsed time, and a snapshot for the database manager, the database, and the application.
- 4 Return a snapshot for the database manager, the database, the application, and the statement (the latter is returned only if autocommit is OFF, and single statements, not blocks of statements, are being processed). The snapshot will not include hash join information.
- 5 Return a snapshot for the database manager, the database, the application, and the statement (the latter is returned only if autocommit is OFF, and single statements, not blocks of statements, are being processed). Also return a snapshot for the buffer pools, table spaces and FCM (an FCM snapshot is only available in a multi-databasepartition environment). The snapshot will not include hash join information.

The default value is 1. A value >1 is only valid on DB2 Version 2 and DB2 database servers, and is not currently supported on host machines.

### ERROR\_STOP

Specifies whether or not db2batch should stop running when a non-critical error occurs. Valid values are:

- **no** Continue running when a non-critical error occurs. This is the default option.
- **yes** Stop running when a non-critical error occurs.

### DELIMITER

A one- or two-character end-of-statement delimiter. The default value is a semicolon (;).

## SLEEP

Number of seconds to sleep. Valid values are 1 to *n*.

### PAUSE

Prompts the user to continue.

### **SNAPSHOT** snapshot

Specifies the monitoring snapshots to take. See the -mss option for the snapshots that can be taken.

### TIMESTAMP

Generates a time stamp.

### TIMING

Print timing information. Valid values are:

- **ON** Timing information is printed. This is the default.
- **OFF** Timing information is not printed.

-a userid/passwd

Specifies the user ID and password used to connect to the database. The slash (/) must be included.

-m parameters\_file

Specifies an input file with parameter values to bind to the SQL statement parameter markers before executing a statement. The default is to not bind parameters.

If a parameters file is used, then each line specifies the parameter values for a given statement and a given iteration of a block. If instead #PARAM directives are used, multiple values and even parameter ranges are specified in advance for each parameter of each statement, and on each iteration of the block a random value is chosen from the specified sets for each parameter. #PARAM directives and a parameters file cannot be mixed.

Parameter Value Format:

-36.6	'DB2'	X'0AB2'	G''	NULL
12	'batch'	x'32ef'	N''	null
+1.345E-6	'db2 batch'	X'afD4'	g''	Null

Each parameter is defined like a SQL constant, and is separated from other parameters by whitespace. Non-delimited text represents a number, plain delimited (') text represents a single byte character string, 'x' or 'X' prefixed text enclosed in single quotation marks (') represents a binary string encoded as pairs of hex digits, 'g', 'G', 'n', or 'N' prefixed text enclosed in single quotation marks (') represents a graphic string composed of double byte characters, and 'NULL' (case insensitive) represents a null value. To specify XML data, use delimited (') text, such as '<last>Brown</last>'.

Parameter Input File Format:

Line X lists the set of parameters to supply to the Xth SQL statement that is executed in the input file. If blocks of statements are not repeated, then this corresponds to the Xth SQL statement that is listed in the input file. A blank line represents no parameters for the corresponding SQL statement. The number of parameters and their types must agree with the number of parameters and the types expected by the SQL statement.

Parameter Directive Format:

--#PARAM [single | start:end | start:step:end] [...]

Each parameter directive specifies a set of parameter values from which one random value is selected for each execution of the query. Sets are composed of both single parameter values and parameter value ranges. Parameter value ranges are specified by placing a colon (':') between two valid parameter values, with whitespace being an optional separator. A third parameter value can be placed between the start and end values to be used as a step size which overrides the default. Each parameter range is the equivalent of specifying the single values of 'start', 'start+step', 'start+2\*step', ... 'start+n\*step' where *n* is chosen such that 'start+n\*step' >= 'end' but 'start+(n+1)\*step' > 'end'. While parameter directives can be used to specify sets of values for any type of parameter (even NULL), ranges are only supported on numerical parameter values (integers and decimal numbers).

-t delcol

Specifies a single character column separator. Specify -t TAB for a tab

column delimiter or -t SPACE for a space column delimiter. By default, a space is used when the -q on option is set, and a comma is used when the -q del option is set.

-r result\_file [,summary\_file]

Specifies an output file that will contain the query results. The default is standard output. Error messages are returned in the standard error. If the optional *summary\_file* is specified, it will contain the summary table.

-z output\_file [,summary\_file]

Specifies an output file that will contain the query results and any error messages returned. The default is standard output. Error messages are also returned in the standard error. If the optional *summary\_file* is specified, it will contain the summary table. This option is available starting in Version 9.7 Fix Pack 1.

- -c Automatically commit changes resulting from each statement. The default is ON.
- -i Specifies to measure elapsed time intervals. Valid values are:
  - **short** Measure the elapsed time to run each statement. This is the default.
  - **long** Measure the elapsed time to run each statement including overhead between statements.

### complete

Measure the elapsed time to run each statement where the prepare, execute, and fetch times are reported separately.

- -g Specifies whether timing is reported by block or by statement. Valid values are:
  - **on** A snapshot is taken for the entire block and only block timing is reported in the summary table. This is the default.
  - **off** A snapshot is taken and summary table timing is reported for each statement executed in the block.
- -w Specifies the maximum column width of the result set, with an allowable range of 0 to 2 G. Data is truncated to this width when displayed, unless the data cannot be truncated. You can increase this setting to eliminate the warning CLI0002W and get a more accurate fetch time. The default maximum width is 32768 columns.
- -time Specifies whether or not to report the timing information. Valid values are:
  - on Timing is reported. This is the default.
  - off Timing is not reported.
- -cli Embedded dynamic SQL mode, previously the default mode for the db2batch, command is no longer supported. This command only runs in CLI mode. The -cli option exists for backwards compatibility. Specifying it (including the optional *cache-size* argument) will not cause errors, but will be ignored internally.

### -msw switch

Sets the state of each specified monitor switch. You can specify any of the following: uow, statement, table, bufferpool, lock, sort, and timestamp. The special switch all sets all of the above switches. For each switch that you specify you must choose one of:

- **hold** The state of the switch is unchanged. This is the default.
- **on** The switch is turned ON.
- **off** The switch is turned OFF.

-mss snapshot

Specifies the monitoring snapshots that should be taken after each statement or block is executed, depending on the -g option. More than one snapshot can be taken at a time, with the information from all snapshots combined into one large table before printing. The possible snapshots are: applinfo\_all, dbase\_applinfo, dcs\_applinfo\_all, db2, dbase, dbase\_all, dcs\_dbase, dcs\_dbase\_all, dbase\_remote, dbase\_remote\_all, agent\_id, dbase\_appls, appl\_all, dcs\_appl\_all, dcs\_appl\_handle, dcs\_dbase\_appls, dbase\_locks, dbase\_tablespaces, bufferpools\_all, dbase\_bufferpools, and dynamic\_sql.

The special snapshot all takes all of the above snapshots. Any snapshots involving an appl ID are not supported in favour of their agent ID (application handle) equivalents. By default, no monitoring snapshots are taken.

-iso Specifies the isolation level, which determines how data is locked and isolated from other processes while the data is being accessed. By default, db2batch uses the RR isolation level.

The TxnIsolation configuration keyword in the db2cli.ini file does not affect db2batch. To run this command with an isolation level other than RR, the -iso parameter must be specified.

- **RR** Repeatable read (ODBC Serializable). This is the default.
- **RS** Read stability (ODBC Repeatable Read).
- **CS** Cursor stability (ODBC Read Committed).
- UR Uncommitted read (ODBC Read Uncommitted).
- -car Specifies the concurrent access resolution to use for the db2batch operation. The -car parameter requires a properly configured database server and the isolation level parameter -iso set to *CS*.
  - **CC** Specifies that the db2batch operation should use the currently committed version of the data for applicable scans when it is in the process of being updated or deleted. Rows in the process of being inserted can be skipped. This option applies when the isolation level in effect is Cursor Stability or Read Stability (for Read Stability it skips uncommitted inserts only) and is ignored otherwise. Applicable scans include read-only scans that can be part of a read-only statement as well as a non read-only statement.
  - **WFO** Specifies that the db2batch operation should wait for the outcome of an operation. For Cursor Stability and higher scans, db2batch will wait for the commit or rollback when encountering data in the process of being updated. Rows in the process of being inserted or deleted rows are not skipped.
- -o options

Control options. Valid options are:

**f** rows\_fetch

Number of rows to be fetched from the answer set. Valid values are -1 to *n*. The default value is -1 (all rows are to be fetched).

```
r rows_out
```

Number of fetched rows to be sent to output. Valid values are -1 to *n*. The default value is -1 (all fetched rows are to be sent to output).

### **p** perf\_detail

Specifies the level of performance information to be returned. Valid values are:

- **0** Do not return any timing information or monitoring snapshots.
- 1 Return elapsed time only.
- 2 Return elapsed time and a snapshot for the application.
- 3 Return elapsed time, and a snapshot for the database manager, the database, and the application.
- 4 Return a snapshot for the database manager, the database, the application, and the statement (the latter is returned only if autocommit is OFF, and single statements, not blocks of statements, are being processed).
- 5 Return a snapshot for the database manager, the database, the application, and the statement (the latter is returned only if autocommit is OFF, and single statements, not blocks of statements, are being processed). Also return a snapshot for the buffer pools, table spaces and FCM (an FCM snapshot is only available in a multi-databasepartition environment).

The default value is 1. A value >1 is only valid on DB2 Version 2 and DB2 database servers, and is not currently supported on host machines.

**o** *query\_optimization\_class* 

Sets the query optimization class. Valid values are 0, 1, 2, 3, 5, 7, or 9. The default is -1 to use the current optimization class.

#### **e** *explain\_mode*

Sets the explain mode under which db2batch runs. The explain tables must be created prior to using this option. Valid values are:

**no** Run query only (default).

#### explain

Populate explain tables only. This option populates the explain tables and causes explain snapshots to be taken.

**yes** Populate explain tables and run query. This option populates the explain tables and causes explain snapshots to be taken.

### **s** error\_stop

Specifies whether or not db2batch should stop running when a non-critical error occurs. Valid values are:

- **no** Continue running when a non-critical error occurs. This is the default option.
- **yes** Stop running when a non-critical error occurs.
- -v Verbose. Send information to standard error during query processing. The default value is 0FF.
- -s Summary table. Provide a summary table for each query or block of queries, containing elapsed time with arithmetic and geometric means, the rows fetched, and the rows output.
- -q Query output. Valid values are:
  - **off** Output the query results and all associated information. This is the default.
  - on Output only query results in non-delimited format.
  - **del** Output only query results in delimited format.

```
-l stmt_delimiter
```

Specifies the termination character (statement delimiter). The delimiter can be 1 or 2 characters. The default is a semi-colon (';').

-h | -u | -?

Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed.

## **Examples**

```
1. The following is sample output from the command db2batch -d crystl -f
  update.sql
  * Timestamp: Thu Feb 02 2006 10:06:13 EST
            ------
  * SQL Statement Number 1:
  create table demo (c1 bigint, c2 double, c3 varchar(8));
  * Elapsed Time is:

## Usage notes

- All SQL statements must be terminated by a delimiter (default ';') set by the --#SET DELIMITER command. This delimiter can be 1 or 2 characters.
- SQL statement length is limited only by available memory and the interface used. Statements can break over multiple lines, but multiple statements are not allowed on a single line.
- Input file line length is limited only be available memory.
- c automatically issues CONNECT and CONNECT RESET statements.
- PAUSE and SLEEP are timed when *long* is specified for the *-i* timing option.
- Explain tables must be created before explain options can be used.
- All command line options and input file statements are case insensitive with respect to db2batch.
- db2batch supports the following data types: INTEGER, CHAR, VARCHAR, LONG VARCHAR, FLOAT, SMALLINT, BIGINT, DECIMAL, DATE, TIME, TIMESTAMP, CLOB, GRAPHIC, VARGRAPHIC, LONGVARGRAPHIC, DBCLOB, BLOB, and XML.
- --#SET PERF\_DETAIL perf\_detail (or -o p perf\_detail) provides a quick way to
  obtain monitoring output. If the performance detail level is > 1, all monitor

switches are turned on internally by db2batch. If more precise control of monitoring output is needed, use the options -msw and -mss (or --#SET SNAPSHOT).

• If you specify -r and -z option together, the -r option is ignored as the -z option includes what the -r specifies.

# db2acsutil - Manage DB2 snapshot backup objects

You can use db2acsutil to manage DB2 snapshot backup objects in the following three ways:

- 1. list the DB2 snapshot backups that you can use to restore your database
- 2. delete DB2 snapshot backups that were generated using the BACKUP command, the db2Backup API, or the ADMIN\_CMD stored procedure with the BACKUP DATABASE parameter
- 3. monitor the status of DB2 snapshot backups

# **Authorization**

None

# **Required connection**

None

# **Command syntax**

# **Command parameters**

### load libraryName

The name of the shared library containing the vendor fast copying technology used in the DB2 snapshot backup. This parameter can contain the full path. If the full path is not given, the default path is the same library as with the BACKUP DB and RESTORE DB commands (in ~/sqllib/acs).

**options** "optionsString"

Specifies options to be used for this utility. The string will be passed to the vendor support library exactly as it was entered, without the double quotation marks.

### query

Queries the ACS repository and returns a table of known objects.

#### status

Queries the ACS repository and returns a table of known objects with their current status.

### delete

This deletes DB2 snapshot objects, and removes their record from the ACS repository once they have been deleted.

### snapshot

Filters the records returned or operated on to only snapshot objects.

#### taken at | older than | since

These options filter the results of the utility to the specified time ranges.

### timestamp

A timestamp of the form YYYYMMDDhhmmss.

#### N days ago

Number of days ago, where *N* is the number of days prior to the current date.

#### [not] newest X

Filter the utility results such that only the newest (by timestamp) X records are considered. If the NOT keyword is specified, then all records except the newest X are considered.

### database | db dbName

Considers only those objects associated with the specified database name.

### **instance** *instanceName*

The name of the database manager instance associated with the DB2 snapshot backup objects you are managing.

### **dbpartitionnum** *db-partition-number*

Considers only those objects created by the specified database partition number.

### host hostname

Considers only those objects created by the specified *hostname*. For example, this would typically be the TCP/IP hostname of the DB2 server.

## show details

Displays detailed object information from the ACS repository. If this option is used, instead of a table with a single brief record per line, a detailed stanza will be produced for each ACS object.

### without prompting

Specifies that the utility will run unattended, and that any actions which normally require user intervention will return an error message.

## **Examples**

Sample output for a snapshot backup with an active background copy. db2acsutil query status db f01 instance db2inst1 dbpartitionnum 0  $\,$ 

Instance Database Part Image Time Status keon14 F01 0 20070719120848 Remotely mountable + Background monitor pending (16 / 1024 MB)

Sample output for a snapshot backup with a completed background copy.

db2acsutil query status db f01 instance db2inst1 dbpartitionnum 0 show details

# **Usage notes**

Using db2acsutil is the only way to delete DB2 snapshot backups created using the BACKUP command, the db2Backup API, or the ADMIN\_CMD stored procedure with the BACKUP DATABASE parameter. You cannot use automated recovery object deletion or the PRUNE HISTORY command with the AND DELETE parameter to delete DB2 snapshot backups. You also cannot delete backups manually though the filer/storage system.

The usability state of a DB2 snapshot backup indicates what you can do with the DB2 snapshot. Table 1 lists and describes possible DB2 snapshot backup usability states.

Usability state	Description
LOCALLY_MOUNTABLE	You can mount the backed up data from the local machine.
REMOTELY_MOUNTABLE	You can mount the backed up data from a remote machine.
REPETITIVELY_RESTORABLE	You can use the DB2 snapshot backup image multiple times to restore your backed up data.
DESTRUCTIVELY_RESTORABLE	You can use the DB2 snapshot backup image to restore your backed up data once; after the backed up data is restored, this DB2 snapshot image, and potentially others, are destroyed.
SWAP_RESTORABLE	You can access the volumes directly, but a RESTORE DB command cannot be executed and the backed up data cannot be copied back onto the source volumes.
PHYSICAL_PROTECTION	The snapshot is protected against physical failures in the source volumes.
FULL_COPY	A full copy of the data has been created. You can use the DB2 snapshot backup image to restore the backed up data.

Table 41. Usability states returned for DB2 snapshot backups

Usability state	Description
DELETED	Indicates that a backup has been marked for deletion. The snapshot storage associated with a DELETED backup will be withdrawn via a maintenance process running in the background. Once this has completed, the backup will be removed from the ACS repository.
FORCED_MOUNT	Awaiting verification of filesystem consistency by mounting an AIX JFS filesystem.
BACKGROUND_MONITOR_PENDING	Status is being monitored by the ACS background progress monitor.
TAPE_BACKUP_PENDING	Awaiting an offloaded tape backup.
TAPE_BACKUP_IN_PROGRESS	An offloaded tape backup is currently in progress.
TAPE_BACKUP_COMPLETE	Offloaded tape backup has completed.

Table 41. Usability states returned for DB2 snapshot backups (continued)

# db2bfd - Bind file description tool

Displays the contents of a bind file. This utility, which can be used to examine and to verify the SQL statements within a bind file, as well as to display the precompile options used to create the bind file, might be helpful in problem determination related to an application's bind file.

# Authorization

None

# **Required connection**

None

# **Command syntax**

# **Command parameters**

- -h Display help information. When this option is specified, all other options are ignored, and only the help information is displayed.
- -b Display the bind file header.
- -s Display the SQL statements.
- -v Display the host variable declarations.

*filespec* Name of the bind file whose contents are to be displayed.

# db2ca - Start the Configuration Assistant

Starts the Configuration Assistant. The Configuration Assistant is a graphical interface that is used to manage DB2 database configuration such as database manager configuration, DB2 registry, node directory, database directory and DCS directory.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

## Authorization

sysadm

# **Required Connection**

None

# **Command syntax**

# **Command parameters**

-t Turns on the GUI trace and sends the output to a console window. On Windows operating systems, the db2ca command does not have a console window. Therefore, this option has no effect on Windows operating systems.

### -tf filename

Turns on the GUI trace and saves the output of the trace to the specified file. The output file is saved to <DB2 install path>\sqllib\tools on Windows operating systems and to /home/<userid>/sqllib/tools on Linux and UNIX systems.

### -tcomms

Limits tracing to communications events.

### -tfilter filter

Limits tracing to entries containing the specified filter or filters.

# db2caem - Capture activity event monitor data tool

The db2caem tool automates the procedure of creating an activity event monitor.

Run the db2caem command to create the activity event monitor to capture data for an SQL statement. This data can be collected with the db2support command. The information collected and generated by the db2caem tool includes:

- Detailed activity information captured by an activity event monitor including monitor metrics, for example total\_cpu\_time for statement execution
- Formatted EXPLAIN output, including section actuals (statistics for different operators in the access plan).

The db2caem tool uses an activity event monitor to capture information about the statements and then extracts and formats the information.

The db2caem tool automates the process for creating an activity event monitor,

- 1. Enabling capture for the statements of interest
- 2. Invoking the statements (each statement is rolled back after being executed to prevent side effects in the database)
- **3.** Formatting the output information (including exporting activity information for the statements of interest and generation of formatted explain output from the captured section and section actuals).

## Authorization

- 1. To create activity event monitor, the privileges must include one of the following:
  - DBADM authority
  - SQLADM authority
  - WLMADM authority

and also EXECUTE privilege on the WLM\_SET\_CONN\_ENV procedure.

- **2.** If there is not a need to create activity event monitor, the following privileges and authority are required:
  - EXECUTE privilege on the EXPLAIN\_FROM\_ACTIVITY procedure
  - INSERT privilege on the Explain tables in the specified schema
  - SELECT privilege on the event monitor tables for the source activity event monitor

and also one of the following:

- DATAACCESS authority on the activity event monitor tables
- · CONTROL or SELECT privilege on the activity event monitor tables

# **Required connection**

None

# **Command syntax**

►►--db2caem-

-d—database-name—┘ └\_-u—userid—-p—password—┘

## db2caem - Capture activity event monitor data tool

query-statement-options event-monitor-options	o—output-path	L_h_	
query-statement-options:			

### event-monitor-options:

L-actevm—event-monitor-name—-appid—application-id—-uowid—uow-id—-actid—activity-id—

# **Command parameters**

-d database-name

Specifies the name of the database to be connected to.

-u userid

(

Specifies the user ID when connecting to the database.

-p password

Specifies the password for the user ID when connecting to the database.

-o output-path

The output files of db2caem will be written to the path that you specify.

-h Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed.

## query-statement-options

-st query-statement

Specifies the SQL statement for which activity event monitor data is to be captured.

**Note:** The SQL statement will be executed against the specified database by the tool.

**-sf** *query-statement-file* 

Specifies the file path containing the SQL statement for which activity event monitor data is being captured. Use the **-terminator** option to specify the character that marks the end of the SQL statement.

**Note:** The SQL statement will be executed against the specified database by the tool.

-compenv compilation-environment-file

Specifies that the compilation environment will be used when the SQL statement is executed. The compilation environment (comp\_env\_desc) is in BLOB data type and specified through a file as an optional input. If the option is not provided, the default compilation environment will be used when executing the SQL statement.

### -tbspname table-space-name

Specifies the table space name for which the activity event monitor will be created in. For a partitioned database environment, the table space should exist on all the database partitions where the SQL statement of interest will be run. If the option is not provided, the default table space will be used when there is a need to create the activity event monitor.

## -terminator termination-character

Specifies the character that indicates the end of the SQL statement in the **-sf** SQL file if there are multiple statements in the file. The default is a semicolon.

## event-monitor-options

The following options uniquely identify an SQL statement that has already been captured by an existing activity event monitor. They are specified together to identify the statement for which **activity data** and **explain output** should be extracted.

**Note:** Formatted explain output will only be gathered if the section for the statement was captured, and the formatted explain output will only include section actuals if section actuals had been captured for the statement.

-actevm event-monitor-name

Specifies the name of the existing activities event monitor containing the data for the statement of interest.

-appid application-id

Specifies the application identifier (appl\_id monitor element) uniquely identifying the application that issued the statement of interest.

-uowid uow-id

Specifies the unit of work ID (uow\_id monitor element) in which the statement of interest was executed.

### -actid activity-id

Specifies the activity ID (activity\_id monitor element) of the statement of interest.

# **Examples**

The following examples show how you can use the db2caem tool to create the activity event monitor to capture data for an SQL statement:

db2caem -d sample -st "select \* from staff"

Creates the activity event monitor and capture information of details, section and values, as well as actuals for the SQL statement "select \* from staff".

db2caem -d sample -sf badquery.sql -terminator \$

Creates the activity event monitor and capture information of details, section and values, as well as actuals for the SQL statement specified in the file badquery.sql.

 db2caem -d sample -actevm mymon -appid \*LOCAL.mikita.100203234904 -uowid 44 -actid 1

Captures the activity event monitor information of details, section and values, as well as actuals for the SQL statement identified by the event monitor options from the existing activity event monitor. The db2caem tool will not create activity event monitor in this example.

# Usage notes

The db2caem tool is used to create the activity event monitor for capturing data which can be collected with the db2support command. DB2CAEM\_<timestamp> directory will be generated to contain all the information captured by the db2caem tool.

# db2cap - CLI/ODBC static package binding tool

Binds a capture file to generate one or more static packages. A capture file is generated during a static profiling session of a CLI/ODBC/JDBC/.NET application, and contains SQL statements that were captured during the application run. This utility processes the capture file so that it can be used by the CLI/ODBC/JDBC/.NET driver to execute static SQL for the application.

## Authorization

- Access privileges to any database objects referenced by SQL statements recorded in the capture file.
- Sufficient authority to set bind options such as OWNER and QUALIFIER if they are different from the connect ID used to invoke the db2cap command.
- BINDADD authority if the package is being bound for the first time; otherwise, BIND authority is required.

## **Command syntax**

1		
L_II_IISprid_		
u uscriu		
	n_naccword_	
	ppussworu-	

# **Command parameters**

-h | -? Displays help text for the command syntax.

**bind** *capture-file* 

Binds the statements from the capture file and creates one or more packages. This capture file is also known as the pureQueryXML file for .NET.

-d database\_alias

Specifies the database alias for the database that will contain one or more packages.

-u userid

Specifies the user ID to be used to connect to the data source. If a user ID is not specified, a trusted authorization ID is obtained from the system.

-p password

Specifies the password to be used to connect to the data source.

## Usage notes

This command must be entered in lowercase on UNIX platforms, but can be entered in either lowercase or uppercase on Windows operating systems. Static package binding for .NET applications is supported only on Windows operating systems.

This utility supports many user-specified bind options that can be found in the capture file. In order to change the bind options, open the capture file in a text editor.

The SQLERROR(CONTINUE) and the VALIDATE(RUN) bind options can be used to create a package.

When using this utility to create a package, static profiling must be disabled.

The number of packages created depends on the isolation levels used for the SQL statements that are recorded in the capture file. The package name consists of up to a maximum of the first seven characters of the package keyword from the capture file, and one of the following single-character suffixes:

- 0 Uncommitted Read (UR)
- 1 Cursor Stability (CS)
- 2 Read Stability (RS)
- 3 Repeatable Read (RR)
- 4 No Commit (NC)

To obtain specific information about packages, the user can:

- Query the appropriate SYSIBM catalog tables using the COLLECTION and PACKAGE keywords found in the capture file.
- View the capture file.

# db2cat - System catalog analysis

Analyzes the contents of packed descriptors. Given a database name and other qualifying information, this command will query the system catalogs for information and format the results. It must be issued on the server.

## Authorization

None

## **Required Connection**

None

## Command syntax

••	-db2catddbnamehhnnameooutfile-
▶	-p—descriptor -vi—versionID -s—schema -t -t
<b>-</b>	└ _v_ └ _x_ └ _cb_ →

# **Command parameters**

#### -d dbname

*dbname* is the name of the database for which the command will query the system catalogs.

- -h Displays usage information.
- -1 Turns on case sensitivity for the object name.

#### -n name

Specifies the name of the object.

#### -o outfile

Specifies the name of the output file.

#### -p descriptor

Specifies the name of the packed descriptor (pd) to display where *descriptor* is one of the following:

- check Display table check constraints packed descriptor.
- rel Display referential integrity constraint packed descriptor.
- **table** Display table packed descriptor. This includes the inline length if at least one exists for the table.

#### summary

Display summary table packed descriptor.

- trig Display table trigger packed descriptor.
- view Display view packed descriptor.

#### remote

Display remote non-relational data sources packed descriptor.

ast Display materialized query table packed descriptor.

### routine

Display routine packed descriptor.

sysplan

Display package packed descriptor.

### datatype

Display structured type packed descriptor.

### sequence

Display sequence packed descriptor.

- esri Display key transformation thread and index extension packed descriptor.
- event Display event monitor packed descriptor.

server Display server packed descriptor.

auth Display privileges held by this grantee on this object.

### -vi versionID

Specifies the version ID of the package packed descriptor. -vi is only valid when -p sysplan is specified. If *versionID* is omitted, the default is the empty string.

- -s schema
  - Specifies the name of the object schema.
- -t Displays terminal output.
- -z Disables keystroke prompt.
- -v Validates packed descriptor. This parameter is only valid for table packed descriptors.
- -x Validates table space extentsize in catalogs (does not require a table name).
- -cb Cleans orphan rows from SYSCAT.BUFFERPOOLNODES (does not require a table name).

## Usage notes

- Table name and table schema may be supplied in LIKE predicate form, which allows percent sign (%) and underscore (\_) to be used as pattern matching characters to select multiple sources with one invocation.
- Prompting will occur for all fields that are not supplied or are incompletely specified (except for the -h and -l options).
- If -o is specified without a file name, and -t is not specified, you will be prompted for a file name (the default name is db2cat.out).
- If neither -o nor -t is specified, you will be prompted for a file name (the default is terminal output).
- If -o and -t are both specified, the output will be directed to the terminal.

# db2cc - Start control center

Starts the Control Center. The Control Center is a graphical interface that is used to manage database objects (such as databases, tables, and packages) and their relationship to one another.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

# Authorization

sysadm

# **Command syntax**

## **Command parameters**

- -rc Opens the Replication Center.
- -hc Opens the Health Center.
- -tc Opens the Task Center.
- -j Opens the Journal.
- -mv Opens the Memory Visualizer.
- -tm Opens the Identify Indoubt Transaction Manager.
- -icc Opens the Information Catalog Manager.
- -ca Opens the Configuration Assistant.
- -t Turns on Control Center Trace for an initialization code. On Windows operating systems, the db2cc command does not have a console window. Therefore, this option has no effect on Windows operating systems.
- -tf Turns on Control Center Trace for an initialization code and saves the

output of the trace to the specified file. The output file is saved to <DB2 install path>\sqllib\tools on Windows and to /home/<userid>/sqllib/tools on UNIX operating systems.

#### -tcomms

Limits tracing to communications events.

### -tfilter filter

Limits tracing to entries containing the specified filter or filters.

### -ccf filename

Opens the Command Editor. If a filename is specified, the contents of this file are loaded into the Command Editor's Script page. When specifying a file name, you must provide the absolute path to the file.

-ic Opens the Information Center.

### -ict seconds

Idle Connection Timer. Closes any idle connections in the pools maintained by the Control Center after the number of seconds specified. The default timer is 30 minutes.

## -h system

Opens the Control Center in the context of a system.

#### -i instance

Opens the Control Center in the context of an instance.

### -d database

Opens the Control Center in the context of a database.

## -sub subsystem

Opens the Control Center in the context of a subsystem.

# db2cfexp - Connectivity configuration export tool

Exports connectivity configuration information to an export profile, which can later be imported at another DB2 database workstation instance of similar instance type (that is, client instance to client instance). The resulting profile will contain only configuration information associated with the current DB2 database instance. This profile can be referred to as a *client* configuration profile or a configuration profile of an *instance*.

This utility exports connectivity configuration information into a file known as a configuration profile. It is a non-interactive utility that packages all of the configuration information needed to satisfy the requirements of the export options specified. Items that can be exported are:

- Database information (including DCS and ODBC information)
- Node information
- Protocol information
- database manager configuration settings
- registry settings
- Common ODBC/CLI settings.

This utility is especially useful for exporting connectivity configuration information at workstations that do not have the DB2 Configuration Assistant installed, and in situations where multiple similar remote DB2 clients are to be installed, configured, and maintained (for example, cloning or making templates of client configurations).

# Authorization

One of the following:

- sysadm
- sysctrl

# **Command syntax**

# **Command parameters**

#### filename

Specifies the fully qualified name of the target export file. This file is known as a configuration profile.

## TEMPLATE

Creates a configuration profile that is used as a template for other instances of the same instance type (that is, client instance to client instance). The profile includes information about:

- All databases, including related ODBC and DCS information
- · All nodes associated with the exported databases
- Common ODBC/CLI settings
- · Common client settings in the database manager configuration
• Common client settings in the DB2 registry.

### BACKUP

Creates a configuration profile of the DB2 database instance for local backup purposes. This profile contains all of the instance configuration information, including information of a specific nature relevant only to this local instance. The profile includes information about:

- All databases including related ODBC and DCS information
- · All nodes associated with the exported databases
- Common ODBC/CLI settings
- All settings in the database manager configuration
- All settings in the DB2 registry
- All protocol information.

### MAINTAIN

Creates a configuration profile containing only database- and node-related information for maintaining or updating other instances.

### Note:

The db2cfexp command will not export the File data source location information from a client.

If you use the default location, no action is required. If you change the default location on a client, you will need to manually copy this location when exporting connectivity information.

To copy the File data source location from one client to another:

- 1. On the client you are exporting connectivity information, locate the %DB2PATH%\T00LS directory.
- 2. Copy the CA.properties file.
- 3. On the client you are importing connectivity information, locate the %DB2PATH%\T00LS directory.
- 4. Overwrite the existing CA.properties file with the copy taken from the originating client.

You have duplicated the File data source location from one client to another.

# db2cfimp - Connectivity configuration import tool

Imports connectivity configuration information from a file known as a configuration profile. It is a non-interactive utility that will attempt to import all the information found in the configuration profile.

A configuration profile can contain connectivity items such as:

- Database information (including DB2 Connect and ODBC information)
- Node information
- Protocol information
- database manager configuration settings
- DB2 database registry settings
- Common ODBC/CLI settings.

This utility can be used to duplicate the connectivity information from another similar instance (that is, client instance to client instance) that was configured previously. It is especially useful on workstations that do not have the DB2 Configuration Assistant (CA) installed, and in situations where multiple similar remote DB2 clients are to be installed, configured, and maintained (for example, cloning or making templates of client configurations). When cloning an instance, the profile imported should always be a client configuration profile that contains configuration information about one DB2 database instance only.

# Authorization

One of the following:

- sysadm
- sysctrl

#### Note:

- The root ID should not be used to run the tool.
- If a valid ID is used to run the tool, the ID must have the correct permission for the configuration profile to be imported.

### Command syntax

►►—db2cfimp—*filename*-

### **Command parameters**

filename

Specifies the fully qualified name of the configuration profile to be imported. Valid import configuration profiles are profiles created by any DB2 database or DB2 Connect product using the Configuration Assistant, Control Center, or db2cfexp.

# db2chglibpath - Modify the embedded runtime library search path

Modifies the embedded runtime library search path value within an executable or shared library file. It can be used to replace the embedded runtime library search path value with a new user-specified value when the existing value is no longer valid.

The db2chglibpath command can be used to replace the requirement for using operating system library search path environment variables such as **LIBPATH** (AIX), **SHLIB\_PATH** (HPPA, HPIPF) and **LD\_LIBRARY\_PATH** (AIX, SUN, HPPA64, HPIPF and Linux). This command is only supported on Linux and UNIX operating systems. It can be found under the *DB2DIR*/bin directory, where *DB2DIR* is the DB2 database installation location.

### Prerequisites

- Read and write access is required on the shared library or executable file to be modified.
- The binary has to have an embedded library path to start with, and the embedded path cannot be changed to anything bigger than the path already in the binary.
- The length of the user-specified value that is to replace the embedded runtime library search path value must not be greater than the existing value.
- This command directly modifies the binary code of the shared library or executable file and it is *strongly recommended* that you create a backup of the file before using the command.

### **Required Connection**

None

# **Command syntax**

### **Command parameters**

#### --querypath

Specifies that a query should be performed without altering the embedded library path in the binary.

--search | -s=search-expression

Specifies the expression to be searched for.

## db2chglibpath - Modify the embedded runtime library search path

#### --replace | -r=replace-expression

Specifies the expression that the *search-expression* is to be replaced with.

#### --show

Specifies that the search and replace operations are to be performed without actually writing the changes to the files.

- --32 Performs the operation if the binary type is 32-bit.
- --64 Performs the operation if the binary type is 64-bit.

#### --verbose

Displays information about the operations that are being performed.

--help Displays usage information.

--mask | -m

Suppresses error messages for exit values and can only be specified once. Exit values for the mask options are shown under the ignore option.

#### --ignore | -i

Suppresses a specific error message.

Exit values for mask and ignore options are:

- 0 path successfully changed
- 1 not all specified search and replace on the operations succeeded.
- 2 file was of the right type but does not have a libpath
- 3 file was not of the right type to have a libpath
- >3 other errors

### --skipInternalPatterns

The pattern search and replace methods is performed internally to reclaim potential space on the resultant path. Use this option to avoid this replacement.

### **Examples**

 To change the embedded runtime library search path value in the executable file named myexecutable from /usr/opt/db2\_08\_01/lib to /u/usr1/sqllib/lib32, issue:

```
db2chglibpath --search=/usr/opt/db2_08_01/lib --replace=/u/usr1/sqllib/lib32
/mypath/myexecutable
```

Note that the length of the new value is the same as that of the original value.

### Usage notes

- This command is only to be used for updating DB2 database application executables and DB2 external routine shared library files when other methods for upgrading applications and routines cannot be used or are unsuccessful.
- This command is not supported under DB2 service contract agreements. It is provided as-is and as such, IBM is not responsible for its unintended or malicious use.
- This command does not create a backup of the shared library or executable file before modifying it. It is *strongly recommended* that a backup copy of the file be made prior to issuing this command.

# db2chgpath - Change embedded runtime path

Used by the DB2 database installer on Linux and UNIX operating systems to update the embedded runtime path in the related DB2 database library and executable files. The command can be reissued under the direction of IBM DB2 database support if there were errors related to the command during the DB2 database installation.

**Note:** If SELinux (Security-enhanced Linux) is enabled after the DB2 database installations on Red Hat Enterprise Linux version 5 (RHEL5), you need to manually run this command for each DB2 database installation of the current release to make the DB2 database system work properly. See the *Usage notes* section below for additional information.

# Authorization

Root installations require root user authority. For non-root installations, you must log on with the user ID that owns the non-root installation.

### **Required Connection**

None

## Command syntax

### **Command parameters**

- -d Turns debug mode on. Use this option only when instructed by DB2 database support.
- -f file-name

Specifies a specific file name to update the runtime path. *file-name* should have the path name relative to the base of the current DB2 database product install location.

### Example

• To check all files under the DB2 database product install path and do a runtime path update, issue:

DB2\_installation\_path/install/db2chgpath

• To update the path for a specific file called libdb2.a which is under *DB2\_installation\_path*/lib64 directory, issue:

DB2\_installation\_path/install/db2chgpath -f lib64/libdb2.a

### Usage notes

On RHEL5 systems, if you have installed a DB2 database product, when SELinux was either uninstalled or disabled, and want to enable SELinux, these are the steps:

- Install SELinux rpms if necessary.
- Change /etc/sysconfig/selinux; set the status to "permissive" or "enforcing".
- Reboot the machine to apply SELinux labels to all files.

• Run db2chgpath to set the SELinux attribute that allows DB2 shared libraries with text relocations to be loaded (textrel\_shlib\_t).

# db2ckbkp - Check backup

This utility can be used to test the integrity of a backup image and to determine whether or not the image can be restored. It can also be used to display the metadata stored in the backup header.

# Authorization

Anyone can access the utility, but users must have read permissions on image backups in order to execute this utility against them.

### **Required connection**

None

### **Command syntax**

### **Command parameters**

- -a Displays all available information.
- -c Displays results of checkbits and checksums.
- -cl decompressionLib

Indicates the name of the library to be used to perform the decompression. The name must be a fully qualified path referring to a file on the server. If this parameter is not specified, DB2 will attempt to use the library stored in the image. If the backup was not compressed, the value of this parameter will be ignored. If the specified library cannot be loaded, the operation will fail.

-co decompressionOpts

Describes a block of binary data that will be passed to the initialization routine in the decompression library. DB2 will pass this string directly from the client to the server, so any issues of byte reversal or code page

conversion will have to be handled by the decompression library. If the first character of the data block is '@', the remainder of the data will be interpreted by DB2 as the name of a file residing on the server. DB2 will then replace the contents of *string* with the contents of this file and will pass this new value to the initialization routine instead. The maximum length for string is 1024 bytes.

- -d Displays information from the headers of DMS table space data pages.
- Extracts pages from an image to a file. To extract pages, you will need an input and an output file. The default input file is called extractPage.in. You can override the default input file name by setting the DB2LISTFILE environment variable to a full path. The format of the input file is as follows:

For SMS table spaces:

S <tbspID> <objID> <objType> <startPage> <numPages>

Note:

1. <startPage> is an object page number that is object-relative.

For DMS table spaces:

D <tbspID> <objType> <startPage> <numPages>

### Note:

- 1. <objType> is only needed if verifying DMS load copy images.
- 2. <startPage> is an object page number that is pool-relative.

For log files:

L <log num> <startPos> <numPages>

For other data (for example, initial data):

0 <objType> <startPos> <numBytes>

The default output file is extractPage.out. You can override the default output file name by setting the DB2EXTRACTFILE environment variable to a full path.

- -h Displays media header information including the name and path of the image expected by the restore utility.
- -H Displays the same information as -h but only reads the 4K media header information from the beginning of the image. It does not validate the image. This option cannot be used in combination with any other options.
- -1 Displays log file header (LFH) and mirror log file header (MFH) data.
- -n Prompt for tape mount. Assume one tape per device.
- -o Displays detailed information from the object headers.
- -p Displays the number of pages of each object type. This option will not show the number of pages for all different object types if the backup was done for DMS table spaces data. It only shows the total of all pages as SQLUDMSTABLESPACEDATA. The object types for SQLUDMSLOBDATA and SQLUDMSLONGDATA will be zero for DMS table spaces.
- -s Displays the automatic storage paths in the image.
- -S Displays the same information as -s but does not validate the image. This option cannot be used in combination with any other options.

- -t Displays table space details, including container information, for the table spaces in the image.
- **-T** Displays the same information as -t but does not validate the image. This option cannot be used in combination with any other options.

#### filename

The name of the backup image file. One or more files can be checked at a time.

#### Note:

- 1. If the complete backup consists of multiple objects, the validation will only succeed if db2ckbkp is used to validate all of the objects at the same time.
- 2. When checking multiple parts of an image, the first backup image object (.001) must be specified first.

### **Examples**

Example 1 (on UNIX platforms)

```
db2ckbkp SAMPLE.0.krodger.NODE0000.CATN0000.19990817150714.001
SAMPLE.0.krodger.NODE0000.CATN0000.19990817150714.002
SAMPLE.0.krodger.NODE0000.CATN0000.19990817150714.003
[1] Buffers processed: ##
[2] Buffers processed: ##
[3] Buffers processed: ##
Image Verification Complete - successful.
```

#### Example 2

db2ckbkp -h SAMPLE2.0.krodger.NODE0000.CATN0000.19990818122909.001

MEDIA HEADER REACHED:	
Server Database Name	SAMPLE2
Server Database Alias	SAMPLE2
Client Database Alias	SAMPLE2
Timestamp	19990818122909
Database Partition Number	0
Instance	krodger
Sequence Number	1
Release ID	900
Database Seed	65E0B395
DB Comment's Codepage (Volume)	0
DB Comment (Volume)	
DB Comment's Codepage (System)	0
DB Comment (System)	
Authentication Value	255
Backup Mode	0
Include Logs	0
Compression	0
Backup Type	0
Backup Gran.	0
Status Flags	11
System Cats inc	1
Catalog Database Partition No.	0
DB Codeset	IS08859-1
DB Territory	
LogID	1074717952
LogPath	/home/krodger/krodger/NODE0000/
	SQL00001/SQL0GDIR
Backup Buffer Size	4194304

Number	of	Sessions		1
Platfor	rm			0

The proper image file name would be: SAMPLE2.0.krodger.NODE0000.CATN0000.19990818122909.001

[1] Buffers processed: #### Image Verification Complete - successful.

### **Usage notes**

- 1. If a backup image was created using multiple sessions, db2ckbkp can examine all of the files at the same time. Users are responsible for ensuring that the session with sequence number 001 is the first file specified.
- 2. This utility can also verify backup images that are stored on tape (except images that were created with a variable block size). This is done by preparing the tape as for a restore operation, and then invoking the utility, specifying the tape device name. For example, on UNIX based systems:

db2ckbkp -h /dev/rmt0

and on Windows:

db2ckbkp -d \\.\tape1

**3**. If the image is on a tape device, specify the tape device path. You will be prompted to ensure it is mounted, unless option -n is given. If there are multiple tapes, the first tape must be mounted on the first device path given. (That is the tape with sequence 001 in the header).

The default when a tape device is detected is to prompt the user to mount the tape. The user has the choice on the prompt. Here is the prompt and options: (where the device I specified is on device path /dev/rmt0)

```
Please mount the source media on device /dev/rmt0. Continue(c), terminate only this device(d), or abort this tool(t)? (c/d/t)
```

The user will be prompted for each device specified, and when the device reaches the end of tape.

# db2ckmig - Database pre-migration

Verifies that a database can be migrated. This command is deprecated and will be discontinued in a future release. You should use the db2ckupgrade command instead.

### Authorization

sysadm

### **Required connection**

None

## **Command syntax**

### **Command parameters**

database

Specifies an alias name of a database to be scanned.

- -e Specifies that all local cataloged databases are to be scanned.
- -1 filename

Specifies a log file to keep a list of errors and warnings generated for the scanned database.

- -not1 Disables the check for type-1 indexes. If this option is not specified, the db2ckmig command checks for type-1 indexes and generates the type1\_index\_database-name.db2 script file, in the same directory indicated for the log file, containing REORG INDEXES ALL statements with the ALLOW WRITE ACCESS and CONVERT clauses for each identified type-1 index.
- -u userid

Specifies the user ID of the system administrator.

-p password

Specifies the password of the system administrator's user ID.

### Usage notes

Refer to the db2ckupgrade command documentation.

# db2ckrst - Check incremental restore image sequence

Queries the database history and generates a list of timestamps for the backup images that are required for an incremental restore. A simplified restore syntax for a manual incremental restore is also generated.

### Authorization

None

### **Required connection**

None

### **Command syntax**

••-	—db2ckrst—-d <i>—database no</i>	ame—-t—	-timestamp—	database rtablespace	
		h u ?_			

# **Command parameters**

-d database name

Specifies the alias name for the database that will be restored.

-t timestamp

Specifies the timestamp for a backup image that will be incrementally restored.

- -r Specifies the type of restore that will be executed. The default is database. If tablespace is chosen and no table space names are given, the utility looks into the history entry of the specified image and uses the table space names listed to do the restore.
- -n tablespace name

Specifies the name of one or more table spaces that will be restored. If a database restore type is selected and a list of table space names is specified, the utility will continue as a table space restore using the table space names given.

-h | -u | -?

Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed.

### **Examples**

```
db2ckrst -d mr -t 20001015193455 -r database
db2ckrst -d mr -t 20001015193455 -r tablespace
db2ckrst -d mr -t 20001015193455 -r tablespace -n tbsp1 tbsp2
> db2 backup db mr
Backup successful. The timestamp for this backup image is : 20001016001426
```

> db2 backup db mr incremental Backup successful. The timestamp for this backup image is : 20001016001445 > db2ckrst -d mr -t 20001016001445 Suggested restore order of images using timestamp 20001016001445 for database mr. \_\_\_\_\_ db2 restore db mr incremental taken at 20001016001445 db2 restore db mr incremental taken at 20001016001426 db2 restore db mr incremental taken at 20001016001445 \_\_\_\_\_ > db2ckrst -d mr -t 20001016001445 -r tablespace -n userspace1 Suggested restore order of images using timestamp 20001016001445 for database mr. \_\_\_\_\_ db2 restore db mr tablespace ( USERSPACE1 ) incremental taken at 20001016001445 db2 restore db mr tablespace ( USERSPACE1 ) incremental taken at 20001016001426 db2 restore db mr tablespace ( USERSPACE1 ) incremental taken at 20001016001445 \_\_\_\_\_

### Usage notes

The db2ckrst utility will not be enhanced for the rebuilding of a database. Due to the constraints of the history file, the utility will not be able to supply the correct list if several table spaces need to be restored from more than one image.

The database history must exist in order for this utility to be used. If the database history does not exist, specify the HISTORY FILE option in the RESTORE command before using this utility.

If the FORCE option of the PRUNE HISTORY command is used, you can delete entries that are required for automatic incremental restoration of databases. Manual restores will still work correctly. Use of this command can also prevent the db2ckrst utility from being able to correctly analyze the complete chain of required backup images. The default operation of the PRUNE HISTORY command prevents required entries from being deleted. It is recommended that you do not use the FORCE option of the PRUNE HISTORY command.

This utility should not be used as a replacement for keeping records of your backups.

# db2ckupgrade - Check database for upgrade

Verifies that a database can be migrated.

#### Scope

In a partitioned database environment, run the db2ckupgrade command on each database partition. This command only affects the database partition on which it is issued.

### Authorization

SYSADM

### **Required connection**

None

### Command syntax

### **Command parameters**

#### database

Specifies an alias name of a local database to be scanned.

- -e Specifies that all local cataloged databases are to be scanned.
- -1 filename

Specifies a log file to keep a list of errors and warnings generated for the scanned database.

- -not1 Disables the check for type-1 indexes. If this option is not specified, the db2ckupgrade command checks for type-1 indexes and generates the type1\_index\_database-name.db2 script file, in the same directory indicated for the log file, containing REORG INDEXES ALL commands with the ALLOW WRITE ACCESS and CONVERT clauses for each identified type-1 index.
- -p password

Specifies the password of the system administrator's user ID.

**-u** userid

Specifies the user ID of the system administrator.

#### Usage notes

To run the db2ckupgrade command:

• On Linux and UNIX operating systems, install a new DB2 copy to which you want to upgrade. Then run the db2ckupgrade command from the *DB2DIR*/bin directory, where *DB2DIR* is the location where the DB2 copy is installed.

• On Windows operating systems, insert the DB2 database product CD to which you want to upgrade. Then run the db2ckupgrade command from the db2\Windows\Utilities directory on the CD.

The db2ckupgrade command fails to run against databases which are catalogued as remote databases.

This command verifies that all the following conditions are true:

- A catalogued database actually exists.
- A database is not in an inconsistent state.
- A database is not in a backup pending state.
- A database is not in a restore pending state.
- A database is not in rollforward pending state.
- Table spaces are in a normal state.
- A database does not contain user-defined types (UDTs) with the name ARRAY, BINARY, CURSOR, DECFLOAT, ROW, VARBINARY, or XML.
- A database does not contain the system-defined DATALINK data type.
- A database does not have a schema with the name SYSPUBLIC.
- A database does not have orphan rows in system catalog tables that would cause database upgrade to fail.
- A database enabled as an HADR primary database allows successful connections.
- An HADR database role is not standby.
- If SYSCATSPACE is a DMS table space and AUTORESIZE is not enabled, SYSCATSPACE has at least 50% free pages of total pages.
- A database is not enabled for XML Extender.

A local database must pass all of these checks to succeed at the upgrade process. The db2iupgrade command calls the db2ckupgrade command with the **-not1** parameter, and specifies update.log as the log file for db2ckupgrade. The default log file created for db2iupgrade is /tmp/db2ckupgrade.log.processID. The db2iupgrade fails if the db2ckupgrade command finds that any of these conditions listed above are not true, and returns the DB11205E error code. The user needs to resolve these errors before upgrading the instance.

The db2ckupgrade command writes to the log file, specified with the **-1** parameter, a warning message for any of the following conditions:

- Column names, routine parameter names, or variable names are called NULL.
- Type-1 indexes exist in the database.
- External routines are declared NOT FENCED and NOT THREADSAFE or user-defined wrappers on UNIX and Linux operating systems are declared NOT FENCED.
- Workload connection attributes contain asterisks (\*).
- Database is enabled for DB2 WebSphere<sup>®</sup> MQ functions.

During installation on Windows operating systems, if you select a DB2 copy with the **upgrade** action in the **Work with Existing** window and you have local databases cataloged on your instances, a message box will warn you that you must run the db2ckupgrade command from the DB2 database product CD. Then you can choose one of the following actions:

• Ignore the message and continue the installation process.

- Run the db2ckupgrade command. If this command runs successfully, continue the installation process. If you find errors, quit the installation process, fix any errors, and then rerun the installation process.
- Quit the installation process.

If the **-not1** parameter is omitted, the db2ckupgrade command calls the db2IdentifyType1 command to identify type-1 indexes and to generate a script to convert type-1 indexes to type-2 indexes for a specified database. The db2IdentifyType1 command can take a long time to complete its processing. The running time of the db2IdentifyType1 command is proportional to the number of tables in the database and the number of database partitions. Take into account the following performance considerations:

- For databases with a large number of tables, large number of database partitions, or both, first run the db2IdentifyType1 command on specific schemas or tables by using the **-s** or **-t** parameters until you process all your tables. Then run the db2ckupgrade command with the **-not1** parameter.
- For Version 9.1 or Version 9.5 partitioned database environments, run the db2ckupgrade command from one database partition, preferably the catalog partition for faster performance, to detect all type-1 indexes. Then run the db2ckupgrade command with the -not1 parameter on all subsequent partitions.

To verify that a database is ready for upgrade, refer to "Verifying that your databases are ready for upgrade" in *Upgrading to DB2 Version 9.7*.

# Example

The following example shows you how to run the db2ckupgrade command for all database partitions on Linux and UNIX operating systems. First, create a Korn shell script called /shared-dir/db2ckupgradeScript.ksh as follows:

```
#!/usr/bin/ksh
# db2ckupgradeScript.ksh : Calls the db2ckupgrade command and generates an unique
# log file name for each database partition
typeset -u database=${1}
```

```
/opt/IBM/db2/V9.5/bin/db2ckupgrade ${database} -1
    /shared-dir/tmp/db2ckupgrade.${database}.${DB2NODE}.`hostname`.log
```

Where /shared-dir is a file system directory available in all database partitions.

Then run the /shared-dir/db2ckupgradeScript.ksh script in all database partitions using the following command:

db2\_all /shared-dir/db2ckupgradeScript.ksh <databaseName>

# db2cli - DB2 interactive CLI

Launches the interactive Call Level Interface environment for design and prototyping in CLI. Located in the sqllib/samples/cli/ subdirectory of the home directory of the database instance owner. In case of IBM Data Server Driver for ODBC and CLI, the db2cli executable will be located in clidriver/bin directory.

### Authorization

None

### **Required connection**

None

### **Command syntax**

## Validate options:

-	dsndsnname └databasedatabase:server:port
<b>P</b> -	-connect-user-username
▶-	

### **Register DSN options:**

### **Command parameters**

## validate

Validates and tests the CLI environment configuration.

-dsn dsn\_name

Specify the data source name to validate.

-database database:server:port

Specify the database name, server and port number to validate. The information must be specified using a colon to separate the database name, server and port number. For example, TESTDB:dbserver.example.com:19677

#### -connect

db2cli validate will connect to a specified data source name or database and output information about the connection attempt.

#### -user username

Specifies the username to use for the connection.

-passwd password

Specifies the password to use for the connection.

#### -f OUTPUT\_FILE

Specify an optional output file for the results of the db2cli command.

-help Displays help information related to the db2cli validate mode.

#### registerdsn

Specifies the db2cli register DSN mode. Use this command parameter to register a data source name.

#### -add dsn\_name

Adds a system or user ODBC data source to the Microsoft ODBC Data Source Administrator. The *dsn\_name* variable specifies a single data source to be added or all data sources present in the db2cli.ini and db2dsdriver.cfg file may be added using the **-alldsn** parameter. The value of *dsn\_name* must be the data source name and not the DBALIAS name. The data source name must be present in the db2cli.ini or db2dsdriver.cfg file.

#### -alldsn

Specify this parameter to register all the data sources available in the db2cli.ini and db2dsdriver.cfg file. This parameter must be used with the **-add** parameter.

-user Specifies to register a user ODBC data source. This is the default if no parameter is specified.

#### -system

Specifies to register a system ODBC Data Source

#### -remove dsn\_name

Removes a system or user ODBC Data Source from the Microsoft ODBC Data Source Administrator.

- -list List all the system or user IBM Data Server ODBC Data Sources registered in the Microsoft ODBC Data Source Administrator.
- -help Displays help information related to the db2cli register DSN mode.
- csc Displays Connection Supervisor Client (CSC) information. A Connection Supervisor Client is a dynamically loadable library that CLI uses for the purpose of end-to-end monitoring.
- -help Displays the db2cli tool help information

# Usage notes

DB2 Interactive CLI consists of a set of commands that can be used to design, prototype, and test CLI function calls. It is a programmers' testing tool provided for the convenience of those who want to use it, and IBM makes no guarantees about its performance. DB2 Interactive CLI is not intended for end users, and so does not have extensive error-checking capabilities.

Three types of commands are supported:

### CLI commands

Commands that correspond to (and have the same name as) each of the function calls that is supported by IBM CLI

### Support commands

Commands that do not have an equivalent CLI function.

### Additional modes

The additional modes for the db2cli command are used to validate and test the CLI environment configuration.

Commands can be issued interactively, or from within a file. Similarly, command output can be displayed on the terminal, or written to a file. A useful feature of the CLI command driver is the ability to capture all commands that are entered during a session, and to write them to a file, thus creating a *command script* that can be rerun at a later time.

# db2cmd - Open DB2 command window

Opens the CLP-enabled DB2 window, and initializes the DB2 command line environment. Issuing this command is equivalent to clicking the *DB2 Command Window* icon.

This command is only available on Windows operating systems.

### Authorization

None

### **Required connection**

None

### **Command syntax**

►►---db2cmd-

option-flag\_\_\_\_command\_\_

### **Command parameters**

- -c | /c Execute command following the -c option in a new DB2 command window, and then terminate. For example, db2cmd -c dir causes the dir command to be invoked in a new DB2 command window, and then the DB2 command window closes.
- -w | /w

Execute command following the -w option in a new DB2 command window, and wait for the new DB2 command window to be closed before terminating the process. For example, db2cmd /w dir invokes the dir command, and the process does not end until the new DB2 command window closes.

- -i | /i Execute command following the -i option while sharing the same DB2 command window and inheriting file handles. For example, db2cmd -i dir executes the dir command in the same DB2 command window.
- -t | /t Execute command following the -t option in a new DB2 CLP window with the specified command as the title of this new window.

### Usage notes

If DB21061E ("Command line environment not initialized.") is returned when bringing up the CLP-enabled DB2 window, the operating system may be running out of environment space. Check the config.sys file for the SHELL environment setup parameter, and increase its value accordingly. For example:

SHELL=C:\COMMAND.COM C:\ /P /E:32768

# db2cptsa - Install or update DB2 HA scripts

Installs or updates the DB2 High Availability (HA) scripts in /usr/sbin/rsct/ sapolicies/db2 on UNIX and Linux operating systems. You need these DB2 HA scripts to use the IBM Tivoli System Automation for Multiplatforms (SA MP) with the DB2 HA feature.

### Authorization

Root user authority

### **Required connection**

None

### Command syntax

### **Command parameters**

- -c Verifies that the DB2 HA scripts exist in /usr/sbin/rsct/sapolicies/db2, and that they are at the proper level.
- -f Forces a reinstall of the DB2 HA scripts in /usr/sbin/rcst/sapolicies/db2. Without this argument, if the version of the DB2 HA scripts that are already installed is the same as or higher than the version of the scripts being installed, then the installed scripts are not overwritten.
- -r Removes the directory /usr/sbin/rsct/sapolicies/db2. This directory is where the DB2 HA scripts for SA MP are located. These scripts and this directory will only be removed if SA MP is not installed.
- -h | -?

Displays help information.

# **Usage notes**

By default, this utility installs the DB2 HA scripts in /usr/sbin/rsct/sapolicies/ db2 if they aren't already installed there, or if the version of the scripts already installed is older than the version of the scripts being installed. This utility installs or updates the DB2 HA scripts if and only if SA MP is already installed.

This command can be found on the DB2 install media in the db2/*plat*/tsamp directory, where *plat* is:

- aix for DB2 for AIX  $5L^{\text{TM}}$
- linux for DB2 for Linux on 32-bit AMD and Intel® systems (x86)
- linuxamd64 for DB2 for Linux on AMD64 and Intel EM64T systems (x64)
- linuxppc for DB2 for Linux on POWER<sup>®</sup> (System i and pSeries<sup>®</sup>) systems
- linux390 for DB2 for Linux on System z9<sup>®</sup> and zSeries<sup>®</sup>

The command is also available at *DB2DIR*/install/tsamp directory where *DB2DIR* is the installation path of the DB2 database product for UNIX and Linux operating systems.

# db2dart - Database analysis and reporting tool

Examines databases for architectural correctness and reports any encountered errors.

### Authorization

sysadm

### **Required connection**

None. db2dart must be run with no users connected to the database.

### Command syntax

### **Command parameters**

#### **Inspection actions**

- /DB Inspects the entire database. This is the default option.
- /T Inspects a single table. Requires two input values: a table space ID, and the table object ID or the table name.
- /TSF Inspects only table space files and containers.
- **/TSC** Inspects a table space's constructs, but not its tables. Requires one input value: table space ID.
- **/TS** Inspects a single table space and its tables. Requires one input value: table space ID.
- /ATSC Inspects constructs of all table spaces, but not their tables.

#### Data formatting actions

- **/DD** Dumps formatted table data. If present, inline LOB data is also shown. Requires five input values: either a table object ID or table name, table space ID, page number to start with, number of pages, and verbose choice.
- **/DI** Dumps formatted index data. Requires five input values: either a table object ID or table name, table space ID, page number to start with, number of pages, and verbose choice.
  - For nonpartitioned indexes on partitioned tables, the /DI action uses INDEX\_OBJECTID and TBSPACEID from SYSCAT.INDEXES as the first two inputs to the /OI and /TSI options. The table name (/TN) option is not supported for the action.
  - For partitioned indexes on partitioned tables, the /DI action uses PARTITIONOBJECTID and TBSPACEID from SYSCAT.DATAPARTITIONS. The table name (/TN) option is not supported for the action.
- **/DM** Dumps formatted block map data. Requires five input values: either a table object ID or table name, table space ID, page number to start with, number

of pages, and verbose choice. The data shows whether a block has been reclaimed for use by the table space following a reorganization to reclaim multidimensional clustering (MDC) table blocks that were empty.

- **/DP** Dumps pages in hex format.
  - For permanent object in DMS table space, action /DP requires three input values consisting of table space ID, page number to start with, and number of pages.
  - For permanent object in SMS table space, action /DP requires five input values consisting of table space ID, object ID, page number to start with, number of pages, and object type.
- /DTSF Dumps formatted table space file information.

#### /DEMP

Dumps formatted extent map page (EMP) information for a DMS table. Requires two input values: table space ID and the table object ID or table name.

#### /DDEL

Dumps formatted table data in delimited ASCII format. Requires four input values: either a table object ID or table name, table space ID, page number to start with, and number of pages.

#### /DHWM

Dumps high water mark information. Requires one input value: table space ID.

- **/DXA** Dumps formatted XML column data in ASCII format. Requires five input values: either a table object ID or table name, table space ID, page number to start with, number of pages, and verbose choice.
- **/DXH** Dumps formatted XML column data in HEX format. Requires five input values: either a table object ID or table name, table space ID, page number to start with, number of pages, and verbose choice.

#### /LHWM

Suggests ways of lowering the high water mark. Requires two input values: table space ID and number of pages (desired high water mark).

#### **Repair actions**

- **/ETS** Extends the table limit in a 4 KB table space (DMS only), if possible. Requires one input value: table space ID.
- /MI Marks index as invalid. When specifying this parameter the database must be offline. Requires two input values: table space ID and index object ID. For partitioned indexes, these values can be obtained from INDPARTITIONOBJECTID and INDPARTITIONTBSPACEID for SYSCAT.INDEXPARTITIONS.

#### /RHWM

Reduces high water mark through empty SMP extents. When specifying this parameter the database must be offline. Requires one input value: table space ID.

#### Change state actions

### /CHST

Change the state of a database. When specifying this parameter the database must be offline. Requires one input value: database backup pending state.

### Help

/H Displays help information.

### Input value options

### /OI object-id

Specifies the object ID.

### **/TN** table-name

Specifies the table name.

### /TSI tablespace-id

Specifies the table space ID.

### /ROW sum

Identifies whether long field descriptors, LOB descriptors, and control information should be checked. You can specify just one option or add the values to specify more than one option.

- 1 Checks control information in rows.
- 2 Checks long field and LOB descriptors.

### /RPT path

Optional path for the report output file.

# /RPTN file-name

Optional name for the report output file.

#### **/PS** number

Specifies the page number to start with. The page number must be suffixed with p for pool relative. Specifying /PS 0 /NP 0 will cause all pages in the specified object to be dumped.

#### /NP number

Specifies the number of pages. Specifying /PS 0 /NP 0 will cause all pages in the specified object to be dumped.

### IV option

Specifies whether or not the verbose option should be implemented. Valid values are:

- Y Specifies that the verbose option should be implemented.
- N Specifies that the verbose option should not be implemented.

### /SCR option

Specifies type of screen output, if any. Valid values are:

- Y Normal screen output is produced.
- M Minimized screen output is produced.
- **N** No screen output is produced.

### /RPTF option

Specifies type of report file output, if any. Valid values are:

Y Normal report file output is produced.

- E Only error information is produced to the report file.
- **N** No report file output is produced.

#### /ERR option

Specifies type of log to produce in DART. INF, if any. Valid values are:

- Y Produces normal log in DART.INF file.
- **N** Minimizes output to log DART.INF file.
- E Minimizes DART.INF file and screen output. Only error information is sent to the report file.

### /WHAT DBBP option

Specifies the database backup pending state. Valid values are:

- **OFF** Off state.
- **ON** On state.

### **/QCK** option

Quick option. Only applies to /DB, /T, and /TS actions. Only inspects page 0 of the DAT objects and partially inspects the index objects (does not inspect BMP, LOB, LF objects and does not traverse the entirety of the DAT or INX objects).

### /TYP option

Specifies the type of object. Valid values are:

- **DAT** Object type is DAT.
- **INX** Object type is INDEX.

**BKM** Object type is BMP.

### Usage notes

- 1. When invoking the db2dart command, you can specify only one action. An action can support a varying number of options.
- 2. If you do not specify all the required input values when you invoke the db2dart command, you will be prompted for the values. For the /DDEL action, the options cannot be specified from the command line, and must be entered when prompted by db2dart.
- **3.** The /ROW, /RPT, /RPTN, /SCR, /RPTF, /ERR, and /WHAT DBBP options can all be invoked in addition to the action. They are not required by any of the actions.
- 4. The /DB, /T and /TS options inspect the specified objects, including associated XML storage objects. The /DB option includes all XML storage objects in the database, the /T option includes XML storage objects associated with the specified table, and the /TS option inspects all XML storage objects whose parent objects exist in the specified table space. As well, the /DEMP option will dump formatted EMP information including that for associated XML storage objects.
- 5. When db2dart is run against a single table space, all dependent objects for a parent table in that table space are checked, irrespective of the table space in which the dependent objects reside. However, extent map page (EMP) information is not captured for dependent objects that reside outside of the specified table space. EMP information is captured for dependent objects found in the specified table space even when the parent object resides in a table space other than the one specified.

- 6. For partitioned tables, the /DD, /DM, /DEMP, /DDEL, /DP, /DXA, /DXH actions use partitionobjectid and tbspaceid from syscat.datapartitions as the input to the table object ID (/OI) and table space ID (/TSI) for a specific partition. The table name option (/TN) is not supported for these actions. The /T action supports the table name or global table object ID when use with global table space ID to check the entire table, and also supports using partitionobjectid and tbspaceid from syscat.datapartitions as the input to /OI and /TSI to check a specific partition.
- 7. In general, db2dart requests are to be run when the database is offline. However, for the **/DHWM** and **/LHWM** actions, an offline database is not strictly required. The report could be generated without the database being offline, but the reliability of the results will vary depending on how much write/update activity has occurred recently (less activity implies more reliable results).

-

# db2daslevel - Show DAS level

Shows the current level of the DAS on the system. Output from this command goes to the console by default.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

# Authorization

# **Required Connection**

None

# **Command Syntax**

► — db2daslevel —

# **Command parameters**

None

# db2dclgn - Declaration generator

Generates declarations for a specified database table, eliminating the need to look up those declarations in the documentation. The generated declarations can be modified as necessary. The supported host languages are C/C++, COBOL, JAVA, and FORTRAN.

### Authorization

None

### **Required connection**

None

### **Command syntax**

# **Command parameters**

-d database-name

Specifies the name of the database to which a connection is to be established.

**-t** table-name

Specifies the name of the table from which column information is to be retrieved to generate declarations.

option One or more of the following:

#### -a action

Specifies whether declarations are to be added or replaced. Valid values are **ADD** and **REPLACE**. The default value is **ADD**.

-b lob-var-type

Specifies the type of variable to be generated for a LOB column. Valid values are:

#### LOB (default)

For example, in C, SQL TYPE is CLOB(5K) x.

#### LOCATOR

For example, in C, SQL TYPE is CLOB\_LOCATOR x.

**FILE** For example, in C, SQL TYPE is CLOB\_FILE x.

- -c Specifies whether the column name is to be used as a suffix in the field name when a prefix (-n) is specified. If no prefix is specified, this option is ignored. The default behavior is to not use the column name as a suffix, but instead to use the column number, which starts at 1.
- -i Specifies whether indicator variables are to be generated. Since host structures are supported in C and COBOL, an indicator table of size equal to the number of columns is generated, whereas for

JAVA and FORTRAN, individual indicator variables are generated for each column. The names of the indicator table and the variable are the same as the table name and the column name, respectively, prefixed by "IND-" (for COBOL) or "ind\_" (for the other languages). The default behavior is to not generate indicator variables.

-l language

Specifies the host language in which the declarations are to be generated. Valid values are **C**, **COBOL**, **JAVA**, and **FORTRAN**. The default behavior is to generate **C** declarations, which are also valid for C++.

-n name

Specifies a prefix for each of the field names. A prefix must be specified if the -c option is used. If it is not specified, the column name is used as the field name.

-o output-file

Specifies the name of the output file for the declarations. The default behavior is to use the table name as the base file name, with an extension that reflects the generated host language:

- .h for C .cbl for COBOL .java for JAVA .f for FORTRAN (UNIX) .for for FORTRAN (INTEL)
- -p password

Specifies the password to be used to connect to the database. It must be specified if a user ID is specified. The default behavior is to provide no password when establishing a connection.

**-r** remarks

Specifies whether column remarks, if available, are to be used as comments in the declarations, to provide more detailed descriptions of the fields.

-s structure-name

Specifies the structure name that is to be generated to group all the fields in the declarations. The default behavior is to use the unqualified table name.

-u userid

Specifies the user ID to be used to connect to the database. It must be specified if a password is specified. The default behavior is to provide no user ID when establishing a connection.

- -v Specifies whether the status (for example, the connection status) of the utility is to be displayed. The default behavior is to display only error messages.
- -w DBCS-var-type

Specifies whether **sqldbchar** or **wchar\_t** is to be used for a GRAPHIC/VARGRAPHIC/DBCLOB column in C.

-y DBCS-symbol

Specifies whether **G** or **N** is to be used as the DBCS symbol in COBOL.

-z encoding

Specifies the encoding the coding convention in accordance to the

particular server. Encoding can be either **LUW** or **OS390**. If **OS390** is specified, the generated file would look identical to a file generated by OS390.

## **Examples**

db2dclgn -d sample -t emp\_resume -l cobol -a replace

# db2diag - db2diag logs analysis tool

This utility is a tool to filter and format both single and rotating db2diag log files. The db2diag tool reads from rotating db2diag log files if the **diagsize** database manager configuration parameter is set. Otherwise, by default, it reads from the default db2diag.log file.

### **Authorization**

None

### **Required connection**

None

### **Command syntax**

### db2diag - db2diag logs analysis tool

### **Command parameters**

#### -global

Specifies that all the db2diag log files from all the database partitions on all the hosts are included in the log file processing.

**Note:** This command parameter is available in DB2 Version 9.7 Fix Pack 1 and later fix packs. This option supports rotating diagnostic log files and files located in split diagnostic data directories. In DB2 Version 9.7 Fix Pack 1, this option cannot be used in combination with the **-follow** option. In DB2 Version 9.7 Fix Pack 2 and later fix packs, this option can be used in combination with the **-follow** option.

#### -merge

Merges diagnostic log files and sorts the records based on the timestamp. This option supports rotating diagnostic log files and files located in split diagnostic data directories. If this command parameter is not followed by two or more space-separated *filename* values, the db2diag log files in the directory or directories specified by the **diagpath** database manager configuration parameter are merged. If the diagnostic data directory path is split across multiple database partitions, only the db2diag log files in the database partitions of the current host are merged.

If only one *filename* is specified, or only one diagnostic file exists in the path specified in the **diagpath** database manager configuration parameter, the single diagnostic log file is processed by the command as though the **-merge** command parameter was not specified.

**Note:** This command parameter is available in DB2 Version 9.7 Fix Pack 1 and later fix packs. It cannot be used in combination with **-facility**, **-follow**, or **-archive** options.

#### -global -merge -sdir sharedDirPathname

Specifying the **-global** and **-merge** options together results in all the db2diag log files from all the database partitions on all the hosts to be merged, and the records sorted based on the timestamp. This option supports rotating diagnostic log files and files located in split diagnostic data directories.

**Note:** The **-sdir** *sharedDirPathname* option must be specified to temporarily store the merged diagnostic log files obtained from the different hosts. The temporary merged diagnostic log files are deleted after processing has been completed. The *sharedDirPathname* must specify a shared directory to which all hosts have access and write permission.

#### filename

Specifies one or more space-separated path names of DB2 diagnostic logs to be processed. If the file name is omitted, the db2diag log file from the current directory is processed. If the file is not found, the directory or directories set by the **diagpath** database manager configuration parameter is searched.

#### -facility | -fac

Reads the files from the corresponding facility. A facility is a logical grouping of records. For example, all optimizer statistics records are grouped into the OPTSTATS facility. The output will be in text format by default. Valid facility options are the following:

- ALL Returns records from all facilities.
- MAIN Returns records from DB2 general diagnostic logs, such as the db2diag log file, and rotating event logs.

#### **OPTSTATS**

Returns records related to optimizer statistics.

#### -fmt formatString

Formats the db2diag output using a format string, *formatString*, containing record fields in the form %field, %{field}, @field, or @{field}. The %{field} and @{field} are used to separate a field name from the alphanumeric (or any other allowed character) that may follow the field name. All field names are case-insensitive. Field names can be shortened to the several first characters that are necessary to recognize a field name without ambiguity. In addition, aliases can be used for fields with long names. A prefix before a field name, %, or @, specifies whether a text preceding the field will be displayed (%) or not (@), if the field is empty.

The following fields are currently available:

#### timestamp | ts

Time stamp. This field can be divided into its constituent fields: %tsyear, %tsmonth, %tsday, %tshour, %tsmin (minute), %tssec (second), %tsmsec (microsecond for UNIX operating systems, millisecond for Windows operating systems).

#### timezone | tz

Number of minutes difference from UTC (Universal Coordinated Time). For example, -300 is Eastern Time.

#### recordid | recid

A unique alphanumeric identifier for a record, such as I11455A696.

#### audience

Intended audience for a logged message. 'E' indicates external users (IBM customers, service analysts, and developers). 'I' indicates internal users (service analysts and developers). 'D' indicates debugging information for developers.

level Severity level of a message: Info, Warning, Error, Severe, or Event.

**source** Location from which the logged error originated: Origin, OS, Received, or Sent.

#### instance | inst

Instance name.

node Database partition server number.

#### database | db

Database name.

pid Process ID.

tid Thread ID.

eduid EDU ID.

#### eduname

EDU name.

#### process

Name associated with the process ID, in double quotation marks. For example, "db2sysc.exe".

#### product

Product name. For example, DB2 COMMON.

#### component

Component name.

#### funcname

Function name.

probe Probe number.

#### function

Full function description: %prod, %comp, %funcname, probe:%probe.

**appid** The application ID. This value is the same as the **appl\_id** monitor element data. For detailed information about how to interpret this value, see "appl\_id - Application ID monitor element".

#### coordnode

Coordinator partition.

### coordindex

Coordinator index.

#### apphdl

Application handle: %coordnode - %coordindex.

#### message | msg

Error message.

#### calledprod

Product name of the function that returned an error.

#### calledcomp

Component name of the function that returned an error.

#### calledfunc

Name of the function that returned an error.

- **called** Full description of the function that returned an error: %calledprod, %calledcomp, %calledfunc.
- rcval Return code value (32 bytes).

rcdesc Error description.

#### retcode | rc

Return code returned by the function called: %rcval %rcdesc.

errno System error number.

#### errname

System-specific error name.

#### oserror

Operating system error returned by a system call: %errno %errname.

#### callstack

Call stack.

#### datadesc

Data description.

#### dataobject

Data object.

**data** Full data section of a message: %datadesc %dataobject.

#### argdesc

Argument description.

#### argobject

Argument object.

arg Arguments of a function call that returned an error: %argdesc %argobject.

### **Event descriptions:**

#### impact

User impact (for events only).

#### startevent

Start event description (\*).

stopevent Stop event description (\*). changeevent Change event description (\*). init Initialization event description (\*). fini Finish/finalize event description (\*). startup Startup event description (\*). terminate Terminate event description (\*). bringdown Bringdown event description (\*). interrupt Interrupt event description (\*). associate Associate event description (\*). disassociate Disassociate event description (\*). changecfg Change configuration event description (\*). transfer Transfer event description (\*). dispatch Dispatch event description (\*). switch Switch event description (\*). **report** Report event description (\*). Get event description (\*). get Free event description (\*). free open Open event description (\*). Close event description (\*). close work Work event description (\*). Wait event description (\*). wait available Available event description (\*). connect Connect event description (\*). disconnect Disconnect event description (\*). **accept** Accept event description (\*). Receive event description (\*). recv send Send event description (\*). **create** Create event description (\*).
# destroy

Destroy event description (\*).

### request

Request event description (\*).

**reply** Reply event description (\*).

### dependency

Dependency event description (\*).

- write Write event description (\*).
- **read** Read event description (\*).

**reset** Reset event description (\*).

**collect** Collect event description (\*).

add Add event description (\*).

**alter** Alter event description (\*).

**drop** Drop event description (\*).

### invalidate

Invalidate event description (\*).

grant Grant event description (\*).

### revoke

Revoke event description (\*).

### (\*) Each event field has the following subfields:

## {event}**type**

Event type (START, STOP, READ, WRITE, GET).

### {event}**desc**

Event description (header with event information).

#### {event}state

Event state (success, failure, start, stop, in progress, idle) or event progress (in %).

### {event}attr

Event attributes (business level, cached, sync, async, internal, external, logical, physical, auto, manual, temporary, permanent).

## {event}objid

Unique object identifier (TABLE, CFG, DBM).

### {event}objname

Event object name (for example, "schema.tablename").

## {event}objdata

Object data (used if object is not a string or simple integer type, for example, data structure or some complex type).

### {event}qtype

Event qualifier type (FROM, TO, ON, FOR, AT, BY, CONTEXT).

### {event}qname

Event qualifier name/value (for example, FOR "DB ABC").

### {event}qdhdr

Event qualifier data header (contains type, text description and size of data). Used together with the %*[event]*qdata field.

### {event}qdata

Event qualifier data (used if qualifier is not a string or simple integer type, for example, some data structure or complex type).

In the above, keyword *{event}* should be substituted by event type for a specific event (for example, start, stop, change, read, write).

To always display the text preceding a field name (for example, for the required fields), the % field prefix should be used. To display the text preceding a field name when this field contains some data, the @ prefix should be used. Any combination of required and optional fields with the corresponding text descriptions is allowed.

The following special characters are recognized within a format string: n, r, f, v, and t.

In contrast to other fields, the data and argument fields can contain several sections. To output a specific section, add the [n] after the field name where n is a section number ( $1 \le n \le 64$ ). For example, to output the first data object and the second data description sections, use  $\{ dataobj \} [1]$  and  $\{ datadesc \} [2]$ . When [n] is not used, all sections logged are output using pre-formatted logged data exactly as appears in a log message, so there is no need to add the applicable text description and separating newline before each data field, argument field, or section.

### -filter fieldPatternList | -g fieldPatternList

*fieldPatternList* is a comma-separated list of field-pattern pairs in the following format: *fieldName operator searchPattern*.

The operator can be one of the following:

- = Selects only those records that contain matches that form whole words. (Word search.)
- := Selects those records that contain matches in which a search pattern can be part of a larger expression.
- != Selects only non-matching lines. (Invert word match.)
- **!:=** Selects only non-matching lines in which the search pattern can be part of a larger expression.
- ^= Selects records for which the field value starts with the search pattern specified.
- !^= Selects records for which the field value does not start with the search pattern specified.

The same fields are available as described for the **-fmt** option, except that the % and @ prefixes are not used for this option.

-gi fieldPatternList

Same as **-g**, but case-insensitive.

### -gv fieldPatternList

Searches for messages that do not match the specified pattern.

-gvi | -giv fieldPatternList

Same as **-gv**, but case-insensitive.

-pid processIDList

Displays only log messages with the process IDs listed.

-tid threadIDList

Displays only log messages with the thread IDs listed.

-eduid EduIDList

Finds all records with a specified EDU ID from a list of EDU IDs containing one or more comma separated numeric values.

-n | -node nodeList

Displays only log messages with the database partition numbers listed.

-e | -error errorList

Displays only log messages with the error numbers listed.

-1 | -level levelList

Finds all records with a specified severity level from a list of severity levels containing one or more comma separated text values, namely: Info, Warning, Error, Severe, Critical and Event.

-c | -count

Displays the number of records found.

-v | -invert

Inverts the pattern matching to select all records that do not match the specified pattern

- -strict Displays records using only one field: value pair per line. All empty fields are skipped. This can be used for scripts to simplify parsing.
- -V | -verbose

Outputs all fields, including empty fields.

-exist Defines how fields in a record are processed when a search is requested. If this option is specified, a field must exist in order to be processed.

-o | -output pathName

Saves the output to a file specified by a fully qualified *pathName*.

-f | -follow

If the input file is a single or rotating db2diag log file, specifies that the tool will not terminate after the last record of the input file has been processed. Instead, it sleeps for a specified interval of time (sleepInterval), and then attempts to read and process further records from the input file as they become available. As of Version 9.7 Fix Pack 2, only the records from the last 8 kilobytes of the input file are processed.

The follow mode will also handle rotating db2diag log files. For example, the command will read the latest rotating diagnostic log file in use (db2diag.23.log) and follow along to the next created rotating log file (db2diag.24.log) when the db2diag.23.log log file meets its size limit.

This option can be used when monitoring records being written to a file by another process. The startTime option can be specified to show all the

<sup>-</sup>cbe Common Base Event (CBE) Canonical Situation Data.

records logged after this time. The *startTime* option is specified using the following format: YYYY-MM-DD-hh.mm.ss.nnnnn, where

- *YYYY* Specifies a year.
- *MM* Specifies a month of a year (01 through 12).
- *DD* Specifies a day of a month (01 through 31).
- *hh* Specifies an hour of a day (00 through 23).
- *mm* Specifies a minute of an hour (00 through 59).
- ss Specifies a second of a minute (00 through 59).

#### nnnnnn

Specifies microseconds on UNIX operating systems, or milliseconds on Windows operating systems.

Some or all of the fields that follow the year field can be omitted. If they are omitted, the default values will be used. The default values are 1 for the month and day, and 0 for all other fields.

If an exact match for the record time stamp does not exist in the diagnostic log file, the closest time earlier than the specified time stamp will be used.

The *sleepInterval* option specifies a sleep interval in seconds. If a smaller time unit is required, it can be specified as a floating point value. The default value is 2 seconds

### -H | -history

Displays the history of logged messages for the specified time interval. This option can be specified with the following options:

historyPeriod

Specifies that logged messages are displayed starting from the most recent logged record, for the duration specified by *historyPeriod*. The *historyPeriod* option is specified using the following format: *Number timeUnit*, where *Number* is the number of time units and *timeUnit* indicates the type of time unit: M (month), d (day), h (hour), m (minute), and s (second). The default value for *Number* is 30, and for *timeUnit* is m.

### historyPeriod:historyReference

Specifies that logged messages are displayed that were recorded within the time period after the start time specified by *historyReference* (if an explicit positive value for *historyPeriod* is given), or logged messages are displayed that were recorded within the time period before the end time specified by *historyReference* (if a negative value for *historyPeriod* is given, or by default).

The format is *YYYY-MM-DD-hh.mm.ss.nnnnn*, where:

*YYYY* Specifies a year.

- *MM* Specifies a month of a year (01 through 12).
- *DD* Specifies a day of a month (01 through 31).
- *hh* Specifies an hour of a day (00 through 23).
- *mm* Specifies a minute of an hour (00 through 59).
- ss Specifies a second of a minute (00 through 59).

nnnnnn

Specifies microseconds (UNIX operating systems) or milliseconds (Windows operating systems).

-t | -time

Specifies a time stamp value. This option can be specified with one or both of the following options:

startTime

Displays all messages logged after *startTime*.

:endTime

Displays all messages logged before *endTime*.

To display messages logged between *startTime* and *endTime*, specify -t *startTime:endTime*.

The format is *YYYY-MM-DD-hh.mm.ss.nnnnn*, where:

*YYYY* Specifies a year.

- *MM* Specifies a month of a year (01 through 12).
- *DD* Specifies a day of a month (01 through 31).
- *hh* Specifies an hour of a day (00 through 23).
- *mm* Specifies a minute of an hour (00 through 59).
- ss Specifies a second of a minute (00 through 59).

nnnnnn

Specifies microseconds (UNIX operating systems) or milliseconds (Windows operating systems).

Some or all of the fields that follow the year field can be omitted. If they are omitted, the default values will be used. The default values are 1 for the month and day, and 0 for all other fields.

If an exact match for the record time stamp does not exist in the diagnostic log file, the time closest to the time stamp specified will be used.

-A | -archive dirName

Archives both single and rotating diagnostic log files. When this option is specified, all other options are ignored. If one or more file names are specified, each file is processed individually. A timestamp, in the format YYYY-MM-DD-hh.mm.ss, is appended to the file name.

You can specify the name of the file and directory where it is to be archived. If the directory is not specified, the file is archived in the directory where the file is located and the directory name is extracted from the file name.

If you specify a directory but no file name, the current directory is searched for the db2diag log file. If found, the file will be archived in the specified directory. If the file is not found, the directory specified by the **diagpath** configuration parameter is searched for the db2diag log file. If found, it is archived in the directory specified.

If you do not specify a file or a directory, the current directory is searched for the db2diag log file. If found, it is archived in the current directory. If the file is not found, the directory specified by the **diagpath** configuration parameter is searched for the db2diag log file. If found, it is archived in the directory specified by the **diagpath** configuration parameter.

-readfile

Forces reading from a diagnostic log file ignoring any terminal input. This option can be used in scripts to guarantee that db2diag will read from a file and not from a terminal, especially in situations when stdin is disabled or when automated tools are used. Running the db2diag command using rah or db2\_all also requires the **-readfile** option to be used.

-rc rcList | switch

Displays descriptions of DB2 internal error return codes for a space separated list, *rcList*, of the particular ZRC or ECF hexadecimal or negative decimal return codes. A full list of ZRC or ECF return codes can be displayed by specifying one of the following switches:

- **zrc** Displays short descriptions of DB2 ZRC return codes.
- ecf Displays short descriptions of DB2 ECF return codes.
- **html** Displays short descriptions of DB2 ZRC return codes in the HTML format.

When this option is specified, all other options are ignored and output is directed to a display.

-ecfid ecfld

Displays function information extracted from the numeric *ecfld*. When this option is specified, all other options are ignored.

-h | -help | ?

Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed. If a list of options, *optionList*, containing one or more comma separated command parameters is omitted, a list of all available options with short descriptions is displayed. For each option specified in the *optionList*, more detailed information and usage examples are displayed. Help output can be modified by using one of the following switches in place of the *optionList* argument to display more information about the tool and its usage:

**brief** Displays help information for all options without examples.

### examples

Displays a few typical examples to assist in using the tool.

### tutorial

Displays examples that describe advanced features.

- notes Displays usage notes and restrictions.
- **all** Displays complete information about all options, including usage examples for each option.

## Examples

The following is a list of some examples which illustrate how to use the db2diag command under various circumstances:

• To merge all db2diag log files in the diagnostic data directory path, execute the following command:

db2diag -merge

If the diagnostic data directory path is split according to database partitions, this command merges the db2diag log files from all the database partitions of the current host. If the diagnostic data directory path is not split, the single diagnostic log file is processed by the command as though the **-merge** option was not specified.

• In this example, the default diagnostic data directory path was split according to physical host and database partition by setting the **diagpath** database manager configuration parameter using the following command:

db2 update dbm cfg using diagpath '"\$h\$n"'

This example shows how to obtain an output of all the records from all the diagnostic logs and merge the diagnostic log files from three database partitions on each of two hosts, bower and horton. The following is a list of the six db2diag log files:

- ~/sqllib/db2dump/HOST\_bower/NODE0000/db2diag.log
- ~/sqllib/db2dump/HOST\_bower/NODE0001/db2diag.log
- ~/sqllib/db2dump/HOST\_bower/NODE0002/db2diag.log
- ~/sqllib/db2dump/HOST\_horton/NODE0003/db2diag.log
- ~/sqllib/db2dump/HOST\_horton/NODE0004/db2diag.log
- ~/sqllib/db2dump/HOST\_horton/NODE0005/db2diag.log

To output the records from all six db2diag log files, run the following command: db2diag -global

To merge all six db2diag log files in the diagnostic data directory path from all three database partitions on each of the hosts bower and horton and format the output based on the timestamp, execute the following command:

```
db2diag _global _merge _sdir /temp/keon _fmt %{ts}
```

where /temp/keon is a shared directory, shared by the hosts bower and horton, to store temporary merged files from each host during processing.

 To display all critical error messages, enter: db2diag -level critical

or

db2diag -g 'level=Critical'

• To display all severe error messages produced by the process with the process ID (PID) 52356 and on node 1, 2 or 3, enter:

db2diag -g level=Severe,pid=952356 -n 1,2,3

- To display all messages containing database SAMPLE and instance aabrashk, enter: db2diag -g db=SAMPLE,instance=aabrashk
- To display all severe error messages containing the database field, enter: db2diag -g db:= -gi level=severe
- To display all error messages containing the DB2 ZRC return code 0x87040055, and the application ID G916625D.NA8C.068149162729, enter: db2diag -g msg:=0x87040055 -1 Error | db2diag -gi appid^=G916625D.NA
- To display all messages not containing the LOADID data, enter: db2diag -gv data:=LOADID
- To display only logged records not containing the LOCAL pattern in the application ID field, enter: db2diag -gi appid!:=local

db2diag -g appid!:=LOCAL

All records that don't match will be displayed. To output only messages that have the application ID field, enter:

db2diag -gvi appid:=local -exist

- To display all messages logged after the one with timestamp 2003-03-03-12.16.26.230520 inclusively, enter:
  - db2diag -time 2003-03-03-12.16.26.230520
- To display severe errors logged for the last three days, enter: db2diag -gi "level=severe" -H 3d
- To display all log messages not matching the pdLog pattern for the funcname field, enter:

db2diag -g 'funcname!=pdLog'

or

db2diag -gv 'funcn=pdLog'

• To display all severe error messages containing component name starting from the "base sys, enter:

```
db2diag -1 severe | db2diag -g "comp^=base sys"
```

- To view the growth of the db2diag.log file, enter: db2diag -f db2diag.log This displays all records written to the db2diag.log file in the current directory. Records are displayed as they are added to the file. The display continues until you press Ctrl-C.
- To write the context of the db2diag.log into the db2diag\_123.log file located in the /home/user/Logs directory, enter:

```
db2diag -o /home/user/Logs/db2diag_123.log
```

- To call db2diag from a Perl script using default settings, enter: system("db2diag -readfile");
- This will force db2diag to process db2diag.log/db2diag.\*.log files (Rotating logs if the database manager **diagsize** configuration parameter is set) from a directory specified by the **diagpath** configuration parameter.
- To read the db2diag.log1 file from a specified directory ignoring any terminal input, enter:

```
system("db2diag -readfile /u/usr/sqllib/db2dump/db2diag.log1");
```

 To display function information corresponding to ecfId = 0x1C30000E, enter: db2diag -ecfid 0x1C30000E

which is equivalent to, db2diag -ecfid 472907790

This will display function name, component and product name.

- To display only logged records containing eduid = 123, enter: db2diag -eduid 123
- To display all records containing eduid = 123 or eduid = 5678, enter: db2diag -eduid "123,5678"
- To display all severe error messages produced by a thread with eduid = 15, enter:

```
db2diag -g "level=Severe, eduid=15"
```

or, which is equivalent,

db2diag -g level=Severe | db2diag -eduid 15

## Usage notes

- Each option can appear only once. They can be specified in any order and can have optional parameters. Short options can not be included together. For example, use **-1** -**e** and not **-le**.
- By default, db2diag looks for the db2diag log file in the current directory. If the file is not found, the directory set by the **diagpath** configuration parameter is searched next. If the db2diag log file is not found, db2diag returns an error and exits.
- Filtering and formatting options can be combined on a single command line to perform complex searches using pipes. The formatting options **-fmt**, **-strict**, **-cbe**, and **-verbose** should be used only after all filtering is done to ensure that only original logged messages with standard fields will be filtered, not those fields either defined or omitted by the user. It is not necessary to use when using pipes.
- When pipes are used and one or more files names are specified on the command line, the db2diag input is processed differently depending on whether the has been specified or not. If the is omitted, input is taken from the specified files. In contrast, when the option is specified, file names (even if present on the command line) are ignored and input from a terminal is used. When a pipe is used and a file name is not specified, the db2diag input is processed exactly the same way with or without the specified on the command line.
- The **-exist** option overrides the default db2diag behavior for invert match searches when all records that do not match a pattern are output independent of whether they contain the proper fields or not. When the **-exist** option is specified, only the records containing fields requested are processed and output.
- If the **-fmt** (format) option is not specified, all messages (filtered or not) are output exactly as they are written in the diagnostic log file. Output record format can be changed by using the **-strict,-cbe**, and **-verbose** options.
- The -fmt option overrides the -strict,-cbe and -verbose options.
- Some restrictions apply when the **-cbe** option is specified and the db2diag log file has been transferred over a network from the original computer. The db2diag tool collects information about DB2 and the computer host name locally, meaning that the DB2 version and the source or reporter componentID location field for the local system can be different from the corresponding values that were used on the original computer.
- It is recommended to specify the **-readfile** option when using db2diag in scripts. It will ensure reading from a file ignoring any terminal input.
- Ordinarily, the exit status is 0 if matches were found, and 1 if no matches were found. The exit status is 2 if there are syntax errors in the input data and patterns, the input files are inaccessible, or other errors are found.
- Severe errors resulting from DB2 Text Search can be found logged in the db2diag log file.
- Be aware that using this tool to read and filter rotating db2diag log files (when the **diagsize** database configuration parameter is nonzero) will result in all the rotating diagnostic log files, to a series maximum of 10 files, to be read and filtered.

# db2drdat - DRDA trace

Allows the user to capture the DRDA data stream exchanged between a DRDA Application Requestor (AR) and the DB2 DRDA Application Server (AS). Although this tool is most often used for problem determination, by determining how many sends and receives are required to execute an application, it can also be used for performance tuning in a client/server environment.

# **Authorization**

None

# **Command syntax**

## **Command parameters**

- on Turns on AS trace events (all if none specified).
- off Turns off AS trace events.
- -r Traces DRDA requests received from the DRDA AR.
- -s Traces DRDA replies sent to the DRDA AR.
- -c Traces the SQLCA received from the DRDA server on the host system. This is a formatted, easy-to-read version of *not null* SQLCAs.
- -i Includes time stamps in the trace information.
- -l Specifies the size of the buffer used to store the trace information.
- -p Traces events only for this process. If -p is not specified, all agents with incoming DRDA connections on the server are traced. The *pid* to be traced can be found in the *agent* field returned by the LIST APPLICATIONS command.
- -t Specifies the destination for the trace. If a file name is specified without a complete path, missing information is taken from the current path. If *tracefile* is not specified, messages are directed to db2drdat.dmp in the current directory.
- -f Formats communications buffers.

## **Usage notes**

Do not issue db2trc commands while db2drdat is active.

db2drdat writes the following information to *tracefile*:

1. -r

Type of DRDA request

- Receive buffer
- 2. -s
  - Type of DRDA reply/object
  - Send buffer

The command returns an exit code. A zero value indicates that the command completed successfully, and a nonzero value indicates that the command was not successful. If db2drdat sends the output to a file that already exists, the old file will be erased unless the permissions on the file do not allow it to be erased, in which case the operating system will return an error.

# db2drvmp - DB2 database drive map

Maps a database drive for Microsoft Cluster Server (MSCS). This command is available only on Windows platforms.

### Authorization

Read/write access to the Windows registry and the cluster registry.

### Required connection

Instance. The application creates a default instance attachment if one is not present.

## Command syntax

### **Command parameters**

- add Assigns a new database drive map.
- **drop** Removes an existing database drive map.
- **query** Queries a database map.

#### reconcile

Reapplies the database drive mapping to the registry when the registry contents are damaged or dropped accidentally.

#### dbpartition\_number

The database partition number. This parameter is required for add and drop operations. If this parameter is not specified for a reconcile operation, db2drvmp reconciles the mapping for all database partitions.

from\_drive

The drive letter from which to map. This parameter is required for add and drop operations. If this parameter is not specified for a reconcile operation, db2drvmp reconciles the mapping for all drives.

#### to\_drive

The drive letter to which to map. This parameter is required for add operations. It is not applicable to other operations.

## **Examples**

To set up database drive mapping from F: to E: for NODE0, issue the following command:

db2drvmp add 0 F E

To set up database drive mapping from E: to F: for NODE1, issue the following command:

db2drvmp add 1 E F

# Usage notes

- 1. Database drive mapping does not apply to table spaces, containers, or any other database storage objects.
- 2. Any setup of or change to the database drive mapping does not take effect immediately. To activate the database drive mapping, use the Microsoft Cluster Administrator tool to bring the DB2 resource offline, then online.
- **3**. Using the TARGET\_DRVMAP\_DISK keyword in the DB2MSCS.CFG file will enable drive mapping to be done automatically.

# db2empfa - Enable multipage file allocation

Enables the use of multipage file allocation for a database. With multipage file allocation enabled for SMS table spaces, disk space is allocated one extent at a time rather than one page at a time.

## Scope

This command only affects the database partition on which it is executed.

## Authorization

sysadm

## **Required connection**

None. This command establishes a database connection.

## **Command syntax**

▶▶—db2empfa—*database-alias*——

# **Command parameters**

database-alias

Specifies the alias of the database for which multipage file allocation is to be enabled.

## Usage notes

This utility:

- · Connects to the database partition (where applicable) in exclusive mode
- In all SMS table spaces, allocates empty pages to fill up the last extent in all data and index files which are larger than one extent
- Changes the value of the database configuration parameter multipage\_alloc to YES
- Disconnects.

Since db2empfa connects to the database partition in exclusive mode, it cannot be run concurrently on the catalog database partition, or on any other database partition.

# db2envar.bat - Set environment of the current command window

Sets the environment of your current command window for the DB2 copy that db2envar.bat is executed from. This is useful if you want to switch between different DB2 copies from the command line. This command is only available on Windows operating systems.

## Authorization

None

## **Required Connection**

None

# **Command Syntax**

▶ — db2envar.bat-

# **Command parameters**

None

# Usage notes

When there are multiple DB2 copies on a machine, the full path should be used to indicate which db2envar.bat is to be executed. For example, if you want to set up the environment for the DB2 copy that is installed under e:\sqllib, you should issuee:\sqllib/bin/db2envar.bat.

•

# db2eva - Event analyzer

Starts the event analyzer, allowing the user to trace performance data produced by DB2 event monitors that have their data directed to tables.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

## Authorization

All of the following privileges and authorizations are required:

- CONNECT authority (or an authority that implicitly includes CONNECT authority)
- SELECT privilege on the following catalog tables (or an authority that implicitly includes SELECT privilege on the catalog tables):
  - SYSIBM.EVENTMONITORS
  - SYSIBM.EVENTS
  - SYSIBM.EVENTTABLE

## **Required connection**

Database connection

## Command syntax

▶dh2eva				M
up2cvu				
	└db <i>──-database-alias</i> ─┘	l	—-evm— <i>evmon-name</i> —	

## **Command parameters**

The db2eva parameters are optional. If you do not specify parameters, the Open Event Analyzer dialog box appears to prompt you for the database and event monitor name.

-db database-alias

Specifies the name of the database defined for the event monitor.

```
-evm evmon-name
```

Specifies the name of the event monitor whose traces are to be analyzed.

## Usage notes

Without the required access, the user cannot retrieve any event monitor data.

There are two methods for retrieving event monitor traces:

- The user can enter db2eva from the command line and the Open Event Analyzer Dialog box opens to let the user choose the database and event monitor names from the drop-down lists before clicking OK to open the Event Analyzer dialog box.
- 2. The user can specify the -db and -evm parameters from the command line and the Event Analyzer dialog opens on the specified database.

The Event Analyzer connects to the database, and issues a select target from SYSCAT.EVENTTABLES to get the event monitor tables. The connection is then released after the required data has been retrieved.

The event analyzer can be used to analyze the data produced by an active event monitor. However, event monitor captured after the event analyzer has been invoked might not be shown. Turn off the event monitor before invoking the Event Analyzer to ensure data are properly displayed.

# db2evmon - Event monitor productivity tool

Formats event monitor file and named pipe output, and writes it to standard output.

## Authorization

None, unless connecting to the database (-db -evm) in which case, all of the following authorization is required:

- CONNECT authority (or an authority that implicitly includes CONNECT)
- SELECT privilege on the following catalog tables (or an authority that implicitly includes SELECT on the catalog tables):
  - SYSIBM.SYSTABLES
  - SYSIBM.SYSEVENTMONITORS

If the event monitor is db2detaildeadlock, then one of the following authorities or privilege is additionally required:

- sysmon
- sysmaint
- sysctrl
- sysadm
- EXECUTE privilege on the SNAPSHOT\_DATABASE table function.
- dataaccess

►►-db2evmon-

## **Required connection**

None

## **Command syntax**

## **Command parameters**

-db database-alias

Specifies the database whose data is to be displayed. This parameter is case sensitive.

-evm event-monitor-name

The one-part name of the event monitor. An ordinary or delimited SQL identifier. This parameter is case sensitive.

-path event-monitor-target

Specifies the directory containing the event monitor trace files.

## Usage notes

db2evmon generates the same output regardless of whether the command is issued while connecting to the database or specifying the path option.

• If the instance is not already started when db2evmon is issued with the -db and -evm options, the command will start the instance.

• If the instance is not already started when db2evmon is issued with the -path option, the command will not start the instance. The instance needs to be started explicitly.

If the data is being written to files, the tool formats the files for display using standard output. In this case, the monitor is turned on first, and any event data in the files is displayed by the tool. To view any data written to files after the tool has been run, reissue db2evmon.

If the data is being written to a pipe, the tool formats the output for display using standard output as events occur. In this case, the tool is started *before* the monitor is turned on.

# db2evtbl - Generate event monitor target table definitions

Generates sample CREATE EVENT MONITOR SQL statements that can be used when defining event monitors that write to SQL tables.

## Authorization

None

### **Required connection**

None

### **Command syntax**

## **Command parameters**

#### -schema schema-name

Schema name. If not specified, the table names are unqualified.

### -partitioned

If specified, elements that are only applicable for a partitioned database environment are also generated.

#### -evm event-monitor-name

The name of the event monitor.

#### event type

Any of the event types available on the CREATE EVENT MONITOR statement, for example, DATABASE, TABLES, UNIT OF WORK.

### Examples

db2evtbl -schema smith -evm foo database, tables, tablespaces, bufferpools

### Usage notes

Output is written to standard output.

Defining WRITE TO TABLE event monitors is more straightforward when using the db2evtbl tool. For example, the following steps can be followed to define and activate an event monitor.

- 1. Use db2evtbl to generate the CREATE EVENT MONITOR statement.
- 2. Edit the SQL statement, removing any unwanted columns.
- **3**. Use the CLP to process the SQL statement. (When the CREATE EVENT MONITOR statement is executing, target tables are created.)
- 4. Issue SET EVENT MONITOR STATE to activate the new event monitor.

# db2evtbl - Generate event monitor target table definitions

Since all events other than deadlock event monitors can be flushed, creating more than one record per event, users who do not use the FLUSH EVENT MONITOR statement can leave the element evmon\_flushes out of any target tables.

# db2exfmt - Explain table format

You use the db2exfmt tool to format the contents of the EXPLAIN tables. This tool is located in the misc subdirectory of the instance sqllib directory. This tool uses the statistics from the EXPLAIN snapshot, if the snapshot is available.

## **Authorization**

To use the tool, you require read access to the explain tables being formatted.

## **Command syntax**

## **Command parameters**

### db2exfmt

If no options are specified, then the command enters interactive mode and you will be prompted to make entries.

-1 Use defaults -e % -n % -s % -v % -w -1 -# 0

If Explain schema is not supplied, the contents of the environment variable \$USER, or \$USERNAME will be used as a default. If this variable is not found, the user will be prompted for an Explain schema.

### -d dbname

Name of the database containing packages.

### -e schema

Explain table SQL schema.

- -f Formatting flags. In this release, the only supported value is O (operator summary).
- -g Graph plan.
  - **x** Turn OFF options (default is to turn them ON).

If only -g is specified, a graph, followed by formatted information for all of the tables, is generated. Otherwise, any combination of the following valid values can be specified:

- **O** Generate a graph only. Do not format the table contents.
- T Include total cost under each operator in the graph.
- **F** Include first tuple cost in graph.
- I Include I/O cost under each operator in the graph.
- **C** Include the expected output cardinality (number of tuples) of each operator in the graph.

Any combination of these options is allowed, except F and T, which are mutually exclusive.

-1 Respect case when processing package names.

### -n name

Name of the source of the explain request (SOURCE\_NAME).

### -s schema

SQL schema or qualifier of the source of the explain request (SOURCE\_SCHEMA).

-o outfile

-t

Output file name.

Direct the output to the terminal.

## -u userID password

When connecting to a database, use the provided user ID and password.

Both the user ID and password must be valid according to naming conventions and be recognized by the database.

### -w timestamp

Explain time stamp. Specify -1 to obtain the latest explain request.

-# sectnbr

Section number in the source. To request all sections, specify zero.

-v srcvers

Source version of source of Explain request (default %)

-h Display help information. When this option is specified, all other options are ignored, and only the help information is displayed.

# **Usage notes**

You will be prompted for any parameter values that are not supplied, or that are incompletely specified, except in the case of the -h and the -l options.

If an explain table SQL schema is not provided, the value of the environment variable USER is used as the default. If this variable is not found, the user is prompted for an explain table SQL schema.

Source name, source SQL schema, and explain time stamp can be supplied in LIKE predicate form, which allows the percent sign (%) and the underscore (\_) to be used as pattern matching characters to select multiple sources with one invocation. For the latest explained statement, the explain time can be specified as -1.

## db2exfmt - Explain table format

If -o is specified without a file name, and -t is not specified, the user is prompted for a file name (the default name is db2exfmt.out). If neither -o nor -t is specified, the user is prompted for a file name (the default option is terminal output). If -o and -t are both specified, the output is directed to the terminal.

The db2exfmt command displays the statistics from the EXPLAIN snapshot, if the snapshot is available. Otherwise, db2exfmt displays statistics stored in the EXPLAIN\_OBJECT table and also displays some statistics retrieved directly from the system catalog.

The following are EXPLAIN snapshot examples. db2 explain plan with snapshot for *query* db2exfmt

Or, db2 set current explain mode yes db2 set current explain snapshot yes run the query db2exfmt

# db2exmig - Migrate explain tables

Migrates explain tables. The explain tables belonging to the user ID that is issuing the db2exmig command, or that is used to connect to the database, are migrated. The explain tables migration tool renames the existing explain tables, creates a new set of tables using the EXPLAIN.DDL, and copies the contents of the existing explain tables to the new tables. Finally, it drops the existing explain tables. The db2exmig command will preserve any user added columns on the explain tables.

## Authorization

If the db2exmig application package is bound then the required authorization is one of the following authorities:

- *dbadm* authority
- EXECUTE authority on the db2exmig application package and SELECT privilege or CONTROL privilege on the following system catalogs:
  - SYSCAT.COLUMNS
  - SYSCAT.TABLES
  - SYSCAT.REFERENCES

If the db2exmig application package is not bound then the required authorization is *dbadm* authority.

## **Required Connection**

None

## **Command Syntax**

►►—db2exmig—-d—dbname—-e—explain schema—\_\_

└\_-u—userID—password—

## **Command parameters**

-d dbname

Specifies the database name.

-e explain\_schema

Specifies the schema name of the explain tables to be migrated.

-u userID password

Specifies the current user's ID and password.

## Usage notes

You can determine the db2exmig application package name by using the command: db2bfd -b db2exmig.bnd. The db2exmig.bnd files are located in the sqllib/bnd folder.

# db2expIn - SQL and XQuery Explain

The db2expln tool describes the access plan selected for SQL and XQuery statements. It can be used to obtain a quick explanation of the chosen access plan when explain data was not captured. For static SQL and XQuery statements, db2expln examines the packages stored in the system catalog tables. For dynamic SQL and XQuery statements, db2expln examines the sections in the query cache.

# Authorization

dbadm or one of the following authorizations or privileges:

- · For static statements, SELECT privilege on the catalog tables
- For dynamic statements, SELECT privilege on the catalog tables plus one of the following authorizations or privileges:
  - Sufficient privileges to compile the statement
  - EXPLAIN authority
  - SQLADM authority

## **Command syntax**

►►—db2expln— connection-options   output-options
▶ package-options   dynamic-options   explain-options   ▶
event-monitor-optionshelp-
connection-options:

output-options:
-output-file -terminal
package-options:
├── -schema— <i>schema-name</i> —-package— <i>package-name</i>
►

--noupper\_\_\_\_\_\_-section\_\_\_section\_number\_\_\_

### dynamic-options:

## db2expIn - SQL and XQuery Explain

▶ <sub>1</sub>					
L-terminator— <i>termination-character</i>					
explain-options:					
└_graph┘└_opids┘└_setup <i>—setup-file</i> ┘					
event-monitor-options:					
actevmevent-monitor-name					
└─-appid <i>──application_id</i> ─┘ └─-uowid <i>──uow_id</i> ─┘					
actid2 0					
-actid_activity id					

## **Command parameters**

The options can be specified in any order.

### connection-options:

These options specify the database to connect to and any options necessary to make the connection. The connection options are required except when the -help option is specified.

#### -database database-name

The name of the database that contains the packages to be explained.

For backward compatibility, you can use -d instead of -database.

-user user-id password

The authorization ID and password to use when establishing the database connection. Both *user-id* and *password* must be valid according to DB2 naming conventions and must be recognized by the database.

For backward compatibility, you can use -u instead of -user.

### output-options:

These options specify where the db2expln output should be directed. Except when the -help option is specified, you must specify at least one output option. If you specify both options, output is sent to a file as well as to the terminal.

#### -output output-file

The output of db2expln is written to the file that you specify.

For backward compatibility, you can use -o instead of -output.

### -terminal

The db2expln output is directed to the terminal.

For backward compatibility, you can use -t instead of -terminal.

## package-options:

These options specify one or more packages and sections to be explained. Only static queries in the packages and sections are explained.

As in a LIKE predicate, you can use the pattern matching characters, which are percent sign (%) and underscore (\_), to specify the *schema-name*, *package-name*, and *version-identifier*.

### -schema schema-name

The SQL schema of the package or packages to be explained.

For backward compatibility, you can use -c instead of -schema.

### -package package-name

The name of the package or packages to be explained.

For backward compatibility, you can use -p instead of -package.

### -version version-identifier

The version identifier of the package or packages to be explained. The default version is the empty string.

## **-escape** *escape-character*

The character, *escape-character* to be used as the escape character for pattern matching in the *schema-name*, *package-name*, and *version-identifier*.

For example, the db2expln command to explain the package TESTID.CALC% is as follows:

db2expln -schema TESTID -package CALC% ....

However, this command would also explain any other plans that start with CALC. To explain only the TESTID.CALC% package, you must use an escape character. If you specify the exclamation point (!) as the escape character, you can change the command to read: db2expln -schema TESTID -escape ! -package CALC!% ... Then the ! character is used as an escape character and thus !% is interpreted as the % character and not as the "match anything" pattern. There is no default escape character.

For backward compatibility, you can use -e instead of -escape.

To avoid problems, do not specify the operating system escape character as the db2expln escape character.

#### -noupper

Specifies that the *schema-name*, *package-name*, and *version-identifier*, should not be converted to uppercase before searching for matching packages.

By default, these variables are converted to uppercase before searching for packages. This option indicates that these values should be used exactly as typed.

For backward compatibility, you can use -l, which is a lowercase L and not the number 1, instead of -noupper.

#### -section section-number

The section number to explain within the selected package or packages.

To explain all the sections in each package, use the number zero (0). This is the default behavior. If you do not specify this option, or if *schema-name*, *package-name*, or *version-identifier* contain a pattern-matching character, all sections are displayed.

To find section numbers, query the system catalog view SYSCAT.STATEMENTS. Refer to the *SQL Reference* for a description of the system catalog views.

For backward compatibility, you can use -s instead of -section.

### dynamic-options:

These options specify one or more dynamic query statements to be explained.

## -statement query-statement

An SQL or XQuery query statement to be dynamically prepared and explained. To explain more than one statement, either use the -stmtfile option to provide a file containing the query statements to explain, or use the -terminator option to define a termination character that can be used to separate statements in the -statement option.

### -stmtfile query-statement-file

A file that contains one or more query statements to be dynamically prepared and explained. By default, each line of the file is assumed to be a distinct query statement. If statements must span lines, use the -terminator option to specify the character that marks the end of an query statement.

### -terminator termination-character

The character that indicates the end of dynamic query statements. By default, the -statement option provides a single query statement and each line of the file in the -stmtfile is treated as a separate query statement. The termination character that you specify can be used to provide multiple query statements with -statement or to have statements span lines in the -stmtfile file.

### -noenv

Specifies that dynamic statements that alter the compilation environment should not be executed after they have been explained.

By default, db2expln will execute any of the following statements after they have been explained:

SET CURRENT DEFAULT TRANSFORM GROUP

SET CURRENT DEGREE

SET CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION

- SET CURRENT QUERY OPTIMIZATION
- SET CURRENT REFRESH AGE
- SET PATH
- SET SCHEMA

These statements make it possible to alter the plan chosen for subsequent dynamic query statements processed by db2expln.

If you specify -noenv, then these statement are explained, but not executed.

It is necessary to specify either -statement or -stmtfile to explain dynamic query. Both options can be specified in a single invocation of db2expln.

## explain-options:

These options determine what additional information is provided in the explained plans.

**-graph** Show optimizer plan graphs. Each section is examined, and the original optimizer plan graph is constructed as presented by Visual Explain.

The generated graph may not match the Visual Explain graph exactly. It is possible for the optimizer graph to show some gaps, based on the information contained within the section plan.

For backward compatibility, you can specify -g instead of -graph.

-opids Display operator ID numbers in the explained plan.

The operator ID numbers allow the output from db2expln to be matched to the output from the explain facility. Not all operators have an ID number and that some ID numbers that appear in the explain facility output do not appear in the db2expln output.

For backward compatibility, you can specify -i instead of -opids.

**-help** Shows the help text for db2expln. If this option is specified no packages are explained.

Most of the command line is processed in the db2exsrv stored procedure. To get help on all the available options, it is necessary to provide **connection-options** along with -help. For example, use:

db2expln -help -database SAMPLE

For backward compatibility, you can specify -h or -?.

### -setup setup-file

A file that contains one or more statements needed to setup the environment for dynamic statements or for static statements that need to be recompiled (such as a static statement that references a declared temporary table). Each statement in the file will be executed and any errors or warnings will be reported. The statements in the file are not explained.

### event-monitor-options:

These options specify one or more section environments from an activities event monitor to be explained.

### -actevm event-monitor-name

Specifies the name of the activities event monitor whose activitystmt logical grouping contains the section environments (in the **section\_env** monitor element) to be explained.

### -appid application-id

Specifies the application identifier (**appl\_id** monitor element) uniquely identifying the application that issued the activities whose section environments are to be explained. -actevm must be specified if -appid is specified.

### -uowid uow-id

Specifies the unit of work ID (**uow\_id** monitor element) whose section environments are to be explained. The unit of work ID is unique only within a given application. -actevm must be specified if -uowid is specified.

### -actid activity-id

Specifies the activity ID (activity\_id monitor element) whose section environments are to be explained. The activity ID is only unique within a given unit of work. -actevm must be specified if -actid is specified.

### -actid2 activity-secondary-id

Specifies the activity secondary ID (activity\_secondary\_id monitor

element) whose section environments are to be explained. This defaults to zero if not specified. -actevm must be specified if -actid2 is specified.

## **Usage notes**

Unless you specify the -help option, you must specify either package-options or dynamic-options. You can explain both packages and dynamic SQL with a single invocation of db2expln.

Some of the option flags above might have special meaning to your operating system and, as a result, might not be interpreted correctly in the db2expln command line. However, you might be able to enter these characters by preceding them with an operating system escape character. For more information, see your operating system documentation. Make sure that you do not inadvertently specify the operating system escape character as the db2expln escape character.

Help and initial status messages, produced by db2expln, are written to standard output. All prompts and other status messages produced by the explain tool are written to standard error. Explain text is written to standard output or to a file depending on the output option chosen.

The following messages can be returned by db2expln:

 No packages found for database package pattern: "<creator>".<package> with version "<version>"

This message will appear in the output if no packages were found in the database that matched the specified pattern.

• Bind messages can be found in db2expln.msg

This message will appear in the output if the bind of db2expln.bnd was not successful. Further information on the problems encountered will be found in the db2expln.msg file in the current directory.

- Section number overridden to  $\ensuremath{\mathbb{O}}$  (all sections) for potential multiple packages.

This message will appear in the output if multiple packages might be encountered by db2expln. This action will be taken if one of the pattern matching characters is used in the package or creator input arguments.

• Bind messages for <bind file> can be found in <message file>

This message will appear if the bind of the specified bind file was not successful. Further information on the problems encountered will be found in the specified message file on the database server.

• No static sections qualify from package.

This message will appear in the output if the specified package only contains dynamic query statements, which means that there are no static sections.

• Package "<creator>"."<package>", "<version>", is not valid. Rebind the package and then rerun db2expln.

This message will appear in the output if the specified package is currently not valid. Reissue the BIND or REBIND command for the plan to recreate a valid package in the database, and then rerun db2expln.

The following statements will not be explained:

- BEGIN/END COMPOUND
- BEGIN/END DECLARE SECTION

## db2expIn - SQL and XQuery Explain

- CLOSE cursor
- COMMIT and ROLLBACK
- CONNECT
- DESCRIBE
- Dynamic DECLARE CURSOR
- EXECUTE
- EXECUTE IMMEDIATE
- FETCH
- INCLUDE
- OPEN cursor
- PREPARE
- SQL control statements
- WHENEVER

Each sub-statement within a compound SQL statement might have its own section, which can be explained by db2expln.

Note: The db2expln command does not exclude any XQuery statements.

### Examples

To explain multiple plans with one invocation of db2expln, use the -package, -schema, and -version option and specify string constants for packages and creators with LIKE patterns. That is, the underscore (\_) can be used to represent a single character, and the percent sign (%) can be used to represent the occurrence of zero or more characters.

To explain all sections for all packages in a database named SAMPLE, with the results being written to the file my.exp, enter

db2expln -database SAMPLE -schema % -package % -output my.exp

As another example, suppose a user has a CLP script file called "statements.db2" and wants to explain the statements in the file. The file contains the following statements:

```
SET PATH=SYSIBM, SYSFUN, DEPT01, DEPT93@
SELECT EMPNO, TITLE(JOBID) FROM EMPLOYEE@
```

To explain these statements, enter the following command:

db2expln -database DEPTDATA -stmtfile statements.db2 -terminator @ -terminal

Explain the following statement:

```
SELECT e.lastname, e.job, d.deptname, d.location, p.projname
FROM employee AS e, department AS d, project AS p
WHERE e.workdept = d.deptno AND e.workdept = p.deptno
```

The following command:

```
db2expln -database SAMPLE
  -statement "SELECT e.lastname, e.job,
    d.deptname, d.location, p.projname
    FROM employee AS e, department AS d, project AS p
    WHERE e.workdept = d.deptno AND e.workdept = p.deptno"
    -terminal
```

```
returns:

## db2extsec - Set permissions for DB2 objects

Sets the permissions for DB2 database objects (for example, files, directories, network shares, registry keys and services) on updated DB2 database system installations.

## Authorization

SYSADM

## **Required connection**

None

## Command syntax

## **Command parameters**

/u | /users usergroup

Specifies the name of the user group to be added. If this option is not specified, the default DB2 user group (DB2USERS) is used. The *usergroup* can be a local group or a domain group. To specify a local group, you can specify the group name with or without the machine name. For example, DB2USERS, or MYWKSTN\DB2USERS. To specify a domain group, you specify the *usergroup* in the form of DOMAIN\GROUP. For example, MYDOMAIN\DB2USERS.

/a | /admins admingroup

Specifies the name of the administration group to be added. If this option is not specified, the default DB2 administration group (DB2ADMNS) is used. The *admingroup* can be a local group or a domain group. To specify a local group, you can specify the group name with or without the machine name. For example, DB2ADMNS, or MYWKSTN\DB2ADMNS. To specify a domain group, you specify the *admingroup* in the form of DOMAIN\GROUP. For example, MYDOMAIN\DB2ADMNS.

**Note:** The following 3 parameters, **/oldusers**, **/oldadmins**, and **/file**, are required when you are changing the extended security group names and have file or directory objects that have been created outside of the default locations (that is, the install directory or database directories). The db2extsec command can only change permissions to a known set of DB2 files. If the user had created private DB2 files with extended security, then the user will need to provide the locations of these file, so the db2extsec command can change the permissions on these files with the new extended security group names. The location of the files are to be supplied in the *inputfile* using the **/file** option.

/oldusers oldusergrp

The old DB2 users group name to be changed.

## /oldadmins oldadmngrp

The old DB2 admins group name to be changed.

### /file inputfile

File listing additional files/directories for which the permissions need to be updated.

### /verbose

Output extra information.

/r | /reset

Specifies that the changes made by previously running db2extsec should be reversed. If you specify this option, all other options are ignored. This option will only work if no other DB2 commands have been issued since the db2extsec command was issued.

/h | /help | ?

Displays the command help information.

# **Examples**

To enable extended security and use the domain groups  ${\tt mydom\db2users}$  and  ${\tt mydom\db2admns}$  to protect your DB2 objects:

db2extsec /u mydom\db2users /a mydom\db2admns

To reset extended security to its previous setting (see **/reset** option above): db2extsec /reset

To enable extended security as above, but also change the security group for the files/directories listed in c:\mylist.lst from local group db2admns and db2users to domain groups mydom\db2admns and mydom\db2users:

db2extsec /users mydom\db2users /admins mydom\db2admns /oldadmins db2admns
/oldusers db2users /file c:\mylist.lst

Note: The format of the input file is as follows:

\* This is a comment D:\MYBACKUPDIR D:\MYEXPORTDIR D:\MYMISCFILE\myfile.dat

\* This is another comment E:\MYOTHERBACKUPDIR E:\MYOTHEREXPORTDIR

\* These are more comments
# db2flsn - Find log sequence number

Returns the name of the file that contains the log record identified by a specified log sequence number (LSN).

### Authorization

None

### **Command syntax**

### **Command parameters**

- -q Specifies that only the log file name be printed. No error or warning messages will be printed, and status can only be determined through the return code. Valid error codes are:
  - -100 Invalid input
  - -101 Cannot open LFH file
  - -102 Failed to read LFH file
  - -103 Invalid LFH
  - -104 Database is not recoverable
  - -105 LSN too big
  - -106 Invalid database
  - -500 Logical error

Other valid return codes are:

- 0 Successful execution
- 99 Warning: the result is based on the last known log file size.

#### -db dbname

Specifies the database name which you want to investigate.

#### -file LFH-file

Specifies the full path of an LFH file including the file name.

**Important:** This option is deprecated and might be removed in a future release because of the usage of mirrored log control files.

#### -path LFH-dir

Specifies the full path to the directory where the LFH files, SQLOGCTL.LFH.1 and its mirror copy SQLOGCTL.LFH.2, reside.

#### input\_LSN

A 12 or 16 character string that represents the internal (6 or 8 byte) hexadecimal value with leading zeros.

#### Examples

db2flsn 000000BF0030

Given LSN is contained in log page 2 in log file S000002.LOG

db2flsn -q 000000BF0030 S0000002.LOG db2flsn 000000BE0030 Given LSN is contained in log page 2 in log file S0000001.LOG db2flsn -q 000000BE0030 S0000001.LOG db2flsn -db flsntest 000000000FA0000 Warning: the result is based on the last known log file size (6 4K pages starting from log extent 10). The input LSN might be before the database becomes recoverable. Given LSN is contained in log page 2 in log file S0000002.LOG db2flsn -q -db flsntest 000000000FA0000 S0000002.LOG db2flsn -file C:\DB2\NODE0000\SQL00001\SQL0GCTL.LFH.1 000000000FA4368 Given LSN is contained in log page 6 in log file S000002.LOG db2flsn -path C:\DB2\NODE0000\SQL00001 000000000FA4368 Given LSN is contained in log page 6 in log file S000002.LOG

### **Usage notes**

- If -db, -file, and -path are not specified, the tool assumes the LFH files, SQLOGCTL.LFH.1 and its mirror copy SQLOGCTL.LFH.2, are in the current directory.
- If -file is specified, only the provided LFH file will be used.
- If -file is not specified, the latest log control record available from the two LFH files, SQLOGCTL.LFH.1 and its mirror copy SQLOGCTL.LFH.2, will be used. If either of the two files is missing or corrupted, the other one will be used. When both files are missing or corrupted, db2flsn will fail.
- The tool uses the **logfilsiz** database configuration parameter. DB2 records the three most recent values for this parameter, and the first log file that is created with each **logfilsiz** value; this enables the tool to work correctly when **logfilsiz** changes. If the specified LSN predates the earliest recorded value of **logfilsiz**, the tool uses this value, and returns a warning. The tool can be used with database managers prior to DB2 Universal Database Version 5.2; in this case, the warning is returned even with a correct result (obtained if the value of **logfilsiz** remains unchanged).
- This tool can only be used with recoverable databases. A database is recoverable if it is configured with the **logarchmeth1** or **logarchmeth2** configuration parameters set to a value other than OFF.

# db2fm - DB2 fault monitor

Controls the DB2 fault monitor daemon. You can use db2fm to configure the fault monitor.

This command is only available on UNIX operating systems.

### **Authorization**

Authorization over the instance against which you are running the command.

### **Required connection**

None

# **Command syntax**

#### **Command parameters**

-m module-path

Defines the full path of the fault monitor shared library for the product being monitored. The default is \$INSTANCEHOME/sqllib/lib/libdb2gcf.

-t service

Gives the unique text descriptor for a service.

-i instance

Defines the instance of the service.

- -u Brings the service up.
- -U Brings the fault monitor daemon up.
- -d Brings the instance down.
- -D Brings the fault monitor daemon down.
- -k Kills the service.
- -K Kills the fault monitor daemon.

- -s Returns the status of the service.
- -S Returns the status of the fault monitor daemon. The status of the service or fault monitor can be one of the following
  - Not properly installed,
  - INSTALLED PROPERLY but NOT ALIVE,
  - ALIVE but NOT AVAILABLE (maintenance),
  - AVAILABLE, or
  - UNKNOWN
- -f on | off

Turns fault monitor ON or OFF. If this option is set off, the fault monitor daemon will not be started, or the daemon will exit if it was running.

-a on | off

Activates or deactivates fault monitoring. If this option if set to OFF, the fault monitor will not be actively monitoring, which means if the service goes down it will not try to bring it back.

**-T** *T*1/*T*2

Overwrites the start and stop time-out.

For example:

- -T 15/10 updates the two time-outs respectively
- -T 15 updates the start time-out to 15 secs
- -T /10 updates the stop time-out to 10 secs
- **-I** *I1/I2*

Sets the status interval and time-out respectively.

**-R** *R*1/*R*2

Sets the number of retries for the status method and action before giving up.

**-n** email

Sets the email address for notification of events.

-h | -? Displays command usage help.

### Usage notes

• If you want to set up e-mail notifications to be sent by the fault monitor daemon, you must have SMTP running on the local host.

# db2fmcu - DB2 fault monitor controller

DB2 Fault Monitor is the DB2 database facility that automatically starts an instance after a crash. It can also auto restart an instance on machine reboot. You can configure the DB2 fault monitor on Linux and UNIX operating systems using the DB2 fault monitor controller command. The command must be run as root because it accesses the system's inittab file.

### Authorization

Root user authority

### **Required connection**

None

### **Command syntax**

# **Command parameters**

-u -p db2fmcd\_path

This option re-configures the inittab file to include the fault monitor controller (FMC) at system startup, where *db2fmcd\_path* is the complete path to the FMC daemon (db2fmcd) object, for example /opt/IBM/db2/bin/db2fmcd.

- -d This option changes the inittab file configuration to prevent the FMC from being run at system startup.
- -f inittab

This option specifies a path to the inittab file.

### Example

To start the fault monitor controller at system startup by re-configuring the inittab file, run the following command:

db2fmcu -u -p /opt/IBM/db2/bin/db2fmcd

To prevent the fault monitor controller from being launched at system startup, run the following command:

db2fmcu -d

### **Usage notes**

- If you changed /etc/inittab manually, you need to send SIGHUP to process 1 to ask it to re-scan /etc/inittab right away. Otherwise, it can take some time before the next re-scan happens. If you updated /etc/inittab via db2fmcu, you do not need to send the signal as it is already done by the db2fmcu command.
- In the Solaris Operating Environment, the processes listed in the /etc/inittab file inherit the default system project settings. Ensure that the kernel parameters for the project are set high enough to accommodate the DB2 processes or start the db2fmcd process under a different project that has the appropriate kernel settings. To start the db2fmcd process under a different project, edit the fmc entry in the /etc/inittab file to use newtask. For example, add

/usr/bin/newtask -p in front of the db2fmcd path. For more information about setting kernel parameters, see the db2osconf command.

# db2fodc - DB2 first occurrence data collection

The db2fodc utility captures symptom-based data about the DB2 instance to help in problem determination situations. It is intended to collect information about potential hangs, severe performance issues, and various types of errors.

#### Purpose

This tool replaces and incorporates functionality from other PD tools. db2fodc command can be used for manual first occurrence data collection (FODC) on problems that cannot trigger automatic FODC, such as hangs or severe performance problems. It also can be used to collect data about index errors. The db2fodc tool captures data, to be included in the FODC package, and places it inside an FODC\_symptom directory created in the current DIAGPATH, where symptom is the problem symptom.

#### Authorization

One of the following:

- On Linux and UNIX systems, the *sysadm* authority level. You must also be the instance owner.
- On Windows operating systems, the sysadm authority level.

### Command syntax

└\_he1p\_/

### **Command parameters**

#### -hang

Collects FODC data related to a potential hang situation or a serious performance issue. The FODC package is prepared as a result of running this option. When this parameter is used, the instance is considered unusable and needs restarting. Data collection is performed as quickly as possible gathering as much information as possible.

#### basic

The basic collection mode will be run, without user interaction.

#### full

The full collection mode will be run, without user interaction. This option requires significantly more resources and time to run than basic collection mode.

#### -perf

Collects data related to a performance issue. This option should be used when

#### db2fodc - DB2 first occurrence data collection

the instance is still usable and restarting it is not necessary. This option should affect the system less the -hang parameter. The FODC package is prepared as a result of running this option.

#### basic

The basic collection mode will be run, without user interaction.

full

The full collection mode will be run, without user interaction. This option includes the db2trc command and additional snapshots. This option requires significantly more resources to run than basic collection mode.

#### Suboptions of -hang and -perf

#### -alldbs

Collects FODC data related to all active databases. This option is active by default.

#### -db dbname

Collects FODC data related to a specified database or databases. For example:

db2fodc -hang -db sample,dbsample

#### -alldbpartitionnum

Specifies that this command is to run on all active database partition servers in the instance. db2fodc will report information from database partition servers on the same physical machine that db2fodc is being run on.

#### -dbpartitionnum *dbpartition\_number*

Collects FODC data related to all the specified database partition numbers.

#### -indexerror FODC\_IndexError\_directory

Collects data related to an index error. *FODC\_IndexError\_directory* is required and must contain the db2cos\_indexerror\_short(.bat) script and/or db2cos\_indexerror\_long(.bat) script.

#### basic

The basic collection mode will be run. Ensure no db2dart reports exist in the same *FODC\_IndexError\_directory*.

#### full

The full collection mode will be run. Ensure no db2dart reports exist in the same *FODC\_IndexError\_directory*. If the db2cos\_indexerror\_long(.bat) script contains the db2dart /t command, the full mode requires that the database the db2dart /t command is run against be offline.

#### -help

Displays usage and help information. When this option is specified, all other options are ignored, and only the help information is displayed.

### Examples

To collect data during a potential hang without stopping the database manager: db2fodc -hang -alldbs

Default DB2FODC registry variables and parameters are used. A new directory FODC\_hang\_<timestamp> is created under the current diagnostic path (an error is generated if it already exists). db2cos\_hang script is executed to collect manual FODC data into one or more files, deposited into the FODC\_hang\_<timestamp> directory.

To collect data from a specific database: db2fodc -db SAMPLE -hang

Data collection is restricted to database SAMPLE. A new directory FODC\_hang\_<timestamp> is automatically created under the current diagnostic path, where the timestamp is the time when db2fodc was invoked. db2cos\_hang script is executed to collect manual FODC data into the FODC package stored in the FODC\_hang\_<timestamp> directory.

To collect data during a performance issue from a specific database using the full collection script:

db2fodc -db SAMPLE -perf full

Data collection is restricted to database SAMPLE. A new directory FODC\_perf\_<timestamp> is created under the current diagnostic path. db2cos\_perf script is executed to collect manual FODC data into one or more files, deposited into the FODC\_perf\_<timestamp> directory.

To collect data about index errors with default (basic) mode without stopping the database manager:

db2fodc -indexerror FODC\_IndexError\_directory

db2cos\_indexerror\_short(.bat) script is executed to collect manual FODC data into one or more files. The files are deposited into the directory FODC\_IndexError\_directory.

### **Usage notes**

db2fodc -hang and db2fodc -perf may be run in a multi-partitioned environment with multiple physical nodes. In this environment

rah ";db2fodc -hang <full | basic> -alldbpartitionum other options"

or

rah ";db2fodc -perf <full | basic> \_alldbpartitionum other\_options"

should be used to invoke db2fodc during a potential hang or severe performance issue at all nodes in a partitioned database environment in a single invocation. Use the suboption full or basic to set a collection mode which does not require user interaction. Options –alldbpartitionum and –dbpartitionnum work only for logical partition numbers (non-different physical machines). By default, only information from the current partition number is collected.

db2fodc -hang and db2fodc -perf will use a log file, db2fodc\_symptom.log, placed inside the FODC\_symptom directory, where symptom is either hang or perf. Inside this file, db2fodc will also store status information and meta-data describing the FODC package inside the FODC subdirectory. This file will contain information on the type of FODC, the timestamp of the start and/or end of data collection, and other information useful for the analysis of the FODC package.

The behavior of data collection by db2fodc -hang and db2fodc -perf is controlled via parameters, and can be customized by changing the script that is executed. If you would like to customize the data collection on UNIX systems, copy the script placed in /bin/db2cos\_symptom to /adm/db2cos\_symptom, where symptom is either hang or perf. Once in this new directory, modify the script as you like. On Windows systems, simply modify the default script \bin\db2cos\_symptom.bat. On

UNIX systems, db2fodc first tries to execute the script in /adm/db2cos\_symptom, and, if it is not found, executes the original script in /bin/db2cos\_symptom. On Windows systems, the script \bin\db2cos\_symptom.bat is always executed.

The data collected will be written to several files stored into a new or existing subdirectory of the default diagnostic path named FODC\_*symptom\_timestamp*, where *symptom* is the problem symptom, and *timestamp* is the time of either automatic or manual FODC invocation. A db2diag log file diagnostic message will be logged to notify you about the directory name used for this specific automatic or manual FODC.

db2fodc -indexerror may be run in a multi-partitioned environment with multiple physical or logical nodes. In this environment

db2\_all "<<+node#< db2fodc -indexerror FODC\_IndexError\_directory <basic | full>"

should be used to invoke db2fodc to collect information for an index error at a specific partition number in a partitioned database environment. Replace node# with the number of the specific node. This number is the last number in the directory name <FODC\_IndexError\_timestamp\_PID\_EDUID\_Node#>. An FODC\_IndexError\_directory with an absolute path must be specified and the suboption full or basic may be used to set a collection mode. An absolute path is only required when using db2fodc -indexerror with the db2\_all command.

db2fodc -indexerror will output the progress of the command and log the messages, if any, in the db2diag log file.

db2fodc -indexerror requires a *FODC\_IndexError\_directory* which contains the db2cos\_indexerror\_short(.bat) script and/or db2cos\_indexerror\_long(.bat) script as input.

The db2cos\_indexerror\_short(.bat) and db2cos\_indexerror\_long(.bat) scripts are located in the *FODC\_IndexError\_directory* created during the automatic index error FODC process. The scripts contain multiple db2dart commands. After running the scripts, the generated db2dart reports will be found in the same *FODC\_IndexError\_directory* that the scripts are located in. Issuing a manual db2fodc -indexerror command will not create a new directory. db2fodc -indexerror will generate new db2dart reports in the same *FODC\_IndexError\_directory* created by the automatic index error FODC process.

Do not rename or move the *FODC\_IndexError\_directory*. The db2dart commands in the scripts need this directory path to correctly generate reports.

If you need to run db2fodc - indexerror manually, check the *FODC\_IndexError\_directory* for any existing db2dart reports. Reports will have the extension .rpt and .rpthex. If reports exists, you should rename these reports or move them to a subdirectory under the *FODC\_IndexError\_directory* before running db2fodc -indexerror manually. This will preserve the existing reports for the db2support tool to collect and will allow db2fodc -indexerror to create new db2dart reports.

#### Preparation of the FODC package

Once execution of the db2fodc command has finished, the db2support tool must be executed to collect the resulting diagnostic files and prepare the FODC package to be submitted to IBM Support.

By default, db2support will collect all FODC\_*xxx\_xxx* directories found under the diagnostics data directory path. This is done to avoid additional requests, from IBM Support, for diagnostic information.

#### db2fodc diagnostic data collection

#### db2fodc -hang collects the following information:

db2fodc -hang collects the following info:

- Basic operating system information. The problem could be due to OS level, patches, etc.
- Basic DB2 configuration information.
- Operating system monitor information: vmstat, netstat, iostat, etc.
  - 2 iterations at least: with timestamps saved
- Partial call stacks: DB2 stack traces of top CPU agents.
- Operating system trace: trace on AIX.
- Diagnostic information collected by db2pd.
- DB2 trace.
- Full DB2 call stacks.
- Second round of DB2 configuration information.
  - Including second DB2 trace collection.
- Snapshot information: db2 get snapshot for database, applications, tables, and so on.
  - Information will be collected per node in case of multiple logical nodes.

# db2fodc -perf monitors the system possibly collecting the following information:

- Snapshots
- Stacktraces
- Virtual Memory (Vmstat)
- Input/Output information (Iostat)
- traces
- Some other information depending on the case. See the script for more details.

#### db2fodc -indexerror collects the following information:

- Basic Mode
  - db2cos\_indexerror\_short(.bat) script is run. See script for additional details.
  - If applicable db2dart commands exist in the script, the db2dart /DD and/or db2dart /DI data formatting actions are run with number of pages limited to 100.
- Full Mode
  - db2cos\_indexerror\_short(.bat) and db2cos\_indexerror\_long(.bat) scripts are run. See scripts for additional details.
  - If applicable db2dart commands exist in the script db2cos\_indexerror\_short(.bat), the db2dart /DD and/or db2dart /DI data formatting actions are run with number of pages limited to 100.

- If applicable db2dart commands exist in the script db2cos\_indexerror\_long(.bat), the db2dart /DD and/or db2dart /DI data formatting actions are run with no limit to the number of pages.
- If applicable db2dart commands exist in the db2cos\_indexerror\_long(.bat) script, the db2dart /T command is run. This command requires the database be offline.

# db2fopt - specify parameters for use by the query optimizer

The db2fopt command specifies parameters for use by the query optimizer. This command can be used when setting up a test system which has less physical resources than the production system. For example, if the production system is running with **sortheap**=20000 and the test system can only run with **sortheap**=5000, you can use db2fopt on the test system to set **opt\_sortheap** to 20000. This will direct the optimizer to use 20000 as the sort heap value when evaluating access plans while the database configuration **sortheap** is set to 5000.

**Scope** This command only affects the database partition on which it is executed.

#### Authorization

To query parameters using the get option: none

To update parameters, one of the following authorities is required:

- SYSADM
- SYSCTRL
- SYSMAINT

Required connection None

### **Command syntax**

### **Command parameters**

#### DBname

Alias name of the database.

#### **update** *optimizer-parameter value*

Use this command to update optimizer parameters.

- opt\_buffpage
- opt\_sortheap
- opt\_locklist
- opt\_maxlocks

#### get optimizer-parameter

Use this command to query optimizer parameter values.

- opt\_buffpage
- opt\_sortheap
- opt\_locklist
- opt\_maxlocks

### Usage notes

This tool is sometimes used in partitioned database environments that consist of heterogeneous database partition configurations. In this case, statement compilation

### db2fopt - specify parameters for use by the query optimizer

occurs on a coordinator database partition which can have different database configuration settings from that of the database partitions in the instance on which query processing takes place.

If an optimizer parameter has a value of 0, then no optimizer value has been specified. Statement compilation will use the value from the database configuration.

Updating an optimizer parameter to a value of  $\theta$  will reset a previously updated value.

Specifying a non-numeric or a negative value on an update action will set the value to  $\boldsymbol{\theta}.$ 

For an update to take effect, all connections must be terminated on the database partition, and the database partition must be deactivated if previously activated.

The optimizer parameters are only used for statement compilation. In partitioned database environments, they must be set on coordinator database partitions.

To determine the actual values to specify on the test system, you can obtain an explain output from the production system by using the **db2exfmt** tool, and review the *Database context* section.

### **Examples**

*Example 1:* Query the values of **opt\_sortheap**, **opt\_locklist**, and **opt\_maxlocks**. db2fopt testdb get opt\_sortheap opt\_locklist opt\_maxlocks

*Example 2:* Set the **opt\_buffpage** and **opt\_sortheap** parameters.

For example, the following database context section is returned from the production system.

Database Context:

	Parallelism:	None
	CPU Speed:	1.456395e-07
	Comm Speed:	0
	Buffer Pool size:	89000
	Sort Heap size:	10000
	Database Heap size:	1200
	Lock List size:	8000
	Maximum Lock List:	10
	Average Applications:	1
	Locks Available:	93030

On the test system, you can use the db2fopt command to set **opt\_buffpage** to 89000, **opt\_sortheap** to 10000, **opt\_locklist** to 8000, and **opt\_maxlocks** to 10. db2fopt testdb update opt\_buffpage 89000 opt\_sortheap 10000 opt\_locklist 8000 opt maxlocks 10

▶∢

▶∢

# db2fs - First steps

Launches the First Steps interface which contains links to the functions users need to begin learning about and using DB2.

On UNIX operating systems, db2fs is located in the sqllib/bin directory. On Windows operating systems, db2fs.exe is located in the DB2PATH\bin directory.

One of the following browsers must be installed in order to issue the db2fs command:

- Internet Explorer 6.0 and up
- Mozilla 1.7 and up
- Firefox 2.0 and up

### Authorization

sysadm

### **Command syntax**

For UNIX operating systems

►►—db2fs—\_\_\_h\_\_\_\_b—browser\_

For Windows operating systems

►►-db2fs-
-----------

# **Command parameters**

#### For UNIX operating systems

- -h Displays command usage information.
- -b browser

Specifies the browser to be used. If it is not specified, db2fs searches for a browser in the directories specified in PATH.

#### For Windows operating systems

None

### db2gcf - Control DB2 instance

Starts, stops, or monitors a DB2 instance, usually from an automated script, such as in an HA (high availability) cluster.

On UNIX operating systems, this command is located in *INSTHOME*/sqllib/bin, where *INSTHOME* is the home directory of the instance owner. On Windows operating systems, this command is located in the sqllib/bin subdirectory.

### Authorization

One of the following:

- Instance owner
- Root user authority on Linux and UNIX operating systems or Local Administrator authority on Windows operating systems

#### **Required connection**

None

#### Command syntax

### **Command parameters**

- -u Starts specified database partition for specified instance on current database partition server (node).
- -d Stops specified database partition for specified instance.
- -k Removes all processes associated with the specified instance.
- -s Returns status of the specified database partition and the specified instance. The possible states are:
  - Available: The specified database partition for the specified instance is available for processing.
  - Operable: The instance is installed but not currently available.
  - Not operable: The instance will be unable to be brought to available state.
- -o Returns the default timeouts for each of the possible actions; you can override all these defaults by specifying a value for the -t parameter.

#### -i instance\_name

Instance name to perform action against. If no instance name is specified, the value of **DB2INSTANCE** is used. If no instance name is specified and **DB2INSTANCE** is not set, the following error is returned:

db2gcf Error: Neither DB2INSTANCE is set nor instance passed.

#### **-p** partition\_number

In a partitioned database environment, specifies database partition numbers to perform action against on local node only (remote partitions are not monitored with this command). Specify the partition numbers without any spaces, but separate with commas. If no value is specified, the default is 0. This value is ignored in a single-partition database environment.

#### -t timeout

Timeout in seconds. The db2gcf command will return unsuccessfully if processing does not complete within the specified period of time. There are default timeouts for each of the possible actions; you can override all these defaults by specifying a value for the **-t** parameter.

- -L Enables error logging. Instance-specific information will be logged to db2diag log file in the instance log directory. Non-instance specific information will be logged to system log files.
- -? Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed.

#### Example

 The following example starts the instance stevera on partition 0: db2gcf -u -p 0 -i stevera

The following output is returned:

Instance : stevera DB2 Start : Success Partition 0 : Success

 The following example returns the status of the instance stevera on partition 0: db2qcf -s -p 0 -i stevera

The following output is returned:

Instance : stevera DB2 State Partition 0 : Available

**3**. The following example stops the instance stevera on partition 0:

db2gcf -d -p 0 -i stevera

The following output is returned:

Instance : stevera DB2 Stop : Success Partition 0 : Success

#### Usage notes

When used together, the **-k** and **-p** parameters do not allow all processes to be removed from the specified partition. Rather, all processes on the instance (all partitions) will be removed.

#### Return codes

The following is a list of all the return codes for this command.

- db2gcf Return Values : 0 : db2 service(start,stop,kill) success or db2gcf -s status Available
- 1 : db2 service(start, stop) failed or db2gcf -s status Not Available
- 2 : db2gcf has been called with wrong number of parameters
- 3 : gcfmodule failed to execute the requested service

### db2gov - DB2 governor

Monitors and changes the behavior of applications that run against a database. By default, a daemon is started on every database partition, but the front-end utility can be used to start a single daemon at a specific database partition.

**Important:** With the new workload management features introduced in DB2 Version 9.5, the DB2 governor utility has been deprecated in Version 9.7 and might be removed in a future release. For more information, see the "DB2 Governor and Query Patroller have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

### Authorization

One of the following:

- sysadm
- sysctrl

In an environment with an instance that has a db2nodes.cfg file defined, you might also require the authorization to invoke the db2\_all command. Environments with a db2nodes.cfg file defined include partitioned database environments as well as single-partition database environments that have a database partition defined in db2nodes.cfg.

### **Command syntax**

### **Command parameters**

#### **START** database

Starts the governor daemon to monitor the specified database. Either the database name or the database alias can be specified. The name specified must be the same as the one specified in the governor configuration file. One daemon runs for each database that is being monitored. In a partitioned database environment, one daemon runs for each database partition. If the governor is running for more than one database, there will be more than one daemon running at that database server.

#### **DBPARTITIONNUM** *db-partition-number*

Specifies the database partition on which to start or stop the governor daemon. The number specified must be the same as the one specified in the database partition configuration file.

#### config-file

Specifies the configuration file to use when monitoring the database. The default location for the configuration file is the sqllib directory. If the specified file is not there, the front-end assumes that the specified name is the full name of the file.

*log-file* Specifies the base name of the file to which the governor writes log records. The log file is stored in the log subdirectory of the sqllib

directory. The number of database partitions on which the governor is running is automatically appended to the log file name. For example, mylog.0, mylog.1, mylog.2.

#### **STOP** database

Stops the governor daemon that is monitoring the specified database. In a partitioned database environment, the front-end utility stops the governor on all database partitions by reading the database partition configuration file db2nodes.cfg.

#### Usage notes

In the [action] clause of the governor configuration file, the nice *nnn* parameter can be set to raise or lower the relative priority of agents working for an application. For additional information, see "Governor rule elements" in the guide called *Tuning Database Performance*.

**Note:** On AIX 5.3 or higher, the instance owner must have the CAP\_NUMA\_ATTACH capability to be able to raise the relative priority of agents working for the application. To grant this capability, logon as root and run the following command:

chuser capabilities=CAP\_NUMA\_ATTACH,CAP\_PROPAGATE

On Solaris 10 or higher, the instance owner must have the proc\_priocntl privilege to be able to raise the relative priority of agents working for the application. To grant this privilege, logon as root and run the following command: usermod -K defaultpri=basic,proc\_priocntl db2user

In this example, proc\_priocntl is added to the default privilege set of user db2user.

Moreover, when DB2 is running in a non-global zone of Solaris, the proc\_priocntl privilege must be added to the zone's limit privilege set. To grant this privilege to the zone, logon as root and run the following command:

global# zonecfg -z db2zone
zonecfg:db2zone> set limitpriv="default,proc\_priocntl"

In this example, proc\_priocntl is added to the limit privilege set of zone db2zone.

On Solaris 9, there is no facility for DB2 to raise the relative priority of agents. Upgrade to Solaris 10 or higher to use the ACTION NICE clause of DB2 governor.

### Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword NODENUM can be substituted for DBPARTITIONNUM.

# db2govlg - DB2 governor log query

Extracts records of specified type from the governor log files. The DB2 governor monitors and changes the behavior of applications that run against a database.

**Important:** With the new workload management features introduced in DB2 Version 9.5, the DB2 governor utility has been deprecated in Version 9.7 and might be removed in a future release. For more information, see the "DB2 Governor and Query Patroller have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

### Authorization

None

### **Command syntax**

►►—db2govlg—*log-file*-

\_\_dbpartitionnum\_\_*db-partition-number*\_\_

\_\_\_\_\_rectype\_\_\_*record-type*\_\_\_

### **Command parameters**

*log-file* The base name of one or more log files that are to be queried.

**dbpartitionnum** *db-partition-number* 

Number of the database partition on which the governor is running.

### rectype record-type

The type of record that is to be queried. Valid record types are:

- START
- FORCE
- NICE
- ERROR
- WARNING
- READCFG
- STOP
- ACCOUNT

### Compatibilities

For compatibility with versions earlier than Version 8:

• The keyword nodenum can be substituted for dbpartitionnum.

# db2gpmap - Get distribution map

If a database is already set up and database partition groups defined for it, db2gpmap gets the distribution map for the database table or the database partition group from the catalog partitioned database server.

### Authorization

Both of the following:

- Read access to the system catalog tables
- BIND and EXECUTE package privileges on db2gpmap.bnd

#### **Required connection**

Before using db2gpmap the database manager must be started and db2gpmap.bnd must be bound to the database. If not already bound db2gpmap will attempt to bind the file.

#### Command syntax

### **Command parameters**

#### -d database-name

Specifies the name of the database for which to generate a distribution map. If no database name is specified, the value of the DB2DBDFT environment variable is used. If DB2DBDFT is not set, the default is the SAMPLE database.

-m map-file-name

Specifies the fully qualified file name where the distribution map will be saved. The default is db2split.map.

-g database-partition-group-name

Specifies the name of the database partition group for which to generate a distribution map. The default is IBMDEFAULTGROUP.

-t table-name

Specifies the table name.

-h Displays usage information.

#### Examples

The following example extracts the distribution map for a table ZURBIE.SALES in database SAMPLE into a file called C:\pmaps\zurbie\_sales.map:

db2gpmap -d SAMPLE -m C:\pmaps\zurbie\_sales.map -t ZURBIE.SALES

# db2has - DB2 Health Advisor Service data collector

Starting in DB2 Version 9.7 Fix Pack 2, the DB2 Health Advisor Service data collector provides information about a DB2 instance, its databases, and its operating environment. It produces a compressed output file that can be sent to IBM Health Advisor Service for analysis and generation of a PDF-based report containing the findings and recommendations concerning the health of your DB2 environment.

### Authorization

You must run this command as the DB2 instance owner.

### **Required connection**

None

### **Command syntax**

### db2has - DB2 Health Advisor Service data collector

#### Notes:

- 1 Specifying your company email address is required for IBM to send back a PDF-based report.
- 2 Specifying your IBM Customer Number is required to receive a PDF-based report from IBM.
- 3 Specifying your system type is required to differentiate the different types of systems or instances in the analysis.

### **Command parameters**

- -A | -address "companyAddress" Specifies your company address.
- -D | -desc "companyDescription" Specifies a short description about your company and type of business.
- -e | -extended

Specifies the collection of extended sets of data including snapshots. Currently, only snapshots for a database manager and active databases are collected.

**Note:** Activating databases and enabling monitor switches needed for some snapshots is the responsibility of an instance owner or database administrator.

-E | -email "companyEmail"

Specifies your company email. A PDF-based report, with our findings and recommendations, will be sent to this address. This is a required parameter.

-f | -firsttime

Specifies a set of data collections that are recommended for the first time run.

-F | -feedback

This option provides you with an opportunity to send feedback, comments, and suggestions. When this option is specified, the tool will prompt for your feedback and then start an input text mode. Ctrl-D terminates the input mode. The maximum size of allowed text input is 2 KB.

-i | -include "dataList"

Specifies a list of comma-separated data collections and checks to be included in the run, in addition to default data collections. The following additional data collections and checks are supported:

dbmsnap

Collection of database manager snapshot output

dbsnap

Collection of database snapshot output

```
t1index
```

Check for tables with type 1 indexes

-I | -icn IBM\_Customer\_Number

Specifies the IBM Customer Number (ICN) that was assigned to your company. This number is used whenever IBM Software Support is involved in troubleshooting problems or issues with DB2 database systems. To get this number, one should contact IBM Software Support. This is a required parameter (it facilitates finding previous Problem Management Records (PMRs) to gain access to historical data to compare with the current system and instance state).

-l | -dblist "list"

Specifies a list of comma-separated database names. Data will be collected for only specified databases that are activated.

-N | -name "companyName"

Specifies your company name.

#### -priority | -p priorityValue

Specifies a scheduled priority. If specified, priority for the process will be lowered either to the lowest value (+20 for UNIX) or to a medium value between the regular and the lowest priority. By default, a regular value, assigned by a system, will be used unless the **-priority** option is specified with a valid value. The valid values are the following:

- Low
- Lowest
- -P | -phone "companyPhone"

Specifies your company phone number.

-q | -quiet

Specifies to use the quiet mode. All output to the terminal will be suppressed. Can be useful in scripts or when the output to the terminal is not needed.

#### -r | -resource *pathName*

Specifies a fully-qualified resource file name containing all the input data. If this option is specified, other options are ignored. This is a convenient way to specify input data instead of manually typing command line options each time, especially when the data collector can be invoked many times over a short period of time with different sets of options. It could also be useful in scripts. You can copy and paste the contents of a sample resource file, found at the following link, into a file that you have created. Options that are required for the data collection can be uncommented and edited as needed. Refer to "Sample db2has resource file (db2has.res)" on page 843.

-R | -runid "ID"

Specifies an identifier or short description (up to 256 bytes) of a run. This identifier could be used to distinguish similar runs on the same system. It can be useful for testing purposes.

-send

Specifies that the collected data is to be sent to a default, official, IBM FTP server (ftp://anonymous@ftp.ecurep.ibm.com:21/toibm/im) which is part of the Enhanced Customer Data Repository (ECuRep) service. The compressed data file will be forwarded to the IBM Health Advisor Service for analysis and generation of a PDF-based report containing the findings and recommendations concerning the health of your DB2 database environment.

#### "protocol://username:password@host:port/path"

Optional argument specifies the URL address of a server. Username, password, port, and path parameters are optional. If any parameters are omitted, they will be set to the default values for the specified protocol. If the argument is not specified, the default URL will be used. If the **-send** option is used in a resource file, the argument must be present to avoid ambiguity. In addition, the argument must be specified as instructed by DB2 Software Support in the event that the ECuRep FTP service is unavailable due to outage. In all other cases, the recommended usage is to specify the **-send** option without the argument.

-S | -symptom

This option provides you with an opportunity to send a short description of an event or events that might be the result of a problem. Your short description can include a specific error message, or a description of a symptom or symptoms of a problem at hand, or any text that may help the analysis engine to identify the problem and provide a solution (if known). If the problem and solution are not known, the analysis engine provides suggestions to help you diagnose and correct the problem. When this option is specified, the db2has tool will prompt you for a description of the problem and then start an input text mode. Ctrl-D terminates the input mode. The maximum size of allowed text input is 2 KB.

-t | -systype sType

Specifies your system type. The following values for *sType* are valid:

- test
- production
- integration
- QA
- DR

QA and DR are acronyms for "quality assurance" and "disaster recovery", respectively. This is a required option (used to differentiate the different types of systems or instances in the analysis).

-V | -version

Displays the version of the db2has data collector in the format release.version.fixpack.build. When this option is specified, all other options are ignored.

-w | -workdir dirName

Specifies the working directory. This directory will contain the resulting .zip file with the collected data, the output file, and the diagnostic log file in case an error was detected. In a partitioned database environment, it is recommended to specify a directory path name on a shared file system. The default value is ~/sqllib/db2hasdir.

#### -W | -workload workload\_type

Specifies a workload type. The following *workload\_type* values are valid:

- DSS
- OLTP
- Hybrid

"DSS" is the acronym for Decision Support System, and "OLTP" is the acronym for Online Transaction Processing.

**Note:** Certain scenarios and recommendations depend on the type of workload for which the system is used. It is recommended that this option is specified so that a more accurate health advisor report is generated.

-x | -exclude dataList

Specifies a list of comma-separated data collections and checks that should be excluded from the run due to performance, security, or other reasons. The following data collections and checks are excluded when specified:

IP Information about IP addresses and active ports will not be collected

-h | -help | ? optionList

Displays help information. When this option is specified, all other options are ignored and only the help information is displayed. If a list of options, containing one or more comma-separated command parameters is omitted, a list of all available options with short descriptions is displayed. For each option specified in the list, more detailed help information and usage examples are displayed. Help output can be modified by using one of the following switches in place of the list argument to display more information about the tool and its usage:

**all** Displays help information for all options

#### examples

Displays a few typical examples to assist in using the tool

notes Displays usage notes and restrictions

#### Examples

#### Example 1

The following is an example of the options to specify for a typical run of the db2has command:

db2has -icn FC123456 -name "Fake 1 Company, Inc." -address "123 Main St., Suite 123, Anywhere, CA 99999" -phone "555-555-5555" -email "john.smith@fake1company.com" -desc "Insurance services provider" -systype test -workload OLTP -send

The data will be collected for all databases that are activated on a test system. The priority of the run could be set to the lowest setting to minimize the performance impact of the data collector, which in most cases is negligible, on a system. The resulting compressed file, db2has\_hostname\_timestamp.zip, will be placed into the default working directory, ~/sqllib/db2hasdir. The collected data will be stored in XML format inside the .zip archive in the db2has\_hostname\_timestamp.xml file. Output of the data collector, showing the flow of execution and displaying all commands that were issued during the run, will be stored inside the archive in the db2has\_hostname\_timestamp.out file. These files can be easily extracted from the archive and examined. The compressed file is sent, by way of ECuRep, to the DB2 Health Advisor Service. A report with findings and recommendations will be sent to DBA John Smith using the provided email address in this example.

**Note:** It is recommended to always specify a workload type to ensure a more accurate health advisor report is generated.

For the first-time run, add the **-firsttime** option. This option adds several additional checks and data collections that can be useful for a detailed initial analysis of a system and DB2 database system health. These checks can be skipped for subsequent runs. Also, use this option after each DB2 database upgrade to a new fix pack or release, or after any other significant change to the DB2 database manager and its operating environment.

#### Example 2

To collect data for a list of specified database names using default values for most options, run the following command:

db2has -icn FC123456 -name "Fake 1 Company, Inc." -address "123 Main St., Suite 123, Anywhere, CA 99999" -phone "555-555-5555" -email "john.smith@fake1company.com" -desc "Insurance services provider" -systype QA -W Hybrid -dblist "mydb1,mydb2,mydb3" -runid "QA test run #26"

The data will be collected for databases mydb1, mydb2, and mydb3 on the QA (quality assurance) system. The run ID is specified for this specific QA test run to distinguish it from other similar runs. In this example, the **-send** option was not specified. If you want to receive a PDF-based report from the DB2 Health Advisor Service, the archived file must be sent to db2has@ca.ibm.com.

#### Example 3

The analysis engine applies more than 20 rule-based scenarios to data collected from snapshots for a database manager and active databases. To include snapshot data for all active databases, excluding information about IP addresses and active ports, on a production system using the quiet mode to suppress output to a terminal, run the following command:

```
db2has -icn FC123456 -name "Fake 1 Company, Inc." -address "123 Main St., Suite 123,
Anywhere, CA 99999" -phone "555-555-5555" -email "john.smith@fake1company.com"
-desc "Insurance services provider" -systype production -W OLTP -exclude IP
-quiet -extended
```

**Note:** The db2has tool does not enable any monitor switches. Enabling such switches and activating databases is a user responsibility. The amount of data sent for analysis depends on what is enabled on a system

### db2has - DB2 Health Advisor Service data collector

during a data collection run. Although using the **-extended** option is optional, it is very useful since it adds more scenarios for the analysis engine to consider and, thereby, increases the chances of finding potential problems with a system or, on the contrary, confirms the DB2 instance and its operating environment are in good health.

#### **Example 4**

To send the data collected to a remote server, run the following command:

```
db2has -icn FC123456 -name "Fake 1 Company, Inc." -address "123 Main St., Suite 123,
Anywhere, CA 99999" -phone "555-5555" -email "john.smith@fake1company.com"
-desc "Insurance services provider" -systype test -workload DSS
-send "ftp://anonymous@ftp.ecurep.ibm.com:21/toibm/im"
```

The data is sent using the FTP protocol to the URL for the host server ftp.ecurep.ibm.com using port number 21. The example specifies anonymous as the user name. The argument for the **-send** option is optional. The argument must be specified when a resource file is used or as instructed by DB2 Software Support in the event that the ECuRep FTP service is unavailable due to outage. In all other cases, the recommended usage is to specify the **-send** option without the argument.

#### Example 5

To collect data using a prepared resource file db2has.res, run the following command:

db2has -resource /home/inst1/db2has.res

You can copy and paste the contents of a sample resource file, found at the following link, into a file that you have created. Options that are required for the data collection can be uncommented and edited as needed. Refer to "Sample db2has resource file (db2has.res)."

#### Usage notes

- Each option can appear only once. The options can be specified in any order and can have optional parameters. Short options cannot be strung together after a single hyphen. For example, use **-q** -**e** and not **-qe**.
- To exclude a collection of some potentially sensitive data, use the **-exclude** option. To display a list of supported excluded data sets, issue the following command:

db2has -help exclude

- Options **-symptom** and **-feedback** require the terminal input mode. These options should not be used in scripts.
- For best results, this program should be run using an ID having SYSADM authority.
- The following is a list of the exit status codes and their definitions:
  - **0** No errors were detected
  - 1 Unrecoverable errors were found
  - 2 There were syntax errors in the input data, or other errors were found

### Sample db2has resource file (db2has.res)

Using a resource file by issuing the db2has -resource *pathName* command is a convenient way to specify input data instead of manually typing command line

#### Sample db2has resource file (db2has.res)

options each time, especially when the data collector can be invoked many times over a short period of time with different sets of options. The sample resource file could also be useful in scripts.

You can copy and paste the contents of the sample resource file into a file that you have created. Options that are required for the data collection can be uncommented and edited as needed.

```
#
 Sample resource file for the DB2 Health Advisor Data Collector (db2has.res)
                                                                        #
#
# Instructions:
                                                                        #
# Use the resource file syntax as written.
# To implement a command parameter, remove the "#" comment symbol from the
# start of the line and provide any values, if necessary.
# Remove the angle brackets "< >" when specifying parameter values.
    #####
#
  Company information
#
#icn=<IBM Customer Number that is usually provided to DB2 support (required)>
#name=<company name>
#address=<company address>
#phone=<company phone number>
#email=<company e-mail address (required)>
#desc=<short description of company and/or type of business>
  System type. Valid values are: "test", "production", "integration", "QA"
#
  (quality assurance) and "DR" (disaster recovery). This is a required option.
#
#systype=test
# Working directory pathname. This directory will contain the resulting zip
# file with collected data, output file and optional diagnostic log file in
# case an error was detected. Please note that parent directory should exist.
  Default is ~/sqllib/db2hasdir.
#
#workdir=/home/<user>/sqllib/db2hasdir
  A list of comma separated database names. If specified, data will be
#
  collected for one or more databases from the list that were activated.
#
#dblist=<comma separated list of database names>
#
#
  Extended option for collecting additional data to allow for more scenarios
#
  not covered by default collections. If specified, output of several snapshot
#
  commands will be collected. Enablement of proper monitor switches is user's
#
  responsibility.
#
#extended
#
#
  Specifies a workload type, workload type. The following values are valid:
  "DSS", "OLTP", and "Hybrid". Here, OLTP and DSS mean "Online Transaction
#
#
  Processing"and "Decision Support System", respectively. Certain scenarios
  and recommendations depend on the kind of workload the system is used for.
#
#
  It is recommended this option is used so that more accurate health check
  reports are generated.
#
#
#workload=<workload type>
  Specifies a scheduled priority. Valid values are: "low" and "lowest". If
#
```

<sup>#</sup> specified, priority for the process will be lowered either to the lowest

```
# value (+20 for Unix) or to a medium between the regular and the lowest
  priority. By default, a regular value assigned by a system will be used
#
#
 unless the -priority is specified
#priority=<value>
# Firsttime option for specifying a set of data collections and checks that
# are recommended for the first time run. This option adds several additional
# checks and data collections that can be useful for a detailed initial
# analysis of a system and DB2 health. These checks can be skipped for
#
  subsequent runs. Using this option is recommended also after each DB2
  upgrade to a new fixpack or release or after any other significant change
#
# to DB2 and its operating environment.
#
#firsttime
#
#
 Included data collections and checks. Specified data collections and checks
  will be included in addition to default ones. Supported values are:
#
    dbmsnap - collection of database manager snapshot output
#
    dbsnap - collection of database snapshot output
#
    tlindex - check for tables with type 1 indexes
#
#include=dbmsnap,dbsnap
# Excluded data collections and checks. Specified data collections and checks
  will be excluded. Supported values are:
#
#
    IP - info about IP addresses and active connections will not be collected.
#
#exclude=IP
#
  Quiet mode. If specified, all output to a terminal will be suppressed.
#
#
#quiet
#
# Runid option for specifying an identifier or short description (up to 256
  bytes) of a run. This identifier could be used to distinguish similar runs
#
#
 on the same system.
#runid=<RunID>
#
  Specifies that collected data should be sent to a specified server. Optional
# argument specifies server's URL address. Username, password, port and path
# are optional. If any are omitted they will be set to the default values for
# the specified protocol. If used in a resource file, the argument should
# always be present to avoid ambiguity
#
#send=ftp://anonymous@ftp.ecurep.ibm.com:21/toibm/im
*********
```

# db2hc - Start health center

Starts the Health Center. The Health Center is a graphical interface that is used to view the overall health of database systems. Using the Health Center, you can view details and recommendations for alerts on health indicators and take the recommended actions to resolve the alerts.

**Important:** This command has been deprecated and might be removed in a future release because the Control Center and its associated components have been deprecated in Version 9.7. For more information, see the "Control Center tools and DB2 administration server (DAS) have been deprecated" topic in the *What's New for DB2 Version 9.7* book.

### Authorization

No special authority is required for viewing the information. Appropriate authority is required for taking actions.

### **Required Connection**

Instance

### **Command Syntax**

### **Command Parameters**

-t Turns on NavTrace for initialization code. You should use this option only when instructed to do so by DB2 Support.

#### -tcomms

Limits tracing to communication events. You should use this option only when instructed to do so by DB2 Support.

#### -tfilter filter

Limits tracing to entries containing the specified filter or filters. You should use this option only when instructed to do so by DB2 Support.

▶∢

# db2iauto - Autostart instance

Enables or disables the autostart of an instance after each system restart. This command is available on Linux and UNIX operating systems only.

### Authorization

One of the following:

- Root user authority
- SYSADM

### **Required connection**

None

### **Command syntax**

► db2iauto -on instance-name-

### **Command parameters**

- **-on** Enables autostart for the specified instance.
- -off Disables autostart for the specified instance.

#### instance-name

The login name of the instance.

# db2iclus - Microsoft cluster server

Allows users to add, drop, migrate and unmigrate instances and DB2 administration servers (DAS) in a Microsoft Cluster Server (MSCS) environment. This command is only available on Windows platforms.

### Authorization

Local administrator authority is required on the machine where the task will be performed. If adding a remote machine to an instance or removing a remote machine from an instance, local administrator authority is required on the target machine.

#### **Required connection**

None

### Command syntax

└/i:—instance name┘└/DAS:—DAS name┘└/c:—cluster name┘

### **Command parameters**

ADD Adds an MSCS node to a DB2 MSCS instance.

DROP Removes an MSCS node from a DB2 MSCS instance.

#### MIGRATE

Migrates a non-MSCS instance to an MSCS instance.

#### UNMIGRATE

Undoes the MSCS migration.

#### /DAS:DAS name

Specifies the DAS name. This option is required when performing the cluster operation against the DB2 administration server.

#### *Ic:cluster name*

Specifies the MSCS cluster name if different from the default/current cluster.

#### *Ip:instance profile path*

Specifies the instance profile path. This path must reside on a cluster disk so it is accessible when DB2 is active on any machine in the MSCS cluster. This option is required when migrating a non-MSCS instance to an MSCS instance.

#### *lu:username,password*

Specifies the account name and password for the DB2 service. This option is required when adding another MSCS node to the DB2 MSCS partitioned database instance.

Im:machine name

Specifies the remote computer name for adding or removing an MSCS node.

*li:instance name* 

Specifies the instance name if different from the default/current instance.

#### Examples

This example shows the use of the db2iclus command to manually configure the DB2 instance to run in a hot standby configuration that consists of two machines, WA26 and WA27.

- 1. To start, MSCS and DB2 Enterprise Server Edition must be installed on both machines.
- 2. Create a new instance called DB2 on machine WA26:

db2icrt DB2

- **3**. From the Windows Services dialog box, ensure that the instance is configured to start manually.
- 4. If the DB2 instance is running, stop it with the DB2STOP command.
- 5. Install the DB2 resource type from WA26:

```
c:>db2wolfi i
ok
```

If the db2wolfi command returns "Error : 183", then it is already installed. To confirm, the resource type can be dropped and added again. Also, the resource type will not show up in Cluster Administrator if it does not exist.

```
c:>db2wolfi u
ok
c:>db2wolfi i
ok
```

6. From WA26, use the db2iclus command to transform the DB2 instance into a clustered instance.

```
c:\>db2iclus migrate /i:db2 /c:mycluster /m:wa26 /p:p:\db2profs
```

```
DBI1912I The DB2 Cluster command was successful.
Explanation: The user request was successfully processed.
User Response: No action required.
```

The directory p:\db2profs should be on a clustered drive and must already exist. This drive should also be currently owned by machine WA26.

7. From WA26, use the db2iclus command to add other machines to the DB2 cluster list:

c:\>db2iclus add /i:db2 /c:mycluster /m:wa27

DBI1912I The DB2 Cluster command was successful. Explanation: The user request was successfully processed. User Response: No action required.

This command should be executed for each subsequent machine in the cluster.

- 8. From Cluster Administrator, create a new group called "DB2 Group".
- **9**. From Cluster Administrator, move the Physical Disk resources Disk O and Disk P into DB2 Group.
- 10. From Cluster Administrator, create a new resource type of type "IP Address" called "mscs5" that resides on the Public Network. This resource should also belong to DB2 Group. This will be a highly available IP address, and this

address should not correspond to any machine on the network. Bring the IP Address resource type online and ensure that the address can be pinged from a remote machine.

- 11. From Cluster Administrator, create a new resource of type "DB2" that will belong to DB2 Group. The name of this resource must be exactly identical to the instance name, so it is called DB2 for this case. When Cluster Administrator prompts for dependencies associated with the DB2 resource, ensure it is dependent on Disk O, Disk P and mscs5.
- **12**. Configure DB2 Group for fallback, if desired, via Cluster Administrator and using the DB2\_FALLBACK profile variable.
- 13. Create or restore all databases putting all data on Disk O and Disk P.
- 14. Test the failover configuration.

### **Usage notes**

To migrate an instance to run in an MSCS failover environment, you need to migrate the instance on the current machine first, then add other MSCS nodes to the instance using the db2iclus with the ADD option.

To revert an MSCS instance back to a regular instance, you first need to remove all other MSCS nodes from the instance by using the db2iclus with the DROP option. Next, you should undo the migration for the instance on the current machine.
# db2icrt - Create instance

Creates DB2 instances.

On Linux and UNIX operating systems, this utility is located in the *DB2DIR*/instance directory, where *DB2DIR* represents the installation location where the current version of the DB2 database system is installed. On Windows operating systems, this utility is located under the **DB2PATH**\bin directory where **DB2PATH** is the location where the DB2 copy is installed.

The db2icrt command creates DB2 instances in the instance owner's home directory.

**Note:** This command is not available for a non-root installation of DB2 database products on Linux and UNIX operating systems.

## **Authorization**

Root user authority on Linux and UNIX operating systems or Local Administrator authority on Windows operating systems.

## **Command syntax**

For Linux and UNIX operating systems

#### For Windows operating systems

# **Command parameters**

#### For Linux and UNIX operating systems

- -h | -? Displays the usage information.
- -d Turns debug mode on. Use this option only when instructed by DB2 database support.
- -a AuthType

Specifies the authentication type (SERVER, CLIENT or SERVER\_ENCRYPT) for the instance. The default is SERVER.

### -p PortName

Specifies the port name or number used by the instance. This option does not apply to client instances.

-s InstType

Specifies the type of instance to create. Use the **-s** option only when you are creating an instance other than the default associated with the installed product from which you are running db2icrt. Valid values are:

**client** Used to create an instance for a client. This is the default instance type for IBM Data Server Client, IBM Data Server Runtime Client, and DB2 Connect Personal Edition.

#### standalone

Used to create an instance for a database server with local clients. It is the default instance type for DB2 Personal Edition.

- ese Used to create an instance for a database server with local and remote clients with partitioned database environment support. This is the default instance type for DB2 Enterprise Server Edition.
- wse Used to create an instance for a database server with local and remote clients. This is the default instance type for DB2 Workgroup Server Edition, DB2 Express<sup>®</sup> Edition or DB2 Express-C, and DB2 Connect Enterprise Edition.

DB2 database products support their default instance types and the instance types lower than their default ones. For instance, DB2 Enterprise Server Edition supports the instance types of ese, wse, standalone and client.

-u Fenced ID

Specifies the name of the user ID under which fenced user-defined functions and fenced stored procedures will run. The **-u** option is required if you are not creating a client instance.

#### InstName

Specifies the name of the instance which is also the name of an existing user in the operating system. This has to be the last argument of the db2icrt command.

#### For Windows operating systems

#### InstName

Specifies the name of the instance.

-s InstType

Specifies the type of instance to create. Currently, there are four kinds of DB2 instance types. Valid values are:

**client** Used to create an instance for a client. This is the default instance type for IBM Data Server Client, IBM Data Server Runtime Client, and DB2 Connect Personal Edition.

#### standalone

Used to create an instance for a database server with local clients. It is the default instance type for DB2 Personal Edition.

ese Used to create an instance for a database server with local and remote clients with partitioned database environment support. The

-s ese -u Username, Password

options have to be used with db2icrt to create the ESE instance type and a partitioned database environment instance.

wse Used to create an instance for a database server with local and remote clients. This is the default instance type for DB2 Workgroup Server Edition, DB2 Express Edition or DB2 Express-C, and DB2 Connect Enterprise Edition.

DB2 database products support their default instance types and the instance types lower than their default ones. For instance, DB2 Enterprise Server Edition supports the instance types of ese, wse, standalone and client.

-u Username, Password

Specifies the account name and password for the DB2 service. This option is required when creating a partitioned database instance.

-p InstProfPath

Specifies the instance profile path.

## -h HostName

Overrides the default TCP/IP host name if there is more than one for the current machine. The TCP/IP host name is used when creating the default database partition (database partition 0). This option is only valid for partitioned database instances.

#### -r PortRange

Specifies a range of TCP/IP ports to be used by the partitioned database instance when running in MPP mode. For example, -r 50000,50007. The services file of the local machine will be updated with the following entries if this option is specified:

DB2	InstName		baseport/tcp
DB2	InstName	END	endport/tcp

#### /j "TEXT\_SEARCH"

Configures the DB2 Text Search server using generated default values for service name and TCP/IP port number. This parameter cannot be used if the instance type is client.

### /j "TEXT\_SEARCH, servicename"

Configures the DB2 Text Search server using the provided service name and an automatically generated port number. If the service name has a port number assigned in the services file, it uses the assigned port number.

### /j "TEXT\_SEARCH, servicename, portnumber"

Configures the DB2 Text Search server using the provided service name and port number.

#### /j "TEXT\_SEARCH, portnumber"

Configures the DB2 Text Search server using a default service name and the provided port number. Valid port numbers must be within the 1024 - 65535 range.

-? Displays usage information.

## Example

• On an AIX machine, to create an instance for the user ID db2inst1, issue the following command:

On a client machine: DB2DIR/instance/db2icrt db2inst1 On a server machine: DB2DIR/instance/db2icrt -u db2fenc1 db2inst1

where db2fenc1 is the user ID under which fenced user-defined functions and fenced stored procedures will run.

# **Usage notes**

- The *instance\_home*/sqllib/db2tss/config folder is created by db2icrt on Linux and UNIX operating systems. It is advised that you use a symbolic link to an area outside the sqllib directory.
- The -s option is intended for situations in which you want to create an instance that does not use the full functions of the system. For example, if you are using DB2 Enterprise Server Edition (ESE) on a UNIX operating system, but do not want partition capabilities, you could create a DB2 Workgroup Server Edition (WSE) instance, using the option -s WSE.
- To create a DB2 instance that supports Microsoft Cluster Server, first create an instance, then use the db2mscs command to migrate it to run in a MSCS instance.
- On Linux and UNIX operating systems, only one instance can be created under a user name. If you want to create an instance under a user name that already has an instance, you must drop the existing instance before creating the new one.
- When creating DB2 instances, consider the following restrictions:
  - If existing IDs are used to create DB2 instances, make sure that the IDs are not locked and do not have passwords expired.
- You can also use the db2isetup command to create and update DB2 instances using a graphical interface on all supported Linux and UNIX operating systems.
- On Linux and UNIX operating systems, if you are using the su command instead of the login command to become the root user, you must issue the su command with the option to indicate that the process environment is to be set as if you had logged in to the system using the login command.
- On Linux and UNIX operating systems, you must not source the DB2 instance environment for the root user. Running db2icrt when you sourced the DB2 instance environment is not supported.
- On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.
- On Windows operating systems, if the IBM Tivoli Monitoring for Databases: DB2 Agent is installed and the DB2 instance is created, the Monitoring Agent for DB2 instance is also created if the following are true:
  - The DB2 instance type is standalone, wse, or ese.
  - The default DB2 copy has the ITM agent component installed.
  - The DB2 instance is at version 9.5 (or higher).
  - There is no existing ITM for Databases product.

In addition, the following are also created after the creation of the Monitoring Agent for DB2 instance: the Monitoring Agent for DB2 instance files, the Windows service and the registry entries.

# db2idrop - Remove instance

Removes a DB2 instance that was created by db2icrt.

You can only drop instances that are listed by db2ilist for the same DB2 copy where you are issuing db2idrop from.

On Linux and UNIX operating systems, this utility is located in the *DB2DIR*/instance directory, where *DB2DIR* represents the installation location where the current version of the DB2 database system is installed. On Windows operating systems, this utility is located under the **DB2PATH**\bin directory where **DB2PATH** is the location where the DB2 copy is installed.

**Note:** A non-root-installed DB2 instance, on Linux and UNIX operating systems, cannot be dropped using this command. The only option is to uninstall the non-root DB2 copy. See *Usage notes* below for more details.

# Authorization

Root user authority on Linux and UNIX operating systems or Local Administrator on Windows operating systems.

# **Command syntax**

For Linux and UNIX operating systems

## For Windows operating systems

dh2idron_InstName_			
	└─ -†/	└─ -h─┘	

# **Command parameters**

#### For Linux and UNIX operating systems

InstName

Specifies the name of the instance.

- -d Enters debug mode, for use by DB2 database support.
- -f This parameter is deprecated.

Specifies the force applications flag. If this flag is specified all the applications using the instance will be forced to terminate.

-h | -? Displays the usage information.

### For Windows operating systems

#### InstName

Specifies the name of the instance.

- -f Specifies the force applications flag. If this flag is specified all the applications using the instance will be forced to terminate.
- -h Displays usage information.

# Example

If you created db2inst1 on a Linux or UNIX operating system by issuing the following command:

/opt/IBM/db2/copy1/instance/db2icrt -u db2fenc1 db2inst1

To drop db2inst1, you must run the following command: /opt/IBM/db2/copy1/instance/db2idrop db2inst1

# **Usage notes**

- Before an instance is dropped, ensure that the DB2 database manager has been stopped and that DB2 database applications accessing the instance are disconnected and terminated. DB2 databases associated with the instance can be backed up, and configuration data saved for future reference if needed.
- The db2idrop command does not remove any databases. Remove the databases first if they are no longer required. If the databases are not removed, they can always be catalogued under another DB2 copy of the same release and continued to be used.
- If you wish to save DB2 Text Search configurations and plan to reuse instance databases, you need to take the extra step of saving the config directory (on UNIX: *instance\_home/sqllib/db2tss/config* and on Windows: *instance\_profile\_path\instance\_name\db2tss\config*) or config directory contents before issuing the db2idrop command. After the new instance is created, the config directory can be restored. However, restoring the config directory is only applicable if the new instance created is of the same release and fix pack level.
- A non-root-installed instance cannot be dropped on Linux and UNIX operating systems. To remove this DB2 instance, the only option available to the user is to uninstall the non-root copy of DB2 by running db2\_deinstall -a.
- On Linux and UNIX operating systems, if you are using the su command instead of the login command to become the root user, you must issue the su command with the option to indicate that the process environment is to be set as if you had logged in to the system using the login command.
- On Linux and UNIX operating systems, you must not source the DB2 instance environment for the root user. Running db2idrop when you sourced the DB2 instance environment is not supported.
- On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.
- On Windows operating systems, if the IBM Tivoli Monitoring for Databases: DB2 Agent is installed and the DB2 instance is dropped, the Monitoring Agent for DB2 is stopped. All files, services and registry entries created for the Monitoring Agent for DB2 instance are also deleted.
- On Windows operating systems, if an instance is clustered with Microsoft Cluster Service (MSCS), then you can uncluster that instance by issuing the db2mscs or db2iclus command prior to dropping the instance.

# db2ldentifyType1 - Type-1 index identification tool

Identifies and generates into an output file the appropriate REORG INDEXES ALL commands with the **ALLOW WRITE ACCESS** and **CONVERT** clauses which you can use to convert type-1 indexes to type-2 indexes for a specified database. This command is intended to be run on databases that have not yet been upgraded to Version 9.7.

You do not need to run this command if your databases do not have type-1 indexes. By default, all new indexes created in Version 8 (or later) are type-2 indexes, except when you created an index on a table that already had type-1 indexes or when the **DB2\_INDEX\_TYPE2** registry variable was set to OFF. You might also have type-1 indexes on databases that were created on DB2 Universal Database Version 7 (or earlier) and that have not yet been converted.

To minimize the performance impact on the first access to tables with type-1 indexes, run db2IdentifyType1, and convert these indexes before upgrading your database to Version 9.7. If some tables still have type-1 indexes on them during the database upgrade, those indexes are marked invalid. After the upgrade, those indexes are converted to type-2 indexes on first access to the tables, or on database restart if you set the **indexrec** configuration parameter to RESTART. The tables are inaccessible until you have rebuilt the indexes. See the Usage Notes section for other important performance notes and details about the impact of running this command in partitioned database environments.

This command does not perform the index conversion. After you generate the output file, you can review it, edit its content if necessary, and then run the output file by using the following command: db2 -tvf *filename* 

Run the db2IdentifyType1 command from the following directories:

- On Linux and UNIX operating systems: from the DB2DIR/bin directory, where DB2DIR is the location where the DB2 copy is installed
- On Windows operating systems: from the db2\Windows\Utilities directory on the product CD

# **Authorization**

For databases not upgraded to Version 9.7, one of the following authorization levels is required:

- SYSADM
- DBADM

For databases upgraded to Version 9.7:

DBADM

# **Required connection**

Database. This command automatically establishes a connection to the specified database.

# **Command syntax**

►►—db2IdentifyType1—-	-o—filename—-o—filename	
		sschema_name
tt	h	

# **Command parameters**

## -d database-name

Specifies the name of the database to query.

-o filename

Specifies the path and the name of a file to which to write the REORG INDEX commands. The db2IdentifyType1.err log file is created in the same path. The db2IdentifyType1.err log file contains troubleshooting information and is created only if the db2IdentifyType1 command fails.You can qualify the file name, which cannot exceed 246 characters, by using a full or relative path name. If a file with the same name exists, it is overwritten.

### -s schema-name

Specifies the schema (creator user ID) of the tables to query. If you do not specify a schema, tables with all schemas are queried. You cannot specify more than one schema name at a time. You must specify schema name identifiers as they are shown in the system catalog tables, using uppercase. You must enclose delimited schema name identifiers in double quotation marks.

### -t table-name

Specifies the name of a table to query. If you do not specify a table name, all tables are queried. You cannot specify more than one table name at a time. You must specify table name identifiers as they are shown in the system catalog tables, using uppercase. You must enclose delimited table name identifiers in double quotation marks.

-h Displays help information. If you specify this option, all other options are ignored.

# **Usage notes**

You do not have to use this tool unless there are type-1 indexes in a database or unless you are unsure whether a database contains type-1 indexes. If you know that you have many type-1 indexes, then you might choose to run REORG INDEXES with the CONVERT option against all of the tables in your database, or against specific tables with type-1 indexes, rather than using this command to identify specific tables. REORG INDEXES with the CONVERT option has no effect if the indexes are already type-2.

This command does not detect typed tables with type-1 indexes in DB2 UDB Version 8 databases. If you are upgrading from Version 8, refer to the "Converting type-1 indexes to type-2 indexes" topic to determine whether your typed tables have type-1 indexes and to convert these indexes.

For databases with a large number of tables, the db2IdentifyType1 command can take a long time to complete its processing, you should use the -s or -t option to scan only a specific subset at a time.

Performance and usage considerations for partitioned database environments: In partitioned database environments, it is possible that type-1 indexes do not exist on all of the database partitions on which a table resides. This could occur if an index was converted to a type-2 index on only a subset of the database partitions. It is also possible that a table resides in a database partition group which does not include every database partition. Depending on the database version level, you might need to run the command on more than one partition:

- In Version 9.1 or Version 9.5 partitioned database environments, the db2IdentifyType1 command needs to run only on one database partition to detect all type-1 indexes, regardless of whether these indexes exist on all database partitions. For best performance, you should run it on the catalog database partition. The command might take a long time to complete if the database has many partitions because data is gathered from each partition.
- In Version 8 partitioned database environments, the db2IdentifyType1 command detects only type-1 indexes that exist on the partition where the command is run. If tables do not exist on every database partition, or if it is suspected that indexes might have been converted to type-2 on some partitions but not others, then you should run it on all database partitions to ensure that all type-1 indexes are detected.

# db2ilist - List instances

Lists all the instances that are created using the db2icrt command from the same DB2 copy location that you are running the db2ilist command.

On Linux and UNIX operating systems, this utility is located in the *DB2DIR*/instance directory, where *DB2DIR* is the instance directory where the DB2 copy is installed. On Windows operating systems, this utility is located under the **DB2PATH**\bin directory where **DB2PATH** represents the installation location where the current version of the DB2 database system is installed.

# Authorization

None

# **Command syntax**

▶►—db2ilist

# **Command parameters**

-h Displays usage information.

# Usage notes

- On Linux and UNIX operating systems, if you are using the su command instead of the login command to become the root user, you must issue the su command with the option to indicate that the process environment is to be set as if you had logged in to the system using the login command.
- On Linux and UNIX operating systems, you must not source the DB2 instance environment for the root user. Running db2ilist when you sourced the DB2 instance environment is not supported.
- On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.

# db2imigr - Migrate instance

The db2imigr command migrates an instance from a previous version of DB2 database system to a new release. This command is deprecated and will be discontinued in a future release. You should use the db2iupgrade command instead.

# **Authorization**

Root access on Linux and UNIX operating systems or Local Administrator on Windows operating systems.

# **Command syntax**

For Linux and UNIX operating systems

### For Windows operating systems

# **Command parameters**

#### For Linux and UNIX operating systems

- -d Turns debug mode on. Use this option only when instructed by DB2 Support.
- -a AuthType

Specifies the authentication type (SERVER, CLIENT or SERVER\_ENCRYPT) for the instance. The default is SERVER.

-u FencedID

Specifies the name of the user ID under which fenced user-defined functions and fenced stored procedures will run. This option is required when migrating a DB2 client instance to a DB2 server instance.

#### InstName

Specifies the name of the instance.

#### For Windows operating systems

#### InstName

Specifies the name of the instance.

### lu:username,password

Specifies the account name and password for the DB2 service. This option is required when migrating a partitioned instance.

### *Ip:instance-profile-path*

Specifies the new instance profile path for the migrated instance.

/q Issues the db2imigr command in quiet mode.

### *la:authType*

Specifies the authentication type (SERVER, CLIENT, or SERVER\_ENCRYPT) for the instance.

## /j "TEXT\_SEARCH"

Configures the DB2 Text Search server using generated default values for service name and TCP/IP port number. This parameter cannot be used if the instance type is *client*.

### /j "TEXT\_SEARCH, servicename"

Configures the DB2 Text Search server using the provided service name and an automatically generated port number. If the service name has a port number assigned in the services file, it uses the assigned port number.

## /j "TEXT\_SEARCH, servicename, portnumber"

Configures the DB2 Text Search server using the provided service name and port number.

## /j "TEXT\_SEARCH, portnumber"

Configures the DB2 Text Search server using a default service name and the provided port number. Valid port numbers must be within the 1024 - 65535 range.

*I*? Displays usage information for the db2imigr command.

# **Usage notes**

Refer to the db2iupgrade command documentation.

# db2inidb - Initialize a mirrored database

Initializes a mirrored database in a split mirror environment. The mirrored database can be initialized as a clone of the primary database, placed in roll forward pending state, or used as a backup image to restore the primary database.

This command can only be run against a split mirror database, and it must be run before the split mirror can be used.

# Authorization

One of the following:

- SYSADM
- SYSCTRL
- SYSMAINT

# **Required connection**

None

# **Command syntax**

# **Command parameters**

#### database\_alias

Specifies the alias of the database to be initialized.

#### **SNAPSHOT**

Specifies that the mirrored database will be initialized as a clone of the primary database.

#### **STANDBY**

Specifies that the database will be placed in roll forward pending state. New logs from the primary database can be fetched and applied to the standby database. The standby database can then be used in place of the primary database if it goes down.

#### MIRROR

Specifies that the mirrored database is to be used as a backup image which can be used to restore the primary database.

#### **RELOCATE USING** *configFile*

Specifies that the database files are to be relocated based on the information listed in the specified *configFile* prior to initializing the database as a snapshot, standby, or mirror. The format of *configFile* is described in "db2relocatedb - Relocate database" on page 1014.

# Usage notes

Do not issue the db2 connect to *database-alias* operation before issuing the db2inidb *database\_alias* as mirror command. Attempting to connect to a split mirror database before initializing it erases the log files needed during roll forward recovery. The connect sets your database back to the state it was in when you

suspended the database. If the database is marked as consistent when it was suspended, the DB2 database system concludes there is no need for crash recovery and empties the logs for future use. If the logs have been emptied, attempting to roll forward results in the SQL4970N error message being returned.

In a partitioned database environment, db2inidb must be run on every database partition before the split mirror from any of the database partitions can be used. db2inidb can be run on all database partitions simultaneously using the db2\_all command.

If, however, you are using the **RELOCATE USING** option, you cannot use the db2\_all command to run db2inidb on all of the partitions simultaneously. A separate configuration file must be supplied for each partition, that includes the NODENUM value of the database partition being changed. For example, if the name of a database is being changed, every database partition will be affected and the db2relocatedb command must be run with a separate configuration file on each database partition. If containers belonging to a single database partition are being moved, the db2relocatedb command only needs to be run once on that database partition.

If the **RELOCATE USING** *configFile* parameter is specified and the database is relocated successfully, the specified *configFile* will be copied into the database directory and renamed to db2path.cfg. During a subsequent crash recovery or rollforward recovery, this file will be used to rename container paths as log files are being processed.

If a clone database is being initialized, the specified *configFile* will be automatically removed from the database directory after a crash recovery is completed.

If a standby database or mirrored database is being initialized, the specified *configFile* will be automatically removed from the database directory after a rollforward recovery is completed or canceled. New container paths can be added to the db2path.cfg file after db2inidb has been run. This would be necessary when CREATE or ALTER TABLESPACE operations are done on the original database and different paths must be used on the standby database.

# db2inspf - Format inspect results

This utility formats the data from INSPECT CHECK results into ASCII format. Use this utility to see details of the inspection. The formatting by the db2inspf utility can be for a table or a table space, and errors, warnings, and summary can be specified either alone or in any combination thereof.

## Authorization

Anyone can access the utility, but users must have read permission on the results file in order to execute this utility against them.

## **Required connection**

None

## **Command syntax**

# **Command Parameters**

data-file

The unformatted inspection results file to format.

*out-file* The output file for the formatted output.

#### -tsi tablespace-id

Table space ID. Format out only for tables in this table space.

#### -ti table-id

Table ID. Format out only for table with this ID, table space ID must also be provided.

- -e Format out errors only.
- -s Summary only.
- -w Warnings only.

## Examples

To format all errors, warnings and summaries from the data file tbschk.log, execute the following:

db2inspf tbschk.log tbschk\_esw.txt -e -s -w

# db2iprune - Reduce installation image size

The db2iprune command can reduce the size of your DB2 product installation image prior to installation.

This tool is useful for large-scale deployments of DB2, as well as for embedding DB2 within an application. Using the input file, or .prn file, which contains a full list of removable products, components, and languages, you can specify what you would like to remove from the installation image. The db2iprune command calls the input file and removes the files associated with those components and languages. The result is a new, smaller DB2 installation image that can be installed using the regular DB2 installation methods.

You cannot prune all products. At a minimum, one product must be still part of the resulting image.

### Authorization

None

## **Required connection**

None

## Command syntax

# **Command parameters**

-r input\_file\_path

Specifies the full path to the input file that is to be used. The input file, or .prn file, contains a full list of removable components and is used to indicate which products, components, and languages you would like to remove from the installation image.

**-p** root\_directory\_path

(On Windows operating systems only.) Specifies the full path to the root directory of the source installation image. This directory contains setup and is the root directory of the DB2 installation DVD.

-o destination\_directory\_path

Specifies the full path to where the new DB2 pruned image is copied. Make sure that you have write access to this directory.

- -c Specifies that you want to prune the source installation image directly. Ensure that the source installation image directory is writable.
- -1 Enables error logging. On Linux and UNIX operating systems, if the -l option is not specified, the default log file name is tmpdir/

db2iprune\_username.log. On Windows operating systems, the log file db2iprune.log is written to the destination directory.

-t trace\_file

(On Linux and UNIX operating systems only.) Turns on the debug mode. The debug information is written to the file name specified.

-? | -h Displays the usage information.

### Examples

On Windows operating systems, to prune an IBM Data Server Client image where the input file is located in c:\db2client.prn, the DB2 setup.exe file is located in d:\, and you want your pruned IBM Data Server Client image to be copied to the e:\compact\_client directory, you would enter the following command at the command prompt:

```
db2iprune.exe -r c:\db2client.prn -p d:\ -o e:\compact_client
```

On Linux and UNIX operating systems, to prune a IBM Data Server Client image where the input file is located in /tmp/db2client.prn, the DB2 source files are located on /mnt/cdrom, and you want your pruned IBM Data Server Client image to be copied to the /compact\_client directory, you would enter the following command at the command prompt:

db2iprune -r /tmp/db2client.prn /mnt/cdrom -o /compact\_client

### Usage notes

The db2iprune command and sample input files are provided on the installation DVD:

On Windows operating systems dvd\_drive:\db2\Windows\utilities\db2iprune

On Linux and UNIX operating systems product image/db2/platform/utilities/db2iprune

# db2isetup - Start instance creation interface

Starts the DB2 Instance Setup wizard, a graphical tool for creating instances and for configuring new functionality on existing instances.

### Authorization

For root installations, root user authority is required on the system where the command is issued. For non-root installations, you must log on with the user ID that owns the non-root installation.

### **Required connection**

None

## Command syntax

## **Command parameters**

-i language-code

Two letter code for the preferred language in which to run the install. If unspecified, this parameter will default to the locale of the current user.

-l logfile

Writes the log to the file name specified. For root installations, the path and filename default to /tmp/db2isetup.log. For non-root installations, the default log file is /tmp/db2isetup\_userID.log, where userID represents the user ID that owns the non-root installation.

-t tracefile

The full path and name of trace file specified by *tracefile*.

-r response\_file

Full path and file name of the response file to use. The response file must contain the keyword **FILE**.

-? | -h Output usage information.

### Usage notes

- This instance setup wizard provides a subset of the functionality provided by the DB2 Setup wizard. The DB2 Setup wizard (which runs from the installation media) allows you to install DB2 database components, do system setup tasks such as DAS creation and configuration, and set up instances. The DB2 Instance Setup wizard only provides the functionality pertaining to instance setup.
- 2. The executable file for this command is located in the *DB2DIR*/instance directory. It is available in a typical install, but not in a compact install.
- 3. db2isetup runs on all supported Linux and UNIX systems.
- 4. On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.

# db2iupdt - Update instances

Updates an instance to run on a DB2 copy that has a new DB2 database product or feature installed, to run on a DB2 copy of the same version as the DB2 copy associated with the instance, or to upgrade the instance type to a higher level instance type.

The db2iupdt command can be issued against instances of the same version that are associated with the same or a different DB2 copy. In all cases, it will update the instance so that it runs against the code located in the same DB2 copy as where you issued the db2iupdt command. You should issue this command if:

- You install a fix pack and the automatic instance update fails.
- You install a new DB2 database product or feature to the DB2 copy associated to the DB2 instance.
- You want to update a DB2 instance from one DB2 copy to another DB2 copy of the same version of DB2 database product.

After a fix pack is installed on Linux and UNIX operating systems, the db2iupdt command is executed automatically.

To update an instance with db2iupdt, you must first stop all processes that are running for the instance.

# Authorization

Root user authority on UNIX and Linux operating systems or Local Administrator on Windows operating systems.

# **Command syntax**

#### For UNIX and Linux operating systems

#### For Windows operating systems

# **Command parameters**

### For UNIX and Linux operating systems

-h | -? Displays the usage information.

- -d Turns debug mode on.
- -k Keeps the current instance type during the update.
- -D Moves an instance from a higher code level on one path to a lower code level installed on another path.
- -s Ignores the existing SPM log directory.
- -a AuthType

Specifies the authentication type (SERVER, SERVER\_ENCRYPT or CLIENT) for the instance. The default is SERVER.

-u Fenced ID

Specifies the name of the user ID under which fenced user defined functions and fenced stored procedures will run. This option is only needed when converting an instance from a client instance to a non-client instance type. To determine the current instance type, refer to the node type parameter in the output from a GET DBM CFG command. If an instance is already a non-client instance, or if an instance is a client instance and is staying as a client instance (for example, by using the **-k** option), the **-u** option is not needed. The **-u** option cannot change the fenced user for an existing instance.

#### InstName

Specifies the name of the instance.

-e Updates every instance.

## For Windows operating systems

#### InstName

Specifies the name of the instance.

#### lu:username,password

Specifies the account name and password for the DB2 service.

## *Ip:instance-profile-path*

Specifies the new instance profile path for the updated instance.

## *Ir:baseport*,*endport*

Specifies the range of TCP/IP ports to be used by the partitioned database instance when running in MPP mode. When this option is specified, the services file on the local machine will be updated with the following entries:

DB2	InstName		baseport/tcp
DB2	InstName	END	endport/tcp

## /h:hostname

Overrides the default TCP/IP host name if there are more than one TCP/IP host names for the current machine.

- **/s** Updates the instance to a partitioned instance.
- /q Issues the db2iupdt command in quiet mode.

### *la:authType*

Specifies *authType*, the authentication type (SERVER, CLIENT, or SERVER\_ENCRYPT) for the instance.

# /j "TEXT\_SEARCH"

Configures the DB2 Text Search server using generated default values for service name and TCP/IP port number. This parameter cannot be used if the instance type is client.

# /j "TEXT\_SEARCH, servicename"

Configures the DB2 Text Search server using the provided service name and an automatically generated port number. If the service name has a port number assigned in the services file, it uses the assigned port number.

### /j "TEXT\_SEARCH, servicename, portnumber"

Configures the DB2 Text Search server using the provided service name and port number.

### /j "TEXT\_SEARCH, portnumber"

Configures the DB2 Text Search server using a default service name and the provided port number. Valid port numbers must be within the 1024 - 65535 range.

*I*? Displays usage information for the db2iupdt command.

# **Examples (UNIX and Linux)**

• An instance, db2inst2, is associated to a DB2 copy of DB2 database product installed at *DB2DIR1*. You have another DB2 copy of DB2 database product on the same computer at *DB2DIR2* for the same version of the DB2 database product as that installed on *DB2DIR1*. To update the instance to run from the DB2 copy installed at *DB2DIR1* to the DB2 copy installed at *DB2DIR2*, issue the following command:

DB2DIR2/instance/db2iupdt db2inst2

If the DB2 copy installed at *DB2DIR2* is at level lower than the DB2 copy installed at *DB2DIR1*, issue:

DB2DIR2/instance/db2iupdt -D db2inst2

# **Usage notes**

#### For all supported operating systems

• If you use the db2iupdt command to update a DB2 instance from one DB2 copy to another DB2 copy of the same version of DB2 database product, the DB2 Global Profile Variables defined in an old DB2 copy installation path will not be updated over to the new installation location. The DB2 Instance Profile Variables specific to the instance will be carried over after the instance is updated.

#### For UNIX and Linux operating systems

- The db2iupdt command is located in the *DB2DIR*/instance directory, where *DB2DIR* is the location where the current version of the DB2 database product is installed.
- If you want to update a non-root instance, refer to the db2nrupdt non-root-installed instance update command. The db2iupdt does not support updating of non-root instances.

- If you are using the su command instead of the login command to become the root user, you must issue the su command with the option to indicate that the process environment is to be set as if you had logged in to the system using the login command.
- You must not source the DB2 instance environment for the root user. Running db2iupdt when you sourced the DB2 instance environment is not supported.
- On UNIX and Linux operating systems, if the IBM Tivoli Monitoring for Databases: DB2 Agent is installed and the DB2 instance is updated, the Monitoring Agent for DB2 instance is also created if the following are true:
  - The DB2 instance type is standalone, wse, or ese.
  - The DB2 instance is at version 9.5 (or higher).

In addition, ITMA must already be installed for the DB2 copy you are updating the instance. Located in *DB2DIR*/itma directory, where *DB2DIR* represents the directory where the DB2 database product is installed.

• On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.

## For Windows operating systems

- The db2iupdt command is located in the **DB2PATH**\bin directory, where **DB2PATH** is the location where the current version of the DB2 database product is installed.
- The instance is updated to the DB2 copy from which you issue the db2iupdt command. However, to move your instance profile from its current location to another location, use the **/p** option and specify the instance profile path. Otherwise, the instance profile will stay in its original location after the instance update. Use the db2iupgrade command instead to upgrade to the current release from a previous release.
- On Windows operating systems, if the IBM Tivoli Monitoring for Databases: DB2 Agent is installed and the DB2 copy instance is updated, the Monitoring Agent for DB2 instance is also created if the following are true:
  - The DB2 instance type is standalone, wse, or ese.
  - The default DB2 copy has the ITM agent component installed.
  - The DB2 instance is at version 9.5 (or higher).
  - There is no existing ITM for Databases product.

In addition, the following are also created after the creation of the Monitoring Agent for DB2 instance: the Monitoring Agent for DB2 instance files, the Windows service and the registry entries.

# db2iupgrade - Upgrade instance

Upgrades an instance to a DB2 copy of the current release from a DB2 copy of a previous release. The DB2 copy from where you are running the db2iupgrade command must support instance upgrade from the DB2 copy that you want to upgrade.

On Linux and UNIX operating systems, this command is located in the *DB2DIR*/instance directory, where *DB2DIR* represents the installation location where the new release of the DB2 database system is installed. This command does not support instance upgrade for a non-root installation.

On Windows operating systems, this command is located in the **DB2PATH**\bin directory, where **DB2PATH** is the location where the DB2 copy is installed. To move your instance profile from its current location to another location, use the **/p** option and specify the instance profile path. Otherwise, the instance profile will stay in its original location after the upgrade.

# Authorization

Root user authority on Linux and UNIX operating systems or Local Administrator on Windows operating systems.

# **Command syntax**

For Linux and UNIX operating systems

# **Command parameters**

### For Linux and UNIX operating systems

- -d Turns debug mode on. Use this option only when instructed by DB2 database support.
- -k Keeps the pre-upgrade instance type if it is supported in the DB2 copy from where you are running the db2iupgrade command. If this parameter is not specified, the instance type is upgraded to the default instance type supported.

#### -a AuthType

Specifies the authentication type (SERVER, CLIENT or SERVER\_ENCRYPT) for the instance. The default is SERVER.

### -u FencedID

Specifies the name of the user ID under which fenced user-defined functions and fenced stored procedures will run. This option is required when upgrading a DB2 client instance to a DB2 server instance.

#### InstName

Specifies the name of the instance.

### For Windows operating systems

#### InstName

Specifies the name of the instance.

#### lu:username,password

Specifies the account name and password for the DB2 service. This option is required when upgrading a partitioned instance.

#### *Ip:instance-profile-path*

Specifies the new instance profile path for the upgraded instance.

/q Issues the db2iupgrade command in quiet mode.

#### la:authType

Specifies the authentication type (SERVER, CLIENT, or SERVER\_ENCRYPT) for the instance.

#### /j "TEXT\_SEARCH"

Configures the DB2 Text Search server using generated default values for service name and TCP/IP port number. This parameter cannot be used if the instance type is client.

#### /j "TEXT\_SEARCH, servicename"

Configures the DB2 Text Search server using the provided service name and an automatically generated port number. If the service name has a port number assigned in the services file, it uses the assigned port number.

#### /j "TEXT\_SEARCH, servicename, portnumber"

Configures the DB2 Text Search server using the provided service name and port number.

#### /j "TEXT\_SEARCH, portnumber"

Configures the DB2 Text Search server using a default service name and the provided port number. Valid port numbers must be within the 1024 - 65535 range.

*I*? Displays usage information for the db2iupgrade command.

### Usage notes

The db2iupgrade command calls the db2ckupgrade command with the **-not1** parameter, and specifies update.log as the log file for db2ckupgrade. The default log file created for db2iupgrade is /tmp/db2ckupgrade.log.processID. Verify that local databases are ready for upgrade before upgrading the instance. The **-not1** parameter disables the check for type-1 indexes. The log file is created in the instance home directory for Linux and UNIX operating systems or in the current directory for Windows operating systems. The instance upgrade will not continue if the db2ckupgrade command returns any errors.

For partitioned database environments, you should run the db2ckupgrade command in all database partitions before you issue the db2iupgrade command. The db2ckupgrade command only returns errors for the database partition where you issue the db2iupgrade command. If you do not check whether all database partitions are ready for upgrade, subsequent database upgrades could fail even though the instance upgrade was successful. See db2ckupgrade for details.

### For Linux and UNIX operating systems

- The db2iupgrade command removes any symbolic links that exist in /usr/lib and /usr/include in version you are upgrading from. If you have applications that load libdb2 directly from /usr/lib rather than using the operating system's library environment variable to find it, your applications might fail to execute properly after you have run the db2iupgrade command.
- If you use the db2iupgrade command to upgrade a DB2 instance from a previous version to the current version of a DB2 database system, the DB2 Global Profile Variables defined in an old DB2 database installation path will not be upgraded over to the new installation location. The DB2 Instance Profile Variables specific to the instance to be upgraded will be carried over after the instance is upgraded.
- If you are using the su command instead of the login command to become the root user, you must issue the su command with the option to indicate that the process environment is to be set as if you had logged in to the system using the login command.
- You must not source the DB2 instance environment for the root user. Running the db2iupgrade command when you sourced the DB2 instance environment is not supported.
- On UNIX and Linux operating systems, if the IBM Tivoli Monitoring for Databases: DB2 Agent is installed and the DB2 instance is upgraded, the Monitoring Agent for DB2 instance is also created if the following are true:
  - The DB2 instance type is standalone, wse, or ese.
  - The DB2 instance is at version 9.5 (or higher).

In addition, ITMA must already be installed for the DB2 copy you are updating the instance for. Located in *DB2DIR*/itma directory, where *DB2DIR* represents the directory where the DB2 database product is installed.

• On AIX 6.1 (or higher), when running this command from a shared DB2 copy in a system workload partition (WPAR) global environment, this command must be run as the root user.

### For Windows operating systems

- On Windows operating systems, if the IBM Tivoli Monitoring for Databases: DB2 Agent is installed and the DB2 copy instance is updated, the Monitoring Agent for DB2 instance is also created if the following are true:
  - The DB2 instance type is standalone, wse, or ese.
  - The default DB2 copy has the ITM agent component installed.
  - The DB2 instance is at version 9.5 (or higher).
  - There is no existing ITM for Databases product.

In addition, the following are also created after the creation of the Monitoring Agent for DB2 instance: the Monitoring Agent for DB2 instance files, the Windows service and the registry entries.

# db2jdbcbind - DB2 JDBC package binder

This utility is used to bind or rebind the JDBC packages to a DB2 database. DB2 Version 8 databases already have the JDBC packages preinstalled, therefore, this command is usually necessary only for earlier servers. JDBC and CLI share the same packages. If the CLI packages have already been bound to a database, then it is not necessary to run this utility and vice versa.

# Authorization

One of the following:

- dbadm
- BINDADD privilege if a package does not exist, and one of:
  - IMPLICIT\_SCHEMA authority on the database if the schema name of the package does not exist
  - CREATEIN privilege on the schema if the schema name of the package exists
- ALTERIN privilege on the schema if the package exists
- BIND privilege on the package if it exists

# **Required connection**

This command establishes a database connection.

# **Command syntax**

# **Command parameters**

-help Displays help information, all other options are ignored.

-url jdbc:db2://servername:portnumber/dbname

Specifies a JDBC URL for establishing the database connection. The DB2 JDBC type 4 driver is used to establish the connection.

### -user username

Specifies the name used when connecting to a database.

#### -password password

Specifies the password for the user name.

### -collection collection ID

The collection identifier (CURRENT PACKAGESET), to use for the packages. The default is NULLID. Use this to create multiple instances of the package set. This option can only be used in conjunction with the Connection or DataSource property currentPackageSet.

### -size number of packages

The number of internal packages to bind for each DB2 transaction isolation level and holdability setting. The default is 3. Since there are four DB2 isolation levels and two cursor holdability settings, there will be 4x2=8 times as many dynamic packages bound as are specified by this option. In addition, a single static package is always bound for internal use.

#### -tracelevel

Identifies the level of tracing, only required for troubleshooting.

# db2ldcfg - Configure LDAP environment

Configures the Lightweight Directory Access Protocol (LDAP) user distinguished name (DN) and password for the current logon user in an LDAP environment using an IBM LDAP client.

# **Authorization**

None

# **Required connection**

None

# **Command syntax**

►►—db21dcfg-

\_\_\_u*\_\_userDN\_\_\_w\_\_password\_\_\_*\_\_

# **Command parameters**

-u userDN

Specifies the LDAP user's Distinguished Name to be used when accessing the LDAP directory. As shown in the example below, the Distinguished name has several parts: the user ID, such as jdoe, the domain and organization names and the suffix, such as com or org.

-w password

Specifies the password.

-r Removes the user's DN and password from the machine environment.

## Example:

db2ldcfg -u "uid=jdoe,dc=mydomain,dc=myorg,dc=com" -w password

# Usage notes

In an LDAP environment using an IBM LDAP client, the default LDAP user's DN and password can be configured for the current logon user. Once configured, the LDAP user's DN and password are saved in the user's environment and used whenever DB2 accesses the LDAP directory. This eliminates the need to specify the LDAP user's DN and password when issuing the LDAP command or API. However, if the LDAP user's DN and password are specified when the command or API is issued, the default settings will be overridden.

This command can only be run when using an IBM LDAP client. On a Microsoft LDAP client, the current logon user's credentials will be used.

# db2level - Show DB2 service level

Shows the current Version and Service Level of the installed DB2 product. Output from this command goes to the console by default.

## Authorization

None

# **Required Connection**

None

## **Command Syntax**

►►-db21eve1---

# **Command parameters**

None

## **Examples**

On Windows operating systems, the db2level command shows the DB2 copy name. For example:

DB21085I Instance "DB2" uses "32" bits and DB2 code release "SQL09010" with level identifier "01010107". Informational tokens are "DB2 v9.1.0.189", "n060119", "", and Fix Pack "0". Product is installed at "c:\SQLLIB" with DB2 Copy Name "db2build".

On Linux and UNIX based operating systems, the db2level command does not show the DB2 copy name. For example:

DB21085I Instance "wqzhuang" uses "64" bits and DB2 code release "SQL09010" with level identifier "01010107". Informational tokens are "DB2 v9.1.0.0", "n060124", "", and Fix Pack "0". Product is installed at "/home/wqzhuang/sqllib".

#### Usage notes

The information output by the command includes Release, Level, and various informational tokens.

# db2licm - License management tool

Performs basic license functions in the absence of the Control Center. Adds, removes, lists, and modifies licenses and policies installed on the local system.

**Note:** Under the processor Value Unit (PVU) licensing structure, each processor core will be assigned a specific number of Value Units. You must acquire the total number of processor Value Units for each processor core on which the software programs are deployed. IBM continues to define a processor to be each processor core on a chip. For example, a dual-core chip contains two processor cores.

Each software program has a unique price per Value Unit. To determine the total cost of deploying an individual software program, you multiply the program price per Value Unit by the total number of processor Value Units required.

# Authorization

On Windows operating systems:

- You must belong to the local Administrators or Power Users group to use the **-a**, **-r**, or **-x** command parameters.
- SYSADM authority is required to use the **-c**, **-e**, **-p**, **-r**, or **-u** command parameters.

On UNIX and Linux operating systems, no authority is required.

# **Required connection**

None

# **Command syntax**

# **Command parameters**

#### -a filename

Adds a license for a product. Specify a file name containing valid license information. This can be obtained from your licensed product CD or by contacting your IBM representative or authorized dealer.

-c product-identifier num-connectors

Updates the number of connector entitlements that have been purchased. Specify the product identifier and the number of connector entitlements.

-e product-identifier

Updates the enforcement policy on the system. Valid values are:

#### HARD

Specifies that unlicensed requests will not be allowed.

- SOFT Specifies that unlicensed requests will be logged but not restricted.
- -g filename

Generates compliance report. Specify file name where output is to be stored.

- -h | -? Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed.
- -1 Lists all the products with available license information, including the product identifier.

#### SHOW DETAIL

Specify to view detailed information about licensed features (if any).

-p product-identifier

Updates the license policy type to use on the system.

### CONCURRENT

Specify for concurrent user policy.

**OFF** Specify to turn off all policies.

### -r product-identifier

Removes the license for a product. To get the product identifier for a specific product, invoke the command with the **-l** option.

-u product-identifier num-users

Updates the number of user licenses that the customer has purchased. Specify the product identifier and the number of users.

- -v Displays version information.
- -x Resets license compliance information for the purposes of license compliance report.

#### Examples

db21icm	-a	db2ese.lic
db21icm	-p	db2consv concurrent
db21icm	-r	db2ese
db21icm	-u	db2wse 10
db21icm	-e	db2ese SOFT

Output example listing all the products with available license information, including the product identifier:

Product name:"DB2 Enterprise Server EditionLicense type:"Trial"Expiry date:"08/31/2009"Product identifier:"db2ese"Version information:"9.7"	С	:\Program Files\IBM\SQLLIB\BIN>dt	o2licm -l

	۷	ersion information:	"9.7"	

# db2listvolumes - Display GUIDs for all disk volumes

Displays the GUIDs for all the disk volumes defined on a Windows operating system. This command creates two files in the directory where the tool is issued from. One file, called volumes.xml, contains information about each disk volume encoded in XML for easy viewing on an XML-enabled browser. The second file, called tablespace.ddl, contains the required syntax for specifying table space containers. This file must be updated to fill in the remaining information needed for a table space definition. The db2listvolumes command does not require any command line arguments. It is only available on Windows operating systems.

# Authorization

## Examples

db2logsForRfwd /home/ofer/NODE0000/S0000001/DB2TSCHG.HIS db2logsForRfwd DB2TSCHG.HIS -all •

# db2look - DB2 statistics and DDL extraction tool

Extracts the required Data Definition Language (DDL) statements to reproduce the database objects of a production database on a test database. The db2look command generates the DDL statements by object type.

This tool can generate the required UPDATE statements used to replicate the statistics on the objects in a test database. It can also be used to generate the UPDATE DATABASE CONFIGURATION and UPDATE DATABASE MANAGER CONFIGURATION commands and the db2set commands so that query optimizer-related configuration parameters and registry variables on the test database match those of the production database.

It is often advantageous to have a test system contain a subset of the production system's data. However, access plans selected for such a test system are not necessarily the same as those that would be selected for the production system. Both the catalog statistics and the configuration parameters for the test system must be updated to match those of the production system. Using this tool makes it possible to create a test database where access plans are similar to those that would be used on the production system.

You should check the DDL statements generated by the db2look command since they might not exactly reproduce all characteristics of the original SQL objects. For table spaces on partitioned database environments, DDL might not be complete if some database partitions are not active. Make sure all database partitions are active using the ACTIVATE command.

# Authorization

SELECT privilege on the system catalog tables.

In some cases, such as generating table space container DDL, you will require one of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon
- dbadm

# **Required connection**

None

# **Command syntax**

# **Command parameters**

#### -d DBname

Alias name of the production database that is to be queried. *DBname* can be the name of a DB2 Database for Linux, UNIX, and Windows or DB2 Version 9.1 for z/OS (DB2 for z/OS) database. If the *DBname* is a DB2 for z/OS database, the db2look utility will extract the DDL and UPDATE statistics statements for OS/390 and z/OS objects. These DDL and UPDATE statistics statements are statements applicable to a DB2 Database for Linux, UNIX, and Windows database and not to a DB2 for z/OS database. This is useful for users who want to extract OS/390 and z/OS objects and recreate them in a DB2 Database for Linux, UNIX, and Windows database.

If *DBname* is a DB2 for z/OS database, the output of the db2look command is limited to the following:

- Generate DDL for tables, indexes, views, and user-defined distinct types
- Generate UPDATE statistics statements for tables, columns, column distributions and indexes
- -e Extract DDL statements for database objects. DDL for the following database objects are extracted when using the -e option:
  - Audit policies
  - Schemas
  - Tables (including the inline length if at least one exists for the table, and the partition level INDEX IN clause for a partitioned table)
  - Views
  - Materialized query tables (MQT)
  - Aliases
  - Indexes (including partitioned indexes on partitioned tables)
  - Triggers
  - Sequences
  - · User-defined distinct types
  - Primary key, referential integrity, and check constraints

- User-defined structured types
- User-defined functions
- User-defined methods
- User-defined transforms
- Wrappers
- Servers
- User mappings
- Nicknames
- Type mappings
- Function templates
- Function mappings
- Index specifications
- Stored procedures
- Roles
- Trusted contexts
- Global variables
- Security label components
- Security policies
- Security labels

The DDL generated by the db2look command can be used to recreate user-defined functions successfully. However, the user source code that a particular user-defined function references (the EXTERNAL NAME clause, for example) must be available in order for the user-defined function to be usable.

#### -u Creator

Creator ID. Limits output to objects with this creator ID. If option -a is specified, this parameter is ignored. The output will not include any inoperative objects. To display inoperative objects, use the -a option.

## -z schema

Schema name. Limits output to objects with this schema name. The output will not include any inoperative objects. To display inoperative objects, use the -a option. If this parameter is not specified, objects with all schema names are extracted. If the -a option is specified, this parameter is ignored. This option is ignored for the federated DDL.

-t Tname1 Tname2 ... TnameN

Table name list. Limits the output to particular tables in the table list. Also generates the DDL for all dependent objects of all returned tables. The maximum number of tables is 30. Table names are separated by a blank space. Case-sensitive names and double-byte character set (DBCS) names must be enclosed inside a backward slash and double quotation delimiter, for example, \" MyTabLe \". For multiple-word table names, the delimiters must be placed within quotation marks (for example, "\"My Table\"") to prevent the pairing from being evaluated word-by-word by the command line processor. If a multiple-word table name is not enclosed by the backward slash and double delimiter (for example, "My Table"), all words will be converted into uppercase and the db2look command will look for an uppercase table (for example, "MY TABLE"). When -t is used with -l, the combination does support partitioned tables in DB2 Version 9.5.
#### -tw Tname

Generates DDL for table names that match the pattern criteria specified by *Tname*. Also generates the DDL for all dependent objects of all returned tables. *Tname* can be a single value only. The underscore character (\_) in *Tname* represents any single character. The percent sign (%) represents a string of zero or more characters. Any other character in *Tname* only represents itself. When -tw is specified, the -t option is ignored.

- -ct Generate DDL by object creation time. Generating DDL by object creation time will not guarantee that all the object DDLs will be displayed in correct dependency order. The db2look command only supports the following options if the -ct option is also specified: -e, -a, -u, -z, -t, -tw, -v, -l, -noview, -wlm.
- -dp Generate DROP statement before CREATE statement. The DROP statement might not work if there is an object that depends on the dropped object. For example, dropping a schema will fail if there is a table that depends on the dropped schema, or dropping a user-defined type/function will fail if there is any other type, function, trigger, or table that depends on it. For typed tables, the DROP TABLE HIERARCHY statement will be generated for the root table only. A DROP statement is not generated for index, primary and foreign keys, and constraints, because they are always dropped when the table is dropped. When a table has the RESTRICT ON DROP attribute, it cannot be dropped.
- -v Vname1 Vname2 ... VnameN

Generates DDL for the specified views. The maximum number of views is 30. If the -t option is specified, the -v option is ignored. The rules governing case-sensitive, DBCS, and multiple-word table names also apply to view names.

- -h Display help information. When this option is specified, all other options are ignored, and only the help information is displayed.
- -ap Generates the required AUDIT USING statements to associate audit policies with other database objects.
- -o Fname

Write the output to *filename*.sql. If this option is not specified, output is written to standard output. If a filename is specified with an extension, the output will be written into that file.

- -a When this option is specified the output is not limited to the objects created under a particular creator ID. All objects, including inoperative objects, created by all users are considered. For example, if this option is specified with the -e option, DDL statements are extracted for all objects in the database. If this option is specified with the -m option, UPDATE statistics statements are extracted for all user created tables and indexes in the database. If neither -u nor -a is specified, the environment variable USER is used. On UNIX operating systems, this variable does not have to be explicitly set; on Windows systems, however, there is no default value for the USER environment variable: a user variable in the SYSTEM variables must be set, or a set USER=*username* must be issued for the session.
- -m Generates the required UPDATE statements to replicate the statistics on tables, statistical views, columns and indexes.
  - -c This option is ignored unless specified in conjunction with the -m or -e option. When the -c option is specified, the db2look

command does not generate COMMIT, CONNECT and CONNECT RESET statements. The default action is to generate these statements.

 -r When this option is specified in conjunction with the -m option, the db2look command does not generate the RUNSTATS command. The default action is to generate the RUNSTATS command.

**Note:** If you intend to run the command processor script created using db2look in mimic mode (-m option) against another database (for example, to make the catalog statistics of the test database match those in production), both databases must use the same codeset and territory.

- -1 If this option is specified, then the db2look command will generate DDL for user defined table spaces, database partition groups and buffer pools. DDL for the following database objects is extracted when using the -l option:
  - User-defined table spaces
  - User-defined database partition groups
  - User-defined buffer pools
- -x If this option is specified, the db2look command will generate authorization DDL (GRANT statement, for example).

The supported authorizations include:

- Table: ALTER, SELECT, INSERT, DELETE, UPDATE, INDEX, REFERENCE, CONTROL
- View: SELECT, INSERT, DELETE, UPDATE, CONTROL
- Index: CONTROL
- Schema: CREATEIN, DROPIN, ALTERIN
- Database: ACCESSCTRL, BINDADD, CONNECT, CREATETAB, CREATE\_EXTERNAL\_ROUTINE, CREATE\_NOT\_FENCED\_ROUTINE, DATAACCESS, DBADM, EXPLAIN, IMPLICIT\_SCHEMA, LOAD, QUIESCE\_CONNECT, SECADM, SQLADM, WLMADM
- User-defined function (UDF): EXECUTE
- User-defined method: EXECUTE
- Stored procedure: EXECUTE
- Package: CONTROL, BIND, EXECUTE
- Column: UPDATE, REFERENCES
- Table space: USE
- Sequence: USAGE, ALTER
- Workloads: USAGE
- Global variables
- Role
- Security labels
- Exemptions
- -xd If this option is specified, the db2look command will generate all authorization DDLs, including authorization DDL for objects whose authorizations were granted by SYSIBM at object creation time.
- -f Use this option to extract the configuration parameters and registry variables that affect the query optimizer.

#### -td delimiter

Specifies the statement delimiter for SQL statements generated by the db2look command. If this option is not specified, the default is the semicolon (;). It is recommended that this option be used if the -e option is specified. In this case, the extracted objects might contain triggers or SQL routines.

#### -noview

If this option is specified, CREATE VIEW DDL statements will not be extracted.

#### -i userid

Use this option when working with a remote database.

#### -w password

Used with the -i option, this parameter allows the user to run the db2look command against a database that resides on a remote system. The user ID and the password are used by the db2look command to log on to the remote system. If working with remote databases, the remote database must be the same version as the local database. The db2look command does not have down-level or up-level support.

- -wlm This option generates WLM specific DDL output, which can serve to generate CREATE and ALTER statements for:
  - Histograms
  - WLM Event Monitors
  - Service Classes
  - Workloads
  - Thresholds
  - Work Class Sets
  - Work Action Sets
- -wrap Generates obfuscated versions of DDL statements for routines, triggers, views, and PL/SQL packages.

# -wrapper Wname

Generates DDL statements for federated objects that apply to this wrapper. The federated DDL statements that might be generated include: CREATE WRAPPER, CREATE SERVER, CREATE USER MAPPING, CREATE NICKNAME, CREATE TYPE MAPPING, CREATE FUNCTION ... AS TEMPLATE, CREATE FUNCTION MAPPING, CREATE INDEX SPECIFICATION, and GRANT (privileges to nicknames, servers, indexes). Only one wrapper name is supported; an error is returned if less than one or more than one is specified. This option does not support non-relational data sources.

#### -server Sname

Generates DDL statements for federated objects that apply to this server. The federated DDL statements that might be generated include: CREATE WRAPPER, CREATE SERVER, CREATE USER MAPPING, CREATE NICKNAME, CREATE TYPE MAPPING, CREATE FUNCTION ... AS TEMPLATE, CREATE FUNCTION MAPPING, CREATE INDEX SPECIFICATION, and GRANT (privileges to nicknames, servers, indexes). Only one server name is supported; an error is returned if less than one or more than one is specified. This option does not support non-relational data sources. **-nofed** Specifies that no federated DDL statements will be generated. When this option is specified, the -wrapper and -server options are ignored.

#### -fedonly

Specifies that only federated DDL statements will be generated.

- -mod Generates DDL statements for each module, and for all of the objects that are defined in each module.
- **-xs** Exports all files necessary to register XML schemas and DTDs at the target database, and generates appropriate commands for registering them. The set of XSR objects that will be exported is controlled by the -u, -z, and -a options.

#### -xdir dirname

Places exported XML-related files into the given path. If this option is not specified, all XML-related files will be exported into the current directory.

-cor Generates DDL statements with the CREATE OR REPLACE clause, regardless of whether or not the statements originally contained that clause.

# **Examples**

• Generate the DDL statements for objects created by user walid in database DEPARTMENT. The db2look output is sent to file db2look.sql:

db2look -d department -u walid -e -o db2look.sql

• Generate the DDL statements for objects that have schema name ianhe, created by user walid, in database DEPARTMENT. The db2look output is sent to file db2look.sql:

db2look -d department -u walid -z ianhe -e -o db2look.sql

• Generate the UPDATE statements to replicate the statistics for the database objects created by user walld in database DEPARTMENT. The output is sent to file db2look.sql:

db2look -d department -u walid -m -o db2look.sql

• Generate both the DDL statements for the objects created by user walid and the UPDATE statements to replicate the statistics on the database objects created by the same user. The db2look output is sent to file db2look.sql:

db2look -d department -u walid -e -m -o db2look.sql

• Generate the DDL statements for objects created by all users in the database DEPARTMENT. The db2look output is sent to file db2look.sql:

db2look -d department -a -e -o db2look.sql

- Generate the DDL statements for all user-defined database partition groups, buffer pools and table spaces. The db2look output is sent to file db2look.sql: db2look -d department -1 -o db2look.sql
- Generate the UPDATE statements for optimizer-related database and database manager configuration parameters, as well as the db2set statements for optimizer-related registry variables in database DEPARTMENT. The db2look output is sent to file db2look.sql:

db2look -d department -f -o db2look.sql

 Generate the DDL for all objects in database DEPARTMENT, the UPDATE statements to replicate the statistics on all tables and indexes in database DEPARTMENT, the GRANT authorization statements, the UPDATE statements for optimizer-related database and database manager configuration parameters, the db2set statements for optimizer-related registry variables, and the DDL for all user-defined database partition groups, buffer pools and table spaces in database DEPARTMENT. The output is sent to file db2look.sql.

db2look -d department -a -e -m -l -x -f -o db2look.sql

• Generate all authorization DDL statements for all objects in database DEPARTMENT, including the objects created by the original creator. (In this case, the authorizations were granted by SYSIBM at object creation time.) The db2look output is sent to file db2look.sql:

db2look -d department -xd -o db2look.sql

• Generate the DDL statements for objects created by all users in the database DEPARTMENT. The db2look output is sent to file db2look.sql:

db2look -d department -a -e -td % -o db2look.sql

The output can then be read by the CLP:

db2 -td% -f db2look.sql

• Generate the DDL statements for objects in database DEPARTMENT, excluding the CREATE VIEW statements. The db2look output is sent to file db2look.sql:

db2look -d department -e -noview -o db2look.sql

• Generate the DDL statements for objects in database DEPARTMENT related to specified tables. The db2look output is sent to file db2look.sql:

db2look -d department -e -t tab1 \"My TaBlE2\" -o db2look.sql

• Generate the DDL statements for all objects (federated and non-federated) in the federated database FEDDEPART. For federated DDL statements, only those that apply to the specified wrapper, FEDWRAP, are generated. The db2look output is sent to standard output:

db2look -d feddepart -e -wrapper fedwrap

• Generate a script file that includes only non-federated DDL statements. The following system command can be run against a federated database (FEDDEPART) and yet only produce output like that found when run against a database which is not federated. The db2look output is sent to a file out.sql:

db2look -d feddepart -e -nofed -o out

• Generate the DDL statements for objects that have schema name walid in the database DEPARTMENT. The files required to register any included XML schemas and DTDs are exported to the current directory. The db2look output is sent to file db2look.sql:

db2look -d department -z walid -e -xs -o db2look.sql

• Generate the DDL statements for objects created by all users in the database DEPARTMENT. The files required to register any included XML schemas and DTDs are exported to directory /home/ofer/ofer/. The db2look output is sent to standard output:

db2look -d department -a -e -xs -xdir /home/ofer/ofer/

 Generate WLM specific DDLs exclusively, in database DEPARTMENT. db2look -d department -wlm

Generate the DDLs for all objects in the database DEPARTMENT.

db2look -d department -wlm -e -l

#### Usage notes

On Windows operating systems, the db2look command must be run from a DB2 command window.

# db2look - DB2 statistics and DDL extraction tool

Several of the existing options support a federated environment. The following db2look command line options are used in a federated environment:

• -ap

When used, AUDIT USING statements are generated.

-е

When used, federated DDL statements are generated.

• -X

When used, GRANT statements are generated to grant privileges to the federated objects.

• -xd

When used, federated DDL statements are generated to add system-granted privileges to the federated objects.

• -f

When used, federated-related information is extracted from the database manager configuration.

• -m

When used, statistics for nicknames are extracted.

-wlm

When used, WLM specific DDLs will be output.

The ability to use federated systems needs to be enabled in the database manager configuration in order to create federated DDL statements. After the db2look command generates the script file, you must set the **federated** configuration parameter to YES before running the script.

You need to modify the output script to add the remote passwords for the CREATE USER MAPPING statements.

You need to modify the db2look command output script by adding AUTHORIZATION and PASSWORD to those CREATE SERVER statements that are used to define a DB2 family instance as a data source.

Usage of the -tw option is as follows:

• To both generate the DDL statements for objects in the DEPARTMENT database associated with tables that have names beginning with abc and send the output to the db2look.sql file:

db2look -d department -e -tw abc% -o db2look.sql

• To generate the DDL statements for objects in the DEPARTMENT database associated with tables that have a d as the second character of the name and to send the output to the db2look.sql file:

db2look -d department -e -tw \_d% -o db2look.sql

• The db2look command uses the LIKE predicate when evaluating which table names match the pattern specified by the *Tname* argument. Because the LIKE predicate is used, if either the \_ character or the % character is part of the table name, the backslash (\) escape character must be used immediately before the \_ or the %. In this situation, neither the \_ nor the % can be used as a wildcard character in *Tname*. For example, to generate the DDL statements for objects in the DEPARTMENT database associated with tables that have a percent sign in the neither the first nor the last position of the name:

db2look -d department -e -tw string\%string

• Case-sensitive, DBCS, and multi-word table and view names must be enclosed by both a backslash and double quotation marks. For example:

\"My TabLe\"

If a multibyte character set (MBCS) or double-byte character set (DBCS) name is not enclosed by the backward slash and double quotation delimiter and if it contains the same byte as the lowercase character, it will be converted into uppercase and db2look will look for a database object with the converted name. As a result, the DDL statement will not be extracted.

- The -tw option can be used with the -x option (to generate GRANT privileges), the -m option (to return table and column statistics), and the -l option (to generate the DDL for user-defined table spaces, database partition groups, and buffer pools). If the -t option is specified with the -tw option, the -t option (and its associated *Tname* argument) is ignored.
- The -tw option cannot be used to generate the DDL for tables (and their associated objects) that reside on federated data sources, or on DB2 for z/OS, DB2 for i , or DB2 Server for VSE & VM.
- The -tw option is only supported via the CLP.

When requesting DDL on systems with a partitioned database environment, a warning message will be displayed in place of the DDL for table spaces that exist on inactive database partitions. To ensure proper DDL is produced for all table spaces all database partitions must be activated.

You can issue the db2look command on databases running on DB2 servers Version 9.5 or higher level. However, the db2look command is not supported on Version 9.1 databases. For example, running this command from a Version 9.1 client on a Version 9.5 database is supported, while running it from a Version 9.5 client on a Version 9.1 database is not supported.

When extracting DDL for security label components of type array, the extracted DDL may not generate a security label component whose internal representation (i.e., the encoding of elements in that array) exactly matches the internal representation of that security label component within the database that the db2look extract was taken from. This can happen when a security label component of type array has been altered and one or more elements were added to it. In such cases, data extracted from one table and moved to another table, created from db2look output, will not have corresponding security label values, such that the protection of the new table may be compromised.

# **Related information**

Nickname column and index names

Changing applications for migration

# db2ls - List installed DB2 products and features

Lists the DB2 products and features installed on your Linux and UNIX systems, including the DB2 HTML documentation. With the ability to install multiple copies of DB2 products on your system and the flexibility to install DB2 products and features in the path of your choice, you can use the db2ls command to list:

- where DB2 products are installed on your system and list the DB2 product level.
- all or specific DB2 products and features in a particular installation path.

The db2ls command can be found both in the installation media and in a DB2 install copy on the system. The db2ls command can be run from either location. The db2ls command can be run from the installation media for all products except IBM Data Server Driver Package.

# Authorization

# Command syntax

# **Command parameters**

-q Signifies that the query is to list installed DB2 products and features. By default, only the visible components (features) are displayed unless the -a parameter is also specified.

-f feature-rsp-file-ID

Queries for the specific feature, if it is installed. If it is not installed, the return code from the program is nonzero, otherwise the return code is zero.

- -a Lists all hidden components as well as visible features. The db2ls command only lists visible features by default.
- -p Lists products only. This will give a brief list of which products the customer has installed rather than listing the features.

#### -b base-install-path

When using the global db2ls command in /usr/local/bin, you need to specify which directory you are querying. The global db2ls command will simply call the db2ls from that install path and pass in the rest of the parameters.

-c Prints the output as a colon-separated list of entries rather than

column-based. This allows you to programmatically with this information. The first line of output will be a colon-separated list of tokens to describe each entry. This first line will start with a hash character ("#") to make it easy to ignore programmatically.

-1 log-file

Trace log file to use for debugging purposes.

# Examples

- To query what DB2 database features are installed to a particular path, issue: db2ls -q -b /opt/ibm/ese/v9
- To see all DB2 database features installed to a particular path, issue: db2ls -q -a -b /opt/ibm/ese/v9
- To check whether a specific DB2 database feature is installed or not, issue: db2ls -q -b /opt/ibm/ese/v9 -f <feature>

### Usage notes

- You cannot use the db2ls command on Windows operating systems.
- If the root has write permission in /usr/local/bin or is able to create /usr/local/bin, the symbolic link /usr/local/bin/db2ls will be created which points to DB2DIR/install/db2ls for the first installation of DB2 Version 9 or later version installed on the system. The root will update the link pointing to the highest version and level of DB2 installed on the system, if multiple copies of DB2 are installed.

A non-root installation will not create or change the /usr/local/bin/db2ls. In that case, to run db2ls, you have to do one of two things:

- add *inst\_home*/sqllib/install to the user's path. Then you can run db2ls as the non-root user.
- pass in the exact path of the command, i.e., *inst\_home*/sqllib/install/db2ls.
- The db2ls command is the only method to query a DB2 product at Version 9 or later. You cannot query DB2 products using Linux or UNIX operating system native utilities such as pkgadd, rpm, SMIT, or swinstall. Any existing scripts containing a native installation utility that you use to interface and query with DB2 installations will need to change.
- Different feature listings are obtained depending upon the root versus non-root method of DB2 installation and the user running the command.

Without the -q option:

- For any user, other than the non-root-install instance user, the command displays all copies installed by the root user.
- For the non-root-install instance user, the command displays all DB2 copies installed by the root user plus the non-root copy owned by the non-root user.

With the -q option:

- If userA wants to know if userB has DB2 installed, userA can run db21s -q -b \$userBHomeDir/sqllib. If userA has access permission, then the DB2 features installed by userB will be displayed, otherwise, an error message will be returned indicating that access permission was denied.
- If you run db21s -q without the -b option, the installed features in the install path where db2ls belongs are displayed.
- If the directory is read-only, the db2ls command cannot be linked to from the /usr/local/bin directory. If you are running in a system workload partitions (WPARs) you can use the db2ls command located in the installation image root directory to query a list of installed copies.

# db2move - Database movement tool

This tool, when used in the EXPORT/IMPORT/LOAD mode, facilitates the movement of large numbers of tables between DB2 databases located on workstations. The tool queries the system catalog tables for a particular database and compiles a list of all user tables. It then exports these tables in PC/IXF format. The PC/IXF files can be imported or loaded to another local DB2 database on the same system, or can be transferred to another workstation platform and imported or loaded to a DB2 database on that platform. Tables with structured type columns are not moved when this tool is used. When used in the COPY mode, this tool facilitates the duplication of a schema.

# Authorization

This tool calls the DB2 export, import, and load APIs, depending on the action requested by the user. Therefore, the requesting user ID must have the correct authorization required by those APIs, or the request will fail.

# **Command syntax**

# **Command parameters**

#### dbname

Name of the database.

action Must be one of:

#### **EXPORT**

Exports all tables that meet the filtering criteria in options. If no options are specified, exports all the tables. Internal staging information is stored in the db2move.lst file.

#### IMPORT

Imports all tables listed in the internal staging file db2move.lst. Use the -io option for IMPORT specific actions.

#### LOAD

Loads all tables listed in the internal staging file db2move.lst. Use the -lo option for LOAD specific actions.

**COPY** Duplicates schemas into a target database. The target database must be a local database. Use the -sn option to specify one or more

schemas. See the -co option for COPY specific options. Use the -tn or -tf option to filter tables in LOAD\_ONLY mode. You must use a table space named SYSTOOLSPACE when either the ADMIN\_COPY\_SCHEMA() stored procedure is used, or when the db2move utility is used with the -COPY option.

See below for a list of files that are generated during each action.

#### **-tc** *table-definers*

The default is all definers.

This is an EXPORT action only. If specified, only those tables created by the definers listed with this option are exported. If not specified, the default is to use all definers. When specifying multiple definers, they must be separated by commas; no blanks are allowed between definer IDs. This option can be used with the -tn *table-names* option to select the tables for export.

An asterisk (\*) can be used as a wildcard character that can be placed anywhere in the string.

# -tn table-names

The default is all user tables.

This is an EXPORT or COPY action only.

If specified with the EXPORT action, only those tables whose names match those in the specified string are exported. If not specified, the default is to use all user tables. When specifying multiple table names, they must be separated by commas; no blanks are allowed between table names. Table names should be listed unqualified and the -sn option should be used to filter schemas.

For export, an asterisk (\*) can be used as a wildcard character that can be placed anywhere in the string.

If specified with the COPY action, the -co "MODE" LOAD\_ONLY *copy-option* must also be specified, and only those tables specified will be repopulated on the target database. The table names should be listed with their schema qualifier in the format "schema"."table".

#### -sn schema-names

The default for EXPORT is all schemas (not for COPY).

If specified, only those tables whose schema names match will be exported or copied. If multiple schema names are specified, they must be separated by commas; no blanks are allowed between schema names. Schema names of less than 8 characters are padded to 8 characters in length.

In the case of export: If the asterisk wildcard character (\*) is used in the schema names, it will be changed to a percent sign (%) and the table name (with percent sign) will be used in the LIKE predicate of the WHERE clause. If not specified, the default is to use all schemas. If used with the -tn or -tc option, db2move will only act on those tables whose schemas match the specified schema names and whose definers match the specified definers. A schema name fred has to be specified -sn fr\*d\* instead of -sn fr\*d when using an asterisk.

**-ts** *tablespace-names* 

The default is all table spaces.

This is an EXPORT action only. If this option is specified, only those tables that reside in the specified table space will be exported. If the asterisk wildcard character (\*) is used in the table space name, it will be changed to a percent sign (%) and the table name (with percent sign) will be used in the LIKE predicate in the WHERE clause. If the -ts option is not specified, the default is to use all table spaces. If multiple table space names are specified, they must be separated by commas; no blanks are allowed between table space names. Table space names less than 8 characters are padded to 8 characters in length. For example, a table space name mytb has to be specified -ts my\*b\* instead of -sn my\*b when using the asterisk.

#### -tf filename

If specified with EXPORT action, only those tables whose names match exactly those in the specified file are exported. If not specified, the default is to use all user tables. The tables should be listed one per line, and each table should be fully qualified. Wildcard characters are not allowed in the strings. Here is an example of the contents of a file:

"SCHEMA1"."TABLE NAME1" "SCHEMA NAME77"."TABLE155"

If specified with the COPY action, the -co "MODE" LOAD\_ONLY *copy-option* must also be specified, and only those tables specified in the file will be repopulated on the target database. The table names should be listed with their schema qualifier in the format "schema"."table".

#### -io import-option

The default is REPLACE\_CREATE. See "IMPORT command options CREATE and REPLACE\_CREATE are deprecated" for limitations of import create function.

Valid options are: INSERT, INSERT\_UPDATE, REPLACE, CREATE, and REPLACE\_CREATE.

#### -lo load-option

The default is INSERT.

Valid options are: INSERT and REPLACE.

-co When the db2move action is COPY, the following -co follow-on options will be available:

#### "TARGET\_DB db name [USER userid USING password]"

Allows the user to specify the name of the target database and the user/password. (The source database user/password can be specified using the existing -p and -u options). The USER/USING clause is optional. If USER specifies a userid, then the password must either be supplied following the USING clause, or if it's not specified, then db2move will prompt for the password information. The reason for prompting is for security reasons discussed below. TARGET\_DB is a mandatory option for the COPY action. The TARGET\_DB cannot be the same as the source database and must be a local database. The ADMIN\_COPY\_SCHEMA procedure can be used for copying schemas within the same database. The COPY action requires inputting at least one schema (-sn) or one table (-tn or -tf).

Running multiple db2move commands to copy schemas from one database to another will result in deadlocks. Only one db2move command should be issued at a time. Changes to tables in the source schema during copy processing may mean that the data in the target schema is not identical following a copy.

#### "MODE"

# DDL\_AND\_LOAD

Creates all supported objects from the source schema, and populates the tables with the source table data. This is the default option.

#### DDL\_ONLY

Creates all supported objects from the source schema, but does not repopulate the tables.

#### LOAD\_ONLY

Loads all specified tables from the source database to the target database. The tables must already exist on the target. The LOAD\_ONLY mode requires inputting at least one table using the -tn or -tf option.

This is an optional option that is only used with the COPY action.

#### "SCHEMA\_MAP"

Allows user to rename schema when copying to target. Provides a list of the source-target schema mapping, separated by commas, surrounded by brackets. e.g schema\_map ((s1, t1), (s2, t2)). This would mean objects from schema s1 will be copied to schema t1 on the target; objects from schema s2 will be copied to schema t2 on the target. The default, and recommended, target schema name is the source schema name. The reason for this is db2move will not attempt to modify the schema for any qualified objects within object bodies. Therefore, using a different target schema name may lead to problems if there are qualified objects within the object body.

For example:create view F00.v1 as 'select c1 from F00.t1'

In this case, copy of schema FOO to BAR, v1 will be regenerated as:create view BAR.v1 as 'select c1 from F00.t1'

This will either fail since schema FOO does not exist on the target database, or have an unexpected result due to FOO being different than BAR. Maintaining the same schema name as the source will avoid these issues. If there are cross dependencies between schemas, all inter-dependent schemas must be copied or there may be errors copying the objects with the cross dependencies.

For example:create view F00.v1 as 'select c1 from BAR.t1'

In this case, the copy of v1 will either fail if BAR is not copied as well, or have an unexpected result if BAR on the target is different than BAR from the source. db2move will not attempt to detect cross schema dependencies.

This is an optional option that is only used with the COPY action.

# "NONRECOVERABLE"

This option allows the user to override the default behavior of the load to be done with COPY-NO. With the default behavior, the user will be forced to take backups of each table space that was loaded into. When specifying this NONRECOVERABLE keyword, the user will not be forced to take backups of the table spaces immediately. It is, however, highly recommended that the backups be taken as soon as possible to ensure the newly created tables will be properly recoverable. This is an optional option available to the COPY action.

#### "OWNER"

Allows the user to change the owner of each new object created in the target schema after a successful COPY. The default owner of the target objects will be the connect user; if this option is specified, ownership will be transferred to the new owner. This is an optional option available to the COPY action.

#### "TABLESPACE\_MAP"

The user may specify table space name mappings to be used instead of the table spaces from the source system during a copy. This will be an array of table space mappings surrounded by brackets. For example, tablespace\_map ((TS1, TS2),(TS3, TS4)). This would mean that all objects from table space TS1 will be copied into table space TS2 on the target database and objects from table space TS3 will be copied into table space TS4 on the target. In the case of ((T1, T2),(T2, T3)), all objects found in T1 on the source database will be recreated in T2 on the target database and any objects found in T2 on the source database will be recreated in T3 on the target database. The default is to use the same table space name as from the source, in which case, the input mapping for this table space is not necessary. If the specified table space does not exist, the copy of the objects using that table space will fail and be logged in the error file.

The user also has the option of using the SYS\_ANY keyword to indicate that the target table space should be chosen using the default table space selection algorithm. In this case, db2move will be able to choose any available table space to be used as the target. The SYS\_ANY keyword can be used for all table spaces, example: tablespace\_map SYS\_ANY. In addition, the user can specify specific mappings for some table spaces, and the default table space selection algorithm for the remaining. For example, tablespace\_map ((TS1, TS2), (TS3, TS4), SYS\_ANY). This indicates that table space TS1 is mapped to TS2, TS3 is mapped to TS4, but the remaining table spaces will be using a default table space target. The SYS\_ANY keyword is being used since it's not possible to have a table space starting with "SYS".

This is an optional option available to the COPY action.

#### -l lobpaths

For IMPORT and EXPORT, if this option is specified, it will be also used for XML paths. The default is the current directory.

This option specifies the absolute path names where LOB or XML files are created (as part of EXPORT) or searched for (as part of IMPORT or LOAD). When specifying multiple paths, each must be separated by commas; no blanks are allowed between paths. If multiple paths are specified, EXPORT will use them in round-robin fashion. It will write one LOB document to the first path, one to the second path, and so on up to the last, then back to the first path. The same is true for XML documents. If files are not found in the first path (during IMPORT or LOAD), the second path will be used, and so on.

```
-u userid
```

The default is the logged on user ID.

Both user ID and password are optional. However, if one is specified, the other must be specified. If the command is run on a client connecting to a remote server, user ID and password should be specified.

-p password

The default is the logged on password. Both user ID and password are optional. However, if one is specified, the other must be specified. When the -p option is specified, but the password not supplied, db2move will prompt for the password. This is done for security reasons. Inputting the password through command line creates security issues. For example, a ps -ef command would display the password. If, however, db2move is invoked through a script, then the passwords will have to be supplied. If the command is issued on a client connecting to a remote server, user ID and password should be specified.

-aw Allow Warnings. When -aw is not specified, tables that experience warnings during export are not included in the db2move.lst file (although that table's .ixf file and .msg file are still generated). In some scenarios (such as data truncation) the user might want to allow such tables to be included in the db2move.lst file. Specifying this option allows tables which receive warnings during export to be included in the .lst file.

# Examples

• To export all tables in the SAMPLE database (using default values for all options), issue:

db2move sample export

• To export all tables created by userid1 or user IDs LIKE us%rid2, and with the name tbname1 or table names LIKE %tbname2, issue:

db2move sample export -tc userid1,us\*rid2 -tn tbname1,\*tbname2

• To import all tables in the SAMPLE database (LOB paths D:\LOBPATH1 and C:\LOBPATH2 are to be searched for LOB files; this example is applicable to Windows operating systems only), issue:

db2move sample import -1 D:\LOBPATH1,C:\LOBPATH2

• To load all tables in the SAMPLE database (/home/userid/lobpath subdirectory and the tmp subdirectory are to be searched for LOB files; this example is applicable to Linux and UNIX systems only), issue:

db2move sample load -1 /home/userid/lobpath,/tmp

• To import all tables in the SAMPLE database in REPLACE mode using the specified user ID and password, issue:

db2move sample import -io replace -u userid -p password

• To duplicate schema schemal from source database dbsrc to target database dbtgt, issue:

db2move dbsrc COPY -sn schema1 -co TARGET DB dbtgt USER myuser1 USING mypass1

• To duplicate schema schemal from source database dbsrc to target database dbtgt, rename the schema to newschemal on the target, and map source table space ts1 to ts2 on the target, issue:

db2move dbsrc COPY -sn schema1 -co TARGET\_DB dbtgt USER myuser1 USING mypass1 SCHEMA\_MAP ((schema1,newschema1)) TABLESPACE\_MAP ((ts1,ts2), SYS\_ANY))

# Usage notes

- A db2move EXPORT, followed by a db2move IMPORT/LOAD, facilitates the movement of table data. It is necessary to manually move all other database objects associated with the tables (such as aliases, views, or triggers) as well as objects that these tables may depend on (such as user-defined types or user-defined functions).
- If the IMPORT action with the CREATE or REPLACE\_CREATE option is used to create the tables on the target database (both options are deprecated and may be removed in a future release), then the limitations outlined in "Imported table re-creation" are imposed. If unexpected errors are encountered during the db2move import phase when the REPLACE\_CREATE option is used, examine the appropriate tabnnn.msg message file and consider whether the errors might be the result of the limitations on table creation.
- Tables that contain GENERATED ALWAYS identity columns cannot be imported or loaded using db2move. You can, however, manually import or load these tables. For more information, see "Identity column load considerations" or "Identity column import considerations".
- When export, import, or load APIs are called by db2move, the **FileTypeMod** parameter is set to lobsinfile. That is, LOB data is kept in files that are separate from the PC/IXF file, for every table.
- The LOAD command must be run locally on the machine where the database and the data file reside.
- When using db2move LOAD and logretain is enabled for the database (the database is recoverable):
  - If the NONRECOVERABLE option is not specified, then db2move will invoke the db2Load API using the default COPY NO option, and the table spaces where the loaded tables reside are placed in the Backup Pending state upon completion of the utility (a full database or table space backup is required to take the table spaces out of the Backup Pending state).
  - If the NONRECOVERABLE option is specified, the table spaces are not placed in backup-pending state, however if rollforward recovery is performed later, the table is marked inaccessible and it must be dropped. For more information on Load recoverability options, see "Options for improving load performance".
- Performance for the db2move command with the IMPORT or LOAD actions can be improved by altering the default buffer pool, IBMDEFAULTBP, and by updating the configuration parameters **sortheap**, **util\_heap\_sz**, **logfilsiz**, and **logprimary**.
- When running Data Movement utilities such as export and db2move, the query compiler might determine that the underlying query will run more efficiently against an MQT than the base table or tables. In this case, the query will execute against a refresh deferred MQT, and the result of the utilities might not accurately represent the data in the underlying table.
- The db2move command is not available with DB2 clients. If you issue the db2move command from a client machine, you will receive a db2move is not recognized as an internal or external command, operable program or batch file error message. To avoid this issue, you can issue the db2move command directly on the server.

# Files Required/Generated When Using EXPORT:

- Input: None.
- Output:

#### EXPORT.out

The summarized result of the EXPORT action.

#### db2move.lst

The list of original table names, their corresponding PC/IXF file names (tabnnn.ixf), and message file names (tabnnn.msg). This list, the exported PC/IXF files, and LOB files (tabnnnc.yyy) are used as input to the db2move IMPORT or LOAD action.

## tabnnn.ixf

The exported PC/IXF file of a specific table.

#### tabnnn.msg

The export message file of the corresponding table.

# tabnnnc.yyy

The exported LOB files of a specific table.

"nnn" is the table number. "c" is a letter of the alphabet. "yyy" is a number ranging from 001 to 999.

These files are created only if the table being exported contains LOB data. If created, these LOB files are placed in the "lobpath" directories. There are a total of 26,000 possible names for the LOB files.

#### system.msg

The message file containing system messages for creating or deleting file or directory commands. This is only used if the action is EXPORT, and a LOB path is specified.

#### Files Required/Generated When Using IMPORT:

• Input:

#### db2move.lst

An output file from the EXPORT action.

#### tabnnn.ixf

An output file from the EXPORT action.

#### tabnnnc.yyy

An output file from the EXPORT action.

• Output:

#### **IMPORT.out**

The summarized result of the IMPORT action.

#### tabnnn.msg

The import message file of the corresponding table.

#### Files Required/Generated When Using LOAD:

• Input:

#### db2move.lst

An output file from the EXPORT action.

#### tabnnn.ixf

An output file from the EXPORT action.

#### tabnnnc.yyy

An output file from the EXPORT action.

• Output:

# LOAD.out

The summarized result of the LOAD action.

## tabnnn.msg

The LOAD message file of the corresponding table.

## Files Required/Generated When Using COPY:

- Input: None
- Output:

#### **COPYSCHEMA.msg**

An output file containing messages generated during the COPY operation.

#### **COPYSCHEMA.err**

An output file containing an error message for each error encountered during the COPY operation, including DDL statements for each object which could not be recreated on the target database.

#### LOADTABLE.msg

An output file containing messages generated by each invocation of the Load utility (used to repopulate data on the target database).

#### LOADTABLE.err

An output file containing the names of tables that either encountered a failure during Load or still need to be populated on the target database. See the "Restarting a failed copy schema operation" topic for more details.

These files are timestamped and all files that are generated from one run will have the same timestamp.

# db2mqlsn - MQ listener

Invokes the asynchronous MQListener to monitor a set of WebSphere MQ message queues, passing messages that arrive on them to configured DB2 stored procedures. It can also perform associated administrative and configuration tasks. MQListener configuration information is stored in a DB2 database and consists of a set of named configurations, including a default. Each configuration is composed of a set of tasks. MQListener tasks are defined by the message queue from which to retrieve messages and the stored procedure to which they will be passed. The message queue description must include the name of the message queue and its queue manager, if it is not the default. Information about the stored procedure must include the database in which it is defined, a user name and password with which to access the database, and the procedure name and schema.

On Linux and UNIX operating systems, this utility is located in the DB2DIR/instance directory, where DB2DIR is the location where the current version of the DB2 database product is installed.

On Windows operating systems, this utility is located in the DB2PATH\sqllib\bin directory, where DB2PATH is the location where the current version of the DB2 database product is installed.

For more information about controlling access to WebSphere MQ objects, refer to the *WebSphere MQ System Administration Guide* (SC34-6068-00).

# Authorization

- All options except db2mqlsn admin access the MQListener configuration in the configDB database. The connection is made as configUser or, if no user is specified, an implicit connection is attempted. The user in whose name the connection is made must have EXECUTE privilege on package mqlConfi.
- To access MQ objects with the db2mqlsn run and db2mqlsn admin options, the user who executes the program must be able to open the appropriate MQ objects.
- To execute the db2mqlsn run option successfully, the dbUser specified in the db2mqlsn add option that created the task must have EXECUTE privilege on the specified stored procedure, and must have EXECUTE privilege on the package mqlRun in the dbName database.

# **Command syntax**

#### configuration:

----configDB---configuration database name------

# db2mqlsn - MQ listener

<b></b>	
co	nfigUser— <i>user ID</i> —-configPwd— <i>password</i> —
►	nfig—configuration name—
run pa	rameters:

run

-adminQueue *admin queue name* -adminQMgr *admin queue manager* This is the queue on which the MQListener listens for administration commands. If you do not specify a queue manager, then the utility uses the configured default queue manager. If you do not specify an adminQueue, then the application does not receive any administration commands (such as shutdown or restart) through the message queue.

#### add

- -inputQueue input queue name -queueManager queue manager name This is the queue on which the MQListener listens for messages for this task. If you do not specify a queue manager, the utility uses the default queue manager configured in WebSphere MQ.
- -procSchema stored procedure schema -procName stored procedure name The stored procedure to which MQListener passes the message when it arrives.

#### -dbName stored procedure database

MQListener passes the message to a stored procedure. This is the database in which the stored procedure is defined.

#### -dbUser user ID -dbPwd password

The user on whose behalf the stored procedure is invoked.

#### -mqCoordinated

This indicates that reading and writing to the WebSphere MQ message queue should be integrated into a transaction together with the DB2 stored procedure call. The entire transaction is coordinated by the WebSphere MQ coordinator. (The queue manager must also be configured to coordinate a transaction in this way. See the WebSphere MQ documentation for more information.) By default, the message queue operations are not part of the transaction in which the stored procedure is invoked.

#### -numInstances number of instances to run

The number of duplicate instances of this task to run in this configuration. If you do not specify a value, then only one instance is run.

#### remove

-inputQueue input queue name -queueManager queue manager name This is the queue and queue manager that define the task that will be removed from the configuration. The combination of input queue and queue manager is unique within a configuration.

# admin

# -adminQueue admin queue name -adminQueueList namelist of admin queue names -adminQMgr admin queue manager

The queue or namelist of queue names on which to send the admin command. If you do not specify a queue manager, the utility uses the default queue manager that is configured in WebSphere MQ.

## -adminCommand admin command

Submits a command. The command can be either shutdown or restart. shutdown causes a running MQListener to exit when the listener finishes processing the current message. restart performs a shutdown, and then reads the configuration again and restarts.

# **Examples**

db2mqlsn show -configDB sampleDB -config nightlies
db2mqlsn add -configDB sampleDB -config nightlies -inputQueue app3
-procSchema imauser -procName proc3 -dbName aDB -dbUser imauser -dbPwd aSecret
db2mqlsn run -configDB -config nightlies

# db2mscs - Set up Windows failover utility

Creates the infrastructure for DB2 failover support on Windows using Microsoft Cluster Server (MSCS). This utility can be used to enable failover in both single-partition and partitioned database environments.

# Authorization

The user must be logged on to a domain user account that belongs to the Administrators group of each machine in the MSCS cluster.

## Command syntax

```
►►-db2mscs-
```

-f:—input\_file— -u:—instance name—

# **Command parameters**

-f:input\_file

Specifies the input file to be used by the MSCS utility. If this parameter is specified, db2mscs utility will use filename as the input file, if this parameter is not specified, the db2mscs utility will try to use the DB2MSCS.CFG file that is in the current directory.

#### -u:instance\_name

This option allows you to undo the db2mscs operation and revert the instance back to the non-MSCS instance specified by *instance\_name*.

# Usage notes

The db2mscs utility is a standalone command line utility used to transform a non-MSCS instance into an MSCS instance. The utility will create all MSCS groups, resources, and resource dependencies. It will also copy all DB2 information stored in the Windows registry to the cluster portion of the registry as well as moving the instance directory to a shared cluster disk. The db2mscs utility takes as input a configuration file provided by the user specifying how the cluster should be set up. The DB2MSCS.CFG file is an ASCII text file that contains parameters that are read by the db2mscs utility. You specify each input parameter on a separate line using the following format: PARAMETER KEYWORD=parameter value. For example:

```
CLUSTER_NAME=FINANCE
GROUP_NAME=DB2 Group
IP ADDRESS=9.21.22.89
```

Two example configuration files can be found in the CFG subdirectory under the DB2 install directory. The first, DB2MSCS.EE, is an example for single-partition database environments. The second, DB2MSCS.EEE, is an example for partitioned database environments.

Ensure the Control Center is not active before issuing the db2mscs command. If the Control Center is active, the db2mscs utility will exit in error.

The parameters for the DB2MSCS.CFG file are as follows:

#### DB2\_INSTANCE

The name of the DB2 instance. This parameter has a global scope and

should be specified only once in the DB2MSCS.CFG file. It is required that DB2\_INSTANCE must be stopped before running db2mscs.

## DAS\_INSTANCE

The name of the DB2 Admin Server instance. Specify this parameter to migrate the DB2 Admin Server to run in the MSCS environment. This parameter has a global scope and should be specified only once in the DB2MSCS.CFG file.

# CLUSTER\_NAME

The name of the MSCS cluster. All the resources specified following this line are created in this cluster until another CLUSTER\_NAME parameter is specified.

#### DB2\_LOGON\_USERNAME

The user name of the domain account for the DB2 service (specified as *domain\user*). This parameter has a global scope and should be specified only once in the DB2MSCS.CFG file.

#### DB2\_LOGON\_PASSWORD

The password of the domain account for the DB2 service. This parameter has a global scope and should be specified only once in the DB2MSCS.CFG file.

# GROUP\_NAME

The name of the MSCS group. If this parameter is specified, a new MSCS group is created if it does not exist. If the group already exists, it is used as the target group. Any MSCS resource specified after this parameter is created in this group or moved into this group until another GROUP\_NAME parameter is specified. Specify this parameter once for each group. A MSCS group can be created within a MSCS Cluster.

#### DB2\_NODE

The database partition number of the database partition server (or database partition) to be included in the current MSCS group. If multiple logical database partitions exist on the same machine, each database partition requires a separate DB2\_NODE parameter. Specify this parameter after the GROUP\_NAME parameter so that the DB2 resources are created in the correct MSCS group. This parameter is required for a multi-partitioned database environment.

# IP\_NAME

The name of the IP Address resource. The value for the IP\_NAME is arbitrary, but it must be unique in the cluster. When this parameter is specified, an MSCS resource of type IP Address is created. This parameter is required for remote TCP/IP connections. This parameter is optional in a single partition database environment. A recommended name is the hostname that corresponds to the IP address.

# **IP\_ADDRESS**

The TCP/IP address for the IP resource specified by the preceding IP\_NAME parameter. This parameter is required if the IP\_NAME parameter is specified. This is a new IP address that is not used by any machine in the network.

#### **IP\_SUBNET**

The TCP/IP subnet mask for the IP resource specified by the preceding IP\_NAME parameter. This parameter is required if the IP\_NAME parameter is specified.

#### **IP\_NETWORK**

The name of the MSCS network to which the preceding IP Address resource belongs. This parameter is optional. If it is not specified, the first MSCS network detected by the system is used. The name of the MSCS network must be entered exactly as seen under the Networks branch in Cluster Administrator. The previous four IP keywords are used to create an IP Address resource.

#### NETNAME\_NAME

The name of the Network Name resource. Specify this parameter to create the Network Name resource. This parameter is optional for single partition database environment. You must specify this parameter for the instance owning machine, on which DB2 instance directory resides, in a partitioned database environment.

## NETNAME\_VALUE

The value for the Network Name resource. This parameter must be specified if the NETNAME\_NAME parameter is specified.

#### NETNAME\_DEPENDENCY

The name for the IP resource that the Network Name resource depends on. Each Network Name resource must have a dependency on an IP Address resource. This parameter is optional. If it is not specified, the Network Name resource has a dependency on the first IP resource in the group.

#### SERVICE\_DISPLAY\_NAME

The display name of the Generic Service resource. Specify this parameter if you want to create a Generic Service resource.

#### SERVICE\_NAME

The service name of the Generic Service resource. This parameter must be specified if the SERVICE\_DISPLAY\_NAME parameter is specified.

# SERVICE\_STARTUP

Optional startup parameter for the Generic Resource service.

# DISK\_NAME

The name of the physical disk resource to be moved to the current group. Specify as many disk resources as you need. The disk resources must already exist. When the db2mscs utility configures the DB2 instance for failover support, the instance directory is copied to the first MSCS disk in the group. To specify a different MSCS disk for the instance directory, use the INSTPROF\_DISK parameter. The disk name used should be entered exactly as seen in Cluster Administrator.

# INSTPROF\_DISK

An optional parameter to specify an MSCS disk to contain the DB2 instance directory. If this parameter is not specified the db2mscs utility uses the first disk that belongs to the same group.

# INSTPROF\_PATH

An optional parameter to specify the exact path where the instance directory will be copied. This parameter *must* be specified when using IPSHAdisks, a ServerRAID Netfinity<sup>®</sup> disk resource (for example, INSTPROF\_PATH=p:\db2profs). INSTPROF\_PATH will take precedence over INSTPROF\_DISK if both are specified.

# TARGET\_DRVMAP\_DISK

An optional parameter to specify the target MSCS disk for database drive mapping for a the multi-partitioned database environment. This parameter will specify the disk the database will be created on by mapping it from the drive the create database command specifies. If this parameter is not specified, the database drive mapping must be manually registered using the db2drvmp utility.

# DB2\_FALLBACK

An optional parameter to control whether or not the applications should be forced off when the DB2 resource is brought offline. If not specified, then the setting for DB2\_FALLBACK will be YES. If you do not want the applications to be forced off, then set DB2\_FALLBACK to NO.

# db2mtrk - Memory tracker

Provides complete report of memory status, for instances, databases, agents, and applications. This command outputs the following memory pool allocation information:

- Current size
- Maximum size (hard limit)
- Largest size (high water mark)
- Type (identifier indicating function for which memory will be used)
- Agent who allocated pool (only if the pool is private)
- Application

The same information is also available from the Snapshot monitor.

# Scope

In a partitioned database environment, this command can be invoked from any database partition defined in the db2nodes.cfg file. Apart from when instance level information is returned, the command returns information only for that database partition. This command does not return information for remote servers.

# Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

# **Required Connection**

Instance. The application creates a default instance attachment if one is not present.

# **Command Syntax**

# **Command Parameters**

- -i Show instance level memory.
- -d Show database level memory.
- -a Show application memory usage.
- -p Deprecated. Show private memory.

Replaced with -a parameter to show application memory usage.

- -m Show maximum values for each pool.
- -w Show high watermark values for each pool.
- -r Repeat mode

```
interval
```

Number of seconds to wait between subsequent calls to the memory tracker (in repeat mode).

- *count* Number of times to repeat.
- -v Verbose output.
- -h Show help screen. If you specify -h, only the help screen appears. No other information is displayed.

# Examples

The following call returns database and instance normal values and repeats every 10 seconds:

db2mtrk -i -d -v -r 10

Consider the following output samples:

The command db2mtrk -i -d displays the following output: Tracking Memory on: 2006/01/17 at 15:24:38

Memory for instance

monh other 576.0K 8.0M

Total: 1441792 bytes

# Usage notes

#### Note:

- 1. When no flags are specified, usage is returned.
- 2. One of the -d, -h, -i, -p or -a flag must be specified.
- **3**. When the -p parameter is specified, detailed private memory usage information is returned, grouped by agent ID.
- 4. When the -a parameter is specified, detailed application memory usage information is returned, grouped by application ID.
- 5. The "Other Memory" reported is the memory associated with the overhead of operating the database management system.
- 6. In some cases (such as the package cache) the current size displayed will be larger than the maximum (configured) value. In such cases, the value assigned to the configuration parameter is used as a 'soft limit', and the pool's actual memory usage might grow beyond the configured size.
- 7. For the buffer pool heaps, the number specified in the parentheses is either the buffer pool ID, or indicates that this buffer pool is one of the system buffer pools.
- 8. For application heaps, the number specified in parentheses is the application ID.
- **9**. The maximum size that the memory tracker reports for some heaps is the amount of physical memory on the machine. These heaps are called unbounded heaps and are declared with an unlimited maximum size because when the heaps are declared, it is not clear how much memory they will require at peak times. Although these heaps are not strictly bounded by the physical memory on the machine, they are reported as the maximum size because it is a reasonable approximation.
- **10**. The bufferpool heaps are always fully allocated so the memory tracker will report the same values for the current and maximum sizes of these heaps. If a bufferpool size is set to automatic then the current and maximum size of the bufferpool heap will be adjusted over time based on workload and available memory.

# db2nchg - Change database partition server configuration

Modifies database partition server configuration. This includes moving the database partition server (node) from one machine to another; changing the TCP/IP host name of the machine; and selecting a different logical port number or a different network name for the database partition server (node). This command can only be used if the database partition server is stopped.

This command is available on Windows operating systems only.

# Authorization

Local Administrator

# **Command syntax**

► db2nchg—/n:—dbpartitionnum/i:—instance_name_							
▶	_/u:—username,password/p:—logical_port/h:—host_name	•					
▶	└/m:—machine name_└/g:—network name_└	-					

# **Command parameters**

## /n:dbpartitionnum

Specifies the database partition number of the database partition server's configuration that is to be changed.

# /i:instance\_name

Specifies the instance in which this database partition server participates. If a parameter is not specified, the default is the current instance.

#### lu:username,password

Specifies the user name and password. If a parameter is not specified, the existing user name and password will apply.

# /p:logical\_port

Specifies the logical port for the database partition server. This parameter must be specified to move the database partition server to a different machine. If a parameter is not specified, the logical port number will remain unchanged.

#### /h:host\_name

Specifies TCP/IP host name used by FCM for internal communications. If this parameter is not specified, the host name will remain the same.

# /m:machine\_name

Specifies the machine where the database partition server will reside. The database partition server can only be moved if there are no existing databases in the instance.

# **/g:**network\_name

Changes the network name for the database partition server. This parameter can be used to apply a specific IP address to the database

# db2nchg - Change database partition server configuration

partition server when there are multiple IP addresses on a machine. The network name or the IP address can be entered.

# **Examples**

To change the logical port assigned to database partition 2, which participates in the instance TESTMPP, to logical port 3, enter the following command:

db2nchg /n:2 /i:TESTMPP /p:3

# db2ncrt - Add database partition server to an instance

Adds a database partition server (node) to an instance.

This command is available on Windows operating systems only.

# Scope

If a database partition server is added to a computer where an instance already exists, a database partition server is added as a logical database partition server to the computer. If a database partition server is added to a computer where an instance does not exist, the instance is added and the computer becomes a new physical database partition server. This command should not be used if there are databases in an instance. Instead, the START DATABASE MANAGER command should be issued with the ADD DBPARTITIONNUM option. This ensures that the database is correctly added to the new database partition server. It is also possible to add a database partition server to an instance in which a database has been created. The db2nodes.cfg file should not be edited since changing the file might cause inconsistencies in the partitioned database environment.

# Authorization

Local Administrator authority on the computer where the new database partition server is added.

# **Command syntax**

# **Command parameters**

#### *In:dbpartitionnum*

A unique database partition number which identifies the database partition server. The number entered can range from 1 to 999.

#### *lu:username,password*

Specifies the logon account name and password for DB2.

#### *li:instance\_name*

Specifies the instance name. If a parameter is not specified, the default is the current instance.

#### /m:machine\_name

Specifies the computer name of the Windows workstation on which the database partition server resides. This parameter is required if a database partition server is added on a remote computer.

#### /p:logical\_port

Specifies the logical port number used for the database partition server. If this parameter is not specified, the logical port number assigned will be 0.

When creating a logical database partition server, this parameter must be specified and a logical port number that is not in use must be selected. Note the following restrictions:

- Every computer must have a database partition server that has a logical port 0.
- The port number cannot exceed the port range reserved for FCM communications in the x:\winnt\system32\drivers\etc\ directory. For example, if a range of 4 ports is reserved for the current instance, then the maximum port number is 3. Port 0 is used for the default logical database partition server.

#### /h:host\_name

Specifies the TCP/IP host name that is used by FCM for internal communications. This parameter is required when the database partition server is being added on a remote computer.

# /g:network\_name

Specifies the network name for the database partition server. If a parameter is not specified, the first IP address detected on the system will be used. This parameter can be used to apply a specific IP address to the database partition server when there are multiple IP addresses on a computer. The network name or the IP address can be entered.

# *lo:instance\_owning\_machine*

Specifies the computer name of the instance-owning computer. The default is the local computer. This parameter is required when the db2ncrt command is invoked on any computer that is not the instance-owning computer.

# **Examples**

To add a new database partition server to the instance TESTMPP on the instance-owning computer SHAYER, where the new database partition server is known as database partition 2 and uses logical port 1, enter the following command:

```
db2ncrt /n:2 /u:QBPAULZ\paulz,g1reeky /i:TESTMPP /m:TEST /p:1 /o:SHAYER /h:TEST
```

# db2ndrop - Drop database partition server from an instance

Drops a database partition server (node) from an instance that has no databases. If a database partition server is dropped, its database partition number can be reused for a new database partition server. This command can only be used if the database partition server is stopped.

This command is available on Windows operating systems only.

# Authorization

Local Administrator authority on the machine where the database partition server is being dropped.

# Command syntax

►► db2ndrop /n: *dbpartitionnum*/i: *instance\_name* 

# **Command parameters**

In:dbpartitionnum

A unique database partition number which identifies the database partition server.

/i:instance\_name

Specifies the instance name. If a parameter is not specified, the default is the current instance.

#### Examples

db2ndrop /n:2 /i=KMASCI

#### Usage notes

If the instance-owning database partition server (dbpartitionnum 0) is dropped from the instance, the instance becomes unusable. To drop the instance, use the db2idrop command.

This command should not be used if there are databases in this instance. Instead, the db2stop drop nodenum command should be used. This ensures that the database partition server is correctly removed from the partition database environment. It is also possible to drop a database partition server in an instance where a database exists. The db2nodes.cfg file should not be edited since changing the file might cause inconsistencies in the partitioned database environment.

To drop a database partition server that is assigned to the logical port 0 from a machine that is running multiple logical database partition servers, all other database partition servers assigned to the other logical ports must be dropped first. Each database partition server must have a database partition server assigned to logical port 0.

# db2nrcfg - Non-root install configuration tool

Configuration tool used for non-root installations of DB2.

# Authorization

Non-root ID who owns the non-root installation.

# **Required Connection**

None

# **Command syntax**

# **Command parameters**

-a AuthType

Sets the authentication type (SERVER, CLIENT, or SERVER\_ENCRYPT) for the instance.

- -d Turns debug mode ON.
- -p PortName

Sets the port name or port number to be used by this instance.

-s InstType

Sets the type of instance to be created (wse, ese, or client).

-h | -?

Displays help information.

#### Usage notes

This command is automatically run by DB2 installer during non-root installation.

The db2icrt, db2iupdt, and db2iupgrade commands, that are available for root install, are not be available in non-root install.
# db2rfe - Enable root features for non-root install

Enables the supported root features, in non-root installations of DB2 database systems, according to the configuration file. The DB2 non-root instance needs to be stopped before the db2rfe command is executed.

# Authorization

Root user authority

# **Required Connection**

None

# Command syntax

►→—db2rfe—-f—db2rfe\_config\_file-

# **Command parameters**

**-f** *db2rfe\_config\_file* 

Specifies the configuration file to be used to enable root features.

-**-**h---**-**?--

-h | -?

Displays help information.

# Usage notes

Each root feature, in the configuration file, will be in a separate section. Each section will have a start and end mark, comments describing what the section will enable, and the command to enable the root feature. The sample configuration file db2rfe.cfg will be installed to the *\$DB2DIR*/instance directory.

The sample configuration file will look like the following (the non-root install owner is db2inst3 in this example):

\*\* Set hard/soft data ulimit to unlimited, and hard/soft nofile ulimit to 65536.

\*\*

# db2rfe - Enable root features for non-root install

```
** Note: This is for AIX only. On other platforms, refer to system documentation
** to set it manually.
** -----
** Valid value is NO and YES. Change to YES if you need to set the ulimit.
SET ULIMIT=NO
** -----
** Enable DB2 High Availability (HA) feature
** -
     -----
                               ** Valid value is NO and YES. Change to YES if you need to enable this feature.
ENABLE HA=NO
** ENABLE DB2 Authentication on the server using local operating system security.
** -----
** Valid value is NO and YES. Change to YES if you need to enable this feature.
ENABLE OS AUTHENTICATION=NO
** -----
** Reserve DB2 remote connection service entry

```

```
** Valid value: 1024 - 65535
```

# db2nrupdt - Non-root-installed instance update

Update tool used for instances created by non-root installations of DB2.

# Authorization

Non-root ID who owns the non-root installation.

# **Required Connection**

None

# **Command syntax**

# **Command parameters**

-a AuthType

Sets the authentication type (SERVER, CLIENT, or SERVER\_ENCRYPT) for the instance.

- -d Turns debug mode ON.
- -k

Keeps the current instance type during the update.

-h | -?

Displays help information.

# Usage notes

The

db2icrt, db2iupdt, and db2iupgrade commands, that are used by root install, are not available in non-root install.

# db2nrupgrade - Upgrade non-root instance

This command is only available on Linux and UNIX systems.

The db2nrupgrade command upgrades a non-root instance from a previous version of the DB2 database system to the current version of the DB2 copy from where you are running the db2nrupgrade command.

This command is located in the DB2DIR/instance directory, where DB2DIR represents the installation location where the new release of the DB2 database system is installed. This command does not support instance upgrade for a root installation.

# Authorization

Non-root ID who owns the non-root installation copy.

# **Command syntax**

# **Command parameters**

# For Linux and UNIX systems

- -d Turns debug mode on. Use this option only when instructed by DB2 Support.
- -a AuthType

Specifies the authentication type (SERVER, CLIENT or SERVER\_ENCRYPT) for the instance. The default is SERVER.

-b backup\_dir

This parameter is mandatory. Specifies the directory where the configuration files from the old DB2 version are stored.

# Usage notes

• This command is run automatically during the copy upgrade. You do not need to manually run this command unless the copy upgrade failed.

# db2osconf - Utility for kernel parameter values

Makes recommendations for kernel parameter values based on the size of a system. The recommended values are high enough for a given system that they can accommodate most reasonable workloads. This command is currently available only for DB2 databases on the Solaris operating system and for 64-bit DB2 instances on HP-UX.

# Authorization

- On DB2 database for HP-UX, no authorization is required. To make the changes recommended by the db2osconf utility, you must have root user authority.
- On DB2 database for Solaris operating systems, you must have root user authority or be a member of the sys group.

# **Command syntax**

To get the list of currently supported options, enter db2osconf -h:

```
db2osconf -h
Usage:
- C
                   # Client only
-f
                   # Compare to current
-h
                  # Help screen
-1
                  # List current
                  # Specify memory in GB
-m <mem in GB>
-n <num CPUs>
                  # Specify number of CPUs
-p <perf level> # Msg Q performance level (0-3)
-s <scale factor> # Scale factor (1-3)
-t <threads>
                   # Number of threads
```

# **Command parameters**

- -c The -c switch is for client only installations. This option is available only for DB2 database systems on Solaris operating systems.
- -f Used to compare the current kernel parameters with the values that would be recommended by the db2osconf utility. The -f option is the default if no other options are entered with the db2osconf command. On Solaris operating systems, only the kernel parameters that differ will be displayed. Since the current kernel parameters are taken directly from the live kernel, they might not match those in /etc/system, the Solaris system specification file. If the kernel parameters from the live kernel are different than those listed in the /etc/system, the /etc/system file might have been changed without a reboot or there might be a syntax error in the file. On HP-UX, the -f option returns a list of recommended parameters and a list of recommended changes to parameter values:

\*\*\*\*\*\* Please Change the Following in the Given Order \*\*\*\*\*\*

WARNING [<parameter name>] should be set to <value>

- -1 Lists the current kernel parameters.
- -m Overrides the amount of physical memory in GB. Normally, the db2osconf utility determines the amount of physical memory automatically. This option is available only for DB2 database systems on Solaris operating systems.
- -n Overrides the number of CPUs on the system. Normally, the db2osconf utility determines the number of CPUs automatically. This option is available only for DB2 database systems on Solaris operating systems.

- -p Sets the performance level for SYSV message queues. 0 (zero) is the default and 3 is the highest setting. Setting this value higher can increase the performance of the message queue facility at the expense of using more memory.
- -s Sets the scale factor. The default scale factor is 1 and should be sufficient for almost any workload. If a scale factor of 1 is not enough, the system might be too small to handle the workload. The scale factor sets the kernel parameters recommendations to that of a system proportionally larger then the size of the current system. For example, a scale factor of 2.5 would recommend kernel parameters for a system that is 2.5 times the size of the current system.
- -t Provides recommendations for semsys:seminfo\_semume and shmsys:shminfo\_shmseg kernel parameter values. This option is available only for DB2 database systems on Solaris operating systems. For multithreaded programs with a fair number of connections, these kernel parameters might have to be set beyond their default values. They only need to be reset if the multithreaded program requiring them is a local application:

# semsys:seminfo\_semume

Limit of semaphore undo structures that can be used by any one process

# shmsys:shminfo\_shmseg

Limit on the number of shared memory segments that any one process can create.

These parameters are set in the /etc/system file. The following is a guide to set the values, and is what the db2osconf utility uses to recommend them. For each local connection DB2 will use one semaphore and one shared memory segment to communicate. If the multithreaded application is a local application and has *X* number of connections to DB2 databases, then that application (process) will need *X* number of shared memory segments and *X* number of the semaphore undo structures to communicate with the DB2 database system. So the value of the two kernel parameters should be set to X + 10 (the plus 10 provides a safety margin).

Without the -l or -f switches, the db2osconf utility displays the kernel parameters using the syntax of the /etc/system file. To prevent human errors, the output can be cut and pasted directly into the /etc/system file.

The kernel parameters are recommended based on both the number of CPUs and the amount of physical memory on the system. If one is disproportionately low, the recommendations will be based on the lower of the two.

# Example

Here is a sample output produced by running the db2osconf utility with the **-t** switch set for 500 threads. The results received are machine-specific, so the results you receive will vary depending on your environment.

```
db2osconf -t 500
```

```
set msgsys:msginfo_msgmax = 65535
set msgsys:msginfo_msgmnb = 65535
set msgsys:msginfo_msgssz = 32
set msgsys:msginfo_msgseg = 32767
set msgsys:msginfo_msgmap = 2562
```

```
set msgsys:msginfo_msgmni = 2560
set msgsys:msginfo_msgtql = 2560
set semsys:seminfo_semmap = 3074
set semsys:seminfo_semmni = 3072
set semsys:seminfo_semmnu = 3072
set semsys:seminfo_semmnu = 3072
set semsys:seminfo_semume = 600
set shmsys:shminfo_shmmax = 2134020096
set shmsys:shminfo_shmmni = 3072
set shmsys:shminfo_shmseg = 600
Total kernel space for IPC:
0.35MB (shm) + 1.77MB (sem) + 1.34MB (msg) == 3.46MB (total)
```

The recommended values for set semsys:seminfo\_semume and set shmsys:shminfo\_shmseg were the additional values provided by running db2osconf -t 500.

# **Usage notes**

Even though it is possible to recommend kernel parameters based on a particular DB2 database workload, this level of accuracy is not beneficial. If the kernel parameter values are too close to what are actually needed and the workload changes in the future, the DB2 database manager might encounter a problem due to a lack of interprocess communication (IPC) resources. A lack of IPC resources can lead to an unplanned outage for the DB2 database manager and a reboot would be necessary in order to increase kernel parameters. By setting the kernel parameters reasonably high, it should reduce or eliminate the need to change them in the future. The amount of memory consumed by the kernel parameter recommendations is almost trivial compared to the size of the system. For example, for a system with 4 GB of RAM and 4 CPUs, the amount of memory for the recommended kernel parameters is 4.67 MB or 0.11%. This small fraction of memory used for the kernel parameters should be acceptable given the benefits.

On Solaris operating systems, there are two versions of the db2osconf utility: one for 64-bit kernels and one for 32-bit kernels. The utility needs to be run as root or with the group sys since it accesses the following special devices (accesses are read-only):

crw-r	1 root	sys	13,	1	Jul	19	18:06	/dev/kmem
crw-rw-rw-	1 root	sys	72,	0	Feb	19	1999	/dev/ksyms
crw-r	1 root	sys	13,	0	Feb	19	1999	/dev/mem

# db2pd - Monitor and troubleshoot DB2 database

Retrieves information from the DB2 database system memory sets.

# Authorization

One of the following authority levels is required:

- The SYSADM authority level.
- The SYSCTRL authority level.
- The SYSMAINT authority level.
- The SYSMON authority level.

When the SYSMON authorization level is granted, the following options are not available:

- dump
- memblocks
- stack

# **Required connection**

There is no minimum connection requirement. However, if a database scope option is specified, that database must be active before the command can return the requested information.

# **Command syntax**

# db2pd - Monitor and troubleshoot DB2 database

# **Command parameters**

# -activestatements

Returns information about the active statement list.

# apphdl=appHandle

If an application handle is specified, information is returned about that particular application.

# file=filename

Sends the -activestatements output to a specified file.

# -addnode

Returns progress information on the add database partition server operation. This parameter only returns information when issued on the database partition server that is being added. The progress information is persistent on the new database partition server until it is restarted. If issued on an existing database partition server, this parameter returns no information.

See Sample output of the db2pd -addnode command.

# -alldatabases | -alldbs

Specifies that the command attaches to all memory sets of all the databases.

# -alldbpartitionnums

Specifies that this command is to run on all active database partition servers in the instance. db2pd will only report information from database partition servers on the same physical machine that db2pd is being run on.

# -agents

Returns information about agents.

If an agent ID is specified, information is returned about the agent. If an application ID is specified, information is returned about all the agents that are performing work for the application. Specify this command parameter with the **-inst** parameter, if you have chosen a database that you want scope output for. See the agents usage notes.

# -apinfo

Displays the detailed information about applications including the execution of dynamic SQL statements of the current unit of work (UOW), if it is applicable.

# AppHandl

If an application handle is specified, information is returned about that particular application. The default is to display information for all applications running at that partition.

# db2pd - Monitor and troubleshoot DB2 database

### MaxStmt

If a number of maximum statements is specified, the information for the most recent of SQL statements, equalling the maximum number specified, is returned. The default is to display information for all the executed SQL statements.

### file=filename

Sends the **-apinfo** output to a specified file.

See Sample output of the db2pd -apinfo command.

**Note:** To capture the past history of a unit of work (UOW) including the SQL statement text for the applications, activate a deadlock event monitor using the statement history clause. For example, use one of the following statements:

create event monitor *testit* for deadlocks with details history write to file *path* global create event monitor *testit* for deadlocks with details history write to table

The CREATE EVENT MONITOR statement has additional options, such as the ability to specify the name of the table space and table into which data will be written. For details, see the CREATE EVENT MONITOR statement description. The event monitor with statement history capability affects all applications and increases the monitor heap usage by the DB2 database manager.

See the **-apinfo** usage notes.

### -applications

Returns information about applications.

If an application ID is specified, information is returned about that application.

If an agent ID is specified, information is returned about the agent that is working on behalf of the application. See the **-applications** usage notes.

### -bufferpools

Returns information about the buffer pools. If a bufferpool ID is specified, information is returned about the bufferpool. See the **-bufferpools** usage notes.

### -catalogcache

Returns information about the catalog cache, which maintains an in-memory version of statistics. For example,

db2pd -catalogcache -db sample

See Sample output of the db2pd -catalogcache command.

Definitions for the returned information can be found here: **-catalogcache**. The output for SYSTABLES can have multiple entries for the same table (see DEPT in the above output). Multiple entries correspond to a different version of the statistics for the same table. The usage lock name will be unique among the entries for the same object and soft invalid entries will be marked with an 'S'. See the **-catalogcache** usage notes.

# -command filename

Specifies to read and execute the db2pd command options that are specified in the file.

# db2pd - Monitor and troubleshoot DB2 database

-database | -db | -d databasename

Specifies that the command attaches to the database memory sets of the specified database. Specify the database name, not the alias name.

-dbcfg Returns the settings of the database configuration parameters. See the -dbcfg usage notes.

#### -dbmcfg

Returns the settings of the database manager configuration parameters.

Specify this option with the **-inst** command parameter, if you have chosen a database for which you want scope output. See the **-dbmcfg** usage notes.

#### -dbpartitionnum number

Specifies that the command is to run on the specified database partition server.

#### -dbptnmem

Lists database partition memory statistics.

#### -dmpftbl

Dumps file table contents.

#### -dump

Produces stack trace and binary dump files in the **diagpath** directory. Only available on UNIX operating systems.

- Specify with the **all** command parameter to produce stack trace files and binary dump files for all agents in the current database partition.
- Specify with the **all** parameter and an **apphdl**=*appHandle* parameter to return all EDUs associated with the specified *appHandle* application.
- Specify with an EDU ID of *eduid* and an **apphdl**=*appHandle* parameter to return information about the specified EDU if it is associated the *appHandle* application.
- Specify with an apphdl=appHandle parameter to return just the EDU of the coordinator agent for the appHandle application.
- Specify with the *pid* option to produce a stack trace file and binary dump file for a specific agent.

#### -dynamic

Returns information about the execution of dynamic SQL. See the **-dynamic** usage notes.

### anch=anchID

If an anchor identifier is specified, information is returned about that particular dynamic SQL.

### file=filename

Sends the -dynamic output to a specified file.

-edus Lists all EDUs in the instance. In the case of a sustained trap, specifying this option outputs the EDU Name indicating that the EDU is suspended.

### interval=interval

Only available on UNIX operating systems. If an interval is specified, two snapshots of the EDUs are taken, *interval* seconds apart. Two new columns are then included in the list of EDUs: USR DELTA which displays the delta of CPU user time across the *interval*, and SYS DELTA which displays the delta of CPU system time across the *interval*. If an EDU is added part way through the *interval* it is included in the list, with the delta calculated from when it was added. If an EDU is deleted part way through the *interval* it is not included in the list at all.

See Sample output of the db2pd -edus command.

# -everything

Runs all options for all databases on all database partition servers that are local to the server.

- -fcm Returns information about the fast communication manager.
  - Specify this parameter with the **-inst** parameter, if you have chosen a database for which you want scope output.
  - Specify this parameter with the **hwm** parameter, to retrieve high-watermark consumptions of FCM buffers and channels by applications since the start of the DB2 instance. The high-watermark consumption values of applications are retained even if they have disconnected from the database already.
  - Specify this parameter with the *numApps* option, to limit the maximum number of applications that the db2pd command reports in the current and HWM consumption statistics.

See the **-fcm** usage notes.

### -file filename

Specifies to write the output to the specified file.

-fmp Returns information about the process in which the fenced routines are executed. See the -fmp usage notes.

### -fixstack

Reads an existing stack file and generates a new file in the same location, with the same file name, but with an additional .fmt file extension. The new .fmt file generated will have improved symbol details on some of the frames in the stack trace if the library where the symbol is defined is available when running this command.

Note: Only applicable on Linux operating systems.

### -fmpexechistory | -fmpe

Displays the fenced routine history that attempted to be loaded and executed. Note that this parameter is available starting in Fix Pack 1.

pid=pid

Displays detailed thread information about a specific fenced process ID. If none is specified, detailed information for all processes is displayed. For thread-safe FMP processes, there will be one execution history list per thread, and threads are presented in three groups: Active, Pooled, Forced. For non thread-safe FMP processes, only one execution history list per process is displayed.

- **tid**=*tid* Displays historical details for a thread-safe routine using a specific thread ID. For non thread-safe routine, the thread ID value will be 1.
- **n**=*n* Use this option to specify the number of routine execution history that is to be displayed for each FMP process. The maximum value is 128. If not specified, only the last routine history is returned by default.

# genquery

Generates a select query that will return the routine schema, module, name and specific name according to the routine unique ID. See the **-fmpexechistory** | **-fmpe** usage notes.

- -full Specifies that all output is expanded to its maximum length. If not specified, output is truncated to save space on the display.
- **-fvp** Displays fenced vendor process information and allows the termination of a fenced vendor process in situations where it is not responding. This applies to backup, restore, prune history, load, load copy (roll forward) and Log Manager, where a vendor media device is being used.

**Note:** The **-database** *database* command parameter must be used in conjunction with this parameter in order to connect to the right memory set to gather the information.

agent eduid

Displays the fenced vendor process information for a DB2 EDU ID of a backup, restore, prune history, load or load copy (roll forward) agent.

- LAM1 Displays fenced vendor process information for logarchmeth1.
- LAM2 Displays fenced vendor process information for logarchmeth2.
- LAM3 Displays fenced vendor process information for the special case where the current log archive method configuration parameter is not set to VENDOR, and so a fenced vendor process needs to be created temporarily, during ROLLFORWARD DATABASE, to retrieve logs from a previous vendor archiving method.
- **term** On top of displaying fenced vendor process information, this option also terminates the fenced vendor process specified.

Note: This has no affect on Windows operating systems.

# -global

Specifies that db2pd will also be run on remote hosts. If the **-file** parameter is specified, a single file consisting of all the individual files from remote host will be created on the computer from where you issued the db2pd command.

**Note:** This command parameter is available in DB2 Version 9.7 Fix Pack 2 and later fix packs.

-dbp database partition number Specifies that db2pd will be run on the ren

Specifies that db2pd will be run on the remote host of the specified database partition. If no database partition is specified with the **-global** option, db2pd will run on all remote hosts.

- -gfw Returns a list of event monitors that are currently active or were deactivated for some reason. It also returns statistics and information about the targets into which event monitors write data for each fast writer independent coordinator.
- -ha Reports high availability statistics.
- -hadr Reports high availability disaster recovery (HADR) information. Descriptions of each reported element can be found in the high availability disaster recovery section of the *Database Monitoring Guide and Reference*.
- -h | -help

Displays the online help information.

-inst Returns all instance-scope information.

#### -interactive

Specifies to override the values specified for the **DB2PDOPT** environment variable when running the db2pd command.

### -latches

Reports all latch holders and all latch waiters.

**group** Just prints the list of holders followed by the list of waiters.

### file=filename

Sends -latches output to *filename*.

-locks Returns information about the locks.

Specify a transaction handle to obtain information about the locks that are held by a specific transaction.

Specify with the **showlocks** command parameter to return detailed information about lock names. For row and block locks on partitioned tables and individual data partitions, **showlocks** displays the data partition identifier as part of the row with the lock information.

Specify the **wait** command parameter to return locks in a wait state and the owners of those locks.

See the **-locks** usage notes.

-logs Returns information about the log files. See the -logs usage notes.

#### -memblocks

Returns information about the memory pools.

**dbms** Only report blocks in the dbms memory set.

- **fcm** Only report blocks in the fast communication manager memory set.
- **fmp** Only report blocks in the fenced mode procedure memory set.

#### appctl id

Only report blocks in the application control set.

- all Report blocks from all memory sets.
- **top** Report the top memory consumers for each set.

**blocks** Report the memory blocks for each set.

**sort** Report the sorted memory blocks for each pool in each set.

#### PoolID

Report memory blocks from a specific pool.

pid=pid

Report memory blocks from a specific process id (for UNIX operating systems only).

# private

Report memory blocks from the private memory set (for Windows operating systems only).

See the -memblocks usage notes.

## -mempools

Returns information about the memory pools.

Specify this option with the **-inst** option to include all the instance-scope information in the returned information. See the **-mempools** usage notes.

#### -memsets

Returns information about the memory sets.

Specify this command parameter with the **-inst** command parameter to include all the instance-scope information in the returned information. See the **-memsets** usage notes.

#### -osinfo

Returns operating system information. If a disk path is specified, information about the disk will be printed. See the **-osinfo** usage notes.

- -pages Returns information about the buffer pool pages.
  - *bpID* If bufferpool ID is specified, only pages from the specified bufferpool are returned.

### summary

If this option is specified, only the summary information section will be displayed.

See the **-pages** usage notes. See also Sample output of the db2pd -pages command.

# -q | -quit | q | quit

Quit. When the db2pd keyword alone is issued, db2pd runs in interactive mode. The **quit** command causes an exit from this mode back to the standard command prompt.

#### -recovery

Returns information about recovery activity. See the **-recovery** usage notes.

- **-reopt** Returns information about cached SQL statements that were re-optimized using the **REOPT ONCE** option. See the **-reopt** usage notes.
- -reorgs

Returns information about table and data partition reorganization. When the **index** parameter is added to the command, index reorganization information is returned along with the table and data partition reorganization information.

**Note:** Starting with DB2 Version 9.7 Fix Pack 2, the db2pd -reorgs index command reports the index reorg statistics for partitioned indexes in addition to the index reorg statistics for non-partitioned indexes reported since DB2 V9.7 Fix Pack 1.

See the **-reorgs** usage notes. See also Sample output of the db2pd -reorgs index command.

### -repeat num sec count

Specifies that the command is to be repeated after the specified number of seconds. If a value is not specified for the number of seconds, the command repeats every five seconds. You can also specify the number of times the output will be repeated. If you do not specify a value for *count*, the command is repeated until it is interrupted.

#### -runstats

Returns information about the status of the RUNSTATS utility on table and associated indexes. The status of table statistics collection is displayed first, followed by the status of index statistics collection. Sample output of the -runstats option:

```
db2pd -runstats
```

Table Runstats Information:

Retrieval Time: 08/13/2009 20:38:20 TbspaceID: 2 TableID: 4 Schema: SCHEMA TableName: TABLE Status: Completed Access: Allow write Sampling: No Sampling Rate: -Start Time: 08/13/2009 20:38:16 End Time: 08/13/2009 20:38:17 Total Duration: 00:00:01 Cur Count: 0 Max Count: 0

Index Runstats Information:

Retrieval Time: 08/13/2009 20:38:20 TbspaceID: 2 TableID: 4 Schema: SCHEMA TableName: TABLE Status: Completed Access: Allow write Start Time: 08/13/2009 20:38:17 End Time: 08/13/2009 20:38:18 Total Duration: 00:00:01 Prev Index Duration [1]: 00:00:01 Prev Index Duration [2]: -Prev Index Duration [3]: -Cur Index Start: 08/13/2009 20:38:18 Cur Index: 2 Max Index: 2 Index ID: 2 Cur Count: 0 Max Count: 0

### -scansharing

Returns scan sharing information about all tables that have table or block index scan sharing in the specified database.

**obj**=*objectID* **pool**=*poolID* 

Returns scan sharing information about the specified table.

all Returns scan sharing information for all tables. For each table, table or range scan sharing information is returned. In addition, for MDC tables, block index scan sharing information is returned.

#### index=

# indexID

Returns scan sharing information for the specified table, and block index scan sharing information for the specified block index.

all Returns table scan sharing information for the specified table, and block index scan sharing information for all block indexes.

See Sample output of the db2pd -scansharing command.

See the -scansharing usage notes.

-serviceclasses serviceclassID

Returns information about the service classes for a database. *serviceclassID* is an optional parameter to retrieve information for one specific service class. If *serviceclassID* is not specified, information for all service classes is retrieved.

See the **-serviceclasses** usage notes. See also Sample output of the db2pd -serviceclasses command.

-sort Starting with Fix Pack 5, this option returns information about the

application sort operation. If an application handle ID is specified, information is returned about the sort operation for the specified application.

See the **-sort** usage notes.

- -stack In case of an engine hang, the events stack and event history (event flow) can be used to get information about the DB2 state. Produces event stack and history trace files in the diagpath directory. With the exception of trapping and panicking EDUs, all other EDUs will dump to a stacktrace file pid.tid.node.stack.txt. Use -stack on UNIX operating systems, and -stack all on Windows operating systems.
  - **all** Specify this option to produce stack trace files for all processes in the current database partition.
  - *pid* Specify this option to produce a stack trace file for just the process ID equal to *pid*. Include an optional **apphdl**=*appHandle* to restrict the output further.
  - eduid Limit output to only EDU with a specified ID. Formatted events
    and data attached will be dumped to the relevant
    pid.tid/EDUID.node.trap.txt trap files in the db2dump directory.

Event stack will be output in the following order:

Last event (on the top of event stack)

- Event type and short description
- · Customer impact
- Object identifier
- ECF ID, probe
- Top event header
- Top event qualifiers (if any)
- Top event data (if present)

First event (on the bottom of event stack)

- Event type and short description
- Customer impact
- Object identifier
- ECF ID, probe
- Bottom event header
- Bottom event qualifiers (if any)
- Bottom event data (if present)

In the above, ECF ID is ECF identifier (will be formatted as *product, component, function*) and probe is a line of code or some unique number (for a function).

Event flow (recorded event "history") will be output in the following order:

First event record

- Event type and short description
- Customer impact
- Object identifier
- ECF ID, probe
- Event header

• Object data (if not a string or integer)

Last event record

- Event type and short description
- Customer impact
- · Object identifier
- ECF ID, probe
- Event header
- Object data (if not a string or integer)
- -static Returns information about the execution of static SQL and packages. See the -static usage notes.

### -statisticscache

Returns information about the statistics cache at the database level.

#### summary

Summarizes statistics cache. To dump the statistics cache summary for database sample, issue the following command:

db2pd -db sample -statisticscache summary

**detail** Specify this option to dump detailed statistics information stored in the statistics cache for all tables with the latest statistics collected by real-time statistics gathering. To dump detailed statistics information stored in the statistics cache for all the databases, issue the following command:

db2pd -statisticscache detail -alldbs

### find schema=schema object=object

Specify this option to dump the detailed statistics information for a specific table with schema as schema name and object as table name. To dump detailed statistics information for table USER1.T1 of database sample, issue the following command:

db2pd -db sample -statisticscache find schema=USER1 object=T1

See the **-statisticscache** usage notes.

## -storagepaths

Returns information about the automatic storage paths defined for the database.

See the **-storagepaths** usage notes. See also Sample output of the db2pd -storagepaths command.

#### -sysplex

Returns information about the list of servers associated with the database alias indicated by the **db** parameter. If the **-database** command parameter is not specified, information is returned for all databases.

Specify this command parameter with the **-inst** command parameter, if you have chosen a database for which you want scope output.

See the **-sysplex** usage notes.

#### -tablespaces

Returns information about the table spaces.

Specify with the **group** command parameter to display the information about the containers of a table space grouped with the table space.

# db2pd - Monitor and troubleshoot DB2 database

Specify with the *Tablespace ID* command parameter to display the information about a specific table space and its containers.

See the **-tablespaces** usage notes. See alsoSample output of the db2pd -tablespaces command.

### -tcbstats

Returns information about tables and indexes. The total number of updates on tables, the UDI and real-time statistics UDI counters (RTSUDI), are returned as well.

### **TbspaceID**=*tablespace\_ID*

Specify this option to display the information about a specific table space.

### TableID=table\_ID

Specify this option to display the information about a specific table. The **TbspaceID** option is required when using the **TableID** option.

For temporary table compression, the **-tcbstats** output will include two new columns in the TCB Table Stats section of the output.

- 1. StoredBytes: This corresponds to the "Total stored temp bytes" from the db2pd -temptable output.
- 2. BytesSaved: This corresponds to the "Total bytes saved" value from the db2pd -temptable output.

See the -tcbstats usage notes.

### -temptable

By default, returns the following information about temporary tables:

- Number of Temp Tables The total number of temporary tables created and dropped since the database manager was started or since the last reset of the counters.
- Comp Eligible Temps Temporary tables that the data base manager has determined is eligible for compression based on these three properties: *query type, minimum row size,* and *minimum expected table size.*
- Compressed Temps The total number of temporary tables that were actually compressed. This implies that the table has enough data so that a compression dictionary is created for the temporary table.
- Total Stored Temp Bytes The total number of actual row data for temporary tables that is stored on disk. This can be from both compressed and non-compressed temporary tables.
- Total Bytes Saved The total bytes saved by compressing rows.
- Total Compressed Rows A cumulative count of the number of rows that saved at least one byte using compression.
- Total Temp Table Rows The total number of rows inserted into all the temporary tables, whether they are compressed or not. Not all rows inserted into a compressed temporary table are necessarily compressed.

See the **-temptable** usage notes. See also Sample output of the db2pd -temptable command.

### -thresholds thresholdID

Returns information about thresholds. *thresholdID* is optional, but specifying a threshold ID returns information about a specific threshold. If *thresholdID* is not specified, information for all enabled and disabled thresholds is retrieved.

See the **-thresholds** usage notes. See Sample output of the db2pd -thresholds command.

# -transactions

Returns information about active transactions. If a transaction handle is specified, information is returned about that transaction handle. If an application handle is specified, information is returned about the application handle of the transaction. See the **-transactions** usage notes.

# -utilities

Reports utility information. Descriptions of each reported element can be found in the utilities section of the *Database Monitoring Guide and Reference*.

### -v | -version

Displays the current version and service level of the installed DB2 database product.

## -wlocks

Displays the owner and waiter information for each lock being waited on. In the Sample output of the db2pd -wlocks command, the lock status (Sts) value of G designates the owner of the lock, while a Sts value of W designates the waiter of that lock.

file=filename

Sends the **-wlocks** output to a specified file.

See the **-wlocks** usage notes.

# -workactionsets workactionsetID

Returns information about all enabled work action sets and all enabled work actions in these sets.

group Returns the same information grouped by work action set.

See the **-workactionsets** usage notes.

# -workclasssets workclasssetID

Returns information about all work class sets that are referenced by an enabled work action set and all work classes in the work class sets.

group Returns the same information grouped by work class set.

See the **-workclasssets** usage notes.

# -workloads workloadID

Returns the list of workload definitions, user privilege holders, and local partition workload statistics in memory at the time the command is run.

group Returns the same information grouped by workload.

See Sample output of the db2pd -workloads command.

See the -workloads usage notes.

# **Examples**

Use the db2pd command, from the command line, in the following way to obtain information about agents that are servicing client requests:

db2pd -agents

Use the db2pd command, from the command line, in the following way to obtain information about agents that are servicing client requests. In this case, the

**DB2PDOPT** environment variable is set with the **-agents** parameter before invoking the db2pd command. The command uses the information set in the environment variable when it executes.

export DB2PD0PT="-agents"
db2pd

Use the db2pd command, from the command line, in the following way to obtain information about agents that are servicing client requests. In this case, the **-agents** parameter is set in the file file.out before invoking the db2pd command. The **-command** parameter causes the command to use the information in the file.out file when it executes.

```
echo "-agents" > file.out
db2pd -command file.out
```

Use the db2pd command, from the command line, in the following way to obtain all database and instance-scope information:

db2pd -inst -alldbs

Use the db2pd -fvp command, from the command line, in the following way to obtain fenced vendor process state information:

### For Log Manager:

 A database named SAMPLE has logarchmeth1 set to TSM. At any time issue: db2pd -db sample -fvp lam1

The resulting output is as follows:

Fenced Vendor Process State Information:

-----

Log Manager:

LOGARCHMETH1 available.

Vendor EDU is available and running. startTime: 1155581841 20060814145721 function: sqluvint

This tells you that the fenced vendor process is running in the vendor function sqluvint since August 14, 2006 14:57. Now, if you feel that this has been running too long, or you have determined that this process has hung waiting for TSM resources, you can terminate the fenced vendor process by issuing:

db2pd -db sample -fvp lam1 term

The resulting output is as follows:

Fenced Vendor Process State Information:

Log Manager:

LOGARCHMETH1 available.

```
Vendor EDU is available and running.
startTime: 1155581841 20060814145721
function: sqluvint
```

This fenced vendor process has been sent a signal to terminate.

This shows you the same information as above, but also lets you know that the terminate request has been sent. After waiting a few moments, you should notice that the request has taken affect.

• If the fenced vendor process is running, but not running in vendor code, you will see this for a regular display request:

```
Fenced Vendor Process State Information:

Log Manager:

LOGARCHMETH1 available.

Vendor EDU is available and running.
```

No vendor code being run.

# For Backup:

**Note:** It should be noted that the FORCE APPLICATION command can be used as an alternative to what is described below.

• A database named SAMPLE is being backed up to TSM using 2 sessions. You need to find out the backup agent EDU ID, which can be found through db2pd -edus or the DB2 diagnostics log. Once found, one can issue:

db2pd -db sample -fvp 149

The resulting output is as follows:

```
_____
Fenced Vendor Process State Information:
_____
Backup:
_____
Media Controller(s):
_____
 EDU ID: 504
mediaSession: 1
mediaSeqNum: 0
Vendor EDU is available and running.
 startTime: 1155583315 20060814152155
 function: sqluvint
 EDU ID: 505
mediaSession: 2
mediaSeqNum: 0
Vendor EDU is available and running.
No vendor code being run.
This says that DB2 Media Controller 0 (EDU ID: 504) is in vendor code, while
```

DB2 Media Controller 1 (EDU ID: 505) has a fenced vendor process, but is not running vendor code. Now, if you feel that this has been running too long, or you have determined that this process has hung waiting for TSM resources, you can terminate the fenced vendor process by issuing:

db2pd -db sample -fvp 149 term

The resulting output is as follows:

-----

Fenced Vendor Process State Information:

startTime: 1155583315 20060814152155
function: sqluvint
This fenced vendor process has been sent a signal to terminate.
EDU ID: 505
mediaSession: 2
mediaSeqNum: 0
Vendor EDU is available and running.
No vendor code being run.
This fenced vendor process has been sent a signal to terminate.

This tells you the same information as above, but notes that both fenced vendor processes have been sent terminate requests and will be terminated shortly.

# Usage notes

The following sections describe the output produced by the different db2pd parameters.

- -agents
- -apinfo
- -applications
- -bufferpools
- -catalogcache
- -dbcfg
- -dbmcfg
- -dynamic
- -fcm
- -fmp
- -fmpexechistory | -fmpe
- -locks
- -logs
- -memblocks
- -mempools
- -memsets
- -osinfo
- -pages
- -recovery
- -reopt
- -reorgs
- -scansharing
- -serviceclasses
- -sort
- -static
- -statisticscache
- -storagepaths
- -sysplex
- -tablespaces
- -tcbstats
- -temptable
- -thresholds
- -transactions
- -wlocks
- -workactionsets
- -workclasssets
- -workloads

# -agents parameter

For the **-agents** parameter, the following information is returned:

### AppHand1

The application handle, including the node and the index.

#### AgentPid

The process ID of the agent process.

#### Priority

The priority of the agent.

**Type** The type of agent.

**State** The state of the agent.

### **ClientPid**

The process ID of the client process.

**Userid** The user ID running the agent.

### ClientNm

The name of the client process.

### Rowsread

The number of rows that were read by the agent.

#### Rowswrtn

The number of rows that were written by the agent.

**LkTmOt** The lock timeout setting for the agent.

# -apinfo parameter

For the **-apinfo** parameter, the following information is returned:

### AppHand1

The application handle, including the node and the index.

## Application PID

The process ID for the application.

### Application Node Name

The name of the application node.

## **IP Address**

The IP address from which the database connection was established.

# **Connection Start Time**

The time stamp at which the application connection started.

# Client User ID

The client user ID.

#### System Auth ID

This is the system authorization ID of the connection.

### **Coordinator EDU ID**

The EDU ID of the coordinator agent for the application.

#### **Coordinator Partition**

The partition number of the coordinator agent for the application.

#### Number of Agents

The number of agents that are working on behalf of the application.

# Locks timeout value

The lock timeout value for the application.

#### Locks Escalation

The locks escalation flag indicates whether the lock, used by the application, has been escalated.

## Workload ID

Workload identifier.

# Workload Occurrence ID

Workload occurrence identifier.

### **Trusted Context**

The name of the trusted context associated with the connection if the connection is either an implicit trusted connection or an explicit trusted connection.

### **Connection Trust Type**

The connection trust type. This is one of: non-trusted, implicit trusted, or explicit trusted connection.

# **Role Inherited**

This is the role inherited through a trusted connection, if any.

### Application Status

The status of the application.

### Application Name

The name of the application.

### Application ID

The application ID. This value is the same as the **appl\_id** monitor element data. For detailed information about how to interpret this value, see the "appl\_id - Application ID monitor element".

### **UOW-ID** The ID of the current UOW of the application.

#### Activity ID

The activity ID within the UOW.

# Package Schema

The package schema.

## Package Name

The package name.

### Package Version

The package version.

# Section Number

The section number of the SQL statement.

## SQL Type

The type of SQL: dynamic or static.

# Isolation

The isolation mode set for the application.

#### Statement Type

The type of statement operation, such as: DML, DDL.

# Statement

The SQL statement.

## ClientUserID

Client userid for the transaction, which is the same as tpmon\_client\_userid (TP Monitor Client User ID monitor element).

# **ClientWrkstnName**

Client workstation name for the transaction, which is the same as tpmon\_client\_wkstn (TP Monitor Client Workstation Name monitor element).

# ClientApp1Name

Client application name driving the transaction, which is the same as tpmon\_client\_app (TP Monitor Client Application monitor element).

#### ClientAccntng

Accounting string of the client driving the transaction, which is the same as tpmon\_acc\_str (TP Monitor Client Accounting String monitor element).

See Sample output of the db2pd -apinfo command.

# -applications parameter

For the **-applications** parameter, the following information is returned:

### App1Hand1

The application handle, including the node and the index.

### NumAgents

The number of agents that are working on behalf of the application.

### CoorPid

The process ID of the coordinator agent for the application.

**Status** The status of the application.

**Appid** The application ID. This value is the same as the **appl\_id** monitor element data. For detailed information about how to interpret this value, see the documentation for the **appl\_id** monitor element.

# ClientIPAddress

The IP address from which the database connection was established.

# **EncryptionLvl**

The data stream encryption used by the connection. This is one of NONE, LOW or HIGH. NONE implies that no data stream encryption is being used. LOW implies that the database server **authentication** type is set to DATA\_ENCRYPT. HIGH implies that SSL is being used.

### SystemAuthID

This is the system authorization ID of the connection.

#### ConnTrustType

The connection trust type. This is one of: non-trusted, implicit trusted connection, or explicit trusted connection.

# TrustedContext

The name of the trusted context associated with the connection if the connection is either an implicit trusted connection or an explicit trusted connection.

# RoleInherited

This is the role inherited through a trusted connection, if any.

# -bufferpools parameter

For the **-bufferpools** parameter, the following information is returned:

### First Active Pool ID

The ID of the first active buffer pool.

### Max Bufferpool ID

The maximum ID of all active buffer pools.

### Max Bufferpool ID on Disk

The maximum ID of all buffer pools defined on disk.

### Num Bufferpools

The number of available buffer pools.

**ID** The ID of the buffer pool.

**Name** The name of the buffer pool.

**PageSz** The size of the buffer pool pages.

### PA-NumPgs

The number of pages in the page area of the buffer pool.

# **BA-NumPgs**

The number of pages in the block area of the buffer pool. This value is 0 if the buffer pool is not enabled for block-based I/O.

### **BlkSize**

The block size of a block in the block area of the buffer pool. This value is  $\theta$  if the buffer pool is not enabled for block-based I/O.

### NumTbsp

The number of table spaces that are using the buffer pool.

# PgsLeft

The number of pages left to remove in the buffer pool if its size is being decreased.

# CurrentSz

The current size of the buffer pool in pages.

# **PostAlter**

The size of the buffer pool in pages when the buffer pool is restarted.

### SuspndTSCt

The number of table spaces mapped to the buffer pool that are currently I/O suspended. If  $\theta$  is returned for all buffer pools, the database I/O is not suspended.

# Automatic

Shows the self-tuning automatic status. "True" means self-tuning for this buffer pool is enabled. "False" means self-tuning for this buffer pool is not enabled.

# DatLRds

Buffer Pool Data Logical Reads. Indicates the number of data pages which have been requested from the buffer pool (logical) for regular and large table spaces.

### DatPRds

Buffer Pool Data Physical Reads. Indicates the number of data pages read in from the table space containers (physical) for regular and large table spaces.

### HitRatio

Hit ratio for data pages in the buffer pool using formula 1 - DatPRds / DatLRds.

# **TmpDatLRds**

Buffer Pool Temporary Data Logical Reads. Indicates the number of data pages which have been requested from the buffer pool (logical) for temporary table spaces.

# **TmpDatPRds**

Buffer Pool Temporary Data Physical Reads. Indicates the number of data pages read in from the table space containers (physical) for temporary table spaces.

# HitRatio

Hit ratio for temporary data pages in the buffer pool using formula 1 - TmpDatPRds / TmpDatLRds.

### IdxLRds

Buffer Pool Index Logical Reads. Indicates the number of index pages which have been requested from the buffer pool (logical) for regular and large table spaces.

# IdxPRds

Buffer Pool Index Physical Reads. Indicates the number of index pages read in from the table space containers (physical) for regular and large table spaces.

### HitRatio

Hit ratio for index pages in the buffer pool using formula 1 - IdxPRds / IdxLRds.

# TmpIdxLRds

Buffer Pool Temporary Index Logical Reads. Indicates the number of index pages which have been requested from the buffer pool (logical) for temporary table spaces.

### TmpIdxPRds

Buffer Pool Temporary Index Physical Reads. Indicates the number of index pages read in from the table space containers (physical) for temporary table spaces.

## HitRatio

Hit ratio for temporary index pages in the buffer pool using formula 1 - TmpIdxPRds / TmpIdxLRds.

# DataWrts

Buffer Pool Data Writes. Indicates the number of times a buffer pool data page was physically written to disk.

#### IdxWrts

Buffer Pool Index Writes. Indicates the number of times a buffer pool index page was physically written to disk.

**DirRds** Direct Reads From Database. The number of read operations that do not use the buffer pool.

#### DirRdReqs

Direct Read Requests. The number of requests to perform a direct read of one or more sectors of data.

# DirRdTime

Direct Read Time. The elapsed time (in milliseconds) required to perform the direct reads.

## DirWrts

Direct Writes to Database. The number of write operations that do not use the buffer pool.

# DirWrtReqs

Direct Write Requests. The number of requests to perform a direct write of one or more sectors of data.

### DirWrtTime

Direct Write Time. The elapsed time (in milliseconds) required to perform the direct writes.

### AsDatRds

Buffer Pool Asynchronous Data Reads. Indicates the number of data pages read in from the table space containers (physical) by asynchronous engine dispatchable units (EDUs) for all types of table spaces.

### AsDatRdReq

Buffer Pool Asynchronous Read Requests. The number of asynchronous read requests.

### AsIdxRds

Buffer Pool Asynchronous Index Reads. Indicates the number of index pages read in from the table space containers (physical) by asynchronous engine dispatchable units (EDUs) for all types of table spaces.

### AsIdxRdReq

Buffer Pool Asynchronous Index Read Requests. The number of asynchronous read requests for index pages.

# AsRdTime

Buffer Pool Asynchronous Read Time. Indicates the total amount of time spent reading in data and index pages from the table space containers (physical) by asynchronous engine dispatchable units (EDUs) for all types of table spaces. This value is given in microseconds.

# AsDatWrts

Buffer Pool Asynchronous Data Writes. The number of times a buffer pool data page was physically written to disk by either an asynchronous page cleaner, or a prefetcher. A prefetcher might have written dirty pages to disk to make space for the pages being prefetched.

# AsIdxWrts

Buffer Pool Asynchronous Index Writes. The number of times a buffer pool index page was physically written to disk by either an asynchronous page cleaner, or a prefetcher. A prefetcher might have written dirty pages to disk to make space for the pages being prefetched.

### AsWrtTime

Buffer Pool Asynchronous Write Time. The total elapsed time spent writing data or index pages from the buffer pool to disk by database manager page cleaners.

# TotRdTime

Total Buffer Pool Physical Read Time. Indicates the total amount of time spent reading in data and index pages from the table space containers (physical) for all types of table spaces. This value is given in microseconds.

### TotWrtTime

Total Buffer Pool Physical Write Time. Provides the total amount of time spent physically writing data or index pages from the buffer pool to disk. Elapsed time is given in microseconds.

#### VectIORds

Total Number of Pages Read by Vectored IO. The total number of pages read by vectored I/O into the page area of the buffer pool.

## VectIOReq

Number of Vectored IO Requests. The number of vectored I/O requests. More specifically, the number of times the DB2 database product performs sequential prefetching of pages into the page area of the buffer pool.

### **BlockIORds**

Total Number of Pages Read by Block IO. The total number of pages read by block I/O into the block area of the bufferpool.

# **BlockIOReq**

Number of Block IO Requests. The number of block I/O requests. More specifically, the number of times the DB2 database product performs sequential prefetching of pages into the block area of the bufferpool.

# PhyPgMaps

Number of Physical Page Maps. The number of physical page maps.

### FilesClose

Database Files Closed. The total number of database files closed.

#### NoVictAv1

Buffer Pool No Victim Buffers. Number of times an agent did not have a preselected victim buffer available.

### UnRdPFetch

Unread Prefetch Pages. Indicates the number of pages that the prefetcher read in that were never used.

# catalogcache parameter

For the -catalogcache parameter, the following information is returned:

## Catalog Cache:

### **Configured Size**

The number of bytes as specified by the **catalogcache\_sz** database configuration parameter.

# **Current Size**

The current number of bytes used in the catalog cache.

#### Maximum Size

The maximum amount of memory that is available to the cache (up to the maximum database global memory).

### High Water Mark

The largest physical size reached during processing.

### SYSTABLES:

**Schema** The schema qualifier for the table.

- **Name** The name of the table.
- **Type** The type of the table.

### TableID

The table identifier.

# TbspaceID

The identifier of the table space where the table resides.

#### LastRefID

The last process identifier that referenced the table.

# CatalogCache LoadingLock

The name of the catalog cache loading lock for the cache entry.

### CatalogCache UsageLock

The name of the usage lock for the cache entry.

- **Sts** The status of the entry. The possible values are:
  - V (valid).
  - I (invalid).
  - S (soft invalid. Catalog cache entries become *soft invalid* when statistics have been updated by real-time statistics collection. These catalog cache entries may still be used by a database agent, but they are not valid for use by a new catalog cache request. Once the soft invalid entry is no longer in use, it will be removed. New catalog cache requests will use the valid entry.)

# SYSRTNS:

#### RoutineID

The routine identifier.

**Schema** The schema qualifier of the routine.

**Name** The name of the routine.

#### LastRefID

The last process identifier that referenced the routine.

### CatalogCache LoadingLock

The name of the catalog cache loading lock for the cache entry.

### CatalogCache UsageLock

The name of the usage lock for the cache entry.

- **Sts** The status of the entry. The possible values are:
  - V (valid).
  - I (invalid).

### SYSRTNS\_PROCSCHEMAS:

#### RtnName

The name of the routine.

### ParmCount

The number of parameters in the routine.

### LastRefID

The last process identifier that referenced the PROCSCHEMAS entry.

### CatalogCache LoadingLock

The name of the catalog cache loading lock for the cache entry.

### CatalogCache UsageLock

The name of the usage lock for the cache entry.

**Sts** The status of the entry. The possible values are:

- V (valid).
- I (invalid).

# SYSDATATYPES:

**TypID** The type identifier.

### LastRefID

The last process identifier that referenced the type.

# CatalogCache LoadingLock

The name of the catalog cache loading lock for the cache entry.

# CatalogCache UsageLock

The name of the usage lock for the cache entry.

- **Sts** The status of the entry. The possible values are:
  - V (valid).
  - I (invalid).

# SYSCODEPROPERTIES:

### LastRefID

The last process identifier to reference the SYSCODEPROPERTIES entry.

## CatalogCache LoadingLock

The name of the catalog cache loading lock for the cache entry.

# CatalogCache UsageLock

The name of the usage lock for the cache entry.

- **Sts** The status of the entry. The possible values are:
  - V (valid).
  - I (invalid).

# SYSNODEGROUPS:

**PMapID** The distribution map identifier.

**RBalID** The identifier if the distribution map that was used for the data redistribution.

### CatalogCache LoadingLock

The name of the catalog cache loading lock for the cache entry.

#### CatalogCache UsageLock

The name of the usage lock for the cache entry.

- **Sts** The status of the entry. The possible values are:
  - V (valid).
  - I (invalid).

# SYSDBAUTH:

**AuthID** The authorization identifier (*authid*).

### AuthType

The authorization type.

### LastRefID

The last process identifier to reference the cache entry.

# CatalogCache LoadingLock

The name of the catalog cache loading lock for the cache entry.

# SYSRTNAUTH:

**AuthID** The authorization identifier (authid).

### AuthType

The authorization type.

**Schema** The schema qualifier of the routine.

### RoutineName

The name of the routine.

### RtnType

The type of the routine.

### CatalogCache LoadingLock

The name of the catalog cache loading lock for the cache entry.

# SYSROLEAUTH:

**AuthID** The authorization identifier (authid).

### AuthType

The authorization type.

**Roleid** The role identifier if the authorization identifier is a role.

### LastRefID

The last process identifier to reference the cache entry.

### CatalogCache LoadingLock

The name of the catalog cache loading lock for the cache entry.

See Sample output of the db2pd -catalogcache command.

# -dbcfg parameter

For the **-dbcfg** parameter, the current values of the database configuration parameters are returned.

# -dbmcfg parameter

For the **-dbmcfg** parameter, current values of the database manager configuration parameters are returned.

# -dynamic parameter

For the **-dynamic** parameter, the following information is returned:

# **Dynamic Cache:**

Current Memory Used

The number of bytes used by the package cache.

### Total Heap Size

The number of bytes configured internally for the package cache.

### Cache Overflow flag state

A flag to indicate whether the package cache is in an overflow state.

# Number of references

The number of times the dynamic portion of the package cache has been referenced.

Number o	of Statement Inserts The number of statement inserts into the package cache.
Number o	of Statement Deletes The number of statement deletions from the package cache.
Number o	of Variation Inserts The number of variation inserts into the package cache.
Number o	of statements The number of statements in the package cache.

# **Dynamic SQL Statements:**

AnchID The hash anchor identifier.

StmtID The statement identifier.

- NumEnv The number of environments that belong to the statement.
- NumVar The number of variations that belong to the statement.
- $\ensuremath{\mathsf{NumRef}}$  The number of times that the statement has been referenced.
- NumExe The number of times that the statement has been executed.
- **Text** The text of the SQL statement.

# **Dynamic SQL Environments:**

AnchID The hash anchor identifier.

- **StmtID** The statement identifier.
- **EnvID** The environment identifier.
- **Iso** The isolation level of the environment.
- **Q0pt** The query optimization level of the environment.
- **Blk** The blocking factor of the environment.

# **Dynamic SQL Variations:**

- **AnchID** The hash anchor identifier.
- **StmtID** The statement identifier for this variation.
- **EnvID** The environment identifier for this variation.
- **VarID** The variation identifier.
- NumRef The number of times this variation has been referenced.
- **Typ** The internal statement type value for the variation section.

# Lockname

The variation lockname.

# -fcm parameter

For the **-fcm** parameter, the following information is returned:

# FCM Usage Statistics:

# **Total Buffers**

Total number of buffers, including all free and in-use ones.

# **Free Buffers**

Number of free buffers.

### **Buffers LWM**

Lowest number of free buffers.

# Max Buffers

Maximum number of buffers that can be allocated based on the amount of virtual memory reserved when the instance was started.

#### Total Channels

Total number of channels, including all free and in-use ones.

#### Free Channels

Number of free channels.

#### Channels LWM

Lowest number of free channels.

# Max Channels

Maximum number of channels that can be allocated based on the amount of virtual memory reserved when the instance was started.

#### Total Sessions

Total number of sessions, including all free and in-use ones.

### **Free Sessions**

Number of free sessions.

## Sessions LWM

Lowest number of free sessions.

# Partition

The database partition server number.

#### **Bufs Sent**

The total number of FCM buffers that are sent from the database partition server where the db2pd command is running to the database partition server that is identified in the output.

## Bufs Recv

The total number of FCM buffers that are received by the database partition server where the db2pd command is running from the database partition server that is identified in the output.

- **Status** The logical connection status between the database partition server where the db2pd command is running and the other database partition servers that are listed in the output. The possible values are:
  - Inactive: The database partition server is defined in the db2nodes.cfg file, but is currently inactive (for example, the user has stopped the partition).
  - Active: The database partition server is active.
  - Undefined: The database partition server is not defined in the db2nodes.cfg file. This might indicate an error.
  - Unknown: The database partition server is in an unknown state. This indicates an error.

### **Buffers Current Consumption**

#### AppHand1

The application handle, including the node and the index.

#### TimeStamp

A unique identifier for the usage of an application handle.
#### **Buffers In-use**

The number of buffers currently being used by an application.

# **Channels Current Consumption**

## AppHand1

The application handle, including the node and the index.

## TimeStamp

A unique identifier for the usage of an application handle.

## Channels In-use

The number of channels currently being used by an application.

## **Buffers Consumption HWM**

## AppHand1

The application handle, including the node and the index.

#### TimeStamp

A unique identifier for the usage of an application handle.

## **Buffers Used**

The high-watermark number of buffers used by an application since the start of the instance.

## **Channels Consumption HWM**

#### AppHand1

The application handle, including the node and the index.

#### TimeStamp

A unique identifier for the usage of an application handle.

#### Channels Used

The high-watermark number of channels used by an application since the start of the instance.

# -fmp parameter

For the **-fmp** parameter, the following information is returned:

- Pool Size: Current number of FMP processes in the FMP pool.
- Max Pool Size: Maximum number of FMP process in the FMP pool.
- Keep FMP: Value of keepfenced database manager configuration parameter.
- Initialized: FMP is initialized. Possible values are Yes and No.
- Trusted Path: Path of trusted procedures
- Fenced User: Fenced user ID

# **FMP Process:**

- FmpPid: Process ID of the FMP process.
- Bit: Bit mode. Values are 32 bit or 64 bit.
- Flags: State flags for the FMP process. Possible values are:
  - 0x00000000 JVM initialized
  - 0x0000002 Is threaded
  - 0x00000004 Used to run federated wrappers
  - 0x0000008 Used for Health Monitor
  - 0x00000010 Marked for shutdown and will not accept new tasks
  - 0x00000020 Marked for cleanup by db2sysc

- 0x00000040 Marked for agent cleanup
- 0x00000100 All ipcs for the process have been removed
- 0x00000200 .NET runtime initialized
- 0x00000400 JVM initialized for debugging
- 0x00000800 Termination flag
- ActiveTh: Number of active threads running in the FMP process.
- PooledTh: Number of pooled threads held by the FMP process.
- Active: Active state of the FMP process. Values are Yes or No.

# **Active Threads:**

- FmpPid: FMP process ID that owns the active thread.
- EduPid: EDU process ID that this thread is working.
- ThreadId: Active thread ID.

# **Pooled Threads:**

- FmpPid: FMP process ID that owns the pooled thread.
- ThreadId: Pooled thread ID.

# -fmpexechistory | -fmpe parameter

For the **-fmpexechistory** | **-fmpe** parameter, the following information is returned:

# **FMP Process:**

- FmpPid Process ID of the FMP process.
- Bit Bit mode. Values are 32 bit or 64 bit.
- Flags State flags for the FMP process. Possible values are:
  - 0x00000000 JVM initialized
  - 0x0000002 Is threaded
  - 0x00000004 Used to run federated wrappers
  - 0x0000008 Used for Health Monitor
  - 0x00000010 Marked for shutdown and will not accept new tasks
  - 0x00000020 Marked for cleanup by db2sysc
  - 0x00000040 Marked for agent cleanup
  - 0x00000100 All ipcs for the process have been removed
  - 0x00000200 .NET runtime initialized
  - 0x00000400 JVM initialized for debugging
  - 0x00000800 Termination flag
- ActiveThrd Number of active threads running in the FMP process.
- PooledThrd Number of pooled threads held by the FMP process.
- ForcedThrd Number of forced threads generated by the FMP process.
- Active Active state of the FMP process. Values are Yes or No.

# Active Threads:

- EduPid EDU process ID that this thread is working.
- ThreadId Active thread ID.
- RoutineID The routine identifier.
- Timestamp A unique identifier for the usage of an application handle.

# **Pooled Threads:**

• ThreadId - Pooled thread ID.

- RoutineID The routine identifier.
- Timestamp A unique identifier for the usage of an application handle.

# Forced Threads:

- ThreadId Forced thread ID.
- RoutineID The routine identifier.
- Timestamp A unique identifier for the usage of an application handle.

See Sample output of the db2pd -catalogcache command.

# -locks parameter

For the **-locks** parameter, the following information is returned:

# TranHd1

The transaction handle that is requesting the lock.

# Lockname

The name of the lock.

**Type** The type of lock. The possible values are:

- Row
- Pool
- Partition
- Table
- AlterTab
- ObjectTab
- OnlBackup
- DMS Seq
- Internal P
- Internal V
- Key Value
- No Lock
- Block Lock
- LOG Release
- LF Release
- LFM File
- LOB/LF 4K
- APM Seq
- Tbsp Load
- Table Part
- DJ UserMap
- DF NickNm
- CatCache
- OnlReorg
- Buf Pool

## Mode The lock mode. The possible values are:

- IS
- IX
- \$
- SIX
- X
- IN
- Z
- U
- NS

- NW
- **Sts** The lock status. The possible values are:
  - G (granted)
  - C (converting)
  - W (waiting)
- **Owner** The transaction handle that owns the lock.
- **Dur** The duration of the lock.

#### HoldCount

The number of holds placed on the lock. Locks with holds are not released when transactions are committed.

- **Att** The attributes of the lock. Possible values are:
  - 0x01 Wait for availability.
  - 0x02 Acquired by escalation.
  - 0x04 RR lock "in" block.
  - 0x08 Insert Lock.
  - 0x10 Lock by RR scan.
  - 0x20 Update/delete row lock.
  - 0x40 Allow new lock requests.
  - 0x80 A new lock requestor.

## ReleaseFlg

- The lock release flags. Possible values are:
- 0x80000000 Locks by SQL compiler.
- 0x40000000 Non-unique, untracked locks.
- **rrIID** The IID of the index through which the RR lock (0x10 attribute above) was acquired. Possible values are:
  - O Not related to a single, specific index (or not an RR lock).
  - <>0 The specific index IID used to acquire the lock.

# logs parameter

For the **-logs** parameter, the following information is returned:

#### Current Log Number

The number of the current active log.

# **Pages Written**

The current page being written in the current log.

#### Cur Commit Disk Log Reads

The number of times the currently committed version of a row was retrieved via a log read from disk (versus log buffer).

## Cur Commit Total Log Reads

The total number of times the currently committed version of a row was retrieved from the logs (log buffer and disk).

#### Method 1 Archive Status

The result of the most recent log archive attempt. Possible values are Success or Failure.

## Method 1 Next Log to Archive

The next log file to be archived.

#### Method 1 First Failed

The first log file that was unsuccessfully archived.

#### Method 2 Archive Status

The result of the most recent log archive attempt. Possible values are Success or Failure.

Method 2 Next Log to Archive The next log file to be archived.

#### Method 2 First Failed

The first log file that was unsuccessfully archived.

#### StartLSN

The starting log sequence number.

- **State** 0x00000020 indicates that the log has been archived.
- **Size** The size of the log's extent, in pages.

**Pages** The number of pages in the log.

## Filename

The file name of the log.

#### Log Chain ID

The identifier of the log chain number

#### **Current LSN**

The current log sequence number (LSN)

# -memblocks parameter

For the **-memblocks** parameter, there are three sections of output: individual blocks for the memory set, sorted totals grouped by memory pool, and sorted totals for the memory set:

Memory blocks:

**PoolID** The memory pool id that owns the memory block.

#### PoolName

The memory pool name that owns the memory block.

#### **BlockAge**

The block age of the memory block. This is an incremental counter assigned as blocks are allocated.

**Size** The size of the memory block in bytes.

- **I** The type of allocation. Value 1 means block will be freed individually while value θ means it will be freed with the pool.
- **LOC** Line of code that allocated the memory block.
- **File** Filename hash value from where the block was allocated.

Sorted totals reported for each memory pool:

**PoolID** The memory pool id that owns the memory block.

#### PoolName

The memory pool name that owns the memory block.

#### **TotalSize**

The total size of blocks (in bytes) allocated from the same line of code and file.

#### TotalCount

The number of blocks allocated from the same line of code and file.

- **LOC** Line of code that allocated the memory block.
- File Filename hash value from where the block was allocated.

Sorted totals reported for each memory set:

**PoolID** The memory pool id that owns the memory block.

#### PoolName

The memory pool name that owns the memory block.

#### **TotalSize**

The total size of blocks (in bytes) allocated from the same line of code and file.

**\*Bytes** The percentage bytes allocated from the same line of code and file.

#### TotalCount

The number of blocks allocated from the same line of code and file.

**Count** The percentage count allocated from the same line of code and file.

**LOC** Line of code that allocated the memory block.

File Filename hash value from where the block was allocated.

## -mempools parameter

For the **-mempools** parameter, the following information is returned (All sizes are specified in bytes):

**MemSet** The memory set that owns the memory pool.

# PoolName

The name of the memory pool.

**Id** The memory pool identifier.

#### **Overhead**

The internal overhead required for the pool structures.

**LogSz** The current total of pool memory requests.

#### LogUpBnd

The current logical size upper bound.

- **LogHWM** The logical size high water mark.
- **PhySz** The physical memory required for logical size.

## PhyUpBnd

The current physical size upper bound.

- **PhyHWM** The largest physical size reached during processing.
- **Bnd** The internal bounding strategy.
- **BlkCnt** The current number of allocated blocks in the memory pool.

#### CfgParm

The configuration parameter that declares the size of the pool being reported.

# memsets parameter

For the -memsets parameter, the following information is returned:

**Name** The name of the memory set.

#### Address

The address of the memory set.

Id The memory set identifier.

#### Size(Kb)

The size of the memory set in kilobytes.

**Key** The memory set key (for UNIX operating systems only).

**DBP** The database partition server that owns the memory set.

**Type** The type of memory set.

## Unrsv(Kb)

Memory not reserved for any particular pool. Any pool in the set can use this memory if needed.

## Used(Kb)

Memory currently allocated to memory pools.

#### Cmt(Kb)

All memory that has been committed by the DB2 database, and occupies physical RAM, paging space, or both.

#### HWM(Kb)

Maximum memory ever allocated to memory pools.

#### Uncmt(Kb)

Memory not currently being used, and marked by the DB2 database to be uncommitted. Depending on the operating system, this memory could occupy physical RAM, paging space, or both.

## -osinfo parameter

For the **-osinfo** parameter, the following information is returned:

CPU information: (On Windows, AIX, HP-UX, Solaris and Linux operating systems)

#### TotalCPU

Total number of CPUs.

# OnlineCPU

Number of CPUs online.

#### ConfigCPU

Number of CPUs configured.

# Speed(MHz)

Speed, in MHz, of CPUs.

#### HMTDegree

Systems supporting hardware multithreading return a value showing the number of processors that will appear to be present on the operating system. On nonHMT systems, this value is always 1. On HMT systems, TOTAL reflects the number of logical CPUs. To get the number of physical CPUs, divide the total by THREADING DEGREE.

#### Timebase

Frequency, in Hz, of the timebase register increment. This is supported on Linux PPC only.

## Cores/Socket

Number of cores per socket

Physical memory and swap in megabytes: (On Windows, AIX, HP-UX, Solaris and Linux operating systems)

#### TotalMemTotal

Size of memory in megabytes.

#### FreeMem

Amount of free memory in megabytes.

## AvailMem

Amount of memory available to the product in megabytes.

#### TotalSwap

Total amount of swapspace in megabytes.

## FreeSwap

Amount of swapspace free in megabytes.

Virtual memory in megabytes (On Windows, AIX, HP-UX, and Solaris operating systems)

**Total** Total amount of virtual memory on the system in megabytes.

#### Reserved

Amount of reserved virtual memory in megabytes.

#### Available

Amount of virtual memory available in megabytes.

Free Amount of virtual memory free in megabytes.

# Operating system information (On Windows, AIX, HP-UX, Solaris and Linux operating systems)

**OSName** Name of the operating system software.

## NodeName

Name of the system.

#### Version

Version of the operating system.

#### Machine

Machine hardware identification.

## Message queue information (On AIX, HP-UX, and Linux operating systems)

MsgSeg System-wide total of SysV msg segments.

MsgMax System-wide maximum size of a message.

- MsgMap System-wide number of entries in message map.
- MsgMni System-wide number of message queue identifiers for system.
- MsgTql System-wide number of message headers.
- MsgMnb Maximum number of bytes on a message queue.
- MsgSsz Message segment size.

#### Shared memory information (On AIX, HP-UX, and Linux operating systems)

ShmMax System-wide maximum size of a shared memory segment in bytes.

- ShmMin System-wide minimum size of a shared memory segment in bytes.
- ShmIds System-wide number of shared memory identifiers.
- **ShmSeg** Process-wide maximum number of shared memory segments per process.

# Semaphore information: (On AIX, HP-UX, and Linux operating systems)

**SemMap** System-wide number of entries in semaphore map.

- **SemMni** System-wide maximum number of a semaphore identifiers.
- SemMns System-wide maximum number of semaphores on system.

SemMnu System-wide maximum number of undo structures on system.

- SemMs1 System-wide maximum number of semaphores per ID.
- SemOpm System-wide maximum number of operations per semop call.

SemUme Process-wide maximum number of undo structures per process.

- SemUsz System-wide size of undo structure. Derived from semume.
- **SemVmx** System-wide maximum value of a semaphore.

SemAem System-wide maximum adjust on exit value.

CPU load information (On Windows, AIX, HP-UX, Solaris, and Linux operating systems)

#### shortPeriod

The number of runable processes over the preceding 1 minute.

## mediumPeriod

The number of runable processes over the preceding 5 minutes.

# longPeriod

The number of runable processes over the preceding 15 minutes.

## **Disk information**

## BkSz(bytes)

File system block size in bytes.

# Total (bytes)

Total number of bytes on the device in bytes.

#### Free(bytes)

Number of free bytes on the device in bytes.

Inodes Total number of inodes.

**FSID** File system ID.

#### DeviceType

Device type.

FSName File system name.

#### MountPoint

Mount point of the file system.

# -pages parameter

For the **-pages** parameter, the following information is returned for each page:

**BPID** Bufferpool ID that contains the page.

## TbspaceID

Table space ID that contains the page.

## TbspacePgNum

Logical page number within the table space (DMS only).

**ObjID** Object ID that contains the page.

#### ObjPgNum

Logical page number within the object.

#### ObjClass

Class of object contained in the page. Possible values are Perm, Temp, Reorg, Shadow, and EMP.

#### **ObjType**

Type of object contained in the page. Possible values are Data, Index, LongField, XMLData, SMP, LOB, LOBA, and MDC BMP.

**Dirty** Indicates if the page is dirty. Possible values are Y and N. In the summary information section of the pages output, the value indicates the number of dirty pages.

## Permanent

In the summary information section of the pages output, the value indicates the number of PERMANENT pages.

## Temporary

In the summary information section of the pages output, the value indicates the number of TEMPORARY pages.

## Prefetched

Indicates if the page has been prefetched. Possible values are Y and N.

See Sample output of the db2pd -pages command.

## -recovery parameter

For the **-recovery** parameter, the following information is returned:

#### **Recovery Status**

The internal recovery status.

## **Current Log**

The current log being used by the recovery operation.

#### Current LSN

The current log sequence number.

#### Job Type

- The type of recovery being performed. The possible values are:
- 5: Crash recovery.
- 6: Rollforward recovery on either the database or a table space.
- Job ID The job identifier.

#### Job Start Time

The time the recovery operation started.

## Job Description

- A description of the recovery activity. The possible values are:
- Tablespace Rollforward Recovery

- Database Rollforward Recovery
- Crash Recovery

## Invoker Type

- How the recovery operation was invoked. The possible values are:
- User
  - DB2

## **Total Phases**

The number of phases required to complete the recovery operation.

#### **Current** phase

The current phase of the recovery operation.

**Phase** The number of the current phase in the recovery operation.

## Forward phase

The first phase of rollforward recovery. This phase is also known as the REDO phase.

#### Backward phase

The second phase of rollforward recovery. This phase is also known as the UNDO phase.

Metric The units of work. The possible values are:

- 1: Bytes.
- 2: Extents.
- 3: Rows.
- 4: Pages.
- 5: Indexes

## TotWkUnits

The total number of units of work (UOW) to be done for this phase of the recovery operation.

## TotCompUnits

The total number of UOWs that have been completed.

## reopt parameter

For the **-reopt** parameter, the following information is returned:

- Dynamic SQL Statements See -dynamic.
- Dynamic SQL Environments See the -dynamic.
- Dynamic SQL Variations See the -dynamic.

#### **Reopt Values**

Displays information about the variables that were used to reoptimize a given SQL statement. Information is not returned for variables that were not used. Valid values are:

AnchID The hash anchor identifier.

- **StmtID** The statement identifier for this variation.
- **EnvID** The environment identifier for this variation.
- VarID The variation identifier.

#### OrderNum

Ordinal number of the variable that was used to reoptimize of the SQL statement

## SQLZType

The variable type.

**CodPg** The variable code page.

- **NullD** The flag indicating whether or not the value is null-terminated.
- **Len** The length in bytes of the variable value.
- **Data** The value used for the variable.

## -reorgs parameter

For the **-reorgs** parameter, the following information is returned:

## **Index Reorg Stats:**

#### Retrieval time

Retrieval time of this set of index reorg statistics information.

#### TabSpaceID

The table space identifier.

#### TableID

The table identifier.

Schema Table schema.

## TableName

The name of the table.

## **MaxPartition**

Total number of partitions for the table being processed. For partition-level reorg, MaxPartition will always have a value of 1 since only a single partition is being reorganized. This field is only displayed for partitioned indexes.

#### PartitionID

The data partition identifier for the partition being processed. This field is only displayed for partitioned indexes.

- **Access** Access level, possible values are:
  - Allow none
  - Allow read
  - Allow write

Status Current reorg status, one of:

- In Progress (operation is in progress)
- Completed (operation has completed successfully)
- Stopped (operation has stopped due to error or interrupt)

## Start time

Start time of this reorg session.

#### End time

End time of this reorg session.

## Total duration

Total duration time of this reorg session.

#### Prev Index Duration

Reorg duration of the previous (completed) index.

## Cur Index Start

Reorg start time of the current (in progress) index.

# Cur Index

Sequence number of the current (in progress) index.

## Max Index

Total number of indexes being monitored. This is not the same as total number of indexes on the table, because some system-generated indexes are not monitored.

## Index ID

Index ID of the current (in progress) index.

## Cur Phase

Sequence number of the current phase. Enclosed within the braces is the name of the current phase, one of:

- Scan (the table is being scanned and sorted one data page at a time)
- Build (the index is being built from the sorted input one row at a time)
- Catchup (transactions that occurred while building the index are being replayed; only seen for index reorgs where access level is allow write)

## Max Phase

Total number of phases for the current (in-progress) index; differs for different types of indexes.

#### CurCount

Units of work processed so far. Unit has a different meaning for each reorg phase, as follows:

- Scan phase: number of data pages scanned
- Build phase: number of rows processed
- Catchup: number of transaction log records replayed

#### MaxCount

Total number of units for the current phase (see CurCount for explanation on units).

#### Total Row Count

Total number of rows processed. May or may not show up depending on the phase and index type.

See Sample output of the db2pd -reorgs index command.

## Table Reorg Stats:

## Address

A hexadecimal value.

## TableName

The name of the table.

- **Start** The time that the table reorganization started.
- **End** The time that the table reorganization ended.

## PhaseStart

The start time for a phase of table reorganization.

## MaxPhase

The maximum number of reorganization phases that will occur during the reorganization. This value only applies to offline table reorganization.

- **Phase** The phase of the table reorganization. This value only applies to offline table reorganization. The possible values are:
  - Sort
  - Build
  - Replace
  - InxRecreat

# CurCount

A unit of progress that indicates the amount of table reorganization that has been completed. The amount of progress represented by this value is relative to the value of MaxCount, which indicates the total amount of work required to reorganize the table.

## MaxCount

A value that indicates the total amount of work required to reorganize the table. This value can be used in conjunction with CurCount to determine the progress of the table reorganization.

**Status** The status of an online table reorganization. This value does not apply to offline table reorganizations. The possible values are:

- Started
- Paused
- Stopped
- Done
- Truncat

# Completion

The success indicator for the table reorganization. The possible values are:

- 0: The table reorganization completed successfully.
- -1: The table reorganization failed.
- **PartID** The data partition identifier. One row is returned for each data partition, showing the reorganization information.

# MasterTbs

For partitioned tables, this is the logical table space identifier to which the partitioned table belongs. For non-partitioned tables, this value corresponds to the TbspaceID.

# MasterTab

For partitioned tables, this is the logical table identifier of the partitioned table. For non-partitioned tables, this value corresponds to the TableID.

- **Type** The type of reorganization. The possible values are:
  - Online
    - Offline

# IndexID

The identifier of the index that is being used to reorganize the table.

#### **TempSpaceID**

The table space in which the table is being reorganized.

# -scansharing parameter

For the **-scansharing** parameter, the following fields are returned, specific to the headings:

## Individual shared scan

- Agent ID
- Application ID
- ScanMode (prewrap or postwrap)
- IsScanWrappable
- Scan speed
- Time spent getting throttled
- Relative location of scan in pages within group (for block index scans). Absolute location of scan in pages (for table and range scans)
- Predicted speed category (SLOW or FAST)
- Remaining pages to process (accurate for table and range scans). For block index scans, the optimizer estimate is returned instead.

See Sample output of the db2pd -scansharing command.

## Sharing set

- Tablespace ID
- Table ID
- Scan object (0 for table scans or ID of block index)
- Number of groups
- Sharing set footprint in pages
- Table size in pages (for table scans and block index scans on nonpartitioned tables, and for range scans on partitioned tables; for block index scans on partitioned tables the value is unknown)
- Fast scan speed (speed at which FAST scans are going)
- Slow scan speed (speed at which SLOW scans are going)

## Sharing group

- Number of scans in the group
- Group footprint (in number of pages)

# -serviceclasses parameter

For the **-serviceclasses** parameter, the following fields are returned, specific to the headings:

## Service class fields:

- Service Class Name: Name of service class
- Service Class ID: System generated ID of service class
- Service Class Type: Type of service class: superclass or subclass
- Service Class State (Effective and Catalog): State of service class: enabled or disabled

- Effective Agent Priority and Catalog Agent Priority: Effective agent priority setting for service class that maps to priority recorded in SYSCAT.SERVICECLASSES
- Effective Prefetch Priority and Catalog Prefetch Priority: Effective prefetch priority setting for service class that maps to priority recorded in SYSCAT.SERVICECLASSES
- Effective Bufferpool Priority and Catalog Bufferpool Priority: Effective buffer pool priority setting for service class that maps to priority recorded in SYSCAT.SERVICECLASSES
- Effective Outbound Correlator and Catalog Outbound Correlator: Effective outbound correlator setting for service class that maps to correlator recorded in SYSCAT.SERVICECLASSES)
- Last Statistics Reset Time: Timestamp of last statistics reset for service class

# Service superclass fields:

- Default Subclass ID: Service class ID of Default Subclass
- Work Action Set ID: ID of work action set associated with service superclass
- Collect Request Metrics: Setting of COLLECT REQUEST METRICS option for service class
- Num Connections: Current number of coordinator and remote connections in service superclass
- Num Coordinator Connections: Current number of coordinator connections in service superclass
- Coordinator Connections HWM: High water mark for coordinator connections since last statistics reset
- Associated Workload Occurrences (WLO): List of workload occurrences currently in service superclass

# Service subclass fields:

- Parent Superclass ID: Service class ID of parent superclass
- Collect Activity Opt: Setting of COLLECT ACTIVITY DATA option for service subclass
- Collect Aggr Activity Opt: Setting of COLLECT AGGREGATE ACTIVITY option for service subclass
- Collect Aggr Request Opt: Setting of COLLECT AGGREGATE REQUEST option for service subclass
- Act Lifetime Histogram Template ID: ID of Activity Lifetime Histogram Template
- Act Queue Time Histogram Template ID: ID of Activity Queue Time Histogram Template
- Act Execute Time Histogram Template ID: ID of Activity Execute Time Histogram Template
- Act Estimated Cost Histogram Template ID: ID of Activity Estimated Cost Histogram Template
- Act Interarrival Time Histogram Template ID: ID of Activity Interarrival Time Histogram Template
- Request Execute Time Histogram Template ID: ID of Request Execute Time Histogram Template
- Access Count: Current number of activities in service subclass

- Activities HWM: High water mark for activities since last statistics reset, counting both activities that entered the system through this subclass and activities that you remap into this subclass by a REMAP ACTIVITY threshold action.
- Activities Completed: Total number of activities completed since last statistics reset. If you remap an activity to a different subclass with a REMAP ACTIVITY action before it completes, then this activity counts only towards the total of the subclass it completes in.
- Activities Rejected: Total number of activities rejected since last statistics reset
- Activities Aborted: Total number of activities aborted since last statistics reset. If you remap an activity to a different subclass with a REMAP ACTIVITY action before it aborts, then this activity counts only towards the total of the subclass it aborts in.
- Associated Agents: List of agent currently working in service subclass
- Associated Non-agent threads: List of non-agent entities currently working in service subclass

See Sample output of the db2pd -serviceclasses command.

## -sort parameter

For the **-sort** parameter, the following information is returned:

#### App1Hand1

The application handle, including the node and the index.

**SortCB** The address of a sort control block

## MaxRowSize

The sum of the maximum length of all columns of the row being sorted

#### EstNumRows

The Optimizer estimated number of rows that will be inserted into the sort

# EstAvgRowSize

The Optimizer estimated average length of the rows being sorted

#### NumSMPSorts

The number of concurrent subagents processing this sort

#### NumSpills

The total number of times this sort has spilled to disk

#### KeySpec

A description of the type and length of each column being sorted

#### SortheapMem

The number of KB of sortheap memory reserved and allocated by this sort

#### NumSpilledRows

The total number of rows spilled to disk for this sort

#### NumBufferedRows

The total number of rows inserted into this sort since the last time it spilled

# -static parameter

For the **-static** parameter, the following information is returned:

Static Cache:

## **Current Memory Used**

The number of bytes used by the package cache.

#### Total Heap Size

The number of bytes internally configured for the package cache.

# Cache Overflow flag state

A flag to indicate whether the package cache is in an overflow state.

## Number of References

The number of references to packages in the package cache.

## Number of Package Inserts

The number of package inserts into the package cache.

# Number of Section Inserts

The number of static section inserts into the package cache.

# Packages:

**Schema** The qualifier of the package.

#### PkgName

The name of the package.

## Version

The version identifier of the package.

#### UniqueID

The consistency token associated with the package.

**NumSec** The number of sections that have been loaded.

#### UseCount

The usage count of the cached package.

NumRef The number of times the cached package has been referenced.

**Iso** The isolation level of the package.

**Q0pt** The query optimization of the package.

**Blk** The blocking factor of the package.

#### Lockname

The lockname of the package.

## Sections:

**Schema** The qualifier of the package that the section belongs to.

## PkgName

The package name that the section belongs to.

#### UniqueID

The consistency token associated with the package that the section belongs to.

SecNo The section number.

NumRef The number of times the cached section has been referenced.

#### UseCount

The usage count of the cached section.

## StmtType

The internal statement type value for the cached section.

**Cursor** The cursor name (if applicable).

**W-H1d** Indicates whether the cursor is a WITH HOLD cursor.

## -statisticscache parameter

For the **-statisticscache** parameter, the following information is returned:

## **Current Size**

The current number of bytes used in the statistics cache.

#### Address

The address of the entry in the statistics cache.

**Schema** The schema qualifier for the table.

**Name** The name of the table.

## LastRefID

The last process identifier that referenced the table.

#### LastStatsTime

The time for the latest statistics collection for the table.

- **Sts** The status of the entry. The possible values are:
  - V (valid).
  - I (invalid).

For additional details about the returned information using the **-statisticscache** command parameter, see the topic "Catalog statistics tables" in *Troubleshooting and Tuning Database Performance* 

## -storagepaths parameter

For the -storagepaths parameter, the following information is returned:

## Number of Storage Paths

The number of automatic storage paths defined for the database.

# PathName

The name of an automatic storage path defined for the database. If the path contains a database partition expression, it is included, in parentheses, after the expanded path.

**PathID** The storage path identifier.

## PathState

Current state of the storage path: NotInUse, InUse, or DropPending.

See Sample output of the db2pd -storagepaths command.

# -sysplex parameter

For the **-sysplex** parameter, the following information is returned:

Alias The database alias.

## Location Name

The unique name of the database server.

**Count** The number of entries found in the list of servers.

# **IP Address**

The IP address of the server

**Port** The IP port being used by the server.

## Priority

The normalized Workload Manager (WLM) weight.

## Connections

The number of active connections to this server.

- **Status** The status of the connection. The possible values are:
  - 0: Healthy.
  - 1: Unhealthy. The server is in the list but a connection cannot be established. This entry currently is not considered when establishing connections.
  - 2: Unhealthy. The server was previously unavailable, but currently it will be considered when establishing connections.
- **PRDID** The product identifier of the server as of the last connection.

# -tablespaces parameter

For the -tablespaces parameter, the output is organized into four segments:

# Table space Configuration:

**Id** The table space ID.

- **Type** The type of table space. The possible values are:
  - SMS
  - DMS

## Content

The type of content. The possible values are:

- Regular
- Large
- SysTmp
- UsrTmp

**PageSz** The page size used for the table space.

## ExtentSz

The size of an extent in pages.

- **Auto** Indicates whether the prefetch size is set to AUTOMATIC. The possible values are:
  - Yes
  - No

# Prefetch

The number of pages read from the table space for each range prefetch request.

**BufID** The ID of the buffer pool that this table space is mapped to.

## BufIDDisk

The ID of the buffer pool that this table space will be mapped to at next startup.

- **FSC** File system caching, indicates whether buffered I/O was specified by the user at CREATE TABLESPACE or ALTER TABLESPACE time. The possible values are:
  - Yes
  - No

## NumCntrs

The number of containers owned by a table space.

#### MaxStripe

The maximum stripe set currently defined in the table space (applicable to DMS table spaces only).

#### LastConsecPg

The last consecutive object table extent.

**Name** The name of the table space.

## Table space Statistics:

**Id** The table space ID.

#### **TotalPages**

For DMS table spaces, the sum of the gross size of each of the table space's containers (reported in the total pages field of the container).

For SMS table spaces, this value reflects the number of pages in the filesystem owned by the table space.

#### Usab1ePgs

For DMS table spaces, the sum of the net size of each of the table space's containers (reported in the usable pages field of the container).

For SMS table spaces, this value reflects the number of pages in the filesystem owned by the table space.

#### UsedPgs

For DMS table spaces, the total number of pages currently in use in the table space.

For SMS table spaces, this value reflects the number of pages in the filesystem owned by the table space.

## **PndFreePgs**

The number of pages that are not available for use but will be available if all the currently outstanding transactions commit.

#### **FreePgs**

For DMS table spaces, the number of pages available for use in the table space.

For SMS table spaces, this value is always 0.

**HWM** The highest allocated page in the table space.

#### State

- 0x0000000 NORMAL
- 0x0000001 QUIESCED: SHARE
- 0x0000002 QUIESCED: UPDATE
- 0x0000004 QUIESCED: EXCLUSIVE

- 0x0000008 LOAD PENDING
- 0x0000010 DELETE PENDING
- Ox0000020 BACKUP PENDING
- 0x0000040 ROLLFORWARD IN PROGRESS
- 0x0000080 ROLLFORWARD PENDING
- 0x0000100 RESTORE PENDING
- 0x0000200 DISABLE PENDING
- 0x0000400 REORG IN PROGRESS
- 0x0000800 BACKUP IN PROGRESS
- 0x0001000 STORAGE MUST BE DEFINED
- 0x0002000 RESTORE IN PROGRESS
- 0x0004000 OFFLINE
- 0x0008000 DROP PENDING
- 0x0010000 WRITE SUSPENDED
- 0x0020000 LOAD IN PROGRESS
- 0x0200000 STORAGE MAY BE DEFINED
- 0x0400000 STORAGE DEFINITION IS IN FINAL STATE
- Ox0800000 STORAGE DEFINITION CHANGED PRIOR TO ROLLFORWARD
- 0x1000000 DMS REBALANCER IS ACTIVE
- 0x2000000 DELETION IN PROGRESS
- 0x4000000 CREATION IN PROGRESS

# MinRecTime

The minimum recovery time for the table space.

# NQuiescers

The number of quiescers.

# PathsDropped

For automatic storage table spaces, specifies whether one or more containers reside on a storage path that has been dropped. The possible values are:

- Yes
- No

# Table space Autoresize Statistics:

- **Id** The table space ID.
- **AS** Indicates whether or not the table space is using automatic storage. The possible values are:
  - Yes
  - No
- **AR** Indicates whether or not the table space is enabled to be automatically resized. The possible values are:
  - Yes
  - No

# InitSize

For automatic storage table spaces, the value of this parameter is the initial size of the table space in bytes.

## IncSize

For automatically resized table spaces, if the value of the IIP field is No, the value of this parameter is the size, in bytes, that the table space will automatically be increased by (per database partition) when the table space is full and a request for space is made. If the value of the IIP field is Yes, the value of this parameter is a percentage.

- **IIP** For automatically resized table spaces, the value of this parameter indicates whether the increment value in the IncSize field is a percent or not. The possible values are:
  - Yes
  - No

## MaxSize

For automatically resized table spaces, the value of this parameter specifies the maximum size, in bytes, to which the table space can automatically be increased (per database partition). A value of NONE indicates that there is no maximum size.

## LastResize

The timestamp of the last successful automatic resize operation.

- **LRF** Last resize failed indicates whether the last automatic resizing operation was successful or not. The possible values are:
  - Yes
  - No

## Table space Containers:

**TspId** The ID of the table space that owns the container.

#### ContainNum

The number assigned to the container in the table space.

- **Type** The type of container. The possible values are:
  - Path
  - Disk
  - File
  - Striped Disk
  - Striped File

#### TotalPgs

The number of pages in the container.

Usab1ePgs

The number of usable pages in the container.

## StripeSet

The stripe set where the container resides (applicable to DMS table spaces only).

## Container

The name of the container.

**PathID** For automatic storage table spaces, the identifier of the storage path on which the container resides.

See Sample output of the db2pd -tablespaces command.

# -tcbstats parameter

For the **-tcbstats** parameter, the following information is returned:

## TCB Table Information:

## TbspaceID

The table space identifier.

## TableID

The table identifier.

**PartID** For partitioned tables, this is the data partition identifier. For non-partitioned table this will display 'n/a'.

#### MasterTbs

For partitioned tables, this is the logical table space identifier to which the partitioned table belongs. For non-partitioned tables, this value corresponds to the TbspaceID.

## MasterTab

For partitioned tables, this is the logical table identifier of the partitioned table. For non-partitioned tables, this value corresponds to the TableID.

#### TableName

The name of the table.

#### SchemaNm

The schema that qualifies the table name.

#### ObjClass

The object class. The possible values are:

- Perm (permanent).
- Temp (temporary).

## DataSize

The number of pages in the data object.

LfSize The number of pages in the long field object.

#### LobSize

The number of pages in the large object.

## XMLSize

The number of pages in the XML object.

## TCB Table Stats:

## TableName

The name of the table.

#### SchemaNm

The schema that qualifies the table name.

- **Scans** The number of scans that have been performed against the table.
- **UDI** The number of update, delete, and insert operations that have been performed against the table since the last time that the table statistics were updated through the background statistics collection process or manually using the RUNSTATS command.
- **RTSUDI** The number of update, delete, and insert operations that have been performed against the table since the last time that the table statistics were updated by real-time statistics gathering, background statistics collection process, or manual RUNSTATS.

## PgReorgs

The number of page reorganizations performed.

#### NoChgUpdts

The number of updates that did not change any columns in the table.

**Reads** The number of rows read from the table when the table switch was on for monitoring.

#### FscrUpdates

The number of updates to a free space control record.

# Inserts

The number of insert operations performed on the table.

# Updates

The number of update operations performed on the table.

# Deletes

The number of delete operations performed on the table.

#### **OvFlReads**

The number of overflows read on the table when the table switch was on for monitoring.

# **OvFlCrtes**

The number of new overflows that were created.

# RowsComp

The total number of rows that were compressed.

## RowsUNcomp

The total number of rows that were uncompressed.

#### CCLogReads

The number of times the currently committed version of a row was retrieved for the table.

# StoredBytes

This column corresponds to the "Total stored temp bytes" from the **db2pd** –temptable output.

#### BytesSaved

This column corresponds to the "Total bytes saved" value from the **db2pd** –**temptable** output.

**Note** The following data is only displayed when the **-all** or **-index** option is specified with the **-tcbstats** parameter.

## **TCB Index Information:**

# InxTbspace

The table space where the index resides.

#### ObjectID

The object identifier of the index.

**PartID** For partitioned tables, the data partition identifier. For nonpartitioned tables, N/A is displayed.

#### **TbspaceID**

The table space identifier.

#### TableID

The table identifier.

#### MasterTbs

For partitioned tables, this is the logical table space identifier to which the partitioned table belongs. For non-partitioned tables, this value corresponds to the TbspaceID.

## MasterTab

For partitioned tables, this is the logical table identifier of the partitioned table. For non-partitioned tables, this value corresponds to the TableID.

#### TableName

The name of the table.

#### SchemaNm

The schema that qualifies the table name.

**IID** The index identifier.

#### IndexObjSize

The number of pages in the index object.

# **TCB Index Stats:**

## TableName

The name of the table.

**IID** The index identifier.

**PartID** For partitioned tables, the data partition identifier. For nonpartitioned tables, N/A is displayed.

## EmpPgDe1

The number of empty leaf nodes that were deleted.

#### RootSplits

The number of key insert or update operations that caused the index tree depth to increase.

#### **BndrySplits**

The number of boundary leaf splits that result in an insert operation into either the lowest or the highest key.

#### PseuEmptPg

The number of leaf nodes that are marked as being pseudo empty.

#### EmPgMkdUsd

The number of pseudo empty pages that have been reused.

**Scans** The number of scans against the index.

# IxOnlyScns

The number of index only scans (result of scan satisfied by access to index only).

# KeyUpdates

The number of updates to the key.

#### InclUpdats

The number of included column updates.

#### NonBndSpts

The number of non-boundary leaf splits.

#### PgAllocs

The number of allocated pages.

**Merges** The number merges performed on index pages.

#### PseuDels

The number of keys that are marked as pseudo deleted.

#### DelClean

The number of pseudo deleted keys that have been deleted.

## IntNodSp1

The number of intermediate level splits.

## -temptable parameter

In order to calculate the cumulative compression ratio across all of the temporary tables, the following formula can be used:

## Note:

- The term Eligible indicates temporary tables that meet the compression criteria.
- The term Compressed indicates temporary tables that finally have sufficient data inserted to be compressed.

```
hotel26:/home/billyp> db2pd -db billdb -temptable
db_state1 db_state2 db_state3 db_state4 use_count dbname
                                                      dbpath
           ----- -----
/home/billyp/billyp/NODE0000/SQL00011/
System Temp Table Stats:
       Number of Temp Tables : 0
              Comp Eligible Temps
                                   : 0
              Compressed Temps
                                  : 0
                                   : 0
              Total Temp Bytes
              Total Bytes Saved : 0
Total Compressed Rows : 0

User Temp Table Stats:
       Number of Temp Tables : 0
              Comp Eligible Temps
                                   : 0
              Compressed Temps
                                   : 0
              Total Stored Temp Bytes : 0
              Total Bytes Saved : 0
              Total Compressed Rows
                                    : 0
                                   : 0
              Total Temp Table Rows
                    All of the counters can be reset to zero by using the reset option.
                    hotel26:/home/billyp> db2pd -db bill -temptable reset
                            Resetting counters to 0.
```

See Sample output of the db2pd -temptable command.

# -thresholds parameter

For the **-thresholds** parameter, the following information is returned:

- Threshold Name: Threshold name
- Threshold ID: Threshold identifier
- Domain: Threshold domain
- Domain ID: Threshold domain identifier
- Predicate ID: Threshold predicate identifier
- Maximum Value: Threshold maximum value
- Enforcement: Threshold enforcement scope
- Queuing: Threshold is a queueing threshold

- Queue Size: Threshold queue size setting
- Collect Flags: Setting of COLLECT ACTIVITY DATA option for threshold
- Partition Flags: Partitions where COLLECT ACTIVITY option setting applies
- Execute Flags: Threshold action setting
- Enabled: State of threshold, enabled or disabled
- · Check Interval (seconds): Frequency setting for threshold condition checks
- Remap Target Serv. Subclass: Target service subclass setting for remapping threshold action
- Log Violation Evmon Record: THRESHOLD VIOLATIONS event monitor log setting

If the threshold is a queuing threshold, the queue section will also show:

- Queue information for threshold: Threshold Name
- Max Concurrency: Maximum concurrency setting
- Concurrency: Actual concurrency value
- Max Queue Size: Maximum threshold queue size setting
- Agents Currently Queued: At the catalog node, the list of all agents waiting in the threshold queue (shown only when agents are queued)

See Sample output of the db2pd -thresholds command.

# -transactions parameter

For the -transactions parameter, the following information is returned:

## App1Hand1

The application handle of the transaction.

## TranHd1

The transaction handle of the transaction.

- Locks The number of locks held by the transaction.
- **State** The transaction state.
- **Tflag** The transaction flag. The possible values are:
  - 0x00000002. This value is only written to the coordinator node of a two-phase commit application, and it indicates that all subordinate nodes have sent a "prepare to commit" request.
  - 0x00000020. The transaction must change a capture source table (used for data replication only).
  - 0x00000040. Crash recovery considers the transaction to be in the prepare state.
  - 0x00010000. This value is only written to the coordinator partition in a partitioned database environment, and it indicates that the coordinator partition has not received a commit request from all subordinate partitions in a two-phase commit transaction.
  - 0x00040000. The rolling back of the transaction is pending.
  - 0x01000000. The transaction resulted in an update on a database partition server that is not the coordinator partition.
  - 0x04000000. Loosely coupled XA transactions are supported.
  - 0x08000000. Multiple branches are associated with this transaction and are using the loosely coupled XA protocol.

- 0x10000000. A data definition language (DDL) statement has been issued, indicating that the loosely coupled XA protocol cannot be used by the branches participating in the transaction.
- Tflag2 Transaction flag 2. The possible values are:
  - 0x00000004. The transaction has exceeded the limit specified by the **num\_log\_span** database configuration parameter.
  - 0x00000008. The transaction resulted because of the running of a DB2 utility.
  - 0x00000020. The transaction will cede its locks to an application with a higher priority (this value ordinarily occurs for jobs that the DB2 database system automatically starts for self tuning and self management).
  - 0x00000040. The transaction will not cede its row-level locks to an application with a higher priority (this value ordinarily occurs for jobs that the DB2 database system automatically starts for self-tuning and self-management)

## Firstlsn

First LSN of the transaction.

## Last1sn

Last LSN of the transaction.

#### LogSpace

The amount of log space that is reserved for the transaction.

#### SpaceReserved

The total log space that is reserved for the transaction, including the used space and all compensation records.

#### **TID** Transaction ID.

## AxRegCnt

The number of applications that are registered for a global transaction. For local transactions, the value is 1.

**GXID** Global transaction ID. For local transactions, the value is 0.

## ClientUserID

Client userid for the transaction, which is the same as tpmon\_client\_userid (TP Monitor Client User ID monitor element).

## **ClientWrkstnName**

Client workstation name for the transaction, which is the same as tpmon\_client\_wkstn (TP Monitor Client Workstation Name monitor element).

#### ClientApp1Name

Client application name driving the transaction, which is the same as tpmon\_client\_app (TP Monitor Client Application monitor element).

# ClientAccntng

Accounting string of the client driving the transaction, which is the same as tpmon\_acc\_str (TP Monitor Client Accounting String monitor element).

## -wlocks parameter

For the **-wlocks** parameter, the following information is returned:

# App1Hand1 The application handle, including the node and the index. TranHd1 The transaction handle that is requesting the lock. LockName The name of the lock. The type of lock. Туре Mode The lock mode. The possible values are: IS • IX • S SIX • X • IN • Z • U NS

- NW
- **Conv** The lock mode to which the lock will be converted after the lock wait ends.
- **Sts** The lock status. The possible values are:
  - G (granted)
  - C (converting)
  - W (waiting)

## CoorEDU

The EDU ID of the coordinator agent for the application.

## AppName

The name of the application.

- AuthID The authorization identifer.
- **AppID** The application ID. This values is the same as the **appl\_id** monitor element data.

See Sample output of the db2pd -wlocks command.

# -workactionsets parameter

For the -workactionsets parameter, the following information is returned:

- Address
- Work action set ID
- Work action set name
- Associated work class set ID
- Type of object work action set is associated (database or service class)
- · ID of the object (service class or database) work action set is associated with
- All the work actions within the work action set:
  - address
  - action ID
  - action type

 reference object ID (threshold ID or service class ID or null depending on the action type)

# -workclasssets parameter

For the **-workclasssets** parameter, the following information is returned:

- address
- work class ID
- reference counter (number of different work action sets that reference this work class set)
- All the work classes within the work class set (shown in their evaluation order):
  - address
  - class ID
  - class name
  - class type
  - schema name
  - from value
  - to value
  - range units

# -workloads parameter

For the **-workloads** parameter, the following information is returned, specific to the headings:

## Workload definitions

- Workload ID and name
- · Database access permission for workload occurrences
- The number of concurrent workload occurrences
- Workload thresholds
- · Associated service class
- Statistics collection settings
- Histogram template IDs

## Usage privilege holders

- Workload ID
- Type of holder
- Authorization ID

## Local partition workload statistics

- Workload ID and name
- Workload occurrence statistics
- Time since last statistics reset
- Activity statistics

See Sample output of the db2pd -workloads command.

# Sample output

## -addnode

The following is a sample of the output of the db2pd -addnode command:

\_\_\_\_\_ Summary of add partition processing done for partition [50] \_\_\_\_\_ 00:Creating database partitions • True 01:Database partitions are created : True 08:Collecting storage information : True 09:Storage information is collected : True 11:FCM Send & Receive daemons are blocked : True 12:FCM Send & Receive daemons are reactivated : True 13:db2start processing is complete : True Conflicting states or activities for add partition for partition[50] \_\_\_\_\_ [14] Messages found for partition [50] \_\_\_\_\_ [Fri Oct 24 16:16:27 2008]:Addnode agent:Got automatic storage details [Fri Oct 24 16:16:28 2008]:Addnode agent:Skeleton datbase is created [Fri Oct 24 16:16:28 2008]:Addnode agent:Scanning for db alias=[PE ] name=[PE [Fri Oct 24 16:16:28 2008]:Addnode agent:Found db alias=[PE ] name=[PE ] [Fri Oct 24 16:16:28 2008]:Addnode agent:Instance directory already exists [Fri Oct 24 16:16:28 2008]:Addnode agent:Node directory already exists [Fri Oct 24 16:16:28 2008]:Addnode agent:Node directory is created [Fri Oct 24 16:16:29 2008]:Addnode agent:Getting automatic storage details [Fri Oct 24 16:16:29 2008]:Addnode agent:Got automatic storage details [Fri Oct 24 16:16:30 2008]:Addnode agent:Skeleton datbase is created [Fri Oct 24 16:16:30 2008]:Addnode agent:Database activation is not required [Fri Oct 24 16:16:30 2008]:Addnode agent:Database activation is complete [Fri Oct 24 16:16:30 2008]:Addnode agent:Online mode processing is complete [Fri Oct 24 16:16:30 2008]:db2start is complete

oldviewapps

Returns information about which applications see the number of database partition servers (nodes) in the instance before the add database partition server operation occurred.

]

The following is a sample of the output of the db2pd -addnode oldviewsapps command:

```
Summary of add partition processing done for partition[0]
```

Conflicting states or activities for add partition for partition[0]

Applications with old view of instance for partition [0]

```
App.Handle(0000000,00000072) view has [3] nodes, instance has [4] nodes
App.Handle(0000000,00000065) view has [3] nodes, instance has [4] nodes

App.Handle(0000000,00000067) view has [3] nodes, instance has [4] nodes
```

**detail** When used with the db2pd command, returns detailed information about the add database partition server operation, including the step in progress and events that are incompatible with the add database partition server operation. When used with the **oldviewapps** option, also returns information about which

applications have a view of the instance that does not include recently added database partition servers.

The following is a sample of the output of the db2pd -addnode detail command:

#### -reorgs index

The following is an example of output obtained using the **-reorgs index** parameter which reports the index reorg progress for a range-partitioned table with 2 partitions.

**Note:** The first output reports the Index Reorg Stats of the non-partitioned indexes. The following outputs report the Index Reorg Stats of the partitioned indexes on each partition; the index reorg statistics of only one partition is reported in each output.

```
Index Reorg Stats:
Retrieval Time: 02/08/2010 23:04:21
TbspaceID: -6 TableID: -32768
Schema: ZORAN TableName: BIGRPT

A new 'Max HWM' column is added to the db2pd –tablespaces output to indicate the maximum HWM for a DMS table space since the instance was started. The 'HWM' column in the output is the current HWM, which for a temporary DMS table space, represents the point-in-time value of the amount of disk space used. For SMS table spaces, the HWM and Max HWM will not have any value.

After a query has been issued, in-memory information about the temporary tables used in the last transaction will be available using db2pd. The example below shows the new column in **bold**. The value of the Max HWM will always be equal to, or greater than, the HWM.

hotel26:/home/billyp> db2pd -db bill -tablespaces

#### -temptable

The system monitor elements could also be used to determine the effectiveness of temporary table compression by examining the amount of buffer pool reads and writes. The following is a sample of the output of the db2pd -temptable command:

```
hotel26:/home/billyp> db2pd -db billdb -temptable
db state1 db state2 db state3 db state4 use count dbname
                                              dbpath
                                              ------
_____ ____
/home/billyp/billyp/NODE0000/SQL00011/
System Temp Table Stats:
      Number of Temp Tables : 0
            Comp Eligible Temps : 0
            Compressed Temps
                             : 0
            Total Stored Temp Bytes : 0
            Total Bytes Saved : 0
            Total Compressed Rows : 0
            Total Temp Table Rows : 0
User Temp Table Stats:
      Number of Temp Tables : 0
            Comp Eligible Temps : 0
            Compressed Temps : 0
            Total Stored Temp Bytes : 0
            Total Bytes Saved : 0
            Total Compressed Rows
                              : 0
            Total Temp Table Rows : 0
```

The same information is stored for system temporary tables as well as user temporary tables. However, all of the counters above are cumulative, and are updated as temporary tables are dropped. As such, these counters represent only historical information.

#### -thresholds

The following is a sample of the threshold information output for a database threshold and its queue.

Sample threshold output:

Threshold Name	=	MAXDBACTIVITIES
Threshold ID	=	6
Domain	=	10
Domain ID	=	10
Predicate ID	=	90
Maximum Value	=	2
Enforcement	=	D
Queueing	=	Y
Queue Size	=	0
Collect Flags	=	V
Partition Flags	=	С
Execute Flags	=	С
Enabled	=	Y
Check Interval (seconds)	=	-1
Remap Target Serv. Subclass	=	0
Log Violation Evmon Record	=	γ

Sample database threshold queue output:

Database Threshold Tickets:

Ticket inform Activity ID 1	nation for UOW ID 6	threshold: Classific READ_DML	TH1 wit ation	th thres AppHanc 51	5hold  1 [no [00	ID 1 d-index] 0-00051]

Sets flags in the DB2 database memory sets to influence the database system behavior for problem determination purposes.

# Authorization

One of the following authority levels is required:

- The SYSADM authority level.
- The SYSCTRL authority level.
- The SYSMAINT authority level.
- The SYSMON authority level.

When the SYSMON authorization level is granted, the following options are not available:

- catch
- cos
- dbcfg
- dbmcfg
- fodc
- trapresilience

# **Required connection**

There is no minimum connection requirement. However, if a database scope option is specified, that database must be active before the command can return the requested information.

# **Command syntax**

\_\_\_\_\_component=*componentID\_\_\_*\_lockname=*lockname\_\_*\_\_locktype=*locktype\_\_*\_\_

# **Command parameters**

-catch Instructs the database manager to catch an error or warning.

clear Clear any catch flags that are set.

status Display any catch flags that are set.

errorCode

Catch specific flags that are set.

Possible *errorCode* options are:

- *sqlCode*[*,reasonCode*] / *sqlCode*=*sqlCode*[*,reasonCode*]
- ZRC (hex or integer)
- ZRC #define (such as SQLP\_LTIMEOUT)
- ADM (such as ADM1611)
- String (such as diagstr="Hello World")
- ECF (hex or integer)
- "deadlock" or "locktimeout"

Catching specific flags that you specify, such as an administration notification message (ADM1611) or any string ("Hello World") observed in the db2diag log, causes the db2cos script to dump out this information.

stack Produce stack trace in db2diag log file. Default.

db2cos

Run the db2cos callout script found in the bin directory. Default.

#### stopdb2trc

Stop db2trc command.

#### dumpcomponent

Dump component flag.

component=componentID Component ID.

#### lockname=lockname

Lockname for catching specific lock (lockname=000200030000001F000000052).

#### **locktype**=*locktype*

Locktype for catching specific lock (locktype=R or locktype=52).

#### count=count

The number of times the database manager executes db2cos during a database manager trap. The default is 255.

# **-cos** Instructs the database manager how to invoke the db2cos callout script upon a database manager trap.

#### status Print the status.

- **off** Turn off the database manager call to db2cos during a database manager trap.
- **on** Turn on the database manager call to db2cos during a database manager trap.

#### sleep=numsec

Amount of time to sleep between checking the size of the output file generated by db2cos. The default is 3 seconds.

#### timeout=numsec

Amount of time to wait before assuming db2cos script has completed. The default is 30 seconds.

#### count=count

The number of times to execute db2cos during a database manager trap. The default is 255.

#### SQLO\_SIG\_DUMP

Enable db2cos execution when SQLO\_SIG\_DUMP signal is received.

#### -dbmcfg

Sets DBM Config Reserved Bitmap. This option is password protected which can be obtained from IBM DB2 Service.

#### xml=0 | 1

Values 0 (default) or 1 (instance has xml data).

-dbcfg Sets Database Config Reserved Bitmap. This option is password protected which can be obtained from IBM DB2 Service.

#### xml=0 | 1

Values 0 (default) or 1 (database has xml data).

**-fodc** Sets flags in the DB2 database memory sets. This influences the database system behavior during problem determination situations involving first occurrence data collection (FODC).

The supported -fodc options with their potential values and defaults are:

reset Restore all the FODC options to their defaults.

**status** Display status of all FODC options. This is a default option, i.e. FODC status will be displayed when db2pdcfg is invoked without parameters.

#### DUMPCORE=

Enables or disables core file generation on only UNIX and Linux platforms.

#### AUTO

Core file is generated if trap cannot be sustained and instance is shut down.

- ON Enables core file generation and overrides DB2RESILIENCE registry variable setting.
- **OFF** Disables core file generation.

#### **DUMPDIR=***dirpath*

Specifies absolute pathname of the directory where core file or shared memory dump will be created. This option may be used for other large binary dumps that have to be stored outside of the FODC package, not only core file and shared memory dumps. Default is DIAGPATH directory or the default diagnostic directory if DIAGPATH is not defined.

#### **CORELIMIT**=size

The maximum size of core files created. This value will override current core file size limit setting. Consideration should be given to the available file system space because core files can be quite large. The size is dependent on the DB2 configuration and the state of the process at the time the problem occurs. If CORELIMIT is not set, DB2 will set the core file size to the value equal to the current ulimit setting.

If CORELIMIT is to be changed using db2pdcfg, it is subject to the usual UNIX access permissions and in some cases CORELIMIT will not be able to exceed your ulimit setting. Use DB2FODC registry variable to change that value on db2start or use large ulimit setting before starting DB2 product.

#### -global

Specifies that db2pdcfg will also be run on remote hosts. If the **-file** parameter is specified, a single file consisting of all the individual files from remote host will be created on the computer from where you issued the db2pdcfg command.

**Note:** This command parameter is available in DB2 Version 9.7 Fix Pack 2 and later fix packs.

#### -dbp database partition number

Specifies that db2pdcfg will be run on the remote host of the specified database partition. If no database partition is specified with the **-global** option, db2pdcfg will run on all remote hosts.

#### -trapresilience

This option displays or modifies trap resilience parameters for problem determination purposes.

The following is a sample output when this option is specified:

DB2 trap resilience is enabled. Current threshold setting : 0 (threshold disabled) Number of traps sustained : 0

threshold=number

Default value: 0 (threshold disabled)

Minimum value: 0

Maximum value: 4294967295 Specifying a number after the threshold= option sets the upper limit of traps which will be sustained for the life of the instance. When this threshold is surpassed, the instance will be stopped regardless if the next trap could have been sustained. The following is a sample output when this option is specified: db2pdcfg -trapresilience threshold=1

DB2 trap resilience threshold is set to 1

#### Usage notes

db2pdcfg is a method for dynamically changing (online) the FODC options.

Since db2pdcfg sets flags in the DB2 database memory, changes done with the db2pdcfg tool will be active only while the instance is up. In order to make the changes permanent, use the DB2FODC registry variable.

In the -fodc option, some of the settings are specified with the format variable=value. Multiple options can be specified in a single command line: db2pdcfg -fodc DUMPCORE=ON -fodc CORELIMIT=8GB

Alternatively, several settings can be concatenated in a single command line string using spaces:

db2pdcfg -fodc DUMPCORE=ON CORELIMIT=8GB

Executing the db2pdcfg command, without any options, provides the following informative summary output with respect to trap resilience (highlighted in bold):

quark:/home/quark/marvin> db2pdcfg
Current PD Control Block Settings:

All error catch flag settings cleared.

db2cos is enabled for engine traps. PD Bitmap: 0x1000 Sleep Time: 3 Timeout: 30

Current bitmap value: 0x0

Instance is not in a sleep state

DB2 trap resilience is enabled. Current threshold setting : θ (threshold disabled) Number of traps sustained : θ FODC (First Occurrence Data Capture) options: Dump directory for large objects (DUMPDIR)= /home/quark/marvin/sqllib/db2dump/ Dump Core files (DUMPCORE)= 0N

# db2perfc - Reset database performance values

Resets the performance values for one or more databases. It is used with the Performance Monitor on Windows operating systems.

# Authorization

Local Administrator

#### **Required connection**

None

#### Command syntax

# **Command parameters**

- -d Specifies that performance values for DCS databases should be reset.
- *dbalias* Specifies the databases for which the performance values should be reset. If no databases are specified, the performance values for all active databases will be reset.

#### Examples

The following example resets performance values for all active DB2 databases: db2perfc

The following example resets performance values for specific DB2 databases: db2perfc dbalias1 dbalias2

The following example resets performance values for all active DB2 DCS databases: db2perfc -d

The following example resets performance values for specific DB2 DCS databases: db2perfc -d dbalias1 dbalias2

#### Usage notes

When an application calls the DB2 monitor APIs, the information returned is normally the cumulative values since the DB2 server was started. However, it is often useful to reset performance values, run a test, reset the values again, and then rerun the test.

The program resets the values for all programs currently accessing database performance information for the relevant DB2 server instance (that is, the one held in db2instance in the session in which you run db2perfc). Invoking db2perfc also resets the values seen by anyone remotely accessing DB2 performance information when the command is executed.

# db2perfc - Reset database performance values

The db2ResetMonitor API allows an application to reset the values it sees locally, not globally, for particular databases.

# db2perfi - Performance counters registration utility

Adds the DB2 Performance Counters to the Windows operating system. This must be done to make DB2 and DB2 Connect performance information accessible to the Windows Performance Monitor.

-

# **Authorization**

Local Administrator

# **Required connection**

None

# **Command syntax**

▶►—db2perfi—

# **Command parameters**

- -i Registers the DB2 performance counters.
- -u Deregisters the DB2 performance counters.

# **Usage notes**

The db2perfi -i command will do the following:

- 1. Add the names and descriptions of the DB2 counter objects to the Windows registry.
- 2. Create a registry key in the Services key in the Windows registry as follows: HKEY LOCAL MACHINE

```
\System
\CurrentControlSet
\Services
\DB2_NT_Performance
\Performance
Library=Name of the DB2 performance support DLL
Open=Open function name, called when the DLL is
first loaded
Collect=Collect function name, called to request
performance information
Close=Close function name, called when the DLL is
unloaded
```

# db2perfr - Performance monitor registration tool

Used with the Performance Monitor on Windows operating systems. The db2perfr command is used to register an administrator user name and password with DB2 with DB2 when accessing the performance counters. This allows a remote Performance Monitor request to correctly identify itself to the DB2 database manager, and be allowed access to the relevant DB2 performance information. You also need to register an administrator user name and password if you want to log counter information into a file using the Performance Logs function.

# Authorization

Local Administrator

# **Required connection**

None

# **Command syntax**

►► db2perfr \_\_\_\_-r \_\_ username \_\_\_ password \_\_\_\_\_ ►

# **Command parameters**

- -r Registers the user name and password.
- -u Deregisters the user name and password.

#### **Usage notes**

- Once a user name and password combination has been registered with DB2, even local instances of the Performance Monitor will explicitly log on using that user name and password. This means that if the user name information registered with DB2 does not match, local sessions of the Performance Monitor will not show DB2 performance information.
- The user name and password combination must be maintained to match the user name and password values stored in the Windows security database. If the user name or password is changed in the Windows security database, the user name and password combination used for remote performance monitoring must be reset.
- The default Windows Performance Monitor user name, SYSTEM, is a DB2 reserved word and cannot be used.

# db2rbind - Rebind all packages

Rebinds packages in a database.

#### Authorization

dbadm

# **Required connection**

None

#### **Command syntax**

http://www.adatabasel_logfile_			
		└u—userid—_n—nassword—	

\_\_\_\_conservative\_\_\_\_

# **Command parameters**

database

Specifies an alias name for the database whose packages are to be revalidated.

-l logfile

Specifies the (optional) path and the (mandatory) file name to be used for recording the package revalidation process.

Example:

```
cat <logfile>
Starting time .... Thu Jun 18 02:47:11 2009
Succeeded to rebind = 0
Failed to rebind = 0
Ending time .... Thu Jun 18 02:47:11 2009
```

- **all** Specifies that rebinding of all valid and invalid packages is to be done. If this option is not specified, all packages in the database are examined, but only those packages that are marked as invalid are rebound, so that they are not rebound implicitly during application execution.
- -u userid
  - User ID. This parameter must be specified if a password is specified.
- -p password

Password. This parameter must be specified if a user ID is specified.

-r Resolve. Specifies whether rebinding of the package is to be performed with or without conservative binding semantics. This affects whether new objects that use the SQL path for resolution are considered during resolution on static DML statements in the package. This option is not supported by DRDA. Valid values are:

#### conservative

Only those objects in the SQL path that were defined before the last explicit bind time stamp are considered for resolving references to any objects that use the SQL path for object resolution. Conservative binding semantics are used. This is the default. This option is not supported for an inoperative package.

**any** All possible matches in the SQL path are considered for resolving references to any objects that use the SQL path for object resolution. Conservative binding semantics are not used.

# **Usage notes**

- This command uses the rebind API (sqlarbnd) to attempt the re-validation of all packages in a database.
- Use of db2rbind is not mandatory.
- For packages that are invalid, you can choose to allow package revalidation to occur implicitly when the package is first used. You can choose to selectively revalidate packages with either the REBIND or the BIND command.
- If the rebind of any of the packages encounters a deadlock or a lock timeout the rebind of all the packages will be rolled back.

# db2relocatedb - Relocate database

This command renames a database, or relocates a database or part of a database (for example, the container and the log directory) as specified in the configuration file provided by the user. This tool makes the necessary changes to the DB2 instance and database support files.

# Authorization

None

#### Command syntax

```
►►—db2relocatedb—-f—configFilename-
```

# **Command parameters**

-f configFilename

Specifies the name of the file containing the configuration information necessary for relocating the database. This can be a relative or absolute file name. The format of the configuration file is:

```
DB_NAME=oldName,newName

DB_PATH=oldPath,newPath

INSTANCE=oldInst,newInst

NODENUM=nodeNumber

LOG_DIR=oldDirPath,newDirPath

CONT_PATH=oldContPath1,newContPath1

CONT_PATH=oldContPath2,newContPath2

...

STORAGE_PATH=oldStoragePath1,newStoragePath1

STORAGE_PATH=oldStoragePath2,newStoragePath2

...

FAILARCHIVE_PATH=newDirPath

LOGARCHMETH1=newDirPath

MIRRORLOG_PATH=newDirPath

OVERFLOWLOG_PATH=newDirPath
```

•••

Where:

#### DB\_NAME

Specifies the name of the database being relocated. If the database name is being changed, both the old name and the new name must be specified. This is a required field.

#### DB\_PATH

Specifies the original path of the database being relocated. If the database path is changing, both the old path and new path must be specified. This is a required field.

#### **INSTANCE**

Specifies the instance where the database exists. If the database is being moved to a new instance, both the old instance and new instance must be specified. This is a required field.

#### NODENUM

Specifies the node number for the database node being changed. The default is 0.

#### LOG\_DIR

Specifies a change in the location of the log path. If the log path is being changed, both the old path and new path must be specified. This specification is optional if the log path resides under the database path, in which case the path is updated automatically.

#### CONT\_PATH

Specifies a change in the location of table space containers. Both the old and new container path must be specified. Multiple CONT\_PATH lines can be provided if there are multiple container path changes to be made. This specification is optional if the container paths reside under the database path, in which case the paths are updated automatically. If you are making changes to more than one container where the same old path is being replaced by a common new path, a single CONT\_PATH entry can be used. In such a case, an asterisk (\*) could be used both in the old and new paths as a wildcard.

#### STORAGE\_PATH

This is only applicable to databases with automatic storage enabled. It specifies a change in the location of one of the storage paths for the database. Both the old storage path and the new storage path must be specified. Multiple STORAGE\_PATH lines can be given if there are several storage path changes to be made.

#### FAILARCHIVE\_PATH

Specifies a new location to archive log files if the database manager fails to archive the log files to either the primary or the secondary archive locations. You should only specify this field if the database being relocated has the **failarchpath** configuration parameter set.

#### LOGARCHMETH1

Specifies a new primary archive location. You should only specify this field if the database being relocated has the **logarchmeth1** configuration parameter set.

#### LOGARCHMETH2

Specifies a new secondary archive location. You should only specify this field if the database being relocated has the **logarchmeth2** configuration parameter set.

#### MIRRORLOG\_PATH

Specifies a new location for the mirror log path. The string must point to a path name, and it must be a fully qualified path name, not a relative path name. You should only specify this field if the database being relocated has the **mirrorlogpath** configuration parameter set.

#### OVERFLOWLOG\_PATH

Specifies a new location to find log files required for a rollforward operation, to store active log files retrieved from the archive, and to find and store log files required by the db2ReadLog API. You should only specify this field if the database being relocated has the **overflowlogpath** configuration parameter set.

Blank lines or lines beginning with a comment character (#) are ignored.

# **Examples**

Example 1

#### db2relocatedb - Relocate database

To change the name of the database TESTDB to PRODDB in the instance db2inst1 that resides on the path /home/db2inst1, create the following configuration file:

```
DB_NAME=TESTDB,PRODDB
DB_PATH=/home/db2inst1
INSTANCE=db2inst1
NODENUM=0
```

Save the configuration file as relocate.cfg and use the following command to make the changes to the database files:

```
db2relocatedb -f relocate.cfg
```

#### Example 2

To move the database DATAB1 from the instance jsmith on the path /dbpath to the instance prodinst do the following:

- 1. Move the files in the directory /dbpath/jsmith to /dbpath/prodinst.
- 2. Use the following configuration file with the db2relocatedb command to make the changes to the database files:

```
DB_NAME=DATAB1
DB_PATH=/dbpath
INSTANCE=jsmith,prodinst
NODENUM=0
```

#### Example 3

The database PRODDB exists in the instance inst1 on the path /databases/PRODDB. The location of two table space containers needs to be changed as follows:

- SMS container /data/SMS1 needs to be moved to /DATA/NewSMS1.
- DMS container /data/DMS1 needs to be moved to /DATA/DMS1.

After the physical directories and files have been moved to the new locations, the following configuration file can be used with the db2relocatedb command to make changes to the database files so that they recognize the new locations:

```
DB_NAME=PRODDB
DB_PATH=/databases/PRODDB
INSTANCE=inst1
NODENUM=0
CONT_PATH=/data/SMS1,/DATA/NewSMS1
CONT_PATH=/data/DMS1,/DATA/DMS1
```

#### Example 4

The database TESTDB exists in the instance db2inst1 and was created on the path /databases/TESTDB. Table spaces were then created with the following containers:

```
TS1
TS2_Cont0
TS2_Cont1
/databases/TESTDB/TS3_Cont0
/databases/TESTDB/TS4/Cont0
/Data/TS5_Cont0
/dev/rTS5_Cont1
```

TESTDB is to be moved to a new system. The instance on the new system will be newinst and the location of the database will be /DB2.

When moving the database, all of the files that exist in the /databases/TESTDB/ db2inst1 directory must be moved to the /DB2/newinst directory. This means that the first 5 containers will be relocated as part of this move. (The first 3 are relative to the database directory and the next 2 are relative to the database path.) Since these containers are located within the database directory or database path, they do not need to be listed in the configuration file. If the 2 remaining containers are to be moved to different locations on the new system, they must be listed in the configuration file.

After the physical directories and files have been moved to their new locations, the following configuration file can be used with db2relocatedb to make changes to the database files so that they recognize the new locations:

```
DB_NAME=TESTDB
DB_PATH=/databases/TESTDB,/DB2
INSTANCE=db2inst1,newinst
NODENUM=0
CONT_PATH=/Data/TS5_Cont0,/DB2/TESTDB/TS5_Cont0
CONT_PATH=/dev/rTS5_Cont1,/dev/rTESTDB_TS5_Cont1
```

#### Example 5

The database TESTDB has two database partitions on database partition servers 10 and 20. The instance is servinst and the database path is /home/servinst on both database partition servers. The name of the database is being changed to SERVDB and the database path is being changed to /databases on both database partition servers. In addition, the log directory is being changed on database partition server 20 from /testdb\_logdir to /servdb\_logdir.

Since changes are being made to both database partitions, a configuration file must be created for each database partition and db2relocatedb must be run on each database partition server with the corresponding configuration file.

On database partition server 10, the following configuration file will be used:

DB\_NAME=TESTDB,SERVDB DB\_PATH=/home/servinst,/databases INSTANCE=servinst NODENUM=10

On database partition server 20, the following configuration file will be used:

DB\_NAME=TESTDB,SERVDB DB\_PATH=/home/servinst,/databases INSTANCE=servinst NODENUM=20 LOG\_DIR=/testdb\_logdir,/servdb\_logdir

#### Example 6

The database MAINDB exists in the instance maininst on the path /home/maininst. The location of four table space containers needs to be changed as follows:

/maininst\_files/allconts/C0 needs to be moved to /MAINDB/C0 /maininst\_files/allconts/C1 needs to be moved to /MAINDB/C1 /maininst\_files/allconts/C2 needs to be moved to /MAINDB/C2 /maininst\_files/allconts/C3 needs to be moved to /MAINDB/C3

After the physical directories and files are moved to the new locations, the following configuration file can be used with the db2relocatedb command to make changes to the database files so that they recognize the new locations.

#### db2relocatedb - Relocate database

A similar change is being made to all of the containers; that is, /maininst\_files/allconts/ is being replaced by /MAINDB/ so that a single entry with the wildcard character can be used:

```
DB_NAME=MAINDB
DB_PATH=/home/maininst
INSTANCE=maininst
NODENUM=0
CONT PATH=/maininst files/allconts/*, /MAINDB/*
```

# **Usage notes**

If the instance that a database belongs to is changing, the following must be done before running this command to ensure that changes to the instance and database support files are made:

- If a database is being moved to another instance, create the new instance. The new instance must be at the same release level as the instance where the database currently resides.
- If the new instance has a different owner than the current instance, grant access to the new instance owner.
- Copy the files and devices belonging to the databases being copied onto the system where the new instance resides. The path names must be changed as necessary. However, if there are already databases in the directory where the database files are moved to, you can mistakenly overwrite the existing sqldbdir file, thereby removing the references to the existing databases. In this scenario, the db2relocatedb utility cannot be used. Instead of db2relocatedb, an alternative is a redirected restore operation.
- Change the permission of the files/devices that were copied so that they are owned by the instance owner.

The db2relocatedb command cannot be used to move existing user created containers for a table space that was converted to use automatic storage using the ALTER TABLESPACE MANAGED BY AUTOMATIC STORAGE statement.

If the instance is changing, the tool must be run by the new instance owner.

In a partitioned database environment, this tool must be run against every database partition that requires changes. A separate configuration file must be supplied for each database partition, that includes the NODENUM value of the database partition being changed. For example, if the name of a database is being changed, every database partition will be affected and the db2relocatedb command must be run with a separate configuration file on each database partition. If containers belonging to a single database partition are being moved, the db2relocatedb command only needs to be run once on that database partition.

You cannot use the db2relocatedb command to relocate a database that has a load in progress or is waiting for the completion of a LOAD RESTART or LOAD TERMINATE command.

The target database must be offline before running the db2relocatedb tool to modify the control files and metadata of the target database.

**Limitation:** In a partitioned database environment, you cannot relocate an entire node if that node is one of two or more logical partitions that reside on the same device.

# db2rfpen - Reset rollforward pending state

Puts a database in rollforward pending state. If you are using high availability disaster recovery (HADR), the database is reset to a standard database.

# Authorization

None

# **Required connection**

None

# Command syntax

```
►► db2rfpen_ON___database_alias

-____file__log_control_file_____

-___path__log_control_files_dir____
```

# **Command parameters**

#### database\_alias

Specifies the name of the database to be placed in rollforward pending state. If you are using high availability disaster recovery (HADR), the database is reset to a standard database.

#### -file log\_control\_file

Specifies the log control file path and file name.

**Important:** This option is deprecated and might be removed in a future release because of the usage of mirrored log control files.

-path log\_control\_files\_dir

Specifies the full path to the directory where the log control files, SQLOGCTL.LFH.1 and its mirror copy SQLOGCTL.LFH.2, reside.

#### Usage notes

With the -file parameter, only the specified log control file, for example either SQLOGCTL.LFH.1 or SQLOGCTL.LFH.2, will be updated. This will cause the two files to be out of synchronization. For this reason, it is recommended that the *database\_alias* or the -path option be used whenever possible, rather than the -file option.

# db2rmicons - Remove DB2 tools from main menu

Removes main menu entries for DB2 tools.

On Linux operating systems, the db2rmicons command removes main menu entries for DB2 tools for the current user. The main menu entries for DB2 tools are removed by manually running the db2rmicons command, or are removed automatically when specific DB2 commands are run (for example, db2\_deinstall or db2idrop.) For non-root installations, the db2\_deinstall command removes the entries for the DB2 instance related to the non-root installation.

# Authorization

None

# **Command syntax**

►►—db2rmicons—\_\_\_h\_

# **Command parameters**

-h Displays usage information.

# db2rspgn - Response file generator

Generates response files and instance configuration profiles for the current copy. These generated files are used to recreate an exact setup on other machines.

# **Command syntax**

# **Command parameters**

-d destination-directory

Specifies the full path to the output directory for generated files. If the output directory specified is an existing directory, the directory must be empty and writable. If the output directory specified does not exist, the new directory is created if the location is writable. This parameter is mandatory.

-i instance

Generates the specified instance configuration and saves this information in the generated response file and instance configuration profile. This parameter is optional. By default, all instances are selected. To specify multiple instances, specify this parameter multiple times. For example, -i db2inst1 -i db2inst3.

#### -t trace-file

Linux and UNIX operating systems only. Turns on the debug mode. The debug information is written to the file name specified as trace-file.

#### -noctlsv

Windows operating systems only. Indicates that an instance configuration profile file will not be generated for the Control Server instance. This parameter is optional.

# db2sampl - Create sample database

Creates a sample database named SAMPLE.

This database will not be automatically configured when it is first created. Users can issue the AUTOCONFIGURE command against the SAMPLE database at a later time.

# Authorization

One of the following:

- sysadm
- sysctrl

#### **Required Connection**

None

# Command syntax

# **Command parameters**

#### -dbpath *path-name*

Specifies the path on which to create the database. On Windows operating systems, specifies the letter of the drive on which to create the database. The maximum length for *path-name* is 175 characters. By default, *path-name* is the default path specified in the database manager configuration file (dftdbpath parameter).

#### -name database-name

Specifies a name for the sample database. The database name must adhere to the naming conventions for databases. By default, *database-name* is SAMPLE.

-force Forces the drop and recreation of any existing database in the instance with the same name as specified for the sample database.

#### -verbose

Prints status messages to standard output.

- -quiet Suppresses the printing of status messages to standard output.
- -sql Creates tables, triggers, functions, procedures, and populates the tables with data.
- -xml Creates tables with columns of data type XML, creates indexes on the XML columns, registers XML schemas, and populates these tables with data including XML document values.

This option is only supported where XML is supported. If XML is not supported, this option is ignored.

- **-v8** Creates the DB2 Universal Database Version 8 sample database, database objects and data. The Version 8 sample database is a non-unicode database named SAMPLE that is created in the default path specified in the database manager configuration file (dftdbpath parameter).
- -? | ? | help

Returns the db2sampl command syntax help.

#### Default behavior of db2samp1

When the db2sampl command is issued without any optional arguments, depending on whether the environment is partitioned or not, it behaves differently:

In non-partitioned database environments:

- Creates a database named SAMPLE with a Unicode (UTF-8) codeset and a UCA400\_NO collation and a C (POSIX) territory in the default database path.
- Creates relational database objects including tables, indexes, constraints, triggers, functions, procedures, multi-dimensional clustered tables and materialized query tables.
- Populates relational tables with data.
- Creates tables with XML data type columns.
- Creates indexes over XML data.
- · Creates an XML schema repository that contains XML schema documents.
- All database object names are qualified with the value of the CURRENT\_SCHEMA special register.

In partitioned database environments:

- Creates a database named SAMPLE with a Unicode (UTF-8) codeset and a UCA400\_NO collation and a C (POSIX) territory in the default database path.
- Creates relational database objects including tables, indexes, constraints, triggers, functions, procedures, multi-dimensional clustered tables and materialized query tables.
- Populates tables with data.
- All database object names are qualified with the value of the CURRENT\_SCHEMA special register.

#### Usage notes

- The db2sampl command can only be issued on a computer where a DB2 database server is installed. It cannot be issued from a remote IBM Data Server Client.
- The sample database is created with the instance authentication type that is specified by the database manager configuration parameter, authentication.

#### **Examples**

- To create a sample database with the default characteristics, issue: db2samp1
- On Windows operating systems, to create a sample database named *mysample* on the E: drive containing only SQL database objects in default schema and to view status messages, issue:

db2sampl -dbpath E -name mysample -sql -force -verbose

# db2sampl - Create sample database

 To create the DB2 Version 8 sample database, issue: db2samp1 -v8

# db2schex - Active Directory schema extension

Extends the Microsoft Active Directory schema to include the DB2 object classes and attribute definitions that you require to use the Lightweight Directory Access Protocol (LDAP) directory server feature with Windows Server 2003 and later.

You should run this command before installing DB2 products and creating databases otherwise you have to manually register the node and catalog the databases. For more information, see the "Extending the Active Directory Schema for LDAP directory services (Windows)" topic.

The db2schex command is included on the product DVD. The location of this command on the DVD is in the path x:\db2\windows\utilities, where x: specifies the DVD drive.

# Authorization

To update the Active Directory schema, you must be a member of the Schema Administrators group or have been delegated the rights to update the schema.

#### **Required connection**

Access to a Windows Domain Controller server in the target domain.

#### **Command syntax**

▶ db2schex

-b—bindDN—-w—password— \_\_\_k\_

# **Command parameters**

#### -b bindDN

Specifies the user Distinguished Name.

-w password

Specifies the bind password.

- -k Forces the uninstall to continue, ignoring errors.
- -u Uninstall the schema.
- -x filename

Specify this parameter to write the changes to the Active Directory schema, performed by the utility, to a file.

# Examples

To install the DB2 schema, execute the following command: db2schex

To install the DB2 schema and specify a bind DN and password, execute the following command:

db2schex -b "cn=A\_Name,dc=toronto1,dc=ibm,dc=com" -w password

or, db2schex -b Administrator -w password

# db2schex - Active Directory schema extension

To uninstall the DB2 schema, execute the following command: db2schex -u

To uninstall the DB2 schema and ignore errors, execute the following command: db2schex -u -k

# **Usage notes**

If *bindDN* and *password* are not specified, db2schex binds as the currently logged in user.

The *bindDN* parameter can be specified as a Windows username.

The DB2 schema extension command carries out the following tasks:

- Detects which server is the Schema Master
- Binds to the Domain Controller that is the Schema Master
- Ensures that the user has sufficient rights to add classes and attributes to the schema
- Ensures that the Schema Master is writable (that is, the safety interlock in the registry is removed)
- Creates all the new attributes
- Creates all the new object classes
- Detects errors and, if they occur, the program will roll back any changes to the schema.

# db2set - DB2 profile registry

Displays, sets, or removes DB2 profile variables. An external environment registry command that supports local and remote administration, via the DB2 Administration Server, of DB2's environment variables stored in the DB2 profile registry.

# Authorization

sysadm

For the **-g** command parameter, root access on Linux and UNIX systems or Local Administrator on Windows operating systems is required.

# **Required connection**

None

# **Command syntax**

# **Command parameters**

variable=

Displays the specified variable's value.

- *value* Sets the specified variable to the entered value. To delete a variable, do not specify a value for the specified variable after the equal sign (=). Changes to settings take effect after the instance has been restarted.
- -g Accesses the global profile registry variables for all instances pertaining to a particular DB2 copy.

-i instance

Specifies the instance profile to use instead of the current, or default.

db-partition-number

Specifies a number listed in the db2nodes.cfg file.

- -gl Accesses the global profile variables stored in LDAP. This option is only effective if the registry variable DB2\_ENABLE\_LDAP has been set to YES.
- -all Displays all occurrences of the local environment variables as defined in:
  - The environment, denoted by [e]
  - The node level registry, denoted by [n]
  - The instance level registry, denoted by [i]
  - The global level registry, denoted by [g].
- -gd agg-registry-variable

Displays the group definition of an aggregate registry variable. For additional information, see "Aggregate registry variables" in the *Data Servers*, *Databases*, *and Database Objects Guide*.

- **-null** Sets the value of the variable at the specified registry level to NULL. This avoids having to look up the value in the next registry level, as defined by the search order.
- -r Resets the profile registry for the given instance.
  - instance

If no instance is specified, and an instance attachment exists, resets the profile for the current instance. If no instance is specified, and no attachment exists, resets the profile for the instance specified by the **DB2INSTANCE** environment variable.

#### db-partition-number

Specifies a number listed in the db2nodes.cfg file.

- -n DAS node
  - Specifies the remote DB2 administration server node name.
- -u user Specifies the user ID to use for the administration server attachment.
- -p password
  - Specifies the password to use for the administration server attachment.
- -l Lists all instance profiles for the current DB2 product installation.
- -lr Lists all supported registry variables.
- -v Specifies verbose mode.
- -ul Accesses the user profile variables. This parameter is supported on Windows operating systems only.
- -ur Refreshes the user profile variables. This parameter is supported on Windows operating systems only.
- -h | -? Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed.

#### **Examples**

• Display all defined profiles (DB2 instances) pertaining to a particular installation :

db2set -1

• Display all supported registry variables:

db2set -lr

• Display all defined global variables which are visible by all instances pertaining to a particular installation:

db2set -g

- Display all defined variables for the current instance: db2set
- Display all defined values for the current instance: db2set -all
- Display all defined values for DB2COMM for the current instance: db2set -all DB2COMM
- Reset all defined variables for the instance INST on node 3: db2set -r -i INST 3
- Unset the variable DB2CHKPTR on the remote instance RMTINST through the DAS node RMTDAS using user ID MYID and password MYPASSWD:

db2set -i RMTINST -n RMTDAS -u MYID -p MYPASSWD DB2CHKPTR=

• Set the variable DB2COMM to be TCPIP globally for all instances pertaining to a particular installation:

db2set -g DB2COMM=TCPIP

- Set the variable DB2COMM to be only TCPIP for instance MYINST: db2set -i MYINST DB2COMM=TCPIP
- Set the variable DB2COMM to null at the given instance level: db2set -null DB2COMM

# **Usage notes**

If no variable name is specified, the values of all defined variables are displayed. If a variable name *is* specified, only the value of that variable is displayed. To display all the defined values of a variable, specify *variable* -all. To display all the defined variables in all registries, specify -all.

To modify the value of a variable, specify *variable*=, followed by its new value. To set the value of a variable to NULL, specify *variable* -null. Changes to settings take effect after the instance has been restarted.

To delete a variable, specify *variable*=, followed by no value.

Although the command behaves the same for non-root installations of DB2, not all parameters are available, such as the one specifying the DAS node name.

# db2setup - Install DB2

Installs DB2 database products. This command is only available on Linux and UNIX operating systems. The command for Windows operating systems is setup.

This utility is located on the DB2 database installation media. It launches the DB2 Setup wizard to define the installation and install DB2 database products. If invoked with the **-r** option, it performs an installation without further input, taking installation configuration information from a response file.

#### Authorization

On Linux and UNIX operating systems, root installations require root user authority. For non-root installations, you must log on with the user ID that owns the non-root installation.

#### Command syntax

# **Command parameters**

-i language

Two-letter language code of the language in which to perform the installation.

-l log\_file

Writes the log to the file name specified. For root installations, the default log file is /tmp/db2setup.log. For non-root installations, the default log file is /tmp/db2setup\_userID.log, where userID represents the user ID that owns the non-root installation. If the IBM Tivoli System Automation for Multiplatforms (SA MP) is being installed with db2setup, the install log file for SA MP will be located in the same directory as the DB2 database log files.

-t trace\_file

Generates a file with install trace information.

-r response\_file

Full path and file name of the response file to use.

-f nobackup

This applies to the non-root upgrade only. Force db2setup to not backup installation files when the components are updated. If you choose not to backup the files, the space requirement of the installation directory is reduced. However, choosing not to backup the files also means that if any errors occur, the DB2 installer will not be able to perform a rollback operation. In this case, you will need to manually clean up the files and reinstall the product.

-? | -h Generates usage information.
# **Usage notes**

You must log on with the ID that has proper authority or use su with the "-" flag (su -) to set the process environment as if you had logged in with the ID that has proper authority. If the process environment is not set with the ID that has proper authority, the installation process finishes without errors but you will encounter errors when you run the DB2 copy.

# db2sqljbind - SQLJ profile binder

db2sqljbind binds DB2 packages for a serialized profile that was previously customized with the db2sqljcustomize command.

Applications that run with the IBM Data Server Driver for JDBC and SQLJ require packages but no plans. If the db2sqljcustomize -automaticbind option is specified as YES or defaults to YES, db2sqljcustomize binds packages for you at the data source that you specify in the -url parameter. However, if -automaticbind is NO, if a bind fails when db2sqljcustomize runs, or if you want to create identical packages at multiple locations for the same serialized profile, you can use the db2sqljbind command to bind packages.

# Authorization

The privilege set of the process must include one of the following authorities:

- DBADM authority
- If the package does not exist, the BINDADD privilege, and one of the following privileges:
  - CREATEIN privilege
  - IMPLICIT\_SCHEMA authority on the database if the schema name of the package does not exist
- If the package exists:
  - ALTERIN privilege on the schema
  - BIND privilege on the package

The user also needs all privileges that are required to compile any static SQL statements in the application. Privileges that are granted to groups are not used for authorization checking of static statements.

# **Command syntax**

## options-string:

DB2-for-z/OS-options DB2-Database-for-Linux-UNIX-and-Windows-options

## Notes:

1 These options can be specified in any order.

## **Command parameters**

## -help

Specifies that db2sqljbind describes each of the options that it supports. If any other options are specified with -help, they are ignored.

-url

Specifies the URL for the data source for which the profile is to be customized. A connection is established to the data source that this URL represents if the -automaticbind or -onlinecheck option is specified as YES or defaults to YES. The variable parts of the -url value are:

## server

The domain name or IP address of the operating system on which the database server resides.

#### port

The TCP/IP server port number that is assigned to the database server. The default is 446.

#### database

A name for the database server for which the profile is to be customized.

If the connection is to a DB2 for z/OS server, *database* is the DB2 location name that is defined during installation. All characters in this value must be uppercase characters. You can determine the location name by executing the following SQL statement on the server:

SELECT CURRENT SERVER FROM SYSIBM.SYSDUMMY1;

If the connection is to a DB2 Database for Linux, UNIX, and Windows server, *database* is the database name that is defined during installation.

If the connection is to an IBM Cloudscape server, the *database* is the fully-qualified name of the file that contains the database. This name must be enclosed in double quotation marks ("). For example:

"c:/databases/testdb"

## property=value;

A property for the JDBC connection.

## -user user-ID

Specifies the user ID to be used to connect to the data source for binding the package.

## -password password

Specifies the password to be used to connect to the data source for binding the package.

## -bindoptions options-string

Specifies a list of options, separated by spaces. These options have the same function as DB2 precompile and bind options with the same names. If you are preparing your program to run on a DB2 for z/OS system, specify DB2 for z/OS options. If you are preparing your program to run on a DB2 Database for Linux, UNIX, and Windows system, specify DB2 Database for Linux, UNIX, and Windows options.

## Notes on bind options:

- Specify VERSION only if the following conditions are true:
  - If you are binding a package at a DB2 Database for Linux, UNIX, and Windows system, the system is at Version 8 or later.
  - You rerun the translator on a program before you bind the associated package with a new VERSION value.
- The value for STATICREADONLY is YES for servers that support STATICREADONLY, and NO for other servers. When you specify STATICREADONLY YES, DB2 processes ambiguous cursors as if they were read-only cursors. For troubleshooting iterator declaration errors, you need to explicitly specify STATICREADONLY NO, or declare iterators so that they are unambiguous. For example, if you want an iterator to be unambiguously updatable, declare the iterator to implement sqlj.runtime.ForUpdate. If you want an iterator to be read-only, include the FOR READ ONLY clause in SELECT statements that use the iterator.

*Important:* Specify only those program preparation options that are appropriate for the data source at which you are binding a package. Some values and defaults for the IBM Data Server Driver for JDBC and SQLJ are different from the values and defaults for DB2.

## -staticpositioned NO | YES

For iterators that are declared in the same source file as positioned UPDATE statements that use the iterators, specifies whether the positioned UPDATEs

## db2sqljbind - SQLJ profile binder

are executed as statically bound statements. The default is NO. NO means that the positioned UPDATEs are executed as dynamically prepared statements. This value must be the same as the -staticpositioned value for the previous db2sqljcustomize invocation for the serialized profile.

#### -genDBRM

Specifies that db2sqljbind generates database request modules (DBRMs) from the serialized profile, and that db2sqljbind does not perform remote bind operations.

-genDBRM applies to programs that are to be run on DB2 for z/OS database servers only.

#### -DBRMDir directory-name

When -genDBRM is specified, -DBRMDir specifies the local directory into which db2sqljbind puts the generated DBRM files. The default is the current directory.

-DBRMdir applies to programs that are to be run on DB2 for z/OS database servers only.

#### -tracefile file-name

Enables tracing and identifies the output file for trace information. This option should be specified only under the direction of IBM Software Support.

#### -tracelevel

If -tracefile is specified, indicates what to trace while db2sqljcustomize runs. The default is TRACE\_SQLJ. This option should be specified only under the direction of IBM Software Support.

#### serialized-profile-name

Specifies the name of one or more serialized profiles from which the package is bound. A serialized profile name is of the following form:

program-name\_SJProfileIDNumber.ser

*program-name* is the name of the SQLJ source program, without the extension .sqlj. *n* is an integer between 0 and *m*-1, where *m* is the number of serialized profiles that the SQLJ translator generated from the SQLJ source program.

If you specify more than one serialized profile name to bind a single DB2 package from several serialized profiles, you must have specified the same serialized profile names, in the same order, when you ran db2sqljcustomize.

## Examples

```
db2sqljbind -user richler -password mordecai
-url jdbc:db2://server:50000/sample -bindoptions "EXPLAIN YES"
pgmname_SJProfile0.ser
```

## **Usage notes**

*Package names produced by db2sqljbind:* The names of the packages that are created by db2sqljbind are the names that you specified using the-rootpkgname or -singlepkgname parameter when you ran db2sqljcustomize. If you did not specify -rootpkgname or -singlepkgname, the package names are the first seven bytes of the profile name, appended with the isolation level character.

**DYNAMICRULES** value for db2sqljbind: The DYNAMICRULES bind option determines a number of run-time attributes for the DB2 package. Two of those attributes are the authorization ID that is used to check authorization, and the

qualifier that is used for unqualified objects. To ensure the correct authorization for dynamically executed positioned UPDATE and DELETE statements in SQLJ programs, db2sqljbind always binds the DB2 packages with the DYNAMICRULES(BIND) option. You cannot modify this option. The DYNAMICRULES(BIND) option causes the SET CURRENT SQLID statement and the SET CURRENT SCHEMA statement to have no impact on an SQLJ program, because those statements affect only dynamic statements that are bound with DYNAMICRULES values other than BIND.

With DYNAMICRULES(BIND), unqualified table, view, index, and alias names in dynamic SQL statements are implicitly qualified with value of the bind option QUALIFIER. If you do not specify QUALIFIER, DB2 uses the authorization ID of the package owner as the implicit qualifier. If this behavior is not suitable for your program, you can use one of the following techniques to set the correct qualifier:

- Force positioned UDPATE and DELETE statements to execute statically. You can use the -staticpositioned YES option of db2sqljcustomize or db2sqljbind to do this if the cursor (iterator) for a positioned UPDATE or DELETE statement is in the same package as the positioned UPDATE or DELETE statement.
- Fully qualify DB2 table names in positioned UPDATE and positioned DELETE statements.

**EXTENDEDINDICATOR bind option behavior:** If the EXTENDEDINDICATOR bind option is not specified in the -bindoptions options string, and the target data server supports extended indicators, bind operations use EXTENDEDINDICATOR(YES). If EXTENDEDINDICATOR(NO) is explicitly specified, and the application contains extended indicator syntax, unexpected behavior can occur because the IBM Data Server Driver for JDBC and SQLJ treats extended indicators as NULL values.

# db2sqljcustomize - SQLJ profile customizer

db2sqljcustomize processes an SQLJ profile, which contains embedded SQL statements.

By default, db2sqljcustomize produces four DB2 packages: one for each isolation level. db2sqljcustomize augments the profile with DB2-specific information for use at run time.

## Authorization

The privilege set of the process must include one of the following authorities:

- DBADM authority
- If the package does not exist, the BINDADD privilege, and one of the following privileges:
  - CREATEIN privilege
  - IMPLICIT\_SCHEMA authority on the database if the schema name of the package does not exist
- If the package exists:
  - ALTERIN privilege on the schema
  - BIND privilege on the package

The user also needs all privileges that are required to compile any static SQL statements in the application. Privileges that are granted to groups are not used for authorization checking of static statements.

## **Command syntax**

# db2sqljcustomize - SQLJ profile customizer

## Notes:

1 These options can be specified in any order.

## DB2 Database for Linux, UNIX, and Windows options:

## Notes:

1 These options can be specified in any order.

## **Command parameters**

## -help

Specifies that the SQLJ customizer describes each of the options that the customizer supports. If any other options are specified with -help, they are ignored.

#### -url

Specifies the URL for the data source for which the profile is to be customized. A connection is established to the data source that this URL represents if the -automaticbind or -onlinecheck option is specified as YES or defaults to YES. The variable parts of the -url value are:

#### server

The domain name or IP address of the z/OS system on which the DB2 subsystem resides.

#### port

The TCP/IP server port number that is assigned to the DB2 subsystem. The default is 446.

#### -url

Specifies the URL for the data source for which the profile is to be customized. A connection is established to the data source that this URL represents if the -automaticbind or -onlinecheck option is specified as YES or defaults to YES. The variable parts of the -url value are:

#### server

The domain name or IP address of the operating system on which the database server resides.

#### port

The TCP/IP server port number that is assigned to the database server. The default is 446.

#### database

A name for the database server for which the profile is to be customized.

If the connection is to a DB2 for z/OS server, *database* is the DB2 location name that is defined during installation. All characters in this value must be uppercase characters. You can determine the location name by executing the following SQL statement on the server: SELECT CURRENT SERVER FROM SYSIBM.SYSDUMMY1;

If the connection is to a DB2 Database for Linux, UNIX, and Windows server, *database* is the database name that is defined during installation.

If the connection is to an IBM Cloudscape server, the *database* is the fully-qualified name of the file that contains the database. This name must be enclosed in double quotation marks ("). For example:

"c:/databases/testdb"

#### property=value;

A property for the JDBC connection.

## property=value;

A property for the JDBC connection.

#### -datasource JNDI-name

Specifies the logical name of a DataSource object that was registered with JNDI. The DataSource object represents the data source for which the profile is to be customized. A connection is established to the data source if the

## db2sqljcustomize - SQLJ profile customizer

-automaticbind or -onlinecheck option is specified as YES or defaults to YES. Specifying -datasource is an alternative to specifying -url. The DataSource object must represent a connection that uses IBM Data Server Driver for JDBC and SQLJ type 4 connectivity.

#### -user user-ID

Specifies the user ID to be used to connect to the data source for online checking or binding a package. You must specify -user if you specify -url. You must specify -user if you specify -datasource, and the DataSource object that *JNDI-name* represents does not contain a user ID.

#### -password password

Specifies the password to be used to connect to the data source for online checking or binding a package. You must specify -password if you specify -url. You must specify -password if you specify -datasource, and the DataSource object that *JNDI-name* represents does not contain a password.

#### -automaticbind YES | NO

Specifies whether the customizer binds DB2 packages at the data source that is specified by the -url parameter.

The default is YES.

The number of packages and the isolation levels of those packages are controlled by the -rootpkgname and -singlepkgname options.

Before the bind operation can work, the following conditions need to be met:

- TCP/IP and DRDA must be installed at the target data source.
- Valid -url, -username, and -password values must be specified.
- The -username value must have authorization to bind a package at the target data source.

#### -pkgversion AUTO | version-id

Specifies the package version that is to be used when packages are bound at the server for the serialized profile that is being customized. db2sqljcustomize stores the version ID in the serialized profile and in the DB2 package. Run-time version verification is based on the consistency token, not the version name. To automatically generate a version name that is based on the consistency token, specify -pkgversion AUTO.

The default is that there is no version.

#### -bindoptions options-string

Specifies a list of options, separated by spaces. These options have the same function as DB2 precompile and bind options with the same names. If you are preparing your program to run on a DB2 for z/OS system, specify DB2 for z/OS options. If you are preparing your program to run on a DB2 Database for Linux, UNIX, and Windows system, specify DB2 Database for Linux, UNIX, and Windows options.

#### Notes on bind options:

- Specify ISOLATION only if you also specify the -singlepkgname option.
- The value for STATICREADONLY is YES for servers that support STATICREADONLY, and NO for other servers. When you specify STATICREADONLY YES, DB2 processes ambiguous cursors as if they were read-only cursors. For troubleshooting iterator declaration errors, you need to explicitly specify STATICREADONLY NO, or declare iterators so that they are unambiguous. For example, if you want an iterator to be unambiguously updatable, declare the iterator to implement sqlj.runtime.ForUpdate. If you

want an iterator to be read-only, include the FOR READ ONLY clause in SELECT statements that use the iterator.

*Important:* Specify only those program preparation options that are appropriate for the data source at which you are binding a package. Some values and defaults for the IBM Data Server Driver for JDBC and SQLJ are different from the values and defaults for DB2.

## -storebindoptions

Specifies that values for the -bindoptions and -staticpositioned parameters are stored in the serialized profile. If db2sqljbind is invoked without the -bindoptions or -staticpositioned parameter, the values that are stored in the serialized profile are used during the bind operation. When multiple serialized profiles are specified for one invocation of db2sqljcustomize, the parameter values are stored in each serialized profile. The stored values are displayed in the output from the db2sqljprint utility.

## -collection collection-name

The qualifier for the packages that db2sqljcustomize binds. db2sqljcustomize stores this value in the customized serialied profile, and it is used when the associated packages are bound. If you do not specify this parameter, db2sqljcustomize uses a collection ID of NULLID.

## -onlinecheck YES | NO

Specifies whether online checking of data types in the SQLJ program is to be performed. The -url or -datasource option determines the data source that is to be used for online checking. The default is YES if the -url or -datasource parameter is specified. Otherwise, the default is NO.

## -qualifier qualifier-name

Specifies the qualifier that is to be used for unqualified objects in the SQLJ program during online checking. This value is not used as the qualifier when the packages are bound.

## -rootpkgname|-singlepkgname

Specifies the names for the packages that are associated with the program. If -automaticbind is NO, these package names are used when db2sqljbind runs. The meanings of the parameters are:

#### -rootpkgname package-name-stem

Specifies that the customizer creates four packages, one for each of the four DB2 isolation levels. The names for the four packages are:

package-name-stem1

For isolation level UR

package-name-stem**2** 

For isolation level CS

package-name-stem3

For isolation level RS

## package-name-stem4

For isolation level RR

If -longpkgname is not specified, *package-name-stem* must be an alphanumeric string of seven or fewer bytes.

If -longpkgname is specified, *package-name-stem* must be an alphanumeric string of 127 or fewer bytes.

#### -singlepkgname package-name

Specifies that the customizer creates one package, with the name

## db2sqljcustomize - SQLJ profile customizer

*package-name*. If you specify this option, your program can run at only one isolation level. You specify the isolation level for the package by specifying the ISOLATION option in the -bindoptions options string.

If -longpkgname is not specified, *package-name* must be an alphanumeric string of eight or fewer bytes.

If -longpkgname is specified, *package-name* must be an alphanumeric string of 128 or fewer bytes.

Using the -singlepkgname option is not recommended.

**Recommendation:** If the target data source is DB2 for z/OS, use uppercase characters for the *package-name-stem* or *package-name* value. DB2 for z/OS systems that are defined with certain CCSID values cannot tolerate lowercase characters in package names or collection names.

If you do not specify -rootpkgname or -singlepkgname, db2sqljcustomize generates four package names that are based on the serialized profile name. A serialized profile name is of the following form:

program-name\_SJProfileIDNumber.ser

The four generated package names are of the following form: *Bytes-from-program-nameIDNumberPkgIsolation* 

Table 42 shows the parts of a generated package name and the number of bytes for each part.

The maximum length of a package name is *maxlen*. *maxlen* is 8 if -longpkgname is not specified. *maxlen* is 128 if -longpkgname is specified.

Package name part	Number of bytes	Value
Bytes-from-program-name	<i>m</i> =min(Length( <i>program-name</i> ), <i>maxlen</i> –1–Length( <i>IDNumber</i> ))	First <i>m</i> bytes of <i>program-name</i> , in uppercase
IDNumber	Length(IDNumber)	IDNumber
PkgIsolation	1	1, 2, 3, or 4. This value represents the transaction isolation level for the package. See Table 43.

Table 42. Parts of a package name that is generated by db2sqljcustomize

Table 43 shows the values of the *PkgIsolation* portion of a package name that is generated by db2sqljcustomize.

Table 43. Pkglsolation values and associated isolation levels

PkgNumber value	Isolation level for package
1	Uncommitted read (UR)
2	Cursor stability (CS)
3	Read stability (RS)
4	Repeatable read (RR)

*Example:* Suppose that a profile name is ThisIsMyProg\_SJProfile111.ser. The db2sqljcustomize option -longpkgname is not specified. Therefore, *Bytes-from-program-name* is the first four bytes of ThisIsMyProg, translated to uppercase, or THIS. *IDNumber* is 111. The four package names are:

THIS1111 THIS1112 THIS1113 THIS1114

*Example:* Suppose that a profile name is ThisIsMyProg\_SJProfile111.ser. The db2sqljcustomize option -longpkgname is specified. Therefore, *Bytes-from-program-name* is ThisIsMyProg, translated to uppercase, or THISISMYPROG. *IDNumber* is 111. The four package names are:

THISISMYPROG1111 THISISMYPROG1112 THISISMYPROG1113 THISISMYPROG1114

*Example:* Suppose that a profile name is A\_SJProfile0.ser. *Bytes-from-program-name* is A. *IDNumber* is 0. Therefore, the four package names are:

A01 A02

A03

A04

Letting db2sqljcustomize generate package names is not recommended. If any generated package names are the same as the names of existing packages, db2sqljcustomize overwrites the existing packages. To ensure uniqueness of package names, specify -rootpkgname.

## -longpkgname

Specifies that the names of the DB2 packages that db2sqljcustomize generates can be up to 128 bytes. Use this option only if you are binding packages at a server that supports long package names. If you specify -singlepkgname or -rootpkgname, you must also specify -longpkgname under the following conditions:

- The argument of -singlepkgname is longer than eight bytes.
- The argument of -rootpkgname is longer than seven bytes.

## -staticpositioned NO | YES

For iterators that are declared in the same source file as positioned UPDATE statements that use the iterators, specifies whether the positioned UPDATEs are executed as statically bound statements. The default is NO. NO means that the positioned UPDATEs are executed as dynamically prepared statements.

## -zosDescProcParms

Specifies that db2sqljcustomize queries the DB2 catalog at the target data source to determine the SQL parameter data types that correspond to the host variables in CALL statements.

-zosDescProcParms applies only to programs that run on DB2 for z/OS data servers.

If -zosDescProcParms is specified, and the authorization ID under which db2sqljcustomize runs does not have read access to the SYSIBM.SYSROUTINES catalog table, db2sqljcustomize returns an error and uses the host variable data types in the CALL statements to determine the SQL data types.

Specification of -zosDescProcParms can lead to more efficient storage usage at run time. If SQL data type information is available, SQLJ has information about the length and precision of INOUT and OUT parameters, so it allocates only the amount of memory that is needed for those parameters. Availability of SQL data type information can have the biggest impact on storage usage for character INOUT parameters, LOB OUT parameters, and decimal OUT parameters.

## db2sqljcustomize - SQLJ profile customizer

When -zosDescProcParms is specified, the DB2 data server uses the specified or default value of -zosProcedurePath to resolve unqualified names of stored procedures for which SQL data type information is requested.

If -zosDescProcParms is not specified, db2sqljcustomize uses the host variable data types in the CALL statements to determine the SQL data types. If db2sqljcustomize determines the wrong SQL data type, an SQL error might occur at run time. For example, if the Java host variable type is String, and the corresponding stored procedure parameter type is VARCHAR FOR BIT DATA, an SQL run-time error such as -4220 might occur.

#### -zosProcedurePath procedure-path

Specifies a list of schema names that DB2 for z/OS uses to resolve unqualified stored procedure names during online checking of an SQLJ program.

-zosProcedurePath applies to programs that are to be run on DB2 for z/OS database servers only.

The list is a String value that is a comma-separated list of schema names that is enclosed in double quotation marks. The DB2 database server inserts that list into the SQL path for resolution of unqualified stored procedure names. The SQL path is:

SYSIBM, SYSFUN, SYSPROC, procedure-path, qualifier-name, user-ID

*qualifier-name* is the value of the -qualifier parameter, and *user-ID* is the value of the -user parameter.

The DB2 database server tries the schema names in the SQL path from left to right until it finds a match with the name of a stored procedure that exists on that database server. If the DB2 database server finds a match, it obtains the information about the parameters for that stored procedure from the DB2 catalog. If the DB2 database server does not find a match, SQLJ sets the parameter data without any DB2 catalog information.

If -zosProcedurePath is not specified, the DB2 database server uses this SQL path:

SYSIBM, SYSFUN, SYSPROC, qualifier-name, user-ID

If the -qualifier parameter is not specified, the SQL path does not include *qualifier-name*.

#### -genDBRM

Specifies that db2sqljcustomize generates database request modules (DBRMs). Those DBRMs can be used to create DB2 for z/OS plans and packages.

-genDBRM applies to programs that are to be run on DB2 for z/OS database servers only.

If -genDBRM and -automaticbind NO are specified, db2sqljcustomize creates the DBRMs but does not bind them into DB2 packages. If -genDBRM and -automaticbind YES are specified, db2sqljcustomize creates the DBRMs and binds them into DB2 packages.

One DBRM is created for each DB2 isolation level. The naming convention for the generated DBRM files is the same as the naming convention for packages. For example, if -rootpkgname SQLJSA0 is specified, and -genDBRM is also specified, the names of the four DBRM files are:

- SQLJSA01
- SQLJSA02
- SQLJSA03
- SQLJSA04

#### -DBRMDir directory-name

When -genDBRM is specified, -DBRMDir specifies the local directory into which db2sqljcustomize puts the generated DBRM files. The default is the current directory.

-DBRMdir applies to programs that are to be run on DB2 for z/OS database servers only.

#### -tracefile file-name

Enables tracing and identifies the output file for trace information. This option should be specified only under the direction of IBM Software Support.

#### -tracelevel

If -tracefile is specified, indicates what to trace while db2sqljcustomize runs. The default is TRACE\_SQLJ. This option should be specified only under the direction of IBM Software Support.

#### *serialized-profile-name* | *file-name*.grp

Specifies the names of one or more serialized profiles that are to be customized. The specified serialized profile must be in a directory that is named in the CLASSPATH environment variable.

A serialized profile name is of the following form:

program-name\_SJProfileIDNumber.ser

You can specify the serialized profile name with or without the .ser extension.

*program-name* is the name of the SQLJ source program, without the extension .sqlj. *n* is an integer between 0 and *m*-1, where *m* is the number of serialized profiles that the SQLJ translator generated from the SQLJ source program.

You can specify serialized profile names in one of the following ways:

- List the names in the db2sqljcustomize command. Multiple serialized profile names must be separated by spaces.
- Specify the serialized profile names, one on each line, in a file with the name *file-name*.grp, and specify *file-name*.grp in the db2sqljcustomize command.

If you specify more than one serialized profile name, and if you specify or use the default value of -automaticbind YES, db2sqljcustomize binds a single DB2 package from the profiles. When you use db2sqljcustomize to create a single DB2 package from multiple serialized profiles, you must also specify the -rootpkgname or -singlepkgname option.

If you specify more than one serialized profile name, and you specify -automaticbind NO, if you want to bind the serialized profiles into a single DB2 package when you run db2sqljbind, you need to specify the same list of serialized profile names, in the same order, in db2sqljcustomize and db2sqljbind.

## Output

When db2sqljcustomize runs, it creates a customized serialized profile. It also creates DB2 packages, if the automaticbind value is YES.

## Examples

```
db2sqljcustomize -user richler -password mordecai
-url jdbc:db2:/server:50000/sample -collection duddy
-bindoptions "EXPLAIN YES" pgmname SJProfile0.ser
```

# **Usage notes**

**Online checking is always recommended:** It is highly recommended that you use online checking when you customize your serialized profiles. Online checking determines information about the data types and lengths of DB2 host variables, and is especially important for the following items:

• Predicates with java.lang.String host variables and CHAR columns

Unlike character variables in other host languages, Java String host variables are not declared with a length attribute. To optimize a query properly that contains character host variables, DB2 needs the length of the host variables. For example, suppose that a query has a predicate in which a String host variable is compared to a CHAR column, and an index is defined on the CHAR column. If DB2 cannot determine the length of the host variable, it might do a table space scan instead of an index scan. Online checking avoids this problem by providing the lengths of the corresponding character columns.

- Predicates with java.lang.String host variables and GRAPHIC columns Without online checking, DB2 might issue a bind error (SQLCODE -134) when it encounters a predicate in which a String host variable is compared to a GRAPHIC column.
- Column names in the result table of an SQLJ SELECT statement at a remote server:

Without online checking, the driver cannot determine the column names for the result table of a remote SELECT.

*Customizing multiple serialized profiles together:* Multiple serialized profiles can be customized together to create a single DB2 package. If you do this, and if you specify -staticpostioned YES, any positioned UPDATE or DELETE statement that references a cursor that is declared *earlier in the package* executes statically, even if the UPDATE or DELETE statement is in a different source file from the cursor declaration. If you want -staticpositioned YES behavior when your program consists of multiple source files, you need to order the profiles in the db2sqljcustomize command to cause cursor declarations to be ahead of positioned UPDATE or DELETE statements in the package. To do that, list profiles that contain SELECT statements that assign result tables to iterators *before* profiles that contain the positioned UPDATE or DELETE statements that assign result tables to iterators *before* profiles that contain the positioned UPDATE or DELETE statements that reference those iterators.

Using a customized serialized profile at one data source that was customized at another data source: You can run db2sqljcustomize to produce a customized serialized profile for an SQLJ program at one data source, and then use that profile at another data source. You do this by running db2sqljbind multiple times on customized serialized profiles that you created by running db2sqljcustomize once. When you run the programs at these data sources, the DB2 objects that the programs access must be identical at every data source. For example, tables at all data sources must have the same encoding schemes and the same columns with the same data types.

**Using the -collection parameter:** db2sqljcustomize stores the DB2 collection name in each customized serialized profile that it produces. When an SQLJ program is executed, the driver uses the collection name that is stored in the customized serialized profile to search for packages to execute. The name that is stored in the customized serialized profile is determined by the value of the -collection parameter. Only one collection ID can be stored in the serialized profile. However, you can bind the same serialized profile into multiple package collections by

specifying the COLLECTION option in the -bindoptions parameter. To execute a package that is in a collection other than the collection that is specified in the serialized profile, include a SET CURRENT PACKAGESET statement in the program.

**Using the VERSION parameter:** Use the VERSION parameter to bind two or more versions of a package for the same SQLJ program into the same collection. You might do this if you have changed an SQLJ source program, and you want to run the old and new versions of the program.

To maintain two versions of a package, follow these steps:

- 1. Change the code in your source program.
- **2**. Translate the source program to create a new serialized profile. Ensure that you do not overwrite your original serialized profile.
- 3. Run db2sqljcustomize to customize the serialized profile and create DB2 packages with the same package names and in the same collection as the original packages. Do this by using the same values for -rootpkgname and -collection when you bind the new packages that you used when you created the original packages. Specify the VERSION option in the -bindoptions parameter to put a version ID in the new customized serialized profile and in the new packages.

It is essential that you specify the VERSION option when you perform this step. If you do not, you overwrite your original packages.

When you run the old version of the program, DB2 loads the old versions of the packages. When you run the new version of the program, DB2 loads the new versions of the packages.

**Binding packages and plans on DB2 for** *z***/OS:** You can use the db2sqljcustomize -genDBRM parameter to create DBRMs on your local system. You can then transfer those DBRMs to a DB2 for z/OS system, and bind them into packages or plans there. If you plan to use this technique, you need to transfer the DBRM files to the z/OS system as **binary** files, to a partitioned data set with record format FB and record length 80. When you bind the packages or plans, you need to specify the following bind option values:

## **ENCODING(EBCDIC)**

The IBM Data Server Driver for JDBC and SQLJ on DB2 for z/OS requires EBCDIC encoding for your packages and plans.

#### DYNAMICRULES(BIND)

This option ensures consistent authorization rules when SQLJ uses dynamic SQL. SQLJ uses dynamic SQL for positioned UPDATE or DELETE operations that involve multiple SQLJ programs.

## DBPROTOCOL(DRDA)

Private protocol is deprecated, so you should use DBPROTOCOL(DRDA) for all applications. However, for SQLJ applications that use remote three-part table names, you must use DBPROTOCOL(DRDA). Otherwise, those applications might fail.

# **EXTENDEDINDICATOR bind option behavior:** If the EXTENDEDINDICATOR bind option is not specified in the -bindoptions options string, and the target data

server supports extended indicators, bind operations use EXTENDEDINDICATOR(YES). If EXTENDEDINDICATOR(NO) is explicitly specified, and the application contains extended indicator syntax, unexpected behavior can occur because the IBM Data Server Driver for JDBC and SQLJ treats

# db2sqljcustomize - SQLJ profile customizer

extended indicators as NULL values.

# db2sqljprint - SQLJ profile printer

db2sqljprint prints the contents of the customized version of a profile as plain text.

## Authorization

None

# **Command syntax**

►►—db2sqljprint—*profilename*-

# **Command parameters**

profilename

Specifies the relative or absolute name of an SQLJ profile file. When an SQLJ file is translated into a Java source file, information about the SQL operations it contains is stored in SQLJ-generated resource files called profiles. Profiles are identified by the suffix \_SJProfileN (where N is an integer) following the name of the original input file. They have a .ser extension. Profile names can be specified with or without the .ser extension.

## **Examples**

db2sqljprint pgmname\_SJProfile0.ser

# db2start - Start DB2

Starts the current database manager instance background processes on a single database partition or on all the database partitions defined in a partitioned database environment.

Start DB2 at the server before connecting to a database, precompiling an application, or binding a package to a database.db2start can be executed as a system command or a CLP command.

The db2start command launches the DB2 database product installation as a Windows service. The DB2 database product installation on Windows can still be run as a process by specifying the /**D** switch when invoking db2start. The DB2 database product installation can also be started as a service using the Control Panel or the NET START command.

Since db2start launches a Windows service, you must meet Windows requirements for starting a service. If Extended Security is disabled, you must be a member of the Administrators, Server Operators or Power Users group. If Extended Security is enabled, you must be a member of either the Administrators group or the DB2ADMNS group to start the database.

If a db2start operation in a multi-partition database is not completed within the value specified by the **start\_stop\_time** database manager configuration parameter, the database partitions that have timed out will not have the database manager instance background processes started (all resources associated with the database partition will be removed). Environments with many database partitions with a low value for **start\_stop\_timeout** might experience this behavior. To resolve this behavior, increase the value of **start\_stop\_time** database manager configuration parameter.

For root-install DB2 copies on Linux and UNIX operating systems, the db2start command sets the ulimit value required by the database manager without changing the permanent setting of ulimit for the instance owner ID.

For non-root install, you should set the ulimit for 'data' to 'unlimited' and 'nofiles' to 'unlimited' or the maximum value allowed on the system.

# db2stat - DB2 process status for Windows

On Windows systems, all of the DB2 processes running under an instance can be displayed using the db2stat command.

## **Authorization**

None

## **Required connection**

None

## Command syntax

▶ → db2stat →

## **Command parameters**

## db2stat

Outputs all of the DB2 processes running under an instance.

## **Examples**

C:\Program Files\IBM\SQLLIB\BIN>db2stat

Environment Strings --> DB2CLP=DB20FADE --> DB2INSTANCE=DB2 --> DB2PATH=C:\Program Files\IBM\SQLLIB DB2 Processes DB2DASRRM 1960 x7A8 DB2MGMTSVC 2012 x7DC DB2RCMD 1212 x4BC DB2DASSTM 2044 x7FC DB2CASTM 2044

724	x2D4
3100	xC1C
3180	xC6C
1592	x638
3468	xD8C
1748	x6D4
	724 3100 3180 1592 3468 1748

## Usage notes

One thing to note in the Windows case is that because DB2 is thread-based, not process-based, you will only see one process (DB2SYSCS) for all of an instance's EDUs. It is obvious that the same degree of information is not returned in Windows as is returned in Linux/UNIX systems, but it is still useful, at times, to know the process ID for a running instance. For example, you can use the Windows Task Manager utility to determine the CPU and memory usage for a given process ID.

# db2stop - Stop DB2

Stops the current database manager instance. db2stop can be executed as a system command or a CLP command.

If a db2stop operation in a multi-partition database is not completed within the value specified by the start\_stop\_time database manager configuration parameter, the database partitions that have timed out will be killed internally (all resources associated with the database partition will be removed). Environments with many database partitions with a low value for start\_stop\_time might experience this behavior. To resolve this behavior, increase the value of start\_stop\_time.

Collects environment data about either a client or server machine and places the files containing system data into a compressed file archive.

This tool can also collect basic data about the nature of a problem through an interactive question and answer process with the user.

## Authorization

For the most complete output, this utility should be invoked by the instance owner. Users with more limited privileges on the system can run this tool, however some of the data collection actions will result in reduced reporting and reduced output.

## **Required connection**

None

## **Command syntax**

event-monitor-options:					

►--actid—activity-id—

#### Note:

- The db2support tool collects bad query-related information only if -st, -sf, or -se options are specified. In case there is an error or trap during optimization, -cl 0 (collect level zero) should be used to collect all catalog tables and db2look table definitions without trying to explain a bad query. -aem (with -st or -sf) or event monitor options could be specified if activity event monitor related information needs to be collected as the part of optimizer collection. One of the these options must be specified to work with optimizer problems.
- 2. In case special registers have been set to values other than the default during the statement execution, it is very important for correct problem analysis that the same values should be passed as parameters to the db2support tool.

Note: The special register options will be ignored by db2caem collection

## **Command parameters**

## output path

Specifies the path where the archived library is to be created. This is the directory where user created files must be placed for inclusion in the archive.

-A archive\_path | -Archive archive\_path

Starting with Fix Pack 1, this option archives all the data from the directory specified in the DIAGPATH configuration parameter into the specified archive path. A new directory will be created in the specified archive path with the name "DB2DUMP" with the system hostname and timestamp appended, for example "DB2DUMP\_systemhostname\_2009-01-12-12.01.01".

-aem Specifies that the db2caem information for the SQL statement specified through -st or -sf should be collected. -aem does not support -se. The

default behavior for db2support will not collect db2caem information. With this option, db2caem will create an activity event monitor in order to collect the requested information. The activity event monitor and other created tables will be cleaned up from the system.

**Note:** The db2support special register options will be ignored by the db2caem tool; **–compenv** should be used to specify the compilation environment for db2caem to use. The specified SQL statement will be executed by the db2caem tool.

-B | -basic

Restricts the collection to only optimizer information. No other information will be collected except information for the db2supp\_opt.zip file. The **-basic** parameter must be used with the **-st**, **-sf**, or **-se** parameters or a syntax error will be returned.

#### -cd | -curdegree

Specifies the value of the current degree special register to use. The default is the value of the **dft\_degree** database configuration parameter.

-cfg Collect configuration information and exclude all other support-related data. This option can only be combined with the following options: -f,
 -flow, -c, -connect, -d, -database, -m, -html, -n, -number, -o, -output, -p,
 -password, -u, -user, -v, -verbose.

**Note:** This command parameter is available in DB2 Version 9.7 Fix Pack 2 and later fix packs.

#### -cl | -collect

Specifies the value of the level of performance information to be returned. Valid values are:

**Note:** If you specify event monitor options (**-actevm**, **-appid**, **-uowid**, **-actid**) without **-st**, **-sf**, or **-se** the effective collection level (**-cl**) is **1** but only db2caem information will be collected there are no exfmt etc collections. The default is also override.

-co Collect catalogs for all tables in the database. The default is to only collect catalog information for the tables used in a query that has a problem.

#### -compenv compilation-environment-file

Specifies that the compilation environment will be used when the db2caem is executed. The compilation environment (comp\_env\_desc) is in BLOB data type and is specified through a file as an optional input. If the option is not provided, the default compilation environment will be used when executing db2caem.

## -cs | -curschema

Specifies the value of the current schema to use to qualify any unqualified table names in the statement. The default value is the authorization ID of the current session user.

#### -C | -compress

Enables archive compression. By default, the archive data is compressed

into a single file using zip compression. Archive compression is only available in archive mode and must be used with the **-A** parameter or a syntax error is returned.

- tar The optional value *tar* enables tar archiving. The *tar* value is only supported on UNIX systems.
- **tgz** The optional value *tgz* enables gzip compressed tar archiving. The *tgz* value is only supported on UNIX systems.

#### -d database\_name | -database database\_name

Specifies the name of the database for which data is being collected.

**Note:** In DB2 Version 9.7 Fix Pack 2 and later fix packs, by default an attempt will be made to connect to the specified database. To override this, specify the **-noconnect** or **-nco** parameter.

#### -nco | -noconnect

Specifies that there is no attempt to connect to the specified database.

**Note:** This command parameter is available in DB2 Version 9.7 Fix Pack 2 and later fix packs.

#### -c | -connect

Specifies that an attempt be made to connect to the specified database.

**Note:** In DB2 Version 9.7 Fix Pack 2 and later fix packs, this command parameter is included by default when a database is specified.

#### event-monitor-options

The following options uniquely identify the SQL statement for which the activity event monitor data will be collected. They must be specified together.

#### -actevm activity-event-monitor-name

Specifies the name of the existing activities event monitor whose activitystmt logical grouping contains the data to be collected.

#### -appid application-id

Specifies the application identifier (appl\_id monitor element) uniquely identifying the application that issued the activities to be collected.

#### -uowid uow-id

Specifies the unit of work ID (uow\_id monitor element) whose data is to be collected. The unit of work ID is only unique within a given application.

#### -actid activity-id

Specifies the activity ID (activity\_id monitor element) whose data is to be collected. The activity ID is only unique within a given unit of work.

#### -extenddb2batch

Specifies that db2batch information for all the optimization levels specified with the **-ol** or **-optlevel** parameter are to be captured. At least one value for the **-ol** parameter and a **-cl** parameter value of 3 must be specified with the **-extenddb2batch** parameter or db2support will return a syntax error.

#### -f | -flow

Ignores pauses when requests are made for the user to Press <Enter> key to continue. This option is useful when running or calling the db2support tool via a script or some other automated procedure where unattended execution is desired.

-fodc Specifies that only the FODC directories and the db2diag log files are collected. If no directories are specified, the db2support command will show a list of all the FODC directories for you to choose from. The directories are listed in ascending chronological order, based on usage timestamps, making the most recently used directories most visible.

The db2support command can only collect the FODC directories on the physical database host from where the command was run. As such, the **-G** or **-global** parameters will not work with **-fodc**.

You can specify the time interval (**-t** or **-time**) or history (**-H** or **-history**) parameters, but if a specified FODC directory is outside the specified timeframe, db2support will return an error.

You also cannot specify the archive (**-A** or **-archive**) or basic (**-B** or **-basic**) parameters when using **-fodc**.

*Trap* | *Panic* | *BadPage* | *Hang* | *IndexError* | *Perf* | *DBMarkedBad* Specifies the category of FODC directories to collect.

list of FODC directories

A comma-separated list of existing FODC directories.

## -F | -full

Specifies that all db2support information and optimizer specific information are to be captured with nothing excluded.

## -fp | -funcpath

Specifies value of the function path special register to be used to resolve unqualified user defined functions and types. The default value is "SYSIBM", "SYSFUN", "SYSPROC", X, where X is the value of the USER special register, delimited by double quotation marks.

#### -g | -get\_dump

Specifies that all files in a dump directory, excluding core files, are to be captured.

## -global | -G

Specifies that db2support will also be run on remote hosts.

**Note:** This command parameter is available in DB2 Version 9.7 Fix Pack 2 and later fix packs.

-dbp *database partition number* | -dbpartitionnum *database partition number* Specifies that db2support will be run on the remote host of the specified database partition. If no database partition is specified with the -global or -G option, db2support will run on all remote hosts.

#### -sdir shared directory path | -S shared directory path

Specifies the shared directory db2support will use for temporary storage.

#### -h | -help

Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed.

#### -H history\_period | -history history\_period

Starting with Fix Pack 1, this option limits the data collected by db2support to a particular interval of time. The history\_period variable must be specified. The history\_period variable may be specified with a number and time type with an optional beginning time value separated by a colon. The available types are:

- d = days h = hours
- m = minutes
- s = seconds

The beginning of time value is specified in time stamp format. Time stamp format is YYYY-MM-DD-hh.mm.ss.nnnnn where YYYY specifies a year, MM for a month of a year (01 through 12), DD for a day of a month (01 through 31), hh for an hour of a day (00 through 23), mm for minute of an hour (00 through 59), ss for the seconds of a minute (00 through 59), nnnnn for microseconds on UNIX systems or milliseconds on Windows systems. Some or all of the fields that follow the year field may be omitted. If fields are omitted, the default values will be used. The default values are 1 for the month and day, and 0 for all other fields.

The number and time type may be positive or negative specified with + or - signs. If only a number and time type are specified the default is negative. If a number and time type are specified and a beginning time value is specified the default is positive. For example, -history 6d will collect data for the past 6 days. -history 6d:2009 will collect data for the first 6 days of 2009.

This option cannot be used with the **-time** or **-t** option.

#### -il | -isolation

Specifies the isolation level to use to determine how data is locked and isolated from other processes while the data is being accessed. By default, the CURRENT ISOLATION special register is set to blanks.

## -l | -logs

Specifies that active logs are to be captured.

#### -m | -html

Specifies that all system output is dumped into HTML formatted files. By default, all system related information is dumped into flat text files if this parameter is not used.

## -n | -number

Specifies the problem management report (PMR) number or identifier for the current problem.

#### -nc | -nocatalog

Specifies that catalog information should not be collected. The default behavior for db2support will collect catalog information.

## -nl | -nodb2look

Specifies that db2look information should not be collected. The default behavior for db2support will collect db2look information.

## -ol levels | -optlevel levels

Specifies the value of the optimization level special register to use. The default is the value of the **dft\_queryopt** database configuration parameter. The optimization level value may be specified as a single value or multiple values separated by a comma.

If multiple values are specified, all optimization information is collected for the first value. For each additional optimization level value specified, the explain plans will be collected and stored in a separate file along with the initial and end times of the collection for each level.

#### -op | -optprofile

Specifies value of the optimization profile special register to use. It is needed only if there was an optimization profile in effect when the statement was bound. The default is "" (an empty string).

## -ot | -opttables

Specifies the value of the special register called "CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION" that is used to identify the types of tables that can be considered when optimizing the processing of dynamic SQL queries. The initial value of CURRENT MAINTAINED TABLE TYPES FOR OPTIMIZATION is "SYSTEM".

#### -p password | -password password

Specifies the password for the user ID.

## -q | -question\_response

Specifies that interactive problem analysis mode is to be used.

#### -ra | -refreshage

Specifies the value of the refresh age special register. It applies only if there are materialized query tables (MQTs) that reference tables in the statement. The default value of CURRENT REFRESH AGE is zero.

#### -ro | -reopt

Specifies whether EXPLAIN with REOPT ONCE should be used when explaining the query. The default is to ignore the REOPT ONCE option.

## -s | -system\_detail

Specifies that detailed hardware and operating system information is to be gathered.

#### -se embedded SQL file | -sqlembed embedded SQL file

Specifies the path of the embedded SQL file containing the SQL statement for which data is being collected.

## -sf SQL file | -sqlfile SQL file

Specifies the file path containing the SQL statement for which data is being collected.

#### -st SQL statement | -sqlstmt SQL statement Specifies the SQL statement for which data is being collected.

#### -t time\_interval | -time time\_interval

Starting with Fix Pack 1, this option limits the data collected by db2support to a particular time interval specified by the time interval variable. The time interval can be specified as a start time, end time, or both in time stamp format separated by a colon. Time stamp format is YYYY-MM-DD-hh.mm.ss.nnnnn where YYYY specifies a year, MM for a month of a year (01 through 12), DD for a day of a month (01 through 31), hh for an hour of a day (00 through 23), mm for minute of an hour (00 through 59), ss for the seconds of a minute (00 through 59), nnnnn for microseconds on UNIX systems or milliseconds on Windows systems. Some or all of the fields that follow the year field may be omitted. If fields are omitted, the default values will be used. The default values are 1 for the month and day, and 0 for all other fields.

If only a start time is specified (-t 2009), db2support will collect files that are modified after the start time. If only an end time is specified (-t :2009), db2support will collect files that are modified before end time. If both of inputs are specified (-t 2008:2009), db2support will collect files that are modified within the interval of the start time and end time. There is no default value for this option. At least one of time stamps must be specified.

This option cannot be used with the **-history** or **-H** option.

#### -td | -delimiter

Specifies the statement termination character. This command parameter works in the same way as the **-td** option of the db2 command. The default is a semicolon.

## -tbspname table-space-name

Specifies the table space name in which the db2caem command creates the activity event monitor. For a partitioned database environment, the table space must exist on all the database partitions where the SQL statement of interest is to be run. If the option is not provided, the default table space is used by the db2caem command when creating the activity event monitor.

#### -u userid | -user userid

Specifies the user ID to connect to the database.

-v | -verbose

Specifies that verbose output is to be used while this tool is running.

-x | -xml\_generate

Specifies that an XML document containing the entire decision tree logic used during the interactive problem analysis mode (**-q** mode) is to be generated.

## Examples

The db2support tool is invoked in the optimizer mode in one of the following ways:

• As an SQL statement from a command line.

db2support output\_directory -d database\_name -st sql\_statement

The db2support tool stores the query in the optimizer directory by copying the query into the file called bad\_query.sql.

As an SQL statement stored in a file.
 db2support output\_directory -d database\_name -sf sql\_file

The file containing the query is copied by the tool into the optimizer directory.

• As a file containing an embedded static SQL statement with the query having the problem.

db2support output\_directory -d database\_name -se embedded\_sql\_file

The file containing the query is copied by the tool into the optimizer directory. The file does not need to be in the current directory but should be readable by an invoking userID.

While returning different levels of performance information.
 db2support output directory -d database name -collect 0

The db2support tool collects different levels of performance information based on the level of detail requested. The values 0 to 3 collect increasing amounts of

detail. Catalog information and table definitions to enable you to reproduce the database objects for a production database are collected when a level of 0 is used.

To collect information to diagnose a slow query using optimizer-related special registers that were set by default, use: db2support . -d sample -st "SELECT \* FROM EMPLOYEE"

This example returns all the data to the db2support.zip file. Diagnostic files are created in the current directory and its subdirectories (since . is specified as the output path). The system information, optimizer information, and diagnostic files are collected as well.

To collect the same information shown in the previous example but with the user-specified values for the optimizer-related special registers, use:

```
db2support . -d sample -st "SELECT * FROM EMPLOYEE" -cs db2usr -cd 3
    -ol 5 -ra ANY -fp MYSCHEMA -op MYPROFSCHEMA.MYPROFILE -ot ALL -il CS
```

To collect the same information shown in the previous example but with multiple user-specified values for the optimizer-related special registers and collect db2batch information for each optimizer special register value, use:

```
db2support . -d sample -st "SELECT * FROM EMPLOYEE" -cs db2usr -cd 3
-ol 3,5,7 -cl 3 -extenddb2batch -ra ANY -fp MYSCHEMA -op MYPROFSCHEMA.MYPROFILE
-ot ALL -il CS
```

This example sets the following special registers: current schema to db2usr, current degree to 3, optimization level to 5, refresh age to ANY, function path to schema MYSCHEMA, optimization profile to MYPROFSCHEMA.MYPROFILE, current maintained table types to ALL, and the isolation level to CS. These values are set only for the connection that db2support establishes to the specified database and does not affect your entire environment. Providing the same special registry variables as used when the query was run is very important when correcting diagnostics.

To limit the data collection to files modified in the last 3 days prior to current time, use:

db2support -H 3d

To limit the data collection to files modified in the first 3 days of 2009 (time period 2009–01–01–00.00.00.000000 through 2009–01–04–00.00.00.000000), use: db2support -H 3d:2009

To limit the data collection to files modified in time period 2008–01–01–00.00.00.000000 through the current time. db2support -t 2008

To limit the data collection to files modified in the time period of 2009–01–01–00.00.00.000000 through 2009–03–01–00.00.00.000000, use: db2support -t 2009-01:2009-03

#### Using db2support to collect activity event monitor data for the SQL statement:

For example:

db2support -d sample -st "select \* from staff" -aem

In addition to current collection at **-cl 2**, this will invoke db2caem, which will create the activity event monitor and capture information of details, section and values, as well as actuals for the SQL statement "select \* from staff". db2support will collect all the db2caem output.

• db2support -d sample -sf badquery.sql -aem

In addition to current collection at **-cl 2**, this will invoke db2caem, which will create the activity event monitor and capture information of details, section and values, as well as actuals for the SQL statement specified in the file badquery.sql. db2support will collect all the db2caem output.

 db2support -d sample -actevm mymon -appid \*LOCAL.amytang.100203234904 -uowid 44 -actid 1

In addition to current collection at **-cl 0**, this will invoke db2caem, which will capture the activity event monitor information of details, section and values, as well as actuals for the SQL statement identified by the event monitor options from the existing activity event monitor. db2caem will not create activity event monitor in this case. db2support will collect all the db2caem output.

# **Usage notes**

In order to protect the security of business data, this tool does not collect table data, schema (DDL), or logs. Some of the options do allow for the inclusion of some aspects of schema and data (such as archived logs). Options that expose database schema or data should be used carefully. When this tool is invoked, a message is displayed that indicates how sensitive data is dealt with.

Data collected from the db2support tool will be from the machine where the tool runs. In a client-server environment, database-related information will be from the machine where the database resides via an instance attachment or connection to the database. For example, operating system or hardware information (-s option) and files from the diagnostic directory (**diagpath**) will be from the local machine where the db2support tool is running. Data such as buffer pool information, database configuration, and table space information will be from the machine where the database physically resides.

There are some limitations on the type of queries accepted by the db2support optimizer tool:

- Multiple queries are not supported. If you place several queries in a file, the tool gathers all the objects necessary for each of the queries. However, only the last query is explained. This is also true for files containing embedded static SQL statements.
- The tool does not run customer applications. However, you can run the application at the same time you are running db2support provided you are using one of the three methods discussed to evaluate a particular bad or slow query.
- Stored procedures are not supported.

db2support does not collect explain data for dynamic SQL.

# db2swtch - Switch default DB2 copy and database client interface copy

Switches both the default DB2 copy and the default database client interface copy. The default DB2 copy is the copy that is used by applications that are not targeted at a specific DB2 copy. Issuing db2swtch launches the Default DB2 and IBM Database Client Interface Selection wizard which you can follow to set a new default DB2 Copy and set the default database client interface copy. This command is only available on Windows operating systems.

## Authorization

sysadm

## **Required connection**

None

# **Command syntax**

►►—db2swtch-			
►d—name	of DB2 copy or IBM	data server driver copy	IDS common- IDS SQLI-

# **Command parameters**

#### no arguments

--h----?--

Launches the utility in graphical mode.

-1 Displays a list of DB2 copies and IBM data server driver copies on the system.

## -db2 -d name of DB2 copy

Switch the default DB2 copy to the name specified.

db2swtch -db2 -d name of DB2 copy

-client -d name of DB2 copy or IBM data server driver copy Switch the default client interface copy to the name specified. db2swtch -client -d name of DB2 copy or IBM data server driver copy

## -d name of DB2 copy

Switches both default DB2 copy and client interface copy to the name specified.

db2swtch -d name of DB2 copy

## -IDS

#### common

Redirects the IDS .NET data provider reference in machine.config to common IDS .NET data provider.

## db2swtch - Switch default DB2 copy and database client interface copy

- **SQLI** Redirects the IDS .NET data provider reference in machine.config to SQLI IDS .NET data provider.
- -h | -? Displays help information.
•

# db2sync - Start DB2 synchronizer

Facilitates the initial configuration of a satellite as well as changes to the configuration. This command can also be used to start, stop and monitor the progress of a synchronization session and to upload a satellite's configuration information (for example, communications parameters) to its control server.

## Authorization

None

### **Required connection**

None

### **Command syntax**

►►-db2sync-

-t--s-application\_version-

## **Command parameters**

-t Displays a graphical user interface that allows an administrator to change either the application version or synchronization credentials for a satellite.

#### -s application\_version

Sets the application version on the satellite.

-g Displays the application version currently set on the satellite.

## db2systray - Start DB2 system tray

Starts the DB2 system tray tool. It is a Windows operating system notify icon which monitors the status of a DB2 database service on Windows operating systems. db2systray provides a visual indication of when the service is started and stopped, as well as the ability to start and stop the service. It also provides a launch point for the DB2 Control Center.

The db2systray icon has two modes, started and stopped. When the monitored instance is stopped, the icon contains an overlay with a red square. When the instance is started, the red square disappears.

In partitioned database environments, the db2systray icon will be in started mode only when all partitions are started. If one or more partitions are stopped, the db2systray icon will be in stopped mode.

When multiple DB2 copies are installed on a single Windows operating system, db2systray can monitor DB2 instances for each DB2 copy that is installed. To monitor a non-default DB2 copy, you can execute the db2systray.exe application from the SQLLIB/bin of the DB2 copy you want to monitor.

You can monitor a single DB2 instance or multiple instances at the same time. Multiple instances can be monitored using multiple db2systray processes. A separate icon will appear in the system tray for each instance monitored by db2systray. Hovering over each icon with your mouse will display the name of the DB2 copy that is being monitored followed by the DB2 instance name monitored by that db2systray icon.

The db2systray icon can be launched manually from the DB2 command window by issuing the db2systray command, or automatically when the Windows operating system starts. db2systray is configured to start automatically when you install the DB2 database. However, having db2systray configured to start automatically when the system starts, does not mean that it will attempt to start the DB2 service as well. All it means is that it will start monitoring the status of the DB2 database automatically.

Issuing the db2idrop command against an instance monitored by a running db2systray process will force the db2systray application to clean up its registry entries and exit.

db2systray is only available on Windows platforms.

### Authorization

No special authority is required for starting db2systray. Appropriate authority is required for taking actions.

### **Required connection**

None

### **Command syntax**

▶ — db2systray — T

+211+0	
- auco	
└─-auto-┘	└─instance-name└┘

### **Command parameters**

- **+auto** Start db2systray automatically for the specified instance when the Windows operating system starts. db2systray can also be configured to launch automatically by enabling the Launch Tool at Startup db2systray menu option.
- -auto Disable db2systray from starting automatically for the specified instance when the Windows operating system starts.

#### instance-name

Name of the DB2 instance to be monitored. If no instance name is specified, db2systray will monitor the default local DB2 instance. If no instance exists, or the specified instance is not found, db2systray will exit quietly.

-clean Clean up all registry entries for all DB2 instances monitored by db2systray and stop all running db2systray.exe processes.

#### Examples

C:\SQLLIB\bin> db2systray

Starts db2systray for the default DB2 instance specified by the DB2INSTANCE environment variable.

2. C:\SQLLIB\bin\> db2systray DB2INST1

Starts db2systray for the instance named DB2INST1.

3. C:\SQLLIB\bin\> db2systray +auto

Starts db2systray for the default DB2 instance, and configures db2systray to start monitoring this instance automatically when the Windows operating system starts.

C:\SQLLIB\bin\> db2systray +auto DB2INST1

Starts db2systray for the instance named DB2INST1, and configures db2systray to start monitoring this instance automatically when the Windows operating system starts.

5. C:\SQLLIB\bin\> db2systray -auto

Disables the auto start option for the default instance defined by the DB2INSTANCE environment variable.

6. C:\SQLLIB\bin\> db2systray -auto DB2INST1

Disables the auto start option for instance DB2INST1.

7. C:\SQLLIB\bin\> db2systray -clean

Removes all registry entries created by db2systray and stops all running db2systray.exe processes. If db2systray.exe processes are running for other installed DB2 copies, they will not be cleaned up. You must execute db2systray-clean from the SQLLIB/bin for each DB2 copy you want to clean up.

# db2tapemgr - Manage log files on tape

Allows the storage and retrieval of DB2 log files to and from tape. The location on tape is stored in the history file.

### **Authorization**

One of the following:

- sysadm
- sysctrl
- sysmaint

## **Command syntax**

▶ — db2tapemgr Di		e-aliasON DBP	ARTITIONNUM—n—	
► STORE DOUBLE STORE RETRIEVE retri SHOW TAPE HEADER EJECT TAPE DELETE TAPE LABEL QUERY for roll	-  store option clause   eve option clause   -tape device	USING—blocksi	zeEJECT	<b>&gt;</b> 4

#### store option clause:

#### retrieve option clause:

#### for rollforward clause:

USING HISTORY FILE—history file—

### **Command parameters**

#### **DATABASE** source-database-alias

Specifies the name of the database. If no value is specified, DB2DBDFT will be used. If no value is specified, and DB2DBDFT is not set, the operation fails.

#### **ON DBPARTITIONNUM**

Specifies the database partition number to work on. If no value is specified, DB2NODE is used.

#### **STORE ON** tape device

Stores log file to tape and deletes it.

#### **DOUBLE STORE ON** *tape device*

Stores all log files that have been stored only once and those log files never stored. Deletes only the log files that have been stored twice to tape; others are kept on disk.

#### TAPE LABEL

Specifies a label to be applied to the tape. If tape label is not specified, one will be generated automatically in the following format: *database-alias* | *timestamp* (up to 22 characters, up to 8 characters for the database alias and 14 characters for the time stamp in seconds).

### ALL LOGS or *n* LOGS

Specifies that the command applies to all logs or a specified number of logs.

#### FORCE

Specifies that if the tape has not expired, then over write it.

#### **USING** blocksize

Specifies the block size for tape access. The default size is 5120, and it must be a multiple of 512. The minimum is 512.

**EJECT** Specifies that the tape is to be ejected after the operation completes.

#### **RETRIEVE FOR ROLLFORWARD TO**

Specifies that the utility will interactively prompt for all logs that are required for the specified rollforward and retrieve them from tape. If a directory is not specified, the path specified by the **overflowlogpath** configuration parameter is used. If a directory is not specified and **overflowlogpath** is not set, the operation fails.

### **END OF LOGS**

Specifies that log files up to the end of the log will be retrieved.

#### isotime USING GMT TIME

Specifies that log files up to the time specified will be retrieved.

#### local time USING LOCAL TIME

Specifies that log files up to the time specified will be retrieved.

#### **USING HISTORY FILE** history file

Specifies an alternate history file to be used.

#### FROM tape device

Specifies the tape device to retrieve log files from.

#### **TO** *directory*

Specifies a directory to copy retrieved log files to.

#### **RETRIEVE ALL LOGS or LOGS** *n* **TO** *m*

Specifies that the command applies to all logs or a specified number of logs on a tape.

FROM tape device

Specifies the tape device to retrieve log files from.

#### **TO** directory

Specifies a directory to copy retrieved log files to.

#### **RETRIEVE HISTORY FILE**

Retrieves the history file

#### **FROM** tape device

Specifies the tape device to retrieve log files from.

#### **TO** *directory*

Specifies a directory to copy retrieved log files to.

#### **SHOW TAPE HEADER** tape device

Shows the content of the tape header file DB2TAPEMGR.HEADER

#### **EJECT TAPE** tape device

Ejects the tape.

### **DELETE TAPE LABEL** tape label

Deletes all locations from the history file that refer to the specified tape label.

### QUERY FOR ROLLFORWARD TO

Displays the location of the log files that are required for rollforward.

#### END OF LOGS

#### isotime USING GMT TIME

Specifies that the operation should query the logs up to the time specified.

### local time USING LOCAL TIME

Specifies that the operation should query the logs up to the time specified.

### **USING HISTORY FILE** history file

Specifies an alternate history file to be used.

•

# db2tbst - Get table space state

Accepts a hexadecimal table space state value, and returns the state. The state value is part of the output from LIST TABLESPACES or the MON\_GET\_TABLESPACE table function.

### Authorization

None

### **Required connection**

None

### **Command syntax**

▶ → db2tbst — tablespace-state — —

## **Command parameters**

*tablespace-state* A hexadecimal table space state value.

## **Examples**

The request db2tbst 0x0000 produces the following output: State = Normal

## db2tdbmgr - Migrate tools catalog database

The db2tdbmgr command migrates specific tools catalog database objects after running the UPGRADE DATABASE command on the tools catalog database.

### **Authorization**

sysadm

### **Required connection**

This command establishes a database connection.

### **Command syntax**

http://www.destander.com/		
	uuser_name	
▶		<b>&gt;</b>
ppassword		

## **Command parameters**

```
-d db_name
Tools catalog database name.
```

-s schema\_name

Tools catalog schema name.

-u user\_name

User name used to connect the tools catalog database.

-p password

Password used to connect the tools catalog database.

### **Examples**

The following example migrates the tools catalog tables, under the database alias toolsdb and schema systools:

db2tdbmgr -d toolsdb -s systools -u db2inst1 -p \*\*\*\*\*\*\*

### **Usage notes**

This command will only migrate tools catalog tables to a newer version, and cannot be used to convert migrated tools catalog tables to its previous version.

The database must be cataloged before migration. Most of the time, a migration error message is self explanatory, clearly stating the location of the error. If the error message complains about any of the objects such as tables or column names, then the reported objects might be corrupted or missing under the database name submitted for migration.

## db2top - DB2 monitoring tool

The db2top command provides a unified, single-system view of a multi-partition database or single-partition database on the AIX<sup>®</sup>, Linux and Solaris operating systems. It can be used to quickly identify global problems, or specific database partition problems in the system. By combining snapshot information from each database partition, the utility can provide a dynamic real-time view of a running DB2 system.

### Scope

db2top can be run in interactive mode or in batch mode.

## Authorization

One of the following:

- sysadm
- sysctrl
- sysmaint
- sysmon

## **Required connection**

Instance. A connection is not required in replay or client mode.

## **Command syntax**

## **Command parameters**

-A Enables automatic performance analysis. The db2top command produces a top five performance report. Use this option in replay and background mode (-b option). Typical usage includes:

Running db2top in collection mode for a long period (for example, 4 hours):

db2top -f collect.file -C -m 240

Running db2top in replay mode with automatic performance analysis. Automatic performance analysis is available for any functions supported in background mode and is based on the default sort criteria specified in .db2toprc for the selected suboption (automatic performance analysis is also available in background mode, even when not replaying). As an example, to analyze the most active sessions, issue the following command: db2top -f collect.file -b 1 -A

Running db2top in replay mode, jumping to the desired point in time to analyze further:

db2top -f collect.file /HH:MM:SS

- -a Specifies that only active objects are displayed.
- -B Displays active objects in bold (reverse) color. This is helpful when the screen does not support colors and colors are set to off in the .db2toprc configuration file.
- -b suboption

Runs db2top in background mode. When using the -b option, the db2top command displays information in CSV format. db2top can be run in background mode in combination with reading snapshot data from a collection file using the -f <file> option. Issuing multiple suboptions for background mode (-b) is not supported. The -b parameter takes one of the following suboption values:

- d database
- 1 sessions
- t tablespaces
- **b** bufferpools
- T tables
- D Dynamic SQL
- s Statements
- U Locks
- u Utilities
- F Federation
- **m** Memory pools

The following options can only be used with the -b option: -X, -L, -A, -s, -D, -o.

- -C Runs db2top in snapshot collector mode. Raw snapshot data is saved in <db2snap-<dbname>-<Machine><bits><.bin> by default (unless -f is specified). Pipe can also be specified for output instead of file. Specifying multiple suboptions for collector mode (-C) are supported. To include locks information in the collection file, use -x along with -C. The -C parameter takes one of the following suboption values:
  - b : bufferpools

- D : Dynamic SQL
- d : database
- F : Federation
- 1 : sessions
- s : Statements
- T : Tables
- t : tablespaces
- U : Locks

The db2top command runs in replay mode if the -C command parameter is not specified.

### -D delimeter

Specifies the field delimiter (single character). Use in background mode (-b option).

### -d database name

Specifies the database to monitor.

### -f file </HH:MM:SS><+offset>

• If -f is not specified db2top is run in replay mode. If -f is specified it indicates output filename. The database name specified with -d does not need to exist. It is only referenced if you want to issue explains or Dump DB Struct.

In replay mode (-C option is not used), if snapshot data has been previously collected in <file>, offset jumps to a certain point in time in the file. It can be expressed in seconds (+10s), minutes (+10m) or hours (+10h). / HH:MM:SS skips entries until the specified point in time.

- In the collector mode (-C option is used), you can specify the output filename. </HH:MM:SS><+offset> will be ignored if you are in collector mode
- -h Displays usage information for the db2top command.

### -i interval in seconds

Specifies the delay between screen updates. The delay time cannot be less than one second.

- -k Displays actual or delta values. For all functions in delta mode, delta values are computed and displayed on a per second basis regardless of the specified refresh interval.
- -L

Specifies that statements that are currently executing or most recent statements from current sessions are captured at each reporting interval specified by the -i option. If an SQL statement starts and finishes between an interval, it will not be included.

In the background mode, use -b l -L command parameters to catch SQL statements executed in a session and output them to the ALL.sql file in the current working directory.

Currently executing or the most recent SQL statement for a connected session are captured at each interval (as specified by -i option). If a SQL statement starts and finishes between an interval, it will not be caught.

### -m duration in minutes

Limits the duration of db2top in minutes for -b and -C parameters.

-nnode name

Specifies the node to attach to.

- -o Specifies the output file name. Used in background mode (-b option).
- -P dbpartition number

Specifies the database partition number on which the snapshot will be issued . If -P is specified and the *dbpartition number* is not specified, db2top will attach to the default database partition.

- -p Specifies the password used to access the database. If omitted and the -u option has been specified, the user is prompted for the password
- -R Resets snapshot at startup.
- -s number

Specifies how many samples will be displayed. Only supported in background mode (-b option).

- -u Specifies the username used to access the database.
- -Vschema

Specifies the default schema used in explains.

-x Specifies whether to display additional counters on session and application screens (might run slower on session).

## Snapshot data collector

The db2top monitoring utility can be run in replay mode, which means it can run against a saved copy of the raw binary snapshot data. To run in replay mode, db2top must be first run in data collector mode, either in batch mode by running db2top from the command line with the -C switch, or by activating or deactivating data collection from an interactive session by pressing C. This will create a file <db2snap-hostname.bin> in the current directory. Then, the db2top utility can be run against <db2snap-<dbname>-<Machine><bits>.bin> using the -f arguments. The db2top monitoring utility does not need to attach to the DB2 instance in replay mode, which is convenient for remote monitoring. It is possible to limit the content and size of the stream file by specifying any of the suboptions available to the -C switch.

### Examples (batch mode)

The command parameters are as below: --> Run in background mode, while catching the "sessions" related -h 1 info in db2top -C --> run db2top in snapshot collector mode -d CUST --> database -i 3 --> 3 second interval -m 60 --> limit duration of db2top to 60 minutes -n node --> node -o db2top.xml --> output file db2top.xml -p password --> password --> collect 10000 samples -s 10000 -u userid --> userid -V sv9 --> Schema --> display additional counters on session - X

The following example commands monitor a database called "CUST" on a node called "node" with a schema called "sv9". The user ID for the database is "userid", and the password is "password":

• The following example command, monitors the database in background mode in three second intervals for sixty minutes and outputs session information in XML format into a file called db2top.xml:

db2top -d CUST -n node -u userid -p password -V sv9 -i 3 -b l -X -o db2top.xml -m 60

• The following example command, monitors the database in background and snapshot collection mode, collecting 10000 samples of session information in XML format. The output binary file is db2snap-CUST-AIX64.bin:

db2top -d CUST -n node -u userid -p password -V sv9 -b l -x -s 10000 -X -f db2snap-CUST-AIX64.bin

• The following example command replays the output capture in the previous example command:

db2top -f db2snap-CUST-AIX64.bin

## db2trc - Trace

db2trc controls the trace facility of a DB2 instance or the DB2 Administration Server (DAS). The trace facility records information about operations and formats this information into readable form. Enabling the trace facility (OFF by default) might impact your system's performance. As a result, only use the trace facility when directed by a DB2 technical support representative; otherwise, turn off the trace once enough information has been recorded.

DB2 traces can be especially useful when analyzing recurring and reproducible problems, which greatly facilitates the support representative's job of problem determination.

When using DB2, you might on occasion encounter an error message that directs you to "get a trace and call IBM Support", "turn on trace and examine the trace record", or to "contact your technical support representative with the following information: problem description, SQLCODE, SQLCA contents (if possible), and trace file (if possible)". Or, when you report a problem to IBM Support, you might be asked to perform a trace to capture detailed information about your environment.

### Authorization

To trace a DB2 instance on a UNIX operating system, you must possess one of the following authorizations:

- sysadm
- sysctrl
- sysmaint

To trace the DB2 Administration Server on a UNIX operating system:

• dasadm

On a Windows operating system, no authorization is required.

### **Required connection**

None

## format-parsing:

### collection-options:

### on-options:

### trace-options:

### performance-counter:

## **Command parameters**

-appid Use this parameter to trace specific application IDs. The –appid option works with the on and change command. -appid will not work with the -perfcount option

#### -apphdl

Use this parameter to trace specific application handles. The **-apphdl** option works with the **on** and **change** command. **-apphdl** will not work with the **-perfcount** option

#### -member

Specifies which database members (or partitions) to trace. The **-member** option works with the **on**, **change**, **format**(flow/format), **stop** and **off** commands. See examples 2,3 below for further details. **-member** will not work with the **-perfcount** option.

- **db2** Specifies that all trace operations will be performed on the DB2 instance. This is the default.
- **das** Specifies that all trace operations will be performed on the DB2 Administration Server instance.
- **on** Use this parameter to start the trace facility. See *Shared trace-options* section below for a list of parameters.
  - -1 [bufferSize]

This option specifies the size and behavior of the trace buffer. -l specifies that the last trace records are retained (that is, the first records are overwritten when the buffer is full). The buffer size can be specified in either bytes or megabytes. To specify the buffer size in megabytes, add the character  $M \mid m$  to the buffer size. For example, to start db2trc with a 4-megabyte buffer: db2trc on -l 4m

The default and maximum trace buffer sizes vary by platform. The minimum buffer size is 1 MB. The buffer size must be a power of 2.

-i [bufferSize]

This option specifies the size and behavior of the trace buffer. -i specifies that the initial trace records are retained (that is, no more records are written to the buffer once it is full). The buffer size can be specified in either bytes or megabytes. To specify the buffer size in megabytes, add the character  $M \mid m$  to the buffer size.

-f filename

When tracing to a file, a fully-qualified file name must be specified, and if -l or -i is used with -f option, their *buffersize* values will limit the size of the file on disk. -l will preserve the last trace records and will be allowed to wrap within the file. -i will preserve the initial trace records and will stop tracing when the file size limit is reached. To specify the file size in megabytes, add the character M

| m, and for gigabytes, add the character G | g after the value specified for -i and/or -l *buffersize*.

- -cli Trace the CLI/ODBC driver and CLI applications. For more information, see "Trace CLI/ODBC configuration keyword".
- -errors Trace only errors and nonzero return codes on function exit. This option cannot be specified at the same time with the -debug or -perfcount options.

#### change

This collection option lets you change the trace options that are in effect. See *Shared trace-options* section below for a list of parameters.

#### -resume

This option lets you resume execution of a suspended process. You cannot resume if -suspend was not enabled.

#### Shared trace-options

Common trace options shared between on and change.

-m mask

Reduces the amount of data collected or formatted. The trace mask has the following format:

types.products.components.functions.categories

Values for the mask would be provided by IBM Support.

The mask consists of five parts (trace record types, products, components, functions, and function categories). Each part can consist of comma separated lists, hyphen separated ranges, or single entries. An asterisk (\*) can be used to match anything. Field values may be specified by their names or corresponding numbers. Short form of mask specifying names of either *products, components* or *functions* parts of the full format may be used. Setting the mask to "\*.\*.\*.\*" is equivalent to not specifying a mask.

Example: -m "entry,exit.\*.SQL0,SQLE.\*.\*"

**-p** *pid* [.*tid*]

Only enables the trace facility for the specified process IDs (*pid*) and thread IDs (*tid*). The period (.) must be included if a tid is specified. A maximum of five *pid.tid* combinations is supported.

For example, to enable tracing for processes 10, 20, and 30 the syntax is:

db2trc on -p 10,20,30

To enable tracing only for thread 33 of process 100 and thread 66 of process 200 the syntax is:

db2trc on -p 100.33,200.66

-c cpid Trace or format only this companion process.

#### **-rc** returnCode

Treat *returnCode* as a system error. *returnCode* must be specified as a signed integer.

#### -e maxSysErrors

Stop trace after *maxSysErrors* system errors occurred.

-t Include timestamps.

-debug

This is an internal option used for debugging purposes by IBM Support. Usage is not recommended.

**info** The following is an example of environment information listed with this parameter:

MB) MB)
MB) MB)
MB) MB)
MB) MB)
MB) MB)
MB)
110)
ffer>
TICI
MB)

#### **dump** *dumpFile*

Dumps the binary format trace information, stored in the buffer, to a file. The following command will put the information in the current directory in a file called db2trc.dmp:

db2trc dump db2trc.dmp

Specify a dump file name with this parameter. The binary format dump file is saved in the current directory unless the path is explicitly specified.

-q Quiet mode.

#### ccfmt destFile

Dump and format a code coverage trace. Specify a destination file name for the dump.

#### **flow** *dumpFile destFile*

After the trace is dumped to a binary file, format it into a readable text file. Use the flow option to format records sorted by process or thread. Specify the name of the dump file and the name of the destination file that will be generated. For example:

db2trc flow db2trc.dmp db2trc.flw

-x firstRecord [—lastRecord]

Only show record numbers *firstRecord* to *lastRecord*.

- -data Include any trace record data in the flow.
- -t Include timestamps (in sec:nsec format), if available.
- -wc Include wall-clock timestamps, if available. To make use of this

option, you must turn trace ON by also specifying the -t option which includes the capture of timestamps. For a usage example, see Example 1.

- -mf Generate a separate destination file for each distinct flow.
- **-rds** Include RDS operators information, if available.

#### **format** *dumpFile destFile*

After the trace is dumped to a binary file, format it into a readable text file. Use the format option to format records chronologically.

-x firstRecord [—lastRecord]

Only show record numbers *firstRecord* to *lastRecord*.

- -r Output in reverse order.
- -xml Output data in xml parsable format.
- -c Format communications buffers.
- -cli Format the CLI/ODBC driver and CLI application buffers. For more information, see "Trace CLI/ODBC configuration keyword".
- -ncf Do not use component custom formatting.

-errors Trace only errors and nonzero return codes on function exit.

#### -global

Specifies that db2trc will also be run on remote hosts. See the command syntax diagrams above for global option command syntax information. See example 3 below for further details.

-host database host name

Specifies that db2trc will only be run on the specified remote host. If no remote host is specified with the **-global** option, db2trc will run on all remote hosts.

-sdir shared directory path

Specifies the shared directory that db2trc will use to save files applicable to the **-f** and **dump** parameters.

**perffmt** *dumpFile destFile* 

The performance trace formatter is a parsing option that formats a dump file containing performance counter data into readable text

- **clear** Clears the contents of the trace buffer, particularly just before connecting to a specific database. This option can be used to reduce the amount of collected information by clearing the buffers of accumulated useless information before a connection to the desired database is established.
- **stop** This collection option stops tracing on demand; all processes suspend tracing, but the contents of the trace buffer are preserved so that they can be dumped later. This action is in contrast to the off option, which disables the trace facility altogether.
- off Disables the trace facility. After the trace is dumped to a file, disable the trace facility by typing: db2trc off
- Provides additional information about most of the command line options.
   General form of the command line entry is shown in *Usage notes* below.
   Here is an example to obtain more information about the dump command for the DAS instance:

db2trc das dump -u

## Examples

#### Example 1

To capture a trace with wall-clock timestamps included, you must specify the -t option when you turn trace ON and you must specify -t -wc options with the flow option to output the wall-clock timestamps into the readable text file. The following is an example of the steps you can perform:

1. Turn trace ON, capture timestamp information, and specify the dump file name by executing the following command:

db2trc on -t -f db2trc.dmp

**2**. After the trace period has ended, turn trace OFF by executing the following command:

db2trc off

**3**. To format the binary dump (.dmp) file into a readable text file (for example, db2trc.flw), execute the following command:

db2trc flow -t -wc db2trc.dmp db2trc.flw

The following is an example of the output displayed when the formatting has been completed:

```
Total number of trace records : 3349

Trace truncated : N0

Trace wrapped : N0

Number of trace records formatted : 43 (pid: 5414 tid 182967198368 node: 0)

Number of trace records formatted : 2690 (pid: 29615 tid 182960067008 node: 0)

Number of trace records formatted : 118 (pid: 5394 tid 183102335328 node: 0)

Number of trace records formatted : 498 (pid: 29616 tid 182965078816 node: -1)
```

4. To view the contents of the readable text file db2trc.flw, execute the following command:

more db2trc.flw

The following is an example of the output displayed when reading the contents of the readable text file containing wall-clock timestamp information:

pid = 5414 tid = 182967198368 node = 0

1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	0.00000000000000000000000000000000000	<pre>clp_bp_con data [probe 21] 2009-06-16-11.02.32.38407400 sqlossig entry 2009-06-16-11.02.32.3841200 sqlossig exit 2009-06-16-11.02.32.38412400 sqlogmblkz entry 2009-06-16-11.02.32.38413600 sqlogmblkz entry 2009-06-16-11.02.32.38413600 sqlogmblkz mbt [Marker:PD_OSS_ALLOCATED_MEMORY] 2009-06-16-11.02.32.38415100 sqlogmblkz exit 2009-06-16-11.02.32.38416600 sqlogmblkz exit 2009-06-16-11.02.32.38416600 sqlorqueInternal entry 2009-06-16-11.02.32.38417000 sqlosigMask entry 2009-06-16-11.02.32.38417500 sqlosigMask exit 2009-06-16-11.02.32.38417500 sqlosigMask exit 2009-06-16-11.02.32.38417000 sqlosigMask exit 2009-06-16-11.02.32.38417000 sqlosigMask exit 2009-06-16-11.02.32.38417500 sqlosigMask exit 2009-06-16-11.02.32.38417500 sqlosigMask exit 2009-06-16-11.02.32.38417500 sqlosigMask exit 2009-06-16-11.02.32.38417500 sqlosig exit 2009-06-16-11.02.32.38417500 sqlosig exit 2009-06-16-11.02.32.38417500 sqlosig exit 2009-06-16-11.02.32.38417500</pre>

#### **Example 2**

The following are examples for the use of the -member trace mask

• db2trc on \_member n1[,n2,n3 ...,n64]

This command allows specification of which database members or partitions to trace.

**Note:** Must be an integer number. If multiple members are specified, they must be separated by a comma. You can specify up to 64 members.

db2trc chg -member n1[,n2,n3 ...,n64]

This command allows you to change the member mask to the specified database members or partitions.

db2trc stop -member n1[,n2,n3 ...,n64]

This command allows you to remove members from the member mask. When the last member is removed from the member mask, trace is fully stopped having the same effect as running db2trc **stop** 

- The member number issued by this command must exist in the current member mask. Running db2trc info will display the current member mask ).
- If you run the db2trc on command without the-member option, there will be no members in the member mask. This means that all members are traced
- When all members (defined by db2nodes.cfg file ) in the current host are specified in this command, it will have the same effect as running db2trc stop , in this case when running db2trc stop without the -member option, trace is fully stopped for all members on that host.
- db2trc off -member n1[,n2,n3 ...,n64]

This command allows removal of members from the member mask. When the last member is removed from the member mask, trace is turned off, this has the same effect as running db2trc **off**.

- The member number issued by this command must exist in the current member mask. Run db2trc info to display the current member mask.
- If you run the db2trc on command without the -member option, there will be no members in the member mask. This means that all members are traced
- When all the members (defined by db2nodes.cfg file) in current host are specified in this command, it will have same effect as db2trc off. When running db2trc off without the -member option then trace is turned off on that host
- db2trc flw -member n1[,n2,n3 ...,n64] and db2trc fmt -member n1[,n2,n3 ...,n64]

Running this command will allows you to specify which members to include in the formatted trace

#### Example 3

The following are examples for the use of the -member trace mask with -global with the db2nodes.cfg defined as the following:

0 host1 0

- 1 hostl 1
- 2 host1 2 3 host2 0
- 3 host2 0 4 host3 0
- db2trc on[ chg] -member 1,2,3 -global

when **-member** is run with **-global** and without **-host**, the member number will be mapped to the related host name, specified by **-member** and then run on the related host by means of the rah (or the db2\_all) command . For this example db2trc **-member** 1,2 will run on host1 and db2trc **-member** 3 will run on host2.

• db2trc on -host host1,host2 -global

db2trc on will run on both host1 and host2

• db2trc on -global

db2trc on will run on host1, host2 and host3

### Example 4

The following are examples for the use of the -appid and apphdl

• db2trc on -appid appid1,appid2

This command will turn on trace for specific application IDs. This supports up to 12 application IDs.

• db2trc chg —appid appid1,appid2

This command will change(or reset) the specific application ID. To reset, run command db2trc chg **-appid** none . It will remove all application IDs in the mask.

• db2trc on -apphdl apphdl1,apphdl2,apphdl3

This command will turn on trace for specific application handle. This supports up to 16 application handles.

• db2trc chg -apphdl apphdl1,apphdl2,apphdl3

This command will change(or reset) the specific application handle. To reset, run command db2trc chg **-apphd1** none . It will remove all application handles in the mask

## **Usage notes**

The db2trc command must be issued several times in the course of conducting a trace. With the DB2 instance stopped, the general sequence would be to first turn tracing on, which immediately begins the collection of the specified data and storage of it in the buffer after the DB2 instance is started, then to clear the buffer before connecting to the database, followed by dumping the binary format data into a dump file, then to turn tracing off, and, finally, to format the dump file into an easily readable text destination file. Here's an example of the commands executed to conduct a trace of the SAMPLE database, with the contents of the trace buffer written to file dmp:

```
db2trc on -i 8m -m "*.*.2.*.*" -t
db2start
db2trc clear
db2 connect to sample
db2trc dump dmp
db2trc off
```

The general syntax of the db2trc command is shown below. The command options can be grouped into two broad stages: collection and parsing.

- *Collection* options include turning a trace on or off; specifying the trace buffer size; specifying or changing trace options; dumping a trace; and clearing the trace buffer.
- *Parsing* options include sorting the formatted trace records chronologically, or by process, or by thread.

```
STAGE #1 - COLLECTION
       Usage: db2trc [facility] <command> [-u]
         [facility]
                db2 - DB2 instance (default)
                das - DB2 Administration Server instance
         <command>
                change - Change trace options
                clear - Clear the trace buffer
                dump - Generate trace dump file
                info - Information
                off - Disable the trace facility
                      - Enable the trace facility
                on
                stop - Stop tracing
STAGE #2 - PARSING
       Usage: db2trc <command> [-u]
         <command>
                ccfmt - Dump and format a code coverage trace
                flow - Generate control flow diagram
```

format - Format info - Information perffmt - Format a performance trace

For more information add the "-u" option to any of the above commands

In Stage #2 - Parsing section above, the command ccfmt dumps and formats a "code coverage trace". The code coverage trace is an extension of db2trc that keeps a count of function entries, exits, probe points, and codepaths. It can be used to gather statistics on what functions are being heavily used, or which functions are not being touched during tests.

When tracing the database server, it is recommended that the trace facility be turned on prior to starting the database manager. This is the most reliable method for the database manager, running on any UNIX and Linux platform, to be immediately aware of trace changes.

To turn tracing ON and receive information specific to DB2 Text Search, a mask with component code for cie (155) can be used: db2trc on -m "\*.\*.155.\*.\*"

When the specific database partitions involved in a problem are known, only trace that database partition. Use the option, db2trc on **-member** NN, to specify which database partitions to trace.

When the problem is related to a specific application ID, you are able to limit trace only to that specific application ID by using the db2trc option db2trc on **-appid** <appID>.

## db2unins - Uninstall DB2 database products, features, or languages

Uninstalls one or more DB2 database products, features, or languages. db2unins can be found both in the installation media and in a DB2 install copy on the system. If run from the installation media, only the -f, -l, -t and -? parameters can be used. If run from a DB2 install copy, all the options except -f can be used.

### **Authorization**

sysadm

### **Required connection**

None

### **Command syntax**

### **Command parameters**

Running the db2unins command without any of the -?, -d, -p or -u parameters will result in the removal of all DB2 database products under the current installation directory.

- -d Displays the products that are installed in the current DB2 copy on the system. This option is only available when executed from an installed copy of a DB2 database product.
- -f Performs a brute force uninstallation of all DB2 database products on the system. The db2unins -f command can only be issued from the installation media. Your system will reboot when you successfully issue db2unins -f. It can only be issued if there are no other DB2 products prior to version 9 installed on the system.

#### -p products

Specifies the products to be uninstalled. This parameter is only available when run from an installed DB2 copy. To uninstall multiple products, separate a list of products by a semicolon and enclosed in double quotation marks. When both parameters -p and -u are specified, the products specified in -p override the products specified in the response file. For example, db2unins -p "ESE;QP" -u db2un.rsp uninstalls both DB2 ESE and QP regardless of the REMOVE\_PROD keyword value in db2un.rsp.

#### -u response-file

Performs an uninstallation of products, features, or languages based on what is specified in the response file. For example, db2unins -u db2un.rsp. This parameter is only available when run from an installed DB2 copy. If both parameters -p and -u are specified, the DB2 products specified in the -p parameter override the REMOVE\_PROD keyword in the response file.

### db2unins - Uninstall DB2 database products, features, or languages

If you have a clustered environment, before uninstalling your DB2 product using a response file, you must first run the db2mscs command, with the -u option, from the same server that originally ran the db2mscs command to create the failover infrastructure. For details, see the db2mscs command.

### -l log-file

Specifies the location of the log file. The default log file location is My Documents\DB2LOG\db2un\_<timestamp>.log.

-t trace-file

Turns on the trace functionality. The trace file will be used for debugging problems with the db2unins command.

- -y Ensures that no confirmation is done during the uninstallation process.
- -? Displays help for the db2unins command.

### **Usage notes**

- If you want to use db2unins -f to manually remove all the DB2 database products on the system, you should use the utility from the version which is equal to the highest DB2 product version on the system. For example, if you have 2 copies installed, DB2COPY1 which is DB2 V9.1 and DB2COPY2 which is DB2 V9.5, run db2unins -f to remove both DB2 versions from the DB2 V9.5 product image. If you run db2unins -f from the DB2 V9.1 product image, it will not clean the machine completely.
- If there are instances that are clustered with Microsoft Cluster Service (MSCS), you can uncluster the instance by issuing the db2mscs or db2iclus command prior to uninstallation.

## db2untag - Release container tag

Removes the DB2 tag on a table space container. The tag is used to prevent DB2 from reusing a container in more than one table space. Displays information about the container tag, identifying the database with which the container is associated. Useful when it is necessary to release a container last used by a database that has since been deleted. If the tag is left behind, DB2 is prevented from using the resource in future.

Attention: This tool should only be used by informed system administrators.

### Authorization

The user needs read/write access to the container for a table space that is owned by the ID that created the database.

### **Required connection**

None

#### Command syntax

►►—db2untag—-f—*filename*-

### **Command parameters**

-f filename

Specifies the fully qualified name of the table space container from which the DB2 tag is to be removed.

#### Usage notes

An SQLCODE -294 (Container in Use error) is sometimes returned from create database or from create or alter table space operations, usually indicating a specification error on the operating system resource name when the container is already in use by another table space. A container can be used by only one table space at a time.

A system or database administrator who finds that the database which last used the container has been deleted, can use the db2untag tool if the container's tag was not removed. If the container is to be released, do one of the following:

- For SMS containers, remove the directory and its contents using the appropriate delete commands.
- For DMS raw containers, either delete the file or device, or let db2untag remove the container tag. The tool will leave such a DMS container otherwise unmodified.

## db2updv97 - Update database to Version 9.7 fix pack

Updates the database system catalog to support the fix pack you have installed. This command can be used only on a database running DB2 Version 9.7 Fix Pack 1 or later on Linux, UNIX or Windows.

### Authorization

SYSADM

### **Required connection**

Database. The command automatically establishes a connection to the specified database.

### **Command syntax**

▶▶—apzupav9/—-a—aatapase name——				
	u—userid—-p—password—	L_a_	L_i_J	
▶				_►∢

## **Command parameters**

-d database name

Specifies the name of the database to be updated.

**-u** userid

Specifies the user ID.

-p password

Specifies the password for the user.

- -a Forces all updates to be run.
- -i Fixes the INDEX\_TBSPACEID column in SYSCAT.DATAPARTITIONS (Starting in DB2 Version 9.7 Fix Pack 2).
- -h Displays help information. When this option is specified, all other options are ignored, and only the help information is displayed.

### Example

After installing Version 9.7 Fix Pack 1 or later, update the database system catalog in the SAMPLE database by issuing the following command: db2updv97 -d sample

If your databases were created or upgraded to DB2 Version 9.7 GA and you applied DB2 Version 9.7 Fix Pack 1 or later, then running the above command will automatically apply all updates required from Version 9.7 GA up to and including the fix pack level that you are installing.

### Usage notes

This command must be run on the catalog partition in a partitioned database environment.

For improved performance, the db2updv97 command will only apply updates that are required in order to make the databases appear as if they were created at the fix pack level that you are installing. Thus, if the command is issued more than once, no errors are reported and each of the system catalog updates is applied only once. However, if you wish to forcefully reapply all of the updates, you may do so by appending the **-a** parameter.

Updates to the system catalogs include the following:

- Creation of any new procedures available in the fix pack level that you are installing.
- Alteration of routines to correct the definition.
- Alteration of system administrative views to the correct definition.

The following query returns a result set that consist of tables with problems that can be resolved by the -i option:

If this query returns any results, then you can do one of the following:

- Drop and recreate the tables shown in the query
- Run the db2updv97 with the -i option

If the problem is not fixed, then the db2look command will not print the correct DDL for tables returned from the query. Additionally, any applications that reference the INDEX\_TBSPACEID column of SYSCAT.DATAPARTITIONS might contain inaccurate data.

# db2updserv - Show product updates

Shows the product updates and enhancements available for DB2 database products. On Windows, the output from this command goes to a Web page, on UNIX, it goes to a Java application .

▶∢

### Authorization

None

## **Required Connection**

Internet connection required.

### **Command Syntax**

▶ — db2updserv — —

### **Command parameters**

None

## db2val - DB2 copy validation tool

Verifies the basic functions of a DB2 copy by checking the state of installation files, instance setup, and local database connections.

### **Authorization**

Instance validation requires one of the following:

- On root copies, root authority is required on Linux and UNIX operating systems.
- SYSADM plus one of the following:
  - Instance owner
  - Root access on Linux and UNIX operating systems, or Local Administrator authority on Windows operating systems

### **Required Connection**

None.

### Command syntax

### **Command parameters**

- -o Specifies that only the installation files will be validated; validation of the instance, database, and extended security will not be performed. If this parameter is specified, the -i, -a, -b, and -s parameters are ignored.
- -i instance\_name

Specifies that the name of the instance to validate. To specify multiple instances are to be validated, specify this parameter multiple times. For example, -i inst1 -i inst2. On Windows operating systems, if this parameter is not specified, the current instance will be used as the default value. On Linux and UNIX operating systems, this parameter can only be used by root users in a root installation of a DB2 copy.

-a Validates all instances in the DB2 copy. On Linux and UNIX operating systems, this parameter can only be used by root users in a root installation of a DB2 copy. This parameter overrides parameter -i.

#### -b <db\_name>

Validates database creation and connections to the database specified. This parameter will be ignored for DB2 client instances.

- -d Valid only on Linux and UNIX operating systems. Use this parameter only when instructed by DB2 Support. Turns the debug mode on.
- -s Starts the DB2 database manager for the specified instance that is part of a partitioned database environment.

### -l <log\_file>

Writes the log to the file name specified. Unless the -l parameter is specified, the default log path on Linux and UNIX operating systems is /tmp/db2valxx.log and on Windows operating systems is My Documents\DB2LOG\db2valxx.log, where xx is a generated value.

-? | -h Displays usage information for the db2val command.

## **Examples**

To validate the instance TEST1 and the database DATA1, run the following command:

db2val —i TEST1 -b DATA1

- To validate all the instances for the DB2 copy, run the following command: db2val -a
- To validate only the DB2 installation files, run the following command: db2va1 -0

## db2xdbmig - Migrate XSR objects

Migrates all XML schema repository (XSR) objects that are enabled for decomposition to the current version and service level of the DB2 copy where you are running the command.

This command is located in the *DB2DIR*/bin directory, where *DB2DIR* represents the installation location where the current version of the DB2 database system is installed.

### Authorization

CREATE, ALTER and DROP privileges on all of the XSR objects in the database.

### **Command syntax**

►►—db2xdbmig—database-alias—

### **Command parameters**

database-alias

Specifies the alias of the database that contains the XSR objects.

### Usage notes

- The db2xdbmig command affects only decomposition-enabled XML schemas.
- When migrating to DB2 Version 9.7 from a DB2 Version 9.1 GA or Fix Pack 1 copy, the UPGRADE DATABASE command implicitly runs the db2xdbmig command. You do not need to run this command in DB2 Version 9.7.

## db2xprt - Format trap file

Formats the DB2 database binary trap files into a human readable ASCII file. Trap files (\*.TRP) are located in the instance directory (DB2INSTPROF) by default or in the diagnostic data directory path if the **DIAGPATH** database manager configuration parameter is set. It can be found under the SQLLIB/BIN directory. The db2xprt command uses DB2 symbol files (.PDB) in order to format the trap files.

### Authorization

You must have access to the DIAGPATH directory.

## **Command syntax**

## **Command parameters**

- **/p** *path* A semicolon (;) separated path that points to the location or locations where the binary files and PDB files are located.
- **/v** Displays version information.
- **/n** Formats data without regard to line number information.
- *infile* Specifies the input file.

outfile Specifies the output file.

### **Examples**

If a trap file called DB30882416.TRP had been produced in your DIAGPATH, you could format it as follows:

db2xprt DB30882416.TRP DB30882416.FMT

## disable\_MQFunctions - Disable WebSphere MQ functions

Disables the use of DB2 WebSphere MQ functions for the specified database.

### **Authorization**

One of the following:

- sysadm
- dbadm
- IMPLICIT\_SCHEMA on the database, if the implicit or explicit schema name of the function does not exist
- CREATEIN privilege on the schema, if the schema name, DB2MQ or DB2MQ1C exists

## **Command syntax**

```
▶ — disable_MQFunctions — - n — database — - u — userid — - p — password — ▶
```

## **Command Parameters**

#### -n database

Specifies the name of the database.

–u userid

Specifies the user ID used to connect to the database.

-p password

Specifies the password for the user ID.

-v Optional. This is used for transactional and non-transactional user-defined function support. The values can be either all, 0pc, or 1pc. When you specify 0pc, the disablement deletes from schema db2mq. If you specify 1pc, then the disablement deletes from schema db2mq1c. If you specify all, then the disablement deletes from both schemas (db2mq and db2mq1c). If you do not specify this option, the disablement defaults to the all option.

### Example

In the following example, DB2MQ and DB2MQ1C functions are disabled for the database SAMPLE.

disable\_MQFunctions -n sample -u user1 -p password1

## doce\_deinstall - Uninstall DB2 Information Center

Uninstalls the DB2 Information Center that is in the same install path as the doce\_deinstall tool. This command is only available on Linux operating systems.

The doce\_deinstall command is located at *DB2DIR*/install, where *DB2DIR* is the location where the current version of the *DB2 Information Center* is installed. The doce\_deinstall command is also available from the DOCE DVD. If run from the DVD, the doce\_deinstall command requires a **-b** option.

### Authorization

Root user authority

### **Required Connection**

None

### **Command syntax**

### **Command parameters**

- -a Removes the Information Center from its current location.
- -b This option is valid if the command is run from the DB2 database product media. It specifies the absolute path where the DB2 database product was installed and will be uninstalled. The command will prompt for the path if the option is not specified.
- -l log-file

Specifies the log file. The default log file is /tmp/doce\_deinstall.log\$\$, where \$\$ is the process ID.

-t trace-file

Turns on the debug mode. The debug information is written to the file name specified as *trace-file*.

-r response\_file

Removes the Information Center using a response file. For example, doce\_deinstall -r db2un.rsp. Cannot be combined with the **-a** parameter.

-h | -? Displays usage information.

### Example

To uninstall a DB2 Information Center that is installed in /opt/ibm/db2/doce, issue: cd /opt/ibm/db2/doce doce\_deinstall -a
# doce\_install - Install DB2 Information Center

Installs the DB2 Information Center. If no path is specified, the DB2 Information Center is installed by default in /opt/ibm/db2ic/V9.7. This command applies only to the Linux operating systems.

## **Authorization**

Root user authority

### **Required Connection**

None

## **Command syntax**

••	—doce_install- b—install-pathp—product_
▶-	└─-c─image-location └─-n └─-L─language └─-1─log-file
▶-	-t—trace-file—h— ?—

# **Command parameters**

-b install-path

Specifies the path where the DB2 Information Center is to be installed. *install-path* must be a full path name and its maximum length is limited to 128 characters. The default installation path is /opt/ibm/db2ic/V9.7. This parameter is mandatory when the **-n** parameter is specified.

-p productID

Specifies the *productID* of the DB2 Information Center. *productID* does not require DB2 as a prefix. This parameter is mandatory when the **-n** parameter is specified.

-c image-location

Specifies the product image location. To indicate multiple image locations, specify this parameter multiple times. For example, -c CD1 -c CD2. This parameter is only mandatory if the **-n** parameter is specified, your install requires more than one CD, and your images are not set up for automatic discovery. Otherwise, you are prompted for the location of the next CD at the time it is needed.

- -n Specifies noninteractive mode.
- -L language

Specifies national language support. The default is English. To install multiple languages at the same time, this parameter can be specified multiple times. For example, to install both English and German, specify -L EN -L DE.

-l log-file

Specifies the log file. The default log file is /tmp/doce\_install.log\$\$, where \$\$ is the process ID.

#### -t trace-file

Turns on the debug mode. The debug information is written to the file name specified as *trace-file*.

-h | -? Displays usage information.

## Example

• To install from an image in /mnt/cdrom, and to be prompted for all needed input, issue:

cd /mnt/cdrom
./doce\_install

 To install DB2 Information Center to /db2/V9.7, from an image in /mnt/cdrom, non-interactively in English, issue:

cd /mnt/cdrom ./doce\_install -p doce -b /db2/V9.7 -n

# enable\_MQFunctions - Enable WebSphere MQ functions

Enables DB2 WebSphere MQ functions for the specified database and validates that the DB2 WebSphere MQ functions can be executed properly. The command fails if WebSphere MQ and WebSphere MQ AMI have not been installed and configured.

### Authorization

One of the following:

- CREATE\_EXTERNAL\_ROUTINE authority on the database and at least one of the following:
  - If the schema name of the function does not refer to an existing schema, IMPLICIT\_SCHEMA authority on the database
  - If the schema name DB2MQ or DB2MQ1C exists, CREATEIN privilege on the schema
- dbadm

### Command syntax

### **Command parameters**

**–n** database

Specifies the name of the database that you want to enable.

–u userid

Specifies the user ID to connect to the database.

-p password

Specifies the password for the user ID.

**–q** queuemanager

Optional. The queue manager name that supports the transactional MQ user-defined functions. If you do not specify a name, it is the default queue manager, DB2MQ\_DEFAULT\_MQM. If you use this option, the function assumes the use of a -novalidate parameter.

- **-echo** Optional. Prints the detailed SQL used to create the UDFs or diagnostic information.
- -force Optional. The use of this option allows the utility program to ignore the existing MQ UDFs. In other words, the program drops any existing functions, before recreating any MQ UDFs. Without this option, the command will not proceed after it finds that the MQ UDFs already exist.

#### -novalidate

Optional. This specifies that there will not be any validation of the DB2 MQSeries<sup>®</sup> functions.

-xml xmlSize

Optional. This is for defining the XML versions of the 0pc functions. This option has no effect if the "-v 1pc" option is specified.

The *xmlSize* specifies the length of XML data. The minimum length is 1 byte. The maximum length is 100M. The default is 1M. You can specify the length as n (number of bytes), nK (length in kilobytes), or nM (length in megabytes).

```
-c clobSize
```

Optional. Specifies the length of CLOB data. The minimum length is 1 byte; this is the default. The maximum length is 100M. You can specify the length as n (number of bytes), nK (length in kilobytes), or nM (length in megabytes).

-v Optional. This is used for transactional and non-transactional user-defined function support. The values can be either all, 0pc, or 1pc. When you specify 0pc, the enablement creates schema db2mq. If you specify 1pc, then the enablement creates schema db2mq1c. If you specify all, then the enablement creates all schemas under user-defined functions (db2mq and db2mq1c). If you do not specify this option, the enablement defaults to the all option.

## Examples

The following example enables the transactional and non-transactional user-defined functions. The user connects to the database SAMPLE.

enable\_MQFunctions -n sample -u user1 -p password1

In the next example, the user connects to the database SAMPLE. The example creates DB2MQ1C functions with schema DB2MQ1C.

enable\_MQFunctions -n sample -u user1 -p password1 -v 1pc

### Usage notes

The DB2 MQ user-defined functions run under the schemas DB2MQ or DB2MQ1C which are automatically created by this command. Before executing this command:

- Ensure that WebSphere MQ and WebSphere Application Messaging Interface (AMI) are installed, and that the version of WebSphere MQ is 5.1 or higher.
- Ensure that the environment variable \$AMT\_DATA\_PATH is defined.
- If you want to use transactional MQ UDFs, make sure that the database is configured for federated operations. Do this with the following command update dbm cfg using federated yes
- Change the directory to the cfg subdirectory of the DB2PATH

On UNIX:

- Use db2set to add AMT\_DATA\_PATH to the DB2ENVLIST.
- Ensure that the user account associated with UDF execution is a member of the mqm group.
- Ensure that the user who will be calling this command is a member of the mqm group.

Note: AIX 4.2 is not supported by MQSeries 5.2.

# installDSDriver - extract Data Server Driver components

Installs Data Server Driver (dsdriver) components.

On Linux and UNIX operating systems, installs all the components of Data Server Driver (dsdriver) in the current directory and removes the .tar files that have been extracted.

# Authorization

None

# **Command syntax**

▶ — installDSDriver \_\_\_\_\_ ►

# **Command parameters**

-h Displays usage information.

### Usage notes

- For 64-bit dsdriver, the script will install 64-bit drivers and remove 64-bit tar files, but will leave 32-bit tar files and directories that are also present in the package.
- For 32-bit dsdriver, if you need 32-bit drivers, you must manually extract the 32-bit files.

# installFixPack - Update installed DB2 database products

Update the installed DB2 database products in a given location, on all UNIX and Linux platforms, to the same level as the image. If there are multi-copy DB2 database products installed, the installFixPack command updates one copy at a time according to the path specified.

This command can be found at the top directory in the image.

Fix pack installation will proceed when the database manager (DBM) of every instance (and in a partitioned database environment, every node) related to the installation path is stopped, and all DB2 libraries are unloaded. If all the preconditions are satisfied, installFixPack will update those instances and DAS related to the installation path. An additional manual update is not required. For all UNIX and Linux operating systems, the djxlink bind command will be launched automatically when the database is reconnected or when applications are restarted.

In some cases, you may specify different force options to continue the fix pack installation, for example, when not all DBMs are stopped, or DB2 libraries remain loaded. installFixPack will continue, but you may need to manually update the instances and DAS, as well as restart the applications.

For a partitioned database environment instance, install the fix pack on all the nodes, while the instance update is only needed on the instance owning node. To keep the instance fully functional after the update, it is recommended to install all the products and features on all the nodes, at least on the instance owning node.

## Authorization

Root installations require root user authority. For non-root installations, you must log on with the user ID that owns the non-root installation.

## **Required Connection**

None

## **Command syntax**

#### Notes:

1 If you omit this option, you will be prompted for the required information without an error message halt.

### **Command parameters**

- -n Specifies non-interactive mode. When specified, you must also specify -b, and/or -c. This mode can be used for applications to provide all the required information at the command line in an unattended mode.
- -b base-install-path

Specifies the path where the DB2 database product will be installed. Mandatory when -n is specified. The length of the path is limited to 128 characters and is a full path name.

The **-b** option is not required for a non-root installation of DB2, but it is still mandatory for a root installation. If **-b** is used in a non-root install, the value of *base-install-path* must be the user's *HOME*/sqllib directory, or else the path is considered invalid. If **-b** is not provided in a non-root install, the DB2 installer will use the user's *HOME*/sqllib as the install path and continue. But, if **-b** is used and the provided install path has a DB2 copy installed by a root user, the path is considered invalid since the DB2 copy can only be updated by the user who installed it.

#### -c NLPACK\_location

Specifies the location of the related DB2 National Language Pack (NLPACK). This parameter is mandatory when **-n** is specified. The DB2 NLPACK location needs to be provided explicitly if all of the following conditions are met:

- The **-n** option is specified.
- The installation requires National Language (non-English) support.
- The DB2 NLPACK is neither on the DB2 DVD nor in the same subdirectory as the DB2 database product being installed.
- -f Force option. -f with no argument is not supported. The force arguments below can be combined. For example, -f level -f db2lib.

#### -f level

Force a down level or same level fix pack install. If the fix pack image is at a higher level than the installed DB2 database product, this option is ignored.

#### -f db2lib

Force installFixPack to bypass the checking on DB2 library loading. To ensure that the instances or applications work properly after the installation, the DBM must be stopped for all the related instances (including all nodes for the related partitioned database environment instances), and all DB2 libraries related to the installation path must be unloaded.

#### -f NOTSAMP

Specifies that the SA MP should not be updated (applicable only to root installation).

#### -f install

Force installFixPack to bypass all the checking on DB2 library loading, instance and DAS properly stopped or not. To ensure that the instances or applications work properly after the installation, the DBM must be stopped for all the related instances (including all nodes for the related partitioned

## installFixPack - Update installed DB2 database products

database environment instances), and all DB2 libraries related to the installation path must be unloaded. If this option is specified, instance/DAS will not be updated. User needs to do the instance/DAS update manually after the installation. Also, note that the options update and install are mutually exclusive and cannot be specified in the same installation.

#### -f update

Force installFixPack to bypass all the checking on DB2 library loading, instance and DAS properly stopped or not. To ensure that the instances or applications work properly after the installation, the DBM must be stopped for all the related instances (including all nodes for the related partitioned database environment instances), and all DB2 libraries related to the installation path must be unloaded. If this option is specified, instance/DAS will be updated. Also, note that the options update and install are mutually exclusive and cannot be specified in the same installation.

#### -f noWPAR

Applicable to AIX 6.1 or later in a global environment. Force installFixPack not to do any checking or any actions on the AIX system workload partitions (WPARs) which share the DB2 copy being updated on the global environment. If **-f** noWPAR is specified, you must manually update the instances and DAS on each system WPAR that shares this DB2 copy.

#### -f nobackup

Force installFixPack to not backup installation files when the components are updated. If you choose not to backup the files, the space requirement of the installation directory is reduced. However, choosing not to backup the files also means that if any errors occur, the DB2 installer will not be able to perform a rollback operation. In this case, you will need to manually clean up the files and reinstall the fix pack.

### -l log-file

Specifies the log file. For root installations, the default log file is /tmp/installFixPack.log\$\$, where \$\$ represents the process ID. For non-root installations, the default log file is /tmp/ installFixPack\_userID.log, where userID represents the user ID that owns the non-root installation. If the IBM Tivoli System Automation for Multiplatforms (SA MP) is being installed or updated with the installFixPack command, the corresponding log file will be located in the same directory as DB2 log files.

#### -t trace-file

Turns on the debug mode. The debug information is written to the file name specified.

-h | -? Displays help information.

## **Usage notes**

• If you have DB2 Text Search installed and Text Search is running on any instances related to the DB2 copy, you will receive an error message indicating you must first stop the Text Search instance service. Stop the Text Search instance service, then rerun the command.

## Examples

• To perform an interactive update from GA to Fix Pack 1 when DB2 Enterprise Server Edition German is installed on /opt/ibm/db2/COPY1, from the Fix Pack 1 image, issue:

./installFixPack -b /opt/ibm/db2/COPY1

• To perform a silent update from GA to Fix Pack 1 when DB2 Enterprise Server Edition German is installed on /opt/ibm/db2/COPY1, from the Fix Pack 1 image, issue:

```
./installFixPack -b /opt/ibm/db2/COPY1 -c full_path_to_NLPACK_image -n
```

- If for any reason the installed DB2 database product files get corrupted, instead
  of uninstalling and installing again to refresh the installation, issue:
   ./installFixPack -f level -b *full\_path\_where\_DB2\_product\_installed*
- To reduce the space requirement of the installation directory, issue: ./installFixPack -f nobackup -b *full\_path\_where\_DB2\_product\_installed*

## setup - Install DB2

Installs DB2 products. This command is only available on Windows operating systems. The command for UNIX operating systems is db2setup.

This utility is located on the DB2 installation media. It launches the DB2 Setup wizard to define the installation and install DB2 products. If invoked with the -u option, it performs an installation without further input, taking installation configuration information from a response file.

When installing the IBM Data Server Runtime Client on Windows, the setup options are different from DB2 product installation. Refer to "IBM Data Server Runtime Client installation command line options (Windows)" for the appropriate options.

### **Command syntax**

••	→_setupfiilanguagellog-filem_
▶-	
•	
	-n— <i>DB2-copy-name</i> -o -?-

## **Command parameters**

#### Note:

The install DB2 setup command can use the / or - switch symbols interchangeably.

- -c Ensures that the setup.exe exits immediately after starting the installation. By selecting this option, the return code of the installation is not available when monitoring the exit code of setup.exe.
- -f Forces any DB2 processes to stop before installing.

#### -i language

Specifies the two-letter language code of the language in which to perform the installation.

### -l log-file

Full path and file name of the log file to use.

-m Used with -u option to show the progress dialog during the installation. However, it will not prompt for any input.

#### -p install-directory

Changes the installation path of the product. Specifying this option overrides the installation path that is specified in the response file.

#### -t trace-file

Generates a file with install trace information.

#### -u response-file

Specifies the full path and file name of the response file to use.

### -n DB2-copy-name

Specifies the DB2 copy name that you want the install to use. Specifying this option overrides the copy name that is specified in the response file.

- -o Always perform a new copy installation with a generated default copy name. This option is only available for installing the IBM Data Server Driver Package on Windows.
- -? | -h Generates usage information.

# sqlj - SQLJ translator

The sqlj command translates an SQLJ source file into a Java source file and zero or more SQLJ serialized profiles. By default, the sqlj command also compiles the Java source file.

## Authorization

None

# **Command syntax**

# **Command parameters**

-help

Specifies that the SQLJ translator describes each of the options that the translator supports. If any other options are specified with -help, they are ignored.

-dir=directory

Specifies the name of the directory into which SQLJ puts .java files that are generated by the translator and .class files that are generated by the compiler. The default is the directory that contains the SQLJ source files.

The translator uses the directory structure of the SQLJ source files when it puts the generated files in directories. For example, suppose that you want the translator to process two files:

- file1.sqlj, which is not in a Java package
- file2.sqlj, which is in Java package sqlj.test

Also suppose that you specify the parameter -dir=/src when you invoke the translator. The translator puts the Java source file for file1.sqlj in directory /src and puts the Java source file for file2.sqlj in directory /src/sqlj/test.

#### -d=directory

Specifies the name of the directory into which SQLJ puts the binary files that are generated by the translator and compiler. These files include the .ser files, the *name\_SJProfileKeys.class* files, and the .class files that are generated by the compiler.

### sqlj - SQLJ translator

The default is the directory that contains the SQLJ source files.

The translator uses the directory structure of the SQLJ source files when it puts the generated files in directories. For example, suppose that you want the translator to process two files:

- file1.sqlj, which is not in a Java package
- file2.sqlj, which is in Java package sqlj.test

Also suppose that you specify the parameter -d=/src when you invoke the translator. The translator puts the serialized profiles for file1.sqlj in directory /src and puts the serialized profiles for file2.sqlj in directory /src/sqlj/test.

#### -compile=true | false

Specifies whether the SQLJ translator compiles the generated Java source into bytecodes.

#### true

The translator compiles the generated Java source code. This is the default.

#### false

The translator does not compile the generated Java source code.

#### -linemap=no|yes

Specifies whether line numbers in Java exceptions match line numbers in the SQLJ source file (the .sqlj file), or line numbers in the Java source file that is generated by the SQLJ translator (the .java file).

**no** Line numbers in Java exceptions match line numbers in the Java source file. This is the default.

#### yes

Line numbers in Java exceptions match line numbers in the SQLJ source file.

#### -smap=no|yes

Specifies whether the SQLJ translator generates a source map (SMAP) file for each SQLJ source file. An SMAP file is used by some Java language debug tools. This file maps lines in the SQLJ source file to lines in the Java source file that is generated by the SQLJ translator. The file is in the Unicode UTF-8 encoding scheme. Its format is described by Original Java Specification Request (JSR) 45, which is available from this Web site:

http://www.jcp.org

no Do not generated SMAP files. This is the default.

#### yes

Generate SMAP files. An SMAP file name is *SQLJ-source-filename.*java.smap. The SQLJ translator places the SMAP file in the same directory as the generated Java source file.

#### -encoding=encoding-name

Specifies the encoding of the source file. Examples are JIS or EUC. If this option is not specified, the default converter for the operating system is used.

#### -db2optimize

Specifies that the SQLJ translator generates code for a connection context class that is optimized for DB2. -db2optimize optimizes the code for the user-defined context but not the default context.

When you run the SQLJ translator with the -db2optimize option, if your applications use JDBC 3.0 or earlier functions, the IBM Data Server Driver for JDBC and SQLJ file db2jcc.jar must be in the CLASSPATH for compiling the generated Java application. If your applications use JDBC 4.0 or earlier

functions, the IBM Data Server Driver for JDBC and SQLJ file db2jcc4.jar must be in the CLASSPATH for compiling the generated Java application.

#### -ser2class

Specifies that the SQLJ translator converts .ser files to .class files.

### -status

Specifies that the SQLJ translator displays status messages as it runs.

#### -version

Specifies that the SQLJ translator displays the version of the IBM Data Server Driver for JDBC and SQLJ. The information is in this form:

IBM SQLJ xxxx.xxx.xx

### -C-help

Specifies that the SQLJ translator displays help information for the Java compiler.

### -Ccompiler-option

Specifies a valid Java compiler option that begins with a dash (-). Do not include spaces between -C and the compiler option. If you need to specify multiple compiler options, precede each compiler option with -C. For example: -C-g -C-verbose

All options are passed to the Java compiler and are not used by the SQLJ translator, **except** for the following options:

#### -classpath

Specifies the user class path that is to be used by the SQLJ translator and the Java compiler. This value overrides the CLASSPATH environment variable.

### -sourcepath

Specifies the source code path that the SQLJ translator and the Java compiler search for class or interface definitions. The SQLJ translator searches for .sqlj and .java files only in directories, not in JAR or zip files.

### -JJVM-option

Specifies an option that is to be passed to the Java virtual machine (JVM) in which the sqlj command runs. The option must be a valid JVM option that begins with a dash (-). Do not include spaces between -J and the JVM option. If you need to specify multiple JVM options, precede each compiler option with -J. For example:

-J-Xmx128m -J-Xmine2M

SQLJ-source-file-name

Specifies a list of SQLJ source files to be translated. This is a required parameter. All SQLJ source file names must have the extension .sqlj.

# Output

For each source file, *program-name*.sqlj, the SQLJ translator produces the following files:

• The generated source program

The generated source file is named *program-name*.java.

• A serialized profile file for each connection context class that is used in an SQLJ executable clause

A serialized profile name is of the following form:

## sqlj - SQLJ translator

program-name\_SJProfileIDNumber.ser

• If the SQLJ translator invokes the Java compiler, the class files that the compiler generates.

# **Examples**

sqlj -encoding=UTF8 -C-0 MyApp.sqlj

Chapter 8. DB2 Text Search commands

# db2ts ALTER INDEX

This command changes the update characteristics of an index.

For execution, the command needs to be prefixed with db2ts at the command line.

## Authorization

The privileges held by the authorization ID of the statement must include at least one of the following:

- CONTROL privilege on the table on which the text index is defined
- DBADM authority

### Prerequisite

The instance owner must hold DBADM with DATAACCESS authority. The SYSADM no longer holds SECADM nor DBADM privilege in Version 9.7. SECADM must explicitly grant DBADM with DATAACCESS authority to the instance owner before running the ALTER INDEX command.

## **Required connection**

Database

## **Command syntax**

••-	—ALTER	INDEX—ind	<i>ex-name</i> —FOR	TEXT-	update	characteristics	$\vdash$	options		-
	connec	ction optio	ns							<b>→</b> ∢

### update characteristics:

### incremental update characteristics:

UPDATE MINIMUM—minchanges—

#### options:

index configuration options activation options
index configuration options:
INDEX CONFIGURATION—(-  option-value  -)_
option-value:
UPDATEAUTOCOMMITcommitcount_number
activation options:
SETACTIVEUNILATERAL
connection options:
CONNECT TO—database-name USER—username—USING—password

# **Command parameters**

### **ALTER INDEX** index-name

The schema and name of the index as specified in the CREATE INDEX command. It uniquely identifies the text search index in a database.

### UPDATE FREQUENCY

Specifies the frequency with which index updates are made. The index will be updated, if the number of changes is at least the value set for UPDATE MINIMUM. The update frequency NONE indicates that no further index updates will be made. This can be useful for a text column in a table with data that will not change. It is also useful when the user intends to manually update the index (using the UPDATE INDEX command). Automatic updates can only be done if the START FOR TEXT command has been run and the DB2 Text Search instance services are running.

The default frequency value is taken from the view SYSIBMTS.TSDEFAULTS, where DEFAULTNAME='UPDATEFREQUENCY'.

#### NONE

No automatic updates will be applied to the text index. Any further index update will have to be started manually.

- **D** The day(s) of the week when the index is updated.
  - \* Every day of the week.

integer1

Specific days of the week, from Sunday to Saturday: 0 to 6

- H The hour(s) of the specified day(s) when the index is updated.
  - \* Every hour of the day.

```
integer2
```

- Specific hours of the day, from midnight to 11 pm: 0 to 23
- M The minute(s) of the specified hour(s) when the index is updated.

#### integer3

Specified as top of the hour (0), or in multiples of 5 minute increments after the hour: 0, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50 or 55

If you do not specify the UPDATE FREQUENCY option, the frequency settings are left unchanged.

#### **UPDATE MINIMUM** minchanges

Specifies the minimum number of changes to text documents that must occur before the index is incrementally updated. Multiple changes to the same text document are treated as separate changes. If you do not specify the UPDATE MINIMUM option, the setting is left unchanged.

#### **INDEX CONFIGURATION** (option-value)

Starting with Version 9.7 Fix Pack 3 and later fix packs, this is an optional input argument of type VARCHAR(32K) that allows altering text index configuration settings. The following option is supported:

Table 44. Specifications for option-value

Option	Value	Data type	Description
UPDATEAUTOCOMMIT	<i>commitcount_number</i> Integer	Integer	Specifies the number of index updates after which a commit is executed to preserve the previous work automatically for either initial or incremental updates.
			• For initial updates, the index update will process batches of documents from a base table after the trigger to capture data updates is activated. After the amount of documents updated reaches the COMMITCOUNT number, the server will do an interim commit. Log entries generated by unprocessed documents will be removed from the staging table. Using the UPDATEAUTOCOMMIT option for an initial text index update will lead to a significant increase of execution time.
			• For incremental updates, log entries which have been processed will be removed correspondingly from staging table with each interim commit. COMMITCOUNT counts the number of documents updated, not the number of staging table entries.

#### activation options

Starting with Version 9.7 Fix Pack 3 and later fix packs, this input argument of type integer sets the status of a text index.

#### ACTIVE

Sets the text index status to active

#### INACTIVE

Sets the text index status to inactive

### UNILATERAL

Specifies a unilateral change which only affects the status of DB2 Text Search indexes. If this argument is specified, only the status of a DB2 Text Search index is changed to active or inactive. Without the UNILATERAL argument, the activation status of the DB2 Text Search and DB2 Net Search Extender indexes is jointly switched so that only one of the text indexes is active.

### **CONNECT TO** *database-name*

This clause specifies the database to which a connection will be established. The database must be on the local system. If specified, this clause takes precedence over the environment variable DB2DBDFT. This clause can be omitted if the following are all true:

- The DB2DBDFT environment variable is set to a valid database name.
- The user running the command has the required authorization to connect to the database server.

**USER** username **USING** password

This clause specifies the username and password that will be used to establish the connection.

## **Usage notes**

All limits and naming conventions, that apply to DB2 database objects and queries, also apply to DB2 Text Search features and queries. DB2 Text Search related identifiers must conform to the DB2 naming conventions. In addition, there are some additional restrictions. For example, these identifiers can only be of the form:

[A-Za-z][A-Za-z0-90#\$\_]\*

or "[A-Za-z ][A-Za-z0-9@#\$ ]\*"

Note that multiple commands cannot be executed concurrently on a text search index if they may conflict. If this command is issued while a conflicting command is running, an error will occur and the command will fail, after which you can try to run the command again. Some of the conflicting commands are:

- ALTER INDEX
- CLEAR EVENTS FOR INDEX
- DROP INDEX
- UPDATE INDEX
- DISABLE DATABASE FOR TEXT
- STOP FOR TEXT

Changes to the database: Updates the DB2 Text Search catalog information.

# db2ts CLEANUP FOR TEXT

This command cleans up any DB2 Text Search collections within the instance that are obsolete. A collection can become obsolete if:

- A database with text search indexes is dropped before DB2 Text Search has been disabled for the database.
- A table is dropped before the text search indexes, associated with it, have been dropped.

**Note:** A text search collection refers to the underlying representation of a text search index. There is a one-to-one relationship between a text search collection and a text search index. While the commands operate on text search indexes, tools operate on text search collections. Query the SYSIBMTS.TSCOLLECTIONNAMES catalog table to determine the text search collection for a text search index. See "Administration Tool for DB2 Text Search" for additional information.

For execution, the command needs to be prefixed with db2ts at the command line.

### Authorization

To issue the command successfully, the user must be the DB2 instance owner with DBADM and DATAACCESS authority.

## **Required connection**

This command must be issued from the DB2 database server.

### **Command syntax**

►►—CLEANUP FOR TEXT—

### **Command parameters**

None

# db2ts CLEAR COMMAND LOCKS

Removes all command locks for a specific text search index or for all text search indexes in the database. A command lock is created at the beginning of a text search index command, and is destroyed when it is done. It prevents undesirable conflict between different commands.

A cleanup is done automatically of all locks associated with processes that are no longer alive. This is done to make a text search index accessible to a new search request.

Use of this command is required in the rare case that locks remain in place due to an unexpected system behavior, and need to be cleaned up explicitly.

For execution, the command needs to be prefixed with db2ts at the command line.

## Authorization

The *username* for the database connection must have DBADM authority if an index name is not specified. For clearing a command lock on a specific index, the *username* for the database connection must have CONTROL privilege on the table for which the text search index was created.

## Prerequisite

Instance owner must hold DBADM with DATAACCESS authority. The SYSADM no longer holds SECADM nor DBADM privilege in Version 9.7. SECADM must explicitly grant DBADM with DATAACCESS authority to the instance owner before running the CLEAR COMMAND LOCKS command.

## **Required connection**

Database

## **Command syntax**

► CLEAR COMMAND LOCKS	FOR TEXT →
▶ – connection options	→
connection options:	

CONNECT TO—database-name USER—username—USING—password—

## **Command parameters**

FOR INDEX index-name

The name of the index as specified in the CREATE INDEX command.

#### **CONNECT TO** *database-name*

This clause specifies the database to which a connection will be established.

### db2ts CLEAR COMMAND LOCKS

The database must be on the local system. If specified, this clause takes precedence over the environment variable DB2DBDFT. This clause can be omitted if the following are all true:

- The DB2DBDFT environment variable is set to a valid database name.
- The user running the command has the required authorization to connect to the database server.

#### **USER** *username* **USING** *password*

This clause specifies the authorization name and password that will be used to establish the connection.

### **Usage notes**

You would invoke this command because the process owning the command lock is dead. In this case, the command (represented by the lock) may not have completed, and the index may not be operational. You need to take appropriate action. For example, the process executing the DROP INDEX command dies suddenly. It has deleted some index data, but not all the catalog and collection information. The command lock is left intact. After clearing the DROP INDEX command. In another example, the process executing the CREATE INDEX command dies suddenly. It has created some index catalog and collection information, but not all. The command lock is left intact. After clearing the CREATE INDEX command dies suddenly. It has created some index catalog and collection information, but not all. The command lock is left intact. After clearing the CREATE INDEX command lock, you can execute the DROP INDEX and CREATE INDEX commands.

When this command is issued, the content of the DB2 Text Search view SYSIBMTS.TSLOCKS is updated.

# db2ts CLEAR EVENTS FOR INDEX

This command deletes indexing events from an index's event table used for administration. The name of this table can be found in the view SYSIBMTS.TSINDEXES in column EVENTVIEWNAME.

Every index update operation that processes at least one document produces informational and, in some cases, error entries in the event table. For automatic updates, this table has to be regularly inspected. Document specific errors have to be corrected (by changing the document content). After correcting the errors, the events can be cleared (and should be, in order not to consume too much space).

For execution, the command needs to be prefixed with db2ts at the command line.

## Authorization

The privileges held by the authorization ID of the statement must include at least one of the following:

- CONTROL privilege on the table on which the index is defined
- DBADM authority

### Prerequisite

Instance owner must hold DBADM with DATAACCESS authority. The SYSADM no longer holds SECADM nor DBADM privilege in Version 9.7. SECADM must explicitly grant DBADM with DATAACCESS authority to the instance owner before running the CLEAR EVENTS command.

## **Required connection**

Database

### **Command syntax**

► CLEAR EVENTS FOR INDEX—*index-name*—FOR TEXT— connection options

#### connection options:

CONNECT TO—database-name USER—username—USING—password—

## **Command parameters**

index-name

The name of the index as specified in the CREATE INDEX command. The index name must adhere to the naming restrictions for DB2 indexes.

### **CONNECT TO** *database-name*

This clause specifies the database to which a connection will be established. The database must be on the local system. If specified, this clause takes precedence over the environment variable DB2DBDFT. This clause can be omitted if the following are all true:

• The DB2DBDFT environment variable is set to a valid database name.

• The user running the command has the required authorization to connect to the database server.

#### **USER** username **USING** password

This clause specifies the authorization name and password that will be used to establish the connection.

### Usage notes

All limits and naming conventions, that apply to DB2 database objects and queries, also apply to DB2 Text Search features and queries. DB2 Text Search related identifiers must conform to the DB2 naming conventions. In addition, there are some additional restrictions. For example, these identifiers can only be of the form: [A-Za-z][A-Za-z0-90#\$]\*

or

"[A-Za-z ][A-Za-z0-90#\$ ]\*"

When regular updates are scheduled (see UPDATE FREQUENCY options in CREATE INDEX or ALTER INDEX commands), the event table should be regularly checked. To cleanup the DB2 Text Search event table for a text search index, use CLEAR EVENTS FOR INDEX command after you have checked the reason for the event and removed the source of the error.

Be sure to make changes to all rows referenced in the event table. By changing the rows in the user table, you ensure that the next UPDATE INDEX attempt can be made to successfully re-index the once erroneous documents.

Note that multiple commands cannot be executed concurrently on a text search index if they may conflict. If this command is issued while a conflicting command is running, an error will occur and the command will fail, after which you can try to run the command again. Some of the conflicting commands are:

- CLEAR EVENTS FOR INDEX
- UPDATE INDEX
- ALTER INDEX
- DROP INDEX
- DISABLE DATABASE FOR TEXT
- STOP FOR TEXT

Changes to the database: The event table is cleared.

# db2ts CREATE INDEX

Creates a text search index for a text column which allows the column data to be searched using text search functions.

The index will not contain any data until the text search UPDATE INDEX command is explicitly executed by the user, or implicitly issued by the text search service, according to the defined update frequency for the index.

For execution, the command needs to be prefixed with db2ts at the command line.

## Authorization

The privileges held by the authorization ID of the statement must include at least one of the following:

One of:

- CONTROL privilege on the table on which the index is defined
- INDEX privilege on the table on which the index is defined and one of the following:
  - IMPLICIT\_SCHEMA authority on the database, if the implicit or explicit schema name of the index does not exist
  - CREATEIN privilege on the schema, if the schema name of the index refers to an existing schema
- DBADM authority

## Prerequisite

Instance owner must hold DBADM with DATAACCESS authority. The SYSADM no longer holds SECADM nor DBADM privilege in Version 9.7. SECADM must explicitly grant DBADM with DATAACCESS authority to the instance owner before running the CREATE INDEX command.

## **Required connection**

Database

### **Command syntax**

►►—CREATE INDEX—index-name—FOR TEXT—ON—table-name—
▶—_(—text-column-name—) (—function-name—(—text-column-name—)—)
▶   text default information   update characteristics
▶ storage options $\mid \mid$ index configuration options $\mid \mid \mid$ connection options $\mid \mid \rightarrow \checkmark$
text default information:

CODEPAGEcode-page	LANGUAGE—locale	FORMAT <i>format</i>	
-------------------	-----------------	----------------------	--

## db2ts CREATE INDEX

#### update characteristics:

#### incremental update characteristics:

MINIMUM— <i>minchanges</i> —	

## storage options:

–ADMINISTRATION TABLES IN—tablespace-name— $\!\!\!$ 

### index configuration options:

#### option-value:

### connection options:

CONNECT TO—database-name USER—username—USING—password—

# **Command parameters**

### **CREATE INDEX** index-name

Specifies the name of the index (optionally schema qualified) to be created, that will uniquely identify the text search index within the database. The index name must adhere to the naming restrictions for DB2 indexes.

### **ON** table-name

The table name containing the text column. Text search indexes cannot be created on the following tables:

- range-partitioned tables
- federated tables
- materialized query tables
- views

### text-column-name

The column name of the column to be indexed. The column must be of one of the following data types: CHAR, VARCHAR, LONG VARCHAR, CLOB, DBCLOB, BLOB, GRAPHIC, VARGRAPHIC, LONG VARGRAPHIC, or XML. If the data type of the column is not one of these, use a transformation function specified with *function-schema.function-name* to convert the column type to one of the valid types. Alternatively, you can specify a user-defined external function that accesses the text documents to be indexed. Only a single text search index can be created for a column.

### function-name(text-column-name)

Specifies the schema qualified name, conforming to DB2 naming conventions, of an external scalar function that accesses text documents in a column that is not of a supported type for text searching. Performs a data type conversion of that value and returns the value as one of the supported data types for text searching. Its task is to perform a column type conversion. This function must take only one parameter and return only one value.

## **CODEPAGE** code-page

Specifies the DB2 code page (CODEPAGE) to be used when indexing text documents. The default value is specified by the value in the view SYSIBMTS.TSDEFAULTS, where DEFAULTNAME='CODEPAGE' (which happens to be the database code page). This argument only applies to binary data types, i.e., the column type or return type from a transformation function must be BLOB or character-type FOR BIT DATA.

## LANGUAGE locale

Specifies the language to be used by DB2 Text Search for language specific processing of a document during indexing. If you do not specify a locale, the database territory will be used to determine the default setting for LANGUAGE. If you would like to have your documents automatically scanned to determine the locale, specify *locale* as AUTO.

### FORMAT format

Specifies the format of text documents in the column. The supported formats include: TEXT, XML, and HTML. DB2 Text Search needs this information when indexing documents. If the format is not specified, the default value is used. The default value is in the view SYSIBMTS.TSDEFAULTS, where DEFAULTNAME='FORMAT'. For columns of data type XML, the default format 'XML' is used, regardless of the value of DEFAULTNAME.

## UPDATE FREQUENCY

Specifies the frequency with which index updates are made. The index will be updated, if the number of changes is at least the value set for UPDATE

MINIMUM. The update frequency NONE indicates that no further index updates will be made. This can be useful for a text column in a table with data that will not change. It is also useful when the user intends to manually update the index (using the UPDATE INDEX command). Automatic updates can only be done if the START FOR TEXT command has been run and the DB2 Text Search instance services are running.

The default frequency value is taken from the view SYSIBMTS.TSDEFAULTS, where DEFAULTNAME='UPDATEFREQUENCY'.

#### NONE

No further index updates are made. The update has to be started manually.

- **D** The day(s) of the week when the index is updated.
  - \* Every day of the week.

integer1

Specific days of the week, from Sunday to Saturday: 0 to 6

**H** The hour(s) of the specified day(s) when the index is updated.

\* Every hour of the day.

#### integer2

Specific hours of the day, from midnight to 11 pm: 0 to 23

**M** The minute(s) of the specified hour(s) when the index is updated.

integer3

Specified as top of the hour (0), or in multiples of 5 minute increments after the hour: 0, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50 or 55

#### **UPDATE MINIMUM** *minchanges*

Specifies the minimum number of changes to text documents before the index is updated incrementally at the time specified in UPDATE FREQUENCY. Positive integer values only are allowed. The default value is taken from the view SYSIBMTS.TSDEFAULTS, where DEFAULTNAME='UPDATEMINIMUM'.

**Note:** This value is ignored during an UPDATE INDEX command (unless the USING UPDATE MINIMUM option is used there). A small value increases consistency between the table column and the text search index. However, it also causes higher performance overhead.

#### **COLLECTION DIRECTORY** directory

The directory in which the text search index is stored. By default the collection data will be located in DBPATH/db2collections where the value for DBPATH is the file path used for creating the database. You must specify the absolute path. The maximum length of the absolute path name is 215 characters. Different indexes are organized in subdirectories named *index identifier* under COLLECTION DIRECTORY where index identifier is a system generated identifier.

#### **ADMINISTRATION TABLES IN** *tablespace-name*

Specifies the name of an existing regular table space for the administration tables created for the index. If not specified, the table space of the base table for which the index is being created is used.

#### **INDEX CONFIGURATION** (option-value)

Specifies additional index related values as option value string pairs. The following values are supported:

Table 45. Specifications for option-value

Option	Value	Data type	Description
COMMENT	text	String value less than 512 bytes	Adds a string comment value to the REMARKS column in the DB2 Text Search catalog view TSINDEXES. It also adds the string comment value as the description of the collection.
UPDATEAUTOCOMMIT	commitcount_number	Integer	Starting with Version 9.7 Fix Pack 3 and later fix packs, this specifies the number of index updates after which a commit is executed to automatically preserve the previous work for either initial or incremental updates.
			• For initial updates, the index update will process batches of documents from a base table after the trigger to capture data updates is activated. After the amount of documents updated reaches the COMMITCOUNT number, the server will do an interim commit. Log entries generated by unprocessed documents will be removed from the staging table. Using the UPDATEAUTOCOMMIT option for an initial text index update will lead to a significant increase of execution time.
			• For incremental updates, log entries which have been processed will be removed correspondingly from the staging table with each interim commit. COMMITCOUNT counts the number of documents updated, not the number of staging table entries.

**Remember:** Non-numeric values must be enclosed in single quotes. A single quote character within a string value must be represented by two consecutive single quotes.

### **Example:**

```
INDEX CONFIGURATION (COMMENT 'Index on User''s Guide column')
```

### **CONNECT TO** *database-name*

This clause specifies the database to which a connection will be established. The database must be on the local system. If specified, this clause takes precedence over the environment variable DB2DBDFT. This clause can be omitted if the following are all true:

- The DB2DBDFT environment variable is set to a valid database name.
- The user running the command has the required authorization to connect to the database server.

### **USER** *username* **USING** *password*

This clause specifies the authorization name and password that will be used to establish the connection.

# **Usage notes**

All limits and naming conventions, that apply to DB2 database objects and queries, also apply to DB2 Text Search features and queries. DB2 Text related identifiers must conform to the DB2 naming conventions. In addition, there are some additional restrictions. For example, these identifiers can only be of the form: [A-Za-z][A-Za-z0-90#\$]\*

or

"[A-Za-z ][A-Za-z0-9@#\$\_ ]\*"

With the successful execution of the CREATE INDEX command:

• DB2 Text Search server data is updated. A collection of name *instance\_database-name\_index-identifier\_number* is created, as in the following example:

tigertail\_MYTSDB\_TS250517\_0000

The collection name can be retrieved from the SYSIBMTS.TSCOLLECTIONNAMES view (column COLLECTIONNAME).

- DB2 Text Search catalog information is updated. An index staging table is created in the specified table space with appropriate DB2 indexes. In addition, an index event table is created in the specified table space.
- When DB2 Text Search coexists with DB2 Net Search Extender and an active Net Search Extender index already exists for the table column, the new text index is set to inactive.
- The newly created text search index is not automatically populated. The UPDATE INDEX command must be executed either manually or automatically (as a result of an update schedule having been defined for the index through the specification of the UPDATE FREQUENCY option) for the text search index to be populated.
- The Text Search index data file on the DB2 database server is updated. Scheduled update information is recorded for each index in the instance.

Usage restrictions:

- A primary key must be defined for the table. In DB2 Text Search, a multi-column DB2 primary key can be used without type limitations. The number of primary key columns is limited to 2 columns less than the number of primary key columns allowed by DB2.
- The total length of all primary key columns for a table with DB2 Text Search indexes is limited to 15 bytes less than the maximum total primary key length allowed by DB2. Refer to the restrictions of the DB2 CREATE INDEX statement.

Note that multiple commands cannot be executed concurrently on a text search index if they may conflict. If this command is issued while a conflicting command is running, an error will occur and the command will fail, after which you can try to run the command again. Some of the conflicting commands are:

- DROP INDEX
- UPDATE INDEX
- CLEAR EVENTS FOR INDEX
- ALTER INDEX
- DISABLE DATABASE FOR TEXT
- STOP FOR TEXT

# db2ts DISABLE DATABASE FOR TEXT

This command somewhat reverses the changes (e.g., drops the text-search related tables and view) done by the command ENABLE DATABASE FOR TEXT.

When issued, this command:

- Disables the DB2 Text Search feature for the database.
- Will delete tables and views such as:
  - SYSIBMTS.TSDEFAULTS
  - SYSIBMTS.TSLOCKS
  - SYSIBMTS.TSINDEXES
  - SYSIBMTS.TSCONFIGURATION
  - SYSIBMTS.TSCOLLECTIONNAMES

The tables are removed from the default table space (IBMDEFAULTGROUP) of the database.

• If the FORCE option is specified, all text index information is removed from the database and all associated collections are deleted. In addition, the text service is updated to remove any remaining update schedule information. See the "db2ts DROP INDEX command" for reference.

For execution, the command needs to be prefixed with db2ts at the command line.

## Authorization

The privileges held by the authorization ID of the statement must include DBADM authority.

## Prerequisite

Instance owner must hold DBADM with DATAACCESS authority. The SYSADM no longer holds SECADM nor DBADM privilege in Version 9.7. SECADM must explicitly grant DBADM with DATAACCESS authority to the instance owner before running the DISABLE DATABASE command.

### **Required connection**

Database

### Command syntax

► DISABLE DATABASE FOR TEXT		
-----------------------------	--	--

### connection options:

CONNECT TOdatabase_name		ļ
	USER_username_USING_password_	
	USER USER Hume USER pussion u	

### **Command parameters**

#### FORCE

Specifies that all text search indexes be forcibly dropped from the database.

If this option is not specified and text search indexes are defined for this database, the command will fail.

If this option is specified and DB2 Text Search service has not been started (the db2ts START FOR TEXT command has not been issued), the text search indexes (collections) are not dropped.

#### **CONNECT TO** database-name

This clause specifies the database to which a connection will be established. The database must be on the local system. If specified, this clause takes precedence over the environment variable DB2DBDFT. This clause can be omitted if the following are all true:

- The DB2DBDFT environment variable is set to a valid database name.
- The user running the command has the required authorization to connect to the database server.

#### **USER** username **USING** password

This clause specifies the authorization name and password that will be used to establish the connection.

### Usage notes

This command does not influence the DB2 Net Search Extender enablement status of the database. It deletes the DB2 Text Search catalog tables and views that are created by the ENABLE FOR TEXT command.

Before dropping a DB2 database that has text search index definitions, issue this command and make sure that the text indexes and collections have been removed successfully.

If some indexes could not be deleted using the FORCE option, the collection names are written to the db2diag log file. If the text search index command DISABLE DATABASE FOR TEXT is not executed before the CLP command DROP DATABASE, the text search index services must also be cleaned up using the CLEANUP FOR TEXT command. See the DROP INDEX command for more about dropping indexes, and the CLEANUP FOR TEXT command for information about text search collections and their relationship to text search indexes.

**Note:** The user is discouraged from usage that results in orphaned collections, i.e., collections that remain defined on the text search server but are not used by DB2. Here are some cases that cause orphaned collections:

- When a DROP DATABASE CLP command or DROP TABLE statement is executed without running a DISABLE DATABASE FOR TEXT command.
- When a DISABLE DATABASE FOR TEXT command is executed using the FORCE option.
- Some other error conditions. The CLEANUP FOR TEXT command can be used in some scenarios.

Note that multiple commands cannot be executed concurrently on a text search index if they may conflict. If this command is issued while a conflicting command is running, an error will occur and the command will fail, after which you can try to run the command again. Some of the conflicting commands are:

- DROP INDEX
- UPDATE INDEX
- CLEAR EVENTS FOR INDEX
- ALTER INDEX
- DISABLE DATABASE FOR TEXT
- STOP FOR TEXT

# db2ts DROP INDEX

Drops an existing text search index.

For execution, the command needs to be prefixed with db2ts at the command line.

### Authorization

The privileges held by the authorization ID of the statement must include at least one of the following:

- · CONTROL privilege on the table on which the index is defined
- DBADM authority

## Prerequisite

Instance owner must hold DBADM with DATAACCESS authority. The SYSADM no longer holds SECADM nor DBADM privilege in Version 9.7. SECADM must explicitly grant DBADM with DATAACCESS authority to the instance owner before running the DROP INDEX command.

### **Required connection**

Database

### Command syntax

►► DROP INDEX—*index-name*—FOR TEXT— | connection options |-----

#### connection options:

CONNECT TO-database-name-		
	USER_username_USING_password_	
	-05LK-usernume-051Na-pussworu-	

### **Command parameters**

#### **DROP INDEX** index-name

The schema and name of the index as specified in the CREATE INDEX command. It uniquely identifies the text search index in a database.

#### **CONNECT TO** *database-name*

This clause specifies the database to which a connection will be established. The database must be on the local system. If specified, this clause takes precedence over the environment variable DB2DBDFT. This clause can be omitted if the following are all true:

- The DB2DBDFT environment variable is set to a valid database name.
- The user running the command has the required authorization to connect to the database server.

#### **USER** username **USING** password

This clause specifies the authorization name and password that will be used to establish the connection.
## **Usage notes**

Note that multiple commands cannot be executed concurrently on a text search index if they may conflict. If this command is issued while a conflicting command is running, an error will occur and the command will fail, after which you can try to run the command again. Some of the conflicting commands are:

- DROP INDEX
- UPDATE INDEX
- CLEAR EVENTS FOR INDEX
- ALTER INDEX
- DISABLE DATABASE FOR TEXT
- STOP FOR TEXT

Dropping the user table in DB2 does not trigger the dropping of text search indexes. They must be dropped manually before or after dropping the table (preferably before dropping the table). After a text search index is dropped, text search is no longer possible on the corresponding text column. If you plan to create a new text search on the same text column, you must first disconnect from the database and then reconnect before creating the new text search index.

Changes to the database:

- Update the DB2 Text Search catalog information.
- Drop the index staging/event tables.
- Delete triggers on the user text table.
- The collection associated with the DB2 Text Search index definition is destroyed.

## db2ts ENABLE DATABASE FOR TEXT

The ENABLE DATABASE FOR TEXT command enables DB2 Text Search for the current database. This command must be issued successfully before you can create text search indexes on columns in tables within the database.

For execution, the command needs to be prefixed with db2ts at the command line.

#### Authorization

The user must have DBADM privilege to execute the ENABLE DATABASE command.

#### Prerequisite

Instance owner must hold DBADM with DATAACCESS authority. The SYSADM no longer holds SECADM nor DBADM privilege in Version 9.7. SECADM must explicitly grant DBADM with DATAACCESS authority to instance owner before running the ENABLE DATABASE command.

#### **Required connection**

Database

#### Command syntax

►►—ENABLE DATABASE FOR TEXT

⊣ AUTOGRANT ├──┤ connection options ├─

# connection options:

#### **Command parameters**

#### **CONNECT TO** database-name

This clause specifies the database to which a connection is established. The database must be on the local system. If specified, this clause takes precedence over the environment variable DB2DBDFT. This clause can be omitted if the following are all true:

- The DB2DBDFT environment variable is set to a valid database name.
- The user running the command has the required authorization to connect to the database server.

#### USER username USING password

This clause specifies the authorization name and password used to establish the connection.

#### AUTOGRANT

If this option is specified, an attempt is made to grant DBADM with DATAACCESS privileges to the instance owner, in case the instance owner misses these privileges for this database. For a successful grant of privileges, the user must have SECADM privilege for the database and cannot be the instance owner (a user cannot grant privileges to herself/himself).

#### **Usage notes**

When executed successfully, this command:

- Enables the DB2 Text Search feature for the database.
- Establishes DB2 Text Search database configuration default values in the view SYSIBMTS.TSDEFAULTS.
- Creates the following DB2 Text Search administrative views in the SYSIBMTS schema:
  - SYSIBMTS.TSDEFAULTS
  - SYSIBMTS.TSLOCKS
  - SYSIBMTS.TSINDEXES
  - SYSIBMTS.TSCONFIGURATION
  - SYSIBMTS.TSCOLLECTIONNAMES

The tables are created in the default table space (IBMDEFAULTGROUP) of the database.

Changes to the file system on the DB2 server: None.

## db2ts HELP

HELP displays the list of available DB2 Text Search commands, or the syntax of an individual command.

Use the db2ts HELP command to get help on specific error messages as well.

For execution, the command needs to be prefixed with db2ts at the command line.

#### Authorization

None.

#### Command syntax

—command———	
—sqlcode———	
—sqlstate———	
—error-identifier—	ļ

#### **Command parameters**

#### HELP | ?

Provides help information for a command or a reason code.

#### command

The first keywords that identify a DB2 Text Search command:

- ENABLE
- DISABLE
- CREATE
- DROP
- ALTER
- UPDATE
- CLEAR (for both CLEAR COMMAND LOCKS and CLEAR EVENTS FOR INDEX)
- CLEANUP
- START
- STOP
- *sqlcode* SQLCODE for message returned by db2ts command (within or outside the administration stored procedure) or text search query.
- *sqlstate* Sqlstate returned by command, administration stored procedure, or text search query.

#### error-identifier

An identifier is part of the *text-search-error-msg* that is embedded in error messages. This identifier starts with 'CIE' and is of the form CIE*nnnnn* where *nnnnn* is a number. This identifier represents the specific error that is returned upon an error during text search. It may also be returned in an informational message upon completion of a text search command or in the message printed at the completion of a text search administration procedure. If the identifier does not start with 'CIE', then db2ts help cannot

provide information about the *error-identifier*. For example, db2ts cannot provide help for a message with an *error-identifier* such as IQQR0012E.

#### Usage notes

When using a UNIX shell, it might be necessary to supply the arguments to db2ts using double-quotes, as in the following example: db2ts "? CIE00323"

Without the quotes, the shell tries to match the wildcard with the contents of the working directory and it may give unexpected results.

If the first keyword of any db2ts command is specified, the syntax of the identified command is displayed. For the two db2ts commands that share the same first keyword (CLEAR COMMAND LOCKS and CLEAR EVENTS FOR INDEX), the syntax of both commands will be displayed when db2ts help clear is issued, but each command may be specifically displayed by adding the second keyword to distinguish them, for example db2ts help clear events. If a parameter is not specified after ? or HELP, db2ts lists all available db2ts commands.

Specifying a *sqlcode*, *sqlstate*, or CIE *error-identifier* will return information about that code, state, or error identifier. For example, db2ts help SQL20423

or db2ts ? 38H10

or

db2ts ? CIE00323

**Note:** For the following Text Search commands, the command help options listed are not valid at this time:

db2ts DISABLE DATABASE FOR TEXT [SERVER]

db2ts ENABLE DATABASE FOR TEXT [SERVER]

db2ts UPDATE INDEX [REORGANIZE] and [PARSE ONLY]

## db2ts START FOR TEXT

This command:

- Starts the DB2 Text Search instance services that support other DB2 Text Search administration commands and the ability to reference text search indexes in SQL queries.
- Starts services (daemons on UNIX) on the host machine running the DB2 database server. These services are responsible for the scheduling of text search index updates on the DB2 database server and for text search engine processing. Instance services are started under the authorization-name of the DB2 instance owner. If the instance services are already running, the command has no effect.

For execution, the command needs to be prefixed with db2ts at the command line.

#### Authorization

Instance owner must hold DBADM with DATAACCESS authority for the current DB2 instance.

#### **Required connection**

This command must be issued from the DB2 database server.

#### **Command syntax**

►►-START FOR TEXT-

### **Command parameters**

None

## db2ts STOP FOR TEXT

This command stops the DB2 Text Search instance services.

For execution, the command needs to be prefixed with db2ts at the command line.

#### Authorization

Instance owner must hold DBADM with DATAACCESS authority for the current DB2 instance.

### **Required connection**

This command must be issued from the DB2 database server.

#### **Command syntax**

► STOP FOR TEXT

## **Command parameters**

None

#### Usage notes

Note that multiple commands cannot be executed concurrently on a text search index if they may conflict. If this command is issued while a conflicting command is running, an error will occur and the command will fail, after which you can try to run the command again. To avoid interrupting the execution of currently running commands, make sure no other administrative commands like update index are still active before issuing the stop command. Some of the conflicting commands are:

- DROP INDEX
- UPDATE INDEX
- CLEAR EVENTS FOR INDEX
- ALTER INDEX
- DISABLE DATABASE FOR TEXT
- STOP FOR TEXT

## db2ts UPDATE INDEX

This command updates the text search index (collection in DB2 Text Search) to reflect the current contents of the text column with which the index is associated. While the update is being performed, a search is possible. Until completion of the update, the search operates on a partially updated index.

For execution, the command needs to be prefixed with db2ts at the command line.

#### Authorization

The privileges held by the authorization ID of the statement must include at least one of the following:

- · CONTROL privilege on the table on which the text index is defined
- DATAACCESS authority

#### Prerequisite

Instance owner must hold DBADM with DATAACCESS authority. The SYSADM no longer holds SECADM nor DBADM privilege in Version 9.7. SECADM must explicitly grant DBADM with DATAACCESS authority to the instance owner before running the UPDATE INDEX command.

#### **Required connection**

Database

#### **Command syntax**

►►—UPDATE INDEX— <i>index-name</i> —FOR TEXT—USING UPDATE MINIMUM—
► index configuration options
index configuration options:
LINDEX CONFIGURATION—(-  option-value -)
option-value:
UPDATEAUTOCOMMITcommitcount_number
connection options:
CONNECT TO—database-name USER—username—USING—password—

## **Command parameters**

#### **UPDATE INDEX** index-name

Specifies the name of the text search index to be updated. The index name must adhere to the naming restrictions for DB2 indexes.

#### USING UPDATE MINIMUM

Specifies that the UPDATE MINIMUM *minchange* settings, specified in the CREATE INDEX command used to create the index, should be used, and starts an incremental update if the specified minimum number of changes have occurred. By default the update is started unconditionally.

#### **INDEX CONFIGURATION** (option-value)

Starting with Version 9.7 Fix Pack 3 and later fix packs, this is an optional input argument of type VARCHAR(32K) that allows altering text index configuration settings. The following option is supported:

Table 46. Specifications for option-value

Option	Value	Data type	Description
UPDATEAUTOCOMMIT	commitcount_number	Integer	Specifies the number of index updates after which a commit is executed to preserve the previous work automatically for either initial or incremental updates.
			• For initial updates, the index update will process batches of documents from a base table after the trigger to capture data updates is activated. After the amount of documents updated reaches the COMMITCOUNT number, the server will do an interim commit. Log entries generated by unprocessed documents will be removed from the staging table. Using the UPDATEAUTOCOMMIT option for an initial text index update will lead to a significant increase of execution time.
			• For incremental updates, log entries which have been processed will be removed correspondingly from staging table with each interim commit. COMMITCOUNT counts the number of documents updated, not the number of staging table entries.

#### **CONNECT TO** *database-name*

This clause specifies the database to which a connection will be established. The database must be on the local system. If specified, this clause takes precedence over the environment variable DB2DBDFT. This clause can be omitted if the following are all true:

- The DB2DBDFT environment variable is set to a valid database name.
- The user running the command has the required authorization to connect to the database server.

#### **USER** username **USING** password

This clause specifies the authorization name and password that will be used to establish the connection.

### **Usage notes**

All limits and naming conventions, that apply to DB2 database objects and queries, also apply to DB2 Text Search features and queries. DB2 Text Search related

identifiers must conform to the DB2 naming conventions. In addition, there are some additional restrictions. For example, these identifiers can only be of the form: [A-Za-z][A-Za-z0-90#\$]\*

or

"[A-Za-z ][A-Za-z0-9@#\$ ]\*"

This command does not return until all index update processing is completed. The duration depends on the number of documents to be indexed and the number of documents already indexed. The collection name for the index can be retrieved from the SYSIBMTS.TSCOLLECTIONNAMES view (column COLLECTIONNAME).

Note that multiple commands cannot be executed concurrently on a text search index if they may conflict. If this command is issued while a conflicting command is running, an error will occur and the command will fail, after which you can try to run the command again. Some of the conflicting commands are:

- UPDATE INDEX
- CLEAR EVENTS FOR INDEX
- ALTER INDEX
- DROP INDEX
- DISABLE DATABASE FOR TEXT
- STOP FOR TEXT

**Note:** In cases of individual document errors, the documents must be corrected. The primary keys of the erroneous documents can be looked up in the event table for the index. The next UPDATE INDEX command will reprocess these documents if the corresponding rows in the user table are modified.

Changes to the database:

- Insert rows to the event table (including parser error information from DB2 Text Search).
- Delete from the index staging table in case of incremental updates.
- Before first update, create triggers on the user text table.
- The collection is updated.
- New or changed documents are parsed and indexed.
- Deleted documents are discarded from the index.

Appendix A. Naming conventions

### Naming conventions

The following conventions apply when naming database manager objects, such as databases and tables:

- Character strings that represent names of database manager objects can contain any of the following: a-z, A-Z, 0-9, @, #, and \$.
- Unless otherwise noted, names can be entered in lowercase letters; however, the database manager processes them as if they were uppercase.

The exception to this convention is character strings that represent names under the systems network architecture (SNA) which, as a communications protocol, is no longer supported. Many values are case sensitive, such as logical unit names (partner\_lu and local\_lu). The name must be entered exactly as it appears in the SNA definitions that correspond to those terms.

• A database name or database alias is a unique character string containing from one to eight letters, numbers, or keyboard characters from the set described above.

Databases are cataloged in the system and local database directories by their aliases in one field, and their original name in another. For most functions, the database manager uses the name entered in the alias field of the database directories. (The exceptions are CHANGE DATABASE COMMENT and CREATE DATABASE, where a directory path must be specified.)

• The name or the alias name of a table or a view is an SQL identifier that is a unique character string 1 to 128 bytes in length. Column names can be 1 to 128 bytes in length.

A fully qualified table name consists of the *schema.tablename*. The schema is the unique user ID under which the table was created. The schema name for a declared temporary table must be SESSION.

- Local aliases for remote nodes that are to be cataloged in the node directory cannot exceed eight characters in length.
- The first character in the string must be an alphabetic character, @, #, or \$; it cannot be a number or the letter sequences SYS, DBM, or IBM.

The following conventions apply when naming user IDs and authentication IDs:

- Character strings that represent names of database manager objects can contain any of the following: a-z, A-Z, 0-9, @, #, and \$.
- User IDs and groups may also contain any of the following additional characters when supported by the security plug-in: \_, !, %, (, ), {, }, -, ., ^.
- User IDs and groups containing any of the following characters must be delimited with quotations when entered through the command line processor: !, %, (, ), {, }, -, ., ^,
- The first character in the string must be an alphabetic character, @, #, or \$; it cannot be a number or the letter sequences SYS, DBM, or IBM.
- Authentication IDs cannot exceed 128 bytes in length.
- Group IDs cannot exceed 128 bytes in length.

Appendix B. File type modifiers and delimiters

## File type modifiers for the export, import and load utilities

The links below will take you to the top of a command topic, where you'll then find a quick link to the respective file type modifier section.

"EXPORT" on page 167

"IMPORT" on page 241

"LOAD" on page 324

### Delimiter considerations for moving data

When moving delimited ASCII (DEL) files, it is important to ensure that the data being moved is not unintentionally altered because of problems with delimiter character recognition. To help prevent these errors, DB2 enforces several restrictions and provides a number of file type modifiers.

#### **Delimiter restrictions**

There are a number of restrictions in place that help prevent the chosen delimiter character from being treated as a part of the data being moved. First, delimiters are mutually exclusive. Second, a delimiter cannot be binary zero, a line-feed character, a carriage-return, or a blank space. As well, the default decimal point (.) cannot be a string delimiter. Finally, in a DBCS environment, the pipe (1) character delimiter is not supported.

The following characters are specified differently by an ASCII-family code page and an EBCDIC-family code page:

- The Shift-In (0x0F) and the Shift-Out (0x0E) character cannot be delimiters for an EBCDIC MBCS data file.
- Delimiters for MBCS, EUC, or DBCS code pages cannot be greater than 0x40, except the default decimal point for EBCDIC MBCS data, which is 0x4b.
- Default delimiters for data files in ASCII code pages or EBCDIC MBCS code pages are:
  - string delimiter: "(0x22, double quotation mark)
  - column delimiter: ,(0x2c, comma)
- Default delimiters for data files in EBCDIC SBCS code pages are:
  - string delimiter: "(0x7F, double quotation mark)
  - column delimiter: ,(0x6B, comma)
- The default decimal point for ASCII data files is 0x2e (period).
- The default decimal point for EBCDIC data files is 0x4B (period).
- If the code page of the server is different from the code page of the client, it is recommended that the hex representation of non-default delimiters be specified. For example,

db2 load from ... modified by chardel0x0C coldelX1e ...

#### Issues with delimiters during data movement

#### Double character delimiters

By default, for character-based fields of a DEL file, any instance of the character delimiter found within the field is represented by double character delimiters. For example, assuming that the character delimiter is the double quote, if you export the text I am 6" tall., the output text in the DEL file reads "I am 6"" tall." Conversely, if the input text in a DEL file reads "What a ""nice"" day!", the text is imported as What a "nice" day!

#### nodoubledel

Double character delimiter behavior can be disabled for the import, export, and load utilities by specifying the nodoubledel file type modifier. However, be aware that double character delimiter behavior exists in order to avoid parsing errors. When you use nodoubledel with export, the character delimiter is not doubled if it

#### Delimiter considerations for moving data

is present in character fields. When you use nodoubledel with import and load, the double character delimiter is not interpreted as a literal instance of the character delimiter.

#### nochardel

When you use the nochardel file type modifier with export, the character fields are not surrounded by character delimiters. When nochardel is used import and load, the character delimiters are not treated as special characters and are interpreted as actual data.

#### chardel

Other file type modifiers can be used to manually prevent confusion between default delimiters and the data. Thechardel file type modifier specifies x, a single character, as the character string delimiter to be used instead of double quotation marks (as is the default).

#### coldel

Similarly, if you wanted to avoid using the default comma as a column delimiter, you could use coldel, which specifies x, a single character, as the column data delimiter.

#### delprioritychar

Another concern in regards to moving DEL files is maintaining the correct precedence order for delimiters. The default priority for delimiters is: row, character, column. However, some applications depend on the priority: character, row, column. For example, using the default priority, the DEL data file: "Vincent <row delimiter> is a manager",<row delimiter>

would be interpreted as having two rows: Vincent, and is a manager, since <row delimiter> takes precedence over the character delimiter ("). Using delprioritychar gives the character delimiter (") precedence over the row delimiter (<row delimiter>), meaning that the same DEL file would be interpreted (correctly) as having one row: Vincent is a manager.

## Appendix C. Overview of the DB2 technical information

DB2 technical information is available through the following tools and methods:

- DB2 Information Center
  - Topics (Task, concept and reference topics)
  - Help for DB2 tools
  - Sample programs
  - Tutorials
- DB2 books
  - PDF files (downloadable)
  - PDF files (from the DB2 PDF DVD)
  - printed books
- Command line help
  - Command help
  - Message help

**Note:** The DB2 Information Center topics are updated more frequently than either the PDF or the hardcopy books. To get the most current information, install the documentation updates as they become available, or refer to the DB2 Information Center at ibm.com.

You can access additional DB2 technical information such as technotes, white papers, and IBM Redbooks<sup>®</sup> publications online at ibm.com. Access the DB2 Information Management software library site at http://www.ibm.com/software/data/sw-library/.

#### **Documentation feedback**

We value your feedback on the DB2 documentation. If you have suggestions for how to improve the DB2 documentation, send an e-mail to db2docs@ca.ibm.com. The DB2 documentation team reads all of your feedback, but cannot respond to you directly. Provide specific examples wherever possible so that we can better understand your concerns. If you are providing feedback on a specific topic or help file, include the topic title and URL.

Do not use this e-mail address to contact DB2 Customer Support. If you have a DB2 technical issue that the documentation does not resolve, contact your local IBM service center for assistance.

## DB2 technical library in hardcopy or PDF format

The following tables describe the DB2 library available from the IBM Publications Center at www.ibm.com/e-business/linkweb/publications/servlet/pbi.wss. English and translated DB2 Version 9.7 manuals in PDF format can be downloaded from www.ibm.com/support/docview.wss?rs=71&uid=swg2700947.

Although the tables identify books available in print, the books might not be available in your country or region.

The form number increases each time a manual is updated. Ensure that you are reading the most recent version of the manuals, as listed below.

**Note:** The *DB2 Information Center* is updated more frequently than either the PDF or the hard-copy books.

Name	Form Number	Available in print	Last updated
Administrative API Reference	SC27-2435-02	Yes	September, 2010

## Ordering printed DB2 books

If you require printed DB2 books, you can buy them online in many but not all countries or regions. You can always order printed DB2 books from your local IBM representative. Keep in mind that some softcopy books on the *DB2 PDF Documentation* DVD are unavailable in print. For example, neither volume of the *DB2 Message Reference* is available as a printed book.

Printed versions of many of the DB2 books available on the DB2 PDF Documentation DVD can be ordered for a fee from IBM. Depending on where you are placing your order from, you may be able to order books online, from the IBM Publications Center. If online ordering is not available in your country or region, you can always order printed DB2 books from your local IBM representative. Note that not all books on the DB2 PDF Documentation DVD are available in print.

**Note:** The most up-to-date and complete DB2 documentation is maintained in the DB2 Information Center at http://publib.boulder.ibm.com/infocenter/db2luw/v9r7.

To order printed DB2 books:

- To find out whether you can order printed DB2 books online in your country or region, check the IBM Publications Center at http://www.ibm.com/shop/publications/order. You must select a country, region, or language to access publication ordering information and then follow the ordering instructions for your location.
- To order printed DB2 books from your local IBM representative:
  - 1. Locate the contact information for your local representative from one of the following Web sites:
    - The IBM directory of world wide contacts at www.ibm.com/planetwide
    - The IBM Publications Web site at http://www.ibm.com/shop/ publications/order. You will need to select your country, region, or language to the access appropriate publications home page for your location. From this page, follow the "About this site" link.
  - 2. When you call, specify that you want to order a DB2 publication.
  - **3**. Provide your representative with the titles and form numbers of the books that you want to order. For titles and form numbers, see "DB2 technical library in hardcopy or PDF format" on page 1156.

## Displaying SQL state help from the command line processor

DB2 products return an SQLSTATE value for conditions that can be the result of an SQL statement. SQLSTATE help explains the meanings of SQL states and SQL state class codes.

To start SQL state help, open the command line processor and enter:

? sqlstate or ? class code

where *sqlstate* represents a valid five-digit SQL state and *class code* represents the first two digits of the SQL state.

For example, ? 08003 displays help for the 08003 SQL state, and ? 08 displays help for the 08 class code.

## Accessing different versions of the DB2 Information Center

For DB2 Version 9.8 topics, the *DB2 Information Center* URL is http://publib.boulder.ibm.com/infocenter/db2luw/v9r8/.

For DB2 Version 9.7 topics, the DB2 Information Center URL is http://publib.boulder.ibm.com/infocenter/db2luw/v9r7/.

For DB2 Version 9.5 topics, the *DB2 Information Center* URL is http://publib.boulder.ibm.com/infocenter/db2luw/v9r5.

For DB2 Version 9.1 topics, the *DB2 Information Center* URL is http://publib.boulder.ibm.com/infocenter/db2luw/v9/.

For DB2 Version 8 topics, go to the *DB2 Information Center* URL at: http://publib.boulder.ibm.com/infocenter/db2luw/v8/.

# Displaying topics in your preferred language in the DB2 Information Center

The DB2 Information Center attempts to display topics in the language specified in your browser preferences. If a topic has not been translated into your preferred language, the DB2 Information Center displays the topic in English.

- To display topics in your preferred language in the Internet Explorer browser:
  - 1. In Internet Explorer, click the **Tools** —> **Internet Options** —> **Languages...** button. The Language Preferences window opens.
  - **2**. Ensure your preferred language is specified as the first entry in the list of languages.
    - To add a new language to the list, click the Add... button.

**Note:** Adding a language does not guarantee that the computer has the fonts required to display the topics in the preferred language.

- To move a language to the top of the list, select the language and click the Move Up button until the language is first in the list of languages.
- **3.** Refresh the page to display the DB2 Information Center in your preferred language.
- To display topics in your preferred language in a Firefox or Mozilla browser:
  - Select the button in the Languages section of the Tools —> Options —> Advanced dialog. The Languages panel is displayed in the Preferences window.
  - **2.** Ensure your preferred language is specified as the first entry in the list of languages.
    - To add a new language to the list, click the Add... button to select a language from the Add Languages window.
    - To move a language to the top of the list, select the language and click the Move Up button until the language is first in the list of languages.
  - **3**. Refresh the page to display the DB2 Information Center in your preferred language.

On some browser and operating system combinations, you must also change the regional settings of your operating system to the locale and language of your choice.

# Updating the DB2 Information Center installed on your computer or intranet server

A locally installed DB2 Information Center must be updated periodically.

A DB2 Version 9.7 Information Center must already be installed. For details, see the "Installing the DB2 Information Center using the DB2 Setup wizard" topic in *Installing DB2 Servers*. All prerequisites and restrictions that applied to installing the Information Center also apply to updating the Information Center.

An existing DB2 Information Center can be updated automatically or manually:

• Automatic updates - updates existing Information Center features and languages. An additional benefit of automatic updates is that the Information

#### Updating the DB2 Information Center installed on your computer or intranet server

Center is unavailable for a minimal period of time during the update. In addition, automatic updates can be set to run as part of other batch jobs that run periodically.

 Manual updates - should be used when you want to add features or languages during the update process. For example, a local Information Center was originally installed with both English and French languages, and now you want to also install the German language; a manual update will install German, as well as, update the existing Information Center features and languages. However, a manual update requires you to manually stop, update, and restart the Information Center. The Information Center is unavailable during the entire update process.

This topic details the process for automatic updates. For manual update instructions, see the "Manually updating the DB2 Information Center installed on your computer or intranet server" topic.

To automatically update the DB2 Information Center installed on your computer or intranet server:

- 1. On Linux operating systems,
  - a. Navigate to the path where the Information Center is installed. By default, the DB2 Information Center is installed in the /opt/ibm/db2ic/V9.7 directory.
  - b. Navigate from the installation directory to the doc/bin directory.
  - c. Run the ic-update script: ic-update
- 2. On Windows operating systems,
  - a. Open a command window.
  - b. Navigate to the path where the Information Center is installed. By default, the DB2 Information Center is installed in the <Program Files>\IBM\DB2 Information Center\Version 9.7 directory, where <Program Files> represents the location of the Program Files directory.
  - c. Navigate from the installation directory to the doc\bin directory.
  - d. Run the ic-update.bat file: ic-update.bat

The DB2 Information Center restarts automatically. If updates were available, the Information Center displays the new and updated topics. If Information Center updates were not available, a message is added to the log. The log file is located in doc\eclipse\configuration directory. The log file name is a randomly generated number. For example, 1239053440785.log.

# Manually updating the DB2 Information Center installed on your computer or intranet server

If you have installed the DB2 Information Center locally, you can obtain and install documentation updates from IBM.

Updating your locally-installed DB2 Information Center manually requires that you:

1. Stop the *DB2 Information Center* on your computer, and restart the Information Center in stand-alone mode. Running the Information Center in stand-alone mode prevents other users on your network from accessing the Information

# Manually updating the DB2 Information Center installed on your computer or intranet server

Center, and allows you to apply updates. The Workstation version of the DB2 Information Center always runs in stand-alone mode. .

2. Use the Update feature to see what updates are available. If there are updates that you must install, you can use the Update feature to obtain and install them

**Note:** If your environment requires installing the *DB2 Information Center* updates on a machine that is not connected to the internet, mirror the update site to a local file system using a machine that is connected to the internet and has the *DB2 Information Center* installed. If many users on your network will be installing the documentation updates, you can reduce the time required for individuals to perform the updates by also mirroring the update site locally and creating a proxy for the update site.

If update packages are available, use the Update feature to get the packages. However, the Update feature is only available in stand-alone mode.

**3**. Stop the stand-alone Information Center, and restart the *DB2 Information Center* on your computer.

**Note:** On Windows 2008, Windows Vista (and higher), the commands listed later in this section must be run as an administrator. To open a command prompt or graphical tool with full administrator privileges, right-click the shortcut and then select **Run as administrator**.

To update the DB2 Information Center installed on your computer or intranet server:

- 1. Stop the DB2 Information Center.
  - On Windows, click Start → Control Panel → Administrative Tools → Services. Then right-click DB2 Information Center service and select Stop.
  - On Linux, enter the following command: /etc/init.d/db2icdv97 stop
- 2. Start the Information Center in stand-alone mode.
  - On Windows:
    - a. Open a command window.
    - b. Navigate to the path where the Information Center is installed. By default, the DB2 Information Center is installed in the Program\_Files\IBM\DB2 Information Center\Version 9.7 directory, where Program\_Files represents the location of the Program Files directory.
    - c. Navigate from the installation directory to the doc\bin directory.
    - d. Run the help\_start.bat file: help start.bat
  - On Linux:
    - a. Navigate to the path where the Information Center is installed. By default, the *DB2 Information Center* is installed in the /opt/ibm/db2ic/V9.7 directory.
    - b. Navigate from the installation directory to the doc/bin directory.
    - c. Run the help\_start script:

help\_start

The systems default Web browser opens to display the stand-alone Information Center.

3. Click the **Update** button ( ). (JavaScript<sup>™</sup> must be enabled in your browser.) On the right panel of the Information Center, click **Find Updates**. A list of updates for existing documentation displays.

# Manually updating the DB2 Information Center installed on your computer or intranet server

- 4. To initiate the installation process, check the selections you want to install, then click **Install Updates**.
- 5. After the installation process has completed, click Finish.
- 6. Stop the stand-alone Information Center:
  - On Windows, navigate to the installation directory's doc\bin directory, and run the help\_end.bat file: help end.bat

**Note:** The help\_end batch file contains the commands required to safely stop the processes that were started with the help\_start batch file. Do not use Ctrl-C or any other method to stop help\_start.bat.

• On Linux, navigate to the installation directory's doc/bin directory, and run the help\_end script:

help\_end

**Note:** The help\_end script contains the commands required to safely stop the processes that were started with the help\_start script. Do not use any other method to stop the help\_start script.

- 7. Restart the DB2 Information Center.
  - On Windows, click Start → Control Panel → Administrative Tools → Services. Then right-click DB2 Information Center service and select Start.
  - On Linux, enter the following command: /etc/init.d/db2icdv97 start

The updated DB2 Information Center displays the new and updated topics.

## **DB2** tutorials

The DB2 tutorials help you learn about various aspects of DB2 products. Lessons provide step-by-step instructions.

### Before you begin

You can view the XHTML version of the tutorial from the Information Center at http://publib.boulder.ibm.com/infocenter/db2help/.

Some lessons use sample data or code. See the tutorial for a description of any prerequisites for its specific tasks.

#### **DB2** tutorials

To view the tutorial, click the title.

"pureXML<sup>®</sup>" in *pureXML* Guide

Set up a DB2 database to store XML data and to perform basic operations with the native XML data store.

"Visual Explain" in Visual Explain Tutorial

Analyze, optimize, and tune SQL statements for better performance using Visual Explain.

## **DB2 troubleshooting information**

A wide variety of troubleshooting and problem determination information is available to assist you in using DB2 database products.

#### DB2 documentation

Troubleshooting information can be found in the *Troubleshooting and Tuning Database Performance* or the Database fundamentals section of the *DB2 Information Center*. There you will find information about how to isolate and identify problems using DB2 diagnostic tools and utilities, solutions to some of the most common problems, and other advice on how to solve problems you might encounter with your DB2 database products.

#### DB2 Technical Support Web site

Refer to the DB2 Technical Support Web site if you are experiencing problems and want help finding possible causes and solutions. The Technical Support site has links to the latest DB2 publications, TechNotes, Authorized Program Analysis Reports (APARs or bug fixes), fix packs, and other resources. You can search through this knowledge base to find possible solutions to your problems.

Access the DB2 Technical Support Web site at http://www.ibm.com/ software/data/db2/support/db2\_9/

## **Terms and Conditions**

Permissions for the use of these publications is granted subject to the following terms and conditions.

**Personal use:** You may reproduce these Publications for your personal, non commercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these Publications, or any portion thereof, without the express consent of IBM.

**Commercial use:** You may reproduce, distribute and display these Publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these Publications, or reproduce, distribute or display these Publications or any portion thereof outside your enterprise, without the express consent of IBM.

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the Publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the Publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information that has been exchanged, should contact:

IBM Canada Limited U59/3600 3600 Steeles Avenue East Markham, Ontario L3R 9Z7 CANADA

Such information may be available, subject to appropriate terms and conditions, including, in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems, and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements, or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only.

This information may contain examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious, and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

#### COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate programming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operating

platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

Each copy or any portion of these sample programs or any derivative work must include a copyright notice as follows:
