VM/ESA 3.2.00 Administration Guide

The following parameter definition has been left out of the C:D 3.2 for VM/ESA Administration Guide. It should be on page 6-5 before the 'session type' entry. The main line should also be in the figure on the top of page 6-4 just before session type.

remote library name | IP address

(third positional parameter) is the library name or IP address. It is used for OS/2, OS/400 and TCP/IP nodes only.

For **OS/400** nodes, this parameter specifies the name of the library where the CONNECT:Direct for OS/400 program SMMAIN resides for the partner CONNECT:Direct.

For **TCP/IP** nodes, this parameter specifies the IP address to be used to establish a TCP/IP session.

For **OS/2** (LU6.2 only) nodes this parameter must be **CDOS2.**
