Product Overview

The IBM® Branch Transformation Toolkit for WebSphere® Studio is a component-based toolkit for developing enterprise e-business applications. The Branch Transformation Toolkit enables the development of interfaces to the services of a financial institution's information system so that they become ubiquitous through all delivery channels (such as the traditional branch, call center, banking kiosk, Internet banking, and mobile access). This minimizes the need for developing new code and reduces the time required to make new financial services available to all delivery channels.
