FURTHER, IF YOU ARE LOCATED OR ACCESSING THIS SOFTWARE IN THE UNITED STATES, ANY EXPRESS OR IMPLIED WARRANTY REGARDING TITLE OR NON-INFRINGEMENT ARE DISCLAIMED.

Table of Contents

| | | |
|------------------|---|------|
| Preface | Before You Begin | |
| | Install Sample Library | P-1 |
| | Environment Control Setup | P-2 |
| | Overview | P-3 |
| Chapter 1 | Inbound Overview | |
| | Assumptions | 1-1 |
| | Signing on to the Gentran System | 1-3 |
| Chapter 2 | Viewing the EDI Data | |
| | In this Chapter | 2-1 |
| | View the Inbound EDI Data | 2-1 |
| | Reset the Status | 2-3 |
| Chapter 3 | Setting Up a Partner | |
| | In this Chapter | 3-1 |
| | What is a Partner? | 3-1 |
| | Create the Partner ID | 3-2 |
| | Add Partner Groups | 3-4 |
| | Add Partner Transactions | 3-8 |
| | Update Name and Address Information | 3-12 |
| | Add Partner Cross References | 3-13 |
| Chapter 4 | Setting Up an Inbound Application Definition | |
| | In this Chapter | 4-1 |
| | What is an Application Definition? | 4-1 |
| | Access the Application Definition Subsystem | 4-2 |
| | Define the Application ID | 4-2 |
| | Customize Application Records/Files | 4-4 |
| | Customize Header Application Fields | 4-5 |

| | | |
|------------------|--|------|
| | Customize Detail Application Fields | 4-6 |
| Chapter 5 | Creating an Inbound Transaction Map | |
| | In this Chapter | 5-1 |
| | What is a Transaction Map? | 5-1 |
| | Access the Transaction Mapping Subsystem | 5-2 |
| | Create a Transaction ID | 5-3 |
| | Define a New Transaction ID | 5-4 |
| | Access the Copy Segments from Standards Panel | 5-5 |
| | Access the Element Mapping Inbound Panel | 5-7 |
| | Map the BEG Segment | 5-8 |
| | Map the PO Number and PO Date | 5-9 |
| | Map the N1 Segment | 5-11 |
| | Map the N3 Segment | 5-12 |
| | Apply Conditions to the N4 Segment | 5-13 |
| | Map the N4 Segment | 5-14 |
| | Map the PO1 Segment | 5-15 |
| | Add Extended Maps for Element Sequence 70 of the PO1 Segment | 5-16 |
| | Map the PID Segment | 5-18 |
| | View the Code Translation Table | 5-19 |
| Chapter 6 | Inbound Processing | |
| | In this Chapter | 6-1 |
| | What is Processing? | 6-1 |
| | Access the Processing Subsystem | 6-2 |
| | Perform Inbound Processing | 6-3 |
| | Access the Message Center | 6-4 |
| | Display Message Center Details for Job | 6-5 |
| | Access Spooled Files for Job (Inbound Processing Reports) | 6-7 |
| | Access the Audit Subsystem | 6-8 |
| | Search for a Document | 6-9 |
| | View Unwrapped EDI Data for a Partner | 6-11 |
| | Access EDI Monitor Reports | 6-14 |
| | Print EDI Monitor Reports | 6-16 |
| Chapter 7 | Outbound Overview | |
| | Assumptions | 7-1 |
| | Signing On to the Gentran System | 7-3 |

| | | |
|-------------------|--|-------|
| Chapter 8 | Setting Up a Partner | |
| | In this Chapter | 8-1 |
| | What is a Partner? | 8-1 |
| | Create the Partner ID | 8-2 |
| | Add Partner Groups | 8-4 |
| | Add Partner Transactions | 8-8 |
| | Update Name and Address Information | 8-12 |
| | Add Partner Cross References | 8-13 |
| Chapter 9 | Setting Up an Outbound Application Definition | |
| | In this Chapter | 9-1 |
| | What is an Application Definition? | 9-1 |
| | Access the Application Definition Subsystem | 9-2 |
| | Define the Application ID | 9-3 |
| | Revise the Application Files | 9-4 |
| | Revise Application Fields | 9-5 |
| | Update the Application Partner Reference | 9-6 |
| Chapter 10 | Creating an Outbound Transaction Map | |
| | In this Chapter | 10-1 |
| | What is a Transaction Map? | 10-1 |
| | Access the Mapping Menu (GENMAP) | 10-2 |
| | Access the Transaction Mapping Subsystem | 10-2 |
| | Create a Transaction ID | 10-3 |
| | Define a New Transaction ID | 10-3 |
| | Copy Segments from the Standards | 10-4 |
| | Modify Segment Information | 10-6 |
| | Copy Segments for Manual Loops | 10-8 |
| | Access the Element Mapping Outbound Panel | 10-10 |
| | Map the BIG Segment | 10-11 |
| | Map the NTE Segment | 10-13 |
| | Map the REF segment | 10-15 |
| | Map the Billto N1 Segment | 10-17 |
| | Map the Billto N3 Segment | 10-17 |
| | Map the Billto N4 Segment | 10-18 |
| | Map the Shipto N1 Segment | 10-18 |
| | Map the Remit To N1 Segment | 10-19 |

Table of Contents

| | |
|--|-------|
| Map the Remit To N3 Segment | 10-19 |
| Subfield the N4 Segment for Remit To | 10-20 |
| Map the Remit To N4 segment | 10-21 |
| Map the DTM Segment | 10-21 |
| Map Element Sequence 10 of the IT1 Segment | 10-22 |
| Map Element 20 of the IT1 Segment | 10-23 |
| Map Element 30 of the IT1 Segment | 10-24 |
| Map Element 40 of the IT1 Segment | 10-24 |
| Map Element 60 of the IT1 Segment | 10-25 |
| Map Element 70 of the IT1 Segment | 10-25 |
| Map Element 80 of the IT1 Segment | 10-26 |
| Map Element 90 of the IT1 Segment | 10-26 |
| Map the PID Segment | 10-27 |
| Map the Dummy TDS Segment | 10-27 |
| Map the TDS Segment in Summary | 10-29 |
| Map the CTT Segment in Summary | 10-29 |
| View a Code Translation Table | 10-30 |
| Update Your Partner with the New Map | 10-31 |

Chapter 11 Outbound Processing

| | |
|--|-------|
| In this Chapter | 11-1 |
| What is Processing? | 11-1 |
| Access the Processing Subsystem | 11-2 |
| Perform Outbound Processing | 11-2 |
| Access the Message Center | 11-3 |
| Display Message Center Details for Job | 11-4 |
| Access Spooled Files for Job (Outbound Processing Reports) | 11-6 |
| Access the Audit Subsystem | 11-7 |
| Search for a Document | 11-8 |
| View Unwrapped EDI Data for a Partner | 11-10 |
| Access EDI Monitor Reports | 11-13 |
| Print EDI Monitor Reports | 11-15 |

Glossary

Index

Before You Begin

Welcome to Gentran:Server[®], the EDI software that makes it easy to manage the data exchange between you and your trading partners.

The ANSI X12 Tutorial enables you to accomplish an end-to-end translation scenario with hands-on experience in partner setup, mapping, and translation processing. Step-by-step instructions are provided to guide you through the setup, and the Gentran:Server online Help will give you additional information at any step in the process.

In this exercise, you are provided with a case scenario in which you will assume the role of a manufacturer who is setting up EDI documents with a fictitious trading partner.

Install Sample Library

If the sample tutorial library has not already been installed, it must be installed before proceeding. If you are unsure if the sample library has been installed, check for the existence of the default library name G3X5SAMP.

To install the sample library, load the Gentran:Server for iSeries Release 3.5 CD-ROM into a CD-ROM device or download the G3X5SAMP Save File from the ESD Portal (which is included with the product download). You must be signed on as QSECOFR or have security privileges.

On the command line, enter **DWNSAMP** and press **F4** to prompt. The command is illustrated below.

```

Download Sample Library (DWNSAMP)

Type choices, press Enter.

Device . . . . . OPT01          Name, *SAVF
Sample Tutorial Library . . . . . G3X5SAMP      Name
Run Interactively? . . . . . *NO             *YES, *NO
Library for Save Files . . . . . _____      Character value

Additional Parameters

Auxiliary Storage Pool . . . . . *SAVASEP      *SAVASEP, 1, 2, 3, 4, 5, 6...
End of tape option . . . . . *UNLOAD          *UNLOAD, *REWIND, *LEAVE
Validate Volume ID? . . . . . *YES             *YES, *NO

Bottom
F3=Exit   F4=Prompt   F5=Refresh   F12=Cancel   F13=How to use this display
F24=More keys _____

```

Specify the device name where the CD is loaded (in this example, **OPT01**) or enter ***SAVF** if restoring from Save Files. Optionally, change the library name (in this example, **G3X5SAMP**). Press **F10** for additional parameters, if restoring from a Save file, specify the library name where the Save file resides. Press **Enter** to run the installation.

Environment Control Setup

When the installation is complete, create user profiles in Gentran:Server by accessing Environment Control (type **GO GENMAIN** and select option **6**) with the sample library listed first in the library list.

To use the tutorial data, the user's library list should include the following libraries when accessing Gentran:

- QTEMP
- QGPL
- G3X5SAMP
- G3X5DTA
- G3X5PGM

SEE the "Environment Control" chapter in the *User Guide* for more information on creating user profiles in Gentran.

Overview

Before starting this translation tutorial, you need the following information about the case scenario:

- You will assume the role of a tea leaf supplier called “Mycompany, Inc.”
- Your trading partner is a tea bag manufacturer called “Sweet Tea.”
- Your partner wants to send X12 purchase orders (850) and receive invoices (810) using the standards version 004010.
- Sample EDI data from your partner has been provided.
- Application files and data have been provided.
- Separate inbound and outbound instructions have been provided to step you through the process.

At this time, you should select the direction (inbound or outbound) for translation.

For inbound, go to page 1 - 1.

For outbound, go to page 7 - 1.

You can choose to complete both the inbound and outbound translations. If so, we recommend you start with the inbound scenario.

Inbound Overview

In this inbound exercise, you will set up your Gentran:Server system to receive purchase orders from Sweet Tea. In this task, you will accomplish the following:

- View the sample inbound EDI data.
- Set up a trading partner.
- Create an application definition that tells Gentran:Server how to interface with your application.
- Create a transaction map that will give Gentran:Server the necessary instructions for the data translation between the EDI data and your sample application.
- Process inbound EDI data for translation and view the resulting reports.

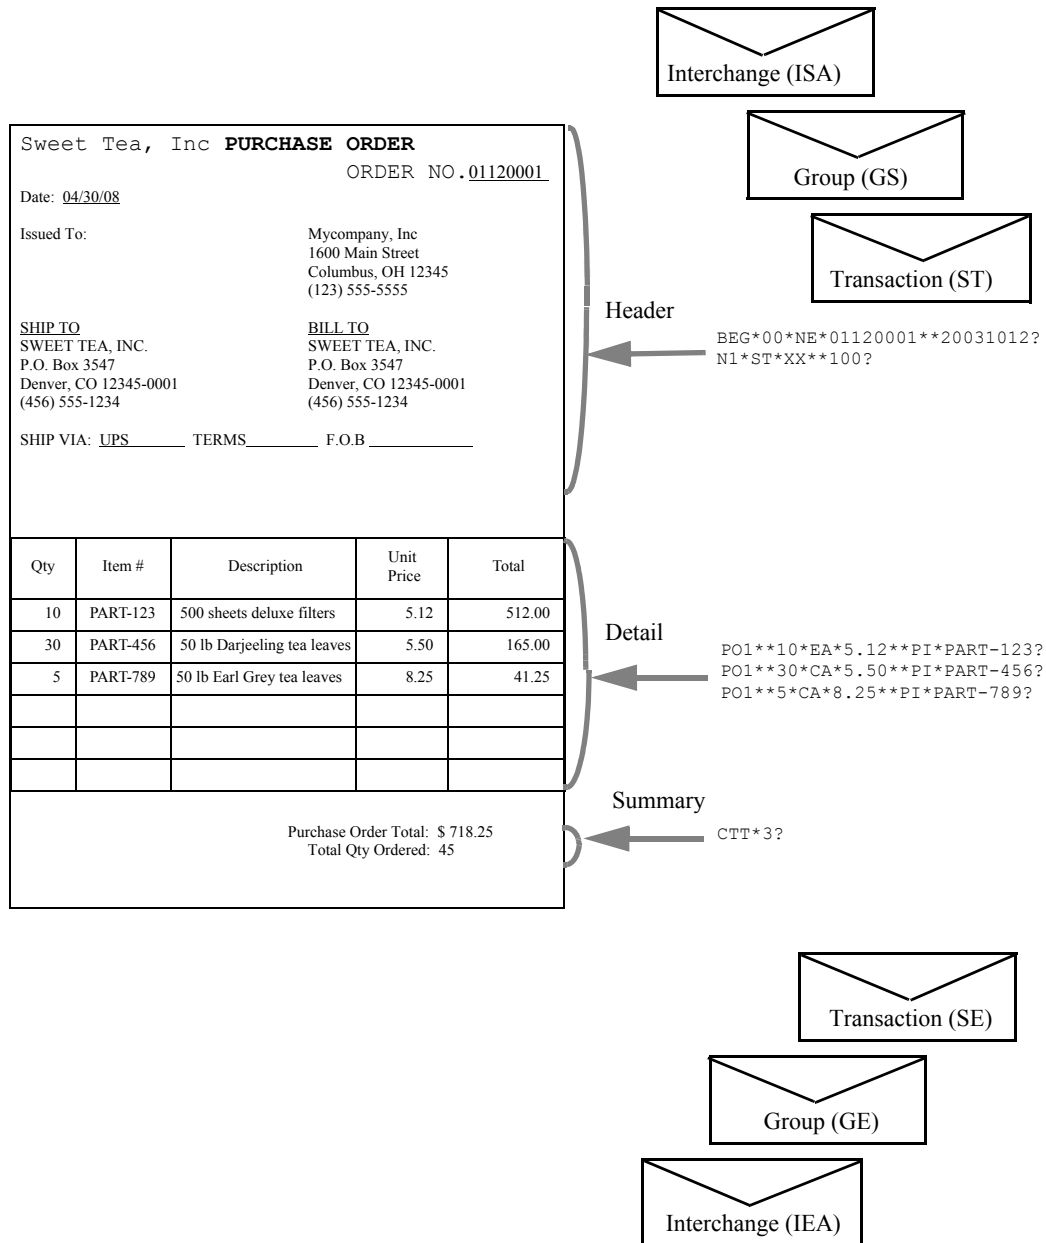

This exercise is not intended to show you all the Gentran:Server features, but to show you how it is possible to set up the system and get it running quickly. That is why you will sometimes be asked to fill in only required fields on panels.

Assumptions

In this scenario, assume the following information is going to be sent by your trading partner (Sweet Tea) in the electronic purchase orders:

- Purchase Order date
- Purchase Order number
- Ship To name
- Quantity
- Unit of measure
- Unit price
- Product UPC number
- Vendor product ID
- Total purchase order amount
- Item count

The following is a sample of the paper purchase order received from your partner along with the EDI equivalent for each component. (You will be using ANSI X12 standard 004010 to translate the data.) In this exercise, you will be generating the application data during translation.

Signing on to the Gentran System

1. Sign on to the iSeries using your iSeries user ID. If you do not have a user ID, see your System Administrator before continuing.
2. To access Gentran, enter **GO GENMAIN** on the command line and press **Enter**.
3. A user profile should have been created for you in the Environment Control subsystem in Gentran. To verify that you have access, select option **1** (Work with Partners) on the GENMAIN menu.
4. If you do not have access, see your System Administrator to get a profile created in Environment Control. If you were able to access Work with Partners, press **F12** (Cancel) to return to GENMAIN.

 **NOTE**

Your library list should have the following libraries: QTEMP, QGPL, G3X5SAMP (tutorial library), G3X5DTA (data library), and G3X5PGM (program library). If you were unable to access the GENMAIN menu, see your System Administrator to help you set up your library list.

Where to go next: Go to Chapter 2, “Viewing the EDI Data,” and follow the step-by-step instructions.

Viewing the EDI Data

In this Chapter

When setting up a new EDI document, it is helpful to begin with a sample of the EDI data that you will be sending or receiving.

Step 1: View the Inbound EDI Data

The inbound queue is the repository for data received from networks or direct communication partners. After a communications session is completed, any data received for the inbound queue is placed on the queue with a status of:

- RN (Received Normal)

or

- RA (Received Abnormal)

After the data has been processed, the system changes the status to PI (Processed Inbound).

Data processed inbound from the queue remains on the queue until the queue is purged by the System Administrator or by the automatic purge function specified with the “Days to Purge” parameter on the Communication Profile panel. If you experience processing problems, you may change the status from **PI** to **RN**, and reprocess the data contained in the batches.

1. On the GENMAIN menu, type **4** (Communications Menu) on the command line, and press **Enter**.

```
GENMAIN          Gentran:Server for iSeries Release 3.5          System: ISDDEV01
Select one of the following:
  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu (GENMAP)
  4. Communications Menu (GENCOM)
  5. Work with Standards
  6. Work with Environment Control

  8. Audit Menu (GENAUD)
  9. Message Center Menu (GENMSG)
 10. Processing Menu (GENPRC)
 11. System Administration Menu (GENSYS)
 12. Viewpoint Menu (GENVPT)
 13. Gentran File Tracking Menu (GENFILETRK)
 14. Gentran:Server Search Index

Selection or command                               More...

- Press **F12** (Cancel) to return to the Work with Inbound Queue Control panel.

Step 2: Reset the Status

Reset the batch status to RN (Received Normal) to prepare the sample data for processing later in the tutorial. Gentran:Server will then treat the data as if it were just received during a communications session.

1. Enter **2** in the Option field next to the batch with status PI for the CN3BSC profile (batch ID POINB) and press **Enter**.
2. Enter **RN** in the Change Status To field in the pop-up window and press **Enter**.
3. Press **F12** (Cancel) until you return to the GENMAIN menu.

You have now viewed EDI data that would have been received during a communications session.

Where to go next: Go to Chapter 3, “Setting Up a Partner,” and follow the step-by-step instructions.

Setting Up a Partner

**NOTE**

If you have already set up the ‘Sweet Tea’ partner during the outbound ANSI tutorial, skip this chapter and go to Chapter 4, “Setting Up an Inbound Application Definition.”

In this Chapter

In this chapter, you will set up your trading partner, Sweet Tea, by performing the following tasks:

- Create a Partner ID
- Add Partner Groups
- Add Partner Transactions
- Update Name and Address Information
- Add Partner Cross References

What is a Partner?

In EDI, anyone to whom you transfer electronic documents is called your ‘trading partner.’ Trading partners may include your customers or vendors. You can think of the trading partner subsystem as a Rolodex that holds all the information about your trading partner(s).

If you mail a document to your trading partner, you need to know the destination address and where that information is stored. The same type of information is needed by Gentran:Server when the document is sent electronically. Gentran:Server requires that you define a unique ‘profile’ for each partner with whom you exchange EDI documents. Setting up a ‘partner profile’ identifies key characteristics of your EDI environment and your partner’s environment associated with how the mail is sent and where it is sent.

Most of the information you will be setting up for the partner will be used to generate the envelopes illustrated in the sample invoice in Chapter 1, “Inbound Overview.”

Step 1: Create the Partner ID

The trading partner ID and partner qualifier form a unique identifier for the partner profile. You may use any alphanumeric value for the partner ID. Typically, most users choose an easily recognizable reference, such as a company name.

1. Select option **1** (Work with Partners) on the GENMAIN menu and press **Enter** to access the Work with Partners subsystem.

```

GENMAIN                               Gentran:Server for iSeries Release 3.5
                                         System:  ISDDEV01
Select one of the following:

  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu (GENMAP)
  4. Communications Menu (GENCOM)
  5. Work with Standards
  6. Work with Environment Control

  8. Audit Menu (GENAUD)
  9. Message Center Menu (GENMSG)
 10. Processing Menu (GENPRC)
 11. System Administration Menu (GENSYS)
 12. Viewpoint Menu (GENVPT)
 13. Gentran File Tracking Menu (GENFILETRK)
 14. Gentran:Server Search Index

Step 2: Add Partner Groups

When the partner was created in the previous task, a default partner group record !!!DFT was also created. You can customize the group default values to replace the generic values. During this task, you will create three groups for this partner: IN (outbound invoices), PO (inbound purchase orders), and FA (functional acknowledgments). This is primarily required to generate the outbound group envelope that is required by the standards.

First, create the functional group ID 'IN.'

1. Enter **11** in the Option field beside the partner you created in the last step (Sweet Tea) on the Work with Partners panel and press **Enter**.

Step 3: Add Partner Transactions

When the new partner was initially created, a default partner transaction record ‘!!!DFT’ was also created. You can customize the transaction default values to replace the generic values provided. During this task, you will create three transactions for this partner: 810 (invoices), 850 (purchase orders), and 997 (acknowledgments).

First, create transaction ID 810 (invoices).

1. On the Work with Partner Groups panel, enter **11** in the Option field on the key entry line and press **Enter**.

```

EDIX030          Work with Partner Groups          EDI 04/30/08

Step 5: Add Partner Cross References

Cross-reference entries are used to help Gentran:Server find the partner ID in the partner file. These identifiers may be different from the application partner ID and EDI data. In this exercise, you will be adding several cross reference values for your partner (Sweet Tea).

1. On the Work with Partners panel, enter **17** in the Option field beside SWEET TEA and press **Enter**.

```

EDIX005          Work with Partners          EDI 04/30/08

 **NOTE** Typically, the same EDI identifiers are used for inbound and outbound EDI data. This exercise illustrates that you can set up more cross references if your business requires it.

5. Press **Enter** to add the new cross references.
6. Press **F12** (Cancel) until you return to the GENMAIN menu.

You have now completed the partner setup – congratulations!

Where to go next: Go to Chapter 4, “Setting Up an Inbound Application Definition,” and follow the step-by-step instructions.

Setting Up an Inbound Application Definition

In this Chapter

In this chapter, you will accomplish the following:

- Access the Application Definition Subsystem
- Define the Application ID
- Customize Application Records/Files
- Customize Detail Application Fields

What is an Application Definition?

The application definition contains all the information about files, records, and fields used for a specific application document, such as an invoice or purchase order. It defines the application interface file format used for translation. The file definitions that exist on the iSeries are pulled into Gentran:Server, stored under a single identifier (application ID), and called the application definition.

The application definition is then used to create a link between the application files and the transaction definition (which is the EDI format). This link is established by identifying how the application data fields are related to the EDI elements. The term “element” is similar to the term “field.”

The goal of this chapter is to build an application definition for your company’s inbound purchase order data. The logical file and associated physical files have been provided for you.

Step 1: Access the Application Definition Subsystem

To access the Application Definition subsystem, select 2 (Work with Application Definition) on the GENMAIN menu and press **Enter**.

The system displays the Work with Application Definition panel.

```

GENMAIN                               Gentran:Server for iSeries Release 3.5
                                         System:  ISDDEV01
Select one of the following:

  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu                               (GENMAP)
  4. Communications Menu                       (GENCOM)
  5. Work with Standards
  6. Work with Environment Control

  8. Audit Menu                               (GENAUD)
  9. Message Center Menu                     (GENMSG)
 10. Processing Menu                         (GENPRC)
 11. System Administration Menu             (GENSYS)
 12. Viewpoint Menu                         (GENVPT)
 13. Gentran File Tracking Menu            (GENFILETRK)
 14. Gentran:Server Search Index

                                         More...

Selection or command
====> 2

F3=Exit  F4=Prompt  F9=Retrieve  F12=Cancel  F13=User Support

```

Step 2: Define the Application ID

The Work with Application Definition panel provides you with the option to create a new application definition. Typically, most users choose a name that identifies the type of document that is being received. To define an application ID for the sample purchase order, complete the following steps.

1. Enter **1** (Create) in the Option field.
2. Enter **POINB** (if POINB already exists, add your initials to the end to make it unique) in the Appl(ication) ID field.
3. Enter **R** in the S/R (Send/Receive) field and press **Enter**.

```

Parameters or command
====>

F1=Help  F3=Exit  F12=Cancel  F15=Sort  F23=More Options  F24=More Keys

```

On the Application Definition panel, specify the characteristics of the application definition.

4. Enter **Tutorial X12 PO Inbound** in the Description field.

5. Enter **PO** on the first line of the Functional Groups field (as defined by the standards for a purchase order).

6. Enter **L** in the File Type field (indicates that the application file is an externally defined multi-format logical file).
Optionally, you can press **F4** (Prompt) for a list of file types.

| | | |
|---|--------------------------------|--------------|
| EDIX552 | Application Definition | EDI 04/30/08 |

The sample application stores the purchase order date in YYYYMMDD format, and the EDI date could be either YYYYMMDD or YYMMDD format. Also, a default value for Customer Number is required. To accomplish these tasks, make the changes listed below.

1. Enter **SENDER-ID** in the Field Value field for sequence 5 (Customer Number).
2. Enter **CY** in the Ty(pe) field for sequence 10 (PO Date) to automatically convert the purchase order date to YYYYMMDD format.
3. Press **F17** (Next Rcd) to update POHEADER and advance to the PODETAIL record.

```

Where to go next: Go to Chapter 5, “Creating an Inbound Transaction Map,” and follow the step-by-step instructions.

Creating an Inbound Transaction Map

In this Chapter

In this chapter, you will perform the following tasks to create a transaction map for a purchase order.

- Access the Transaction Mapping Subsystem
- Create and Define a New Transaction ID
- Copy Segments from Standards
- Map the Segments
- Create Subfield Mapping and Conditions for Some Segments
- View the Code Translation Table

What is a Transaction Map?

Transaction Mapping is the process of creating a map. A map contains all the information about the EDI segments and elements that are used for a specific document, such as the invoice or purchase order. It defines the transaction format that is used for translation. The segments and elements are pulled into your map and stored under a single identifier called the transaction ID or map name.

The map is then used to create a link with the application definition. The link is established by identifying how the transaction elements are related to the application fields.

Step 1: Access the Transaction Mapping Subsystem

1. To access the Transaction Mapping subsystem, select option **3** (Mapping Menu) on the GENMAIN menu, as shown at right, and press **Enter**.

```
GENMAIN                Gentran:Server for iSeries Release 3.5                System:  ISDDEV01
Select one of the following:
1. Work with Partners
2. Work with Application Definition
3. Mapping Menu (GENMAP)
4. Communications Menu (GENCOM)
5. Work with Standards
6. Work with Environment Control

8. Audit Menu (GENAUD)
9. Message Center Menu (GENMSG)
10. Processing Menu (GENPRC)
11. System Administration Menu (GENSYS)
12. Viewpoint Menu (GENVPT)
13. Gentran File Tracking Menu (GENFILETRK)
14. Gentran Search Index
More...

Selection or command
====> 3

F3=Exit  F4=Prompt  F9=Retrieve  F12=Cancel  F13=User Support
```

2. From the GENMAP menu, enter **2** (Work with Transaction Mapping) on the command line and press **Enter**.

```
GENMAP                Gentran:Server Mapping 3.5                System:  ISDDEV01
Select one of the following:
1. Work with Application Definition
2. Work with Transaction Mapping
3. Work with Extended Mapping
4. Work with Tables
5. Work with Sub-Splits

10. Print Application Definition (PRTAPP)
11. Print Mapping Files (PRTMAP)
12. Print Translation Tables (PRTTRNTBL)
13. Application Synchronization (APPSYNCH)
14. Mapping Synchronization (MAPSYNCH)
15. Map Version Compare and Conversion (VERCNVT)

```

Step 2: Create a Transaction ID

The Work with Transaction Mapping panel provides an option for creating a new transaction ID. Typically, most users choose a name that identifies the transaction, version, and optionally, a partner-specific identifier.

To create a map for this example, complete the following instructions:

1. Enter **1** (Create) in the Option field on the key entry line.
2. Enter **850INB** (if 850INB already exists, add your initials to the end to make it unique) in the Tran(saction) ID field.
3. Enter **R** in the S/R (Send/Receive) field and press **Enter**.

```

Step 3: Define a New Transaction ID

The Transaction Map Definition panel is used to specify the characteristics of your Transaction ID.

1. Enter **Tutorial PO Inbound 004010** in the Description field.
2. Enter **004010** in the Standards Version field.
3. Enter **850** in the Transaction Set field.
4. Leave the **0** in the Transaction Set Release field as is. (This is for TRADACOMS standards only.)

| Transaction Map Definition | | EDI 04/30/08 |
|--|----------------------------|--------------|
| EDIX503 | | 12:00:00 |
| FMT01 | | |
| Transaction ID | 850INB | |
| Send or Receive | R | |
| Division | 000 | |
| Description | Tutorial PO Inbound 004010 | |
| Standards Version | 004010 | |
| Transaction Set | 850 | |
| Transaction Set Release | 0 | |
| Transaction Status | T | |
| Use Code | G | |
| Envelope Type | X | |
| Application ID | POINB | |
| Application Selection Field Values | _____ | _____ |
| | _____ | _____ |
| Update Allowed | Y | |
| F1=Help F4=Prompt F10=Update F12=Cancel F13=Services F24=More Keys | | |

5. Enter **T** in the Transaction Status field for ‘Test.’
6. Enter **G** in the Use Code field for ‘General.’
7. Enter **X** in the Envelope Type field for ‘X12.’
8. On the Application ID field, press **F4** (Prompt).
9. In the pop-up window displayed, enter **1** in the field next to POINB (or the actual application ID that you created in the last chapter) and press **Enter**.
10. Make sure the Update Allowed flag is set to **Y**, and press **F10** (Update) to update the panel and return to the Work with Transaction Mapping panel.

Step 4: Access the Copy Segments from Standards Panel

The next step is to copy the segments from the standards into your map.

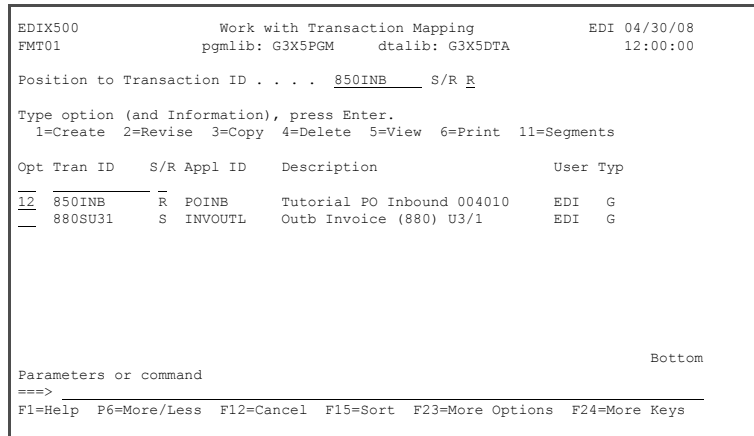

1. Enter **12** (Copy Segments) in the Option field next to your map (850INB) and press **Enter**.

Quite often, the segments that need to be included in your map are requested by your trading partner. The table below lists the segments that are required for this sample purchase order map.

As you select the segments from the panels, verify that the Area and Seq# for each segment matches the one given in the table below, because many segments occur more than once in a transaction. For example, you will see two sets of N1 through N4 segments as you go through the panels: one in the H (Header) area, and one in the D (Detail) area.

Important

Be sure to choose the N1, N3, and N4 that are in the Header area to avoid mapping problems later on.

| Segment | Area | Seq # | Comments |
|---------|------|-------|---|
| BEG | H | 1 | Mandatory – will already have 3 in the Option field. |
| N1 | H | 41 | Enter 3 in the Option field. |
| N3 | H | 43 | Enter 3 in the Option field. |
| N4 | H | 44 | Enter 3 in the Option field. |
| PO1 | D | 76 | Mandatory – will already have 3 in the Option field. |
| PID | D | 86 | Enter 3 in the Option field. |
| CTT | S | 193 | Enter 3 in the Option field. |

2. Enter **3** (Copy) in the Option field next to each segment listed in the preceding table. The first panel is illustrated in the figure at right.

3. Press **Page Up/Page Down** to select additional segments to be copied. All mandatory segments will already have a **3** in the Option field.

4. When you have finished selecting the segments, press **Enter** to copy them into your map.

5. Press **F12** (Cancel) to return to the Work with Transaction Mapping panel.

| Opt | Seq No | Area | Seg Id | Man Cd | Max Use | Loop Id | Max Loop | Description |
|-----|--------|------|--------|--------|---------|---------|----------|-------------------------------------|

Step 6: Map the BEG Segment

Application fields can be entered in the Mapping Target field or selected from a list of available fields. The panel below shows how to use option '1' (Appl Fields) to select an application field from a pop-up window.

1. Enter **1** in the Option field next to element 2 (Purchase Order Type Code), and press **Enter**. A window that contains values to select from is displayed.

```

- Press **F10** (Update) to update this element and to return to the Work with Extended Mapping panel.

- Press **F12** (Cancel) to return to the Element Mapping Inbound panel.

- Press **F17** (Next Rcd) to update the panel and to advance to the next segment (N1).

Step 8: Map the N1 Segment

First, you will add a condition to the map for this segment. The condition will cause the map to use only those instances of the N1 (Name) that are labeled as Ship To information. In the EDI data, these are marked with the code 'ST.'

1. In the Cond field at the top, enter **N1/10/4100**.
2. Use the **Tab** key to move the cursor to the Op field.
3. Enter **EQ** in the Op field.
4. The cursor automatically advances to the Field/Constant field. Enter **'ST'** (Shipto), enclosed in single quotes.

```

F1=Help F4=Prompt F10=Update F12=Cancel F19=Apply Global F24=More Keys

You now have a condition that reads: If element 10 (Entity Identifier Code) is equal to 'ST,' use the data; otherwise, ignore it.

5. Press **F19** (Apply Global).
6. Leave the default map number **0** and press **Enter**. This applies the If-condition to all the elements in the segment and flags the Ext Map column with a 'C' for conditions.

Step 9: Map the N3 Segment

Only Ship To address information is needed for this example, so use the same conditional statement here that was used on the N1 segment.

1. In the Cond field, enter **N1/10/4100**.
2. Use the **Tab** key to move the cursor to the Op field.
3. Enter **EQ** in the Op field.
4. The cursor automatically advances to the Field/Constant field. Enter **'ST'** (enclosed in single quotes) in this field.
5. Press **F19** (Apply Global).
6. Leave the default map number **0** and press **Enter**.
7. Enter **F010.SHIPTOADD1** in the Mapping Target field for element 1 or use option **1** to select the field from the list.
8. Enter **F010.SHIPTOADD2** in the Mapping Target field for element 2 or use option **1** to select the field from the list.
9. Press **F17** (Next Rcd) to update the panel and to advance to the next segment.

Step 10: Apply Conditions to the N4 Segment

Only Ship To city and state information is needed for this example, so use the same conditional statement here that was used on the N1 segment.

1. In the Cond field, enter **N1/10/4100**.
2. Use the **Tab** key to move the cursor to the Op field.
3. Enter **EQ** in the Op field.
4. The cursor automatically advances to the Field/Constant field. Enter **'ST'** (enclosed in single quotes) in this field.
5. Press **F19** (Apply Global).
6. Leave the default map number **0** and press **Enter**.

Step 11: Map the N4 Segment

1. Enter **F010.SHIPTOCITY** in the Mapping Target field for element 1 or use Option **1** to select the field from the list.
2. Enter **F010.SHIPTOST** in the Mapping Target field for element 2.
3. Enter **F010.SHIPTOZIP** in the Mapping Target field for element 3.
4. Press **F17** (Next Rcd) to update the panel and advance to the next segment.

7. Enter **PO1/60/7600** in the first value field.

8. **Tab** to Op field and enter **EQ**.

9. In the second value field, enter **'CB'** (enclosed in single quotes). This mapping enables you to map to the item number field if the EDI qualifier is either 'PI' or 'CB.' Often, partners use different codes that mean the same thing to your application.

Add Extended Maps for Element Sequence 70 of the PO1 Segment Creating an Inbound Transaction

10. Press **F10** (Update) to update the extended map and return to the Work with Extended Mapping panel.

11. Enter **3** (Copy) in the Option field for element sequence 70, map 0, and press **Enter**. Enter **1** in the Copy To field in the pop-up window and press **Enter** to add extended map #1.

13. On the Extended Inbound Mapping panel, change the second value field on the If line to **'VN'**. Optionally, you can press **F20** (Codes) on the Value field to choose from a list of available codes.

14. Blank out all values on the And/Or line.

15. Blank out the Table ID field.

16. Press **F10** (Update) to add the extended map and return to the Work with Extended Mapping panel.

17. Press **F12** (Cancel) to return to the Element Mapping Inbound panel.

18. Press **F17** (Next Rcd) to advance to the next segment (PID).

 **NOTE**

Even though there is a CTT segment in the Summary section, there is nothing we need to map into our application.

Step 15: View the Code Translation Table

Gentran:Server allows you to create tables that will be used during inbound and outbound processing to translate between your application code values and EDI standard code values. Let us now look at the contents of the SEMCODE table.

1. On the Work with Transaction Mapping panel, enter **13** (Tables) in the Option field on the key entry line and press **Enter**.

```

EDIX500          Work with Transaction Mapping          EDI 04/30/08

Where to go next: Go to Chapter 6, “Inbound Processing,” and follow the step-by-step instructions.

In this Chapter

In this chapter, you will accomplish the following:

- Access the Processing Subsystem
- Perform Inbound Processing
- Access the Message Center
- Display Message Center Details for Job
- Access Spooled Files for Job (Inbound Processing Reports)
- Access the Audit Subsystem
- Search for a Document
- View Unwrapped EDI Data for a Partner
- Access EDI Monitor Reports
- Print EDI Monitor Reports

What is Processing?

Processing, which is also called ‘translation processing,’ is the work Gentran:Server does to convert the format of the data transmitted between you and your trading partners. The best way to explain processing is to divide it into the inbound and outbound components.

Outbound Processing prepares your application output data for transmission to your trading partner. First, the data is translated into the proper EDI standard for your trading partner. The system then performs compliance checking.

Inbound Processing converts the EDI standard documents received from your trading partners into the proper input format for your applications. The system first performs ‘compliance checking,’ which verifies whether the data you received conforms to the EDI standard that your trading partner has agreed to use. The data is then converted into the application format that you specified in the Transaction Mapping subsystem.

Step 1: Access the Processing Subsystem

1. To access the Processing subsystem, select option **10** (Processing menu) on the GENMAIN menu and press **Enter**. Alternatively, you can access the Processing subsystem is to enter **GO GENPRC** on the command line and press **Enter**.

The system displays the Gentran:Server Processing menu (GENPRC).

```
GENMAIN                Gentran:Server for iSeries Release 3.5                System:  ISDDEV01
Select one of the following:
  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu (GENMAP)
  4. Communications Menu (GENCOM)
  5. Work with Standards
  6. Work with Environment Control
  8. Audit Menu (GENAUD)
  9. Message Center Menu (GENMSG)
 10. Processing Menu (GENPRC)
 11. System Administration Menu (GENSYS)
 12. Viewpoint Menu (GENVPT)
 13. Gentran File Tracking Menu (GENFILETRK)
 14. Gentran:Server Search Index

 **NOTE**

If you were unable to access reports, your environment profile might be set up to route reports to an active writer (hence, the reports would have already been printed). The reports can alternatively be accessed from the Work with Message Center panel using option **14** (EDI Monitor).

Step 6: Access the Audit Subsystem

To access the Audit subsystem, select option **8** (Audit menu) on the GENMAIN menu and press **Enter**. Alternatively, you can access the Audit file from the Message Center. This example illustrates the selection from the main menu.

The Audit subsystem enables you to see inbound and outbound documents that have been translated and determine if they have been acknowledged.

The first option, Audit Search Utility, is extremely useful for locating specific documents such as one particular invoice or all documents that have not been acknowledged or all purchase orders for a specific partner on a given date. The data must still reside in the communications queues to be selected for matching criteria.

Options 2 through 4 on the Audit menu allow you to access all documents at a specific level according to the EDI standards (Interchange, Group or Transaction).

Selection or command
====>

F3=Exit  F4=Prompt  F9=Retrieve  F12=Cancel  F13=User Support

```

Step 7: Search for a Document

1. On the Audit menu, select option **1** (Audit Search Utility) and press **Enter**.

The Select Audit Records (SLTAUD) panel is displayed. In this example, you will search for an inbound document containing a specific purchase order number.

2. Enter ***IN** in the direction field (for Inbound).
3. Enter **011200** in the Doc Info field (for the PO number) and press **Enter**.

The Work with Selected Audit Records panel displays the results of the search. From this Work with panel, you can choose from various options to work with the documents that matched your selection criteria.

You can print the results, look at the actual EDI data, branch to the Audit entry and manually acknowledge or see the EDI data in an unwrapped view.

You may also choose to requeue the document with the ability to edit or modify the data so it can be processed again. This is useful if your partner sent bad data that needs to be corrected before being processed.

- Enter **12** (EDI Data) in the option field next to any entry for Sweet Tea and press Enter.

Step 9: Access EDI Monitor Reports

There are several ways to review the reports after processing has completed. Reports can be accessed from the Message Center (access spooled files), directly from the iSeries output queues (WRKSPLF), and from the EDI Monitor within Gentran.

The EDI Monitor stores a copy of the Processing reports if the global parameter is set up to do so. This can be a good way to access a report that is no longer on the iSeries system.

NOTE

The EDI Monitor can also be directly accessed for the job from the Message Center.

To access the EDI Monitor function:

1. Select option **11** (Gentran:Server System Administration) on the GENMAIN menu and press **Enter**.

```

GENMAIN          Gentran:Server for iSeries Release 3.5          System:  ISDDEV01
Select one of the following:

  1. Work with Partners
  2. Work with Application Definition

```

You have now completed the inbound portion of the ANSI tutorial. Press **F12** (Cancel) until you return to the GENMAIN menu.

Where to go next: You can go on to Chapter 7, “Outbound Overview,” to continue with the outbound portion of the tutorial (if you have not already done so), or you can sign off the system (Option 90 on the GENMAIN menu)

Outbound Overview

In this outbound exercise, you will set up your Gentran:Server system to send invoices to Sweet Tea. In this exercise, you will accomplish the following:

- Set up a trading partner.
- Create an application definition that tells Gentran:Server how to interface with your application.
- Create a transaction map that will give Gentran:Server the necessary pointers for the data translation between your application and EDI data.
- Perform outbound data processing and view the resulting reports generated.

This exercise is not intended to show you all of the Gentran:Server features, but to show you how it is possible to set the system up and get it running quickly. That is why you will sometimes be asked to only fill in required fields on panels.

Assumptions

In this case scenario, assume the following information is being requested by your partner (Sweet Tea) for inclusion on the electronic invoices:

- Invoice Date
- Invoice Number
- Purchase Order date
- Purchase Order number
- Remit To name and address
- Ship To name
- Quantity Invoiced
- Unit of Measure
- Unit price
- Product UPC number
- Vendor product ID
- Total invoice amount
- Item count

Signing On to the Gentran System

If you are already signed on to the system and accessing the tutorial library, continue with Chapter 8.

1. Sign on to the iSeries using your iSeries user ID. If you do not have a user ID, see your System Administrator before continuing.
2. To access Gentran, enter **GO GENMAIN** on the command line and press **Enter**.
3. A user profile should have been created for you in the Environment Control subsystem in Gentran. To verify that you have access, select option **1** (Work with Partners) on the GENMAIN menu.
4. If you do not have access, see your System Administrator to get a profile created in Environment Control. If you were able to access Work with Partners, press **F12** (Cancel) to return to GENMAIN.

NOTE

Your library list should have the following libraries: QTEMP, QGPL, G3X5SAMP (tutorial library), G3X5DTA (data library), G3X5PGM (program library). If you were unable to access the GENMAIN menu, see your System Administrator to help you set up your library list.

Where to go next: Go to Chapter 8, “Setting up a Partner,” and follow the step-by-step instructions.

Setting Up a Partner

**NOTE**

If you have already set up the 'Sweet Tea' partner during the inbound ANSI X12 tutorial, skip this chapter and go to Chapter 9, "Setting Up an Outbound Application Definition."

In this Chapter

In this chapter, you will perform the following tasks to set up your trading partner, Sweet Tea:

- Creating a Partner ID
- Adding Partner Groups
- Adding Partner Transactions
- Updating Name and Address Information
- Adding Partner Cross References

What is a Partner?

In EDI, anyone to whom you transfer documents is called your 'trading partner.' Trading partners may include your customers or vendors. You can think of the trading partner subsystem as a Rolodex that holds all the information about your trading partner(s).

If you mail a document to your trading partner, you need to know the destination address and where that information is stored. The same type of information is needed by Gentran:Server when the document is sent electronically. Gentran:Server requires that you define a unique 'profile' for each partner with whom you exchange EDI documents. Setting up a 'partner profile' identifies key characteristics of your EDI environment and your partner's environment associated with how the mail is sent and where it is sent.

Most of the information you will be setting up for the partner will be used to generate the envelopes illustrated in the sample invoice in Chapter 7, "Outbound Overview."

Step 1: Create the Partner ID

The trading partner ID and partner qualifier form a unique identifier for the partner profile. You may use any alphanumeric value for the partner ID. Typically, users choose an easily recognizable reference, such as a company name.

1. Select option **1** (Work with Partners) on the GENMAIN menu and press **Enter** to access the Work with Partners subsystem.

```

GENMAIN                               Gentran:Server for iSeries Release 3.5
                                         System:  ISDDEV01
Select one of the following:

  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu (GENMAP)

Step 2: Add Partner Groups

When the partner was created in the previous task, a default partner group record !!!DFT was also created. You can customize the group default values to replace the generic values. During this task, you will create three groups for this partner: IN (outbound invoices), PO (inbound purchase orders), and FA (functional acknowledgments). This is primarily required to generate the outbound group envelope that is required by the standards.

First, create the functional group ID 'IN.'

1. Enter **11** in the Option field beside the partner you created in the last step (Sweet Tea) on the Work with Partners panel and press **Enter**.

Step 3: Add Partner Transactions

When the new partner was initially created, a default partner transaction record '!!!DFT' was also created. You can customize the transaction default values to replace the generic values provided. During this task, you will create three transactions for this partner: 810 (invoices), 850 (purchase orders), and 997 (acknowledgments).

First, create transaction ID 810 (invoices).

1. On the Work with Partner Groups panel, enter **11** in the Option field on the key entry line and press **Enter**.

```

Where to go next: Go to Chapter 9, “Setting up an Outbound Application Definition,” and follow the step-by-step instructions.

Setting Up an Outbound Application Definition

In this Chapter

In this chapter, you will accomplish the following:

- Access the Application Definition Subsystem
- Define the Application ID
- Revise the Application Files
- Revise Application Fields
- Update the Application Partner Reference

What is an Application Definition?

The application definition contains all the information about the files, records, and fields used for a specific application document, such as an Invoice or Purchase Order. It defines the application interface file format used for translation. The file definitions that exist on the iSeries are pulled into Gentran:Server, stored under a single identifier (Application ID), and called the application definition.

The application definition is then used to create a link between the application files and the transaction definition (which is the EDI format). This link is established by identifying how the application data fields are related to the EDI elements. The term “element” is similar to the term “field.”

The goal of this chapter is to build an application definition for your company’s outbound invoice data. The logical file and associated physical files have been provided for you.

Step 1: Access the Application Definition Subsystem

To access the Application Definition subsystem, select **2** (Work with Application Definition) on the GENMAIN menu, and press **Enter**.

The Work with Application Definition panel is displayed.

```
GENMAIN          Gentran:Server for iSeries Release 3.5          System:  ISDDEV01
Select one of the following:

  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu              (GENMAP)
  4. Communications Menu      (GENCOM)
  5. Work with Standards
  6. Work with Environment Control

  8. Audit Menu              (GENAUD)
  9. Message Center Menu     (GENMSG)
 10. Processing Menu         (GENPRC)
 11. System Administration Menu (GENSYS)
 12. Viewpoint Menu         (GENVPT)
 13. Gentran File Tracking Menu (GENFILETRK)
 14. Gentran:Server Search Index

More...

Selection or command
====> 2

F3=Exit  F4=Prompt  F9=Retrieve  F12=Cancel  F13=User Support
```

Step 2: Define the Application ID

For the application ID, most users choose a name that identifies the type of document being sent.

To define an Application ID for the sample invoice:

1. Enter **1** (Create) in the Option field on the key entry line.
2. Enter **INVOUT** (if INVOUT already exists, add your initials to the end to make it unique) in the App ID field.
3. Enter **S** in the S/R field and press **Enter** to go to the Application Definition panel.

```

```

Enter the following information for the application definition:

4. On the Application Definition panel, enter **Tutorial X12 Invoice Outbound** in the Description field.
5. Enter **IN** on the first line of the Functional Groups field (as defined by the standards as the ID for an invoice).
6. Enter **L** in the File Type field (indicates that the application file is an externally defined multi-format logical file). Optionally, press **F4** (Prompt) for a list of file types.

```

EDIX552          Application Definition          EDI 04/30/08

```

7. Enter **WLEINV** in the Application File field (this logical file has been provided for you).
8. Press **F10** (Update) to create the application definition and to return to the Work with Application Definition panel.

Gentran:Server automatically retrieves the files and fields from the multi-format logical file. The message **DDS was retrieved for the Application Files and Fields** is displayed at the bottom of the panel.

Step 3: Revise the Application Files

The first step in revising the files for your application definition is to access the Application Records/Files panel.

1. On the Work with Application Definition panel, enter **11** (Rec/Files) in the Option field next to the application ID you just created (INVOUT) and press **Enter**.

```

You have now finished customizing the invoice application definition – congratulations!

Where to go next: Go to Chapter 10, “Creating an Outbound Transaction Map,” and follow the step-by-step instructions.

Creating an Outbound Transaction Map

In this Chapter

In this chapter, you will create a transaction map for an outbound invoice by performing the following tasks.

- Access the Transaction Mapping Subsystem
- Create and Define a New Transaction ID
- Copy Segments from Standards
- Map the Segments
- Create Subfield Mapping and Conditions for Some Segments
- View the Code Translation Table
- Update the Partner with the New Map

What is a Transaction Map?

Transaction mapping is the process of creating a map. A map contains all the information about the EDI segments and elements that are used for a specific document, such as the invoice or purchase order. It defines the transaction format that is used for translation. The segments and elements are pulled into your map and stored under a single identifier called the transaction ID or map name.

The map is then used to create a link with the application definition. The link is established by identifying how the transaction elements are related to the application fields.

Step 1: Access the Mapping Menu (GENMAP)

To access the Mapping Menu (GENMAP), select option 3 (Mapping Menu) on the GENMAIN menu and press **Enter**.

```

GENMAIN          Gentran:Server for iSeries Release 3.5          System:  ISDDEV01
Select one of the following:

  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu (GENMAP)
  4. Communications Menu (GENCOM)
  5. Work with Standards
  6. Work with Environment Control

  8. Audit Menu (GENAUD)
  9. Message Center Menu (GENMSG)
 10. Processing Menu (GENPRC)
 11. System Administration Menu (GENSYS)
 12. Viewpoint Menu (GENVPT)
 13. Gentran File Tracking Menu (GENFILETRK)
 14. Gentran:Server Search Index

Step 3: Create a Transaction ID

The Work with Transaction Mapping panel provides you with the option for creating a new transaction ID. Typically, most users choose a name that identifies the transaction, version, and optionally, a partner-specific code.

To create a map for this example, complete the following instructions:

1. Enter **1** (Create) in the Option field.
2. Enter **810OUT** in the Tran(saction) ID field. If 810OUT already exists, add your initials to the end.
3. Enter **S** in the S/R (Send/Receive) field, and press **Enter**.

```

Step 4: Define a New Transaction ID

The Transaction Map Definition panel is used to specify the characteristics of your transaction ID.

1. Enter **Tutorial Invoice Outbound 4010** in the Description field.
2. Enter **004010** in the Standards Version field.
3. Enter **810** in the Transaction Set field.
4. Enter **T** in the Transaction Status field for 'Test.'
5. Enter **P** in the Use Code field for 'Partner-specific.'
6. Enter **X** in the Envelope Type field for 'X12.'
7. Press **F4** (Prompt) on the Application ID field.
8. A pop-up window is displayed with a list of application IDs from which to choose. Enter **1** next to the application ID you created earlier (INVOUT) and press **Enter**.
9. Make sure the Update Allowed flag is set to **Y** and press **F10** (Update) to add the map.

```

EDIX503          Transaction Map Definition          EDI 04/30/08

```

Step 5: Copy Segments from the Standards

The next step is to copy the segments from the standards into your map.

1. Enter '12' (Copy Segments) in the Option field next to 810OUT, and press **Enter**.

Quite often, the segments that need to be included in your map are requested by your trading partner. The following table lists the segments that are required for this sample invoice map.

As you select the segments from the panels, verify that the Area and Seq# for each matches the one given in the table below, because many segments occur more than once in a transaction. For example, you will see two sets of N1 through N4 segments as you go through the panels: one in the H (Header) area, and one in the D (Detail) area.

```

Important:

Be sure to choose the N1, N3, and N4 in the Header area to avoid mapping problems later on.

| Segment | Area | Seq# | Comments |
|---------|------|------|---|
| BIG | H | 1 | Mandatory – will already have 3 in the Option field |
| NTE | H | 2 | Enter 3 in the Option field |
| REF | H | 4 | Enter 3 in the Option field. |
| N1 | H | 7 | Enter 3 in the Option field |
| N3 | H | 9 | Enter 3 in the Option field |
| N4 | H | 10 | Enter 3 in the Option field |
| DTM | H | 15 | Enter 3 in the Option field |
| IT1 | D | 34 | Enter 3 in the Option field |
| PID | D | 43 | Enter 3 in the Option field |
| TDS | S | 80 | Mandatory – will already have 3 in the Option field |
| CTT | S | 88 | Enter 3 in the Option field |

2. Enter **3** (Copy) in the Option field next to each segment listed in the table on the preceding page. The first panel is illustrated in the figure at right.

3. Press **Page Up/Page Down** to select additional segments to be copied. All mandatory segments will have a **3** already in the Option field.

4. When you have finished selecting the segments, press **Enter** to copy them into your map.

5. Press **F12** (Cancel) to return to the Work with Transaction Mapping panel.

```

Step 6: Modify Segment Information

The next several steps show how to change and copy segment information to properly align the segments. If you skip these steps, the segments might not be written (or not written as many times as you had expected) during translation. To align the segments in this sample invoice map, complete the following instructions:

1. On the Work with Transaction Mapping panel, enter **11** (Segments) in the Option field next to your map (810OUT) and press **Enter**.

```

```

 **NOTE**

You may change the descriptions to denote specific information, such as the Bill To and Ship To Name for the N1, as illustrated in the above figure, but it is not necessary for this exercise.

Step 7: Copy Segments for Manual Loops

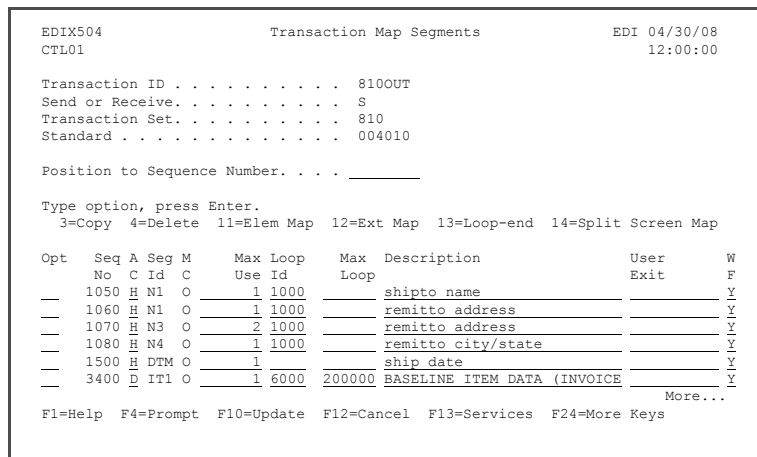

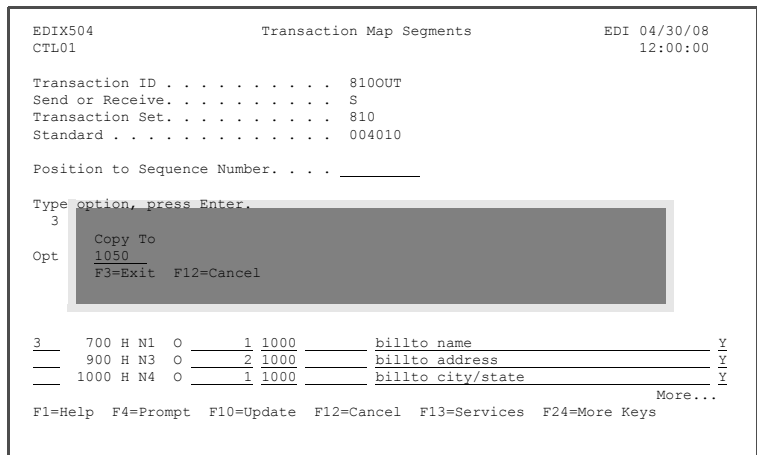

The next step in aligning the segments is to create manual loops by copying existing segments. In this example, the segments in the N1 loop from the Bill To loop need to be copied to create another occurrence for the Ship To name loop. The N1 loop for the Bill To information is at segment sequence 700 through 1000. The next segment sequence occurs at 1500. This allows another N1 segment to be copied somewhere between sequence 1000 and 1500. For this exercise, copy the segment to sequence 1050.

To create a manual loop for the sample invoice, complete the following instructions:

1. Select the segment to be copied (in this example it is the N1 segment at sequence 700) using option **3** and press **Enter**. This action displays a pop-up window.
2. Enter **1050** on the Copy To line in the window and press **Enter**. This action redisplay the panel showing the copied segment ID **1050**.
3. Change the Description field for sequence 1050 to 'shipto name' and press **Enter**.
4. Repeat the Copy step to copy the following segments and update the descriptions:

- N1 at 700 to 1060
- N3 at 900 to 1070
- N4 at 1000 to 1080

Change the descriptions to indicate Remit To information for the segments at 1060 – 1080.

This tutorial illustrates calculating summary information within the map instead of having a summary application file. To do this, we will create a dummy segment.

- Use option **3** to copy the TDS segment at 8000 to sequence **4350**.

```

EDIX504          Transaction Map Segments          EDI 04/30/08
CTL01          12:00:00

Transaction ID . . . . . 810OUT
Send or Receive. . . . . S
Transaction Set. . . . . 810

8000 S CTT O 1 TRANSACTION TOTALS Y

More...
F1=Help F4=Prompt F10=Update F12=Cancel F13=Services F24=More Keys
    
```

- On the TDS at 4350, change the area code (AC field) from **S** to **D** and add the Loop ID of **6000**. Change the description to indicate it is a dummy segment and change the WF (write flag) field to an **N**.
- Press **Enter** to update.

```

Step 8: Access the Element Mapping Outbound Panel

Now that the segments are aligned to work with our application definition, you need to define what will be mapped to each element.

For this tutorial, we will use the Split Screen Mapping feature. You could also perform mapping using option **11**.

1. Enter **14** (Split Screen Map) in the Option field next to the BIG segment as shown on the panel.

2. Press **Enter**.

```

EDIX504                               Transaction Map Segments          EDI 04/30/08
CTL01                                  12:00:00

F1=Help  F4=Prompt  F10=Update  F12=Cancel  F13=Services  F24=More Keys
    
```

Step 9: Map the BIG Segment

The split screen shows EDI elements in the bottom half and application fields in the top half. You will be modifying the bottom half only.

Application fields can be entered in the Target field or selected from the list in the top half of the screen. The panel below shows how to initiate mapping for an element.

1. Enter **1** in the Option field next to Element 1 (Invoice Date) and press **Enter**. Control is passed to the top portion of the screen so you can select the field.

```

Next, specify an If-condition to prevent the code GEN from being written if there is no message. To add the If-condition, complete the following instructions:

- Enter **F020.ICMSG** (or press **F19** (Appl) to select the field from a list) on the If-condition line under the Value field to identify the application field to be checked.
- Enter **GT** (Greater Than) in the Op (Operator) field or press **F4** (Prompt) for a list of valid operators that can be used in the Operator field for the If-condition.

```

- Enter **' '** (single quote, space, single quote) in the second value field on the If-condition line. This enables you to check for a BLANK field.
- Press **F10** (Update) to update the panel. This action returns you to the previous panel and displays the message **Revise Operation Successful** at the bottom of the panel.
- Press **F12** (Cancel) to return to the Split Screen Mapping panel. Notice the Y that appears in the X field for Element 1. This indicates that an Extended Mapping panel exists for this element.
- Press **F17** (Next Rcd) to advance to the next segment (REF).

Step 11: Map the REF segment

1. Enter **\DP'** (enclosed in single quotes to indicate a literal value) in the Target field for Element 1 to indicate a department number.
2. Enter **F010.IHSDPT** in Element 2 or use option **1** to select the field from the field list in the top half of the screen.
3. Enter **11** (Ext Map) in the Option field next to the 'DP' element and press **Enter**.
4. Enter **2** (Revise) in the Option field next to the first extended map and press **Enter** to display the Extended Outbound Mapping panel.
5. Enter **F010.IHSDPT** on the If-condition line under the value or use **F19** (Appl) to select the field from the list.
6. Enter **GT** (Greater Than) in the Op field.
7. Enter **' '** (single quote, space, single quote) in the second value field on the If-condition line. This checks for a blank field.
8. Press **F10** (Update) to update and return to the Work with Extended Mapping panel.

Step 17: Map the Remit To N3 Segment

In this step, you will map the N3 segment for the Remit To address.

1. Use Option **1** to select the F010.IHR2A1 field for Element 1 or enter the field name in the Target field.
2. Press **F17** (Next Rcd) to update and advance to the next segment (Remit To N4).

```

Step 18: Subfield the N4 Segment for Remit To

The postal code for the Remit To location consists of two fields: a five-character zip code and a four-character extension. These two fields can be concatenated by using subfield mapping, which allows the user to break a single element into multiple “sub-elements.” An application field, constant, or literal value can be moved into each “sub-element.”

1. Enter **12** in the Option field next to Element 3 (Postal Code) and press **Enter**.

Step 21: Map Element Sequence 10 of the IT1 Segment

Segment IT1 is the first segment in the detail loop. It contains the information that needs to be mapped for the line item segment. This segment will be mapped from the extended mapping panel.

First, you will need to set up the map to count the number of line items. This is accomplished by using one of the reserved ‘accumulator’ formulas.

1. Enter **11** in the Option field next to Element 1 and press **Enter**.

Step 25: Map Element 60 of the IT1 Segment

In this step, you will map element 60 of the IT1 segment.

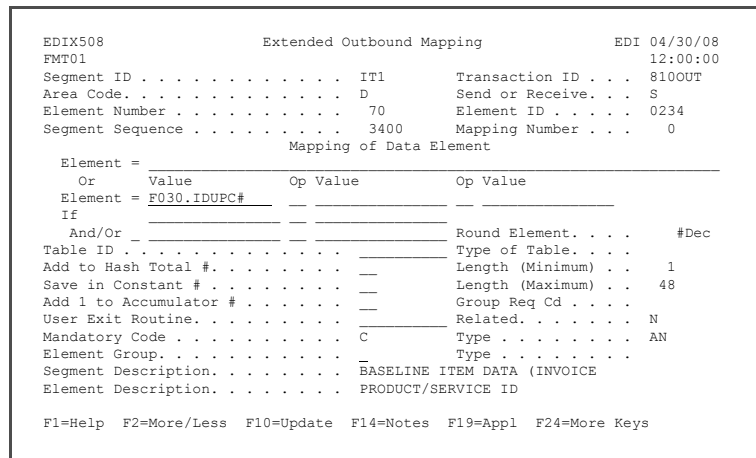

1. On the Element = field, press **F20** (Codes).
2. Enter **1** next to the code **UP** and press **Enter** to select it. Optionally, you can enter **UP** in the Element field.
3. Press **F17** (Next Rcd) to update the record and to advance to element 70 in the IT1 segment.

Step 26: Map Element 70 of the IT1 Segment

In this step, you will map element 70 of the IT1 segment.

1. Enter **F030.IDUFC#** in the Element field or use **F19** to select the field from the list.
2. Press **F17** (Next Rcd) to update the record and to advance to element 80 in the IT1 segment.

Step 27: Map Element 80 of the IT1 Segment

In this step, you will map element 80 of the IT1 segment.

1. Enter **'VP'** (enclosed in single quotes) in the Element field or press **F20** to select the code from the list.
2. Press **F17** (Next Rcd) to update the record and to advance to element 90 in the IT1 segment.

Step 33: View a Code Translation Table

Gentran:Server allows you to create tables that will be used during inbound and outbound processing to translate between your application code values and EDI standard code values. In **Step 22: Map Element 20 of the IT1 Segment**, you used an existing table called UNITMEAS, which contains the codes for units of measurement for your application and their corresponding EDI codes. At this point, you will go look at the contents of UNITMEAS table.

1. On the Work with Transaction Mapping panel, enter **13** (Tables) in the Option field on the key entry line and press **Enter**.

```

6. Press **F12** (Cancel) until you return to the GENMAIN menu.

You have now completed the ANSI outbound transaction map – congratulations!

Where to go next: Go to Chapter 11, “Outbound Processing,” and follow the step-by-step instructions.

11 Outbound Processing

In this Chapter

In this chapter, you will complete the following tasks.

- Access the Processing Subsystem
- Perform Outbound Processing
- Access the Message Center
- Display Message Center Details for Job
- Access Spooled Files for Job (Outbound Processing Reports)
- Access the Audit Subsystem
- Search for a Document
- View Unwrapped EDI Data for a Partner
- Access EDI Monitor Reports
- Print EDI Monitor Reports

What is Processing?

Processing, which is also called ‘translation processing,’ is the work Gentran:Server does to convert the format of the data transmitted between you and your trading partners. The best way to explain processing is to divide it into the inbound and outbound components.

Outbound Processing prepares your application output data for transmission to your trading partner. First, the data is translated into the proper EDI standard for your trading partner. The system then performs compliance checking.

Inbound Processing converts the EDI standard documents received from your trading partners into the proper input format for your applications. The system first performs ‘compliance checking,’ which verifies whether the data you received conforms to the EDI standard that your trading partner has agreed to use. The data is then converted into the application format that you specified in the Transaction Mapping subsystem.

Step 1: Access the Processing Subsystem

1. To access the Processing subsystem, select option **10** (Processing menu) on the GENMAIN menu and press **Enter**. Optionally, enter **GO GENPRC** on the command line and press **Enter**.

The system displays the Gentran:Server Processing menu (GENPRC).

```

GENMAIN                               Gentran:Server for iSeries Release 3.5
                                     System:  ISDDEV01
Select one of the following:

  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu                               (GENMAP)
  4. Communications Menu                       (GENCOM)
  5. Work with Standards
  6. Work with Environment Control

  8. Audit Menu                               (GENAUD)
  9. Message Center Menu                     (GENMSG)
 10. Processing Menu                         (GENPRC)
 11. System Administration Menu             (GENSYS)
 12. Viewpoint Menu                         (GENVPT)
 13. Gentran File Tracking Menu             (GENFILETRK)
 14. Gentran:Server Search Index

Selection or command
====> 10

F3=Exit  F4=Prompt  F9=Retrieve  F12=Cancel  F13=User Support
(C) COPYRIGHT Sterling Commerce Inc., 2008, ALL RIGHTS RESERVED.
    
```

2. To run outbound processing (PRCTRNOU), select **1** (Process Outbound Files) on the GENPRC menu command line and press **Enter**.

```

GENPRC                               Gentran:Server Processing 3.5
                                     System:  ISDDEV01
Select one of the following:

  1. Process Outbound Files                   (PRCTRNOU)
  2. Process Inbound Files                   (PRCTRIN)
  3. Add Data to Queues                      (ADD)
  4. Extract Data from Queues                (EXTRACT)
  5. Inbound Split File Status Inquiry
  6. Standards Selective Download            (DWNSTD)
  7. Standards Selective Delete              (DLTSTD)
  8. Remove Gentran Work Members             (RMVGENMBR)
  9. Purge VAT Report Database               (PRGVAT)
 10. Retrieve VAT Report Database            (RTVVAT)
 11. Print VAT Reports                      (PRTVAT)
 12. TRADACOMS Standards Selective Download (DWNSTDTC)
 13. Replace Characters                      (RPLCHARS)

Selection or command
====> 1

F3=Exit  F4=Prompt  F9=Retrieve  F12=Cancel  F13=User Support
(C) COPYRIGHT Sterling Commerce Inc., 2008, ALL RIGHTS RESERVED.
    
```

Step 2: Perform Outbound Processing

1. Enter the name of the application definition you created earlier (**INVOUT**) in the Application ID field and press **Enter** to submit the processing to batch.
2. Press **F12** (Cancel) to return to the GENMAIN menu.

```

                                     Process Transactions Outbound (PRCTRNOU)
Type choices, press Enter.

Application Data ID . . . . . INVOUT      Character value
+ for more values
Mapper Debug Report? . . . . . *NO      *YES, *NO
Clear Temporary Files ? . . . . *YES      *YES, *NO
Application File Member . . . . *DEFAULT  *DEFAULT, Name
Run Interactively? . . . . . *NO      *YES, *NO

Bottom
F3=Exit  F4=Prompt  F5=Refresh  F10=Additional parameters  F12=Cancel
F13=How to use this display  F24=More keys
    
```

Step 3: Access the Message Center

- To access the Message Center subsystem, select Option **9** (Message Center menu) on the GENMAIN menu. Alternatively, you can directly access it by entering **GO GENMSG** on the Command line.

```

GENMAIN          Gentran:Server for iSeries Release 3.5          System:  ISDDEV01
Select one of the following:
  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu (GENMAP)
  4. Communications Menu (GENCOM)
  5. Work with Standards
  6. Work with Environment Control

  8. Audit Menu (GENAUD)
  9. Message Center Menu (GENMSG)
 10. Processing Menu (GENPRC)
 11. System Administration Menu (GENSYS)
 12. Viewpoint Menu (GENVPT)
 13. Gentran File Tracking Menu (GENFILETRK)
 14. Gentran:Server Search Index

Step 6: Access the Audit Subsystem

- To access the Audit subsystem, select option **8** (Audit menu) on the GENMAIN menu and press **Enter**. (You could have also accessed the Audit file from the Message Center. We chose to illustrate it from the Main Menu.)

The Audit subsystem enables you to see the inbound and outbound documents that have been translated and determine if they have been acknowledged.

The first option, Audit Search Utility, is useful for locating specific documents such as one particular invoice, all documents that have not been acknowledged, or purchase orders for a specific partner on a given date.

Options 2 – 4 on the Audit menu allow you to access all documents at a specific level according to the EDI standards (Interchange, Group or Transaction).

- On the Audit menu, select Option **1** (Audit Search Utility) and press **Enter**.

```

GENMAIN                               Gentran:Server for iSeries Release 3.5           System:  ISDDEV01
Select one of the following:

  1. Work with Partners
  2. Work with Application Definition
  3. Mapping Menu (GENMAP)
  4. Communications Menu (GENCOM)
  5. Work with Standards
  6. Work with Environment Control

  8. Audit Menu (GENAUD)
  9. Message Center Menu (GENMSG)
 10. Processing Menu (GENPRC)
 11. System Administration Menu (GENSYS)
 12. Viewpoint Menu (GENVPT)
 13. Gentran File Tracking Menu (GENFILETRK)

Step 8: View Unwrapped EDI Data for a Partner

You can search for Partner data using the Audit Search Utility or by using one of the other three audit options on the menu. This example illustrates using the Work with Audit Interchange panel to access the partner’s document to show the data in an unwrapped view.

- To access the Work with Audit Interchange Status panel, select Option **2** on the GENAUD menu and press **Enter**.

From the Work with Audit Interchange Status panel, you can view, print, delete, and manually acknowledge documents, as well as “drill down” to the group and transaction level for a specific partner.

```

GENAUD                               Gentran:Server Audit 3.5                               System:  ISDDEV01
Select one of the following:

  1. Audit Search Utility                (SLTAUD)
  2. Work with Audit Interchange Status
  3. Work with Audit Group Status
  4. Work with Audit Transaction Status
  5. Print Audit Report                  (PRTAUD)
  6. Print Network Status Report        (PRTNETSTS)
  7. Print Overdue Acknowledgments      (PRTOVRACK)

 10. Purge Audit File                    (PRGAUD)
 11. Purge Audit using Partner File Options (AUDITPURGE)
 12. Purge Network Status File          (PRGNET)

Step 9: Access EDI Monitor Reports

There are several ways to review the reports after processing has completed. Reports can be accessed from the Message Center (access spooled files), directly from the iSeries output queues (WRKSPLF), and from the EDI Monitor within Gentran.

The EDI Monitor stores a copy of the processing reports if the global parameter is set up to do so. This can be a good way to access a report that is no longer on the iSeries system.

Note: The EDI Monitor can be directly accessed for the job from the Message Center.

To access the EDI Monitor function from the Main Menu:

1. Select option **11** (System Administration menu) on the GENMAIN menu and press **Enter**.

```

GENMAIN                Gentran:Server for iSeries Release 3.5                System:  ISDDEV01
Select one of the following:

  1. Work with Partners
  2. Work with Application Definition

In the EDI Monitor Inquiry panel, the job number and process name shown at the top of the panel are the key fields identifying this report in the EDI Monitor file.

You can page through the report or scroll the report to the right or left to display lines that are longer than 76 characters. A plus symbol (+) indicator appears at the end of a line that contains additional data.

```

4. When you are finished viewing the data, press **F12** (Cancel) to return to the Work with EDI Monitor panel.

Step 10: Print EDI Monitor Reports

All Inbound and Outbound batch processing reports can be printed from the EDI Monitor.

1. To print reports, enter **6** in the Option field next to the selected report(s) and press **Enter**.

2. The system copies the report file to a spool file in the user's default output queue, as defined in the user's Gentran:Server profile. Reports are not deleted from the EDI Monitor file when they are printed so they can be printed again.

You have now completed the outbound portion of the ANSI tutorial. Press **F12** (Cancel) until you return to the GENMAIN menu.

Where to go next: At this point, you can either go on to the Inbound portion of the tutorial (if you have not already done so) or sign off the system (Option 90 on the GENMAIN menu).

Glossary

Acknowledgment

An acknowledgment is a special Transaction set (either 997 or 999) that is transmitted to the original sender to indicate the status of the transmission with respect to standards adherence. It does not imply acceptance of the contents of the associated Transaction sets.

Acknowledgments are also known as Functional Acknowledgments (the 997 Transaction set) and Accept/Reject Advices (the 999 Transaction set).

Gentran:Server differentiates between inbound acknowledgments (those from your Trading Partner), and outbound acknowledgments (those to go to your Trading Partner). Gentran:Server also deals with “expected acknowledgments” that should be satisfied by inbound acknowledgments.

Acknowledgment Reconciliation

The primary purpose for using the Audit file is to verify the documents you sent have been received by your Trading Partner. The Functional Acknowledgment is sent by your Partner to indicate it had been received and if there were any compliance errors. When you receive the Acknowledgment, it must be processed INBOUND (PRCTRININ). The acknowledgments do not have to be mapped, though. The reconciliation is performed by the Inbound Editor by posting a status flag on the original EDI document sent and the date of the acknowledgment.

Application

An in-house program designed to process specific jobs. This program is formatted by the customer for their business needs. (Example, payroll.)

Application Definition

The definition of the application interface file used during the mapping process.

Application File

A file, or set of files, containing application data destined to be sent out through EDI to specific Trading Partners or that has been received through EDI and translated to the application format from specific Trading Partners.

Application File Types

There are three "application file types" that can be used with Gentran: multiple externally described physical files (created using DDS), one externally described multi-format logical file (created using DDS), or one internally described physical file (flat file created using record length instead of DDS).

- An external file to Gentran is a file created using DDS.
- An internal file to Gentran is a "flat file" that contains multiple record types and is typically defined within each program that it is used. It has a field that contains the record format in each record of the file.
- A logical file to be used in Gentran must be a multi-format logical file. Logical files are typically used for outbound documents. By using logical files for outbound documents, you can select specific records based on some indicator field in the file if only certain records are to be processed through EDI. Only one logical file can be defined to an application definition.
- A physical file is a file that has been created external to Gentran using DDS. Multiple physical files can be used within an application definition. An example application definition might have four physical files: a header file, a comments file, a detail file, and a summary file. Another application may only contain a header file and a detail file. For outbound applications, physical files must be keyed or your fields need to be identified to Gentran as the fields that should be used by Gentran for key fields for the logical file that Gentran builds over your physical files during outbound processing. There is no requirement for key fields for Inbound Processing.

Application ID

A user-defined identifier indicating the source or destination of documents, typically used in reporting and routing of inbound documents.

Batch Processing

A type of data processing operation and data communications transmission where related transactions are grouped together and transmitted for processing. Usually by the same computer and under the same application; generally regarded as non-real time data traffic consisting of large files; type of data traffic where network response time is not critical; compare with interactive (processing).

Comm Profile ID

The identifier under which communications information is stored. All protocol information about how communication sessions will be performed with this entity, whether it be a Third Party Network or a Direct-connect, is also stored under this identifier. The inbound and outbound EDI data is stored in Queue files under the Comm Profile ID so that when a communication session is established with this entity, all data under this identifier will be picked up and sent to them, and any data received will be stored under this identifier.

COMMERCE:Network

Sterling Commerce's Value Added Network (VAN).

Compression

An automated process where data is compressed and wrapped by removing trailing blanks and spaces from segments, groups, and/or transactions. Data compression reduces data field information to its minimum (for cost effectiveness). This is controlled by Gentran global parameters.

Control Numbers

These are assigned by the sender for the purpose of identifying documents and transmissions, and to facilitate sequence checking by the receiver. Control numbers are maintained at three levels: the Transmission or Interchange, the Functional Group, and the Transaction Set.

Gentran:Server supports numerous methods of maintaining, formatting and checking sequence numbers to accommodate the variations in your industry.

Data Element

The smallest named item in a segment that can convey data. For example, "Bill To City" is one data element within a segment.

Data Separation

See *Splitting*.

Decompression

An automated process to decompress or "unwrap" data received by re-inserting trailing blanks and spaces. This occurs during the inbound editing process.

Delimiters

Delimiters are special characters used to separate and mark the end of segments and the beginning of data elements. Two characters are required (one is used to separate data elements, the other to separate segments) and, when used as delimiters, the characters may not be used within the data itself. A third delimiter is used in EDIFACT messages to separate subelements. Delimiters are dynamically defined by the Interchange Envelope.

EDI (Electronic Data Interchange)

Electronic Data Interchange (EDI) is the exchange of routine business transaction in a computer-processable format, covering such traditional applications as inquiries, planning, purchasing, acknowledgments, pricing, order status, scheduling, test results, shipping and receiving, invoices, payments and financial reporting.

EDI Coordinator

A person assigned to coordinate EDI functions for an organization. As EDI and EC (Electronic Commerce) continue to grow at a rapid pace, the role of the Coordinator is dynamically changing. Many Coordinators are asked to fill a complex role of being a business analyst, technical wizard, and liaison to the trading partner, while performing daily audits and controls.

The EDI Coordinator is responsible for the setup of partners, maps, daily processing, communications, and acknowledgment reconciliation.

Editor

The Inbound Editor uses pre-determined instructions to verify, check, and possibly reject the EDI standard data you have received from a Trading Partner, and moves the edited data to split files and then to the appropriate inbound application files via Mapping.

The Outbound Editor prepares your data for transmission to your Trading Partners. Outbound processing translates your application data to the chosen EDI standard being used, and checks all data to ensure compliance with the selected public standard.

Element

A unit of information with specific edit and length characteristics. This represents the smallest unit of information in the Standard. Also called a data element.

Element Separator

A syntax character used to separate data elements within a segment. Also referred to as a “delimiter”.

Envelope

The transmission header and trailer enclosing an EDI message. This is automatically generated by Gentran:Server using the information on the Partner file.

There are three levels of envelopes: Interchange, Group, and Transaction.

Environment Profile

The environment profile is a subset of the Gentran:Server user's profile that contains parameters specific to the environment in which the user runs Gentran:Server. These parameters include the data formats, language ID, and division code used for the online file maintenance panels as well as the following batch processing options: job description, job queue, message queue, output queue, print device, and print file.

The program and data libraries are used only when files are requested to be created without a target library. They are defaulted from the libraries defined during installation of Gentran:Server.

EOT

End of Transmission

Field

The smallest item of information in a record.

Function

In Gentran:Server, a function refers to a program or command under a subsystem that can be secured individually in the Environment Control subsystem.

Functional Acknowledgment

A special transaction set transmitted by a receiver as an affirmative response to the sender. This is automatically generated and reconciled by Gentran:Server based upon the Trading Partner configuration.

Global Parameters

The switches that affect the Editing function during Translation. Typically they identify whether a feature should be performed for all Partners in the same manner or whether it should be performed on a partner-by-partner basis by looking at the Partner parameters. One feature in the Global Parameters is whether acknowledgements should be created for all Partners or on a partner-by-partner basis.

Header

The portion of the message that precedes the actual body and trailer of the business transaction.

Key Entry Line

This is the blank line at the top of the subfile in which you enter the key fields necessary to advance to the next panel, as specified by the option code selected.

Loop

A loop is when more than one EDI segment exists that occur together more than one time. In order to evaluate the information, all the segments need to be evaluated together. It is the group of multiple segments that occur repeatedly. A common loop is the N1 loop that contains Name and Address information.

Loop ID

This is the identifier used in Gentran:Server to tie all the segments together to produce a Loop. This loop ID can also exist on the Application records to identify a single record or group of records that is associated with the loop on the EDI side.

Mandatory

A statement that a segment, data element or component data element must be used.

Map

The “map” is the definition of instructions for moving data between the EDI format and the Application format. It is also known as the Transaction Definition. To perform the “task of mapping” means to create the definition of how to move the data between elements and fields.

Mapping

Map processing utilizes user-defined maps to translate business documents from the in-house data format to the selected EDI standard or from EDI standard to internal format. Maps are defined using the online Mapping Integration system. When data is created by the user’s application program and processing is initiated, the system selects the proper map, based on partner definitions, and translates the data into the EDI standard format.

Max Loop

This is the number of times a loop can occur on the EDI side. If the N1 loop contains Name and Address information, the Max Loop value would identify how many different Name and Address loops can occur.

Max Use

The number of times a segment or record can occur. If this value is more than one, the segment or record would be read or written multiple times before the next segment or record.

Partner

The Partner is commonly known as the Trading Partner and is someone with whom you are trading EDI documents.

Partner ID

The Partner ID is the identifier used in the Partner file under which information is stored that is necessary to trade EDI documents via Gentran:Server. This identifier can be an internal identifier for how you know them in your Applications such as a customer or vendor number, or it can be a descriptive identifier such as a company name, or it can be an EDI-specific identifier such as a DUNS number or communications phone number.

Partner Profile

The Partner Profile refers to all of the information that is stored under the Partner ID. This information includes what EDI documents are being traded, what values should be loaded into the envelopes when sending data outbound, error rejection rules, and FYI comments.

Security Profile

The security profile is a subset of the Gentran:Server user's profile that contains authority codes defining the subsystems and functions the user can access as well as the level of access allowed to that user.

If the user has full or partial access to a subsystem, the level of access is determined by the data rights.

Segment

Each record in a transaction set or a string of associated data elements. A segment is like a sentence: composed of data elements that appear in a specific order to convey its meaning. Envelope segments come in pairs, for example, GS/GE group parts, and ST/SE transaction set pairs.

Segment Terminator

The syntax character that is used to identify the end of a segment. One of the most common terminators used in EDI is HEX '15' (new line character).

Separation

See *Splitting*.

Simple Data Element

A data element whose data item representation embodies a single concept; that is, a data element that is not made up of component data elements.

Split File

The Split file is one of the work files used during the Inbound Processing by the Splitter program to separate or sort the EDI data by the Application type in preparation for Mapping. There are 80 Split files available (identified as numbers 01-80).

Splitting

This is the process during Inbound Translation that occurs to separate the edited EDI data by Application types prior to the Mapping process. EDI data that is received may be from many different Partners and may contain several different types of documents. It is much more efficient to sort the data by Application type before mapping the EDI data into the Application formats.

Sub-Split File

This file further separates the data within each of the 80 Split files by using an element in the EDI data to determine where the data should be placed. There are 80 Sub-Split files available per Split file or Slide file.

Subsystem

This is a collection of functions categorized together to perform certain tasks in Gentran. The Partner subsystem is a group of functions that collectively allow you to define the Trading Partner.

Summary Area

The portion of the message that follows the body of the message and contains summary information relating to the entire message.

Suspension

When Gentran:Server cannot determine key information necessary in order to continue processing, the data is placed in the Suspense File. Suspended data is in error and the Editor and/or Mapping Reports can be evaluated to determine the cause of the suspension. Typically, suspension occurs when the Partner ID cannot be found in the Partner file for whom the data is destined or the Transaction ID cannot be found to instruct the Mapper how to move the data between formats.

Trading Partner

A Trading Partner is any organization with whom you do business. Typically, Trading Partners are customers, suppliers, and intra-company divisions.

Transaction ID

Within Gentran:Server, the mapping definition that identifies how data is moved between the EDI format and the Application format is stored under an identifier, known as the Transaction ID.

Transaction Set

The Transaction set is the EDI equivalent of an Application document. Common documents include Purchase Orders and Invoices. The X12 Transaction sets for these are 850 and 810. The UCS Transaction sets for these same documents are 875 and 880. The Transaction set is the EDI format of Segments and Elements that compose the related information for the document. These Transaction set numbers vary between Standards.

Translation

Translation is the process of moving the data between EDI and Application formats using the mapping definition. Translation occurs in Gentran:Server by the Inbound and Outbound Mappers during PRCTRIN and PRCTRNOU.

User ID

The User ID refers to an individual defined in the Environment Control subsystem as someone who can access Gentran:Server. The Gentran:Server User ID is set up using the iSeries User ID.

User Document Reference

The User Document Reference is a user-defined field that provides a way of referring to EDI documents by your existing methods – for example, documents can be referred to by your Purchase Order Number rather than referring to an EDI control number. The User Document Reference is supported for both inbound and outbound documents.

User Exit

The point during Translation mapping that an API (Application Program Interface) can be invoked to perform some special processing. The Gentran:Server mapping is temporarily suspended while this API is invoked. Data from the Mapping can be passed to the API through the User Exit Call Block. User Exits can be invoked at the Element level, the Segment level, and the Mapping Run level (at the Start of and End of Mapping).

User Profile

The user profile refers to the combination of the environment profile and the security profile that is defined for each user in Gentran:Server. This profile identifies what systems and functions the user is permitted to access as well as the data rights for each subsystem.

This profile is specific to Gentran:Server, however, it cannot be created without first having an iSeries User ID and does not supersede any of the user's iSeries authority.

For example, if a user's iSeries profile has the option “Limit Capabilities” set to '*YES', then the user cannot execute any commands from the command line, including Gentran-specific commands. Command line authority is maintained within Gentran's “Work with” panels.

 defined 5-1, 10-1
 element mapping 5-7, 10-10

extended mapping 10-13

Extended mapping for elements 5-9

IT1 segment (outbound) 10-22

modifying segment information 10-6

N1 Remit To segment (outbound) 10-19

N1 Ship To segment (outbound) 10-21

N1segment (inbound) 5-11

N3 Remit To segment (outbound) 10-19

N3 segment (inbound) 5-12

N4 Remit To segment (outbound) 10-20

N4 segment (inbound) 5-14

NTE segment (outbound) 10-13

subfield mapping 10-20

TDS segment (outbound) 10-29

transaction ID 5-3, 10-3

transaction ID, defining new 5-4

transaction ID, defining new ID 10-3

transaction mapping subsystem 10-2

update partner with the new map 10-31

using If-conditions 5-11, 5-12, 5-13

using If-conditions in 10-14

viewing code translation table 5-19, 10-30

Work with Transaction Mapping panel 5-3, 5-6,
 5-19, 10-3

Transactions

using the Copy feature 3-9, 8-9

Translation processing, see Processing

U

Updating application partner reference 9-6

V

Viewing documents after inbound processing 6-8

Viewing documents after outbound processing 11-7,
 11-8

Viewing the EDI data

reset the status 2-3

W

What is a partner? 3-1, 8-1

What is a transaction map? 5-1, 10-1

What is an application definition? 4-1, 9-1

What is processing? 6-1, 11-1

Work with application definition 4-2, 9-2

Work with Application Definition panel 4-2, 9-2, 9-3,
 9-4

Work with Audit Interchange Status panel 6-11,
 11-10
