## Chapter 1. Sterling File Gateway Build 5102 Enhancements

### Increased Customization and New Features for myFileGateway

- Extension to myFileGateway enabling custom tabs for access to custom functionality controlled by custom permissions. See *Adding Custom Tabs to myFileGateway*.
- Support for displaying myFileGateway within an HTML iframe element. See *Deploying myFileGateway within an <iFrame> HTML Element*.
- File upload transfer dialog prevents users from other activity during the file transfer and notifies users of successful completion after a session time out. See *Sending a File Using myFileGateway*
- Rebranding for footer on log in page. See *Rebranding Sterling File Gateway and myFileGateway*.
- Ability to disable hover help. See *Rebranding Sterling File Gateway and myFileGateway*.

### Broadcast File Transfers

- Multi-consumer broadcast. See *Creating a Broadcast Routing Channel Template*, *Creating a Broadcast Routing Channel*, and *Broadcast Messages Using Shared Mailboxes*.
- Broadcast using shared mailboxes

### Improved Control over User Permissions

- Specific permissions can be assigned to user groups or partner users to control which tabs of myFileGateway can be accessed and which functionality is available. See *About Permissions*.
- New permissions to control whether the user name is displayed on the web page, and whether the logout URL is displayed on the web page. See *About Permissions*.
- New tabs can be defined and specified in `customer_overrides.properties`. See *Adding Custom Tabs to myFileGateway* and *Assigning Custom Permissions to Partners, filegateway\_ui.properties*.
- Permissions can be managed to control whether partner users are automatically given access to mailboxes created as a result of routing channels. See *filegateway.properties*.

### Other Enhancements

- Delivery channel option to avoid duplicate transfers to listening consumers. See *About Delivery Channels* and *Create a Routing Channel Template*.

### New and Removed Properties in filegateway.properties

Property	Description
fgmaxBroadcastListSize	Maximum allowed size of the consumer list used for broadcast. If the returned list of consumers exceeds this size, the file is not routed. By default, the maximum size of a broadcast list is set to 100.

Property	Description
grantIntermediateMailboxPermissions	<p>Controls permissions granted to intermediate mailboxes (those between a partner user's virtual root and the leaf mailbox). These mailboxes are created during routing channel creation or dynamic routing. Setting this property to true grants View &amp; Execute rights to the intermediate mailboxes to eligible partner users. View rights are required to list mailbox contents. Execute rights are required to 'log in' to a mailbox. Setting both rights allows users of the FTP and SFTP protocol adapters to traverse through any intermediate mailboxes to reach the leaf. The default is false.</p> <p>For example:</p> <pre>grantIntermediateMailboxPermissions=false</pre>
REMOVED fgRouteConcurrentSessionLimit	The property that limited the number of concurrent sessions does not apply.

## New Properties in filegateway\_ui.properties

Property	Description
myfilegateway.extension_js_file_x	<p>The name of the JavaScript that defines a custom functionality for tabs in myFileGateway. You can list several .js files by incrementing the final x. The value is in the format:For example:</p> <pre>myfilegateway. extension_js_file_1=CustomFunc1.js myfilegateway. extension_js_file_2=CustomFunc2.js</pre> <p>where CustomFunc = name of the .js file</p>
myfilegateway.extension_tab_resource_ids	<p>Contains a comma separated list of resource identifiers that define additional permissions. When setting permissions for users that access myFileGateway, assign myfilegateway.extension_tab_resource_ids for a custom tabs. When you create a custom tab, you can also create a new permission to control whether a user can view that tab. Only new and custom tab permissions are listed in this property.</p> <p><b>Restriction:</b> Users must have permissions to at least one tab, either the standard upload, download, file activity, or reports tab, or one of the permissions created for a custom tab.</p>

## Documentation Additions

The following enhancements are available in System Administrator Help:

- Creating User Accounts - inclusion of initial log in user IDs and passwords, clarification of restrictions for creating System Administrators.
- Rebranding Sterling File Gateway and myFileGateway - additional instructions for greater customization and clean up of files.
- filegateway\_protocol.properties - provides details about enabling or disabling protocols for search criteria.
- Sterling File Gateway: Specific Recommendations Checklist - recommendation for persistence settings for business processes for translation layers and custom consumer identification. Clarification that number of threads for processes is not limited by licensing.
- Improving Loading Time for myFileGateway Partners - suggestions for externalizing your static skin images to a hosting server closer to your users.
- Adding Custom Protocols - clarification of restriction on business process names for implementing custom protocols

- About Custom File Layers and Adding Custom File Layers - Reorganized and clarified information to support new file layer types.

The following enhancements are available in Operator documentation:

- Troubleshoot and Resolve Problems with Broadcast File Transfer
- Prevent Failed PGP Routes

## **Response Time Improvement**

The following topics provide guidance for improving response time for myFileGateway:

- Set Up HTTPS for Use with myFileGateway
- Best Practices: Specific Recommendations Checklist
- Troubleshoot and Resolve Slow Response Issues

## **Sterling B2B Integrator Enhancements**

### **Shared and Linked Mailboxes**

Support for Shared and Linked Mailboxes. See *About Shared and Linked Mailboxes* and *Broadcast Messages Using Shared or Linked Mailboxes*.

---

## Chapter 2. System Administrator Help

---

### Creating User Accounts (Build 5102 and Later)

Each user of IBM® Sterling File Gateway must have a user account, which controls access and determines what functions the user can perform. Create user accounts in the B2B Console, which is a component of IBM Sterling B2B Integrator.

#### About this task

When you install Sterling File Gateway, several default accounts are automatically created to get you started. You can use the default accounts to perform the tutorial described in the Overview.

One of the first actions you must take is to create your own accounts with unique IDs and passwords, because the default ones can be known by all Sterling File Gateway customers. Log in to Sterling File Gateway with the following credentials:

- User ID = fg\_sysadmin
- Password = password

To create a user account:

#### Procedure

1. From Sterling File Gateway, select **Tools > B2B Console**.
2. From within Sterling B2B Integrator, Select **Accounts > User Accounts > Create a new Account**.
3. Complete the steps in the wizard. Supply the following information about the user:
  - Authentication type (Local or external)
  - User ID - by default, the User ID must be at least five characters. To enable shorter or require longer User IDs, modify the following property in customer\_overrides.properties:  
`ui.userIdMinLength=(# of characters)`

The value of this property must be greater than zero. To implement single sign-on, this value must match the value set in Sterling B2B Integrator.

- Password
- Confirm Password
- Policy - choose from:
  - [blank] (default)
  - Default User Policy - For the default user policy, the password must be at least six characters and is required to contain at least two of the following characters (numeral, capital letter, !, @, #, \$, %, ^, &, \*).
  - You can create a different policy for your system. Create the policy in Sterling B2B Integrator first, then select it from the list when you create a user.
- SSH Authorized User Key
- Session Timeout (in minutes)
- Accessibility

- Dashboard Theme

See Managing User Accounts.

4. Select one or more groups from the following list:

- File Gateway Integration Architects - can only access File Gateway, not *myFileGateway*
- File Gateway Operators - can only access File Gateway, not *myFileGateway*
- File Gateway Partner Users - can only access *myFileGateway*
- File Gateway Route Provisioners - can only access File Gateway, not *myFileGateway*
- File Gateway System Administrators - can only access File Gateway, not *myFileGateway*

**Fast path:** For full Sterling File Gateway functionality, each of these groups must have at least one user. By default, the following users are created during installation of Sterling File Gateway:

- *fg\_sysadmin* - belongs to all File Gateway groups except File Gateway Partner Users. Also belongs to Sterling B2B Integrator Admin group.
- *fg\_architect* - belongs to File Gateway Integration Architects group
- *fg\_provisioner* - belongs to File Gateway Route Provisioners group
- *fg\_operator* - belongs to File Gateway Operators group

A user can belong to multiple groups, but cannot belong to File Gateway Partner Users group while a member of any other group.

**Important:** To protect the security of your system, delete the default users or change the default passwords.

**Fast path:** To create an independent user that is the equivalent of *fg\_sysadmin*, assign the Sterling B2B Integrator Admin group and all File Gateway groups except File Gateway Partner Users group to that user. Ensure that the user is not associated with any Identity (partner) that belongs to the "All Partners" group in Sterling File Gateway. Membership in a partner group prevents log in to Sterling File Gateway as an administrator.

5. Select the permissions for the user. (Optional.) The group assignments include the standard permissions for users of each group.
6. Supply the following information for the user:
- First Name
  - Last Name
  - Email
  - Pager
  - Preferred Language (English, Japanese)
  - Manager ID
  - Identity
7. Review and confirm to create the new user account.

---

## Adding Custom Tabs to myFileGateway (Build 5102 and Later)

System Administrators can create new tabs for additional functionality in myFileGateway.

## About this task

To create new tabs for additional functionality in myFileGateway:

### Procedure

1. Define some custom functionality in a new JavaScript file, either within the myFileGateway web application or in a separate web application.
2. Reference your JavaScript file by setting the property:  
`myfilegateway.extension_js_file_x=customTabCode.js`

(where customTabCode.js is the name of the JavaScript file you created)

### Example Custom Tab

One example of a custom tab you can add to myFileGateway is a Welcome Tab. This example adds the new JavaScript file to the myFileGateway application. As a consequence, step 6 may have to be reapplied after the myFileGateway application is modified in a future patch. If a new web application is created to host the new JavaScript file, patch updates to myFileGateway will not interfere.

To create a new Welcome Tab in myFileGateway:

1. Create a new permission for accessing your new custom tab within myFileGateway. From the B2B Console, select **Accounts > Permissions**. Create a new permission with Permission Type=File Gateway.  
Make note of the PERMISSION\_ID you create, as it will be used in the JavaScript file in the next step (for example, MYFG\_WELCOME).
2. Assign the custom tab permission you created to a group. Select **Accounts > Groups**. Create a group and assign the permission you created in step 1.
3. Navigate to the directory <install\_dir>/container/Applications/myFileGateway.
4. Create a new directory named "custom" and under it, create a directory as appropriate, for example "welcomepage". Creating the myfilegateway/custom directory is important to ensure that future updates to the myFileGateway application do not overwrite such additions as the custom tab.
  - a. Inside this new directory, create a new JavaScript (\*.js) file (for example, "welcomepage.js"). Copy and paste the following JavaScript into this file:

```
var WelcomePage = function() {
  var createWelcomeLayout = function() {
    return isc.VLayout.create({
      name:"myFgWelcome_Layout ",
      autoDraw:false,
      showEdges:false,
      backgroundColor:"#FFFFFF",
      members:[
        isc.Label.create({
          contents:"<b>Welcome to the myFileGateway upload and download
            application.</b><br>",
          icon:"[SKIN]/FGimages/FileTxfr_23.png",
          iconHeight:23,
          iconWidth:44,
          padding:5,
          height:1,
          width:400
        })
      ]
    });
  };
};
```

```

var welcomeTab = {
  ID:"WelcomeTab",
  title:"Welcome",
  prompt:"Welcome",
  permission:" MYFG_LOGIN ",
  initTab: function() {
    this.pane = createWelcomeLayout();
  }
}
this.welcomeTab = welcomeTab;
}
com.sc.fg.welcomePage = new WelcomePage();
MyFileGatewayManager.addTab(com.sc.fg.welcomePage.welcomeTab);

```

- b. Create or edit `customer_overrides.properties` to reference your new JavaScript file and location URL. For example:

```

filegateway_ui.myfilegateway.extension_js_file_1=
/myfilegateway/custom/welcomepage/welcomepage.js

```

5. Before saving the file, locate in the JavaScript source code the “permission” attribute for the tab control. Change the permission name in this example script to the `PERMISSION_ID` used when creating the permission. (that is, change `MYFG_LOGIN` to `MYFG_WELCOME`)
6. Edit the `security_filter.properties` file under `container/Applications/myfilegateway/WEB-INF/classes`. Add a new entry for your new JavaScript file (`welcomepage.js`). For example:

```

loginjsXX=${WEBAPP_CONTEXT_NAME}/custom/welcomepage/welcomepage.js

```

where `XX` is an identifier that is unique within the `security_filter.properties` file.

7. Navigate to `<install_dir>/bin`.
8. Run the following scripts:
  - `<install_dir>/bin/hardstop.sh`
  - `<install_dir>/bin/deployer.sh`
  - `<install_dir>/bin/run.sh`
9. After the deployer is complete, stop and restart Sterling File Gateway.
10. Log in to `myFileGateway` to verify your custom tab is visible.

---

## About Permissions (Build 5102 and Later)

Permissions control access to the pages of `myFileGateway`.

The permissions that control access to the pages of `myFileGateway` are:

- `myFileGateway Login`
- `myFileGateway Logout` (determines whether the logout button is displayed on the pages)
- `myFileGateway User Name` (determines whether the user name is displayed on the user interface)
- `myFileGateway File Activity`
- `myFileGateway Reports`
- `myFileGateway Change Password`
- `myFileGateway Help`
- Custom permissions created by System Administrators
- `myFileGateway Event Subscription`

**Restriction:** Partner users with the Event Subscription permission may receive notifications for events they have subscribed to, even if they do not have File Activity permission. The Event Subscription permission only affects a user's ability to view and modify their subscriptions to events. If the Event Subscription permission is removed from a user or group, the user or members of the group will continue to receive notifications for any events already subscribed to, but cannot subscribe to additional events.

The File Gateway Partner Users group is assigned all of the available permissions, which means that all available pages of myFileGateway are displayed for partner users assigned to the File Gateway Partner Users group. To limit partners to fewer permissions, create a new group and assign only the desired permissions to the new group, then assign partners to the new group. See *About User Groups and Partner Groups*.

Do not modify the File Gateway Partner Users group, because your changes may be overwritten when later builds are applied.

### Other Permissions

Other permissions used in Sterling File Gateway are:

- File Gateway Auto-grant Mailbox Permissions
- File Gateway Producer Proxy

The File Gateway Partner Users group is assigned the File Gateway Auto-grant Mailbox Permissions, which indicates to the system whether to configure mailbox permissions automatically. With this permission, partner users are automatically assigned permission to mailboxes created as a result of File Gateway routing channels.

File Gateway Producer Proxy is for system use only, and requires no action by users.

---

## User Interface Access (Build 5102 and Later)

Access to each page of the user interface is authorized based on permission groups assigned when the user is created.

The following table describes which screens and functions each persona can access:

Page	System Admin	Integration Architect	Route Provisioner	Operator	Partner
<b>Routes &gt; Activity</b>	(Default page.) Can search and view details and links to details in B2B Console. Can mark routes as reviewed or not reviewed. Can replay and redeliver.	Can search and view events, but cannot view linked details. Can mark routes as reviewed or not reviewed. Cannot replay or redeliver.	Can search and view events, but cannot view linked details. Can mark routes as reviewed or not reviewed. Cannot replay or redeliver.	(Default page.) Can search and view details and links to details in B2B Console. Can mark routes as reviewed or not reviewed. Can replay and redeliver.	No access.
<b>Routes &gt; Channels</b>	Can view and edit.	No access.	(Default page.) Can view and edit.	No access.	No access.

Page	System Admin	Integration Architect	Route Provisioner	Operator	Partner

---

## Assigning Custom Permissions to Partners (Build 5102 and Later)

For partners who need access to custom tabs, or where you want to restrict access to certain tabs, you can create a group with custom permissions.

### About this task

To assign custom permissions to partners:

### Procedure

1. Select **Tools > B2B Console > Groups > Create a Group**.
2. Name your group and click **create**.
3. On the **Assign Permissions** tab, select the myFileGateway permissions you prefer including the custom permissions you defined (if any).
4. Save the group.
5. Add an entry to customer\_override.properties like:

```
filegateway_ui.fgOnboardingDefaultUserGroupId=name-of-group-created
(from step 2)
```

This property setting adds subsequently created partner users to the new group. Existing partner users are not affected.

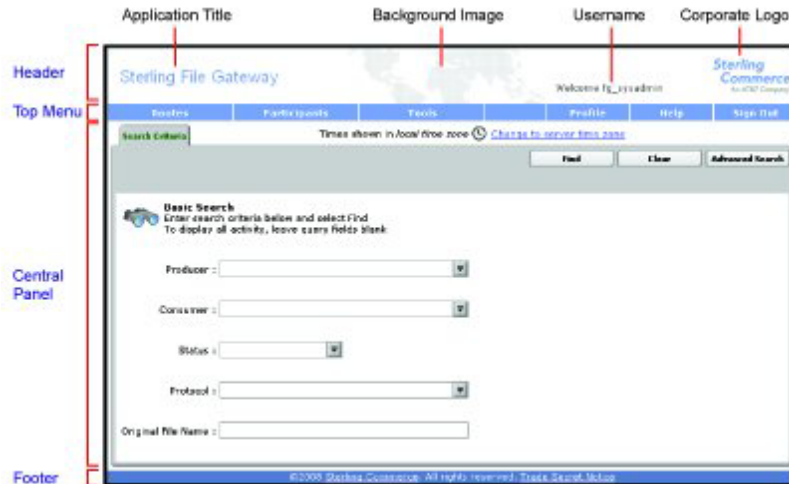

---

## Rebranding Sterling File Gateway and myFileGateway (Build 5102 and Later)

You can rebrand Sterling File Gateway and myFileGateway to use your company's logo or other special content. To customize the look of Sterling File Gateway and myFileGateway, you create a skin, reference this new skin, and restart your system. You can use the same or different skins for Sterling File Gateway and myFileGateway.

### About this task

The following figure shows the location of the portions of the screens you can rebrand:

The corresponding file names are:

- Header:
  - [skin]/brandingcontent/header.txt
  - [skin]/brandingcontent/myFgHeader.txt
  - [skin]/load\_skin.js
  - [skin]/images/FGimages/brandingimages/
- Top Menu: [skin]/skin\_styles.css
- Central Panel:
  - [skin]/skin\_styles.css
  - [skin]/load\_skin.js
  - [skin]/images/...
- Footer: [skin]/brandingcontent/footer.txt
- Login Footer: [skin]/brandingcontent/loginFooter.txt

**Important:** If you rebranded Sterling File Gateway in a previous version, you must make an additional change after you install Build 5101 or later. Add the menuBackground property to your custom skin .css file as in the following sample:

```
/* --- menu background color for main navigation bar;
default is #7896CF --- */
.menuBackground {
background-color: #7896CF;
}
```

To rebrand Sterling File Gateway:

### Procedure

1. Locate files in the following directories for the default skins:  
 <install\_dir>/container/Applications/filegateway/isomorphic/skins/  
 FileGateway  
 and <install\_dir>/container/Applications/myfilegateway/isomorphic/  
 skins/FileGateway
2. Copy and rename the “FileGateway” directory in path: <install\_dir>/  
 container/Applications/filegateway/isomorphic/skins/FileGateway\_vXXX

You can use any valid directory name. In the next steps, the renamed directory is referred to as [skin].

3. To customize the header, you can change the following elements:
  - Application Title
  - Background Image
  - Corporate Logo
  - Position of the user name
  - HeaderALT
4. To change the Application Title:
  - a. Open the following file: [skin]/brandingcontent/header.txt
  - b. Change line 15 to refer to your company name (padding-left: 15px" nowrap="nowrap">My Company</td> )
  - c. Open [skin]/brandingcontent/myFgHeader.txt
  - d. Change line 15 to refer to your company name (or another name) (padding-left: 15px" nowrap="nowrap">My Company</td> )
5. To change the browser title text, which appears up in the top left-hand side of the browser (if different from Application Title, mentioned in the graphic, above) set the variables:
  - fgWindowTitle (for Sterling File Gateway)
  - myfgWindowTitle (for myFileGateway)in customer\_overrides.properties as  
filegateway\_ui.fgWindowTitle=xxx  
  
and  
filegateway\_ui.myfgWindowTitle=xxx
6. To change the Background Image:
  - a. Create a new Background Image GIF image, 66 pixels high by 800 pixels wide and named "MastheadBkgd\_Map.gif"
  - b. Place this GIF in the following directory:[skin]/images/FGimages/brandingimages/
  - c. Open the following file: [skin]/brandingcontent/header.txt
  - d. Change line 3 to refer to your skin's directory where the background image (from step 5) is located (isomorphic/skins/[skin]/images/FGimages/brandingimages/ MastheadBkgd\_Map.gif)
  - e. Open [skin]/brandingcontent/myFgHeader.txt
  - f. Change line 3 to refer to your skin's directory where the background image (from step 5a) is located (isomorphic/skins/[skin]/images/FGimages/brandingimages/ MastheadBkgd\_Map.gif)
7. To change the Corporate Logo:
  - a. Create a new Corporate Logo GIF image, which should be 66 pixels high by 93 pixels wide and named "hdr\_logo.gif"
  - b. Place this GIF in the following directory:[skin]/images/FGimages/brandingimages/
  - c. Open the following file: [skin]/brandingcontent/header.txt
  - d. Change line 18 to refer to your skin's directory where the corporate logo image (from step 6a) is located (isomorphic/skins/[skin]/images/FGimages/brandingimages/ hdr\_logo.gif)
  - e. Open [skin]/brandingcontent/myFgHeader.txt

- f. Change line 18 to refer to your skin's directory where the corporate logo image (from step 6a) is located (isomorphic/skins/[skin]/images/FGimages/brandingimages/ hdr\_logo.gif)
8. To change the position of the user name:
  - a. Open the following file:[skin]/load\_skin.js
  - b. Change the two variables on Lines 14 and 15 to position the name label where you desire:
    - headerUserNameTop (expressed in absolute pixels from the top)
    - headerUserNameLeft (expressed as a percentage of page width, from the left side)
9. To change the headerALT, which is displayed while the header is loading:
  - a. Open the following file:[skin]/load\_skin.js
  - b. Change the variable on Line 13 (headerALT) to your company name (e.g. "My Company").
10. To change the Log In page footer:
  - a. Open the following file: [skin]/brandingcontent/loginFooter.txt
  - b. Modify the first line to refer to your company name as well as the link to your corporate Web site, if desired: ...href=http://www.MyCompany.com.
11. To change the footer for all pages after the Log In page::
  - a. Open the following file: [skin]/brandingcontent/footer.txt
  - b. Modify the first line to refer to your company name as well as the link to your corporate Web site, if desired: href='http://www.MyCompany.com' target='\_blank'>My Company... The <DIV> within the footer will be modified such that only a background color is used and not a background image. You can modify the <DIV> if preferred. The color of the footer background is found in load\_skin.js as the variable 'footerBkClr' and has been explained in the page 'load\_skin.js' comments.
12. To suppress hover help:
  - a. Access the file [skin]/load\_skin.js
  - b. Around Line 398, find the section titled "11) Hovers"
  - c. Within this section, locate the conditional statement "if (isc.Hover) { ..."
  - d. Modify the property "defaultWidth:200" to a value of 0 ("defaultWidth:0")
13. To reference the new [skin], create or open customer\_overrides.properties in a text editor. Add the following line:
 

```
filegateway_ui.fgSkinName=[skin]
```

where [skin] is your new skin name for Sterling File Gateway and  
filegateway\_ui.myfgSkinName=[skin]

where [skin] is your new skin name for myFileGateway. The values for [skin] can be different for Sterling File Gateway and myFileGateway.
14. Open the "load\_skin.js" file in your new skin directory ([skin]/load\_skin.js) and change the line in the "Specify skin directory" area:
 

```
isc.Page.setSkinDir("[ISOMORPHIC]/skins/FileGateway/")
```

to refer to your new skin's name:

```
isc.Page.setSkinDir("[ISOMORPHIC]/skins/[skin]/")
```
15. To change the header only for myFileGateway:

- Modify only the two files, header.txt and myFgHeader.txt in the new directory at:(<install\_dir>/container/Applications/myfilegateway/isomorphic/skins/[skin]/brandingcontent
16. Run the following scripts for UNIX:
    - <install\_dir>/bin/hardstop.sh
    - <install\_dir >/bin/deployer.sh
    - <install\_dir >/bin/run.sh

For Microsoft Windows:

    - <install\_dir>StopWindowsService.cmd
    - <install\_dir>Deployer.cmd
    - <install\_dir>StartWindowsService.cmd
  17. If any branding files modified contain a matching .gz file (for example, "load\_skin.js and load\_skin.js.gz"), then the .gz file must be removed. Check the /install/noapp/deploy/myfilegateway/webapp or /install/noapp/deploy/filegateway/webapp directory to ensure your changes have been propagated as expected.
  18. Refresh your browser cache and delete any temporary Internet files.

## Results

When you launch Sterling File Gateway, the new branding is shown in the header and footer. When your Partner users launch myFileGateway, the new branding is shown in the header.

---

## filegateway.properties (Build 5102 and Later)

The filegateway.properties file contains properties which control the operation of Sterling File Gateway.

The following table describes properties in the filegateway.properties file:

**Important:** Do not edit the filegateway.properties file. Make all changes in the customer\_overrides.properties file. For example, to change the pgpCmdline2svcname property, enter the following line into customer\_overrides.properties:

```
filegateway.pgpCmdline2svcname=CUSTOM
```

substituting CUSTOM with the name of your Command Line 2 adapter. See *Using Property Files* in the Sterling B2B Integrator 5.1 online library.

Property	Description
ignoreFilenamexx	<p>Setting a regex pattern for this will cause any arrived file that matches your regex pattern to be ignored by Sterling File Gateway.</p> <p>This is useful for recognizing and ignoring temporary files sent by producers before they are renamed to the expected name. These will not be routed and are not considered failures.</p> <p>Specify one or more file name patterns to ignore in the following format:</p> <ul style="list-style-type: none"> <li>• filegateway.ignoreFilename1=&lt;regex expression&gt;</li> <li>• filegateway.ignoreFilename2=&lt;regex expression&gt;</li> <li>• filegateway.ignoreFilename3=&lt;regex expression&gt;</li> <li>• filegateway.ignoreFilenamexx=&lt;regex expression&gt;</li> </ul> <p>where xx is a number of one or more digits.</p> <p>For example: filegateway.ignoreFilename1=.[.]tmp\$</p> <p>would cause all files with an extension of .tmp to be ignored. <b>Restriction:</b> The regex pattern must match the file name in its entirety. Partial matches are not recognized.</p>
ftpClientAdapterName	<p>The FTP Client Adapter instance or service group that the FileGatewayDeliverFTP business process will use. Override this property in customer_overrides.properties if a custom FTP Client Adapter instance must be used to contact trading partners. You can also specify an adapter group name to load-balance outbound FTP sessions across multiple adapter instances. Default is:</p> <p>ftpClientAdapterName=FTPClientAdapter</p>
bpCompletionProbes.1 bpCompletionSleepMsec.1 bpCompletionProbes.2 bpCompletionSleepMsec.2	<p>Timeouts and sleep intervals that control how long Sterling File Gateway waits for every sub-business process it invokes. These control the timeouts when a business process is executed synchronously during routing. Used for consumer identification business processes and for PGP processing. Enables one set of relatively quick probes followed by a second set of slower probes. The first set will be very reactive, but consume more processor. The second set will activate for longer-running processes and will consume less processor.</p> <p>First probe 120 times with 100 Milliseconds between, for a total of 12 seconds. Default is: bpCompletionProbes.1=120 and bpCompletionSleepMsec.1=100</p> <p>Then probe 600 times with 2000 Milliseconds between, for a total of 1200 seconds (20 minutes). Default is: bpCompletionProbes.2=600 and bpCompletionSleepMsec.2=2000</p>
pgpCmdline2svcname	<p>The name of the Command Line 2 adapter to be used for PGP packaging and unpackaging. Override this property in customer_overrides.properties if a custom Command Line 2 adapter must be used for PGP operations. You can also specify an adapter group name to load-balance outbound PGP sessions across multiple adapter instances. Default is:</p> <p>pgpCmdline2svcname=PGPCmdlineService</p>

Property	Description
fgRoutePGPCmdLineSocketTimeout	Timeout value, in milliseconds, for PGP package and unpackage operations invoked by Sterling File Gateway. Default value is 240000 milliseconds (4 minutes)
required_si_build_ver	The build number (version) of Sterling B2B Integrator that Sterling File Gateway requires. This is checked at system start up. If the current version of Sterling B2B Integrator does not equal the required_si_build_ver, a warning is issued and the system is shut down. Required. Do not change or override this property.
fgmaxBroadcastListSize	Maximum allowed size of the consumer list used for broadcast. If the returned list of consumers exceeds this size, the file is not routed. By default, the maximum size of a broadcast list is set to 100.
grantIntermediateMailboxPermissions	Controls permissions granted to intermediate mailboxes (those between a partner user's virtual root and the leaf mailbox). These mailboxes are created during routing channel creation or dynamic routing. Setting this property to true grants View & Execute rights to the intermediate mailboxes to eligible partner users. View rights are required to list mailbox contents. Execute rights are required to 'log in' to a mailbox. Setting both rights allows users of the FTP and SFTP protocol adapters to traverse through any intermediate mailboxes to reach the leaf. The default is false.  For example:  grantIntermediateMailboxPermissions=false

## filegateway\_ui.properties (Build 5102 and Later)

The filegateway\_ui.properties file contains properties which control the location of the Help systems for Sterling File Gateway and *myFileGateway*, as well as several other user interface settings.

The following table describes properties in the filegateway\_ui.properties file:

**Remember:** Do not edit the filegateway\_ui.properties file. Make all changes in the customer\_overrides.properties file. For example, to change the URL for the Help system, enter the following line into customer\_overrides.properties:

```
filegateway_ui.help.uri=http://CUSTOM
```

substituting CUSTOM with your preferred URL. See *Using Property Files* in the Sterling B2B Integrator 5.1 online library.

Property	Description
reportingdirectory	Location of the reports templates.  Default - reportingdirectory=&INSTALL_DIR;/reporting  Required. Do not modify or override.
help.uri	Specifies the URL for the Help used by Sterling File Gateway. Required. The default is:  http://help.sterlingcommerce.com/SFG21/index.jsp  This site is hosted by IBM.

Property	Description
myFghelp.uri	Specifies the URL for the help used by <i>myFileGateway</i> . Required. The default is: http://help.sterlingcommerce.com/mySFG21/index.jsp  This site is hosted by IBM.
notification.partner.url	Login URL for partner users to access <i>myFileGateway</i> . Required. The default is: notification.partner.url=http://&HOST_ADDR;:&PORT1;/myfilegateway  <b>Important:</b> The specified URL will be included in email messages generated to partner users. If you implement Sterling Secure Proxy, it is imperative that you override this property to remove the original server host and port and replace with the URL designated by Sterling Secure Proxy.
notification.admin.url	Login URL for administrative users to access Sterling File Gateway. Required. The default is: notification.admin.url=http://&HOST_ADDR;:&PORT1/filegateway  <b>Important:</b> The specified URL will be included in email messages generated to administrative users. If you implement Sterling Secure Proxy, it is imperative that you override this property to remove the original server host and port and replace with the URL designated by Sterling Secure Proxy.
fgMaxRoutingChannelRecords	Limits the total number of routing channel records returned by a search. Required. Default is 1000. You can change this to fine tune performance by editing the customer_overrides.properties file.
myFgStorageType	Storage type to use for new documents sent through <i>myFileGateway</i> . Possible values are: <ul style="list-style-type: none"> <li>• default - use the system default</li> <li>• db - store documents in database</li> <li>• file - store documents in file system</li> </ul> The default is default.  To change this value, use the customer_overrides.properties file. For example to set it to database: filegateway_ui.myFgStorageType=db
fgMaxActivityRecords	Limits the total number of Activity Records that will be returned in activity search. This can be edited to fine tune performance. The default is: fgMaxActivityRecords=1000
fgWindowTitle	The title of the window that displays in the top browser bar for Sterling File Gateway. Required. Default is Welcome to Sterling File Gateway.
myfgWindowTitle	The title of the window that displays in the top browser bar for <i>myFileGateway</i> . Default is Welcome to Sterling File Gateway.
fgSkinName	The file that contains the branding information for Sterling File Gateway. Required. Default is FileGateway.
myfgSkinName	The file that contains the branding information for <i>myFileGateway</i> . Required. Default is FileGateway.

Property	Description
fgOnboardingDefaultSessionTimeout	The default session timeout in minutes for a Partner User created using the Sterling File Gateway onboarding.  The default is: fgOnboardingDefaultSessionTimeoutInMinutes=15
fgOnboardingDefaultUserGroupId	The group partner users are automatically assigned to when they are created as a result of creating a partner in Sterling File Gateway, migrated from AFT, or the partner's identity is associated with a File Gateway partner group. Required. Default is File Gateway Partners Users Group.
FGConsecFailedAttempts	Number of consecutive failed login attempts that are allowed before a user is locked out of Sterling File Gateway or myFileGateway. Default is 0, which means users are never locked out.
FGLockInterval	Length of time, in minutes, that the lock is applied after the number of failed login attempts is exceeded. Default is 30.
userIdMinLength	Minimum number of characters in the user ID. The default is 5. To enable shorter or require longer User IDs, modify the following property in customer_overrides.properties: userIdMinLength.ui=(# of characters)  The value of # of characters must be greater than zero. To implement single sign-on, this value must match the value set in Sterling B2B Integrator.
myfilegateway.extension_js_file_x	The name of the JavaScript that defines a custom functionality for tabs in myFileGateway. You can list several .js files by incrementing the final x. The value is in the format: myfilegateway. extension_js_file_1=CustomFunc1.js myfilegateway. extension_js_file_2=CustomFunc2.js where CustomFunc = name of the .js file
myfilegateway.extension_tab_resource_ids	Contains a comma separated list of resource identifiers that define additional permissions. When setting permissions for users that access myFileGateway, assign myfilegateway.extension_tab_resource_ids for a custom tabs. When you create a custom tab, you can also create a new permission to control whether a user can view that tab. Only new and custom tab permissions are listed in this property.  <b>Restriction:</b> Users must have permissions to at least one tab, either the standard upload, download, file activity, or reports tab, or one of the permissions created for a custom tab.

## filegateway\_protocol.properties

The filegateway\_protocol.properties file contains properties which control the protocols available when specifying the search criteria for Sterling File Gateway activity searches.

The following table describes properties in the filegateway\_protocol.properties file:

**Important:** Do not edit the filegateway\_protocol.properties file. Make all changes in the customer\_overrides.properties file. For example, to change the setting for Sterling Connect:Direct® Inbound, enter the following line into customer\_overrides.properties:

filegateway\_protocol.FG\_CDIN=

See *Using Property Files* in the See *Using Property Files* in the Sterling B2B Integrator 5.1 online library.

Property	Description
FG_CDIN	Enables the Sterling Connect:Direct Inbound protocol
FG_CDOUT	Enables the Sterling Connect:Direct Outbound protocol
FG_CD	Enables the Sterling Connect:Direct Inbound and Outbound protocol
FG_FTPIN	Enables the FTP Inbound protocol
FG_FTPOUT	Enables the FTP Outbound protocol
FG_FTP	Enables the FTP Inbound and Outbound protocol
FG_SFTPIN	Enables the SFTP Inbound protocol
FG_SFTPOUT	Enables the SFTP Outbound protocol
FG_SFTP	Enables the SFTP Inbound and Outbound protocol

---

## About Event Codes (Build 5102 and Later)

Each activity during the progress of a file transfer generates an event code. These codes are displayed in the activity details to enable Partners and Operators to see the progress and navigate to more details. System Administrators can create custom event codes and modify the permissions for standard event codes.

Some event codes trigger notifications to subscribers. System Administrators can change the permissions for an event code by using the `customer_overrides.properties` file to override values in the `filegateway_eventcodes.properties` file. The default subscription settings are provided in the table below:

Event Code	Name	Description	Default Subscription Settings
FG_0050	MailboxAuthorizationFailure	When a user fails to access a mailbox that is monitored	Operators
FG_0201	BusinessProcessStarting	When a business process is started, with the reason for starting it stored in context.	Only in activity details.
FG_0202	BusinessProcessSuccess	When a business process is successfully completed, with a link to the business process.	Only in activity details.
FG_0203	SendMessageBusinessProcessStarted	When a business process is successfully started, with a link to the business process.	Only in activity details.
FG_0250	BusinessProcessFailure	When a business process fails, with a link to the business process	Operators
FG_0401	FactDiscovery	When a fact is discovered by the route, for example, matching a pattern on the file name.	Only in activity details.

<b>Event Code</b>	<b>Name</b>	<b>Description</b>	<b>Default Subscription Settings</b>
FG_0404	ProducerFound	When a producer and user are identified based on the arrived file.	Only in activity details.
FG_0407	ConsumerFound	When a consumer is identified based on the route plan.	Only in activity details.
FG_0408	ArrivedFileStarted	When a file arrives to be routed	Operators, producers, and consumers
FG_0409	ArrivedFileDeterminingRoutes	When an arrived file starts determining routes.	Only in activity details.
FG_0410	ArrivedFileRouting	When an arrived file starts processing routes.	Only in activity details.
FG_0411	ArrivedFileRouted	When an arrived file completes all its routes	Operators, producers, and consumers
FG_0412	RouteStarted	When a route is started from an arrived file.	Only in activity details.
FG_0413	RouteDeterminingDeliveries	When a route starts determining deliveries.	Only in activity details.
FG_0414	RouteDelivering	When a route starts processing deliveries.	Only in activity details.
FG_0415	RouteComplete	When a route completes all its deliveries	Operators, producers, and consumers
FG_0416	DeliveryStarted	When a delivery is started from a route.	Only in activity details.
FG_0417	DeliveryTransforming	When a delivery starts to transform the consumer file.	Only in activity details.
FG_0418	DeliveryDelivering	When a delivery starts delivering the consumer file to the consumer.	Only in activity details.
FG_0419	DeliveryComplete	When a delivery is complete	Operators, producers, and consumers
FG_0420	ArrivedFileReplayed	When an arrived file is replayed, with a link to the replay	Operators, producers, and consumers
FG_0421	ArrivedFileReplayOf	When an arrived file is a replay of an original arrived file, with a link to the original file.	Only in activity details.
FG_0422	Redeliver	When a redelivery is requested by a user	Operators, producers, and consumers
FG_0423	DeliverRedelivering	When a delivery starts redelivering the consumer file to the consumer.	Only in activity details.
FG_0424	ArrivedFileIgnored	When an arrived file is ignored due to a configured pattern for ignoring files	Operators, producers
FG_0425	ArrivedFileDescription	The description of the Arrived File	Operators, producers
FG_0450	ProducerMessageNotFound	When a producer message is invalid or cannot be found	Operators, producers

Event Code	Name	Description	Default Subscription Settings
FG_0451	ProducerDocumentNotFound	When a producer document is invalid or cannot be found	Operators, producers
FG_0455	ArrivedFileFailed	When an arrived file fails	Operators, producers
FG_0456	RouteFailed	When a route file fails	Operators, producers, and consumers
FG_0457	DeliveryFailed	When a delivery fails	Operators, producers, and consumers
FG_0458	FileGatewayServiceVersionMismatch	When a newer version of a system business process is installed, but is not the default chosen version.	Operators
FG_0501	ProducerMailboxRouteCandidatesFound	When route candidates are found for an arrived file based on the producer and the mailbox of the message.	Only in activity details.
FG_0502	RouteCandidatesFound	When route plan candidates are found for an arrived file.	Only in activity details.
FG_0503	RouteCandidate	A route plan candidate for an arrived file.	Only in activity details.
FG_0504	Route	When one or more routes are chosen from the candidates.	Only in activity details.
FG_0505	RoutesFound	The number of routes that will be executed.	Only in activity details.
FG_0506	Route Candidate Does Not Match	When a routing channel template contains no matching producer file structure for an arrived file.	Only in activity details.
FG_0550	ZeroRouteCandidatesFound	When no route candidates are found for an arrived file	Operators, producers
FG_0551	ZeroRouteChannelsFound	When no route channels are chosen from the list of candidates for an arrived file	Operators, producers
FG_0552	InvalidRoute	When a route is invalid	Operators, producers
FG_0553	InvalidConsumerBroadcastGroup	When value of ConsumerBroadcastGroup does not contain name of an existing partner group	Operators, producers
FG_0554	MaxBroadcastGroupSizeExceeded	When the number of consumers in broadcast scenarios is too big	Operators, producers
FG_0601	TransformedMessage	When a message is transformed to the final format for the consumer.	Only in activity details.
FG_0602	ProducerPayloadExtracting	When the router begins to extract a producer payload file.	Only in activity details.
FG_0603	ConsumerPayloadConstructing	When the router begins to construct a consumer payload file for delivery.	Only in activity details.
FG_0604	ConstructedLayer	When a single layer in the consumer payload file gets constructed.	Only in activity details.

Event Code	Name	Description	Default Subscription Settings
FG_0605	ExtractedLayer	When a single layer in the producer payload file gets extracted.	Only in activity details.
FG_0606	LayerOptions	When options are passed to a business process to process a layer.	Only in activity details.
FG_0607	PGPConstructSkipped	When the PGP Construct layer is skipped because the consumer does not handle PGP and it is optional on the Routing Channel Template	Operators, consumers
FG_0650	ExtractLayerFailed	When extraction of a layer fails	Operators, producers
FG_0651	ConstructLayerFailed	When construction of a layer fails	Operators, consumers
FG_0701	DeliveredMailboxMessage	When a message is delivered to a mailbox (either a consumer mailbox or a mailbox for sending to a listening consumer).	Only in activity details.
FG_0702	DeliveredListeningPartnerMessage	When the file transfer is complete.	Only in activity details.
FG_0703	ChangeDirectory	When the supported protocol changes directory on the listening consumer's server to transfer the file.	Only in activity details.
FG_0704	ConsumerDestinationMailboxFound	When the destination mailbox for the consumer is discovered.	Only in activity details.

---

## filegateway\_eventcodes.properties (Build 5102 and Later)

The filegateway\_eventcodes.properties file contains properties that control the operation of event codes in Sterling File Gateway.

There are multiple properties in the filegateway\_eventcodes.properties file for each event, in the format:

```
FG_<EVENT_CATEGORY><EVENT_CODE>.<PROPERTY_NAME>=<REPLACEABLE_TEXT>
```

where:

- <PROPERTY\_NAME> is the parameter being defined for the particular event
- <REPLACEABLE\_TEXT> is the value of the parameter for the particular event
- and the values used by Sterling File Gateway for <EVENT\_CATEGORY> are:

Code	Category
00	Producer File Transfer
02	Routing Business Process
04	File Gateway General
05	Route Plan Determination
06	File Transformation
07	Consumer File Transfer

<EVENT\_CODE> is a unique code (within the category) to identify this event. Check the other properties (or the FileGatewayEvent enumeration) to ensure no duplication.

<REPLACEABLE\_TEXT> is text displayed in the route details so users can monitor progress of the route.

The following information is provided for each event:

Property	Description	Example
Name	Name of the event. Displayed in the subscription UI ( <b>Profile &gt; Notifications</b> ). Required.	XX_0050.name=MyCustomEventFailure
Attributes	Comma delimited list of named attributes to the event. Used in the text field and must correspond to the order listed in the text field. For example, UserId attribute corresponds to {0} below. All attributes need not appear in the text field. Required, but can be empty.	XX_0050.attributes=UserId,ErrorMessage
Text	Event description displayed in the route activity UI for a specific occurrence of this event. Required.	XX_0050.text=User {0} encountered failure {1}
Description	A generic event description that does not use attributes. Displayed in the subscription UI ( <b>Profile &gt; Notifications</b> ). Required.	XX_0050.description=When a user encounters this custom event failure
Permissions	Comma delimited list that indicates who can be notified and who can view this event. Possible values are: <ul style="list-style-type: none"> <li>• subscription - available for subscription to notifications</li> <li>• producer - producers can see in route activity events list and receive notifications</li> <li>• consumer - consumers can see in route activity events list and receive notifications</li> </ul> Optional.	XX_0050.permissions=subscription

filegateway\_eventcodes.properties includes only standard events shipped with Sterling File Gateway. Custom events you create are entered and configured in customer\_overrides.properties.

**Restriction:** Do not edit the filegateway\_eventcodes.properties file. Make all changes in the customer\_overrides.properties file. For example, to change the name property, enter the following line into customer\_overrides.properties:

```
filegatewayeventcodes.name=CUSTOM
```

Substitute CUSTOM with the name of your event code. See *Add Custom Event Codes*.

---

## Sterling File Gateway: Specific Recommendations Checklist

Sterling File Gateway is installed on an instance of Sterling B2B Integrator, and shares many of the resources with the latter, including:

- Communication Adapters
- Business Processes
- Security Services
- Perimeter Services
- Encryption
- Decryption
- Account Management

You should, therefore, tune your Sterling B2B Integrator installation first, and then perform the Sterling File Gateway-specific tuning and troubleshooting tasks. Be aware that the changes you make to Sterling File Gateway can also affect the performance of Sterling B2B Integrator.

**Important:** Do not edit the properties files. Make all the changes in the `customer_overrides.properties` file. For example, to change the `pgpCmdLine2svcname` property, enter the following line in the `customer_overrides.properties` file:

```
filegateway.pgpCmdLine2svcname=CUSTOM
```

In this line, replace **CUSTOM** with the name of your Command Line 2 adapter. For more information about the `customer_overrides.properties` file, See *Using Property Files* in the Sterling B2B Integrator 5.1 online library.

The following table describes some of the key parameters that must be configured to optimize Sterling File Gateway performance.

In the following table, the Development (Dev) and Production (Prod) columns indicate whether the recommendations are Recommended (R), Critical (C), or Not Applicable (NA) in the development and production environments.

Recommendation	Dev	Prod	Comments
<p>If you are processing very large files, increase the probe values to avoid timeout conditions.</p> <p>Property:</p> <ul style="list-style-type: none"> <li>• filegateway.bpCompletionProbes.2</li> <li>• filegateway.bpCompletionSleepMsec.2</li> </ul>	R	R	<p>Timeouts and sleep intervals that control the period for which Sterling File Gateway waits for each of the sub-business process it invokes. The timeouts and sleep intervals control the timeouts when a business process is executed synchronously during routing. The types of business processes that run during routing are consumer identification and PGP processing. Setting the values for these properties also enables one set of relatively quick probes, followed by a second set of slower probes. The first set will be reactive, but consumes more processor capacity. The second set will be activated for longer-running processes and will consume less processor capacity.</p> <p>First, probe 120 times, with 100 milliseconds between each probe, for a total of 12 seconds.</p> <p>Default value:</p> <ul style="list-style-type: none"> <li>• bpCompletionProbes.1=120</li> <li>• bpCompletionSleepMsec.1=100</li> </ul> <p>Then, probe 600 times with 2000 milliseconds between each probe, for a total of 1200 seconds (20 minutes).</p> <p>Default value:</p> <ul style="list-style-type: none"> <li>• bpCompletionProbes.2=600</li> <li>• bpCompletionSleepMsec.2=2000</li> </ul>
<p>If you have a high volume of PGP traffic, you can improve your performance by specifying a group for the file gateway.</p> <p>Property: pgpCmdline2svcname</p>	R	R	<p>The name of the Command Line 2 adapter to be used for PGP packaging and unpackaging. You can override this property in the customer_overrides.properties file if a custom Command Line 2 adapter is used for PGP operations. You can also specify an adapter group name to balance the outbound PGP sessions load across multiple adapter instances.</p> <p>Default value: pgpCmdline2svcname=PGPCmdlineService</p>
<p>If you have very large files that will be processed by PGP, increase the value of:</p> <p>Property: fgRoutePGPCmdLineSocketTimeout</p>	R	R	<p>Timeout value, in milliseconds, for PGP package and unpackage operations invoked by Sterling File Gateway.</p> <p>Default value: 240000 milliseconds (4 minutes)</p>
<p>If you have high volumes of FTP traffic, you can improve your performance by specifying a group.</p> <p>Property: filegateway.ftpClientAdapterName</p>	R	R	<p>The FTP Client Adapter instance or service group that the FileGatewayDeliverFTP business process will use. You can override this property in the customer_overrides.properties file to use a custom FTP Client Adapter instance to contact trading partners. You can also specify an adapter group name to balance the outbound FTP sessions load across multiple adapter instances.</p> <p>Default value: ftpClientAdapterName=FTPClientAdapter</p>

Recommendation	Dev	Prod	Comments
<p>Decrease the evaluation frequency.</p> <p>Property:</p> <ul style="list-style-type: none"> <li>MailboxEvaluateAllAutomaticRules</li> </ul> <p>or</p> <ul style="list-style-type: none"> <li>MailboxEvaluateAllAutomaticRulesSubMin</li> </ul>	R	R	<p>You can enable either MailboxEvaluateAllAutomaticRules or MailboxEvaluateAllAutomaticRulesSubMin.</p> <p>MailboxEvaluateAllAutomaticRulesSubMin verifies the presence of routable messages once every 10 seconds, and can be edited for other intervals of less than one minute by modifying the MailboxEvaluateAllAutomaticRulesSubMin business process.</p> <p>MailboxEvaluateAllAutomaticRulesSubMin is recommended.</p>
<p>Suppress Duplicate Messages</p> <p>Property:</p> <p>mailbox.disallowDuplicateMessages=true</p>	R	R	Prevents duplicate messages from using system resources.
<p>Increase the number of steps a business process must complete prior to returning to the queue.</p> <p>Property: noapp.AE_ExecuteCycle.#</p>	R	R	<p>Number of steps involved in the completion of a business process before the business process returns to the queue. Higher values will accelerate individual business process execution, while lower values will provide smoother multitasking capabilities. Interactive use favors a lower number of steps, while batch processing favors a higher number of steps. The value of noapp.AE_ExecuteCycle.# can be different for each queue. # indicates the queue number.</p> <p>When a business process has one service to begin a protocol session and another service to use the protocol session, a very low AE_ExecuteCycle may lead many business processes to be in the queue, with only the first service running. This may result in many protocol sessions accumulating in an open state, and session limits being met sooner than is necessary.</p>
<p>Increase the time period that a business process can use a thread before releasing it to be used for another business process.</p> <p>Property: noapp.AE_ExecuteCycleTime.#</p>	R	R	<p>Maximum time period, in milliseconds, for which a business process can use a thread before releasing it for use by another business process. This value will override the value set for AE_ExecuteCycle. Tuning the value for this property ensures that a series of unusually slow steps will not tie up a thread completely. This value can be different for each queue. # indicates the queue number. A value that is too low may result in the accumulation of more sessions than are recommended.</p>
<p>Increase the number of concurrent threads.</p> <p>Property: noapp.MaxThreads</p>	R	R	<p>Total number of concurrent threads that Sterling File Gateway is allowed to use. This value is the total number of threads available to a workflow engine to execute business process steps. Other, nonworkflow engine threads do not come under the purview of this limit. For example, the threads set in fgRouteConcurrentSessionLimit do not come under the purview of this limit.</p>

Recommendation	Dev	Prod	Comments
<p>Increase the number of concurrent threads in HTTP sever adapters.</p> <p>Property: http.numOfmaxThread</p>	R	R	<p>If you have many concurrent users, you may find some degradation of performance. All HTTP server adapters in your Sterling B2B Integrator installation share the setting for maximum number of threads. To increase the maximum number of threads running at the same time, edit customer_overrides.properties to modify the following property:</p> <p>http.numOfmaxThread=X</p> <p>where X is the number of threads. The default value is 10. If your users are experiencing slow response when many concurrent connections have been made to the same port, increase this value to 50. Continue tuning this value until the system response is acceptable for the number of concurrent connections that must be supported. Setting this value too high could be detrimental to system stability when too many concurrent connections are made.</p>
<p>Set storage type.</p> <p>Property: filegateway_ui.storageType=file</p>	R	R	<p>File System is more efficient.</p> <p>Default value: database</p>
<p>Set persistence setting for business processes that perform protocol translation to System Default.</p>	C	C	<p>Business processes that must have persistence settings set to System Default:</p> <ul style="list-style-type: none"> <li>• FileGatewayRoutePGPPackageDocument</li> <li>• FileGatewayRoutePGPUncpackageDocument</li> <li>• User defined business processes used for translation of custom file layers</li> </ul>

## About Shared and Linked Mailboxes (Build 5102 and Later)

Sterling B2B Integrator supports shared and linked mailboxes.

The Shared mailbox functionality allows you to instantly share real-time data with trading partners. You can use the Linked mailbox functionality to link individual trading partner's mailboxes with one or more shared mailboxes. Linking trading partner mailboxes to shared mailboxes allows the trading partners to view real-time data stored in the shared mailboxes. In other words, a linked mailbox provides a link to view data in a shared mailbox. The linked mailbox has a read-only copy of the data in the shared mailbox and data in the linked mailbox cannot be modified or deleted.

To enable the shared and linked mailbox functionality, set the following property:  
`mailbox.enableSharedLinkedMailboxes=true`

in the `customer_overrides.properties` file. By default, this property is set to false.

Full documentation on the shared and linked mailbox feature can be found in the Sterling B2B Integrator 5.1 online library.

Sterling File Gateway either creates new or reuses existing mailboxes as necessary to support producer drop off and consumer pick up of messages for a routing channel. Sterling File Gateway does not create or update any mailbox to be shared

or linked. Sterling File Gateway will, however, reuse an existing shared or linked mailbox within the usage constraints placed upon those mailboxes. The constraints upon shared/linked mailboxes are documented in the Sterling B2B Integrator online library, and should be reviewed in detail for compatibility with the intended usage by Sterling File Gateway and the respective partners. For example, linked mailboxes are read only and would not be suitable for use as either a routing channel producer or consumer mailbox since there would be no way to add messages to that mailbox. A shared mailbox could be used, but a system administrator would be responsible for creating the shared and linked mailboxes, aligning the routing channel and routing channel template with them, and establishing appropriate user permissions on the linked mailboxes.

To protect system integrity, Sterling File Gateway does not allow a Partner mailbox to be changed to type "shared" whether by UI, import, or other method. Any mailbox whose top level is a Sterling File Gateway Partner name is considered a Partner mailbox. If a shared mailbox is meant to participate in a routing channel it must be created in Sterling B2B Integrator in an alternate mailbox location and administered separately.

Sterling File Gateway does not allow creation of a routing channel if due to preexisting configuration the routing channel would use a linked producer or consumer mailbox. Since these mailboxes would not be writable they are not suitable for this use in routing channels.

---

## Setting Up HTTPS for myFileGateway

### About this task

To run myFileGateway inside your secure network, no configuration is required. An HTTP Server adapter configuration (named Http Server Adapter) comes with Sterling File Gateway that enables the clients on the same network as Sterling File Gateway to access myFileGateway.

To run myFileGateway in a DMZ, an HTTP Server adapter must be configured that uses a remote perimeter server.

After a Perimeter Server has been configured in Sterling B2B Integrator, its name is available to the HTTP Server adapter configuration, in the Perimeter Server Name list on the HTTP Connection Properties page.

**Restriction:** You cannot deploy Sterling File Gateway on an HTTP server adapter. Only myFileGateway is installed on an HTTP server adapter.

To configure myFileGateway to run in the DMZ:

### Procedure

1. Set up a perimeter server in the DMZ.
2. Configure a new Perimeter Server in Sterling B2B Integrator. The port specified in the Perimeter Server configuration must *not* be the HTTP listen port (to which trading partners are expected to connect), which is specified in a subsequent stage.
3. Ensure that the remote perimeter server is running.
4. Create a new instance of the HTTP Server Adapter configuration.
  - a. Log into Sterling File Gateway as a system administrator.

- b. Select **Tools > B2B Console**.
  - c. From the Sterling B2B Integrator Admin menu, select **Deployment > Services > Configuration**.
  - d. Under **Create**, next to **New Service**, click **Go!**
  - e. For **Service Type**, open the **List View**, select **HTTP Server Adapter > Save**, then **Next**.
  - f. Give the adapter a new unique name and description. If you are using a clustered environment, from the **Environment** list, select the node where the remote perimeter server is to be assigned. Click **Next**.
  - g. For the **HTTP Listen Port**, specify the port that the Partner is expected to connect to. This port must not be used by a different application on the computer that the remote perimeter server is installed on. No two HTTP Server adapter configurations can listen on the same port on the same remote perimeter server computer. The default port for Sterling File Gateway is 33, so select a different port number.
  - h. From the **Perimeter Server Name** list, select the name of the Perimeter Server (previously configured) that corresponds to the specific remote perimeter server to be used. The name is in the format `node & name`, where `name` is what you specified.
  - i. For **Total Business Process queue depth threshold**, enter a number of business processes to allow in queue. The value of this setting has no effect if Sterling File Gateway is the only application hosted on this HTTP Server adapter, because Sterling File Gateway does not initiate business processes.
  - j. For **Document Storage** and **User Authentication Required**, you can accept the default or change to match your system.
  - k. For **Use SSL**, select **Must** to implement stronger security. Click **Next**. See *Implementing SSL* for more information about settings for the SSL Settings page. Click **Next**.
  - l. On the Services Configuration page, click **add**, type the URI `/myfilegateway`.
  - m. Select **War File**. Click **Next**.
  - n. **Enter the War File Path**. The `myFileGateway` war file is located at `<install dir>\SI\container\Applications\myfilegateway.war`. (For UNIX, `<install dir>/container/Applications/myfilegateway.war`.)
  - o. Click **Save**.
  - p. In the **Confirm** page, verify that all parameters are as specified.
  - q. Ensure the **Enable Service for Business Process** check box enabled.
  - r. Click **Finish**.
5. If you have access to the computer on which the remote perimeter server is running, log in to that computer and run the following command:
 

```
netstat -an | grep <httpListenPort>
```

 where `<httpListenPort>` is the port previously specified. If a row is found that reads, `LISTEN`, the HTTP Server adapter is ready to handle requests from external clients.
  6. Verify that the HTTP Server adapter is listening and that `myFileGateway` is configured correctly by pointing an HTTP browser to the following URL:
 

```
https://<host>:<httpListenPort>/myfilegateway
```

 where `<host>` is the IP address or host name of the computer where the remote perimeter server is running and `<httpListenPort>` is the port previously specified. The `myFileGateway` login page is displayed, requesting the user name and password to use with `myFileGateway`. If instead the browser encounters a connection error, verify that `<httpListenPort>` is being listened on

by the HTTP Server Adapter instance created above. Verify that some other application has not reserved this port. To do this, disable the HTTP Server adapter and verify that this port is not being listened on. If it is, find the application that has the port bound and shut it down. Alternately, select a different HTTP Listen Port and try again. Set your browser options to select TLS 1.0 (in the browser's Advanced tab).

## What to do next

If you have many concurrent users, you may find some degradation of performance. All HTTP server adapters in your Sterling B2B Integrator installation share the setting for maximum number of threads that they will consume. To increase the maximum number of threads running at the same time, edit `customer_overrides.properties` to modify the following property:

```
http.numOfmaxThread=X
```

where X is the number of threads. The default value is 10. If your users experience slow response when many concurrent connections have been made to the same port, increase this value to 50. Continue tuning this value until the system response is acceptable for the number of concurrent connections that must be supported. Setting this value too high could be detrimental to system stability when too many concurrent connections are made.

---

## Adding Custom Event Codes (Build 5102 and Later)

You can add custom events to Sterling File Gateway that are associated with any custom protocols and business processes you create. You will need a code, a name, and a description for each event you want to create, as well as permission and subscription settings.

### About this task

To add custom event codes:

### Procedure

1. Open or create a file named `<install_dir>/properties/customer_overrides.properties`.
2. Add entries in the `customer_overrides.properties` file with the appropriate details about the custom event codes you are creating. Your new event will be a series of properties describing attributes of the event. See the `filegateway_eventcodes.properties` file for examples. Do not edit the `filegateway_eventcodes.properties` file. Use the example as a model:

```
filegateway_eventcodes.CUST_0265.name=  
filegateway_eventcodes.CUST_0265.attributes=  
filegateway_eventcodes.CUST_0265.text=  
filegateway_eventcodes.CUST_0265.description=  
filegateway_eventcodes.CUST_0265.permissions=
```

- Event Code: The event code in the example above is CUST\_0265. It consists of keyword underscore 4-digit code. It is used to identify all the attributes for a particular event code. Required.
  - Keyword - any text, optimally 4 characters long, but cannot be FG\_ nor AFT\_. In the example, the keyword is CUST.
  - 4-digit Code - consists of two 2-digit codes - a category identifier and a unique identifier. No two events can have the same 4-digit code.

- Category Identifier - The first 2-digit code is a category identifier. You can use a system-defined category or create your own 2-digit code to categorize your codes in a way that is convenient for you. In the example, the category identifier is 02. The following table provides the system-defined category codes:

Code	Category
00	Producer File Transfer
02	Routing Business Process
04	File Gateway General
05	Route Plan Determination
06	File Transformation
07	Consumer File Transfer

- Unique Identifier - The second 2-digit code is the unique identifier for the event within the category. 00 to 49 are successful events and 50 to 99 are error events. Error events display in red in Sterling File Gateway. You cannot exceed 99 event codes in a category. In the example, the unique identifier is 65.
- <EventCode>.name - This is the name of your event. It will be shown in the subscription UI (**Profile > Notifications**) if subscriptions are enabled, and in the log. Required.
- <EventCode>.attributes - A comma-delimited list of attributes for this event. While any attribute can be passed into the event, only these attributes will be stored in the database, will be searchable through the UI, and are usable in the event text defined below. They are generally indexed with the first one in the list having an index of 0. The attribute names must be names that can be passed as an xml element (no special characters, no spaces). This property is required but the list can be empty.
- <EventCode>.text - This property contains the text that displays in the UI when this event is viewed. It can contain text and is generally limited by the Java™ Format rules (for example, in order to have a single quote, you must put two of them right next to each other.) You can also use attributes above by using the notation {#} which will substitute in the UI the value of the attribute at the index of the #. You do not have to use attributes, the user in the UI can click the event and see all the attributes and they will still be searchable. So you can send in and store more attributes than you might want to show in the UI. Required.
- <EventCode>.description - This description is shown in the subscription UI (**Profile > Notifications**). Required.
- <EventCode>.permissions - This is a comma-delimited list of permissions for this event. There are three possible values to use: producer, consumer, subscription. This property is required but it can be empty. Empty means that only the Operator can see the event, and no one can subscribe for notifications to the event.
  - producer - This event can be seen by the producer for this route, and the producer receives notifications if subscribed.
  - consumer - This event can be seen by the consumer for this route, and the consumer receives notifications if subscribed.
  - subscription - This event can be subscribed to. After the subscription is selected for an event, the producer or consumer receives notification of the event if the event has the corresponding producer or consumer permission

AND the subscription permission. For a Operator to subscribe to an event, the event must have the subscription permission.

- EventNotificationEmailSubject - This is the subject line for the email notifications when events occurs. This applies to all event codes for your system. The default value is File Gateway Routing Event E-mail Notification [Event Code = {0}], where 0 is the four-digit identifier for the event code.
- EventNotificationEmailContentType - This specifies the content type for the email notification when the event occurs. This applies to all event codes for your system. Valid values are text/plain and html. The default is text/plain.

**Fast path:** See the `<install_dir>/properties/filegateway_eventcodes.properties` file as an example for how to structure your event properties. Do not edit the `filegateway_eventcodes.properties` file. See Using Property Files.

3. Save the `customer_overrides.properties` file and restart Sterling File Gateway for the new file to take effect.
4. Edit your business process that generates the new event codes to call the `FileGatewayRouteEventService`, with the proper parameters, including the new custom event codes.
5. Add the `FileGatewayRouteEventService`, with the proper parameters, including the new custom event code. The following example records a hypothetical event:

```
<operation>
  <participant name=" FileGatewayRouteEventService "/>
  <output message="Output">
    <assign to="EventCode">CUST_0265</assign>
    <assign to="ExceptionLevel">Normal</assign>
    <assign to="EventAttributes/Directory"
      from="directory/text()" append="true"/>
    <assign to="EventAttributes/Comment" >
      BP changed directories</assign>
    <assign to="." from="*"></assign>
  </output>
  <input message="Input">
    <assign to="." from="*"></assign>
  </input>
</operation>
```

To send attributes to the `FileGatewayRouteEventService`, use the following guidelines. These guidelines only apply to the `EventAttributes`, not to other parameters of the service:

- The attributes will be sent to the service as a series of assigns. They need to be a series of assigns in order to support the advanced event attribute naming of Sterling File Gateway.
- The first assign must have an attribute `append="true"`. This will append the `EventAttributes` the first time. The remaining assigns cannot have the `append` attribute.
  - Hardcoded Values. If you want to send a hardcoded attribute value to the service (for example, `IsError=true`, when you know it will be true every time) then use the following assign statement template:

```
<assign to="EventAttributes/IsError"
  from="string('true')" />
```
  - Process Data. If you want to send an attribute that is copied from another attribute in the service (for example, the results of another service, stored in the `ProcessData` at `MyService/ResultCode`) then use the following assign statement template:

```
<assign to="EventAttributes/MyServiceResultCode"
from="MyService/ResultCode/text()" />
```

You can combine those two methods to send both types of attributes into the service, adding the append to the first one:

```
<assign to="EventAttributes/IsError"
from="string('true')" append="true" />
<assign to="EventAttributes/MyServiceResultCode"
from="MyService/ResultCode/text()" />
```

## Example Section in `customer_overrides.properties` File

**Remember:** Although the example below shows the items displaying on multiple lines, do not do so in your implementation.

```
filegateway_eventcodes.CUST_0265.name=Custom Event - File Error
filegateway_eventcodes.CUST_0265.attributes=ConsumerName,MyServiceResultCode,
IDNumber
filegateway_eventcodes.CUST_0265.text=File Error generated during processing:
Result code:
    {1} reported for File ID
    {2} received for Consumer {0}
filegateway_eventcodes.CUST_0265.description=Event from Custom BP generated when
error occurs
filegateway_eventcodes.CUST_0265.permissions=producer,consumer,subscription
```

---

## Deploying myFileGateway within an iFrame (Build 5102 and Later)

You can deploy myFileGateway within an iFrame.

### About this task

There are specific parameters and guidelines that must be followed to deploy *myFileGateway* in an iFrame:

- The `<iframe>` block must be well-formed (that is, every use of `<iframe>` must be closed by `</iframe>`).
- Change references in any JavaScript page to “top” to refer to the encapsulating page.
- The source HTML file that contains the iFrame must be hosted on the same server domain that hosts myFileGateway. If the iFrame file and myFileGateway are hosted on separate servers, users accessing myFileGateway with Apple Safari browsers may receive a message that the session has expired due to inactivity.
- Although a minimum of 800 x 500 pixels resolution for the encapsulating page will work, 950 x 600 pixels or greater is preferred.
- If any new extensions are created, ensure you reference “.top” if the window DOM hierarchy is needed, since this may refer to the encapsulating page.

Set the doctype appropriately. For example:

```
<DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd">
```

### Procedure

1. Set the doctype appropriately. For example:

```
<DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd">
```

2. Specify the iFrame tag.

## Example

The following example is an HTML file that could be used to implement *myFileGateway* in an `<iFrame>`:

```
<DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd">
<html>
  <head>
    <title>Test Page for SFG within an iframe</title>
    <style type="text/css">
      <!--
      body {
        font-family: Arial, Helvetica, sans-serif;
        font-size: 12px;
        font-style: normal;
        color: #FFFFFF;
      }
      -->
    </style>
  </head>
  <body>
    <div style="WIDTH:100%;HEIGHT:30;BACKGROUND-COLOR:#000099">
      NON-SFG Application Area 1
    </div>
    <iframe frameborder="0" title="Secure File Transfer" src="/myfilegateway/"
    style="WIDTH:100%;HEIGHT:100%" hastray="true" fullpage="true"></iframe>
    <div style="WIDTH:100%;HEIGHT:30;BACKGROUND-COLOR:#000099">
      NON-SFG Application Area 2
    </div>
  </body>
</html>
```

---

## Improving Loading Time for myFileGateway

To improve latency from the time *myFileGateway* is requested until the log in page is rendered, externalize the *myFileGateway* skin directory assets on servers in closer proximity to users accessing *myFileGateway*.

### About this task

The *myfilegateway.war* file is built from the contents of the `<install_dir>/container/Applications/myfilegateway` directory, which in turn contains several files named `load_skin.js`. Locate:

```
container/Applications/myfilegateway/isomorphic/skins/CustomSkin/load_skin.js
```

To externalize the *myFileGateway* skin directory assets:

### Procedure

1. Make a copy of the *FileGateway* skin directory at:  
`container/Applications/myfilegateway/isomorphic/skins/`
2. If you have rebranded *myFileGateway*, there will be an additional directory that contains `load_skin.js`, which for the purposes of illustration will be assumed to be:  
`container/Applications/myFileGateway/isomorphic/skins/CustomSkin`
3. Edit `container/Applications/myfilegateway/isomorphic/skins/CustomSkin/load_skin.js` and replace:  
`isc.Page.setSkinDir("[ISOMORPHIC]/skins/CustomSkin/")`  
with

```
isc.Page.setSkinDir("https://servername:portnumber  
/myfilegatewayparts/isomorphic/skins/CustomSkin")
```

4. Install the skin directory on the server that you are pointing to with the `isc.page.setSkinDir` line.
5. You or a vendor can stage the files on geographically dispersed web servers, so that users in distant locations have less lag time to access the skin files and use `myFileGateway`. In this case, each user thinks they are accessing `https://servername:portnumber` but in reality, they access a different server based upon their geographic location, from which they can download files quicker.

---

## Adding Custom Protocols

You can add support for custom protocols for listening consumers in addition to the ones preconfigured in Sterling File Gateway.

### About this task

The information you provide in performing this procedure determines the text displayed in the Partner management wizard. That is, after you perform this procedure, new choices are available for protocols offered by Sterling File Gateway when creating a community and when creating a listening consumer in a community that is configured for the custom protocol.

### Procedure

1. Write a business process that implements the custom protocol. The business process name must be unique for each custom protocol. Do not use an underscore character (`_`) in the name of the business process.
2. Use the existing `AFTEExtensions.xml` as a guide to create an `AFTEExtensionsCustomer.xml` file to describe the protocol. Do not edit the `AFTEExtensions.xml` file. The `AFTEExtensions.xml` file is located in the following directory: `<install_dir>/container/Applications/aft/WEB-INF/classes/resources/xml`.
3. Save the `AFTEExtensionsCustomer.xml` file to the same directory as `AFTEExtensions.xml`.
4. Use the existing `AFTEExtensions.properties` file as a guide to create the `AFTEExtensionsCustomer.properties` file. Do not edit the `AFTEExtensions.properties` file. The `AFTEExtensions.properties` is located in the following directory: `<install_dir>/container/Applications/aft/WEB-INF/classes/resources`. The user interface elements to describe the protocol are specified in the `htmlType` parameter. Valid values are:
  - `text`
  - `password`
  - `select` - When "select" is chosen for `htmlType`, the UI presents a list whose contents are derived from an "options" class. An example of an "options" class list is in the `AFTEExtensions.xml` file (the text starts with "`<OPTION name="SSHRemoteProfiles" class="`")
5. Copy the `AFTEExtensionsCustomer.properties` file to: `<install_dir>/container/Applications/aft/WEB-INF/classes/resources`
6. Reference the business process you created in step 1 in a new `AFTEExtension` element in the `AFTEExtensionsCustomer.xml` file.
7. Stop Sterling File Gateway.
8. Run `<install_dir>/bin/setupfiles.sh`.

9. Run `<install_dir>/bin/deployer.sh`.
10. Start Sterling File Gateway. The additional protocol will be available when adding and editing communities. After this protocol has been chosen for a community, it then becomes available when creating and editing partners in that community.

---

## About Custom File Layer Types

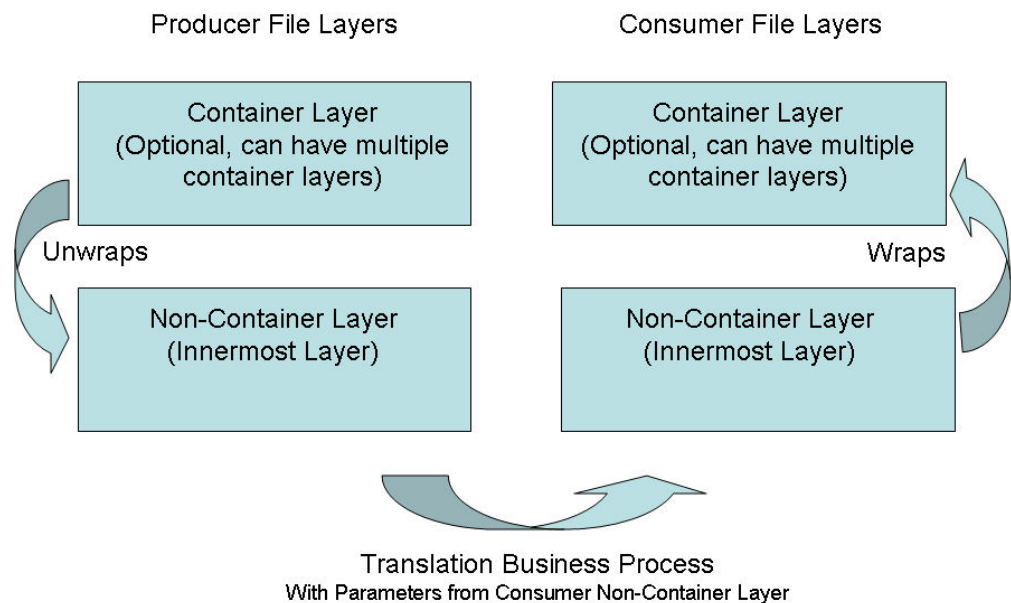

Routing channel templates use file layer types to describe producer and consumer file structures. The following file types are supported when you install:

- Container type layers - contain other container or non-container layers. For example, a PGP layer can contain a ZIP layer and a ZIP layer can contain a TEXT layer. The standard container types are:
  - ZIP
  - GZIP
  - PGP

**Restriction:** A zip layer can only contain multiple files if it is the outermost layer.

- Non-container type layers - or primitive, do not contain any nested layers. The standard non-container layers are:
  - Text
  - Unknown

The following graphic shows the relationship between the file layers for the producer and the consumer and the processing that Sterling File Gateway performs between each layer:

### Restrictions for Custom File Layer Types

The following constraints apply to custom file layer types:

- Custom file layer types can be container or non-container types.

- A custom file layer type can be used for the producer layer, the consumer layer, or both.
- A custom container layer type must be configured with a business process that will perform the appropriate function on the container layer.
- A custom non-container layer type on the producer side may map to a custom non-container layer type on the consumer side, but a business process must be specified to perform the appropriate translation from one format to the other.
- The name provided for custom file layer types must begin with "FGC\_". This indicates that table entries for the LAYER\_TYPE column in the FG\_P\_FLR\_TYPE and FG\_C\_FLR\_TYPE tables must begin with "FGC\_". The maximum length for LAYER\_TYPE is 10 characters, including the "FGC\_".
- You can define a maximum of 100 custom layers types, and each type can have a maximum of 10 parameters, including the required parameters.
- All parameter values for custom file layer type tables should conform to the corresponding maximum character length specified in the tables below.
- Every producer file layer type must specify the parameters in the following table for the producer file structure in the FG\_P\_FLR\_PRM\_TYPE table and FgProducerFileLayerParameterType XML element:

Ordinal Value	Parameter
0	File name pattern as regular expression
1	File name pattern group fact names, comma delimited

- Every consumer file layer type must specify the parameter in the following table for the consumer file structure in the FG\_C\_FLR\_PRM\_TYPE table and FgConsumerFileLayerParameterType XML element:

Ordinal Value	Parameter
0	File name format

- Parameters that correspond to ordinal value 0 are displayed in bold in the UI and are required. Other parameters added for custom file layer types cannot be specified to display in bold.
- You cannot can be edit or delete a file layer type if it is used in a template.

## Business Processes Used for Custom File Layers

To create custom file layer types, create the business processes to perform the functions on the custom layers.

- Translation - converts a file in the producer non-container layer to a file in the consumer non-container layer
- Container layer transformation - unwraps the producer container layer to reveal the files within it
- Container layer creation - creates the consumer container layer
- Consumer identification - defines the manner in which the characteristics of the layer identify the consumer to deliver it to

Plan the mappings from your layers in the following sequence:

- Producer container
- Producer non-container
- Consumer non-container

- Consumer container

Sterling File Gateway invokes custom file layer business processes synchronously, waiting for each business process to complete before continuing with the next one. Consequently, all business processes that operate on custom file layers must:

- Complete as quickly as possible. While Sterling File Gateway waits for the business process to complete, finite resources like threads and memory are utilized. The longer the custom file layer business process waits, the longer Sterling File Gateway must wait. This use of resources reduces overall performance and throughput.
- Do not call the Sleep service or the Wait service from the business process.
- Set recovery levels to "manual". Settings of "auto recover" and "auto resume" slow down recovery after a shutdown.

Consumer identification business processes must also:

- Not manipulate the document, such as changing its name. While doing this may work in specific circumstances, future releases may change that behavior. What Sterling File Gateway does or does not do with the document after calling the consumer identification business process should be treated as an implementation detail subject to change.
- Not be coded to handle the case where the consumer cannot be found; if the ConsumerName element is empty or missing, Sterling File Gateway raises the appropriate event to report that the consumer could not be determined.

## Container File Layer Types for Producer File Structure

To add a container file layer type for the Producer File Structure, three tables must be updated:

- FG\_P\_FLR\_TYPE
- FG\_P\_FLR\_PRM\_TYPE
- FG\_P\_FLR\_TRANS

*Table 1. FG\_P\_FLR\_TYPE.* This table specifies the new file layer type. The value provided in this table for P\_FLR\_TYPE\_KEY will need to be repeated in the FG\_P\_FLR\_PRM\_TYPE and FG\_P\_FLR\_TRANS tables to properly configure a custom file layer type. This table contains the following parameters:

Parameter	Example	Where in UI	Type	Max Characters
P_FLR_TYPE_KEY	DR13D_GUID	Not visible	char	24
LAYER_TYPE	FGC_DR13D	Not visible	varchar	10
IS_CONTAINER	Y	If Y, PFS configuration requires selection of inner layer type	char	1
CONTAINS_NAME	N	Not visible	char	1
DISP_LABEL	Double Rot13 Decrypt	Not visible	varchar	255
DESCRIPTION	Double Rot13 Decrypt	File layer drop down menu	varchar	255
LOCKID	0	Not visible	int	5
CREATETS	2008-09-22 17:48:45	Not visible	datetime	19
MODIFYTS	2008-09-22 17:48:45	Not visible	datetime	19
CREATEUSERID	SYSTEM	Not visible	varchar	40
MODIFYUSERID	SYSTEM	Not visible	varchar	40

*Table 1. FG\_P\_FLR\_TYPE (continued).* This table specifies the new file layer type. The value provided in this table for P\_FLR\_TYPE\_KEY will need to be repeated in the FG\_P\_FLR\_PRM\_TYPE and FG\_P\_FLR\_TRANS tables to properly configure a custom file layer type. This table contains the following parameters:

Parameter	Example	Where in UI	Type	Max Characters
CREATEPROGID	XMLMigrator	Not visible	varchar	40
MODIFYPROGID	XMLMigrator	Not visible	varchar	40

*Table 2. FG\_P\_FLR\_PRM\_TYPE.* This table specifies the individual parameters for the new producer file layer type. Multiple entries may be made for any file layer type. At least two entries are required for the two parameters that are automatically displayed with standard producer file layer types:

- File name pattern as regular expression
- File name pattern group fact names, comma delimited. Each entry for a file layer type requires a new ordinal, increasing in increments of one. Parameters are displayed in the UI in the order indicated by the ordinal (0 is the first parameter in the UI, 1 is the second, and so forth).

The FG\_P\_FLR\_PRM\_TYPE table must specify a value for the P\_FLR\_TYPE\_KEY parameter that matches the value for the P\_FLR\_TYPE\_KEY parameter in the FG\_P\_FLR\_TYPE table.

Parameter Name	Example 1	Example 2	Where Visible in the UI	Type	Max Characters
P_FLR_PRM_TYPE_KEY	DR13D_FP_GUID	DR13D_FPF_GUID	Not visible	char	24
P_FLR_TYPE_KEY	DR13D_GUID	DR13D_GUID	Not visible	char	24
ORDINAL	0	1	Controls order of appearance in UI for PFS configuration	int	9
DESCRIPTION	File name pattern as regular expression	File name pattern group fact names, comma delimited	PFS configuration	varchar	255
DISPLAY_TYPE	String	String	Not visible	varchar	255
DISPLAY_LABEL	File name pattern	File name pattern fact names	Not visible	varchar	255
PARAM_NAME	FILENAME_PATTERN	FILENAME_PATTERN_FACTNAMES	Not visible	varchar	255
DEFAULT_VALUE	.+	null	Not visible	varchar	255
ALLOWABLE_VALUES	null	null	Not visible	varchar	255
LOCKID	0	0	Not visible	int	5
CREATETS	2008-09-22 17:48:45	2008-09-22 17:48:45	Not visible	datetime	19
MODIFYTS	2008-09-22 17:48:45	2008-09-22 17:48:45	Not visible	datetime	19
CREATEUSERID	SYSTEM	SYSTEM	Not visible	varchar	40
MODIFYUSERID	SYSTEM	SYSTEM	Not visible	varchar	40

## Non-Container File Layer Types for Producer File Structure

Creating a non-container file layer type is similar to creating a container file layer type, with two exceptions:

- The value for the IS\_CONTAINER parameter in the FG\_P\_FLR\_TYPE should be set to N (No).
- An entry must be made in a new table, FG\_C\_FLR\_TRANS, instead of the FG\_P\_FLR\_TRANS table.

To add a non-container file layer type for the Producer File Structure, three tables must be updated:

- FG\_P\_FLR\_TYPE
- FG\_P\_FLR\_PRM\_TYPE
- FG\_C\_FLR\_TRANS

*Table 4. FG\_P\_FLR\_TYPE.* This table specifies the new producer file layer type.

Parameter Name	Example	Where Visible in the UI	Type	Max Characters
P_FLR_TYPE_KEY	BLOCK_GUID	Not visible	char	24
LAYER_TYPE	FGC_BLOCK	Not visible	varchar	10
IS_CONTAINER	N	If N, PFS configuration recognizes as inner layer type	char	1
CONTAINS_NAME	N	Not visible	char	1
DISP_LABEL	Blocked Text	File layer drop down menu	varchar	255
DESCRIPTION	Blocked Text Description	Not visible	varchar	255
LOCKID	0	Not visible	int	5
CREATETS	2008-09-22 17:48:45	Not visible	datetime	19
MODIFYTS	2008-09-22 17:48:45	Not visible	datetime	19
CREATEUSERID	SYSTEM	Not visible	varchar	40
MODIFYUSERID	SYSTEM	Not visible	varchar	40
CREATEPROGID	XMLMigrator	Not visible	varchar	40
MODIFYPROGID	XMLMigrator	Not visible	varchar	40

*Table 5. FG\_P\_FLR\_PRM\_TYPE.* This table specifies the individual parameters for the new file layer type. Multiple entries may be made for any file layer type. At least two entries are required for the two parameters that are automatically displayed with standard file layer types:

- File name pattern as regular expression
- File name pattern group fact names, comma delimited. Each entry for a file layer type requires a new ordinal, increasing in increments of one. Parameters are displayed in the UI in the order indicated by the ordinal (0 is the first parameter in the UI, 1 is the second, and so forth).

This table must specify a value for the P\_FLR\_TYPE\_KEY parameter that matches the value for the P\_FLR\_TYPE\_KEY parameter in the FG\_P\_FLR\_TYPE table.

**Restriction:** DEFAULT\_VALUE and ALLOWABLE\_VALUES are required to be in the table, but are not supported in the application.

Parameter Name	Example 1	Example 2	Where Visible in the UI	Type	Max Characters
P_FLR_PRM_TYPE_KEY	BLOCK_FP_GUID	BLOCK_FPF_GUID	Not visible	char	24
P_FLR_TYPE_KEY	BLOCK_GUID	BLOCK_GUID	Not visible	char	24
ORDINAL	0	1	Controls order of appearance in UI for PFS configuration	int	9
DESCRIPTION	File name pattern as regular expression	File name pattern group fact names, comma delimited	PFS configuration	varchar	255
DISPLAY_TYPE	String	String	Not visible	varchar	255
DISPLAY_LABEL	File name pattern	File name pattern fact names	Not visible	varchar	255
PARAM_NAME	FILENAME_PATTERN	FILENAME_PATTERN_FACTNAMES	Not visible	varchar	255
DEFAULT_VALUE	.+	null	Not visible	varchar	255
ALLOWABLE_VALUES	null	null	Not visible	varchar	255
LOCKID	0	0	Not visible	int	5
CREATETS	2008-09-22 17:48:45	2008-09-22 17:48:45	Not visible	datetime	19

MODIFYUSERID	SYSTEM	SYSTEM	Not visible	varchar	40
CREATEPROGID	XMLMigrator	XMLMigrator	Not visible	varchar	40
MODIFYPROGID	XMLMigrator	XMLMigrator	Not visible	varchar	40

*Table 6. FG\_C\_FLR\_TRANS.* This table specifies the legitimate mapping between the producer and consumer inner layers. Only layers with a defined mapping can be configured in the routing channel template. It also specifies the business process that should be used to perform the work necessary to translate the producer file layer type into the corresponding consumer file layer type. This table must be provided a value for the P\_FLR\_TYPE\_KEY parameter that matches the value for the P\_FLR\_TYPE\_KEY parameter in the FG\_P\_FLR\_TYPE table and a value for the C\_FLR\_TYPE\_KEY parameter that matches the value for the C\_FLR\_TYPE\_KEY parameter in the FG\_C\_FLR\_TYPE table. The consumer file layer type specified is required to be a custom type.

Parameter Name	Example	Where Visible in the UI	Type	Max Characters
C_FLR_TRANS_KEY	asdfnlsadjfs_GUID	Not visible	char	24
P_FLR_TYPE_KEY	BLOCK_GUID	Not visible	char	24
C_FLR_TYPE_KEY	STREAM_GUID	Not visible	char	24
BP_NAME	BaseMFT_Preprocessor	Not visible	varchar	255
LOCKID	0	Not visible	int	5
CREATETS	2008-09-22 17:48:45	Not visible	datetime	19
MODIFYTS	2008-09-22 17:48:45	Not visible	datetime	19

*Table 6. FG\_C\_FLR\_TRANS (continued).* This table specifies the legitimate mapping between the producer and consumer inner layers. Only layers with a defined mapping can be configured in the routing channel template. It also specifies the business process that should be used to perform the work necessary to translate the producer file layer type into the corresponding consumer file layer type. This table must be provided a value for the P\_FLR\_TYPE\_KEY parameter that matches the value for the P\_FLR\_TYPE\_KEY parameter in the FG\_P\_FLR\_TYPE table and a value for the C\_FLR\_TYPE\_KEY parameter that matches the value for the C\_FLR\_TYPE\_KEY parameter in the FG\_C\_FLR\_TYPE table. The consumer file layer type specified is required to be a custom type.

Parameter Name	Example	Where Visible in the UI	Type	Max Characters
CREATEUSERID	admin	Not visible	varchar	40
MODIFYUSERID	admin	Not visible	varchar	40
CREATEPROGID	admin	Not visible	varchar	40
MODIFYPROGID	admin	Not visible	varchar	40

## Container File Layer Types for Consumer File Structure

To add a container file layer type for the Consumer File Structure, three tables must be updated:

- FG\_C\_FLR\_TYPE
- FG\_C\_FLR\_PRM\_TYPE
- FG\_C\_FLR\_TRANS

*Table 7. FG\_C\_FLR\_TYPE.* This table specifies the new file layer type.

Parameter Name	Example	Where Visible in the UI	Type	Max Characters
C_FLR_TYPE_KEY	DR13E_GUID	Not visible	char	24
LAYER_TYPE	FGC_DR13E	Not visible	varchar	10
IS_CONTAINER	Y	If Y, PFS configuration requires selection of inner layer type	varchar	10
DISP_LABEL	Double Rot13 Encryption	File layer drop down menu	varchar	255
DESCRIPTION	Double Rot13 Encryption Description	Not visible	varchar	255
LOCKID	0	Not visible	int	5
CREATETS	2008-09-22 17:48:45	Not visible	datetime	19
MODIFYTS	2008-09-22 17:48:45	Not visible	datetime	19

## Adding Custom File Layer Types

System Administrators can add custom file layer types to supplement the supplied file layer types (ZIP, GZIP, PGP, Text, and Unknown).

### Before you begin

This procedure is for advanced users with a knowledge of XAPIs and APIs.

### About this task

The following procedure creates some example file layers to demonstrate the process. The specific XML will be different when you create different custom file layers. To create the example custom file layers:

### Procedure

1. Create a business process named FileGatewayCustomLayerXAPI with the following BPML:

```
<process name="FileGatewayCustomLayerXAPI">
  <!--
  This business process can be used to manage File
  Gateway Custom Layers.
  -->
  <sequence name="Begin Process">
    <operation name="XAPIServiceType">
      <participant name="XAPIService"/>
      <output message="XAPIServiceTypeInputMessage">
        <assign to="api">multiApi</assign>
        <assign to="." from="*"></assign>
      </output>
      <input message="inmsg">
        <assign to="." from="*"></assign>
      </input>
    </operation>
  </sequence>
</process>
```

2. Using a text editor, create a file named CreateCustomLayersSampleBPInput\_EX.xml. Copy and paste the following contents into the XML file, removing any page breaks:

```
<MultiApi>
<API Name="manageFgProducerFileLayerType">
<!-- This API affects the first Producer File Layer Type
and the Parameter types associated with it. See the
FG_P_FLR_TYPE, FG_P_FLR_PRM_TYPE, and FG_P_FLR_TRANS
table information below. -->
<Input>
<FgProducerFileLayerType ContainsName="N"
Description="EX Prod Container"
DisplayLabel="EX Prod Container " IsContainer="Y"
LayerType="FGC_EXPCON" Lockid="0"
ProducerFileLayerTypeKey="EXPCON_GUID">
<FgProducerFileLayerParameterTypeList
TotalNumberOfRecords="3">
<FgProducerFileLayerParameterType DefaultValue="."+
Description="File name pattern as regular expression"
DisplayLabel="File name pattern"
DisplayType="String" Ordinal="0"
ParameterName="FILENAME_PATTERN"
ProducerFileLayerParameterTypeKey="EXPCON_P1_GUID"
ProducerFileLayerTypeKey="EXPCON_GUID" />
<FgProducerFileLayerParameterType Description=
"File name pattern group fact names, comma delimited"
```

```

        DisplayLabel="File name pattern fact names"
        DisplayType="String" Ordinal="1"
        ParameterName="FILENAME_PATTERN_FACTNAMES"
        ProducerFileLayerParameterTypeKey="EXPCON_P2_GUID"
        ProducerFileLayerTypeKey="EXPCON_GUID" />
<FgProducerFileLayerParameterType
  Description="Spin value for encryption"
  DisplayLabel="Spin"
  DisplayType="String" Ordinal="2"
  ParameterName="EncryptionSpin"

</API>
<API Name="manageFgConsumerFileLayerTranslation">
    <Input>
        <FgConsumerFileLayerTranslation
            BusinessProcessName="CustomBP1"
            ConsumerFileLayerTranslationKey=
                "EXCTRAN2_GUID"
            ConsumerFileLayerTypeKey="EXCCON_GUID"
            ProducerFileLayerTypeKey="" />
    </Input>
</API>
<API Name="manageFgProducerFileLayerTranslation">
    <Input>
        <FgProducerFileLayerTranslation
            BusinessProcessName="CustomBP2"
            ProducerFileLayerTypeKey="EXPCON_GUID"

```

```

        ProducerFileLayerTranslationKey="EXPTRAN1_GUID" />
    </Input>
</API>
</MultiApi>

```

3. Execute the FileGatewayCustomLayerXAPI business process, specifying CreateCustomLayersSampleBPInput\_EX.xml you created in step 2 as the primary document.
4. Restart Sterling File Gateway.
5. Create an routing channel template using the custom layer types. In the example XML, the following layers are used:
  - EX Prod Container - outer layer for producer
  - EX Prod Non Container - inner layer for producer
  - EX Con Container - outer layer for consumer
  - EX Con Non-Container - inner layer for consumer

**Tip:** The parameters for the custom layers can include custom parameters. You can create up to eight custom parameters for each custom layer.

6. Now that you have completed the example, you can modify the XML file to create custom file layer types to meet your needs. For practice, substitute each occurrence of EX with your unique characters (represented in the steps as xx), or substituting any descriptive terms. For each one, specify the following parameters:

Parameter	Description
Description	Descriptive string for the layer type. For a parameter, the value of Description is displayed in the UI.
DisplayLabel	Descriptive string displayed in the drop down box while creating layers. For a Layer, the value under "DisplayLabel" is displayed in the UI.
IsContainer	Y or N
LayerType	String
ProducerFileLayerTypeKey	A unique value

7. Substitute business processes that you write to translate one file type for another for the following business processes in the XML file:
  - CustomBP1 - If creating XX Con Container, substitute the business process you want to use for translation for CustomBP1.
  - CustomBP2 - If creating XX Prod Container, substitute the business process you want to use for translation for CustomBP2.
  - CustomBP3 - If creating XX Prod Non Container and XX Con Non Container, substitute the business process you want to use for translation for CustomBP3.
8. Save the XML file as CreateCustomLayersSampleBPInput\_xx.xml.
9. Execute the FileGatewayCustomLayerXAPI business process, specifying CreateCustomLayersSampleBPInput\_xx.xml as the primary document.
10. Restart Sterling File Gateway.
11. Create an RCT using the custom layer types you need. In the example XML, the following layers are used:
  - xx Prod Container - outer layer for producer

- xx Prod Non Container - inner layer for producer
- xx Con Container - outer layer for consumer
- xx Con Non-Container - inner layer for consumer

## Results

The parameters for some of the custom layers include custom parameters with the changes you made to the labels.

## What to do next

**Restriction:** You cannot export custom file layer types from one system and import the custom file layer types to another system. You must create any custom file layer types you require in each system separately.

---

## Chapter 3. Integration Architect Help

---

### About Delivery Channels (Build 5102 and Later)

The delivery channel defines what will be delivered to a consumer.

A routing channel template contains one or many delivery channels. Each delivery channel consists of:

- One consumer mailbox name pattern
- One consumer file structure

The mailbox name pattern can be specified using the following components:

- System facts (for example, `/${ConsumerName}/Inbox`) where the actual name would be determined dynamically
- Explicit strings (for example, `/${ConsumerName}/myInbox`)
- Provisioning facts (for example, `/${ConsumerName}/${myUserName}`) that are specified on the Provisioning Facts tab of the Routing Channel Template wizard
- A combination of system facts, explicit strings, and provisioning facts. The mailbox pattern must always start with `/${ConsumerName}`

You can specify that a message be delivered using a consumer listening protocol if available. The default is to always attempt to deliver to a listening protocol if available, but if you have two delivery channels and you only want to send to one listening protocol, uncheck this option for one of the delivery channels. This is useful in scenarios where you have two delivery channels, (for example the second is used to deliver to an archive mailbox) and you want only one of the delivery channels to deliver outbound to a listening consumer to avoid delivering a duplicate message.

The Integration Architect creates a delivery channel as part of the process of creating a routing channel template.

---

### Creating a Routing Channel Template (Build 5102 and Later)

#### About this task

To create a routing channel template:

#### Procedure

1. From the main menu, select **Routes > Templates**.
2. Click **Create**.
3. On the **Type** tab, enter a descriptive name for the template. Only alphanumeric, underscores, and `<space>` characters are allowed in the template name.

The following character strings are system-designated prefixes and must not be used for user-created templates:

- AFT
- FileGateway
- FG

4. Select **Static** or **Dynamic**. If **Dynamic**, select how the consumer is determined, whether by facts or by business process. If by facts, specify the **ConsumerName** or **ConsumerCode** facts in every producer file structure. If by business process, specify the business process name and the element name in **ProcessData** that identifies the consumer.
5. On the **Special Characters** tab, select how special characters in producer file names should be handled. Use this when the file name the producer gives a file is incompatible with the naming convention the consumer uses. Select from the following choices:

Selection	Other Input and Results
None	Do not change any special characters.
Substitute characters individually	<p>Enter which characters to substitute with what new characters. The number of characters specified in the search for and replace fields must match. The characters are case-sensitive.</p> <p>For example, Search for character sequence ABC, Replace with 123 would translate a producer file name of:</p> <ul style="list-style-type: none"> <li>• Abbot.txt to a consumer file name of 1bbot.txt</li> <li>• ABBOT.TXT to a consumer file name of 122OT.TXT</li> </ul> <p>Search for abcdef, Replace with ABCDEF would translate producer a file name of:</p> <ul style="list-style-type: none"> <li>• abbot.txt to a consumer file name of ABBot.txt</li> </ul>
Replace characters, then omit consecutive replacements	<p>Enter which sequence to substitute with what new sequence.</p> <p>For example, Search for [%*\$] Replace with -, would translate all of the following producer file names:</p> <ul style="list-style-type: none"> <li>• A*B.txt</li> <li>• A***B.txt</li> <li>• A%%%%B.txt</li> <li>• A*B.txt</li> <li>• A\$**%B.txt</li> <li>• A*\$%\$*%B.txt</li> </ul> <p>to a consumer file name of A-B.txt</p>
Remove characters	Enter the characters to remove from the producer file name to create the consumer file name.
Remove Microsoft Windows invalid characters <code>/\:*?"&lt;&gt; ;%</code>	Characters that are invalid or cause problems in the Microsoft Windows operating system are removed from producer file names prior to delivering to consumers.

Selection	Other Input and Results
Remove UNIX invalid characters /; \!#\$%&*!'"?<>)	Characters that are invalid or cause problems in the UNIX operating system are removed from producer file names prior to delivering to consumers.
Remove all characters, except alphanumeric, dash, and period	All special characters are removed from producer file names prior to delivering to consumers.

- On the **Groups** tab, click **Add** beneath each group box. Select from the drop down lists the producer groups and consumer groups that can use the template. You can select one or more producer groups and consumer groups by clicking **Add** and selecting additional groups from the lists.

**Tip:** Select the **All Partners** group in the producer and consumer lists to enable all partners present in the application to use the RCT.

- On the **Provisioning Facts** tab, click **Add** to specify facts for the users to provide values at the time of creating a routing channel. Provisioning facts are optional. Enter the following information for each provisioning fact:
  - Display Label - the short name that would identify the fact at routing channel provision time. Maximum length allowed is 255. Valid characters are alphanumeric, comma, hyphen, space, and underscore. Unicode characters that represent alphanumeric in various languages are also allowed.
  - Fact name - the name of the fact for use in mailbox and file name creation. Maximum length allowed is 255. Valid characters are alphanumeric in English only and the hyphen. Fact name must begin with case-insensitive "my".
  - Description - the description of the fact, to be displayed as a tool tip during route channel provision to guide users in supplying values. Maximum length allowed is 255. Valid characters are alphanumeric, comma, hyphen, space, and underscore. Unicode characters that represent alphanumeric in various languages are also allowed.

**Important:** For the fact value - Maximum length allowed for a fact value is 255. Valid characters are alphanumeric, equal, and space characters. Unicode characters that represent alphanumeric in various languages are also allowed. The following characters are explicitly prohibited because they are not allowed in a mailbox path: ? < > | ' " : / \ % \*

Click **Save**. The values entered in the form are validated. If a validation error occurs, the validation message is displayed and the Provisioning Fact is not saved. If validation succeeds, the Provisioning Fact is saved and is displayed in the Routing Channel wizard.

- On the **Producer** tab, specify the producer mailbox name pattern and producer file structure. Mailbox paths are case insensitive and should therefore be unique without regard to case.

**Restriction:** The root mailbox for the user must already exist; only a submailbox for the partner is created by Sterling File Gateway.

If checked, the delivery channel will attempt to deliver to a listening protocol if available.

**Tip:** If you have two delivery channels and you only want to send to the listening protocol one time, uncheck this option for one of the delivery

channels to avoid delivering a duplicate message. This is useful in scenarios where you have two delivery channels, (for example the second is used to deliver to an archive mailbox) and you want only one of the delivery channels to deliver outbound to a listening consumer.

9. On the **Consumer** tab, specify the consumer mailbox pattern. To have a mailbox created for the partner when the file is routed, check the box. For a dynamic template, mailbox creation at run time is required.
10. Specify the delivery channel, including the consumer file structure. The innermost layer of the consumer file structure must match the innermost layer of the producer file structure, or be Unknown. The consumer file structure defines the file name format delivered to the consumer. To pass the file name through unchanged, enter: `${ProducerFilename}`

**Restriction:** There can only be one consumer file structure for each delivery channel. If you click **Add** and specify another file structure, it will overwrite the previously defined file structure.

11. Click **Save** to complete the routing channel template. Sterling File Gateway validates the routing channel template and displays errors for invalid criteria. You will get a confirmation when the template is successfully validated and saved.

---

## Creating a Broadcast Routing Channel Template (Build 5102 and Later)

Dynamic routing channel templates can be created to route copies of the same payload file to multiple consumers. The set of consumers receiving a copy of the payload file can be defined either through the system fact *ConsumerBroadcastGroup* or through a business process that returns multiple consumer partner names.

### About this task

Use of Sterling File Gateway is not strictly limited to the selections provided in this procedure. To simplify your initial use of broadcast with Sterling File Gateway, some suggested selections are provided.

To create a simple routing channel template to broadcast messages to a list of consumers using the *ConsumerBroadcastGroup* fact:

### Procedure

1. Select **Routes > Templates**.
2. Click **Create**.
3. Type a name, for example `DynamicBroadcastFromFact`.
4. Select **Dynamic**.
5. Select 'Facts in producer file structure' for "What will determine the consumer?"
6. Select your preferences for special character handling, producer groups, and consumer groups.
7. Create a new provisioning fact with:
  - Fact Name = `ConsumerBroadcastGroup`
  - Display Label = name of Sterling File Gateway Partner Group Defining Broadcast List
  - Description = Sterling File Gateway Partner Group Defining Broadcast List
8. For **Producer File Structure** and **Consumer File Structure**, select your preferences.

9. Save the Routing Channel Template.

## Results

When a routing channel is created using the routing channel template above, a value for the provisioning fact, `ConsumerBroadcastGroup`, must be specified and the value must correspond to a File Gateway Partner Group. Each member of the specified Partner Group will receive a copy of any file processed through the resulting routing channel.

**Tip:** The fact `ConsumerBroadcastGroup` does not have to be set as a provisioning fact, it can also be set as a producer file structure file name pattern. If the `ConsumerBroadcastGroup` is set by the file name pattern in the producer file structure, the producer specifies the name of the File Gateway Partner Group in the name of the file they upload.

## Use a Business Process to Identify Consumers

To create a simple routing channel template to broadcast messages to a list of consumers using a consumer identification business process, create a business process that populates a list of consumer names at the same process data element level. For example, a business process named `MyBroadcastList` might generate the following list of three consumers in process data:

```
<ProcessData>
  <ConsumerNameList>
    <Consumer>ConsumerOne</Consumer>
    <Consumer>ConsumerTwo</Consumer>
    <Consumer>ConsumerThree</Consumer>
  </ConsumerNameList>
</ProcessData>
```

Using the name and sample process data above, create the routing channel template as follows:

1. Select **Routes > Templates**.
2. Click **Create**.
3. Type a name, for example `DynamicBroadcastFromBP`.
4. Select **Dynamic**.
5. Select 'Business Process' for "What will determine the consumer?"
6. Select 'MyBroadcastList' for 'Business Process Name.'
7. Select 'ConsumerNameList/Consumer' for 'Process Data Element Name.'
8. Select the desired Special Character Handling, Producer Groups and Consumer Groups
9. Define the desired **Producer File Structure** and **Consumer Delivery Channels**
10. Save the Routing Channel Template.

---

## Broadcasting Messages Using Shared Mailboxes (Build 5102 and Later)

You can broadcast messages to several consumers by using the shared mailboxes feature in Sterling B2B Integrator.

### About this task

To broadcast messages to several consumers by using shared mailboxes:

## Procedure

1. Create a shared mailbox in Sterling B2B Integrator by selecting **Tools > B2B Console > Deployment > Mailboxes > Configuration**. Select **Mailbox Type = Shared**.
2. Note the specific mailbox path from step 1.
3. Create a partner group in Sterling File Gateway that will contain all consumers who should receive the file when broadcast.
4. Create a dynamic routing channel template with the following configurations:
  - Specifies fact name to identify consumer
  - Consumer Groups value specifies the partner group from step 3
  - Producer File Structure file name pattern includes a capturing group that maps to the ConsumerBroadcastGroup fact name
  - Consumer Mailbox Path specifies shared mailbox from step 1
5. Create producer and consumer partners.
6. Associate consumer partners with partner group from step 3.
7. Create a routing channel that uses the routing channel template from step 4.
8. Edit consumer partner mailboxes in Sterling B2B Integrator to make them linked mailboxes, and link them to the shared mailbox from step 1.

**Tip:** Linked mailbox restrictions apply. For example, a mailbox with sub-mailboxes or messages cannot be changed to type linked.

9. To use your configuration, log in to *myFileGateway* as the producer (or use FTP client) and upload (send) a file, ensuring that the file name specifies the appropriate Consumer Group name (defined in the routing channel template).

---

## Chapter 4. Route Provisioner Help

---

### Creating a Broadcast Routing Channel (Build 5102 and Later)

Use of Sterling File Gateway is not strictly limited to the selections provided in this procedure. To simplify your initial use of broadcast with Sterling File Gateway, some suggested selections are provided.

#### Before you begin

An Integration Architect must create a routing channel template configured for broadcasting before a Route Provisioner can create a broadcast routing channel.

#### About this task

To create a routing channel for use to broadcast messages to a list of consumers:

#### Procedure

1. Select **Routes > Channels**.
2. Click **Create**.
3. For Routing Channel Template, select one created for broadcasting, for example, **DynamicBroadcastFromFact**.
4. For Producer, select the partner that will send the file.
5. For 'name of SFG Partner Group Defining Broadcast List', enter the name of an Sterling File Gateway Partner Group whose members will make up the broadcast list.

**Restriction:** The example routing channel template, `DynamicBroadcastFromFact`, defines a provisioning fact 'name of SFG Partner Group Defining Broadcast List'. If you create a different routing channel template, you can use a different fact name.

---

## Chapter 5. Operator Help

---

### Troubleshooting and Resolving Slow Response Issues

If your users are experiencing slow response when many concurrent connections have been made to the same port, you may need to change some property settings.

All HTTP server adapters in your Sterling B2B Integrator installation share the setting for maximum number of threads. To increase the maximum number of threads running at the same time, edit `customer_overrides.properties` to modify the following property:

```
http.numOfmaxThread=X
```

where `X` is the number of threads. The default value is 10. If your users are experiencing slow response when many concurrent connections have been made to the same port, increase this value to 50. Continue tuning this value until the system response is acceptable for the number of concurrent connections that must be supported. Setting this value to a value that is too high could be detrimental to system stability when too many concurrent connections are made. See *Using Property Files* in the Sterling B2B Integrator 5.1 online library.

---

### Preventing Failed PGP Routes

Failed PGP routes or other failed routes may be due to incorrect persistence settings for business processes.

Set persistence settings for business processes that perform protocol translation or translation of custom file layers to System Default.

Business processes that must have persistence settings set to System Default:

- FileGatewayRoutePGPPackageDocument
- FileGatewayRoutePGPUnpackageDocument
- User defined business processes used for translation of custom file layers

---

## Chapter 6. myFileGateway

---

### Accessing myFileGateway (Build 5102 and Later)

An administrative user must establish an account for a Partner before the Partner can access myFileGateway.

#### About this task

To access myFileGateway:

#### Procedure

1. Obtain the URL for myFileGateway from an administrative user.
2. Disable pop up blocker in your browser.
3. Set your browser options to select TLS 1.0 (in the browser's Advanced tab).
4. Log in to myFileGateway with the user name and password supplied by the System Admin.

**Restriction:** Administrative users of Sterling File Gateway cannot access myFileGateway.

---

### Sending a File Using myFileGateway (Build 5102 and Later)

#### About this task

To send a file:

#### Procedure

1. In myFileGateway, click the **Upload** tab. Only mailboxes that you have permission to upload to are displayed in the list.
2. Select the mailbox path where the file should be dropped off.
3. Enter the name and location of the file or browse to the file to be uploaded.
4. If you want to rename the file, enter the new file name.
5. Click **Send**.

**Restriction:** During the file transfer, a dialog box is displayed indicating that the file upload is in progress. If you click **Cancel**, the transfer is stopped. If a session times out, a notification is posted. You cannot perform any other functions in myFileGateway while the upload is in progress. If the file is very large and the session times out during the upload, the upload is not affected. The file upload continues in the background despite the session time out. After the upload completes, a dialog box indicates that the session has timed out and the file upload is complete.

---

### Retrieving a File Using myFileGateway (Build 5102 and Later)

In myFileGateway, Partners retrieve a file from a mailbox.

#### About this task

To retrieve a file:

## Procedure

1. From myFileGateway, click the **Download** tab.
2. Select a file from the list of files. Only files present in the mailboxes that you have permission to download from are provided in the list. You can filter the list for specific character strings. Enter the characters in the field above the column headings.

**Tip:** The filter finds any occurrence of the requested string. For example, if you want to find records from the date that contain a 13, the filter will also return records that have a 13 in the time field, or any other field.

3. Select whether to open or save the file.
4. To save the file, browse to the location for the file to be saved. Select the location and click **Save**.

**Restriction:** During the file transfer, if you click **Cancel**, the transfer may or may not be stopped, depending on the size of the file and rate of transfer. Click **Refresh** to see if the file is still available for download. If the cancel was received before the transfer, the file will still be available in the list. If you clicked cancel after the file was transferred, the file will not be listed anymore.

---
