

WebSphere Virtual Enterprise

Tendances Logicielles

L'architecture pour répondre aux besoins métier

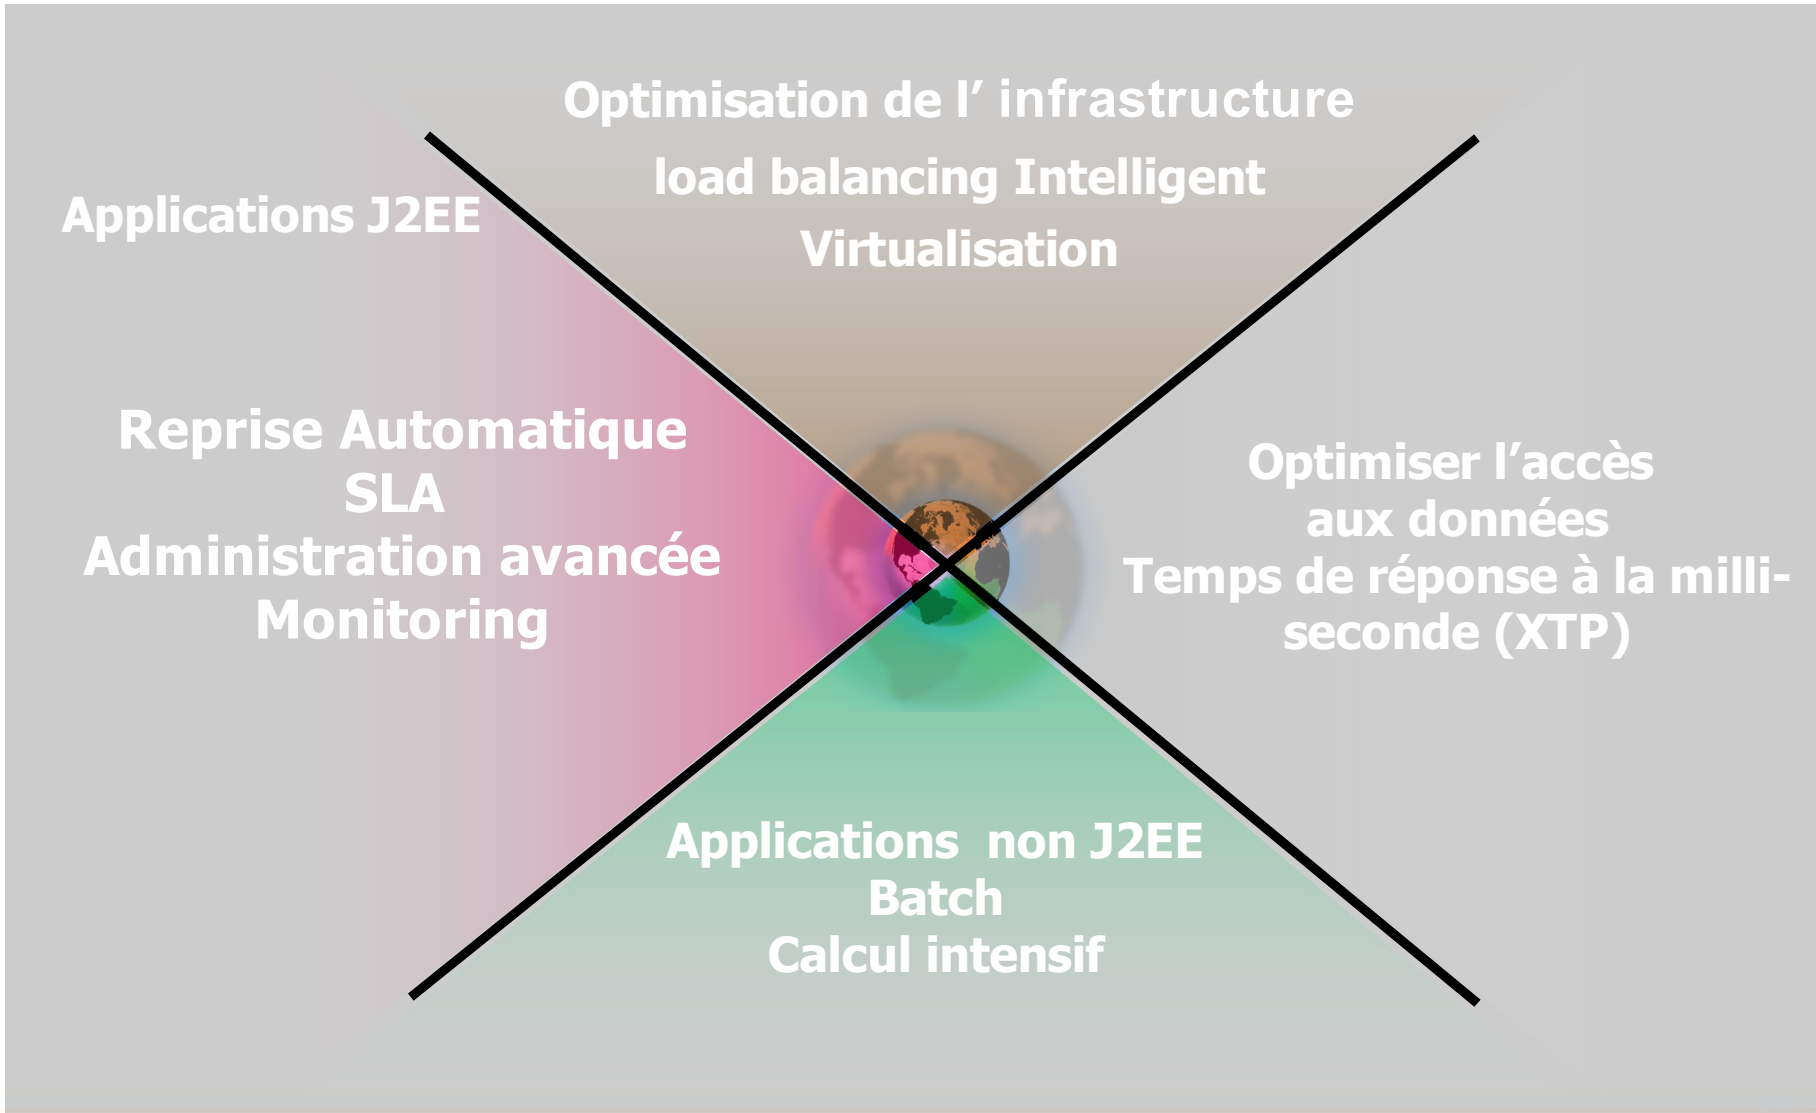

Les besoins à couvrir

- Optimisation des coûts par la consolidation des serveurs
 - Au travers du partage de serveurs physiques, permettre la virtualisation des serveurs applicatifs
 - Augmenter le taux moyen d'utilisation des serveurs physiques (de 10 à 60, 80%)
- Amélioration de la maintenance et des opérations
 - Permettre aux équipes d'exploitation « Middleware » d'être plus efficaces
 - Fournir des outils avancés de versioning et de monitoring des applications
 - Centraliser les opérations d'installation d'application
- Amélioration de la qualité de service et de la disponibilité
 - Adapter automatiquement la puissance serveur au flux des requêtes
 - Améliorer le taux d'utilisation moyen du matériel
 - Appliquer une approche de niveau de service pour appuyer le contrat d'engagement

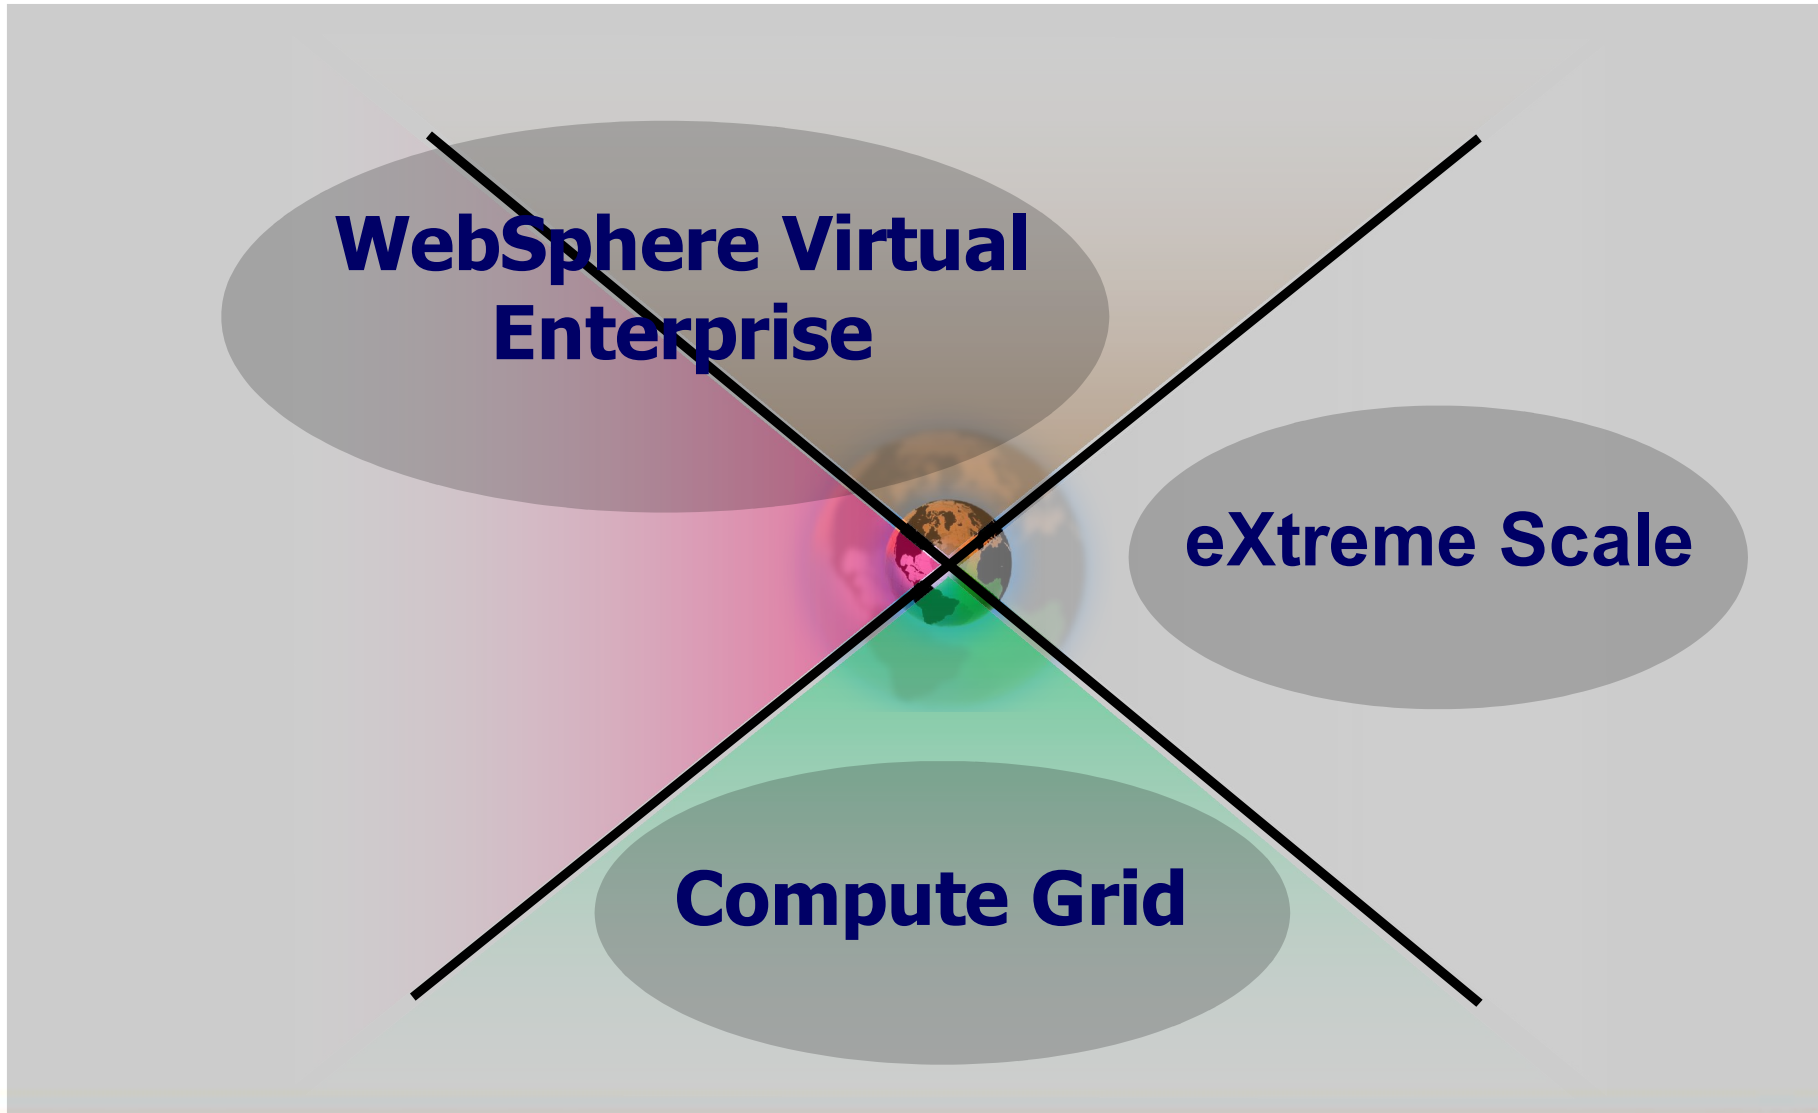

L'approche innovante d'IBM pour couvrir ces besoins

Fournir une infrastructure opérationnelle permettant de

XD Management Topologies

Administration unique et centralisée des opérations

Un ensemble d'interfaces communes pour permettre aux administrateurs d'interagir avec les serveurs WebSphere et les autres serveurs d'application

The screenshot displays the 'Middleware servers' management interface. On the left, a navigation tree is visible, with 'Other middleware servers' highlighted by an orange circle. The main content area shows a list of servers with the following data:

Select	Name	Type	Node	Cluster Name	Version	Status	Action
<input type="checkbox"/>	tomcat	Apache Tomcat server	xdblade01b11		ND 6.1.0.4 XD 6.1.0.0	✖	
<input type="checkbox"/>	testcustom	Custom HTTP server	xdblade01b06		ND 6.1.0.4 XD 6.1.0.0	✖	
<input type="checkbox"/>	odr	On demand router	xdblade01b06		ND 6.1.0.4 XD 6.1.0.0	➡	
<input type="checkbox"/>	TestClusterC_xdblade01b12	WebSphere application server	xdblade01b12	TestClusterC	ND 6.1.0.4 XD 6.1.0.0	➡	
<input type="checkbox"/>	TestClusterA_xdblade01b12	WebSphere application server	xdblade01b12	TestClusterA	ND 6.1.0.4 XD 6.1.0.0	➡	

Les 3 catégories de support

... en fonction du middleware

1-Gestion complète du cycle de vie des applications

- *Création/suppression d'un instance de serveur d'application*
- *Gestion complète de la configuration*
- *Contrôle opérationnel et pilotage des serveurs d'application*
- *Déploiement des applications*
- *Supervision et visualisation de l'état de santé des serveurs d'application*
- *Gestion automatisée de la performance et de la reprise sur incidents .*

WebSphere

• **Community Edition**

WebSphere

• **Application Server**

2-Gestion assistée du cycle de vie

- *Templates de mise en oeuvre spécifique à chaque Middleware*
- *Contrôle opérationnel et pilotage des serveurs d'application*
- *Assistants à la configuration des serveurs d'application*
- *Supervision et visualisation de l'état de santé des serveurs d'application*
- *Gestion automatisée de la performance et de la reprise sur incidents .*

• **Tomcat**

3-Gestion générique du cycle de vie

- *Template générique de mise en oeuvre d'un nouveau middleware*
- *Les commandes opérationnelles et de définition de serveurs doivent être fournies*
- *Contrôle opérationnel et pilotage des serveurs d'application*

Les outils de reporting

- Prise de statistique au niveau de la cellule, du noeud, du serveur ou de l'application
- Possibilité de comparer deux prises de statistique
 - ▶ Expl temps réponse moyen entre deux versions d'une même application
- Échelle adaptée automatiquement
- Les objectifs de performances apparaissent avec les statistiques associées

The Adobe SVG Viewer is required to have full functionality in the chart. [Click here](#) for more information.

Select	Pattern	Data Set Type	Data Set	Data Metric	Data Filter	Scale
<input type="checkbox"/>		Service Policy	Platinum_SP	Avg. Response Times (ms)		100.0
<input type="checkbox"/>		Service Policy	Bronze_SP	Avg. Response Times (ms)		100.0

<input type="checkbox"/>		Service Policy Goal	Platinum_SP_Goal	Avg. Response Times (ms)		100.0
<input type="checkbox"/>		Service Policy Goal	Bronze_SP_Goal	Avg. Response Times (ms)		100.0
<input type="checkbox"/>		Service Policy Goal	Silver_SP_Goal	Avg. Response Times (ms)		100.0
<input type="checkbox"/>		Service Policy Goal	Gold_SP_Goal	Avg. Response Times (ms)		100.0

Détection automatique avec reprise

Challenge:

- ◇ Mieux maîtriser techniquement les opérations d'exploitation afin de faciliter l'administration
- ◇ Mutualiser la gestion des opérations et des applications sur une infrastructure hétérogène et distribuée de serveurs applicatifs.
- ◇ Anticiper et réagir sur des incidents classiques applicatifs, avant l'interruption de service
- ◇ Historique des statistiques, sizing, refacturation à la ressource consommée
- ◇ Réduire les coûts d'exploitations, d'administration

WebSphere XD propose un environnement d'administration intégré, facile d'accès

Operational Management

Introspection

Health Management

Proactive

Data Logging

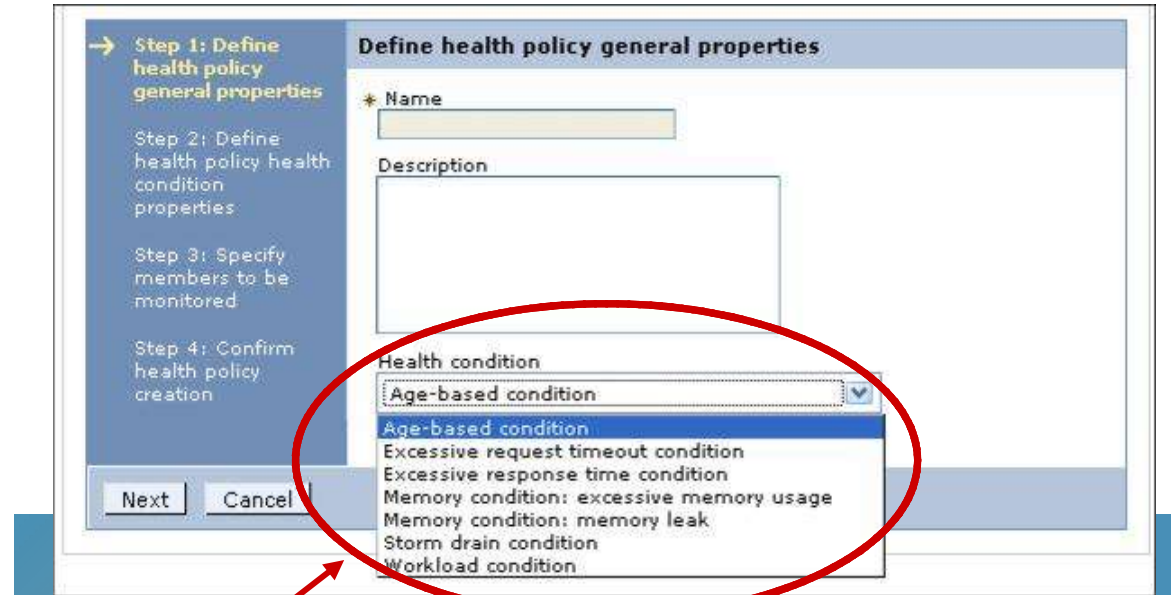

Analysis

Health Management – Politiques de santé

Anticiper des instabilités classiques d'application avant l'interruption de service

- Health policies can be defined for common server health conditions
- Health conditions are monitored and corrective actions taken automatically
 - Notify administrator
 - Capture diagnostics
 - Restart server
- Application server restarts are done in a way that prevent outages and service policy violations

Health Conditions

- **Age-based:** *amount of time server has been running*
- **Excessive requests:** *% of timed out requests*
- **Excessive response time:** *average response time*
- **Excessive memory:** *% of maximum JVM heap size*
- **Memory leak:** *JVM heap size after garbage collection*
- **Storm drain:** *significant drop in response time*
- **Workload:** *total number of requests*

Health Management – Customiser les Conditions

Plus de flexibilité et de critères de détection de disfonctionnement...

Custom expressions can be built which use metrics from:

- ▶ The On Demand Router, URI return codes
- ▶ Base PMI metrics, MBean operations and attributes (WAS only)

Complex expressions using a mix of operands is supported

```
C:\WebSphere\AppServer\bin>wsadmin
WASX7209I: Connected to process "dmgr" on node dabtcCellManager01 using
connector; The type of process is: DeploymentManager
WASX7029I: For help, enter: "$Help help"
wsadmin>$AdminTask createHealthAction < -name logItAction2 -nonJava <
e logit.exe -osNames "windows" -workingDir c:\logit\temp > >
wsadmin>$AdminConfig save

wsadmin>$AdminTask createHealthPolicy < -name testPolicy -reactionMod
-addMember < <CELL dabtcCell02> > -addAction < <HEAPDUMP 1><CUSTOM 2
n2 dabtcNode01 server1> > -addCondition < -type CUSTOM -expression "O
ric_FromServerStart$errors > 100L" > >
wsadmin>$AdminConfig save
```

The screenshot shows the 'Create a new health policy' wizard. The main window is titled 'Define health policy health condition properties'. It has a sidebar with four steps: Step 1: Define health policy general properties, Step 2: Define health policy health condition properties (selected), Step 3: Specify members to be monitored, and Step 4: Confirm health policy creation. The main area shows an 'Edit rule' section with a 'Subexpression builder' button. Below it is a 'Run reaction plan when:' field. At the bottom, there are 'Add step', 'Delete', and 'Select: Step' buttons. A 'Subexpression builder' dialog box is open, showing a list of metrics to choose from. The 'Logical operator' is set to 'and'. The 'Subexpression:' field is empty. There are 'Append' and 'Close' buttons at the bottom of the dialog.

Health Management – Customiser les Actions

Avoir le contrôle!

Provides flexibility by allowing the definition of custom actions allowing administrators to define an action plan to be carried out when the unhealthy situation detected.

Health management monitor reaction

Reaction mode: Supervise

Take the Following Actions When the Health Condition Breaches

Select	Step	Action	Target Server	Target Node
<input type="checkbox"/>	1	Place Server Into Maintenance Mode	Sick Server	Node hosting Sick Server
<input type="checkbox"/>	2	Dump Application State	Sick Server	Node hosting Sick Server
<input type="checkbox"/>	3	Restart Server	Sick Server	Node hosting Sick Server
<input type="checkbox"/>	4	Place Server outof Maintenance Mode	Sick Server	Node hosting Sick Server

Health Policy Custom Health Actions

Add, delete, and edit custom operations

Les statistiques

New and Enhanced!

Challenge:

- ◇ A lot is going on in my environment. I need to be able to log information so I can do historical trend analysis of how my infrastructure is performing.
- ◇ My infrastructure resources are shared across multiple applications and users. I need an easy way to meter usage and appropriately chargeback to users and/or departments.

XD contains comprehensive data logging of applications, users and resources; in XD 6.1 content in logs is now configurable and aggregated for easily integrating with accounting and chargeback products

- **Comprehensive logging** of application, resource and workload information across XD's autonomic systems
- **Historical trend analysis** using either pre-packaged or customized reports with innovative visualization techniques
- **Integration with accounting and chargeback systems** such as Tivoli Usage and Accounting Manager

%CPU per Application

■ StockTrade
 ■ StockQuery
 ■ AccountManagement
 ■ FinancialAdvice

Average CPU per Application

Simplifier les Installations et le déploiement

Challenge:

- ◇ I've got a lot of servers that I have to install, configure and deploy XD on and I don't want to have to create my own way of doing it!
- ◇ Patch management of my WebSphere application servers (WAS, ND) is challenging, takes too long, and I don't want to create my own way of doing it!

Solution

Centralized Installation Manager

*Centralization of XD configuration and deployment XD across all application servers;
centralization of patch management for WebSphere Application Server*

- **Supports centralized installation** from the Deployment Manager to Nodes in the cell
- **Single install** to the Deployment Manager
- **Push install package from DMGR to endpoints**
 - Select a set of hosts and push XD to those endpoints
 - Installs appropriate endpoint code based on type of endpoint
 - Agent-less
- **Centralization of patch management**

Gérer les versions applicatives

Challenge:

- ◇ I want to support different versions of my applications for my users or customers for continuous availability
- ◇ I need a more agile production deployment process, where I can quickly back-off new application versions to prevent loss of service
- ◇ I'd like to better support iterative development; and potentially use my free resources in my production environment for application testing

Solution

Application Edition Manager

Dynamically introduce, run, and manage multiple versions of the same application in your infrastructure

- **Coordinates the activation of application editions** and the routing of requests to the application
- **Validation Mode** enables final pre-production testing of an application edition by a select group of users
- **Routing Rules** allow intelligent routing to multiple application editions in production

Edition Control Center

- [Applications > Edition Control Center](#)

Edition Control Center

The edition control center enables management and operational control over application editions, including interruption free application upgrade. An application edition is a version of an application comprised of distinct versions of modules and/or bindings. This page provides a summary view of each enterprise application, its editions, and their current state. Click on an enterprise application name to manage the individual editions of the selected application.

⊕ Preferences

Total 4			

Edition Control Center: Manage Editions

[Edition Control Center](#) > Manage Editions

Manage editions of an application. The deployment targets for each edition were specified during the application install process. After install, an edition is initially in the inactive state. Inactive editions cannot be started. Activating an edition makes it eligible to be started. Validating an edition puts it into a special "validation mode" that configures the edition to run on a clone of its original deployment target. Validation mode requires assignment of a routing policy to the edition to control who may access it. Rolling out an edition performs an interruption-free upgrade of one edition to another on the same deployment target. Rolling out an edition that is in validation mode performs an interruption free upgrade of the edition on the deployment target from which the validation mode target was cloned. After the rollout, the clone is deleted. Deactivation makes an edition ineligible to be started. An edition must be stopped before deactivation.

Serveur en mode Maintenance

- XD provides the capability to isolate a running server (of any type) from production traffic. This allows for problem determination to be performed on the server or other maintenance without disruption to production traffic.
- If the server is a member of a dynamic cluster, a new cluster member will first be started before the server is placed into maintenance mode in order to assure the minimum policy on the dynamic cluster is met.

Middleware servers

A list of all middleware servers such as WebSphere Application Server, generic server, proxy server, ODR, etc.

Total 7

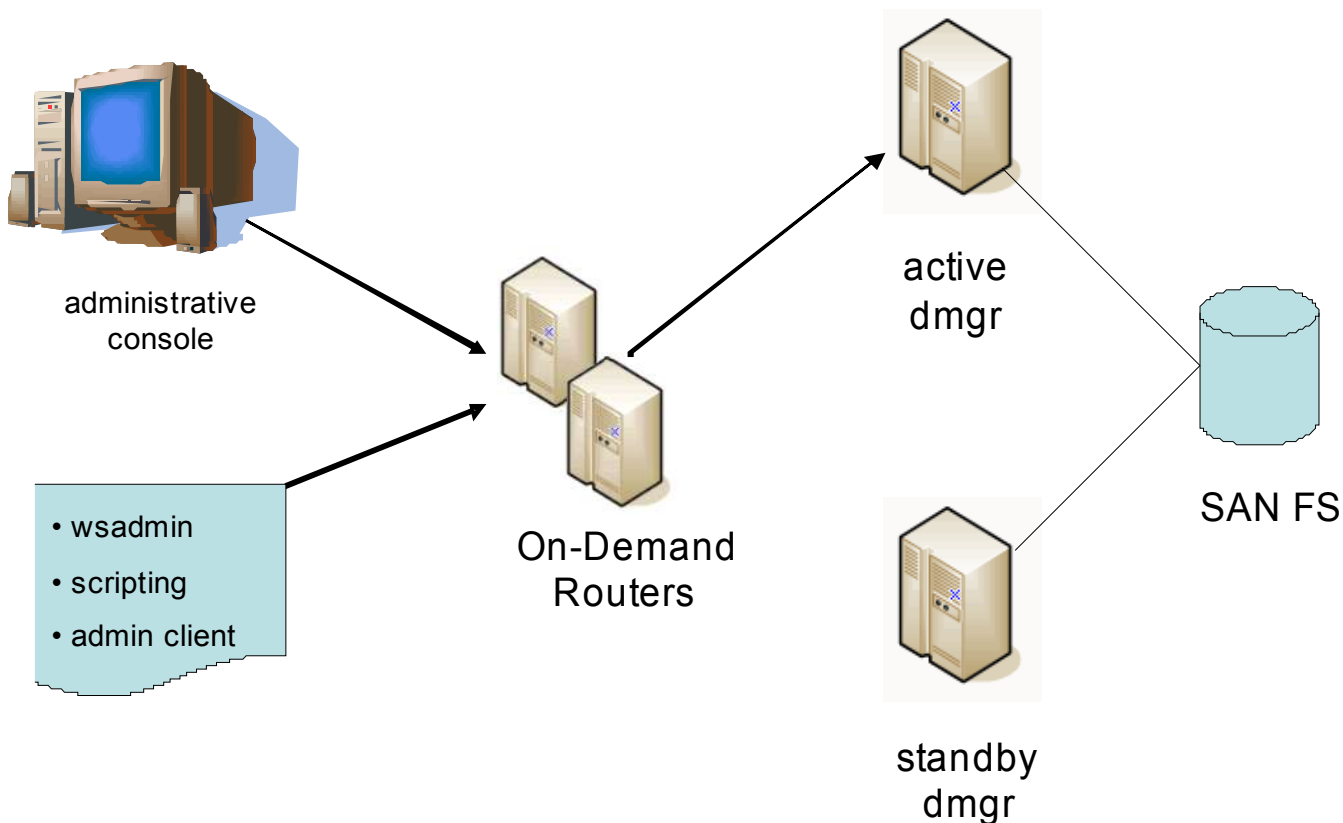

Haute Disponibilité du Deployment Manager

- Each deployment manager on a separate machine
 - ▶ Only one is active
 - ▶ Others are standby
- Shared file system required for dmgrs to share configuration repository
 - ▶ File system with recoverable locks required - e.g. SAN FS, DFS v4
- JMX traffic proxied through XD On-demand Router (ODR)
 - ▶ SOAP connector only
- HA ODRs recommended
 - ▶ (they're recommended for production XD configurations anyway)
- hadmgrConfig command line utility provided to perform configuration

Highly Available Deployment Manager

“Warm-standby Model”

Increasing flexibility and manageability of web applications

Problem

- Roll out new web-based applications that are adaptable, flexible, and manageable (can be self-monitored)

Solution

- WebSphere XD
- WebSphere Application Server ND

Primary XD features / benefits

- ✓ Ability to virtualize computing resources without impact to application design or execution
- ✓ More adaptable, flexible, and manageable applications
- ✓ Self-monitoring and self-healing
- ✓ Autonomic computing
- ✓ Adherence to enterprise security and privacy policies
- ✓ Supports mixed application architectures based on J2EE standards

Problem

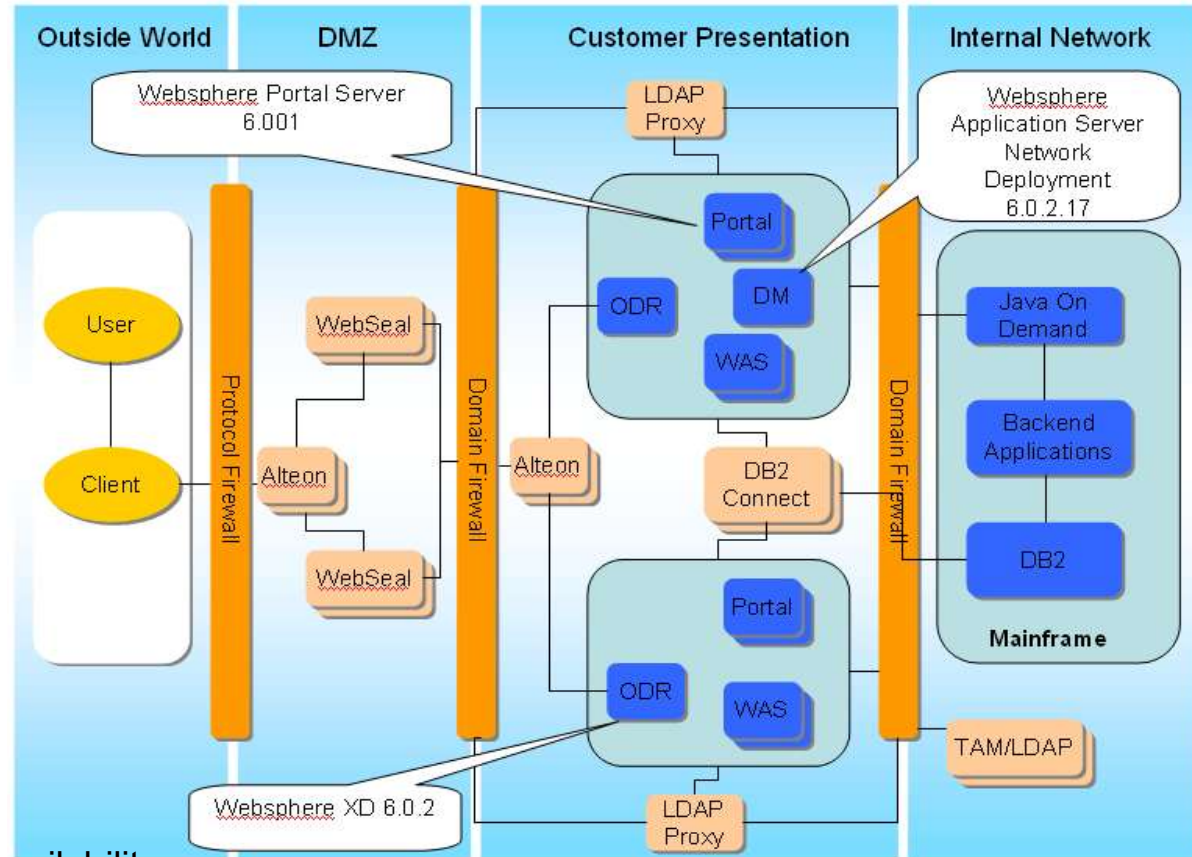

- A secure, scalable and reliable environment for online banking applications

Solution

- New portal platform
- WebSphere Application Server ND
- WebSphere XD
- WebSphere Portal
- IBM servers and storage
- Tivoli identity management

Key XD Features / Benefits

- ✓ Self-managing intelligent technologies ensure high performance and continuous availability
- ✓ Improved speed to market for new applications
- ✓ Much simpler to manage on a daily basis
- ✓ System can be upgraded while running
- ✓ Improved performance and scalability
- ✓ Resources dynamically allocated based on business goals
