

DB2 for OS/390
Version 5

IBM

Messages and Codes

Note!

Before using this information and the product it supports, be sure to read the general information under "Notices" on page vii.

First Edition (June 1997)

This edition applies to Version 5 of IBM DATABASE 2 Server for OS/390 (DB2 for OS/390), 5655-DB2, and to any subsequent releases until otherwise indicated in new editions. Make sure you are using the correct edition for the level of the product.

The technical changes for this edition are summarized under "Summary of Changes to this Book" in the Introduction. Specific changes are indicated by a vertical bar to the left of a change. A vertical bar to the left of a figure caption indicates that the figure has changed. Editorial changes that have no technical significance are not noted.

This softcopy version is based on the printed edition of the book and includes the changes indicated in the printed version by vertical bars. Additional changes made to this softcopy version of the manual since the hardcopy manual was published are indicated by the hash (#) symbol in the left-hand margin.

Programming Interface Information

This book is intended to help you interpret messages issued by IBM DATABASE 2 for OS/390 (DB2 for OS/390).

This book also documents General-use Programming Interface and Associated Guidance Information provided by DB2 for OS/390.

General-use programming interfaces allow the customer to write programs that obtain the services of DB2 for OS/390.

General-use Programming Interface and Associated Guidance Information is identified where it occurs by an introductory statement to a chapter or section.

#

Introduction to This Book and the DB2 Library

This chapter contains specific information about this book and a general overview of the DB2 library.

Throughout this book, “DB2” means the program product IBM DATABASE 2 Server for OS/390 (DB2 for OS/390). Other DB2 products are given their complete names or abbreviations.

Who Should Read This Book

This book, *IBM DATABASE 2 Server for OS/390 Messages and Codes*, lists messages and codes issued by DB2, with explanations and suggested responses. This book is intended for users and system programmers who might encounter DB2 messages and codes.

How to Use This Book

This book consists of the following six sections and four appendixes:

- “Section 1. Introduction” on page 1-1 explains the different types of messages and codes that DB2 generates.
- “Section 2. SQL Return Codes” on page 2-1 lists the SQL return codes.
- “Section 3. DB2 Messages” on page 3-1 lists the various DB2 messages.
- “Section 4. DB2 Codes” on page 4-1 lists the various DB2 codes.
- “Section 5. IRLM Messages and Codes” on page 5-1 lists the various IRLM messages and codes.
- “Section 6. SNA Codes” on page 6-1 lists the SNA codes.
- “Appendix A. CICS Transaction Abend/Dump Code” on page X-3 explains the CICS transaction abend/dump code (DSNC).
- “Appendix B. Problem Determination” on page X-5 lists the diagnostic items and resource types you can use to resolve problems.
- “Appendix C. SQLSTATE Values—Common Error Codes” on page X-13 lists the error code SQLSTATE values. These values provide common return codes for common error conditions.
- “Appendix D. New, Changed, and Deleted Messages and Codes” on page X-25 lists the new, changed, and deleted messages and codes.

The introduction provides general information about DB2 messages and codes. You will be referred to it from appropriate places in the manual. However, it is recommended that you become familiar with this material ahead of time.

The SQL return codes are listed by numeric sequence. The DB2 messages are listed in order of their subcomponent identifier and further by their numeric identifier. The codes are listed by their hexadecimal ID and further by their numeric identifier. The IRLM messages and codes are listed by numeric sequence.

Message identifiers and CSECT names are used to identify messages. Unless the message is issued by a subcomponent operating outside the DB2 environment (such as the precompiler or attachment facilities), messages are preceded by a *subsystem recognition character* that is defined during system installation. The subsystem recognition character is not shown in the message texts in this book.

All DB2 message identifiers are eight characters long. The first three characters are always DSN: it is the DB2 component prefix name. The fourth character is the *subcomponent identifier*: it identifies the subcomponent of DB2 that issued the message. Each subcomponent has an associated *hexadecimal identifier* (hex ID): it is the hexadecimal representation of the subcomponent identifier. The fifth through seventh characters represent the *numeric identifier*: it is unique within the subcomponent. The last character of the message identifier is the *message type code*. It indicates the type of response that the message requires. A *subsystem identifier* is an optional field found after the message number: it is also known as the *csect-name*. Message identifiers and CSECT names have the following format:

```
DSNB209I DSNB1CHK
```

where:

DSN	is the DB2 subsystem prefix name.
B	is the subcomponent identifier; in this example B identifies the DB2 buffer manager and the hexadecimal ID for this subcomponent is X'C2'.
209	is the numeric identifier.
I	indicates that this message is for information only.
DSNB1CHK	is the csect name; it is an optional field.

The DB2 reason codes and subsystem termination reason codes are 4 bytes long. The first byte is always 00: it is the *high-order byte*. The second byte is the *hexadecimal identifier* (hex ID): it identifies the DB2 subcomponent. The last 2 bytes are the *numeric identifier*: it is unique within the subcomponent. The codes have the following format:

```
00E50041
```

where:

00	is the high-order byte.
E5	is the hexadecimal identifier; it identifies the DB2 agent services manager.
0041	is the numeric identifier.

Accompanying each message and code is the following information, when applicable:

Explanation: This section tells what the message or code means, why it occurred, and what caused it. To assist in diagnosing problems, the CSECTs that issued the message are also included. However, if the issuing CSECT is placed in the message text at run time, it is not included in the explanation.

System Action: This part tells what is happening as a result of the condition causing the message or code. If this information is not shown, no system action is taken.

User Response: If a response by the user is necessary, this section tells what the pertinent responses are and their effect. If this information is not shown, no user response is required.

Operator Response: If an operator response is necessary, this section tells what the pertinent responses are and their effect. If this information is not shown, no operator response is required.

System Programmer Response: If a response by the system programmer is needed, this part tells what the pertinent responses are and their effect. If this information is not shown, no system programmer response is required.

Programmer Response: If a programmer response is necessary, this part tells what the pertinent responses are and their effect. If this information is not shown, no programmer response is required.

Problem Determination: This section lists the actions that can be performed to obtain adequate data for support personnel to diagnose the problem. If this information is not shown, no problem determination is required.

Message Type Codes

The last character of a message identifier is the *type code*. Four type codes are used, as shown in the following list:

A	Immediate action	Action is required immediately. The associated task does not continue until the requested action is taken.
D	Immediate decision	Decision or action is required immediately. The associated task does not continue until the requested decision is made or action is taken.
E	Eventual action	Action is required at some point; however, the associated task continues. All RC=8 error messages that are not host related (SOFT errors) have the E changed to a W in precompiler output when SQL(ALL) is in effect. All RC=8 errors (HARD errors) look the same as they have in the past.
I	Information only	No action is required.

DB2 Message Severity Codes

Messages issued by the precompiler subcomponent of DB2, as well as some messages issued by the service controller and utility subcomponents of DB2, provide severity codes. The specific meanings of the severity codes differ slightly for each of the subcomponents. In general, the higher the severity level, the more significant the situation.

Severity codes for these subcomponents are described at the beginning of the individual subcomponent sections in “Section 3. DB2 Messages” on page 3-1. They are also included in the individual messages, where appropriate.

DB2 Abend Completion Codes (X'04E' and X'04F')

DB2 uses two system abend completion codes: X'04E' and X'04F'.

X'04E' and X'04F' identify:

- Internal errors encountered during DB2 operation
- Diagnostic information for problem determination
- Subsystem actions initiated by the DB2 subcomponent involved in the error

X'04E'

An X'04E' abend completion code indicates that DB2 detected an internal error and abended a DB2 internal task (TCB) or a user-connected task. Errors associated with an X'04E' abend completion code might be preceded by an MVS system code or by internal errors.

The diagnostic material generated by the X'04E' abend must be examined to determine the source of the error that actually resulted in a subsequent task or subsystem termination.

X'04F'

An X'04F' abend completion code indicates that DB2 detected a severe error and abended the entire DB2 subsystem. When an X'04F' is issued, DB2 determined that continued operation could result in the loss of data integrity. Errors associated with an X'04F' abend completion code might be preceded by an MVS system error or by one or more DB2 X'04E' abend completion codes.

Table 1 summarizes the diagnostic information and subsystem actions available to DB2 when these abend completion codes are issued. Some pieces of this information are not relevant to some error situations and will not help in problem diagnosis. In these cases, DB2 does not produce any diagnostic information that is unnecessary. The information that DB2 produces for a given error depends upon the specific problem. The MVS services that provide diagnostic information are discussed in “DB2 Diagnostic Information” on page 1-7

Table 1 (Page 1 of 2). Abend Completion Codes

	X'04E'	X'04F'
Explanation	<ul style="list-style-type: none"> • Error during DB2 normal operation 	<ul style="list-style-type: none"> • Severe error; continued operation may jeopardize data integrity
System action	<ul style="list-style-type: none"> • Internal DB2 task is abended • Connected user task is abended 	<ul style="list-style-type: none"> • The entire DB2 subsystem is abended • User task with an active DB2 connection may be abnormally terminated with an X'04F' • Possible MEMTERM (memory termination) of connected allied address space
Diagnostic information	<ul style="list-style-type: none"> • SVC dump • SYS1.LOGREC entries • VRA data entries 	<ul style="list-style-type: none"> • SYS1.LOGREC entries • VRA data entries

Table 1 (Page 2 of 2). Abend Completion Codes

	X'04E'	X'04F'
Associated reason codes	<ul style="list-style-type: none"> • DB2 abend reason code • Associated MVS system codes 	<ul style="list-style-type: none"> • Subsystem termination reason code • MVS system completion codes and X'04E' codes that precede the X'04F' abend
Location of accompanying codes	<ul style="list-style-type: none"> • SVC dump title • Message DSNW050I • Register 15 of SDWA section "General Purpose Registers at Time of Error" • SYS1.LOGREC entries • VRA data entries 	<ul style="list-style-type: none"> • SYS1.LOGREC entries • VRA data entries • Message DSNV086E, which is sent to MVS system operator

DB2 Diagnostic Information

DB2's functional recovery routines use MVS services to provide diagnostic information for assistance in problem determination.

The following MVS services provide diagnostic information:

- SVC dumps

The DB2 abend completion code X'04E' uses the MVS SDUMP service to create SVC dumps. The content and storage areas associated with these dumps vary depending on the specific error and the state of the DB2 subsystem at the time the error.

- SYS1.LOGREC entries

Entries are requested in the SYS1.LOGREC data set at the time of the error using the MVS SETRP service. The following are also recorded in SYS1.LOGREC:

- Subsystem abnormal terminations
- Secondary abends occurring in a recovery routine
- Recording requests from recovery routines percolated to by the recovery termination manager.

- Variable recording area (VRA) data

Data entries are added to the VRA of the SDWA by using an MVS VRA defined key. VRA data includes a series of diagnostic data entries common to both DB2 abend completion codes. Additional information is provided by the invoking subcomponent recovery routine during initial error processing or recovery termination manager percolation.

MVS Abends Resulting from DB2 Operation

During DB2 operation, an abend can occur with an MVS system completion code. If you receive an MVS abend during DB2 operation, refer to the appropriate MVS publication.

How to Use the DB2 Library

Titles of books in the library begin with DB2 for OS/390 Version 5. However, references from one book in the library to another are shortened and do not include the product name, version, and release. Instead, they point directly to the section that holds the information. For a complete list of books in the library, and the sections in each book, see the bibliography at the back of this book.

Throughout the library, the DB2 for OS/390 licensed program and a particular DB2 for MVS/ESA subsystem are each referred to as “DB2.” In each case, the context makes the meaning clear.

The most rewarding task associated with a database management system is asking questions of it and getting answers, the task called *end use*. Other tasks are also necessary—defining the parameters of the system, putting the data in place, and so on. The tasks associated with DB2 are grouped into the following major categories (but supplemental information relating to all of the below tasks for new releases of DB2 can be found in *Release Guide*):

Installation: If you are involved with DB2 only to install the system, *Installation Guide* might be all you need.

If you will be using data sharing then you also need *Data Sharing: Planning and Administration*, which describes installation considerations for data sharing.

End use: End users issue SQL statements to retrieve data. They can also insert, update, or delete data, with SQL statements. They might need an introduction to SQL, detailed instructions for using SPUFI, and an alphabetized reference to the types of SQL statements. This information is found in *Application Programming and SQL Guide* and *SQL Reference*.

End users can also issue SQL statements through the Query Management Facility (QMF) or some other program, and the library for that program might provide all the instruction or reference material they need. For a list of some of the titles in the QMF library, see the bibliography at the end of this book.

Application Programming: Some users access DB2 without knowing it, using programs that contain SQL statements. DB2 application programmers write those programs. Because they write SQL statements, they need *Application Programming and SQL Guide*, *SQL Reference*, and *Call Level Interface Guide and Reference* just as end users do.

Application programmers also need instructions on many other topics:

- How to transfer data between DB2 and a host program—written in COBOL, C, or FORTRAN, for example
- How to prepare to compile a program that embeds SQL statements
- How to process data from two systems simultaneously, say DB2 and IMS or DB2 and CICS
- How to write distributed applications across platforms
- How to write applications that use DB2 Call Level Interface to access DB2 servers

- How to write applications that use Open Database Connectivity (ODBC) to access DB2 servers
- How to write applications in the Java programming language to access DB2 servers

The material needed for writing a host program containing SQL is in *Application Programming and SQL Guide* and *Application Programming Guide and Reference for Java*. The material needed for writing applications that use DB2 Call Level Interface or ODBC to access DB2 servers is in *Call Level Interface Guide and Reference*.

For handling errors, see *Messages and Codes*.

Information about writing applications across platforms can be found in *Distributed Relational Database Architecture: Application Programming Guide*.

System and Database Administration: *Administration* covers almost everything else. *Administration Guide* divides those tasks among the following sections:

- Section 2 (Volume 1) of *Administration Guide* discusses the decisions that must be made when designing a database and tells how to bring the design into being by creating DB2 objects, loading data, and adjusting to changes.
- Section 3 (Volume 1) of *Administration Guide* describes ways of controlling access to the DB2 system and to data within DB2, to audit aspects of DB2 usage, and to answer other security and auditing concerns.
- Section 4 (Volume 1) of *Administration Guide* describes the steps in normal day-to-day operation and discusses the steps one should take to prepare for recovery in the event of some failure.
- Section 5 (Volume 2) of *Administration Guide* explains how to monitor the performance of the DB2 system and its parts. It also lists things that can be done to make some parts run faster.

In addition, the appendixes in *Administration Guide* contain valuable information on DB2 sample tables, National Language Support (NLS), writing exit routines, interpreting DB2 trace output, and character conversion for distributed data.

If you are involved with DB2 only to design the database, or plan operational procedures, you need *Administration Guide*. If you also want to carry out your own plans by creating DB2 objects, granting privileges, running utility jobs, and so on, then you also need:

- *SQL Reference*, which describes the SQL statements you use to create, alter, and drop objects and grant and revoke privileges
- *Utility Guide and Reference*, which explains how to run utilities
- *Command Reference*, which explains how to run commands

If you will be using data sharing, then you need *Data Sharing: Planning and Administration*, which describes how to plan for and implement data sharing.

Additional information about system and database administration can be found in *Messages and Codes*, which lists messages and codes issued by DB2, with explanations and suggested responses.

Diagnosis: Diagnosticians detect and describe errors in the DB2 program. They might also recommend or apply a remedy. The documentation for this task is in *Diagnosis Guide and Reference* and *Messages and Codes*.

How to Obtain DB2 Information

DB2 on the Web

Stay current with the latest information about DB2. View the DB2 home page on the World Wide Web. News items keep you informed about the latest enhancements to the product. Product announcements, press releases, fact sheets, and technical articles help you plan your database management strategy. Technical professionals can access DB2 publications on the Web and follow links to other Web sites with more information about DB2 family and OS/390 solutions. Access DB2 on the Web with the following URL:

<http://www.ibm.com/software/db2os390>

DB2 Publications

The DB2 publications are available in both hardcopy and softcopy format. Using online books on CD-ROM, you can read, search across books, print portions of the text, and make notes in these BookManager books. With the appropriate BookManager READ product or IBM Library Readers, you can view these books on the MVS, VM, OS/2, DOS, AIX and Windows platforms.

When you order DB2 Version 5, you are entitled to one copy of the following CD-ROM, which contains the DB2 licensed book for no additional charge:

DB2 Server for OS/390 Version 5 Licensed Online Book, LK2T-9075.

You can order multiple copies for an additional charge by specifying feature code 8207.

When you order DB2 Version 5, you are entitled to one copy of the following CD-ROM, which contains the DB2 and DATABASE 2 Performance Monitor online books for no additional charge:

DB2 Server for OS/390 Version 5 Online Library, SK2T-9092

You can order multiple copies for an additional charge through IBM's publication ordering service.

Periodic updates will be provided on the following collection kit available to licensees of DB2 Version 5:

IBM Online Library Transaction Processing and Data Collection, SK2T-0730

SK2T-9092 will be superseded by SK2T-0730 when updates to the online library are available.

In some countries, including the United States and Canada, you receive one copy of the collection kit at no additional charge when you order DB2 Version 5. You will automatically receive one copy of the collection kit each time it is updated, for no additional charge. To order multiple copies of SK2T-0730 for an additional charge, see "How to Order the DB2 Library" on page 1-11. In other countries, updates will be available in displayable softcopy format in the IBM Online Book Library Offering

(5636-PUB), SK2T-0730 IBM Online Library Transaction Processing and Data Collection at a later date.

See your IBM representative for assistance in ordering the collection.

DB2 Server for OS/390 books are also available for an additional charge on the following collection kits, which contain online books for many IBM products:

IBM Online Library MVS Collection, SK2T-0710, in English

Online Library Omnibus Edition OS/390 Collection, SK2T-6700, in English

IBM Online Library MVS Collection Kit, SK88-8002, in Japanese, for viewing on DOS and Windows platforms

How to Order the DB2 Library

You can order DB2 publications and CD-ROMs through your IBM representative or the IBM branch office serving your locality. If you are located within the United States or Canada, you can place your order by calling one of the toll-free numbers :

- In the U.S., call 1-800-879-2755.
- In Canada, call 1-800-565-1234.

To order additional copies of licensed publications, specify the SOFTWARE option. To order additional publications or CD-ROMs, specify the PUBLICATIONS & SLSS option. Be prepared to give your customer number, the product number, and the feature code(s) or order numbers you want.

DB2 Classes

IBM Education and Training offers a wide variety of classroom courses to help you quickly and efficiently gain DB2 expertise. Classes are scheduled in cities all over the world. For more information, including the current local schedule, please contact your IBM representative.

Classes can also be taught at your location, at a time that suits your needs. Courses can even be customized to meet your exact requirements. The diagrams below show the DB2 curriculum in the United States. *Enterprise Systems Training Solutions*, GR28-5467 describes these courses. You can inquire about or enroll in them by calling 1-800-IBM-TEACH (1-800-426-8322).

Summary of Changes to DB2 for OS/390 Version 5

DB2 for OS/390 Version 5 delivers a database server solution for OS/390. Version 5 supports all functions available in DB2 for MVS/ESA Version 4 plus enhancements in the areas of performance, capacity, and availability, client/server and open systems, and user productivity.

If you are currently using DB2, **you can migrate only from a DB2 for MVS/ESA Version 4 subsystem**. This summary gives you an overview of the differences to be found between these versions.

Server Solution

OS/390 retains the classic strengths of the traditional MVS/ESA operating system, while offering a network-ready, integrated operational environment.

The following features work directly with DB2 for OS/390 applications to help you use the full potential of your DB2 subsystem:

- Net.Data for OS/390
- DB2 Installer
- DB2 Estimator for Windows
- DB2 Visual Explain
- Workstation-based Performance Analysis and Tuning
- DATABASE 2 Performance Monitor

Net.Data for OS/390

Net.Data provides support for Internet access to DB2 data through a Web server. Applications built with Net.Data make data stored in any DB2 server more accessible and useful. Net.Data Web applications provide continuous application availability, scalability, security, and high performance.

This no charge feature can be ordered with DB2 Version 5 or downloaded from Internet. The Net.Data URL is:

<http://www.ibm.com/software/data/net.data/downloads.html>

DB2 Installer

DB2 Installer offers the option to install DB2 on an OS/2 workstation. Now, you can use a friendly graphical interface to complete installation tasks easily with DB2 Installer.

This function is delivered on CD-ROM with DB2 Visual Explain.

DB2 Estimator for Windows

DB2 Estimator provides an easy-to-use capacity planning tool. You can estimate the sizes of tables and indexes, and the performance of SQL statements, groups of SQL statements (transactions), utility runs, and groups of transactions (capacity runs). From a simple table sizing to a detailed performance analysis of an entire DB2 application, DB2 Estimator saves time and lowers costs. You can investigate the impact of new or modified applications on your production system, *before* you implement them.

This no charge feature can be ordered with DB2 Version 5 or downloaded from the Internet. From the internet, use the IBM Software URL:

<http://www.ibm.com/software/>

From here, you can access information about DB2 Estimator using the download function.

DB2 Visual Explain

DB2 Visual Explain lets you tune DB2 SQL statements on an OS/2 workstation. You can see DB2 EXPLAIN output in a friendly graphical interface and easily access, modify, and analyze applications with DB2 Visual Explain.

Workstation-based Performance Analysis and Tuning

The new workstation-based Performance Analysis and Tuning function simplifies system administration. You can access statistical data to help you analyze and improve system performance. This function works with the optional DB2 PM feature to provide full analysis and tuning functionality.

DATABASE 2 Performance Monitor (DB2 PM)

DB2 PM lets you monitor, analyze, and optimize the performance of DB2 Version 5 and its applications. An online monitor, for both host and workstation environments, provides an immediate "snap-shot" view of DB2 activities and allows for exception processing while the system is operational. The workstation-based online monitor can connect directly to the Visual Explain function of the DB2 base product.

DB2 PM also offers a history facility, a wide variety of customizable reports for in-depth performance analysis, and an EXPLAIN function to analyze and optimize SQL statements. For more information, see *DB2 PM for OS/390 General Information*.

This feature can be ordered with DB2 Version 5.

Performance

Sysplex Query Parallelism

The increased power of Sysplex query parallelism in DB2 for OS/390 Version 5 allows DB2 to go far beyond DB2 for MVS/ESA Version 4 capabilities; from the ability to split and process a single query within a DB2 subsystem to processing that same query across many different DB2 subsystems in a data sharing group.

The advances this release offers in scalable query processing let you process queries quickly while accommodating the potential growth of data sharing groups and the increasing complexity of queries.

Prepared Statement Caching

DB2 reduces the cost of duplicate prepares for the same dynamic SQL statement by saving them in a cache. Now, different application processes can share prepared statements and they are preserved past the commit point. This performance improvement offers the most benefit for:

- Client/server applications that frequently use dynamic SQL for repeated execution of SQL statements
- Relatively short dynamic SQL statements for which PREPARE cost accounts for most of the CPU expended

Reoptimization

When host variables, parameter markers, or special registers were used in previous releases, DB2 could not always determine the best access path because the values for these variables were unknown. Now, you can tell DB2 to reevaluate the access path at run time, after these values are known. As a result, queries can be processed more efficiently, and response time is improved.

Faster Transactions and Batch

- Caching of package authorization improves performance at run time for remote packages and applications that use pattern-matching characters in a package list.
- You can define a table space to use **selective partition locking**, which can reduce locking costs for applications that do partition-at-a-time processing. It also can reduce locking costs for certain data sharing applications that rely on an affinity between members and data partitions.
- A new standalone utility lets you preformat active logs.
- With LOAD and REORG, you can preformat data sets up to the high allocated RBA, which can make processing for sequential inserts more predictable.

Faster Utilities

- LOAD and REORG jobs run faster and more efficiently with enhanced index key sorting that reduces CPU and elapsed time, and an inline copy feature that lets you make an image copy without a separate copy step.
- New REORG options let you select rows to discard during a REORG and, optionally, write the discarded records to a file.
- When you run the REBUILD, RECOVER, REORG, or LOAD utility on DB2-managed indexes or table spaces, a new option lets you logically reset and reuse the DB2-managed objects.

- RECOVER INDEX and LOAD run faster on large numbers of rows per page.
- Sampling support for RUNSTATS reduces the processing required to collect nonindexed column statistics.
- BSAM striping improves the I/O capability of DB2 utilities.

Other Performance Enhancements

- There are several significant performance enhancements to data sharing, including selective partition locking, the MAXROWS option, and several optimizations to reduce data sharing overhead.
- DB2 installations that run in the OS/390 Version 2 Release 6 environment can now have as many as (approximately) 25 000 open DB2 data sets at one time. The maximum number of open data sets in earlier releases of OS/390 is 10000.
- You can easily alter the length of variable-length character columns using the new ALTER COLUMN clause of the ALTER TABLE statement.
- SQL CASE expressions let you eliminate queries with multiple UNIONS and improve performance by using only one table scan.
- You can collect a new statistic on concatenated index keys to improve the performance of queries with correlated columns. The statistic lets DB2 estimate the number of rows that qualify for the query more accurately, and select access paths more efficiently.
- DB2 scans partitions more efficiently and allows scans during parallel processing.
- Query enhancements include the ability to:
 - Use indexes for joins on string columns that have different lengths
 - Use an index to access predicates with noncorrelated IN subqueries
- Noncolumn expressions in simple predicates are evaluated at stage 1 and can be indexable.

Increased Capacity

DB2 for OS/390 Version 5 introduces the concept of a *large* partitioned table space. Defining your table space as large allows a substantial capacity increase: to approximately one terabyte of data and up to 254 partitions. In addition to accommodating growth potential, large partitioned table spaces make database design more flexible, and can improve availability.

Improved Availability

Online REORG

DB2 for OS/390 Version 5 adds a major improvement to availability with *Online REORG*. Now, you can avoid the severe availability problems that occurred while offline reorganization of table spaces restricted access to read only during the unload phase and no access during reload phase of the REORG utility. Online REORG gives you full read and write access to your data through most phases of the process with only very brief periods of read only or no access.

Data Sharing Enhancements

- Version 5 provides continuous availability with group buffer pool duplexing. Prior releases of DB2 rely on DASD and the merged recovery logs to recover group buffer pool (GBP) data that is lost if a coupling facility fails. With group buffer pool duplexing, DB2 writes changed pages to both a *primary GBP* and a *secondary GBP*. Overlapped writes to the GBPs provide good performance and eliminate the writes to DASD.
- Group buffer pool rebuild makes coupling facility maintenance easier and improves access to the group buffer pool during connectivity losses.
- Automatic group buffer pool recovery accelerates GBP recovery time, eliminates operator intervention, and makes data available faster when GBPs are lost because of coupling facility failures.
- Improved restart performance for members of a data sharing group reduces the impact of retained locks by making data available faster when a group member fails.
- Changes to traces and DISPLAY GROUPBUFFERPOOL output improve monitoring.

Tracker site for disaster recovery

You can set up a tracker site that shadows the activity of a primary site, and eliminate the need to constantly ship image copies.

Client/Server and Open Systems

Native TCP/IP Network Support

DB2's support of TCP/IP networks allows DRDA clients to connect directly to DDF and eliminate the gateway machine. In addition, customers can now use asynchronous transfer mode (ATM) as the underlying communication protocol for both SNA and TCP/IP connections to DB2.

Stored Procedures

- Return multiple SQL result sets to local and remote clients in a single network operation.
- Receive calls from applications that use standard interfaces, such as Open Database Connectivity** (ODBC) and X/Open** Call Level Interface, to access data in DB2 for OS/390.
- Run in an enhanced environment. DB2 supports multiple stored procedures address spaces managed by the MVS Workload Manager (WLM). The WLM environment offers efficient program management and allows WLM-managed stored procedures to run as subprograms and use RACF security.
- Use individual MVS dispatching priorities to improve stored procedure scheduling.
- Access data sources outside DB2 with two-phase commit coordination.
- Use an automatic COMMIT feature on return to the caller that reduces network traffic and the length of time locks are held.
- Have the ability to invoke utilities, which means you can now invoke utilities from an application that uses the SQL CALL statement.

- # • Support IMS Open Database Access (ODBA). Now a DB2 stored procedure
- # can directly connect to IMS DBCTL and access IMS data.

Dynamic Query and Network Performance

Improvements for DRDA Applications

- Reduced processing costs for block fetch operations
- DRDA support for OPTIMIZE FOR n ROWS on SELECT
- Faster dynamic SQL queries and reduced processing costs for VTAM network operations
- Reduced message traffic for dynamic SQL SELECT statements

Improved Application Portability

- DB2 for OS/390 Version 5 introduces the DB2 Call Level Interface (CLI) to MVS/ESA. Unlike applications that use embedded SQL to access DB2 data, applications that choose CLI are not tied to a precompiler, packages, or a plan.

Workstation and desktop applications use standard interfaces, such as Open Database Connectivity (ODBC), to access relational data. Standard interfaces need one version of an application to access many data sources. Now, you can port UNIX workstation and PC desktop applications to DB2 for OS/390 and exploit the CLI (ODBC) capabilities without modification. In addition, applications can issue ODBC or CLI calls from within a stored procedure.

- # • You can now access DB2 for OS/390 databases in your Java applications. You
- # can use DB2 Connect Java Database Connectivity (JDBC) for your dynamic
- # SQL applications, or SQLJ for your static SQL applications.
- # • DB2 adds DRDA support for the DESCRIBE INPUT statement to improve per-
- # formance for many ODBC applications.
- # • Now, you can write multithreaded DB2 CLI applications, and restrictions on
- # connection switching no longer exist.
- DB2 now provides ASCII table support for clients and servers across platforms. This support reduces the cost of translation between EBCDIC and ASCII encoding schemes. ASCII table support also offers an alternative to writing field procedures that provide the ASCII sort sequence, which improves performance.

Improved Security

- DB2 for OS/390 supports Distributed Computing Environment (DCE) for authenticating remote DRDA clients. DCE offers the following benefits:
 - Network security: By providing an encrypted DCE ticket for authentication, remote clients do not need to send an MVS password in readable text.
 - Simplified security administration: End users do not need to maintain a valid password on MVS to access DB2; instead, they maintain their DCE password only.
- New descriptive error codes help you determine the cause of network security errors.
- You can change end user MVS passwords from DRDA clients.

User Productivity

Improved SQL Compatibility

DB2 conforms to the ANSI/ISO SQL entry level standard of 1992. Application programmers can take advantage of a more complete set of standard SQL to use across the DB2 family to write portable applications. New SQL function includes:

- More check options for view definitions.
- Foreign keys that reference UNIQUE keys as well as PRIMARY keys.
- An extension to GRANT that lets the REFERENCES privilege apply to a list of columns.
- A new delete rule, NO ACTION, that you can use to define referential constraints for self-referencing tables.
- SQL CASE expressions provide the capability to create conditional logic wherever an expression is allowed.
- SQL temporary tables allow application programs to easily create and use temporary tables that store results of SQL transactions without logging or recovery.

New Access Choice

A new attachment facility, the Recoverable Resource Manager Services attachment facility, improves access in a client/server environment. It coordinates two-phase commit processing between DB2 and other participating resource managers in any MVS application environment. Other key features include the ability for multiple users to run in a single address space, thread reuse, and moving threads between MVS tasks.

Image Copy Enhancements

The COPY, LOAD, and REORG utilities provide:

- Features of the COPY utility that help you quickly determine what type of image copy to take, when to take it, and let DB2 automatically take it for you.
- Inline copy in LOAD and REORG that lets you create an image copy while improving data availability.

Improved Integration of C++ and IBM COBOL for MVS & VM Support

It is easier for application programmers to use object-oriented programming techniques in their DB2 applications. DB2 for OS/390 Version 5 adds COBOL and C++ languages as options on installation panels, DB2I panels, the DSNH command, and DCLGEN.

Other Usability Enhancements

- To prevent long running units of work and to help avoid unnecessary work during the recovery phase of restart, DB2 issues new warning messages at an interval of your choice.
- A new special register for decimal precision provides better granularity, so that applications that need different values for decimal precision can run in the same DB2 subsystem.
- Trace records for IFCID 0022 now include most information in the PLAN_TABLE.

- An increase from 127 to 255 rows on a page improves table space processing and eliminates the need for compression.
- Install SYSOPR can recover objects using the START DATABASE command.
- A filtering capability for DISPLAY BUFFERPOOL limits statistics information to a specified set of page sets.
- You can enter comments within the SYSIN input stream for DB2 utilities.

Summary of Changes to This Book

This edition adds and modifies messages and codes to support DB2 Version 5. It also incorporates technical corrections and changes made to previously published information.

Section 2. SQL Return Codes

SQL Return Codes

The information in this chapter is General-use Programming Interface and Associated Guidance Information, as defined in “Notices” on page vii.

Introduction

Structured Query Language (SQL) return codes, and the tokens referred to in the explanations, are returned in the SQL communication area (SQLCA).

The SQLCA is an area in the application program (defined by the application program) for the use of DB2. It is described in Appendix C of *SQL Reference*.

The SQL return code is returned in the SQLCODE field of the SQLCA. The tokens are returned in the SQLERRM field. If there are several tokens, they appear sequentially in SQLERRM in the order in which they appear in the message text. The tokens are separated by the character X'FF'.

A token appears in the message text in lowercase letters. When an SQL return code is returned through SPUFI, the tokens have been substituted into the message text and the text is displayed. The substitution of tokens into message text is performed by a DB2 module named DSNTIAR. This module can also be used by application programs. Refer to Section 3 of *Application Programming and SQL Guide* for more information about DSNTIAR.

Checking the Execution of SQL Statements

An application program containing executable SQL statements must either provide a structure named SQLCA or a stand-alone integer variable named SQLCODE (SQLCOD in FORTRAN). An SQLCA may be provided by using the INCLUDE SQLCA statement. INCLUDE SQLCA must not be used if a stand-alone SQLCODE is provided.

The SQLCA includes an integer variable named SQLCODE. The option of providing a stand-alone

SQLCODE instead of an SQLCA allows for conformance with the ISO/ANSI SQL standard. The use of this option must be indicated to the pre-compiler.

SQLCODE

Regardless of whether the application program provides an SQLCA or a stand-alone variable, SQLCODE is set by DB2 after each SQL statement is executed. DB2 conforms to the ISO/ANSI SQL standard as follows:

- If SQLCODE = 0, execution was successful.
- If SQLCODE > 0, execution was successful with a warning.
- If SQLCODE < 0, execution was not successful.
- SQLCODE = 100, "no data" was found. For example, a FETCH statement returned no data because the cursor was positioned after the last row of the result table.

SQLSTATE

SQLSTATE is also set by DB2 after the execution of each SQL statement. Thus, application programs can check the execution of SQL statements by testing SQLSTATE instead of SQLCODE. SQLSTATE (SQLSTT in FORTRAN) is a 5-byte character string variable in the SQLCA.

SQLSTATE provides application programs with common codes for common error conditions (the values of SQLSTATE are product-specific only if the error or warning is product-specific). Furthermore, SQLSTATE is designed so that application programs can test for specific errors or classes of errors. The coding scheme is the same for all IBM relational database products. See “Appendix C. SQLSTATE Values—Common Error Codes” on page X-13 for more information and a complete list of the possible values of SQLSTATE.

Successful Execution SQL Code

000 SUCCESSFUL EXECUTION

Explanation: Unqualified successful execution or successful execution with one or more warnings. If SQLWARN0 is blank, there are no warnings. If SQLWARN0 = W, at least one of the other warning indicators in the SQLCA has been set to indicate a warning condition. For example, SQLWARN1 is used to indicate that a value of a string column was truncated when assigned to a host variable. SQLWARNx fields are described in Appendix C of *SQL Reference*.

Destination: 00000 for unqualified successful execution

Destination: 01ddd for successful execution with warning 'ddd'.

Warning SQL Codes

+012 THE UNQUALIFIED COLUMN NAME *column-name* WAS INTERPRETED AS A CORRELATED REFERENCE

Explanation: The column name does not identify a column of a table or view in the FROM clause of the subquery. However, it does identify a column of a table or view in a FROM clause at a higher level in the statement.

System Action: The column name is interpreted as a correlated reference.

Programmer Response: If DB2's interpretation of the column name was not what you intended, rewrite the SQL statement and submit it again. If you intend the column name to refer to a table named at a higher level, we advise rewriting the statement anyway, using a table name or correlation name as a qualifier for the column name. The unqualified column name could be interpreted differently if you do a rebind after altering one of the tables to which you refer.

Destination: 01545

+098 A DYNAMIC SQL STATEMENT ENDS WITH A SEMICOLON.

Explanation: The statement string of a PREPARE or EXECUTE IMMEDIATE statement is a valid dynamic SQL statement, but it ends with a semicolon.

System Action: The semicolon and any subsequent text are ignored.

Programmer Response: Check that the semicolon is being used as a statement terminator.

Destination: 01568

+100 ROW NOT FOUND FOR FETCH, UPDATE OR DELETE, OR THE RESULT OF A QUERY IS AN EMPTY TABLE

Explanation: One of the following conditions occurred:

- No row met the search conditions specified in an UPDATE or DELETE statement.
- The result of a SELECT INTO statement was an empty table.
- A FETCH statement was executed when the cursor was positioned after the last row of the result table.
- The result of the subselect of an INSERT statement is empty.

When a SELECT statement is executed using SPUFI, this SQLCODE indicates normal completion.

System Action: No data was retrieved, updated, or deleted.

Destination: 02000

+110 SQL UPDATE TO A DATA CAPTURE TABLE NOT SIGNALLED TO ORIGINATING SUBSYSTEM

Explanation: DataPropagator (DPropNR) exit routine issued an SQL INSERT, UPDATE, or DELETE statement to a table defined with DATA CAPTURE CHANGES. Since data capture is already in progress, notification is not sent back to the originating IMS subsystem.

System Action: DB2 changes the data and records the change in the log. DB2 does not notify DPropNR's exit routine of the change, because doing so might cause the same change to be made again.

User Response: None required.

Destination: 01561

+111 THE SUBPAGES OPTION IS NOT SUPPORTED FOR TYPE 2 INDEXES

Explanation: You cannot use the SUBPAGES option for type 2 indexes.

System Action: The option is ignored and processing continues.

Programmer Response: Remove the SUBPAGES option to get rid of the warning.

Destination: 01590

+117 THE NUMBER OF INSERT VALUES IS NOT THE SAME AS THE NUMBER OF OBJECT COLUMNS

Explanation: The number of insert values in the value list of the INSERT statement is not the same as the number of object columns specified.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, specify one and only one value for each of the specified object columns.

Destination: 01525

**+162 TABLESPACE *database-name.tablespace-name*
HAS BEEN PLACED IN CHECK PENDING**

Explanation: The indicated table space is in check pending status because the ALTER TABLE statement was used to specify a referential constraint or a check constraint (while special register CURRENT RULES = 'DB2') on a populated table. The table space is not generally available until the check pending status is removed from the table space.

System Action: The table space was placed in check pending status.

Programmer Response: Run the CHECK DATA utility. The enforcement of the referential constraint or the check constraint is deferred until the CHECK DATA utility is run.

Destination: 01514

**+203 THE QUALIFIED COLUMN NAME *column-name*
WAS RESOLVED USING A NON-UNIQUE OR
UNEXPOSED NAME**

Explanation: The table designator selected to resolve a qualified column name is one of the following:

- An unexposed name
- An exposed name that has an exposed duplicate in the same FROM clause
- An exposed name that has an unexposed duplicate which appears before the selected name in the ordered list of names to which the qualifier is compared

Therefore, the statement does not conform to the guidelines for using only unique exposed names as qualifiers or it is possible that the column reference was not resolved to the intended instance of the table or view.

System Action: DB2 uses the selected name to resolve the reference.

Programmer Response: If DB2's resolution of the qualifier was not what you intended, rewrite the SQL statement and submit it again. The rules used to resolve column name qualifiers are given in Chapter 3 of *SQL Reference*.

Destination: 01552

+204 *name* IS AN UNDEFINED NAME

Explanation: The object identified by 'name' is not defined in the DB2 subsystem. This return code can be generated for any type of DB2 object.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, determine that the object name was correctly specified in the SQL statement (including any required qualifiers). If so, ensure that the object exists in the system before resubmitting the statement.

Destination: 01532

**+206 *column-name* IS NOT A COLUMN OF AN
INSERTED TABLE, UPDATED TABLE, OR ANY
TABLE IDENTIFIED IN A FROM CLAUSE**

Explanation: This return code is used to report one of these errors:

- In the case of an INSERT or UPDATE statement, the specified column is not a column of the table or view that was specified as the object of the insert or update.
- In the case a SELECT or DELETE statement, the specified column is not a column of any of the tables or views identified in a FROM clause in the statement.
- There is a correlated reference in GROUP BY.
- There is an unresolved qualified reference in HAVING.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, verify that the column and table names are specified correctly in the SQL statement. In the case of a SELECT statement, check to be sure that all of the required tables were named in the FROM clause.

Destination: 01533

**+218 THE SQL STATEMENT REFERENCING A
REMOTE OBJECT CANNOT BE EXPLAINED**

Explanation: The user has used EXPLAIN(YES) on the bind subcommand to bind an application which has SQL statement referencing a remote object or the user has a static EXPLAIN SQL statement which references a remote object in the application program. EXPLAIN on a remote object is not supported by DB2.

It is issued at BIND time, and only with VALIDATE(RUN).

System Action: The plan or package will be bound successfully, but no information will be filled in the user's PLAN-TABLE for the SQL statement referencing a remote object. An SQLCODE -512 will be issued at run time if the EXPLAIN statement is found to explain a remote object.

Destination: 01537

**+219 THE REQUIRED EXPLANATION TABLE *table-
name* DOES NOT EXIST**

Explanation: The EXPLAIN statement assumes the existence of the explanation table and it is not defined in the DB2 subsystem as a base table. Refer to Chapter 6 of *SQL Reference* for more information.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, determine whether the required explanation table does exist. If not, create the required table.

Destination: 01532

+220 THE COLUMN *column-name* IN EXPLANATION TABLE *table-name* IS NOT DEFINED PROPERLY

Explanation: An error occurred during the insertion of a row into the explanation table. The table is improperly defined for the following reasons:

- A column is missing.
- Columns are defined in the wrong order.
- The table contains an extra column.
- A column description is invalid because of its name, data type, length, or null attributes.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, correct the definition of the required explanation table. Refer to Chapter 6 of *SQL Reference* for information about defining an explanation table.

Destination: 01546

+304 A VALUE WITH DATA TYPE *data-type1* CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE THE VALUE IS NOT WITHIN THE RANGE OF THE HOST VARIABLE IN POSITION *position-number* WITH DATA TYPE *data-type2*

Explanation: A FETCH or SELECT into a host variable list or structure, position number 'position-number' failed because the host variable having data type 'data-type2' was not large enough to hold the retrieved value having data type 'data-type1'.

System Action: The FETCH or SELECT could not return the data for the indicated SELECT item, the indicator variable is set to negative two (-2) to indicate a null value returned. Processing continues.

Programmer Response: Verify that table definitions are current, and that the host variable has the proper data type. See the explanation for SQLCODE -405 for ranges of SQL data types.

Destination: 01515

+331 THE NULL VALUE HAS BEEN ASSIGNED TO A HOST VARIABLE BECAUSE THE STRING CANNOT BE TRANSLATED. REASON *reason-code*, CHARACTER *code-point*, HOST VARIABLE *position-number*

Explanation: A string assigned to a host variable had to be translated from its coded character set to the coded character set of the host variable and an error occurred during the translation. The position-number is the ordinality of the host variable in the SQLDA. See the description of SQLCODE -331 for further information including the meaning of the reason-code and code-point.

System Action: The host variable is unchanged and its indicator variable is set to -2 to indicate that a null value is returned. Execution of the statement continues as if the translation error had not occurred.

Destination: 01520

+339 THE SQL STATEMENT HAS BEEN SUCCESSFULLY EXECUTED, BUT THERE MAY BE SOME CHARACTER CONVERSION INCONSISTENCIES

Explanation: The application is connected to a DB2 Version 2 Release 3 database server. The SQL statement is using an alias or three-part name, which refers to another DB2 subsystem that is at the Version 2 Release 2 level. DB2 Version 2 Release 2 does not support character conversion. Since the execution of SQL statements from an EBCDIC DRDA requester to an EBCDIC Version 2 Release 2 DB2 server could require character conversion, a warning is generated. If the requester system CCSID is inconsistent with the DB2 Version 2 Release 2 environment, most EBCDIC character code points match to the same character. Only certain special characters typically lead to data integrity concerns. Therefore, a warning is generated.

System Action: The statement is successfully executed.

Programmer Response: If the DB2 Version 2 Release 2 table is accessed from other environments (different CCSID), incorrect results might occur (relative to what the other environment might expect). You should understand what characters might not be consistent with the DB2 Version 2 Release 2 environment (its inherent CCSID) and avoid use of those characters or understand the exposure you face if you use them.

System Programmer Response: If the application must refer to the Version 2 Release 2 subsystem data, the Version 2 Release 2 DB2 subsystem can be migrated to Version 2 Release 3 where character conversion is supported.

Destination: 01569

+402 LOCATION *location* IS UNKNOWN

Explanation: A remote object is referenced and either the table SYSIBM.LOCATIONS is not defined or the referenced 'location' matches no entry in the SYSIBM.LOCATIONS.LOCATION column.

System Action: For the CREATE ALIAS statement, the alias is created. For binding a plan or package with the VALIDATE(RUN) option, the plan or package is created.

Destination: 01521

+403 THE LOCAL OBJECT REFERENCED BY THE CREATE ALIAS STATEMENT DOES NOT EXIST

Explanation: The local object referenced by the CREATE ALIAS statement does not exist when creating the alias.

System Action: The alias is created.

Destination: 01522

+464 PROCEDURE *proc* RETURNED *num* QUERY RESULT SETS, WHICH EXCEEDS THE DEFINED LIMIT *integer*

Explanation: The stored procedure named by *proc* completed normally. However, the stored procedure exceeded the defined limit on the number of query result sets the procedure can return.

- *num* identifies the number of query result sets returned by the stored procedure.

- *integer* identifies the defined limit on the number of query result sets for the stored procedure.

Only the first *integer* query result sets are returned to the SQL program that issued the SQL CALL statement.

The possible causes are as follows:

- The stored procedure is unable to return *num* result sets due to the limit established in the RESULT_SETS column of SYSIBM.SYSPROCEDURES.
- The stored procedure is unable to return *num* result sets due to the DRDA limitations imposed by the client. The DRDA client establishes this limit with the MAXRSLCNT DDM code point.

System Action: The SQL statement is successful. The SQLWARN9 field is set to 'Z'.

Destination: 01609

+466 PROCEDURE *proc* RETURNED *num* QUERY RESULT SETS

Explanation: The stored procedure named by *proc* completed normally. The procedure returned the number of SQL query result sets specified in *num*.

System Action: The SQL statement is successful. The SQLWARN9 field is set to 'Z'.

Destination: 01610

+494 NUMBER OF RESULT SETS IS GREATER THAN NUMBER OF LOCATORS

Explanation: The number of result set locators specified on the ASSOCIATE LOCATORS statement is less than the number of result sets returned by the stored procedure. The first "n" result set locator values are returned, where "n" is the number of result set locator variables specified on the SQL statement.

System Action: The SQL statement is successful. The SQLWARN3 field is set to 'Z'.

Programmer Response: Increase the number of result set locator variables specified on the SQL statement.

Destination: 01614

+535 THE RESULT OF THE POSITIONED UPDATE OR DELETE MAY DEPEND ON THE ORDER OF THE ROWS.

Explanation: A positioned update of a primary key or a delete from a table with a self-referencing constraint was requested.

System Action: DB2 executes the UPDATE or DELETE statement and the contents of the table are changed.

Destination: 01591

+541 THE REFERENTIAL OR UNIQUE CONSTRAINT *name* HAS BEEN IGNORED BECAUSE IT IS A DUPLICATE

Explanation: A FOREIGN KEY clause uses the same key and parent table as another FOREIGN KEY clause, or a UNIQUE clause uses the same column list as another UNIQUE clause. In either case, the duplicate clause is ignored. '*name*' is either the foreign key name or the name of the first column in the constraint that is ignored.

System Action: DB2 continues processing.

Programmer Response: If the duplication is an error, correct the statement and execute it again.

Destination: 01543

+551 *auth-id* DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION *operation* ON OBJECT *object-name*

Explanation: Authorization ID '*auth-id*' has attempted to perform the specified '*operation*' on object '*object-name*' without having been granted the proper authority to do so. This error might also occur if the specified object does not exist, if the object is a read-only view (for UPDATE or INSERT), or if '*auth-id*' is trying to create a table or view with an authorization ID other than its own. Only if your authorization ID is SYSADM, DBADM, or DBCTRL can you create a table or view from an '*auth-id*' other than your own.

If this error occurs while DB2 is creating or altering a table involving referential constraints, this code reports that the user does not have the necessary ALTER privilege to perform a FOREIGN KEY, DROP FOREIGN KEY, or DROP PRIMARY KEY operation. The '*object-name*' identifies the object table of the CREATE or ALTER TABLE statement, not the table for which the user lacks the ALTER privilege.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, ensure that '*auth-id*' has been granted the authority to perform the desired operation, that '*object-name*' exists, and that '*auth-id*' is not trying to create a table with a different authorization ID.

Destination: 01548

+552 *auth-id* DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION *operation*

Explanation: Authorization ID '*auth-id*' has attempted to perform the specified '*operation*' without having been granted the authority to do so.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, ensure that the authorization-ID has been granted the authority necessary to perform the desired operation.

Destination: 01542

+558 THE WITH GRANT OPTION IS IGNORED

Explanation: The GRANT statement contained one of the following situations:

- PUBLIC was within the list of '*grantee*' authorization IDs.
- BINDAGENT privilege was being granted.
- ANY package privilege on collection-id.* was being granted.

The WITH GRANT option may not be used in the above situations.

System Action: The offending privilege(s) in the authorization specification are granted without the GRANT option. If the grantee is PUBLIC, all the privileges in the authorization specification are granted without the GRANT option.

Destination: 01516

+561 THE ALTER, INDEX, AND REFERENCES PRIVILEGES CANNOT BE GRANTED TO PUBLIC AT ALL LOCATIONS

Explanation: You specified a GRANT statement with either an ALL or ALL PRIVILEGES keyword. ALL and ALL PRIVILEGES imply the granting of ALTER, INDEX, and REFERENCES privileges that cannot be granted to a remote user.

System Action: DB2 executes the GRANT statement. However, it does not grant the ALTER, INDEX, or REFERENCES privileges to PUBLIC*.

Destination: 01523

+562 A GRANT OF A PRIVILEGE WAS IGNORED BECAUSE THE GRANTEE ALREADY HAS THE PRIVILEGE FROM THE GRANTOR

Explanation: At least one of the privileges in the GRANT statement was ignored because the privilege was already granted to the grantee by the grantor.

System Action: The privileges previously granted are ignored; all others are granted.

Programmer Response: None.

Destination: 01560

+610 INDEX *index-name* HAS BEEN PLACED IN RECOVER PENDING

Explanation: The identified index is in the recover pending state because CREATE INDEX with DEFER YES was specified on a populated table. The index is not generally available until the index is removed from the recover pending state.

System Action: The index was placed in recover pending state.

Programmer Response: Use the RECOVER INDEX utility to rebuild the index and remove the recover pending state.

Destination: 01566

+625 THE DEFINITION OF TABLE *table-name* HAS BEEN CHANGED TO INCOMPLETE

Explanation: This warning code is used to report that the definition of the indicated table is incomplete because DROP INDEX was used to drop its primary index. The table is not generally available until a new primary index is created.

System Action: The definition of the table is marked as incomplete. Subsequent SQL references to the table, except to grant or revoke privileges on it, will cause SQLCODE -540 to be returned. Attempts to run already bound plans referencing the table will result in SQLCODE -904 or -923 with resource unavailable reason code 00C9009F. CHECK and LOAD utilities involving the table are not allowed. If they are used, you will receive message DSNU305I or DSNT500I with reason code 00C9009F. Utilities other than CHECK and LOAD are allowed.

Programmer Response: Recreate the primary index using CREATE INDEX. This will remove the table from INCOMPLETE DEFINITION status.

Note: The reason that a primary index may need to be dropped and recreated is to change the STOGROUP or SUBPAGES parameters of the index.

Destination: 01518

+626 DROPPING THE INDEX TERMINATES ENFORCEMENT OF THE UNIQUENESS OF A KEY THAT WAS DEFINED WHEN THE TABLE WAS CREATED

Explanation: The index was created to enforce the uniqueness of a key that was defined as UNIQUE when the table was created. Dropping the index terminates enforcement of the unique constraint by DB2.

System Action: The index is dropped.

Programmer Response: If the unique constraint is still intended to apply, create a new unique index with the same key as the dropped index.

Destination: 01529

+645 WHERE NOT NULL IS IGNORED BECAUSE THE INDEX KEY CANNOT CONTAIN NULL VALUES

Explanation: The WHERE NOT NULL clause is ignored on the CREATE INDEX statement because the index key is defined on columns that cannot contain null values.

System Action: The option is ignored; processing continues.

Programmer Response: Remove the WHERE NOT NULL clause to get rid of the warning.

Destination: 01528

+650 THE TABLE BEING CREATED OR ALTERED CANNOT BECOME A DEPENDENT TABLE

Explanation: This table is defined with the maximum number of columns. It cannot be altered to be a dependent table later.

System Action: The table is created. Check to see if the table will become a dependent table at a later time. If yes, drop and recreate the table with fewer than 750 columns.

Destination: 01538

+653 TABLE *table-name* IN PARTITIONED TABLESPACE *t-space-name* IS NOT AVAILABLE BECAUSE ITS PARTITIONED INDEX HAS NOT BEEN CREATED

Explanation: An attempt has been made to insert or manipulate data in or create a view on a partitioned table (that is, a table residing in a partitioned table space) before the partitioned index for that table has been created.

A table residing in a partitioned table space cannot be referenced in any SQL manipulative statement or a CREATE VIEW statement before the partitioned index for that table has been created.

System Action: A valid plan or package will be created if no errors are detected. The statement is bound dynamically on each execution of the statement.

Programmer Response: For better performance, rebind the plan or package after correcting the statement. To correct the statement, verify that the correct table was specified in the statement. If so, ensure that the partitioned index for the table has been created successfully before attempting to execute any SQL manipulative statements that reference that table.

Destination: 01551

+658 THE SUBPAGES VALUE IS IGNORED FOR THE CATALOG INDEX *index-name*

Explanation: Only SUBPAGES 1 is allowed for this catalog index.

System Action: The index was altered successfully using SUBPAGES 1. If you are also altering the TYPE option to a new value, the index is placed in recovery pending status.

Destination: 01600

+664 THE INTERNAL LENGTH OF THE LIMIT-KEY FIELDS FOR THE PARTITIONED INDEX *index-name* **EXCEEDS THE LENGTH IMPOSED BY THE INDEX MANAGER**

Explanation: The CREATE INDEX statement defines a partitioned index (that is, the cluster index for a table residing in a partitioned table space), and the length of the limit key exceeds the permitted maximum.

The index manager restricts the internal length of the limit keys for a partitioned index to a maximum of 40 bytes. The sum of the internal lengths of the limit keys specified in the PART clause of the CREATE INDEX statement exceeds that 40-byte maximum. The limit key was truncated to 40 bytes.

System Action: The specified index was created but the limit key was truncated to 40 bytes.

Destination: 01540

+738 DEFINITION CHANGE OF *object object_name* **MAY REQUIRE SIMILAR CHANGE ON READ-ONLY SYSTEMS**

Explanation: A change was made to the definition of the specified object that may also require a similar change to any read-only shared systems.

System Action: The statement is successfully executed.

Programmer Response: Check the read-only shared systems that have the specified object defined, and determine if a change must be made to the object on those systems.

Destination: 01530

+802 EXCEPTION ERROR *exception-type* **HAS OCCURRED DURING** *operation-type* **OPERATION ON** *data-type* **DATA, POSITION** *position-number*

Explanation: The exception error 'exception-type' occurred while doing an ADDITION, SUBTRACTION, MULTIPLICATION, DIVISION, or NEGATION operation on a field whose 'data-type' is DECIMAL, FLOAT, SMALLINT, or INTEGER. The error occurred while processing an arithmetic expression in the SELECT list of an outer SELECT statement, and the position in the select list is denoted by 'position-number'. The possible exception types are FIXED POINT OVERFLOW, DECIMAL OVERFLOW, DIVIDE EXCEPTION, EXPONENT

OVERFLOW, and ZERO DIVIDE. The data type displayed in the message may indicate the data type of the temporary internal copy of the data, which may differ from the actual column or literal data type due to conversions by DB2.

A fixed point overflow can occur during any arithmetic operation on either INTEGER or SMALLINT fields.

A decimal overflow exception can occur when one or more nonzero digits are lost because the destination field in any decimal operation is too short to contain the result.

A divide exception can occur on a decimal division operation when the quotient exceeds the specified data-field size. A zero divide exception occurs on any division by zero.

An exponent overflow can occur when the result characteristic of any floating-point operation exceeds 127 and the result fraction is not zero, i.e. the magnitude of the result exceeds approximately 7.2E+75.

Note: Parts of 'exception-type', 'data-type', 'operation-type', and 'position-number' may or may not be returned in SQLCA, depending upon when the error was detected.

System Action: For each expression in error the indicator variable is set to negative two (-2) to indicate a null value returned. The data variable is unchanged. Execution of the statement continues with all nonerror columns and expressions of the outer SELECT list being returned. If the statement is cursor controlled then the CURSOR will remain open.

Programmer Response: Examine the expression for which the warning occurred to see if the cause (or the likely cause) of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was being processed at the time the error occurred.

See the explanation of SQLCODE -405 for allowed ranges of numeric data types.

Destination: 01519

+806 BIND ISOLATION LEVEL RR CONFLICTS WITH TABLESPACE LOCKSIZE PAGE OR LOCKSIZE ROW AND LOCKMAX 0

Explanation: The specification of isolation level RR is incompatible with the LOCKSIZE PAGE or LOCKSIZE ROW and LOCKMAX 0 specification for a table space accessed by the application. Table space locking is used to protect the integrity of the application.

System Action: A valid package/plan is created if no errors are detected. Table space locking is used. RR isolation level is preserved.

Programmer Response: If you do not want table space locking, use isolation level UR, CS, or RS.

Destination: 01553

+807 THE RESULT OF DECIMAL MULTIPLICATION MAY CAUSE OVERFLOW

Explanation: An arithmetic expression contains a decimal multiplication that may cause an overflow condition when the statement is executed. The problem may be corrected by restructuring the arithmetic expression so that decimal multiplication precedes decimal division or by changing the precision and scale of the operands in the arithmetic expression. Refer to Chapter 3 of *SQL Reference* for the precision and scale of the decimal multiplication and division results.

System Action: A valid package will be created if no errors are detected.

Destination: 01554

+863 THE CONNECTION WAS SUCCESSFUL BUT ONLY SBCS WILL BE SUPPORTED

Explanation: The target AS supports only the DB2 SBCS CCSID. The DB2 Mixed CCSID or GRAPHIC CCSID or both are not supported by the target AS. DB2 character data sent to the target AS must be restricted to SBCS.

System Action: The CONNECT statement is successful. The release level of the target AS has been placed into the SQLERRP field of the SQLCA (see *SQL Reference* for the CONNECT statement).

Programmer Response: Do not execute any SQL statements which pass either mixed data or graphic data as input host variables.

Destination: 01539

+2000 TYPE 1 INDEXES WITH SUBPAGES GREATER THAN 1 CANNOT BECOME GROUP BUFFER POOL DEPENDENT IN A DATA SHARING ENVIRONMENT.

Explanation: A SUBPAGES value of greater than 1 was specified on a CREATE INDEX or ALTER INDEX statement in a data sharing environment. Type 1 indexes with a SUBPAGES value greater than 1 can only be accessed in a data sharing environment in non-group buffer pool dependent mode. Any read or update request that would cause the index to become group buffer pool dependent will be denied with a 'resource unavailable' condition. Only type 2 indexes or type

1 indexes with SUBPAGES 1 can become group buffer pool dependent.

System Action: The statement is successfully executed. If ALTER INDEX was performed, then the index is placed in recovery pending status.

Destination: 56094

+30100 OPERATION COMPLETED SUCCESSFULLY BUT A DISTRIBUTION PROTOCOL VIOLATION HAS BEEN DETECTED. ORIGINAL SQLCODE=*original-sqlcode* AND ORIGINAL SQLSTATE=*original-sqlstate*

Explanation: The application requested operation (either COMMIT or ROLLBACK) has completed successfully but the response from the remote server and the SQLCODE that was returned from the remote server are inconsistent. For example, the reply message from the remote server indicates that a COMMIT operation completed successfully but the SQLCODE returned from the AS was negative.

System Action: An alert was generated. A DSNL0311 message may have been written to the console. Refer to the description of this message for further information.

The SQLCODE returned by the remote server is replaced with +30100 and the SQLSTATE returned by the remote server is replaced with 01558.

The SQLCODE and SQLSTATE values that were returned from the AS are stored in the SQLERRM field in a string of the following format:

```
# 'original-sqlcode 'FF'X original-sqlstate'
```

Programmer Response: Notify the System Programmer for assistance in analyzing the trace data that was generated.

Destination: 01558

Error SQL Codes

-007 STATEMENT CONTAINS THE ILLEGAL CHARACTER *character*

Explanation: The specified 'character' is not a valid character in SQL statements.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement. Refer to Chapter 3 of *SQL Reference* for information about the valid SQL character set.

Destination: 42601

-010 THE STRING CONSTANT BEGINNING *string* IS NOT TERMINATED

Explanation: The statement contains a string constant, beginning with 'string', that is not terminated properly.

System Action: The statement cannot be executed.

Programmer Response: Examine the statement for missing quotation marks or apostrophes in the indicated string constant.

Destination: 42603

-029 INTO CLAUSE REQUIRED

Explanation: SELECT statements embedded in an application program must have an INTO clause to denote where the results of the SELECT are to be placed. Dynamic SELECT statements do not permit the INTO clause.

System Action: The statement cannot be executed.

Programmer Response: Add the INTO clause to the SELECT statement and precompile the application program again.

Destination: 42601

-060 INVALID *type* SPECIFICATION : *spec*

Explanation: 'type' is either LENGTH or SCALE. 'spec' is the specified length or scale. Length or scale must be specified by an unsigned integer constant and the value must be in the range allowed by the data type.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 3 of *SQL Reference* for rules for length and scale.

Destination: 42815

-084 UNACCEPTABLE SQL STATEMENT

Explanation: This SQL statement is unacceptable to DB2. One of the following has occurred:

- An attempt has been made to PREPARE or EXECUTE IMMEDIATE an SQL statement that cannot be prepared; refer to the proper SQL statement in *SQL Reference*
- The embedded SQL statement is not an SQL statement supported by DB2.

- The statement referenced an undeclared cursor.
- An attempt was made to prepare an ALLOCATE CURSOR statement but the statement identifier is already associated with a declared cursor.

System Action: The statement cannot be executed.

Programmer Response: If the situation involves an SQL statement that cannot be prepared, the problem is in the source of the SQL statement, not the application program. Thus, no action is necessary unless the source of the SQL statement is the application program itself.

If the situation involves an SQL statement that is not supported by DB2, remove it from the application program and precompile again.

If the situation involves an invalid PREPARE of an ALLOCATE CURSOR statement, change the application program to use a statement identifier that is not associated with a declared cursor.

Destination: 42612

-101 THE STATEMENT IS TOO LONG OR TOO COMPLEX

Explanation: The statement cannot be executed because it exceeds the system limits for either length or complexity. Enabling parallelism will increase the complexity of the statement.

System Action: The statement cannot be executed.

Programmer Response: Break the statement up into shorter or less complex SQL statements. If parallelism is enabled, try disabling parallelism by using the DEGREE(1) bind option for static SQL or by setting the CURRENT DEGREE special register to '1' for dynamic SQL.

Destination: 54001

-102 LITERAL STRING IS TOO LONG. STRING BEGINS *string*

Explanation: The string constant beginning with 'string' has a length greater than 255 characters or 124 graphic characters. Character strings with lengths greater than 255 and graphic strings with lengths greater than 124 can be specified only through assignment from host variables. For SET CURRENT PACKAGESET, up to 18 characters are allowed; for SET CURRENT SQLID, up to 8 characters are allowed; for SET CURRENT DEGREE, up to 3 characters are allowed.

Two consecutive string delimiters are used to represent one string delimiter within the character string, but these count as 2 bytes when calculating the lengths of character string constants.

System Action: The statement cannot be executed.

Programmer Response: The requested function is not available interactively. If the error occurred in the context of an SQL statement embedded in an application program, the desired result can be achieved by assigning the long string to a host variable, and substituting that variable for the string literal in the SQL statement.

Destination: 54002

-103 *literal* IS AN INVALID NUMERIC LITERAL

Explanation: The indicated 'literal' begins with a digit, but is not a valid integer, decimal, or float literal.

System Action: The statement cannot be executed.

Programmer Response: Correct the invalid literal.

Destination: 42604

-104 ILLEGAL SYMBOL "*token*". SOME SYMBOLS THAT MIGHT BE LEGAL ARE: *token-list*

Explanation: A syntax error was detected where the symbol "*token*" occurs in the SQL statement. The list of symbols that might be legal shows some alternate symbols that could possibly be correct at that point, if the preceding part of the statement is entirely correct.

However, the preceding part of the statement might be incorrect. For example, if an important keyword is omitted, DB2 detects the error later, and not always immediately after the point where the keyword should appear. The list of alternate symbols are only suggestions. Some of those symbols might not even be legal for statements to be executed by DB2. Those symbols are possibly correct for statements sent to other database management systems.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement and execute it again.

Destination: 42601

-105 INVALID STRING

Explanation: The statement contains an invalid string. It is neither a character string nor a graphic string.

System Action: The statement cannot be executed.

Programmer Response: Specify the correct format of the string. Check for a graphic string, paired delimiters, the character G or N, and an even number of bytes within the string.

Destination: 42604

-107 THE NAME *name* IS TOO LONG. MAXIMUM ALLOWABLE SIZE IS *size*

Explanation: The *name* is too long. The maximum permissible length for names of that type is indicated by *size*.

Names for the following cannot contain more than 64 characters:

- Version-id

Names for the following cannot contain more than 18 characters (20 including SQL escape characters, if present):

- SQL columns
- SQL tables
- SQL views
- SQL indexes
- SQL aliases
- SQL synonyms
- Collection-ids
- Check constraints

Names for the following cannot contain more than 16 characters:

- Location-name

The following cannot contain more than 8 characters:

- Table qualifiers
- View qualifiers
- Library member names specified in an INCLUDE statement
- Storage group names
- Database names
- Table space names
- Application plans
- Database request modules (DBRMs)
- Referential constraint names specified in CREATE or ALTER TABLE statements
- Package-id

Host variable names cannot contain more than 64 characters.

Volume serial numbers cannot contain more than 6 characters.

Labels cannot contain more than 30 characters.

System Action: The statement cannot be executed.

Programmer Response: Choose a shorter name for the object.

Destination: 42622

-108 THE NAME *name* IS QUALIFIED INCORRECTLY

Explanation: The name *name* is improperly qualified.

A target name on the RENAME statement may not have a qualifier.

System Action: The statement cannot be executed.

Programmer Response: Remove the qualifier and reissue the statement.

Destination: 42601

-109 *clause* CLAUSE IS NOT PERMITTED

Explanation: The indicated clause is not permitted in the context in which it appears in this SQL statement for the following reasons:

- A subselect cannot have an INTO clause.
- A CREATE VIEW statement cannot have INTO, ORDER BY, or FOR UPDATE clauses.
- An embedded SELECT statement cannot have ORDER BY or FOR UPDATE clauses
- SELECT statements used in cursor declarations cannot have an INTO clause.
- A CREATE TABLESPACE statement cannot specify the LARGE clause without the NUMPARTS option.
- A CREATE TABLESPACE statement cannot specify LOCKPART without the NUMPARTS option.
- An ALTER TABLESPACE statement cannot specify LOCKPART for a non-partitioned table space.
- A table space with LOCKPART YES cannot be altered to LOCKSIZE TABLESPACE.
- A table space with LOCKSIZE TABLESPACE cannot be altered to LOCKPART YES.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

Destination: 42601

-110 INVALID HEXADECIMAL LITERAL BEGINNING
string

Explanation: The literal beginning with the specified 'string' contains one or more characters that are not valid hexadecimal digits.

System Action: The statement cannot be executed.

Programmer Response: Correct the invalid literal.

Destination: 42606

-111 A COLUMN FUNCTION DOES NOT INCLUDE A
COLUMN NAME

Explanation: The specification of a column function (AVG, MAX, MIN, or SUM) was invalid because such functions must include a column name in the operand.

System Action: The statement cannot be executed.

Programmer Response: A column name must be specified as an operand to the function. Refer to Chapter 4 of *SQL Reference* for information about the proper usage of column functions.

Destination: 42901

-112 THE OPERAND OF A COLUMN FUNCTION IS
ANOTHER COLUMN FUNCTION

Explanation: The operand of a column function can be either an expression or DISTINCT followed by an expression. The operand cannot be another column function.

System Action: The statement cannot be executed.

Programmer Response: Correct the function specification. Refer to Chapter 4 of *SQL Reference* for information about the proper usage of column functions.

Destination: 42607

-113 INVALID CHARACTER FOUND IN *string*,
REASON CODE *nnn*

Explanation: The *string* contains an invalid character. It can be an SQL ordinary identifier name, a host variable name, or a DBCS comment.

For SBCS SQL ordinary identifiers, names of buffer pools, databases, plans, and storage groups must contain only upper-case alphabetic or national characters and numerics when CHARSET is KATAKANA; the first character must be alphabetic or national.

The following reason codes apply to SBCS identifiers:

000 An invalid character was found in the SBCS identifier (including the case in which a DBCS identifier was used where only an SBCS identifier is allowed.)

The following reason codes apply to DBCS identifiers or comments:

101 An odd number of bytes exists between the shift-out and the shift-in character.

102 Either a shift-in or shift-out character is missing.

103 DBCS blanks X'4040' are not allowed.

104 There are no characters between the shift-out and the shift-in characters.

105 Shift-out cannot be the first byte of the DBCS character between the shift-out and the shift-in characters.

System Action: Processing is terminated.

User Response: Correct the name.

Destination: 42602

-114 THE LOCATION NAME *location* **DOES NOT**
MATCH THE CURRENT SERVER

Explanation: A 3-part SQL procedure name was provided for one of the following SQL statements:

```
ASSOCIATE LOCATORS
CALL
DESCRIBE PROCEDURE
```

The first part of the SQL procedure name, which specifies the location where the stored procedure resides, did not match the value of the SQL CURRENT SERVER special register.

System Action: The statement cannot be executed.

Programmer Response: Take one of these actions to resolve the mismatch:

- Change the location qualifier to match the CURRENT SERVER special register.
- Issue an SQL CONNECT to the location where the stored procedure resides before issuing the SQL statement. Ensure that the SQL CALL statement is issued before the ASSOCIATE LOCATORS or DESCRIBE PROCEDURE.

Destination: 42961

-115 A PREDICATE IS INVALID BECAUSE THE
COMPARISON OPERATOR *operator* **IS FOL-**
LOWED BY A PARENTHEZIZED LIST OR BY
ANY OR ALL WITHOUT A SUBQUERY

Explanation: A simple comparison like '>' must not be followed by a list of items. ANY and ALL comparisons must be followed by a subselect, rather than an expression or a list of items.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement. Refer to Chapter 6 of *SQL Reference* for information about the syntax of SQL statements.

Destination: 42601

-117 THE NUMBER OF INSERT VALUES IS NOT
THE SAME AS THE NUMBER OF OBJECT
COLUMNS

Explanation: The number of insert values in the value list of the INSERT statement is not the same as the number of object columns specified.

System Action: The statement cannot be executed. No data was inserted into the object table.

Programmer Response: Correct the statement to specify one and only one value for each of the specified object columns.

Destination: 42802

-118 THE OBJECT TABLE OR VIEW OF THE INSERT, DELETE, OR UPDATE STATEMENT IS ALSO IDENTIFIED IN A FROM CLAUSE

Explanation: The table or view specified as the object of an INSERT, DELETE, or UPDATE statement also appears in the FROM clause of a subselect within the statement.

The table or view that is the object of an INSERT, UPDATE, or DELETE cannot also be used to supply the values to be inserted or to qualify the rows to be inserted, updated, or deleted.

System Action: The statement cannot be executed. No data was inserted, updated, or deleted.

Programmer Response: The implied function is not supported by DB2. It may be possible to obtain the desired result by creating a temporary copy of the object table or view and addressing the subselect to that copy. Refer to Chapter 6 of *SQL Reference* for information about the syntax of SQL statements.

Destination: 42902

-119 A COLUMN IDENTIFIED IN A HAVING CLAUSE IS NOT INCLUDED IN THE GROUP BY CLAUSE

Explanation: A column identified in a HAVING clause (possibly within a scalar function) does not appear in the GROUP BY clause. Columns specified in a HAVING clause must appear within column functions or also be specified in the GROUP BY clause.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 5 of *SQL Reference* for information about the proper usage of HAVING and GROUP BY clauses.

Destination: 42803

-120 A WHERE CLAUSE OR SET CLAUSE INCLUDES A COLUMN FUNCTION

Explanation: A column function is not permitted in a SET clause. A column function is allowed in a WHERE clause only if the WHERE clause appears within a subquery of a HAVING clause.

System Action: The statement cannot be executed.

Note: The 'column-name' may or may not be returned in SQLCA, depending on the nature of the error occurring in the SQL statement.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 5 of *SQL Reference* for information about restrictions on operands that can be specified within WHERE and SET clauses.

Destination: 42903

-121 THE COLUMN *name* IS IDENTIFIED MORE THAN ONCE IN THE INSERT OR UPDATE STATEMENT

Explanation: The same column 'name' is specified more than once, either in the list of object columns of an INSERT statement, or the SET clause of an UPDATE statement.

System Action: The statement cannot be executed. No data was inserted or updated in the object table.

Programmer Response: Correct the syntax of the statement so that each column name is specified only once.

Destination: 42701

-122 A SELECT STATEMENT WITH NO GROUP BY CLAUSE CONTAINS A COLUMN NAME AND A COLUMN FUNCTION IN THE SELECT CLAUSE OR A COLUMN NAME IS CONTAINED IN THE SELECT CLAUSE BUT NOT IN THE GROUP BY CLAUSE

Explanation: The SELECT statement contains one of these errors:

- The statement contains a column name and a column function in the SELECT clause, but no GROUP BY clause.
- A column name is contained in the SELECT clause (possibly within a scalar function) but not in the GROUP BY clause.

Note: A HAVING clause specified without a GROUP BY clause implies a GROUP BY with no columns. Thus, no column names are allowed in the SELECT clause.

System Action: The statement cannot be executed.

Programmer Response: You can correct the statement by:

- # • including the columns in the GROUP BY clause that are in the SELECT clause, or
- # • removing the columns from the SELECT clause.

Refer to Chapter 5 of *SQL Reference* for information about the use of GROUP BY clauses in SQL statements.

Destination: 42803

-125 AN INTEGER IN THE ORDER BY CLAUSE DOES NOT IDENTIFY A COLUMN OF THE RESULT

Explanation: The ORDER BY clause in the statement contains a column number that is either less than one, or greater than the number of columns of the result table (the number of items in the SELECT clause).

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the ORDER BY clause such that each column identifier properly denotes a column of the result table.

Destination: 42805

-126 THE SELECT STATEMENT CONTAINS BOTH AN UPDATE CLAUSE AND AN ORDER BY CLAUSE

Explanation: The SELECT statement in the declaration for a cursor contains both an UPDATE clause and an ORDER BY clause. An ORDER BY clause cannot be specified in the declaration for a cursor that is to be used for update.

System Action: The statement cannot be executed. The cursor remains undefined in the application program.

Programmer Response: The implied function is not supported by DB2. A cursor that is to be used for update cannot be defined to fetch the rows of the object table in a specific order.

Refer to Chapter 5 of *SQL Reference* for information about restrictions on the declarations for cursors to be used for update.

Destination: 42829

-127 DISTINCT IS SPECIFIED MORE THAN ONCE IN A SUBSELECT

Explanation: The DISTINCT qualifier can be used only once in a SELECT statement or a subselect.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 5 of *SQL Reference* for information about restrictions on the use of the DISTINCT qualifier.

Destination: 42905

-128 INVALID USE OF NULL IN A PREDICATE

Explanation: The use of NULL in the search condition does not conform to the rules of SQL syntax.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 3 of *SQL Reference* for information about the proper use of the NULL operand.

Destination: 42601

-129 THE STATEMENT CONTAINS TOO MANY TABLE NAMES

Explanation: A subselect (including all subqueries) can have a maximum of 15 references to table names.

System Action: The statement cannot be executed.

Programmer Response: Break the SQL statement into two or more simpler statements with 15 or fewer table references in each. The count will include the number of base table occurrences from each table or view on the FROM list. Refer to Chapter 5 of *SQL Reference* for the definition of a subselect.

Destination: 54004

-130 THE ESCAPE CLAUSE CONSISTS OF MORE THAN ONE CHARACTER, OR THE STRING PATTERN CONTAINS AN INVALID OCCURRENCE OF THE ESCAPE CHARACTER

Explanation: The ESCAPE character must be a single character, either SBCS or DBCS as appropriate. For 'column-name LIKE pattern', the ESCAPE character can only appear in the character string if it is followed by itself, %, or _ (underscore). The Escape Clause cannot be specified if the column name at the left of the LIKE or NOT LIKE has the MIXED subtype.

System Action: The statement cannot be executed.

Programmer Response: Correct the string pattern, or choose a different ESCAPE character and change the pattern accordingly, or eliminate the use of the Escape Clause on the LIKE or NOT LIKE predicate where the column name to the left has the MIXED subtype.

Destination: 22019 if other than invalid ESCAPE pattern. 22025 if invalid ESCAPE pattern.

-131 STATEMENT WITH LIKE PREDICATE HAS INCOMPATIBLE DATA TYPES

Explanation: If the column name at the left of LIKE or NOT LIKE is of type character, the expression at the right and the ESCAPE character must be of type character. If the column name is of type graphic, the expression at the right and the ESCAPE character must be of type graphic.

System Action: The statement cannot be executed.

Programmer Response: Check the data type of every operand.

Destination: 42818

-132 A LIKE PREDICATE IS INVALID BECAUSE THE SECOND OPERAND IS NOT A STRING

Explanation: The token following LIKE must be a special register, a string constant, or a host variable with a string value.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 3 of *SQL Reference* for information about the proper syntax for LIKE and NOT LIKE predicates.

Destination: 42824

-133 A COLUMN FUNCTION IN A SUBQUERY OF A HAVING CLAUSE IS INVALID BECAUSE ALL COLUMN REFERENCES IN ITS ARGUMENT ARE NOT CORRELATED TO THE GROUP BY RESULT THAT THE HAVING CLAUSE IS APPLIED TO

Explanation: If a column function has a correlated column reference, it must be correlated from within a HAVING clause to the GROUP BY result that the HAVING clause is applied to. All column references in the argument must satisfy this condition.

System Action: The statement cannot be executed.

Programmer Response: Refer to Chapter 5 of *SQL Reference* for information about restrictions on the syntax of the HAVING clause.

Destination: 42906

-134 IMPROPER USE OF LONG STRING COLUMN *column-name* OR A HOST VARIABLE OF MAXIMUM LENGTH GREATER THAN 255

#

Explanation: A long string was referenced in a context in which long strings are not allowed. For an exhaustive list of such contexts, refer to "Varying Length Character Strings" in Chapter 3 of *SQL Reference*.

System Action: The statement cannot be executed.

Note: The 'column-name' might not be returned in SQLCA, depending on the nature of the error and the syntax in which it occurred.

Programmer Response: The requested operation on a long string value is not supported by DB2. Refer to Chapter 3 of *SQL Reference* for information about restrictions on the specification and manipulation of long string values.

Destination: 42907

-136 SORT CANNOT BE EXECUTED BECAUSE THE SORT KEY LENGTH IS GREATER THAN 4000 BYTES

Explanation: A sort key is derived from the list of columns specified following a DISTINCT qualifier, or in an ORDER BY or GROUP BY clause. If both a DISTINCT qualifier and an ORDER BY or GROUP BY clause are present, the sort key is derived from the combination of both lists of columns.

The *internal* length of the sort key cannot exceed 4000 bytes. In attempting to process the SQL statement, the internal length of the sort key derived from the DISTINCT and/or ORDER BY or GROUP BY specifications was found to exceed that 4000-byte maximum.

System Action: The statement cannot be executed.

Programmer Response: The statement must be modified such that the internal length of the sort key will not exceed 4000 bytes. In general, this means that one or more column names must be deleted from the ORDER BY or GROUP BY clause, or the list following the DISTINCT qualifier.

Destination: 54005

-137 RESULT OF CONCATENATION TOO LONG

Explanation: The length of the result of a concatenation exceeds 32,764 (if character operands) or 16,382 (if graphic operands).

System Action: The statement cannot be executed.

Programmer Response: Ensure that the total of the lengths of the concatenated operands is less than or equal to 32,764 (for character operands) or 16,382 (for graphic operands).

Destination: 54006

-138 THE SECOND OR THIRD ARGUMENT OF THE SUBSTR FUNCTION IS OUT OF RANGE

Explanation: One of the following conditions exists:

- The second argument of the SUBSTR function is less than 1 or greater than M.
- The third argument of the SUBSTR function is an integer constant 0 or an expression whose value is less than 0 or greater than M-N+1.

M is the length of the first argument, if it is of fixed-length, or M is the maximum length of the first argument, if it is of varying-length. N is the value of the second argument.

System Action: The statement cannot be executed.

Programmer Response: Ensure that the second and third arguments of the SUBSTR function have legal values according to the above rules.

Destination: 22011

-144 INVALID SECTION NUMBER *number*

Explanation: One of the following:

1. The user attempted to execute an invalid section.
2. This release of DB2 does not support the SQL statement.
3. The section number in the call parameter list is one of these:
 - Negative
 - An invalid duplicate
 - Greater than the maximum section number of the DBRM or package.

System Action: The statement is not executed.

Programmer Response: For case 1: If you are executing a package that was bound with SQLERROR(CONTINUE), determine whether the statement in question was bound as a valid section. You can use the following statements to query the DB2 catalog:

```
SELECT SQLERROR
FROM SYSIBM.SYSPACKAGE
WHERE COLLID = collection-id AND
      NAME = package-id AND
      VERSION = version-name;
```

If that query returns 'C', the package was bound with SQLERROR(CONTINUE).

```
SELECT STMTNO, TEXT
FROM SYSIBM.SYSPACKSTMT
WHERE COLLID = collection-id AND
      NAME = package-id AND
      VERSION = version-name AND
      SECTNO = number AND
      BINDERROR = 'Y';
```

If that query returns any rows, the section is invalid. Refer to the error messages issued during the bind to determine the cause. Correct any errors and bind the package again, using the REPLACE option.

For case 2: If the DB2 system has fallen back to a previous release, determine whether there are any SQL statements with a section number of zero that are not supported by that release. You can use the following statements to query the DB2 catalog.

When executing from a DBRM, use:

```
SELECT *
FROM SYSIBM.SYSSSTMT
WHERE SECTNO = 0
ORDER BY NAME, PLNAME, STMTNO, SEQNO;
```

When executing from a package, use:

```
SELECT *
FROM SYSIBM.SYSPACKSTMT
WHERE SECTNO = 0
ORDER BY COLLID, NAME, VERSION, STMTNO, SEQNO;
```

For case 3: Examine the application to determine whether the call parameter list was changed in some way. In general, you should not attempt to change the output of the precompiler.

Destination: 58003

-148 THE SOURCE TABLE *source-name* CANNOT BE RENAMED OR ALTERED

Explanation:

- # • The RENAME statement cannot be used to rename a view, an active RLST table, or a table for which a synonym is defined.
- # • The ALTER statement cannot be used to alter the length of the column because the column is referenced in a referential integrity relation, a user exit (field procedure, edit procedure, valid procedure, stored procedure, or user-defined function), a global temporary table, or a table defined with data capture changes. If the table name specified in the ALTER is a view or if there exists a row in SYSVIEWDEP that has *source-name* as a base table name, then this ALTER statement will fail.

System Action: The statement cannot be executed.

Programmer Response: For the RENAME statement, change the source name to the name of an object that can be renamed and reissue the statement. For the ALTER statement, the table cannot be altered

Destination: 42809

-150 THE OBJECT OF THE INSERT, DELETE, OR UPDATE STATEMENT IS A VIEW FOR WHICH THE REQUESTED OPERATION IS NOT PERMITTED

Explanation: The view named in the INSERT, UPDATE, or DELETE statement is defined in such a way that the requested insert, update, or delete operation cannot be performed upon it.

Inserts into a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.
- The SELECT clause in the view definition contains the DISTINCT qualifier, an arithmetic expression, a string expression, a built-in function, or a constant.
- Two or more columns of the view are derived from the same column.
- A base table of the view contains a column that does not have a default value and is not included in the view.

Updates to a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.
- The SELECT clause in the view definition contains the DISTINCT qualifier or a function.

Also, a given column in a view cannot be updated (that is, the values in that column cannot be updated) if the column is derived from an arithmetic expression, a constant, a column that is part of the key of a partitioned index, or a column of a catalog table that cannot be updated.

Deletes against a view are prohibited if:

- The view definition contains a join, a GROUP BY, or a HAVING clause.
- The SELECT clause in the view definition contains the DISTINCT qualifier or a built-in function.

System Action: The statement cannot be executed. No data was inserted, updated, or deleted.

Programmer Response: The requested function cannot be performed on the view. Refer to Chapter 6 of *SQL Reference* for further information regarding inserting, deleting, and updating views.

Destination: 42807

-151 THE UPDATE STATEMENT IS INVALID BECAUSE THE CATALOG DESCRIPTION OF COLUMN *column-name* INDICATES THAT IT CANNOT BE UPDATED

Explanation: The specified column cannot be updated for one of the following reasons:

- # • The object table is partitioned (that is, resides in a partitioned table space), the column is included in the partitioning key, and the partitioning index was created prior to application of the DB2 maintenance that allows update of partitioning keys.
- # • The object table is a view and the specified column is defined (in the definition of the view) in such a way that it cannot be updated.
- # • The object table is a catalog table with no columns that can be updated.

The values for columns occurring in the partitioning key of a partitioned table cannot be updated if the index was created prior to application of the maintenance that allows update of partitioning keys. The UPDATES field of SYSIBM.SYSCOLUMNS holds a value of 'M' if the partitioning index was created after application of the cited maintenance. Otherwise the value is 'N' for partitioning indexes.

The specified column of catalog tables cannot be updated because the column itself is not updatable.

Individual columns in a view cannot be updated for one of the following reasons:

- # • The column is derived from an SQL function, an arithmetic expression, or a constant.
- # • The column is defined on a column that is in the partitioning key of a partitioned table and the partitioning index was created prior to application of the maintenance that allows update of partitioning keys.
- # • The column is defined for a column of an underlying view that cannot be updated.

System Action: The statement cannot be executed. No data was updated in the object table or view.

Programmer Response: The requested function is not supported by DB2. Refer to the description of the UPDATE statement in Chapter 6 of *SQL Reference* for information about restrictions on the ability to update columns in partitioned tables and views.

Destination: 42808

-152 THE DROP *clause* CLAUSE IN THE ALTER STATEMENT IS INVALID BECAUSE *constraint-name* IS A *constraint-type*

Explanation: Either the DROP FOREIGN KEY clause of an ALTER TABLE statement tried to drop a check constraint, or the DROP CHECK clause of an ALTER TABLE statement tried to drop a referential constraint.

The *clause* is either CHECK or FOREIGN KEY. The *constraint-type* is either REFERENTIAL CONSTRAINT or CHECK CONSTRAINT.

System Action: The ALTER TABLE DROP statement cannot be executed. No object was dropped.

Programmer Response: Drop the existing object with the correct DROP clause of the ALTER TABLE statement.

Destination: 42809

-153 THE CREATE VIEW STATEMENT DOES NOT INCLUDE A REQUIRED COLUMN LIST

Explanation: You must specify a list of column names if the result table of the subselect has duplicate column names or an unnamed column (a column derived from a constant, function, or expression).

System Action: The statement cannot be executed. The specified view was not created.

Programmer Response: Correct the statement by providing a list of names for the columns of the view. Refer to Chapter 6 of *SQL Reference* for information about the syntax of the CREATE VIEW statement.

Destination: 42908

-154 THE CREATE VIEW FAILED BECAUSE THE VIEW DEFINITION CONTAINS A UNION, A UNION ALL, OR A REMOTE OBJECT

Explanation: The view defined in the CREATE VIEW statement contains a UNION, a UNION ALL, or a remote object. DB2 cannot create views containing unions or a remote object.

System Action: The CREATE VIEW statement cannot be executed. The specified view is not created.

Programmer Response: Refer to Chapter 6 of *SQL Reference* for information about restrictions on the definitions for views.

Destination: 42909

-156 THE STATEMENT DOES NOT IDENTIFY A TABLE

Explanation: The statements ALTER TABLE, DROP TABLE, LOCK TABLE, and CREATE INDEX apply only to tables. Indexes can be defined only on tables.

System Action: The statement cannot be executed. The specified view or remote object was not altered, dropped, or locked, or the index was not created.

Programmer Response: Verify that the proper name was specified in the statement.

Destination: 42809

-157 ONLY A TABLE NAME CAN BE SPECIFIED IN A FOREIGN KEY CLAUSE. *object-name* IS NOT THE NAME OF A TABLE.

Explanation: The indicated object was identified in a FOREIGN KEY clause of a CREATE or ALTER TABLE statement. A FOREIGN KEY clause must identify a table.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to specify a table name in the foreign key clause.

Destination: 42810

-158 THE NUMBER OF COLUMNS SPECIFIED FOR THE VIEW IS NOT THE SAME AS THE NUMBER OF COLUMNS SPECIFIED BY THE SELECT CLAUSE

Explanation: The number of column names specified for a view in a CREATE VIEW statement must equal the number of elements (column names, SQL functions, expressions, etc.) specified in the following AS SELECT clause.

System Action: The statement cannot be executed. The specified view was not created.

Programmer Response: Correct the syntax of the statement to specify a column name for each column in the view to be created. Refer to Chapter 6 of *SQL Reference* for information about the syntax of the CREATE VIEW statement.

Destination: 42811

-159 DROP OR COMMENT ON *token* IDENTIFIES A(N) *token* RATHER THAN A(N) *token*

Explanation: The object specified in the DROP VIEW statement, DROP ALIAS statement, or COMMENT ON ALIAS statement identifies a table instead of a view or an alias.

The DROP VIEW statement can have only a view as its object. The DROP ALIAS or COMMENT ON ALIAS statement can have only an alias as its object. You must use the DROP TABLE statement to drop a table that is neither a view nor an alias. You must use the COMMENT ON TABLE statement to comment on a table or view.

System Action: The statement cannot be executed.

Programmer Response: Correct the DROP VIEW, DROP ALIAS, or COMMENT ON ALIAS statement so that the view name or the alias name is specified correctly (with the proper qualifier). If you intended to drop or comment on the specified table, use the DROP TABLE or COMMENT ON TABLE statement.

Destination: 42809

-160 THE WITH CHECK OPTION CANNOT BE USED FOR THE SPECIFIED VIEW

Explanation: The WITH CHECK OPTION does not apply to a view definition under either of the following circumstances:

- The view is read-only (for example, the view definition includes DISTINCT GROUP BY, or JOIN).
- The view definition includes a subquery.

System Action: The statement cannot be executed. The specified view was not created.

Programmer Response: Refer to Chapter 6 of *SQL Reference* for rules regarding use of the WITH CHECK OPTION in view definitions.

Destination: 42813

-161 THE INSERT OR UPDATE IS NOT ALLOWED BECAUSE A RESULTING ROW DOES NOT SATISFY THE VIEW DEFINITION

Explanation: The WITH CHECK OPTION applies to the view that is the object of the INSERT or UPDATE statement. Consequently, all attempts to insert or update rows in that view are checked to ensure that the results will conform to the view definition.

System Action: The statement cannot be executed. No inserts or updates were performed, and the contents of the object view (and underlying base table) remain unchanged.

Programmer Response: Examine the view definition to determine why the requested INSERT or UPDATE was rejected. Note that this may be a data-dependent condition.

Destination: 44000

-164 *auth-id1* DOES NOT HAVE THE PRIVILEGE TO CREATE A VIEW WITH QUALIFICATION *authorization ID*

Explanation: The authorization ID 'auth-id' does not have the authority necessary to create views with qualifiers other than its own authorization ID. Specifically, the attempt to create a view with qualifier 'authorization ID' is rejected.

System Action: The statement cannot be executed. The specified view was not created.

Programmer Response: Do not attempt to create views with other than your own ID as a qualifier. Only an authorization ID that holds 'SYSADM' authority can create views for other authorization IDs.

Destination: 42502

-170 THE NUMBER OF ARGUMENTS SPECIFIED FOR *function-name* IS INVALID

Explanation: An SQL statement includes the scalar function '*function-name*' with either too many or too few arguments.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 4 of *SQL Reference* for information about the number of arguments required by the scalar function '*function-name*'.

Destination: 42605

-171 THE DATA TYPE, LENGTH, OR VALUE OF ARGUMENT *nn* OF *function-name* IS INVALID

Explanation: Either the data type, the length or the value of argument '*nn*' of scalar function '*function-name*' is incorrect.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 4 of *SQL Reference* for rules for each argument of the scalar function '*function-name*'.

Destination: 42815

-173 UR IS SPECIFIED ON THE WITH CLAUSE BUT THE CURSOR IS NOT READ-ONLY

Explanation: The cursor is not a read-only cursor. WITH UR can be specified only if DB2 can determine that the cursor is read-only.

System Action: Statement execution fails.

Programmer Response: If the cursor is intended to be read-only but is ambiguous, add the FOR FETCH ONLY clause. If the cursor is updateable, change the isolation level specified on the WITH clause.

Destination: 42801

-180 THE DATE, TIME, OR TIMESTAMP VALUE *value* IS INVALID

Explanation: The length or string representation of a DATE, TIME, or TIMESTAMP *value* does not conform to any valid format.

The *value* can contain one of the following:

- For a host variable, the position number of the input host variable. If the position number cannot be determined, a blank is displayed.
- For a character string constant, the character string constant. The maximum length that is displayed is the length of SQLERRM.
- For a character column, the column name. If the column is a VIEW column and it has a corresponding base column, the VIEW column name is displayed. If the column is a VIEW column but it does not have a corresponding base column, a string of '*N' is displayed.

Otherwise, *value* is a string of '*N'.

System Action: The statement cannot be executed.

Programmer Response: Correct the program to ensure the specified value conforms to the syntax of DATE, TIME, and TIMESTAMP. Refer to Chapter 3 of *SQL Reference* for a list of valid DATE and TIME formats.

Destination: 22007

-181 THE STRING REPRESENTATION OF A DATETIME VALUE IS NOT A VALID DATETIME VALUE

Explanation: The string representation of a datetime is not in the acceptable range or is not in the correct format. The proper ranges for datetime values are as follows:

Table 2.

Datetime		Numeric Range
Years		0001 to 9999
Months		1 to 12
Days	April, June, September, November (months 4, 6, 9, 11)	1 to 30
	February (month 2)	1 to 28 (Leap year 1 to 29)
	January, March, May, July, August, October, December (months 1, 3, 5, 7, 8, 10, 12)	1 to 31
Hours		0 to 24 (If hour is 24, other parts of time values are zeroes. If hour is USA, maximum hour is 12.)
Minutes		0 to 59
Seconds		0 to 59
Microseconds		0 to 999999

System Action: The statement cannot be executed.

Programmer Response: Check whether the value is within the valid range and is in the proper format. Refer to Chapter 3 of *SQL Reference* for information on string data formats.

Destination: 22007

-182 AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE IS INVALID

Explanation: The specified arithmetic expression contains an improperly used datetime value or labeled duration.

System Action: The statement cannot be executed.

Programmer Response: Correct the indicated arithmetic expression.

Destination: 42816

-183 AN ARITHMETIC OPERATION ON A DATE OR TIMESTAMP HAS A RESULT THAT IS NOT WITHIN THE VALID RANGE OF DATES

Explanation: The result of an arithmetic operation is a date or timestamp that is not within the valid range of dates which are between 0001-01-01 and 9999-12-31.

System Action: The statement cannot be executed.

Programmer Response: Examine the SQL statement to see if the cause of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was processed at the time the error occurred.

Destination: 22008

-184 AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE CONTAINS A PARAMETER MARKER

Explanation: The specified arithmetic expression contains a parameter marker improperly used with a datetime value.

System Action: The statement cannot be executed.

Programmer Response: Correct the indicated arithmetic expression.

Destination: 42610

-185 THE LOCAL FORMAT OPTION HAS BEEN USED WITH A DATE OR TIME AND NO LOCAL EXIT HAS BEEN INSTALLED

Explanation: The local format option has been used with a datetime value and no datetime exit has been installed. This may occur if the LOCAL DATE LENGTH or LOCAL TIME LENGTH on the Installation Application Programming Defaults Panel indicated that an exit for datetime was supplied, but in fact the exit supplied by DB2 was not replaced. This may also occur if the datetime exit was replaced and the corresponding LOCAL DATE LENGTH or LOCAL TIME LENGTH on the Installation Application Programming Defaults Panel was not set to a nonzero value.

System Action: The statement cannot be executed.

Programmer Response: Contact the system programmer about installation of the date or time exit.

Destination: 57008

-186 THE LOCAL DATE LENGTH OR LOCAL TIME LENGTH HAS BEEN INCREASED AND EXECUTING PROGRAM RELIES ON THE OLD LENGTH

Explanation: The local format option has been used with a datetime value and DB2 has discovered that the datetime exit routine has been changed to produce a longer local format.

System Action: The statement cannot be executed.

Programmer Response: If the statement receiving this error is embedded in the application program, then a REBIND command must be issued for the application plan. If the statement was dynamic SQL, then the statement can be reentered.

Destination: 22505

-187 A REFERENCE TO A CURRENT DATE/TIME SPECIAL REGISTER IS INVALID BECAUSE THE MVS TOD CLOCK IS BAD OR THE MVS PARMTZ IS OUT OF RANGE

Explanation: DB2 has encountered an invalid time-of-day (TOD) clock. The user referenced one of the special registers: CURRENT DATE, CURRENT TIME, CURRENT TIMESTAMP, or CURRENT TIMEZONE. If the user referenced CURRENT TIMEZONE, the MVS parameter PARMTZ was out of range.

System Action: The statement cannot be executed.

Programmer Response: For CURRENT TIMEZONE, check that the MVS parameter PARMTZ is between -24 and +24 hours. For the other CURRENT special registers, check that the MVS TOD clock has been set correctly.

Destination: 22506

-188 THE STRING REPRESENTATION OF A NAME IS INVALID

Explanation: The host variable referenced in the DESCRIBE statement does not contain a valid string representation of a name. One of the following error conditions has occurred.

- The first byte of the variable is a period or a blank.
- The number of identifiers is greater than 3.
- An identifier is too long.
- A period not contained in a delimited identifier is followed by a period or a blank.
- A delimited identifier is followed by a character other than a period or a blank.
- A delimited identifier is not terminated by a quotation mark.

System Action: The statement cannot be executed.

Programmer Response: Correct the value of the host variable so that it is a valid string representation of a name.

Destination: 22503

-189 CCSID *ccsid* IS UNKNOWN OR INVALID FOR THE DATA TYPE OR SUBTYPE

Explanation: To determine the subtype of an input host variable or result column, the SYSSTRINGS catalog table was accessed with the specified CCSID and:

- The CCSID is not a value of either INCCSID or OUTCCSID, or
- The TRANSTYPE column classifies the CCSID as GRAPHIC rather than CHARACTER.

This error can occur when SYSSTRINGS is accessed with a pair of CCSIDs to determine if a translation is defined for the pair. In this case, the error is the inconsistency between the data type of a string and the TRANSTYPE classification of its CCSID (one is GRAPHIC and the other is CHARACTER).

This error can also occur when a CCSID specified in DECP does not exist as a value in the INCCSID or OUTCCSID columns of SYSSTRINGS.

System Action: The statement cannot be bound or executed.

Programmer Response: Ensure that the CCSID is valid and consistent with the data type of the string. If a valid CCSID is not listed in a built-in row of SYSSTRINGS, it can be defined by inserting a user-provided row. If a valid CCSID is misclassified in a user-provided row, that row can be updated to correct the mistake. Refer to the appendices of *Installation Guide* for more information on CCSIDs and to *SQL Reference* for more information on the SYSSTRINGS catalog table.

Destination: 22522

-190 ATTRIBUTES OF COLUMN *column-name* IN TABLE *table-name* ARE NOT COMPATIBLE WITH THE EXISTING COLUMN

Explanation: The attributes specified for the column in an ALTER statement are not compatible with the attributes of the existing column in the specified table. Either the data type or length is not valid.

- The new altered length for the column is shorter than the current length of the column.

• The existing column is not a VARCHAR data type.

System Action: The ALTER statement cannot be executed.

Programmer Response: Specify attributes that are compatible with the existing column.

Destination: 42809

-191 A STRING CANNOT BE USED BECAUSE IT IS INVALID MIXED DATA

Explanation: The operation required the translation of a mixed data character string to a different coded character set. The string could not be translated because it does not conform to the rules for well-formed mixed data. For example, the string contains EBCDIC shift codes that are not properly paired.

System Action: The statement cannot be executed.

Programmer Response: If the string contains the intended information, the description of the column or host variable should be changed from MIXED DATA to BIT or SBCS DATA. If the description of the column or host variable is correct, the string is the problem and it must be changed to conform to the rules for well-formed mixed data. For more information about well-formed MIXED DATA refer to Chapter 3 of *SQL Reference*.

Destination: 22504

-197 QUALIFIED COLUMN NAMES IN ORDER BY CLAUSE NOT PERMITTED WHEN UNION OR UNION ALL SPECIFIED

Explanation: A SELECT statement that specifies both the union of two or more tables and the ORDER BY clause cannot use qualified column names in the ORDER BY clause.

Programmer Response: Change the statement so that qualified names are not necessary in the ORDER BY clause.

System Action: The statement is not executed.

Destination: 42877

-198 THE OPERAND OF THE PREPARE OR EXECUTE IMMEDIATE STATEMENT IS BLANK OR EMPTY

Explanation: The operand (host variable or literal string) that was the object of the PREPARE or EXECUTE IMMEDIATE statement either contained all blanks or was an empty string. A DBRM built in Version 2 Release 3 cannot be used on a Version 2 Release 2 system if the distributive functions were used. If this error appears on Version 2 Release 2 and the DBRM was built on Version 2 Release 3, the program needs to be precompiled again to correct the problem.

System Action: The statement cannot be executed.

Programmer Response: Correct the logic of the application program to ensure that a valid SQL statement is provided in the operand of the PREPARE or EXECUTE IMMEDIATE statement before that statement is executed.

Destination: 42617

-199 **ILLEGAL USE OF KEYWORD** *keyword*. **TOKEN**
token-list **WAS EXPECTED**

Explanation: A syntax error was detected in the statement at the point where the keyword 'keyword' appears.

As an aid to the programmer, a partial list of valid tokens is provided in SQLERRM as 'token-list'. Only those tokens that will fit are listed. Some tokens in the list might not be valid in statements to be executed by DB2; those tokens are valid for sending to other database management systems.

System Action: The statement cannot be executed.

Programmer Response: Examine the statement in the area of the indicated keyword. A colon or SQL delimiter might be missing.

Destination: 42601

-203 **A REFERENCE TO COLUMN** *column-name* **IS**
AMBIGUOUS

Explanation: An unqualified column name is ambiguous if more than one table or view identified in the FROM clause has a column with that name, or if more than one column of a nested table expression has that name.

A qualified column name is ambiguous only if the qualifier is the correlation name for a nested table expression and the column name is not unique.

System Action: The statement cannot be executed.

Programmer Response: If the problem is caused by a non-unique column name in a nested table expression, change the nested table expression so that the column name is unique. If the problem is caused by the use of an unqualified name, qualify it with a table, view, or correlation name.

Destination: 42702

-204 *name* **IS AN UNDEFINED NAME**

Explanation: The object identified by *name* is not defined in the DB2 subsystem. This SQLCODE can be generated for any type of DB2 object.

System Action: The statement cannot be executed.

Programmer Response: Verify that the object name was correctly specified in the SQL statement, including any required qualifiers. If it is correct, ensure that the object exists in the system before resubmitting the statement.

If the specified object is a stored procedure, add a row to the SYSIBM.SYSPROCEDURES catalog table to define the stored procedure. Issue the -START PROCEDURE command to activate the new definition.

Destination: 42704

-205 *column-name* **IS NOT A COLUMN OF TABLE**
table-name

Explanation: No column with the specified 'column-name' occurs in the table or view 'table-name'.

System Action: The statement cannot be executed.

Programmer Response: Verify that the column and table names are specified correctly (including any required qualifiers) in the SQL statement.

Destination: 42703

-206 *column-name* **IS NOT A COLUMN OF AN**
INSERTED TABLE, UPDATED TABLE, OR ANY
TABLE IDENTIFIED IN A FROM CLAUSE

Explanation: This return code is used to report one of these errors:

- In the case of an INSERT or UPDATE statement, the specified column is not a column of the table or view that was specified as the object of the insert or update.
- In the case of a SELECT or DELETE statement, the specified column is not a column of any of the tables or views identified in a FROM clause in the statement.
- There is a correlated reference in GROUP BY.
- There is an unresolved qualified reference in HAVING.

System Action: The statement cannot be executed. No data was retrieved, inserted, or updated.

Programmer Response: Verify that the column and table names are specified correctly in the SQL statement. In the case of a SELECT statement, check to be sure that all of the required tables were named in the FROM clause.

Destination: 42703

-208 **THE ORDER BY CLAUSE IS INVALID**
BECAUSE COLUMN *name* **IS NOT PART OF**
THE RESULT TABLE

Explanation: The statement is invalid because a column ('name') specified in the ORDER BY list does not appear in the result table (that is, it is not specified in the SELECT-list).

Only columns in the result table can be used to order that
result when the *fullselect* of the *select-statement* is not a *sub-*
select.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the statement, either by adding the specified column to the result table, or deleting it from the ORDER BY clause. Refer to Chapter 5 of *SQL Reference* for information about restrictions on the use of the ORDER BY clause to order the result of an SQL SELECT.

Destination: 42707

-214 **An expression starting with** *expression-start* **in**
the *clause-type* **clause is not valid. Reason**
code = *reason-code*.

Explanation: The expression identified by the first part of the
expression *expression-start* in the *clause-type* clause is not
valid for the reason specified by the *reason-code* as follows:

2 DISTINCT is specified in the select clause and the
expression cannot be matched exactly with an
expression in the select list. This reason code
occurs only when *clause-type* is ORDER BY.

System Action: The statement cannot be executed.

Programmer Response: Modify the select-statement based
on the reason specified by the *reason-code* as follows:

2 Remove DISTINCT from the select clause.

Destination: 42822

-219 THE REQUIRED EXPLANATION TABLE *table-name* DOES NOT EXIST

Explanation: The EXPLAIN statement assumes the existence of the explanation table and it is not defined in the DB2 subsystem as a base table. Refer to Chapter 6 of *SQL Reference* for more information.

System Action: The statement cannot be executed.

Programmer Response: Determine whether the required explanation table does exist. If not, create the required table.

Destination: 42704

-220 THE COLUMN *column-name* IN EXPLANATION TABLE *table-name* IS NOT DEFINED PROPERLY

Explanation: An error occurred during the insertion of a row into the explanation table. The table is improperly defined for the following reasons:

- A column is missing.
- Columns are defined in the wrong order.
- The table contains an extra column.
- A column description is invalid because of its name, data type, length, or null attributes.

System Action: The statement cannot be executed. The explanation information is not generated.

Programmer Response: Correct the definition of the required explanation table. Refer to Chapter 6 of *SQL Reference* for information on defining an explanation table.

Destination: 55002

-221 "SET OF OPTIONAL COLUMNS" IN EXPLANATION TABLE *table-name* IS INCOMPLETE. OPTIONAL COLUMN *column-name* IS MISSING

Explanation: The EXPLAIN statement assumes the required explanation table is defined properly. The optional column indicated is not defined in the indicated explanation table.

PLAN-TABLE can have none or all of the Version 2 Release 2 optional columns (PREFETCH, COLUMN-FN-EVAL, MIXOPSEQ). If the Version 2 Release 2 optional columns are present, it can also have all or none of the optional Version 2 Release 3 columns (VERSION,COLLID).

System Action: The explanation information is not generated.

Programmer Response: Correct the definition of the required explanation table to include all five optional columns, just the Version 2 Release 2 optional columns, or no optional columns. Refer to Chapter 6 of *SQL Reference* for information on defining an explanation table.

Destination: 55002

-240 THE PART CLAUSE OF A LOCK TABLE STATEMENT IS INVALID

Explanation: The LOCK TABLE statement is invalid for one of the following reasons:

- The table space in which the table resides is not partitioned or does not have the LOCKPART YES attribute, and the PART clause is specified.
- An integer specified in the PART clause does not identify a partition of the table space.

System Action: The LOCK TABLE statement cannot be executed.

Programmer Response: Determine whether the specified table resides in a partitioned table space defined with LOCKPART YES.

- If it is partitioned and defined with LOCKPART YES, specify a PART clause that identifies the partition you want to lock.
- If it is partitioned but does not have the LOCKPART YES attribute and you want to lock a single partition, use ALTER TABLESPACE to change the LOCKPART attribute to YES.
- If it is not partitioned, do not specify the PART clause.

Destination: 428B4

-250 THE LOCAL LOCATION NAME IS NOT DEFINED WHEN PROCESSING A THREE-PART OBJECT NAME

Explanation: A three-part object name (table, view, or alias) cannot be used until the local location name is defined.

System Action: Install or reinstall the DB2 distributed data facility (DDF) with a registered location name for local DB2.

Programmer Response: Define the local location name and then retry the function.

Destination: 42718

-251 TOKEN *name* IS NOT VALID

Explanation: A location name cannot contain alphabetic extenders. (The standard alphabetic extenders in the United States are #, @, \$.)

System Action: The statement cannot be executed

Programmer Response: Correct the location name.

Destination: 42602

-300 THE STRING CONTAINED IN HOST VARIABLE OR PARAMETER *position-number* IS NOT NUL-TERMINATED

Explanation: A host variable or parameter is invalid. Its entry in the SQLDA is indicated by *position-number*. The host variable or parameter is a C string variable that is one of the following:

- Used as an input parameter to a stored procedure.
- Returned as an output parameter from a stored procedure.
- Referenced as an input variable in an embedded SQL statement.
- Used to provide a value for a parameter marker of a dynamic SQL statement.

If the data type of the variable is character string, it is invalid because it does not include 'X'00'. If the data type of the variable is graphic string, it is invalid because it does not include 'X'0000'.

System Action: The statement cannot be executed.

Programmer Response: Append a NUL-terminator to the end of the string.

Destination: 22024

-301 THE VALUE OF INPUT HOST VARIABLE OR PARAMETER NUMBER *position-number* CANNOT BE USED AS SPECIFIED BECAUSE OF ITS DATA TYPE

Explanation: DB2 received data that could not be used as specified in the statement because its data type is incompatible with the requested function.

The *position-number* identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, DELETE, or SELECT statement), or the parameter number (if the message is issued as the result of a CALL statement).

System Action: The statement cannot be executed.

Programmer Response: Correct the application program or stored procedure. Ensure that the data type of the indicated input host variable or parameter in the statement is compatible with the way it is used.

Destination: 42895

-302 THE VALUE OF INPUT VARIABLE OR PARAMETER NUMBER *position-number* IS INVALID OR TOO LARGE FOR THE TARGET COLUMN OR THE TARGET VALUE

Explanation: DB2 received data that was invalid or too large to fit in the corresponding column of the table or the corresponding target value. The *position-number* identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, DELETE, or SELECT statement), or the parameter number (if the message is issued as the result of a CALL statement).

One of the following occurred:

- The column is defined as a string and the host variable or parameter contains a string that is too long for the column.
- The column is defined as numeric and the host variable or parameter contains a numeric value too large for the definition of the column.
- The host variable is defined as decimal, but contains invalid decimal data.
- The target value is a string constant and the host variable or parameter contains a string that is too long for the target value.
- The target value is a numeric constant and the host variable or parameter contains a numeric value that is too large for the target value.

System Action: The statement cannot be executed.

Programmer Response: Correct the application program or stored procedure. Check the column type and length of the value or the data type and contents of the input host variable or parameter *position-number*. Ensure that the value of the host variable or parameter will fit in the column or contains

valid decimal data. Valid decimal data is a System/370 packed decimal number.

Destination: 22003 if *number too large for target*, 22001 otherwise.

-303 A VALUE CANNOT BE ASSIGNED TO OUTPUT HOST VARIABLE NUMBER *position-number* BECAUSE THE DATA TYPES ARE NOT COMPARABLE

Explanation: A CALL, FETCH, or SELECT into the output host variable, whose entry in the output SQLDA is indicated by *position-number*, could not be performed. The data type of the variable was not compatible with the data type of the corresponding SELECT or CALL list element. The output host variable and the corresponding SELECT or CALL list element must be in one of the following categories:

- Both values must be numbers.
- Both values must be character strings.
- Both values must be graphic strings.

In addition, for datetime and timestamp values, the host variable must be a character string variable with a correct length.

System Action: The CALL, FETCH, or SELECT statement cannot be executed. No data was retrieved.

Programmer Response: Verify that table definitions are current and that the host variable has the correct data type.

Destination: 42806

-304 A VALUE WITH DATA TYPE *data-type1* CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE THE VALUE IS NOT WITHIN THE RANGE OF THE HOST VARIABLE IN POSITION *position-number* WITH DATA TYPE *data-type2*

Explanation: A CALL, FETCH, or SELECT into a host variable list or structure in position number *position-number* failed because the host variable with data type *data-type2* was not large enough to hold the retrieved value with data type *data-type1*.

System Action: The statement cannot be executed. No data was retrieved. If the statement was a FETCH, the cursor remains open.

Programmer Response: Verify that table definitions are current, and that the host variable has the correct data type. See the explanation for SQLCODE -405 for ranges of SQL data types.

Destination: 22003

-305 THE NULL VALUE CANNOT BE ASSIGNED TO OUTPUT HOST VARIABLE NUMBER *position-number* BECAUSE NO INDICATOR VARIABLE IS SPECIFIED

Explanation: A FETCH or embedded SELECT operation resulted in the retrieval of a null value to be inserted into the output host variable, designated by entry number 'position-number' of the output SQLDA, for which no indicator variable was provided. An indicator variable must be supplied if a column returns a null value.

System Action: The statement cannot be executed. No data was retrieved.

Programmer Response: Examine the definition of the table that is the object of the FETCH or SELECT, and correct the application program to provide indicator variables for all host variables into which null values can be retrieved. This includes host variables for columns which can contain null values and host variables which receive the results of column functions whose result table could be empty.

Destination: 22002

-309 A PREDICATE IS INVALID BECAUSE A REFERENCED HOST VARIABLE HAS THE NULL VALUE

Explanation: The statement could not be processed because a host variable appearing in a predicate such as

`column-name = host-variable`

had the NULL value. Such a predicate is not permitted when the host variable contains the NULL value even though the object column might contain nulls.

System Action: The statement cannot be executed.

Programmer Response: Rebind the plan or package containing the statement. The condition described is not an error in DB2 Version 2 Release 3 and later releases.

Destination: 22512

-310 DECIMAL HOST VARIABLE OR PARAMETER *number* CONTAINS NON-DECIMAL DATA.

Explanation: DB2 received nondecimal data from either an application (in the form of a host variable) or a stored procedure (in the form of a parameter that was passed to or from a stored procedure).

number Identifies either the host variable number (if the message is issued as a result of an INSERT, UPDATE, DELETE, or SELECT statement), or the parameter number (if the message is issued as the result of a CALL statement).

System Action: The statement cannot be executed.

Programmer Response: Correct the application program or stored procedure. Ensure that all decimal variables or parameters contain valid System/370 packed decimal numbers.

Destination: 22023

-311 THE LENGTH OF INPUT HOST VARIABLE NUMBER *position-number* IS NEGATIVE OR GREATER THAN THE MAXIMUM

Explanation: When evaluated, the length specification for input host string variable, whose entry in the SQLDA is indicated by *position-number*, was negative or greater than the maximum.

System Action: The statement cannot be executed.

Programmer Response: Correct the program to ensure that the lengths of all host string variables are not negative or that they are not greater than the maximum allowed length.

Destination: 22501

-312 UNDEFINED OR UNUSABLE HOST VARIABLE *variable-name*

Explanation: The host variable *variable-name* appears in the SQL statement, but:

- The SQL statement is a prepared statement, or
- The attributes of the variable are inconsistent with its usage in the static SQL statement, or
- The variable is not declared in the application program.

System Action: The statement cannot be executed.

Programmer Response: Verify that

- The variable name is spelled properly in the SQL statement.
- The variable is allowed in the SQL statement.
- The application program contains a declaration for that variable.
- The attributes of the variable are compatible with its use in the statement.

Destination: 42618

-313 THE NUMBER OF HOST VARIABLES SPECIFIED IS NOT EQUAL TO THE NUMBER OF PARAMETER MARKERS

Explanation: The number of host variables specified in the EXECUTE or OPEN statement is not the same as the number of parameter markers (question marks) appearing in the prepared SQL statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the application program so that the number of host variables specified in the EXECUTE or OPEN statement is the same as the number of parameter markers appearing in the prepared SQL statement. The # DESCRIBE INPUT SQL statement can be used to determine the expected number of input parameter markers.

Destination: 07001

-314 THE STATEMENT CONTAINS AN AMBIGUOUS HOST VARIABLE REFERENCE

Explanation: A host variable used in the statement has been defined more than once in this application program causing confusion as to which host variable defined should be used.

System Action: The statement cannot be executed.

Programmer Response: Make the host variable unique or use qualifications to indicate which host variable definition is to be used.

Destination: 42714

-327 THE ROW CANNOT BE INSERTED BECAUSE IT IS OUTSIDE THE BOUND OF THE PARTITION RANGE FOR THE LAST PARTITION.

Explanation: When a row is inserted, the calculated partition key value for the new row must be within the bounds of a partition (as specified in the VALUES clause of the CREATE INDEX statement).

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to specify a value for the partition key that is within the bounds of the last partition of the partitioned table space.

Destination: 22525

-330 A STRING CANNOT BE USED BECAUSE IT CANNOT BE TRANSLATED. REASON *reason-code*, **CHARACTER** *code-point*, **HOST VARIABLE** *position-number*

Explanation: A translation error occurred during the translation of a string to a different coded character set. The type of error is indicated by the *reason-code*:

- 8 Length exception (for example, expansion required for PC MIXED data exceeds the maximum length of the string).
- 12 Invalid code point (for example, use of the ERRORBYTE option of SYSSTRINGS).
- 16 Form exception (for example, invalid MIXED data).
- 20 Translate procedure error (for example, an exit set the length control field of the string to an invalid value).
- 24 SBCS character found in string contained in a wchar_t host variable.

If the *reason-code* is 12, *code-point* is the invalid code point. Otherwise, *code-point* is either blank or an additional *reason-code* returned by an exit. If the string is the value of an input host variable, the *position-number* is the ordinality of the variable in the SQLDA. If the string is not the value of a host variable, the *position-number* is blank.

System Action: The statement cannot be executed.

Programmer Response: Take one of the following actions based on the *reason-code*

- If the *reason-code* is 8, extend the maximum length of the host variable to allow for the expansion that occurs when the string is translated.
- If the *reason-code* is 12, either change the translate table to accept the *code-point* or the data to eliminate the *code-point*.
- If the *reason-code* is 16 and the string is described as MIXED data, either change its description or the string to conform to the rules for well-formed mixed data.
- If the *reason-code* is 20, correct the translate procedure.
- If the *reason-code* is 24, delete the SBCS character from the graphic string.

Destination: 22021

-331 A STRING CANNOT BE ASSIGNED TO A HOST VARIABLE BECAUSE IT CANNOT BE TRANSLATED. REASON *reason-code*, **CHARACTER** *code-point*, **POSITION** *position-number*

Explanation: The operation required the translation of a string to the coded character set of the host variable and a translation error occurred. The type of error is indicated by the 'reason-code':

- 8 for length exception (e.g., expansion required for PC MIXED data exceeds the maximum length of the string).
- 12 for invalid 'code point' (e.g., use of the ERRORBYTE option of SYSSTRINGS).

- 16 for form exception (e.g., invalid MIXED data).
- 20 for translate procedure error (e.g., an exit set the length control field of the string to an invalid value).

If the 'reason-code' is 12, 'code-point' is the invalid 'code point'. Otherwise, 'code-point' is blank. The 'position-number' is the ordinality of the output variable in the SQLDA.

System Action: The statement cannot be executed.

Programmer Response: If the 'reason-code' is 8, the maximum length of the result column must be extended to allow for the expansion that occurs when the string is translated. If the 'reason-code' is 12, either the translate table must be changed to accept the 'code-point' or the data must be changed to eliminate the 'code point'. If the 'reason-code' is 16, and the string is described as MIXED data, either its description must be changed or the string must be changed to conform to the rules for well-formed MIXED data. If the 'reason-code' is 20, the translate procedure must be corrected. An alternative to these corrective actions is to provide an indicator variable so that a null value and a warning can be returned rather than an error. Refer to Chapter 3 of *SQL Reference* for more information on coded character set.

Destination: 22021

-332 SYSSTRINGS DOES NOT DEFINE A TRANSLATION FROM CCSID *ccsid* **TO** *ccsid*

Explanation: The operation required a translation of a string to a different coded character set, but the particular translation is not described in the SYSSTRINGS catalog table. The first 'ccsid' identifies the coded character set of the string and the second 'ccsid' identifies the coded character set to which it must be translated.

System Action: The statement cannot be executed.

Programmer Response: If the CCSIDs are correct, the only corrective action is to provide for the translation by inserting a row into SYSSTRINGS. For an SBCS translation, the row must contain a translate table or the name of a user-provided translate procedure. For a DBCS translation, the row must contain the name of a user-provided translate procedure. Refer to Chapter 3 of *SQL Reference* for more information on coded character set.

Destination: 57017

-333 THE SUBTYPE OF A STRING VARIABLE IS NOT THE SAME AS THE SUBTYPE KNOWN AT BIND TIME AND THE DIFFERENCE CANNOT BE RESOLVED BY TRANSLATION

Explanation: The CCSID in the run time SQLDA is inconsistent with the bind time subtype of the host variable or parameter marker. Either the run time description is BIT and the bind time description was not BIT, or the run time description is not BIT and the bind time description was BIT.

System Action: The statement cannot be executed.

Programmer Response: Change the CCSID in the SQLDA so that the subtype of the host variable is consistent with the bind time subtype of the host variable or parameter marker. If the input data in error is a parameter marker, you can use the DESCRIBE INPUT SQL statement to determine the expected SQLTYPE, SQLLEN and CCSID expected. Refer to Chapter 3 of *SQL Reference* for more information on coded character set.

Destination: 56010

-338 AN ON CLAUSE IS INVALID

Explanation: This return code reports a violation of one of the following:

- One expression of the predicate must only reference columns of one of the operand tables of the associated join operator, and the other expression of the predicate must only reference columns of the other operand table.
- A VALUE or COALESCE function is allowed in the ON clause only when the join operator is a FULL OUTER JOIN or FULL JOIN.
- An operator other than '=' is not allowed in a FULL OUTER JOIN or FULL JOIN.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the statement so that each ON clause expression references only one of the operand tables.

You can work around the second restriction by using a nested table expression with the VALUE/COALESCE function in the SELECT list of the table expression.

For example, this statement violates the restriction and results in SQLCODE -338.

```
SELECT T1.C2,T2.C2,T3.C2 FROM T1 FULL JOIN T2 ON T1.C1=T2.C1
LEFT JOIN T3 ON COALESCE(T1.C1,T2.C1)=T3.C1;
```

You can rewrite the statement as follows:

```
SELECT X.C2,X.C3,T3.C2 FROM
(SELECT COALESCE(T1.C1,T2.C1) AS C1,T1.C2,T2.C2 AS C3 FROM
T1 FULL JOIN T2 ON T1.C1=T2.C1) AS X
LEFT JOIN T3 ON X.C1=T3.C1;
```

Destination: 42972

-339 THE SQL STATEMENT CANNOT BE EXECUTED FROM AN ASCII BASED DRDA APPLICATION REQUESTOR TO A V2R2 DB2 SUBSYSTEM

Explanation: The application is connected to a DB2 Version 2 Release 3 database server. The SQL statement is using an alias or three-part name, which refers to another DB2 subsystem that is at the Version 2 Release 2 level. DB2 Version 2 Release 2 does not support character conversion. Since the execution of SQL statements from an ASCII DRDA requester to an EBCDIC Version 2 Release 2 DB2 server could require character conversion, access to the Version 2 Release 2 DB2 is denied for data integrity reasons.

System Action: The statement cannot be executed.

Programmer Response: Remove statements from the application that resolve to a DB2 Version 2 Release 2 subsystem.

System Programmer Response: If the application must refer to the Version 2 Release 2 subsystem data, the Version 2 Release 2 DB2 subsystem must be migrated to Version 2 Release 3 where character conversion is supported.

Destination: 56082

-351 AN UNSUPPORTED SQLTYPE WAS ENCOUNTERED IN POSITION "<position-number>" ON A PREPARE OR DESCRIBE OPERATION.

Explanation: Some SQL data types are not supported by DB2 Version 5. "<position-number>" is the position of the first element with an invalid data type in the SQLDA. A common reason why this error occurs is when DB2 attempts to describe large object data residing at a non-DB2 server. Some of the SQLTYPES that can cause this error are: LOB, BLOB, CLOB, and DBLOB.

System Action: The statement cannot be executed.

Programmer Response: The application program must not include any SQL operations that describe SQL data types which DB2 Version 5 does not support when DB2 is the application requester (AR). For example, instead of dynamically selecting all columns from SYSTABLES, only select those columns that have data types defined to DB2. If the error is caused by an unsupported LOB type, then exclude such data from the list of data to be described.

Destination: 56084

-400 THE CATALOG HAS THE MAXIMUM NUMBER OF USER DEFINED INDEXES

Explanation: Only one hundred user-defined indexes can be created in the catalog database.

System Action: The statement cannot be executed.

Programmer Response: If this index must be created, another user-defined index on the catalog must be dropped. After that index is dropped, this statement can be executed.

Destination: 54027

-401 THE OPERANDS OF AN ARITHMETIC OR COMPARISON OPERATION ARE NOT COMPATIBLE

Explanation: An arithmetic operation appearing within the SQL statement has a mixture of numeric and nonnumeric operands, or the operands of a comparison operation are not compatible.

System Action: The statement cannot be executed.

Programmer Response: Check the data types of all operands to ensure that their data types are comparable and compatible with their usage in the statement.

If all the operands of the SQL statement are correct, then, if a view is being accessed, check the data types of all the operands in the view definition.

Destination: 42818

-402 AN ARITHMETIC FUNCTION OR OPERATOR *arith-fop* IS APPLIED TO CHARACTER OR DATETIME DATA

Explanation: A nonnumeric operand has been specified for the arithmetic function or operator '*arith-fop*'.

System Action: The statement cannot be executed.

Programmer Response: Examine and correct the syntax of the SQL statement such that all operands of the specified function or operator are numeric.

Destination: 42819

-404 THE UPDATE OR INSERT STATEMENT SPECIFIES A STRING THAT IS TOO LONG *column-name*

Explanation: An INSERT or UPDATE statement specifies a value that is longer than the maximum-length string that can be stored in the indicated column.

System Action: The statement cannot be executed.

Note: 'column-name' may or may not be returned in SQLCA, depending on the syntax of the INSERT or UPDATE statement.

Programmer Response: Check the length of the object column, and correct the program or SQL statement so that the length of the insert or update string does not exceed that maximum.

Destination: 22001

-405 THE NUMERIC LITERAL literal CANNOT BE USED AS SPECIFIED BECAUSE IT IS OUT OF RANGE

Explanation: The specified numeric literal is not in the proper range.

The proper ranges for SQL values are as follows:

- 5.4E-79 to 7.2E+75 for FLOAT values
- -(10³¹ -1) to +(10³¹ -1) for DECIMAL values
- -2147483648 to 2147483647 for INTEGER values
- -32768 to +32767 for small integer (SMALLINT) values.

System Action: The statement cannot be executed.

Programmer Response: The value of the literal should be reduced to the appropriate size for this data type.

Destination: 42820

-406 A CALCULATED OR DERIVED NUMERIC VALUE IS NOT WITHIN THE RANGE OF ITS OBJECT COLUMN

Explanation: A value derived or calculated during processing of the SQL statement was outside the range of the data type of its object column. This problem might have arisen because either the values occurring in the object column were out of range, or the SQL operation performed was not appropriate for the values in the object column.

System Action: The statement cannot be executed.

Programmer Response: See the explanation of SQLCODE -405 for allowed ranges for numeric data types.

Destination: 22003

-407 AN UPDATE OR INSERT VALUE IS NULL, BUT THE OBJECT COLUMN *column-name* CANNOT CONTAIN NULL VALUES

Explanation: One of the following conditions occurred:

- A null insert or update value was specified for a column defined as NOT NULL.
- No insert value was provided for a column that does not have a default value.

System Action: The statement cannot be executed. The 'column-name' might be returned in SQLCA, depending on

the syntax of the SQL statement in which the error was detected.

Programmer Response: Examine the definition of the object table to determine which columns of the table have the NOT NULL attribute, and correct the SQL statement accordingly.

Destination: 23502

-408 AN UPDATE OR INSERT VALUE IS NOT COMPARABLE WITH THE DATA TYPE OF ITS OBJECT COLUMN *column-name*

Explanation: The data type of the value to be inserted into or set in the column 'column-name' by an INSERT or UPDATE statement is incompatible with the declared data type of that column. Both must be numeric or both must be graphic string; or both must be either:

- Dates or character
- Times or character
- Timestamps or character.

However, dates, times, or timestamps cannot be assigned to a character column that has a field procedure.

System Action: The statement cannot be executed. No data was inserted or updated.

Programmer Response: Examine the current definition for the object table, and ensure that the host variable or literal value assigned to the specified column has the proper data type.

Destination: 42821

-409 INVALID OPERAND OF A COUNT FUNCTION

Explanation: The operand of the COUNT function in the statement violates SQL syntax. A common error is a column name or other expression without DISTINCT.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax and resubmit the statement. Refer to Chapter 4 of *SQL Reference* for information about the proper form for the operands of a COUNT function.

Destination: 42607

-410 THE FLOATING POINT LITERAL *literal* CONTAINS MORE THAN 30 CHARACTERS

Explanation: The specified floating-point literal is more than 30 characters in length. A floating-point literal has a maximum length of 30 characters.

System Action: The statement cannot be executed.

Programmer Response: Correct the indicated literal.

Destination: 42820

-411 CURRENT SQLID CANNOT BE USED IN A STATEMENT THAT REFERENCES REMOTE OBJECTS

Explanation: A reference to the CURRENT SQLID special register is invalid in a statement that contains the three-part name or alias of an object that is remote to the remote server.

System Action: The statement cannot be executed.

Programmer Response: Either remove the reference to CURRENT SQLID or the reference to the remote object.

Destination: 56040

-412 THE SELECT CLAUSE OF A SUBQUERY SPECIFIES MULTIPLE COLUMNS

Explanation: In the context in which it was used in the SQL statement, the subquery can have only one column specified in its SELECT clause.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the SQL statement. Refer to Chapter 5 of *SQL Reference* for information about restrictions on the syntax for subqueries.

Destination: 42823

-413 OVERFLOW OCCURRED DURING NUMERIC DATA TYPE CONVERSION

Explanation: During processing of the SQL statement, an overflow condition arose when converting from one numeric type to another. Numeric conversion is performed according to the standard rules of SQL.

System Action: The statement cannot be processed. No data was retrieved, updated, or deleted.

Programmer Response: Examine the syntax of the SQL statement to determine the cause of the error. If the problem is data-dependent, it might be necessary to examine the data processed at the time of the error.

Destination: 22003

-414 A LIKE PREDICATE IS INVALID BECAUSE THE FIRST OPERAND IS NOT A STRING

Explanation: The data type of the first operand of the LIKE predicate must be a character string or graphic string.

System Action: The statement cannot be executed.

Programmer Response: Respecify the predicate so that the data type of each operand is a character string or a graphic string.

Destination: 42824

-415 THE CORRESPONDING COLUMNS, *column-number*, OF THE OPERANDS OF A UNION OR A UNION ALL DO NOT HAVE COMPARABLE COLUMN DESCRIPTIONS

Explanation: The column descriptions of corresponding columns of the operands of a UNION or UNION ALL must be comparable. The columns of ordinality '*column-number*' of the operands in this UNION or UNION ALL do not satisfy this requirement. For columns to be comparable, they must both be either numeric, character, graphic, date, time, or timestamp. They cannot be a mixture of these groups. If corresponding columns have field procedures, they must both have the same field procedure.

System Action: The statement cannot be executed.

Programmer Response: Check the data types of the specified columns and correct the UNION or UNION ALL statement so that all corresponding columns have comparable column descriptions.

Destination: 42825

-416 AN OPERAND OF A UNION CONTAINS A LONG STRING COLUMN

Explanation: The UNION specified in the SQL statement could not be performed because one of the tables participating in the union contains a long string column (for example, a # VARCHAR column with length greater than 255). The operands of a UNION cannot contain long string columns.

System Action: The statement cannot be executed.

Programmer Response: The implied function is not supported by DB2. Refer to Chapter 3 of *SQL Reference* for information about restrictions on the manipulation of long string columns.

Destination: 42907

-417 A STATEMENT STRING TO BE PREPARED INCLUDES PARAMETER MARKERS AS THE OPERANDS OF THE SAME OPERATOR

Explanation: The statement string specified as the object of a PREPARE contains a predicate or expression where parameter markers have been used as operands of the same operator—for example:

? > ?

This syntax is not permitted.

System Action: The statement cannot be executed.

Programmer Response: Correct the logic of the application program so that this syntax error does not occur. Refer to Chapter 6 of *SQL Reference* for information about the proper usage of parameter markers within SQL statements to be prepared.

Destination: 42609

-418 A STATEMENT STRING TO BE PREPARED CONTAINS AN INVALID USE OF PARAMETER MARKERS

Explanation: Parameter markers cannot be used in the SELECT list, as the sole argument of a scalar function, or in a concatenation operation. Parameter markers cannot be used in the string expression of an EXECUTE IMMEDIATE SQL statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the logic of the application program so that this error does not occur. Refer to Chapter 6 of *SQL Reference* for information about the proper usage of parameter markers within SQL statements and for EXECUTE IMMEDIATE SQL statement restrictions.

Destination: 42610

-419 THE DECIMAL DIVIDE OPERATION IS INVALID BECAUSE THE RESULT WOULD HAVE A NEGATIVE SCALE

Explanation: The decimal division is invalid because it will result in a negative scale.

The formula used internally to calculate the scale of the result for decimal division is explained in Chapter 3 of *SQL Reference*.

System Action: The statement cannot be executed. No data was retrieved, updated, or deleted.

Programmer Response: Examine the precision and scale of all columns that may have participated in a decimal division. Note that an integer or small integer value may have been converted to decimal for this calculation.

Destination: 42911

-420 THE VALUE OF A CHARACTER STRING ARGUMENT WAS NOT ACCEPTABLE TO THE *function-name* FUNCTION

Explanation: A character string argument did not conform to the requirements of the function. For example, a character string passed to the DECIMAL function did not conform to the rules for forming an SQL integer or decimal constant.

System Action: The statement cannot be executed.

Programmer Response: Change the argument value so that it conforms to the requirements of the function as specified in *SQL Reference*.

Destination: 22018

-421 THE OPERANDS OF A UNION OR UNION ALL DO NOT HAVE THE SAME NUMBER OF COLUMNS

Explanation: The operands of a UNION or UNION ALL must have the same number of columns.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement so that there are exactly the same number of columns in each operand.

Destination: 42826

-423 INVALID RESULT SET LOCATOR VALUE

Explanation: The value specified in a result set locator host variable does not identify a valid result set locator.

System Action: The SQL statement fails.

Programmer Response: There are two common causes for this error:

- The host variable used as a result set locator was never assigned a valid result set locator value. Result set locator values are returned by the DESCRIBE PROCEDURE and ASSOCIATE LOCATORS statements. Make sure the value in your host variable is obtained from one of these statements.
- Result set locator values are only valid as long as the underlying SQL cursor is open. If a commit or rollback operation closes an SQL cursor, the result set locator associated with the cursor is no longer valid.

Destination: 0F001

-426 DYNAMIC COMMIT NOT VALID AT AN APPLICATION SERVER WHERE UPDATES ARE NOT ALLOWED

Explanation: An application executing using DRDA protocols has attempted to issue a dynamic COMMIT statement, or a stored procedure has attempted to issue a COMMIT_ON_RETURN, while connected to a location at which updates are not allowed. A dynamic COMMIT or COMMIT_ON_RETURN can be issued only while connected to a location at which updates are allowed.

System Action: The statement cannot be executed. No COMMIT is performed.

Programmer Response: The IMS or CICS protocols should be used to commit work in these environments.

Destination: 2D528

-427 DYNAMIC ROLLBACK NOT VALID AT AN APPLICATION SERVER WHERE UPDATES ARE NOT ALLOWED

Explanation: An application executing using DRDA protocols has attempted to issue a dynamic ROLLBACK statement while connected to a location at which updates are not allowed. A dynamic ROLLBACK may be issued only while connected to a location at which updates are allowed.

System Action: The statement cannot be executed. No ROLLBACK is performed.

Programmer Response: The IMS or CICS protocols should be used to rollback work in these environments.

Destination: 2D529

-440 THE NUMBER OF PARAMETERS IN THE PARAMETER LIST DOES NOT MATCH THE NUMBER OF PARAMETERS EXPECTED FOR STORED PROCEDURE *name*, AUTHID *authid*, LUNAME *luname*. *number* PARAMETERS WERE EXPECTED.

Explanation: DB2 received an SQL CALL statement for a stored procedure. DB2 found the row in the SYSIBM.SYSPROCEDURES catalog table associated with the requested procedure name. However, the number of parameters supplied on the CALL statement does not match the number of parameters defined in the PARMLIST column of the SYSIBM.SYSPROCEDURES table.

The definition of a stored procedure might be cached. If you suspect that this message is being issued because the cached definition of a procedure does not match the definition of a procedure in the SYSIBM.SYSPROCEDURES table, issue the -START PROCEDURE command to refresh the cache.

- name* The name of the stored procedure from the PROCEDURE field in SYSIBM.SYSPROCEDURES.
- authid* The authorization id from the AUTHID field in SYSIBM.SYSPROCEDURES.
- luname* The logical unit name from the LUNAME field in SYSIBM.SYSPROCEDURES.
- number* The expected number of parameters for the stored procedure with the NAME, AUTHID, and LUNAME described above.

System Action: The statement cannot be executed.

Programmer Response: If the SQL CALL statement is coded incorrectly, modify the SQL application to provide the correct number of parameters on the SQL CALL statement.

If the PARMLIST column of the SYSIBM.SYSPROCEDURES table contains incorrect information, make the required updates to the PARMLIST column and issue the -START PROCEDURE command to activate the updated definition.

Destination: 42884

-444 USER PROGRAM *name* COULD NOT BE FOUND

Explanation: DB2 received an SQL CALL statement for a stored procedure and found the row in the SYSIBM.SYSPROCEDURES catalog table associated with the requested procedure name. However, the MVS load module identified in the LOADMOD column of the SYSIBM.SYSPROCEDURES row could not be found.

name The name of the MVS load module that could not be found

System Action: The statement cannot be executed.

Programmer Response: If the LOADMOD column value in the SYSIBM.SYSPROCEDURES table was specified incorrectly, correct the value and issue the -START PROCEDURE command to activate the changed definition.

If the LOADMOD column value is correct, use the MVS linkage editor to create the required MVS load module in one of the MVS load libraries used by your installation for stored procedures.

```
# This error can also occur if you are invoking a WLM-managed
# stored procedure that is not APF authorized, and the DB2 load
# libraries are not in the STEPLIB concatenation because they
# are being loaded from LINKLIST. In this case, if you want the
# stored procedure program to run APF-authorized, link-edit it
# with AC=1 into an MVS APF authorized library. If you do not
# want the stored procedure program to run APF authorized, add
# the DB2 load library to the STEPLIB concatenation of the JCL
# used to start the WLM-managed address space.
```

Destination: 42724

-450 STORED PROCEDURE *name*, PARAMETER NUMBER *number*, OVERLAYED STORAGE BEYOND ITS DECLARED LENGTH.

Explanation: While returning parameters from a stored procedure to an application, DB2 detected an overlay of one of the parameters. A stored procedure overwrote storage beyond a parameter's declared length.

name The name of the stored procedure from the NAME field in the SYSIBM.SYSPROCEDURES catalog table.

number The parameter from the PARMLIST field in the SYSIBM.SYSPROCEDURES catalog table.

System Action: The results of the stored procedure cannot be returned.

Programmer Response: Examine the stored procedure to determine the cause of the overlay. Ensure that all parameters are declared correctly and that they match the definitions in SYSIBM.SYSPROCEDURES for procedure *name*.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Destination: 39501

-469 SQL CALL STATEMENT MUST SPECIFY AN OUTPUT HOST VARIABLE FOR PARAMETER *number*.

Explanation: DB2 received an SQL CALL statement for a stored procedure. DB2 found the row in the SYSIBM.SYSPROCEDURES catalog table associated with the requested procedure name. However, parameter *number* was identified in the PARMLIST column of the SYSIBM.SYSPROCEDURES table as an OUT or INOUT parameter. A host variable must be supplied on the SQL CALL statement for parameters defined as OUT or INOUT.

number The parameter number from the PARMLIST field in SYSIBM.SYSPROCEDURES.

System Action: The statement cannot be executed.

Programmer Response: If the SQL CALL statement is coded incorrectly, modify the SQL application to provide an output host variable on the SQL CALL statement.

If the PARMLIST column of the SYSIBM.SYSPROCEDURES table contains incorrect information, perform the required updates to the PARMLIST column and issue the -START PROCEDURE command to activate the updated definition.

Destination: 42886

-470 SQL CALL STATEMENT SPECIFIED A NULL VALUE FOR INPUT PARAMETER *number*, BUT THE STORED PROCEDURE DOES NOT SUPPORT NULL VALUES.

Explanation: DB2 received an SQL CALL statement for a stored procedure and found a null value in the incoming parameter list. The DB2 stored procedure was defined in the SYSIBM.SYSPROCEDURES catalog table with LINKAGE=' ', which specifies that the DB2 stored procedure does not accept null values.

```
# A call to a stored procedure with a LANGUAGE value of
# COMPJAVA receives this SQLCODE if an input parameter in
# the compiled Java stored procedure has a Java base type that
# cannot be set to a null value.
```

number The parameter from the PARMLIST field in SYSIBM.SYSPROCEDURES.

System Action: The statement cannot be executed.

Programmer Response: If the stored procedure should not accept null values, change the calling application to provide a nonnull value.

If the stored procedure should accept null values, change the LINKAGE column in SYSIBM.SYSPROCEDURES to N.

Use the -START PROCEDURE command to activate the changes to the SYSIBM.SYSPROCEDURES table.

Destination: 39002

-471 SQL CALL FOR STORED PROCEDURE *name* FAILED DUE TO REASON *rc*

Explanation: DB2 received an SQL CALL statement for a stored procedure. The CALL statement was not accepted because of DB2 reason code *rc*.

name The name of the stored procedure specified on the SQL CALL statement.

rc The DB2 reason code describing the cause of the failure. Possible values are: 00E79000, 00E79001, 00E79002, 00E79003, 00E79004, 00E79005, 00E79006, 00E79007, 00E7900B, 00E7900C.

System Action: The statement cannot be executed. A DSNX9xx message describing the error might be displayed on the MVS system console.

Programmer Response: Correct the condition described by the DB2 reason code.

Destination: 55023

-480 THE PROCEDURE *procedure-name* HAS NOT YET BEEN CALLED

Explanation: The procedure identified in a DESCRIBE PROCEDURE or an ASSOCIATE LOCATORS statement has not yet been called within the application process or the procedure has been called, but an explicit or implicit commit occurred before the statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the order of the statements and rerun them.

Destination: 51030

-482 THE PROCEDURE *procedure-name* RETURNED NO LOCATORS

Explanation: The procedure identified in an ASSOCIATE LOCATORS statement returned no result set locators.

System Action: The statement cannot be executed.

Programmer Response: Determine if result set locators are returned from the identified procedure by using the DESCRIBE PROCEDURE statement.

Destination: 51030

-496 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT REFERENCES A RESULT SET THAT WAS NOT CREATED BY THE CURRENT SERVER

Explanation: The SQL statement cannot be executed because the current server is different from the server that called a stored procedure. The SQL statement can be any of the following:

- ALLOCATE CURSOR
- DESCRIBE CURSOR
- FETCH (using an allocated cursor)
- CLOSE (using an allocated cursor)

System Action: The statement cannot be executed.

Programmer Response: Connect to the server that called the stored procedure which created the result set before running the SQL statement that failed.

Destination: 51033

-499 CURSOR *cursor-name* HAS ALREADY BEEN ASSIGNED TO THIS OR ANOTHER RESULT SET FROM PROCEDURE *procedure-name*.

Explanation: An attempt was made to assign a cursor to a result set using the SQL statement ALLOCATE CURSOR and one of the following applies:

- The result set locator variable specified in the ALLOCATE CURSOR statement has been previously assigned to cursor *cursor-name*.
- Cursor *cursor-name* specified in the ALLOCATE CURSOR statement has been previously assigned to a result set from stored procedure *procedure-name*.

System Action: The statement cannot be executed.

Programmer Response: Determine if the target result set named in the ALLOCATE CURSOR statement has been previously assigned to a cursor.

If the result set has been previously assigned to cursor *cursor-name*, then either choose another target result set or call stored procedure *procedure-name* again and reissue the ASSOCIATE LOCATOR and ALLOCATE CURSOR statements.

If the result set has not been previously assigned to a cursor, the cursor *cursor-name* specified in the ALLOCATE CURSOR statement has been previously assigned to some result set from stored procedure *procedure-name*. You can not assign cursor *cursor-name* to another result set, so you must specify a different cursor name in the ALLOCATE CURSOR statement.

Destination: 24516

-500 THE IDENTIFIED CURSOR WAS CLOSED WHEN THE CONNECTION WAS DESTROYED

Explanation: The FETCH, UPDATE, DELETE, or CLOSE statement identifies a closed cursor that was defined with the WITH HOLD option. The cursor was closed when the connection on which it was dependent was destroyed during a commit operation. The connection was destroyed because the application process placed it in the released state, or the application plan was bound with the DISCONNECT(AUTOMATIC) option.

System Action: The statement cannot be executed.

Programmer Response: The correction depends on the desired state of both the cursor and the connection, as follows:

- If you want the cursor closed, change the application program so that the cursor is not referenced in the closed state.
- If you want the cursor open and the connection was placed in the released state by the application program, change the program so that the connection is not placed in the released state until the cursor is explicitly closed.
- If you want the cursor open and the connection was placed in the released state as a result of the DISCONNECT(AUTOMATIC) option, rebind the plan using DISCONNECT(CONDITIONAL).

Correct the error in the application, rebind the plan, and resubmit the job.

Destination: 24501

-501 THE CURSOR IDENTIFIED IN A FETCH OR CLOSE STATEMENT IS NOT OPEN

Explanation: The application program attempted to either:

1. FETCH using a cursor, or
2. CLOSE a cursor

at a time when the specified cursor was not open.

System Action: The statement cannot be executed.

Programmer Response: Check for a previous SQL return code that may have closed the cursor. Commit and rollback operations close cursors. SQLCODES -404, -652, -679, -802, -901, -904, -909, -910, -911, and -913 will force the cursor to close. After the cursor is closed, any fetches or close cursor statements will receive this SQLCODE -501.

If no previous SQL return codes have been issued, correct the logic of the application program to ensure that the cursor is open at the time the FETCH or CLOSE statement is executed.

Destination: 24501

-502 THE CURSOR IDENTIFIED IN AN OPEN STATEMENT IS ALREADY OPEN

Explanation: The application program attempted to execute an OPEN statement for a cursor that was already open.

System Action: The statement cannot be executed. The cursor was unchanged (that is, it was not 'reopened').

Programmer Response: Correct the logic of the application program to ensure that it does not attempt to execute an OPEN statement for a cursor that is already open.

Destination: 24502

-503 A COLUMN CANNOT BE UPDATED BECAUSE IT IS NOT IDENTIFIED IN THE UPDATE CLAUSE OF THE SELECT STATEMENT OF THE CURSOR

Explanation: The application program attempted to update (using a cursor) a value in a column of the object table that was not identified in the FOR UPDATE clause in the cursor declaration.

Any column that is to be updated must be identified in the FOR UPDATE clause of the cursor declaration.

System Action: The statement cannot be executed. No data was updated in the object table.

Programmer Response: Correct the application program. If the column is to be updated, its name must be added to the FOR UPDATE clause of the cursor declaration.

Destination: 42912

-504 THE CURSOR NAME *cursor-name* IS NOT DEFINED

Explanation: Cursor *cursor-name* was referenced in an SQL statement, and one of the following is true:

- Cursor *cursor-name* was not declared (using the DECLARE CURSOR statement) or allocated (using the ALLOCATE CURSOR statement) in the application program before it was referenced.

- Cursor *cursor-name* was referenced in a positioned UPDATE or DELETE statement which is not a supported operation for an allocated cursor.

- Cursor *cursor-name* was allocated, but a CLOSE cursor statement naming *cursor-name* was issued and deallocated the cursor before this cursor reference.

- Cursor *cursor-name* was allocated, but a ROLLBACK operation occurred and deallocated the cursor before this cursor reference.

- Cursor *cursor-name* was allocated, but its associated cursor declared in a stored procedure was not declared WITH HOLD, and a COMMIT operation occurred and deallocated the cursor before this cursor reference. The COMMIT operation can be either explicit (the COMMIT statement) or implicit (that is, a stored procedure defined as COMMIT_ON_RETURN = 'Y' was called before this cursor reference).

- Cursor *cursor-name* was allocated, but its associated stored procedure was called again since the cursor was allocated, new result sets were returned, and cursor *cursor-name* was deallocated.

System Action: The statement cannot be executed.

Programmer Response: Check the application program for completeness and for a possible spelling error in the cursor declaration or allocation. The declaration for or allocation of a cursor must appear in an application program before SQL statements that reference the cursor.

If the *cursor-name* was <UNKNOWN>, then the cursor was not successfully declared or allocated. This can occur if SQL(DB2) was used, and a warning message was issued during precompilation. Check the precompile output for warning messages on the DECLARE CURSOR or ALLOCATE CURSOR statement, and correct the statement.

For an allocated cursor, if an implicit or explicit COMMIT, ROLLBACK, or CLOSE occurred since the cursor was successfully allocated, modify the application program logic to do one of the following:

- After the COMMIT, ROLLBACK, or CLOSE operation, call the associated stored procedure again, and reissue the ASSOCIATE LOCATORS and ALLOCATE CURSOR statements.
- For COMMIT, declare the associated cursor in the stored procedure WITH HOLD so the COMMIT operation will not deallocate the cursor.

For an allocated cursor, if the associated stored procedure was called again and new result sets were returned since the cursor was allocated, reissue the ASSOCIATE LOCATORS and ALLOCATE CURSOR statements.

Destination: 34000

-507 THE CURSOR IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT OPEN

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement at a time when the specified cursor was not open.

System Action: The statement cannot be executed. No update or delete was performed.

Programmer Response: Check for a previous SQL return code that might have closed the cursor. SQLCODES -404, -652, -679, -901, -904, -909, -910, -911, and -913 force the

cursor to close. After the cursor is closed, any fetches or close cursor statements receive SQLCODE -501. Any updates or deletes receive this SQLCODE -507. Correct the logic of the application program to ensure that the specified cursor is open at the time the UPDATE or DELETE statement is executed.

Destination: 24501

-508 THE CURSOR IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT POSITIONED ON A ROW

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement at a time when the specified cursor was not positioned on a row of the object table. The cursor must be positioned on the row that is to be updated or deleted.

Note that the cursor is no longer positioned on a row if the row is deleted or an index column of the row is updated by another cursor in the same application program.

System Action: The statement cannot be executed. No data was updated or deleted.

Programmer Response: Correct the logic of the application program to ensure that the cursor is correctly positioned on the intended row of the object table before the UPDATE or DELETE statement is executed. Note that the cursor is not positioned on a row if FETCH returned an SQLCODE = 100.

Destination: 24504

-509 THE TABLE IDENTIFIED IN THE UPDATE OR DELETE STATEMENT IS NOT THE SAME TABLE DESIGNATED BY THE CURSOR

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement where the table named in that statement did not match the name of the table specified in the declaration for that cursor.

System Action: The statement cannot be executed. The update or delete was not performed.

Programmer Response: Correct the application program to ensure that the table identified in the UPDATE or DELETE statement is the same table identified in the declaration for the cursor.

Destination: 42827

-510 THE TABLE DESIGNATED BY THE CURSOR OF THE UPDATE OR DELETE STATEMENT CANNOT BE MODIFIED

Explanation: The application program attempted to execute an UPDATE or DELETE WHERE CURRENT OF cursor statement against a table or view that cannot be updated or deleted. This can occur for a delete from a read-only view or for an update in which the cursor was not defined with the FOR UPDATE clause.

This error code is also returned when the table exists at a remote location and DB2 has employed block fetching because you explicitly declared the cursor FOR FETCH ONLY, or because the application is bound CURRENTDATA(NO) and the cursor is ambiguous.

This error code is also returned if DB2 has employed
parallelism to execute the SELECT statement associated with
the cursor named in a DELETE WHERE CURRENT OF cursor

statement, or if a DELETE WHERE CURRENT OF is issued
against a row which DB2 cannot guarantee to have not been
modified by another application since the time the cursor was
positioned upon it (in accordance with ISO(CS)) semantics for
an ambiguous cursor in an application bound
CURRENTDATA(NO)).

System Action: The statement cannot be executed. No data was updated or deleted in the object table.

Programmer Response: The requested UPDATE or DELETE cannot be performed. Refer to Chapter 6 of *SQL Reference* for information about restrictions on using UPDATE and DELETE operations against views.

For a remote table, modify the DECLARE CURSOR and then rebind the PLAN.

For a cursor that uses parallelism, disable parallelism for the
query by using the DEGREE(1) BIND option for static SQL or
by setting the CURRENT DEGREE special register to '1' for
dynamic SQL.

For an ambiguous cursor in an application bound CURRENTDATA(NO), either make the cursor unambiguous (declare it FOR UPDATE OF), or rebind the application CURRENTDATA(YES).

Destination: 42828

-511 THE FOR UPDATE CLAUSE CANNOT BE SPECIFIED BECAUSE THE TABLE DESIGNATED BY THE CURSOR CANNOT BE MODIFIED

Explanation: The result table of the SELECT statement cannot be updated. This can occur if the SELECT specifies more than one table or view in the FROM clause, if the SELECT list contains a built-in function or DISTINCT, or if the statement contains an ORDER BY or GROUP BY or HAVING clause. This can also occur if a view is specified in the FROM clause and the view cannot be updated.

System Action: The statement cannot be executed. The specified cursor remains undefined in the application program.

Programmer Response: Updates cannot be performed on the result table as it is specified. Refer to Chapter 6 of *SQL Reference* for information about restrictions on the updating of views.

Destination: 42829

-512 STATEMENT REFERENCE TO REMOTE OBJECT IS INVALID

Explanation: One of the following conditions exists:

- The statement refers to multiple locations.
- A statement with a remote reference is being EXPLAINED either by a dynamic EXPLAIN statement or the EXPLAIN(YES) option.
- An alias is used incorrectly.
- A three-part name is implicitly or explicitly used in a statement that is not supported by the DB2 private protocols.

System Action: The statement cannot be executed.

Programmer Response: If the object cannot be meaningfully eliminated from the statement, see your Database Administrator for other ways to obtain the data required. Refer to Chapter 4 of *SQL Reference* for more information about using remote objects.

Destination: 56023

-513 THE ALIAS *alias-name* MUST NOT BE DEFINED ON ANOTHER LOCAL OR REMOTE ALIAS

Explanation: The object indicated by 'alias-name' is a local or remote alias. An alias is not allowed to be defined on a local alias, and it should not be defined on a remote alias.

System Action: The statement cannot be executed.

Programmer Response: Modify the SQL statement to ensure that all object references are to base tables or views.

Destination: 42924

-514 THE CURSOR *cursor-name* IS NOT IN A PREPARED STATE

Explanation: The application program has tried to use a cursor, 'cursor-name,' that is not in a prepared state. The cursor is associated with a statement that either (1) has never been prepared, or (2) has been invalidated by a commit or rollback operation.

System Action: The statement cannot be executed.

Programmer Response: For case (1), ensure that you prepare the statement that is named in the DECLARE CURSOR statement for 'cursor-name' before you try to open the cursor. For case (2), do one of the following:

- Use the WITH HOLD option of DECLARE CURSOR.
- Do not execute a commit or rollback operation until you are finished using the cursor.
- Prepare the statement again after the commit or rollback.

Destination: 26501

-516 THE DESCRIBE STATEMENT DOES NOT IDENTIFY A PREPARED STATEMENT

Explanation: An attempt was made to execute a DESCRIBE for a statement that had not been successfully prepared beforehand. This error can occur when the DESCRIBE originates on an application requester that supports extended dynamic SQL. Because the target statement is static on the DB2 for MVS/ESA subsystem, the DESCRIBE statement fails.

System Action: The statement cannot be executed.

Programmer Response: Correct the logic of the application program to ensure that a statement is properly prepared before a DESCRIBE of the statement is attempted. If the DESCRIBE is a distributed request that originated on a system that supports extended dynamic SQL, contact your system administrator about changing the DB2 subsystem parameter DESCSTAT to YES to tolerate these DESCRIBE requests against static SQL.

Destination: 26501

-517 CURSOR *cursor-name* CANNOT BE USED BECAUSE ITS STATEMENT NAME DOES NOT IDENTIFY A PREPARED SELECT STATEMENT

Explanation: The cursor 'cursor-name' could not be used as specified because the prepared statement named in the declaration for the cursor was not a SELECT statement.

System Action: The statement cannot be executed.

Programmer Response: Verify that the statement-name is

specified correctly in the PREPARE statement and the DECLARE CURSOR statement for cursor 'cursor-name'. Alternatively, correct the application program logic to ensure that only prepared SELECT statements are used in association with cursor declarations.

Destination: 07005

-518 THE EXECUTE STATEMENT DOES NOT IDENTIFY A VALID PREPARED STATEMENT

Explanation: One of the following conditions exists:

- The statement named in the EXECUTE statement has not been prepared.
- The statement named in the EXECUTE statement identifies a SELECT statement.
- The statement named in the EXECUTE IMMEDIATE statement identifies a SELECT statement.

System Action: The statement cannot be executed.

Programmer Response: Ensure that you prepare the statement prior to EXECUTE. Also, ensure that the statement you prepare is not a SELECT statement.

Destination: 07003

-519 THE PREPARE STATEMENT IDENTIFIES THE SELECT STATEMENT OF THE OPENED CURSOR *cursor-name*

Explanation: The application program has attempted to PREPARE (actually, re-PREPARE) the SELECT statement for the specified cursor at a time when that cursor was already open.

System Action: The statement cannot be executed. The cursor was not affected.

Programmer Response: Correct the logic of the application program so that it does not attempt to re-PREPARE the SELECT statement for a cursor when that cursor is open.

Destination: 24506

-525 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE IT WAS IN ERROR AT BIND TIME FOR SECTION = *sectno* PACKAGE = *pkgname* CONSISTENCY TOKEN = X'*contoken*'

Explanation: One of the following:

- The statement was in error when the package was bound, but the error was ignored then because the option SQLERROR (CONTINUE) was used. Since the statement contains an error, it cannot be executed.
- The statement might not be an executable statement at this location, or might only be executable by a DB2 application requester (for example, DECLARE TABLE in an application running on OS/2 causes this message).

The variables are:

sectno	Section number
pkgname	locid.collid.pkgid
contoken	Consistency token in hexadecimal

System Action: The statement cannot be executed.

Programmer Response: If the SQL statement is not supposed to execute at the indicated location, then correct the program so that the statement in error does not execute at that location. Precompile, compile, and bind replace the package. If the SQL statement is supposed to execute at the indicated location, correct the problem found when it was bound and bind the package over using BIND with ACTION(REPLACE). If multiple versions of the package have been bound, issue the following SELECT statement to determine which version has the error: SELECT VERSION FROM locid.SYSIBM.SYSPACKAGE WHERE LOCATION = ' ' AND COLLID = 'collid' AND NAME = 'pkgid' AND HEX(CONTOKEN) = 'contoken'

Where:

locid Location name
collid Collection id
pkgid Program name

Destination: 51015

-526 THE REQUESTED FUNCTION DOES NOT APPLY TO GLOBAL TEMPORARY TABLES

Explanation: The SQL statement being executed refers to a temporary table. A temporary table cannot be used in the given context.

System Action: The statement cannot be processed.

Programmer Response: Modify the SQL statement to ensure that the object references are not to temporary tables.

Destination: 42995

-530 THE INSERT OR UPDATE VALUE OF FOREIGN KEY *constraint-name* IS INVALID

Explanation: An UPDATE or INSERT operation attempted to place a value in a foreign key of the object table; however, this value was not equal to some value of the parent key of the parent table.

When a row is inserted into a dependent table, the insert value of a foreign key must be equal to the value of the parent key of some row of the parent table in the associated relationship.

When the value of the foreign key is updated, the update value of a foreign key must be equal to the value of the parent key of some row of the parent table of the associated relationship.

System Action: The UPDATE or INSERT statement cannot be executed. The object table is unchanged.

Programmer Response: Examine the insert or update value of the foreign key first, and then compare it with each of the parent key values of the parent table to determine the cause of the problem.

Destination: 23503

-531 PARENT KEY IN A PARENT ROW CANNOT BE UPDATED BECAUSE IT HAS ONE OR MORE DEPENDENT ROWS IN RELATIONSHIP *constraint-name*

Explanation: For plans and packages bound beginning with Version 5 or dynamic SQL, a multi-row update of a parent key attempted to remove a parent key value on which a foreign key was dependent.

For plans and packages bound prior to Version 5 an UPDATE operation attempted to update a primary key in the specified row of the object table; however, the primary key in the specified row had dependent rows associated with it. The value of a primary key in a parent row cannot be updated if the parent row has any dependent rows.

System Action: The UPDATE statement cannot be executed. The object table is unchanged.

Programmer Response: Examine the parent key of the object table and the foreign key of the dependent table to determine if the value of the specified row of the parent key should be changed. If this does not expose the problem, examine the contents of the object table and the dependent table to determine the cause of the problem.

Destination: 23504

-532 THE RELATIONSHIP *constraint-name* RESTRICTS THE DELETION OF ROW WITH RID X'rid-number'

Explanation: A DELETE operation attempted to delete a specified parent row in the object table and all related descendent rows in the descendent tables. However, a delete rule of RESTRICT or NO ACTION was specified for one or more descendent tables.

A row of the table cannot be deleted because it has a dependent in a relationship with a delete rule of RESTRICT or NO ACTION or the deletion cascades to a row which is a dependent in a relationship with a delete rule of RESTRICT or NO ACTION.

System Action: The DELETE statement cannot be executed. The contents of the object table are unchanged.

Programmer Response: Examine the delete rule for all descendent tables to determine the cause of the problem. The specific tables involved can be determined from the relationship '*constraint-name*'. The specific descendent row is known by RID X'rid-number'.

Destination: 23504

-533 INVALID MULTIPLE-ROW INSERT

Explanation: An INSERT operation with a subselect attempted to insert multiple rows into a self-referencing table.

The subselect of the INSERT operation should return no more than one row of data.

System Action: The INSERT statement cannot be executed. The contents of the object table are unchanged.

Programmer Response: Examine the search condition of the subselect to make sure that no more than one row of data is selected.

Destination: 21501

-534 THE PRIMARY KEY CANNOT BE UPDATED BECAUSE OF MULTIPLE-ROW UPDATE

Explanation: An UPDATE operation attempted to update a primary key on multiple rows of the object table.

An UPDATE statement updating the primary key cannot be used to update more than one row of the object table.

Note: This SQLCODE will only be issued for plans and packages bound prior to Version 5. SQLCODE -534 will not

be issued for dynamic SQL or plans and packages bound with Version 5 or later releases.

System Action: The UPDATE statement cannot be executed. The contents of the object table are unchanged.

Programmer Response: Examine the search condition of the UPDATE statement to make sure that no more than one row of the object table is selected to be updated.

Destination: 21502

-536 THE DELETE STATEMENT IS INVALID BECAUSE TABLE *table-name* CAN BE AFFECTED BY THE OPERATION

Explanation: A DELETE operation with the indicated table referenced in a subquery was attempted.

If 'T' is the object table of the DELETE, the indicated table is one of the following:

- A dependent of 'T' in a relationship with a delete rule of CASCADE or SET NULL
- A dependent of another table in a relationship with a delete rule of CASCADE or SET NULL in which deletions from 'T' can cascade to that table.

System Action: The DELETE statement cannot be executed. The contents of the object table are unchanged.

Programmer Response: Do not attempt to reference a table in a subquery of a DELETE statement when the table can be affected by the DELETE statement.

Destination: 42914

-537 THE PRIMARY KEY CLAUSE, A FOREIGN KEY CLAUSE, OR A UNIQUE CLAUSE IDENTIFIES COLUMN *column-name* MORE THAN ONCE

Explanation: PRIMARY KEY, FOREIGN KEY, or UNIQUE can each be followed by a list of column names. The statement violates the rule that no column name can appear more than once in any such list.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to specify unique names for each column.

Destination: 42709

-538 FOREIGN KEY *name* DOES NOT CONFORM TO THE DESCRIPTION OF A PARENT KEY OF TABLE *table-name*

Explanation: The code is used to report that the definition of the indicated foreign key does not conform to the description of a parent key of the indicated table. Either the keys do not have the same number of columns or their descriptions are not identical. The requirement for identical descriptions includes data type, length attribute, and field procedure. The 'name' is the constraint-name specified in the foreign key clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement so that the description of the foreign key conforms to that of a parent key of the indicated table.

Destination: 42830

-539 TABLE *table-name* DOES NOT HAVE A PRIMARY KEY

Explanation: The CREATE or ALTER TABLE statement cannot be executed because the indicated table does not have a primary key. Thus, the primary key cannot be dropped, or the table cannot be defined as a parent in a referential constraint.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to reference a table with a primary key or define a primary key before referencing the table in a FOREIGN KEY clause.

Destination: 42888

-540 THE DEFINITION OF TABLE *table-name* IS INCOMPLETE BECAUSE IT LACKS A PRIMARY INDEX OR A REQUIRED UNIQUE INDEX

Explanation: The table named was defined with a PRIMARY KEY clause or a UNIQUE clause. Its definition is incomplete, and it cannot be used until a unique index is defined for the primary key (the primary index) and for each set of columns in any UNIQUE clause (the required unique indexes). An attempt was made to use the table in a FOREIGN KEY clause or in an SQL manipulative statement.

System Action: The statement cannot be executed.

Programmer Response: Define a primary index or a required unique index on the table before referencing it.

Destination: 57001

-542 *column-name* CANNOT BE A COLUMN OF A PRIMARY KEY, A UNIQUE CONSTRAINT, OR A PARENT KEY BECAUSE IT CAN CONTAIN NULL VALUES

Explanation: The code is used to report that a column identified in a PRIMARY KEY, a UNIQUE constraint clause, or a parent key (via a REFERENCES clause) is defined to allow null values.

System Action: The statement cannot be executed.

Programmer Response: In the case of a column identified in a PRIMARY KEY or a UNIQUE constraint clause, correct the statement and rerun it.

In the case of a column identified in a REFERENCES clause, **#** drop the parent table and recreate it with referenced columns **#** defined as NOT NULL, then rerun the statement.

Destination: 42831

-543 A ROW IN A PARENT TABLE CANNOT BE DELETED BECAUSE THE CHECK CONSTRAINT *check-constraint* RESTRICTS THE DELETION

Explanation: The delete operation cannot be executed because the target table is a parent table and is connected with a referential constraint to a dependent table with a delete rule of SET NULL. However, a check constraint defined on the dependent table restricts the column from containing a null value.

System Action: The DELETE statement was not executed. The contents of the tables are unchanged.

Programmer Response: Examine the foreign key and its delete rule in the dependent table and the conflicting check constraint. Change either the delete rule or the check constraint so that they do not conflict.

Destination: 23511

-544 THE CHECK CONSTRAINT SPECIFIED IN THE ALTER TABLE STATEMENT CANNOT BE ADDED BECAUSE AN EXISTING ROW VIOLATES THE CHECK CONSTRAINT

Explanation: An existing row violates the check constraint specified in the ALTER TABLE statement.

System Action: The statement cannot be executed. The check constraint definition is not added to the table. The table definition is unchanged.

Programmer Response: Examine the check constraint definition that was specified in the ALTER TABLE statement and the data in the table to determine why the ALTER TABLE statement was rejected.

You can determine which rows violated the check constraint by using the SELECT statement, negating the check constraint in the WHERE clause. For example:

```
SELECT * FROM table WHERE (NOT (check-condition));
```

Destination: 23512

-545 THE REQUESTED OPERATION IS NOT ALLOWED BECAUSE A ROW DOES NOT SATISFY THE CHECK CONSTRAINT *check-constraint*

Explanation: Table check constraint violations occurred on an INSERT or UPDATE statement. The resulting row violated the check constraint definition on the table.

System Action: The INSERT or UPDATE statement cannot be executed. The contents of the table are unchanged.

Programmer Response: Examine the data and the check constraint definition in the SYSIBM.SYSCHECKS catalog table to determine why the INSERT or UPDATE statement was rejected. The data must be changed to satisfy the check constraint.

Destination: 23513

-546 THE CHECK CONSTRAINT *constraint-name* IS INVALID

Explanation: A check constraint in the CREATE TABLE or ALTER TABLE statement is invalid for one or more of the following reasons:

- The constraint definition refers to a column that has a field procedure.
- The constraint definition refers to a column with a data type that is lower in the hierarchy of numeric data types than the data type of any other operand. The hierarchy is as follows:
small integer < large integer < decimal < single precision float < double precision float
- The constraint definition refers to a column with a numeric data type that is not the same numeric data type as that of the other column operands.

- The constraint definition refers to a column with a length that is shorter than the other operands when the column and other operands are not character string data types.

System Action: The statement is not executed.

For ALTER TABLE, the check constraint is not added to the object table. The definition of the table is unchanged.

For CREATE TABLE, the table is not created.

Programmer Response: Correct the check constraint definition and execute the statement again.

Destination: 42621

-548 A CHECK CONSTRAINT THAT IS DEFINED WITH *column-name* IS INVALID

Explanation: A check constraint in the CREATE TABLE or ALTER TABLE statement is invalid for one or more of the following reasons:

- The constraint definition refers to a column that has a field procedure.
- The constraint definition refers to a column with a data type that is lower in the hierarchy of numeric data types than the data type of any other operand. The hierarchy is as follows:
small integer < large integer < decimal < single precision float < double precision float
- The constraint definition refers to a column with a numeric data type that is not the same numeric data type as that of the other column operands.
- The constraint definition refers to a column with a length that is shorter than the other operands when the column and other operands are not character string data types.

System Action: The statement is not executed.

For ALTER TABLE, the check constraint is not added to the object table. The definition of the table is unchanged.

For CREATE TABLE, the table is not created.

Programmer Response: Correct the check constraint definition and execute the statement again.

Destination: 42621

-549 THE *statement* STATEMENT IS NOT ALLOWED FOR *object_type1 object_name* BECAUSE THE BIND OPTION DYNAMICRULES(BIND) IN THE *object_type2* IS IN EFFECT.

Explanation: A program attempted to issue the indicated SQL statement that is one of several SQL statements that cannot be issued from a plan or package for which the option DYNAMICRULES(BIND) is in effect. Those SQL statements are:

- Dynamic GRANT statement
- Dynamic REVOKE statement
- Dynamic ALTER statement
- Dynamic CREATE statement
- Dynamic DROP statement
- Static or dynamic SET CURRENT SQLID statement

The indicated SQL statement is bound to one of the following:

- The named plan or package that was bound with the option DYNAMICRULES(BIND)
- The named package that was not bound with the DYNAMICRULES option, but is appended to a plan that was bound with DYNAMICRULES(BIND)

statement The SQL statement in error

object_type1 PACKAGE or DBRM

object_name If *object_type1* is PACKAGE, *object_name* is the name of the package in the format 'location-id.collection-id.package-id'.
If *object_type1* is DBRM, *object_name* is the name of the DBRM in the format 'plan-name DBRM-name'.

object_type2 PLAN or PACKAGE
If *object_type1* is PACKAGE, *object_type2* can be either PACKAGE or PLAN (whichever is bound with DYNAMICRULES(BIND)).
If *object_type1* is DBRM, *object_type2* is PLAN.

System Action: The SQL statement cannot be executed.

Programmer Response: Do one of the following to correct the error:

- If the SQL statement is embedded, remove it, precompile and compile the application program again, and reissue the BIND command with the DYNAMICRULES(BIND) option.
- If appropriate, use the SQL statement with a package or plan that is bound with DYNAMICRULES(RUN).
- Issue the REBIND command with the DYNAMICRULES(RUN) option for the plan or package to which the SQL statement is bound

Refer to the BIND PACKAGE(DSN), BIND PLAN(DSN), REBIND PACKAGE(DSN), or REBIND PLAN(DSN) statement in *Command Reference* for the description of the DYNAMICRULES option and the expected results. Determine if either the SQL statement should be removed from the program or the plan or package should be rebound with the DYNAMICRULES(RUN) option.

Destination: 42509

-551 *auth-id* **DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION** *operation* **ON OBJECT** *object-name*

Explanation: Authorization ID 'auth-id' attempted to perform 'operation' on object 'object-name' without having been granted the proper authority to do so. This error might also occur if the object is a read-only view (for INSERT, DELETE, or UPDATE), or if 'authorization ID' is trying to create a table or view with an authorization ID other than its own. You can create a table from an 'authorization ID' other than your own only if your authorization ID is SYSADM, DBADM, or DBCTRL. You can create a view from an 'authorization ID' other than your own only if your authorization ID is SYSADM.

When 'operation' is 'GRANT ***', the keyword ALL was used in the GRANT statement, but the grantor 'auth-id' did not possess any privilege to grant.

If this error occurs while DB2 is creating or altering a table involving referential constraints, this code reports that the user

does not have the necessary ALTER privilege to perform a FOREIGN KEY, DROP FOREIGN KEY, or DROP PRIMARY KEY operation. The 'object-name' identifies the object table of the CREATE or ALTER TABLE statement, not the table for which the user lacks the ALTER privilege.

If this error occurs for a distributed SQL request, then:

1. If authorization ID translation is in effect for either the requesting DB2 site or the serving (responding) DB2 site, then 'auth-id' is the translated authorization ID. Refer to Section 3 (Volume 1) of *Administration Guide* for information on authorization ID translation.
2. If an alias name was used in the SQL statement, then 'object-name' is the resolved remote table or view name.

If the operation is a DROP PACKAGE, the object name consists of the collection ID, the package name and the consistency token. The consistency token uniquely identifies which version of the package the user does not have authorization to drop.

Note: Beginning with Version 5, SQLCODE -551 will be returned instead of SQLCODE -204 for the runtime error where an object does not exist and the CURRENT RULES special register is set to 'STD'.

System Action: The statement cannot be executed.

Installation Action: Check for an attempted authorization violation.

Programmer Response: Ensure that 'authorization ID' was granted the authority to perform the desired operation, the 'object-name' exists, and 'authorization ID' is not trying to create a table with a different authorization ID.

Destination: 42501

-552 *auth-id* **DOES NOT HAVE THE PRIVILEGE TO PERFORM OPERATION** *operation*

Explanation: Authorization ID 'auth-id' has attempted to perform the specified 'operation' without having been granted the authority to do so.

System Action: The statement cannot be executed.

Installation Action: Check for an attempted authorization violation.

Programmer Response: Ensure that the authorization ID has been granted the authority necessary to perform the desired operation.

Destination: 42502

-553 *auth-id* **SPECIFIED IS NOT ONE OF THE VALID AUTHORIZATION IDS**

Explanation: The authorization ID specified as the value of the 'authorization-id' or host variable in the SQL SET CURRENT SQLID statement is neither the user's primary authorization ID nor one of the associated secondary authorization IDs.

System Action: The SET CURRENT SQLID statement cannot be executed. The current SQL ID is not changed.

Programmer Response: Correct the error in the statement or contact the security administrator to have the authorization ID defined for your use.

Destination: 42503

-554 AN AUTHORIZATION ID CANNOT GRANT A PRIVILEGE TO ITSELF

Explanation: An authorization ID attempted to execute a GRANT statement in which that ID itself appears as one of the entries in the list of 'grantee' authorization IDs.

An authorization ID cannot GRANT a privilege to itself. However, if SQLRULES(STD) is in effect or CURRENT RULES contains STD, GRANT to self is allowed.

System Action: The statement cannot be executed. No privileges were granted.

Programmer Response: Refer to Chapter 5 of *SQL Reference* for information about restrictions on the use of the GRANT statement.

Destination: 42502

-555 AN AUTHORIZATION ID CANNOT REVOKE A PRIVILEGE FROM ITSELF

Explanation: An authorization ID attempted to execute a REVOKE statement in which that ID itself appears as one of the entries in the list of authorization IDs to be revoked.

An authorization ID cannot REVOKE its own privilege. However, if SQLRULES(STD) is in effect or CURRENT RULES contains STD, REVOKE to self is allowed.

System Action: The statement cannot be executed. No privileges were revoked.

Programmer Response: Refer to Chapter 6 of *SQL Reference* for information about restrictions on the use of the REVOKE statement.

Destination: 42502

-556 *authid2* CANNOT HAVE THE *privilege* PRIVILEGE *on_object* REVOKED BY *authid1* BECAUSE THE REVOKEE DOES NOT POSSESS THE PRIVILEGE OR THE REVOKER DID NOT MAKE THE GRANT

Explanation: The REVOKE statement was not successful for one of the following reasons:

- *Authid2* does not possess the *privilege*.
- The revoker, *authid1*, did not explicitly grant the privilege to *authid2*.
- *Authid2* is the owner of the specified object.
- When *privilege* is '****' the keyword ALL was used in the REVOKE statement, but *authid2* did not possess any privilege to revoke.
- When *authid1* is ALL, the BY ALL clause was used in the REVOKE statement, but *authid2* did not possess any privilege to revoke.

An authorization ID can revoke only the privileges that it has explicitly granted to other authorization IDs, unless the authorization ID has SYSADM or SYSCTRL authority and specifies the BY clause. No authorization ID, not even SYSADM, can revoke 'privileges' on an object from the object owner.

System Action: The statement cannot be executed. No privileges were revoked from any authorization ID.

Programmer Response: Check the appropriate authorization catalog tables to verify that *authid2* possesses the privilege to be revoked. Queries can be made with GRANTEE = *authid2*

and the privilege column not = blanks. Correct and reissue the REVOKE statement.

If a user holding SYSADM or SYSCTRL authority receives this SQLCODE, the BY clause might have been omitted from the REVOKE statement.

Destination: 42504

-557 INCONSISTENT GRANT/REVOKE KEYWORD *keyword*. PERMITTED KEYWORDS ARE *keyword-list*

Explanation: The GRANT or REVOKE statement contains a syntax or spelling error at or before the specified 'keyword'. As an aid to the programmer, 'keyword-list' provides a list of the keywords that would be permitted in this context.

Alternatively:

- The mixture of privileges specified on the GRANT or REVOKE statement is not permitted. The privileges must all be of one type, and consistent with the form of the GRANT or REVOKE statement.
- REVOKE UPDATE (column-list) is not permitted; only REVOKE UPDATE is valid.

System Action: The statement cannot be executed.

Programmer Response: Correct the syntax of the GRANT or REVOKE statement.

Destination: 42852

-558 INVALID CLAUSE OR COMBINATION OF CLAUSES ON A GRANT OR REVOKE

Explanation: The location qualifier specified for a GRANT or REVOKE statement is invalid.

System Action: The statement cannot be executed.

Programmer Response: Refer to Chapter 6 of *SQL Reference* for valid keywords for the GRANT statement.

Destination: 56025

-559 ALL AUTHORIZATION FUNCTIONS HAVE BEEN DISABLED

Explanation: The authorization mechanism has been disabled in the DB2 subsystem. Consequently, GRANT and REVOKE statements are ignored.

System Action: The statement cannot be executed. No privileges were granted or revoked.

Programmer Response: Do not attempt to execute GRANT or REVOKE statements unless and until the authorization mechanism is enabled in the DB2 subsystem.

Destination: 57002

-567 *bind-type* AUTHORIZATION ERROR USING *auth-id* AUTHORITY PACKAGE = *package-name* PRIVILEGE = *privilege*

Explanation: The authorization ID given does not have the privilege indicated, and cannot invoke the indicated subcommand against the indicated package.

bind-type	Type of bind subcommand (BIND REBIND FREE).
auth-id	Authorization ID of the package owner.

- package-name Name of the package
(location.collection.package.version)
- privilege Name of the privilege not held:
- BINDADD—The authority to create a new package using BIND with the ADD option.
 - BIND—The authority to BIND (REPLACE) or REBIND a package.
 - COPY—The authority to COPY from the indicated package
 - CREATE IN—The authority to create a package in the indicated collection.

System Action: The indicated package is not bound, rebound, or freed.

System Programmer Response: The indicated privilege must be granted to the authorization ID that will become the package owner.

Destination: 42501

-571 THE STATEMENT WOULD RESULT IN A MULTIPLE SITE UPDATE

Explanation:

This SQLCODE is issued in the following situations:

- When an application program operating in an IMS or CICS environment attempts to modify data at a remote location where multi-site update capabilities are not supported.
- When an application program has explicit SQL statements within a commit scope that would result in updates at multiple sites where one of the sites at which data is being updated does not support multi-site update.

This SQLCODE can be issued when an application program explicitly modifies data at a single location within a commit scope. This can occur in the following situations:

- A package or plan associated with the application program was invalidated.
- A package or plan was bound at one release of DB2 and fallback occurs to a prior release.

In the situations described above, an implicit autobind is done on behalf of the user. An autobind results in the DB2 catalog being updated. The conditions that must exist for this SQLCODE to be issued when an autobind occurs are:

- One site where data has been modified does not support multi-site update.
- The autobind occurs at a separate and distinct site from where an application program explicitly modifies data.
- At the time of the autobind, locks are being held to process an SQL statement within the application program.

System Action: The statement cannot be executed.

Programmer Response:

- Ensure that all requests for modifications to the data are confined to a single location within any given commit scope for any application that references a location that does not support multi-site update.
- For programs operating in an IMS or CICS environment where the remote database systems do not support multi-site update, all SQL statements must be read-only access.

- If an autobind is causing this SQLCODE to be issued, REBIND the plan or package.

Destination: 25000

-573 TABLE *table-name* DOES NOT HAVE A UNIQUE KEY WITH THE SPECIFIED COLUMN NAMES

Explanation: A referential constraint cannot be defined with the specified table as the parent because a unique index with the specified column names does not exist for the identified parent table.

System Action: The statement cannot be executed.

Programmer Response: Create a unique index with the specified columns for the parent table.

Destination: 42890

-574 THE SPECIFIED DEFAULT VALUE CONFLICTS WITH THE COLUMN DEFINITION

Explanation: USER, CURRENT SQLID, or a constant value was specified as a default for a column, but either the target column length is too short or its data type is incompatible. This error can occur if the value is more than 255 bytes, including quotes for strings, and introduces characters such as the X for a hex constant.

Programmer Response: Define a column whose length and data type is consistent with the intended default value.

Destination: 42894

-580 THE RESULT-EXPRESSIONS OF A CASE EXPRESSION CANNOT ALL BE NULL

Explanation: There is a CASE expression in the statement that has all the *result-expressions* (expressions following the THEN and ELSE keywords) coded with the keyword NULL.

System Action: The statement cannot be processed.

Programmer Response: Change the CASE expression to include at least one *result-expression* with a keyword other than NULL.

Destination: 42625

-581 THE DATA TYPES OF THE RESULT-EXPRESSIONS OF A CASE EXPRESSION ARE NOT COMPATIBLE

Explanation: There is a CASE expression in the statement that has *result-expressions* (expressions following THEN and ELSE keywords) that are not compatible. The data type of the *result-expressions* might be incompatible because the CASE condition result data types are not all:

- character
- graphic
- numeric
- date
- time
- timestamp

System Action: The statement cannot be processed.

Programmer Response: Correct the *result-expressions* so that they are compatible.

Destination: 42804

-582 THE SEARCH-CONDITION IN A SEARCHED-WHEN-CLAUSE CANNOT BE A QUANTIFIED PREDICATE, IN PREDICATE, OR AN EXISTS PREDICATE.

Explanation: The *search-condition* in a *searched-when-clause* specifies a quantified predicate, an IN predicate, or an EXISTS predicate, but is not allowed.

System Action: The statement cannot be processed.

Programmer Response: Correct the *search-condition*.

Destination: 42625

-601 THE NAME OF THE OBJECT TO BE CREATED IS IDENTICAL TO THE EXISTING NAME *name* OF THE OBJECT TYPE *obj-type*

Explanation: The CREATE statement tried to create an object *name* of type *obj-type*, but an object of that type with the same name is already defined in the DB2 subsystem.

- If *obj-type* is CONSTRAINT, the *name* was specified in the FOREIGN KEY clause or the CHECK clause of either a CREATE or ALTER TABLE statement. All referential integrity and check constraint names defined on a table must be unique.
- If *obj-type* is TABLE/VIEW, the alias-name specified in the CREATE ALIAS statement is identical to the table-name/view-name specified. The TABLE/VIEW might not exist in the DB2 subsystem.

System Action: The CREATE or ALTER statement cannot be executed. No new object was created, and the existing object was not altered.

Programmer Response: Either drop the existing object or choose another name for the new object. If *obj-type* is data set, do an IDCAMS DELETE of the data set before retrying the CREATE. Refer to Chapter 3 of *SQL Reference* for information about the scope of object names in DB2.

Destination: 42710

-602 TOO MANY COLUMNS SPECIFIED IN A CREATE INDEX

Explanation: The number of columns specified in the CREATE INDEX statement exceeds 64, the maximum permitted by DB2.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: The index definition must be modified to conform to the system-imposed column limit of 64.

Destination: 54008

-603 A UNIQUE INDEX CANNOT BE CREATED BECAUSE THE TABLE CONTAINS ROWS WHICH ARE DUPLICATES WITH RESPECT TO THE VALUES OF THE IDENTIFIED COLUMNS

Explanation: The index defined in the CREATE INDEX statement could not be created as unique because the specified table already contains rows that are duplicates with respect to the values of the identified columns.

System Action: The statement cannot be executed.

Programmer Response: Examine the data to ascertain whether or not the duplicate data is valid. Alternatively, consider creating a nonunique index.

Destination: 23515

-604 A COLUMN DEFINITION SPECIFIES AN INVALID LENGTH, PRECISION, OR SCALE ATTRIBUTE

Explanation: A column definition in the CREATE or ALTER TABLE statement contains an invalid length, precision, or scale attribute specification. In addition, the specification of data type might be incorrect or invalid. Or, the column definition in a view referenced within a CREATE TABLE LIKE *view* has an invalid length.

System Action: The statement cannot be executed. The specified table was not created or altered.

Programmer Response: Correct the syntax, and resubmit the statement. Refer to Chapter 3 of *SQL Reference* for information about valid length, precision, and scale attributes for the columns in a DB2 table.

Destination: 42611

-607 OPERATION OR OPTION *operation* IS NOT DEFINED FOR THIS OBJECT

Explanation: The operation or option cannot be performed on the object specified in the SQL statement.

If the operation is RENAME then one possible reason is that the name of a catalog table was specified as the source name, but catalog tables cannot be renamed.

System Action: The statement cannot be executed.

Programmer Response: If an option of the SQL statement is not allowed for this object, modify the SQL statement and resubmit the statement. If an operation is not defined for the object, the statement cannot be executed.

Destination: 42832

-611 ONLY LOCKMAX 0 CAN BE SPECIFIED WHEN THE LOCK SIZE OF THE TABLESPACE IS TABLESPACE OR TABLE.

Explanation: This message is issued when:

- The LOCKSIZE of the table space is TABLESPACE or TABLE, and LOCKMAX is being altered to or created as a nonzero value.
- The LOCKSIZE of the table space is being altered to TABLESPACE or TABLE, and LOCKMAX is being altered to or created as a nonzero value.

If LOCKSIZE is TABLESPACE or TABLE, LOCKMAX must be 0 because lock escalation is not supported from these levels.

System Action: The statement cannot be executed.

Programmer Response: Do one of the following:

- Reissue the statement with LOCKMAX 0.
- Alter the LOCKSIZE of the table space to a value other than TABLESPACE or TABLE.

Destination: 53088

-612 *column-name* IS A DUPLICATE COLUMN NAME

Explanation: The CREATE INDEX, CREATE TABLE,

CREATE VIEW , or ALTER TABLE statement specifies the same '*column-name*' for two (or more) columns of the index, table, or view. Column names must be unique within an index, a table, or a view. You cannot specify a column in more than one ALTER TABLE clause unless those clauses are ALTER COLUMN and ADD CHECK CONSTRAINT.

System Action: The statement cannot be executed. The specified index, table, or view was not created.

Programmer Response: Correct the CREATE statement to specify unique names for each of the columns of the index, table, or view. Correct the ALTER statement to specify unique names for each of the ALTER COLUMN clauses.

This error can also occur on CREATE TABLE when a column list of a PRIMARY KEY, FOREIGN KEY, or UNIQUE clause contains two or more occurrences of the same column name.

Destination: 42711

-613 THE PRIMARY KEY OR A UNIQUE CONSTRAINT IS TOO LONG OR HAS TOO MANY COLUMNS

Explanation: In a list of columns following either PRIMARY KEY or UNIQUE, the number of columns is greater than 64 or the sum of the column length attributes is greater than the number allowed for the type of index.

System Action: The CREATE or ALTER statement cannot be executed. The specified table cannot be created or altered.

Programmer Response: Change the table definition to keep within the prescribed limits.

Destination: 54008

-614 THE INDEX CANNOT BE CREATED OR THE LENGTH OF THE COLUMN CANNOT BE CHANGED BECAUSE THE SUM OF THE INTERNAL LENGTHS OF THE IDENTIFIED COLUMNS IS GREATER THAN THE ALLOWABLE MAXIMUM

Explanation: The index could not be created because the sum of the *internal* lengths of the key columns would exceed the allowable maximum. The maximum length permitted is a function of whether the index is partitioned or not, whether the index is unique or not, and the number of sub-pages of the index. For a non-partitioned index with less than 8 sub-pages (either unique or not), the maximum permitted key length is 255.

System Action: The statement cannot be executed. The specified index was not created or the length of the column was not changed.

Programmer Response: The definition for the index must be modified (possibly by eliminating one or more key columns) to reduce the length of the key to the permitted maximum. Refer to Chapter 6 of *SQL Reference* if you require a complete explanation of other possible maximum key lengths and how they are computed.

Destination: 54008

-615 *operation-type* IS NOT ALLOWED ON A PACKAGE IN USE

Explanation: The operation '*operation-type*' cannot be performed because the package is in use by the same application process.

operation-type Type of bind operation (BIND, REBIND or DROP).

System Action: The BIND, REBIND, or DROP operation on the package is not performed.

Programmer Response: Change the application to invoke the BIND, REBIND or DROP operation when the package is not use by the same application process.

Destination: 55006

-616 *obj-type1 obj-name1* CANNOT BE DROPPED BECAUSE IT IS REFERENCED BY *obj-type2 obj-name2*

Explanation: Some types of objects cannot be dropped if there are other objects which are dependent upon them. For example, a storage group cannot be dropped if there are one or more existing table spaces that use that storage group.

Execution of the specified DROP statement would drop object '*obj-name1*' of type '*obj-type1*' on which object '*obj-name2*' of type '*obj-type2*' is dependent.

System Action: The statement cannot be executed. The specified object was not dropped.

Programmer Response: Verify that the object specified in the DROP statement was indeed the object to be dropped. If so, all the existing objects that have a dependency on that object must be dropped first.

Destination: 42893

-617 A TYPE 1 INDEX CANNOT BE DEFINED ON A TABLE IN A LARGE TABLE SPACE OR IN A TABLE SPACE WITH LOCKSIZE ROW.

Explanation: All indexes defined on a table within a large table space or a table space with LOCKSIZE ROW must be defined as TYPE 2 indexes.

System Action: The statement cannot be executed.

Programmer Response: Either create the index as TYPE 2 or, if LOCKSIZE ROW was used, alter the LOCKSIZE of the table space containing the table to a value other than LOCKSIZE ROW.

Destination: 56089

-618 OPERATION *operation* IS NOT ALLOWED ON SYSTEM DATABASES

Explanation: System databases cannot be the object of certain types of operations. The attempted '*operation*' cannot be performed on system databases. One possible reason for this error is that CCSID ASCII was specified when a system database was being created.

System Action: The statement cannot be executed. No changes were made to the specified system database.

Programmer Response: Do not attempt to perform the requested operation on system databases.

Destination: 42832

-619 OPERATION DISALLOWED BECAUSE THE WORK FILE DATABASE IS NOT STOPPED

Explanation: The statements CREATE, ALTER or DROP for a table space in the work file database cannot be processed unless the work file database is stopped (using the STOP command).

System Action: The statement cannot be executed.

Programmer Response: Issue the -DISPLAY DATABASE command to verify that the work file database is stopped before resubmitting the statement.

Destination: 55011

-620 KEYWORD *keyword* IN *stmt type* STATEMENT IS NOT PERMITTED FOR A TABLE SPACE IN THE WORK FILE DATABASE

Explanation: The specified keyword in the SQL statement is not allowed for a table space in the work file database.

System Action: The statement cannot be executed.

Programmer Response: Correct and resubmit the statement.

Destination: 53001

-621 DUPLICATE DBID *dbid* WAS DETECTED AND PREVIOUSLY ASSIGNED TO *database-name*

Explanation: The current database being created was assigned a DBID of '*dbid*', which is identical to the DBID assigned to database '*database-name*'. An inconsistency exists between the DB2 catalog and directory.

System Action: The statement cannot be executed. No new object was created, and the existing object was not altered or modified.

Programmer Response: Notify the system programmer. The inconsistency must be corrected before CREATE DATABASE will be successful.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Destination: 58001

-622 FOR MIXED DATA IS INVALID BECAUSE THE MIXED DATA INSTALL OPTION IS NO

Explanation: FOR MIXED DATA is specified in a column description of a CREATE or ALTER TABLE statement, but the MIXED DATA install option is set to NO. FOR MIXED DATA is valid only when the MIXED DATA install option is set to YES.

System Action: The statement is not executed.

Programmer Response: Either change the install option or the FOR clause. If the install option is correctly set to NO, the allowable FOR clause options are BIT and SBCS.

Destination: 56031

-623 A CLUSTERING INDEX ALREADY EXISTS ON TABLE *table-name*

Explanation: The CREATE INDEX statement would create a second cluster index on the specified table. A given table can have only one cluster index.

System Action: The statement cannot be executed.

Programmer Response: Check to determine the identity and validity of the existing cluster index on the object table. Alternatively, consider creating the index without the CLUSTER attribute.

Destination: 55012

-624 TABLE *table-name* ALREADY HAS A PRIMARY KEY

Explanation: The code is used to report that a primary key cannot be defined in an ALTER TABLE statement because the indicated table already has a primary key.

System Action: The statement cannot be run.

Programmer Response: A table cannot have more than one primary key.

Destination: 42889

-625 TABLE *table-name* DOES NOT HAVE AN INDEX TO ENFORCE THE UNIQUENESS OF THE PARENT KEY

Explanation: The code is used to report that an ALTER TABLE statement is invalid because the table does not have a unique index with a key that is identical to the nominated PARENT KEY.

System Action: The statement cannot be executed.

Programmer Response: Make sure the key list specified on the ALTER TABLE statement identifies an existing unique index of the table.

Destination: 55014

-626 THE ALTER STATEMENT IS NOT EXECUTABLE BECAUSE THE PAGE SET IS NOT STOPPED

Explanation: An ALTER statement specifies a BUFFERPOOL, USING, PRIQTY, SECQTY, ERASE, or GBPCACHE clause, but the page set is not stopped.

System Action: The SQL statement cannot be executed.

Programmer Response: Stop the page set before resubmitting the statement.

Destination: 55015

-627 THE ALTER STATEMENT IS INVALID BECAUSE THE PAGESET HAS USER-MANAGED DATA SETS

Explanation: This code is used if a PRIQTY, SECQTY, or ERASE clause is specified, USING STOGROUP is not specified, and the page set has user-managed data sets.

System Action: The SQL statement cannot be executed.

Programmer Response: Verify that the correct table or partition is specified. The primary and secondary space allocation of a user-managed data set cannot be altered by means of an ALTER statement.

Destination: 55016

-628 THE CLAUSES ARE MUTUALLY EXCLUSIVE.

Explanation: Mutually exclusive clauses were specified in one or more of the following ways:

- A CREATE TABLESPACE statement contains both the SEGSIZE and NUMPARTS clauses.
- A CREATE TABLESPACE statement contains both the SEGSIZE and LARGE clauses.
- # • A CREATE TABLESPACE statement contains both the SEGSIZE and MEMBER CLUSTER clauses.
- # • A CREATE or ALTER TABLESPACE contains both the LOCKPART YES and LOCKSIZE TABLESPACE
- A 'column-definition' contains both NOT NULL and DEFAULT NULL clauses.
- A 'column-definition' contains both FIELDPROC and DEFAULT clauses.
- A select-statement contains both the update-clause and the FOR FETCH ONLY clause.
- An ALTER TABLE statement contains both a DROP CONSTRAINT clause and either a DROP FOREIGN KEY clause or a DROP CHECK clause.
- A CREATE or ALTER TABLESPACE statement contains both LOCKPART YES and LOCKSIZE TABLESPACE.
- # • An ALTER TABLE statement contains both an ALTER COLUMN clause and a VALIDPROC clause.
- # • An ALTER TABLE statement contains both an ALTER COLUMN clause and a clause other than the check constraint clause.

Programmer Response: Change the options specified in the statement and reissue it.

Destination: 42613

-629 SET NULL CANNOT BE SPECIFIED BECAUSE FOREIGN KEY *name* CANNOT CONTAIN NULL VALUES

Explanation: The code is used to report that the SET NULL option of the indicated FOREIGN KEY clause is invalid because no column of the key allows null values. The 'name' is the constraint-name specified in the FOREIGN KEY clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System Action: The statement cannot be run.

Programmer Response: Change a column of the key to allow null values or change the delete rule.

Destination: 42834

-630 THE WHERE NOT NULL SPECIFICATION IS INVALID FOR TYPE 1 INDEXES

Explanation: Type 1 indexes cannot be created with the WHERE NOT NULL specification.

System Action: The statement cannot be executed.

Programmer Response: Either the index must be created as a type 2 index, or the WHERE NOT NULL specification must not be used.

Destination: 56089

-631 FOREIGN KEY *name* IS TOO LONG OR HAS TOO MANY COLUMNS

Explanation: This code is used to report that the sum of the length attributes of the columns identified in the indicated FOREIGN KEY clause is greater than 255 bytes or the number of columns identified is greater than 64. The 'name' is the constraint-name specified in the FOREIGN KEY clause or, if a constraint-name was not specified, the first column-name specified in the clause.

System Action: The statement cannot be executed.

Programmer Response: The table definition must be modified to conform to the system-imposed limit of the sum of the length attributes of the columns identified in the PRIMARY KEY clause.

Destination: 54008

-632 THE TABLE CANNOT BE DEFINED AS A DEPENDENT OF *table-name* BECAUSE OF DELETE RULE RESTRICTIONS

Explanation: This code is used to report that the object of an ALTER TABLE statement cannot be defined as a dependent of the indicated table because either:

- The relationship would form a cycle that would cause the table to be delete-connected to itself.
- The relationship would cause the table to be delete-connected to the indicated table through multiple paths and the delete rule of the existing relationship is SET NULL.

The error is due to the delete rules of existing relationships, not the delete rule specified in the FOREIGN KEY clause of the ALTER TABLE statement.

System Action: The statement cannot be executed.

Programmer Response: Eliminate the particular FOREIGN KEY clause from the ALTER or CREATE TABLE statement.

Destination: 42915

-633 THE DELETE RULE MUST BE *delete-rule*

Explanation: The code is used to report that the 'delete-rule' specified in a FOREIGN KEY clause of the ALTER TABLE statement is invalid. The indicated 'delete-rule' is required because:

- A self-referencing constraint must have a 'delete-rule' of CASCADE or NO ACTION.
- The relationship would cause the table to be delete-connected to the same table through multiple paths and such relationships must have the same 'delete-rule'.

System Action: The statement cannot be executed.

Programmer Response: Change the 'delete rule' in the FOREIGN KEY clause.

Destination: 42915

-634 THE DELETE RULE MUST NOT BE CASCADE

Explanation: The code is used to report that the CASCADE delete rule specified in the FOREIGN KEY clause of an ALTER TABLE statement is invalid because:

- The relationship would form a cycle that would cause a table to be delete-connected to itself.
- The relationship would cause another table to be delete-connected to the same table through multiple paths with different delete rules or with a delete rule equal to SET NULL.

System Action: The statement cannot be executed.

Programmer Response: Change the delete rule.

Destination: 42915

-635 THE DELETE RULES CANNOT BE DIFFERENT OR CANNOT BE SET NULL

Explanation: The code is used to report that the delete rules specified in two FOREIGN KEY clauses of the CREATE TABLE statement are invalid because the table would be delete-connected to the same table through multiple paths involving relationships with different delete rules or with delete rules of SET NULL.

System Action: The statement cannot be executed.

Programmer Response: Change the delete rule.

Destination: 42915

-636 THE PARTITIONING KEYS FOR PARTITION *part-num* ARE NOT SPECIFIED IN ASCENDING OR DESCENDING ORDER

Explanation: In the CREATE INDEX statement for the CLUSTER index for a partitioned table (that is, a table residing in a partitioned table space), the partitioning key values specified in the limit key value specifications were not in either ascending or descending order.

System Action: The statement cannot be executed. The specified cluster index was not created.

Programmer Response: Correct the limit key value specifications in the CREATE INDEX statement for the identified partition so that the limit key values for successive partitions are in strictly ascending or descending order.

Destination: 56016

-637 DUPLICATE *keyword* KEYWORD

Explanation: The SQL statement contains a duplicate specification for the keyword '*keyword*'.

System Action: The statement cannot be executed.

Programmer Response: Correct the statement to eliminate all but one specification for the keyword.

Destination: 42614

-638 TABLE *table-name* CANNOT BE CREATED BECAUSE COLUMN DEFINITION IS MISSING

Explanation: The CREATE TABLE statement does not contain any column definition.

System Action: The SQL statement cannot be executed.

Programmer Response: Add column definition to the statement.

Destination: 42601

-639 A NULLABLE COLUMN OF A FOREIGN KEY WITH A DELETE RULE OF SET NULL CANNOT BE A COLUMN OF THE KEY OF A PARTITIONED INDEX

Explanation: A partition key of the clustering index cannot be updated. Therefore, a foreign key column with a delete rule of SET NULL cannot be a column of a partition key if that column is nullable. If this error occurs for an ALTER TABLE operation, the foreign key cannot be created. If this error occurs for a CREATE INDEX operation, the index cannot be created.

System Action: The statement cannot be executed.

Programmer Response: Review the delete rule of the referential constraint and the partition keys for the index. Do one of the following:

- If the operation in error was CREATE INDEX, either change the index partition key definition or drop and re-define the referential constraint with a different delete rule.
- If the operation in error was ALTER TABLE, change the referential delete rule so that all nullable index keys are not part of the foreign keys.

Destination: 56027

-640 LOCKSIZE ROW CANNOT BE SPECIFIED BECAUSE TABLE IN THIS TABLESPACE HAS TYPE 1 INDEX

Explanation: If LOCKSIZE ROW is specified for a table space, all indexes on tables in the table space must be type 2 indexes. The following SQL statement identifies all the type 1 indexes:

```
SELECT I.CREATOR, I.NAME
       FROM SYSIBM.SYSINDEXES I,
            SYSIBM.SYSTABLES T
       WHERE INDEXTYPE = '1'
            AND T.TSNAME = 'table_space_name'
            AND T.DBNAME = 'database_name'
            AND T.CREATOR = I.TBCREATOR
            AND T.NAME = I.TBNAME;
```

where '*table_space_name*' is the name of the table space that is to be altered; '*database_name*' is the name of the database that contains the table space.

System Action: The statement cannot be executed.

Programmer Response: Since the LOCKSIZE ROW on the table space and the type 1 indexes conflict, either use the ALTER INDEX statement to convert all type 1 indexes to type 2 indexes or use another LOCKSIZE option.

Destination: 56089

-642 TOO MANY COLUMNS IN UNIQUE CONSTRAINTS

Explanation: There is a limit to the total number of columns that can be used in UNIQUE constraints in a CREATE TABLE statement. The statement exceeds the limit.

System Action: The statement is not executed.

Programmer Response: Change the statement to remove some of the unique constraints. You can impose the same constraints later by creating unique indexes on the table, using CREATE INDEX.

Destination: 54021

-643 CHECK CONSTRAINT EXCEEDS MAXIMUM ALLOWABLE LENGTH

Explanation: The check constraint definition exceeds the maximum allowable limit of 3800 characters. The redundant blank spaces are excluded from this limit.

System Action: The CREATE TABLE or ALTER TABLE statement failed.

Programmer Response: Rewrite the check constraint definition so that it is less than 3800 characters. You might need to divide the check constraint into two or more smaller check constraints.

Destination: 54024

-644 INVALID VALUE SPECIFIED FOR KEYWORD *keyword* IN *stmt-type* STATEMENT

Explanation: The value specified for the 'keyword' parameter in the 'stmt-type' SQL statement is not a permitted value.

System Action: The SQL statement cannot be executed.

Programmer Response: Correct the statement. Refer to Chapter 6 of *SQL Reference* for information about the permissible values for the 'keyword' keyword in 'stmt-type' statements.

Destination: 42615

-646 TABLE *table-name* CANNOT BE CREATED IN PARTITIONED/DEFAULT TABLE SPACE *tspace-name* BECAUSE IT ALREADY CONTAINS A TABLE

Explanation: The table space specified in a CREATE TABLE statement is a partitioned or default table space in which an existing table already resides. Only one table may reside in a partitioned or default table space.

System Action: The statement cannot be executed. The specified table was not created.

Programmer Response: Verify that the correct table space was specified in the CREATE statement. Do not attempt to create more than one table in a partitioned or default table space.

Destination: 55017

-647 BUFFERPOOL *bp-name* CANNOT BE SPECIFIED BECAUSE IT HAS NOT BEEN ACTIVATED

Explanation: The buffer pool specified in a CREATE or ALTER statement for a table space or index (index space) is not activated.

Table spaces and indexes (index spaces) can only be assigned or reassigned to buffer pools that are currently activated.

System Action: The statement cannot be executed. The specified table space or index space was not created or altered.

Programmer Response: Verify that the proper buffer pool was specified in the CREATE or ALTER statement. Use the -DISPLAY BUFFERPOOL command to display the attributes of the buffer pool and determine if the buffer pool is activated. If the buffer pool is not activated, use the -ALTER BUFFERPOOL command to change the VPSIZE from 0 to the desired size.

Destination: 57003

-650 THE ALTER INDEX CANNOT BE EXECUTED, REASON *reason*

Explanation: The ALTER INDEX statement cannot be executed for one of the following reasons:

- 1 Alter to type 1 index is not allowed for the index whose associated table space has a LOCKSIZE specification of ROW.
- 2 Alter to type 1 index is not allowed for the index defined with UNIQUE WHERE NOT NULL.
- 3 Alter to type 1 index is not allowed for the index whose associated table space has been defined as a LARGE table space.
- 4 Alter to type 1 index is not allowed for an index on an ASCII table.
- 5 Alter PIECESIZE is not allowed for a partitioning index.
- 6 Alter PIECESIZE 4G is not allowed for non-partitioned indexes on a non-LARGE table.

System Action: The ALTER INDEX statement is not executed.

Programmer Response: Correct the error according to the given reason and execute the statement again.

Destination: 56090

-651 TABLE DESCRIPTION EXCEEDS MAXIMUM SIZE OF OBJECT DESCRIPTOR.

Explanation: The CREATE TABLE or ALTER TABLE statement causes the table descriptor (record OBD) to exceed the object descriptor size limit of 32KB.

Programmer Response: Change the statement by reducing either the number or length (or a combination of both) of the user-defined default string constants or check constraints and execute the statement again.

System Action: The statement is not executed. For an ALTER TABLE statement, the definition of the table is unchanged. For a CREATE TABLE statement, the table is not created.

Destination: 54025

-652 VIOLATION OF INSTALLATION DEFINED EDIT OR VALIDATION PROCEDURE *proc-name*

Explanation: The result of the SQL statement has been rejected by the installation defined edit or validation procedure 'proc-name' for the object table.

System Action: The statement cannot be executed. The contents of the object table were not modified.

Programmer Response: Determine the requirements imposed by the edit or validation procedure for inserts and updates of the object table.

Destination: 23506

-653 TABLE *table-name* IN PARTITIONED TABLE SPACE *t-space-name* IS NOT AVAILABLE BECAUSE ITS PARTITIONED INDEX HAS NOT BEEN CREATED

Explanation: An attempt has been made to insert or manipulate data in or create a view on a partitioned table (that is, a table residing in a partitioned table space) before the partitioned index for that table has been created.

A table residing in a partitioned table space cannot be referenced in any SQL manipulative statement or a CREATE VIEW statement before the partitioned index for that table has been created.

System Action: The statement cannot be executed.

Programmer Response: Verify that the correct table was specified in the statement. If so, ensure that the partitioned index for the table has been created successfully before attempting to execute any SQL manipulative statements that reference that table.

Destination: 57004

-655 THE CREATE OR ALTER STOGROUP IS INVALID BECAUSE THE STORAGE GROUP WOULD HAVE BOTH SPECIFIC AND NONSPECIFIC VOLUME IDs

Explanation: One of the following error conditions occurred:

- Both a specific and a nonspecific ('*') volume ID are specified in the VOLUMES clause of a CREATE STOGROUP statement.
- Both a specific and a nonspecific ('*') volume ID are specified in an ADD VOLUMES clause of an ALTER STOGROUP statement.
- A specific volume ID is specified in an ADD VOLUMES clause of an ALTER of a storage group that has nonspecific volume IDs or mixed volume IDs.
- A nonspecific volume ID ('*') is specified in an ADD VOLUMES clause of an ALTER of a storage group that has specific volume IDs or mixed volume IDs.

System Action: The statement is not executed.

Programmer Response: Specify either specific or nonspecific volume IDs in the VOLUMES clause of CREATE STOGROUP statement and the ADD VOLUMES clause of the ALTER STOGROUP statement. To add specific volume IDs to a storage group with nonspecific volume IDs, use the REMOVE VOLUMES clause to remove the nonspecific volume

IDs. To add nonspecific volume IDs to a storage group with specific volume IDs, use the REMOVE VOLUMES clause to remove the specific volume IDs.

Destination: 56036

-660 INDEX *index-name* CANNOT BE CREATED ON PARTITIONED TABLE SPACE *t-space-name* BECAUSE KEY LIMITS ARE NOT SPECIFIED

Explanation: The CREATE INDEX statement attempted to create a cluster index for a partitioned table (that is, a table residing in a partitioned table space) without specifying limit key values for the partitions of the table space.

System Action: The statement cannot be executed. The specified cluster index was not created.

Programmer Response: Verify that the correct table was specified in the CREATE INDEX statement. If so, the definition for the partitioned table space must be examined so that a proper definition for the cluster index for the table may be constructed. Refer to Chapter 6 of *SQL Reference* for information about the requirements that must be satisfied by the definitions for the cluster indexes for partitioned tables.

Destination: 53035

-661 INDEX *index-name* CANNOT BE CREATED ON PARTITIONED TABLE SPACE *t-space-name* BECAUSE THE NUMBER OF PART SPECIFICATIONS IS NOT EQUAL TO THE NUMBER OF PARTITIONS OF THE TABLE SPACE

Explanation: The CREATE INDEX statement for the cluster index on a partitioned table (that is, a table residing in a partitioned table space) does not contain the same number of PART specifications as there are partitions in the table space. The definition for the cluster index for a partitioned table must contain exactly as many PART specifications as there are partitions in the table space in which that table resides. Also, the part numbers must be valid and unique.

System Action: The statement cannot be executed. The specified cluster index was not created.

Programmer Response: Examine the definition of the partitioned table space to determine how many partitions have been specified, and then correct the syntax of the CREATE INDEX statement to provide the proper number of PART specifications. Refer to Chapter 6 of *SQL Reference* for information about the definitions for cluster indexes on partitioned tables.

Destination: 53036

-662 A PARTITIONED INDEX CANNOT BE CREATED ON A NON-PARTITIONED TABLE SPACE *t-space-name*

Explanation: The CREATE INDEX statement contains PART specifications, but the specified object table is not partitioned (that is, does not reside in a partitioned table space).

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: Verify that the proper object table was specified in the statement. Refer to Chapter 6 of *SQL Reference* for information about the proper usage of PART specifications in CREATE INDEX statements.

Destination: 53037

-663 THE NUMBER OF KEY LIMIT VALUES IS EITHER ZERO, OR GREATER THAN THE NUMBER OF COLUMNS IN THE KEY OF INDEX *index-name*

Explanation: The number of limit key value specifications provided in at least one of the PART specifications of the CREATE INDEX statement is either zero or greater than the number of columns in the index key.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: Correct the statement so that each PART specification contains exactly the same number of limit key value specifications as there are columns in the index key.

Destination: 53038

-665 THE PART CLAUSE OF AN ALTER STATEMENT IS OMITTED OR INVALID

Explanation: The ALTER statement is invalid for one of the following reasons:

- The table space or index is not partitioned and the PART clause is specified.
- The table space or index is partitioned, a partition attribute (FREEPAGE or PCTFREE) is specified, and the PART clause is not specified.
- The integer specified in the PART clause does not identify a partition of the table space or index.
- A USING, PRIQTY, SECQTY, or ERASE clause is used to alter storage attributes, but the partition is not specified.
- A GBPCACHE clause is used to alter the group buffer pool caching attributes, but the partition is not specified.

System Action: The SQL statement cannot be executed.

Programmer Response: Determine whether the table space or index you want to alter is partitioned. If it is partitioned, specify a PART clause that identifies the partition you want to alter. If it is not partitioned, do not specify the PART clause.

Destination: 53039

-666 *stmt-verb object* CANNOT BE EXECUTED BECAUSE *function* IS IN PROGRESS

Explanation: The SQL statement could not be executed because the named function was executing at the time.

stmt-verb The type of data definition language (DDL) statement

object The DB2 object type

function A utility, the governor, or the distributed data facility (DDF)

If the object is part of the communications database, it cannot be dropped while the DDF is active.

System Action: The statement was not executed.

Programmer Response: If the function is a utility, wait for the function to complete or stop. Then resubmit the statement for execution.

If the function is the governor, the statement cannot be executed until the resource limit facility is stopped or switched to a different resource limit specification table (RLST). In a DB2 data sharing environment, the resource limit facility must be

stopped on all members of the DB2 data sharing group or all members must switch to an RLST that is not associated with the object.

If the function is the DDF, the facility must be stopped before the object can be dropped. In a DB2 data sharing environment, the facility must be stopped on all members of the DB2 data sharing group.

Destination: 57005

-667 THE CLUSTERING INDEX FOR A PARTITIONED TABLE SPACE CANNOT BE EXPLICITLY DROPPED

Explanation: The DROP INDEX statement attempted to drop the cluster index for a table residing in a partitioned table space. The cluster index for such a table cannot be dropped explicitly with the DROP INDEX statement.

System Action: The statement cannot be executed. The specified index was not dropped.

Programmer Response: The cluster index for a table in a partitioned table space can only be dropped implicitly when the associated partitioned table space is dropped.

Destination: 42917

-668 THE COLUMN CANNOT BE ADDED TO THE TABLE BECAUSE THE TABLE HAS AN EDIT PROCEDURE

Explanation: The ALTER TABLE statement attempted to add a column to a table that has an edit procedure. If a table has an edit procedure, no columns can be added to it.

System Action: The statement cannot be executed. The specified table was not altered.

Programmer Response: Verify that the correct table was specified in the ALTER statement. Do not attempt to ALTER the definition of a table that has an installation-written edit procedure associated with it.

Destination: 56018

-669 A TABLE IN A PARTITIONED TABLE SPACE CANNOT BE EXPLICITLY DROPPED

Explanation: The DROP TABLE statement attempted to drop a table that resides in a partitioned table space.

System Action: The statement cannot be executed. The specified table was not dropped.

Programmer Response: The table of a partitioned table space can only be dropped implicitly when the table space itself is dropped.

Destination: 42917

-670 THE RECORD LENGTH OF THE TABLE EXCEEDS THE PAGE SIZE LIMIT

Explanation: The row length for a table cannot exceed the page size of the table space in which that table resides (or is to reside). The page size of the table space is determined by the buffer pool used by that table space.

One of three conditions may occur:

- As defined in a CREATE TABLE statement, the row length for the table would exceed the page size of the specified (or default) table space.

- In the case of an ALTER TABLE statement, addition of the specified column would cause the row length of the table to exceed the page size of the table space.
- ```
#
#
#
```
- In the case of an ALTER TABLE statement used to alter the length of an existing variable length column, the new length of the altered column would cause the row length of the table to exceed the page size of the table space.
- The row length in the result of a join exceeds the page size of a work file table space.
- ```
#
#
#
#
#
```
- The row length of a large sort record exceeds the page size of a work file table space. The sort record includes columns that are being sorted and columns that the user selects. The length of the columns that are being sorted is the sort key length. The length of the columns that the user selects is the sort data length.

System Action: The statement cannot be executed. The object table was not created or altered.

Programmer Response: In the case of CREATE TABLE, either (1) the row length of the table must be reduced (by eliminating or reducing the lengths of one or more of the columns), or (2) the table must be assigned to a table space that uses the 32KB buffer pool (assuming that the row length of the table does not exceed that page size limit).

In the case of ALTER TABLE, either (1) the length of the column to be added to the table must be reduced or, (2) if the row length of the table is already at the maximum, the table cannot be altered to add any additional columns or alter existing columns .

```
#
#
```

In the case of a row length that exceeds the page size of a work file table space, eliminate columns from the result of the join.

```
#
#
#
#
```

Destination: 54010

-671 THE BUFFERPOOL ATTRIBUTE OF THE TABLE SPACE CANNOT BE ALTERED AS SPECIFIED BECAUSE IT WOULD CHANGE THE PAGE SIZE OF THE TABLE SPACE

Explanation: The change to the buffer pool attribute for the table space specified in the ALTER TABLESPACE statement would change the page size of the table space—either from 4KB to 32KB, or vice versa.

Use of the ALTER TABLESPACE statement to change the page size of a table space is not permitted.

System Action: The statement cannot be executed. The table space definition was not altered.

Programmer Response: If the table space uses one of the 4KB buffer pools (for example, BP0, BP1, or BP2), it can be reassigned to one of the other 4KB buffer pools (but not buffer pool BP32K). If, however, it is assigned to buffer pool BP32K, the buffer pool assignment cannot be subsequently altered.

Destination: 53040

-672 OPERATION DROP NOT ALLOWED ON TABLE table_name

Explanation: The DROP operation failed for one of the following reasons:

- The table being dropped has the RESTRICT ON DROP attribute.
- The table space or database being dropped contains the specified table, which has the RESTRICT ON DROP attribute.

System Action: The DROP statement cannot be executed.

Programmer Response: Before dropping the table, alter the table, specifying DROP RESTRICT ON DROP.

For DROP TABLESPACE or DROP DATABASE, make sure that there are no other tables within the table space or database with the RESTRICT ON DROP attribute. The following SELECT statement can identify the tables:

```
SELECT CREATOR, NAME
FROM SYSIBM.SYSTABLES
WHERE TYPE = 'T'
AND CLUSTERTYPE = 'Y'
AND DBNAME = 'database_name'
AND TSNAME = 'tablespace_name';
```

Destination: 55035

-676 A 32K PAGE BUFFERPOOL MAY NOT BE USED FOR AN INDEX

Explanation: A buffer pool having a 32KB page size was specified in the CREATE INDEX statement. Only 4KB buffer pools (that is, BP0, BP1, and BP2) can be specified for indexes.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: Correct the statement to specify a 4KB buffer pool. Refer to Chapter 6 of *SQL Reference* for information about the syntax of SQL statements.

Destination: 53041

-677 INSUFFICIENT VIRTUAL STORAGE FOR BUFFERPOOL EXPANSION

Explanation: An attempt to either open (create) or expand a buffer pool has failed because insufficient virtual storage was available.

This error may occur under either of two circumstances:

- An attempt to create a buffer pool while opening a table space or index(space), or
- An attempt to expand a buffer pool from its current size to its maximum size.

System Action: The statement cannot be executed.

Programmer Response: If this error should occur during interactive execution of an SQL statement or execution of an application program, installation administration should be notified.

Installation Action: It may be necessary to reexamine the buffer pool storage strategy.

One of the following messages has also been sent to the MVS console: DSNB6011, DSNB6031, or DSNB6051. Refer to "Section 3. DB2 Messages" on page 3-1 for explanations of these messages.

Destination: 57011

-678 THE LITERAL *literal* SPECIFIED FOR THE INDEX LIMIT KEY MUST CONFORM TO THE DATA TYPE *data-type* OF THE CORRESPONDING COLUMN *column-name*

Explanation: The index limit key value 'literal' has been specified incorrectly in the CREATE INDEX statement.

Limit key value specifications must conform to the data type of the corresponding index key column. In this case, the 'literal' must be of data type 'data-type' to conform to the data type of column 'column-name'.

System Action: The statement cannot be executed. The specified index was not created.

Programmer Response: Correct the statement so that each limit key value literal is of precisely the same data type as that of the corresponding index key column.

Destination: 53045

-679 THE OBJECT *name* CANNOT BE CREATED BECAUSE A DROP IS PENDING ON THE OBJECT

Explanation: The application program has executed a DROP for the specified object, and then tried to re-create an object with the same name (and of the same type) before the DROP was completed.

System Action: The statement cannot be executed. The specified object was not created.

Programmer Response: The logic of the application program must be modified to issue a COMMIT (or the IMS or CICS equivalent) between the DROP and CREATE statements.

Destination: 57006

-680 TOO MANY COLUMNS SPECIFIED FOR A TABLE

Explanation: The maximum number of columns permitted per table is 750.

System Action: The statement cannot be executed.

Programmer Response: Do not attempt to CREATE or ALTER a table to contain more than 750 columns. Create separate tables as required to hold the additional information.

Destination: 54011

-681 COLUMN *column-name* IN VIOLATION OF INSTALLATION DEFINED FIELD PROCEDURE. RT: *return-code*, RS: *reason-code*, MSG: *message-token*

Explanation: An installation field procedure returned an error for 'column-name'. The 'reason-code' and 'message-token' are defined by the field procedure. They may give additional information to help determine the cause of the problem.

Return code	Error
4	Invalid value on encode or decode or invalid column description on define
8	Invalid parameter value
12	Field procedure error on any function

Use 'reason-code' and 'message-token' for additional information.

System Action: The statement cannot be executed.

Programmer Response: If it is not a field procedure error, determine the requirements imposed by the field procedure. If it is a field procedure error, examine the field procedure.

Destination: 23507

-682 FIELD PROCEDURE *procedure-name* COULD NOT BE LOADED

Explanation: The field procedure 'procedure-name' cannot be loaded.

System Action: The statement cannot be executed.

Programmer Response: The application should either commit or roll back to previous COMMIT. Then, in general, the application should terminate.

Destination: 57010

-683 INVALID COLUMN TYPE FOR FIELDPROC, BIT DATA, SBCS DATA, OR MIXED DATA OPTION, *column-name*

Explanation: The FIELDPROC, BIT DATA, SBCS DATA, or MIXED DATA option was specified for column 'column-name'. This is invalid. Data subtypes can only be specified for character string columns; and field procedures can only be specified for string columns that allow nulls or have no default value.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

Destination: 42842

-684 THE LENGTH OF LITERAL LIST BEGINNING *string* IS TOO LONG

Explanation: The length of the literal list beginning with 'string', excluding insignificant blanks and delimiting parentheses is greater than 255.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

Destination: 54012

-685 INVALID FIELD TYPE, *column-name*

Explanation: The field description returned by the field procedure is invalid. The data type code denotes a long string or has an invalid value.

System Action: The statement cannot be executed.

Programmer Response: Correct the field procedure so that it returns a valid data type code.

Destination: 58002

-686 COLUMN DEFINED WITH A FIELD PROCEDURE CAN NOT COMPARE WITH ANOTHER COLUMN WITH DIFFERENT FIELD PROCEDURE

Explanation: The columns specified are not compatible. Different field procedures are specified, or only one field procedure is specified.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement. Refer to Chapter 3 of *SQL Reference* for comparison restrictions between columns defined with a field procedure.

Destination: 53043

-687 FIELD TYPES INCOMPARABLE

Explanation: One column cannot be compared with another column that has incompatible field types.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement. Refer to Chapter 3 of *SQL Reference* for comparison restrictions between columns defined with a field procedure.

Destination: 53044

-688 INCORRECT DATA RETURNED FROM FIELD PROCEDURE, *column-name, msgno*

Explanation: Unexpected data returned from field procedure for column '*column-name*'. For more information see '*msgno*'.

System Action: The statement cannot be executed.

Programmer Response: Correct the field procedure so that it returns values that are consistent with their descriptions.

Destination: 58002

-689 TOO MANY COLUMNS DEFINED FOR A DEPENDENT TABLE

Explanation: The maximum number of columns allowed for a dependent table is 749. The code is used to report that the statement is invalid because of one of the following:

- A CREATE TABLE statement is creating a dependent table with 750 columns.
- An ALTER TABLE statement is altering a dependent table with 749 columns to add a column, or altering a table with 750 columns to become a dependent table.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement to conform to the column limit for a dependent table.

Destination: 54011

-690 THE STATEMENT IS REJECTED BY DATA DEFINITION CONTROL SUPPORT. REASON *reason-code*

Explanation: The code is issued by the data definition control support to report that the statement is rejected for the reason indicated by '*reason-code*' after consulting the application registration table and object registration table.

The explanation of the given reason code:

- 0001

Data definition control support is running under the controlling by application name mode. The statement is rejected because the current application is not registered in application registration table with DEFAULTAPPL on.

- 0002

Data definition control support is running under the controlling by application name with exceptions mode. The state-

ment is rejected because the object is not registered in object registration table and the current application is not registered in application registration table with DEFAULTAPPL on.

- 0003

Data definition control support is running under the controlling by application name with exceptions mode. The statement is rejected because the object is registered in object registration table but the current application does not match.

- 0004

Data definition control support is running under the controlling by object name with exceptions mode. The statement is rejected because the object is registered in object registration table but the current application does not match.

- 0005

Data definition control support is running under the controlling by object name mode. The statement is rejected because the object is registered in object registration table but the current application does not match.

- 0006

Data definition control support is running under the controlling by object name mode. The statement is rejected because the object is not registered in object registration table.

System Action: The statement cannot be executed.

Programmer Response: None if valid rejection. Otherwise, check to see if data definition control support is running under the desired mode. Check one or both registration table(s) to determine if the entries of the registration table(s) are correct. If they are not, then update the registration table(s).

Destination: 23508

-691 THE REQUIRED REGISTRATION TABLE *table-name* DOES NOT EXIST

Explanation: The data definition control support assumes the existence of the application registration table and object registration table. But either one or both tables is not defined.

System Action: The statement cannot be executed.

Programmer Response: Determine whether the required registration tables do exist. If not, create the required tables.

Destination: 57018

-692 THE REQUIRED UNIQUE INDEX *index-name* FOR DDL REGISTRATION TABLE *table-name* DOES NOT EXIST

Explanation: A unique index must be defined for each registration table. The code is issued when either the required index does not exist or the index defined is not a unique index.

System Action: The statement cannot be executed.

Programmer Response: Determine whether the required unique index does exist. If not, create the required index. If the index does exist, but is not unique, drop it and recreate it as a unique index.

Destination: 57018

-693 THE COLUMN *column-name* IN DDL REGISTRATION TABLE OR INDEX *table-name* (*index-name*) IS NOT DEFINED PROPERLY

Explanation: An error occurred during verification of the application or object registration table.

The table is improperly defined for the following reasons:

- A required column is missing.
- A column description is invalid because its name, column number, data type, length, or null attribute is incorrect.

or

The index is improperly defined for the following reasons:

- A required key column is missing.
- A key column description is invalid because of its key sequence or because its ordering is incorrect.
- A defined key column should not be part of the unique key.

System Action: The statement cannot be executed.

Programmer Response: Correct or alter the definition of the required registration table or index.

Destination: 55003

-694 THE DDL STATEMENT CANNOT BE EXECUTED BECAUSE A DROP IS PENDING ON THE DDL REGISTRATION TABLE *table-name*

Explanation: An error occurred while accessing the application registration table or object registration table. The application registration table or object registration table was dropped, but the DROP statement was not committed.

System Action: The statement cannot be executed.

Programmer Response: Resubmit the job. If the same error happens, check for the application that issued the DROP statement for the application registration table or the object registration table. Either commit the DROP statement which dropped the table and create a new application registration table or object registration table, or issue a ROLLBACK for the DROP statement to put the tables back.

Destination: 57023

-713 THE REPLACEMENT VALUE FOR *special-register* IS INVALID

Explanation: The value specified in the SET special-register statement is not a valid value of the indicated special register.

System Action: The statement cannot be executed.

Programmer Response: Correct the replacement value. See *SQL Reference* for an explanation of the valid values of each special register.

Destination: 42815

-715 PROGRAM *program-name* WITH MARK *release-dependency-mark* FAILED BECAUSE IT DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALLBACK HAS OCCURRED

Explanation: Program '*program-name*' depends on a function of DB2 that is not supported by the current active release.

program-name Name of the application program.

release-dependency-mark

A 1-character mark showing the oldest DB2 release supporting this program.

System Action: The BIND operation for this plan or package is not performed.

User Response: The program cannot be used until the DB2 subsystem is remigrated to the newer release.

Operator Response: Notify the system programmer.

System Programmer Response: Warn users not to use plans or packages containing this program until the DB2 subsystem has been remigrated to the newer release.

Destination: 56064

-716 PROGRAM *program-name* PRECOMPILED WITH INCORRECT LEVEL FOR THIS RELEASE.

Explanation: Program '*program-name*' was precompiled under a release not supported by the current level of DB2, or the contents of the DBRM have been modified after the pre-compilation phase.

User Response: Precompile the named program again using the current precompiler. Reissue the BIND subcommand.

Problem Determination: If the program was precompiled at an appropriate release, and the problem persists, collect the following:

- A hexadecimal print of the first record of the failing DBRM
- The listing from the precompile job that generated the DBRM
- Output from the BIND attempt.

Destination: 56065

-717 *bind-type* FOR *object-type* *object-name* WITH MARK *release-dependency-mark* FAILED BECAUSE *object-type* DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALLBACK HAS OCCURRED.

Explanation: The plan or package indicated depends on a function of DB2 which is not supported by the currently active release.

bind-type REBIND

object-type PLAN | PACKAGE

object-name Name of the application plan, or the package

release-dependency-mark

A one-character mark showing the oldest release of DB2 can support this plan or package. The release dependency mark for the plan is kept in the IBMREQD columns in the DB2 catalog in SYSIBM.SYSPLAN (plans), SYSIBM.SYSPACKAGE (packages).

System Action: The REBIND operation for this plan or package is not performed.

User Response: The plan or package cannot be used until the DB2 subsystem is remigrated to the newer release.

Operator Response: Notify the system programmer.

System Programmer Response: Warn users not to use the plan or package until the DB2 subsystem has been remigrated to the newer release.

Destination: 56066

**-718 REBIND OF PACKAGE *package-name* FAILED
 BECAUSE IBMREQD OF *ibmreqd* IS INVALID**

Explanation: The IBMREQD column of the SYSIBM.SYSPACKAGE catalog table for the named package contains an unrecognizable character.

package-name Name of the package
 (location.collection.package.version)

System Action: The REBIND failed.

User Response: You must do a BIND ACTION(REPLACE) for this package.

Destination: 56067

**-719 BIND ADD ERROR USING *auth-id*
 AUTHORITY PACKAGE *package-name*
 ALREADY EXISTS**

Explanation: An attempt is made to add a package that already exists. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE table. In addition, the combination of 'location.collection.package.consistency-token' must be unique.

auth-id Authorization ID of the invoker of the BIND subcommand.

package-name Name of the package
 (location.collection.package.version).

System Action: No package is created.

System Programmer Response: Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages. Re-invoke the BIND subcommand with a 'location.collection.package.version' that is not in use.

Destination: 42710

**-720 BIND ERROR, ATTEMPTING TO REPLACE
 PACKAGE = *package_name* WITH VERSION =
 version2 BUT THIS VERSION ALREADY
 EXISTS**

Explanation: An attempt is made to create a version of a package that already exists. The version specified in the REPLVER keyword is different from the version specified for the precompile. The version specified for the precompile already exists in the catalog. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE catalog table. A common mistake is that the user may believe that the version he is creating is the one specified in the REPLVER keyword. This is not the case. The version specified in the REPLVER keyword is the name of the version being replaced. The version that will be created is the version that was given to the program when it was precompiled.

package_name Fully qualified package name
version2 Version-id of package that is to be created

System Action: The bind will fail.

System Programmer Response: There are two approaches to solve this problem. The first is to precompile the program again with a new version name and reissue the original BIND subcommand. The other approach is not to do the precompile but reissue the BIND subcommand with REPLVER(SAME).

Destination: 42710

**-721 BIND ERROR FOR PACKAGE = *pkg-id*
 CONTOKEN = 'contoken'X IS NOT UNIQUE SO
 IT CANNOT BE CREATED**

Explanation: An attempt is made to add or replace a package with a consistency token that is not unique for that package. In other words, the combination of 'location.collection.package.consistency-token' already exists.

pkg-id Fully qualified name of the package.

contoken Consistency token in hexadecimal.

System Action: The BIND will fail.

System Programmer Response: Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages with the indicated consistency token. Reissue the BIND subcommand such that the 'location.collection.package.consistency-token' is unique within the catalog. The following SQL statement can be used to query the catalog:

```
SELECT COLLID,NAME
FROM loc-id.SYSIBM.SYSPACKAGE
WHERE HEX(CONTOKEN) = 'contoken';
```

Destination: 42710

**-722 *bind-type* ERROR USING *auth-id* AUTHORITY
 PACKAGE *package-name* DOES NOT EXIST**

Explanation: The indicated subcommand was issued against a package that does not exist. The individual variable fields contain:

bind-type Type of bind subcommand (BIND | REBIND | FREE).

auth-id Authorization ID of the invoker of the BIND subcommand.

package-name Name of the package
 (location.collection.package.version)

System Action: Package not rebound or freed.

System Programmer Response: Check the SYSPACKAGE catalog table for the correct 'location.collection.package.version' to use.

Destination: 42704

**-726 BIND ERROR ATTEMPTING TO REPLACE
 PACKAGE = <*package_name*>. THERE ARE
 ENABLE OR DISABLE ENTRIES CURRENTLY
 ASSOCIATED WITH THE PACKAGE**

Explanation: The BIND subcommand was issued to replace a package that has ENABLE or DISABLE entries currently associated with the package.

System Action: Package not bound.

System Programmer Response: FREE the package first and then BIND the package.

Destination: 55030

-730 THE PARENT OF A TABLE IN A READ-ONLY SHARED DATABASE MUST ALSO BE A TABLE IN A READ-ONLY SHARED DATABASE

Explanation: An attempt was made to define a relationship between a table in a read-only shared database and a table that is not.

System Action: The statement cannot be executed.

Programmer Response: Insure that the correct tables are being used for the relationship being defined.

Destination: 56053

-731 USER-DEFINED DATASET *dsname* MUST BE DEFINED WITH SHAREOPTIONS(1,3)

Explanation: The VSAM SHAREOPTIONS must be (1,3) for all of the indexes and table spaces in the database. The user-defined data set identified did not meet this requirement.

System Action: The statement cannot be executed.

Programmer Response: Insure that the data sets used in the shared database are defined with the proper SHAREOPTIONS.

Destination: 56054

-732 THE DATABASE IS DEFINED ON THIS SUBSYSTEM WITH THE ROSHARE READ ATTRIBUTE BUT THE TABLE SPACE OR INDEX SPACE HAS NOT BEEN DEFINED ON THE OWNING SUBSYSTEM

Explanation: Prior to creating a table space or index in a database with the ROSHARE READ attribute, that object must first be defined on the owning subsystem.

System Action: The statement cannot be executed.

Programmer Response: Verify that the table space or index has been defined on the owning system in a ROSHARE OWNER database.

Destination: 56055

-733 THE DESCRIPTION OF A TABLE SPACE, INDEX SPACE, OR TABLE IN A ROSHARE READ DATABASE MUST BE CONSISTENT WITH ITS DESCRIPTION IN THE OWNER SYSTEM

Explanation: This code is issued while creating a table space, index, or table in the ROSHARE READ database. These objects must be consistent with their descriptions in the ROSHARE OWNER database as follows:

- For a table space, the following attributes must be the same:
 - Page size
 - Segment size
 - Number of partitions
- For an index, the following attributes must be the same:
 - Number of partitions
 - Number of subpages
 - Table OBID
 - Total key length
 - Index type (Type 1 or Type 2 Index)
 - Number of key columns

- For a table, the following attributes must be the same:
 - Table OBID
 - Maximum record length
 - Number of columns
 - Whether an edit procedure exists

System Action: The statement cannot be executed.

Programmer Response: Ensure that the definition of the table space, index, or table is consistent with that in the ROSHARE OWNER database.

Destination: 56056

-734 THE ROSHARE ATTRIBUTE OF A DATABASE CANNOT BE ALTERED FROM ROSHARE READ

Explanation: An attempt was made to ALTER a database from ROSHARE READ to either ROSHARE OWNER or ROSHARE NONE.

System Action: The statement cannot be executed.

Programmer Response: Verify that the correct database was specified on the ALTER DATABASE statement. The ROSHARE attribute of a read-only shared database cannot be altered. To change this, DROP and recreate the database.

Destination: 56057

-735 DATABASE *dbid* CANNOT BE ACCESSED BECAUSE IT IS NO LONGER A SHARED DATABASE

Explanation: An attempt was made to access an object in the database identified by '*dbid*', that is known to the system as having the ROSHARE READ attribute. The database, however, is no longer defined as ROSHARE OWNER on the owning subsystem.

System Action: The statement cannot be executed.

Programmer Response: Verify that the correct object is specified on the statement.

Destination: 55004

-736 INVALID OBID *obid* SPECIFIED

Explanation: An invalid OBID value was given on the CREATE statement. The OBID is invalid for one of the following reasons:

- The specified OBID does not fall within the acceptable range for OBIDs, which is 1 to 32767.
- The specified OBID is already in use for the given database.

System Action: The statement cannot be executed.

Programmer Response: Verify that the given OBID is a valid value for an OBID. If so, ensure that the OBID is correct for the object to be created, then query the catalog to find the object that is already defined as having the same OBID in the database. If an invalid OBID was given for the object to be created, correct the statement and execute it again. If the existing object is in error, then DROP and CREATE that object using the correct OBID value.

It is possible that the OBID "in use" is the OBID for an object that had been previously dropped. If that is the case, and the CREATE was issued for a table in a non-ROSHARE READ database, then select a different OBID for use in the OBID

clause. If the object had been previously dropped and the CREATE was issued for a table in a ROSHARE READ database, COMMIT and re-submit the CREATE TABLE request.

Destination: 53014

-737 IMPLICIT TABLE SPACE NOT ALLOWED

Explanation: A CREATE TABLE statement was issued using an implicit table space. An implicit table space may not be used in a database that has been defined as a read-only shared database.

System Action: The statement cannot be executed.

Programmer Response: CREATE a table space for the table, using the same name as is given on the owning system. Then resubmit the CREATE TABLE statement.

Destination: 56056

-741 A WORK FILE DATABASE IS ALREADY DEFINED FOR MEMBER *member-name*

Explanation: A work file database cannot be created for the specified member of the DB2 data sharing group because that member already has a work file database defined for it. Each member can have only one work file database.

System Action: The statement cannot be executed.

Programmer Response: Verify the identity and validity of the existing work file database for the specified member. The existing work file database can be altered or dropped, if necessary. If the existing work file database is dropped, resubmit the CREATE DATABASE statement.

Destination: 55020

-742 DSNDB07 IS THE IMPLICIT WORK FILE DATABASE

Explanation: The WORKFILE clause cannot be used on a CREATE DATABASE statement to create a work file database for a DB2 subsystem that is not a member of a DB2 data sharing group. The system database, DSNDB07, is the implicit work file database.

System Action: The statement cannot be executed.

Programmer Response: To create the work file database for a DB2 subsystem that is not a member of a DB2 data sharing group, create database DSNDB07 without the WORKFILE clause.

Destination: 53004

-750 THE SOURCE TABLE *source-name* CANNOT BE RENAMED BECAUSE IT IS REFERENCED IN EXISTING VIEW DEFINITIONS

Explanation: The *source table* in a RENAME statement cannot be renamed because it is referenced in one or more existing view definitions.

System Action: The statement cannot be executed.

Programmer Response: Change the source name to the name of an object that can be renamed and reissue the statement.

Destination: 42986

-751 A STORED PROCEDURE HAS BEEN PLACED IN MUST_ROLLBACK STATE DUE TO SQL OPERATION *name*

Explanation: A stored procedure issued an SQL operation that forced the DB2 thread to roll back the unit of work.

name The SQL operation that caused the thread to be placed in the MUST_ROLLBACK state is one of the following:

- CALL
- COMMIT
- CONNECT
- RELEASE
- ROLLBACK
- SET CONNECTION
- SET CURRENT SQLID

System Action: The statement cannot be executed. All further SQL statements are rejected until the SQL application that issued the SQL CALL statement rolls back the unit of work.

Programmer Response: If this message is received by a stored procedure, the stored procedure must terminate. Remove the unsupported statement from your stored procedure.

When control returns to the SQL application that issued the SQL CALL statement, the SQL application must roll back the unit of work. This can be done by issuing an SQL ROLLBACK statement or the equivalent IMS or CICS operation.

Destination: 42987

-752 THE CONNECT STATEMENT IS INVALID BECAUSE THE PROCESS IS NOT IN THE CONNECTABLE STATE

Explanation: The application process attempted to execute a CONNECT statement while in the unconnectable state. See the description of the CONNECT statement in the *SQL Reference* for an explanation of connection states.

System Action: The statement cannot be executed. The connection state of the application process is unchanged.

Programmer Response: Modify the application program to execute a commit or rollback operation prior to executing the CONNECT statement.

Destination: 0A001

-802 EXCEPTION ERROR '*exception-type*' HAS OCCURRED DURING '*operation-type*' OPERATION ON '*data-type*' DATA, POSITION '*position-number*'

Explanation: The processing of an SQL arithmetic function or arithmetic expression that was either in the SELECT list of an SQL select statement, in the search condition of a SELECT, UPDATE, or DELETE statement, during the evaluation of a column function, or in the SET clause of the UPDATE statement has encountered an exception error, possibly indicated by '*exception-type*'.

Possible values for '*exception-type*' are FIXED POINT OVERFLOW, DECIMAL OVERFLOW, ZERO DIVIDE, DIVIDE EXCEPTION, or EXPONENT OVERFLOW. '*data-type*' may indicate the data types of the items being manipulated, and '*operation-type*' may indicate the arithmetic operation that was being performed at the time of the error. If the error was in the

SELECT list of an outer SELECT statement then 'position-number' may indicate the position of the expression in the select list. The possible data-types are INTEGER, SMALLINT, DECIMAL, and FLOAT. The data type displayed in the message may indicate the data type of the temporary internal copy of the data which may differ from the actual column or literal data type due to conversions by DB2. The possible operation-types are ADDITION, SUBTRACTION, MULTIPLICATION, DIVISION, NEGATION, and COLUMN FUNCTION .

A fixed point overflow can occur during any arithmetic operation on either INTEGER or SMALLINT fields.

A decimal overflow exception can occur when one or more nonzero digits are lost because the destination field in any decimal operation is too short to contain the result.

A divide exception can occur on a decimal division operation when the quotient exceeds the specified data-field size. A zero divide occurs on a division by zero.

An exponent overflow can occur when the result characteristic of any floating-point operation exceeds 127 and the result fraction is not zero, for example, the magnitude of the result exceeds approximately 7.2E+75.

Note: Parts of 'exception-type' 'data-type' 'operation-type', 'position-number' may or may not be returned in SQLCA, depending on where the error was detected.

System Action: The statement cannot be executed. In the case of an INSERT or UPDATE statement, no data is updated or deleted. If the statement was a cursor-controlled FETCH, then the CURSOR will remain open unless the exception occurred while processing a column function (indicated by an operation-type of 'COLUMN FUNCTION'), in which case the CURSOR will be closed. If the CURSOR is closed, subsequent attempts to use that cursor without first doing an OPEN for it will receive SQLCODE -501. If it was a cursor-controlled OPEN, the CURSOR will remain closed.

Programmer Response: Examine the SQL statement to see if the cause (or the likely cause) of the problem can be determined. The problem may be data-dependent, in which case it will be necessary to examine the data that was being processed at the time the error occurred.

If the arithmetic expression in error was within the SELECT list of the outer SELECT statement then it is advisable to include an indicator variable for all expressions in the SELECT list. This allows processing to continue so that nonerror column and expression values can be returned.

See the explanation of SQLCODE -405 for allowed ranges of numeric data types.

Destination: 22012 if ZERO DIVIDE

Destination: 22003 if other than ZERO DIVIDE

-803 AN INSERTED OR UPDATED VALUE IS INVALID BECAUSE THE INDEX IN INDEX SPACE *indexspace-name* CONSTRAINS COLUMNS OF THE TABLE SO NO TWO ROWS CAN CONTAIN DUPLICATE VALUES IN THOSE COLUMNS. RID OF EXISTING ROW IS X'rid'

Explanation: The table that is the object of the INSERT or UPDATE operation is constrained (by UNIQUE INDEX in the INDEX SPACE 'indexspace-name') to have unique values in certain columns. Completion of the requested INSERT or

UPDATE would result in duplicate values occurring in row 'rid'.

If a view is the object of the INSERT or UPDATE statement, the table that defines the view is constrained. The update might also be caused by a DELETE operation of a parent row that cascades to a dependent row with a delete rule of SET NULL.

System Action: The INSERT, UPDATE, or DELETE statement cannot be executed. The object table is unchanged.

Programmer Response: Examine the definitions for UNIQUE INDEX in the INDEX SPACE 'indexspace-name' to determine the uniqueness constraint imposed. Please refer to SYSIBM.SYSINDEXES for the 'indexspace-name' and the associated 'index-name'.

For an UPDATE statement, verify that the specified operation is consistent with the uniqueness constraint. If this does not indicate the error, examine the object table to determine the cause of the problem.

For an INSERT statement, examine the object table to determine which values violate the uniqueness constraint. If the INSERT statement contains a subquery, match the contents of the table addressed by the subquery and the contents of the object table to determine the cause of the problem.

For a DELETE statement, examine the index key columns in the table that defines the index. These columns contain a foreign key, which when set NULL on a cascade delete from the object table, causes the duplicate values.

Destination: 23505

-804 AN ERROR WAS FOUND IN THE APPLICATION PROGRAM INPUT PARAMETERS FOR THE SQL STATEMENT. REASON *reason*

Explanation: The call parameter list or the SQLDA is invalid.

- The call parameter list, which is created by the precompiler, might be invalid if the application programmer has modified the output of the precompiler, used a variable name beginning with 'SQL' in the application program, or overwritten the call parameter list in some other way.
- The SQLDA, which is created by the application program, has an invalid data type or data length.
- The value of SQLDABC is not consistent with the value of SQLD.

The following is the list of reason codes:

- | | |
|-----------|--|
| 01 | Open issued for non-cursor. |
| 02 | Close issued for non-cursor. |
| 03 | Prepare of EXECUTE IMMEDIATE. |
| 04 | Statement is not recognized. |
| 05 | No statement string present. |
| 06 | Bad SQLDA format in parameter list. |
| 07 | SQLDA length is invalid. |
| 08 | Unrecognized input data type. |
| 09 | Invalid length for input variable. |
| 10 | Invalid data length for output variable. |
| 11 | The value of SQLDABC is not consistent with the value of SQLD. |

- 12 Invalid input data pointer.
- 13 Invalid output data pointer.
- 14 SQLN has too many items for SQLDABC.
- 15 Input RDI pointer is invalid

System Action: The statement cannot be executed.

System Programmer Response: Examine the application program for any of the errors noted under the explanation above. In general, the application programmer should not attempt to modify the output of the precompiler.

Destination: 07002

-805 DBRM or PACKAGE NAME *location-name.collection-id.dbrm-name.consistency-token*
NOT FOUND IN PLAN *plan-name.* **REASON**
reason

Explanation: An application program attempted to use a DBRM or package 'location-name.collection-id.dbrm-name.consistency-token' that was not found.

Collection id is blank ('location-name..dbrm-name.consistency-token') if the CURRENT PACKAGESET special register was blank for the local program execution.

The REASON token is blank if the length of 'location-name' is 16, the length of 'collection-id' is 18, and the length of 'dbrm-name' is 8 due to the length of SQLERRMT.

The DBRM or package name was not found for one or more of the following reasons:

- 01
 - The DBRM name was not found in the member list of the plan and there is no package list for the plan. Refer to the first SQL statement under problem determination for assistance in determining the problem.
 - The package name was not found because there is no package list for the plan. Refer to the second SQL statement under Problem Determination for assistance in determining the problem.

• 02

The DBRM name 'dbrm-name' did not match an entry in the member list or the package list. Any of the following conditions could be the problem:

Bind conditions:

- The 'collection-id' in the package list was not correct when the application plan 'plan-name' was bound. Refer to the second SQL statement under Problem Determination for assistance in determining the problem.
- The 'location-name' in the package list was not correct when the application 'plan-name' was bound. Refer to the second SQL statement under Problem Determination for assistance in determining the problem.
- The 'location-name' in the CURRENTSERVER option for the bind subcommand was not correct when the application plan 'plan-name' was bound. Refer to the third SQL statement under Problem Determination for assistance in determining the problem.

Application conditions:

- The CURRENT PACKAGESET special register was not set correctly by the application.
- The application was not connected to the proper location.

• 03

The DBRM name 'dbrm-name' matched one or more entries in the package list and the search of those entries did not find the package. The conditions listed under reason 02 or the following conditions might be the problem.

- The DBRM of the version of the application program being executed was not bound (A package with the same consistency token as that of the application program was not found.) Refer to the fourth and fifth SQL statements under the Problem Determination section.
- The incorrect version of the application program is being executed.

• 04

The package, 'collection-id.dbrm-name.consistency-token', does not exist at the remote site, 'location-name'. Refer to the fifth SQL statement under the Problem Determination section.

System Action: The statement cannot be executed.

System Programmer or Programmer response: Based on the above reasons, the programmer can perform **one or more** of the following operations for each reason to correct the error.

• 01

- Add the DBRM name 'dbrm-name' to the MEMBER list of the BIND subcommand and bind the application plan 'plan-name', or
- Add the PKLIST option with the appropriate package list entry to the REBIND subcommand and rebind the application plan 'plan-name'.

• 02

- Correct the dbrm-name of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan 'plan-name', or
- Correct the location-name of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan 'plan-name', or
- Correct the location-name in the CURRENTSERVER option and use the REBIND subcommand to rebind the application plan 'plan-name', or
- Set the CURRENT PACKAGESET special register correctly, or
- Connect to the correct location name.

• 03

All the operations under reason 02 above might fix the problem, plus the following operations.

- Correct the collection-id of the entry in the PKLIST option and use the REBIND subcommand to rebind the application plan 'plan-name', or
- Bind the DBRM of the version of the application program to be executed into the collection 'collection-id', or

- Execute the correct version of the application program. The consistency token of the application program is the same as the package that was bound.

• 04

All the operations under reason 02 and 03 might fix the problem.

Problem Determination: The following queries aid in determining the problem. Run these queries at the local location.

1. This query displays the DBRMs in the member list for the plan. If no rows are returned, then the plan was bound without a member list.

```
SELECT PLCREATOR, PLNAME, NAME, VERSION
FROM SYSIBM.SYSDBRM
WHERE PLNAME = 'plan-name';
```

2. This query displays the entries in the package list for the plan. If no rows are returned, then the plan was bound without a package list.

```
SELECT LOCATION, COLLID, NAME
FROM SYSIBM.SYSPACKLIST
WHERE PLANNAME = 'plan-name';
```

3. This query displays the CURRENTSERVER value specified on the BIND subcommand for the plan.

```
SELECT NAME, CURRENTSERVER
FROM SYSIBM.SYSPLAN
WHERE NAME = 'plan-name';
```

4. This query displays if there is a matching package in SYSPACKAGE. If the package is remote, put the location name in the FROM clause. If no rows are returned, the correct version of the package was not bound.

```
SELECT COLLID, NAME, HEX(CONTOKEN), VERSION
FROM <location-name.>SYSIBM.SYSPACKAGE
WHERE NAME = 'dbrm-name'
AND HEX(CONTOKEN) = 'consistency-token';
```

5. This query displays if there is a matching package in SYSPACKAGE. If the package is remote, put the location name in the FROM clause. Use this query when collection-id is not blank. If no rows are returned, the correct version of the package was not bound.

```
SELECT COLLID, NAME, HEX(CONTOKEN), VERSION
FROM <location-name.>SYSIBM.SYSPACKAGE
WHERE NAME = 'dbrm-name'
AND HEX(CONTOKEN) = 'consistency-token'
AND COLLID = 'collection-id';
```

Destination: 51002

-807 ACCESS DENIED: PACKAGE *package-name* IS NOT ENABLED FOR ACCESS FROM *connection-type connection-name*

Explanation: Access is denied for one of the following reasons:

- It is disabled, either from the 'connection-type' or from the 'connection-type' with the specific 'connection-name'.
- The attach library that you are using is from a previous release of DB2 that does not support the ENABLE and DISABLE options of the bind operation.

The variables are:

package-name The package name (collection.package-id).

connection-type One of the following: BATCH, DB2CALL, REMOTE, IMSBMP, IMSMPP, CICS, DLIBATCH, or UNKNOWN.

connection-name Name of the connection that is restricted. If all connection names from a specific connection-type are restricted, this value is not specified.

System Action: The statement is not executed and the package is not allocated.

System Programmer Response: One of the following:

- Rebind the package to enable it to execute with the required connection type and name.
- Check the SYSPLSYSTEM or SYSPKSYSTEM catalog table to find a connection from which the package can be executed.
- Correct the attach library.

Destination: 23509

-808 THE CONNECT STATEMENT IS NOT CONSISTENT WITH THE FIRST CONNECT STATEMENT

Explanation: The CONNECT semantics that apply to an application process are determined by the first CONNECT statement executed (successfully or unsuccessfully) by the application process. One of the following rules was violated:

- A type 2 CONNECT statement cannot be executed after a type 1 CONNECT statement was executed.
- A type 1 CONNECT statement cannot be executed after a type 2 CONNECT statement was executed.

System Action: The statement cannot be executed.

Programmer Response: The probable cause of this error is that different programs in the application process were precompiled with different CONNECT options.

Ensure that the application process uses either type 1 or type 2 CONNECT statements and then resubmit the job. The type of CONNECT to be used is a precompiler option. The default is type 2 CONNECT.

Destination: 08001

-811 THE RESULT OF AN EMBEDDED SELECT STATEMENT IS A TABLE OF MORE THAN ONE ROW, OR THE RESULT OF THE SUBQUERY OF A BASIC PREDICATE IS MORE THAN ONE VALUE

Explanation: Execution of an embedded SELECT statement has resulted in a result table containing more than one row. Alternatively, a subquery contained in a basic predicate has produced more than one value.

System Action: The statement cannot be executed.

Programmer Response: Examine the syntax of the statement to ensure that it contains the proper condition specifications. If it does, there may be a problem with the data that is causing more than one row or value to be returned when you do not expect it.

Destination: 21000

-812 THE SQL STATEMENT CANNOT BE PROCESSED BECAUSE A BLANK COLLECTION-ID WAS FOUND IN THE CURRENT PACKAGESET SPECIAL REGISTER WHILE TRYING TO FORM A QUALIFIED PACKAGE NAME FOR PROGRAM *program-name.consistency-token* USING PLAN *plan-name*

Explanation: A last or only entry in the package list for the plan contained asterisk (*) the 'collection-id' which requires the 'CURRENT PACKAGESET' special register to be set to a nonblank 'collection-id' in order to form a qualified package name.

System Action: The statement cannot be executed.

Programmer Response: Set the 'CURRENT PACKAGESET' special register to the desired 'collection-id' or have your system administrator check the plan's package list for correctness.

Destination: 22508

-815 A GROUP BY OR HAVING CLAUSE IS IMPLICITLY OR EXPLICITLY SPECIFIED IN AN EMBEDDED SELECT STATEMENT OR A SUBQUERY OF A BASIC PREDICATE

Explanation: An embedded SELECT statement or a subquery of a basic predicate either (1) directly contains a GROUP BY or HAVING clause, or (2) specifies as its object a view having a definition that includes a GROUP BY or HAVING clause. Neither construct is permitted.

System Action: The statement cannot be executed. No data was retrieved.

Programmer Response: The implied function is not supported by DB2. In the case of a view, embedded SELECT statements cannot be used to retrieve data from that view.

The SELECT INTO statement should be changed to a DECLARE CURSOR statement in order to use the GROUP BY/HAVING. In the case of the subquery, there is no coding workaround. A GROUP BY/HAVING cannot be used within the subquery of a basic predicate because the subquery is allowed to return only a single value. For more information on basic predicates, refer to *SQL Reference*.

Destination: 42920

-817 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THE STATEMENT WILL RESULT IN A PROHIBITED UPDATE OPERATION.

Explanation: The application attempted to execute an SQL statement that would result in updates to user data or to the subsystem catalog. This is prohibited for one of the following reasons:

- The application is running as an IMS inquiry-only transaction.
- The application is an IMS or CICS application that is attempting to update data at a remote DBMS that does not support two-phase commit.
- The application is attempting to update data at multiple locations and one of the locations does not support two-phase commit.

These SQL statements include INSERT, UPDATE, DELETE, CREATE, ALTER, DROP, GRANT, and REVOKE.

System Action: The statement cannot be executed.

Programmer Response: If the application is running as an IMS inquiry-only transaction, see your IMS system programmer about changing the inquiry-only status of the transaction under which your application is running.

If the IMS or CICS application is attempting a remote update, either the application must be changed to run as a local application on the server DBMS, or the server DBMS must be upgraded to support two-phase commit.

If the application is attempting to update data at multiple locations, either the application must be changed, or all DBMSs involved must be upgraded to support two-phase commit.

Destination: 25000

-818 THE PRECOMPILER-GENERATED TIMESTAMP *x* IN THE LOAD MODULE IS DIFFERENT FROM THE BIND TIMESTAMP *y* BUILT FROM THE DBRM *z*

Explanation: The SQL precompiler places timestamp 'y' in the DBRM, and time stamp 'x' in the parameter list in the application program for each SQL statement. At BIND time, DB2 stores the DBRM timestamp for run-time use. At run-time, timestamp 'x', for the SQL statement being processed, is compared with timestamp 'y' derived from the DBRM 'z' at BIND time. If the two timestamps do not match, the DBRM and the application program were not the result of the same precompile.

This problem can occur if you:

- Precompile, compile, and link, without doing a BIND of the application,
- Precompile and BIND, without doing the compile and link for the application program, or
- BIND the application using a DBRM that resulted from a different precompile of the application program than that which produced the object module that is linked into the application module.

The timestamps 'x' and 'y' are DB2 internal timestamps. They do not have an external interpretation.

System Action: The statement cannot be executed.

Programmer Response: BIND the application again, using the DBRM for the application program that matches the object module.

Destination: 51003

-819 THE VIEW CANNOT BE PROCESSED BECAUSE THE LENGTH OF ITS PARSE TREE IN THE CATALOG IS ZERO

Explanation: SYSIBM.SYSVTREE.VTREE is a varying-length string column that contains the parse trees of views. In processing a view, the length control field of its parse tree was found to be zero.

System Action: The statement cannot be executed.

Programmer Response: This is a system error. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Destination: 58004

-820 THE SQL STATEMENT CANNOT BE PROCESSED BECAUSE *catalog-table* CONTAINS A VALUE THAT IS NOT VALID IN THIS RELEASE

Explanation: A column of the indicated catalog table contains a value that prevents further processing of an SQL statement. The meaning of the value is unknown to the release of DB2. If a fall back has occurred, the value is probably the result of the use of new function prior to the fall back.

System Action: The statement cannot be executed.

Programmer Response: Verify that the statement refers to the intended tables or views and that the problem is the result of a fall back. If this is the case, the statement cannot be corrected because it depends on a function that is not supported in the current release. If the problem is not the result of a fallback, -820 is a system error. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Destination: 58004

-822 THE SQLDA CONTAINS AN INVALID DATA ADDRESS OR INDICATOR VARIABLE ADDRESS

Explanation: The application program has placed an invalid address in the SQLDA.

System Action: The statement cannot be executed.

Programmer Response: Correct the application program such that valid addresses are placed in SQLDA.

Destination: 51004

-840 TOO MANY ITEMS RETURNED IN A SELECT OR INSERT LIST

Explanation: The number of items returned in the select list or presented in an insert list exceeds the allowable maximum of 750.

System Action: The statement cannot be executed.

Programmer Response: Determine whether all the information is actually needed. (Note that the number of items returned by the select list * in the SQL statement SELECT * FROM A, B, C is the sum of the number of columns in all three tables.) If not, rewrite the SQL statement so that only the necessary items of information are returned. If so, break the SQL statement up into two or more statements, as required.

Destination: 54004

-842 A CONNECTION TO *location-name* ALREADY EXISTS

Explanation: One of the following situations occurred:

- A CONNECT statement identifies a location with which the application process has a private connection, using system-directed access.
- SQLRULES(STD) is in effect and a CONNECT statement identifies an existing SQL connection.
- A private connection, using system-directed access, cannot be established because of an existing SQL connection to that location.

System Action: The statement cannot be executed.

Programmer Response: The correction depends on the error, as follows:

- If the location name is not the intended name, correct it.
- If SQLRULES(STD) is in effect and the CONNECT statement identifies an existing SQL connection, replace the CONNECT with SET CONNECTION or change the option to SQLRULES(DB2).
- If the CONNECT statement identifies an existing private connection, destroy that connection (by using the RELEASE statement in a previous unit of work) before executing the CONNECT statement. If the SQL statements following the CONNECT can be executed using system-directed access, an alternative solution is to change the application to use that method.
- If system-directed access cannot be used, destroy the conflicting SQL connection (by using the RELEASE statement in a previous unit of work) before executing the SQL statement that requires system-directed access. An alternative solution is to change the application so that only application-directed access is used.

Correct the error in the application, rebind the plan or package, and resubmit the job.

Destination: 08002

-843 THE SET CONNECTION OR RELEASE STATEMENT MUST SPECIFY AN EXISTING CONNECTION

Explanation: One of the following rules was violated:

- A SET CONNECTION statement must identify an existing SQL connection of the application process.
- A RELEASE statement must identify an existing connection of the application process.

System Action: The statement cannot be executed.

Programmer Response: The correction depends on the error, as follows:

- If the location name is not the intended name, correct it.
- If the location name does not identify an existing SQL connection, replace the SET CONNECTION with a CONNECT statement.
- If RELEASE CURRENT was executed in the unconnected state or the specified location name does not identify an existing SQL or DB2 private connection, delete the RELEASE statement.

Correct the error in the application, rebind, the plan and resubmit the job.

Destination: 08003

-870 THE NUMBER OF HOST VARIABLES IN THE STATEMENT IS NOT EQUAL TO THE NUMBER OF DESCRIPTORS

Explanation: The number of host variables in the SQL statement does not match the number of host variable descriptors.

System Action: The statement cannot be executed.

Programmer Response: Correct the application program. The most likely cause of this problem is a missing colon before a host variable.

Problem Determination: If the SQL statement is bound locally, descriptors are built by the DB2 precompiler. For a remote SQL statement, descriptors are built by DDF and are passed in the array SQLSTTVRB.

Destination: 58026

-872 A VALID CCSID HAS NOT YET BEEN SPECIFIED FOR THIS MVS/ESA SUBSYSTEM

Explanation: A valid CCSID was not specified on either the ASCII CODED CHAR SET or EBCDIC CODED CHAR SET subsystem parameter on installation panel DSNTIPF.

System Action: The statement cannot be executed.

Programmer Response: Contact your system administrator to have the necessary CCSID defined for your system.

Destination: 51032

-873 DATA ENCODED WITH DIFFERENT CCSIDS CANNOT BE REFERENCED IN THE SAME SQL STATEMENT

Explanation: You cannot refer to a column defined in an ASCII table in the same SQL statement as a column defined in an EBCDIC table.

This situation can also occur when a table is created; a DECP CCSID value is changed; another table is created, and then the two tables are referenced in a single SQL statement.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

Destination: 53090

-874 THE ENCODING SCHEME SPECIFIED FOR THE TABLE IS NOT THE SAME AS THAT USED FOR THE TABLE SPACE CONTAINING THIS TABLE

Explanation: If CCSID ASCII was specified, then the containing table space is EBCDIC. If CCSID EBCDIC was specified, then the containing table space is ASCII. The encoding scheme of a table must be the same as the table space which contains the table.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

Destination: 53091

-875 *operand* CANNOT BE USED WITH THE ASCII DATA REFERENCED

Explanation: ASCII data was referenced in one of the following situations:

- A LIKE predicate refers to a mixed data column in an ASCII table. The LIKE predicate is not supported for mixed ASCII data.
- A VARGRAPHIC function was specified for a column in an ASCII table. The VARGRAPHIC function is not supported for ASCII data.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement.

Destination: 42988

-876 '*object*' CANNOT BE CREATED, REASON '*reason*'

Explanation: The object cannot be created in the SQL statement.

Possible values for '*object*':

TYPE 1 INDEX The object being created is a type 1 index.

INDEX The object being created is an index.

Possible values for '*reason*':

TABLE DEFINED AS ASCII

The underlying table is defined as ASCII. Only type 2 indexes are supported for ASCII tables.

PIECESIZE IS NOT VALID

PIECESIZE is only valid for non-partitioned indexes.

PIECESIZE 4GB IS NOT VALID

PIECESIZE 4GB is only valid for non-partitioned indexes on LARGE tables.

System Action: The statement cannot be executed.

Programmer Response: Correct the SQL statement for the object being created.

Destination: 53092

-877 CCSID ASCII IS NOT ALLOWED FOR THIS DATABASE OR TABLE SPACE

Explanation: The database or table space specified is required to be in EBCDIC.

System Action: The statement cannot be executed.

Programmer Response: Remove the CCSID ASCII clause from the statement.

Destination: 53093

-878 THE PLAN_TABLE USED FOR EXPLAIN CANNOT BE ASCII

Explanation: PLAN_TABLEs must be encoded in EBCDIC for use with EXPLAIN.

System Action: The statement cannot be executed.

Programmer Response: Drop the existing PLAN_TABLE, and recreate it with the EBCDIC encoding scheme.

Destination: 53094

-879 A COLUMN CANNOT BE CREATED AS GRAPHIC, VARGRAPHIC OR LONG VARGRAPHIC IN AN ASCII TABLE

Explanation: A CREATE or ALTER TABLE statement for an ASCII table cannot define a column as GRAPHIC, VARGRAPHIC or LONG VARGRAPHIC when the MIXED DATA install option is set to NO.

System Action: The statement cannot be executed.

Programmer Response: Contact your system administrator to properly setup the installation options for ASCII tables, or change the data types of the columns in your CREATE or ALTER TABLE statement.

Destination: 53095

-900 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THE APPLICATION PROCESS IS NOT CONNECTED TO AN APPLICATION SERVER

Explanation: A previous failure has placed the application process in the unconnected state. The only SQL statements that can be successfully executed from the unconnected state are CONNECT, COMMIT, ROLLBACK, and local SET statements.

System Action: The statement cannot be executed.

Programmer Response: It is possible that no response is required because checking for -900 is one way of detecting the unconnected state. If this is not the case, the logic of the application program must be changed. For additional information, see the description of the CONNECT statement in Chapter 6 of *SQL Reference*.

Destination: 08003

-901 UNSUCCESSFUL EXECUTION CAUSED BY A SYSTEM ERROR THAT DOES NOT PRECLUDE THE SUCCESSFUL EXECUTION OF SUBSEQUENT SQL STATEMENTS

Explanation: A system error occurred that prevented successful execution of the current SQL statement. However, the error does not prevent successful execution of further SQL statements.

The error might occur if the length of the SQL statement is less than 0, or is greater than the DB2 maximum length for a statement.

This SQLCODE might also occur when distributed commit processing encounters an error. In this case, all servers in the unit of work that support distributed two-phase commit backed out the unit of work. If a server that does not support distributed two-phase commit has updates in the unit of work, that server must be queried to determine if its updates were committed or backed out.

Finally, this error might occur during commit if post-processing cannot be completed because of an update that changes the partition of a row. Resource unavailable problems can prevent the post-processing from completing. The existence of held cursors can prevent the post-processing from completing.
Commit is failed. The transaction is aborted.

System Action: The statement cannot be executed. A X'04E' abend might be requested for the application. The application program can have a recovery routine to recover from such an abend and can retry SQL statements.

Programmer Response: If an abend occurred, notify the system programmer for analysis of the abend that caused this return code.

Even if an abend occurred, an application program receiving this return code can retry and is not prohibited from executing further SQL statements.

Destination: 58004

-902 POINTER TO THE ESSENTIAL CONTROL BLOCK (CT/RDA) HAS VALUE 0, REBIND REQUIRED

Explanation: Pointer to the essential control block, either the CT or the RDA is zeroes. This precludes the successful execution of the current SQL statement, as well as any subsequent SQL statements.

System Action: The statement cannot be executed. The application program is not permitted to issue additional SQL statements. For example, a recovery routine associated with the application program may not issue additional SQL statements.

Programmer Response: Rebind the failing application program and try again. If the problem persists, examine your DBRM and make sure it matches your program.

Destination: 58005

-904 UNSUCCESSFUL EXECUTION CAUSED BY AN UNAVAILABLE RESOURCE. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

Explanation: The SQL statement could not be executed because resource '*resource-name*' of type '*resource-type*' was not available at the time for the reason indicated by '*reason-code*'. Refer to Table 3 in "Appendix B. Problem Determination" on page X-5 for an explanation of resource type codes. Refer to "Section 4. DB2 Codes" on page 4-1 for an explanation of the given reason code.

System Action: The SQL statement cannot be executed. If the SQL statement being executed was a cursor FETCH, DB2 closes the cursor. Subsequent attempts to use that cursor without first doing an OPEN for it receive an SQLCODE -501.

Programmer Response: Verify the identity of the resource that was not available. To determine why the resource was unavailable, refer to the specified '*reason-code*'.

Destination: 57011

-905 UNSUCCESSFUL EXECUTION DUE TO RESOURCE LIMIT BEING EXCEEDED, RESOURCE NAME = *resource-name* LIMIT = *limit-amount1* CPU SECONDS (*limit-amount2* SERVICE UNITS) DERIVED FROM *limit-source*

Explanation: The execution of the SQL statement was terminated because a resource limit was exceeded.

resource-name The name of the resource whose limit was exceeded. It is also the name of the column in the DB2 table from which the limit was derived. The *resource-name* can be ASUTIME, which is the number of CPU seconds permitted for each SQL statement.

limit-amount1 The limit that was exceeded in CPU seconds

limit-amount2 The limit that was exceeded in service units

limit-amount1 The maximum number of CPU seconds permitted

limit-amount2 The maximum number in service units permitted

limit-source The source used to derive the limit-amount: the name of a resource limit specification table, a system parameter, or the SYSIBM.SYSPROCEDURES catalog table. If the source is a system parameter, the resource limit specification table did not contain an applicable entry or an error occurred while accessing the table.

System Action: If the *limit-source* was a resource limit specification table or a system parameter, the execution of this SQL statement is terminated. A record containing more detailed information about this failure is generated. If an SQL cursor is associated with the failed instruction, its position is unchanged and a CLOSE or PREPARE command can be issued. If any other operation is attempted with the cursor, it cannot be executed and SQLCODE -905 is returned. If there is no cursor, this statement was rolled back.

Programmer Response: Determine why this SQL statement or stored procedure took so long and take appropriate action. Consider simplifying the SQL statement, restructuring tables and indexes, or contacting the installation group responsible for maintaining the resource limit specification tables.

If the *limit-source* was a resource limit specification table or a system parameter, the application program that receives this return code can execute additional SQL statements.

If the *limit-source* was the SYSIBM.SYSPROCEDURES table, the application program must roll back.

Destination: 57014

-906 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE THIS FUNCTION IS DISABLED DUE TO A PRIOR ERROR

Explanation: Execution of the SQL statement failed because the requested function had been disabled by a prior error. This situation can arise if the application program has intercepted an abend (for instance, by an ON ERROR condition in a PL/I program) and continued to execute SQL statements. This situation may also arise if a DB2 CICS transaction encountered a create thread error yet continued to issue SQL requests without issuing a SYNCPOINT ROLLBACK first.

System Action: The statement cannot be executed.

Programmer Response: In general, an application program should terminate upon receipt of this return code. All subsequent attempts by the application to execute other SQL statements will also fail with the same return code. In the case of a DB2 CICS transaction, if the SQLERRP field in the SQLCA contains the module name DSNCEXT1, the transaction may issue a SYNCPOINT ROLLBACK and continue processing. If the transactions chooses to ROLLBACK and continue processing, it must be capable of correcting the situation that caused the create thread error to occur originally.

Destination: 51005

-908 bind-type ERROR USING auth-id AUTHORITY BIND, REBIND OR AUTO-REBIND OPERATION IS NOT ALLOWED

Explanation: For BIND and REBIND, the indicated authorization ID is not allowed to perform the indicated bind-type against a plan or package. An entry in the resource limit specification table (RLST) prohibits binding and rebinding by this authorization ID, or all authorization IDs. For AUTO-REBIND, the system parameter controlling AUTO-REBIND operations is set to disallow AUTO-REBIND.

bind-type Type of bind operation (BIND, REBIND or AUTO-REBIND).

auth-id Authorization ID of the invoker of the BIND subcommand or primary authorization ID of the invoker of the plan for AUTO-REBIND operations.

System Action: The plan or package is not bound.

System Programmer Response: If the indicated authorization id should be allowed to bind, change the entry in the active RLST table. If AUTO-REBIND operations are disabled, rebind the package before reexecuting the package.

Destination: 23510

-910 THE SQL STATEMENT CANNOT ACCESS AN OBJECT ON WHICH A DROP OR ALTER IS PENDING

Explanation: The application program has issued a DROP or ALTER against an object, and then attempted to access that object before the DROP or ALTER is completed.

System Action: The statement cannot be executed.

Programmer Response: In the case of ALTER, the logic of the application program must be modified so that a COMMIT (or the IMS or CICS equivalent) is executed between the ALTER and the failing SQL statement.

For DROP, the logic of the application program should be modified such that there is no attempt to access an object after the DROP has been executed.

Destination: 57007

-911 THE CURRENT UNIT OF WORK HAS BEEN ROLLED BACK DUE TO DEADLOCK OR TIMEOUT. REASON *reason-code*, TYPE OF RESOURCE *resource-type*, AND RESOURCE NAME *resource-name*

Explanation: The current unit of work was the victim in a deadlock, or experienced a timeout, and had to be rolled back.

The reason code indicated whether a deadlock or timeout occurred. Refer to message DSNT500I under "DSNT... Messages" on page 3-201 for an explanation of 'resource-type' and 'resource-name'. Refer to Table 3 in "Appendix B. Problem Determination" on page X-5 for an explanation of resource type codes.

SQLERRD(3) also contains the *reason-code* which indicates
whether a deadlock or timeout occurred. The most common
reason codes are:

- # • 00C90088 — deadlock
- # • 00C9008E — timeout

Note: The changes associated with the unit of work must be entered again.

System Action: The statement cannot be executed. The application is rolled back to the previous COMMIT.

Programmer Response: A long-running application, or an application that is likely to encounter a deadlock, should (if possible) issue frequent COMMIT commands. This can lessen the possibility of a deadlock occurring. See message DSNT376I for other possible ways to avoid future deadlocks or timeouts. On receipt of the SQLCODE -911, the application should, in general, terminate.

For more information about how IMS, CICS, and TSO handle deadlocks, see Section 4 of *Application Programming and SQL Guide*.

Destination: 40001

-913 UNSUCCESSFUL EXECUTION CAUSED BY DEADLOCK OR TIMEOUT. REASON CODE
reason-code, **TYPE OF RESOURCE** *resource-type*, **AND RESOURCE NAME** *resource-name*

Explanation: The application was the victim in a deadlock or experienced a timeout. The reason code indicates whether a deadlock or timeout occurred.

Refer to message DSNT500I under "DSNT... Messages" on page 3-201 for an explanation of 'resource-type' and 'resource-name'. Refer to Table 3 in "Appendix B. Problem Determination" on page X-5 for an explanation of resource type codes.

System Action: The SQL statement cannot be executed. If the SQL statement being executed was a cursor FETCH, DB2 closes the cursor.

SQLERRD(3) also contains the *reason-code* which indicates whether a deadlock or timeout occurred. The most common reason codes are:

- # • 00C90088 — deadlock
- # • 00C9008E — timeout

Programmer Response: The application should either commit or roll back to the previous COMMIT. Then, generally, the application should terminate. See message DSNT376I for possible ways to avoid future deadlocks or timeouts.

For more information about how CICS and TSO handle deadlocks, see Section 4 of *Application Programming and SQL Guide*.

Destination: 57033

-917 BIND PACKAGE FAILED

Explanation: An error has occurred which prevents the package from being created. This SQLCODE can be issued during bind or commit processing.

System Action: The bind fails and the package is not created. If issued during commit processing, all changes to the database are rolled back. If issued during bind processing, only package creation fails. Other changes within the logical unit of work are committable.

Programmer Response: Correct the cause of the problem and try again.

Problem Determination: Inspect the SQLCODES issued for the SQL statements of the package.

Destination: 42969

-918 THE SQL STATEMENT CANNOT BE EXECUTED BECAUSE A CONNECTION HAS BEEN LOST

Explanation: Execution of the SQL statement failed because a communications link between the local DB2 and at least one remote server no longer exists. A previous failure caused this condition.

System Action: In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: In general, an application program should issue a static ROLLBACK. Attempts by the application to issue SQL statements other than static ROLLBACK might fail. Once the static ROLLBACK is issued, the application can resume execution.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

Destination: 51021

-919 A ROLLBACK OPERATION IS REQUIRED

Explanation: The unit of work was placed in a state where a rollback operation is required. This can happen for the following reasons:

- An SQL statement updated a distributed database server, but the database server can be used only for read-only operations. Either updates are currently restricted to servers that support distributed two-phase commit and this application server does not support distributed two-phase commit, or updates are restricted to a single server that does not support distributed two-phase commit and this application server is not that server.

The unit of work must be terminated by a rollback operation because the update made (but not committed) at the application server cannot be committed consistently with other current or future updates made to this distributed unit of work.

- An abend occurred during the execution of a stored procedure, or a restricted SQL statement was issued from a stored procedure.

System Action: In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: Correct the application or stored procedure, rebind it, and resubmit the job.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

Destination: 56045

-922 AUTHORIZATION FAILURE: *error-type* ERROR. REASON *reason-code*

Explanation: Authorization failed because of the error indicated by 'error-type'

error-type Types of authorization failure

- User authorization
- Plan access

- Duplicate exit requested
- Installation error
- INTERNAL

#

reason-code DB2 reason code associated with authorization failure

System Action: The statement cannot be executed. The connection to DB2 is not established.

Programmer Response: If 'error-type' is 'user authorization:', the authorization-ID specified to DB2 through your attachment facility is not valid for DB2. See your system programmer or your CICS, IMS, or TSO system administrator.

If 'error-type' is 'plan access', then the authorization ID associated with this connection is not authorized to use the specified plan name or the specified plan name does not exist. See your system administrator.

If 'error-type' is 'duplicate exit', then you requested a duplicate exit.

If 'error-type' is 'installation error', a connection or sign-on exit denied your request. See your system programmer.

If 'error-type' is INTERNAL, then please call the IBM Support Center. The information you will need is the program using DB2, the type of request being invoked, and the authorization request.

Look up the reason code in "Section 4. DB2 Codes" on page 4-1 for further information.

Any attempts to issue SQL statements following the -922 SQLCODE causes unpredictable results.

Destination: 42505

-923 CONNECTION NOT ESTABLISHED: DB2 condition REASON reason-code, TYPE resource-type, NAME resource-name

Explanation: The connection to DB2 failed for the reason indicated by *condition*, which can be any of the following:

- DB2 not up
- DB2 not operational
- DB2 shutdown in progress
- DB2 restricted access mode
- Allocation error
- DB2 - CICS attachment not up
- DB2 - CICS ENTRY disabled

#

Possible causes of an allocation error are:

- The application plan does not exist.
- The application plan is inoperative. An explicit REBIND or BIND is required.
- The application plan is invalid. Underlying resources have changed.
- A required database, table space, table, or index is unavailable.
- Data set allocation failed for a required data set.
- There is insufficient virtual storage.
- The application is trying to execute the plan from a system (environment) that was restricted when the plan was bound or rebound. Check the SYSPLSYSTEM table to determine from which systems (for example, IMS or CICS) the plan can be executed.

If the *condition* is "CICS attachment not up", then NAME indicates the DB2 subsystem that is not available. The *reason code* indicates the reason the attachment is not available.

If the *condition* is "CICS entry disabled", then NAME indicates the entry that is disabled.

System Action: The statement cannot be executed. The connection to DB2 is not established.

Programmer Response: If the connection failed because either DB2 or a required database, table space, table, or index was unavailable, wait until it is available before invoking the application again.

If allocation failed for an application plan, REBIND the plan to determine the problem. Error messages are produced explaining why the plan could not be allocated.

For other types of allocation errors, installation action might be required to correct the problem.

For CICS attachment failures, resolve the primary cause as noted by the reason code. Then restart the attachment.

Problem Determination: The *reason-code*, *resource-type*, and *resource-name* might not be available. If they are not available, nothing appears. If they are available, refer to Section 4. DB2 Codes for an explanation of the *reason-code*, *resource-type*, and *resource-name*.

Refer to message DSNT500I under DSNT... Messages for an explanation of resource type and resource name. Refer to Table 3 in "Appendix B. Problem Determination" on page X-5 for an explanation of resource type codes. Any attempts to issue SQL statements after receiving SQLCODE -923 will cause unpredictable results.

Destination: 57015

-924 DB2 CONNECTION INTERNAL ERROR, function-code, return-code, reason-code

Explanation: Connection to DB2 has failed because of an unexpected internal error, identified by the 'reason-code'.

System Action: The statement cannot be executed. The connection to DB2 is not established.

Programmer Response: Look up the abend 'reason-code' in Section 4. DB2 Codes for further information. The requested 'function-code' and 'return-code' may provide additional information. Any attempts to issue SQL statements following the SQLCODE -924 will cause unpredictable results.

Destination: 58006

-925 COMMIT NOT VALID IN IMS, CICS OR RRSF ENVIRONMENT

Explanation: An application executing in either an IMS or CICS environment or an application executing in an RRSF environment when DB2 is not the only resource manager has attempted to execute a COMMIT statement. The SQL COMMIT statement cannot be executed in these environments.

| **System Action:** The statement cannot be executed. No commit is performed.

Programmer Response: The IMS, CICS or RRS protocols should be used to commit work in these environments.

If a stored procedure is being called from IMS or CICS, ensure that the stored procedure is not defined to perform a commit on return.

Destination: 2D521

-926 ROLLBACK NOT VALID IN IMS, CICS OR RRSF ENVIRONMENT

Explanation: An application executing in either an IMS or CICS environment or an application executing in an RRSF environment when DB2 is not the only resource manager has attempted to execute a ROLLBACK statement. The SQL ROLLBACK statement cannot be executed in these environments.

System Action: The statement cannot be executed. No rollback is performed.

Programmer Response: The IMS, CICS or RRS protocols should be used to rollback work in these environments.

Destination: 2D521

-927 THE LANGUAGE INTERFACE (LI) WAS CALLED WHEN THE CONNECTING ENVIRONMENT WAS NOT ESTABLISHED. THE PROGRAM SHOULD BE INVOKED UNDER THE DSN COMMAND

Explanation: In the TSO environment, the user has attempted to execute an application program without first establishing the correct execution environment by issuing the DSN command. In the IMS, CICS, or call attachment facility (CAF) environment, the user has attempted to execute an application program that is not using the correct language interface module.

System Action: The statement cannot be executed.

Programmer Response: In the TSO environment, DB2 application programs should be invoked under the RUN subcommand of the DSN command processor. In the IMS, CICS or CAF environment check that the application was link-edited with or is dynamically allocating the correct language interface module. The language interface modules required in each environment are as follows:

- IMS: DFSLI000
- CICS: DSNCLI
- CAF: DSNALI
- TSO: DSNELI

The DYNAM option can result in the incorrect language interface module being loaded at runtime.

Destination: 51006

-929 FAILURE IN A DATA CAPTURE EXIT: *token*

Explanation: 'token' is an information string provided by DPROP's exit routine which captures data changes in tables defined with DATA CAPTURE CHANGES.

System Action: The information string is placed in the SQLERRM area of the SQLCA.

System Programmer Response: For documentation of the actions associated with this SQLCODE, refer to the Data Propagator (DPROP) publications.

Destination: 58002

-939 ROLLBACK REQUIRED DUE TO UNREQUESTED ROLLBACK OF A REMOTE SERVER

Explanation: A dynamic commit was executed preceding the execution of this request. The remote server to which the application was CONNECTed during the dynamic COMMIT successfully committed. However, at least one other remote server (which was read-only) rolled back its portion of the distributed unit of work during the dynamic commit.

To ensure that an application that uses cursor-hold cursors does not incorrectly assume cursor position is being maintained at any remote server that rolled back, the application must perform a rollback operation.

Communications are still established with all remote servers.

System Action: In the IMS and CICS environments, all SQL statements are rejected until the rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: Issue the appropriate (depending on the environment) request to cause a rollback. Re-establish any cursor positioning and continue the application with the first request that received the -939 SQLCODE.

SQLERRP contains the name of the module that detected the previous failure and placed the application in the must-abort state.

Destination: 51021

-947 THE SQL STATEMENT FAILED BECAUSE IT WILL CHANGE A TABLE DEFINED WITH DATA CAPTURE CHANGES, BUT THE DATA CANNOT BE PROPAGATED

Explanation: The DPROP SUPPORT option on the installation panel is set to 2 (support DPROP only). The SQL statement would have changed a table defined with DATA CAPTURE CHANGES. However, the data cannot be propagated because the SQL statement did not originate from an IMS subsystem, or monitor trace class 6 was not active at the beginning of the unit of work for that change.

System Action: The statement is not executed.

System Programmer Response: Take one of the following actions:

- Change the installation option to 1 (no propagation) or 3 (permit changes from any subsystem).
- Change the application program that receives this SQLCODE so that it can be run in an IMS subsystem, and activate monitor trace class 6.

If the installation option is changed to 3, SQL changes to tables defined with DATA CAPTURE CHANGES are permitted from any subsystem, but they are not propagated unless the environment is set up for propagation.

Destination: 56038

-948 DISTRIBUTED OPERATION IS INVALID

Explanation: The unit of work was initiated before DDF was started, and the application attempted to perform a distributed operation. The unit of work must be terminated by a rollback operation.

System Action: In the IMS and CICS environments, all SQL statements are rejected until a rollback occurs. In the other environments, all SQL statements other than a static ROLLBACK are rejected until a static ROLLBACK is executed.

Programmer Response: An application that performs local database updates before DDF is started cannot perform distributed operations within the same unit of work. The current unit of work must be terminated by a rollback operation and a new unit of work must be initiated before any SQL operations can be performed.

Restart the current unit of work.

Destination: 56062

-950 THE LOCATION NAME SPECIFIED IN THE CONNECT STATEMENT IS INVALID OR NOT LISTED IN THE COMMUNICATIONS DATABASE

Explanation: One of the following conditions applies:

- The location name is blank.
- The data type of the host variable is not character string.
- The length attribute of the host variable is greater than 16.
- The location name does not appear in the LOCATIONS column of the SYSIBM.LOCATIONS table, nor is it the name of the local DB2 subsystem.

System Action: The statement cannot be executed. The application process is placed in the unconnected state.

Programmer Response: If the location name is specified as the value of a host variable, ensure that the name is left justified in the host variable and, if necessary, padded on the right with blanks. If this is not the problem, either SYSIBM.LOCATIONS must be updated to include the specified name, or the specified name must be changed to match a name in SYSIBM.LOCATIONS.

Destination: 42705

-965 STORED PROCEDURE *procname* TERMINATED ABNORMALLY

Explanation: DB2 received an SQL CALL statement for a stored procedure. The stored procedure terminated abnormally while attempting to satisfy the request.

procname The name of the stored procedure that terminated abnormally

System Action: The statement cannot be executed. The calling application must issue a ROLLBACK statement before attempting to continue SQL processing.

If the abnormal termination count for procedure *procname* was reached, the procedure is stopped and further requests for the procedure are rejected.

Programmer Response: Correct the cause of the stored procedure abnormal termination. Then issue the DB2 -START PROCEDURE command to activate the stored procedure.

Destination: 51021

-981 THE SQL STATEMENT FAILED BECAUSE THE RRSFSAF CONNECTION IS NOT IN A STATE THAT ALLOWS SQL OPERATIONS, REASON *reason-code*.

Explanation: The application attempted to execute an SQL operation but the RRSFSAF connection was not in a state that allows the processing of SQL statements.

System Action: The statement cannot be executed.

Programmer Response: See reason-code in "Section 4. DB2 Codes" on page 4-1 for an explanation of the problem. Correct the error in the application, REBIND, and run the application again.

Destination: 57015

-991 CALL ATTACH WAS UNABLE TO ESTABLISH AN IMPLICIT CONNECT OR OPEN TO DB2. RC1= *rc1* RC2= *rc2*

Explanation: Call attach attempted to perform an implicit connect and open as the result of an SQL statement. The connect or open failed with the returned values.

rc1 The value returned in FRBRC1 for the failed CONNECT or OPEN request.

rc2 The value returned in FRBRC2 for the failed CONNECT or OPEN request.

System Action: The statement cannot be executed.

Programmer Response: Verify that the application intended to use the call attachment facility (CAF) as the mechanism to connect to DB2. For stored procedures running in the WLM-established stored procedure address space the application must be link-edited with or dynamically allocate the RRS attachment language interface module (DSNRLI), not CAF.

Destination: 57015

-2001 THE NUMBER OF HOST VARIABLE PARAMETERS FOR A STORED PROCEDURE IS NOT EQUAL TO THE NUMBER OF EXPECTED HOST VARIABLE PARAMETERS. ACTUAL NUMBER *sqlданum*, EXPECTED NUMBER *opnum*

Explanation: DB2 received an SQL CALL statement for a stored procedure. However, the number of host variable parameters supplied on the CALL statement does not match the expected number of host variable parameters.

sqlданum The number of host variable parameters as determined by examining the SQLDA.

opnum The expected number of host variable parameters as determined by parsing the statement.

System Action: The statement cannot be executed.

Programmer Response: If the SQL CALL statement is coded incorrectly, modify the SQL application to provide the correct number of parameters on the SQL CALL statement.

Destination: 53089

-20104 AN ATTEMPT TO ALTER A CCSID FROM *from-ccsid* TO *to-ccsid* FAILED

Explanation: The statement attempted to alter the CCSID for a database or table space and the statement failed.

from-ccsid The CCSID that is currently in use for the database or table space.

to-ccsid The CCSID that specified on the alter statement.

System Action: The statement cannot be executed.

Programmer Response: See the ALTER DATABASE section in Chapter 6 of *SQL Reference* for a list of CCSIDs that may be specified on this statement. Only CCSIDs specified in the ALTER DATABASE section may be altered, and then, only to the corresponding value listed in the table. Altering the CCSID of a database or table space to a value not listed in the table is not permitted.

Destination: 42856

-20106 THE CCSID FOR TABLE SPACE OR DATABASE CANNOT BE CHANGED BECAUSE THE TABLE SPACE OR DATABASE ALREADY CONTAINS A TABLE THAT IS REFERENCED IN EXISTING VIEW DEFINITIONS

Explanation: An ALTER statement cannot be used to alter the CCSID for a table space or database that contains a table referenced in existing view definitions.

System Action: The statement cannot be executed.

Programmer Response: To alter the CCSID for the specified space, drop any existing view definitions that refer to tables contained in the identified space and then reissue the ALTER statement.

Destination: 42945

-30000 EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT WILL NOT AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS: REASON *reason-code* (*sub-code*)

Explanation: A DRDA protocol error has resulted which prevented successful execution of the current SQL statement. The error was such that it will not preclude the successful execution of further SQL statements.

System Action: The statement cannot be executed. The SQLCA is formatted. Message DSNL031I or DSNL032I, which might contain additional diagnostic information, might be issued to the MVS console.

Programmer Response: Notify the DBA for assistance in analysis of the SQL statement which yielded this SQLCODE.

Problem Determination: The 'reason-code' identifies the DDM code point which represents the DDM reply message received from the remote server in response to the attempt to execute the SQL statement. These represent internal errors detected at the remote server or possibly, by the local DB2 functions.

The 'reason-code' value is the two-byte hexadecimal code point for the DDM reply message that represents the error and is one of the following:

- X'1254' - CMDCHKRM
- X'220A' - DSCINVRM

- X'220E' - DTAMCHRM
- X'1245' - PRCCNVRM
- X'2202' - QRYNOPRM
- X'220F' - QRYPOPRM
- X'2207' - RDBACCRM
- X'2204' - RDBNACRM
- X'124C' - SYNTAXRM

A two-byte 'sub-code' accompanies 'reason-codes' X'220A' (DSCINVRM), X'1245' (PRCCNVRM), and X'124C' (SYNTAXRM). In all other cases, the 'sub-code' is zero.

The 'sub-code' when nonzero, consists of two bytes such that the high-order byte indicates the site at which the error was detected. This is X'01' if the error was detected by the local DB2; it is X'02' if the error was detected by the remote server. The low-order byte is dependent on the 'reason-code' as follows:

1. Description Error Code (DSCERRCD) if 'reason-code' = X'220A' (DSCINVRM).
2. Syntax Error Code (SYNERRCD) if 'reason-code' = X'124C' SYNTAXRM).
3. Conversational Protocol Error Code (PRCCVNCD) if 'reason-code' = X'1245' (PRCCNVRM).

Refer to the *IBM Distributed Data Management (DDM) Reference Guide* for a detailed discussion of the semantics of the DDM terms DSCERRCD, SYNERRCD, and PRCCVNCD.

Destination: 58008

-30020 EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT CAUSED DEALLOCATION OF THE CONVERSATION: REASON *<reason-code (sub-code)>*

Explanation: A DRDA protocol error has occurred that prevented the successful execution of the current SQL statement or command, as well as any subsequent SQL statements.

The 'reason-code' identifies the DDM code point which represents the DDM reply message received from the remote server in response to the attempt to execute the SQL statement. These represent internal errors detected at the remote server site or possibly, by the local DB2 functions.

The 'reason-code' value is the two-byte hexadecimal code point for the DDM reply message that represents the error and is one of the following:

- X'1232' - AGNPRMRM
- X'1254' - CMDCHKRM
- X'220A' - DSCINVRM
- X'220E' - DTAMCHRM
- X'0010' - FDODSC
- X'1218' - MGRDEPRM
- X'1245' - PRCCNVRM
- X'241A' - QRYDSC
- X'2202' - QRYNOPRM
- X'220F' - QRYPOPRM
- X'2207' - RDBACCRM
- X'2204' - RDBNACRM
- X'124C' - SYNTAXRM

A two byte sub-code accompanies 'reason codes'. The sub-code, when nonzero, consists of two bytes such that the high-order byte indicates the site at which the error was detected. This is X'01' if the error was detected by the local DB2; It is X'02' if the error was detected by the remote server. The low-order byte is dependent upon the 'reason code' as follows:

Description Error Code (DSCERRCD) if reason code= X'220A' (DSCINVRM).
Syntax Error Code (SYNERRCD) if reason code = X'124C' (SYNTAXRM).
Conversational Protocol Error Code (PRCCVNCD) if reason code = X'1245' (PRCCNVRM).
Manager Dependency Error Code (DEPERRCO) if reason code = X' 1218' (MGRDEPRM).

Refer to *IBM Distributed Data Management (DDM) Reference Guide* for a detailed discussion of the semantics of the DDM terms DSCERRCD, SYNERRCD, PRCCVNCD, and DEPERRCO.

System Action: The statement cannot be executed. The SQLCA is formatted and the conversation on which the error was detected is deallocated. Message DSNL0311 or DSNL0321, which might contain additional diagnostic information, might be issued to the MVS console.

Programmer Response: The connection to the server has been broken, and the server has, therefore, rolled back the unit of work. In this case, the only SQL statement that may be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

Destination: 58009

-30021 EXECUTION FAILED DUE TO A DISTRIBUTION PROTOCOL ERROR THAT WILL AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS: MANAGER *manager* AT LEVEL *level* NOT SUPPORTED ERROR

Explanation: A DRDA error occurred that prevented the successful execution of the current SQL statement or command and any subsequent SQL statements.

A manager-level conflict was detected during the processing of the DDM EXCSAT command. Refer to the *IBM Distributed Data Management (DDM) Reference Guide* for a detailed description of EXCSAT processing and errors.

The *manager* value is the 2-byte hexadecimal code point of the DDM manager class identified as not supported in the EXCSATRD that reported the error. Refer to the DDM term MGRLVL in the *IBM Distributed Data Management (DDM) Reference Guide* for the 2-byte hexadecimal values.

The *level* value is the 2-byte hexadecimal value of the manager level identified as not supported in the EXCSATRD that reported the error. Refer to the DDM term MGRLVL in the *IBM Distributed Data Management (DDM) Reference Guide* for the 2-byte hexadecimal values.

System Action: The statement cannot be executed.

Programmer Response: Notify the system programmer for analysis of the condition that caused this SQLCODE.

Destination: 58010

-30030 COMMIT REQUEST WAS UNSUCCESSFUL, A DISTRIBUTION PROTOCOL VIOLATION HAS BEEN DETECTED, THE CONVERSATION HAS BEEN DEALLOCATED. ORIGINAL SQLCODE=*original-sqlcode* AND ORIGINAL SQLSTATE=*original-sqlstate*

Explanation: The application requested COMMIT operation was unsuccessful and the response from the remote server and the SQLCODE that was returned from the remote server are inconsistent. For example, the reply message from the remote server indicates that a COMMIT operation did not complete successfully but the SQLCODE returned from the remote server was greater than or equal to zero. The unit of work has been rolled back and the connection with the remote server has been deallocated.

System Action: An alert was generated. A DSNL0311 message may have been written to the console. Refer to the description of this message for further information.

The SQLCODE returned by the remote server is replaced with -30030 and the SQLSTATE returned by the AS is replaced with '158013' and the connection with the remote server has been deallocated.

The SQLCODE and SQLSTATE values that were returned from the remote server are stored in the SQLERRM field in a string of the following format:

'original-sqlcode 'FF'X original-sqlstate'

Programmer Response: Notify the system programmer for assistance in analyzing the trace data that was generated.

Destination: 58013

-30040 EXECUTION FAILED DUE TO UNAVAILABLE RESOURCES THAT WILL NOT AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS OR SQL STATEMENTS. REASON *<reason-code>* TYPE OF RESOURCE *<resource-type>* RESOURCE NAME *<resource-name>* PRODUCT ID *<pppvrrm>* RDBNAME *<rdbname>*

Explanation: The SQL statement or command requires a non RDB resource that is currently unavailable. The *<reason-code>* identifies why the resource identified by the *<resource-type>* and *<resource-name>* is unavailable. The product, product level, and RDB are identified.

Values for *<reason-code>*

This is product specific and can be found in the remote server documentation.

Values for *<resource-type>*

Two byte hexadecimal number defined as follows:

This is product specific and can be found in the remote server documentation.

Values for *<resource-name>*

Variable length field with alphanumeric characters and a maximum length of 35 bytes.

Values for *<pppvrrm>*

Eight-byte field with alphanumeric characters defined as follows:

ppp..... DSN for DB2, ARI for SQL/DS SQL for OS/2 and QSQ for AS/400 (3 bytes)

vv..... version number (2 bytes)
 rr..... release level (2 bytes)
 m..... modification level (1 byte)

Values for <rdbname>

Sixteen-byte field with the RDBNAME.

System Action: The statement cannot be executed. The local DB2 is disconnected from the remote server.

Programmer Response: Verify the identify of the resource that was not available. The reason the resource is unavailable is identified by the <reason-code>.

Collect the following diagnostic items to help determine the cause of the unavailable resource.

- Console output from the system identified by RDBNAME, and a listing of SYSLOG data set for the period of time spanning the failure.
- Information described for the reason code received.

Destination: 57012

-30041 EXECUTION FAILED DUE TO UNAVAILABLE RESOURCES THAT WILL AFFECT THE SUCCESSFUL EXECUTION OF SUBSEQUENT COMMANDS AND SQL STATEMENTS
REASON <reason-code> **TYPE OF RESOURCE** <resource-type> **RESOURCE NAME** <resource-name> **PRODUCT ID** <pppvrrm> **RDBNAME** <rdbname>

Explanation: The SQL statement or command requires a non RDB resource that is currently unavailable. The <reason-code> identifies why the resource identified by the <resource-type> and <resource-name> is unavailable. The product, product level, and RDB are identified.

Values for <reason-code>

Four byte binary number that is product specific. This can be found in the remote server documentation.

Values for <resource-type>

Two byte hexadecimal number that is product specific. This can be found in the remote server documentation.

Values for <resource-name>

Variable length field with alphanumeric characters and a maximum length of 35 bytes.

Values for <pppvrrm>

Eight byte field with alphanumeric characters defined as follows:

ppp..... DSN for DB2, ARI for SQL/DS, SQL for OS/2 and QSQ for AS/400 (3 bytes)
 vv..... version number (2 bytes)
 rr..... release level (2 bytes)
 m..... modification level (1 byte)

Values for <rdbname>

Sixteen byte field with the RDBNAME.

System Action: The statement cannot be executed. The local DB2 is disconnected from the remote server.

Programmer Response: Verify the identity of the resource that was not available. The reason the resource is unavailable is identified by the reason-code.

Collect the following diagnostic items to help determine the cause of the unavailable resource.

- Console output from the system identified by RDBNAME, and a listing of SYSLOG data set for the period of time spanning the failure.
- Information described for the <reason-code> received.

Destination: 57013

-30050 <command-or-SQL-statement-type> **COMMAND OR SQL STATEMENT INVALID WHILE BIND PROCESS IN PROGRESS**

Explanation: A remote command or remote SQL execution was attempted while a remote bind was in progress. The only commands allowed during bind are, BIND STATEMENT, END BIND, ROLLBACK, or COMMIT.

System Action: The request is rejected. The local DB2 is disconnected from remote server.

Programmer Response: Ensure the remote bind has completed before attempting to execute an SQL statement or process a remote command. COMMIT and ROLLBACK will terminate the bind processing.

Destination: 58011

-30051 BIND PROCESS WITH SPECIFIED PACKAGE NAME AND CONSISTENCY TOKEN NOT ACTIVE

Explanation: Binding of a statement or end bind was attempted while the package was not undergoing bind processing.

System Action: The bind statement request or end bind request is rejected. The local DB2 is disconnected from the remote server.

Programmer Response: Ensure that the server processing the bind request was not abending when this request was being processed, or that the package name hasn't changed before terminating the remote bind package request.

Destination: 58012

-30052 PROGRAM PREPARATION ASSUMPTIONS ARE INCORRECT

Explanation: The program preparation assumptions in effect for binding a statement (i.e. BINDSQLSTT command) are incorrect.

System Action: The statement is rejected.

Programmer Response: The creation of the package following this error is dependent on the package creation options specified at begin bind time.

Destination: 42932

-30053 OWNER AUTHORIZATION FAILURE

Explanation: An authorization error associated with the package owner is detected. The AS, for example, has determined that the binder has specified a package owner that the binder has no authorization to specify.

System Action: The begin bind request is rejected.

Programmer Response: Correct the authorization problem and reissue the request.

Destination: 42506

-30060 RDB AUTHORIZATION FAILURE

Explanation: The user is not authorized to access an RDB.

System Action: The request is rejected.

Programmer Response: Correct the authorization problem and resubmit the job.

Destination: 08004

-30061 RDB NOT FOUND

Explanation: An attempt was made to access an RDB which cannot be found. This usually means that a requester specified the server location name incorrectly. The server responded by indicating that the requester's specification of the server location name is incorrect. Requester or server changes are needed to make the location names consistent. Location names for DB2 systems are defined in the BSDS DDF record and are also in the DSNL004I console message when DDF is started. For more information about defining location names, see Section 3 of *Installation Guide*.

System Action: The request is not processed.

Programmer Response: Ensure the RDB name was correctly specified and resubmit the job.

Destination: 08004

-30070 <command> COMMAND NOT SUPPORTED ERROR

Explanation: The target does not support a particular command. The error causes termination of the connection between the local DB2 and the remote server.

Values for <command>

Two byte hexadecimal DDM code point.

System Action: The command is rejected. The local DB2 is disconnected from the remote server.

Programmer Response: Ensure the proper command was issued.

Destination: 58014

-30071 <object-type> OBJECT NOT SUPPORTED ERROR

Explanation: The target does not support a particular object. The error causes the termination of the connection between the local DB2 and the remote server.

Values for <object-type>

Two byte hexadecimal DDM code point.

System Action: The command/SQL statement is rejected. The local DB2 is disconnected from the remote server.

Programmer Response: Ensure the object has been correctly specified and resubmit the job or reissue the command.

Destination: 58015

-30072 <parameter>:<subcode> PARAMETER NOT SUPPORTED ERROR

Explanation: A particular parameter is not supported by either the application requester or the remote server.

Values for <parameter>

Two byte hexadecimal DDM code point.

Values for <subcode>

Two byte hexadecimal number defined as follows: This subcode is composed of two distinct parts, but may optionally be zero. The high-order byte (when not zero) indicates the site at which the error was detected. This is X'01' if the error was detected by the local DB2; it is X'02' if the error was detected by the remote server. The low order byte is always zero.

System Action: The command/SQL statement is rejected. A disconnect has occurred.

Programmer Response: The connection to the server has been broken, and the server has therefore rolled back the unit of work. In this case, the only SQL statement that may be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

Destination: 58016

-30073 <parameter>:<subcode> PARAMETER VALUE NOT SUPPORTED ERROR

Explanation: The specified parameter value is not supported by either the local DB2 or the remote server.

The *parameter*, is a 2-byte hexadecimal DDM code point. See # *IBM Distributed Data Management (DDM) Reference Guide* for # a definition of the valid code points. Common values for # *parameter* include:

X'0035' Usually means that a DB2 V2R3 server does not support the single-byte coded character set identifier (CCSID) sent by the requester, or a DB2 V2R3 requester does not support the single-byte CCSID received from a server. See X'119C' for more information.

X'1144' DRDA servers return this code point when a DB2 client specifies a version for a package and the DRDA server does not support versions.

X'119C' If the subcode information contains X'01', the requester does not support the single-byte CCSID that the server wants to use. If the subcode information contains X'02', the server does not support the single-byte CCSID that the requester wants to use.

Determine the single-byte CCSIDs for the requester and server systems. The single-byte CCSID for DB2 subsystems is defined in DSNHDECP. One or both partners might be using an incorrect CCSID, or support might need to be added. Individual CCSID support for DB2 subsystems is obtained by making changes to the SYSIBM.SYSSTRINGS catalog table. See *Installation Guide* for more information on CCSIDs.

```

# X'147A'    DB2 servers can return this code point when a
#           numeric input host variable is not within the
#           range that DB2 supports. See the explanation of
#           SQLCODE -406 for more information.
# X'14AC'    DB2 servers return this code point when a DRDA
#           client requests an authentication mechanism that
#           is not supported by the DB2 server. See the
#           explanation of DB2 reason code 00D3010E for
#           more information.
# X'2110'    Usually means that a requester specified the
#           server location name incorrectly. The server
#           responded by indicating that the requester's
#           specification of the server location name is incor-
#           rect, and the length of the location name is
#           longer than that supported by the server.
#           Requester or server changes are needed so the
#           location names are consistent. Location names
#           for DB2 systems are defined in the BSDS DDF
#           record and can also be seen in the DSNL004I
#           console message when DDF is started. See
#           Section 3 of Installation Guide for more informa-
#           tion about defining location names.
# X'2120'    Usually means that the server does not support
#           the use of double quote string delimiters in SQL
#           statements. DB2 COBOL applications can use
#           double quote string delimiters in SQL statements.
#           This requires that the program be precompiled
#           with the SQLDELIM(QUOTESQL) option. If the
#           server product does not support double quote
#           SQL statement string delimiters, then the
#           program must be modified to use single quote
#           SQL string delimiters and be precompiled with
#           the SQLDELIM(APOSTSQL) option.
# X'2121'    Usually means that there is a semantic error
#           with the string that specifies the character used
#           as a decimal delimiter in SQL statements.
# X'213F'    Means that the server was processing a bind or
#           rebind command that specified an unsupported
#           value for the DYNAMICRULES bind parameter. If
#           the server is a DB2 Version 3 system, specify
#           DYNAMICRULES(RUN) or omit the
#           DYNAMICRULES parameter.

```

The 'subcode', which is a 2-byte hexadecimal number, consists of two distinct parts and can optionally be zero. The high-order byte (when not zero) indicates the site at which the error was detected. If the error was detected by the local DB2, it is X'01'. If the error was detected by the remote server, it is X'02'. The low-order byte is always zero.

System Action: The command or SQL statement is rejected. A disconnect occurred.

Programmer Response: The connection to the server was broken, and the server rolled back the unit of work. The only SQL statement that can be successfully executed is ROLLBACK. However, if the requester detects this error on a COMMIT, then it is unknown whether the unit of work was committed or rolled back at the server.

Destination: 58017

-30074 REPLY MESSAGE WITH *codepoint* (*svrcod*) NOT SUPPORTED ERROR

Explanation: A reply message *codepoint* is not recognized or the reply message *SVRCOD* is not recognized. The error does not affect the processing of subsequent DRDA commands and SQL statements issued by the application program.

Values for *codepoint*

- The *codepoint* is a two-byte hexadecimal value that represents a DDM reply message. *IBM Distributed Data Management (DDM) Reference Guide* defines the valid *codepoints* for reply messages.

Values for *SVRCOD*

- The *SVRCOD* is a one-byte hexadecimal value which represents the reply messages severity code. *IBM Distributed Data Management (DDM) Reference Guide* defines the valid *SVRCOD* for reply messages.

System Action: Processing continues.

Programmer Response: The cause of this error may be a mismatch in source and target manager levels or might be an internal error.

Destination: 58018

-30080 COMMUNICATION ERROR *code* (*subcode*)

Explanation: A SNA communications error was detected. *VTAM for MVS/ESA Programming for LU 6.2* contains the valid 'code' and 'subcode' values that can appear in this message.

- 'code' is VTAM's primary LU6.2 return code (RCPRI).
- 'subcode' takes one of the following forms:

- rcsec-sense
- rcsec

The 'rcsec' portion of 'subcode' is VTAM's secondary LU6.2 return code (RCSEC).

The 'sense' portion of 'subcode' is VTAM's sense code. See "Section 6. SNA Codes" on page 6-1, for descriptions of sense codes that are often associated with SNA network definition errors.

System Action: The statement is not executed. The application was disconnected from the server because of a communication failure. A DSNL500I message containing additional diagnostic information might be issued to the MVS console.

Programmer Response: Review the diagnostic information described in *VTAM for MVS/ESA Programming for LU 6.2* for the particular LU6.2 return codes. Consult with a communications expert to determine the cause of the communication failure.

Destination: 08001

-30081 *prot* COMMUNICATION ERROR DETECTED. API=*api*, LOCATION=*loc*, FUNCTION=*func*, ERROR CODES=*rc1 rc2 rc3*

Explanation: A communications error was detected while communicating with a remote client or server.

prot Identifies the communication protocol that encountered the error. Currently, 'TCP/IP' is the only possible value.

api	Identifies the communication application programming interface (API) used by DB2. Currently, 'SOCKETS' is the only possible value.
loc	The network location of the partner system. For TCP/IP partners, this field contains the dotted decimal IP address of the partner.
func	The communication function that failed. For TCP/IP partners, this field identifies name of the socket call that failed.
rc1	The first return code indicator. For TCP/IP partners, this field contains the TCP/IP <i>return code</i> in decimal format. The <i>return code</i> values are documented in <i>OS/390 OpenEdition Messages and Codes</i> .
rc2	The second return code indicator. For TCP/IP partners, this field contains the TCP/IP <i>reason code</i> in decimal format. The <i>reason code</i> values are documented in <i>OS/390 OpenEdition Messages and Codes</i> .
rc3	The third return code indicator. For TCP/IP partners, this field contains zero.

System Action: The statement is not executed. The application is disconnected from the server.

Programmer Response: Consult with a communications expert to determine the cause of the communication failure.

Destination: 58019

-30082 CONNECTION FAILED FOR SECURITY REASON *reason-code (reason-string)*

Explanation: The attempt to connect to a remote database server was rejected due to invalid or incorrect security information. The cause of the security error is described by the *reason-code* and *reason-string* values.

The possible values for *reason-code* and *reason-string* appear below:

- 1 (PASSWORD EXPIRED) -- the password used to connect to the remote server has expired.
- 2 (PASSWORD INVALID) -- the password used to connect to the remote server does not match the password stored at the remote server.
- 3 (PASSWORD MISSING) -- the remote server rejected the connection request because the request did not include a password.
- 4 (PROTOCOL VIOLATION) -- the remote server rejected the connection request because the request did not contain the proper security information. Error messages or trace records should be produced by the server system to explain the nature of the security violation.
- 5 (USER-ID MISSING) -- the remote server rejected the connection request because the request did not specify a user-id.
- 6 (USER-ID INVALID) -- the user-id specified in the connection request is not defined at the remote server system.
- 7 (USER-ID REVOKED) -- the user-id specified in the connection request has been revoked.

- 15 (SECURITY FAILURE:*secchkcd:svcerrno*)—Authentication failed at the remote server system. Refer to the *IBM Distributed Data Management (DDM) Reference Guide* for a detailed discussion of the semantics of the DDM terms SECCHKCD and SVCERRNO.
- 16 (NEW PASSWORD INVALID) -- the password specified on a change password request did not meet the server's requirements.
- 17 (UNSUPPORTED FUNCTION) -- the security mechanism specified by the client is invalid for this server. Some typical examples:
 - The client sent a new password value to a server that does not support the DRDA change password function.
 - The client sent DCE authentication information to a server that does not support DCE.

System Action: The attempt to connect to the remote database server fails. If the server system is a DB2 for OS/390 server, a DSNL030I message at the server system describes the cause.

Programmer Response: DB2 uses the communications database (CDB) to control network security functions. Make the appropriate changes to the CDB to correct the security failure.

Destination: 08001

-30090 REMOTE OPERATION INVALID FOR APPLICATION EXECUTION ENVIRONMENT

Explanation: An update operation or a dynamic commit or rollback was attempted at a server that was supporting an application that was in a read-only execution environment (IMS or CICS).

System Action: The request is rejected.

Programmer Response: Do not attempt to update data or issue dynamic commits or rollbacks from IMS or CICS applications that are accessing remote data.

Destination: 25000

-30104 ERROR IN BIND OPTION *option* **AND BIND VALUE** *value*.

Explanation: While processing the bind parameters that were passed from the requester site, either the bind option or the bind value is not acceptable to the server database, or the option/value pair is not appropriate.

System Action: None.

Programmer Response: The BIND or REBIND command failed. Examine the command options and values, determine the error, and resubmit the command.

Destination: 56095

-30105 BIND OPTION *option1* **IS NOT ALLOWED WITH BIND OPTION** *option2*

Explanation: While processing the bind parameters that were passed from the requester site, it was found that there is a conflict in bind options that are mutually exclusive.

System Action: None.

Programmer Response: The BIND or REBIND command failed. Examine the command options, determine the cause of the conflict, and resubmit the command.

| Destination: 56096

DB2 Messages

Refer to “Section 1. Introduction” on page 1-1 for a description of message types and message numbering conventions.

Unless the message is issued by a subcomponent operating outside the DB2 environment, messages are preceded by a *command prefix* that is defined

during system installation. The command prefix is not shown in the message texts in this book.

In the TSO attachment facility, the user can control whether message IDs are displayed. To see them, type 'PROFILE MSGID'. To suppress them, type 'PROFILE NOMSGID'.

DSNA... Messages

The messages in this chapter are written to the trace. They are seen only if the trace is turned on (that is, ddname DSNTRACE was allocated to SYSOUT or the TSO terminal).

DSNA... messages share a basic structure. Here are the message elements, listed in order:

1. Message number (DSNAnna).
2. The name of the CSECT responsible for writing the message.
3. TCB address of the task currently executing.
4. A series of tokens and token-explanations unique to each message.

Note: The intent of these messages is to aid IBM development and the IBM Support Center. They contain information that might not be meaningful except to IBM.

DSNA002E DSNACA00 TCB=address SYSTEM ERROR - FOUND UNEXPECTED THREAD

Explanation: The DB2 call attachment facility control block, the CAB, indicated that a thread was present when none should have been present. This is a CAF system error.

This message is issued by the following CSECT: DSNACA00

System Action: This message immediately precedes an 04E abend, with reason code 00C10002.

System Programmer Response: Collect a SYSUDUMP and DSNTRACE trace stream.

Programmer Response: Refer the problem to your system programmer.

Problem Determination: Contact your IBM Support Center.

DSNA201E DSNACA00 TCB=address CANNOT USE 'CONNECT', ALREADY CONNECTED TO DB2

Explanation: A CONNECT request was received but a connection to DB2 already existed for the TCB identified by 'address' in the message. This is a CAF error (application program error). The message is accompanied by return code (R15) 200 and code (R0) 00C10201.

This message is issued by the following CSECT: DSNACA00

System Action: No new connection is made to DB2 and an error return and reason code are issued. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: You must DISCONNECT the previous connection before you can re-CONNECT. Correct the logic in your code.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA202E DSNACA00 TCB=address CANNOT USE 'OPEN', PRIOR OPEN OR SQL ALREADY CONNECTED APPLICATION TO DB2

Explanation: An OPEN request was received but a DB2 thread had already been created for the specified TCB. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10202.

This message is issued by the following CSECT: DSNACA00

System Action: No new DB2 thread is created and an error return and reason code are issued. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Your application program had already (explicitly or implicitly) established an OPEN level connection to DB2. You cannot do this again until the original OPEN is terminated. 'Explicit' OPENS occur when an application issues the call attachment facility OPEN request. 'Implicit' OPENS occur when an application issues SQL statements before a DB2 connection was established. Correct the logic in your application program.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA203E DSNACA00 TCB=address CANNOT USE 'CLOSE', THERE WAS NO 'OPEN' IN EFFECT

Explanation: A CLOSE request was received but no OPEN level connection (implicit or explicit) existed for this task. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10203.

This message is issued by the following CSECT: DSNACA00

System Action: No CLOSE is performed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Do not issue CLOSE unless an explicit OPEN has been performed. 'Explicit' OPENS occur when an application issues the call attachment facility OPEN request.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA204E DSNACA00 TCB=address CANNOT USE 'DISCONNECT', THERE WAS NO 'CONNECT' IN EFFECT

Explanation: A DISCONNECT request was received but no DB2 connection had been established. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10204.

This message is issued by the following CSECT: DSNACA00

System Action: No DISCONNECT has been performed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Do not issue DISCONNECT unless a CONNECT has been performed.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA205E DSNACA00 TCB=address CANNOT USE 'TRANSLATE', THERE WAS NO CONNECTION TO DB2 OR NOTHING TO TRANSLATE

Explanation: A TRANSLATE request was received but no data was available for translation. You must have valid DB2 call attachment facility control structures before you can make a TRANSLATE request. Control structures are built when you issue explicit or implicit connection requests. This is a user error. The message is accompanied by return code (R15) 200 and code (R0) 00C10205.

This message is issued by the following CSECT: DSNACA00

System Action: No TRANSLATE is performed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Do not issue TRANSLATE unless a DB2 connection has been attempted.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA206E DSNACA00 TCB=address WRONG NUMBER OF PARMS OR VL BIT OFF

Explanation: An erroneous DB2 call attachment facility request was received. The request had too many or too few parameters and could not be processed. The message is accompanied by return code (R15) 200 and code (R0) 00C10206.

This message is issued by the following CSECT: DSNACA00

System Action: The previous request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Be sure that any parameter list passed to the DB2 call attachment facility has the correct number of parameters for the individual call, and that the high order (VL) bit is turned on to end the parameter list.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA207E DSNACA00 TCB=address DID NOT RECOGNIZE ACTION PARAMETER - parm

Explanation: An unrecognized action request type or parameter was received by the DB2 call attachment facility and could not be processed. The allowable action request types are CONNECT, OPEN, CLOSE, DISCONNECT, and TRANSLATE. For allowable parameters, refer to the CAF section in *Application Programming and SQL Guide*. This message is accompanied by return code (R15) 200 and code (R0) 00C10207.

This message is issued by the following CSECT: DSNACA00

System Action: Control returns to the caller. Your request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Correct the logic in your application. Check the spelling of the action parameter type or keyword on the previous request passed to the DB2 call attachment facility. The action parameter type you passed is listed in the parm field of the DSNCA800I trace message. If the error is not the action parameter, the parameter in error is listed in the parm field of this message.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA208E DSNACA00 TCB=address CANNOT HAVE 2 SSIDS (ssid1 AND ssid2) FROM 1 TCB

Explanation: An OPEN request was received specifying a different subsystem identifier (ssid2) than the previous CONNECT request (ssid1). Your task can only be connected to a single DB2 subsystem. The message is accompanied by return code (R15) 200 and code (R0) 00C10208.

This message is issued by the following CSECT: DSNACA00

System Action: Control returns to the caller. Your request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Specify the correct DB2 subsystem identifier on both the OPEN and CONNECT requests.

Problem Determination: See a DSNTRACE trace stream to understand the context of this message.

DSNA209E DSNACA00 A STORED PROCEDURE ISSUED AN EXPLICIT CALL TO DSNALI

Explanation: A stored procedure issued an explicit call to DSNALI. This is not allowed. Return code 200 in register 15 and code 00C10209 in register 0 accompany this message.

System Action: Control returns to the caller. The request was not processed. The DB2 call attachment facility is ready for more input.

System Programmer Response: Refer the problem to the programmer using the DB2 call attachment facility.

Programmer Response: Remove explicit calls to DSNALI from the application program.

Problem Determination: See a DSNTRACE trace job stream to understand the context of this message.

DSNA8xx

Explanation: Messages in the DSNA800 series are intended for diagnosis and are documented in Section 9 of *Diagnosis Guide and Reference*.

DSNB... Messages

**DSNB200I UPDATE VVDS FAILED. DSNNAME = *dsn*,
MMRC=*cccccccc* CONNECTION-ID=*xxxxxxxxx*,
CORRELATION-ID=*yyyyyyyyyyyyy*,
LUW-ID=*logical-unit-of-work-id =token***

Explanation: DB2 was unable to update the data set high-used RBA in the VSAM volume data set (VVDS) when it was ready to close a data set that was used by a RECOVER, LOAD, or REORG utility job. The error was detected by the media manager catalog update function that issues system message IEC1611. The *dsn* indicates the DSNNAME of the data set. MMRC is the return code that DB2 received from the media manager catalog update service. Refer to *DFSMS/MVS: Diagnosis Reference for DFSMSdfp* for a description of these codes.

The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

An LUW-ID of '*' indicates that the thread does not have an LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

This message is issued by the following CSECT: DSNB1CST

System Action: DB2 continues closing this data set. However, the utility job is informed with a 00C2010C 'resource unavailable' reason code. The utility job is left in a failed state.

Operator Response: Notify the system programmer.

System Programmer Response: To determine the cause of the error, refer to system message IEC1611 in the appropriate MVS publication. Correct the error, and then notify the user to reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 10, 11.

DSNB204I OPEN OF DATA SET FAILED. DSNNAME = *dsn*

Explanation: A required data set of a DB2 table or index space could not be opened. The error was detected by the media manager CONNECT function that issues system message IEC1611. The *dsn* indicates the DSNNAME of the data set.

After being issued for a given data set, this message is disabled for that data set.

This message is issued by the following CSECT: DSNB1OST

System Action: Buffer manager functions that detect this condition terminate.

Operator Response: Notify the system programmer.

System Programmer Response: To determine the cause of the error, refer to system message IEC1611 in the appropriate MVS publication. Correct the error, and reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5, 10, 12.

**DSNB207I DYNAMIC ALLOCATION OF DATA SET
FAILED. REASON = *rrrr* DSNNAME = *dsn***

Explanation: A required data set of a DB2 table or index space could not be allocated. Reason code *rrrr*, which is returned by dynamic allocation, indicates the reason for the failure. Refer to the appropriate MVS publications for a description of this reason code. The *dsn* indicates the data set's DSNNAME.

After being issued for a given data set, this message is disabled for that data set.

This message is issued by the following CSECT: DSNB1OST

System Action: Buffer manager functions that detect this condition terminate and pass a unique error return code.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the situation, and then reinvoke the application.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5, 10, 12.

**DSNB209I *csect-name*-BUFFER MANAGER
TABLESPACE/INDEXSPACE CLEAN-UP
ROUTINE (DSNB1CFC) HAS BEEN SCHED-
ULED FOR DBNAME = *dbn*, SPACENAME =
spn, PSID = X' *psid*'**

Explanation: DB2 detected an abnormal condition for one of the following reasons:

- The associated table space or index space contains modified pages that cannot be written to DASD for a period of time that is longer than expected. This can be caused by either an unusually long period of contiguous update or by an internal logic error.
- This message follows an abnormal termination due to inconsistent data or an incomplete update to the page.

DB2 scheduled the table space or index space cleanup routine (DSNB1CFC) for the associated table space or index space. DSNB1CFC acquires a drain lock to ensure that no updates are in progress. Data is inaccessible to users during the cleanup process.

For recoverable inconsistent pages with unbalanced write intents, DB2 initiates the recovery process and reconstructs the pages using the DB2 log. For other modified pages with unbalanced write intents, the buffer manager forces the pages to be written back to DASD and then makes the buffer space available for reassignment.

The *dbn* indicates the database name with which the table space or index space is associated. The *spn* is the name of the table space or index space that must be cleaned up. The *psid* is the internal identifier for the table space or index space; it is used to associate this message with follow-on message DSNB221I, which might be issued.

System Action: DB2 is ready to clean up the associated table space or index space. However, before any cleanup is initiated, DB2 requests a drain on the table space or index space. DB2 waits indefinitely for this lock. Therefore, all activ-

ities against the table space and/or index space must be quiesced before the cleanup process can proceed. If the associated object is an index space, all activities against the table space for which the index space is defined must also be quiesced. After the cleanup process completes, the table space or index space is automatically made accessible to users.

User Response: If the clean up activity does not appear to be completed, DB2 might still be waiting for a drain lock on the table space. Issue a -DISPLAY DATABASE CLAIMERS command for the table space in question (for index spaces, this would be the associated table space) to determine whether the clean up routine is still waiting for a lock and if so, to determine the holders of the table space lock. If the jobs are holding the table space lock for a very long duration (for instance, wait-for-input), it might be necessary to cancel those jobs in order to allow the clean up process to proceed.

DSNB212I *csect-name*—RECOVER PAGE STARTING
DBNAME = *dbn* , SPACENAME = *spn* , PAGE NUMBER = X'*pno*'

Explanation: The buffer manager (BM) subcomponent of DB2 discovered an inconsistent page with unbalanced write intents. DB2 is ready to do online recovery on the page using the DB2 log. The *dbn* indicates the associated database name. The *spn* indicates the table space name or index space name. The *pno* is the page number (in hexadecimal) within the table space or index space that is logically inconsistent.

System Action: Processing continues.

DSNB215I *csect-name*—ONLINE RECOVERY FOR AN INCONSISTENT PAGE HAS BEEN COMPLETED FOR DBNAME = *dbn* , SPACENAME = *spn* , PAGE NUMBER = X'*pno*'

Explanation: The recovery process for an inconsistent page completed. The *dbn* indicates the associated database name. The *spn* indicates the table space name or index space name. The *pno* is the page number (in hexadecimal) within the table space or index space that was logically inconsistent.

System Action: Processing continues.

DSNB217I *csect-name*—ONLINE RECOVERY FOR AN INCONSISTENT PAGE WAS UNSUCCESSFUL FOR DBNAME = *dbn* , SPACENAME = *spn* , PAGE NUMBER = X'*pno*'

Explanation: The recovery process for an inconsistent page failed. The page is written to DASD as logically inconsistent. This message is issued in response to message DSNB212I, which was issued to indicate the start of the recovery process. The *dbn* indicates the associated database name. The *spn* indicates the table space name or index space name. The *pno* is the page number (in hexadecimal) within the table space or index space that was logically inconsistent.

System Action: The page is marked as logically inconsistent and is unavailable until it is repaired. The execution unit driving this function proceeds normally.

Problem Determination: A DSNIO12I message might be issued before this message to indicate the same failure. If it is, a 00C90102 abend dump might help determine the cause of this failure. Otherwise, see SYS1.LOGREC for any abend that

occurred between the associated DSNB212I message and this message. Use the time stamp on the log records to find this abend.

DSNB219I *csect-name*—BUFFER MANAGER TABLESPACE/INDEXSPACE CLEAN-UP PROCESS HAS BEEN COMPLETED FOR DBNAME = *dbn* , SPACENAME = *spn*

Explanation: This message indicates that the buffer manager (BM) table space or index space cleanup process completed for the associated table space or index space. Refer to message DSNB209I for the reasons why the buffer manager schedules the table space or index space cleanup process. The *dbn* indicates the associated database name. The *spn* indicates the table space name or index space name.

System Action: Processing continues.

DSNB221I *csect-name*—BUFFER MANAGER TABLESPACE/INDEXSPACE CLEAN-UP PROCESS WAS NOT REQUIRED FOR PSID = X'*psid*'

Explanation: This message indicates that the buffer manager (BM) table space or index space cleanup process was bypassed for the associated table space or index space. After quiescing all other activities against the table space or index space, the buffer manager discovered that the table space or index space is no longer in active mode; that is, it was closed.

The abnormal condition detected earlier was resolved by buffer manager close page set processing. Refer to the corresponding message, DSNB209I, using *psid* as the matching field, for the reasons the buffer manager schedules the table space or index space cleanup process. The *psid* is the internal identifier for the associated table space or index space.

System Action: Processing continues.

DSNB223I *csect-name*—BUFFER MANAGER TABLESPACE/INDEXSPACE CLEANUP PROCESS WAS SKIPPED FOR PSID = X'*psid*'

Explanation: This message indicates that the table space or index space cleanup process was bypassed for the associated table space or index space. During the process of quiescing all other activities against the table space or index space, an error that is not recoverable was detected. The error might be caused by any of the following conditions:

- An out-of-storage condition was detected by IRLM.
- The table space or index space was dropped because of a backout.

It is assumed that the abnormal condition detected earlier can later be resolved by the close page set processing. Refer to the corresponding message DSNB209I (use *psid* as the matching field) for the reasons for scheduling the table space or index space cleanup process. The *psid* specifies the internal identifier for the associated table space or index space.

System Action: Processing continues.

System Programmer Response: The associated table space or index space might contain inconsistent data. Issue the DB2 STOP TABLESPACE or INDEXSPACE command to allow close page set processing to perform cleanup for the associated table space or index space.

DSNB224I *csect-name*– **BUFFER MANAGER I/O ERROR DURING** *function*,
DBNAME=*dbn*,**SPACENAME=***snm*, **DATA SET NUMBER=***dsno*, **PAGE NUMBER=X'***pno***'**, **MM ERROR FLAG=X'***aa***'**,
CSW STATUS=X'*bbbb***'**, **SENSE BYTES=X'***cccc***'**,
SEEK ADDRESS=X'*ddddddddddddddd***'**

Explanation: An I/O error was encountered by the buffer manager (BM) subcomponent of DB2. The function specified in the message is READ, WRITE, or FORMAT. The message gives the database name, table space name or index space name, data set number, and page number (in hexadecimal) of the page for which the I/O operation was being performed. The remaining information is error information returned by the media manager and is used for error analysis by IBM support personnel.

System Action: The system action depends on the function being performed. If the function is WRITE, or if the function is READ and the operation was performed during restart or rollback, the I/O error page range of the data set is updated and message DSNU086I is issued. In most cases (READ, synchronous WRITE, FORMAT), a 'resource not available' is returned to the user with a reason code that identifies the nature of the problem.

After being issued 10 times for a given data set, this message is disabled for that data set until it is closed and reopened.

Operator Response: Notify the system programmer.

System Programmer Response: See documentation in "Section 4. DB2 Codes" on page 4-1 for the reason code returned to the user in the SQLCA or in utility messages. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: See the Problem Determination section of the reason code returned to user.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5.

DSNB225I *csect-name* - **BUFFER MANAGER I/O ERROR DURING** *function*
DBNAME=*dbn*,**SPACENAME=***snm*, **DATA SET NUMBER=***dsno*, **MM ERROR CODES=X'***aaaaaaaa***'** **DB2 REASON CODE=X'***bbbbbbbb***'**

Explanation: DB2 encountered an I/O error. The function specified in the message is READ, WRITE, CASTOUT, or FORMAT. The message contains the database name, table space name or index space name, data set number, media manager error information returned at the time of the failure, and the DB2 reason code associated with this failure.

System Action: Except for a castout error, the application terminates with abend X'04E' and reason code 00C200A4 or 00C200C0. If an error occurs during castout, processing continues.

Operator Response: Notify the system programmer and follow the directions given for the reason code described in "Section 4. DB2 Codes" on page 4-1.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This message is issued before the occurrence of abend X'04E' and reason code 00C200A4 or 00C200C0 to provide information related to the media manager failure.

Check the MVS console log for an IOS error message indicating the type of I/O error that occurred. If an IOS message was issued, follow the problem determination directions for that message.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 10, 12.

DSNB226I *csect-name* - **BUFFER MANAGER PAGE GET ROUTINE DETECTED AN INVALID PAGE IN**
DBNAME=*dbn*, **SPACENAME=***snm*, **DATA SET NUMBER=** *dsno*, **PAGE EXPECTED=X'***aaaaaa***'**,
PAGE RECEIVED=X'*bbbbbb***'**

Explanation: An unexpected page was received during buffer manager (BM) get page processing. The page set involved is identified by the database name, space name, and data set number. The page in error is identified by page expected *aaaaaa*. Page number *bbbbbb* was found in the buffer that should contain the expected page.

System Action: The application is terminated with abend X'04E' and reason code 00C200F7.

Operator Response: Notify the system programmer and follow the directions given for reason code 00C200F7 in "Section 4. DB2 Codes" on page 4-1

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This message is issued before the occurrence of abend X'04E' and reason code 00C200F7 to provide information about the page set involved.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 10, 12, 64.

DSNB227I *csect-name* - **DFHSM RECALL FAILED FOR**
DSNAME=*dsn* **HSMRC=***aaaaaaaa*
HSMRSN=*bbbbbbbb*

Explanation: The attempt to recall a migrated data set failed. DSNAME identifies the data set. HSMRC and HSMRSN are the return code and reason code given by DFHSM.

System Action: A 'resource not available' code is returned to the user.

Operator Response: Notify the system programmer.

System Programmer Response: Use the information provided in the message to determine the reason for the DFHSM recall failure.

Problem Determination: Refer to "Section 4. DB2 Codes" on page 4-1 for an explanation of the return and reason codes contained in this message. Refer to the DFHSM message ARC11nnl, where nn is the value of HSMRC.

DSNB228I *csect-name* GROUP BUFFER POOL *gbpname*
CANNOT BE ACCESSED FOR *function* MVS
IXLCACHE REASON CODE=*reason*

Explanation: While accessing group buffer pool *gbpname* for function *function* DB2 received an error from the MVS IXLCACHE request.

function READ or WRITE
reason Reason code from the MVS IXLCACHE request

System Action: The system action depends on the function being performed. If the function is a WRITE, or a READ performed during rollback or DB2 restart, the page is added to the logical page list (LPL) for the data set and message DSNB250E is issued. Otherwise, 'resource unavailable' is returned to the user with a reason code that identifies the specific problem.

System Programmer Response: See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the MVS IXLCACHE reason code.

DSNB230I A SHARED OWNING SYSTEM CANNOT
CONNECT A SHARED DATASET IN OUTPUT
MODE. DSN=*dsn*

Explanation: A required inter-system sharing data set of a DB2 table or index space could not be opened in output mode. The error was detected by the media manager CONNECT function, which issues system message IEC1611. The *dsn* is the DSNAME of the data set.

This message is issued by the following CSECT: DSNB1OST

DSNB231I A SHARED DATASET CANNOT BE CON-
NECTED IN INPUT MODE. DSN=*dsn*

Explanation: A required inter-system sharing data set of a DB2 table or index space could not be opened in input mode. The error was detected by the media manager CONNECT function, which issues system message IEC1611. The *dsn* is the DSNAME of the data set.

This message is issued by the following CSECT: DSNB1OST

DSNB232I *csect-name* - UNEXPECTED DATA SET LEVEL
ID ENCOUNTERED - LEVEL ID =*lvlid*
EXPECTED LEVEL ID=*xlvlid* **DSN=***dsn*

Explanation: A required data set of a DB2 table space could not be opened. DB2 encountered an unexpected data set level ID.

lvlid The unexpected level ID from the data set
xlvlid The level ID recorded by DB2 previously and is the expected level ID for opening the data set
dsn The DSNAME of the data set.

This problem could be the result of data sets that were restored to a level that is inconsistent with other data sets, inconsistent with the DB2 log, or both.

System Action: DB2 sends back a 'resource unavailable' SQL code to the application and a reason code explaining the error.

Operator Response: Notify the system programmer.

System Programmer Response: To enable access to a data set reported as down level, take one of the following actions:

- Restore the page set or partition to the proper level (use DSN1COPY, DFHSM, or another tool).
 Identify the level ID of a copy of the page set or partition by running the DSN1PRNT(FORMAT) utility. The level ID is found in the header page of the page set or partition.
- Recover the down level page set or partition to currency by running the RECOVER or RECOVER LOGONLY utility.
- Accept the down levelling by running the REPAIR utility with the LEVELID option.
 Inconsistent data problems might result from this action and are the user's responsibility.
- Replace the contents of the page set or partition using the LOAD REPLACE utility.
- Explicitly restore the page set to a prior point in time with the RECOVER utility.

If the expected level ID is less than the encountered level ID, it is possible that the object identified in the message was ported from another system improperly (e.g., test system) or it might indicate that DSNDB01.SYSLGRNX is down level. If the problem is in the object identified in the message, the actions listed above can be used to allow access to the data. If the problem is in SYSLGRNX, this is a serious situation that compromises the recoverability of all objects managed by DB2. Investigate whether SYSLGRNX might have inadvertently been restored to a point in time inconsistent with the rest of the DB2 system.

DSNB250E *csect-name* A PAGE RANGE WAS ADDED TO
THE LOGICAL PAGE LIST DATABASE NAME
= *dbn* **SPACE NAME =** *spn* **DATA SET**
NUMBER = *dsno* **PAGE RANGE =** *lowpg* **TO**
highpg **START LRSN =** *startlrsn* **END LRSN =**
endlrsn **START RBA =** *startrba*

Explanation: DB2 added a page range to the logical page list (LPL) for the specified data set because of a problem with the pages in the page range. The *startlrsn* and *endlrsn* give the log range needed to recover the pages in the page range. These values are RBA values unless DB2 is in the data sharing environment, in which case these values are LRSN values. In the data sharing environment, *startrba* indicates the starting RBA value of the recovery log range if the value is not zero. The *startrba* only applies to log records for the DB2 member that issued the message. The zero value for *endrba* or *endlrsn* in this message refers to the current end of the recovery log.

System Action: The page range is added to the LPL for the page set. The page remains inaccessible until it is recovered with either the START DATABASE command with the SPACENAM option, the RECOVER utility, or the LOAD utility. Users attempting to access a page in the LPL receive SQLCODE -904 with reason code 00C20206. If MVS detects a problem during group buffer pool access processing, DB2 writes a SYS1.LOGREC entry describing the error.

System Programmer Response: To recover pages from the LPL, use the -START DATABASE command with the SPACENAM option, the RECOVER utility, or the LOAD utility.

DSNB301E *csect-name* **GROUP BUFFER POOL *gbpname* CANNOT BE CONNECTED DB2 REASON CODE = *reason1* MVS IXLCONN REASON CODE = *reason2***

Explanation: DB2 was not able to connect to the named group buffer pool. This message is generally issued once for each DB2 subsystem for each DB2 reason code, except 00C20204, until the failure condition is corrected.

reason1 DB2 reason code
reason2 MVS IXLCONN reason code

For DB2 reason code 00C20204, which indicates a problem during MVS IXLCONN processing, this message is issued once for each DB2 subsystem for each IXLCONN reason code until the failure condition is corrected. If the DB2 reason code is not 00C20204, then *reason2* contains zeros. See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of MVS IXLxxxx reason codes

System Action: If the connection was requested on behalf of an access request by an SQL user on this DB2, SQLCODE -904 (resource unavailable) is returned to the SQL user with the DB2 reason code shown in this message.

If the connection was requested on behalf of an SQL user on another DB2 in the data sharing group, SQLCODE -904 (resource unavailable) is returned to the SQL user with DB2 reason code 00C20252. This indicates that the requested table space or index space is unavailable because another DB2 cannot connect to the group buffer pool.

If the MVS IXLCONN reason code is xxxx0C08 (structure allocation failed because there was no suitable facility to allocate based on the preference list in the MVS CFRM administrative policy), or if the MVS IXLCONN reason code is xxxx084C (user does not have proper Security Access Facility (SAF) authorization), then IFCID 0250, if active, contains additional diagnostic information.

DSNB302I *csect-name* **GROUP BUFFER POOL *gbpname* IS ALLOCATED IN A VOLATILE STRUCTURE**

Explanation: The DB2 group buffer pool structure is volatile.

One DB2 member issues this message whenever the structure has the volatile attribute. DB2 detects this either on the first connection to the group buffer pool or when the attribute changes later. DB2 always requests nonvolatile group buffer pools but allows allocation in a volatile structure if that is all that is available.

System Action: DB2 processing continues.

System Programmer Response: To cause the group buffer pools to be allocated in nonvolatile coupling facilities, ensure that:

- At least a subset of your coupling facilities are configured correctly for nonvolatility.
- The MVS CFRM policy correctly specifies the nonvolatile coupling facilities in the preference list for the group buffer pool coupling facility structures.

Even when these things are correctly done, there might be instances when a suitable coupling facility in the preference list

cannot be found (for example, not enough free space), and therefore allocation occurs in a different coupling facility. MVS tries to allocate the structure in the facility that best meets the structure allocation request as follows:

- 1st choice: Coupling facility that meets the volatility requirement, the space requirement, and the exclusion list requirement.
- 2nd choice: Coupling facility that meets the volatility requirement and the storage requirement.
- 3rd choice: Coupling facility that has the best fit (most available free space) even though this might be less than the amount requested.
- 4th choice: Structure cannot be allocated.

IFCID 0250, if activated, contains a list of the coupling facilities on which allocation was attempted.

DSNB303E *csect-name* **A LOSS OF CONNECTIVITY WAS DETECTED TO GROUP BUFFER POOL *gbpname***

Explanation: Connectivity to group buffer pool *gbpname* was lost.

System Action: DB2 disconnects from the coupling facility structure with REASON=FAILURE.

The action taken in response to this problem depends on the attempted function, as follows:

- For a coupling facility read: SQLCODE -904 (resource unavailable) is returned to the SQL user with a reason code indicating the specific error.
- For a coupling facility read during rollback, backout, or restart: The inaccessible page is added to the logical page list (LPL) for the page set. Message DSNB250E is issued for the first page of each data set added to the LPL.
- For a coupling facility read during castout: The castout operation cannot complete.
- For a coupling facility write: The changed page is added to the LPL for the page set.

DSNB304I *csect-name* **GROUP BUFFER POOL *gbpname* WAS SET TO 'DAMAGE ASSESSMENT PENDING' STATUS**

Explanation: A coupling facility structure for a group buffer pool was damaged.

System Action:

- DB2 puts the group buffer pool into 'damage assessment pending' (DAP) status. Message DSNB304I indicates the DAP status. The group buffer pool cannot be accessed until DAP status is cleared.
- The DB2 damage assessment process determines which table spaces and index spaces are using the failed group buffer pool and puts those spaces into 'group buffer pool recovery pending' (GRECP) status.
- After DB2 sets all the necessary spaces to GRECP status, the DAP status for the group buffer pool is cleared. Message DSNB305I indicates that DAP status is cleared.

DSNB305I *csect-name* 'DAMAGE ASSESSMENT PENDING' STATUS WAS CLEARED FOR GROUP BUFFER POOL *gbpname*

Explanation: Damage assessment completed and the 'damage assessment pending' (DAP) status is cleared for the group buffer pool (GBP). At this point, the group buffer pool status is no longer restricted and DB2 attempts to reconnect to the group buffer pool on the next reference to a GBP-dependent page set within the associated buffer pool.

Message DSNB304I precedes this message.

DSNB306I *csect-name* THE REQUESTED LENGTH OF THE LOCAL CACHE VECTOR COULD NOT BE ALLOCATED FOR GROUP BUFFER POOL *gbpname* REQUESTED LENGTH = *length1* ALLOCATED LENGTH = *length2*

Explanation: DB2 connected to the group buffer pool indicated by *gbpname*, but the MVS Cross-system Extended Services (XES) component could not allocate the requested size of the local cache vector (LCV) in the hardware system area (HSA). DB2 requires an LCV size that is large enough to handle all pages in the member's buffer pool (virtual pool and hiperpool combined).

length1 indicates the LCV size (in number of bits) that DB2 requested. *length2* indicates the LCV size (in number of bits) that XES was able to allocate.

To prevent flooding the operator console, this message is only issued once per DB2 member per group buffer pool until the condition is corrected.

System Action: DB2 disconnects from the GBP and issues message DSNB301E with reason code 00C20208, if it has not yet been issued.

SQLCODE -904 is returned to the user with a reason code of 00C20208.

System Programmer Response: There is not enough HSA storage on the processor to support the size of the local cache vector. The details of HSA allocation are machine-dependent and are defined by the hardware. To correct this problem, take one or both of the following actions:

- Consult the documentation for your processor hardware to determine if the HSA storage allocation can be increased, and if so, how to do it.
- Modify the software configuration in your parallel sysplex to reduce the number or size of the vectors that are in use by other coupling facility structure users. Consider the following possible solutions:
 - Use the DB2 ALTER BUFFERPOOL command to reduce the size of this local buffer pool. This means you might have to reduce or eliminate the hiperpool or reduce the size of the virtual pool.
 - Use the DB2 ALTER BUFFERPOOL command to reduce the size of another local buffer pool that is already connected to a group buffer pool. This means that you might have to reduce or eliminate the hiperpool, or reduce the size of the virtual pool. If you make a connected buffer pool smaller, DB2 can usually contract the size of the corresponding LCV dynamically, making HSA storage available. However, DB2 cannot always do the dynamic LCV contraction; this is especially true if there is a hiperpool. In cases where DB2 cannot dynamically contract the LCV size, you

can use the DB2 ALTER BUFFERPOOL command to either force a deallocation of the LCV or to force a contraction of the LCV as follows:

1. Delete the hiperpool, if it exists.
 2. Take one of the following actions:
 - a. Make the virtual pool very small (perhaps 50 pages or less). Making the virtual pool sufficiently small should let DB2 dynamically contract the LCV, or
 - b. Delete the virtual pool to let DB2 disconnect from the group buffer pool. This frees the entire LCV associated with that member's connection to that group buffer pool.
 3. Redefine the virtual pool to be smaller than the original size. If a hiperpool originally existed, then you can probably restore the virtual pool back to its original size.
- Consolidate your group buffer pool-dependent page sets into fewer buffer pools to reduce the number of group buffer pool connections.
 - Consult the documentation for the other software components that might be using a coupling facility cache or list structure with an associated LCV to determine whether it is possible to either delete the connection or to reduce the size of the LCV associated with the connection.

DSNB307I *csect-name* GROUP BUFFER POOL *gbpname* WAS SUCCESSFULLY ALLOCATED BUT THE EXCLUSION LIST WAS NOT HONORED

Explanation: DB2 successfully connected to the group buffer pool and allocated the group buffer pool in a coupling facility. However, the group buffer pool was allocated in a coupling facility containing a structure in the exclusion list.

System Programmer Response: If you require that the exclusion list be honored, you must ensure that there is sufficient space in the coupling facilities that are not in the exclusion list. IFCID 0250 provides information about which facilities were attempted.

DSNB308I *csect-name* GROUP BUFFER POOL *gbpname* WAS SUCCESSFULLY ALLOCATED BUT THE ALLOCATED SIZE OF *alloc_size* IS LESS THAN THE REQUESTED SIZE OF *req_size*

Explanation: DB2 successfully connected to the group buffer pool and allocated the group buffer pool in a coupling facility. However, the allocated size of the group buffer pool was less than the requested size in the MVS CFRM administrative policy because there is not enough space in the preference list facilities. Both *alloc_size* and *req_size* are in 4KB blocks.

System Programmer Response: IFCID 0250 provides information about which coupling facilities were used for attempted allocation.

DSNB309I *csect-name* GROUP BUFFER POOL *gbpname* HAS BEEN DISCONNECTED WITH A REASON OF '*reason*'

Explanation: DB2 disconnected from the named group buffer pool.

reason indicates one of the following values:

- NORMAL** DB2 disconnected the group buffer pool normally. MVS deletes the connection.
- FAILURE** DB2 disconnected the group buffer pool abnormally. MVS puts the connection into a 'failed-persistent' state. DB2 disconnects the GBP with a reason of FAILURE when some type of error has been detected, and castout processing cannot proceed. Usually the error involves a connectivity failure to either the coupling facility or DASD. This message is preceded by message DSNB303E, and probably a series of DSNB311I and DSNB312I messages.

If this message is issued because connectivity was lost to the group buffer pool, this message signifies that this DB2 member has completed its processing of the error.

System Programmer Response: See the system programmer response for message DSNB311I or DSNB312I.

DSNB310I *csect-name* **GROUP BUFFER POOL** *gpbname*
IS ALLOCATED IN A NONVOLATILE STRUCTURE

Explanation: The coupling facility storage in which the group buffer pool is allocated was previously volatile, but is now non-volatile. For availability reasons, we recommend that DB2 group buffer pools be allocated in nonvolatile coupling facility storage. When DB2 connects a group buffer pool, it requests that the backing coupling facility structure be allocated in non-volatile storage. If the request for nonvolatile storage is not honored, DB2 issues message DSNB302I.

System Action: DB2 processing continues.

DSNB311I *csect-name* **DBNAME** *database* **SPACE NAME**
spacename **HAS PAGES IN THE LOGICAL PAGE LIST**

Explanation: This message is issued after a loss of connectivity to a group buffer pool was detected. The message indicates that the named table space or index space has one or more pages in the logical page list (LPL) that need to be recovered. This message is issued after DB2 has completed its processing for the table space or index space; this is the earliest point at which you can recover LPL pages for that table space or index.

System Action: The pages in the LPL are not accessible until they have been recovered.

System Programmer Response: Issue the START DATABASE command with the named table space or index to recover the LPL pages. The START DATABASE command must be issued from a DB2 member that can connect to the group buffer pool. Alternatively, the RECOVER utility or the LOAD utility can be used to recover the LPL pages.

DSNB312I *csect-name* **DBNAME** *database* **SPACE NAME**
spacename **PARTITION** *part-number* **HAS PAGES IN THE LOGICAL PAGE LIST**

Explanation: This message is issued after a loss of connectivity to a group buffer pool was detected. The message indicates that a partition of the named table space or index has one or more pages in the logical page list (LPL) that need to be recovered. This message is issued after DB2 has completed its processing for the partition; this is the earliest point at which you can recover the LPL pages for that partition.

System Action: The pages in the LPL are not accessible until they have been recovered.

System Programmer Response: Issue the START DATABASE command on the table space or index space partition to recover the LPL pages. The START DATABASE command must be issued from a DB2 member that can connect to the group buffer pool. Alternatively, the RECOVER utility or the LOAD utility can be used to recover the LPL pages.

DSNB313I *csect-name* **GROUP BUFFER POOL** *gpbname*
TO BE DISCONNECTED REASON=reason
LOSSCONN PERCENTAGE=percentage

Explanation: This DB2 member is disconnecting from group buffer pool *gpbname* because it has lost connectivity to the coupling facility in which the group buffer pool is allocated.

reason is one of the following:

- NOSFMPOL** MVS cannot determine the scope of the loss of connectivity because there is no active SFM policy with CONNFIL(YES).
- LOSSCONN** MVS determined that the scope of the loss of connectivity was less than 100%.
- NOXESEVL** MVS started to try to determine the scope of the loss of connectivity, but some condition occurred which prevented MVS from being able to complete the evaluation. One example of such a condition would be that the SFM policy became inactive while MVS was trying to do the evaluation.

If *reason* is LOSSCONN, then *percentage* indicates the percentage of lost connectivity that was calculated by MVS. MVS evaluates the scope of the loss of connectivity in terms of SFM weights associated with the systems which have lost connectivity and which have active connectors to the coupling facility structure (if there are systems that do not have an active connector to the coupling facility structure, then those systems are not factored into the "percentage loss of connectivity" calculation).

If *reason* is not LOSSCONN, then *percentage* is not applicable (it should appear as zero).

System Action: The DB2 member disconnects the group buffer pool, putting its connection into a "failed-persistent" state.

If there are transactions that are in progress at the time of the connectivity failure, DB2 might need to add pages to the logical page list (LPL).

System Programmer Response: Use the START DATABASE command to recover the LPL pages. If DSNDB01 or DSNDB06 objects have LPL pages, you might need to recover these first, before proceeding with LPL recovery for other objects.

DSNB314I *csect-name* **DAMAGE ASSESSMENT TO BE TRIGGERED FOR GROUP BUFFER POOL**
gpbname **REASON=reason**

Explanation: DB2 is about to initiate the damage assessment function for group buffer pool *gpbname* because of a detected error in either the coupling facility in which the group buffer pool was allocated, or in the connectivity from the MVS systems to the coupling facility.

reason is one of the following:

- 100%LCON** An error has occurred in a coupling facility or in the attachments of MVS systems to a coupling facility which has caused all DB2 members to lose connectivity to the named group buffer pool.
- STRFAIL** There was an error in the coupling facility in which the group buffer pool was allocated which caused a failure of the coupling facility structure.
- CONERROR** The named group buffer pool is currently allocated in a coupling facility, but DB2 cannot connect to the group buffer pool because the system on which it is running does not currently have connectivity, and MVS has indicated that currently no other member is actively connected and has connectivity.
- DAP** The named group buffer pool is in damage assessment pending (DAP) state.

System Action: DB2 triggers the damage assessment function to ensure that any changed pages that might have been cached in the affected group buffer pool get marked as "needing recovery" (the objects to which the pages belong are marked in GRECP state). This message should be immediately followed by a DSNB304I message indicating that the group buffer pool has been entered into damage assessment pending (DAP) state.

If there are transactions that are in progress at the time of the connectivity failure, DB2 might need to add pages to the logical page list (LPL).

There is one case where DB2 triggers damage assessment for a group buffer pool, but no DSNB314I message is issued. This case is where the group buffer pool was manually deleted (via MVS SETXCF FORCE commands) while all connections to the group buffer pool were failed-persistent (e.g. all DB2 members were down). In this case, the next DB2 member to connect to the group buffer pool will cause MVS to try to reallocate a new instance of the group buffer pool in some coupling facility in the CFRM policy preference list. If the allocation succeeds, then DB2, by doing a coupling facility structure version id comparison, will detect that the previous instance of the group buffer pool had been lost, and will trigger damage assessment. But you will not receive the DSNB314I message in this case, nor will you receive the DSNB304I or DSNB305I messages indicating that the group buffer pool has been put into damage assessment pending (DAP) state. You will only receive a series of DSNB322I and/or DSNB323I messages indicating those pagesets or partitions that have been put into GRECP state by the damage assessment process.

System Programmer Response: Use the START DATABASE command to recover the LPL pages and GRECP objects. If DSNDB01 or DSNDB06 objects are in GRECP state or have LPL pages, you might need to recover these first, before proceeding with GRECP or LPL recovery for other objects.

DSNB319A *csect-name* **THERE IS A SHORTAGE OF SPACE IN GROUP BUFFER POOL** *gbp-name*

Explanation: The amount of storage in the group buffer pool (GBP) coupling facility structure available for writing new pages is low. The GBP is 75 percent full with changed data. As the GBP fills with changed data, the castout thresholds are continuously reached, and the castout engines must continuously work to attempt to keep the number of changed pages in the GBP below the castout thresholds. Also, the more changed data the GBP contains, the less efficiently it operates. Completely running out of GBP storage can result in transaction delays and in pages being added to the logical page list (LPL).

This message stays on the MVS console and is highlighted.

System Action: DB2 processing continues.

This message might remain highlighted and might not be automatically deleted in a pre SP5.2.1-JES3 environment.

Operator Response: Contact the system programmer to fix the storage problem.

System Programmer Response:

You can relieve the GBP storage shortage by taking one or more of the following actions:

- Use the ALTER GROUPBUFFERPOOL command to lower the CLASST and GBPOOLT castout thresholds.
- Use the ALTER GROUPBUFFERPOOL command to lower the GBPCHKPT GBP checkpoint frequency.
- Use the MVS SETXCF START,REBUILD command to expand the GBP coupling facility structure. If you rebuild, you can use the ALTER GROUPBUFFERPOOL command to lower the RATIO so that a higher percentage of the GBP storage is given to data entries over directory entries.
- If you are running on MVS 5.2 or a subsequent release, you can use the MVS SETXCF START,ALTER command to expand the size of the GBP (the maximum size to which you can expand is determined by the SIZE parameter in the CFRM policy that was used to allocate the GBP).

If you don't do anything to relieve the storage shortage, message DSNB325A appears if the GBP reaches 90 percent full.

Message DSNB327I appears when the GBP storage shortage is relieved.

You can monitor the amount of GBP storage in use with the DISPLAY GBPOOL command and with the DB2 statistics trace. Monitor the castout activity to ensure that castouts are keeping up with the rate of GBP-write activity. You can use Performance trace classes 20 and 21 (specifically, IFCIDs 0261, 0262 and 0263) to do more detailed monitoring of the DB2 castout processing.

DSNB320I *csect-name - DBNAME database* **SPACE NAME spacename PARTITION part-number IN GROUP BUFFERPOOL** *gbpname* **IS IN GROUP BUFFERPOOL RECOVERY PENDING STATE**

Explanation: This message reports the group buffer pool recovery pending (GRECP) status of the named table space or index space partition.

Severity: 4 (warning)

System Action: The data in the named partition is not accessible.

User Response: Issue the -START DATABASE command on the partition to remove the GRECP status and make the data accessible again. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB321I *csect-name* - DBNAME *database* SPACE NAME *spacename* IN GROUP BUFFERPOOL *gbpname* IS IN GROUP BUFFERPOOL RECOVERY PENDING STATE

Explanation: This message reports the group buffer pool recovery pending (GRECP) status of the named table space or index space.

Severity: 4 (warning)

System Action: The table space or index space is not accessible.

User Response: Issue the -START DATABASE command on the table space or index space to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB322I *csect-name* - TABLE SPACE OR INDEX SPACE WITH DBID X'*dbid*' PSID X'*psid*' PARTITION *part-number* IN GROUP BUFFERPOOL *gbpname* IS IN GROUP BUFFERPOOL RECOVERY PENDING STATE AND CANNOT BE AUTOMATICALLY RECOVERED

Explanation: This message reports the group buffer pool recovery pending (GRECP) status of the table space or index space partition identified by the internal identifiers DBID and PSID. This message is issued instead of message DSNB320I when the name of the table space or index space is not available. The partition cannot be automatically recovered because there are retained physical locks (P-locks) on the partition.

Severity: 4 (warning)

System Action: The data in the identified partition is not accessible.

User Response: Issue the -DISPLAY DATABASE(*) SPACENAM(*) RESTRICT command to determine the table spaces or index spaces partition in GRECP status. First, start the failed DB2 members that hold retained P-locks on the partition. Issue the -START DATABASE command on the partition to remove the GRECP status and make the data accessible again. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB323I *csect-name* - TABLE SPACE OR INDEX SPACE WITH DBID X'*dbid*' PSID X'*psid*' IN GROUP BUFFERPOOL *gbpname* IS IN GROUP BUFFERPOOL RECOVERY PENDING STATE AND CANNOT BE AUTOMATICALLY RECOVERED

Explanation: This message reports the group buffer pool recovery pending (GRECP) status of the table space or index space identified by the internal identifiers DBID and PSID. This message is issued instead of message DSNB321I when the name of the table space or index space is not available. The table space or index space cannot be automatically recovered because there are retained physical locks (P-locks) on the space.

Severity: 4 (warning)

System Action: The table space or index space is not accessible.

User Response: Issue the -DISPLAY DATABASE(*) SPACENAM(*) RESTRICT command to determine the table spaces or index spaces in GRECP status. First, start the failed DB2 members that hold retained P-locks on the table space or index space. Issue the -START DATABASE command on the table space or index space to remove the GRECP status and make the data accessible again. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB325A *csect-name* THERE IS A CRITICAL SHORTAGE OF SPACE IN GROUP BUFFER POOL *gbpname*

Explanation: The amount of storage in the group buffer pool (GBP) coupling facility structure available for writing new pages is critically low. The GBP is 90 percent full with changed data. As the GBP fills with changed data, the castout thresholds are continuously reached, and the castout engines must continuously work to attempt to keep the number of changed pages in the GBP below the castout thresholds. In addition, the more the GBP is filled with changed data, the less efficient are the coupling facility storage management algorithms. Completely running out of GBP storage can result in transaction delays and in pages being added to the logical page list (LPL).

This message stays on the MVS console and is highlighted.

System Action: DB2 processing continues.

This message might remain highlighted and might not be automatically deleted in a pre-SP5.2.1-JES3 environment.

Operator Response: Contact the system programmer to fix the storage problem.

System Programmer Response: You can relieve the GBP storage shortage by taking one or more of the following actions:

- Use the ALTER GROUPBUFFERPOOL command to lower the CLASST and GBPOOLT castout thresholds.
- Use the ALTER GROUPBUFFERPOOL command to lower the GBPCHKPT GBP checkpoint frequency.
- Use the MVS SETXCF START,REBUILD command to expand the GBP coupling facility structure. If you rebuild, you can use the ALTER GROUPBUFFERPOOL command to lower the RATIO so that a higher percentage of the GBP storage is given to data entries over directory entries.
- If you are running on MVS 5.2 or a subsequent release, you can use the MVS SETXCF START,ALTER command to expand the size of the GBP (the maximum size to which you can expand is determined by the SIZE parameter in the CFRM policy that was used to allocate the GBP).

If you don't do anything to relieve the storage shortage, message DSNB228I appears if a write to the GBP fails due to a 'GBP full' condition. If DB2 detects a 'full' condition, it will suspend the transaction, initiate castout activity, and then retry the write to the GBP. If the GBP write still fails after several retry attempts, then DB2 adds the page to LPL.

Message DSNB327I appears when the GBP storage shortage is relieved.

You can monitor the amount of GBP storage in use with the DISPLAY GBPOOL command and with the DB2 statistics trace. Monitor the castout activity to ensure that castouts are

keeping up with the rate of GBP-write activity. You can use Performance trace classes 20 and 21 (specifically, IFCIDs 0261, 0262 and 0263) to do more detailed monitoring of the DB2 castout processing.

DSNB327I *csect-name* **GROUP BUFFER POOL** *gbp-name*
HAS ADEQUATE FREE SPACE

Explanation: The group buffer pool (GBP) coupling facility structure has adequate space available for the writing of new pages to the GBP.

This message may be issued when either of the following occurs:

- Rebuilding of GBP reduces changed page count to 60% or less of GBP capacity.
- 'changed data.' entries decrease to 60% or lower when they were previously 75% GBP capacity or higher.

System Action: DB2 processing continues.

DSNB330I *csect-name* **GROUP BUFFER POOL** *gbpname*
CANNOT BE CONNECTED FOR REBUILD
DB2 REASON CODE = *reason1* **MVS IXLCONN**
REASON CODE = *reason2*

Explanation: DB2 was not able to connect to the named group buffer pool for rebuild. *reason1* is the DB2 reason code. *reason2* is the MVS IXLCONN reason code. See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of MVS IXLxxx reason codes.

System Action: DB2 stops the rebuild.

Problem Determination: If the MVS IXLCONN reason code is xxxx0C08 (structure allocation failed because there was no suitable facility to allocate based on the preference list in the MVS CFRM administrative policy), or if the MVS IXLCONN reason code is xxxx084C (user does not have proper Security Access Facility (SAF) authorization), then IFCID 0250, if active, contains additional diagnostic information.

DSNB331I *csect-name* **REBUILD STARTED FOR GROUP**
BUFFER POOL *gbpname* **REASON =** *reason*

Explanation: A rebuild has been initiated for the named group buffer pool. *reason* indicates the reason why the rebuild was initiated. *reason* can be one of the following:

- OPERATOR** The operator initiated a SETXCF command to initiate the rebuild.
- LOSSCONN** MVS detected a loss of connectivity to the group buffer pool.

This message is issued by each DB2 member participating in the rebuild.

System Action: The DB2 members that are actively connected to the named group buffer pool participate in the rebuild. DB2 accomplishes the group buffer pool rebuild processing in two phases:

1. Quiesce phase. Each member quiesces all local access to the group buffer pool.
2. Connect phase. Each member connects to the new structure. Each page set or partition castout owner that has connectivity to original structure is responsible for writing pages from the original structure to the new one. If there are not enough data entries in the new structure, the page

set and partition owners cast those pages out to DASD instead. Each member issues message DSNB332I after it completes this activity. After all members have completed their castout owner rebuild work, the group buffer pool structure owner does the final sweep and checks to see if there are any changed pages still remaining in the original structure. If so, the structure owner reads the changed pages from the original structure and writes them to the new one. The structure owner issues message DSNB333I after it has completed the final sweep.

After all members have responded to MVS indicating that its connect phase processing is complete, MVS then notifies each member that the rebuild is complete. Each DB2 member issues message DSNB338I indicating that the rebuild has completed successfully.

If an error occurs during the rebuild, the rebuild is stopped. Each DB2 member issues message DSNB335I indicating the reason why the rebuild is stopping, followed by message DSNB339I indicating that the rebuild has not completed successfully. The operator can also stop rebuilds using the MVS SETXCF command.

DSNB332I *csect-name* **THIS MEMBER HAS COMPLETED**
CASTOUT OWNER REBUILD FOR GROUP
BUFFER POOL *gbpname* **PAGES CAST OUT**
FROM ORIGINAL STRUCTURE = *value1*
PAGES WRITTEN TO NEW STRUCTURE
= *value2*

Explanation: This DB2 member has completed its part of the rebuild processing for the named group buffer pool for the page sets and partitions for which it is the castout owner.

value1 indicates the number of pages that this member has castout to DASD for the rebuild. If the new structure has a sufficient number of data entries, then *value1* should normally be zero because DB2 writes the changed pages from the original structure to the new structure. However, if the new structure does not have sufficient space, then *value1* may be greater than zero because DB2 responds to insufficient space in the new structure by casting the changed pages in the original structure to DASD instead of writing them to the new structure.

value2 indicates how many changed pages this member wrote to the new structure from the original as part of the rebuild process. If the new structure has sufficient space, then each DB2 that has connectivity to the original structure writes the changed pages for page sets and partitions for which it is the castout owner from the original structure to the new structure, and *value2* indicates the number of pages that the DB2 member wrote.

value1 and *value2* would be zero if this member has no page set or partition castout ownership responsibility.

This message is issued by each DB2 member that has connectivity to the original group buffer pool, and it is always be preceded by message DSNB331I.

System Action: If this DB2 member is not the group buffer pool structure owner, then its rebuild work is done, and it notifies MVS that it has completed its part of the rebuild and awaits later notification that all members have completed. If this member is the structure owner, then it proceeds to its final sweep processing (see DSNB333I).

Refer to "System Action" for message DSNB331I for an explanation of the group buffer pool rebuild processing.

DSNB333I *csect-name* REBUILD FINAL SWEEP COMPLETED FOR GROUP BUFFER POOL *gbpname* PAGES WRITTEN TO NEW STRUCTURE = *value1*

Explanation: DB2 has completed the final sweep for the rebuild of the named group buffer pool. A final sweep means that the DB2 member that is the group buffer pool structure owner ensures that all changed pages have either been cast out to DASD or have been written to the new structure after all the page set and partition owners have finished their work. If any changed pages are found in the original structure during the final sweep, then the structure owner writes them out to the new structure. *value1* should be zero in most cases for a manual rebuild. *value1* will probably be greater than zero in most cases where the rebuild was initiated because a DB2 lost connectivity to the group buffer pool.

This message is issued by the structure owner and is always preceded by message DSNB332I.

System Action: Immediately after issuing this message, the structure owner notifies MVS that the rebuild has completed, and MVS should soon begin notifying each participating member that the rebuild is complete.

Refer to "System Action" for message DSNB331I for an explanation of the group buffer pool rebuild processing.

DSNB335I *csect-name* REBUILD STOPPED FOR GROUP BUFFER POOL *gbpname* REASON = *reason1* DB2 REASON CODE = *reason2*

Explanation: A rebuild has been stopped for the named group buffer pool.

reason1 indicates why the rebuild was stopped:

OPERATOR	The operator initiated an MVS SETXCF command to stop the rebuild.
LOSSCONNNEW	One or more of the DB2 members lost connectivity to the new group buffer pool structure while the rebuild was in progress.
LOSSCONNOLD	One or more of the DB2 members lost connectivity to the original group buffer pool structure while the rebuild was in progress.
STRFAILNEW	The new group buffer pool structure failed while the rebuild was in progress.
STRFAILOLD	The original group buffer pool structure failed while the rebuild was in progress.
DB2REASON	DB2 decided to stop the rebuild. The reason code given in <i>reason2</i> indicates why DB2 stopped the rebuild.

If *reason1* indicates 'DB2REASON', then *reason2* specifies a DB2 reason code that indicates why DB2 stopped the rebuild. If *reason1* is not 'DB2REASON', then *reason2* is zero.

This message is normally preceded by message DSNB331I, which indicates that the rebuild was started and the reason why the rebuild was started. This message is issued by each DB2 member participating in the rebuild. This message is followed by message DSNB339I.

System Action: The new structure is discarded. If the original structure is still usable, then all members that still have connectivity to the original structure resume using it. Members that do not have connectivity to the original structure disconnect, and their connections become failed-persistent.

If the original structure is not usable, then DB2 initiates damage assessment processing for the group buffer pool.

System Programmer Response: If the rebuild stopped because of "DB2REASON," see the explanation for the reason code given.

DSNB338I *csect-name* THE REBUILD FOR GROUP BUFFER POOL *gbpname* HAS COMPLETED SUCCESSFULLY

Explanation: The rebuild for the named group buffer pool has successfully completed.

This message is preceded by message DSNB331I which indicates the reason why the rebuild was started. This message is issued by each DB2 member participating in the rebuild.

System Action: The original structure is discarded and all DB2s that are connected to the group buffer pool begin using the new structure.

DSNB339I *csect-name* THE STOP OF THE REBUILD FOR GROUP BUFFER POOL *gbpname* HAS COMPLETED

Explanation: The stop of the rebuild for the named group buffer pool has completed.

This message is preceded by message DSNB335I which indicates the reason why the rebuild was stopped. This message is issued by each DB2 member participating in the rebuild.

System Action: The new structure is discarded. If the original structure is still usable, then all members that still have connectivity to the original structure resume using it, and members that do not have connectivity to the original structure disconnect and their connection goes into a failed-persistent state.

If the original structure is not usable, then DB2 initiates damage assessment processing for the group buffer pool.

DSNB340I *csect-name* UNEXPECTED ERROR DURING REBUILD FOR GROUP BUFFER POOL *gbpname* MVS *service-name* RETURN CODE = *rc* MVS *service-name* REASON CODE = *reason*

Explanation: DB2 received an unexpected error from MVS during rebuild processing for the named group buffer pool.

service-name is one of the following:

IXLREBLD
IXLEERSP

rc is the return code from the MVS service and *reason* is the reason code.

System Action: DB2 stops the rebuild.

System Programmer Response: See *MVS/ESA Programming: Sysplex Services Reference* for an explanation of the return and reason code for the named MVS service.

DSNB350I *csect-name* **DBNAME database SPACE NAME spacename CANNOT BE AUTOMATICALLY RECOVERED. DB2 REASON CODE = reason**

Explanation: Following a group buffer pool failure, DB2 cannot automatically recover the named table space or index space. *reason* specifies a DB2 reason code that indicates why DB2 could not initiate the recovery.

Severity: 4 (warning)

System Action: The table space or index space remains in group buffer pool recovery pending (GRECP) status and is inaccessible.

User Response: Use the DB2 -START DATABASE command on the table space or index space to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB351I *csect-name* **DBNAME database SPACE NAME spacename PARTITION part# CANNOT BE AUTOMATICALLY RECOVERED. DB2 REASON CODE = reason**

Explanation: Following a group buffer pool failure, DB2 cannot automatically recover the named table space or index space partition. *reason* specifies a DB2 reason code that indicates why DB2 could not initiate the recovery.

Severity: 4 (warning)

System Action: The partition remains in group buffer pool recovery pending (GRECP) status and is inaccessible.

User Response: Use the DB2 -START DATABASE command on the partition to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

DSNB352I *csect-name* **AUTOMATIC RECOVERY CANNOT BE INITIATED FOR GROUP BUFFER POOL gbp-name REASON = reason**

Explanation: Following a failure of the named group buffer pool, DB2 is not able to initiate automatic recovery.

reason indicates the reason why automatic recovery was not initiated:

AUTORECNO The AUTOREC option is set to NO for the group buffer pool.

CONNRELEASE At least one actively connected DB2 member is not at the proper release to support automatic recovery.

Severity: 4 (warning)

System Action: The page sets and partitions that are in group buffer pool recovery pending (GRECP) status remain inaccessible.

User Response: Use the DB2 -START DATABASE command on the page sets and partitions to remove the GRECP status and make the data accessible. You can also use the RECOVER or LOAD utility with the REPLACE option to clear the GRECP status.

If *reason* is AUTORECNO and you want to enable automatic recovery for the group buffer pool, use the ALTER GROUPBUFFERPOOL command to set AUTOREC to YES for the group buffer pool.

If *reason* is CONNRELEASE, then you must ensure that all DB2 members in the group are running at the appropriate release. Automatic recovery is not supported unless all members are running Version 5 or a later release.

DSNB353I *csect-name* **ASYNCHRONOUS GRECP RECOVERY IN PROGRESS FOR GROUP BUFFER POOL bpoolname**

Explanation: Following a group buffer pool failure, DB2 triggers an automatic recovery process to attempt to recover GRECP page sets for the specified group buffer pool. This message is issued once by any DB2 member who is the page set castout owner on one of the objects being recovered.

System Action: Check for the DSNB354I message to verify the completion of the automatic recovery process.

DSNB354I *csect-name* **ASYNCHRONOUS GRECP RECOVERY HAS COMPLETED FOR GROUP BUFFER POOL bpoolname.**

Explanation: DB2 has completed the GRECP recovery process for those GRECP page sets in the group buffer pool specified in the message. This message is issued once by any DB2 member who previously issued a DSNB353I message, who is the page set castout owner on one of the objects being recovered.

DSNB401I **BUFFERPOOL NAME bpname, BUFFERPOOL ID bpid, USE COUNT ucount**

Explanation: This message contains the display information that results from a DISPLAY BUFFERPOOL command. For each buffer pool, this message is the first of a set of messages that display information from the DISPLAY BUFFERPOOL command.

The statistics are:

bpname	The buffer pool external name (BP0, BP1,..., BP49, BP32K, BP32K1,..., BP32K9).
bpid	The buffer pool internal identifier (0-49, 80-89).
ucount	The number of open table spaces or index spaces that refer to this buffer pool. A zero use count means that the buffer pool is inactive.

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB402I **VIRTUAL BUFFERPOOL SIZE = vpsize BUFFERS ALLOCATED = vpalc TO BE DELETED = vptbd IN-USE/UPDATED = vpcba**

Explanation: This message, displayed by the DISPLAY BUFFERPOOL command, describes the allocation status of a virtual buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

vpsize	The user-specified virtual buffer pool size
vpalc	Number of allocated buffers in an active virtual buffer pool
vptbd	Number of buffers to be deleted in an active virtual buffer pool because of pool contraction
vpcba	Number of currently active (that is, not stealable) buffers in the virtual buffer pool

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB403I HIPERPOOL SIZE = *hpsize* BUFFERS, CASTOUT = *hpcast* ALLOCATED = *hpalc* TO BE DELETED = *hptbd* BACKED BY ES = *hpback*

Explanation: This message, displayed by the DISPLAY BUFFERPOOL command, describes the allocation status of a hiperpool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The variables are:

<i>hpsize</i>	The user-specified hiperpool size.
<i>hpcast</i>	The hiperpool's CASTOUT attribute (YES or NO).
<i>hpalc</i>	Number of allocated buffers in an active hiperpool.
<i>hptbd</i>	Number of buffers to be deleted in an active hiperpool because of pool contraction.
<i>hpback</i>	Number of buffers backed by expanded storage. For a CASTOUT(YES) hiperpool, this number is higher than the actual number of backed buffers if expanded storage frames were stolen by the system and DB2 did not subsequently try to access the buffers.

This message is issued by the following CSECT: DSNB1DBP

DSNB404I THRESHOLDS — VP SEQUENTIAL = *vpseq* HP SEQUENTIAL = *hpseq* DEFERRED WRITE = *dwt* VERTICAL DEFERRED WRT = *dww* PARALLEL SEQUENTIAL = *vppseqt* ASSISTING PARALLEL SEQT = *VPXPSEQT*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command to describe the user-modifiable thresholds for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The input threshold variables are:

<i>vpseq</i>	Sequential steal threshold for the virtual pool, expressed as a percentage of the total virtual buffer pool size.
<i>hpseq</i>	Sequential steal threshold for the hiperpool, expressed as a percentage of the total hiperpool size.
<i>dwt</i>	Free buffer deferred write threshold for the virtual buffer pool, expressed as a percentage of the total virtual buffer pool size.
<i>dww</i>	Vertical deferred write threshold for the virtual buffer pool, expressed as a percentage of the total virtual buffer pool size.
<i>vppseqt</i>	Sequential threshold for parallel query processing, expressed as a percentage of the virtual sequential steal threshold. When the threshold is set to 0, there is no parallel query processing support.

VPXPSEQT Assisting parallel sequential threshold, expressed as a percentage of the sequential threshold for parallel query processing. *VPXPSEQT* allows you to control how much buffer resource is used when this

DB2 is assisting another member of the group in parallel processing. When the threshold is set to 0, this buffer pool will not be used to assist other data sharing members in processing a query. In a non-data-sharing environment, this value is ignored.

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB405I HIPERSPACE NAMES - *hsn hsn hsn hsn*

Explanation: This message, displayed by the DISPLAY BUFFERPOOL command, lists the names of the hiperspaces allocated to a hiperpool. This message is always preceded by message DSNB401I identifying the associated buffer pool, and is displayed only if the hiperpool is active.

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB408I NO DETAIL STATISTICS AVAILABLE FOR BUFFER POOL *bpname*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It indicates that no detail statistics are available for the requested buffer pool because the pool was not activated since DB2 startup.

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB409I INCREMENTAL STATISTICS SINCE *basetime*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL(INTERVAL) option specified. It indicates the start time of the interval for which the statistics were accumulated (that is, either the time of the previous incremental display or the time the buffer pool was first activated, if there was no previous incremental display).

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB410I CUMULATIVE STATISTICS SINCE *basetime*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL(*) option specified. It indicates the start time of the interval for which the statistics were accumulated (that is, the time the buffer pool was first activated).

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB411I RANDOM GETPAGE = *rgp* SYNC READ I/O (R) = *srr* SEQ. GETPAGE = *sgp* SYNC READ I/O (S) = *srs* DMTH HIT = *dmt*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists the page read statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

<i>rgp</i>	Number of nonsequential GETPAGE requests
------------	--

srr Number of synchronous read I/O operations for nonsequential GETPAGE requests

sgp Number of sequential GETPAGE requests

srs Number of synchronous read I/O operations for sequential GETPAGE requests

dmt Number of times data management threshold was hit

This messages is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB412I SEQUENTIAL PREFETCH - REQUESTS = *pft* PREFETCH I/O = *pio* PAGES READ = *pfp*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists the sequential prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

pft Number of times sequential prefetch was requested

pio Number of sequential prefetch read I/O operations

pfp Number of pages read because of sequential prefetch

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB413I LIST PREFETCH - REQUESTS = *pft* PREFETCH I/O = *pio* PAGES READ = *pfp*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It shows the list prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

pft Number of times list prefetch was requested

pio Number of list prefetch read I/O operations

pfp Number of pages read because of list prefetch

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB414I DYNAMIC PREFETCH - REQUESTS = *pft* PREFETCH I/O = *pio* PAGES READ = *pfp*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists the dynamic prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

pft Number of times dynamic prefetch was requested

pio Number of dynamic prefetch read I/O operations

pfp Number of pages read because of dynamic prefetch

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB415I PREFETCH DISABLED - NO BUFFER = *pdf* NO READ ENGINE = *ree*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists prefetch statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

pdf Number of times prefetch was disabled (no buffer)

ree Number of times prefetch was disabled (no asynchronous read processor available)

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB420I SYS PAGE UPDATES = *sws* SYS PAGES WRITTEN = *pws* ASYNC WRITE I/O = *wio* SYNC WRITE I/O = *imw*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists page write statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

sws Number of system page updates

pws Number of system pages written

wio Number of asynchronous write I/O operations

imw Number of synchronous write I/O operations

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB421I DWT HIT= *dwt* VERTICAL DWT HIT=*vdw* NO WRITE ENGINE=*wee*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists page-write statistics for the buffer pool. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The statistics are:

dwt Number of times deferred write threshold was hit

vdw Number of times vertical deferred write threshold was hit

wee Number of times write engine (asynchronous write processor) was not available for I/O operations

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB430I HIPERPOOL ACTIVITY (NOT USING ASYNCHRONOUS DATA MOVER FACILITY) — SYNC HP READS=*hrs* SYNC HP WRITES=*hws* ASYNC HP READS=*hra* ASYNC HP WRITES=*hwa* READ FAILURES=*hrf* WRITE FAILURES=*hwf*

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists statistics about the movement of pages between the virtual buffer pool and the hiperpool. This message is always

preceded by message DSNB401I identifying the associated buffer pool. The statistics listed are for pages moved without the use of the Asynchronous Data Mover Facility.

The statistics are:

- hrs Number of pages moved from hiperpool to virtual pool synchronously (that is, in response to a page access request by an application)
- hws Number of pages moved from virtual buffer pool to hiperpool synchronously (that is, in response to a page access request by an application)
- hra Number of pages moved from hiperpool to virtual buffer pool asynchronously (that is, by a DB2 system process such as a sequential prefetch)
- hwa Number of pages moved from virtual buffer pool to hiperpool asynchronously (that is, by a DB2 system process such as sequential prefetch)
- hrf Number of attempts to read a page from a hiperpool, but the backing E-frame was stolen by the system
- hwf Number of attempts to write a page to the hiperpool, but no backing E-frame could be allocated

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

**DSNB431I HIPERPOOL ACTIVITY (USING ASYNCHRO-
NOUS DATA MOVER FACILITY) —
HP READS = ara HP WRITES = awa READ
FAILURES = arf WRITE FAILURES = awf**

Explanation: This message is displayed by the DISPLAY BUFFERPOOL command with the DETAIL option specified. It lists statistics about the movement of pages between the virtual buffer pool and the hiperpool. The statistics listed are for pages moved asynchronously, (that is, by a DB2 system process such as sequential prefetch, using the Asynchronous Data Mover Facility.). This message is always preceded by message DSNB401I identifying the associated buffer pool.

The variables are:

- ara Number of pages moved from hiperpool to virtual buffer pool
- awa Number of pages moved from virtual buffer pool to hiperpool
- arf Number of pages for which a read request failed
- awf Number of pages for which a write request failed

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

**DSNB440I PARALLEL ACTIVITY — PARALLEL REQUEST
= tpa DEGRADED PARALLEL = dpa**

Explanation: This message is issued in response to the DISPLAY BUFFERPOOL command with DETAIL specified. It lists statistics about parallel activities. This message is always preceded by message DSNB401I identifying the associated buffer pool.

The variables are:

- tpa Total number of negotiations with the buffer pool for getting the requested number of sequential prefetch streams
- dpa Total number of times the negotiation resulted in the degraded mode of parallel operations

This message is issued by the following CSECT: DSNB1DBP

**DSNB450I TABLESPACE= dbname.tsname, USE
COUNT=ucount, GBP-DEP=gbpind**

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LIST option. It indicates that the specified table space is currently open and associated with the buffer pool. The preceding DSNB401I message identifies the associated buffer pool.

- dbname Database space name
- tsname Table space name
- sh Shadow page set indication - '(S)' for shadow table space for REORG with SHRLEVEL REFERENCE or CHANGE, blank otherwise.
- ucount The count of applications currently accessing the table space.
- gbpind Whether the table space is group buffer pool (GBP) dependent; that is, whether there is inter-DB2 read/write interest in the table space:
 - N The table space is not currently GBP-dependent. Therefore, DB2 does not need to use a group buffer pool for this table space.
 - Y The table space is currently GBP-dependent. Therefore, DB2 needs to use a group buffer pool for this table space. If the table space is partitioned, Y means that at least one of the partitions is GBP-dependent.

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

**DSNB451I INDEXSPACE= dbname.isname, USE
COUNT=ucount, GBP-DEP=gbpind**

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LIST option. It indicates that the specified table space is currently open and associated with the buffer pool. The preceding DSNB401I message identifies the associated buffer pool.

- dbname Database name
- isname Index space name
- sh Shadow page set indication - '(S)' for shadow table space for REORG with SHRLEVEL REFERENCE or CHANGE, blank otherwise.
- ucount The count of applications currently accessing the index space.
- gbpind Whether the index space is group buffer pool (GBP) dependent; that is, whether there is inter-DB2 read/write interest in the index space:

- N The index space is not currently GBP-dependent. Therefore, DB2 does not need to use a group buffer pool for this index space.
- Y The index space is currently GBP-dependent. Therefore, DB2 needs to use a group buffer pool for this index space. If the index space is partitioned, Y means that at least one of the partitions is GBP-dependent.

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB452I STATISTICS FOR DATASET *dsn* —

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LSTATS option specified. It identifies the relative data set number within a table space or index space for the statistics displayed in one or more of the messages that follow this one. This message is always preceded by message DSNB401I identifying the associated buffer pool and DSNB450I or DSNB451I identifying the table space or index space.

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB453I VP CACHED PAGES - CURRENT = *vcount* MAX = *mvcount* CHANGED = *ccount* MAX = *mccount*

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with LSTATS specified. It lists the number of cached pages and the number of changed pages in the virtual buffer pool for a data set. The message is only issued if there are nonzero values to display. This message is always preceded by message DSNB401I identifying the associated buffer pool, DSNB450I or DSNB451I identifying the table space or index space, and DSNB452I identifying the data set.

The statistics are:

- vcount* Number of cached pages in VP for the data set (that is, the number of buffers that contain pages for the data set in the virtual buffer pool).
- mvcount* Maximum number of cached pages in VP for the data set since the last DISPLAY BUFFERPOOL command with the LSTATS option was issued.
- ccount* Number of changed pages in VP for the data set (that is, the number of buffers that were changed in the virtual buffer pool for the data set).
- mccount* Maximum number of changed pages in VP for the data set since the last DISPLAY BUFFERPOOL command with the LSTATS option was issued.

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB454I HP CACHED PAGES — CURRENT = *hcount* MAX = *mhcount*

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with LSTATS specified. It lists the number of cached pages and the number of changed pages in the hiperpool for a data set. The message is only issued if there are nonzero values to display. This message is always preceded by message DSNB401I identifying the associated buffer pool, DSNB450I or DSNB451I identifying the table space or index space, and DSNB452I identifying the data set.

The statistics are:

- hcount* Number of cached pages in HP for the data set (that is, the number of buffers that contain pages for the data set in the hiperpool).
- mhcount* Maximum number of cached pages in HP for the data set since the last DISPLAY BUFFERPOOL command with the LSTATS option was issued.

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB455I SYNCHRONOUS I/O DELAYS — AVERAGE DELAY = *avd* MAXIMUM DELAY = *mxd* TOTAL PAGES = *tpg*

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LSTATS option specified. It lists synchronous I/O delay statistics for a data set belonging to an open table space or index space associated with the buffer pool. The values listed are incremental since the last display for the data set. The message is only issued if there are nonzero values to display. This message is always preceded by message DSNB401I identifying the associated buffer pool, DSNB450I or DSNB451I identifying the table space or index space, and DSNB452I identifying the relative data set within the table space or index space.

The statistics are:

- avd* Average I/O delay in milliseconds for pages in the data set
- mxd* Maximum I/O delay in milliseconds for pages in the data set
- tpg* Total number of pages read or written for the data set

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB456I ASYNCHRONOUS I/O DELAYS — AVERAGE DELAY = *avd* MAXIMUM DELAY = *mxd* TOTAL PAGES = *tpg* TOTAL I/O COUNT = *tio*

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LSTATS option specified. It lists asynchronous I/O delay statistics for a data set belonging to an open table space or index space associated with the buffer pool. The values listed are incremental since the last display for the data set. The message is only issued if there are nonzero values to display. This message is always preceded by message DSNB401I identifying the associated buffer pool, DSNB450I or DSNB451I identifying the table space or index space, and DSNB452I

identifying the relative data set within the table space or index space.

The statistics are:

avd	Average I/O delay in milliseconds for pages in the data set
mxd	Maximum I/O delay in milliseconds for pages in the data set
tpg	Total number of pages read or written for the data set
tio	Total number of I/Os issued for the data set

This message is issued by the following CSECT: DSNB1DBP

System Action: Processing continues.

DSNB459I *csect-name* **OPEN FAILURE HAS OCCURRED FOR DATA SET** *dsn*

Explanation: This message might be displayed for an active buffer pool by the DISPLAY BUFFERPOOL command with the LIST option specified. It indicates that a previous attempt to access a data set (identified by its relative data set number within a table space or index space) failed due to an allocation or open error.

This message is always preceded by a DSNB401I message identifying the associated buffer pool and a DSNB450I or DSNB451I message identifying the table space or index space.

System Action: Processing continues.

DSNB499I **DISPLAY TERMINATED DUE TO INSUFFICIENT MESSAGE SPACE**

Explanation: The DISPLAY BUFFERPOOL or the DISPLAY GROUPBUFFERPOOL command was unable to obtain storage for additional messages. This should only happen for a particularly long display request, such as a detail display for a large number of buffer pools or group buffer pools.

This message is issued by the following CSECTs: DSNB1DBP, DSNB1DGB

System Action: The display is truncated.

System Programmer Response: Reissue the -DISPLAY BUFFERPOOL or the -DISPLAY GROUPBUFFERPOOL command, specifying a smaller number of buffer pools or group buffer pools.

DSNB501I *bpname* **IS NOT A VALID BUFFER POOL NAME**

Explanation: An invalid buffer pool name was specified on an ALTER BUFFERPOOL or DISPLAY BUFFERPOOL command. THE VALID NAMES ARE BP0, BP1,..., BP49, BP32K, BP32K1,...BP32K9.

This message was issued by the following CSECT: DSNB1CMD

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL or DISPLAY BUFFERPOOL command, specifying a valid buffer pool name.

DSNB502I **VPSIZE FOR** *bpname* **MUST BE BETWEEN** *llimit* **AND** *ulimit*

Explanation: An attempt was made to change a buffer pool's VPSIZE to an invalid value using the ALTER BUFFERPOOL command. VPSIZE is the number of buffers in the virtual buffer pool.

<i>bpname</i>	Buffer pool name.
<i>llimit</i>	Lower limit for buffer pool's VPSIZE. For BP0, the lower limit is 56. For all other buffer pools, the lower limit is 0.
<i>ulimit</i>	Upper limits for buffer pool's VPSIZE. For 4KB page-size buffer pools, the upper limit is 400,000. For 32KB page-size buffer pools, the upper limit is 50,000.

This message is issued by the following CSECT: DSNB1CMD

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate VPSIZE value.

DSNB503I **HPSIZE FOR** *bpname* **MUST BE BETWEEN** *llimit* **AND** *ulimit*

Explanation: An attempt was made to change a buffer pool's HPSIZE to an invalid value using the ALTER BUFFERPOOL command. HPSIZE is the number of buffers in the hiperpool. The variables are:

<i>bpname</i>	Buffer pool name.
<i>llimit</i>	Lower limit for buffer pool's HPSIZE. The lower limit for all buffer pools is 0.
<i>ulimit</i>	Upper limits for buffer pool's HPSIZE. For 4KB page-size buffer pools, the upper limit is 2,097,152. For 32KB page-size buffer pools, the upper limit is 262,144.

This message is issued by the following CSECT: DSNB1CMD

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate HPSIZE value.

DSNB504I **VPSEQT FOR** *bpname* **MUST BE BETWEEN 0 AND 100**

Explanation: An ALTER BUFFERPOOL command was issued to try to alter a buffer pool's VPSEQT attribute to an invalid value. VPSEQT is the virtual buffer pool sequential steal threshold. Valid values range from 0 to 100.

This message is issued by the following CSECT: DSNB1CMD

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate VPSEQT value.

DSNB505I HPSEQT FOR *bpname* MUST BE BETWEEN 0 AND 100

Explanation: An attempt was made to change a buffer pool's HPSEQT attribute to an invalid value using the ALTER BUFFERPOOL command. HPSEQT is the hiperpool sequential steal threshold. Valid values range from 0 to 100.

This message is issued by the following CSECT: DSNB1CMD

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate HPSEQT value.

DSNB506I DWQT FOR *bpname* MUST BE BETWEEN 0 AND 90

Explanation: An attempt was made to change a buffer pool's DWQT attribute value using the ALTER BUFFERPOOL command. DWQT is the free buffer deferred write threshold. Valid values range from 0 to 90.

This message is issued by the following CSECT: DSNB1CMD

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate DWQT value.

DSNB507I VDWQT FOR *bpname* MUST BE BETWEEN 0 AND 90

Explanation: An attempt was made to change a buffer pool's VDWQT attribute to an invalid value using the ALTER BUFFERPOOL command. VDWQT is the vertical deferred write threshold. Valid values range from 0 to 90.

This message is issued by the following CSECT: DSNB1CMD

System Action: The request is rejected.

System Programmer Response: Reissue the ALTER BUFFERPOOL command, specifying a legitimate VDWQT value.

DSNB508I THE TOTAL VPSIZE IS BEYOND THE MAXIMUM LIMIT

Explanation: An ALTER BUFFERPOOL command specified a VPSIZE value that would cause the sum of the VPSIZE value for all buffer pools to exceed 1.6GB.

This message is issued by the following CSECT: DSNB1ABP

System Action: The buffer pool's VPSIZE is not changed. Processing for other parameters, if requested, proceeds normally.

System Programmer Response: Rebalance VPSIZE for all buffer pools.

DSNB509I THE TOTAL HPSIZE IS BEYOND THE MAXIMUM LIMIT

Explanation: An ALTER BUFFERPOOL command specified an HPSIZE value that would cause the sum of the HPSIZE value for all buffer pools to exceed 8GB.

This message is issued by the following CSECT: DSNB1ABP

System Action: The buffer pool's HPSIZE is not changed. Processing for other parameters, if requested, proceeds normally.

System Programmer Response: Rebalance HPSIZE for all buffer pools.

DSNB510I NO ACTION REQUESTED

Explanation: An ALTER BUFFERPOOL command was issued, but no buffer pool attributes were specified.

This message is issued by the following CSECT: DSNB1CMD

System Action: The buffer pool's attributes are not changed.

System Programmer Response: Reissue the ALTER BUFFERPOOL command specifying one or more buffer pool attributes.

DSNB511I VDWQT CANNOT BE GREATER THAN DWQT

Explanation: An ALTER BUFFERPOOL command specified a DWQT and/or VDWQT value that would result in the buffer pool's VDWQT parameter being greater than its DWQT parameter.

This message is issued by the following CSECT: DSNB1ABP

System Action: The buffer pool's VDWQT or DWQT is not changed. Processing for other parameters, if requested, proceeds normally.

System Programmer Response: Rebalance DWQT and VDWQT for the buffer pool.

DSNB512I *integer* IS THE CURRENT VPSIZE FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a VPSIZE equal to the buffer pool's current virtual buffer pool size.

This message is issued by the following CSECT: DSNB1ABP

System Action: The virtual buffer pool size is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB513I *integer* IS THE CURRENT HPSIZE FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified an HPSIZE equal to the buffer pool's current hiperpool size.

This message is issued by the following CSECT: DSNB1ABP

System Action: The hiperpool size is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB514I *integer* IS THE CURRENT VPSEQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified an VPSEQT equal to the current sequential steal threshold of the virtual buffer pool.

This message is issued by the following CSECT: DSNB1ABP

System Action: The hiperpool size is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB515I *integer* IS THE CURRENT HPSEQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified an HPSEQT equal to the current sequential steal threshold of the hiperpool.

This message is issued by the following CSECT: DSNB1ABP

System Action: The sequential steal threshold of the hiperpool is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB516I *integer* IS THE CURRENT DWQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a DWQT equal to the current deferred write threshold of the buffer pool.

This message is issued by the following CSECT: DSNB1ABP

System Action: The deferred write threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB517I *integer* IS THE CURRENT VDWQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a VDWQT equal to the current vertical deferred write threshold of the buffer pool.

This message is issued by the following CSECT: DSNB1ABP

System Action: The vertical deferred write threshold of the buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB518I *value* IS THE CURRENT CASTOUT ATTRIBUTE FOR HIPERPOOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a CASTOUT attribute equal to the hiperpool's current CASTOUT attribute.

This message is issued by the following CSECT: DSNB1ABP

System Action: The hiperpool's CASTOUT attribute is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB520I READY TO EXPLICITLY DELETE BUFFER POOL *bpname*

Explanation: This message is issued before draining an active buffer pool in response to an ALTER BUFFERPOOL command, which specified VPSIZE=0 against an active buffer pool.

This message is issued by the following CSECT: DSNB1ABP

System Action: After this message is issued, DB2 quiescs all current activities against this buffer pool. DB2 locks the table space exclusively and performs physical close for all open table spaces or index spaces that reference this pool. DB2 also prevents subsequent database access that references this pool. SQL applications get an SQLCODE -904 (resource not available) with reason code 00C200E0 to indicate that the requested virtual buffer pool size is not initialized.

After the requested buffer pool is deleted, message DSNB521I is issued.

DSNB521I BUFFER POOL *bpname* HAS BEEN EXPLICITLY DELETED

Explanation: This message is issued after an active buffer pool is explicitly deleted with an ALTER BUFFERPOOL command. This message is always preceded by a corresponding DSNB520I message.

This message is issued by the following CSECT: DSNB1ABP

System Action: The virtual storage and hiperspaces associated with this buffer pool are released.

DSNB522I VPSIZE FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command to indicate that the requested change to the VPSIZE parameter was accepted. For an active pool, the actual expansion, contraction, or deletion does not take place until after this message is issued.

This message is issued by the following CSECT: DSNB1ABP

System Action: Processing continues.

System Programmer Response: Issue the DISPLAY BUFFERPOOL command to determine the actual virtual storage usage for this pool.

DSNB523I HPSIZE FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command to indicate that the requested change to the HPSIZE parameter was accepted. For an active hiperpool, the actual expansion, contraction, creation, or deletion does not take place until after this message is issued.

This message is issued by the following CSECT: DSNB1ABP

System Action: Processing continues.

System Programmer Response: Issue the DISPLAY BUFFERPOOL command to determine the actual hiperpool size for this pool.

DSNB524I VPSEQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the sequential steal threshold of the virtual buffer pool.

This message is issued by the following CSECT: DSNB1ABP

DSNB525I HPSEQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the sequential steal threshold of the hiperpool.

This message is issued by the following CSECT: DSNB1ABP

DSNB526I DWQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the deferred write threshold of the buffer pool.

This message is issued by the following CSECT: DSNB1ABP

DSNB527I VDWQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command. It indicates the successful modification of the vertical deferred write threshold of the buffer pool.

This message is issued by the following CSECT: DSNB1ABP

DSNB528I CASTOUT ATTRIBUTE FOR *bpname* HAS BEEN SET TO *value*

Explanation: This message is issued in response to an ALTER BUFFERPOOL command. It indicates that the requested change to the hiperpool's CASTOUT attribute was accepted. For an active pool, the actual rebuilding of the hiperpool with the new CASTOUT attribute does not take place until after this message is issued.

This message is issued by the following CSECT: DSNB1ABP

System Action: Processing continues.

System Programmer Response: Use the DISPLAY BUFFERPOOL command to determine the actual CASTOUT attribute for this pool.

DSNB529I VPPSEQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued in response to the ALTER BUFFERPOOL command. It indicates the successful modification of the parallel sequential steal threshold of the virtual buffer pool.

This message is issued by the following CSECT: DSNB1ABP

DSNB530I *integer* IS THE CURRENT VPPSEQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a VPPSEQT equal to the current parallel sequential steal threshold of the virtual buffer pool.

This message is issued by the following CSECT: DSNB1ABP

System Action: The parallel sequential steal threshold of the virtual buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB531I VPPSEQT FOR *bpname* MUST BE BETWEEN 0 AND 100

Explanation: An ALTER BUFFERPOOL command was issued to alter a buffer pool's VPPSEQT attribute to an invalid value. VPPSEQT is the parallel sequential steal threshold of the virtual buffer pool. Valid values range from 0 to 100.

This message is issued by the following CSECT: DSNB1ABP

System Action: The VPPSEQT value is not changed.

System Programmer Response: Change the VPPSEQT attribute to a valid value and reenter the command.

DSNB532I VPPSEQT FOR *bpname* HAS BEEN SET TO *integer*

Explanation: This message is issued from DSNB1ABP csect in response to the ALTER BUFFERPOOL command. It indicates the successful modification of the assisting parallel sequential threshold of the virtual buffer pool.

DSNB533I *integer* IS THE CURRENT VPPSEQT FOR BUFFER POOL *bpname*

Explanation: An ALTER BUFFERPOOL command specified a VPPSEQT equal to the current assisting parallel sequential threshold of the virtual buffer pool. This message is issued from DSNB1ABP csect.

System Action: The assisting parallel sequential threshold of the virtual buffer pool is not changed. Processing for other parameters, if requested, proceeds normally.

DSNB534I VPPSEQT FOR *bpname* MUST BE BETWEEN 0 AND 100

Explanation: An ALTER BUFFERPOOL command was issued to change a buffer pool's VPPSEQT attribute to an invalid value. VPPSEQT is the assisting parallel sequential threshold of the virtual buffer pool. Valid values range from 0 to 100. This message is issued from DSNB1ABP csect.

System Action: The VPPSEQT value is not changed.

System Programmer Response: Change the VPPSEQT attribute to a valid value and reenter the command.

DSNB540I *csect-name* INSUFFICIENT LOCAL CACHE VECTOR STORAGE TO EXPAND VIRTUAL BUFFER POOL *bpname* TO SPECIFIED SIZE *size1*. VIRTUAL BUFFER POOL SIZE IS NOW *size2*.

Explanation: The specified virtual buffer pool could not be expanded to the requested size (*size1*). The associated group buffer pool is connected, and the local cache vector could not be expanded to cover the requested virtual buffer pool size.

The local cache vector is a bit array which tracks whether the page in a given buffer was modified by another system (cross-invalidated). There must be one bit in the vector for each buffer in the virtual buffer pool and hiperpool. For more information on the local cache vector, see *MVS/ESA Programming: Sysplex Services Reference*.

System Action: DB2 downgrades the expansion request to the size that can be supported by the available local cache vector storage (*size2*).

System Programmer Response: Free local cache vector storage by contracting or deleting other buffer pools that are connected to a group buffer pool. Then reattempt the virtual pool expansion by reissuing the ALTER BUFFERPOOL command.

DSNB541I *csect-name* INSUFFICIENT LOCAL CACHE VECTOR STORAGE TO CREATE/EXPAND HIPERPOOL *bpname* TO SPECIFIED SIZE *size1* HIPERPOOL SIZE IS NOW *size2*.

Explanation: The specified hiperpool could not be created or expanded to the requested size (*size1*). The associated group buffer pool is connected, and the local cache vector could not be expanded to cover the requested hiperpool size.

The local cache vector is a bit array which tracks whether the page in a given buffer was modified by another system (cross-invalidated). There must be one bit in the vector for each buffer in the virtual buffer pool and hiperpool. For more information on the local cache vector, see *MVS/ESA Programming: Sysplex Services Reference*.

System Action: DB2 downgrades the hiperpool size to the size that can be supported by the available local cache vector storage (*size2*).

System Programmer Response: Free local cache vector storage by contracting or deleting other buffer pools that are connected to a group buffer pool. Then reattempt the hiperpool expansion or creation by issuing the ALTER BUFFERPOOL command.

DSNB551I BSDS READ ERROR, RC= *integer*, RSN=*integer*

Explanation: This message is issued in response to a failure of a READ function on the bootstrap data set (BSDS). Users should check any previous error messages issued by MVS and DB2 against the corresponding BSDS. RC and RSN indicate an error return code and reason code from the BSDS function.

This message is issued by the following CSECT: DSNB1BSD

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the return and reason codes to determine what type of error occurred. Refer to message DSNJ107I for more information.

DSNB552I BSDS WRITE ERROR, RC= *integer*, RSN=*integer*

Explanation: This message is issued in response to a failure of a WRITE function on the bootstrap data set (BSDS). Check any previous error messages issued by MVS and DB2 against the corresponding BSDS. RC and RSN indicate an error return code and reason code from the BSDS function.

This message is issued by the following CSECT: DSNB1BSD

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the return and reason codes to determine what type of error occurred. Refer to message DSNJ108I for more information.

DSNB553I BSDS INSERT ERROR, RC= *integer*, RSN=*integer*

Explanation: This message is issued in response to a failure of an INSERT function on the bootstrap data set (BSDS). Check any previous error messages issued by MVS and DB2 against the corresponding BSDS. RC and RSN indicate an error return code and reason code from the BSDS function.

This message is issued by the following CSECT: DSNB1BSD

System Action: Processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the return and reason codes to determine what type of error occurred. For more information, refer to message DSNJ109I or other DSNJ messages related to BSDS.

DSNB601I BUFFER POOL *bpname* FULL

Explanation: A buffer is required to access a database page that is not currently contained within the virtual buffer pool. A buffer cannot be assigned because all buffers in the virtual buffer pool are in a nondisplaceable state. (Buffers are in a nondisplaceable state when they contain actively referenced pages or updated pages for which writes are pending.)

This message can occur if there is an overload of concurrent activity for the buffer pool size. The variable *bpname* is the buffer pool external name.

This message is issued by the following CSECT: DSNB1GWB

System Action: Reason code 00C200E9 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages. An SQLCODE -904 (resource not available) is returned to the user.

Operator Response: Notify the system programmer.

System Programmer Response: Do one of the following:

- Reduce concurrent activity by reducing the number of DB2 threads.
- Use the ALTER BUFFERPOOL command to increase the size of the virtual buffer pool.

DSNB602I UNABLE TO CREATE BUFFER POOL *bpname*. VIRTUAL BUFFER POOL SIZE IS ZERO

Explanation: An attempt to create the buffer pool failed while opening a DB2 table space or index that specified its use. The virtual buffer pool size for *bpname* was zero. This indicates that the use of the pool is invalid.

This message is issued by the following CSECTs: DSNB1OPP, DSNB1OPS

System Action: Reason code 00C200E0 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages. An SQLCODE -904 (resource not available) is returned to the user.

Operator Response: Notify the system programmer.

System Programmer Response: Use the ALTER TABLESPACE or ALTER INDEX statement to modify affected table spaces or indexes to indicate a usable buffer pool. Use the DISPLAY BUFFERPOOL command to determine a usable buffer pool. If necessary, use the ALTER BUFFERPOOL command to activate the failing buffer pool by setting its VPSIZE to a nonzero value.

DSNB603I INSUFFICIENT VIRTUAL STORAGE TO CREATE/EXPAND VIRTUAL BUFFER POOL *bpname* TO SPECIFIED SIZE *integer*. VIRTUAL BUFFER POOL SIZE IS NOW *integer*.

Explanation: A virtual buffer pool could not be created or expanded to the requested size. Insufficient virtual storage exists within the *ssnm*DBM1 address space to build the virtual buffer pool. The virtual buffer pool size is set by the ALTER BUFFERPOOL command and can be queried by using the DISPLAY BUFFERPOOL command.

This message is issued by the following CSECTs: DSNB1ABP, DSNB1OPS

System Action: The virtual buffer pool is created or expanded to the size allowed by the available virtual storage. If

the virtual buffer pool cannot be created at all, and the creation request was triggered by a page set open by an application, then an SQLCODE -904 (resource not available) is returned to the user. Reason code 00C200E8 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the virtual storage content of the *ssnmDBM1* address space to determine further action. If appropriate, use the ALTER TABLESPACE or ALTER INDEX statement to use a different buffer pool. Otherwise, use ALTER BUFFERPOOL commands to balance virtual storage use for all buffer pools.

DSNB605I UNABLE TO CREATE VIRTUAL BUFFER POOL *bpname* TO SPECIFIED SIZE DURING STARTUP/RESTART. INSUFFICIENT VIRTUAL STORAGE

Explanation: An attempt to create the virtual buffer pool failed at the time that DB2 was performing its startup or restart processing. Insufficient virtual storage exists within the *ssnmDBM1* address space for building the virtual buffer pool. The name of the buffer pool is *bpname*.

This message is issued by the following CSECT: DSNB10PS

System Action: The buffer pool is not created. The table space or index open request, which triggered the attempt to create the buffer pool, fails. An SQLCODE -904 (resource not available) is returned to the user. Reason code 00C200E8 and the buffer pool external name are recorded in the cursor table (CT), which is available in the SQL communication area (SQLCA) or messages.

Operator Response: Notify the system programmer. This message remains on the console until the operator deletes it.

System Programmer Response: Analyze the virtual storage content of the DSNDBM1 *ssnmDBM1* address space to determine further action. If appropriate, use ALTER BUFFERPOOL commands to balance virtual storage use for all buffer pools.

DSNB606I INSUFFICIENT VIRTUAL STORAGE TO CREATE/EXPAND HIPERPOOL *bpname* TO SPECIFIED SIZE *integer* HIPERPOOL SIZE IS NOW *integer*

Explanation: A hiperpool could not be created or expanded to the requested size. Insufficient virtual storage exists within the DSNDBMI address to build the buffer control structures for managing the hiperpool. The hiperpool size is set by the ALTER BUFFERPOOL command. Its size can be queried with the DISPLAY BUFFER command. Approximately 20MB of virtual storage is required to construct a 2GB hiperpool.

This message is issued by the following CSECT: DSNB10PS

System Action: The hiperpool is created or expanded to the size allowed by the available virtual storage.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the virtual storage content of the DSNDBMI address space for more information. If necessary, rebalance buffer pool virtual storage use for all active buffer pools with the ALTER BUFFERPOOL command.

DSNB607I UNABLE TO CREATE HIPERPOOL *bpname* NO EXPANDED STORAGE ON THE SYSTEM

Explanation: DB2 is unable to create an ESO hiperspace to back the hiperpool because there is no expanded storage on the system.

This message is issued by the following CSECT: DSNB10PS

System Action: The hiperpool is not created. However, the failure of the hiperpool creation does not have any impact on the creation of the corresponding virtual buffer pool.

Operator Response: Notify the system programmer.

System Programmer Response: Because there is no expanded storage on the system, set the hiperpool size to zero for all buffer pools.

DSNB608I UNABLE TO CREATE HIPERPOOL *bpname* RETURN CODE = *rr* REASON CODE = *cccc*

Explanation: DB2 is unable to create an ESO hiperspace to back the hiperpool because of an error returned from the MVS DSPSERV macro.

Variables *rr* and *cccc* identify the return and reason codes for the failure.

This message is issued by the following CSECT: DSNB10PS

System Action: The hiperpool is not created. However, the failure of the hiperpool creation does not have any impact on the creation of the corresponding virtual buffer pool.

Operator Response: Notify the system programmer.

System Programmer Response: For more information about the failure, look up the identified return and reason codes in *MVS/ESA Programming: Authorized Assembler Services Reference, Volumes 1-4*.

DSNB609I VIRTUAL BUFFER POOL *bpname* CREATED USING DEFAULT SIZE *integer* DURING STARTUP/RESTART. VIRTUAL BUFFER POOL SIZE IS ZERO

Explanation: While activating a buffer pool during DB2 startup or restart processing, the virtual buffer pool size was zero. A zero value might be caused by an unusable bootstrap data set (BSDS) or by a DB2 abnormal termination after buffer pool size was altered to zero. The name of the buffer pool is *bpname* and the default buffer pool size is *integer*.

This message is issued by the following CSECT: DSNB10PS

System Action: DB2 creates the virtual buffer pool using the startup restart default value. For 4KB/32KB page-type buffer pools, the default values are 1000 and 12, respectively.

Operator Response: Notify the system programmer. This message remains on the console until deleted by the operator.

System Programmer Response: Use the ALTER TABLESPACE or ALTER INDEX statement to modify the affected table spaces or indexes to indicate a usable buffer pool. To determine a usable buffer pool, use the DISPLAY BUFFERPOOL command. If necessary, use the ALTER BUFFERPOOL command to activate the failing buffer pool by setting the VPSIZE to a nonzero value.

DSNB610I UNABLE TO CREATE HIPERPOOL *bpname* - ASYNCHRONOUS DATA MOVER FACILITY NOT INSTALLED

Explanation: One of the following events occurred:

- DB2 was building a buffer pool in response to a table space open request and noted that the hiperpool size for the buffer pool was nonzero.
- An ALTER BUFFERPOOL command specified a nonzero hiperpool size for an active buffer pool.

However, the hiperpool could not be created since the Asynchronous Data Mover Facility was not installed on the system.

This message is issued by the following CSECT: DSNB10PS

System Action: The hiperpool is not created. However, the absence of the hiperpool has no impact on the virtual buffer pool.

Operator Response: Notify the system programmer.

System Programmer Response: Since hiperpools cannot be created, set the hiperpool size for all buffer pools to zero.

DSNB611I HIPERPOOL *bpname* DELETED — ASYNCHRONOUS DATA MOVER FACILITY IS INOPERATIVE

Explanation: DB2 was trying to access data in an existing hiperpool and received a failure from the Asynchronous Data Mover Facility indicating that it was inoperative.

This message is issued by the following CSECT: DSNB1GHP

System Action: The hiperpool is deleted. However, the absence of the hiperpool has no impact on the virtual buffer pool.

Operator Response: Notify the system programmer. This message remains on the console until deleted by the operator.

System Programmer Response: Take appropriate action to restore the availability of the Asynchronous Data Mover Facility. Once the Asynchronous Data Mover Facility becomes available, use the ALTER BUFFERPOOL command to rebuild the hiperpool.

DSNB750I DISPLAY FOR GROUP BUFFER POOL *gbpname* FOLLOWS

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command. It signals the beginning of a display for group buffer pool *gbpname* if the following are true:

- It meets the selection criteria on the command.
- The MVS CFRM administrative policy information for the group buffer pool is accessible.

If the CFRM policy information is unavailable, message DSNB751I signals the partial display of group buffer pool information.

The series of messages DSNB755I through DSNB759I provide information on the group buffer pool's allocation characteristics. Messages DSNB765I through DSNB769I provide information on DB2 connections to the group buffer pool, while DSNB770I through DSNB788I provide statistics on group buffer pool usage. Note that all message numbers in the range might not be used. Message DSNB790I ends the display.

DSNB751I MVS CFRM POLICY INFORMATION NOT AVAILABLE FOR GROUP BUFFER POOL *gbpname* MVS IXCQUERY RETURN CODE = *retcode* MVS IXCQUERY REASON CODE = *reason* A PARTIAL DISPLAY FOLLOWS

Explanation: DB2 could not retrieve group buffer pool policy information in response to a DISPLAY GROUPBUFFERPOOL command. Either the MVS query request (IXCQUERY) did not successfully complete, or the backing structure for the group buffer pool is not defined in the MVS CFRM administrative policy. To determine the exact reason, examine return code *retcode* and reason code *reason* returned by MVS on the query request. For an explanation of the IXCQUERY codes, see *MVS/ESA Programming: Sysplex Services Reference*. If the IXCQUERY request did not complete successfully, no CONNLIST information, even if requested, is provided.

System Action: Processing continues, but the information displayed is incomplete.

DSNB752I GROUP DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL BECAUSE A REBUILD IS IN PROGRESS

Explanation: Because a rebuild is in progress for the group buffer pool, DB2 cannot retrieve group buffer pool group (GDETAIL) statistics in response to a DISPLAY GROUPBUFFERPOOL command. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

DSNB753I GROUP BUFFER POOL STRUCTURE OWNER INFORMATION NOT AVAILABLE IRLM NOTIFY RETURN CODE = *retcode* IRLM NOTIFY REASON CODE = *reason*

Explanation: DB2 could not retrieve group buffer pool structure owner information for message DSNB798I because the IRLM Notify request did not successfully complete. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

retcode Return code from IRLM on the Notify request

reason Reason code from IRLM on the Notify request

For an explanation of IRLM return and reason codes, see "IRLM Error Return and Reason Codes" on page 5-15.

System Action: Processing continues.

DSNB755I DB2 GROUP BUFFER POOL STATUS CONNECTED = *status1* CURRENT DIRECTORY TO DATA RATIO = *ratio1* PENDING DIRECTORY TO DATA RATIO = *ratio2*

Explanation: In response to a DISPLAY GROUPBUFFERPOOL command, this is the first of two messages displaying information about the status of the group buffer pool as it is known to DB2. This message is followed by DSNB756I. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

status1 Whether this DB2 is connected to the group buffer pool:

YES This DB2 is actively connected to the group buffer pool.

NO This DB2 is not actively connected to the group buffer pool.

ratio1 The ratio of directory entries to data pages, as specified for the current allocation of this group buffer pool. If the group buffer pool is not currently allocated, this field contains blanks.

ratio2 The desired ratio of directory entries to data pages to take effect at the next reallocation of the group buffer pool.

DSNB756I CLASS CASTOUT THRESHOLD = *threshold1* % GROUP BUFFER POOL CASTOUT THRESHOLD = *threshold2* % GROUP BUFFER POOL CHECKPOINT INTERVAL = *interval* MINUTES RECOVERY STATUS = *status1* AUTOMATIC RECOVERY = *auto-rec-parm*

Explanation: This is the second of two messages displaying information about the status of the group buffer pool as it is known to DB2. If DB2 was successful in getting MVS CFRM policy information for the group buffer pool, messages DSNB757I through DSNB759I immediately follow this message. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

threshold1 The threshold at which class castouts are to be initiated. It is expressed as a percentage of the group buffer pool size.

threshold2 The threshold at which castout is to be initiated at the group buffer pool level. It is expressed as a percentage of the group buffer pool size.

interval The time, in minutes, between successive initiations of group buffer pool checkpoint.

status1 The recovery status for the group buffer pool:

DAP Damage assessment pending. DB2 is in the process of doing damage assessment for the group buffer pool in response to a coupling facility structure failure. The group buffer pool is temporarily stopped internally by DB2 and is unavailable for use until the damage assessment process completes.

NORMAL There is no pending recovery action for this group buffer pool.

auto-rec-parm Automatic recovery parameter specification:

YES DB2 should automatically initiate recovery for the objects using this group buffer pool following a failure of the group buffer pool. This is the default.

NO DB2 should not initiate automatic group buffer pool recovery. If the group buffer pool fails, you must manually issue DB2 -START DATABASE commands to do the recovery.

DSNB757I MVS CFRM POLICY STATUS FOR *coupling facilityname* = *status2* MAX SIZE INDICATED IN POLICY = *psize* KB ALLOCATED = *status1*

Explanation: For a DISPLAY GROUPBUFFERPOOL command, this message gives the status for the structure associated with the group buffer pool. It is displayed only if DB2 was successful in querying the MVS CFRM administrative policy. It is immediately preceded by message DSNB756I, and if the structure is allocated, followed by messages DSNB758I and DSNB759I. A preceding DSNB750I message identifies the associated group buffer pool.

coupling facilityname
The backing coupling facility structure name for this group buffer pool, such as DSNCAT_GBP0.

status2
MVS global status of the backing coupling facility structure:

NORMAL Structure is defined in the current CFRM policy and has no current MVS restrictions.

CHNGP Change pending in the structure policy.

psize
The size (in kilobytes) of the coupling facility structure as indicated in the CFRM policy definition.

status1
Whether the backing coupling facility structure is currently allocated:

YES The coupling facility structure is allocated in a coupling facility.

NO The coupling facility structure is not allocated in any coupling facility.

DSNB758I ALLOCATED SIZE = *asize* KB VOLATILITY STATUS = *volstat* REBUILD STATUS = *rblstat* CFLEVEL = *cflvel*

Explanation: This message is the first of two messages giving the allocation details for the group buffer pool on a DISPLAY GROUPBUFFERPOOL command. It is issued only if DB2 determines, by successfully querying the MVS CFRM policy, that the group buffer pool is allocated. It is immediately preceded by message DSNB757I. A preceding DSNB750I message identifies the associated group buffer pool.

asize The actual allocated group bufferpool structure size (in kilobytes).

volstat The volatility status of the backing group buffer pool structure for this group buffer pool:

VOLATILE The backing coupling facility structure is volatile.

NON-VOLATILE The backing coupling facility structure is non-volatile.

rblstat Indication of whether or not rebuild is in progress for the group buffer pool structure, and if so, which part of the rebuild process is happening:

NONE Rebuild is not in progress.

QUIESCE Rebuild is in progress and the rebuild is currently in the rebuild quiesce phase.

CONNECT	Rebuild is in progress and the rebuild is currently in the rebuild connect phase.
CLEANUP	The rebuild has completed, and the connected DB2 members are making final preparations to use the new group buffer pool structure.
STOPPING	The rebuild is stopping, and the connected DB2 members are making preparations to fall back to the original group buffer pool structure.
<i>clevel</i>	The coupling facility level for the coupling facility in which this group buffer pool is allocated.

**DSNB759I NUMBER OF DIRECTORY ENTRIES = *dir#*
NUMBER OF DATA PAGES = *data#*
NUMBER OF CONNECTIONS = *conn#***

Explanation: This message is the second of two messages giving the allocation details for the group buffer pool for a DISPLAY GROUPBUFFERPOOL command. It is issued only if DB2 determines, by successfully querying the MVS CFRM administrative policy, that the group buffer pool is allocated. It is immediately preceded by message DSNB758I. A preceding DSNB750I message identifies the associated group buffer pool.

<i>dir#</i>	Actual number of directory entries allocated for the coupling facility structure.
<i>data#</i>	Actual number of data pages allocated for the coupling facility structure.
<i>conn#</i>	The number of DB2 subsystems that are connected to the coupling facility structure. This includes both active connections and failed-persistent connections. The CONNLIST option of the DISPLAY GROUPBUFFERPOOL command gives details of the connection status.

**DSNB765I NO CONNLIST REPORT IS GENERATED.
THERE ARE NO CONNECTIONS TO THIS
GROUP BUFFER POOL.**

Explanation: DB2 displays this message in response to a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option when there are currently no connection names to report for the group buffer pool. A preceding DSNB750I message identifies the associated group buffer pool.

DSNB766I THE CONNLIST REPORT FOLLOWS

Explanation: DB2 displays this message in response to a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option to indicate the beginning of the CONNLIST display for this group buffer pool. A preceding DSNB750I message identifies the associated group buffer pool.

**DSNB767I CONNECTION NAME = *conname*, CONNECTION STATUS = *status*
CONNECTOR'S RELEASE = *DB2 release***

Explanation: This message contains the display information that results from a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option. One DSNB767I message is issued for each defined connection to the group buffer pool. The associated group buffer pool is identified on a preceding DSNB750I message.

<i>conname</i>	Name of the connection. DB2 subsystems use the DB2 member name as the connection name.
<i>status</i>	Status of the connection. A Active. F Failed-Persistent. D Dually connected to both the original structure and the new structure during a rebuild.
<i>DB2 release</i>	The release of the connected DB2.

DSNB769I THE CONNLIST REPORT IS COMPLETE

Explanation: DB2 displays this message in response to a DISPLAY GROUPBUFFERPOOL command with the CONNLIST option to indicate the end of the CONNLIST display for this group buffer pool. A preceding DSNB750I message identifies the associated group buffer pool.

**DSNB770I MEMBER DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL.
THIS DB2 HAS NEVER BEEN CONNECTED TO
THE GROUP BUFFER POOL.**

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with MDETAIL specified. MDETAIL statistics are not available for the requested group buffer pool because this DB2 has not connected to the group buffer pool since startup. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

**DSNB771I INCREMENTAL MEMBER DETAIL STATISTICS
SINCE *basetime***

Explanation: This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with MDETAIL(INTERVAL) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time of the previous MDETAIL incremental display on this DB2 or the time DB2 first connected to the group buffer pool if there was no previous MDETAIL incremental display. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

DSNB772I CUMULATIVE MEMBER DETAIL STATISTICS SINCE *basetime*

Explanation: This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with MDETAIL(*) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time this DB2 first connected to the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

DSNB773I MEMBER DETAIL STATISTICS SYNCHRONOUS READS DUE TO BUFFER INVALIDATION DATA RETURNED = *r1* DATA NOT RETURNED = *r2*

Explanation: This is the first of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists some synchronous read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. Messages DSNB774I, DSNB775I, DSNB789I, and DSNB776I through DSNB779I always follow this one.

The counter descriptions are listed below. In the descriptions, the term "synchronous" means that the coupling facility interaction is done under the DB2 user's execution unit.

- r1* Synchronous coupling facility read requests issued because the virtual buffer or hiperpool buffer was marked "invalid." Data is successfully returned from the group buffer pool.
- r2* Synchronous coupling facility read requests issued because the virtual buffer or hiperpool buffer was marked "invalid." Data is *not* returned from the group buffer pool.

DSNB774I DUE TO DATA PAGE NOT IN BUFFER POOL DATA RETURNED = *r3* DATA NOT RETURNED = *r4*

Explanation: This is the second of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists more local synchronous read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by message DSNB773I and followed by messages DSNB775I, DSNB789I, and DSNB776I through DSNB779I.

The counter descriptions are listed below. In the descriptions, the term "synchronous" means that the coupling facility interaction is done under the DB2 user's execution unit.

- r3* Synchronous coupling facility read requests issued because the required data was not in the virtual buffer pool or in the hiperpool buffer. Data is successfully returned from the group buffer pool.
- r4* Synchronous coupling facility read requests issued because the required data was not in the virtual buffer pool or hiperpool buffer. Data is *not* returned from the group buffer pool.

DSNB775I PREFETCH READS DATA NOT RETURNED = *r5* REGISTER PAGE LIST NOT AVAILABLE DATA RETURNED = *r6*

Explanation: This is the third of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists some prefetch read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

r5 If the "register page list" (RPL) function is not in use, then this is the number of coupling facility read requests issued for prefetch where data is *not* returned from the group buffer pool.

If RPL is in use, then this is the number of pages that were not retrieved from the group buffer pool following the RPL request (these pages were retrieved from DASD). Note that if RPL is in use, then there are not any coupling facility interactions associated with this number; this number is incremented when the RPL feedback indicates that the page is not cached in the GBP, and so DB2 can avoid a coupling facility read request for the page and go directly to DASD.

r6 If RPL is not in use, then this is the number of coupling facility read requests issued for prefetch where data is returned from the group buffer pool.

If RPL is in use, then this number should be zero.

DSNB776I SYNCHRONOUS WRITES CHANGED PAGES = *w1* CLEAN PAGES = *w2*

Explanation: This is the fifth of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists some local write statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I and DSNB789I and followed by messages DSNB777I through DSNB779I.

The counter descriptions are listed below. In the descriptions, the term "synchronous" means that the coupling facility interaction is done under the DB2 user's execution unit.

- w1* Synchronous coupling facility write requests for changed pages
- w2* Synchronous coupling facility write requests for clean pages

DSNB777I ASYNCHRONOUS WRITES CHANGED PAGES = *w3* CLEAN PAGES = *w4* FAILED WRITES DUE TO LACK OF STORAGE = *w5*

Explanation: This is the sixth of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local write and cross-invalidation statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, and DSNB776I and followed by messages DSNB778I and DSNB779I.

The counter descriptions are listed below. In the descriptions, the term "asynchronous" means that the coupling facility interaction is done under a DB2 system execution unit, such as with a prefetch.

- w3 Asynchronous coupling facility write requests for changed pages
- w4 Asynchronous coupling facility write requests for clean pages
- w5 Coupling facility write requests that were not completed because of a lack of storage in the group buffer pool.

DSNB778I CASTOUT THRESHOLDS DETECTED FOR CLASSES = t1 FOR GROUP BUFFER POOL = t2 GBP CHECKPOINTS TRIGGERED = k1 PARTICIPATION IN REBUILD = k2

Explanation: This is the seventh of ten messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local castout threshold statistics for the group buffer pool and also group buffer pool checkpoint and rebuild statistics. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, DSNB776I, and DSNB777I and followed by messages DSNB796I, DSNB779I, and DSNB797I.

Counters:

- t1 Number of times the class castout threshold was detected
- t2 Number of times the group buffer pool castout threshold was detected
- k1 Number of group buffer pool checkpoints that were triggered.
- k2 Number of times that this member participated in a rebuild of the group buffer pool structure.

DSNB779I ENGINES NOT AVAILABLE FOR CASTOUT = e1 FOR WRITING = e2

Explanation: This is the ninth of ten messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists miscellaneous local statistics for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, DSNB776I through DSNB778I, and DSNB796I. It is followed by message DSNB797I.

Counters:

- e1 Engine not available for castout
- e2 Engine not available for coupling facility write

DSNB780I GROUP DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL. THIS DB2 IS NOT CURRENTLY CONNECTED TO THE GROUP BUFFER POOL.

Explanation: DB2 could not retrieve group buffer pool group (GDETAIL) statistics in response to a DISPLAY GROUPBUFFERPOOL command because this DB2 subsystem is not currently connected to the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

System Action: Processing continues.

DSNB781I GROUP DETAIL STATISTICS ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL. MVS IXLCACHE RETURN CODE = retcode MVS IXLCACHE REASON CODE = reason

Explanation: DB2 could not retrieve group buffer pool group (GDETAIL) statistics in response to a DISPLAY GROUPBUFFERPOOL command because the statistics request (IXLCACHE macro) did not successfully complete. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

retcode Return code from MVS on the statistics request

reason Reason code from MVS on the statistics request

For an explanation of IXLCACHE return and reason codes, see *MVS/ESA Programming: Sysplex Services Reference*.

System Action: Processing continues.

DSNB782I INCREMENTAL GROUP DETAIL STATISTICS SINCE basetime

Explanation: This message is displayed by the DISPLAY GROUPBUFFERPOOL command with GDETAIL(INTERVAL) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time of the previous GDETAIL incremental display from this DB2 or the time the group buffer pool was allocated or reallocated, if there was no previous GDETAIL incremental display.

System Action: Processing continues.

DSNB783I CUMULATIVE GROUP DETAIL STATISTICS SINCE basetime

Explanation: This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command with GDETAIL(*) specified. It indicates the start time of the interval for which the statistics were accumulated. This is the time the group buffer pool was first allocated or reallocated.

System Action: Processing continues.

DSNB784I GROUP DETAIL STATISTICS READS DATA RETURNED = r1

Explanation: This is the first of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It lists the successful reads for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always followed by messages DSNB785I through DSNB788I.

r1 "Read hit" counter. Number of times that a page was returned on a coupling facility read request.

For information about the Group Detail Report, see *Data Sharing: Planning and Administration*.

DSNB785I DATA NOT RETURNED DIRECTORY ENTRY EXISTED = r2 DIRECTORY ENTRY CREATED = r3 DIRECTORY ENTRY NOT CREATED = r4, r5

Explanation: This is the second of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It continues the read statistics for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message. This message is always

preceded by message DSNB784I and followed by messages DSNB786I through DSNB788I.

All the "read counters" in this message represent cases where data was not returned on the coupling facility read request.

- r2 "Read miss directory hit" counter. Number of times that a coupling facility read request specified a page for which a directory entry exists, but no data was cached for that page.
- r3 "Read miss name assigned" counter. Number of times that a coupling facility read request specified a page for which a directory entry was created.
- r4 "Read miss assignment suppressed" counter. Number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created.
- r5 "Read miss cache full" counter. Number of times that a coupling facility read request specified a page for which no directory entry exists and no directory entry is created because of a lack of storage in the group buffer pool.

For information about the Group Detail Report, see *Data Sharing: Planning and Administration*.

DSNB786I WRITES CHANGED PAGES= w1 CLEAN PAGES = w2 FAILED DUE TO LACK OF STORAGE = w3 CHANGED PAGES SNAPSHOT VALUE = p1

Explanation: This is the third of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It is followed by messages DSNB787I and DSNB788I. It lists the statistics on writes to the group buffer pool and the total number of changed pages for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message. This message is always preceded by messages DSNB784I and DSNB785I.

- w1 "Changed page write hit" counter. Number of times a coupling facility write request for a changed page successfully completed.
- w2 "Clean page write hit" counter. Number of times a coupling facility write request for a clean page completed successfully.
- w3 "Write miss cache full" counter. Number of times a coupling facility write request was not completed because of a lack of storage in the group buffer pool.
- p1 "Total changed" counter. Snapshot value of the current number of changed pages. The displayed value of this counter is not affected by whether this is an incremental or cumulative display.

For information about the Group Detail Report, see *Data Sharing: Planning and Administration*.

DSNB787I RECLAIMS FOR DIRECTORY ENTRIES = d1 FOR DATA ENTRIES = d2 CASTOUTS= c1

Explanation: This is the fourth of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It is always preceded by messages DSNB784I through DSNB786I and followed by message DSNB788I. It lists the statistics on reclaims and castouts for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message.

- d1 "Directory entry reclaim" counter. Number of times a name assignment required that a directory entry be reclaimed by the coupling facility.
- d2 "Data entry reclaim" counter. Number of times a name assignment required that a data page be reclaimed by the coupling facility.
- c1 "Castout" counter. Number of castout operations performed.

For information about the Group Detail Report, see *Data Sharing: Planning and Administration*.

DSNB788I CROSS INVALIDATIONS DUE TO DIRECTORY RECLAIMS = x1 DUE TO WRITES = x2

Explanation: This is the last of five messages containing group statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the GDETAIL option. It lists the cross-invalidation (XI) statistics for the group buffer pool. The associated group buffer pool is identified in a preceding DSNB750I or DSNB751I message. This message is always preceded by messages DSNB784I through DSNB787I.

- x1 "XI for directory reclaim" counter. Number of times a directory entry was reclaimed (stolen) and XI signals had to be sent (that is, the stolen directory entry had registered DB2 interest).
- x2 "XI for write" counter. Number of times a coupling facility write request caused XI to one or more registered DB2s.

For information about the Group Detail Report, see *Data Sharing: Planning and Administration*.

DSNB789I REGISTER PAGE LIST = r7 RETRIEVE CHANGED PAGES = r8 RETRIEVE CLEAN PAGES = r9 FAILED READS DUE TO LACK OF STORAGE = r10

Explanation: This is the fourth of eight messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists more local read statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool.

The counter descriptions are listed below.

- r7 The number of requests to the coupling facility to register interest in a list of pages. DB2 does this when prefetch (sequential or list) is used when the following conditions are met:
 - The DB2 member is running on a particular service level of MVS 5.2 or above
 - The GBP is allocated in a coupling facility with CFLEVEL=2 or above.
- r8 Coupling facility read requests done for prefetch to retrieve a page marked as "changed" in the group buffer pool as a result of feedback from the request to register a list of pages.
- r9 Coupling facility read requests done for prefetch to retrieve a page marked as "clean" in the group buffer pool as a result of feedback from the request to register a list of pages.
- r10 Coupling facility read requests in which a directory entry was *not* created because of a lack of storage in the group buffer pool.

DSNB790I DISPLAY FOR GROUP BUFFER POOL
gbpname IS COMPLETE

Explanation: For a DISPLAY GROUPBUFFERPOOL command, this message signals the end of the display for group buffer pool *gbpname*.

DSNB791I THIS DB2 IS NOT CONNECTED TO *gbpname*

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with TYPE(MCONN) and either one name or a list of names specified in the selection list. The DB2 on which the DISPLAY GROUPBUFFERPOOL command was issued is not currently connected to the specified group buffer pool. This message is issued once for each group buffer pool that does not match the "member connectivity" criterion.

System Action: The display is terminated for this group buffer pool. Command processing continues, if there are other group buffer pool names to process.

DSNB792I NO DB2 IN THE GROUP IS CONNECTED TO
gbpname

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with TYPE(GCONN) and either one name or a list of names specified in the selection list. No DB2 in the group is currently connected to the specified group buffer pool. This message is issued once for each group buffer pool that does not match the "group connectivity" criterion.

System Action: The display is terminated for this group buffer pool. Command processing continues, if there are other group buffer pool names to process.

DSNB794I THIS DB2 IS NOT CONNECTED TO ANY
GROUP BUFFER POOL

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with the TYPE(MCONN) option and an asterisk (*) specified as the selection list. This message is issued when DB2 determines that there are no group buffer pools having "member connectivity" from the DB2 on which the DISPLAY GROUPBUFFERPOOL command was issued.

System Action: Command processing is terminated.

DSNB795I NO DB2 IN THE GROUP IS CONNECTED TO
ANY GROUP BUFFER POOL

Explanation: This message is issued in response to a DISPLAY GROUPBUFFERPOOL command with the TYPE(GCONN) option and an asterisk (*) specified as the selection list. When DB2 successfully determines (that is, no error is encountered during command processing) that there are no group buffer pools connected to any DB2 in the data sharing group.

System Action: Command processing is terminated.

DSNB796I CASTOUTS PAGES CAST OUT = c1 UNLOCK
CASTOUT = c2 READ CASTOUT CLASS = c3
READ CASTOUT STATISTICS = c4 READ
DIRECTORY INFO = c5

Explanation: This is the eighth of ten messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local castout statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, DSNB776I through DSNB778I, and followed by messages DSNB779I and DSNB797I.

Counters:

- c1 Number of pages cast out.
- c2 Number of requests to unlock for castout.
- c3 Number of read castout class requests.
- c4 Number of read castout statistics requests.
- c5 Number of read directory info requests. These requests are made during group buffer pool checkpoint.

DSNB797I OTHER INTERACTIONS REGISTER PAGE = o1
UNREGISTER PAGE = o2 DELETE NAME = o3
READ STORAGE STATISTICS = o4

Explanation: This is the last of ten messages containing local statistics, displayed as a result of the DISPLAY GROUPBUFFERPOOL command with the MDETAIL option. It lists local castout statistics for the group buffer pool. A preceding DSNB750I or DSNB751I message identifies the associated group buffer pool. This message is always preceded by messages DSNB773I through DSNB775I, DSNB789I, DSNB776I through DSNB779I, and DSNB796I.

Counters:

- o1 Number of requests to the coupling facility to register interest in a single page.
- o2 Number of requests to the coupling facility to remove the registered interest in a single page.
- o3 Number of requests to the coupling facility to delete the directory entries associated with a set of pages.
- o4 Number of requests to the coupling facility to read the statistics counters associated with the structure. This request is issued on a timer interval basis by the GBP structure owner to detect when the GBPOOLT castout threshold is reached. It is also issued in a GDETAIL request on the DB2 DISPLAY GROUPBUFFERPOOL command.

DSNB798I LAST GROUP BUFFER POOL
CHECKPOINT*timestamp* **MINIMUM**
CLEAN-TO-DIRTY LRSN = lrsn1 MINIMUM
MEMBER RESTART/REDO LRSN = lrsn2,
member-name1 **STRUCTURE OWNER =**
member-name2

Explanation: This message is displayed in response to the DISPLAY GROUPBUFFERPOOL command. It is issued only if DB2 determines, by successfully querying the MVS CFRM policy, that the group buffer pool is allocated. It is immediately preceded by message DSNB759I. A preceding DSNB750I message identifies the associated group buffer pool.

timestamp The date and time of the last group buffer pool checkpoint.

Irsn1 The recovery log record sequence number (LRSN) that was recorded by the last group buffer pool checkpoint that reflects the oldest changed page clean-to-dirty LRSN value at the time of the checkpoint. If the group buffer pool were to fail, *Irsn1* is used by DB2 as input to determine the starting points for the merged log scan to recover the page sets and partitions that are entered into group buffer pool recovery pending (GRECP) status. You can do more detailed monitoring of the group buffer pool checkpoint processing with IFCID 0261.

Irsn2 The minimum member-level write-pending (restart/redo) LRSN that was recorded by the last group buffer pool checkpoint. *member-name1* is the DB2 member associated with the minimum restart/redo LRSN. Group buffer pool checkpoint records a restart/redo LRSN for each member - *Irsn2* reflects only the single minimum value across all members. If the group buffer pool were to fail, DB2 uses each member's restart/redo LRSN in conjunction with *Irsn1* to determine the starting points for the merged log scan to recover the page sets and partitions that are entered into group buffer pool recovery pending (GRECP) status. You can do more detailed monitoring of the group buffer pool checkpoint processing with IFCID 0261.

member-name2 The member name of the group buffer pool structure owner. The structure owner's responsibilities include the following:

- Issue the group buffer pool checkpoint.
- Detect the GBPOOLT castout threshold and initiate castout if this threshold has been reached (by notifying the pageset or partition castout owners).
- Coordinate the damage assessment process in case the group buffer pool fails.
- Coordinate the rebuild process for the group buffer pool.

'UNKNOWN' is displayed if DB2 is not able to determine which member is the structure owner for the group buffer pool. This should only happen in an unexpected error situation. See the message accompanying that error.

System Action: Processing continues.

DSNB800I DIRECTORY ENTRY TO DATA PAGE RATIO SET TO *value* FOR *gbpname*. IT WILL TAKE EFFECT ON THE NEXT REALLOCATION.

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change to the directory entry to the data page ratio for a group buffer pool. It is also issued for the first ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no ratio value is specified on the command (in this case, the default ratio value is being used). The new ratio takes effect the next time the coupling facility cache structure is allocated.

The directory entry to data page ratio determines the number of directory entries and the number of data pages that are allocated in the coupling facility cache structure for the group buffer pool. If the coupling facility structure is not allocated, the first connect from any DB2 causes allocation of the structure and the new directory entry to data page ratio to take effect.

If the structure size can be determined from the MVS CFRM administrative policy, message DSNB801I is issued to indicate an estimate of the number of directory and data entries that are allocated based on the new ratio and the current size of the coupling facility structure. Otherwise, message DSNB812I is issued.

System Action: Processing continues.

System Programmer Response: Use the -DISPLAY GROUPBUFFERPOOL command to display the number of allocated directory and data entries.

DSNB801I MAX STRUCTURE SIZE INDICATED IN MVS CFRM POLICY = *size* KB ESTIMATED NUMBER OF DIRECTORY ENTRIES = *dir#* ESTIMATED NUMBER OF DATA PAGES = *data#*

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command after the directory entry to data page ratio is successfully updated. It is also issued for the first ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no ratio value is specified on the command (in this case, the default ratio value is used). The group buffer pool is identified in message DSNB800I, which immediately precedes this message.

Because the actual ratio change does not take effect until the group buffer pool is reallocated, this message shows the estimated number of directory entries and data pages that are allocated based on the new ratio and the maximum size of the coupling facility structure, as indicated in the active CFRM policy definition. The actual number of entries that are allocated varies based on the amount of coupling facility storage that is available at the time the allocation is attempted, and on the amount of storage overhead necessary for the coupling facility control structures. Because DB2 cannot determine these variables, the estimated number of directory and data entries displayed in this message assumes that the entire storage allocation for the coupling facility cache structure will be used for directory and data entries, which is not the case.

To determine the actual number of directory and data entries that are allocated for this group buffer pool, you must cause the buffer pool to be reallocated or rebuilt, as described in *Data Sharing: Planning and Administration*, then issue a DISPLAY GROUPBUFFERPOOL command.

System Action: Processing continues.

DSNB803I RATIO IS TRUNCATED TO *value*

Explanation: The precision specified on the RATIO parameter on an ALTER GROUPBUFFERPOOL command was greater than allowed. For decimal numbers less than 25, any digits after the first decimal place are ignored: for example, 5.67 is treated as 5.6. For decimal numbers greater than or equal to 25, any digits after the decimal point are ignored: for example, 25.3 is treated as 25.

System Action: Processing continues.

DSNB804I CLASS CASTOUT THRESHOLD SET TO *value%* **FOR** *gbpname*

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that requests a change to the class castout threshold value for a group buffer pool. It is also issued for the first ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no threshold value is specified on the command (in this case, the default class castout threshold value is being used).

System Action: Processing continues.

DSNB805I *value* **IS NOT A VALID PARAMETER FOR** 'CLASST'

Explanation: An illegal value was specified on the CLASST (class castout threshold) keyword on an ALTER GROUPBUFFERPOOL command. The CLASST value must be an integer between 0 and 90, inclusive.

System Action: The request is rejected.

System Programmer Response: Reissue the -ALTER GROUPBUFFERPOOL command, specifying an acceptable value for CLASST.

DSNB806I GROUP BUFFER POOL CASTOUT THRESHOLD SET TO *value%* **FOR** *gbpname*

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that successfully changes the group buffer pool castout threshold value for a group buffer pool. It is also issued for the first successful ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no threshold value is specified on the command (in this case, the default group buffer pool castout threshold value is being used).

System Action: Processing continues.

DSNB807I *value* **IS NOT A VALID PARAMETER FOR** 'GBPOOLT'

Explanation: An ALTER GROUPBUFFERPOOL command was issued with an illegal value specified on the GBPOOLT (group buffer pool castout threshold) keyword. The GBPOOLT value must be an integer between 0 and 90, inclusive.

System Action: The request is rejected.

System Programmer Response: Reissue the -ALTER GROUPBUFFERPOOL command, specifying an acceptable value for GBPOOLT.

DSNB808I GROUP BUFFER POOL CHECKPOINT INTERVAL SET TO *value* **MINUTES FOR** *gbpname*

Explanation: This message is issued in response to an ALTER GROUPBUFFERPOOL command that successfully changes the group buffer pool checkpoint interval value for a group buffer pool. It is also issued for the first successful ALTER GROUPBUFFERPOOL command for a group buffer pool, even when no interval value is specified on the command (in this case, the default group buffer pool checkpoint interval value is being used).

System Action: Processing continues.

DSNB809I *value* **IS NOT A VALID PARAMETER FOR** 'GBPCHKPT'

Explanation: An ALTER GROUPBUFFERPOOL command was issued with an illegal value specified on the GBPCHKPT (group buffer pool checkpoint) keyword. The GBPCHKPT value must be an integer between 1 and 999999, inclusive.

System Action: The request is rejected.

System Programmer Response: Reissue the -ALTER GROUPBUFFERPOOL command, specifying an acceptable value for GBPCHKPT.

DSNB812I SIZE ESTIMATES ARE NOT AVAILABLE FOR THE GROUP BUFFER POOL **MVS IXCQUERY RETURN CODE =** *return code* **MVS IXCQUERY REASON CODE =** *reason code*

Explanation: The directory entries and data pages estimates for the group buffer pool, identified on the preceding DSNB800I message, could not be computed because IXCQUERY was unable to obtain the backing structure's size information from the MVS CFRM administrative policy definition. This can happen if an IXCQUERY processing error occurred, or if the structure was not defined in the CFRM policy. The backing structure for the group buffer pool must be defined in the CFRM policy before the group buffer pool can be allocated. The exact reason can be determined from the *return code* and the *reason code*. For an explanation of the IXCQUERY codes, see *MVS/ESA Programming: Sysplex Services Reference*.

System Action: The command completes successfully, but without giving the estimates.

DSNB813I *csect-name* **ALTER NOTIFICATION FAILED**

Explanation: An ALTER GROUPBUFFERPOOL command failed to propagate the request for castout threshold or checkpoint interval change to other DB2s in the data sharing group. This error is triggered by an error encountered by the IRLM notification process. As a result, different DB2s in the group might have different values for the castout threshold or checkpoint interval. The RATIO change does not use the notification process and is, therefore, not affected by such a failure.

System Action: Processing continues.

System Programmer Response: Reissue the -ALTER GROUPBUFFERPOOL command with the same parameters. If the problem persists, it indicates a deeper problem, such as inadequate space for the locking structures.

DSNB814I *csect-name* **NO CHANGES REQUESTED ON COMMAND**

Explanation: An ALTER GROUPBUFFERPOOL command without any parameters was issued for an existing group buffer pool. If an ALTER GROUPBUFFERPOOL command without any parameters is issued for a group buffer pool that does not yet exist, a group buffer pool definition with default parameters values is created.

System Action: The command is successful and processing continues.

DSNB890I *command-verb gbp-kwd* **COMMAND IS ONLY VALID FOR DATA SHARING**

Explanation: An attempt was made to issue a GROUPBUFFERPOOL command on a DB2 that was not initialized to participate in data sharing.

command-verb The name of the command attempted:
ALTER, or DISPLAY

gbp-kwd The keyword GROUPBUFFERPOOL or GBPOOL

System Action: The command request is rejected.

DSNB891I *name* **IS NOT A VALID GROUP BUFFER POOL OR COUPLING FACILITY STRUCTURE NAME**

Explanation: An invalid name was specified on an ALTER GROUPBUFFERPOOL or DISPLAY GROUPBUFFERPOOL command.

name Either the DB2 group buffer pool name or the backing coupling structure name

You must either specify the DB2 group buffer pool name (*gbpname*) or the backing coupling facility structure name

(*strname*). Acceptable values for *gbpname* are GBP0, GBP1, ... , GBP49, GBP32K, GBP32K1, ... , GBP32K9. The *strname* has the following format:

groupname_gbpname

The *groupname* is the DB2 data sharing group name. The underscore (`_`) is used as a delimiter between the *groupname* and the *gbpname*.

System Action: The request is rejected.

System Programmer Response: Reissue the command specifying a valid group buffer pool name.

DSNB892I *grpname* **IS NOT A VALID GROUP NAME FOR THIS DB2**

Explanation: The group name specified as part of the full coupling facility cache structure name on an ALTER GROUPBUFFERPOOL or DISPLAY GROUPBUFFERPOOL command is incorrect. On the commands, you can specify either the correct 16-byte coupling facility cache structure name or the DB2 group buffer pool name. The coupling facility cache structure name is a 16-character name specified as follows:

groupname_gbpname

The *gbpname* can be GBP0, GBP1, ..., GBP49 GBP32K, GBP32K1, ..., GBP32K9. The *groupname* is the DB2 data sharing group name. The underscore (`_`) is used as a delimiter between the *groupname* and the *gbpname*. The coupling facility cache structure names are left-justified with a blank as the rightmost padding character. DB2 adds the padding blanks if they are not specified on the command.

System Action: The request is rejected.

System Programmer Response: Reissue the command, specifying a valid group buffer pool name.

DSNC... Messages

There are two versions of the CICS attachment facility:

- The version shipped with DB2 requires CICS Version 3 Release 3 or an earlier release. This attachment facility issues DSNCxxx messages.
- The version shipped with CICS requires a CICS release later than Version 3 Release 3. This attachment facility issues DSN2xxx messages.

DSNC

Explanation: This is a CICS transaction abend/dump code, not a DB2 message. Refer to "Appendix A. CICS Transaction Abend/Dump Code" on page X-3 for a complete explanation.

DSNC001I CICS UR INDOUBT RESOLUTION IS INCOMPLETE FOR *ssid*

Explanation: CICS cannot resolve the disposition of the units of recovery that DB2 holds indoubt from the previous connection because CICS was cold started.

This message is issued by the following CSECT: DSNCEXT1

System Action: The CICS attachment facility continues the startup process.

Operator Response: Notify the CICS system programmer.

System Programmer Response: You must resolve the indoubt units of recovery manually by issuing the DB2 -DISPLAY THREAD and -RECOVER INDOUBT commands.

DSNC002I DSNCRCT *n* MODULE NOT FOUND

Explanation: The resource control table (RCT) with suffix *n* could not be loaded.

This message is issued by the following CSECT: DSNCSTR1

System Action: The CICS attachment facility initialization is terminated.

Operator Response: Reenter the start command with the correct suffix.

System Programmer Response: Ensure that the RCT is in the correct application program library and that it is concatenated to the JOBLIB, STEPLIB, or MVS LINK library.

DSNC003I THE ATTACHMENT FACILITY IS ALREADY ACTIVE

Explanation: The CICS attachment facility is already active and enabled to CICS.

This message is issued by the following CSECT: DSNCCOM1

System Action: The CICS attachment facility initialization is terminated.

Operator Response: Only one CICS attachment facility is permitted.

DSNC004I THE PLAN NAME IS NOT FOUND IN THE RCT

Explanation: This message is the response to a DSNC DISPLAY or DSNC DISCONNECT command. The plan specified in the command was not found in the resource control table (RCT).

This message is issued by the following CSECT: DSNCCOM1

System Action: The CICS attachment facility command is not processed.

Operator Response: Reenter the command with the correct plan name.

DSNC005I THE TRANSACTION NAME IS NOT FOUND IN THE RCT

Explanation: This message is the response to a DSNC DISPLAY or DSNC MODIFY command. The transaction specified in the command was not found in the resource control table (RCT).

This message is issued by the following CSECT: DSNCCOM1

System Action: The CICS attachment facility command is not processed.

Operator Response: Reenter the command with the correct transaction name.

DSNC006I THE *dest* DESTINATION ID IS INVALID

Explanation: This message is the response to a CICS attachment facility command. The destination ID *dest* specified in the command was not found in the CICS destination control table (DCT) or the resource control table (RCT).

This message is issued by the following CSECT: DSNCCOM1

System Action: The CICS attachment facility command is not processed.

Operator Response: Reenter the command with the correct destination ID.

DSNC007I THE COMMAND VERB IS MISSING OR INVALID

Explanation: The CICS attachment facility does not recognize the ACTION keyword on the entered command.

This message is issued by the following CSECT: DSNCCMDP

System Action: The command is not processed.

Operator Response: Reenter the command with the correct syntax.

DSNC008I KEYWORD IS MISSING OR INVALID

Explanation: A CICS attachment facility command contains an unknown positional keyword or a keyword is missing.

This message is issued by the following CSECT: DSNCCMDP

System Action: The command is not processed.

Operator Response: Reenter the command with the correct syntax.

DSNC009I THE VALUE IN THE COMMAND IS INVALID

Explanation: The numeric value in the DSNC MODIFY command might be invalid. Otherwise, the error is caused by one of the following:

- The value in the command is greater than the value specified for the THRDM parameter in the resource control table (RCT).
- If the POOL RCT entry is being changed, the active thread count cannot be set to less than 3.

This message is issued by the following CSECT: DSNCCOM1

System Action: The command is not processed.

Operator Response: Reenter the command with a valid value.

System Programmer Response: If the number of threads required is more than the number allowed in the resource control table (RCT), specify a larger number of threads in the THRDM parameter and regenerate the table.

DSNC011I *tran* TRANSACTION ABENDED BECAUSE THREADS ARE UNAVAILABLE

Explanation: The transaction with CICS transaction ID *tran* was abnormally terminated because a thread connection to DB2 was not available for the transaction. This error message can occur when:

- TWAIT of the transaction entry in the resource control table is NO.
- TWAIT of the transaction entry is POOL, TWAIT in the pool entry is NO, and all threads in the POOL are active.

This message is issued by the following CSECT: DSNCEXT1

System Action: The indicated transaction is abended. No other action is taken by the CICS attachment facility

Operator Response: Notify the CICS system programmer.

System Programmer Response: Determine which of the following actions will correct the problem:

- If more threads are available with the current generation of the resource control table (RCT), tell the master terminal operator to make more threads active by using the DSNC MODIFY command.
- Regenerate the RCT and make more threads available to the transaction that failed. Stop and then restart the CICS attachment facility to make the new RCT active.

DSNC012I THE ATTACHMENT FACILITY STOP QUIESCE IS PROCEEDING

Explanation: A DSNC STOP command entered by the master terminal operator is being processed.

This message is issued by the following CSECT: DSNCCOM1

System Action: The CICS attachment facility releases the terminal entering the command and proceeds with the quiesce process.

Operator Response: If the quiesce is not completed within the required time period, you can enter a DB2 -STOP FORCE command.

DSNC013I DISPLAY REPORT FOLLOWS

Explanation: A CICS attachment facility display was requested and follows this message.

This message is issued by the following CSECT: DSNCCOM1

System Action: Processing continues.

DSNC014I STATISTICS REPORT FOR *rct-name* FOLLOWS

Explanation: A CICS attachment facility statistics display was requested and follows this message. The name of the resource control table (RCT) that is currently in use is *rct-name*.

The following information is displayed for each entry in the RCT:

TRAN	CICS transaction name.
PLAN	DB2 plan name.
CALLS	Total number of SQL statements in this connection.
AUTHS	Total number of new authorizations for sign-ons. Sign-on occurs only if the CICS transaction ID or DB2 authorization ID has changed.
W/P	Number of times all available threads for this entry were busy and the transaction had to wait or the thread request was diverted to the POOL.
HIGH	Maximum number of concurrent threads required by transactions associated with this entry at any time since the CICS attachment facility was started.
ABORTS	Total number of units of recovery that were rolled back.
COMMITTS	One of the following two fields is incremented each time a DB2 transaction associated with this entry has an explicit or implicit (such as EOT) sync point.
1-PHASE	The total number of single phase commits for transactions associated with this entry.
2-PHASE	The total number of two-phase commits for transactions associated with this entry.

For a more detailed explanation of the fields in the statistics report, refer to "Controlling CICS Connections" in Section 4 (Volume 1) of *Administration Guide*.

This message is issued by the following CSECT: DSNCCOM1

System Action: Processing continues normally.

DSNC016I THE CONNECTION OF CICS TO *name* FAILED

Explanation: The CICS attachment facility is abnormally terminating because an error occurred while connecting with DB2.

This message is issued by the following CSECT: DSNCESTR1

System Action: The CICS attachment facility terminates with abend completion code X'04E' and one of the following reason codes: 00C30002, 00C30003, 00C30006, 00C30007, 00C30008, or 00C30009. If the initial identify fails because of an authorization error, DSNC042I is issued and no dump is requested.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the abend dumps associated with this message to determine the source of the error. Refer to the description of message DSNC0421.

DSNC0171 ATTACHMENT OF A THREAD SUBTASK FAILED

Explanation: The CICS attachment facility continues processing but is unable to start as many thread subtasks as are allowed in a resource control table (RCT) entry.

This message is issued by the following CSECT: DSNCEXT2

System Action: The CICS attachment facility attempted to terminate all subtasks that are currently unused, but none could be terminated. If other subtasks are not active to process the current transaction, CICS is requested to abend the transaction.

Operator Response: Notify the system programmer.

System Programmer Response: The error might be caused by one of the following:

- There is a shortage of storage in the local storage queue area (LSQA).
- The maximum number of thread subtasks allowed was reached. The maximum is specified in the THRDMAX parameter of RCT. The DSNC DISPLAY STATISTICS command is useful in analyzing the current thread usage.

DSNC0181 *name* IS NOT ACTIVE

Explanation: The DSNC STRT command cannot proceed because subsystem *name* is not active.

This message is issued by the following CSECT: DSNCSTRT

System Action: The DSNC STRT command processing ends without starting the CICS attachment facility.

Operator Response: Reenter the CICS attachment facility command after DB2 is started.

DSNC0191 THE MODIFY COMMAND IS COMPLETE

Explanation: The DSNC MODIFY command completed successfully.

This message is issued by the following CSECT: DSNCCOM1

DSNC0201 THE DISPLAY COMMAND IS COMPLETE

Explanation: The DSNC DISPLAY command completed successfully.

This message is issued by the following CSECT: DSNCCOM1

DSNC0211 THE DISCONNECT COMMAND IS COMPLETE

Explanation: The DSNC DISCONNECT command completed successfully.

This message is issued by the following CSECT: DSNCCOM1

DSNC0221 THE ATTACHMENT FACILITY STOP FORCE IS PROCEEDING

Explanation: A DSNC STOP FORCE command entered by the master terminal operator is being processed.

This message is issued by the following CSECT: DSNCCOM1

System Action: The CICS attachment facility releases the terminal entering the command and proceeds with the STOP FORCE processing.

DSNC0231 THE ATTACHMENT FACILITY HAS CONNECTED TO *name* USING *rct-name*

Explanation: The DSNC STRT command successfully completed. Subsystem *name* is now available to CICS. The name of the resource control table (RCT) that was specified for this start of the CICS attachment facility is *rct-name*.

This message is issued by the following CSECTs: DSNCCOM1 DSNCEXT2

System Action: The DSNC STRT command completes processing. The CICS attachment facility is active.

DSNC0241 *dest* CANNOT BE LOCATED IN THE DCT

Explanation: The destination shown in the message cannot be located in the CICS destination control table (DCT).

This message is issued by the following CSECT: DSNCCOM1

System Action: The CICS attachment facility startup process continues. The destination entry in the resource control table (RCT) is set to '*' for potential modification by the CICS attachment facility.

Operator Response: Notify the system programmer. Use the DSNC MODIFY command to set the error destination to the correct identification characters.

System Programmer Response: Correct either the RCT or the DCT to synchronize the error destinations.

DSNC0251 THE ATTACHMENT FACILITY IS INACTIVE

Explanation: This is the final message issued by the CICS attachment facility to inform the resource control table error destinations that the CICS attachment facility completed the shutdown process.

This message is issued by the following CSECT: DSNCCSTOP

System Action: The CICS attachment facility is terminated.

DSNC0261 DSNCCSTOP FAILED TO DISABLE THE *name* RMI EXIT

Explanation: The CICS attachment facility failed to disable the named resource manager interface (RMI) exit. Either the exit was in use at the time DSNCCSTOP tried to disable it, or an abend occurred in the RMI exit code while the 'in use' flag was on. The CICS system must be stopped and restarted before the CICS attachment facility can be restarted.

This message is issued by the following CSECT: DSNCCSTOP

System Action: The CICS attachment facility continues termination processing after dumping the CICS trace, the resource control table (RCT), and the connection control table (CCT).

Operator Response: Notify the CICS attachment facility system programmer. CICS must be stopped and restarted before restarting the CICS attachment facility.

System Programmer Response: This could be a problem in the CICS 'task-related user exit'. Analyze the trace and any dumps associated with this execution to determine the source of the error.

DSNC027I SHUTDOWN IS IN PROGRESS. *transaction* COMMANDS MAY NOT BE ENTERED

Explanation: The CICS attachment facility does not accept commands directed to DB2 during or after the termination of the CICS attachment facility.

This message is issued by the following CSECT: DSNCCOM1

System Action: The command is rejected.

User Response: Notify the CICS attachment facility system programmer.

DSNC028I USER IS NOT AUTHORIZED FOR *transaction* COMMANDS

Explanation: DB2 rejected the command request during the sign-on of the user. Therefore, the user is assumed to be unauthorized for the requested function in the command.

This message is issued by the following CSECT: DSNCCOM1

System Action: The command is rejected.

Operator Response: Notify the CICS attachment facility system programmer.

System Programmer Response: The authorization ID used is described in the generation procedures of the resource control table (RCT). If this user should be allowed access to the command, use the GRANT statement to grant authorization.

DSNC029I *transaction* COMMAND FAILED, REASON CODE *rc*

Explanation: The DB2 command, identified in the message as *transaction*, failed to return a response message indicating the action taken by the command. DB2 returned reason code *rc*.

This message is issued by the following CSECT: DSNCCOM1

System Action: The results of the command are unknown.

Operator Response: Notify the CICS attachment facility system programmer.

System Programmer Response: Check the master console for any messages indicating why the command failed. Refer to the explanation of the reason code returned by DB2 in "Section 4. DB2 Codes" on page 4-1.

DSNC030E AN ERROR HAS OCCURRED WRITING TO THE TRANSIENT DATA OUTPUT DESTINATION *destination*

Explanation: The CICS attachment facility encountered an error while writing to the indicated destination.

This message is issued by the following CSECT: DSNCMMSG0

System Action: The CICS attachment facility continues operation.

Operator Response: Notify the system programmer. If the destination is one of the resource control table error destinations, use the CICS MODIFY command to change the destination code to another destination, if one is available.

System Programmer Response: Follow CICS procedures to correct the error. Refer to *CICS/ESA Problem Determination Guide* for additional information.

DSNC031I THE COMMAND IS INVALID. THE ATTACHMENT FACILITY IS INACTIVE

Explanation: STRT is the only valid command when the CICS attachment facility is inactive. No other commands to the CICS attachment facility are accepted.

This message is issued by the following CSECT: DSNCCOM1

System Action: The command is rejected.

DSNC032I *transaction* COMMAND ALTERNATE DESTINATION OUTPUT COMPLETE

Explanation: The DB2 command identified in the message as *transaction* is complete. The resulting output should be available at the requested device.

This message is issued by the following CSECT: DSNCCOM1

System Action: Processing continues normally.

DSNC033I TERMINAL *termid* IS NOT SUPPORTED BY BMS OR IS INVALID

Explanation: This message is issued in response to a CICS attachment facility or DB2 command that requested an alternate destination for the response. CICS basic mapping support (BMS) encountered an error while routing to the requested terminal named *termid*.

This message is issued by the following CSECT: DSNCMMSG0

System Action: The output from the command might be suppressed.

Operator Response: Ensure that the terminal ID was correctly entered. Otherwise, notify the system programmer.

System Programmer Response: Verify that the terminal ID is valid. This message might occur if the destination device is not supported by BMS or if it does not exist in the CICS terminal control table. If *termid* is CSMT, this message might also follow message DSNC030E. The attachment facility unconditionally routes output to terminal CSMT following a transient data destination error.

DSNC034I INDOUBT RESOLUTION FOR *ur-id* IS INCORRECT

Explanation: CICS indicates recovery is required for the *ur-id*, but the unit of recovery is not indoubt to DB2.

This message is issued by the following CSECT: DSNCEXT1

System Action: The CICS attachment facility continues the startup process.

Operator Response: Notify the CICS system programmer.

System Programmer Response: CICS tried to recover a unit of recovery using an identifier that was not in the resolution request list from DB2. Use the DB2 -DISPLAY THREAD and -RECOVER INDOUBT commands to ensure that all indoubt units of recovery are resolved.

You must identify the reason for the inconsistency. A DB2 cold start, for example, might cause the problem.

DSNC035I INDOUBT RESOLUTION FOR *ur-id* IS INCOMPLETE

Explanation: CICS indicates recovery should not be required for the *ur-id*, but DB2 is indoubt.

This message is issued by the following CSECT: DSNCEXT1

System Action: The CICS attachment facility continues the startup process.

Operator Response: Notify the CICS system programmer.

System Programmer Response: CICS cannot recover a unit of recovery using an identifier that was in the resolution request list from DB2. Use the DB2 -DISPLAY THREAD and -RECOVER INDOUBT commands to ensure that all indoubt units of recovery are resolved.

You must identify the cause of the error. A CICS cold start could cause this problem.

DSNC036I INDOUBT RESOLUTION FOR *ur-id* IS INCONSISTENT

Explanation: CICS indicates recovery resolution for the *ur-id* should be ABORT (backout), but DB2 indicates the resolution should be COMMIT.

This error can be caused by a damaged CICS system journal file.

This message is issued by the following CSECT: DSNCEXT1

System Action: DB2 committed the unit of recovery. The CICS attachment facility continues the startup process.

Operator Response: Notify the CICS system programmer.

System Programmer Response: CICS and/or DB2 restart processes are not in synchronization. You must identify the cause of the error. Take appropriate action to return all resources to a consistent state.

DSNC037A *subsystem* IS NOT ACTIVE *transaction* IS WAITING

Explanation: The CICS attachment facility start transaction identified in the message is waiting for notification from the indicated DB2 subsystem that it is active. The start of the CICS attachment facility is complete after DB2 is started.

This message is issued by the following CSECT: DSNCEXT1

System Action: The CICS attachment facility waits to complete the start process.

Operator Response: Start the DB2 subsystem.

DSNC038I THE COMMAND IS INVALID WHILE WAITING FOR *subsystem name*

Explanation: The command entered cannot be processed while the CICS attachment facility is waiting for the DB2 subsystem to start. The name of the DB2 subsystem that is not yet operational is *subsystem name*.

This message is issued by the following CSECT: DSNCCOM1

System Action: The command is rejected.

DSNC039I THE ERROR DESTINATIONS ARE:

d1 d2 d3

Explanation: This message is the response to the DSNC MODIFY DESTINATION command that lists the currently active message destinations known to the CICS attachment facility. Null entries that show as '*****' can be modified so they identify actual destinations.

This message is issued by the following CSECT: DSNCCOM1

DSNC040I MODULE *name* COULD NOT BE FOUND

Explanation: During the CICS attachment facility initialization, an attempt was made to locate and load the named module, but it was not found in any of the libraries accessible to MVS through the MVS LOAD macro.

This message is issued by the following CSECT: DSNCEXT1

System Action: The CICS attachment facility initialization is terminated.

Operator Response: Notify the CICS attachment facility system programmer.

System Programmer Response: Check the CICS JOBLIB/STEPLIB libraries and ensure that DB2 libraries are made available.

DSNC041I NO ACTIVE THREADS

Explanation: A DSNC DISPLAY TRANSACTION or DSNC DISPLAY PLAN command was entered, but there were no active threads created. The CICS attachment facility might have identified and signed on the attached subtasks, but a create thread was not issued for any of the subtasks.

This message is issued by the following CSECT: DSNCCOM1

DSNC042I CONNECTION NOT AUTHORIZED TO *name*

Explanation: The attempt to connect to the named DB2 subsystem failed because the user was not authorized to access DB2. Authorization was denied by either RACF or a user-written connection exit.

This message is issued by the following CSECT: DSNCEXT1

System Action: The CICS attachment facility terminates.

Operator Response: Notify the system programmer.

System Programmer Response: The user specified on the CICS job was not authorized to connect to the named DB2 subsystem. Refer to Section 3 (Volume 1) of *Administration Guide* for information on how to authorize a user to access DB2.

DSNC043I DSNCSTOP ENCOUNTERED ERROR, RECOVERY ROUTINE started/completed

Explanation: A CICS abend occurred while disconnecting the CICS attachment facility from DB2 and deleting it from storage. This message might be issued twice. It is issued at the start of the abend recovery routine, which is indicated by 'started' in the message text. If the recovery routine is successful, the message is issued with 'completed' in the message text.

This message is issued by the following CSECT: DSNCEXT1

System Action: If the recovery routine is not successful, program DSNCSTOP terminates with a CICS transaction

dump. If the recovery routine is successful, the CICS attachment facility is terminated normally.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze any abend dumps associated with this message to determine the cause of the failure.

DSNC044I DSNCRCT ENTRY HAS BEEN CORRUPTED OR OVERLAID

Explanation: The CICS attachment facility detected that a resource control table (RCT) entry was corrupted or overlaid since the CICS attachment facility was last started.

This message is issued by the following CSECT: DSNCEXT1

System Action: The CICS task is abended with reason code 00C30011. No other action is taken by the CICS attachment facility.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the abend dumps associated with this message to determine which CICS transaction and RCT entry was corrupted. Restart the CICS attachment facility to obtain a valid copy of the RCT.

DSNC045I RESOURCE MANAGER *rmi-name* IS UNKNOWN TO CICS ATTACH FACILITY

Explanation: The CICS attachment facility received a request from a resource manager interface (RMI) named *rmi-name*. This RMI is not known by the CICS attachment facility.

This message is issued by the following CSECT: DSNCEXT1

System Action: The CICS task is abended with a CICS transaction dump.

Operator Response: Notify the system programmer.

System Programmer Response: Analyze the CICS transaction dump to determine the source of the unknown resource manager interface (RMI) request.

Problem Determination: CICS dump information, such as the trace table and program storage, can aid in determining which module issued the request. The CICS EXEC interface block resource name field, EIBRSRCE, contains the name of the RMI.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNC046I RCT RELEASE LEVEL *nnnn* IS INCONSISTENT WITH CICS ATTACH RELEASE LEVEL *mmmm*

Explanation: The resource control table (RCT) release level *nnnn* does not match the CICS attachment facility release level *mmmm*.

This message is issued by the following CSECT: DSNCESTR

Operator Response: Notify the system programmer.

System Programmer Response: Reassemble the RCT using the correct DB2 release level *mmmm* DSNCRCT macro.

DSNC047I TWA SIZE IS TOO SMALL FOR TRANSID *tran*

Explanation: The CICS TWASIZE defined for transaction *tran* is too small to support the CICS attachment facility command processor program (DSNCCOM1).

This message is issued by the following CSECT: DSNCEXT1

System Action: The CICS attachment facility abends this CICS task with a CICS transaction abend.

Operator Response: Notify the system programmer.

System Programmer Response: Redefine the command processor transaction to specify the correct TWASIZE.

DSNC048I UNABLE TO INTERPRET SQL CALL WHILE FORMATTING AN EDF DISPLAY TRAN *tran* TASK *task*

Explanation: The CICS attachment facility was unable to decipher storage associated with an SQL statement for CICS transaction *tran* and task id *task*. Either the SQL communications area (SQLCA) or the RDS input parameter list (RDI) storage could not be interpreted by the CICS attachment facility.

This message is issued by the following module: DSNCEXT1

System Action: A CICS transaction dump is taken of the storage in question.

Programmer Response: Ensure that CICS storage associated with this task was not altered or overlaid. Analyzing the storage in the CICS transaction dump might provide clues about the source of the problem.

Problem Determination: Analyze the CICS transaction dump of the storage in question. In this situation the information supplied by the Execution Diagnostic Facility (EDF) of CICS for SQL statements consists of:

- The EDF status: ABOUT TO EXECUTE or COMMAND EXECUTION COMPLETE
- The processing status: CALL TO RESOURCE MANAGER DSNCSQL
- The ARG values associated with this call to the CICS attachment facility resource manager

No other information is provided about the SQL statement.

DSNC049I CSD PROGRAM ATTRIBUTE '*attribute-name*' IS INCORRECT FOR ATTACHMENT PROGRAM '*program-name*'

Explanation: A CICS system definition file (CSD) PROGRAM definition attribute *attribute-name* value was incorrectly specified for the CICS attachment facility program *program-name*.

Message DSNC051I is also issued to specify which CICS attachment facility function is unavailable because of this CSD PROGRAM definition error.

This message is issued by the following module: DSNCEDON

Operator Response: Notify the system programmer.

System Programmer Response: Ensure that this CICS attachment facility program was defined correctly in the CICS CSD. Refer to Section 2 of *Installation Guide* for information about the correct PROGRAM attribute values.

DSNC050I MISSING CSD PROGRAM DEFINITION FOR ATTACHMENT FACILITY PROGRAM 'program-name'.

Explanation: A required CICS system definition file (CSD) PROGRAM definition was not found for CICS attachment facility program *program-name*.

Message DSNC051I is also issued to specify which CICS attachment facility function is unavailable because of this PROGRAM definition error.

This message is issued by the following module: DSNCEDON

Operator Response: Notify the system programmer.

System Programmer Response: Ensure that this CICS attachment facility program was defined correctly in the CICS CSD. Refer to Section 2 of *Installation Guide* for information about the correct PROGRAM attribute values.

DSNC051I 'function-name' SUPPORT IS NOT AVAILABLE DUE TO ATTACHMENT FACILITY INITIALIZATION ERRORS

Explanation: The function *function-name* is not available because of errors encountered during the initialization of the CICS attachment facility.

In addition to this message, the CICS attachment facility previously issued one or both of these messages during initialization: DSNC049I and DSNC050I.

This message is issued by the following module: DSNCEDON

Operator Response: Correct any error conditions indicated in messages DSNC049I and DSNC050I to allow the CICS attachment facility to initialize properly.

DSNC052I INSUFFICIENT STORAGE AVAILABLE TO START ATTACHMENT FACILITY

Explanation: During startup the CICS attachment facility was unable to allocate the required amount of storage. This message might be issued if an error occurs while the attachment facility is loading the data only load module, DSNCRCTx.

This message is issued by the following CSECTs: DSNCMSG0 DSNCSTRT

System Action: The CICS attachment facility is not initialized.

System Programmer Response: Allow a larger amount of dynamic storage on your CICS system. Alternatively, you can delete unused entries or lower THRDA and THRD M values in your RCT, which reduces the size of the storage that the attachment facility requires.

For a load error, check the MVS console log for any preceding messages to determine why the load failed. If there is not enough free REGION space to load the RCT, see the appropriate CICS documentation for information on tuning your CICS system.

DSNC053I INSUFFICIENT TWASIZE FOR DSNCCOM1. REQUIREMENT IS *twasize*

Explanation: The CICS attachment facility requires a TWASIZE of *twasize* on all transactions that execute DSNCCOM1. Either the TWASIZE that was specified is less than the requirement, or no TWASIZE was specified at all.

This message is issued by the following CSECT: DSNCCOM1

System Action: The attachment facility terminates.

System Programmer Response: Update either the CICS program control table (PCT) or the CICS resource definition online (RDO) transaction resource definition. Any transaction that executes program DSNCCOM1 should specify TWASIZE(*twasize*) on its transaction entry.

DSNC054I DYNAMIC PLAN PROGRAM LINK FAILED FOR TRANSACTION '*transaction*'. EIBRESP WAS '*eibresp*'.

Explanation: The attachment facility was unable to link to the dynamic plan exit program specified in DSNCRCT. The reason code provided by CICS in the EIBRESP field of the EIB is given in this message.

This message is issued by the following CSECT: DSNCEXT1

System Action: The transaction is abended with a DSNC abend.

User Response: Look up the *eibresp* value in *CICS/ESA Application Programming Reference*. This value was returned from CICS after the attachment facility attempted to link to the dynamic plan exit. Take appropriate action based on the *eibresp*. For example, if *eibresp* was PGMIDERR, check your RCT entry for transaction *transaction* to ensure that the dynamic plan exit program name (PLNPGME or PLNPGMI) is the name of a valid program known to CICS.

DSNC055I SINGLE PHASE COMMIT FAILED FOR TRANSACTION '*transaction*'. EIBTASKN WAS '*task number*'.

Explanation: CICS requested a single phase commit from DB2, but DB2 was unable to comply.

This message is issued by the following CSECT: DSNCEXT1

System Action: The transaction is abended with a DSNC abend.

User Response: Contact the IBM Support Center for assistance.

DSNC057I *csect-name* CICS RELEASE *release* IS TOO HIGH FOR THIS ATTACHMENT FACILITY

Explanation: The attachment facility that you are using requires CICS Version 3 Release 3 or an earlier release. You are using a CICS release later than CICS Version 3 Release 3. For this release of CICS, you must use the attachment facility shipped with CICS.

System Action: The attachment facility does not initialize.

User Response: Ensure that the CSD definition of the DSNC transaction specifies program DSN2COM1. If you are initializing the attachment facility using CICS program list table (PLT) processing, ensure that your CICS PLTPI table uses program DSN2COM0 to initialize the attach.

DSNC059I *csect-name* CICS ATTACHMENT FACILITY MISMATCH WITH RESOURCE CONTROL TABLE
rct-name

Explanation: The wrong macro library was used to assemble DSNCRCT, the resource control table.

There are two versions of the CICS attachment facility. The version shipped with DB2 requires CICS Version 3 Release 3 or an earlier release; the one shipped with CICS requires a CICS release later than Version 3 Release 3. This message indicates that CICS is using the attachment facility shipped with DB2, but the RCT was assembled using the CICS macro libraries.

System Action: The CICS attachment facility initialization terminates.

User Response: Reassemble DSNCRCT using the DSNCRCT macro shipped in the DB2 macro libraries.

DSNC062I *csect-name* RCT *rct-name* WAS LINK EDITED WITH OPTION RMODE=ANY, BUT IT NEEDS RMODE=24

Explanation: The resource control table must reside below the 16 megabyte line of virtual storage, but it was link edited with option RMODE=ANY.

System Action: The CICS attachment facility initialization terminates.

User Response: Linkedit the resource control table with option RMODE(24).

DSNC065I *csect-name* INVALID LENGTH. DATA NOT DISPLAYABLE.

Explanation: The module running under the CICS Execution Diagnostic Facility (EDF) attempted to display an input or output variable that had an incorrect length indicator.

System Action: EDF processing continues, but the value of the variable is not displayed.

DSNC070I ROLLBACK FAILED FOR TRANSACTION *tran*

EIBRESP2 = X'eibresp'

Explanation: The attachment facility was unable to issue a CICS ROLLBACK. The reason code provided by CICS in the EIBRESP2 field of the EIB is given in this message.

This message is issued by the following CSECT: DSNCEXT1

System Action: The transaction is abended with a DSNC abend.

User Response: Look up the *eibresp* value in CICS/ESA Application Programming Reference. This value was returned from CICS after the attachment facility attempted a ROLLBACK requested by the ROLBE=YES option.

DSNC700I DSNCSAMG *message-id* HAS BEEN ISSUED

Explanation: This message is issued only if the requested message was not found in the message directory (DSNCMSGT).

System Action: The system proceeds as though the requested message was issued.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to this manual for the message text.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNC901I UNRECOVERABLE IOERROR IN PROGRAM DSNCCOM1. THE ATTACHMENT FACILITY WILL SHUTDOWN.

Explanation: An attempt to retrieve data stored for program DSNCCOM1 failed when CICS returned an exceptional condition of IOERR (EIBRESP = X'11').

This message is issued by the following CSECT: DSNCCOM1

System Action: The DB2-CICS attachment facility is shutdown.

Operator Response: Notify the system programmer.

System Programmer Response: An IOERR occurs if an input or output error occurs during a RETRIEVE operation. Examine the CICS auxiliary trace records and the CICS system log to determine the cause of the IOERR.

DSNE... Messages

In the TSO attachment facility, the user can control whether message IDs are displayed. To see them, type PROFILE MSGID. To suppress them, type PROFILE NOMSGID.

Trace messages associated with the TSO attachment facility (including DSN and DB2I) are not listed in this manual. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

All DSN command processor trace messages have the same message number: DSNET20I.

DSNET20I

Explanation: This is one of many possible trace messages bearing this message number. Complete documentation of all of the TSO attachment facility trace messages bearing this message number is found in Section 9 of *Diagnosis Guide and Reference*.

DSNE004E PROBABLE SUBSYSTEM ERROR DETECTED IN CSECT csect-name, SUBSYSTEM FUNCTION service, RETCODE retcode, REASON CODE reason-code

Explanation: A subsystem error has occurred. The function identified in the message as 'service' is either an MVS or a DB2 service routine. The error was discovered in the 'csect-name' indicated in the message. Refer to the appropriate MVS publications for a description of the return and reason codes.

This message is issued by the following CSECTs:

DSNECP00	DSNECP10	DSNECP12	DSNECP13
DSNECP14	DSNECP16	DSNECP17	DSNECP18
DSNECP19	DSNECP20	DSNECP22	DSNECP23
DSNECP24	DSNECP25	DSNECP26	DSNECP29
DSNECP30	DSNECP31	DSNECP40	DSNECP41
DSNECP42	DSNECP44	DSNECP45	DSNECP46
DSNECP60	DSNECP61	DSNECP62	DSNECP66
DSNECP67	DSNECP68	DSNECP69	

System Action: This message is sometimes followed by an intentional system abend. In other instances, the DSN command processor will terminate the current subcommand and attempt to continue by issuing another DSN prompt.

User Response: Run the job again with a SYSUDUMP dump data set allocated and DSN tracing set to 123. Collect the DSN trace stream. If an abend occurs, collect the dump.

DSNE005A EXECUTION IS INTERRUPTED. ENTER C TO CANCEL, OR ANY OTHER REPLY TO RESUME THE subcmd SUBCOMMAND

Explanation: The Attention key was pressed. Entering a 'C' will cancel the DSN subcommand that is currently executing. If the user enters a question mark, message DSNE006A will appear. Any other reply will cause execution of the subcommand that was in progress to continue.

If the DSN prompt was issued just before the Attention key was pressed, 'subcmd' may be either 'DSN' or the previously invoked subcommand.

This message is issued by the following CSECT: DSNECP01

User Response: Enter a 'C' to cancel the DB2 subcommand currently executing. The DSN prompt will appear on the terminal. Enter anything else (except another attention) to resume execution.

DSNE006A C WILL TERMINATE THE SUBCOMMAND WITH UNCOMMITTED CHANGES BACKED OUT

Explanation: Enter a 'C' to terminate the subcommand. No uncommitted changes are made to the database. Any other reply causes subcommand execution to continue.

This message is issued by the following CSECT: DSNECP01

User Response: Enter a 'C' to terminate the subcommand. Control returns to DSN, and the DSN prompt appears on the terminal. This is a second-level help message associated with message DSNE005A.

DSNE008I REPLY WAS xxxxx, EXECUTION RESUMED

Explanation: Execution was suspended by a user ATTENTION and then was resumed, because the string specified in the message as 'xxxxx' was entered.

This message is issued by the following CSECT: DSNECP01

System Action: Control returns to the interrupted session.

DSNE009I REPLY WAS C, EXECUTION TERMINATED

Explanation: The response to message DSNE005A was a C. This caused the current subcommand to terminate.

This message is issued by the following CSECT: DSNECP01

System Action: The current subcommand is terminated. The DSN prompt appears on the terminal.

User Response: You can now enter another DSN subcommand.

DSNE010I SUBCOMMAND subcmd CANCELED BY ATTENTION

Explanation: The subcommand specified in the messages was canceled because the user pressed the attention key and then entered a 'C'.

This message is issued by the following CSECT: DSNECP01

System Action: The current subcommand is terminated. The DSN prompt appears on the terminal.

User Response: A new subcommand can be entered.

DSNE011I DSN COMMAND CANCELED BY ATTENTION

Explanation: The user of the DSN command processor has pressed attention. Since this occurred before DSN was fully initialized, DSN terminates. If DSN had been fully initialized, it would have prompted the user to continue or cancel.

This message is issued by the following CSECT: DSNECP01

System Action: The DSN command processor terminates. Control returns to TSO or the calling CLIST.

User Response: Restart DSN.

DSNE100I ssid NOT OPERATIONAL, RETRY COUNT IS ZERO

Explanation: The subsystem (specified in the message as 'ssid') was not active, and no retries remain to be executed. No more connection attempts are made. The operator should be notified to start this specific subsystem, and the DSN command should be resubmitted. Issue the DSN command with the RETRY parameter set greater than zero.

This message is issued by the following CSECT: DSNECP12

System Action: Control returns to TSO.

User Response: Notify the operator to start the subsystem.

Operator Response: Start the subsystem with the 'ssid' specified in the message.

DSNE101I ssid NOT OPERATIONAL, WILL RETRY nnn MORE TIMES

Explanation: The requested DB2 subsystem 'ssid' was not started or is not available. Connection to it will be attempted 'nnn' more times. This message is issued every 30 seconds (and each time 'nnn' is decreased by 1) until the connection is made or 'nnn' is zero.

This message is issued by the following CSECT: DSNECP12

System Action: DSN repeats the connection attempt until the connection is made or until the retry count is decreased to zero.

User Response: Notify the operator start DB2.

DSNE102I YOU ARE NOT AUTHORIZED TO USE DB2 SUBSYSTEM ssid

Explanation: The authorization ID is not authorized to use subsystem 'ssid'.

This message is issued by the following CSECT: DSNECP12

System Action: Control returns to TSO.

User Response: Contact the system programmer, or system administrator to arrange for the required RACF or equivalent security system authorization.

DSNE103E MAIN STORAGE REQUEST FROM csect-id FAILED

Explanation: A request for main storage failed.

This message is issued by the following CSECTS:

DSNECP29	DSNECP42	DSNECP46
DSNECP41	DSNECP45	DSNECP66

System Action: The TSO attachment facility is ready for more input.

User Response: Increase the address space size. This can be done as part of the logging on process.

DSNE104E RETRY COUNT OF number NOT VALID, SET TO 120

Explanation: An invalid 'RETRY' parameter was entered on the DSN command. It has been set to 120. Valid retry counts are integer numbers from 0 to 120.

This message is issued by the following CSECT: DSNECP12

System Action: Retry count is modified, and DSN execution continues.

User Response: The next time you invoke DSN, use a RETRY count of 0 to 120.

DSNE105E SUBSYSTEM ssid NO LONGER OPERATIONAL

Explanation: The DB2 subsystem is down. It must be restarted before the user can continue.

This message is issued by the following CSECTS: DSNECP13, DSNECP66

System Action: Control returns to TSO attachment facility.

User Response: Before you can continue, DB2 must be restarted. You must also reissue the DSN command. ISPF users should restart their jobs.

DSNE106E PLAN plan-id NOT AUTHORIZED FOR SUBSYSTEM ssid AND AUTH-ID auth-id

Explanation: The requested combination of plan-id, subsystem-id, and user-id is not currently authorized.

This message is issued by the following CSECT: DSNECP13

System Action: The TSO attachment facility is ready for more input.

User Response: Notify the system programmer or system administrator to obtain proper authorization.

System Programmer Response: The system administrator for the DB2 subsystem can arrange the necessary authorization.

DSNE107E SUBSYSTEM RESOURCE NEEDED FOR PLAN plan-name, AUTH ID auth-id, AND SUBSYSTEM subsys IS NOT AVAILABLE

Explanation: The DB2 subsystem was unable to allocate a necessary resource for the requested combination of plan-id, user-id, and subsystem-id. This message is accompanied by DSNE108E. An attempt to establish connection with the DB2 subsystem has failed.

This message is issued by the following CSECT: DSNECP13

System Action: The TSO attachment facility is ready for more input.

User Response: Arrange to obtain the needed resource, and resubmit the subcommand. See the explanation for message DSNE108E, which accompanies this message.

**DSNE108E FEEDBACK - REASON CODE reason-code
TYPE= type RESOURCE NAME - 44 characters**

Explanation: This message accompanies message DSNE107E or DSNE114E to explain the problem more clearly. RESOURCE NAME is the name of the unavailable resource. The reason code is in hexadecimal format.

This message is issued by the following CSECT: DSNECP13

System Action: The TSO attachment facility is ready for more input.

User Response: Arrange for the missing resource to be available, and resubmit your job.

Problem Determination: The reason the resource is unavailable is identified by a reason code. The reason codes that appear in this message are described in "Section 4. DB2 Codes" on page 4-1.

TYPE and RESOURCE NAME identify the resource that is currently unavailable. The TYPE code identifies the type, as well as the format and content, of the RESOURCE NAME. Refer to Table 3 in "Appendix B. Problem Determination" on page X-5 for an explanation of resource type codes.

DSNE109E NO INPUT TO BIND, SUBCOMMAND TERMINATED

Explanation: No LIBRARY parameter was specified on the BIND subcommand. No DBRMLIB was allocated.

This message is issued by the following CSECT: DSNECP29

System Action: The TSO attachment facility is ready for more input.

User Response: Specify the LIBRARY parameter, and resubmit the BIND subcommand. Alternatively, you could issue an ALLOCATE command for the DDNAME DBRMLIB and then resubmit the BIND subcommand as originally written.

DSNE110E ssid NOT VALID SUBSYSTEM ID, COMMAND TERMINATED

Explanation: There is no subsystem id with the name identified in the message as 'ssid'. The subsystem identifier you specify (or default to) on the DSN command must exist. This message is the result of specifying (or defaulting to) a nonexistent subsystem identifier. For information on the SYSTEM parameter of the DSN command, refer to *Command Reference*.

This message is issued by the following CSECT: DSNECP12

System Action: The DSN processor ends, and control returns to TSO.

User Response: Reissue the command with a valid SYSTEM parameter.

DSNE111E INSTALLATION EXIT REJECTED DSNAME data-set-name

Explanation: A local installation-supplied exit has rejected the data set name identified in the message as 'data-set-name'.

This message is issued by the following CSECTS:

DSNECP23

DSNECP29

DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Either correct the data set name specified, or arrange to authorize the original data set name. Resubmit the request.

DSNE112E userid STILL SIGNED ON TO SUBSYSTEM ssid

Explanation: An attempt was made to sign on to DB2 when the user was already signed on.

This message is issued by the following CSECT: DSNECP12

System Action: Control returns to TSO.

User Response: Log off and log on again.

DSNE113E NOT ABLE TO LINK TO MODULE modname IN DSNAME data-set-name

Explanation: A DB2 subsystem error occurred during an attempt to link to module 'modname' in data set 'data-set-name'.

This message is issued by the following CSECT: DSNECP16

System Action: The TSO attachment facility is ready for more input.

User Response: Check that the module exists and that its name is spelled correctly. Enter the correct module name.

DSNE114E THE COMBINATION OF PLAN planid, AUTH ID auth-id, AND SUBSYSTEM ssid IS NOT VALID

Explanation: The resource in message DSNE108E, which will follow this message, is not a valid resource name.

This message is issued by the following CSECT: DSNECP13

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the invalid combination, and resubmit the subcommand. The problem is probably caused by a user spelling error. If it is not, check with the system administrator to determine the availability of the needed resource. Your program may need to be bound. See the explanation for message DSNE108 (which accompanies this one) for more information.

DSNE117E NOT ABLE TO LOCATE membername IN DSNAME data-set-name

Explanation: The 'data-set-name' specified does not contain the member the user wanted to run.

This message is issued by the following CSECT: DSNECP16

System Action: Control remains with the DSN command processor, and the DSN prompt appears on the terminal. The DSN command processor is ready for another command.

User Response: Correct the PROGRAM or LIBRARY parameter, and resubmit the subcommand.

DSNE118E invalid-command NOT VALID COMMAND

Explanation: The user entered an invalid command. A typing error may be responsible. You may be trying to run a command processor that is either not available on your system or that is not part of your current LNKLST or STEPLIB concatenation.

This message is issued by the following CSECT: DSNECP31

System Action: The TSO attachment facility is ready for more input.

User Response: Either correct the spelling error, or rearrange your library concatenation so that you can access the required command processor. Resubmit the command.

DSNE119E data-set-name NOT PARTITIONED DATA SET

Explanation: The user tried to allocate a sequential data set when a partitioned data set was required.

This message is issued by the following CSECTs:

DSNECP23 DSNECP29 DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Check the data-set-name. The data set you specified is sequential, but you specified a member name. Remove the member name, and resubmit the job.

DSNE120E data-set-name NOT SEQUENTIAL DATA SET

Explanation: The user tried to allocate a partitioned data set when a sequential data set was required.

This message is issued by the following CSECT: DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Check the data-set-name. The data set you specified is partitioned, but you did not specify a member name. Add a member name, and resubmit the job.

DSNE121E csect-id NOT ABLE TO OPEN DATA SET

Explanation: The DB2 subsystem was unable to open the requested data set.

This message is issued by the following CSECTs: DSNECP23, DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: For information about why the data set could not be opened, read the explanations of the messages that accompany this message. Correct the condition, and resubmit the job.

DSNE122E DATA SET ORGANIZATION MUST BE EITHER SEQUENTIAL OR PARTITIONED. data-set-name IS NOT

Explanation: The DB2 subsystem was unable to open data set 'data-set-name', because it is not a sequential or partitioned data set.

This message is issued by the following CSECT: DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the data-set-name, or change the data set organization. Resubmit the job.

DSNE123I data-set-name NOT PARTITIONED DATA SET, IT IS IGNORED

Explanation: The data-set-named in the message is required to be partitioned. It is not and, consequently, was ignored.

This message is issued by the following CSECT: DSNECP29

System Action: DSN will attempt to continue BIND processing.

User Response: Correct the subcommand, and resubmit it.

DSNE124E DATA SET data-set-name, MEMBER member-name IN USE, TRY LATER

Explanation: The member contained in 'data-set-name' is currently in use. This message is normally issued when another user is updating the specified member.

This message is issued by the following CSECT: DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Wait until the member is available and reissue your DCLGEN request.

DSNE125E DATA SET data-set-name IN USE, TRY LATER

Explanation: The sequential data set 'data-set-name' is currently in use. This message is normally issued when another user is updating the specified data set.

This message is issued by the following CSECT: DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Wait until the data set is available and reissue your DCLGEN request.

DSNE126E THE DB2 OPERATOR IS STOPPING THE SUBSYSTEM. PLEASE END YOUR DSN SESSION

Explanation: The operator has requested that DB2 quiesce. The user should promptly finish the current task and terminate the DSN session so that this can take place. This message may be followed by message DSNE127I.

This message is issued by the following CSECT: DSNECP00

System Action: No new users will be permitted to initiate DB2 sessions. Current users will be permitted to work until they terminate their connections to DB2.

User Response: End your DSN session as soon as possible.

DSNE127I THE DB2 OPERATOR IS STOPPING THE SUBSYSTEM. DSN IS TERMINATING

Explanation: The operator has requested that DB2 terminate.

This message is issued by the following CSECT: DSNECP00

System Action: DB2 will shut down, interrupting user activities as necessary. DSN will terminate immediately and return the user to TSO.

User Response: Reinitiate your session when DB2 returns.

DSNE128I DB2 IS ABNORMALLY ENDING. DSN IS TERMINATING

Explanation: DB2 has encountered a problem from which it cannot recover.

This message is issued by the following CSECT: DSNECP00

System Action: DB2 is abending. DSN terminates immediately and returns the user to TSO.

User Response: Reinitiate your session when DB2 returns.

DSNE130I MAXIMUM NUMBER OF DB2 USERS REACHED. YOUR RETRY COUNT IS ZERO

Explanation: The number of concurrent connections to DB2 is restricted. The number is specified in the installation parameters in member DSN6SYSP. For TSO foreground, see parameter IDFORE. For background jobs, see parameter IDBACK. The DSN request has been denied, because the current number of DB2 connections in the system has reached the installation-specified limit.

This message is issued by the following CSECT: DSNECP12

System Action: Control returns to TSO.

User Response: Resubmit the DSN command when activity using DB2 has diminished. If still unsuccessful, see the system programmer about the installation parameters.

DSNE131I MAXIMUM NUMBER OF DB2 USERS REACHED. WILL RETRY nnn MORE TIMES

Explanation: The number of concurrent connections to DB2 is restricted. The number is specified in the installation parameters in member DSN6SYSP. For TSO foreground, see parameter IDFORE. For background jobs, see parameter IDBACK. The DSN request was denied because the current number of DB2 connections in the system reached the installation specified limit.

The DSN connection to DB2 is attempted 'nnn' more times. The number of retries is determined by the RETRY parameter on the DSN command. For more information, refer to *Command Reference*.

This message is issued every 30 seconds (and each time 'nnn' is decreased by 1) until the connection is made or until 'nnn' is decreased to zero.

This message is issued by the following CSECT: DSNECP12

System Action: DSN repeats the connection attempt until the connection is made or the retry count is decreased to 0.

User Response: If all retry attempts fail, resubmit the DSN command when DB2 activity diminishes. If still unsuccessful, see the system programmer about the installation parameters.

DSNE132I DB2 IS OPERATING IN RESTRICTED ACCESS MODE. MAINTENANCE PERSONNEL ONLY

Explanation: DB2 is not available for normal operation. It is only available to service personnel.

This message is issued by the following CSECT: DSNECP12.

System Action: Control returns to the caller. Your request was not processed. The DSN command processor was unable to connect to DB2.

User Response: Wait until DB2 is available for general use, then resubmit your request.

DSNE133E csect-name RELEASE LEVELS NOT COMPATIBLE. DSN=release_level, DB2=release_level

Explanation: The DSN command processor, perhaps running under the control of DB2I, has detected a release level incompatibility between itself and DB2. The current *release_level* of the DSN command processor code and the DB2 subsystem load modules is indicated as a string of three numeric characters as follows:

- Version
- Release
- Modification level

System Action: The DSN command processor terminates.

User Response: Check that your method of invoking DSN or DB2I allocates the correct libraries for DSN. If you used JCL or a TSO logon procedure to execute DSN code, check your JOBLIB and STEPLIB allocations. If you used a CLIST to execute DSN, insure that you obtained the correct version of the DSN code. See your system programmer if you invoke DSN using procedures supplied by your system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: If you are unable to determine the problem, you can trace DSN execution through DB2I or the DSN command processor.

Problem Determination: Insure that coexistence is supported on both release levels (DSN and DB2). If coexistence is supported, insure that the lower level release has the correct SPE level code support that is required to coexist with the current higher level release.

For more information about coexistence and SPEs, refer to the program directory or preventative service planning (PSP) updates.

DSNE231A ONE NAME IS REQUIRED TO FREE A PLAN OR A PACKAGE

Explanation: The user has attempted to use the FREE PLAN or PACKAGE panel without specifying a plan or package name.

This message is issued by the following CSECTs: DSNEBP09, DSNEBP18

System Action: The TSO attachment facility is ready for more input.

User Response: Enter the name of a plan or package, or (*) to indicate 'all'.

DSNE232A CONNECTION NAME REQUIRES ENABLE/DISABLE OF CONNECTION TYPE

Explanation: The user indicated that specific connection names were to be specified for ENABLE or DISABLE, but the associated connection type field was not updated. The ENABLE or DISABLE of connection names requires the corresponding connection type to also be specified for ENABLE or DISABLE.

This message is issued by the following CSECT: DSNEBP13

System Action: The TSO attachment facility is ready for more input.

User Response: Enter Y (Yes) on the connection type for the associated connection names.

DSNE233A MEMBER NAME MUST NOT BE SPECIFIED MORE THAN ONCE

Explanation: The LIBRARY field containing the data set name, also contains a member name.

This message is issued by the following CSECTs: DSNEBP02, DSNEBP07

System Action: The TSO attachment facility is ready for more input.

User Response: The member name must be specified only once, and must be specified on the MEMBER field.

DSNE234A EITHER DBRM MEMBER OR INCLUDE PACKAGE LIST MUST BE SPECIFIED

Explanation: The BIND PLAN subcommand requires either a DBRM member name or a package list as input, neither was specified.

This message is issued by the following CSECT: DSNEBP02

System Action: The TSO attachment facility is ready for more input.

User Response: Enter a DBRM member name(s), or specify that a package list is to be included. Both options are also allowed.

DSNE235A *plan/package* NAME IS A DUPLICATE OF PRIMARY *plan/package* NAME

Explanation: In addition to the primary 'plan' or 'package' name specified on the REBIND or FREE subcommand panel, the user also specified that additional plans or packages were to be included in the list. The primary 'plan' or 'package' name was again specified to be included in the list.

This message is issued by the following CSECTs: DSNEBP04, DSNEBP15

System Action: The duplicate of the primary 'plan' or 'package' name is automatically deleted from the list to avoid errors during subcommand processing. The TSO attachment facility is ready for more input.

User Response: Complete the list of additional plans or packages.

DSNE236A SPECIFY A CONNECTION TYPE TO ENABLE OR DISABLE

Explanation: The user indicated that individual connection types were to be ENABLED or DISABLED, but no specific connection types were specified.

This message is issued by the following CSECT: DSNEBP13

System Action: The TSO attachment facility is ready for more input.

User Response: Enter Y (YES) for each individual connection type to ENABLE, or DISABLE.

DSNE237A SPECIFY ENABLE ALL OR SPECIFIC CONNECTION TYPES

Explanation: In addition to requesting that all connection types be enabled, the user also requested that specific connection types be enabled. The enable of all connection types includes the enable of specific connection types.

This message is issued by the following CSECT: DSNEBP13

System Action: The TSO attachment facility is ready for more input.

User Response: Specify specific connection types to be enabled, or specify that all connection types are to be enabled.

DSNE240A ISPF RETURNED AN UNEXPECTED CODE WHILE CLOSING A TABLE

Explanation: An ISPF error return code was encountered when attempting to perform a TBCLOSE for an ISPF table while processing the current subcommand panel.

This message is issued by the following CSECTs:

DSNEBC05 DSNEBC09 DSNEBC13

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Verify that the ISPF table library allocated to the DSNETBLS DD statement has sufficient space or directory entries available. Also refer to the ISPF error log for additional diagnostic information.

DSNE241A INTERNAL PROCEDURE WAS PASSED AN INVALID NUMBER OF ARGUMENTS

Explanation: A TSO Interpreter error was encountered while executing a subroutine during the processing of the current subcommand.

This message is issued by the following CSECTs:

DSNEBC05 DSNEBC09 DSNEBC13

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Notify the IBM support center that an error was encountered in the TSO SYSCALL instruction.

Problem Determination: The TSO SYSCALL instruction is not passing all the parameters to a subroutine defined within the CLIST.

DSNE242A ISPF RETURNED AN UNEXPECTED CODE WHILE SETTING SEARCH ARGUMENTS

Explanation: An ISPF table for the current function does not contain the expected column or table format.

This message is issued by the following CSECTs:

DSNEBC05 DSNEBC09 DSNEBC13

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Delete the ISPF table in error. The table is recreated automatically during the next invocation of the DB2I function.

Problem Determination: The format of the ISPF table was changed since the last successful use of the table. Refer to the DB2I ISPF table library allocated to the DSNETBLS DD statement, and examine the ISPF error log for additional diagnostic information.

DSNE243A ISPF RETURNED AN UNEXPECTED CODE DURING A TABLE DISPLAY

Explanation: An ISPF error was encountered when attempting to display a DB2I table panel.

This message is issued by the following CSECTs:

DSNEBC05 DSNEBC09 DSNEBC13

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Insure that the DB2I panel and panel library are established correctly. If the format of both is correct, then use ISPF option 7.2 to test the panel for additional errors.

Examine the ISPF error log for additional error information and determine the name of the panel to be displayed.

DSNE244A CANNOT SAVE CREATED TABLE, VERIFY SPACE IN TABLE LIBRARY

Explanation: An ISPF TBSAVE function returned with a condition code greater than zero.

This message is issued by the following CSECTs:

DSNEBC05 DSNEBC09 DSNEBC13

System Action: TSO processing for the current subcommand is terminated.

User Response: Notify the system programmer.

System Programmer Response: Verify that the ISPF table library allocated to the DSNETBLS DD statement has sufficient space and directory entries available. Also refer to the ISPF error log for additional diagnostic information.

DSNE245A ISPF RETURNED AN UNEXPECTED CODE WHILE ADDING A ROW TO A TABLE

Explanation: An ISPF TBADD function returned with a condition code greater than four.

This message is issued by the following CSECTs:

DSNEBC05 DSNEBC09 DSNEBC13

System Action: The TSO attachment facility is ready for more input.

User Response: Enter the DB2I CANCEL command, and notify the system programmer.

System Programmer Response: Verify that the user has enough memory to perform ISPF functions. Also refer to the ISPF error log for additional diagnostic information.

DSNE246A ISPF RETURNED AN UNEXPECTED CODE WHILE DELETING A ROW

Explanation: An ISPF TBDELETE function returned with a condition code greater than zero.

This message is issued by the following CSECTs:

DSNEBC05 DSNEBC09 DSNEBC13

System Action: TSO processing for the current subcommand is terminated.

User Response: Enter the DB2I CANCEL command, and notify the system programmer.

System Programmer Response: Verify that the user has enough memory to perform ISPF functions. Also refer to the ISPF error log for additional diagnostic information.

DSNE247A ISPF RETURNED AN UNEXPECTED CODE WHILE UPDATING A ROW

Explanation: An ISPF TBPUR function returned with a condition code greater than four.

This message is issued by the following CSECTs:

DSNEBC05 DSNEBC09 DSNEBC13

System Action: TSO processing for the current subcommand is terminated.

User Response: Enter the DB2I CANCEL command, and notify the system programmer.

System Programmer Response: Verify that the user has enough memory to perform ISPF functions. Recreate the user actions that lead to the failure. Also refer to the ISPF error log for additional diagnostic information.

DSNE248A COMMAND ENTERED CONTAINS INVALID CHARACTERS, RESPECIFY

Explanation: The command entered at the command line contains an invalid character, the command must be reentered.

This message is issued by the following CSECTs:

DSNEBP04 DSNEBP05 DSNEBP12 DSNEBP13
DSNEBP14 DSNEBP15 DSNEBP16 DSNEBP17

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the invalid command entry.

DSNE250A PLEASE ENTER THE COMMAND AT THE LINE WITH THE PLAN/PACKAGE NAME

Explanation: SELECT or RESET commands must be entered on the line where the PLAN/PACKAGE name is shown. This line contains the name of the PLAN/PACKAGE, while the secondary line(s) do not.

This message is issued by the following CSECT: DSNEBP16

System Action: The line command is rejected. The TSO attachment facility is ready for more input.

User Response: Reenter the line command on the primary PLAN/PACKAGE line(s).

DSNE252A JCL WAS NOT CREATED, ERROR *errcode* WHILE DOING *function_name* FUNCTION

Explanation: Error code '*errcode*' was received while doing a function '*function_name*', the JCL was not created.

This message is issued by the following CSECTs: DSNEPC01, DSNETC01

Severity: 20

System Action: Refer to *ISPF Version 4 for MVS Dialog Management Guide* for the cause of this error.

User Response: Contact your systems programmer.

Problem Determination: Use the return code/function combination to find the causes for the problem in *ISPF Version 4 for MVS Dialog Management Guide* and correct the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 21.

DSNE283A THE , (COMMA) OPTION IS INCOMPATIBLE WITH THE *hostlang* LANGUAGE

Explanation: The user tried to select the '*hostlang*' APPLICATION LANGUAGE and the comma option of the DECIMAL POINT field on the DB2I defaults panel. This combination is not supported.

This message is issued by the following CSECT: DSNEOP01

System Action: The defaults panel is displayed again.

User Response: Either change the APPLICATION LANGUAGE field or the DECIMAL POINT field. If you need the C (C/370 Compiler), then the DECIMAL POINT field must contain a decimal point (.).

DSNE288A YOU CANNOT SPECIFY (RUN)=YES WITH CICS OR IMS

Explanation: Application programs that make CICS or IMS calls cannot be run from the TSO environment. They can, however, be precompiled, bound, compiled, and linked under TSO. The user should specify N on the RUN panel when preparing a CICS or IMS application.

This message is issued by the following CSECT: DSNEPP01

System Action: The system is waiting for new input to the panel.

User Response: Change the RUN option to N.

DSNE291A ALL DB2 COMMANDS BEGIN WITH A DASH

Explanation: The user omitted the DB2 command recognition character that must precede all DB2 commands.

This message is issued by the following CSECT: DSNEKP01

System Action: The DB2 commands panel is displayed again so the user can resubmit the command.

User Response: Add the DB2 command recognition character, and reenter the command.

DSNE292I DATA SET *data-set-name* NOW CONTAINS YOUR JCL

Explanation: DB2I has just created some JCL for you. The JCL now resides in data set '*data-set-name*'. You can now edit this data, if desired. The TSO SUBMIT command will start the job running in background.

This message is issued by the following CSECTs:

DSNEUC01 DSNEPC01 DSNETC01

System Action: The system is waiting for your next request.

User Response: You can start another DB2I job or leave the panel.

DSNE293A MEMBER NAME IS REQUIRED. YOUR PROGRAM MUST BE IN A PDS

Explanation: The user either has attempted to run a program that is not in a partitioned data set or has forgotten to specify a member name.

This message is issued by the following CSECT: DSNERC01

System Action: The RUN panel will be displayed so that the user can specify a member name and try the run again.

User Response: Specify a member name, and rerun the program.

DSNE294I SYSTEM RETCODE=*hex-code* USER OR DSN RETCODE=*decimal-code*

Explanation: A DB2I function has just completed. The return codes for that function are returned in this message. The variable '*hex-code*' is a 3-digit hexadecimal number; the variable '*decimal-code*' is a 3-digit decimal number. Refer to the appropriate MVS publication for explanations of the return codes.

This message is issued by the following CSECTs:

DSNEBC02 DSNEBC03 DSNEBC04 DSNEDC01
DSNEKC01 DSNERC01 DSNEUC01

System Action: DB2I is ready for another execution cycle unless other messages appeared indicating that DB2 is unavailable.

User Response: You may have to change input parameters to correct unsatisfactory completion codes.

DSNE295A YOU CANNOT DISPLAY AND RESTART A UTILITY AT THE SAME TIME

Explanation: You have set options on the DB2I Utilities panel that call for conflicting actions. You can either DISPLAY the status of a utility, or you can RESTART a utility, but you cannot do both.

This message is issued by the following CSECT: DSNEUP01

System Action: The system is waiting for new input to the panel.

User Response: Either change the RESTART option to NO, or select a different FUNCTION.

DSNE296A YOU CANNOT TERMINATE AND RESTART A UTILITY AT THE SAME TIME

Explanation: You have set conflicting options on the DB2 Utilities panel. You can either TERMINATE a utility, or you can RESTART a utility, but you cannot do both.

This message is issued by the following CSECT: DSNEUP01

System Action: The system is waiting for new input to the panel.

User Response: Either change the RESTART option to NO, or select a different FUNCTION.

DSNE297A ENTER DATA SET NAME: COPYDSN OR RCPYDSN1

Explanation: You have not specified a data set name for the COPY utility. A data set name for the local/current site (COPYDSN), and/or the recovery site (RCPYDSN1) is required.

This message is issued by the following CSECT: DSNEUP02

System Action: The system is waiting for new input to the panel.

User Response: Enter a data set name for COPYDSN, and/or RCPYDSN1.

DSNE298A ERROR DURING EDIT: CLIST *data set name*

Explanation: Errors were encountered while attempting to change the online book data set names in the DB2 CLIST member DSNEMC01. No data set names were changed.

System Action: The system is waiting for new input to the panel.

User Response: Ensure that the CLIST data set name is correct and contains the DSNEMC01 CLIST member to be changed. This CLIST data set must also be available to the TSO user ID in WRITE mode. This error will continue to be displayed on the panel until the error is resolved or the user exits the panel (END).

System Programmer Response: If you are unable to determine the problem, you can trace the DB2 CLIST execution while displaying this panel.

Problem Determination: Examine the CLIST trace output for any TSO/ISPF nonzero return codes encountered during CLIST execution.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE340I INTERNAL ERROR – ILLEGAL TYPE IN MODULE *module-name*

Explanation: An internal DB2 problem has occurred. The named module has detected a nonexistent SQLTYPE.

This message is issued by the following CSECTs: DSNESM30, DSNESM32

User Response: Collect the SPUFI trace and ISPF log, and notify either the system programmer or the database administrator.

You may have to rerun the failing job after you have turned on trace. This will enable you to send trace messages to the ISPF log.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE351A EDIT PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified an edit option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI invokes the ISPF editor to allow the user to edit the input data set.

This message is issued by the following CSECT: DSNEBP01

System Action: SPUFI will wait until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE352A EXECUTE PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified an execute option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI executes the SQL statements in the user input data set.

This message is issued by the following CSECT: DSNEBP01

System Action: SPUFI waits until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE353A BROWSE PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified a browse option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI invokes ISPF BROWSE to allow the user to browse the output data set.

This message is issued by the following CSECT: DSNEBP01

System Action: SPUFI will wait until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE354A AUTOCOMMIT PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified an AUTOCOMMIT option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI automatically commits all the changes to the database subsystem. This was encountered as a result of executing the user's SQL statement(s). The commit is done at the end of the processing of an input data set, if it is requested and if there has been no SQL execution error.

This message is issued by the following CSECT: DSNEBP01

System Action: SPUFI waits until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE355A CHANGE DEFAULTS PROCESSING OPTION MUST BE Y (YES) OR N (NO)

Explanation: The user specified a change-default option other than 'YES', 'NO', or the abbreviation 'Y' or 'N'. A valid user response determines whether SPUFI displays the current-session SPUFI defaults and allows the user to change the defaults.

This message is issued by the following CSECT: DSNESP01

System Action: SPUFI waits until the user enters a valid response.

User Response: Type in a 'Y' or an 'N', and press 'ENTER'.

DSNE359A OUTPUT DATA SET NAME REQUIRED FOR EXECUTE OR BROWSE

Explanation: The user did not specify the name of the output data set.

This message is issued by the following CSECT: DSNESP01

System Action: SPUFI waits until the user specifies an output data set.

User Response: Type in the correct entry, and press 'ENTER'.

DSNE360A THE OUTPUT DATA SET MUST RESIDE ON DASD

Explanation: The user has attempted to send the output of SPUFI to a SYSOUT data set. He must enter a generic device class that contains only DASD devices.

This message is issued by the following CSECT: DSNESP01

System Action: SPUFI waits until the user specifies a valid output device class.

User Response: Type in the correct entry, and press 'ENTER'.

DSNE361I SPUFI PROCESSING COMPLETE

Explanation: This informational message is displayed after SPUFI successfully created the output data set. If errors are encountered before the completion of output data set processing, or during the subsequent BROWSE OUTPUT option for this data set, this message is replaced by either SPUFI or TSO/ISPF error messages.

This message is issued by the following CSECT: DSNESM00

System Action: The system waits for the next user input.

User Response: At this point you can change the SPUFI panel variable settings to initiate a new SPUFI request, or you can exit SPUFI.

DSNE363A ONLY RR (REPEATABLE READ) OR CS (CURSOR STABILITY) ALLOWED

Explanation: The user has entered an invalid isolation level. This value must be either RR or CS. 'Isolation level' here refers to the degree to which the SPUFI user wants to isolate SQL execution from the effects of other concurrently executing DB2 applications.

If the repeatable read (RR) level is specified and the

AUTOCOMMIT option is 'YES', other applications can modify the selected database values as soon as the SPUFI EXECUTE phase is completed and as soon as the automatic COMMIT (or ROLLBACK, if an error was encountered,) operation is performed. Therefore, it is possible that the retrieved data being browsed by the user has already been modified by another application.

If the RR level is specified and the AUTOCOMMIT option is 'NO', no other DB2 application executing concurrently can change any of the selected database values until the SPUFI user issues either a COMMIT or a ROLLBACK. Therefore, other applications might be in a normal wait state while the SPUFI user is browsing the output data set.

If the cursor stability (CS) level is specified, it does not make any difference whether the AUTOCOMMIT option is 'YES' or 'NO'. Other concurrently executing DB2 applications can change the selected database values as soon as the SELECT has completed.

This message is issued by the following CSECT: DSNESP02

System Action: SPUFI waits until the user specifies either 'RR' or 'CS'.

User Response: Type in the correct entry, and press 'ENTER'.

DSNE366A ONLY THE LISTED RECFM TYPES ARE ALLOWED

Explanation: The user has entered an invalid record format for the output data set.

This message is issued by the following CSECT: DSNESP02

System Action: The system waits until the user enters one of the allowed RECFM types.

User Response: Enter a RECFM of V, VB, VBA, F, FB, or FBA.

DSNE367A ACTION MUST BE C (COMMIT) OR R (ROLLBACK) OR D (DEFER)

Explanation: This message requests the user to make a commit action decision.

This message is issued by the following CSECT: DSNESP03

User Response: To commit all the changes made since the last commit point, enter a 'C'. To undo all the changes that have been made since the last commit point, enter an 'R'. To defer the decision, enter a blank.

DSNE368A YES OR NO MUST BE ENTERED FOR EACH PROCESSING OPTION

Explanation: One of the processing options was left blank or set to blank by the user.

This message is issued by the following CSECT: DSNESP01

User Response: Enter 'YES' or 'NO' for each processing option.

DSNE370A INPUT DATA SET COULD NOT BE OPENED

Explanation: The input data set could not be opened because of invalid data set attributes. The logical record length (LRECL) of the input data set must be 80K. The record format (RECFM) must be either F or FB. The input data set may be either sequential or partitioned.

This message is issued by the following CSECT: DSNESM55

User Response: Specify an input data set having valid attributes.

DSNE371A OUTPUT DATA SET COULD NOT BE OPENED

Explanation: The output data set could not be opened because of invalid data set attributes. The logical record length (LRECL) must be at least 80KB and less than 32KB. The record format (RECFM) must be F, FB, FBA, V, VB, or VBA. The output data set must be sequential.

This message is issued by the following CSECT: DSNESM55

User Response: Either specify an output data set having valid attributes, or enter correct attributes for this data set.

DSNE372A OUTPUT DATA SET MUST BE SEQUENTIAL

Explanation: The user has requested that a nonsequential output data set contain the output from execution of SQL statements.

This message is issued by the following CSECT: DSNESM55

User Response: Enter the data-set-name of a sequential data set for the output data set.

DSNE374A OUTPUT DATA SET MUST BE SEQUENTIAL

Explanation: The output data set is of unrecognized organization. It must be sequential.

This message is issued by the following CSECT: DSNESM55

System Action: Processing does not begin until the panel entries are correct and the user presses 'ENTER'.

User Response: The output data set must be sequential. Enter a sequential data-set-name (no member) in the output data set field.

DSNE375A ACCESS TO INPUT DATA SET NOT AUTHORIZED

Explanation: A local installation-supplied exit has rejected access to the input data set specified by the user.

This message is issued by the following CSECT: DSNESM55

User Response: Either specify the name of a data set for which authorization will be allowed, or arrange to authorize the original data-set-name. Resubmit the request.

DSNE376A ACCESS TO OUTPUT DATA SET NOT AUTHORIZED

Explanation: A local installation-supplied exit has rejected access to the output data set.

This message is issued by the following CSECT: DSNESM55

User Response: Either specify the name of a data set for which authorization will be allowed, or arrange to authorize the original data-set-name. Resubmit the request.

DSNE377A INPUT DATA SET RECFM MUST BE F OR FB WITH LRECL 79 OR 80

Explanation: The user specified an input data set that does not have the required attributes (F or FB with LRECL 79 or 80).

Note: If the input data set has an LRECL of 79, SPUFI assumes the data set was exported by QMF. Therefore, it is recommended that you should not use an LRECL of 79 for a data set that is not exported from QMF.

This message is issued by the following CSECT: DSNESM55

User Response: Correct the input data set attributes, and try again.

DSNE378A ASA CONTROL CHARACTER NOT ALLOWED ON INPUT DATA SET RECFM

Explanation: The user attempted to use an input data set containing forms control characters or machine control characters. These characters are not allowed on the input data set.

This message is issued by the following CSECT: DSNESM55

User Response: Remove the forms control characters or machine control characters from the input data set, and try again.

DSNE379A text from DYNALLOC

Explanation: An attempt to allocate a data set has failed. This message contains the secondary explanation for the failure.

This message is issued by the following CSECT: DSNESM55

User Response: Correct the condition, and resubmit the subcommand.

**DSNE381A UNEXPECTED ALLOCATION RETURN CODE
return-code, reason-code**

Explanation: An unexpected return code from SVC 99 was received. The return code received is the DYNALLOC (SVC 99) return code. Refer to the appropriate MVS publication for explanations of the return and reason codes.

This message is issued by the following CSECT: DSNESM55

User Response: Correct the condition, and resubmit the subcommand.

**DSNE383A INVALID OUTPUT DATA SET RECORD
FORMAT. OPEN RETURN CODE rcode**

Explanation: The data set format was invalid. Acceptable record formats are: F, FB, FBA, V, VB, or VBA.

This message is issued by the following CSECT: DSNESM55

User Response: Enter a valid value in the record format field.

**DSNE384A UNEXPECTED DEALLOCATION RETURN
CODE return-code, reason-code**

Explanation: A deallocation request has returned an unexpected return and reason code.

This message is issued by the following CSECT: DSNESM55

User Response: Refer to the appropriate MVS publication for explanations of the return and reason codes.

**DSNE385A ENTER MEMBER NAME. INPUT DATA SET IS
PARTITIONED**

Explanation: The input data set is partitioned, and the user did not enter the member name on the SPUFI main menu.

This message is issued by the following CSECT: DSNESM55

System Action: Processing does not begin until the panel entries are correct. If any of the processing options are changed, this message is ignored, and processing will proceed according to the new settings.

User Response: Enter the member name.

**DSNE386A MEMBER member-name NOT PRESENT IN
SPECIFIED INPUT DATA SET**

Explanation: The named member is not in the input data set.

This message is issued by the following CSECT: DSNESM55

System Action: Processing does not begin until the panel entries are correct.

User Response: Enter a correct member name or a correct data-set-name.

**DSNE387I DSNTIAR ERROR. RETURN CODE = return-
code**

Explanation: An internal DB2 error has occurred. DSNTIAR attempted to format a message to explain a nonzero SQL code, but the attempt failed.

This message is issued by the following CSECT: DSNESM40

User Response: Notify the system programmer.

System Programmer Response: Print the ISPF log, and collect a dump of the TSO address space. Refer to Section 3 of *Application Programming and SQL Guide* for failure analysis procedures.

**DSNE388A INPUT DATA SET MUST BE SEQUENTIAL OR
PARTITIONED**

Explanation: The input data set organization is not recognized.

This message is issued by the following CSECT: DSNESM55

System Action: Processing does not begin until the panel entries are correct.

User Response: Enter a data-set-name with sequential or partitioned organization. It may be necessary to allocate a sequential or partitioned data set.

**DSNE389A A MEMBER HAS BEEN SPECIFIED FOR A
SEQUENTIAL DATA SET**

Explanation: The user has specified a member as input to SPUFI. However, the input data set specified is sequential.

This message is issued by the following CSECT: DSNESM55

System Action: Processing does not begin until the panel entries are correct.

User Response: Enter the data-set-name without attempting to specify a member.

**DSNE390A THE OUTPUT DATA SET ATTRIBUTES ARE
INCONSISTENT**

Explanation: This message indicates that the user made one of three possible errors in specifying block size and logical record length (LRECL):

- The user specified a record format (RECFM) of F, but the block size is not equal to the logical record length (LRECL).
- The user specified a record format (RECFM) of F, FB, or FBA, but block size is not evenly divisible by logical record length (LRECL).
- The user specified a record format (RECFM) of VB, but the block size is less than logical record length (LRECL) + 4. The user must allow 4 bytes for the block header.

This message is issued by the following CSECT: DSNESM55

User Response: Specify logical record length (LRECL) and block size appropriately on the DSNESP02 panel.

DSNE391I FREEMAIN ERROR IN MODULE module-name

Explanation: SPUFI encountered a FREEMAIN error in the specified module.

This message is issued by the following CSECT: DSNESM90

System Action: This message is logged in the ISPF log data set. No abend occurs.

User Response: Notify the system programmer or system administrator.

System Programmer Response: Print the ISPF log, and collect a dump of the TSO address space. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE392I GETMAIN ERROR IN MODULE module-name

Explanation: SPUFI encountered a GETMAIN error in the specified module.

This message is issued by the following CSECT: DSNESM00

System Action: This message is logged in the ISPF log data set. User abend X'00C50003' is issued.

User Response: Notify the system programmer or system administrator.

System Programmer Response: Ensure that enough storage is allocated to the TSO user.

**DSNE393I SPF VDELETE ERROR IN MODULE
DSNESM90. ERROR CODE = flag**

Explanation: An internal SPUFI error has occurred. CSECT DSNESM90 tried to delete an ISPF dialog variable that was not previously defined.

This message is issued by the following CSECT: DSNESM90

System Action: This message is logged in the ISPF log data set. No abend is issued. However, if the problem persists, notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Record the error code 'flag'. It has no user significance, but it can assist the IBM Support Center in resolving the problem.

**DSNE395I UNEXPECTED RETURN CODE FROM SPF
SERVICE**

Explanation: A return code of 4 from ISPF DISPLAY or a return code of 8 from the ISPF editor was encountered.

This message is issued by the following CSECT: DSNESM00

System Action: The message is displayed on the SPUFI panel and logged in the ISPF log data set. No user abend is issued.

User Response: Notify the system programmer.

System Programmer Response: If a new release of ISPF is used, determine whether the above return codes are now assigned meaning by ISPF.

Problem Determination: This message may be issued if a previously unassigned (by ISPF) return code from the ISPF DISPLAY or EDIT function is encountered. If a new release of ISPF is used, determine whether the above return codes are now assigned meaning by ISPF.

**DSNE396A YOU CANNOT SPECIFY DEFER WHEN
LEAVING SPUFI**

Explanation: You have attempted to leave SPUFI with outstanding database changes not yet committed or rolled back. You can't leave SPUFI unless a decision has been made to commit or rollback.

This message is issued by the following CSECT: DSNESM00

System Action: The system is waiting for new input to the panel.

User Response: Specify COMMIT or ROLLBACK.

DSNE415A csect-name TYPE IS DATE

Explanation: This is a SPUFI trace message. SPUFI has looked in the SQLTYPE field of the SQLDA and detected a data type of DATE.

DSNE416A csect-name TYPE IS TIME

Explanation: This is a SPUFI trace message. SPUFI has looked in the SQLTYPE field of the SQLDA and detected a data type of TIME.

DSNE417A csect-name TYPE IS TIMESTAMP

Explanation: This is a SPUFI trace message. SPUFI has looked in the SQLTYPE field of the SQLDA and detected a data type of TIMESTAMP.

**DSNE457I csect-name ARITHMETIC ERROR IN THE
CURRENT ROW AND COLUMN**

Explanation: This is a SPUFI trace message. SPUFI has looked in the SQLDA and detected an arithmetic error. The indicator variable associated with this value contains -2.

**DSNE601I SQL STATEMENTS ASSUMED TO BE
BETWEEN COLUMNS nn AND nn**

Explanation: This message indicates which record columns in the input data set are scanned for SQL statements. For data sets of type COBOL, columns 8 through 72 are scanned. For STANDARD data set types, if the LRECL is 79 then columns 1 through 71 are scanned, and if the LRECL is 80 then columns 1 through 72 are scanned.

This message is issued by the following CSECT: DSNESM41

System Action: This message is written to the SPUFI output data set along with other summary messages.

**DSNE603E INPUT STATEMENT HAS UNBALANCED
APOSTROPHES**

Explanation: An opening apostrophe was detected in an input record, but the end of data set was reached before a closing apostrophe was encountered.

This message is issued by the following CSECT: DSNESM21

System Action: SPUFI processing stops. Correct the error, and start again.

User Response: A closing apostrophe was probably omitted from a literal value. Add the missing apostrophe, and execute the input file again.

**DSNE604E THE SQL STATEMENT EXCEEDS THE
MAXIMUM ALLOWED LENGTH**

Explanation: This message indicates that the preceding SQL statement in the output data set exceeds the maximum length allowed. An SQL statement may span up to a maximum of 455 input records.

This message is issued by the following CSECT: DSNESM21

System Action: SPUFI processing stops. Correct the error, and start again.

User Response: Edit the SQL statement in question so that it resides on fewer input records.

DSNE605E THE INPUT DATA SET IS EMPTY

Explanation: The user has specified an input data set that does not contain any valid SQL statements.

This message is issued by the following CSECT: DSNESM21

System Action: SPUFI processing stops. Correct the error, and start again.

User Response: Edit SQL statements into the specified data set, or specify another input data set that contains valid SQL statements.

DSNE606E INVALID USE OF SEMI-COLON DETECTED

Explanation: A semicolon has been used improperly in an SQL input statement. Either two successive semicolons were encountered, or a series of blanks followed by a semicolon was detected. The proper use of the semicolon is to delimit the end of a valid SQL statement.

This message is issued by the following CSECT: DSNESM21

System Action: SPUFI processing stops. Correct the error, and start again.

User Response: Remove the extraneous semicolon from the input data set.

DSNE607E PREVIOUS INPUT RECORD HAS UNBALANCED SO/SI CHARACTERS

Explanation: A shift out (SO) character was detected in the previous input record with no corresponding shift in (SI) character in the record. The SO/SI characters delimit a DBCS string in the SPUFI input data set. SPUFI requires that SO/SI characters be paired within an input record.

This message is issued by the following CSECT: DSNESM21

System Action: SPUFI processing stops.

User Response: A closing SI character was probably omitted from a literal value. Add the missing SI character, and re-execute the input file.

DSNE609E INPUT STATEMENT HAS UNBALANCED QUOTES

Explanation: An opening quote (") was detected in an input record, but a corresponding quote was not found at the end. Two sets of quotes are used to delimit a statement.

This message is issued by the following CSECT: DSNESM21

System Action: SPUFI processing stops.

User Response: A closing quote was probably omitted from a literal value. Add the missing quote, and execute the input file again.

DSNE610I NUMBER OF ROWS DISPLAYED IS nn

Explanation: Execution of an SQL SELECT statement causes one or more rows of data to be displayed. This message appears in the output data set following the returned data for a SELECT. It gives a count, 'nn', of the number of rows displayed.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

DSNE611I COLUMN HEADER FOR COLUMN NUMBER nn WAS TRUNCATED

Explanation: An SQL SELECT statement was executed, but the specified column name, identified by 'nn' in the message, was truncated. This truncation occurred either because the column name was longer than the remaining record width or because the name was longer than the user-specified maximum field length.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: If the truncation is caused by insufficient record width, use a larger LRECL for the output data set or specify fewer data columns to be returned on the SELECT statement.

If the truncation is caused by the user-specified maximum field length setting, use a larger value for this setting.

DSNE612I DATA FOR COLUMN HEADER name COLUMN NUMBER nn WAS TRUNCATED

Explanation: An SQL SELECT statement was executed, but data for the specified column name, identified by 'nn' in the message, was truncated. This truncation occurred either because the data was longer than the remaining record width or because the data was longer than the user-specified maximum field length.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: If the truncation is because of insufficient record width, use a larger LRECL for the output data set or specify fewer data columns be returned on the SELECT statement.

If the truncation is because of the user-specified maximum field length setting, use a larger value for this setting.

DSNE613I OUTPUT LRECL IS TOO SMALL TO DISPLAY THE FOLLOWING COLUMNS:

Explanation: An SQL SELECT statement was executed, but the logical record length of the output data set was not large enough to display the column names and data values of all returned columns. The columns specified following this message were not displayed because of insufficient remaining record width.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: This condition can be avoided by using a larger LRECL for the output data set or by specifying that fewer data columns be returned on the SELECT statement.

DSNE614I AUTOCOMMIT IS NO, NO CHANGES COMMITTED

Explanation: The user delayed committing or rolling back changes made during execution of the input file until later in the session. This is done by specifying an AUTOCOMMIT option of 'NO'.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: Commit or roll back these changes before ending the session.

DSNE615I NUMBER OF ROWS AFFECTED IS nn

Explanation: This message is written to the output data set following execution of an SQL UPDATE, INSERT, or DELETE statement. 'nn' in the message is a count of the number of rows that were modified as a result of executing the UPDATE, INSERT, or DELETE statement.

Note: In the case of a mass delete of a table in a segmented table space where DB2 does not access nor count the individual rows, this message will not be displayed.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

DSNE616I STATEMENT EXECUTION WAS SUCCESSFUL, SQLCODE IS number

Explanation: This message is written to the output data set following the successful execution of an SQL statement from the input data set. 'number' specifies the SQL return code for the statement. These return codes are listed in Section 2. SQL Return Codes.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

DSNE617I COMMIT PERFORMED, SQLCODE IS number

Explanation: When an input file is executed successfully and the user specified an AUTOCOMMIT option of 'YES', this message is written to the output data set to indicate the status of the COMMIT that was performed. 'number' specifies the SQL return code for the COMMIT. These return codes are listed in "Section 2. SQL Return Codes" on page 2-1.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

DSNE618I ROLLBACK PERFORMED, SQLCODE IS number

Explanation: When an error is encountered while executing a SPUFI input file, and the user specified an AUTOCOMMIT option of 'YES', this message will be written to the output data set to indicate the status of the ROLLBACK that was performed. 'number' specifies the SQL return code for the statement. These return codes are listed in "Section 2. SQL Return Codes" on page 2-1.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

DSNE620I NUMBER OF SQL STATEMENTS PROCESSED IS nn

Explanation: This message is written to the output data set after processing all SQL statements in the current input data set. The term 'nn' is a count of the number of SQL statements processed.

This message is issued by the following CSECT: DSNESM41

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

DSNE621I NUMBER OF INPUT RECORDS READ IS nn

Explanation: This message is written to the output data set after processing all SQL statements in the current input data set. The term 'nn' is a count of the total number of records read from the input data set.

This message is issued by the following CSECT: DSNESM41

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

DSNE622I NUMBER OF OUTPUT RECORDS WRITTEN IS nn

Explanation: This message is written to the output data set after processing all SQL statements in the current input data set. The term 'nn' is a count of the total number of records written to the output data set.

This message is issued by the following CSECT: DSNESM41

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

DSNE623I SYNTAX ERROR AT RECORD xx, OFFSET xx

Explanation: A syntax error was detected in the SQL statement preceding this message in the output data set. 'xx' identifies the erroneous line number in the SQL statement, and 'yy' identifies the offset (in characters) of the error within that record.

This message is issued by the following CSECT: DSNESM40

System Action: Input data set processing is completed, and this message is included in the SPUFI output.

User Response: Correct the specified syntax error in the input data set, and execute the job again.

DSNE624I UNABLE TO LOAD ISPLINK MODULE. SPUFI PROCESSING TERMINATED

Explanation: During SPUFI initialization processing, an error was encountered attempting to LOAD the ISPF interface module, ISPLINK. This module could not be located in the LNKLST or STEPLIB library concatenation.

This message is issued by the following CSECT: DSNECP10

System Action: SPUFI processing is terminated.

User Response: Rearrange your library concatenation so that the ISPLINK module can be located. This module resides in the ISPF load library.

DSNE625I CONNECT TO LOCATION (location name) PERFORMED, SQLCODE IS number

Explanation: The SPUFI user has indicated that the SQL statements defined in the input file are to be processed by the server at the remote location specified in the CONNECT LOCATION field of the SPUFI panel.

This message appears in the output file and indicates that an SQL CONNECT request was issued by SPUFI to the specified location name. The 'number' specifies the SQL return code associated with the CONNECT request. These return codes are listed in "Section 2. SQL Return Codes" on page 2-1.

This message is issued by the following CSECT: DSNESM40

System Action: Subsequent processing of the SQL statements in the input file is based upon the successful completion

of the CONNECT request. If the request is unsuccessful, the SQL error number and all associated error messages are placed in the output file.

User Response: Respond as indicated by the SQL code returned.

DSNE626I MAXIMUM OUTPUT LINES FOR SELECT STATEMENT REACHED (number), PROCESSING FOR CURRENT SELECT STATEMENT TERMINATED

Explanation: The maximum number of output lines to be displayed for a SELECT statement was reached. Processing of the current SELECT statement is terminated. The maximum number to display is specified by the SPUFI user on the CURRENT SPUFI DEFAULTS panel.

This message appears in the SPUFI output file.

This message is issued by the following CSECT: DSNESM20

System Action: Processing of subsequent SQL statements in the input file continues.

User Response: If the number of lines displayed is insufficient, you can increase the maximum number of lines to be displayed for SELECT statements on the CURRENT SPUFI DEFAULTS panel and re-execute the SELECT statement.

DSNE800A NO DEFAULT VALUES WERE CHANGED. PRESS ENTER TO CONTINUE

Explanation: The user left panel DSNEP02 without changing it. This panel contains all the defaults that can be modified by the user.

This message is issued by the following CSECT: DSNESM00

System Action: This message is presented on the SPUFI panel DSNEP01. SPUFI waits for the next user input.

User Response: Press 'ENTER' if you want to continue.

DSNE803A INPUT FILE WAS NOT CHANGED. PRESS ENTER TO CONTINUE

Explanation: The user has exited from the ISPF editor without modifying the input data set.

This message is issued by the following CSECT: DSNESM00

System Action: The system waits for the next user input.

User Response: Press 'ENTER' if you want to continue. The SPUFI panel variable settings can be changed at this point.

DSNE804A TO CONTINUE, C (COMMIT) OR R (ROLLBACK) MUST BE SPECIFIED

Explanation: The user has specified the AUTOCOMMIT=NO option and now wants either to exit or to switch to another DB2 subsystem with outstanding work uncommitted on the current DB2 subsystem.

This message is issued by the following CSECT: DSNESM00

System Action: DB2 waits for the user to specify either the COMMIT (C) or the ROLLBACK (R) option.

User Response: Enter 'C' or 'R' to continue.

DSNE808A EDIT SESSION HAS COMPLETED. PRESS ENTER TO CONTINUE.

Explanation: The user has exited from the ISPF editor.

This message is issued by the following CSECT: DSNESM00

System Action: SPUFI waits for the next user input.

User Response: Press 'Enter' if you want to continue. Press 'END' if you want to terminate your SPUFI session. The SPUFI panel variable settings can be changed at this point.

DSNE901I EXECUTION COMPLETE

Explanation: Execution of a subcommand has successfully completed.

This message is issued by the following CSECT: DSNECP14

System Action: The TSO attachment facility is ready for more input.

DSNE903I WARNING, DECLARATION HAS SAME NAME AS TABLE table-name

Explanation: A DCLGEN subcommand has a 'STRUCTURE' parameter that is the same as the 'table name' specified in the message. The requested declaration has been created, but this could cause conflicts with internal names.

This message is issued by the following CSECTs: DSNECP61, DSNECP62

System Action: DCLGEN execution continues.

User Response: Choose a different 'STRUCTURE' parameter.

DSNE904I EXECUTION COMPLETE, MEMBER member-name REPLACED

Explanation: A DCLGEN subcommand executed successfully, replacing the 'member-name' specified in the message.

This message is issued by the following CSECT: DSNECP14

System Action: The TSO attachment facility is ready for more input.

DSNE905I EXECUTION COMPLETE, MEMBER member-name ADDED

Explanation: A DCLGEN subcommand executed successfully, adding the 'member-name' specified in the message to the data set specified in the DCLGEN subcommand.

This message is issued by the following CSECT: DSNECP14

System Action: The TSO attachment facility is ready for more input.

DSNE908E csect-name INVALID USE OF parameter IN PARAMETER LIST OF KEYWORD keyword.

Explanation: An invalid parameter was specified in the parameter list of the specified keyword.

Severity: 8

System Action: Subcommand processing is terminated. The TSO attachment facility is ready for more input.

User Response: Correct the parameter list in error, and resubmit the job.

DSNE909E *csectname* **WARNING, DBCSSYMBOL KEYWORD IS INVALID WITH LANGUAGE *language* KEYWORD IGNORED**

Explanation: You specified the DBCSSYMBOL keyword in your DCLGEN invocation, but your LANGUAGE keyword value was not COB2. DBCSSYMBOL only applies to COB2 PICTURE clauses. DCLGEN will ignore this keyword.

System Action: DCLGEN processing continues.

User Response: In the future, do not specify the DBCSSYMBOL keyword unless the LANGUAGE keyword value is COB2.

DSNE910E *csectname* **WARNING, THE OWNER KEYWORD WAS SPECIFIED WITH A QUALIFIED TABLE NAME. OWNER KEYWORD IGNORED**

Explanation: You specified both the OWNER keyword and a qualified table name for the TABLE keyword in your DCLGEN invocation. The table qualifier will be used as the table owner, and the OWNER keyword will be ignored.

System Action: DCLGEN processing continues.

User Response: In the future, specify either a qualified table name for the TABLE keyword, or an unqualified table name for the TABLE keyword along with the OWNER keyword.

DSNE920E *member-name* **ALREADY EXISTS, SPECIFY ACTION(REPLACE) TO REPLACE**

Explanation: The DCLGEN user tried to overwrite an old declaration with a new one without specifying REPLACE on the 'ACTION' parameter.

This message is issued by the following CSECT: DSNECP69

System Action: The TSO attachment facility is ready for more input.

User Response: Change the 'ACTION' parameter to REPLACE (if that's actually what you want to do), and resubmit the command.

DSNE921E **REQUIRED PARAMETER *table-parameter* IS MISSING**

Explanation: Your DCLGEN subcommand was missing the required TABLE parameter.

This message is issued by the following CSECT: DSNECP24

System Action: Your DCLGEN subcommand was not processed. The DSN command processor issued a return code of 8. DSN is ready for more input.

User Response: Resubmit the DCLGEN subcommand with a TABLE parameter.

DSNE922E **TABLE NAME QUALIFIER OF *qualifier* IS TOO LONG. CANNOT EXCEED 8 CHARACTERS IN LENGTH**

Explanation: DCLGEN detected an invalid TABLE parameter. The table name qualifier (the left portion of the table name) was too long.

This message is issued by the following CSECT: DSNECP24

System Action: Your DCLGEN subcommand was not processed.

The DSN command processor issued a return code of 8. DSN is ready for more input.

User Response: Resubmit the DCLGEN subcommand with a shorter table name qualifier.

DSNE923E CSECT *csect-name* **FOUND AN UNRECOGNIZED LANGUAGE *unknown***

Explanation: This is a DCLGEN subsystem error, not a user error. The language parameter 'unknown' is not known to the subsystem.

This message is issued by the following CSECTs: DSNECP14, DSNECP60

System Action: The TSO attachment facility is ready for more input.

User Response: Report the problem to the system programmer.

System Programmer Response: Re-create the problem with DSN tracing turned on. Collect the trace stream in the DSNTRACE data set. Use the ABEND subcommand of the DSN command processor to collect a dump. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE924E **PARSE FAILED IN CSECT *csect-name* PARAMETER *parm*, FLAG *flag***

Explanation: This is a DB2 subsystem error, not a user error. The 'PARM' parameter was not correctly parsed. The flag specified was detected as an inappropriate value in a parse results field.

This message is issued by the following CSECT:

DSNECP21	DSNECP24	DSNECP26	DSNECP40
DSNECP41	DSNECP42	DSNECP44	DSNECP45
DSNECP46			

System Action: The TSO attachment facility is ready for more input.

User Response: Report the problem to the system programmer.

System Programmer Response: Re-create the problem with DSN tracing turned on. Collect the trace stream in the DSNTRACE data set. Use the ABEND subcommand of the DSN command processor to collect a dump. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE925E **BUFFER OVERFLOW IN CSECT *csect-name* WHILE WRITING *string***

Explanation: This is a DCLGEN subsystem error. CSECT '*csect-name*' detected a buffer overflow condition while attempting to write '*string*'.

This message is issued by the following CSECT: DSNECP67

System Action: The TSO attachment facility is ready for more input.

User Response: Notify the system programmer.

System Programmer Response: Re-create the problem with DSN tracing turned on. Collect the trace stream in the DSNTRACE data set. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNE926E COMMAND REJECTED, command NOT SUPPORTED UNDER subsystem

Explanation: The user entered a TSO TIME or TEST command. These are not supported by DSN or DB2I.

This message is issued by the following CSECT: DSNECP31

System Action: The user should leave DSN or DB2I, return to TSO, and retry the command. DSN can be run under TSO TEST. The TSO attachment facility is ready for more input.

User Response: Enter the DSN subcommand, or leave DSN to execute the requested command.

DSNE927E RUN SUBCOMMANDS REQUIRE (1)PROGRAM PARM OR (2)PLAN AND CP PARMS

Explanation: RUN subcommands may contain (1) the 'PROGRAM' parameter and, optionally, the 'PLAN' parameter or (2) the 'PLAN' and command processor ('CP') parameters. Combinations of (1) and (2) are not allowed.

This message is issued by the following CSECT: DSNECP26

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the subcommand, and resubmit the job.

DSNE928E RUN SUBCOMMANDS CANNOT HAVE A PROGRAM PARM AND A CP PARM

Explanation: A RUN subcommand cannot contain both the 'PROGRAM' and command processor ('CP') parameters. The subcommand should be resubmitted with only one of the parameters.

This message is issued by the following CSECT: DSNECP26

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the subcommand, and resubmit the job.

DSNE929E TABLE NAME LOCATION OF (location-name) IS TOO LONG. CANNOT EXCEED 16 CHARACTERS IN LENGTH.

Explanation: DCLGEN detected an invalid AT(location) keyword parameter. The specified location name is too long.

This message is issued by the following CSECT: DSNECP24

System Action: Your DCLGEN subcommand was not processed. The DSN command processor issues a return code of 8. The DSN is ready for more input.

User Response: Resubmit the DCLGEN subcommand specifying a location name that does not exceed 16 characters.

DSNE930E TABLE NAME OF table-name MUST BE QUALIFIED WHEN SPECIFIED WITH LOCATION OF location-name

Explanation: DCLGEN detected an invalid TABLE keyword parameter. You must specify a qualified table name with the AT (location) keyword.

This message is issued by the following CSECT: DSNECP24

System Action: Your DCLGEN subcommand was not processed.

essed. The DSN command processor issues a return code of 8. DSN is ready for more input.

User Response: Specify a qualified table name and resubmit the DCLGEN command.

DSNE931E csect-name keyword-name (parameter_value) CONTAINS AN INVALID SYMBOL (symbol)

Explanation: An invalid 'symbol' (symbol) was specified in the 'parameter_value' associated with the specified 'keyword-name'.

Severity: 8

System Action: Subcommand processing is terminated. The TSO attachment facility is ready for more input.

User Response: Correct the keyword 'parameter_value' in error, and resubmit the job.

DSNE932I WARNING, ONLY IBM SUPPLIED names SHOULD BEGIN WITH DSN

Explanation: The user has issued a BIND, REBIND, or FREE subcommand, using a name or id that begins with DSN.

This message is issued by the following CSECTS:

DSNECP40	DSNECP41	DSNECP42	DSNECP44
DSNECP45	DSNECP46		

System Action: Processing continues.

User Response: In the future, do not use plan-names, collection-ids, or package -ids that begin with DSN. It would be a good idea to FREE the plan or package you just created and to BIND again with a new plan-name, collection-id, or package-id.

DSNE935I ... IS THE DCLGEN COMMAND THAT MADE THE FOLLOWING STATEMENTS

Explanation: This message is a part of normal DCLGEN output. It identifies the DCLGEN command that produced the declaration of which it is a part.

This message is issued by the following CSECT: DSNECP14

System Action: This message is included in the DCLGEN output.

DSNE936I THE NUMBER OF COLUMNS DESCRIBED BY THIS DECLARATION IS nnn

Explanation: This message is a part of normal DCLGEN output. It tells how many columns were in the table that was named in the DCLGEN command.

This message is issued by the following CSECT: DSNECP14

System Action: This message is included in the DCLGEN output.

DSNE937I COBOL DECLARATION FOR TABLE table-name

Explanation: This message is a part of normal DCLGEN output. It tells the name of the table for which the declaration was created.

This message is issued by the following CSECT: DSNECP61

System Action: This message is included in the DCLGEN output.

DSNE938I PLI DECLARATION FOR TABLE table-name

Explanation: This message is a part of normal DCLGEN output. It tells the name of the table for which the declaration was created.

This message is issued by the following CSECT: DSNECP62

System Action: This message is included in the DCLGEN output.

DSNE939E csect-name THE COMBINATION ACQUIRE(ALLOCATE) AND RELEASE(COMMIT) IS NOT ALLOWED

Explanation: The BIND or REBIND subcommand was submitted with conflicting parameters. You cannot specify ACQUIRE(ALLOCATE) and RELEASE(COMMIT) on the same subcommand.

System Action: The subcommand is terminated and the DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information about the BIND and REBIND subcommands.

DSNE940E DEFER(PREPARE) INVALID WITH NODEFER(PREPARE)

Explanation: The BIND or REBIND subcommand was submitted with conflicting parameters. You cannot specify DEFER(PREPARE) and NODEFER(PREPARE) on the same subcommand because these actions conflict.

This message is issued by the following CSECTs: DSNECP40, DSNECP41

System Action: The subcommand is terminated and the DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information regarding the BIND and REBIND subcommands.

DSNE941I DSNBIND IS A RESERVED PLAN NAME

Explanation: This message is generated when the plan name is 'DSNBIND' in a BIND statement.

This message is issued by the following CSECT: DSNECP40

System Action: Subcommand processing is terminated. The TSO attachment facility is ready for more input.

User Response: Change the plan-name and resubmit the job.

DSNE942E csect-name REMOTE CONNECTION NAME (parameter_value) HAS INVALID FORMAT

Explanation: The REMOTE connection name 'parameter_value' contains a < or > character in the starting or ending position of the parameter, but the parameter value is not bracketed by both characters. This message is also generated if the first character of the connection name is not an alphabetic character.

If the LU name format of the REMOTE keyword is to be used, the name must be specified as <LU_name>.

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Correct the keyword 'parameter_value' in error, and resubmit the job. Refer to *Command Reference* for additional information about the specification of connection names for the REMOTE keyword.

DSNE943E csect-name REMOTE CONNECTION NAME (parameter_value) CANNOT EXCEED (length_value) CHARACTERS IN LENGTH

Explanation: The REMOTE connection name 'parameter_value' specified is greater than the length 'length_value' permitted for the REMOTE keyword.

This message is issued if the REMOTE location name format exceeds 16 characters, or the LU name format (<LU name>) exceeds 10 characters in length.

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Correct the keyword 'parameter_value' in error and resubmit the job. Refer to *Command Reference* for additional information about the specification of connection names for the REMOTE keyword.

DSNE944I WARNING, BECAUSE YOUR TABLE OR COLUMN NAMES CONTAIN LOWER CASE OR NON-ALPHABETIC CHARACTERS, YOU WILL NEED TO USE THE SQL (NOT PL/I) INCLUDE STATEMENT TO INCLUDE DCLGEN OUTPUT INTO YOUR PROGRAM

Explanation: DCLGEN had to wrap your table or column name(s) in quotes so DB2 could process them. Quotes are not recognized by the PL/I compiler. To avoid compilation errors, use the SQL INCLUDE statement ('EXEC SQL INCLUDE membername') to merge the DCLGEN output with your source program.

Refer to Chapter 6 of *SQL Reference* for more information about the SQL INCLUDE statement.

This message is issued by the following CSECT: DSNECP60.

System Action: DCLGEN processing continues.

User Response: If you have not coded the SQL INCLUDE, do so before the next compile.

DSNE947I QUOTE PARAMETER IS ONLY VALID WITH COBOL. IT HAS BEEN CHANGED TO APOST

Explanation: You specified the DCLGEN QUOTE parameter and a non-COBOL language parameter. This combination is not valid. The QUOTE parameter was specified as either a parameter on the DCLGEN subcommand or a default set for your site at DB2 installation time.

The DCLGEN processor changed the QUOTE setting (for this run) to APOST.

This message is issued by the following CSECT: DSNECP24.

System Action: DCLGEN processing continues and should produce valid output.

User Response: If you used QUOTE on the DCLGEN command, you may want to change it to APOST before submitting it again.

DSNE948I *csect-id* **FURTHER subcommand PROCESSING WILL NOT BE ATTEMPTED**

Explanation: A DSN command processor subcommand (indicated in the message) has encountered an error which stopped DSN from processing this subcommand. The subcommand will not complete normally. This message is accompanied by other messages explaining the exact nature of the problem.

This message is issued by the following CSECT: DSNECP24

System Action: Subcommand processing terminates. The DSN prompt is reissued, indicating DSN is ready for another subcommand.

User Response: Read the accompanying messages for help in deciding what to do next.

DSNE949E **COMMIT PROCESSING ABNORMAL TERMINATION, REASON CODE reason_code**

Explanation: The DSN command processor has initiated a 'prepare to commit' request in DB2. The request is rejected when DB2 cannot commit the work performed

This message is issued by the following CSECT: DSNECP18

System Action: Commit processing is terminated.

User Response: Examine the reason code associated with this message, and respond as indicated before resubmitting the job.

Problem Determination: Reference the associated reason code to determine why the 'prepare to commit' was not successful.

DSNE950E **DCLGEN DOES NOT SUPPORT THE lang LANGUAGE**

Explanation: A DCLGEN user attempted to specify a LANGUAGE parameter, 'lang', that DCLGEN does not support.

This message is issued by the following CSECT: DSNECP24

System Action: DCLGEN processing terminates.

User Response: Correct the LANGUAGE parameter and resubmit the DCLGEN subcommand.

DSNE952I **C DECLARATION FOR TABLE table-name**

Explanation: This message is a part of normal DCLGEN output. It tells the name of the table for which the declaration was created.

This message is issued by CSECT DSNECP63.

System Action: This message is included in the DCLGEN output.

DSNE953I *csect-name* **PRECISION OF DECIMAL COLUMN colname EXCEEDS THE MAXIMUM PRECISION FOR THE lang LANGUAGE.**

Explanation: DCLGEN was building a COBOL or PL/I language declaration for a table when it encountered a decimal column with a precision greater than the precision supported by the language.

System Action: DCLGEN set the return code to 4 and processed the rest of the table.

User Response: This is a warning. Be aware that the declaration for column 'colname' causes a compiler error. You must edit the declaration before including it in an application program.

DSNE954I *csect-name* **USE OF THE DCLGEN COLSUFFIX(YES) OPTION WILL RESULT IN A MIXED FIELD NAME FOR COLUMN colname. THE lang LANGUAGE DOES NOT SUPPORT MIXED FIELD NAMES.**

Explanation: The COLSUFFIX(YES) option and a double-byte NAMES prefix were specified in a DCLGEN invocation, but column *colname* contains single-byte characters. This combination would result in a generated field name with a mixture of double-byte and single-byte characters, but the *lang* language does not support mixed field names.

System Action: DCLGEN set the return code to 4 and generated the field name as requested.

User Response: This is a warning. Be aware that the declaration for column *colname* causes a compiler error. You must edit the declaration before including it in an application program.

DSNE955I *csect-name* **COLSUFFIX(YES) WAS SPECIFIED WITHOUT A NAMES PREFIX. COLUMN NAMES WILL BE USED FOR FIELD NAMES.**

Explanation: When COLSUFFIX(YES) is specified in a DCLGEN invocation, DCLGEN generates field names by concatenating the NAMES prefix with the column names. However, no NAMES prefix was specified.

System Action: DCLGEN set the return code to 4 and used the column names as field names.

User Response: This is a warning. Specify a NAMES prefix when you specify COLSUFFIX(YES).

DSNE956A **A FIELD NAME PREFIX MUST BE SPECIFIED WHEN COLUMN SUFFIX VALUE IS YES.**

Explanation: When YES is specified for the COLUMN SUFFIX field on the DCLGEN panel, DCLGEN generates field names by concatenating the value in the FIELD NAME PREFIX field with the column names. However, no value was specified for FIELD NAME PREFIX.

This message is issued by the following panel: DSNEP01

System Action: The DCLGEN panel generated this error message.

User Response: Specify a FIELD NAME PREFIX value, or change the COLUMN SUFFIX value to NO.

DSNE960E PARAMETER STRING EXCEEDS ALLOWABLE LIMIT OF 100 (DECIMAL) CHARACTERS

Explanation: The PARMS option parameter-string of the RUN subcommand cannot exceed 100 (decimal) characters in length.

This message is issued by the following CSECT: DSNECP26

System Action: The TSO attachment facility is ready for more input.

User Response: Correct the PARMS option and resubmit the job.

DSNE964E *csect-name* INVALID SYNTAX FOR *keyword* KEYWORD PARAMETER *parameter*

Explanation: A parameter that does not follow DB2 naming conventions was specified for *keyword*.

System Action: Subcommand processing is terminated. The DSN command processor reissues the DSN prompt to allow you to enter another subcommand.

User Response: Correct the keyword parameter value in error, and resubmit the command. Refer to *Command Reference* for additional information about the specification of a package name and the REBIND/BIND PACKAGE/PLAN or FREE PACKAGE subcommand.

DSNE965E *parameter_value* IS NOT A VALID *keyword* KEYWORD PARAMETER

Explanation: The *parameter_value* is not a valid parameter value for the *keyword*.

This message is issued by the following CSECTs:

DSNECP50 DSNECP51 DSNECP54 DSNECP55

System Action: Subcommand processing terminates. The DSN command processor reissues the DSN prompt to allow you to enter another subcommand.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information about the parameter values supported on the *keyword*.

DSNE966E *connection_type* KEYWORD OMITTED FROM THE ENABLE|DISABLE DECLARATION

Explanation: The '*connection_type*' keyword was not specified in either the ENABLE or DISABLE keywords and is required if *connection-names* are specified for the '*connection_type*'.

This message is issued by the following CSECTs:

DSNECP40 DSNECP41 DSNECP44 DSNECP45

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor reissues the DSN prompt to allow you to enter another subcommand.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information about the *connection type* parameter values supported on the ENABLE and DISABLE keywords.

DSNE967E *keyword_name* KEYWORD CANNOT BE SPECIFIED MORE THAN ONCE PER RUN

Explanation: Either the BIND PACKAGE MEMBER or LIBRARY keywords specified more than one parameter value. Only one member or library name is permitted.

This message is issued by the following CSECT: DSNECP44

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information regarding the BIND PACKAGE and BIND PLAN subcommands.

DSNE969E *csect-name keyword1* IS MUTUALLY EXCLUSIVE WITH *keyword2*

Explanation: Both the PKLIST and NOPKLIST keywords, cannot be specified on one invocation of the REBIND PLAN subcommand. Both the ENABLE and DISABLE keywords cannot be specified on one invocation of the BIND/REBIND PLAN/PACKAGE subcommand.

Severity: 8

System Action: Subcommand processing is terminated. DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information regarding the REBIND PLAN subcommand.

DSNE970E EITHER MEMBER OR PKLIST MUST BE SPECIFIED, BOTH ARE ALSO ALLOWED

Explanation: The BIND PLAN subcommand requires either the MEMBER or PKLIST keyword, and neither was specified. Either keyword or both may be specified.

Severity: 8

This message is issued by the following CSECT: DSNECP40

System Action: Subcommand processing is terminated. DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information regarding the BIND PLAN subcommand.

DSNE971E EITHER MEMBER OR COPY BUT NOT BOTH MUST BE SPECIFIED

Explanation: The BIND PACKAGE subcommand requires either the MEMBER or COPY keyword; both are not allowed on the same subcommand invocation.

Severity: 8

This message is issued by the following CSECT: DSNECP44

System Action: Subcommand processing is terminated and the DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information regarding the BIND PACKAGE subcommand.

DSNE974E *csect-name keyword1* **KEYWORD IS INVALID WITH *keyword2* KEYWORD.**

Explanation: The keyword2 should not be specified with keyword1.

System Action: Subcommand processing is terminated. The DSN command processor reissues the DSN prompt to allow another subcommand to be entered.

User Response: Modify one of the keywords on the command and resubmit the job. Refer to *Command Reference* for additional information about the BIND PACKAGE/PLAN subcommands.

DSNE975E *csect-name keyword* **KEYWORD IS ONLY VALID WHEN COPY KEYWORD IS PRESENT**

Explanation: A keyword was issued that may only be specified in conjunction with the COPY keyword.

keyword COPYVER or OPTIONS

Severity: 8

System Action: Subcommand processing is terminated. The DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information regarding the BIND PACKAGE subcommand.

DSNE976E **LIBRARY KEYWORD IS ONLY VALID WHEN MEMBER KEYWORD IS PRESENT**

Explanation: The LIBRARY keyword may only be specified in conjunction with the MEMBER keyword.

This message is issued by the following CSECT: DSNECP44

Severity: 8

System Action: Subcommand processing is terminated. The DSN command processor will reissue the DSN prompt to allow another subcommand to be entered.

User Response: Enter the corrected subcommand. Refer to *Command Reference* for additional information regarding the BIND PACKAGE subcommand.

DSNE999 **INVALID SQL RETURN CODE**

Explanation: The number you selected is not a valid SQL return code.

This message is issued by panel: DSN4SRC

User Response: Check the number and enter it again.

DSNF... Messages

**DSNF001I MESSAGE GENERATOR INITIALIZATION
PARAMETERS NOT FOUND. DEFAULTS
ASSUMED**

Explanation: The message generator was unable to access the routing code initialization parameter defined by the DSN6SYSP macro. Default values defined by that macro are assumed.

This message is issued by the following CSECT: DSNFMGIN

System Action: Subsystem initialization continues.

Operator Response: Notify the system programmer.

System Programmer Response: It might be necessary to change the DSN6SYSP macro and replace the DSN6SYSP member of the DSNIPARM directory. Refer to Section 2 of *Installation Guide* for details of this process.

DSNF700I csect-name message-id HAS BEEN ISSUED

Explanation: An unsuccessful attempt has been made to issue the message 'message-id'. This message is issued only if the requested message could not be found in the DB2 message directory.

System Action: The system proceeds as though the requested message had been issued.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to this manual for actual message text. You need the message number ('message-id'). If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH... Messages

Message Line Numbers

The line number *nnnn* in the following compiler messages is generated by assigning sequential numbers to the original source. The numbers are printed on the SQL precompiler source listing (if the SOURCE option is specified to the precompiler).

'COL *cc*' in the messages identifies the source column in which the condition was detected. This is usually the location of the column containing the first character of the associated source token. However, if the precompiler cannot determine this location, it is the beginning of the statement. Because the detected error might be similar to a valid, but different, construction, the SQL parsing might indicate the wrong location for the error.

Message Severity Codes

One of the characters I, W, E, S, or U is shown at the beginning of each precompiler message as an aid to the programmer. These characters indicate the severity level as follows:

I	0	Informational
W	4	Warning
E	8	Error
S	12	Severe error
U	16	Unrecoverable error

When unsupported non-DB2 statements are detected during SQL(ALL) precompilation, the return code will be forced to 4 if the return code was 8, and no host-related errors were detected. This is done so that the application can proceed with the compilation and link-edit steps. This allows the syntax checking to be delayed until bind. If a severity 8 precompiler error message is not a host-related error, the precompiler treats the error as a warning and place a W instead of an E in the precompiler output listing. In this instance,

the precompiler also issues DSNH049I to indicate that the actual return code 8 from the precompiler was changed to 4.

The following precompiler messages with severity levels of 8 are not changed from errors to warnings when SQL(ALL) is in effect:

```

DSNH051I
DSNH080I
DSNH290I
DSNH291I
DSNH292I
DSNH312I
DSNH313I
DSNH314I
DSNH504I

```

Source Tokens in Messages

Tokens from your source program do not always appear in messages exactly as they appear in your program. For example, leading zeros are removed from integer tokens.

DSNH003I S *csectname* FILE *ddname* PARAMETERS INCORRECT

Explanation: The file *ddname* has invalid or incorrect parameters, such as logical record length.

Severity: 12 (severe error)

System Action: The precompiler is terminated.

User Response: Correct the data set or library parameters.

DSNH004I S *csectname type* COULD NOT BE FOUND

Explanation: The precompiler could not find the indicated type of statement in the application program source. This message is only issued for HOST(COBOL) and HOST(COB2). The *type* is DATA DIVISION, WORKING-STORAGE SECTION, or PROCEDURE DIVISION. This error can cause other errors.

Severity: 12 (severe error)

System Action: Processing continues. Additional errors might result.

User Response: Ensure that the host language statement in your application program is correct and that the statement is present within the proper margins.

DSNH005I U csectname FILE ddname NO MEMBER NAME SPECIFIED

Explanation: The *ddname* must refer to a partitioned data set, and the member name must be specified in the allocation. This helps to prevent accidental erasure of the DBRM library.

Severity: 16 (unrecoverable error)

System Action: The precompiler is terminated.

User Response: Correct the JCL or TSO allocate command to specify a member name.

DSNH006I U csectname FILE ddname COULD NOT BE OPENED

Explanation: The file identified in the message is required, but it could not be opened.

Severity: 16 (unrecoverable error)

System Action: The precompiler is terminated.

User Response: Ensure that the file is present in your JCL.

System Programmer Response: Ensure that the SYSIN data is provided. Also ensure that SYSLIB is defined if the application program contains SQL INCLUDE statements.

DSNH007I E csectname LINE nnnn COL cc ILLEGAL CHARACTER IGNORED: 'c' ('hh'X)

Explanation: The character identified in the message as *c* is not permitted. The hexadecimal representation for the character is *hh*.

Severity: 8 (error)

System Action: The character is ignored.

User Response: Correct the character. It might need to be within quotation marks or apostrophes.

DSNH008I S csectname LINE nnnn COL cc NESTED INCLUDE NOT SUPPORTED

Explanation: While processing an INCLUDE, another nested INCLUDE statement was encountered.

Severity: 12 (severe error)

System Action: The nested INCLUDE statement is ignored.

User Response: Remove the nested INCLUDE statements; they are not allowed in an included file. The DB2 precompiler permits only one level of INCLUDE statements.

DSNH009I S csectname LINE nnnn COL cc MEMBER name COULD NOT BE INCLUDED

Explanation: The identified member name was not found or could not be read.

Severity: 12 (severe error)

System Action: Processing continues without the data from that member.

User Response: Ensure that the member is in the library and that its name is spelled correctly. Check and correct any JCL

errors. They are likely to cause other errors. Ensure that the data set and library parameters are correct.

DSNH010I S csectname LINE nnnn COL cc UNTERMINATED STRING CONSTANT BEGINNING text

Explanation: The constant identified in the message as '*text*' is not terminated properly.

Severity: 12 (severe error)

System Action: The string is treated as if it were terminated by the end of file.

User Response: Terminate the string constant. Check for and correct any missing or extra quotation marks and apostrophes. These errors are likely to cause others. Some statements were probably missed because of missing or extra string delimiters.

DSNH011I S csectname LINE nnnn COL cc UNTERMINATED COMMENT

Explanation: A comment is not terminated properly. This message is only issued for HOST(PLI) and HOST(C).

Severity: 12 (severe error)

System Action: The string is treated as if it were terminated by the end of file.

User Response: Ensure that the comment terminator is typed properly and that it is within the specified margins. This error is likely to cause others. Some statements were probably missed because of the missing comment terminator.

DSNH012I W csectname LINE nnnn COL cc INVALID CONTINUATION

Explanation: The continuation does not follow the host language rules.

Severity: 4 (warning)

System Action: Processing continues. Additional errors might result.

User Response: Follow the host language continuation rules and embedded SQL continuation rules. Check the margin option. This error is most common in assembler language in cases where a continuation begins before the continuation column (the continuation column is column 16 by default).

DSNH013I E csectname LINE nnnn COL cc SQL STATEMENT FOUND OTHER THAN IN THE FIRST PROGRAM (OR MAIN PROGRAM)

Explanation: This message is for VS COBOL II only. If any SQL statement is found in the source after the first program in a BATCH COMPILE or the end of the main program of a nested program, this message is issued.

Severity: 8 (error)

System Action: The precompiler is terminated.

User Response: Move up the SQL statement and corresponding host variable declaration to the main program or to the first program and resubmit the job.

DSNH014I S *csectname* **LINE** *nnnn* **COL** *cc* **SQL STATEMENT IS FOUND IN AN INAPPROPRIATE PLACE**

Explanation: If any SQL statement is found in the COBOL DECLARATIVES section, this message is issued.

Severity: 12 (severe error)

System Action: Processing continues. Additional errors might result.

User Response: Move the SQL statement out of the COBOL DECLARATIVES section and resubmit the job.

DSNH016I E *csectname* **LINE** *nnnn* **COL** *cc* **token REQUIRED**

Explanation: The required character or keyword identified as *token* is missing.

Severity: 8 (error)

System Action: The token is assumed to be present in order to continue checking the statement syntax.

User Response: Correct the SQL statement. Determine if you skipped either this keyword or another keyword earlier in the SQL statement. The assumed token is printed in the SYSTEM error message. This token might not be what you intended, even though it is the only symbol allowed in the clause at this point.

DSNH019I W *csectname* **OPTION: INVALID OPTION** *option*

Explanation: The identified option was requested, but it is not a precompiler option.

Severity: 4 (warning)

System Action: The option is ignored.

User Response: Check the valid precompiler options to determine if your spelling is correct for this option. This problem might cause additional errors if the APOST, APOSTSQL, COMMA, HOST, MARGINS, QUOTESQL, or TWOPASS option is needed but not specified. The other options are either defaults or affect only the listing. Correct the problem and run the precompile again.

DSNH021I W *csectname* **OPTION: SUBOPTION NOT PERMITTED WITH OPTION** *option*

Explanation: The identified option cannot have suboptions, but one or more were specified.

Severity: 4 (warning)

System Action: The suboptions are ignored.

User Response: None is required. However, you should remove the suboption.

DSNH022I W *csectname* **OPTION: UNMATCHED ')'**
TAKEN AS ','

Explanation: An unmatched ending parenthesis was found before the end of the option string.

Severity: 4 (warning)

System Action: The parenthesis is assumed to be a comma.

User Response: Balance the parentheses.

DSNH023I W *csectname* **OPTION: SUBOPTION MISSING FOR OPTION** *option*

Explanation: The specified option requires a suboption, but one was not provided.

Severity: 4 (warning)

System Action: The option is ignored.

User Response: Provide a suboption or remove the option. This problem might cause additional errors if the HOST or MARGINS option is needed but not specified. The other options are either defaults or affect only the listing. Correct the problem and run the precompile again.

DSNH024I W *csectname* **OPTION: SUBOPTION** *suboption*
INVALID FOR OPTION *option*

Explanation: The identified suboption is not allowed for the option specified.

Severity: 4 (warning)

System Action: The entire option is usually ignored.

User Response: Refer to the 'options used' list in the pre-compiler output listing to see if the option was used. Remove the suboption.

DSNH025I W *csectname* **OPTION: EXCESSIVE SUB-OPTIONS FOR OPTION** *option*

Explanation: Too many suboptions were given for the identified option.

Severity: 4 (warning)

System Action: The excess suboptions are ignored.

User Response: Remove excess suboptions.

DSNH026I W *csectname* **OPTION: INVALID MARGINS FOR HOST LANGUAGE**

Explanation: The host language does not permit the specified margins.

Severity: 4 (warning)

System Action: The MARGINS option is ignored.

User Response: Ensure that the source statements are within the proper margins and that the margins are specified correctly. The margins for COBOL must be 8, 72. The margins for FORTRAN must be 1, 72.

DSNH027I W *csectname* **SUBOPTION** *suboption* **TOO LONG, TRUNCATED AFTER** *numofchar* **CHARS**

Explanation: The version ID is greater than *numofchar* bytes long. The maximum length for the version ID is 64 bytes.

Severity: 4 (warning)

System Action: The option is honored, but the version ID is truncated after 64 bytes.

User Response: Refer to the 'options used' list in the pre-compiler output to see what version ID was used.

DSNH028I W *csectname* ATTACH SUBOPTION *suboption*
 # NOT PERMITTED WITH HOST (FORTRAN)
 # SPECIFIED.

Explanation: The identified suboption for precompiler option
 # ATTACH cannot take effect when the application is a
 # FORTRAN application because the interface code for
 # FORTRAN is always DSNHFT.

Severity: 4 (warning)

System Action: The option is ignored.

User Response: None is required. However, you can either
 # code ATTACH(TSO) or specify no ATTACH precompiler option

DSNH029I E *csectname* LINE *nnnn* COL *cc* INTO CLAUSE
 REQUIRED

Explanation: SELECT statements embedded in an applica-
 tion program must have an INTO clause to denote where the
 results of the SELECT are to be placed. Dynamic SELECT
 statements do not permit the INTO clause.

Severity: 8 (error)

System Action: The statement is replaced by host language
 statements that, if executed, set an error code in the SQLCA.

User Response: Add the INTO clause to the SELECT state-
 ment, and precompile the application program again.

DSNH030I W *csectname* LINE *nnnn* COL *cc* STATEMENT
 CONTAINS WRONG NUMBER OF 'INTO' VAR-
 IABLES

Explanation: The number of variables specified in an INTO
 clause is not the same as the number of select-list elements
 (taking into account expansion of host structures and '*' or
 'table.*' select entries according to the declarations supplied).

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure the included table declarations are
 correct. If the declarations are correct, this statement causes
 an error when the application program is bound. If the decla-
 rations are incorrect, you can proceed, but the declarations
 should be corrected. Otherwise, you need to correct the SQL
 statement and precompile again.

DSNH031I W *csectname* LINE *nnnn* COL *cc* STATEMENT
 CREATES A COLUMN WITH NAME *name1*
 WHICH DOES NOT MATCH DECLARED NAME
name2

Explanation: The column name specified in a CREATE state-
 ment (*name1*) is not the same as the name of the corre-
 sponding column in the DECLARE TABLE statement (*name2*).

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the DECLARE TABLE matches
 the CREATE TABLE. You can use the cross-reference and
 source listings to help find the two statements.

DSNH032I W *csectname* LINE *nnnn* COL *cc* STATEMENT
 CREATES A COLUMN *name* WHOSE ATTRI-
 BUTES DO NOT MATCH THE DECLARATION

Explanation: The column *name* is specified in a CREATE
 statement with a different data type or length than was speci-
 fied for the corresponding column in the DECLARE TABLE
 statement.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Correct the DECLARE TABLE or CREATE
 TABLE statement. If the DECLARE TABLE statement is incor-
 rect, some warnings might also be incorrect or might not be
 generated when needed. If the CREATE TABLE statement is
 incorrect, you must correct it.

DSNH033I W *csectname* LINE *nnnn* COL *cc* STATEMENT
 CREATES MORE OR LESS COLUMNS THAN
 WERE DECLARED

Explanation: The number of columns specified in a CREATE
 statement is different from the number of columns specified in
 the DECLARE TABLE statement.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the DECLARE TABLE matches
 the CREATE TABLE. If the DECLARE TABLE statement is
 incorrect, some warnings might also be incorrect or might not
 be generated when needed. If the CREATE TABLE statement
 is incorrect, you must correct it.

DSNH034I W *csectname* LINE *nnnn* COL *cc* STATEMENT
 INSERTS MORE OR LESS VALUES THAN THE
 NUMBER OF COLUMNS DECLARED

Explanation: The number of values specified in an INSERT
 statement is different from the number of columns specified in
 the DECLARE TABLE statement for the receiving table.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Insert the correct number of values. If the
 DECLARE TABLE statement is incorrect, this warning might
 also be incorrect. If the INSERT statement is incorrect, you
 must correct it.

DSNH038I S *csectname* LINE *nnnn* COL *cc* PROGRAM OR
 SUBPROGRAM CONTAINS MORE THAN 32767
 SQL STATEMENTS

Explanation: The number of SQL statements in an applica-
 tion program or a FORTRAN subprogram is greater than
 32767.

Severity: 12 (severe error)

System Action: The precompiler terminates.

User Response: Divide the application program or subpro-
 gram into smaller programs or reduce the SQL statements in
 each program unit so that the maximum number of SQL state-
 ments is not exceeded.

DSNH041I W csectname OPTION: MISSING HOST OPTION

Explanation: The host language was not specified in the OPTION field.

Severity: 4 (warning)

System Action: HOST(COBOL) is assumed.

User Response: Specify the host language if it is not COBOL. It is probably best to specify the host language and remove all warnings.

DSNH042I W csectname OPTION: option OPTION INVALID FOR HOST LANGUAGE

Explanation: The option identified in the message is not valid. The QUOTE and COMMA options are not permitted with HOST(ASM), HOST(PLI), or HOST(C). The TWOPASS option is not permitted with HOST(COBOL).

Severity: 4 (warning)

System Action: The specified option is ignored.

User Response: Remove the invalid option, or correct the host specification.

DSNH049I W csectname RETURN CODE IS FORCED TO 4 BECAUSE OPTION SQL(ALL) IS IN EFFECT, ORIGINAL RETURN CODE WAS nnn

Explanation: One or more SQL-related error messages were detected by the precompiler, but because of option SQL(ALL), the return code is forced to 4 in order to let the application proceed with compilation.

The SQL syntax checking is deferred until bind time because the source might contain non-DB2 SQL syntax that the DB2 precompiler does not recognize and flags as an error. The DBRM produced by this precompilation cannot be bound successfully by DB2 if there are SQL syntax errors or non-DB2 SQL syntax.

The return code remains untouched if there are host-related syntax or semantic errors in the source.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the intention of this precompilation is for executing it in a non-DB2 system.

DSNH050I I csectname WARNINGS HAVE BEEN SUPPRESSED DUE TO LACK OF TABLE DECLARATIONS

Explanation: One or more warning messages were suppressed because no table declarations were found before the first SQL statement that referenced a table or column.

Severity: 0

System Action: Processing continues. Suppression is discontinued if a table declaration is found.

User Response: Insert (or INCLUDE) table declarations before they are referenced in order to permit table and column checking.

DSNH051I E csectname LINE nnnn COL cc sqltype name PREVIOUSLY DECLARED OR REFERENCED

Explanation: The variable *sqltype* is TABLE, CURSOR, or STATEMENT. The identifier *name* was already defined with the given *sqltype*. The definition might have occurred implicitly. For example, *name* might have been found in the FROM clause of a SELECT, causing it to be defined as a table.

Severity: 8 (error)

System Action: The name is installed in the symbol table as a duplicate.

User Response: Remove duplicate definitions, or correct the references. Avoid implicit definitions by inserting (or including) table declarations before they are referenced. Check the number of passes used. Use the cross-reference and source listings to help resolve this type of error.

DSNH052I E csectname LINE nnnn COL cc COLUMN name IS ALREADY DEFINED IN TABLE table-name

Explanation: The identified name is already defined as a column in the table named *table-name*. The definition might have occurred implicitly. For example, *table-name* might have been found in a select-list, causing *name* to be defined as a column within *table-name* if *table-name* was not declared as a host variable.

Severity: 8 (error)

System Action: The name is installed in the symbol table as a duplicate.

User Response: Remove duplicate definitions, or correct the references. Avoid implicit definitions by inserting (or including) table declarations before they are referenced.

DSNH053I W csectname NO SQL STATEMENTS WERE FOUND

Explanation: No SQL statements were found in the precompiler input file. An empty DBRM member was written.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If you embedded SQL statements in your application program and none were found, make sure your column margins are properly defined for your application program.

DSNH060I E csectname LINE nnnn COL cc INVALID type SPECIFICATION: spec

Explanation: The *type* is either SCALE or LENGTH. The *spec* is the given SCALE or LENGTH specification in an SQL declaration. Length and scale specifications must be unsigned integers. The scale specification, where permitted, cannot exceed the length. The length specification cannot be 0.

Severity: 8 (error)

System Action: Processing continues.

User Response: Correct the length or scaling.

DSNH080I E csectname LINE nnnn COL cc usage VARIABLE name IS NOT type TYPE

Explanation: The *usage* is INDICATOR or STRING. The *type* is SMALLINT, VARCHAR, or CHARACTER. The data type of the variable *name* is not acceptable. All indicator variables must be small integers. PREPARE and EXECUTE strings must be variable character strings, except for FORTRAN, which requires character type.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Specify a host variable of the proper type.

DSNH081I W csectname LINE nnnn COL cc STATEMENT DOES NOT CONFORM TO ANS SYNTAX STANDARD - REASON CODE ccc

Explanation: When the precompiler option STDSQL(YES) is in effect, the SQL syntax is checked to see if it conforms to the ANSI/ISO SQL standard of 1992. Reason codes are:

- 000 Column function with DISTINCT as an arithmetic-operation operand does not conform to the ANSI/ISO SQL standard of 1992.
- 001 FOR UPDATE OF as part of a DECLARE CURSOR statement does not conform to the ANSI/ISO SQL standard of 1992.

Severity: 4 (warning)

System Action: Processing continues.

User Response: You have the option of changing or not changing the syntax to conform to the ANS syntax standard.

System Programmer Response: Check the SQL statement.

DSNH082I I csectname LINE nnnn COL cc STATEMENT DOES NOT CONFORM TO IBM SQL SYNTAX OR SEMANTIC STANDARD - REASON CODE ccc

Explanation: When the precompiler option SQL(ALL) is in effect, statements that do not conform to certain IBM SQL rules are flagged. The reason codes are:

- 000 An optional colon is not a feature of IBM SQL.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Change the syntax of the statement to conform to the IBM SQL standard if portability is required. Not changing the syntax means that the program is less portable within the IBM SQL environment.

DSNH083I I csectname LINE nnnn COL cc IBM SQL RESERVED WORD *ibmkeywd* SPECIFIED AS AN IDENTIFIER NAME

Explanation: When the precompiler option SQL(ALL) is in effect, IBM SQL reserved words should not be used as identifier names. Using IBM SQL reserved words limits the portability of the statement.

Severity: 0 (informational)

System Action: Processing continues.

User Response: If possible, change the identifier name to a non-IBM SQL reserved word so that the statement conforms to the IBM SQL standard. Not changing the identifier name means that the program is less portable within the IBM SQL environment.

DSNH084I W csectname LINE nnnn COL cc UNACCEPTABLE SQL STATEMENT

Explanation: The referenced SQL statement is not allowed in this situation, but it will not cause an error. Depending on the option specified at precompile time, one of the following occurred.

- The BEGIN DECLARE SECTION(*), END DECLARE SECTION(*), and UPDATE STATISTICS statements are flagged as not compatible.
 - * for C applications, BEGIN and END DECLARE SECTION are not flagged.
- Using the STDSQL(YES) precompiler option, the INCLUDE SQLCA statement is flagged as a warning.

Severity: 4 (warning)

System Action: The BEGIN DECLARE SECTION, END DECLARE SECTION, and INCLUDE SQLCA statements are ignored. The other statements are replaced by host language statements that will, if executed, set a warning code or SQLCODE -84 in the SQLCA.

User Response: Unless this application program is used in a portable manner, remove the statement.

DSNH085I W csectname LINE nnnn COL cc UNACCEPTABLE SQL KEYWORD IGNORED: *keyword*

Explanation: The SQL *keyword* is not allowed by DB2, but it does not cause an error. This message is printed as a warning to the programmer.

Severity: 4 (warning)

System Action: The keyword and its parameters are ignored.

User Response: Unless this application program is used with both SQL/DS and DB2, remove the keyword.

DSNH088I W csectname LINE nnnn COL cc THIS STATEMENT WILL *action* AN ENTIRE TABLE

Explanation: The *action* is either DELETE or UPDATE. The referenced SQL statement has no WHERE clause and will delete or update all rows of the specified table. This message is printed as a warning to the programmer.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Be sure that you intend to delete or update all rows, or add a suitable WHERE clause.

DSNH090I S csectname LINE nnnn COL cc HOST VARIABLE NOT PERMITTED HERE: *name*

Explanation: Host variable references are not permitted in this type of SQL statement. The *name* is invalid.

Severity: 12 (severe error)

System Action: The statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Specify a literal or a column name rather than a host variable. The colon (:) indicates that the name that follows is a host variable. Remove it to specify a column name.

DSNH101I S csectname THE STATEMENT IS TOO LONG OR TOO COMPLEX.

Explanation: The statement cannot be executed because it exceeds the system limits for either length or complexity.

Severity: 16

System Action: The statement cannot be executed.

User Response: Break the statement into shorter or less complex SQL statements.

DSNH102I E csectname LINE nnnn COL cc LITERAL STRING IS TOO LONG. STRING BEGINS string

Explanation: The referenced character string literal (beginning with *string* in the message) is too long. Up to 255 characters or 124 graphic characters are permitted.

Two consecutive string delimiters are used to represent one string delimiter within the character string, but these count as 2 bytes when calculating the lengths of character string constants. For SET CURRENT PACKAGESET, up to 18 characters are allowed; for SET CURRENT SQLID, up to 8 characters are allowed; for SET CURRENT DEGREE, up to 3 characters are allowed.

Severity: 8 (error)

System Action: If the SQL statement containing the string is a declaration, it is discarded. If the SQL statement containing the string is executable, it is replaced by host language statements that, if executed, set an error code in the SQLCA.

User Response: Correct the string. If a shorter string is acceptable, reduce the length of the literal. If a long string is required, a host variable is required.

DSNH103I E csectname LINE nnnn COL cc INVALID NUMERIC LITERAL token

Explanation: The *token* was found. It begins with a digit, but it is not a valid integer, decimal, or float literal. Identifiers cannot begin with a digit except for the WHENEVER statement with HOST(FORTRAN), and the identifiers in COBOL.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Check the indicated token for validity. Use apostrophes or quotation marks if a character literal is desired. Remove the invalid characters if a number is desired.

DSNH104I E csectname LINE nnnn COL cc ILLEGAL SYMBOL "token". SOME SYMBOLS THAT MIGHT BE LEGAL ARE: token-list

Explanation: A syntax error was detected where the symbol "*token*" occurs in the SQL statement. The list of symbols that might be legal shows some alternate symbols that could possibly be correct at that point, if the preceding part of the statement is entirely correct.

However, the preceding part of the statement might be incorrect. For example, if an important keyword is omitted, DB2

detects the error later, and not always immediately after the point where the keyword should appear. The list of alternate symbols are only suggestions.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the statement and precompile the program again.

DSNH105I E csectname LINE nnnn COL cc, INVALID STRING CONSTANTS

Explanation: Incorrect graphic or mixed data literals were found on line *nnnn*, column *cc*.

Severity: 8 (error)

System Action: The literal is ignored and the SQL statement containing the problem is discarded.

User Response: Specify the correct format of literals.

System Programmer Response: Check for a quote, an apostrophe, shift-out (so) or shift-in (si) characters, G or N characters, or the number of characters within the literal.

DSNH107I E csectname LINE nnnn COL cc NAME name IS TOO LONG; MAXIMUM IS size CHARACTERS

Explanation: Names for the following cannot contain more than 64 characters:

- Version-id

Names for the following cannot contain more than 18 characters (20 including SQL escape characters, if present):

- SQL columns
- SQL tables
- SQL views
- SQL indexes
- SQL synonyms
- Collection-ids
- Check constraints

Names for the following cannot contain more than 16 characters:

- Location-name

The following cannot contain more than 8 characters:

- Authorization IDs
- INCLUDE member names
- Storage group names
- Buffer pool names
- Field procedure names
- Database names
- Table space names
- Application plans
- Database request modules (DBRMs)
- Referential constraint names specified in CREATE or ALTER TABLE statements.
- Package-id

Host variable names cannot contain more than 64 characters.

Volume serial numbers cannot contain more than 6 characters.

Severity: 8 (error)

System Action: If the SQL statement containing the problem is a declaration, it is discarded. If the SQL statement containing the problem is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the name length.

DSNH109I E csectname LINE nnnn COL cc type CLAUSE NOT PERMITTED

Explanation: The *type* is INTO, ORDER BY, FOR UPDATE, or LARGE.

- Embedded SELECT statements cannot include ORDER BY, because the result cannot be more than a single row.
- Embedded SELECT statements cannot include FOR UPDATE OF, because position is not retained.
- SELECT clauses used in cursor declarations or subselects cannot have an INTO clause because the INTO is on the FETCH statement.
- CREATE VIEW statements cannot include any of the above clauses.
- The UNION operator is not allowed in an embedded SELECT.
- A CREATE TABLESPACE statement cannot specify LOCKPART without the Numparts option.
- An ALTER TABLESPACE statement cannot specify LOCKPART for a non-partitioned table space.
- A table space with LOCKPART YES cannot be altered to LOCKSIZE TABLESPACE.
- A table space with LOCKSIZE TABLESPACE cannot be altered to LOCKPART YES.
- The LARGE clause without the Numparts option is not allowed in a CREATE TABLESPACE statement.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Remove the clause. You might need to use a cursor to perform the processing. The ORDER and FOR UPDATE clauses are accepted on the DECLARE CURSOR statement. The INTO clause is accepted on the FETCH statement. The LARGE clause is accepted on a CREATE TABLESPACE statement with the Numparts option.

DSNH110I E csectname LINE nnnn COL cc INVALID HEX LITERAL BEGINNING string

Explanation: The referenced hexadecimal literal contains one or more characters that are not valid hexadecimal numbers.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the literal.

DSNH111W W csectname LINE nnnn COL cc THE SUBPAGES OPTION IS NOT SUPPORTED FOR TYPE 2 INDEXES

Explanation: You cannot use the SUBPAGES option for type 2 indexes.

Severity: 4 (warning)

System Action: The option is ignored; processing continues.

Programmer Response: Remove the SUBPAGES option to get rid of the warning.

DSNH113I E csectname LINE nnnn COL cc INVALID CHARACTER FOUND IN string, REASON CODE - nnn

Explanation: The string contains an invalid character. It can be an SQL ordinary identifier name, a host variable name, or a DBCS comment.

For SBCS SQL ordinary identifiers, names of buffer pools, databases, plans and storage groups must contain only upper-case alphabetic or national characters and numerics when CHARSET is KATAKANA; the first character must be alphabetic or national.

The following reason codes apply to SBCS identifiers:

000	An invalid character was found in the SBCS identifier (including the case in which a DBCS identifier was used where only an SBCS identifier is allowed.)
-----	--

The following reason codes apply to DBCS identifiers or comments:

101	An odd number of bytes exists between the shift-out and the shift-in character.
102	Either a shift-in or shift-out character is missing.
103	DBCS blanks X'4040' are not allowed.
104	There are no characters between the shift-out and the shift-in characters.
105	Shift-out cannot be the first byte of the DBCS character between the shift-out and the shift-in characters.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the name.

DSNH115I E csectname LINE nnnn COL cc ILLEGAL USE OF COMPARISON OPERATOR operator

Explanation: The syntax is not correct for this type of comparison. A simple comparison such as '>' must not be followed by a list of items. The ANY and ALL comparisons must precede a subselect, rather than an expression or a list of items.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. If necessary, refer to Chapter 3 of *SQL Reference* for the correct syntax.

**DSNH1171 E csectname LINE nnnn COL cc STATEMENT
INSERTS THE WRONG NUMBER OF VALUES**

Explanation: The number of entries in a value-list is not the same as the number of columns specified in an INSERT statement.

Severity: 8 (error)

System Action: Processing continues.

User Response: Correct the syntax. If necessary, refer to Chapter 6 of *SQL Reference* for the correct syntax.

**DSNH120I E csectname LINE nnnn COL cc FUNCTION
USAGE NOT PERMITTED: fname**

Explanation: A WHERE clause or SET clause contains a column function, possibly as a result of a reference to a column that is derived from a column function in a view definition. A column function is allowed in a WHERE clause only if that clause appears within a subquery of a HAVING clause.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. A subselect clause might be needed to produce the function result. If necessary, refer to Chapter 5 of *SQL Reference* for the correct syntax.

**DSNH125I E csectname LINE nnnn COL cc INVALID
ORDER BY COLUMN NUMBER: number**

Explanation: The identified column number is either less than 1 or greater than the number of items in the select-list.

Severity: 8 (error)

System Action: The cursor declaration is discarded.

User Response: Correct the column number. If necessary, refer to Chapter 5 of *SQL Reference* for the correct syntax.

**DSNH126I E csectname LINE nnnn COL cc ORDER BY
CANNOT BE USED WITH A FOR UPDATE OF
CLAUSE**

Explanation: The ORDER BY clause makes the cursor incapable of being updated.

Severity: 8 (error)

System Action: The cursor declaration is discarded.

User Response: This is a DB2 restriction. You can have either an ordered cursor or a cursor that can be updated. You cannot specify both attributes for the same cursor. You might need to change your application logic.

**DSNH129I E csectname LINE nnnn COL cc TOO MANY
TABLES SPECIFIED IN SQL STATEMENT**

Explanation: In a subselect, (including all subqueries), there can be no more than 15 references to table names.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Reduce the number of table references in each subselect. Each reference to a single table counts separately. The count only applies to table/view references in the FROM list. Each view is only counted one time. Refer to Chapter 5 of *SQL Reference* for the definition of a subselect.

**DSNH130I E csectname LINE nnnn COL cc THE ESCAPE
CLAUSE 'x' CONSISTS OF MORE THAN ONE
CHARACTER**

Explanation: The literal x used in the ESCAPE clause is too long. Only one SBCS or one DBCS character is allowed.

Severity: 8 (error)

System Action: The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the string. The literal string for the ESCAPE clause can only be one SBCS or DBCS character.

**DSNH131I E csectname LINE nnnn STATEMENT WITH
LIKE PREDICATE HAS INCOMPATIBLE DATA
TYPES**

Explanation: If the column name at the left of LIKE or NOT LIKE is a character type, the expression at the right must be a character type. If the column name is a graphic type, the expression at the right must be a graphic type.

Severity: 8 (error)

System Action: The statement is ignored.

User Response: Check the data type of every operand.

**DSNH132I E csectname LINE nnnn COL cc INVALID LIKE
PREDICATE**

Explanation: The value following LIKE must be an alphanumeric host variable or literal, graphic host variable or literal, or special character literal.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. If necessary, refer to Chapter 3 of *SQL Reference* for the correct syntax.

DSNH170I E *csectname* LINE *nnnn* COL *cc* NUMBER OF ARGUMENTS SPECIFIED FOR *function-name* IS INVALID

Explanation: An SQL statement specified the scalar function *function-name* with either too many or too few arguments.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the function call. Refer to Chapter 4 of *SQL Reference* for information about the number of arguments required by the scalar function *function-name*.

DSNH171I E *csectname* LINE *nnnn* COL *cc* THE DATA TYPE, LENGTH, OR VALUE OF ARGUMENT *nn* OF *function-name* IS INVALID

Explanation: Either the data type, the length or the value of argument *nn* of scalar function *function-name* is incorrect.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the argument. Refer to Chapter 4 of *SQL Reference* for rules for each argument of the scalar function *function-name*.

DSNH182I E *csectname* LINE *nnnn* COL *cc* AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE IS INVALID

Explanation: The specified arithmetic expression contains an improperly used date/time value or labeled duration.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the indicated expression. Refer to Chapter 3 of *SQL Reference* for the rules for date/time arithmetic.

DSNH184I E *csectname* LINE *nnnn* COL *cc* AN ARITHMETIC EXPRESSION WITH A DATETIME VALUE CONTAINS A PARAMETER MARKER

Explanation: The specified expression contains a parameter marker improperly used with a date/time value.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the indicated expression. Refer to Chapter 3 of *SQL Reference* for information about date/time arithmetic.

DSNH198I E *csectname* LINE *nnnn* COL *cc* EMPTY SQL STATEMENT IGNORED

Explanation: The referenced SQL statement has no text between the EXEC SQL and the statement terminator.

Severity: 8 (error)

System Action: The statement is ignored.

User Response: Correct the statement, or remove it.

DSNH199I E *csectname* LINE *nnnn* COL *cc* INVALID KEYWORD *keyword*; VALID SYMBOLS ARE: *token list*

Explanation: A syntax error was detected at the keyword specified in the message. As an aid to the programmer, a partial list of valid tokens is provided in the message. Only those tokens that fit are listed. The error might be earlier in the statement, but the syntax of the statement appears to be valid up to this point.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Check the SQL statement in the area of the indicated keyword. A colon or SQL delimiters might be missing. Correct the SQL statement.

DSNH203I W *csectname* LINE *nnnn* COL *cc* STATEMENT REFERENCES COLUMN *column name*, WHICH IS DECLARED IN MORE THAN ONE OF THE SPECIFIED TABLES

Explanation: The column *column name* was referenced without sufficient qualification. Type checking cannot be done.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the table declares are correct and the column name is not unique, this creates an error in the BIND step. Correct the DECLARE TABLE statement, or use the correct table name to qualify the column name.

DSNH204I W *csectname* LINE *nnnn* COL *cc* STATEMENT REFERENCES UNDECLARED TABLE *table-name*

Explanation: The table definition was not provided. It is optional, but checking cannot be done without the table information. (BIND checks against the actual table during later processing.)

Severity: 4 (warning)

System Action: Processing continues.

DSNH205I W *csectname* LINE *nnnn* COL *cc* COLUMN *column-name* WAS NOT DECLARED IN TABLE *table-name*

Explanation: The column name *column-name* is not contained in the table declarations. The name specified in a DISTINCT function must reference a column of the table. The value expression of an ALL function must reference a column of the table.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the table declares are correct and the column name is not in the table, this creates an error in the BIND step. Correct the DECLARE TABLE statement or the column name.

DSNH206I W *csectname* LINE *nnnn* COL *cc* STATEMENT REFERENCES COLUMN *column name* WHICH IS NOT DECLARED IN THE SPECIFIED TABLE(S)

Explanation: The column *column name* is not contained in any TABLE declaration for the tables specified in the statement.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If the table declares are correct and the column name is not in the tables, this creates an error in the BIND step. Correct the DECLARE TABLE statements or the column name.

System Programmer Response: Check the spelling of the column name. Ensure that all the tables needed were specified in the statement.

DSNH207I E *csectname* LINE *nnnn* COL *cc* ILLEGAL ORDER BY SPECIFICATION

Explanation: If the select expression involves a UNION operator, the ORDER BY list must use numeric constants rather than variables.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. If necessary, refer to Chapter 5 of *SQL Reference* for the correct syntax.

DSNH251I E *csectname* LINE *nnnn* COL *cc* TOKEN *name* IS NOT VALID

Explanation: The location name cannot contain alphabetic extenders for national languages (that is, #, @, and \$ in the United States).

Severity: 8 (error)

System Action: Processing continues.

User Response: Correct the content of the location name.

DSNH290I E *csectname* LINE *nnnn* COL *cc* NO VALID 'END DECLARE SECTION' FOUND

Explanation: The user's source program contains a BEGIN DECLARE SECTION, but no corresponding END DECLARE SECTION was found.

Severity: 8 (error)

System Action: Processing continues.

User Response: Check the application program and ensure that a valid END DECLARE SECTION statement is present.

DSNH291I E *csectname* LINE *nnnn* COL *cc* NO VALID 'BEGIN DECLARE SECTION' FOUND

Explanation: The user's source program contains an END DECLARE SECTION, but no corresponding BEGIN DECLARE SECTION was found.

Severity: 8 (error)

System Action: Processing continues.

User Response: Check the application program and ensure that a valid BEGIN DECLARE SECTION is present.

DSNH292I E *csectname* LINE *nnnn* COL *cc* HOST NAME *name* IS TOO LONG; MAXIMUM IS *size* CHARACTERS

Explanation: Fully qualified C host variable names cannot contain more than 255 characters.

Severity: 8 (error)

System Action: If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Reduce the length of names or the level of qualification of the host variable name in error.

DSNH303I W *csectname* LINE *nnnn* COL *cc* STATEMENT SELECTS INCOMPATIBLE DATA TYPE INTO *hostvar*

Explanation: The data type of host variable *hostvar* is not compatible with the apparent type of the corresponding select expression. One of them is numeric and the other is character, or one of them is character and the other is graphic. If the select expression is a column reference, the data type is obtained from its declaration.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the table definitions are current and that the host variable has the proper data type.

System Programmer Response: Ensure that the table definitions are current, and that the host variable has the proper data type.

DSNH310I W *csectname* LINE *nnnn* COL *cc* language HOST VARIABLE *name* WAS DECLARED IN *location*

Explanation: Host variable *name* should not be declared in this *location* of the source program. This message is issued only at reference time.

Severity: 4 (warning)

System Action: Processing continues.

User Response: If this host variable is used, the user assumes responsibility for possible exposure of incorrect output. Refer to Section 3 of *Application Programming and SQL Guide* to determine where host variables can be validly declared.

Declaring a COBOL host variable in the File Section might lead to incorrect output from SQL statements or abend 04E with RC=00E7000C.

DSNH312I E csectname LINE nnnn COL cc UNDEFINED OR UNUSABLE HOST VARIABLE name

Explanation: The *name* in the message is used in an SQL statement, but either no declaration was found in the application program so far, or the attributes are improper for this use. Declarations for host variables used in a DECLARE CURSOR statement must precede the SQL statement, regardless of the ONEPASS or TWOPASS option for the precompiler, or a parameter marker was expected in an EXECUTE IMMEDIATE statement. This message is issued only at reference time.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Check the declaration and the attributes of the named host variable. If you intended the name to refer to a column, the colon (:) should not be present. If you intended a literal, you need to enclose the value in string delimiters (apostrophes or quotation marks).

If you intended to use a host variable, only a subset of the possible variable declarations are valid for use as a DB2 host variable. The rules for host variables are listed in the application programming guides. Use the cross-reference listing and precompiler source listing to determine the source of the problem.

- If you use the STDSQL(YES) option for the precompilation, make sure that all of the host variable declarations are declared within BEGIN/END DECLARE SECTIONS.
- If the cross-reference listing does not contain the host variable name, the declaration is missing. If the source for a declaration is present, a missing terminator from a comment or from a string might cause this type of error. The margins could also cause this type of error.
- If the name is present, but the data type is not listed, the host variable is not usable; it does not follow the rules outlined for valid host variable definitions.
- If several definitions exist for the name, the first reference might occur before the definition. The use of the TWOPASS option helps by processing DECLARE statements before the other types of statements. However, host variable declarations and cursor declarations are processed in the same pass. The host variables referenced in cursor declarations must be defined before the cursor is defined in the application program.
- A parameter marker is expected rather than a host variable in an EXECUTE IMMEDIATE statement.
- The data type of a host variable passed in a CALL statement is not character or varying character.
- The length attribute of a character or varying character host variable passed in a CALL statement exceeds 255 characters.

#

DSNH313I E csectname LINE nnnn COL cc INVALID TYPE OR LENGTH OF HOST VARIABLE 'name'

Explanation: The host variable *name* is used in an SQL statement, but either the type or the length is improper for this use.

Severity: 8 (error)

System Action: The corresponding SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Check the declaration and the attributes of the named host variable. Refer to Section 3 of *Application Programming and SQL Guide* for the allowable host variable type and length.

DSNH314I E csectname LINE nnnn COL cc REFERENCE TO HOST VARIABLE name IS AMBIGUOUS

Explanation: The host variable *name* was defined more than once in this application program. The precompiler cannot distinguish which host variable definition should be used here. The following table indicates some possible combinations. DB2 supports only a single adjacent qualifier for a host variable name.

Case	Ref	Definition	Result	Suggested Change
1	a	x.a	Valid	None
2	x.a	x.a, y.a	Valid	None
3	a	x.a, y.a	DSNH314I	Reference x.a or y.a
4	a	x.a, a	Valid	None
5	x.a	q.x.a, v.x.a	DSNH314I	Variable name changes
6	a	a, a	DSNH314I	Variable name changes

Severity: 8 (error)

System Action: If the SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Make the host variable name unique or use qualification to indicate which host variable definition is to be used, as suggested in the above table.

DSNH315I I csectname LINE nnnn COL cc token IS NOT PRECEDED WITH A COLON. A COLON MAY BE NEEDED

Explanation: The use of a host variable name without a leading colon was detected.

Severity: 0 (informational)

System Action: Processing continues.

User Response: If the use of the name is for a host variable, then it is recommended that a colon be placed in front of the host variable name to conform to standard requirement. This optional colon support might be withdrawn in a future version.

DSNH4011 W csectname LINE nnnn COL cc STATEMENT SPECIFIES INCOMPATIBLE OPERANDS FOR COMPARISON OPERATOR name

Explanation: The comparison operation *name* is used with a mixture of incompatible data type operands.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Make both operands compatible character data types. Ensure that the table declaration is correct.

DSNH4021 W csectname LINE nnnn COL cc STATEMENT APPLIES name TO CHARACTER DATA

Explanation: The numeric operation or function *name* is used with a non-numeric operand.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Make the operand numeric or use a character function. Ensure that the table declaration is correct.

DSNH4041 W csectname LINE nnnn COL cc STATEMENT INSERTS OR UPDATES COLUMN name WITH VALUE THAT IS TOO LONG

Explanation: An INSERT or UPDATE statement specifies a value that is longer than the maximum length string that can be stored in that column, according to the DECLARE TABLE statement.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Ensure that the length is allowed and that the table declaration is correct.

DSNH4051 E csectname LINE nnnn COL cc LITERAL number IS OUT OF RANGE

Explanation: The number is not in the proper range:

- +5.4E-79 to 7.2E+75 for floating-point
- $-(10^{31} - 1)$ to $+(10^{31} - 1)$ for packed decimal
- -2147483648 to 2147483647 for integers

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the number.

DSNH4081 W csectname LINE nnnn COL cc STATEMENT INSERTS OR UPDATES COLUMN name WITH INCOMPATIBLE DATA TYPE

Explanation: The data type of the value to be inserted into column *name* by an INSERT or UPDATE statement is incompatible with the declared data type of the column. Both must be numeric or both must be character.

Severity: 4 (warning)

System Action: Processing continues.

Programmer Response: Be sure that the table definitions are current, and that host variables and literals have the proper data types and are matched.

DSNH4141 E csectname LINE nnnn COL cc THE NUMERIC OR DATETIME COLUMN column-name IS SPECIFIED IN A LIKE PREDICATE

Explanation: Column *column-name* with a numeric data type was specified in a LIKE predicate. Columns specified in a LIKE predicate must be character or graphic string columns.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the statement.

DSNH5041 E csectname LINE nnnn COL cc CURSOR name WAS NOT DECLARED

Explanation: Identifier *name* is used as a cursor, but was not declared. The declaration might have been discarded because of errors.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct or add the required cursor declaration.

DSNH5061 E csectname LINE nnnn COL cc DECLARE CURSOR FOR STATEMENT NAME MUST PRECEDE THE PREPARE STATEMENT FOR THAT STATEMENT NAME

Explanation: This DECLARE *name* CURSOR statement is preceded by a PREPARE *name* statement. In DB2, declarations must precede action statements. This is not the same as in SQL/DS.

Severity: 8 (error)

System Action: The declaration is noted as being in error and discarded.

User Response: Move the DECLARE or PREPARE statement so that they are in the proper order, or specify the TWOPASS option if the host language is PLI, ASM, or C. The TWOPASS option has the precompiler check for declarations on the first pass and avoids this problem.

DSNH520I E csectname THE OPEN STATEMENT FOR CURSOR cursor-name IS INVALID BECAUSE THE CURSOR WAS DEFINED BY AN ALLOCATE CURSOR STATEMENT

Explanation: The cursor defined by an ALLOCATE CURSOR statement is open after successful completion of the statement. Attempting to OPEN an allocated cursor is an error.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: An OPEN is not allowed or required for a cursor defined using the ALLOCATE CURSOR statement.

DSNH521I W *csectname* THE statement FOR CURSOR cursor-name IS ASSUMED TO APPLY TO A DYNAMIC ALLOCATE CURSOR STATEMENT.

Explanation: A FETCH or CLOSE for an undeclared cursor was issued. The cursor is assumed to be defined using a dynamic ALLOCATE CURSOR statement.

Severity: 4 (warning).

System Action: The cursor is assumed to be allocated dynamically.

User Response: Ensure that the cursor in the FETCH or CLOSE statement is dynamically allocated.

DSNH522I E *csectname* DESCRIBE CURSOR cursor-name IS INVALID BECAUSE THE CURSOR WAS DEFINED BY A DECLARE CURSOR STATEMENT.

Explanation: DESCRIBE CURSOR is allowed for cursors defined using the ALLOCATE CURSOR statement.

Severity: 8 (error).

System Action: The statement cannot be executed.

User Response: Remove the DESCRIBE CURSOR statement. Issue a DESCRIBE of the statement used to define the declared cursor.

DSNH557I E *csectname* LINE *nnnn* COL *cc* INCONSISTENT GRANT/REVOKE KEYWORD *keyword*; PERMITTED KEYWORDS ARE *keyword list*

Explanation: The identified *keyword* is not permitted. The *keyword list* is a list of the keywords that are permitted in this context. The combination of privileges requested on a GRANT or REVOKE statement is not allowed. The authorities must all be of one type and consistent with the form of GRANT or REVOKE. REVOKE UPDATE(*column list*) is not allowed; only REVOKE UPDATE is permitted.

Severity: 8 (error)

System Action: The containing SQL statement is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the syntax. If necessary, refer to Chapter 6 of *SQL Reference* for the correct syntax.

DSNH558I E *csectname* LINE *nnnn* COL *ccc* INVALID CLAUSE OR COMBINATION OF CLAUSES ON A GRANT OR REVOKE

Explanation: "PUBLIC AT ALL LOCATIONS" is invalid for non-table privilege GRANT or REVOKE statements. It is also invalid for table privilege GRANT or REVOKE statements that specify the ALTER or INDEX privilege.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Refer to Chapter 6 of *SQL Reference* for valid keywords for the GRANT or REVOKE statement.

DSNH580I E *csectname* LINE *nnnn* COL *cc* THE RESULT-EXPRESSIONS OF A CASE EXPRESSION CANNOT ALL BE NULL

Explanation: There is a CASE expression in the statement that has all the *result-expressions* (expressions following the THEN and ELSE keywords) coded with the keyword NULL.

Severity: 8 (error)

System Action: The statement was not processed.

Programmer Response: Change the CASE expression to include at least one *result-expression* with a keyword other than NULL.

DSNH582I E *csectname* LINE *nnnn* COL *cc* THE SEARCH-CONDITION IN A SEARCHED-WHEN-CLAUSE CANNOT BE A QUANTIFIED PREDICATE, IN PREDICATE, OR AN EXISTS PREDICATE

Explanation: The *search-condition* in a *searched-when-clause* specifies a quantified predicate, an IN predicate or an EXISTS predicate, but is not allowed.

Severity: 8 (error)

System Action: The statement was not processed.

Programmer Response: Correct the *search-condition*.

DSNH628I E *csectname* LINE *nnnn* COL *cc* MUTUALLY EXCLUSIVE CLAUSES HAVE BEEN SPECIFIED.

Explanation: Mutually exclusive clauses were specified as follows:

- A 'column-definition' contains both NOT NULL and DEFAULT NULL clauses.
- A 'column-definition' contains both FIELDPROC and DEFAULT clauses.
- A select-statement contains both the update-clause and the FOR FETCH ONLY clause.
- An ALTER TABLE statement contains both a DROP CONSTRAINT clause and either a DROP FOREIGN KEY clause or a DROP CHECK clause.
- A CREATE or ALTER TABLESPACE contains both the LOCKPART YES and LOCKSIZE TABLESPACE

Severity: 8 (error)

System Action: The statement was not executed.

Programmer Response: Specify one clause or the other, but not both.

DSNH630E E *csectname* LINE *nnnn* COL *cc* THE WHERE NOT NULL SPECIFICATION IS INVALID FOR TYPE 1 INDEXES

Explanation: Type 1 indexes cannot be created with the WHERE NOT NULL specification.

Severity: 8 (error)

System Action: The statement cannot be executed.

Programmer Response: Either the index must be created as a type 2 index, or the WHERE NOT NULL specification must not be used.

DSNH637I E *csectname* LINE *nnnn* COL *cc* DUPLICATE
keyword KEYWORD

Explanation: The identified keyword was specified twice in the statement.

Severity: 8 (error)

System Action: If the containing SQL statement is a declaration, it is discarded. If the containing SQL statement is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Remove the duplicate specification.

DSNH644I E *csectname* INVALID VALUE SPECIFIED FOR
KEYWORD *keyword* IN *stmt-type* STATEMENT

Explanation: The value specified for the *keyword* parameter in the *stmt-type* SQL statement is not a permitted value.

Severity: 8 (error)

System Action: If the SQL statement containing the problem is a declaration, it is discarded. If the SQL statement containing the problem is executable, it is replaced by host language statements that will, if executed, set an error code in the SQLCA.

User Response: Correct the statement. Refer to Chapter 6 of *SQL Reference* for information about the allowable values for the *keyword* in the *stmt-type* statement.

DSNH684I E *csectname* LINE *nnnn* COL *cc* LENGTH OF
LITERAL LIST BEGINNING *string* IS TOO
LONG

Explanation: The length of the literal list beginning with *string*, excluding insignificant blanks and delimiting parenthesis, is greater than 255 .
#

Severity: 8 (error)

System Action: The SQL statement cannot be executed.

System Programmer Response: Correct the SQL statement. Refer to Chapter 3 of *SQL Reference* for information about writing literal lists.

DSNH700I I *csectname* THE FIPS STANDARD IS USED
FOR FLAGGING

Explanation: This message identifies the standard used for flagging during execution.

Severity: 0 (informational)

System Action: Processing continues.

DSNH701I I *csectname* THE IBM SQL STANDARD IS
USED FOR FLAGGING

Explanation: This message identifies the standard used for flagging during execution.

Severity: 0 (informational)

System Action: Processing continues.

DSNH702I W *csectname* LINE *nnnn* COL *cc* THE STATE-
MENT DEVIATES FROM THE SQL STANDARD
AT THE TOKEN COMMENCING WITH THE
TEXT *text*

Explanation: A syntax deviation from the standard named in the earlier message (FIPS or IBM SQL) was found in the SQL statement.

Severity: 4

User Response: Check and correct the SQL statement.

DSNH703I W *csectname* LINE *nnnn* COL *cc*. A DATA DEF-
INITION STATEMENT IS NOT WITHIN A
CREATE SCHEMA STATEMENT

Explanation: The FIPS standard requires all data definition statements to be contained within a CREATE SCHEMA statement.

Severity: 4

User Response: Check and correct the SQL statement.

DSNH704I W *csectname* LINE *nnnn* COL *cc*. THERE IS A
NONSTANDARD EMBEDDED COMMENT

Explanation: A comment embedded within an SQL statement does not meet the requirements of the standard being flagged: The FIPS standard is being checked and the comment does not begin with at least two consecutive hyphens.

Severity: 4

User Response: Check and correct the SQL statement.

DSNH705I W *csectname* LINE *nnnn* COL *cc*. AN SQL
SYNTAX DEVIATION OCCURRED. THE STATE-
MENT IS NOT COMPLETE

Explanation: The SQL statement terminated before all required elements were found.

Severity: 4

User Response: Check and correct the SQL statement.

DSNH706I W *csectname* LINE *nnnn* COL *cc*. THE IDENTI-
FIER *token* IS GREATER THAN 18 CHARAC-
TERS

Explanation: Authorization identifier, table identifier, column name, correlation name, module name, cursor name, procedure name, or parameter name has a length of more than 18 characters.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH707I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN
column HAS AN INVALID LENGTH, PRECI-
SION, OR SCALE ATTRIBUTE

Explanation: One of the following conditions was not met:

- The length value should be greater than zero.
- The precision value should be greater than zero.
- The scale value should not be greater than precision.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH708I W *csectname* LINE *nnnn* COL *cc*. **THE DATA TYPE OF *token* SHOULD BE EXACT NUMERIC WITH A SCALE OF ZERO**

Explanation: The data type of INDICATOR PARAMETER or INDICATOR VARIABLE should be exact numeric with a scale of zero.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH709I W *csectname* LINE *nnnn* COL *cc*. **THE SET FUNCTION REFERENCES COLUMN *column***

Explanation: One of the following conditions was not met:

- A column specification of a DISTINCT set function cannot reference a column derived from a set function specification.
- A column specification of an ALL set function cannot reference a column derived from a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH710I W *csectname* LINE *nnnn* COL *cc*. **A VALUE EXPRESSION CONTAINING *column* CANNOT INCLUDE OPERATORS**

Explanation: A value expression cannot include operators in an outer reference column specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH711I W *csectname* LINE *nnnn* COL *cc*. **THE COLUMN SPECIFICATION IS MISSING OR INVALID FOR THE ALL SET FUNCTION *function***

Explanation: The value expression of an ALL set function specification should include a column specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH712I W *csectname* LINE *nnnn* COL *cc*. **THE COLUMN *column* IS NOT UNIQUE AND REQUIRES QUALIFICATION.**

Explanation: The identified column is duplicated within the current scope. Qualification must be given to uniquely identify the required column.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH713I W *csectname* LINE *nnnn* COL *cc*. **A VALUE EXPRESSION MAY NOT CONTAIN A SET FUNCTION SPECIFICATION**

Explanation: The value expression of an ALL set function might not contain a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH714I W *csectname* LINE *nnnn* COL *cc*. **THE COLUMN *column* DOES NOT IDENTIFY A COLUMN OF A TABLE WITHIN THE CURRENT SCOPE**

Explanation: One of the following conditions was found:

- The table or correlation name used as a qualifier does not exist.
- The column name does not exist within the current scope or the scope of the qualifier.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH715I W *csectname* LINE *nnnn* COL *cc*. **A SET FUNCTION THAT CONTAINS THE OUTER REFERENCED COLUMN *column* IS NOT IN THE SUBQUERY OF A HAVING CLAUSE**

Explanation: A set function specification must be contained in a subquery of a HAVING clause if it contains an outer referenced column specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH716I W *csectname* LINE *nnnn* COL *cc*. **THE RESULT OF A SUM OR AVG FUNCTION CANNOT BE A CHARACTER STRING**

Explanation: The character string is not valid for the result of a SUM or AVG set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH717I W *csectname* LINE *nnnn* COL *cc*. **THE OPERATOR *operator* IS INVALID IN THIS CONTEXT**

Explanation: One of the following conditions was not met:

- A value expression containing a distinct set function cannot include dyadic operators.
- The first character following a monadic operator cannot be a plus or minus sign.
- The value expression should not contain operators if primary is a character string.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH718I *W csectname* **LINE nnnn COL cc. THE** *exptype*
EXPRESSION IS COMPARING INCOMPATIBLE
DATA TYPES

Explanation: The data types of one of the following (identified by *exptype*) do not match:

exptype	Meaning
COMPARISON	Comparison operators must match.
BETWEEN	The three value expressions must match.
IN	Value expression, subquery, and all value specifications must match.
QUANTIFIED	Value expression and subquery must match.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH719I *W csectname* **LINE nnnn COL cc. THE**
OPERAND IN THE LIKE PREDICATE IS NOT A
CHARACTER STRING

Explanation: One of the following conditions was found:

- The data type of the column in a LIKE predicate is not a character string.
- The data type of the pattern in a LIKE predicate is not a character string.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH720I *W csectname* **LINE nnnn COL cc. THE ESCAPE**
CHARACTER MUST BE A ONE-BYTE CHAR-
ACTER STRING

Explanation: The escape character in a LIKE predicate must have the data type of character string with a length of 1.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH721I *W csectname* **LINE nnnn COL cc. THE WHERE**
CLAUSE, GROUP BY CLAUSE, OR HAVING
CLAUSE IS INVALID FOR THE GROUPED
VIEW table.

Explanation: If the table identified in the FROM clause is a grouped view, then the table expression must not contain a WHERE clause, GROUP BY clause, or HAVING clause.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH722I *W csectname* **LINE nnnn COL cc. name**
OCCURS MORE THAN ONCE IN A FROM
CLAUSE

Explanation: One of the following conditions was found:

- The table name occurs more than once in a FROM clause.
- The correlation name is identical to a table name or to another correlation name in a FROM clause.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH723I *W csectname* **LINE nnnn COL cc. ONLY ONE**
TABLE REFERENCE IS ALLOWED IN THE
FROM CLAUSE FOR A GROUPED VIEW

Explanation: If the table identified by table name is a grouped view, then the FROM clause must contain exactly one table reference.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH724I *W csectname* **LINE nnnn COL cc. A REFER-**
ENCE TO THE COLUMN column WHICH IS
DERIVED FROM A SET FUNCTION IS INVALID
IN A WHERE CLAUSE

Explanation: A value expression directly contained in the search condition of a WHERE clause must not include a reference to a column derived from a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH725I *W csectname* **LINE nnnn COL cc. A WHERE**
CLAUSE MUST BE CONTAINED IN A HAVING
CLAUSE WHEN A FUNCTION IS USED

Explanation: If a value expression directly contained in the search condition is a set function specification, then the WHERE clause must be contained in a HAVING clause.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH726I *W csectname* **LINE nnnn COL cc. THE COLUMN**
SPECIFICATION FOR column MUST BE AN
OUTER REFERENCE

Explanation: If a value expression directly contained in the search condition is a function, then the column specification in the function must be an outer reference.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH727I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN *column* IS DUPLICATED WITHIN THE CURRENT SCOPE

Explanation: The specified column is duplicated within the current scope.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH728I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN SPECIFICATION FOR *table* SHOULD BE A GROUPING COLUMN OR SHOULD BE SPECIFIED WITHIN A SET FUNCTION

Explanation: Each column specification contained in a subquery in the search condition of a HAVING clause must reference a grouping column or be specified within a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH729I W *csectname* LINE *nnnn* COL *cc*. THE DEGREE OF TABLE *table* SHOULD BE 1 WHEN USING A RESULT SPECIFICATION OF *

Explanation: The degree of the table expression must be 1 if the result specification "*" is specified in a subquery of any predicate other than an EXISTS predicate.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH730I W *csectname* LINE *nnnn* COL *cc*. THE SET FUNCTION IS NOT VALID FOR THE TABLE EXPRESSION BEGINNING WITH *table*

Explanation: One of the following conditions was not met:

- If the table expression is a grouped view, the result specification of a subquery cannot contain a set function specification.
- If the table expression is a grouped view, the select list of a query specification cannot contain a function.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH731I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN SPECIFICATION FOR *column* IS INVALID

Explanation: One of the following conditions was not met:

- For a grouped table, the column specification must reference a grouping column or be specified within a set function specification.
- If it is not a grouped table, and the value expression includes a set function specification, then each column specification must be specified within a set function.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH732I W *csectname* LINE *nnnn* COL *cc*. DISTINCT IS SPECIFIED MORE THAN ONCE.

Explanation: One of the following conditions has not been met:

- DISTINCT must not be specified more than once in a query specification, excluding any subquery of that query specification.
- DISTINCT must not be specified more than once in a subquery, excluding any subquery contained in that subquery.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH733I W *csectname* LINE *nnnn* COL *cc*. THE COMPARISON PREDICATE SUBQUERY CANNOT CONTAIN A GROUP BY OR HAVING CLAUSE

Explanation: If a subquery is specified in a comparison predicate, then the table expression whose FROM clause identifies the named table must not contain a GROUP BY clause or a HAVING clause.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH734I W *csectname* LINE *nnnn* COL *cc*. THE COMPARISON PREDICATE SUBQUERY CANNOT IDENTIFY A GROUPED VIEW

Explanation: If a subquery is specified in a comparison predicate, then the table expression whose FROM clause identifies the named table must not identify a grouped view.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH735I W *csectname* LINE *nnnn* COL *cc*. INVALID AUTHORIZATION IDENTIFIER *authid*

Explanation: The authorization identifier prefixed to the table name is invalid.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH736I W *csectname* LINE *nnnn* COL *cc*. THE TABLE OR VIEW *name* ALREADY EXISTS

Explanation: The table name or view name specified already exists in the catalog.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH737I W *csectname* LINE *nnnn* COL *cc*. THE COLUMN DEFINITION IS MISSING

Explanation: At least one column definition should be specified for a CREATE TABLE.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH738I W *csectname* LINE *nnnn* COL *cc*. THE DATA TYPE *type1* OF THE TARGET IS NOT COMPATIBLE WITH THE DATA TYPE *type2* OF THE SOURCE

Explanation: Data types should match between source and target in a FETCH and SELECT statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH739I W *csectname* LINE *nnnn* COL *cc*. YOU MUST SPECIFY A VIEW COLUMN LIST FOR *table*

Explanation: If any two columns in the table specified by the query specification have the same column name, or if any column of that table is an unnamed column, then a view column list must be specified.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH740I *xxxxxx phase* FINISHED, RC = *retcode*, LISTING IN *data-set*

Explanation: The DSNH INST phase completed with return code *retcode*. The *phase* is one of the following:

- PLI Macro Pass
- Precompiler
- CICS Command Translator
- Bind Package
- Bind Plan
- Compile/assembly
- PLI
- Prelink (unique to C/370 Compiler)
- Link
- Run

If the CLIST puts the listing into a data set, the name of the data set is shown as *data-set*. If the PRINT parameter is LEAVE, NONE, or TERM, the 'LISTING IN *data-set*' part of this message is omitted.

Refer to message DSNH756I for an explanation of the print data set names assigned during processing.

This message is issued by the following CLIST: DSNH

Severity: *retcode*

System Action: Processing continues as requested.

User Response: This phase is complete. If there are errors, other messages are produced. The next phase requested begins. The order of the phases is:

1. PLI Macro Pass
2. Precompiler
3. CICS Command Translator
4. Bind Package
5. Bind Plan
6. ASM, ASMH, C (C/370 Compiler), COBOL, COBOL2, FORTRAN, PLI
7. Prelink
8. Link
9. Run

DSNH741I *process1*(NO) IMPLIES THAT *process2* CANNOT BE RUN

Explanation: An inconsistent processing set was specified. An earlier phase and a later phase were requested, but not the intermediate step needed to process data between them. For example, requesting the precompile and the link edit without the compile produces this error. Values for *process1* are PRECOMP, CICSXLAT, COMPILE, LINK, or BIND. Values for *process2* are COMPILE, LINK, or RUN.

This message is issued by the following CLIST: DSNH

Severity: 4 (warning)

System Action: *process2* is not performed, but other processing is done.

User Response: Specify a consistent combination of processing. Application program preparation needs to run all the steps to provide a correct application program. The process does allow beginning or ending steps to be run at a different time. See message DSNH740I for the required step order.

DSNH750I INVALID DATA SET: *clist-keyword clist-keyword-parameter*

Explanation: The data set name specified on the *clist-keyword-parameter* contains unbalanced parenthesis.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST is terminated.

User Response: If a member name is to be associated with the specified data set, the member name must be enclosed in parentheses.

DSNH751I *clist* ERROR IN *parameter* VALUE *value*

Explanation: The specified CLIST keyword *parameter* does not have an acceptable value.

This message is issued by the following CLISTS: DSNH, DSNHC

Severity: 8 (error)

System Action: The CLIST processing is terminated.

User Response: Refer to the DSNH (TSO clist) section in *Command Reference* for a complete list of the supported CLIST parameters and their associated values. Correct the invalid parameter, and resubmit the job.

DSNH752I INPUT DATA SET NAME IS MISSING OR NONE

Explanation: The DSNH CLIST requires a value for the input data set name (INPUT). You cannot use an input data set name of NONE.

This message is issued by the following CLIST: DSNH

Severity: 0 (successful)

System Action: The CLIST prompts for a name, if prompting is allowed. If prompting is not allowed, for example in batch or when PROFILE NOPROMPT was entered, the CLIST terminates.

User Response: Specify an INPUT name. See message DSNH753I.

DSNH753I ENTER INPUT DATA SET NAME

Explanation: The CLIST is requesting the name of the input data set.

This message is issued by the following CLIST: DSNH

Severity: 0 (successful)

System Action: The system waits for user to enter data set name or for the CLIST to be terminated.

User Response: Enter the name of the data set. Do not specify the parameter or command, but just enter the name of the data set. The standard TSO prefixing will be done if the data set name is not entered within apostrophes.

DSNH754I *clist* OUTNAME PARAMETER *name* MUST NOT CONTAIN SPECIAL CHARACTERS

Explanation: The DSNH and DSNHC CLISTs, *clist*, use the OUTNAME parameter to build names for a number of data sets that are passed from phase to phase. These names are prefixed by an authorization ID or TSO prefix value and have a number of suffixes. For this reason, OUTNAME parameter *name* must not contain special characters. It can contain a period or national characters. It cannot have apostrophes to specify a single data set name.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST is terminated.

User Response: Correct the input request. The default for this parameter is TEMP, which should be adequate for most usage.

DSNH755I OUTNAME PARAMETER *name* MUST NOT BEGIN THE SAME AS INPUT *input*

Explanation: The DSNH CLIST uses the OUTNAME parameter *name* to build a number of data sets that are passed from phase to phase. These data sets could conflict with the INPUT data set (*input*) if the names are the same, causing the INPUT data set to be overwritten. To avoid this problem, the names are not allowed to have the same initial characters.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST is terminated.

User Response: Correct the input request. Specify a different OUTNAME. The default for OUTNAME is TEMP.

DSNH756I *clist* PRINT PARAMETER *name* MUST NOT CONTAIN SPECIAL CHARACTERS

Explanation: The DSNH and DSNHC CLISTs (*clist*) use the PRINT parameter to build names for data sets used for the print listings from various phases. These names are prefixed by an authorization ID or a TSO prefix value and have a number of suffixes. The PRINT parameter *name* can contain a period or national characters, but it cannot contain special characters. It cannot have apostrophes to specify a single data set name.

The data set names built using the PRINT(print) qualifier are the following:

print.CXLIST	CICS Command Translator
print.LINKLIST	Linkage Editor
print.LIST	Compiler or Assembler
print.PCLIST	DB2 Precompiler
print.SYSCPRT.LIST	C/370 Compiler
print.SYSOUT.PRELLIST	C/370 Prelink Utility

This message is issued by the following CLISTs: DSNH, DSNHC

Severity: 8 (error)

System Action: The CLIST terminates.

User Response: Correct the *name* specified with the PRINT parameter.

DSNH757I ERROR IN PLAN NAME LENGTH *value*

Explanation: The *value* is too long for a plan name. A plan name has a maximum of 8 characters.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST is terminated.

User Response: Specify a plan name with 8 or fewer characters.

DSNH758I HOST(*host-language*) IS NOT PERMITTED WITH RUN(IMS) OR RUN(CICS)

Explanation: There is no facility for connecting a FORTRAN program to either IMS or CICS.

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST terminates.

User Response: Use the specified language in the TSO or batch environment.

DSNH759I *clist* TERMINATING, *phase* RC = *retcode*

Explanation: The DSNH or DSNHC *clist* terminated at *phase* because the return code *retcode* was greater than or equal to the RCTERM parameter value.

The *phase* is one of the following:

ASM	ASMH
BIND Package	BIND Plan
	CICS Command Translator
COBOL	COB2
CLIST CHECKING	FORTRAN
PLI	C (C/370 Compiler)
Prelink	Link
PLI Macro Pass	Precompiler
Run	

This message is issued by the following CLISTS: DSNH, DSNHC

Severity: *retcode*

System Action: The CLIST terminates.

User Response: Determine the cause for the high return code. If the parameters include TERM(NONE) and direct the PRINT to a data set, you might need to search the print data sets for the listing of the error. Refer to message DSNH756I for an explanation of the print data set names assigned during processing.

Problem Determination: The location of the messages describing the prior errors depends upon the values of the TERM and PRINT parameters. The messages can be directed to the terminal, to preallocated data sets, or to data sets dynamically allocated during CLIST processing.

If TERM(NONE) PRINT(NONE) was specified, the messages are not available. Execute the CLIST again and specify a location for the error messages.

To find the documentation, note the immediately preceding DSNH740I message for the location of the listings. If the 'LISTING IN data-set' portion of the message is missing, specify a PRINT data set, SOURCE(YES) and XREF(YES), and execute the CLIST again. Use TERM(TERM) to direct error messages to your terminal. These listings and execution of the DSNH CLIST are required for problem diagnosis.

If the error is in the CLIST or the error location is CLIST CHECKING, use CONTROL(SYMLIST) to produce a detailed trace of the CLIST execution and provide the trace listing.

Check for DSNH751I messages that describe the error.

DSNH760I PRELINK OPTION INVALID WITH HOST LANGUAGE (*host-language*)

Explanation: Invocation of the PRELINK step is not supported by *host-language*. This option is valid only with C language (C/370 compiler).

This message is issued by the following CLIST: DSNH

Severity: 8 (error)

System Action: The CLIST terminates.

User Response: Refer to the description of the DSNH PRELINK keyword option in *Command Reference* .

DSNH770I W csectname LINE nnnn COL cc. YOU MUST DECLARE COLUMN column AS NOT NULL

Explanation: All columns identified as UNIQUE must be defined with the NOT NULL option.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH771I W csectname LINE nnnn COL cc. THE VIEWED TABLE table MUST BE UPDATEABLE

Explanation: When the WITH CHECK OPTION is specified, then the viewed table must be updateable.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH772I W csectname LINE nnnn COL cc. INVALID NUMBER OF COLUMN NAMES

Explanation: The number of column names in the view column list should be the same as the degree of the table specified by the query specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH773I W csectname LINE nnnn COL cc. YOU MUST DECLARE THE CURSOR cursor BEFORE USE

Explanation: The cursor specified was not declared in a DECLARE CURSOR statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH774I W csectname LINE nnnn COL cc. THE CURSOR cursor IS ALREADY DECLARED

Explanation: The cursor specified was already declared in a DECLARE CURSOR statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH775I W csectname LINE nnnn COL cc. ONLY '*' OR COLUMN NAMES ARE VALID IN THIS CONTEXT

Explanation: When UNION is specified, the select list for the specification of the two table expressions identified by the query expression and query term should consist of '*' or column specifications.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH776I W csectname LINE nnnn COL cc. THE DESCRIPTIONS OF TABLES IDENTIFIED BY THE QUERY EXPRESSION BEGINNING WITH TABLE: table1 AND THE QUERY TERM BEGINNING WITH TABLE: table2 SHOULD BE IDENTICAL

Explanation: When UNION is specified, the descriptions of the two tables should be identical, except for the column names.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH777I W *csectname* LINE *nnnn* COL *cc*. THE SORT SPECIFICATION *number* IS OUTSIDE THE DEGREE OF TABLE *table*

Explanation: If the sort specification contains an unsigned integer, it should be greater than zero and not greater than the number of columns in the table.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH778I W *csectname* LINE *nnnn* COL *cc*. THE TABLE *table* IS A READ-ONLY TABLE

Explanation: A DELETE, an INSERT, or an UPDATE statement was specified on a read-only table.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH779I W *csectname* LINE *nnnn* COL *cc*. THE TABLE *table* MUST NOT BE IDENTIFIED IN A FROM CLAUSE OF ANY SUBQUERY CONTAINED IN A SEARCH CONDITION

Explanation: A table specified in a DELETE or an UPDATE statement cannot be used in a FROM clause of any subquery contained in its search condition.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH780I W *csectname* LINE *nnnn* COL *cc*. THE TABLE *table1* IS NOT THE FIRST TABLE *table2* SPECIFIED IN THE DECLARE CURSOR STATEMENT

Explanation: The table specified in a DELETE or an UPDATE statement should be the first table specified in the FROM clause of the DECLARE CURSOR statement.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH781I W *csectname* LINE *nnnn* COL *cc*. THE NUMBER OF TARGET SPECIFICATIONS DO NOT MATCH THE DEGREE OF TABLE *table*

Explanation: The number of target specifications in the FETCH statement do not match the degree of the table specified.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH782I W *csectname* LINE *nnnn* COL *cc*. THE TARGET TABLE *table* OF THE INSERT STATEMENT IS ALSO IN THE FROM CLAUSE OR IN A CONTAINED SUBQUERY

Explanation: The named table must not be identified in a FROM clause of a query specification or of any subquery contained in the query specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH783I W *csectname* LINE *nnnn* COL *cc*. THE NUMBER OF COLUMNS SPECIFIED DOES NOT MATCH THE NUMBER OF VALUES SPECIFIED

Explanation: In an INSERT statement, the number of columns specified does not match the number of values specified.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH784I W *csectname* LINE *nnnn* COL *cc*. THE NUMBER OF COLUMNS SPECIFIED DOES NOT MATCH THE DEGREE OF TABLE *table* IN THE QUERY SPECIFICATION

Explanation: The number of columns specified in an INSERT statement does not match the degree of the table specified in the query specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH785I W *csectname* LINE *nnnn* COL *cc*. THERE IS A DATA TYPE OR LENGTH MISMATCH BETWEEN COLUMN *column* AND ITS INSERT OR UPDATE ITEM

Explanation: One of the following conditions was not met:

- If the data type of the column name is character string, then the corresponding item in the INSERT or UPDATE statement should be character string with a length equal to or less than the length of the column name.
- If the data type of the column name is exact numeric, then the corresponding item in the INSERT or UPDATE statement should be exact numeric.
- If the data type of the column name is approximate numeric, then the corresponding item in the INSERT or UPDATE statement should be approximate numeric or exact numeric.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH786I W *csectname* LINE *nnnn* COL *cc*. YOU CANNOT USE A GROUP BY OR HAVING CLAUSE OR IDENTIFY A GROUPED VIEW IN THIS CONTEXT

Explanation: The table identified in the FROM clause of the table expression in a SELECT statement should not include a GROUP BY or HAVING clause and should not identify a grouped view.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH787I W *csectname* LINE *nnnn* COL *cc*. THE NUMBER OF ELEMENTS SPECIFIED IN THE SELECT LIST SHOULD MATCH THE NUMBER IN THE TARGET LIST

Explanation: In the SELECT statement, the number of elements specified in the select list should match the number of elements in the target list.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH788I W *csectname* LINE *nnnn* COL *cc*. THE SET FUNCTION *function* IS NOT ALLOWED IN AN UPDATE STATEMENT

Explanation: A value expression in a SET clause of an UPDATE statement should not include a set function specification.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH789I W *csectname* LINE *nnnn* COL *cc*. YOU CANNOT SPECIFY NULL FOR NOT NULL COLUMN *column*

Explanation: If NULL is specified in the SET clause of the UPDATE statement, then the corresponding column should allow nulls.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH790I W *csectname* LINE *nnnn* COL *cc*. THERE IS AN INVALID SQL TERMINATOR FOR THE HOST LANGUAGE

Explanation: The SQL statement was not terminated by the correct construct for the host language being processed.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH791I W *csectname* LINE *nnnn* COL *cc*. YOU MUST DEFINE THE HOST VARIABLE *identifier*

Explanation: The host variable named was either not defined within the program or defined outside the SQL declaration section.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH792I W *csectname* LINE *nnnn* COL *cc*. THE TABLE *table* WAS NOT FOUND IN THE CATALOG

Explanation: The named table does not exist in the catalog.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH793I W *csectname* LINE *nnnn* COL *cc*. THERE IS AN INVALID IDENTIFIER FORMAT *identifier* FOR HOST LANGUAGE *language*

Explanation: The format of the identifier name displayed does not meet the requirements of the host language.

Severity: 4

User Response: Note the deviation from the applicable standard. Check and correct the SQL statement.

DSNH870I W *csectname* THERE IS NOT ENOUGH MEMORY FOR THE FLAGGER; FLAGGING IS DISCONTINUED

Explanation: The flagger could not allocate enough storage to load all required modules.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: Increase the region size in the JCL for the application. Allocate more storage for flagger operation.

DSNH871I W *csectname* AN ERROR OCCURRED WHEN ATTEMPTING TO LOAD THE FLAGGER MODULE *module*. FLAGGING IS DISCONTINUED

Explanation: A flagger module was not found during flagger initialization.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: Refer to the message produced by the operating system for details of causes and proceed as instructed for that message.

DSNH872I W *csectname* AN ERROR OCCURRED WHEN INITIALIZING THE FLAGGER. FLAGGING IS DISCONTINUED

Explanation: An internal error occurred during flagger initialization.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH873I W *csectname* THE FLAGGER COULD NOT PROCESS THE SQL STATEMENT. FLAGGING IS DISCONTINUED

Explanation: An SQL statement passed to the flagger caused an internal error within the flagger.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH874I W csectname AN ERROR OCCURRED WHEN TERMINATING THE FLAGGER

Explanation: An internal error occurred during flagger termination.

Severity: 4

System Action: Precompiling continues but flagger operation is discontinued.

User Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH875I W csectname AN ERROR OCCURRED WHEN ATTACHING TO DB2, REASON CODE: X'reason'; FLAGGING CONTINUED AS SYNTAX ONLY

Explanation: An error occurred while trying to connect or disconnect from the DB2 subsystem.

Severity: 4

System Action: Processing continues without semantics flagging.

User Response: Refer to the reason code returned in this message and perform corrective actions.

DSNH876I W csectname AN ERROR SQLCODE sqlcode WAS RETURNED DURING FLAGGER ACCESS TO THE CATALOG OBJECT authid.table. MODULE NAME: module ERROR REASON CODE: X'reason'; FLAGGING CONTINUES WITH SYNTAX CHECK ONLY

Explanation: An error occurred during the execution of a flagger access to the DB2 catalog.

Severity: 4

System Action: Processing continues without semantics flagging.

User Response: Use the provided SQL return code, object type, and name to identify the problem. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH877I W csectname NOT ENOUGH MEMORY FOR FLAGGER OPERATION: RETURN CODE: return

Explanation: Insufficient storage is available for flagger operation.

Severity: 4

System Action: Processing continues without flagging.

User Response: Check whether the storage allocation for the precompiler can be increased. Allocate more storage for flagger operation.

DSNH878I W csectname ERROR RELEASING FLAGGER MEMORY; FLAGGING IS DISCONTINUED

Explanation: An error occurred when a flagger module attempted to release storage back to the flagger pool.

Severity: 4

System Action: Processing continues without flagging.

User Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH879I W csectname ERROR RELEASING FLAGGER MEMORY; RETURN CODE return

Explanation: An error occurred when a flagger module attempted to release storage back to the operating system.

Severity: 4

System Action: Processing continues without flagging.

User Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH880I W csectname AN ERROR WAS RETURNED DURING FLAGGER ACCESS TO THE DB2 CATALOG; REASON CODE: X'reason' RETURN CODE X'return'

Explanation: An error occurred when a flagger module attempted to access the system catalog.

Severity: 4

System Action: Processing continues without flagging.

User Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNH901I S csectname U LINE nnnn COL cc INTERNAL PRECOMPILER ERROR – REASON CODE ccc

Explanation: An internal compiler consistency check failed. Reason codes are:

- 000 The message formatter was called with an unlisted internal message number.
- 001 The parser received a token code of 0 from the lexical scan. Lexical scan refers to a scan of words rather than syntax.
- 002 Error in storage suballocation control blocks.
 - The error might have occurred because a DB2 SQL statement limitation was exceeded. The SQL statement might be referencing, creating, or declaring more columns than the DB2 defined maximum number allowed for an SQL statement. Another possibility is that too many host variables are being referenced in the SQL statement.
- 003 Error in a storage suballocation request.
 - This error might have occurred because of storage constraints when building the DBRM entry for the SQL statement or because the SQL statement exceeds the DB2 maximum statement length.

- 004 Error in pointer structures.
- 005 On BIND or REBIND, a host variable was not found.
- 006 Unexpected value for parser option.
- 007 The internal limit was exceeded.
- A fully qualified name exceeds the maximum length of 255 characters.
 - The size of a DBRM record exceeds 65536 bytes of storage.
- 008 Internal conversion error.
- An error occurred when converting a timestamp version-id.

Severity: 16 (unrecoverable error)

System Action: The precompiler is terminated immediately.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: A copy of the application program source and the printout is useful (specify SOURCE and XREF).

DSNH904I *csectname* **U STORAGE OVERFLOW**

Explanation: More storage is needed, but could not be obtained during precompiler/parser execution.

Severity: 16 (unrecoverable error)

System Action: The precompiler/parser is terminated immediately.

System Programmer Response: The storage required for the current statement could not be acquired or exceeds the maximum for a single request. If the region size is being used completely, check whether the region can be expanded. If it cannot be expanded, the SQL statement is too large to be processed.

DSNI... Messages

DSNI001I RESTART HAS BEEN DEFERRED REASON reason TYPE type NAME name

Explanation: Restart could not be performed for one or more pages of the resource identified by *type* and *name*. Those pages are placed in the logical page list (LPL) and restart for those pages is deferred. The reason code explains why restart was not performed.

Refer to Table 3 on page X-7 for an explanation of resource type codes.

This message is issued by the following CSECT: DSNIIMPD

System Action: DB2 restart continues. Pages for which restart activity was not performed are put into the LPL.

User Response: Correct the problem indicated by the reason code. Then use the START DATABASE command or the RECOVER utility to remove the pages from the LPL.

DSNI002I *csect-name* UNABLE TO START OBJECT TYPE *object-type* OBJECT NAME *object-name* REASON *reason* TYPE *type* NAME *name*

Explanation: The resource identified could not be started because it was unavailable. The resource could be a database, a table space, an index space, or a partition within a table space or an index space. The 'object-type' identifies the type. The 'object-name' identifies the name. If the DB2 catalog is unavailable, 'object-type' contains binary zeros and 'object-name' contains blanks.

The resource that was unavailable is identified by 'type' and 'name'. The 'type' code identifies the type of the resource as well as the format and content of the 'name'. For an explanation of resource type codes, see "Resource Types" on page X-7. The 'reason' contains the reason code explaining why the resource was unavailable.

System Action: The specified database, space, or partition is not started and remains in its current state. If there are other databases, spaces, or partitions to be started, they are processed normally.

User Response: Correct the resource unavailable problem and reissue the -START command.

DSNI003I *csect-name* UNABLE TO STOP OBJECT TYPE *object-type* OBJECT NAME *object-name* REASON *reason* TYPE *type* NAME *name*

Explanation: The identified object could not be stopped because a resource required to perform the stop was unavailable. The object could be a database, a table space, an index space, or a partition within a table space or an index space.

The 'object-type' identifies the type and 'object-name' identifies the name. If the DB2 catalog is unavailable, 'object-type' contains binary zeros and 'object-name' contains blanks.

The resource that was unavailable is identified by 'type' and 'name'. The 'type' code identifies the type of the resource as well as the format and content of the resource, 'name'. For an explanation of resource type codes, see "Resource Types" on page X-7. The 'reason' contains the reason code explaining why the resource was unavailable.

System Action: The specified database, space, or partition is not stopped and remains in the current state. If there are other databases, spaces, or partitions to be stopped, they are processed normally.

User Response: Correct the resource unavailable problem and reissue the -STOP command.

DSNI004I RESOURCE HAS BEEN STOPPED TYPE *type* NAME *name*

Explanation: The resource identified by TYPE and NAME could not be opened/closed, initialized, or was found to be in an inconsistent state. The resource has been 'stopped' by DB2. If an open error occurred during DB2 startup, restart processing for the resource was deferred.

TYPE and NAME identify the resource that has been stopped. The TYPE code identifies the type of the resource as well as the format and content of the resource, NAME.

For an explanation of resource type codes, see "Resource Types" on page X-7.

This message is issued by the following CSECTS: DSNISDBA, DSNIBWAC

System Action: The database, table space or index space is stopped by DB2.

User Response: Previous messages provide information to allow you to determine the cause of the problem and the method of correcting it. Refer to them, and correct the problem. Then restart the database, table space, or index space using the -START command; and invoke the application again.

DSNI005I *csect-name* LPL OR GRECP RECOVERY CANNOT BE DONE FOR START DATABASE COMMAND-ID = *command-id* OBJECT TYPE *object-type* OBJECT NAME *object-name* REASON *reason* TYPE *type* NAME *name*

Explanation: The resource identified could not be recovered during a START DATABASE command identified by the 'command-id' because of problems during LPL or GRECP recovery. The resource could be a table space, an index space, or a partition within a table space or an index space. The 'object-type' identifies the type. The 'object-name' identifies the name.

The resource that could not be recovered is identified by 'type' and 'name'. The 'type' code identifies the type of the resource as well as the format and content of the 'name'. The 'reason' contains the reason code explaining why the resource could not be recovered. For an explanation of resource type codes, see "Resource Types" on page X-7. The 'reason' contains the reason code explaining why the resource could not be recovered.

The 'command-id' is a decimal number that represents a START DATABASE command.

This message, in combination with message DSNI006I or DSNI022I, provides the LPL or GRECP recovery information for a START DB command identified by the 'command-id'.

System Action: The specified space, or partition is started but remains in a LPL/GRECP state. If there are other spaces or partitions to be recovered, they are processed normally.

User Response: Correct the problem specified by the reason code and reissue the -START command.

DSNI006I **csect-name ASYNCHRONOUS GRECP OR LPL RECOVERY IN PROGRESS FOR START DATABASE COMMAND-ID = command-id TYPE type NAME name**

Explanation: This message is issued in response to a START DATABASE command when the object (table space or index space) identified by TYPE and NAME had group buffer pool recovery pending (GRECP) or logical page list (LPL) status, and recovery was triggered.

The 'command-id' is a decimal number that represents a START DATABASE command.

Refer to "Resource Types" on page X-7 for an explanation of resource type codes.

System Action: The object is started. Also, GRECP or LPL recovery is initiated. During LPL or GRECP recovery process, message DSNI022I might be issued periodically to indicate the recovery status. If the recovery completes successfully, message DSNI021I will appear at the end of recovery, otherwise message DSNI005I will indicate the error.

User Response: Wait for the DSNI021I or the DSNI005I message to be issued to the console. You can periodically issue a DISPLAY DATABASE RESTRICT command for the specified table space or index space to determine whether the GRECP or LPL exception state has been cleared.

DSNI007I **csect-name UNABLE TO START/RECOVER BECAUSE UNABLE TO DIRECT READ A LOG RECORD LOGRBA logrba**

Explanation: Unable to START (or RECOVER) because the necessary log records could not be accessed. Either an error occurred while attempting to allocate or open the log data set or an expected log record was not found on the log.

If the message is in response to a START command, issue the -DISPLAY command to determine which resource(s) was not started. If the message is in response to a RECOVER utility, the resource is the table space or index space that is the object of the RECOVER.

LOGRBA gives the log RBA of the log record that is unavailable.

System Action: The resource is not started (or recovered) and remains in the current state. If this is a START command, the resources are processed normally if there are other databases or spaces to be started and they do not involve reading the log.

User Response: Resubmit the utility, or reissue the START command, when the problem with the log has been resolved.

System Programmer Response: Run the print log map (DSNJU004) utility. This may be run with DB2 up or down. Find the data set that contains the requested RBA in the output of DSNJU004. If the required RBA is not in a listed data set, one of the following may have occurred:

- The data set was deleted from the bootstrap data set by a run of the change log inventory (DSNJU003) utility. In this case, rerun the utility to insert the missing data set name. DB2 must be down to run this utility.
- The bootstrap data set has been damaged. In this case, the BSDS must be restored from the dump that occurred with the most recent archive log data set. DSNJU003 must

be run to supply changes that occurred during and after the last off-load operation. Changes may be determined from the operator's console listing.

If a listed log data set contains the required RBA, this message will be preceded by one or more error messages from the log manager (DSNJ). See these messages for appropriate action.

Problem Determination: Issue the -DISPLAY command to verify what got started.

DSNI008I **DATABASE VALIDATION PROCEDURE name COULD NOT BE LOADED**

Explanation: The database validation procedure identified by 'name' could not be loaded.

This message is issued by the following CSECT: DSNIENSR

User Response: Correct the name, and rerun the application.

DSNI009I **csect-name DATABASE EDIT PROCEDURE name COULD NOT BE LOADED**

Explanation: The database edit procedure identified by 'name' could not be loaded.

User Response: Correct the name, and rerun the application.

DSNI010I **BROKEN PAGE ACCESSED TYPE type NAME name MODNAME csect-name CONN-ID id CORR-ID id LUW-ID id**

Explanation: The page identified by TYPE and NAME could not be accessed, because it is marked as logically broken.

The TYPE and NAME identify the resource that is currently unavailable. The TYPE code identifies the type of the resource as well as the format and content of the resource NAME.

Type codes '00000301', '00000302', and '00000303' apply to this message. Refer to "Appendix B. Problem Determination" on page X-5 for a table showing all types and names.

'csect-name' has encountered the logically broken page. CONN-ID, CORR-ID, and LUW-ID identify the thread involved in the problem. If the LUW-ID is an '*', the thread originated at this site. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

This message is issued by the following CSECT: DSNIADBR

User Response: If the TYPE is '00000300', use NAME to determine if the page is in an index space or a table space. Use the REPAIR utility to fix the broken page. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNI011I **PAGE TEMPORARILY UNAVAILABLE TYPE type NAME name MODNAME modname ERQUAL erqual**

Explanation: The page identified by TYPE and NAME has been temporarily marked as logically broken to prevent access until it can be recovered.

The TYPE and NAME identify the resource that is currently unavailable. The TYPE code identifies the type of the resource as well as the format and content of the resource NAME. Refer to Table 3 on page X-7 for an explanation of resource type codes.

The module named modname has called a page checking routine, which discovered an error in the page.

The ERQUAL gives the trace id for the error in the page. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

This message is issued by the following CSECT: DSNI012I

System Action: Automatic recovery for the page has been scheduled. The current agent will abend with reason code '00C90105', and a dump will be taken. The page will be unavailable to this and other agents until the online recovery has completed successfully. Message DSNI010I will be issued, and a 'resource unavailable' condition will be returned to any agents that attempt to access the page. If the online recovery fails, the page will be marked as broken until it is repaired or recovered (see message DSNI012I).

User Response: Save the dump. Watch for message DSNB215I (indicating successful recovery of the page), or DSNI012I (indicating failure of recovery of the page).

DSNI012I PAGE LOGICALLY BROKEN TYPE type NAME name MODNAME modname ERQUAL erqual

Explanation: The page identified by TYPE and NAME is logically incorrect. Additional attempts to access the page will be denied.

The TYPE and NAME identify the resource that is currently unavailable. The TYPE code identifies the type of the resource as well as the format and content of the resource NAME. Refer to Table 3 on page X-7 for an explanation of resource type codes.

The module named 'modname' has called a page checking routine, which discovered an error in the page.

The ERQUAL gives the trace id for the error in the page. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem. An ERQUAL of X'0000' indicates that an abend occurred during online recovery or recover utility. The page has been marked as broken, and the recovery has failed.

This message is issued by the following CSECTS:

DSNI012I DSNI012I DSNI012I DSNI012I

System Action: The page is marked as logically broken, an 04E abend with reason code '00C90102' is issued, and a dump is taken. The page will be unavailable to this and other agents until it is repaired.

User Response: Save the dump for analysis by IBM Support Center. Copy the table space or index space to another data set for later analysis by IBM Support Center. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Operator Response: Notify the system programmer.

System Programmer Response: See the Explanation section of this message.

DSNI013I csect-name POTENTIALLY INCONSISTENT DATA REASON reason ERQUAL erqual TYPE type NAME name CONN-ID id CORR-ID id LUW-ID id

Explanation: This message identifies a page with potentially inconsistent data. This message is issued for each page involved in the current data manager operation. The 'csect-name' in the message identifies the CSECT that issued the message.

The 'erqual' in the message identifies the specific abend in the CSECT that caused this message to be issued. This information and the reason code are used by IBM Support Center to identify the cause of the problem.

'name' and 'type' identify the page and its type. The TYPE code identifies the type, as well as the format and content, of the NAME. Refer to "Appendix B. Problem Determination" on page X-5 for a table showing all types and names.

CONN-ID, CORR-ID, and LUW-ID together identify the thread involved in the problem. If the LUW-ID is an '*', the thread originated at this site. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

For further information, see the Explanation section for the abend reason code specified in this message.

System Action: The job is abended shortly after this message appears.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run. Save this output for use in problem determination.

System Programmer Response: See the Problem Determination section for the specific abend reason code.

Problem Determination: See the System Programmer Response section of the abend reason code specified in this message.

DSNI014I csect-name DATA IN USE DURING ABEND REASON 00C90101 ERQUAL erqual TYPE type NAME name CONN-ID id CORR-ID id LUW-ID id

Explanation: This message identifies a page that was in use at the time an abend condition occurred with reason code 00C90101. This message is issued for each page involved in the current operation.

ERQUAL identifies the specific abend in the CSECT that caused this message to be issued. This information and the reason code are used by IBM Support Center to identify the cause of the problem.

NAME and TYPE identify the page and its type. The TYPE code identifies the type, as well as the format and content, of the NAME. Refer to Table 3 in "Appendix B. Problem Determination" on page X-5 for an explanation of resource type codes.

CONN-ID, CORR-ID, and LUW-ID together identify the agent involved in the problem. If the LUW-ID is an '*', the thread originated at this site. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

System Action: The job abends with reason code 00C90101 after this message appears.

User Response: Notify the system programmer.

Operator Response: Collect the console output from the system on which the job was run for the period of time spanning the failure. Save this output for use in problem determination.

System Programmer Response: See abend reason code 00C90101 for more information.

Problem Determination: In general, the data in these pages is fine. However, if problems are reported that repeatedly involve the same pages or if the same pages are reported by other abends, you might want to analyze the set of pages involved.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNI015I OBJECT name IS ALREADY STARTED FOR RW ACCESS. THE OBJECT WILL REMAIN STARTED FOR RW ACCESS

Explanation: The -START DATABASE command with the ACCESS(FORCE) keyword was entered, but the object specified was already started for read/write access.

This message is issued by the following CSECT: DSNILSTS

DSNI016I RESOURCE TYPE type NAME name MUST FIRST BE STOPPED BEFORE IT CAN BE STARTED IN A DIFFERENT ACCESS MODE

Explanation: When issuing the -START DATABASE command on the ROSHARE OWNER system, the object to be started must first be stopped before changing access modes. For example, if a table space in a database defined as ROSHARE OWNER is started for RW access, before it can be started for RO access it must be stopped via the -STOP DATABASE command. It can then be started for RO access via the -START DATABASE command.

This message is issued by the following CSECT: DSNILSTS

Severity: 8 (error)

System Action: The -START DATABASE command is not allowed to proceed.

User Response: Issue a -STOP DATABASE command to stop the object before attempting to start it.

DSNI017I RESOURCE TYPE type NAME name IS INCONSISTENT DUE TO ONE OR MORE PENDING STATES

Explanation: There are two possible reasons for this message:

1. The header page of a table space, index, or partition belonging to a database defined as ROSHARE OWNER could not be marked as consistent during the processing of the STOP DATABASE command because one or more of the following was true:
 - The table space, index, or partition is in recovery pending status.
 - The table space, index, or partition is in check pending status.
 - The table space, index, or partition has pages in the logical page list (LPL).

- The table space, index, or partition status has a utility in progress (UTUT status on the output from a DISPLAY DATABASE command).
- The table space, index, or partition has a utility in progress that allows read-only access (UTRO on the output from a DISPLAY DATABASE command).
- An I/O error range exists.

2. A retained lock is held on the table space, index, or partition. The retained lock could be signifying a pending status.

If the STOP DATABASE command was issued without specifying the SPACENAM parameter, then one or more of the conditions stated above is true for one or more table spaces, indexes, or partitions in the specified database.

This message is issued by the following CSECT: DSNILSTS

Severity: 4 (warning)

System Action: For case 1, if the STOP DATABASE command was specified with the SPACENAM parameter, the table space, index, or partition is stopped. DB2 does not allow access to an inconsistent table space, index, or partition by any ROSHARE READ system.

For case 2, no access to an inconsistent table space, index, or partition is allowed until the retained lock is released by the failed system at completion of its restart.

User Response: Issue a DISPLAY DATABASE command to display the status of the object in question. Resolve the pending states and then reissue the STOP DATABASE command to ensure that the consistency indicator is reset.

DSNI018I UNABLE TO GET LOCK FOR RESOURCE TYPE type NAME name. WILL RETRY TO GET LOCK.

Explanation: The resource identified by 'type' and 'name' could not be locked because of lock contention. The lock request is made again for this resource.

The 'type' and 'name' identify the resource trying to get a lock. The 'type' code identifies the type of resource as well as the format and content of the resource 'name'.

Refer to Table 3 in "Appendix B. Problem Determination" on page X-5 for an explanation of resource type codes.

This message is issued by the following CSECT: DSNISTPS

Severity: 0 (informational)

System Action: The lock request is made again for the specified resource.

DSNI019I THE STOP COMMAND FOR OBJECT name WAS OVERRIDDEN BY A START FORCE. THE STOP COMMAND IS IGNORED.

Explanation: The object identified by 'name' was not stopped because a START FORCE command on this object was subsequently issued and processed.

This message is informational only.

This message is issued by the following CSECT: DSNISTPS

Severity: 0 (informational)

System Action: The object is not stopped.

DSNI020I *csect-name* **UNABLE TO DRAIN RESOURCE TYPE *type* NAME *name*. WILL RETRY DRAINING THE RESOURCE.**

Explanation: The resource identified by 'type' and 'name' could not be drained. The 'type' code identifies the type of resource as well as the format and content of the resource 'name'. The drain request is made again for this resource.

Refer to Table 3 in "Appendix B. Problem Determination" on page X-5 for an explanation of resource type codes.

System Action: The drain request is made again for the specified resource.

DSNI021I *csect-name* **GRECP OR LPL RECOVERY FOR START DATABASE COMMAND-ID = *command-id* TYPE *type* NAME *name* HAS COMPLETED SUCCESSFULLY.**

Explanation: The group buffer pool recovery pending (GRECP) or logical page list (LPL) exception state of the table space or index space identified by TYPE and NAME has been cleared.

The 'command-id' is a decimal number that represents a START DATABASE command.

Refer to "Resource Types" on page X-7 for an explanation of resource type codes.

This message is always preceded by the DSN1006I message, which indicates the beginning of the LPL or GRECP recovery for the object.

System Action: The identified table space or index space is started normally.

DSNI022I *csect-name* **LPL or GRECP RECOVERY LOG APPLY FOR START DATABASE COMMAND-ID = *command-id* AT LOGPOINT *xxx* TO LOGPOINT *yyy***

Explanation: This message periodically shows the progress of the LPL or GRECP recovery of a START DATABASE command.

The 'command-id' is a decimal number that represents a START DATABASE command.

The 'xxx' is the LOGPOINT of the log record currently being processed. The 'yyy' is the LOGPOINT of the last log record that will be applied in this recovery. The value of logpoint is RBA in a non-data sharing environment and LRSN in a data sharing environment.

This message, in combination with message DSN1006I, DSN1005I or DSN1021I, provides the LPL or GRECP recovery information for a START DATABASE command identified by the 'command-id'.

System Action: The LOGAPPLY phase continues normally.

DSNJ... Messages

DSNJ001I *csect-name* CURRENT COPY *n* ACTIVE LOG
DATA SET IS DSNAME=..., STARTRBA=...,
ENDRBA=...

Explanation: This message is generated for one of two reasons:

1. When the log manager is initialized, it sends this informational message to identify the current active log data sets (copy-1 and, if dual logging is used, copy-2).
2. When the current active log data set is full, DB2 will switch to the next available active log data set. This message identifies the next available active log data set which will be used for logging.

The value specified by the STARTRBA=value keyword is the RBA of the first byte of log data in the named data set. The value specified by the ENDRBA=value keyword is the RBA of the last possible byte in the data set. These values may later be needed for a conditional restart.

System Programmer Response: None required. However, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ002I FULL ACTIVE LOG DATA SET DSNAME=...,
STARTRBA=..., ENDRBA=...

Explanation: This message is sent at the time the log manager fills an active log data set and switches to a new empty data set. The message shows the name and log RBA range of the full data set.

This message is issued by the following CSECT: DSNJW307

System Programmer Response: None required. However, if recovery is required information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ003I *csect-name* FULL ARCHIVE LOG VOLUME
DSNAME=..., STARTRBA=..., ENDRBA=...,
STARTxxxx=..., ENDxxxx=..., UNIT=...,
COPYnVOL=..., VOLSPAN=..., CATLG=...

Explanation: Offloading for the specified archive log data set was successfully completed for the given volume. If the data set spans multiple tape volumes, this message is generated for each tape volume. 'xxxx' is replaced by either TIME or LRSN.

System Action: An archive log data set has been created, and the archive log data set inventory in the bootstrap data set (BSDS) has been updated with the information in the message:

DSNAME	The name of the archive log data set.
STARTRBA	The starting RBA contained in the volume.
ENDRBA	The ending RBA contained in the volume.
STARLTRSN	The starting LRSN contained in the volume for data sharing systems.
ENDLRSN	The ending LRSN contained in the volume for data sharing systems.
STARTTIME	The starting store-clock value of the log records in the volume for non-data sharing systems.

ENDTIME	The ending store-clock value of the log records in the volume for non-data sharing systems.
UNIT	The device unit to which the data set was allocated.
COPYnVOL	The name of the volume. This message keyword is displayed as COPY1VOL if this is the copy-1 archive log data set, and as COPY2VOL if this is the copy-2 archive log data set.
VOLSPAN	An indicator to denote one of four conditions: <ul style="list-style-type: none"> • If '00', the data set is entirely contained on the volume specified by 'COPYnVOL'. • If '01', this is the first entry of a multi-volume data set. • If '11', this is the middle entry of a multivolume data set. • If '10', this is the last entry of a multi-volume data set.
CATLG	An indicator to denote one of two conditions: <ul style="list-style-type: none"> • If 'NO', the archive log data set is uncataloged. • If 'YES', the archive log data set is cataloged.

The BSDS is automatically updated with the information contained in this message; however, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ004I ACTIVE LOG COPY *n* INACTIVE, LOG IN
SINGLE MODE, ENDRBA=...

Explanation: This message is sent when the dual active logging option is selected and copy 'n' becomes inactive. A log copy becomes inactive when the next active log data set is not ready when required. ENDRBA is the last byte of log data written on copy 'n'. This is usually caused by a delay in off-load.

This message is issued by the following CSECT: DSNJW307

System Action: The log is switched to single mode until the next data set for copy 'n' is ready for logging.

If DB2 is shut down or abends while in single mode with the ZPARAM option still set for dual active data sets, the previous state of the active log data sets determines what happens when DB2 is started, as follows:

- If fewer than two data sets are available (not flagged as STOPPED) for each set of active logs, DB2 startup terminates and message DSNJ112E is issued.
- If an active log data set is in NOTREUSABLE state, DB2 can be started in single logging mode, but dual mode takes effect when the other active log data set becomes available after offloading.

Operator Response: Execute an MVS *Display System*
Requests command (D R,L for example) to ensure that there
are no outstanding requests that are related to the log off-load
process. Take the necessary action to satisfy any requests,
and permit off-load to continue.

System Programmer Response: If the switch to single mode was caused by the lack of a resource required for off-load, the necessary resource should be made available to allow off-load to complete and thus permit dual logging to proceed. If recovery is required, information from this message might be required as input to the change log inventory (DSNJU003) utility.

DSNJ005I ACTIVE LOG COPY *n* IS ACTIVE, LOG IN DUAL MODE, STARTRBA=...

Explanation: This message is sent when copy '*n*' of the log becomes active after previously being flagged as inactive. STARTRBA is the RBA of the first byte of log data written on copy '*n*' after it was activated.

This message is issued by the following CSECT: DSNJW307

System Programmer Response: None required. However, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ006I ALLOCATION FOR NEW ARCHIVE LOG DATA SET HAS BEEN CANCELLED BY OPERATOR.

Explanation: This message is sent if the operator answers 'N' to the WTOR message DSNJ008E.

This message is issued by the following CSECT: DSNJDS01

System Action: If the allocation is for copy 1 archive log data set, off-load terminates processing until the next time it is activated. If copy 1 has already been allocated and this request is for copy 2, off-load switches to single off-load mode for this data set only.

DSNJ007I *csect-name* OPERATOR CANCELED MOUNT OF ARCHIVE VOL SER= *volser*

Explanation: If the operator answers 'N' to the WTOR message DSNJ009I, this message is issued. The variable '*volser*' is the volume serial of an archive log volume required for the read request.

System Action: The read request for the archive log volume fails. If the request was issued with the COND=YES parameter, return code 12 and reason code 00D1032B are returned to the requester. Otherwise, DB2 abends with reason code 00D1032B.

DSNJ008E *nn* OF *mm* ACTIVE LOGS ARE FULL. *ssname* NEEDS ARCHIVE SCRATCH. REPLY Y WHEN DEVICE READY OR N TO CANCEL.

Explanation: The installation has requested a WTOR before archive log data set allocation. DB2 needs a scratch volume for offloading an active log data set. '*ssname*' is the name of the DB2 subsystem. '*nn*' is the number of full active log data sets. '*mm*' is the total number of active log data sets.

This message is issued by the following CSECT: DSNJDS01

System Action: The off-load task waits for the operator's reply.

Operator Response: The operator has three options:

- Get a scratch volume ready, make sure there is an available unit for the volume, and reply 'Y'. DB2 then continues with the off-load.
- Determine from the number of active log data sets available whether the off-load can be delayed until the next time an active log data set becomes full. If the process can be delayed, then reply 'N'.

This response has two possible effects.

- If dual archive logging is in effect and this allocation is for a copy 1 archive data set, the 'N' response delays the off-load process until the next active log data set becomes full.
- However, if the copy 1 archive data set has already been allocated and this request is for copy 2, the 'N' response causes the off-load to switch to single archive mode (the switch is for this data set only).
- Defer giving a response. This causes off-load to wait before processing. However, because off-load is a separate service task, the wait does not affect DB2 performance.

If offloading to DASD, an error has occurred attempting to allocate an archive log data set. Reply 'Y' to receive the error messages.

DSNJ009E *ssname* NEEDS VOL SER=*nnnnnn*. REPLY Y TO CONTINUE OR N TO CANCEL

Explanation: The installation requested WTOR before archive log data set allocation. DB2 needs the specified archive volume for a read operation. The subsystem name is '*ssname*'.

This message is issued by the following CSECTs: DSNJDS01, DSNJDS06

System Action: The archive log read service task waits for the operator's reply. This wait affects the agent for which the log read was issued and any other agents that might be waiting on the log read service task queue.

Operator Response: Locate the requested volume, ensure that a device is available, and reply 'Y'. DB2 continues with dynamic allocation and then begins reading the log.

If dual archiving is in effect, a response of 'N' causes archive read to reissue the message for the copy 'Z' copy 2 archive VOLSER with the same RBA range. A response of 'N' to this second WTOR, or to the initial WTOR for single archiving, causes the archive read service task to fail with unpredictable results.

DSNJ010I *csect-name* INVALID RESPONSE. WTOR WILL BE REPEATED.

Explanation: A WTOR was issued during archive data set allocation. The user did not respond correctly to the message. Either 'Y' or 'N' must be entered.

System Action: The original WTOR is repeated.

Operator Response: Reply as indicated in the repeated message.

DSNJ011I **CONDITIONAL RESTART RECORD *rrr* CREATED AT WAS FOUND. REPLY Y TO USE, N TO CANCEL**

Explanation: When the log manager was initialized, a conditional restart control record was found in the bootstrap data set. Both the record identifier (a 4 byte hexadecimal number) and the creation time stamp (yy.ddd hh:mm) are displayed to help identify the conditional restart record which will be used. If you want a conditional restart using that record, reply 'Y' to the message. Otherwise, reply 'N' and notify the system programmer.

System Action: If 'Y' is the response, DB2 is started conditionally, using the record found. If 'N' is the response, DB2 startup is terminated.

Operator Response: If a DB2 conditional restart is to be done and if the date and time displayed are correct, then reply 'Y' to the outstanding message. If you are not sure, then contact the system programmer.

System Programmer Response: If a normal restart of DB2 has failed and you have created a conditional restart control record with the change log inventory (DSNJU003) utility, check whether the time and date in the message agree with when you created that record. If they do, reply 'Y' to the outstanding WTOR. If they do not, reply 'N' and investigate the discrepancy.

DSNJ012I **ERROR *ccc* READING RBA *rrr* IN DATA SET *ddd* CONNECTION-ID=*xxxxxxxx*, CORRELATION-ID=*yyyyyyyyyyyy***

Explanation: While scanning log records read into a buffer, the log manager detected a logical error with reason code 'ccc'. 'rrr' is the log RBA of the segment in the buffer at which the error was detected. 'ddd' is the name of the active or archive log data set from which the record was read. If 'ddd' is blank, the data was read from an active log output buffer.

The connection and correlation IDs identify the user or application that encountered the problem. Messages that have the same connection ID and correlation ID relate to the same user. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

Refer to Section 4 (Volume 1) of *Administration Guide* for information about recovery from log failures.

This message is issued by the following CSECTs:

DSNJR005 DSNJOFF1 DSNJOFF4 DSNJW009

System Action: The application program that invoked the log manager is terminated with reason code 'ccc'. However, information in this message may be useful in diagnosing the abend that will follow.

DSNJ013I **TERMINAL ERROR *ccc* IN BUFFER *rrr* BEFORE ACTIVE LOG WRITE**

Explanation: A scan of the log output buffer just prior to writing the buffer detected an inconsistency in the log data. 'ccc' is the abend reason code associated with the SDUMP that is produced. 'rrr' is the log RBA at which the error was detected.

This message is issued by the following CSECT: DSNJW107

System Action: DB2 will terminate with a dump, and will not write the damaged buffer to either COPY 1 or COPY 2 active log data set.

Operator Response: Notify the system programmer. Start DB2 after it terminates.

System Programmer Response: Because the damaged buffer has not been written to a log data set, DB2 may be restarted. No corrective action is required.

Problem Determination: In the DB2 formatted block section of the dump, locate the chain of LBCE blocks. Those are log buffer control elements, and each LBCE controls one 4KB log output buffer. LBCEBUFF, at offset X'20' in the LBCE, points to the buffer, which is always on a 4KB boundary. The log RBA of the first byte of the buffer is in a 6-byte field at offset X'FF2' in the buffer itself. The layout of the buffer is described by the DSNLDCID mapping macro. The header of each record within the buffer is described by the DSNDLRH mapping macro. Locate the buffer that contains the log RBA from the message and find the damage by referring to the description of the reason code later in this book.

DSNJ014I **TERMINAL ERROR *ccc* IN BUFFER *rrr* AFTER ACTIVE LOG WRITE.**

Explanation: A scan of the log output buffer, after writing to the COPY 1 active log data set and before writing to COPY 2, detected an inconsistency in the log data. 'ccc' is the abend reason code associated with the SDUMP that is produced. 'rrr' is the log RBA at which the error was detected.

This message is issued by the following CSECT: DSNJW107

System Action: DB2 will terminate with a dump, and will not write the damaged buffer to the COPY 2 data set.

Operator Response: Notify the system programmer.

System Programmer Response: The block containing the indicated log RBA may be damaged. The buffer was found to be in error at the completion of the write to the COPY 1 data set of the active log.

If dual active logs are being used, use print log map (DSNJU004) to list the active log data sets for both copies of the active log. Find the COPY 2 data set with the corresponding RBA, and copy that data set (using access method services REPRO) to the COPY 1 data set. Start DB2.

If only a single active log is used, contact the IBM support center for assistance. An attempt to start DB2 may succeed if the damage to the buffer occurred after completion of the write to DASD.

Problem Determination: In the DB2 formatted block section of the dump, locate the chain of LBCE blocks. Those are log buffer control elements, and each LBCE controls one 4KB log output buffer. LBCEBUFF, at offset X'20' in the LBCE points to the buffer, which is always on a 4KB boundary. The log RBA of the first byte of the buffer is in a 6-byte field at offset X'FF2' in the buffer itself. The layout of the buffer is described by the DSNLDCID mapping macro. The header of each record within the buffer is described by the DSNDLRH mapping macro. Locate the buffer that contains the log RBA from the message and find the damage by referring to the description of the reason code later in this book.

DSNJ015I CSRONLY PROHIBITS LOG ALTERATIONS. RECORD *rrr* CREATED REPLY Y TO USE, N TO CANCEL.

Explanation: During DB2 startup, the log manager found an inactive conditional restart control record in the bootstrap data set. Because this control record indicates CSRONLY, no log data sets will be modified. If log truncation was specified, it will be simulated. Only the first phase of restart (current status rebuild) will be performed. The hexadecimal identifier (*rrr*) and creation timestamp (*yy.ddd hh:mm*) identify the record found.

This message is issued by the following CSECT: DSNJS001

System Action: A 'Y' reply will continue the conditional restart. A 'N' reply will terminate DB2 startup.

Operator Response: To continue this CSRONLY processing, reply 'Y' to this message. If you are not sure, contact the system programmer.

System Programmer Response: The conditional restart control record will not be deactivated at the end of the CSRONLY processing. To deactivate this record, either cancel this record or create a new record. Refer to Section 4 (Volume 1) of *Administration Guide* for more information.

DSNJ020I *csect-name* RECEIVED REPLY OF N TO *msg-num*. SUBSYSTEM STARTUP IS TERMINATED.

Explanation: The operator chose to terminate DB2 startup by answering 'N' to '*msg-num*'.

System Action: DB2 will not restart.

Operator Response: To restart DB2, follow the 'operator response' of '*msg-num*'.

DSNJ030I RBA RANGE *startrba* TO *endrba* NOT AVAILABLE IN ACTIVE LOG DATA SETS

Explanation: Previous errors have made the active log data set(s) that contain the relative byte address (RBA) range reported in the message unavailable to DB2. The status of these log(s) is STOPPED in the bootstrap data set (BSDS).

This message is issued by the following CSECT: DSNJW106

System Action: DB2 terminates with a dump.

Operator Response: Notify the system programmer.

System Programmer Response: The log RBA range must be available for DB2 to be recoverable. Correct previous errors and restore the active log data set(s) that contain the RBA range reported in the message.

- If the log data set(s) are recoverable, the active log data set inventory in the BSDS must be modified to reset the STOPPED status. Use the print log map (DSNJU004) utility to obtain a copy of the BSDS log inventory. Next, use the change log inventory (DSNJU003) utility to delete the active log data sets marked STOPPED (use the DELETE statement), and then add them again (use the NEWLOG statement). The starting and ending RBA for each active log data set must be specified on the NEWLOG statement when the log(s) are added back to the BSDS using the DSNJU003 utility.
- If the log data set(s) are not recoverable, it is necessary to conditionally restart DB2. See Section 4 (Volume 1) of *Administration Guide* for additional information on conditional restart and recovering from log failures.

Problem Determination: Examine previous messages to determine the reason the active log data set(s) are unavailable to DB2.

DSNJ050I LOAD MODULE DSNJL003 DOES NOT HAVE RMODE(24) ATTRIBUTE

Explanation: The named load module was not link edited with the required RMODE(24) attribute.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer of the failure.

System Programmer Response: Verify that all installation and maintenance activities against this module were executed using SMP. Verify that the JCLIN for SMP includes the correct RMODE control statement, and that the Linkage Editor provided with the Data Facility Product (DFP) for the version of MVS being used was invoked by SMP for the link edits. Correct the procedure or JCL which caused the error and rerun the necessary SMP jobs.

Problem Determination: The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

DSNJ070I *csect-name* ARCHIVE LOG DSN PREFIX NOT IN PROPER FORMAT TO RECEIVE TIMESTAMP DATA. TIMESTAMPING OF *dsname* BYPASSED

Explanation: By way of a ZPARM parameter, the user has specified that the date and time of creation of an archive log data set be included as part of the archive log data set name (DSN). To accomplish this, the DB2 subsystem requires that the length of the archive log data set name prefix not exceed # 19 characters if using the standard DATE format (YYDDD), or # 17 characters if using the extended DATE format (YYYYDDD). If the prefix requirement is not met, this message is issued just prior to the allocation of the archive log data set specified in the message.

System Action: The archive log data set will be allocated using the archive log prefix. However, the archive log DSN will not contain the date and time as the user requested.

Operator Response: Notify the system programmer.

System Programmer Response: The ZPARM parameters for the log archive function must be changed. Specifically, the TSTAMP and ARCPFXn fields are not consistent with one another. For details concerning the course of action required to # eliminate this problem, refer to Section 2 of *Installation Guide*, # under the DSNTIPH panel and DSN6ARVP macro subtopics.

System Action: The archive log data set will be allocated using the archive log prefix. However, the archive log DSN will not contain the date and time as the user requested.

DSNJ072E ARCHIVE LOG DATA SET *dsname* HAS BEEN ALLOCATED TO NON-TAPE DEVICE AND CATALOGED. ZPARM CATALOG OPTION OF 'NO' HAS BEEN OVERRIDDEN.

Explanation: By way of an archive log DSNZPARM parameter, the user specified that all archive log data sets should be uncataloged (CATLG=NO). However, DB2 requires that all archive log data sets allocated to nontape devices must be cataloged. The archive log data set specified by '*dsname*' has

been allocated to a nontape device, and has thus been cataloged. The user's DSNZPARM CATLG setting of 'NO' has been overridden.

This message is issued by the following CSECT: DSNJDS04

System Action: The archive log data set has been allocated to a nontape device, and has been cataloged. The DSNZPARM CATLG=NO setting has been overridden. The BSDS reflects that the data set has been cataloged.

Operator Response: Notify the system programmer.

System Programmer Response: The DSNZPARM parameters for the log archive function must be changed. Specifically, the ARCHCTLG and ARCHDEVT fields are not consistent with one another. For details concerning the course of action required to eliminate this problem, refer to Section 2 of *Installation Guide* under the DSNTIPA panel and DSN6ARVP macro subtopics.

DSNJ073I LOG ARCHIVE UNIT ALLOCATION FAILURE DETECTED, RETURN CODE=nnnn. ALLOCATION OR OFF-LOAD OF ARCHIVE LOG DATA SET MAY FAIL.

Explanation: While building the SVC99 text entries to dynamically allocate a new archive log data set, a unit allocation failure was detected. The reason code, indicated by 'nnnn' in the message, further clarifies the problem as follows:

4 (X'04')	The device type (unit name) on which the archive log data set is to be allocated is specified by the user in the DB2 system parameters. This device type (unit name) could not be found in the MVS eligible device table (EDT).
8 (X'08')	The device type (unit name) on which the archive log data set is to be allocated is specified by the user in the DB2 system parameters. This device type (unit name) could not be found in the MVS eligible device table (EDT).
16 (X'10')	Nonfetch protected storage could not be obtained by an MVS service to build a list of devices.
32 (X'20')	DB2 was able to obtain a list of devices corresponding to the device type (unit name) specified in ZPARMs. However, it was determined by DB2 that this list contained a mixture of tape and nontape devices.
36 (X'24')	Nonfetch protected storage could not be obtained by DB2 to build a parameter list for an MVS service.
40 (X'28')	The device type (unit name) specified by the user in ZPARMs is valid. However, no devices are currently associated with the given device type (unit name).
44 (X'2C')	The device type (unit name) specified by the user in ZPARMs is valid. However, no DASD volumes are available with a volume use attribute of 'storage'.

This message is issued by the following CSECT: DSNJDS01

System Action: This message is issued by DB2 after the SVC99 text entries are built, but prior to the allocation of the

new archive log data set. As a result of the error, the dynamic allocation of the archive log data set will be attempted using standard default values. The standard default values are generally acceptable; however, the allocation may fail or the subsequent off-load may produce undesirable processing results. For example:

- A return code of 4 or 44 (X'2C') will foretell an allocation error (DSNJ103I) when the SVC99 is issued for the archive data set.
- Off-load processing to tape may fail. DB2 uses a volume count of 20 when allocating to tape, and uses the standard MVS volume count default of 5 volumes when writing to nontape devices. In the case of most of the above errors, it would be impossible for the DB2 subsystem to determine the device type on which the data set is to be allocated. Therefore, the standard MVS default is assumed for the volume count. If the data set is successfully allocated to a tape device, and the volume of data is such that more than five volumes will be used for the archive data set, the off-load processing will receive an MVS ABEND 837-08 with message IEC028I when attempting to write to the sixth tape volume.
- Off-load processing to a direct access device may fail. When allocating a new archive log data set on a direct access device, the DB2 subsystem will use a unit count to facilitate multivolume archive data sets. With most of the above errors, it may be impossible for the DB2 subsystem to correctly determine the type of device on which the data set is to be allocated. Therefore, the standard default (1) is assumed for the unit count. If the data set is successfully allocated to a direct access device, and during the off-load processing it becomes necessary to extend the data set to another device, the off-load processing will receive an MVS B37 (out of space) ABEND, and the archive log data set will be deallocated.

Operator Response: Notify the system programmer.

System Programmer Response: The required action is based on the return code indicated in the message.

4 (X'04')

The most likely cause is an incorrect specification in the archive log ZPARMs (DSNTIPA panel). Correct the DEVICE TYPE field. If the DEVICE TYPE field from the archive log ZPARMs appears to be correct, check the EDT to ensure that the esoteric or generic unit name specified in the ZPARMs is actually in the EDT. Subsequent off-load processing will archive the log data which could not be previously archived due to the allocation failure (DSNJ103I).

16 (X'10') or 36 (X'24')

This is usually a temporary problem. If the allocation of the archive log data set is successful, no action is required to correct this situation. If this is a recurring problem, then sufficient page space is not available, and the region size for the DB2 data systems services may have to be increased, or standard MVS diagnostic procedures may have to be used to correct the problem.

32 (X'20') or 40 (X'28')

To correct this situation, change the archive log DEVICE TYPE ZPARM to use a device type (unit name) which contains homogenous devices, or modify the device list associated with the device

type (unit name) via a system generation to supply a list of homogenous devices.

44 (X'2C')

To correct this situation, issue an MVS mount command to change the volume use attribute of a mounted 'private' volume to 'storage'. If this is a recurring problem, a system generation may be required to add permanently resident volumes with a volume use attribute of 'storage' to the esoteric or generic unit, or ZPARMs may have to be changed to use a different esoteric or generic unit name for the DEVICE TYPE (on the DSNTIPA installation panel).

DSNJ097E *csect-name* LOG TRUNCATION BY ENDLRSN

IS ONLY VALID IN DATA SHARING.

Explanation: ENDLRSN was specified in the active conditional restart control record but this DB2 is not a member of a data sharing group.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Run the Change Log Inventory (DSNJU003) utility with the CRESTART CANCEL parameters to cancel the conditional restart control record. Restart DB2.

DSNJ098E *csect-name* CRCR ENDLRSN OF *rrr* IS *xxx*

THAN ANY KNOWN LRSN, NO TRUNCATION WILL OCCUR

Explanation: Truncation cannot take place because the CRCR ENDLRSN is not in the range of LRSN values known to either the active or archive logs. *rrr* is the end LRSN specified in the active record. *xxx* is replaced by either HIGHER or LOWER. If HIGHER is the case, the CRCR ENDLRSN is higher than the LRSN of the last record written to the log data sets. LOWER means the CRCR ENDLRSN is lower than the starting LRSN of the oldest archive data set.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Confirm that the ENDLRSN value specified in the Conditional Restart control record is correct. If it is not correct, run the Change Log Inventory (DSNJU003) utility with the CRESTART CANCEL parameters to cancel the conditional restart. If log truncation is desired, run the the DSNJU003 utility with the correct ENDLRSN. Restart DB2.

DSNJ099I LOG RECORDING TO COMMENCE WITH STARTRBA=...

Explanation: This message is generated when the log manager is initialized during DB2 startup. The value specified by the STARTRBA=value keyword is the RBA of the next byte of log data to be recorded in the DB2 active log data set(s). This information may later be needed for a conditional restart.

This message is preceded by one DSNJ001I message (if single logging) or two DSNJ001I messages (if dual logging).

This message is issued by the following CSECT: DSNJW007

System Programmer Response: None required. However, if recovery is required, information from this message may be required as input to the change log inventory (DSNJU003) utility.

DSNJ100I *csect-name* ERROR OPENING BSDSn
DSNAME=..., ERROR STATUS=eeii

Explanation: Log manager initialization or the -RECOVER BSDS command could not open the specified bootstrap data set (BSDS). BSDSn matches the ddname in the log startup JCL of the data set that cannot be opened. The value of 'n' is 1 or 2. Refer to Section 4 (Volume 1) of *Administration Guide* for information about recovery from BSDS or log failures.

System Action: When this error occurs at initialization time, DB2 startup must be terminated, because the log data sets cannot be determined and allocated without the BSDS. When this error occurs during -RECOVER BSDS processing, the command is terminated, and the system continues in single BSDS mode.

Operator Response: Notify the system programmer.

System Programmer Response: Recover the BSDS that cannot be opened. Normally, if dual BSDSs are being used, recovery consists of making a copy of the remaining good BSDS.

Problem Determination: The 'error status' contains the VSAM open return code in 'ee', and the VSAM open reason code in 'ii'. Refer to *DFSMS/MVS: Macro Instructions for Data Sets* for a list of the VSAM open return codes and reason codes, and the steps required to take corrective action.

DSNJ101E *csect-name* CRCRERBA OF *rrr* IS *xxx* THAN ANY KNOWN RBA, BUT COLD START WAS NOT SPECIFIED

Explanation: Truncation cannot take place because the CRCR end RBA is not in the range of RBA values known to either the active or archive logs. '*rrr*' is the end RBA specified in the active record. '*xxx*' is replaced by either HIGHER or LOWER. If HIGHER is the case, the CRCRERBA is higher than the end RBA of the most recent active log data set. LOWER means the CRCRERBA is lower than the starting RBA of the oldest archive data set.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Most likely, the archive log data set that contained the requested RBA has been deleted from the bootstrap data set (BSDS) by the change log inventory (DSNJU003) utility. Locate the output from an old Print Map run, and identify the data set that contains the missing RBA. If the data set has not been reused, run the DSNJU003 utility to add this data set back into the inventory of log data sets. Restart DB2.

DSNJ102I LOG RBA CONTENT OF LOG DATA SET
DSNAME=..., STARTRBA=..., ENDRBA=..., DOES NOT AGREE WITH BSDS INFORMATION

Explanation: The log RBA range shown in the BSDS for the specified data set does not agree with the content of the data set. This message indicates that the change log inventory (DSNJU003) utility was used incorrectly or that a down-level volume is being used.

This message is issued by the following CSECT: DSNJW009

System Action: DB2 startup processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Use the print log map (DSNJU004) and change log inventory (DSNJU003) utilities to make the BSDS consistent with the log data sets.

DSNJ103I *csect-name* **LOG ALLOCATION ERROR**
DSNAME=dsname, ERROR STATUS=eeeeiii,
SMS REASON CODE=ssssssss

Explanation: The log manager encountered an error while attempting to allocate the active or archive log data set indicated by the DSNAME=keyword. The STATUS=keyword indicates the error reason code returned by MVS dynamic allocation (SVC99).

This message might be preceded by message DSNJ073I.

System Action: Subsequent log manager actions are based upon the type of data set involved.

For active log data sets, if the error is encountered during log manager initialization, DB2 startup is terminated. If two copies of the active log data sets are defined, this message appears only once.

For archive log data sets, if two copies of the archive log data sets are defined, processing continues on the remaining archive log data set.

Operator Response: Notify the system programmer.

System Programmer Response: The error status portion of this message contains a 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC99 request block. If the S99ERROR code indicates an SMS allocation error (97XX), then 'ssssssss' contains additional SMS reason code information obtained from S99ERSN. Refer to *OS/390 MVS Programming: Authorized Assembler Services Guide* for a description of these codes.

For active log data sets, if the problem occurred during DB2 initialization, you can resolve the problem by either:

- Resolving the error associated with the active log data set as indicated by STATUS=keyword
- Using AMS, providing another copy of the active log data set
- Updating the BSDS with the change log inventory (DSNJU003) utility
- Restarting DB2.

For archive log data sets:

- If the problem occurred during allocation with the intent to write the data set, no immediate action is required. However, failure to resolve the SVC99 error (indicated by the STATUS value in the message) might eventually cause the available space in the active log to be exhausted (DSNJ111E), since all future off-loads might fail due to the same error.
- If the problem occurred during allocation with the intent to read the data set, determine the problem, and use the DSNJU003 utility DELETE function to delete the archive log data set from the BSDS archive log inventory. Then use the NEWLOG function to add the data set back into the archive log inventory, pointing to the correct volume and device.

If additional information is required about recovery from log failures, refer to Section 4 (Volume 1) of *Administration Guide*.

This message can also be issued as the result of a possible user error. If the STATUS=keyword displays a value of '17080000', then the site might have one or more active log data sets defined in the BSDS, but not allocated on DASD. To correct the situation, print the contents of the current active log data set inventory using the print log map (DSNJU004) utility, and then do *one* of the following:

- For each active log data set listed in the BSDS, but not actually allocated on DASD, allocate the active log data set using access method services. The access method services command syntax for active log data sets can be found in the DSNTIJIN installation job stream.
- Use the DSNJU003 utility DELETE statement to delete the errant active log data set name, and the NEWLOG statement to add the correct name to the active log data set inventory. The name specified on the NEWLOG statement must be the same as the name of the actual DB2 active log data set allocated on DASD.

DSNJ104I *csect-name* **RECEIVED ERROR STATUS nnn**
FROM macro-name FOR DSNAME dsname

Explanation: The log manager encountered an error while issuing macro 'macro-name'. Error status is the return code from the specified macro.

- For an OPEN of a VSAM data set, the return code in the error field of the access method services control block is included in this message as the error status value. Refer to the appropriate VSAM publication for a definition of these values.
- If the OPEN was for a non-VSAM data set, the error status is zero.
- For MMSRV errors, error status contains the error information returned by media manager services. If an MMSRV CATUPDT failure occurs attempting to truncate an active log data set, the log data set will be unavailable to DB2 and the status of the log data set will be flagged as 'STOPPED' in the BSDS.
- For VSAM OPEN and MMSRV errors, this message is preceded by an IEC161I message that defines the error that occurred.
- For a PROTECT of an archive log data set, the return code is from DADSM PROTECT. Refer to the appropriate MVS publication for a description of the MMSRV return codes.
- For a CLOSE of an archive log data set, the return code is the TCB completion code for an abend received during CLOSE processing. This abend is normally preceded by an IEC210I or IEC212I message that defines the error.

Refer to Section 4 (Volume 1) of *Administration Guide* for information about recovery from log failures.

System Action: If this condition is encountered during log manager initialization, DB2 startup is terminated. If the error occurs later and the data set is needed either for offload or for input operations, log manager processing continues. If a second copy of the data is available, the log manager attempts to allocate and open the second data set.

If the data set is needed as an active log data set, the log manager attempts to retry the failing request. If the retry fails, the DB2 subsystem is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: If the error occurred during initialization, the installation must either correct the problem so that the data set is available or provide another copy of the data set and change the BSDSs to point to the new data set.

If the error occurred during DB2 processing, the return code should be reviewed and the appropriate action taken to correct the problem so that the data set can be used at a later time or the data set entry can be removed from the BSDS via the change log inventory (DSNJU003) utility.

If the error was received from PROTECT, there may be a problem with the PASSWORD data set. You should refer to the appropriate DADSM publication to determine the cause of the problem. When the problem has been corrected, you should ensure the archive log data sets receiving the error are added to the PASSWORD data set. If these archive log data sets are not added to the PASSWORD data set, archive read will fail when attempting to OPEN these data sets.

DSNJ105I *csect-name* LOG WRITE ERROR DSNAME=..., LOGRBA=..., ERROR STATUS=ccccffss

Explanation: The log manager encountered a write error in the specified active log data set. If 'csect-name' is DSNJW107, the error occurred writing the log buffers to an active log data set. If 'csect-name' is DSNWJ207, the error occurred while preformatting the next control area before writing log data into it.

Error status contains the error information returned by media manager in the form 'ccccffss', where 'cccc' is a 2-byte return code that describes the error, 'ff' is a 1-byte code that defines the functional routine that detected the error, and 'ss' is the 1-byte status code that defines a general category of error. Refer to the appropriate MVS publication for a description of the MMCALL return codes.

If the dual active logging option is selected, the log manager switches to the next data set for this copy. If the next data set is not ready, the log manager temporarily enters single logging mode and allocates a replacement data set for the one that encountered the error. Dual logging is resumed as soon as possible.

If single active logging option is selected and the next data set is not ready, the log manager waits for that data set to be available. In this case, log writing is inhibited until the replacement is ready for output.

System Action: See the Explanation section of this message.

Operator Response: Notify the system programmer.

System Programmer Response: See the Explanation section of this message.

DSNJ106I LOG READ ERROR DSNAME=..., LOGRBA=..., ERROR STATUS=ccccffss

Explanation: The log manager encountered an error while reading an active log data set. The 'error status' contains the error information returned by the media manager in the form 'ccccffss', where 'cccc' is a 2-byte return code that describes the error, 'ff' is a 1-byte code that defines the functional routine that detected the error, and 'ss' is the 1-byte status code that defines a general category of error.

This message is issued by the following CSECT: DSNJR007

System Action: If another log data set contains the data, the log manager attempts to read the data from the alternate

source. If an alternate source is not available, the log manager returns a read error return code to the program requesting the log data.

Operator Response: Notify the system programmer.

System Programmer Response: If the site is using dual logging, the requested RBA was probably retrieved from the corresponding dual active log data set, and no immediate response is necessary. However, if this error occurs frequently, or if the site is using single logging, immediate attention may be required.

Since this condition might indicate an error detected by the media manager, refer to *DFSMS/MVS: Diagnosis Reference for DFSMSdftp* for a description of media manager return codes. Take corrective action based on these codes.

It might be necessary to replace the bad data set with a new data set containing the log data, and to update the BSDSs to reflect the new data set using the change log inventory (DSNJU003) NEWLOG operation.

For additional information about recovery from log failures, refer to Section 4 (Volume 1) of *Administration Guide*

This message can also be issued as the result of a possible user error. If the data set name associated with the DSNAME=keyword is missing, and the STATUS=keyword displays a value of '00180408' or '00100408', then the site is using dual logging, but only one set of active log data sets are defined in the BSDS. To resolve this condition, do *one* of the following:

- Define a second set of active log data sets using access method services (if they are not defined already), and update the BSDS log inventory using the DSNJU003 NEWLOG operation.
- Reset the log parameters ZPARM to indicate single logging. To do this, set the TWOACTV parameter in the DSN6LOGP ZPARAMs to NO.

DSNJ107I READ ERROR ON BSDS DSNAME=... ERROR STATUS=...

Explanation: The log manager encountered an error while reading the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first byte containing the hexadecimal return code and the second containing the hexadecimal feedback code. Refer to the appropriate MVS publication for a description of VSAM return and reason codes.

Refer to Section 4 (Volume 1) of *Administration Guide* for information about recovery from BSDS or log failures.

This message is issued by the following CSECT: DSNJB006

System Action: If dual BSDSs are available, the log manager attempts to read from the other BSDS. If read from the second BSDS fails or if there is only one BSDS, an error code is returned to the log request that caused access to the BSDS.

If read error is detected during start-up, DB2 initialization process is terminated to prevent users from operating in a cripple mode. User should take action to correct the problem.

Operator Response: Notify the system programmer.

System Programmer Response: It may be necessary to replace or repair the BSDS, depending on what conditions resulted from the read error. To replace a BSDS, first delete the bad BSDS, and then define the new BSDS with the same

name and attributes. If a new name is used for the new BSDS, change the log startup JCL to specify the new BSDS name.

DSNJ108I WRITE ERROR ON BSDS DSNAME=... ERROR STATUS=...

Explanation: The log manager encountered an error while writing to the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code. Refer to the appropriate VSAM publication for a description of VSAM return and reason codes.

This message is issued by the following CSECT: DSNJB006

System Action: If dual BSDSs are available, the log manager enters single BSDS mode using the remaining good BSDS. Otherwise, an error code is returned to the log request that caused access to the BSDS.

Operator Response: Notify the system programmer.

System Programmer Response: If dual BSDS mode is being used, execute an offline access method services job to rename the error BSDS and define a new BSDS with the same name. Then enter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

If dual BSDS mode is not being used, the DB2 subsystem must be shut down, and the BSDS must be recovered from a backup copy. To recover the BSDS, use the change log inventory (DSNJU003) utility.

DSNJ109I OUT OF SPACE IN BSDS DSNAME=...

Explanation: There is no more space in the specified bootstrap data set. The operation that encountered the out-of-space condition did not complete properly.

This message is issued by the following CSECT: DSNJB006

System Action: If dual BSDSs are available, the log manager enters single BSDS mode using the remaining good BSDS. Otherwise, an error code is returned to the log request that caused access to the BSDS.

Operator Response: Notify the system programmer.

System Programmer Response: If dual BSDS mode is being used, execute an offline access method services job to rename the full BSDS and define a new, larger BSDS with the same name. Enter the DB2 -RECOVER BSDS command to reestablish dual BSDS mode.

If dual BSDS mode is not being used, the DB2 subsystem must be shut down and the BSDS recovered offline. In this case, execute the same access method services job mentioned above to rename the full data set and define a larger data set. Next, execute an access method services REPRO job to copy the full BSDS into the new BSDS.

DSNJ110E LAST COPYn ACTIVE LOG DATA SET IS nnn PERCENT FULL

Explanation: This message is issued when the last available active log data set is 5% full, and is reissued after each additional 5% of the data set space is filled.

This message is issued by the following CSECT: DSNJW107

System Action: Each time the message is issued, the off-load processing is retried. If the situation is not corrected, the

active log data space fills to capacity, message DSNJ111E is issued, and the DB2 online processing halts.

Operator Response: To clear this condition, steps must be taken to complete other waiting off-load tasks. Once an active log data set is made available (reusable) by completing the off-load process for it, the DB2 logging activity can continue.

```
# Execute an MVS Display System Requests command (D R,L
# for example) to determine the outstanding requests related to
# the log off-load process. Take the necessary action to satisfy
# any requests, and permit off-load to continue. If off-load fails to
# complete normally or cannot be initiated, notify the system pro-
# grammer.
```

System Programmer Response: Either correct the problem that is causing the off-load process to fail, or add more active log data sets. Note that the latter action requires DB2 to be down and the change log inventory (DSNJU003) utility to be run.

Possible causes for the shortage of active log data space are:

- Excessive logging. For example, too many users have requested logs at the same time or too many utilities have specified LOG(YES).
- Delayed or slow off-loading. For example, failure to mount archive volumes, incorrect replies to off-load messages, or slow device speeds.
- Excessive use of the -ARCHIVE LOG command. Each invocation of the -ARCHIVE LOG command causes the DB2 subsystem to switch to a new active log data set and to initiate an off-load of the active log. Although the -ARCHIVE LOG command will not be processed when only one active log data set remains in a copy of the active log (see DSNJ319I), excessive use of the command could have consumed all space in the active log except the current active log data sets.
- Off-loads failed. See Operator Response.
- Insufficient active log space. See Operator Response.
- Offload task no longer functioning. Issue the -ARCHIVE LOG CANCEL OFFLOAD command to abnormally terminate and restart the offload process.

DSNJ111E OUT OF SPACE IN ACTIVE LOG DATA SETS

Explanation: Due to delays in off-load processing, all available space in all active log data sets has been exhausted. DB2 recovery logging cannot continue.

This message is issued by the following CSECT: DSNJW307

System Action: The DB2 log manager waits for an available data set.

```
# Operator Response: Execute an MVS Display System
# Requests command (D R,L for example) to ensure that there
# are no outstanding requests that are related to the log off-load
# process. Take the necessary action to satisfy any requests,
# and permit off-load to continue.
```

System Programmer Response: If the delay was caused by the lack of a resource required for off-load, the necessary resource must be made available to allow off-load to complete and thus permit logging to proceed. For additional information on recovery from this condition, refer to the discussion on DB2 system resource failures and active log failures in Section 4 (Volume 1) of *Administration Guide*.

DSNJ112E *csect-name* **INSUFFICIENT ACTIVE LOG DATA SETS DEFINED IN BSDS**

Explanation: There are not enough active log data sets defined in the BSDS to start DB2. This condition usually exists for one of the following reasons.

- Fewer than two data sets are defined for one of the active log copy sets.
- DSN6LOGP specified TWOACTV=YES in DB2 initialization parameters, but data sets for two copies of active log are not defined in BSDS.
- Fewer than two data sets are available (not flagged as STOPPED) for one of the active log copy sets.

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Use the change log inventory (DSNJU003) utility to make the number of active log data sets defined in the BSDS consistent with the parameters specified on DSN6LOGP. Log data sets that are flagged as 'STOPPED' will not be reused by DB2. These data sets must be recovered (either redefined or recovered from the other copy of the log) and the log data sets must be deleted and re-added to the BSDS (using DSNJU003) with the appropriate RBA's, to clear the STOPPED status. Restart DB2.

DSNJ113E **RBA log-rba X NOT IN ANY ACTIVE OR ARCHIVE LOG DATA SET.**
CONNECTION-ID=aaaaaaa,
CORRELATION-ID=aaaaaaa

Explanation: The log manager has been requested to read the log record starting at this relative byte address (RBA). However, this log record cannot be found in any active or archive log data set. The connection and correlation IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents. Refer to Section 4 (Volume 1) of *Administration Guide* for information about recovery from log failures.

This message is issued by the following CSECT: DSNJR003

System Action: Depending upon what log record is being read and why, the log manager may abend with a reason code of '00D1032A'.

Operator Response: Copy the RBA value, and notify the system programmer.

System Programmer Response: Probable user error. Most likely, the archive log data set that contained the requested RBA has been deleted from the bootstrap data set (BSDS) by the change log inventory (DSNJU003) utility. Locate the output from an old print log map run, and identify the data set that contains the missing RBA. If the data set has not been reused, run the DSNJU003 utility to add this data set back into the inventory of log data sets. Restart DB2.

DSNJ114I **ERROR ON ARCHIVE DATA SET, OFFLOAD CONTINUING WITH ONLY ONE ARCHIVE DATA SET BEING GENERATED**

Explanation: An error occurred while accessing one of the archive data sets being created by off-load. Because the dual archive option is specified, off-load is continuing with the other archive data set. For the RBA range being off-loaded, there is only one copy of archive instead of the usual two copies.

This message is issued by the following CSECTs: DSNJOFF1, DSNJOFF4

System Action: Off-load produces a single archive data set.

System Programmer Response: A second copy of this archive log data set can be made, and the BSDS(s) can be updated with the change log inventory (DSNJU003) utility.

DSNJ115I **OFFLOAD FAILED, COULD NOT ALLOCATE AN ARCHIVE DATA SET**

Explanation: Off-load could not allocate an archive log data set. The off-load was not performed. This message is usually preceded by message DSNJ103I.

This message is issued by the following CSECT: DSNJOFF1

System Action: Off-load will be tried at a later time.

Operator Response: Notify the system programmer.

System Programmer Response: Review the error status information of message DSNJ103I. Correct the condition that caused the data set allocation to fail so that, on retry, the off-load can take place.

DSNJ116I **ERROR ATTEMPTING TO ADD ARCHIVE ENTRY TO BSDS**

Explanation: Off-load could not add an archive entry to the BSDS. The off-load is considered incomplete. The active log data set is not marked as reusable for new log data. This message is preceded by message DSNJ107I, DSNJ108I, or DSNJ109I.

This message is issued by the following CSECT: DSNJOFF3

System Action: Off-load will be retried at a later time.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to the specific preceding message for action.

DSNJ117I **INITIALIZATION ERROR READING BSDS DSNAME=....., ERROR STATUS=...**

Explanation: The log manager encountered an error during initialization reading from the specified bootstrap data set. Error status contains the VSAM return and feedback codes. It is a two byte field with the first containing the hexadecimal return code and the second byte containing the hexadecimal feedback code. Refer to the appropriate VSAM publication for a description of VSAM return and reason codes.

This message is issued by the following CSECT: DSNJB005

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the read error using the VSAM error status information provided. Restart DB2.

DSNJ118I **LOG INITIALIZATION RECEIVED RETURN CODE nnn FROM xxxxxxxx MACRO**

Explanation: Log manager initialization received a bad return code from the named macro.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 initialization is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the problem from the documentation on the named macro and return code. Then take appropriate steps, and restart the DB2 subsystem.

DSNJ119I BOOTSTRAP ACCESS INITIALIZATION PROCESSING FAILED

Explanation: During log manager initialization, the bootstrap data set access function was unable to complete its initialization process. Refer to Section 4 (Volume 1) of *Administration Guide* for information about recovery from BSDS or log failures.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error have preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ120I DUAL BSDS DATA SETS HAVE UNEQUAL TIMESTAMPS, BSDS1 SYSTEM=..., UTILITY=..., BSDS2 SYSTEM=..., UTILITY=...

Explanation: When the log manager was initialized, the time stamps of the dual bootstrap data sets (BSDS) did not agree. The time stamps from the system and from the change log inventory (DSNJU003) utility are shown for each BSDS. The time stamps have the format yy.ddd hh:mm:ss.th.

This message is issued by the following CSECT: DSNJB005

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Run the print log map (DSNJU004) utility against each BSDS. From the output, determine which data set is obsolete, delete it, define a replacement for it, and copy the remaining BSDS to the replacement.

If output from the print log map (DSNJU004) utility for both data sets is similar, delete the data set with the oldest time stamp, and copy the data set with the most recent time stamp.

DSNJ121I LOG MANAGER ENCOUNTERED AN ERROR READING THE JFCB. DDNAME=nnnnnnnn

Explanation: During log manager initialization (if dual BSDS data sets are specified), the job file control block (JFCB) in MVS is read to obtain the data set names associated with DDNAME BSDS1 and BSDS2. This error is caused by a missing DD statement.

This message is issued by the following CSECT: DSNJB006

System Action: DB2 is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Ensure that a DD statement exists in the DB2 startup procedure for DDNAME BSDS1. If dual BSDS data sets are used, ensure that a DD statement also exists in the DB2 startup procedure for DDNAME BSDS2.

DSNJ122I DUAL BSDS DATA SETS ARE OUT OF SYNCHRONIZATION

Explanation: During log manager initialization, the dual BSDS data sets were found to differ in content.

This message is issued by the following CSECT: DSNJB005

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Run the print log map (DSNJU004) utility against each BSDS to determine which data set was last used as copy 1. Delete the copy 2 data set, define a replacement for the deleted data set, and copy the remaining BSDS to the replacement.

DSNJ123I CHANGE LOG INVENTORY FAILURE DETECTED

Explanation: During log manager initialization, the BSDS data set was found to have been incompletely processed by the change log inventory (DSNJU003) utility.

This message is issued by the following CSECT: DSNJB005

System Action: DB2 startup is terminated.

System Programmer Response: Run the print log map (DSNJU004) utility to determine what operation against the BSDS did not complete. Run the change log inventory (DSNJU003) utility against the BSDS(s) to allow any unfinished processing to be completed.

DSNJ124I OFFLOAD OF ACTIVE LOG SUSPENDED FROM RBA xxxxxx TO RBA xxxxxx DUE TO I/O ERROR

Explanation: During off-load, an unrecoverable I/O error was encountered on an active log data set. The data set experiencing the error is marked unusable, and no further logging is done to that data set.

This message is issued by the following CSECT: DSNJOFF4

System Action: Active log data sets continue to be off-loaded as they become full.

Operator Response: Notify the system programmer to allow recovery actions to be initiated.

System Programmer Response: Recover the data manually from the data set, copy it to an archive data set, run the change log inventory (DSNJU003) utility to make the new archive data set available to the DB2, and remove the error-prone active log data set from DB2 by using the change log inventory utility.

DSNJ125I ERROR DUMPING BSDS, OFFLOAD CONTINUING WITHOUT PRODUCING THE BSDS DUMP

Explanation: An error occurred while dumping the BSDS data set during the off-load process. The data set is not produced, but the off-load process continues. The volume containing the off-loaded data set does not contain a BSDS for recovery use.

This message is issued by the following CSECT: DSNJOFF3

System Action: The system continues the off-load process without producing a dump of the bootstrap data set.

DSNJ126I BSDS ERROR FORCED SINGLE BSDS MODE

Explanation: The log manager encountered an I/O error or a VSAM logical error on a bootstrap data set. This message is preceded by message DSNJ107I or DSNJ108I.

This message is issued by the following CSECT: DSNJB001

System Action: The log manager enters single BSDS mode using the remaining BSDS.

Operator Response: Notify the system programmer.

System Programmer Response: Execute an offline access method services job to rename the error BSDS and define a new BSDS with the same name. Then enter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

DSNJ127I SYSTEM TIMESTAMP FOR BSDS=...

Explanation: When the log manager is initialized, the system time stamp for the bootstrap data sets (BSDS) is displayed. The time stamp is of the format yy.ddd hh:mm:ss.th. This time stamp should be close to the last time at which this subsystem was stopped. If not, then it may indicate a restart is being attempted with the wrong BSDS.

This message is issued by the following CSECT: DSNJB005

System Action: DB2 startup continues.

Operator Response: If the time displayed does not appear to be close to the time this subsystem was last stopped, contact the system programmer.

System Programmer Response: If you cannot explain the apparent time discrepancy, cancel the subsystem. From the startup procedure for the subsystem services address space, determine the data set names of the bootstrap data sets and run the print log map (DSNJU004) utility. Check whether the active and archive log data sets all belong to this subsystem. If not, then change the startup procedure for the subsystem services address space to use the correct bootstrap data sets.

DSNJ128I LOG OFF-LOAD TASK FAILED FOR ACTIVE LOG nnnnn

Explanation: The off-load task abended while attempting to offload the relative byte address (RBA) range in active log data set 'nnnnn'.

This message is issued by the following CSECT: DSNJOFF6

System Action: The off-load task terminates and the archive data sets allocated to the off-load task are deallocated and deleted. The status of the active log data sets involved in the failed off-load processing remains set to 'not reusable'.

The log off-load task will be reinitiated by one of several events. The most common are:

- All the available space in the current active log data set has been used (normal case).
- A DSNJ110E message is issued.
- The master address space is started, but data in the active log has not been archived.
- An I/O error occurs on the active log, which will force the system to truncate and off-load the active log data set, and switch to a new active log data set.

Operator Response: This message is the result of an off-load failure, and will be preceded by one or more DB2 mes-

sages (for example, DSNJ073I) and/or MVS ABEND messages (for example, IEC030I, IEC031I, IEC032I). If DB2 is operating with restricted active log resources (see message DSNJ110E), quiesce the system to restrict logging activity until the ABEND or the DSNJ110E condition can be resolved. Notify the system programmer.

System Programmer Response: This message is the result of an off-load failure, and will be preceded by one or more DB2 messages (for example, DSNJ073I) and/or MVS ABEND messages (for example, IEC030I, IEC031I, IEC032I). Investigate and correct the cause of the ABEND before the off-load is attempted again by DB2.

Problem Determination: This message is the result of an off-load ABEND and will be preceded by one or more DB2 messages and/or MVS ABEND messages. See the documentation for the associated DB2 and/or MVS messages to formulate a course of corrective action. Use the print log map (DSNJU004) utility to print the BSDS (both copies if running in dual mode), and then use the DSNJU004 output to determine the current status of the active and archive log data sets.

This message can be generated for a variety of reasons. However, the most likely are:

- Archive log data set allocation errors. Refer to the text for message DSNJ103I for corrective action.
- The size of the archive log data set is too small to contain the active log data set(s) during off-load processing. All secondary space allocations have been used. This condition is normally accompanied by MVS ABEND message IEC030I.
- All available space on the DASD volume(s) to which the archive data set is being written has been exhausted. This condition is normally accompanied by MVS ABEND message IEC032I.
- The primary space allocation for the archive log data set (as specified in ZPARMS) is too large to allocate to any available online DASD device. This condition is normally accompanied by MVS ABEND message IEC032I.

DSNJ129I END OF log-rba eol-rba X COULD NOT BE FOUND IN ANY ACTIVE LOG DATA SET HIGHEST RBA FOUND WAS hi-rba X

Explanation: The log manager has been requested to find 'eol-rba', the log record which has been recorded in the bootstrap data set (BSDS) as the highest RBA written. This RBA cannot be found in any active log data set. The highest RBA which could be found in any active data set was 'hi-rba'.

This message is issued by the following CSECT: DSNJW009

System Action: DB2 startup processing is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Most likely, the active log data set containing the requested RBA has been deleted from the BSDS by the change log inventory (DSNJU003) utility. If the data set has not been reused, run DSNJU003 to add this data set back into the BSDS. Restart DB2.

If the data set is not available, a conditional restart must be performed to either truncate the log prior to the RBA value of the missing data set, or to cold start at a higher RBA value. Refer to Section 4 (Volume 1) of *Administration Guide* for more information.

DSNJ130I ICF CATALOG NAME IN BSDS DOES NOT AGREE WITH DSNZPARM. BSDS CATALOG NAME=*name*, DSNZPARM CATALOG NAME=*name*

Explanation: The ICF catalog name defined in DSNZPARM does not agree with the name contained in the bootstrap data set (BSDS).

This message is issued by the following CSECT: DSNJB005

System Action: DB2 startup is abended.

User Response: Notify the system programmer.

Operator Response: If you attempt to start the DB2 subsystem, you will receive this same message and abnormal termination will result until the problem is resolved.

System Programmer Response: Change the ICF catalog name in the BSDS to agree with the name defined in DSNZPARM during DB2 initialization. To change the ICF catalog name in the BSDS, use the BSDS change log inventory (DSNJU003) utility with the NEWCAT control statement.

Problem Determination: During log manager initialization, the ICF catalog name defined in DSNZPARM is compared to the catalog name in the BSDS to ensure that the catalog name used by the log manager during DB2 processing is correct. These names were found not to be the same.

DSNJ139I LOG OFFLOAD TASK ENDED

Explanation: Processing of the active log off-load ended.

This message is issued by the following CSECT: DSNJOFF1

System Action: This message is written to the MVS console.

Operator Response: This message does not guarantee that the off-load completed without errors. Check the console log and task messages to review the execution of the off-load task to determine whether any abnormal events occurred during the off-load.

DSNJ140I *csect-name* INVALID BSDS RELEASE LEVEL ACTIVE=*xxxxxx* ARCHIVE=*yyyyyy* DSN=*zzzzzz*

Explanation: At initialization time DB2 detected that the BSDS log records are not at the proper release level for this release of DB2. '*xxxxxx*' contains the release level for the ACTIVE log records and '*yyyyyy*' contains the release level for the ARCHIVE log records. '*zzzzzz*' contains the data set name for the BSDS encountering the error.

System Action: DB2 startup will be terminated.

Operator Response: Notify the system programmer so operating procedures can be changed.

System Programmer Response: Run the appropriate conversion program (DSNJMIG0 or DSNJFAL0) to convert the BSDS data set to a compatible release level.

DSNJ150E LOG CAPTURE EXIT ABEND, EXIT DEACTIVATED

Explanation: An abnormal program interrupt was detected while executing in the installation-supplied log capture exit code (i.e. entry point DSNJW117 in load module DSNJL004). As a result of the abend, the log capture exit will no longer be active; log data will no longer be available for Exit capture/processing.

This message can only occur when an installation-supplied log capture exit (entry DSNJW117) is active for this instance of DB2.

This message is issued by the following CSECT: DSNJW008

System Action: The log capture exit (entry point DSNJW117) is terminated. No further calls will be attempted for this DB2 instance. A full dump is provided for diagnostic purposes.

User Response: See "System Programmer Response" below.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the DSNJL004 load module (DSNJW117 entry point) abend and take corrective action.

Note: A correctly-functioning copy of load module DSNJL004/entry DSNJW117 must be available in order to start DB2. If the problem which caused the above abend cannot be corrected, ensure that the default DSNJW117 entry (load module DSNJL004 - supplied with the DB2 release) is available during the next DB2 subsystem start.

DSNJ151I *csect-name* IN READING RBA *rrr*, A NONZERO REASON CODE WAS RETURNED. CONNECTION-ID = *xxxx*, CORRELATION-ID = *yyyyyy*, REASON-CODE = *ccc*

Explanation: DB2 could not successfully complete the read of RBA '*rrr*' due to reason code '*ccc*'. The user or application that encountered the error is identified by the connection and correlation ID. Messages that have the same connection ID and correlation ID relate to the same application. Correlation IDs beginning with '*0nn*', where '*nn*' is a number from 01 to 28, identify system agents.

System Action: DB2 attempts to recover from the error.

System Programmer Response: If DB2 was able to recover from the error and successfully complete the application, no further action is required. If the application abnormally terminated or DB2 could not recover successfully, this message is followed by one or more messages. Refer to the information in this message and the subsequent messages to determine the appropriate corrective action. For information about recovery from log failures, refer to Section 4 (Volume 1) of *Administration Guide*.

DSNJ152I *csect-name* ERROR ENCOUNTERED WHEN ATTEMPTING TO BUILD ARCHIVE LOG VOLUME LIST. CONNECTION-ID=*xxxx*, CORRELATION-ID=*yyyyyy*, REASON-CODE=*ccc*

Explanation: An error occurred while attempting to create the Archive Log Volumes report. An RBA range could not be successfully mapped into one or more archive data sets due to reason code '*ccc*'. The user or application that encountered the error is identified by the connection and correlation ID. This message might be preceded by one or more related error messages. Messages that have the same connection ID and correlation ID relate to the same user. Correlation IDs beginning with '*0nn*', where '*nn*' is a number from 01 to 28, identify system agents.

This failure could be caused by one or more missing archive log data sets, or a system error (for example, an I/O error reading BSDS).

The Archive Log Volumes report (see message DSNJ330) is not produced. In addition, no premounting of tapes is possible.

System Action: The user or application continues execution. The physical read process for the user or application continues until the job completes normally or terminates abnormally. The job can terminate abnormally if the error is encountered again when the data set is physically required for the read process.

System Programmer Response: If the user or application completes successfully, no further action is necessary. If the user or application does not complete successfully, refer to the messages related to the actual failure to determine the appropriate corrective actions. For information about recovery from log failures, refer to Section 4 (Volume 1) of *Administration Guide*.

DSNJ200I *csect-name xxxxxxxx* **UTILITY PROCESSING COMPLETED SUCCESSFULLY**

Explanation: The control section 'csect-name' successfully completed the 'xxxxxxx' utility.

System Action: DB2 writes this message to the SYSPRINT data set, not to a console.

DSNJ201I *csect-name xxxxxxxx* **UTILITY PROCESSING WAS UNSUCCESSFUL**

Explanation: The control section 'csect-name' was unable to successfully complete processing of 'xxxxxxx' utility.

System Action: The current utility is terminated. DB2 writes this message to the SYSPRINT data set, not to a console.

User Response: Review other messages produced by the utility to determine the appropriate action to be taken.

DSNJ202I *csect-name* **INSUFFICIENT VIRTUAL STORAGE AVAILABLE TO CONTINUE WITH UTILITY**

Explanation: A GETMAIN macro instruction has failed, because virtual storage is unavailable for the job-step.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Rerun the utility after providing a larger virtual storage allocation for the job-step.

DSNJ203I *xxxxxxx* **OPERATION IS INVALID**

Explanation: The user entered a utility control statement operation of 'xxxxxxx' that is invalid.

This message is issued by the following CSECT: DSNJU001

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ204I *xxxxxxx* **PARAMETER IS INVALID**

Explanation: The user specified a utility control statement parameter of 'xxxxxxx' that is invalid.

This message is issued by the following CSECT: DSNJU001

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ205I *xxxxxxx* **PARAMETER HAS NO ARGUMENT**

Explanation: 'xxxxxxx' contains the name of a parameter that requires an argument.

This message is issued by the following CSECT: DSNJU001

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Specify an argument for the identified parameter and then rerun the utility.

DSNJ206I *xxxxxxx* **PARAMETER REQUIRES NO ARGUMENT**

Explanation: 'xxxxxxx' contains the name of the parameter that has been incorrectly followed by an = symbol.

This message is issued by the following CSECT: DSNJU001

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ207I *csect-name* **PARAMETERS INCONSISTENT WITH SPECIFIED OPERATION**

Explanation: The user has specified utility control statement parameters that are inconsistent with the specified utility operation.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ209I **ENDRBA VALUE MUST BE GREATER THAN STARTRBA VALUE**

Explanation: The 'STARTRBA' and 'ENDRBA' parameters specify an RBA range. Hence, the ENDRBA value must be greater than the STARTRBA value.

This message is issued by the following CSECT: DSNJU103

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ208E *csect name* **MEMBER** *member name* **WAS NOT FOUND IN THE BSDS SPECIFIED IN THE GROUP DD STATEMENT.**

Explanation: You are running the print log map (DSNJU004) utility. No member record exists for this member in the bootstrap data set (BSDS) specified in the GROUP DD statement.

System Action: The log map for this member is not printed. If the records for other members are requested and are found in the BSDS specified in the GROUP DD statement, they are printed.

User Response: Use the DISPLAY GROUP command to verify that the member name is a valid name and that the member has successfully joined the group. Also verify that the BSDS specified in the GROUP DD statement is correct. If the member name and the BSDS name are correct, then the most likely causes of this message are:

- The 'missing member' never joined the group because it was never started.
- The member whose BSDS you specified in the GROUP DD statement was down when the missing member joined the group and has not been restarted.

To gather the information from the missing member, you can rerun the utility, using the BSDS DDNAME option to point to the missing member's BSDS. To avoid this problem in the future, make sure the BSDS named in the GROUP statement is from a recently started member.

DSNJ210I **OLD ICF CATALOG NAME=oldname, NEW CATALOG NAME=newname**

Explanation: Change log inventory (DSNJU003) utility processing for the NEWCAT control statement has completed successfully.

oldname Either:

- The name of the prior ICF catalog or
- 'NULL' if no prior name existed.

newname The name of the ICF catalog defined by the VSAMCAT keyword.

This message is issued by the following CSECT: DSNJU003

DSNJ211I **UNEXPECTED END OF DATA ON SYSIN DATA SET**

Explanation: Additional control statements were expected but could not be found.

This message is issued by the following CSECTS: DSNJU001, DSNJU003

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement(s), and rerun the utility.

DSNJ212I *csect-name* **ERROR RETURNED FROM BSDS READ, RPLERRCD=yy, DDNAME=xxxxxxx**

Explanation: A VSAM GET was issued that resulted in a nonzero return code. 'yy' contains the error code returned by VSAM. 'xxxxxxx' contains the ddname of the BSDS encountering the error.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: The action taken is dictated by the return code. The BSDS may have to be recovered by use of a backup copy.

DSNJ213I *csect-name* **ERROR RETURNED FROM BSDS WRITE, RPLERRCD=yy, DDNAME=xxxxxxx**

Explanation: A VSAM PUT was issued that resulted in a nonzero return code. 'yy' contains the error code returned by VSAM. 'xxxxxxx' contains the ddname of the BSDS encountering the error.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: The action to be taken is dictated by the return code. The BSDS may have to be recovered by use of a backup copy.

DSNJ214I **SPECIFIED DSNAME ALREADY EXISTS IN BSDS, DDNAME=xxxxxxx**

Explanation: The user attempted a NEWLOG operation with a data set name that already exists in the BSDS. An entry is never made in a BSDS if the specified DSNAME currently exists in either the active or archive records of that BSDS. 'xxxxxxx' contains the ddname of the subject BSDS.

This message is issued by the following CSECT: DSNJU103

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Either correct the control statement and rerun the utility, or delete the existing DSNAME from the BSDS and rerun the utility.

DSNJ215I *csect-name* **SVC 99 INFORMATION REQUEST FOR DD NAME 'ddname' FAILED. RC= rc, RSN= rsncd, AND INFO CODE infocode.**

Explanation: The Print Log Map utility requested information from the MVS Dynamic Allocation facility about the DD name shown in the message, but the system was unable to provide the information. The return code, reason code, and information code were returned by the system's SVC 99 facility. See *MVS/ESA Programming: Authorized Assembler Services Guide* for an explanation of these codes.

System Action: If the information request was for the SYSIN DD statement, the Print Log Map utility assumes the control statement was not provided and attempts to continue the request using the SYSUT1 DD statement to locate the BSDS to be mapped.

If the information request was for the DD name of a BSDS, attempts to get information about BSDS data sets is terminated. If information about any BSDS data sets was previously

acquired, the maps of those BSDS data sets are printed. Otherwise, the utility terminates.

System Programmer Response: Use the MVS manual (or the equivalent manual for the level of MVS on your system) to help you in problem determination.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5 : 4, 32.

DSNJ216I BSDS ACTIVE LOG DATA SET RECORD IS FULL, DDNAME=xxxxxxx

Explanation: The maximum number of active log data sets is fixed. No further entries can be inserted after the maximum has been reached. 'xxxxxxx' contains the ddname of the subject BSDS.

This message is issued by the following CSECT: DSNJU103

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Run the print log map utility to determine the current status of the BSDS. Subsequent actions can then be formulated, depending upon the status of the BSDS.

DSNJ217I SPECIFIED DSNAME DOES NOT EXIST IN BSDS, DDNAME=xxxxxxx

Explanation: The DELETE operation specifies a DSNAME that cannot be found in the BSDS. 'xxxxxxx' contains the ddname of the subject BSDS.

This message is issued by the following CSECT: DSNJU203

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ218I SPECIFIED VOLUME DOES NOT EXIST IN BSDS, DDNAME=xxxxxxx

Explanation: The DELETE operation specifies a COPY1VOL or COPY2VOL argument that cannot be found in the BSDS. 'xxxxxxx' contains the ddname of the subject BSDS.

This message is issued by the following CSECT: DSNJU203

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement, and rerun the utility.

DSNJ219I csect-name OPEN ERROR, DDNAME=xxxxxxx

Explanation: An error occurred when the CSECT 'csect-name' tried to open a data set named 'xxxxxxx'.

This error can be caused by a number of different conditions. The most probable conditions are:

1. The ddname of the SYSPRINT, SYSIN, or SYSUT1 data set was not specified in the user's job control language (JCL).

2. The DB2 subsystem is currently executing.
3. The bootstrap data set (BSDS) was allocated by another job with a disposition (DISP) that conflicts with the DISP specified in the user's JCL.
4. The data set associated with 'xxxxxxx' is already open, possibly due to an earlier system abend.
5. The user is not authorized to access the data set associated with 'xxxxxxx'
6. Insufficient virtual storage is available to perform the OPEN command.
7. The catalog indicates that the data set associated with 'xxxxxxx' has an invalid physical record size.

System Action: The current utility is terminated.

DB2 writes this message to the SYSPRINT data set, not to a console.

User Response: The user's action depends on the condition that caused the OPEN error. The following is a list of appropriate actions corresponding to the conditions listed in the explanation:

1. Provide the missing DD statements, and then rerun the utility. Refer to *Utility Guide and Reference* for details about the required DD statements.
2. Wait until the DB2 subsystem is inactive before running the utility again because the log utility cannot execute while the DB2 subsystem is active.
3. Correct the disposition conflict and then rerun the utility.
4. Submit an access method services (IDCAMS) VERIFY job against the data set associated with 'xxxxxxx'. Rerun the log utility job.
5. In the case of an authorization failure, a separate message is usually generated from the authorization facility (RACF, for example). Investigate the authorization messages and obtain the proper authorization before running the utility again.
6. Insufficient virtual storage is usually accompanied by a separate error from the MVS operating system. Increase the REGION size on the JCL job step and rerun the utility.
7. Contact the system programmer.

DSNJ220I BSDS IN CREATE MODE. NO DATA TO MAP, DDNAME=nnnnnnnn

Explanation: The print log map utility found the BSDS to be in create mode, so it cannot contain data to map. 'xxxxxxx' contains the ddname of the data set.

This message is issued by the following CSECT: DSNJU004

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the JCL so that a nonnull data set can be processed.

DSNJ221I PREVIOUS ERROR CAUSED xxxxxxxx OPERATION TO BE BYPASSED

Explanation: DB2 encountered errors while processing a utility. These errors subsequently caused 'xxxxxxx' to be bypassed.

This message is a warning only and is displayed after messages that specify the error or errors that caused the utility operation to abend. Note that the error or errors may not be associated with the current 'xxxxxxx' operation; rather, under log utility processing, a significant error in any operation causes the control statements for this and any subsequent operations to be checked for syntax only. BSDS updates do not occur for any operation specified in this message.

This message is issued by the following CSECT: DSNJU003

System Action: The log utility continues to process. However, for this and all subsequent operations, the bootstrap data set (BSDS) is not updated and the utility only checks the syntax of the control statements.

DB2 writes this message to the SYSPRINT data set, not to a console.

User Response: Consult the previous messages and correct any errors that caused this message to be generated. Resubmit the log utility job for all operations that have been bypassed.

DSNJ222I INVALID SPECIFICATION OF xxxx PARAMETER ARGUMENT

Explanation: You specified the parameter 'xxxx'. This parameter is not valid for the argument.

This message is issued by the following CSECTS:

DSNJU103 DSNJU003 DSNJU403 DSNJU503

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the parameter argument on the control statement, and rerun the utility.

DSNJ223I xxxx PARAMETER ARGUMENT EXCEEDS MAXIMUM ALLOWABLE LENGTH

Explanation: The argument value of the parameter named 'xxxx' exceeds the maximum length allowed.

This message is issued by the following CSECT: DSNJU001

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the parameter argument on the control statement, and rerun the utility.

DSNJ224I xxxx PARAMETER APPEARS TOO OFTEN

Explanation: The parameter named 'xxxx' was specified more than once on the same control statement.

This message is issued by the following CSECT: DSNJU001

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Remove the redundant parameter, and rerun the utility.

DSNJ225I xxxx OPERATION SUCCESSFULLY COMPLETED

Explanation: The change log inventory (DSNJU003) utility operation named 'xxxx' completed successfully.

This message is issued by the following CSECT: DSNJU003

System Action: This message is written to the SYSPRINT data set, not to a console.

DSNJ226I SPECIFIED VOLUME ALREADY EXISTS IN BSDS, DDNAME=xxxxxxx

Explanation: The specified volume currently exists in the archive log records of the BSDS. 'xxxxxxx' specifies the ddname of the subject BSDS.

This message is issued by the following CSECT: DSNJU103

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Either correct the parameter argument on the control statement, or delete the specified volume and rerun the utility.

DSNJ227I NO SPACE AVAILABLE IN BSDS FOR ADDITIONAL ARCHIVE VOLUME ENTRIES, DDNAME=xxxxxxx

Explanation: The maximum number of archive volumes has been exceeded, and no more space is available for volume entries in the copy specified.

This message is issued by the following CSECT: DSNJU103

System Action: The current utility is terminated.

User Response: Delete some of the archive entries in the specified copy number, and rerun the utility.

DSNJ228I csect-name LOG DEALLOCATION ERROR DSNAME=dsname, ERROR STATUS=eeeeiiii, SMS REASON CODE=ssssssss

Explanation: The log manager encountered an error while trying to dynamically deallocate the data set. Error status is the error reason code returned by MVS dynamic allocation.

System Action: Log manager processing continues.

Operator Response: Notify the system programmer.

System Programmer Response: The error status portion of this message contains the 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC request block. If the S99ERROR code indicates an SMS deallocation error (97XX), then 'ssssssss' contains additional SMS reason code information obtained from S99ERSN. Refer to the

MVS/ESA SPL: Application Development Guide for a description of these codes.

DSNJ229I *csect-name* **OPEN FAILED FOR SYSIN**

Explanation: An error occurred when the DB2 Print Log Map utility tried to open the SYSIN data set.

Possible causes are:

1. The DD name of the SYSIN data set was not specified in the user's job control language (JCL).
2. Insufficient virtual storage is available to perform the OPEN command.
3. The characteristics of the SYSIN data set are different from those expected by the print log map (DSNJU004) utility.

System Action: DSNJU004 attempts to continue processing without an input control statement. DB2 writes this message to the SYSPRINT data set, not to the system console.

User Response: Take one of the following actions based on the cause of the error.

1. Provide the missing DD statement and rerun the utility. Refer to *Utility Guide and Reference* for details about the required DD statements.
2. Insufficient virtual storage is usually accompanied by a separate error message from the MVS operating system. Increase the REGION size on the JCL job step and rerun the utility.
3. Check that the SYSIN data set is a fixed record format (blocked or unblocked) with an LRECL of 80. You might need to contact the system programmer for help if this is a JES data set.

DSNJ230I **LOG OFFLOAD SUBCOMPONENT INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the off-load function was unable to complete its initialization process.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate actions to take.

DSNJ231I **LOG COMMAND INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the log command function was unable to complete its initialization process.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

Operator Response: The rest of subsystem termination will direct the actions you should take.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

This message will be of interest to the IBM support center when the problem is described.

DSNJ232I **OUTPUT DATA SET CONTROL INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the output data set control function was unable to complete its initialization process.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message for error analysis and the appropriate action to take.

This message will be of interest to the IBM support center when the problem is described.

DSNJ233I **ARCHIVE LOG READ INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the archive log read function was unable to complete its initialization process.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ234I **ARCHIVE LOG COMMAND QUIESCE INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the quiesce function which supports the -ARCHIVE LOG MODE(QUIESCE) command processing was unable to complete its initialization process.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ235I **OUTPUT BUFFER WRITER INITIALIZATION PROCESSING FAILED**

Explanation: During log manager initialization, the output buffer writer function was unable to complete its initialization process.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ236I BOOTSTRAP ACCESS TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the bootstrap data set access function was unable to complete its termination process.

This message is issued by the following CSECT: DSNJT001

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ237I *csect-name* INVALID CONTROL STATEMENT. THE FIRST WORD MUST BE 'MEMBER'.

Explanation: The print log map (DSNJU004) utility read an invalid control statement from the SYSIN data set.

System Action: DSNJU004 ignores the control statement and attempts to continue processing by looking for a SYSUT1 DD statement to describe the BSDS that is to be printed.

User Response: Refer to *Utility Guide and Reference* for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5 : 32.

DSNJ238I LOG OFFLOAD TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the off-load function was unable to complete its termination process.

This message is issued by the following CSECT: DSNJT001

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ239I LOG COMMAND TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the log command function was unable to complete its termination process.

This message is issued by the following CSECT: DSNJT001

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message.

Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ240I OUTPUT DATA SET CONTROL TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the output data set control function was unable to complete its termination process.

This message is issued by the following CSECT: DSNJT001

System Action: The log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ241I ARCHIVE LOG READ TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the archive log read function was unable to complete its termination process.

This message is issued by the following CSECT: DSNJT001

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ242I ARCHIVE LOG COMMAND QUIESCE TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the quiesce function which supports the -ARCHIVE LOG MODE(QUIESCE) command processing was unable to complete its termination process.

This message is issued by the following CSECT: DSNJT001

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ243I OUTPUT BUFFER WRITER TERMINATION PROCESSING FAILED

Explanation: During log manager termination, the output buffer writer function was unable to complete its termination process.

This message is issued by the following CSECT: DSNJT001

System Action: Log manager shutdown continues to the next step.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message.

Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ244I LOG TERMINATION RECEIVED RETURN CODE nnn FROM xxxxxxxx MACRO

Explanation: Log manager termination was passed a bad return code from the named macro.

This message is issued by the following CSECT: DSNJT001

System Action: Log manager termination processing continues.

Operator Response: Record the return code and macro-name, and notify the system programmer.

System Programmer Response: This message is associated with a failure in the named macro. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNJ245I CONDITIONAL RESTART RECORD INDICATES TRUNCATION AT xxx rrr. REPLY Y TO CONTINUE, N TO CANCEL

Explanation: The conditional restart control record in use indicates that the DB2 log should be truncated at the specified RBA or LRSN. xxx is replaced by either RBA or LRSN, and rrr is the value specified in the current record.

This message is issued by the following CSECT: DSNJW306

System Action: If Y, DB2 startup continues. If N, DB2 startup is terminated.

Operator Response: Reply N if the truncation is going to occur at an undesirable point. Notify system programmer. Reply Y to continue the restart.

System Programmer Response: Rerun the change log inventory (DSNJU003) utility to modify the conditional restart record.

DSNJ246I CONDITIONAL RESTART RECORD INDICATES COLD START AT RBA rrr. REPLY Y TO CONTINUE, N TO CANCEL

Explanation: The conditional restart control record in use indicates that DB2 is to be cold started and that logging is to be begin at the specified RBA.

This message is issued by the following CSECT: DSNJW306

System Action: If 'Y', DB2 startup continues. If 'N', DB2 startup is terminated.

Operator Response: Reply 'N' if the truncation is going to occur at an undesirable point. Notify the system programmer. Reply 'Y' to continue the cold start.

System Programmer Response: Rerun the change log inventory (DSNJU003) utility to modify the conditional restart record.

DSNJ247E csect-name I/O ERROR DURING PROCESSING OF rrr RC = rc, REASON = reason

Explanation: The I/O error occurred at record 'rrr'. 'rc' indicates the return code received from the I/O operation. 'reason' indicates the reason code received from the I/O operation.

If a return code '4' was received, this indicates that the log manager detected a problem. If a return code '8' was received, this indicates a VSAM error.

System Action: DB2 startup terminates.

Operator Response: Notify the system programmer.

System Programmer Response: For a return code of '4', if you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem. For a return code of '8', execute an offline access method services job to determine the cause of the VSAM error.

DSNJ248I ARCHIVE LOG READ DEALLOCATION INITIALIZATION PROCESSING FAILED

Explanation: During log initialization, the archive log read deallocation process was unable to complete its initialization.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error precede this message. Refer to these messages for error analysis and the appropriate action to take.

DSNJ249I ARCHIVE LOG READ SCHEDULER INITIALIZATION PROCESSING FAILED

Explanation: During log initialization, the archive log read scheduling process was unable to complete its initialization.

This message is issued by the following CSECT: DSNJS001

System Action: DB2 startup is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error precede this message. Refer to these messages for error analysis and the appropriate action to take.

DSNJ250E csect-name DATA SHARING REQUIRES ALL ACTIVE LOG DATA SETS TO BE DEFINED WITH SHAREOPTIONS(2 3) OR HIGHER.

Explanation: DB2 detected an active log data set defined with share options that do not permit recovery operations in a data sharing environment. This message is followed by message DSNJ251E, which identifies the specific active log data set.

All active log data sets for a DB2 data sharing member must be defined with a minimum of SHAREOPTIONS(2 3) for successful DB2 initialization. See the description of message DSNJ251E for more details.

System Action: The DB2 subsystem detecting this condition is terminated.

DSNJ251E *csect-name* **DATA SET** *dsname* **FAILS TO MEET THE MINIMUM REQUIRED SHAREOPTIONS FOR DATA SHARING.**

Explanation: The share options defined for the data set named in the message are too low to permit the data set to participate in a DB2 data sharing group. All active log data sets must be defined with SHAREOPTIONS(2 3) or higher in order to participate in a data sharing group.

System Action: The DB2 subsystem detecting this error is terminated.

System Programmer Response: Using IDCAMS LISTCAT or TSO LISTCAT, display the share options of all of the active log data sets of all of the members in the data sharing group. For any active log data set that is defined with less than SHAREOPTIONS(2 3), use IDCAMS ALTER or TSO ALTER to alter the data set definitions to SHAREOPTIONS(2 3) or higher.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 11.

DSNJ301I *csect-name* **ERROR** *action* **ONLINE BOOTSTRAP DATA SET**

Explanation: During command processing for the -RECOVER BSDS command or the -ARCHIVE LOG command, an error occurred while performing an operation on the Bootstrap Data Set. The type of operation is specified in the 'action' keyword in the message text:

- **ACCESSING** Unable to OPEN the BSDS.
- **READING** Unable to read a required record from the BSDS.
- **UPDATING** Unable to write a required record to the BSDS.
- **RESTORING DUAL** The contents of the stable BSDS was successfully copied to the replacement BSDS; however, the DB2 subsystem was unable to successfully restore dual BSDS operation.

System Action: If this message was received during processing of the -RECOVER BSDS command, then the DB2 subsystem will continue in single BSDS mode. If this message was received during processing of the -ARCHIVE LOG command, the archive log history record in the BSDS will not be updated to reflect the occurrence of an -ARCHIVE LOG command; logging and the off-load processing will continue.

Operator Response: Inform the system programmer of the type of error that occurred, and whether the error occurred while processing a -RECOVER BSDS command or an -ARCHIVE LOG command.

System Programmer Response: If this message was received during processing of the -RECOVER BSDS command, then recovery action must be performed on the bootstrap data set before reentering the command. If this message was received during processing of the -ARCHIVE LOG command, no action is necessary.

DSNJ302I **ALLOCATION ERROR ON REPLACEMENT BSDS** *DSNAME=...* **ERROR STATUS=...**

Explanation: The RECOVER BSDS command encountered an error while trying to dynamically allocate the specified data set. DSNAME is the data set name. Error Status is the error code and information code returned by MVS dynamic allocation.

This message is issued by the following CSECT: DSNJC004

System Action: Processing of the command is terminated. The system continues in single BSDS mode.

Operator Response: Determine the cause of the error from the error status contained in the message, and correct the condition. Then reenter the -RECOVER BSDS command.

System Programmer Response: The error status portion of this message contains the 2-byte error code (S99ERROR) followed by the 2-byte information code (S99INFO) from the SVC request block. Refer to the appropriate MVS publication for a description of these codes.

DSNJ303I **WRITE ERROR ON REPLACEMENT BSDS** *DSNAME=...* **ERROR STATUS=...**

Explanation: The -RECOVER BSDS command encountered an error while attempting to write to the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code.

This message is issued by the following CSECT: DSNJC002

System Action: Processing of the command is terminated. The system continues in single BSDS mode.

Operator Response: Notify the system programmer.

System Programmer Response: Execute an offline access method services job to delete or rename the replacement BSDS and define a new BSDS with the same name. Reenter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

DSNJ304I **ERROR CLOSING REPLACEMENT BSDS** *DSNAME=...* **ERROR STATUS=...**

Explanation: The -RECOVER BSDS command encountered an error while attempting to close the specified bootstrap data set. Error Status contains the VSAM return and feedback codes. It is a 2-byte field with the first containing the hexadecimal return code and the second containing the hexadecimal feedback code.

This message is issued by the following CSECT: DSNJC004

System Action: Processing of the command is terminated. The system continues in single BSDS mode.

Operator Response: Notify the system programmer.

System Programmer Response: Execute an offline access method services job to delete or rename the replacement BSDS and define a new BSDS with the same name. Reenter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

**DSNJ305I REPLACEMENT BSDS NOT EMPTY
DSNAME=...**

Explanation: The -RECOVER BSDS command was issued, but the replacement bootstrap data set was not empty; that is, it contained data.

This message is issued by the following CSECT: DSNJC004

System Action: Processing of the command is terminated. DB2 continues in single BSDS mode.

Operator Response: Notify the system programmer.

System Programmer Response: Execute an offline access method services job to delete or rename the error BSDS and define a new BSDS with the same name. Reenter the log manager -RECOVER BSDS command to reestablish dual BSDS mode.

DSNJ306I DUAL BSDS MODE ALREADY ESTABLISHED

Explanation: The -RECOVER BSDS command was issued, but DB2 was already in dual BSDS mode.

This message is issued by the following CSECT: DSNJC002

System Action: The command is ignored.

DSNJ307I LOG INITIALIZED IN SINGLE BSDS MODE

Explanation: The -RECOVER BSDS command was issued, but the system was initialized in single BSDS mode.

This message is issued by the following CSECT: DSNJC002

System Action: Processing of the command is terminated. The system continues in single BSDS mode.

**DSNJ310I (A)SYNCHRONOUS ARCHIVE LOG COMMAND
QUIESCE PROCESSING STARTED FOR
MAXIMUM OF xxx SECONDS**

Explanation: An -ARCHIVE LOG command with the MODE(QUIESCE) option has been accepted by the DB2 subsystem. The quiesce processing has commenced.

This message is issued by the following CSECT: DSNJC005

System Action: The DB2 subsystem will attempt to stop all updates to DB2 resources within the time period specified in the message. Users/jobs operating on the DB2 subsystem will be allowed to reach a point of consistency (commit point) before being blocked from further update activity. Jobs and users will be suspended until they are released by DB2 following the initiation of the off-load processing. If the DB2 subsystem can effectively block all users from performing updates before the maximum specified time, then the off-load will be initiated immediately, and normal processing will be resumed.

The message will display either the word SYNCHRONOUS or ASYNCHRONOUS, to inform the user of the type of quiesce processing which has been used.

- If the word SYNCHRONOUS is displayed, then the invoker used the WAIT(YES) option. This means that quiesce processing will be synchronous to the user; that is, the user can enter additional DB2 commands, but the commands will not be processed by the DB2 command processor until the quiesce processing has ended.
- If the word ASYNCHRONOUS is displayed, then the invoker used the WAIT(NO) option, or did not specify the WAIT option. This means that quiesce processing will be asynchronous to the user; that is, control will be returned

to the invoker as soon as the quiesce task has been started. Thus, the DB2 command processor will accept - and process - any new DB2 commands while the quiesce task is running.

This message will be followed by message DSNJ311I or DSNJ317I.

Operator Response: No operator response is necessary. However, it can be expected that users and jobs using DB2 resources will be suspended (queued) by DB2 through the duration of the specified time interval, or until the DB2 subsystem can be certain that all update activity has been effectively blocked. At some point, this message will be followed by the DSNJ311I message or DSNJ317I message.

**DSNJ311I csect-name ASYNCHRONOUS LOG ARCHIVE
(OFFLOAD) TASK INITIATED**

Explanation: A user-initiated -ARCHIVE LOG command has been accepted by the DB2 subsystem. An asynchronous task to archive (off-load) the active log data set has been started.

System Action: The current active log data set(s) will be truncated and switched to the next available active log data set(s), and an asynchronous off-load task will be initiated to archive the Active log data set(s).

The term ASYNCHRONOUS is used to indicate that control will be returned to the invoker as soon as the off-load task has been started. Thus, the DB2 command processor will accept — and process — any DB2 commands while the off-load task is running.

This message is followed by message DSNJ312I if the MODE(QUIESCE) option was used with the -ARCHIVE LOG command.

Operator Response: The operator should respond per normal operational procedures when the off-load task begins.

**DSNJ312I ARCHIVE LOG QUIESCE ENDED. UPDATE
ACTIVITY AGAINST DB2 RESOURCES IS NOW
RESUMED.**

Explanation: An -ARCHIVE LOG command with the MODE(QUIESCE) option was processed by the DB2 subsystem. As part of the MODE(QUIESCE) processing, an attempt was made to stop all new update activity against DB2 resources. This message signals the end of the quiesce processing, and the resumption of normal DB2 activity for all users and jobs which were blocked during the quiesce period.

This message follows message DSNJ311I or DSNJ317I.

This message is issued by the following CSECT: DSNJC007

System Action: The DB2 subsystem has now resumed all normal DB2 activity for all users and jobs that were blocked during the quiesce period.

**DSNJ313I PARAMETER SPECIFIED ON THE keyword
KEYWORD (value) IS NOT IN THE RANGE OF
ALLOWABLE VALUES**

Explanation: This message was generated by an error occurring in the -ARCHIVE LOG command with the MODE(QUIESCE) option or in the -SET ARCHIVE command. One of the command keywords specified a value that was outside of the range of allowed values.

This message is issued by the following CSECTs: DSNJC005 DSNJC009

System Action: Processing for the -ARCHIVE LOG command or -SET ARCHIVE command is terminated. This message is followed by message DSN9023I.

Operator Response: Refer to *Command Reference* for the correct syntax of the command. Correct the command syntax and reenter the command.

**DSNJ314I xxxx KEYWORD REQUIRES yyyy KEYWORD
 TO ALSO BE SPECIFIED ON THE COMMAND**

Explanation: A command was entered which specified the 'xxxx' keyword. However, use of the 'xxxx' keyword requires that the 'yyyy' keyword also be used.

This message is issued by the following CSECT: DSNJC005

System Action: Command processing terminates for the -ARCHIVE LOG or -RECOVER BSDS command. This message is followed by message DSN9023I.

Operator Response: Refer to the *Command Reference* for the correct syntax of the command. Correct the command syntax, and reenter the command.

DSNJ315I -STOP DB2 MODE(FORCE) IN PROGRESS

Explanation: An attempt was made to issue an -ARCHIVE LOG command when a -STOP DB2 MODE(FORCE) command was already in progress.

This message is issued by the following CSECT: DSNJC005

System Action: Command processing terminates for the -ARCHIVE LOG command. The -STOP DB2 MODE(FORCE) processing continues.

DSNJ316I SYSTEM QUIESCE ALREADY IN PROGRESS

Explanation: An attempt was made to issue an -ARCHIVE LOG command with the MODE(QUIESCE) option when a system quiesce was already in progress. The system quiesce could be the result of processing by another -ARCHIVE LOG MODE(QUIESCE) command, or by a -STOP DB2 MODE(QUIESCE) command.

This message is issued by the following CSECT: DSNJC005

System Action: Command processing will terminate. The system quiesce currently in progress will continue.

**DSNJ317I ARCHIVE LOG QUIESCE PERIOD EXPIRED.
 NUMBER OF OUTSTANDING UR'S = xxxx.
 ARCHIVE LOG PROCESSING WILL BE TERMINATED,
 AND UPDATE ACTIVITY AGAINST
 DB2 RESOURCES WILL BE RESUMED.
 HH:MM:SS**

Explanation: An -ARCHIVE LOG MODE(QUIESCE) command was processed by the DB2 subsystem; however, the DB2 subsystem was not able to quiesce all update activity in the user-specified quiesce time interval.

This message is issued by the following CSECT: DSNJC007

System Action: This message is informational only. The DB2 subsystem determined that 'xxxx' units of recovery (URs) did not reach a point of consistency during the quiesce period, and therefore could not be stopped from continuing their associated update processing.

Consequently, the -ARCHIVE LOG processing will be terminated. The current active log data set(s) will not be truncated,

and will not be switched to the next available active log data set(s). The log archive (off-load) task will not be created. All jobs and users suspended during the quiesce will be resumed, and normal update activity against DB2 resources will be commenced.

This message will be followed by the DSNJ312I message.

Operator Response: Contact the system programmer.

System Programmer Response: A determination must be made whether the outstanding (nonquiesced) URs represent significant work.

Each user on the system has a unit of recovery if they are modifying DB2 resources. URs are also created by the DB2 subsystem itself for internal processing. Since the purpose of the MODE(QUIESCE) option is to have all URs reach a point of consistency (commit point) before the active log data set is truncated and off-loaded, determine all outstanding nonqueued jobs and users by using -DISPLAY THREAD and the MVS 'D A,L' operator command.

It should be noted that URs may be outstanding due to lock contention between a user or job which holds a resource (and has reached a point of consistency), and a user or job which wants a lock (and therefore cannot reach a point of consistency).

Before resubmitting the -ARCHIVE LOG command with the MODE(QUIESCE) option, either:

- Wait until the threads have been deallocated.
- Wait until the DB2 subsystem is less busy.
- Force the offending thread(s) to terminate.
- Use the TIME option to dynamically override and extend the maximum quiesce time period specified in ZPARMS.
- Or, if having all URs reach a point of consistency in the active log is no longer critical, issue the -ARCHIVE LOG command without the MODE(QUIESCE) option.

Important: If the decision is made to use the -ARCHIVE LOG command without the MODE(QUIESCE) option, the active log data set(s) will be truncated without regard to quiescing activity on the DB2 subsystem. If the resulting archive log data set is used for recovery, it is possible that some URs may be found to be In-flight, In-Abort, In-Commit, or In-doubt during DB2 initialization.

If expiration of the quiesce period before all URs reach a consistent point are a chronic problem, an adjustment to ZPARMS may have to be made. The quiesce period is controlled by the 'Maximum Quiesce Period' ZPARM. Refer to the discussion about the Archive Log Parameters (DSNTIPA) panel in Section 2 of *Installation Guide*.

**DSNJ318I csect-name ARCHIVE LOG COMMAND
 ALREADY IN PROGRESS**

Explanation: An attempt was made to issue an ARCHIVE LOG command when an ARCHIVE LOG command was already in progress. In data sharing, the ARCHIVE LOG command currently in progress could be initiated by another member.

Operator Response: If the conflicting command satisfies your archival request, do not reissue the command. Otherwise, wait for the conflicting command to complete and then reissue the -ARCHIVE LOG command.

DSNJ319I *csect name* **CURRENT ACTIVE LOG DATA SET IS THE LAST AVAILABLE ACTIVE LOG DATA SET. ARCHIVE LOG PROCESSING WILL BE TERMINATED.**

Explanation: The -ARCHIVE LOG command was rejected because the current active log is the last available active log data set. To process the command when these conditions exist would cause the DB2 subsystem to exhaust its available active log resources and immediately halt processing.

System Action: Processing for the command is terminated. If the situation is not corrected, the DB2 subsystem will issue the DSNJ110E message (if it has not already done so) as the available active log data space reaches critically low levels. Ultimately, message DSNJ111E will be issued when the available active log data space is exhausted, and the DB2 online processing will halt until active log space is made available.

User Response: Notify the operator or system programmer.

Operator Response: To clear this condition, steps must be taken to complete other waiting off-load tasks. Once another active log is made available (re-usable) by completing the off-load process for it, the command processing for the current active log can proceed.

```
# Execute an MVS Display System Requests command (D R,L
# for example) to determine the outstanding requests related to
# the log off-load process. Take the necessary action to satisfy
# any requests, and permit off-load to continue. If off-load fails to
# complete normally, or cannot be initiated, notify the systems
# programmer.
```

System Programmer Response: Either correct the problem that is causing the off-load process to fail, or add more active log data sets. Note that the latter action requires DB2 to be down and the change log inventory (DSNJU003) utility to be run.

Possible causes for the shortage of active log data space are:

- Excessive logging. For example, too many users requesting logs at the same time, or too many utilities specifying LOG (YES).
- Delayed or slow off-loading. For example, failure to mount archive volumes, incorrect replies to off-load messages, or slow device speeds.
- Excessive use of the -ARCHIVE LOG command. Each invocation of the command causes the DB2 subsystem to switch to a new active log data set. Excessive use could consume the available active log data space if the resulting off-loads were not processed in a timely manner.
- Off-loads(s) failed (see Operator Response).
- Insufficient active log space (see Operator Response).

DSNJ320I *csect-name* **UNABLE TO PROCESS LOG TRUNCATION REQUEST DUE TO SUBSYSTEM COMPONENT** *action* **FAILURE**

Explanation: While processing an -ARCHIVE LOG command, an internal request was made of the log buffer output routine to force-write the log buffers and to truncate and switch the active log to the next available active log data set(s). The request failed during the processing of the 'action' specified in the message.

System Action: Processing for the command is terminated.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: This error is an internal error detected by the DB2 subsystem. The error may be caused by an unrelated ABEND in the Log Buffer Writer component (DSNJVxxx), by a -STOP DB2 MODE(FORCE) command, or by abnormal subsystem termination. Refer to messages and ABENDS which precede this message.

DSNJ321I **UNABLE TO CONTINUE ARCHIVE LOG QUIESCE DUE TO INTERNAL SUBSYSTEM ERROR. ARCHIVE LOG PROCESSING WILL BE TERMINATED, AND UPDATE ACTIVITY AGAINST DB2 RESOURCES WILL BE RESUMED.**

Explanation: An -ARCHIVE LOG command with the MODE(QUIESCE) option was processed by the DB2 subsystem. As part of the MODE(QUIESCE) processing, an attempt was made to stop all new update activity against DB2 resources. During the internal subsystem interaction between the log manager and the recovery manager, an internal interface error was detected by the recovery manager.

This message is issued by the following CSECT: DSNJC007

System Action: The -ARCHIVE LOG MODE(QUIESCE) processing is terminated. This message will be followed by message DSNJ312I after all users and jobs quiesced by the MODE(QUIESCE) processing are resumed.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: This error is an internal error detected by the DB2 subsystem. Retry the -ARCHIVE LOG MODE(QUIESCE) command. If the error persists, the active log data sets may be switched using the -ARCHIVE LOG command without the MODE(QUIESCE) option.

DSNJ322I **DISPLAY ARCHIVE REPORT FOLLOWS—**

Explanation: This message is always generated as the title for the -DISPLAY ARCHIVE command report output. It precedes the other messages generated by this command.

The series of messages DSNJ323I through DSNJ329I provide the formatted report for -DISPLAY ARCHIVE.

DSNJ323I **COUNT TIME**

Explanation: The column headings for the list of parameter specifications generated by the -DISPLAY ARCHIVE command are displayed. The message number is not included in this message.

DSNJ324I **(TAPE UNITS) (MIN,SEC)**

Explanation: The format of the COUNT and TIME parameter specifications displayed by the -DISPLAY ARCHIVE command are shown. The message number is not included in this message.

DSNJ325I **name count time**

Explanation: This message, in combination with messages DSNJ323I and DSNJ324I, provides the parameter information that is a part of the -DISPLAY ARCHIVE report.

name Identifies the count and time values in the message line.

DSNZPARM Values specified during DB2 installation.
 CURRENT Current values in the DB2 system.
 count The value for COUNT as specified in name.
 time The value for TIME as specified in name.
 The message number is not included in this message.

DSNJ326I

Explanation: This message separates messages DSNJ325I and DSNJ327I that are generated by the -DISPLAY ARCHIVE command. The message number is not included in this message.

DSNJ327I ADDR STATUS CORR-ID VOLSER DATASET_NAME

Explanation: This message displays the column headings for the DISPLAY ARCHIVE report.

The message number is not included in this message.

DSNJ328I tapeaddr status corr-id vname dsname

Explanation: This message, in combination with message DSNJ327I, provides the tape unit information that is part of the -DISPLAY ARCHIVE report.

tapeaddr The physical tape address of the tape unit allocated to read archive log.
 status Status of tape address:
 BUSY Tape address is actively processing an archive log data set.
 PREM Tape address is active and allocated for premount.
 AVAIL Tape unit is inactive and waiting for work.
 corr-id The correlation id associated with the user of the tape being processed. If the status is PREM or AVAIL, this column might contain '*****', indicating no current user is associated with this tape.
 vname The name of the tape volume that is mounted on the tape address.
 dsname The data set on the tape volume that is being processed (BUSY and PREM) or was last processed (AVAIL).

The message number is not included in this message.

DSNJ329I END OF DISPLAY ARCHIVE REPORT

Explanation: This message follows messages DSNJ322I through DSNJ328I and indicates that the -DISPLAY ARCHIVE report was generated successfully. The message number is not included in this message.

DSNJ330I ARCHIVE LOG VOLUMES REQUIRED FOR CONNECTION ID conn-id CORRELATION ID corr-id

Explanation: This message is the title for the ARCHIVE LOG VOLUMES report output. The ARCHIVE LOG VOLUMES report lists the archive log volumes needed by the correlation ID for that connection ID. This message is generated automatically by the archive read process at the first archive log tape mount for corr-id. This message precedes the other messages generated by this action.

This message, in combination with messages DSNJ331I and DSNJ332I, provides the formatted report for the ARCHIVE LOG VOLUMES requested.

conn-id An identifier representing the 'connection name' used to establish the thread.
 corr-id An identifier associated with a specified thread. In TSO, it is either the authorization ID or the job name.

DSNJ331I avolume, avolume, avolume, avolume ...

Explanation: This message provides the tape volume information for the Archive Log Volumes report output.

avolume The name of the archive log volume required for this correlation ID. An 'avolume' prefixed with an '*' signifies that the data on the archive log volume is also mapped by an active log data set. As such, the 'avolume' **might not** be required for the read process, since the data is read from the active log, if possible.

DSNJ332I END OF ARCHIVE LOG VOLUMES REPORT

Explanation: This message follows messages DSNJ330I and DSNJ331I and indicates that the ARCHIVE LOG VOLUMES report was generated successfully. The message number is not included in this message.

DSNJ334I PARAMETER SPECIFIED ON THE keyword KEYWORD (VALUE) CONTAINS INVALID CHARACTERS

Explanation: A -SET ARCHIVE command was processed by the DB2 subsystem. One of the command keywords specified a value that contains an invalid character.

This message is issued by the following CSECT: DSNJC009

System Action: Processing for the -SET ARCHIVE command is terminated. This message is followed by the DSN9023I message.

Operator Response: Refer to *Command Reference* for the syntax of the command. Correct the syntax and reenter the command.

DSNJ335I INVALID KEYWORDS COMBINATION IN SET ARCHIVE COMMAND

Explanation: This command requires that keyword COUNT or keyword TIME be specified. If both are omitted, the keyword DEFAULT must be specified. It is invalid to specify keyword DEFAULT when either the COUNT keyword or TIME keyword is specified.

This message is issued by the following CSECT: DSNJC009

System Action: Processing for the -SET ARCHIVE command is terminated. This message is followed by the DSN9023I message.

Operator Response: Refer to *Command Reference* for the syntax of the command. Correct the syntax and reenter the command.

**DSNJ336I UNABLE TO ALLOCATE TAPE UNIT FOR
conn-id corr-id, x ALLOCATED, y ALLOWED.**

Explanation: An attempt to allocate a tape unit for connection ID 'conn-id' failed. The current maximum tape unit specified is 'y', but only 'x' are physically available.

This message is issued by the following CSECT: DSNJR206

System Action: The 'conn-id corr-id' process is queued until either an allocated tape unit becomes free or more tape units are varied online and made available to the DB2 archive read task.

Operator Response: This situation rectifies itself over time as currently allocated tape units become available. To improve throughput, vary additional tape units online and make them available to DB2. Note that a queue rescan is not attempted until the -SET ARC READ COUNT command is issued or when an allocated tape dismounts.

**DSNJ337I SET ARCHIVE COMMAND COMPLETED
COUNT(count) TIME(minute,second)**

Explanation: This message indicates that the -SET ARCHIVE command processed successfully and displays the current values for COUNT and TIME.

count The value for the COUNT parameter
minute The 'minute' value for the TIME parameter
second The 'second' value for the TIME parameter

DSNJ338I NO TAPE ARCHIVE READING ACTIVITY

Explanation: This message indicates that there is no current archive tape reading activity to report.

The message number is not included in this message.

**DSNJ340I csect-name COMMAND KEYWORD xxx IS
ONLY VALID FOR DATA SHARING**

Explanation: An attempt was made to issue a DB2 command with KEYWORD xxx on a DB2 that was not initialized to participate in data sharing.

System Action: The command request is rejected.

**DSNJ350I csect-name (A)SYNCHRONOUS ARCHIVE LOG
COMMAND QUIESCE PROCESSING STARTED
IN DATA SHARING**

Explanation: The DB2 subsystem of a data sharing group accepted an ARCHIVE LOG command with the MODE(QUIESCE) option.

Each active DB2 member in the data sharing group performs the quiesce operation. The member originating the quiesce issues message DSNJ350I; all other members issue DSNJ310I as they start quiescing.

**DSNJ351I csect-name MEMBER member name
STATUS=member status**

Explanation: This message appears in response to MODE(QUIESCE) being specified with the ARCHIVE LOG command. It is one of a list of elements that display archive related status of the indicated member of the data sharing group. These member status messages are preceded by the message DSNJ359I and are followed by DSNJ361I.

member name identifies the member of the data sharing group.

member status indicates archive related status of the named member. It appears as one of the following:.

ABNORMALLY TERMINATING

The named member was undergoing abnormal subsystem termination at the time ARCHIVE LOG processing was active for the data sharing group. ARCHIVE LOG command processing for the remainder of the data sharing group terminates unsuccessfully.

ARCHIVE ALREADY ACTIVE

ARCHIVE LOG command processing was running at the named member at the time a succeeding ARCHIVE LOG command was issued. The succeeding ARCHIVE LOG command terminates unsuccessfully for the remaining members of the data sharing group.

CANCELED

ARCHIVE LOG command processing for the named member was canceled due to a problem encountered elsewhere in the data sharing group. The quiesce operation is interrupted and terminated and update activity against DB2 resources is resumed before command processing is terminated for the member.

COMMUNICATIONS FAILURE

A communications failure occurred between the named member and one or more other members in the data sharing group. The quiesce operation is interrupted and update activity against DB2 resources is resumed before command processing is terminated for the member. ARCHIVE LOG command processing for the remainder of the data sharing group terminates unsuccessfully.

FAILED

The named member was inactive at the time the ARCHIVE LOG command was issued. Termination of the DB2 subsystem for this member was abnormal. This status, if displayed for any member, will cause ARCHIVE LOG command processing for the entire data sharing group to terminate unsuccessfully.

NOT AVAILABLE

Archive command status for the named member could not be determined. This condition typically occurs when the named member fails to respond during ARCHIVE LOG command processing and is usually accompanied by message DSNJ353I and/or message DSNJ355I.

QUIESCED

The named member was active at the time the ARCHIVE LOG command was issued. Update activity against DB2 resources had successfully quiesced for that member (no active URs) in response to specifying MODE(QUIESCE).

QUIESCED/OFFLOADING

The named member was active at the time the ARCHIVE LOG command was issued. Update activity against DB2 resources had successfully quiesced for that member (no active URs) in response to specifying MODE(QUIESCE). The active log at the time was truncated and an offload process was initiated after all members in the data sharing group had reached a quiesce point.

STOPPED

The named member was inactive at the time the ARCHIVE LOG command was issued. Termination of the DB2 subsystem for this member was normal with no incomplete URs outstanding. Log truncation and offload processing are scheduled to be performed automatically the next time the named member is started. When the member is started, it is important to ensure that archive processing occurs automatically. Certain error conditions might require entering an ARCHIVE LOG command via the operator console to cause log truncation and offload processing to be performed. This member status is accompanied by warning message DSNJ362A.

TIME EXCEEDED

The named member could not quiesce its update activity within the allotted period of time. The incomplete quiesce operation is interrupted and update activity is resumed before command processing is terminated for the member. ARCHIVE LOG command processing for the remainder of the data sharing group is unsuccessfully terminated.

DSNJ352W *csect-name* **MEMBERS WERE NOT OFFLOADED**

Explanation: DB2 issues this message during processing of an ARCHIVE LOG command with the MODE(QUIESCE) option. One or more quiesced members were not available to receive the archive request. DSNJ3511 messages follow to display the quiesced members.

At the next start up of the quiesced member, DB2 switches (truncates) the current active log and initiates the archive task.

DSNJ353I *csect-name* **DSNJ353I MEMBER** *member name* **NOT RESPONDING.**

Explanation: This message is displayed when a response is needed but not received within an expected period of time during ARCHIVE LOG MODE(QUIESCE) command processing. This can occur as a result of abnormal subsystem termination under the named member or, possibly from communications problems among members of the data sharing group.

Operator Response: Examine the console log of the named member for operator information messages that might relate to the problem.

DSNJ354I *csect-name* **DSNJ354I ARCHIVE LOG: ALL ACTIVE MEMBER(S) STARTED OFFLOAD TASKS**

Explanation: This message is displayed when MODE(QUIESCE) is specified with the ARCHIVE LOG command, after all active members in the data sharing group have successfully quiesced their update activity within the allotted time period. For each active member in the data sharing group, the active log is truncated and switched, and an offload task is initiated to begin the offload process. Log truncation, switch and offload processing for stopped (and quiesced) members is performed the next time they are started.

DSNJ355I *csect-name* **ARCHIVE LOG: ONE OR MORE ACTIVE MEMBERS FAILED TO RESPOND OR START OFFLOAD TASKS**

Explanation: This message is displayed when MODE(QUIESCE) is specified with the ARCHIVE LOG command, and one or more active members could not successfully quiesce their update activity in the time allotted. Subsystem activity already quiesced is resumed, and ARCHIVE LOG command processing terminates unsuccessfully for all active members in the data sharing group. Message DSNJ353I might also appear with this message.

Operator Response: See the list of DSNJ351I member status messages following message DSNJ359I to determine the reason for the archive command failure.

DSNJ356I *csect-name* **COMMUNICATIONS FAILURE TERMINATED COMMAND**

Explanation: This message appears as a result of the failure of a communications request by one or more members of the data sharing group. This message is likely to be accompanied by DSN7xxx or other error messages and/or an SVC dump.

System Action: ARCHIVE LOG command processing terminates unsuccessfully for all members in the group.

DSNJ357E **SYSTEM QUIESCE FAILED**

Explanation: This message indicates the unsuccessful outcome of an ARCHIVE LOG MODE(QUIESCE) command. This message indicates that one or more members were unable to quiesce their update activity in the time allowed. It is usually accompanied by one or more related messages (e.g., DSNJ355I), and a list of member status messages indicating the reason for the failure.

Operator Response: Refer to messages DSNJ359I, DSNJ351I and DSNJ361I to determine archive related status of members in the data sharing group.

DSNJ359I **MEMBER RESPONSES**

Explanation: This message marks the beginning of a list of one or more DSNJ351I member status messages and precedes the first status message in the list.

DSNJ361I *csect-name* **END OF MEMBER RESPONSES LIST**

Explanation: This message marks the end of a list of one or more DSNJ351I member status messages and follows the last status message in the list.

DSNJ362E *csect-name* **WARNING: LOGS OF nn STOPPED OR FAILED MEMBERS NOT OFFLOADED.**

Explanation: This message is displayed when either MODE(QUIESCE) or SCOPE(GROUP) is specified with the ARCHIVE LOG command, and one or more members of the data sharing group either stopped or failed and were not available to receive the archive request. Active log truncation, log switch and offload processing for these inactive members is scheduled to be performed the next time those members are started.

Operator Response: Verify that log switch and offload processing does automatically occur when the inactive members are started. Certain error conditions might require the ARCHIVE LOG command to be individually issued for a member if ARCHIVE LOG processing does not occur automatically. Refer to messages DSNJ359I, DSNJ351I, and DSNJ361I to identify the inactive members.

DSNJ401I *csect-name rrrr* **RECORD NOT FOUND**

Explanation: An attempt was made to read the 'rrrr' record from the BSDS. In so doing, the read routine (DSNJU01B) could not find the record.

System Action: Utility processing continues. This message is written to the SYSPRINT data set, not to a console.

DSNJ402I **UNABLE TO LOCATE aaaa TBLSPACE NAME IN SYSTEM CATALOG OR DIRECTORY DATA-BASES**

Explanation: The table space name specified on the TBLSPACE parameter of the change log inventory (DSNJU003) utility SYSTEMDB statement could not be found in any DB2 subsystem catalog or directory database. The table space name in error is named in the 'aaaa' message keyword.

This message is issued by the following CSECT: DSNJU403

System Action: All subsequent DSNJU003 utility statements are bypassed, and DSNJU003 processing is terminated with a return code of 4. The DB2 SYSTEMDB record is not updated.

This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the table space name specified on the TBLSPACE parameter, and resubmit the change log inventory (DSNJU003) utility job.

DSNJ403I **CAPACITY OF BSDS SYSTEMDB RECORD EXCEEDED**

Explanation: The BSDS SYSTEMDB record contains VSAM passwords for data sets in the DB2 catalog and directory, and has a maximum capacity of 168 entries. This message is issued when the number of eligible DB2 catalog and directory data sets exceeds the maximum capacity of the BSDS SYSTEMDB record. This is an internal error.

This message is issued by the following CSECT: DSNJU403

System Action: All subsequent change log inventory (DSNJU003) utility statements are bypassed, and DSNJU003 processing is terminated with a return code of 4. The DB2 SYSTEMDB record is not updated.

This message is written to the SYSPRINT data set, not to a console.

User Response: Notify the systems programmer.

DSNJ404E **keyword NOT ALLOWED FOR operation OPERATION**

Explanation: An invalid keyword was used during the operation named 'operation'.

This message is issued by the following CSECT: DSNJU503

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ405E **keyword1 KEYWORD MUTUALLY EXCLUSIVE WITH keyword2 KEYWORD**

Explanation: 'keyword1' and 'keyword2' are mutually exclusive and cannot appear on the same control statement.

This message is issued by the following CSECT: DSNJU503

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Determine the extraneous keyword and remove it from the control statement. Rerun the utility.

DSNJ406E **EITHER keyword1 KEYWORD OR keyword2 KEYWORD MUST BE SPECIFIED**

Explanation: A required keyword was not used on the control statement. Use either 'keyword1' or 'keyword2' with the attempted control statement type.

This message is issued by the following CSECT: DSNJU503

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ407E *csect-name* **NO VALID CHECKPOINT RBA FOUND**

Explanation: After completing its search through the resource manager status table and the checkpoint queue, no valid checkpoint RBA was found within the specified range.

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: The last 100 checkpoints are recorded in the BSDS, including the log STARTRBA and log ENDRBA of the checkpoint range. When either STARTRBA or ENDRBA are specified, the change log inventory (DSNJU003) utility attempts to locate a valid checkpoint in the range. In this case, DSNJU003 was unsuccessful in finding a valid checkpoint.

Do one of the following, as appropriate:

- If no checkpoint exists in the STARTRBA/ENDRBA range, set STARTRBA=ENDRBA and cold start DB2.
- If the ENDRBA is less than all recorded checkpoints or the STARTRBA is higher than all recorded checkpoints, then use DSN1LOGP to locate a valid checkpoint. Use DSN1LOGP SUMMARY(ONLY) option to find a valid checkpoint. Message DSN1153I is issued if any complete checkpoint is found. DSN1153I identifies the log RBA of the checkpoint. Update the CHPTRBA parameter using the log RBA identified in DSN1153I and resubmit DSNJU003.

DSNJ408I *csect-name* **CHECKPOINT RBA FOUND, RBA = rba, TIME = time**

Explanation: After completing its search through the resource manager status table and the checkpoint queue, 'rba' was the most recent checkpoint RBA in the specified range and 'time' was the time of the checkpoint.

System Action: Utility processing continues.

DSNJ409I UNABLE TO WRITE ACTIVE LOG RECORD TO THE BSDS DATASET. DDNAME=xxxxxx

Explanation: A program encountered an I/O error when attempting to write a BSDS active log record to the BSDS data set. 'xxxxxx' is the DDNAME of the BSDS data set being accessed.

This message is issued by the following CSECTs: DSNJMIG0, DSNJFAL0

System Action: The program will terminate.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. This error is considered unrecoverable and will leave the BSDS data set in an uncertain state. It will be necessary to either: recreate the data set using access method service routines and then use change log inventory (DSNJU003) to make the active and archive log data set(s) known to the BSDS, or recover the BSDS using a backup copy.

DSNJ410E *csect-name* **I/O ERROR DURING nnn PROCESSING OF yyy RECORD**

Explanation: An I/O error occurred during a READ or WRITE of a record. 'nnn' is either READ or WRITE, depending on the operation. 'yyy' specifies the Conditional Restart control record, checkpoint queue record, archive log command history record, or resource manager status table.

System Action: The current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console, and will be accompanied by message DSNJ212E or DSNJ213E.

User Response: Determine the cause of the I/O error based upon the error status information provided in messages DSNJ212E or DSNJ213E.

DSNJ411I *csect-name* **CRESTART nnnn FOR CRCRID = yyyy, DDNAME = ddname**

Explanation: A CRESTART request has just completed. 'nnnn' is either CREATE or CANCEL. 'yyyy' is the restart control record hexadecimal identifier and 'ddname' is the BSDS data set (SYSUT1 or SYSUT2) associated with the request.

System Action: Current utility processing continues. This message is written to the SYSPRINT data set, not to a console.

User Response: Note the record identifier for future reference.

DSNJ412E *csect-name* **RESTART CONTROL RECORD NOT FOUND IN BSDS**

Explanation: The CRESTART CANCEL keyword was specified but the conditional restart control record does not exist in the BSDS data set.

System Action: Current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: CREATE the conditional restart control record prior to attempting the CANCEL function.

DSNJ413E *csect-name* **INVALID LOG RANGE SCOPE OR CHECKPOINT SPECIFIED**

Explanation: The values specified thru the STARTRBA, ENDRBA, and CHPTRBA keywords are invalid.

System Action: Current utility processing is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Ensure that the log range values are correct and correspond to the other log range values either specified or defaulted. A valid log range is where STARTRBA is less than or equal to CHPTRBA, and CHPTRBA is less than ENDRBA. The STARTRBA must be less than or equal to the ENDRBA.

DSNJ414I *csect-name* **COLD START WILL RESULT FROM THIS RESTART CONTROL RECORD. FORWARD AND BACKOUT SET TO NO.**

Explanation: STARTRBA and ENDRBA are equal. A cold start will result if this restart control record is used during DB2 restart. No forward or backout processing will be performed.

System Action: CRESTART processing continues.

User Response: No additional actions are required if a cold start of the system is desired. If a cold start is not desired, reissue the CRESTART and either CANCEL the current restart control record, or CREATE a new restart control record.

DSNJ415E *csect-name* **ENDRBA = rba IS INVALID, MUST BE A MULTIPLE OF 4K**

Explanation: The specified ENDRBA at 'rba' is not a multiple of 4KB.

System Action: CRESTART processing is terminated.

User Response: Correct the ENDRBA value on the CRESTART statement and rerun the utility.

DSNJ416I WARNING - BSDS UTILITY TIMESTAMP MISMATCH DETECTED. PROCESSING CONTINUES.

Explanation: As a result of a change log inventory (DSNJU003) update, it was discovered that the SYSUT1 BSDS and SYSUT2 BSDS timestamps are unequal. Being unequal indicates the possibility of a BSDS mismatch.

This message is issued by the following CSECT: DSNJU003

System Action: Current utility processing continues.

User Response: Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine if each BSDS is current. If each BSDS is current, this warning can be ignored. If either BSDS is not current, delete the obsolete data set and define a replacement data set, then copy the current BSDS into the replacement data set.

DSNJ417I REQUIRED xxxxxxxx PARAMETER FOR yyyyyyyy OPERATION IS MISSING

Explanation: A required parameter 'xxxxxxx' for a Log utility operation was missing from the Log utility control statement. The attempted operation is 'yyyyyyy'.

This message is issued by the following CSECT: DSNJU003

System Action: The Log utility 'yyyyyyy' operation does not perform its function. All subsequent Log utility control statements are processed. A nonzero return code is issued by the utility.

DB2 writes this message to the SYSPRINT data set, not to a console.

User Response: Add the missing parameter to the control statements associated with the specified operation and rerun the utility.

DSNJ418I WARNING - A NOTREUSEABLE ACTIVE LOG DATA SET WAS DELETED FROM BSDS LOG INVENTORY, STARTRBA=...,ENDRBA=...

Explanation: The data set name specified on the DSNNAME parameter of the change log inventory (DSNJU003) utility DELETE statement was a NOTREUSABLE active log.

This message is issued by the following CSECT: DSNJU203

System Action: DSNJU003 processing continues, it will terminate with a return code of 4. This message is written to the SYSPRINT data set, not to a console.

User Response: No additional actions are required if a deletion of a NOTREUSABLE active log was desired. If this was not desired, recreate the deleted log by using the NEWLOG statement with the RBA values specified in the warning message.

DSNJ419I UNABLE TO WRITE ARCHIVE LOG RECORD TO THE BSDS DATASET. DDNAME=xxxxxx

Explanation: A program encountered an I/O error when attempting to write a BSDS archive record to the BSDS data set. 'xxxxxx' is the DDNAME of the BSDS data set being accessed.

This message is issued by the following CSECTs: DSNJMIG0, DSNJFAL0

System Action: The program will terminate.

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. This error is considered unrecoverable and will leave the BSDS data set in an uncertain state. It will be necessary to either: recreate the data set using access method service routines and then use change log inventory (DSNJU003) utility to make the active and archive log data set(s) known to the BSDS, or recover the BSDS using a backup copy.

DSNJ420I UNABLE TO WRITE BCR1 RECORD TO BSDS DATASET. DDNAME=xxxxxx

Explanation: A program encountered an I/O error when attempting to write the BSDS control record to the BSDS data set. 'xxxxxx' is the DDNAME of the BSDS data set being accessed.

This message is issued by the following CSECTs:

DSNJMIG0 DSNJFAL0

Operator Response: Notify the system programmer.

System Programmer Response: One or more error messages describing the specific error preceded this message. Refer to the specific message(s) for error analysis and the appropriate action to take.

DSNJ421I THE BSDS IS NOT AT THE PROPER RELEASE LEVEL. DDNAME=xxxxxx

Explanation: This message is issued when a program attempting to access The BSDS data set is not at a compatible release level. This can be one of the following:

- The program accessing the BSDS data set is at a NEW release level and the BSDS is at the old level.
- The program accessing the BSDS data set is at an OLD release level and the BSDS is at the NEW level.
- The program encountered an UNKNOWN release level on the BSDS data set.

This message is issued by the following CSECTs:

DSNJU004 DSNJU003 DSNJMIG0 DSNJFAL0

System Action: The program will terminate with no action taken.

System Programmer Response: If the program that encountered the error was one of the BSDS conversion programs (DSNJMIG0 or DSNJFAL0) an unrecoverable error was found on the BSDS data set and it must be recreated. If the error was encountered running some other utility program (i.e., change log inventory or print log map), one of the following actions may be taken:

- Run a version of the program that is compatible with the release level of the BSDS.
- Run the appropriate formatting program (DSNJMIG0 or DSNJFAL0) to convert the BSDS data set to a release level compatible with the running program. If this was successful, rerun the original program.

DSNJ422I LOG RECORDS HAVE ALREADY BEEN FORMATTED - THIS UTILITY WILL TERMINATE

Explanation: This message will occur when one of the BSDS formatting programs detects the BSDS had already been reformatted or was already at the desired format level.

This message is issued by the following CSECTs: DSNJMIG0, DSNJFALO

System Action: The program will terminate without any action being taken.

System Programmer Response: If the appropriate BSDS formatting program was being run, no further action is necessary.

DSNJ423I ACTIVE LOG MAY NOT HAVE BEEN ARCHIVED. DSN=xxxxxx

Explanation: The program was attempting to convert an old BSDS data set with more than 31 active log data sets to the new format. The program will drop the oldest active log data set(s) to get to the new maximum (31) limit. When dropping one of the old active log data sets from the BSDS, it was found to have been flagged as NOT REUSABLE (i.e., this data set MAY NOT have been archived). 'xxxxxx' will contain the data set name of the active log in question.

This message is issued by the following CSECTs: DSNJMIG0, DSNJFALO

System Action: The program will remove this active log data set from the BSDS and continue.

System Programmer Response: Check to see if this data set had been archived. The active log data set was not deleted on disk but removed only from the BSDS data set, so it may still be archived, if needed. Use access method service routines to copy the VSAM active log data set to a sequential archive log data set.

DSNJ424I csect-name INVALID CONTROL STATEMENT. THE SECOND WORD MUST BE 'DDNAME' OR '*' OR MUST START WITH A PARENTHESIS.

Explanation: The control statement is invalid.

System Action: The control statement is ignored. DB2 uses the SYSUT1 DD statement to locate the BSDS to be mapped. If the SYSUT1 DD statement is not available, the utility terminates.

User Response: Refer to *Utility Guide and Reference* for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 32.

DSNJ425I INVALID xxxxxx VALUE/FORMAT FOR yyyyyyyy PARAMETER (YYYYDDHHMMSST)

Explanation: 'xxxxxx' is the field in the 'yyyyyyy' parameter that contains an incorrect value or incorrect format.

This message is issued by the following CSECT: DSNJU103

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ426I ENDTIME VALUE CANNOT BE LESS THAN STARTIME VALUE

Explanation: The 'STARTIME' and 'ENDTIME' parameters specify a time range. Hence, the ENDTIME value must be equal to or greater than STARTIME value.

This message is issued by the following CSECT: DSNJU103

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ427I CHECKPOINT RECORD ADDED TO QUEUE

Explanation: The checkpoint record specified has been added to the checkpoint queue.

This message is issued by the following CSECT: DSNJU603

System Action: The BSDS checkpoint queue is modified as stated. This message is written to the SYSPRINT data set, not to a console.

DSNJ428I CHECKPOINT RECORD DELETED FROM QUEUE, STARTRBA=startrba, ENDRBA=endrba

Explanation: The checkpoint record specified has been deleted from the Checkpoint Queue. 'startrba' and 'endrba' was the RBA range indicated in the deleted checkpoint record.

This message is issued by the following CSECT: DSNJU603

System Action: The BSDS checkpoint queue is modified as stated. This message is written to the SYSPRINT data set, not to a console.

DSNJ429I RBA RANGE CONFLICTS WITH EXISTING CHECKPOINT RECORD RBA RANGE

Explanation: The specified RBA range for the new checkpoint record either exists or overlaps an existing RBA range in the checkpoint queue.

This message is issued by the following CSECT: DSNJU603

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine the correct RBA range and correct the STARTRBA and ENDRBA parameters and rerun the utility.

DSNJ430I SPECIFIED ENTRY CANNOT BE ADDED WITHOUT OVERLAYING EXISTING LOWEST ENTRY

Explanation: The specified RBA range for the new checkpoint record is less than the existing lowest entry. The checkpoint queue is currently full and cannot add the new entry without overlaying the lowest entry.

This message is issued by the following CSECT: DSNJU603

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine the lowest existing entry and either change the STARTRBA and ENDRBA parameters or delete the existing lowest entry and add the new low checkpoint entry and rerun the utility.

DSNJ431I STARTRBA SPECIFIED NOT FOUND IN CHECKPOINT QUEUE

Explanation: The specified STARTRBA could not be located in the checkpoint queue.

This message is issued by the following CSECT: DSNJU603

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Run the print log map (DSNJU004) utility against the SYSUT1 BSDS and SYSUT2 BSDS. Determine the correct STARTRBA value and correct the STARTRBA parameter and rerun the utility.

DSNJ432I THE OFFLRBA VALUE MUST END WITH 'FFF'

Explanation: The OFFLRBA value is invalid. It must end with 'FFF'.

This message is issued by the following CSECT: DSNJU005

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ433I csect-name INVALID CONTROL STATEMENT. A MEMBER LIST MUST CONTAIN AT LEAST ONE MEMBER NAME.

Explanation: The control statement is invalid. The member list is either empty or in the wrong format.

System Action: The control statement is ignored. DB2 uses the SYSUT1 DD statement to locate the BSDS to be mapped. If the SYSUT1 DD statement is not available, the utility terminates.

User Response: Refer to *Utility Guide and Reference* for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 32.

DSNJ434I csect-name SYSIN MUST CONTAIN AT LEAST ONE RECORD.

Explanation: A SYSIN DD statement was provided, but the data set was null, or the JCL statement "//SYSIN DD *" was immediately followed by the statement "/*".

System Action: The error is ignored. DB2 uses the DD SYSUT1 statement to locate the BSDS to be mapped. If the SYSUT1 DD statement is not available, the utility terminates.

User Response: Refer to *Utility Guide and Reference* for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 32.

DSNJ435I csect-name THE MEMBER LIST OF A CONTROL STATEMENT MUST BE TERMINATED WITH A PARENTHESIS.

Explanation: The control statement contained the correct format for starting a list of members, but the terminating parenthesis was not found.

System Action: The control statement is accepted with an assumed parenthesis after the last member name recognized, and processing continues.

User Response: Refer to *Utility Guide and Reference* for information on creating a print log map (DSNJU004) utility control statement. Correct or remove the control statement and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 32.

DSNJ436I csect THE DD STATEMENT FOR ddname IS MISSING.

Explanation: The print log map (DSNJU004) utility requested information about the identified *ddname* from the MVS Dynamic Allocation facility, but the DD statement was not found in the job.

System Action: The job is terminated.

User Response: Refer to *Utility Guide and Reference* for information on required JCL statements. Correct the JCL and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 32.

DSNJ437I *csect-name* **UNABLE TO ALLOCATE BSDS**
dsname. SVC 99 RTN CODE rc, RSN CODE
rsncd, INFO infocd.

Explanation: The print log map (DSNJU004) utility attempted to allocate a BSDS data set using the MVS Dynamic Allocation facility, but the system was unable to complete the allocation. The return code, reason code, and information code were returned by the system's SVC 99 facility. See *MVS/ESA Programming: Authorized Assembler Services Guide* for an explanation of these codes.

System Action: The processing of the BSDS named in the message is terminated. If this is the last (or only) BSDS to be processed by this job, the job is terminated.

User Response: Refer to *Utility Guide and Reference* for information on required JCL statements. Correct the JCL and rerun the job.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Utility Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 32.

DSNJ438I *csect-name* **THE xxx VALUE MUST END WITH**
'yyy'

Explanation: The STARTRBA or ENDRBA value specified on the NEWLOG statement is invalid. 'xxx' is either STARTRBA or ENDRBA, depending on which parameter is invalid. If 'xxx' equals STARTRBA, then 'yyy' equals '000' and if 'xxx' equals ENDRBA, then 'yyy' equals 'FFF'.

System Action: The current utility is terminated. This message is written to the SYSPRINT data set, not to a console.

User Response: Correct the control statement and rerun the utility.

DSNJ700I *csect_name* **ERROR ATTEMPTING TO ACCESS**
BSDS FOR PEER MEMBER ID= *member-id*,
MEMBER NAME= *member-name*,
REASON-CODE= *reason-code*.

Explanation: DB2 issues this message to identify the peer member ID, and if known, the peer member name associated with listed DB2 reason code.

System Action: An execution unit issues this message and then, if this was an unconditional request, writes a record to SYS1.LOGREC and requests an SVC dump. The execution unit then terminates.

Operator Response: Collect all relevant diagnostic materials, including SYS1.LOGREC, SVC dump, and console output of peer and host.

System Programmer Response: Review the explanation for the associated DB2 reason code for further action.

DSNJ701E *csect-name* **MEMBER NAME (*membername*) IN**
BSDS DOES NOT MATCH MEMBER NAME
(*membername*) IN DB2 SYSTEM PARAMETERS
dsnzparm

Explanation: During startup, DB2 detected that the member name listed in its bootstrap data set (BSDS) does not match the member name in the DB2 system parameters load module.

Operator Response: Notify the system programmer.

System Programmer Response: Restore the BSDS or specify a different system parameters load module on the START DB2 command.

DSNJ702E *csect_name* **GENERIC LU NAME *lu-name* IN**
BSDS DOES NOT MATCH THE GENERIC LU
NAME *lu-name* ASSOCIATED WITH THE DATA
SHARING GROUP.

Explanation: DB2 issues this message during startup when it detects that the generic LU name in the bootstrap data set (BSDS) does not match the generic LU name in the shared communications area (SCA) structure.

System Action: DB2 startup continues.

Operator Response: Notify the system programmer.

System Programmer Response: Depending on the accuracy of the BSDS value, take one of the following actions:

- BSDS value is correct: DB2 startup will automatically replace the generic LU name in the SCA with the correct value. The BSDS for each member of this DB2 data sharing group must specify this same value for generic LU name. If any member specifies a different value for generic LU name, use the change log inventory utility (DSNJU003) to change the generic LU name, as described in *Utility Guide and Reference*.
- BSDS value is not correct: DB2 startup will replace the generic LU name in the SCA. The SCA value will be incorrect when startup is complete. Take the following actions to correct this situation:
 - Stop this DB2 subsystem.
 - Use the change log inventory utility (DSNJU003) to change the generic LU name of this member, as described in *Utility Guide and Reference*.
 - Issue START DB2 for this member. START DB2 will correct the generic LU name contained in the SCA.

DSNJ703E *csect-name* **GROUP NAME (*groupname*) IN**
BSDS DOES NOT MATCH GROUP NAME
(*groupname*) IN DB2 SYSTEM PARAMETERS
dsnzparm

Explanation: During startup, DB2 detected that the group name listed in its bootstrap data set (BSDS) does not match the group name in the DB2 system parameters load module.

Operator Response: Notify the system programmer.

System Programmer Response: Restore the BSDS or specify a different system parameters load module on the START DB2 command.

DSNJ704I *csect-name* **NEW MEMBER(*member-name*) START-UP NOT ALLOWED WHEN GROUP-RESTART IS REQUIRED FOR GROUP(*group-name*).**

Explanation: One of the following occurred:

- A new member *member-name* tried to start when a group restart of data sharing group *group-name* is required.
- A member other than the originating member of a data sharing group attempted to start the new DB2 data sharing group. The originating member of a group is either an existing DB2 subsystem which formed the data sharing group or a new DB2 subsystem which was installed to form the group.

System Action: The DB2 subsystem stops.

Operator Response: Start a previously active member of this group. When the required group restart is completed, start the new member again.

If this is the very first startup of the group, you must start the originating member first before starting any other member.

DSNJ705I *csect-name* **THE DB2 SYSTEM PARAMETERS SPECIFY DATA SHARING, BUT THE BSDS SPECIFIES NON-DATA SHARING.**

Explanation: The system parameters passed on the DB2 start command specified data sharing, but the bootstrap data set (BSDS) did not indicate this DB2 is a data sharing member.

System Action: The DB2 subsystem stops.

Operator Response: If this DB2 should be a member of a data sharing group, inform the system programmer. If this DB2 is not a member of a data sharing group, restart DB2 with the correct system parameters load module

System Programmer Response: If this DB2 should be a member of a data sharing group, execute the installation job DSNTIJUZ, which updates the BSDS for data sharing.

If this DB2 is not a member of a data sharing group, reassemble the system parameters load module and specify DSHARE=NO.

If this DB2 is attempting to disable the data sharing group, then reassemble the system parameters load module and specify DSHARE=NO, then execute the installation job DSNTIJGF, and then restart this DB2. Job DSNTIJGF must be used with caution, this will disable the data sharing group. For more information, see Chapter 3 of *Data Sharing: Planning and Administration*.

DSNJ706I *csect-name* **THE DB2 SYSTEM PARAMETERS SPECIFY NON-DATA SHARING, BUT THE BSDS SPECIFIES DATA SHARING.**

Explanation: The system parameters passed on the DB2 START command specified non-data sharing, but the bootstrap data set (BSDS) indicates this is a data sharing member.

System Action: The DB2 subsystem stops.

Operator Response: If this DB2 is a member of a data

sharing group, restart DB2 with the correct system parameters load module. If this DB2 is not a member of a data sharing group, inform the system programmer.

System Programmer Response: If this DB2 should be a member of a data sharing group, reassemble the system parameters load module and specify DSHARE=YES. If this DB2 is not a member of a data sharing group, execute the installation job DSNTIJGF, which updates the BSDS for non-data sharing.

DSNJ707E *csect_name* **LOCATION NAME *location-name* IN BSDS DOES NOT MATCH THE LOCATION NAME *location-name* ASSOCIATED WITH THE DATA SHARING GROUP.**

Explanation: DB2 issues this message during startup when it detects that the LOCATION name in the bootstrap data set (BSDS) does not match the LOCATION name in the system communications area (SCA) structure.

System Action: DB2 startup continues.

Operator Response: Notify the system programmer.

System Programmer Response: Depending on the accuracy of the BSDS value, take one of the following actions:

- BSDS value is correct: DB2 startup will automatically replace the LOCATION name in the SCA with the correct value. The BSDS for each member of this DB2 data sharing group must specify this same value for LOCATION. If any member specifies a different value for LOCATION, use the change log inventory utility (DSNJU003) to change the LOCATION name, as described in *Utility Guide and Reference*.
- BSDS value is not correct: DB2 startup will replace the LOCATION name in the SCA. The SCA value will be incorrect when startup is complete. Take the following actions to correct this situation:
 - Stop this DB2 subsystem.
 - Use the change log inventory utility (DSNJU003) to change the LOCATION name of this member, as described in *Utility Guide and Reference*.
 - Issue START DB2 for this member. START DB2 will correct the LOCATION name contained in the SCA.

DSNJ711E *csect-name* **SCA OPEN FAILURE ENCOUNTERED.**

Explanation: A failure occurred during command processing in an attempt to open an object in the SCA.

System Action: Command processing terminates unsuccessfully.

System Programmer Response: Obtain SYS1.LOGREC and possible SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and/or SVC dump messages that could relate to this problem.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNJ712E *csect-name* **SCA READ FAILURE ENCOUNTERED.**

Explanation: A failure occurred during command processing attempting to read from the SCA.

System Action: Command processing terminates unsuccessfully.

System Programmer Response: Obtain SYS1.LOGREC and possible SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and/or SVC dump messages that could relate to this problem.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNJ713E *csect-name* **SCA WRITE FAILURE ENCOUNTERED.**

Explanation: A failure occurred during command processing attempting to write to the SCA.

System Action: Command processing terminates unsuccessfully.

System Programmer Response: Obtain SYS1.LOGREC and possible SVC dump for analysis.

Problem Determination: Review the DB2 system console for possible DSN7xxxx and/or SVC dump messages that could relate to this problem.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNJ991I *csect-name* **START OF LOG DATA SET PREFORMAT FOR JOB** *job-name step-name*

Explanation: The active log data set preformat utility has started.

Severity: 0 (informational)

DSNJ992I *csect-name* **LOG DATA SET NAME =** *data-set-name*

Explanation: The indicated *data-set-name* is to be preformatted.

Severity: 0 (informational)

DSNJ993I *csect-name* **LOG DATA SET IS NOT A VSAM DATA SET**

Explanation: The input log dataset is not a VSAM data set.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Use the AMS IDCAMS Service to define the active log data set as a VSAM Linear data set.

DSNJ994I *csect-name* **VSAM OPEN ERROR, ACBERRFLG =** *error-code*

Explanation: VSAM OPEN failed with the indicated ACB *error-code*.

Severity: 8 (error) if error is greater than or equal to 128; otherwise, 4 (warning)

System Action: Processing terminates if the error code is greater than or equal to 128; otherwise, processing continues normally.

User Response: Notify the system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to *DFSMS/MVS: Macro Instructions for Data Sets*. See also *MVS/DFP V3R3 Diagnosis Guide* for more information about the VSAM procedures.

DSNJ995I *csect-name* **VSAM PUT ERROR, RPLERREG =** *return-code*, **RPLERRCD =** *reason-code*

Explanation: VSAM PUT failed with the indicated *return-code* and *reason-code*.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to *DFSMS/MVS: Macro Instructions for Data Sets*. See also *MVS/DFP V3R3 Diagnosis Guide* for more information about the VSAM procedures.

DSNJ996I *csect-name* **LOG PREFORMAT COMPLETED SUCCESSFULLY, nn RECORDS FORMATTED**

Explanation: The active log data set has been preformatted successfully. 'nn' records (or VSAM control intervals) have been formatted.

Severity: 0 (informational)

DSNJ997I *csect-name* **LOG PREFORMAT TERMINATED**

Explanation: Preformatting of the active log data set did not complete successfully.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Examine other error messages associated with this job.

DSNJ998I *csect-name* **LOG DATA SET IS NOT EMPTY**

Explanation: The input log data set is not an empty data set. The input data set must be empty to prevent the loss of actual log data.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Use the AMS IDCAMS Service to delete and redefine the active log data set or correct the input log data set name.

DSNL... Messages

DSNL001I DDF IS ALREADY STARTED

Explanation: The distributed data facility (DDF) was already active when you issued -START DDF command.

This message is issued by the following CSECT: DSNLSSRC

System Action: The issued command is not executed.

DSNL002I DDF IS ALREADY STOPPED

Explanation: The distributed data facility (DDF) had already been stopped when the -STOP DDF command was issued.

This message is issued by the following CSECT: DSNLSSRC

System Action: The issued command is not executed.

DSNL003I DDF IS STARTING

Explanation: The distributed data facility (DDF) -START command is starting.

This message is issued by the following CSECT: DSNLSSST

System Action: DB2 begins processing the -START DDF command.

DSNL004I *csect* **DDF START COMPLETE LOCATION**
locname LU netname.luname GENERICLU
netname.glname DOMAIN domain TCPPORT
tcpport RESPORT resport

Explanation: The distributed data facility (DDF) started.

locname

The LOCATION of the DB2 subsystem.

netname.luname

The fully qualified LU name for the DB2 subsystem.

netname.glname

The fully qualified VTAM generic LU name for the DB2 subsystem. The value '-NONE' indicates that no VTAM generic LU name is used by the DB2 subsystem.

domain

For non-data sharing systems, domain is the name returned by the DNS for the system's default IP address. For data sharing systems, domain is the name that represents the DB2 group. For the remote DB2 data sharing group, the DRDA requester should use a domain name of the following form:

location.sysplex.domainname

where **location** is the DB2 location name, **sysplex** is the sysplex name in the COUPLExx parmlib member and **domainname** is the domain name specified in the TCPIP.DATA file. If you are an MVS requester, the domain name is specified in column IPADDR of catalog table SYSIBM.IPNAMES. If you are a DB2 Connect requester, the CATALOG TCPIP NODE command (or the equivalent command for your environment) is used to specify the TCP/IP domain name. The value '-NONE' indicates that TCP/IP is not supported, or TCP/IP initialization failed, or DB2 has been started in restricted access mode.

tcpport

The TCP/IP port number used by this DB2 subsystem to accept incoming DRDA connection requests.

A zero indicates TCP/IP is not supported.

resport

The TCP/IP port number used by this DB2 subsystem to accept incoming two-phase commit resynchronization requests.

A zero indicates TCP/IP is not supported.

System Action: The DDF start up process completed. However, it might fail for reasons specified by messages DSNL013I, DSNL015I, DSNL016I, DSNL017I, DSNL018I, DSNL019I, DSNL700I, or DSNL705I.

System Programmer Response: Use the recommended domain name when configuring network definitions for TCP/IP requesters.

DSNL005I DDF IS STOPPING

Explanation: The distributed data facility (DDF) -STOP command has been initiated.

This message is issued by the following CSECT: DSNLSSST

System Action: The -STOP DDF command is initiated.

DSNL006I DDF STOP COMPLETE

Explanation: The distributed data facility (DDF) -STOP command has completed.

This message is issued by the following CSECT: DSNLSSST

System Action: The DDF has stopped.

DSNL007I DDF IS ABNORMALLY TERMINATING

Explanation: Abnormal termination of the distributed data facility (DDF) has started.

This message is issued by the following CSECT: DSNLSSST

System Action: Abnormal termination of the DDF is starting.

DSNL008I DDF ABNORMAL TERMINATION COMPLETE

Explanation: Abnormal termination of the distributed data facility (DDF) has completed.

This message is issued by the following CSECT: DSNLSSST

System Action: The DDF has stopped.

DSNL009I INVALID DDF THREAD *logical-unit-of-work-id* SPECIFIED

Explanation: No distributed transaction with the specified 'logical-unit-of-work-id' exists.

This message is issued by the following CSECT: DSNLCNCL

System Action: The specified thread is not canceled.

User Response: Determine the correct 'logical-unit-of-work-id' of the distributed thread that is to be canceled and then reissue the command.

Problem Determination: Determine the correct value. The -DISPLAY THREAD command can be used to display all distributed activity.

DSNL010I DDF THREAD *logical-unit-of-work-id* HAS BEEN CANCELED

Explanation: The distributed data facility (DDF) thread 'logical-unit-of-work-id' was canceled.

If 'logical-unit-of-work-id' is an LUWID (LU network name and an LUW instance number) instead of an LUWID TOKEN, then in rare circumstances more than one DDF thread might be canceled.

This situation only arises when an application accesses the same DB2 server by different access paths (for example, A->B->C and A->D->C). In such a case, multiple threads with the same LUWID exist at the server (for example, C). If CANCEL DDF THREAD is issued at the server specifying this LUWID, every thread at the server with the LUWID is canceled.

This message is issued by the following CSECT: DSNLCNCL

System Action: The specified thread is canceled.

DSNL011I VTAM STOPPING DDF

Explanation: The operator issued a HALT NET command to terminate VTAM.

This message is issued by the following CSECT: DSNLVPTE

System Action: The distributed data facility (DDF) -STOP command is initiated.

DSNL012I VTAM TERMINATING DDF

Explanation: The operator issued a HALT NET QUICK command or a HALT NET CANCEL command, or VTAM is terminating abnormally. This message can be issued any time after -START DDF and occurs when VTAM is stopped, which can occur prior to DDF termination. This message is not issued when DDF terminates normally.

This message is issued by the following CSECT: DSNLVPTE

System Action: Termination of the distributed data facility is initiated.

DSNL013I VTAM OPEN ACB FAILED ERROR=*error-code*

Explanation: VTAM returned a nonzero return code after DB2 invoked the OPEN ACB macro instruction during termination of the distributed data facility (DDF). VTAM return codes for OPEN error conditions are defined in *VTAM for MVS/ESA Programming*.

This message is issued by the following CSECT: DSNLVACB

System Action: Termination of the distributed data facility is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the OPEN ACB failure, correct the error, and issue the -START DDF command.

Problem Determination: Refer to *VTAM for MVS/ESA Programming* for failure analysis during an OPEN macro instruction.

DSNL014I VTAM CLOSE ACB FAILED ERROR=*error-code*

Explanation: VTAM returned a nonzero return code after DB2 invoked the CLOSE ACB macro instruction during termination of the distributed data facility (DDF). VTAM return codes for CLOSE error conditions are defined in *VTAM for MVS/ESA Programming*.

This message is issued by the following CSECT: DSNLVACB

System Action: Termination of DDF continues.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure, fix the error condition, and then issue the -START DDF command.

Problem Determination: Refer to *VTAM for MVS/ESA Programming* for failure analysis during a CLOSE macro instruction.

DSNL015I VTAM SETLOGON FAILED RTNCD=*error-code* FDBK2=*open-flags*

Explanation: VTAM returned a nonzero return code after DB2 invoked the SETLOGON macro during initialization of the distributed data function (DDF). VTAM return codes are defined in *VTAM for MVS/ESA Programming*.

This message is issued by the following CSECT: DSNLVINI

System Action: Termination of the DDF is started.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming* to determine the cause of the failure. After the error is fixed, issue the -START DDF command.

DSNL016I DDF RECORD NOT FOUND IN BSDS

Explanation: DDF cannot find the DDF communication record in the BSDS.

This message is issued by the following CSECT: DSNLVACB

System Action: DDF termination process is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Use the change log inventory to add the DDF communication record to the BSDS.

Problem Determination: Collect the following diagnostic item:

- Print the contents of the BSDS using the print log map utility.

DSNL017I INVALID DDF RECORD FOUND IN BSDS

Explanation: A invalid or incomplete DDF communication record was found in the BSDS.

This message is issued by the following CSECT: DSNLVACB

System Action: DDF termination process is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Use the change log inventory to add a valid DDF communication record to the BSDS.

Problem Determination: Collect the following diagnostic item:

- Print the contents of the BSDS using the print log map utility.

DSNL018I VSAM ERROR READING DDF RECORD IN BSDS RPLERRCD=*error-code*

Explanation: A VSAM GET command was issued that resulted in a nonzero return code. RPLERRCD '*error-code*' is the VSAM return code.

This message is issued by the following CSECT: DSNLVACB

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure, fix the error condition, and issue the -START DDF command.

The cause of the failure is dictated by the VSAM return code. The BSDS may have to be recovered by using a backup copy.

Problem Determination: Refer to the appropriate VSAM publications.

DSNL019I VTAM DOES NOT SUPPORT APPC FUNCTIONS

Explanation: The installed release of VTAM does not support the advanced program-to-program communications (APPC) application program interface (API). The APPC API bit is not set in the VTAM function-list vector in the access-method-support vector list.

This message is issued by the following CSECT: DSNLVACB

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine whether the installed release of VTAM supports the APPC API. If VTAM does not support the APPC API, a VTAM release that supports the APPC API must be installed before the DDF can be started.

DSNL020I KEYWORD 'THREAD' PARAMETER *parameter* FORMAT IN ERROR

Explanation: The parameter value specified for the logical-unit-of-work ID on the CANCEL DDF THREAD has an invalid format. The correct form is '*netid.luname.luwunique*', where:

<i>netid</i>	A 1- to 8-character network ID.
<i>luname</i>	A 1- to 8-character luname.
<i>luwunique</i>	A 12-character hex number.

Luname and luwunique are separated by a '.' delimiter. Netid is optional. If netid is specified, then netid and luname are separated by a '.' delimiter. If netid is not specified, then the '.' delimiter before luname is not present.

This message is issued by the following CSECT: DSNLCNCL

System Action: The specified thread is not canceled.

User Response: Determine the correct logical-unit-of-work ID of the distributed thread that is to be canceled and reissue the command.

Problem Determination: Determine the correct value. The -DISPLAY THREAD command can be used to display all distributed activity.

DSNL021I *command* IS ACCEPTED

Explanation: The '*command*' command has been accepted and asynchronous processing of '*command*' has been initiated. The command can only be -START or -STOP the distributed data facility.

This message is issued by the following CSECT: DSNLSSRC

System Action: The command was accepted and asynchronous processing has been initiated.

DSNL022I *csect-name* DDF THREAD *logical-unit-of-work-id* WAS PREVIOUSLY CANCELED

Explanation: A command to cancel the distributed data facility (DDF) thread *logical-unit-of-work-id* was previously issued. Either the CANCEL DDF THREAD or the CANCEL THREAD command was entered. The thread is currently being canceled. The CANCEL command terminates a thread only if the thread is processing in DB2 or is currently suspended by DB2. The thread might not be processing in DB2 in these situations:

- The thread is processing in the application and has not made a request to DB2. The DISPLAY THREAD command indicates this.
- The user placed the thread on an MVS resource using the ENQUE command. The CANCEL command has no effect on the thread until ENQUE completes and the thread returns to DB2.
- The thread is processing in VTAM and is waiting for a response from a partner. The DISPLAY THREAD DETAIL command indicates this. In this case the thread does not terminate until VTAM returns to DB2. VTAM commands, which will terminate the session or LU, can be used to cause VTAM to return to DB2.

DSNL023I DDF IS ALREADY IN THE PROCESS OF STARTING

Explanation: The distributed data facility (DDF) was starting when the -START DDF or -STOP DDF command was issued.

This message is issued by the following CSECT: DSNLSSRC

System Action: The issued command is not executed.

DSNL024I DDF IS ALREADY IN THE PROCESS OF STOPPING

Explanation: The distributed data facility (DDF) was stopping when the -STOP DDF or -START DDF command was issued.

This message is issued by the following CSECT: DSNLSSRC

System Action: The -START or -STOP DDF command is not executed.

DSNL025I A DISTRIBUTED AGENT FOR *luw-id=token* EXISTS AT THIS LOCATION BUT NOT AT SITE WITH LOCATION *location* AND LU *luname*

Explanation: The DDF error monitor has detected that a distributed agent exists at this location but not at the named partner location.

Where

luw-id=token The logical unit of work ID of the thread followed by an '=' sign and a token which may be used in place of '*luw-id*' in

any DB2 command that accepts 'luw-id' as input.

location The location name of the partner site where a thread with the same 'luw-id' does not exist.

luname The 8-character LUNAME of the partner location.

This message is issued by the following CSECTs: DSNLEDDA, DSNLEDPE

System Action: None. This message will repeat periodically until the inconsistency is resolved.

Operator Response: Determine if the inconsistency is due to network conditions or a DB2 error. If a DB2 error is suspected, acquire documentation to diagnose the problem.

1. Console dump of DB2 address spaces (*ssnmDBM1*, *ssnmMSTR*, *ssnmDIST*), VTAM, and user's address space at the requesting site.
2. Console dump of DB2 address spaces (*ssnmDBM1*, *ssnmMSTR*, *ssnmDIST*), and VTAM at the server site.
3. SYSLOG from requesting and server sites.
4. LOGREC from requesting and server sites.

If an indefinite inconsistency is suspected, use the CANCEL DDF THREAD command to terminate the thread. If CANCEL DDF THREAD fails to terminate the agent, use VTAM commands to terminate the thread conversations.

Problem Determination: Use the DB2 DISPLAY THREAD command with DETAIL option at each DB2 subsystem to display information about the agent and its conversations. Use VTAM commands to display additional information about the conversations being used by the thread and also about network conditions.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 3, 5.

DSNL026I LUW-ID *luw-id=token* APPEARS TO BE SUSPENDED PARTNER LOCATION *location* PARTNER LU *luname*

Explanation: The DDF error monitor has detected that a distributed agent with the specified 'luw-id' at this location and at the named partner 'location' may be suspended indefinitely.

Where

luw-id=token The logical unit of work ID of the thread followed by an '=' sign and a token which may be used in place of 'luw-id' in any DB2 command that accepts 'luw-id' as input.

location The location name of the partner site where a thread with the same 'luw-id' exists.

luname The 8-character LUNAME of the partner location.

This message is issued by the following CSECTs: DSNLEDDA, DSNLEDPE

System Action: None. This message will repeat periodically until the inconsistency is resolved.

Operator Response: Determine if the inconsistency is due to network conditions or a DB2 error. If a DB2 error is suspected, acquire documentation to diagnose the problem.

1. Console dump of DB2 address spaces (*ssnmDBM1*, *ssnmMSTR*, *ssnmDIST*), VTAM, and hung user's address space at the requesting site.
2. Console dump of DB2 address spaces (*ssnmDBM1*, *ssnmMSTR*, *ssnmDIST*), and VTAM as the server site.
3. SYSLOG from requesting and server sites.
4. LOGREC from requesting and server sites.

If an indefinite inconsistency is suspected, use the CANCEL DDF THREAD command to terminate the thread. If CANCEL DDF THREAD fails to terminate the agent, use VTAM commands to terminate the thread conversations.

Problem Determination: Use the DB2 DISPLAY THREAD command with DETAIL option at each DB2 subsystem to display information about the agent and its conversations. Use VTAM commands to display additional information about the conversations being used by the thread and also about network conditions.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 3, 5.

DSNL027I *dis-agent-type* DISTRIBUTED AGENT WITH LUW-ID *luw-id=token* THREAD-INFO *thread-info* RECEIVED ABEND=*abnd* REASON=*reason*

Explanation: A distributed agent has abended at this location. This message will be followed by zero or more occurrences of DSNL028I, each of which describes a remote location where the distributed agent also exists and where diagnostic information might also need to be collected. This message is informational and with the DSNL028I message(s) identifies the remote locations where diagnostic information may have to be collected.

Where

dis-agent-type 'REQUESTING' if the thread that abended is an allied thread that has distributed activity and SERVER if the thread that abended is a database access thread.

luw-id=token The logical unit of work ID of the thread followed by an '=' sign and a 5 digit token value which may be used in any DB2 command that accepts *luw-id* as input.

thread-info Thread info contains additional identifiers that define more specific information regarding the identity of the thread.

In many distribution configurations, the primary authorization-id used with DB2 is not necessarily the user-id of the end user. If provided by the client, the additional tokens further assist in identifying the client end user.

The following identifiers, separated by a colon (:), are provided:

- # • The primary authorization-id associated with the thread.
- # • Name of the end user's work station. An asterisk (*) indicates that it is not relevant to the thread or was not provided by the client.

error id	The module name concatenated with a 4-byte source id that uniquely determines the source within the module where the exception is encountered.
correlation-id	The correlation identifier of the thread that detected the DRDA exception condition. Correlation-IDs beginning with '0nn', where nn is a number from 01 to 28, identify system agents.
connection-id	The connection name of the thread that detected the DRDA exception condition.
ifcid	The IFCID number of the trace record that was written.
seq-no	<p>The IFCID sequence number associated with the trace record. The trace record contains information that can be used to determine what caused the DRDA exception condition, and is written to statistics class 4. Statistics class 4 is directed to SMF by default during DB2 installation, and must be directed to a permanent destination (SMF or GTF) for the trace record to be accessible. The message and the trace record are only written the first time an error is detected. This avoids flooding the console and the trace. The sequence number is printed in hexadecimal.</p> <p>If the sequence number is zero this has been caused by one of two conditions:</p> <ul style="list-style-type: none"> • statistics class 4 was not directed to a permanent destination • statistics class 4 was directed to the resident trace table as its permanent destination. <p>If this message first occurred because statistics class 4 was not directed to a permanent destination, then the same message recurs later (along with trace record) when the statistics class is directed to the resident table as its permanent destination instead of SMF or GTF.</p>

System Action: An alert was generated. Additionally, the system wrote a trace record with IFCID=*ifcid* to statistics class 4 that can be used to diagnose the problem.

Problem Determination: Determine the destination of statistics class 4 and locate and print the trace record with SEQUENCE NUMBER=*seq-no*. The reason code is described in "Section 4. DB2 Codes" on page 4-1. The description of the reason code can be used in conjunction with the publication Distributed Relational Database Architecture Reference to determine the type of DRDA exception that has been detected. Use the procedures described in Section 5 of *Diagnosis Guide and Reference* to determine the problem and which system is responsible.

DSNL032I *csect-name* **DRDA EXCEPTION CONDITION IN REQUEST FROM REQUESTER LOCATION=*location* FOR THREAD WITH LUWID=*luwid* REASON=*reason code* ERROR ID=*module_name* and source id IFCID=*ifcid* SEE TRACE RECORD WITH IFCID SEQUENCE NUMBER=*seq-no***

Explanation: A DRDA exception condition was detected while processing a command or command data received from the application requester (AR) with location name *location*. A DRDA exception condition, detected at the application server (AS), is a parsing error detected while processing a command or a command data object.

location	<p>This field contains one of the following:</p> <ul style="list-style-type: none"> • The requester's relational database name (location name) • The requester's VTAM LU name (<lname>) • The requester's dotted decimal IP address (nnn.nnn.nnn.nnn)
luwid	The logical unit of work (LUW) ID that identifies the thread and is also included in the trace record, or 'NETID.LUNAME.000000000000' if the error detected involves an invalid FMH5.
reason	The DB2 reason code for this specific error.
error id	The module name concatenated with a 4-byte source id that uniquely determines the source within the module where the exception was encountered.
ifcid	<p>The IFCID sequence number associated with the trace record. The trace record contains information that can be used to determine what caused the DRDA exception condition, and is written to statistics class 4. Statistics class 4 is directed to SMF by default during DB2 installation, and must be directed to a permanent destination (SMF or GTF) for the trace record to be accessible. The message and the trace record are only written the first time an error is detected. This avoids flooding the console and the trace. The sequence number is printed in hexadecimal.</p> <p>If the sequence number is zero this has been caused by one of two conditions:</p> <ul style="list-style-type: none"> • statistics class 4 was not directed to a permanent destination • statistics class 4 was directed to the resident trace table as its permanent destination. <p>If this message first occurred because statistics class 4 was not directed to a permanent destination, then the same message recurs later (along with trace record) when the statistics class is directed to the resident table as its permanent destination instead of SMF or GTF.</p>

System Action: An alert was generated and the system wrote a trace record with IFCID=*ifcid* to statistics class 4 that can be used to diagnose the problem.

Operator Response: Notify the system programmer for analysis.

System Programmer Response: Determine the destination of statistics class 4 and locate and print the trace record with SEQUENCE NUMBER=*seq-no*. The reason code is described

in "Section 4. DB2 Codes" on page 4-1. The description of the reason code can be used in conjunction with the publication Distributed Relational Database Architecture Reference to determine the type of DRDA exception that has been detected. Use the procedures described in *Diagnosis Guide and Reference* to determine the problem and which system is responsible.

DSNL033I *csect-name* **DDF TERMINATION SCHEDULED DUE TO DETECTION OF ABEND** *abend*
REASON *reason*

Explanation: A severe error was detected during DDF processing. DDF processing can no longer continue so DDF termination has been scheduled. 'Csect-name' is the DB2 module that detected the condition and requested DDF termination.

The *abend* and *reason* may also contain additional information about the cause.

<i>abend</i>	The <i>abend</i> code or zeros if no <i>abend</i> is associated with the termination of DDF. If the <i>abend</i> was a DB2 04E <i>abend</i> , the reason code will contain additional information about the <i>abend</i> .
<i>reason</i>	The DB2 reason code or zeros if no DB2 reason code is associated with the termination of DDF. If no <i>abend</i> is associated with the problem, the reason code describes the cause for the termination.

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer for analysis.

System Programmer Response: Determine the cause of the failure. Correct the condition and restart DDF using the -START DDF command.

Problem Determination: If an *abend* is associated with the failure, a dump may have been provided. LOGREC will also contain information about the *abend*.

DSNL034E **DDF CANNOT BE STARTED BECAUSE OF BSDS INCONSISTENCIES, ORIGINAL LUNAME=*luname1*, BSDS LUNAME=*luname2*, ORIGINAL LOCATION=*location1*, BSDS LOCATION=*location2***

Explanation: The LUNAME or the LOCATION name stored in the bootstrap data set (BSDS) was changed since the distributed data facility (DDF) was last started, but DDF still has resynchronization responsibility with one or more partner logical units using the old LUNAME and LOCATION name. Both the original and current BSDS values of LUNAME and LOCATION name are displayed.

<i>luname1</i>	The LUNAME required for resynchronization
<i>luname2</i>	The LUNAME currently stored in the BSDS
<i>location1</i>	The LOCATION name required for resynchronization
<i>location2</i>	The LOCATION name currently stored in the BSDS

This message is issued by the following CSECTs: DSNLTESU, DSNLTMIN

System Action: DDF cannot be started until the inconsistencies are corrected.

Operator Response: Inform the database administrator.

Database Administrator Action: You have the following options, depending on whether there is a requirement to change the LUNAME or LOCATION name in the BSDS:

- If the names were changed in error, use the change log inventory (DSNJU003) utility to change the LUNAME and/or LOCATION name back to the correct value. Then START DDF.
- If the name must be changed, you must first remove all of the resynchronization responsibility that DB2 had using the old names. You can purge this information, allow automatic resynchronization to take place, or use a combination of both.

You can purge resynchronization information by using the RESET INDOUBT command with the FORCE option. You can purge all information regardless of partner name (LOCATION (*)), or you can selectively purge by specifying a location name. DDF does not have to be started to use this command. You can use the DISPLAY THREAD command to generate a report of indoubt threads. This report indicates all resynchronization responsibility known by DB2.

If you do not purge the resynchronization information, or only selectively purge, and you want automatic resynchronization to occur before changing the names, you must first use the change log inventory (DSNJU003) utility to change the LUNAME and/or LOCATION name back to the correct value. Then START DDF. At this point, automatic resynchronization begins. You can monitor the progress by periodically using the DISPLAY THREAD command for TYPE (INDOUBT) threads. Resynchronization does not complete until all needed communications paths are available and all needed partner logical units are available. If you cannot wait for availability, use the RESET INDOUBT command with the FORCE option to purge information associated with unavailable partners.

DSNL035I **DDF CANNOT BE STOPPED BECAUSE AN INDOUBT DATA BASE ACCESS THREAD EXISTS**

Explanation: DDF is the connection manager for a database access thread (DBAT) that is indoubt. A STOP DDF MODE(QUIESCE) command is rejected until the indoubt logical unit of work is resolved.

This message is issued by the following CSECT: DSNLSSRC

System Action: DDF is not stopped.

Operator Response: Inform the database administrator.

Database Administrator Action: You have the following options:

- Wait for automatic resynchronization to be performed. When this occurs, either message DSNL407I or DSNL415I is displayed.

After the indoubt thread is resolved, reissue the STOP DDF command.
- Use the DISPLAY THREAD TYPE(INDOUBT) command to find the LOCATION that has coordinator responsibility for the indoubt LUW. Contact that location and determine whether the LUW committed or aborted. Then use the RECOVER INDOUBT command to cause the indoubt DBAT to be resolved with the same decision.

After the indoubt thread is resolved, reissue the STOP DDF command.

- Issue the STOP DDF MODE(FORCE) command. The indoubt thread remains indoubt and can be resolved by using automatic resynchronization after DDF is started again, or it can be resolved manually as described above.

DSNL036I DDF THREAD *logical-unit-of-work-id* SPECIFIED IS INDOUBT

Explanation: A database access thread that is indoubt cannot be canceled by using the -CANCEL DDF THREAD command.

This message is issued by the following CSECT: DSNLCNCL

System Action: The specified thread is not canceled.

Operator Response: Use the -DISPLAY THREAD TYPE(*) command to display all distributed activity.

DSNL037I *csect-name* RESET GENERICLU *lu* SUCCESSFUL

Explanation: The RESET GENERICLU command successfully purged the VTAM sysplex information from shared memory.

lu The value supplied on the RESET GENERICLU command

System Action: The VTAM information contained in the sysplex shared memory for the indicated LU is purged.

DSNL038E *csect-name* RESET GENERICLU *lu* FAILED DUE TO VTAM RTNCD=*xx* and FDB2=*yy*

Explanation: The VTAM CHANGE,OPTCD=(SYN,ENDAFFIN) macro returned an unexpected return code, which is described by the indicated VTAM RTNCD and FDB2 values.

lu The value supplied on the RESET GENERICLU command

xx The hexadecimal value of the VTAM RTNCD field

yy The hexadecimal value of the VTAM FDB2 field

System Action: VTAM was not able to purge the sysplex shared memory information for the indicated LU.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming* for the meaning of the VTAM RTNCD and FDB2 values.

DSNL039E *csect-name* RESET GENERICLU *lu* FAILED DUE TO ACTIVE VTAM SESSIONS

Explanation: The RESET GENERICLU command was not accepted because one or more active VTAM sessions exist to the indicated LU. All VTAM sessions must be terminated before the command is accepted.

lu The value supplied on the RESET GENERICLU command

System Action: The command is rejected.

System Programmer Response: Terminate the VTAM sessions to the remote LU and reissue the -RESET GENERICLU command.

DSNL040E *csect-name* RESET GENERICLU *lu* FAILED DUE TO INDOUBT RESOLUTION INFORMATION

Explanation: The RESET GENERICLU command was not accepted because information is currently being retained for resolution of indoubt threads for the indicated partner LU. The DISPLAY THREAD TYPE(INDOUBT) command can be used to view this information.

lu The value supplied on the RESET GENERICLU command

System Action: The command is rejected.

System Programmer Response: Make sure that all indoubt threads at the remote site are resolved before issuing the RESET GENERICLU command.

When DB2 performs automatic indoubt thread resolution, the information contained in the DISPLAY THREAD TYPE(INDOUBT) display is purged at the end of the resynchronization process.

If required, use the -RESET INDOUBT command to manually purge the indoubt resolution information.

DSNL041E *csect-name* DB2 GENERIC LU NAME REQUESTED, BUT REQUIRED VTAM LEVEL IS NOT INSTALLED

Explanation: The DB2 GENERIC LUNAME installation option was specified. This option requires VTAM Version 4 Release 2 or a later release.

System Action: The DB2 GENERIC LUNAME installation option is ignored.

System Programmer Response: If the DB2 GENERIC LUNAME is required, install VTAM Version 4 Release 2 or a later release.

DSNL042E *csect-name* DB2 SYSPLEX TP WAS INVOKED BY LU *lu*, BUT REQUIRED MVS LEVEL IS NOT INSTALLED

Explanation: A request for the DB2 sysplex transaction program (TP) was received by a DB2 server that is a member of a data sharing group. The DB2 sysplex TP is used by the requesting systems to determine which DB2 systems within the group are currently available for DDF conversations.

The DB2 sysplex TP uses functions in MVS Version 5 Release 2 or a later release to balance distributed workload among the DB2 systems in the group. Because the required MVS release is not installed, the DB2 sysplex TP is not able to provide the requested information.

lu The name of the LU in the network that invoked the DB2 sysplex TP

System Action: The DB2 sysplex TP returns the NETID.LUNAME of the local DB2 system as the only available DB2 server in the group. The requester is not provided the names of other DB2 systems in the group, so all sessions from the requester are routed to the local DB2 server.

System Programmer Response: Install MVS Version 5 Release 2 or a later release if you want to have the DB2 sysplex TP return multiple NETID.LUNAME values to the requester.

DSNL043I *csect-name* **RESET GENERICLU** *luname*
INVALID

Explanation: The luname value specified is invalid. The correct format is either a

- 1 to 8 character luname, or
- 1 to 8 character network ID, a period, and a 1 to 8 character luname.

System Action: The parameter is ignored. Processing continues with the next luname, if any.

User Response: Determine the correct luname and reissue the command.

DSNL044I *csect-name* **MVS** *macname* **MACRO FAILED**
WITH RETCODE=xx AND RSNCODE=yy

Explanation: An MVS Workload Manager (WLM) macro
returned an unexpected return code, which is described by the
indicated RETCODE and RSNCODE values. DDF uses MVS
Workload Manager macros to obtain data sharing sysplex
routing information for incoming DDF work requests, and to
establish an MVS enclave for the execution environment of the
distributed thread.

macname The name of the MVS macro that returned the
unexpected return code. The possible values
are:

- # • IWMSRSRG: Register with WLM for
sysplex routing.
- # • IWMSRSRS: Request sysplex routing
information.
- # • IWMSRDRS: Deregister with WLM for
sysplex routing.
- # • IWMECREA: Create enclave.

xx The hexadecimal value of the MVS
RETCODE field.

yy The hexadecimal value of the MVS
RSNCODE field.

System Action: If a sysplex routing macro failed, then
sysplex routing may not be performed in which case, all SQL
statements received from the client will be processed by this
DB2 subsystem. If an enclave macro failed, the distributed
thread may not be able to execute in an MVS enclave,
however the distributed thread will continue to execute as an
MVS SRB.

System Programmer Response: Refer to *MVS/ESA
Programming: Workload Management Services* for the
meaning of the MVS RETCODE and RSNCODE values.

DSNL050E *csect-name* **DB2 ENCOUNTERED AN ERROR**
WHILE DOING DCE-RELATED PROCESSING.
ERROR ID=errid RETURN STATUS=major
(MINOR=minor) FUNCTION=function-name

Explanation: DB2 has received a CONNECT request from a
DRDA requester that requires DCE authentication. DDF
encountered an error in performing the DCE-related functions
required to complete the request. The FUNCTION field con-
tains the name of the function being performed. RETURN
STATUS and MINOR may contain additional information about
the error, depending on the ERROR ID.

The FUNCTION name may be one of the following:

ENROLL_DB2

A set of DCE operations per-
formed to enroll DB2 as a
DCE-based server. Message
DSNL051 was also issued for
this error.

ACCEPT_PRINCIPAL

A set of DCE and RACF oper-
ations performed to accept DCE
security tokens from a DCE user
and to derive the corresponding
RACF user ID for that user.
Message DSNL052 was also
issued for this error.

The ERROR ID may be one of the following:

20301 DDF is unable perform DCE-related processing.

20302 The current cell size is not large enough to process
the function. RETURN STATUS and MINOR contain
serviceability information.

20303 DDF issued the MVS CPOOL macro to get a cell
from its cell pool for DCE-related processing but the
CPOOL operation failed. RETURN STATUS contains
the MVS system code returned by the MVS CPOOL
macro and MINOR contains the associated reason
code. For example, RETURN STATUS of '00000C78'
is the C78 system code. Refer to *OS/390 MVS
System Codes* for an explanation and a description
of relevant reason codes.

20304 DCE working storage could not be acquired.

20305 DDF received more connection requests requiring
DCE authentication than it could handle concurrently.

System Action: The connection request is terminated. Other
messages may also have been issued.

It may be necessary to stop and restart DDF to correct the
problem. If this is the case and it is not possible to do so
immediately, all other DDF activity not requiring DCE services
will process normally.

User Response: Attempt the connection request again. If the
connection request fails for the same reason, contact the
system programmer.

System Programmer Response: Take the actions indicated
for the following errors:

20301 Refer to DSNL057 for further information and correc-
tive actions.

20302 DDF preallocates fixed-sized storage cells large
enough to accommodate the largest expected DCE
authentication request. This request exceeds this
amount. This connection request cannot be pro-
cessed, although other requests requiring less storage
will continue to be processed. Report this problem as
a DDF internal error.

To process this request, DDF can be stopped and
restarted; DDF will automatically allocate a larger cell
size. When DB2 is stopped, however, the cell size
reverts to the default.

20303 Refer to the RETURN STATUS and MINOR to
understand the CPOOL macro failure. It may be nec-
essary to stop and restart DDF to clear the problem.
If the problem persists, report the problem.

20304 Retry the connection request. If the error persists,
report the problem.

20305 The number of concurrent DCE authentication requests allowed is 4096. Retry the connection request.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 4, 5.

DSNL051E *csect-name* DB2 ENCOUNTERED AN ERROR WHILE ENROLLING UNDER ITS LOCATION NAME=*locname* TO USE OS/390 DCE SERVICES. ERROR ID=*errid* RETURN STATUS=*major* (MINOR=*minor*)

Explanation: DB2 has received a CONNECT request from a DRDA requester that requires DCE authentication. Before it can complete this request, DDF must first be enabled for DCE-related processing. If DDF has not completed all enablement functions when a CONNECT request is received, it automatically attempts to perform the uncompleted functions.

DDF was not enabled for DCE-related processing when it received this CONNECT request. One of the uncompleted functions was to enroll with DCE. This function registers DB2's location name as a server principal capable of accepting DCE security tokens. An error occurred while performing this function.

LOCATION NAME is the location name for the DB2 system.

For ERROR IDs greater than 20000, message DSNL050E was also issued and describes the ERROR ID listed.

ERROR IDs less than 20000 may be one of the following:

- 101** gss_import_name failed
- 102** gssdce_register_acceptor_identity failed

The RETURN STATUS contains error information about the function that failed. The RETURN STATUS contains OS/390 DCE return information that is described in *OS/390 R1 OE DCE Messages and Codes*.

System Action: DDF cannot complete the processing that enable it to perform DCE-related operations. DSNL056 is also issued to the console.

It may be necessary to stop and restart DDF to correct the problem. If this is the case and it is not possible to do so immediately, all other DDF activity not requiring DCE services will process normally.

System Programmer Response: Verify that DCE is operational. If it is not, correct the problem. Refer to DSNL054 and DSNL056 for additional information.

If DCE is operational, determine the reason *locname* cannot be enrolled by examining the RETURN STATUS and MINOR codes.

- Contact the DCE security administrator to determine if *locname* is a valid principal in the DCE security registry.
- Contact the RACF security administrator to determine if *locname* is a valid OMVS user.

If *locname* has not been properly defined to DCE and RACF security, then correct the problem. Refer to DSNL056 for additional information.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 4, 5.

DSNL052E *csect-name* DB2 ENCOUNTERED AN ERROR WHILE ATTEMPTING TO VALIDATE DCE AUTHENTICATION TOKENS FROM A REMOTE USER AT LOCATION=*locname* LUWID=*luwid* ERROR ID=*errid* RETURN STATUS=*major* (MINOR=*minor*)

Explanation: DB2 has received a CONNECT request from a DRDA requester that requires DCE authentication. DDF encountered an error in performing one of the operations required to authenticate the DCE user identity or to determine the corresponding RACF user ID.

For ERROR IDs greater than 20000, message DSNL050E was also issued and describes the ERROR ID listed.

ERROR IDs less than 20000 may be one of the following:

- 201** gss_import_name failed
- 202** gss_acquire_cred failed
- 203** gss_accept_sec_context failed
- 204** gss_display_name failed
- 205** gssdce_extract_creds_from_sec_context failed
- 206** sec_cred_get_initiator failed
- 207** sec_cred_get_pa_data failed
- 208** uuid_to_string failed
- 209** uuid_to_string failed
- 210** __convert_id_np failed

The RETURN STATUS contains error information about the function that failed. For all ERROR IDs except 210, the RETURN STATUS contains OS/390 DCE return information that is described in *OS/390 R1 OE DCE Messages and Codes*. If MINOR is provided, it contains the DCE minor code.

For ERROR ID 210, RETURN STATUS contains an errno described in *IBM C/C++ for MVS/ESA Library Reference*. MINOR contains errno2 information for the operation.

System Action: Connection processing terminates.

It may be necessary to stop and restart DDF to correct the problem. If this is the case and it is not possible to do so immediately, all other DDF activity not requiring DCE services will process normally.

System Programmer Response: Verify that DCE is operational. If it is not, correct the problem.

If DCE is operational, determine the cause of the failure by examining the return status and minor code.

For ERROR ID 210, verify that RACF has been properly set up to handle cross-linked DCE information. If this is correct, verify whether cross-linking information has been added for the user attempting access to the database resource. If not, contact the RACF administrator and DCE security administrator to perform this task.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 4, 5.

DSNL053I *csect-name* **DDF COMPLETED DCE-RELATED PROCESSING BUT COULD NOT RELEASE TEMPORARY DCE WORK STORAGE. ERROR ID=errid RETURN STATUS=major (MINOR=minor) FUNCTION=function-name**

Explanation: DB2 has received a CONNECT request from a DRDA requester that requires DCE authentication. DDF encountered an error in releasing temporary work storage acquired by DCE as part of function processing.

The FUNCTION name may be one of the following:

ENROLL_DB2	A set of DCE operations performed to enroll DB2 as a DCE-based server.
ACCEPT_PRINCIPAL	A set of DCE and RACF operations performed to accept DCE security tokens from a DCE user and to derive the corresponding RACF user ID for that user.

ERROR IDs may be one of the following:

103	gss_release_name failed
211	gss_release_name failed
212	gss_release_name failed
213	gss_release_cred failed
214	gss_delete_sec_context failed
215	rpc_string_free failed
216	rpc_string_free failed
217	gss_release_buffer failed
218	gss_release_buffer failed

The RETURN STATUS contains error information about the operation that failed. The RETURN STATUS contains OS/390 DCE return information that is described in *OS/390 R1 OE DCE Messages and Codes*. If MINOR is provided, it contains the DCE minor code.

System Action: Connection processing continues. The storage will be recovered when DDF is stopped.

System Programmer Response: No action is required. If this error occurs repeatedly and the storage loss appears to be negatively affecting DDF operation, then stop and restart DDF to clear the problem. Report the problem. Refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 4, 5.

DSNL054I *csect-name* **DDF IS BEING ENABLED FOR DCE-RELATED PROCESSING.**

Explanation: DB2 has received a CONNECT request from a DRDA requester that requires DCE authentication. To process this request, DDF must first have completed a set of functions that enable it to invoke DCE services. If DDF receives such a CONNECT request and it has not already successfully completed all these functions, it automatically attempts each uncompleted function and issues this message to indicate that this processing is in progress.

When DDF has successfully completed all these functions, it issues DSNL055 to indicate that DDF is now enabled for DCE-related processing. Otherwise, it issues DSNL056 to indicate a failure has occurred.

System Action: DDF completes the functions needed to enable for DCE-related processing. If the functions complete, then DDF continues processing the DRDA connection request.

DSNL055I *csect-name* **DDF HAS BEEN ENABLED FOR DCE-RELATED PROCESSING.**

Explanation: DB2 has received a CONNECT request from a DRDA requester that requires DCE authentication. To process this request, DDF must first have completed a set of functions that enable it to invoke DCE services. If DDF receives such a CONNECT request and it has not already successfully completed all these functions, it automatically attempts each uncompleted function and issues DSNL054 to indicate that this processing is in progress.

When DDF has successfully completed all these functions, it issues this message to indicate that DDF is now enabled for DCE-related processing.

System Action: DDF continues processing the DRDA connection request. DDF is now able to process other CONNECT requests requiring DCE authentication.

DSNL056E *csect-name* **DDF COULD NOT BE ENABLED FOR DCE-RELATED PROCESSING. ERROR ID=errid, RETURN STATUS=major (MINOR=minor)**

Explanation: DB2 has received a CONNECT request from a DRDA requester that requires DCE authentication. To process this request, DDF must first have completed a set of functions that enable it to invoke DCE services. If DDF receives such a CONNECT request and it has not already successfully completed all these functions, it automatically attempts each uncompleted function. An error has occurred while performing these enabling functions. RETURN STATUS and MINOR may contain additional information, depending on the ERROR ID.

The ERROR ID may be one of the following:

- 20101** A fatal error has occurred and DDF cannot perform the functions required. See message DSNL057 for additional information.
- 20102** The OS/390 DCE service routine (EUVQDMC) could not be loaded. Verify that the DCE base services feature has been enabled on your system and that your system is at the OS/390 Release 1 level or higher. If DCE as this level has not been enabled, then DCE authentication cannot be used. Another authentication method should be selected for this user. Refer to the *OS/390 MVS System Codes* for an explanation and a description of relevant reason codes.
- 20103** DDF issued the CPOOL macro to build a cell pool for use in DCE-related processing, but the CPOOL request failed. RETURN STATUS contains the MVS system code returned by the MVS CPOOL macro and MINOR contains the reason code. For example, RETURN STATUS of '00000C78' is the C78 system code. Refer to the *OS/390 MVS System Codes* for an explanation and a description of relevant reason codes.
- 20104** The OS/390 DCE service routine (EUVQDMC) could not load the module EUVQSAM.
- 20105** The OS/390 DCE service routine (EUVQDMC) could not attach a task.

20106 The OS/390 DCE service routine (EUVQDMC) had a storage allocation error.

20107 DDF could not enroll with DCE security services as a DCE-based server. See message DSNL051 for error information.

System Action: The connection request is terminated. Other messages may also have been issued.

It may be necessary to stop and restart DDF to correct the problem. If this is the case and it is not possible to do so immediately, all other DDF activity not requiring DCE services will process normally.

User Response: Attempt the connection request again. If the connection request fails for the same reason, contact the system programmer.

System Programmer Response: Take the actions indicated for the following errors:

20101 Refer to DSNL057 for corrective action.

20102 The required module EUVQDMC is located in the DCE library (xxx.SEUVLIB). Verify that the OS/390 DCE feature is enabled on your system. If it is, verify that the DCE library is either in the link list for your system or included in the STEPLIB for the DDF startup procedure (ssnDIST).

If DCE is not enabled on your system, then DCE authentication cannot be used. Another authentication method should be chosen for this user.

If DCE is enabled, correct the problem. DDF must be stopped and restarted after the problem is corrected.

20103 DDF preallocates a cell pool for use in processing DCE-related functions. Examine the CPOOL macro system and reason codes. Attempt to stop and restart DDF to clear the problem. If the problem persists, report the problem.

20104 Report this problem to OS/390 DCE as an error involving EUVQDMC.

20105 Report this problem to OS/390 DCE as an error involving EUVQDMC.

20106 Retry the connection request. If the problem persists, stop and restart DDF to clear the problem. DCE message EUVQ00103E has also been issued to the console.

20107 DSNL051 and possibly DSNL050 will also have been issued. Refer to those messages for corrective action.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 4, 5.

DSNL057I *csect-name* DDF CANNOT PERFORM DCE-RELATED PROCESSING: REASON=*reason* FAILURE TOKEN=*token*

Explanation: DB2 has received a CONNECT request from a DRDA requester that requires DCE authentication but cannot process it because DDF is unable to perform DCE-related functions. REASON explains why this is so. FAILURE TOKEN contains serviceability information.

REASON may be one of the following:

ERROR An error occurred while performing DCE-related processing. DDF is no longer enabled for DCE-related processing.

DDF-STOPPING DDF is stopping. DDF cannot perform DCE-related functions until DDF is started again.

NOT-ENABLED DDF automatically attempts to enable DCE-related processing when it receives a connection request from a DRDA requester requiring DCE authentication. An error has occurred during this processing.

ENABLE-ERROR An unrecoverable error occurred and DDF is unable to perform operations needed to enable for DCE-related processing.

NOT-RESPONDING DDF received a previous DRDA CONNECT request requiring DCE authentication and is already performing operations to enable DDF to perform DCE-related functions. That processing may be taking longer than expected or it may have encountered a fatal error. The other requester may be hung.

System Action: The connection request is terminated. Other messages may also have been issued.

It may be necessary to stop and restart DDF to correct the problem. If this is the case and it is not possible to do so immediately, all other DDF activity not requiring DCE services will process normally.

User Response: Attempt the connection request again. If the connection request fails for the same reason, contact the system programmer.

System Programmer Response: Take the actions indicated for the following errors:

ERROR Determine the cause of the failure by examining related console messages, especially DSNL058 to determine if a fatal error has occurred but has not been recovered.

If DSNL059 has been issued, DDF was able to reset from the error and it will automatically attempt to re-enable for DCE-related processing with the next DRDA CONNECT request requiring DCE authentication. No action is required.

DDF-STOPPING No action is required. Wait for DDF to start again and retry the request.

NOT-ENABLED Determine why DDF was not able to enable for DCE-related processing by examining related console messages, especially DSNL056.

ENABLE-ERROR Determine why DDF was not able to enable for DCE-related processing by examining related console messages, especially DSNL056 and DSNL058.

NOT-RESPONDING Determine if DDF processing to enable DCE-related functions is encountering errors by examining console messages (DSNL050-DSNL064). Look for a DSNL054 message that is not paired with a DSNL055 or DSNL056 message. Look for threads that may be hung in DCE processing by issuing the -DISPLAY THREADS(*) LOCATION(*) command and looking for STATUS of RD. If any threads are hung in this manner, it will be necessary to issue -STOP DDF MODE(FORCE) to clear the error.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 4, 5.

DSNL058I *csect-name* **DDF DISABLED FOR DCE-RELATED PROCESSING. TOKEN=token.**

Explanation: DDF is disabled for DCE-related processing. Either DDF is being stopped or DDF encountered a fatal error while performing DCE-related operations. The error may have occurred in DDF processing or in DCE processing. TOKEN contains serviceability information.

System Action: If DDF is being stopped, DDF stop processing continues.

If a fatal error has occurred, DB2 attempts to reset itself and allow for future re-enablement. The next DRDA CONNECT request requiring DCE authentication will then trigger operations that re-enable DDF for DCE-related functions. If DDF cannot reset itself or if the enablement operations fail, all DRDA CONNECT requests requiring DCE authentication are rejected.

It may be necessary to stop and restart DDF to correct the problem. If this is the case and it is not possible to do so immediately, all other DDF activity not requiring DCE services will process normally.

System Programmer Response: If DDF stop processing is being performed, no action is required.

If a fatal error has occurred, no action is required if the DDF is able to reset itself for future re-enablement. If subsequent DRDA CONNECT requests fail because DDF was not able to re-enable for DCE-related processing, examine messages at the console, especially DSNL056 and take corrective action. It may be necessary to stop and restart DDF to clear the problem.

If you suspect a problem in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 4, 5.

DSNL059I *csect-name* **DDF RESET FROM FAILURE THAT DISABLED DCE-RELATED PROCESSING.**

Explanation: DDF previously encountered a fatal error while performing DCE-related processing and issued message DSNL058. DDF has been able to reset from this failure.

System Action: DDF recovered from the previous failure. The next DRDA CONNECT request requiring DCE authentication will trigger the operations needed to re-enable for DCE-related processing.

DSNL060I *csect-name* **DDF ATTEMPTED TO FREE A CELL AT ADDRESS=address IN THE CELL POOL WITH CPOOL ID=cpid BUT FAILED WITH CPOOL ABEND CODE=syscode, REASON CODE=reascode. STORAGE RECOVERED WHEN DDF STOPPED.**

Explanation: DB2 has received a CONNECT request from a DRDA requester that requires DCE authentication. DDF acquired a cell from its cell pool to process the request. The request completed successfully, but DDF encountered an error in freeing the cell. ABEND CODE contains the MVS system code returned by the CPOOL macro and REASON CODE contains the associated reason code. For example, an ABEND CODE of '00000C78' is the C78 system code. Refer to the *OS/390 MVS System Codes* for an explanation and a description of relevant reason codes.

System Action: Connection processing continues. The storage will be recovered when DDF is stopped.

System Programmer Response: No action is required. If this error occurs repeatedly and the storage loss appears to be negatively affecting DDF operation, stop and restart DDF to clear the problem. Report the problem. Refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 4, 5.

DSNL061I *csect-name* **DDF ATTEMPTED TO DELETE THE CELL POOL WITH ID=cpid BUT FAILED WITH CPOOL ABEND CODE=syscode, REASON CODE=reascode. STORAGE RECOVERED WHEN DB2 STOPPED.**

Explanation: A -STOP DDF or -STOP DDF MODE(FORCE) command is being executed. The cell pool allocated by DDF to perform DCE-related processing could not be deleted. ABEND CODE contains the MVS system code returned by the CPOOL macro and REASON CODE contains the associated reason code. For example, an ABEND CODE of '00000C78' is the C78 system code. Refer to the *OS/390 MVS System Codes* for an explanation and a description of relevant reason codes.

System Action: DDF completes STOP DDF processing. Cell pool storage is recovered when DB2 is stopped.

System Programmer Response: No action is required. If this error occurs repeatedly and the storage loss appears to be negatively affecting DDF operation, then stop and restart DB2 to clear the problem. Report the problem. Refer to Section 3 of

Diagnosis Guide and Reference for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 4, 5.

DSNL062I *csect-name* DDF DCE-RELATED SHUTDOWN PROCESSING HAS STARTED.

Explanation: A -STOP DDF or -STOP DDF MODE(FORCE) command is being executed. DDF is performing operations to disable for DCE-processing and to free resources used in that processing.

System Action: DDF completes the disablement operations and then continues with the STOP DDF processing.

DSNL063I *csect-name* DDF DCE-RELATED SHUTDOWN PROCESSING HAS COMPLETED.

Explanation: A -STOP DDF or -STOP DDF MODE(FORCE) command is being executed. DDF has completed DCE operations that disable its capability to perform DCE-related processing.

System Action: DDF continues with STOP DDF processing.

DSNL064E *csect-name* DDF DCE-RELATED SHUTDOWN PROCESSING FAILED. FAILURE TOKEN=*token*

Explanation: A -STOP DDF or -STOP DDF MODE(FORCE) command is being executed. An operation to remove DDF's DCE processing capability has failed. FAILURE TOKEN contains serviceability information.

System Action: DDF continues with STOP DDF processing. It should not be affected by this failure.

DSNL200I DISPLAY LOCATION REPORT FOLLOWS—

Explanation: This message is the title for the -DISPLAY LOCATION command report output. It precedes the other messages generated by this command. This message is followed by messages DSNL201I and DSNL202I. The final message for the report is be message DSNL205I.

This message is issued by the following CSECT: DSNLDLM

System Action: The -DISPLAY LOCATION command continues normally.

DSNL201I LOCATION PRDID LINKNAME REQUESTERS SERVERS CONVS

Explanation: The column headings for the list of locations generated by the -DISPLAY LOCATION command are displayed. The definitions are listed below:

Heading	Description
LOCATION	The location name associated with the remote site
PRDID	Identifies the database product at the location
LINKNAME	The VTAM LU name associated with the remote location
REQUESTERS	The number of agents at this site that are requesting data from the remote location

SERVERS The number of agents at this site that are acting as a server to the remote location

CONVS The total number of conversations in use between this site and the remote location

See message DSNL202I a for more specific description of these items.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNLDLM

System Action: Processing continues normally.

DSNL202I LOCATION PRDID LINKNAME REQUESTERS SERVERS CONVS

Explanation: This message lists the status of communications between a remote location and this DB2 subsystem. Information about the status appears below:

Item	Description
LOCATION	A 16-byte name for the remote site.
PRDID	Identifies the database product at the location in the form nnnvvrrm. <ul style="list-style-type: none"> • nnn - Identifies the database product. E.g., DSN=DB2. • vv - Product version. • rr - Product release. • m - Product modification level.
LINKNAME	The VTAM LU name or dotted decimal IP address associated with the remote location.
REQUESTERS	A count of the threads at this location that access data at the remote location. The count includes all the allied threads associated with the remote location, and any database access threads that are accessing data at the remote location.
SERVERS	A count of the database access threads at this location that access data for agents at the remote location.
CONVS	A count of the total number of conversations between the two systems. The count includes both allied and database threads.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNLDL

System Action: Processing continues normally.

DSNL203I L203-SYSTASK SESSID A ST TIME

Explanation: This message forms the heading for the listing of DB2 system threads that communicate with other locations. It follows each occurrence of message DSNL202I if the DETAIL keyword of the DISPLAY LOCATION command is used. This message is followed by one or more occurrences of message DSNL204I, which describe the DB2 system threads communicating with the remote site and its conversation information. Items in this part of the heading are:

SYSTASK Heading that describes the DB2 system thread

SESSID Heading for the associated conversation identifiers
 A Heading for the associated active indicators
 ST Heading for the associated status indicators
 TIME Heading for the associated timestamps

See message DSNL204I for descriptions of these items.

The message number and subsystem recognition character are not included in this message. However, L203 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNLDDL

System Action: Processing continues normally.

**DSNL204I L204-SYSTASK SESSID ACTIVE STATUS
 TIME**

Explanation: This message follows the DSNL203I message for a remote location when a detail display is specified on the DISPLAY LOCATION command. This message is displayed for each conversation owned by a DB2 system thread that communicates with the site. It lists detailed information about the conversations associated with the DB2 system thread.

systask Describes the DB2 system threads as follows:

- SYSCON-x
 Where x =
 - O The system thread that manages 'outbound' DB2 system conversations.
 - I The system thread that manages 'inbound' DB2 system conversations.

When DB2 is communicating with other DB2 locations using system-directed access, DB2 establishes 'system conversations' to the remote DB2 location. DB2 uses these conversations internally. The conversations created are one directional. That is, DB2 has a conversation that it uses to send information to the remote site, and another that it uses to receive information from the remote site. A DB2 system thread is created to manage 'outbound' (used for sending) conversations and another to manage 'inbound' (used for receiving) conversations.

- RESYNC
 A conversation used to resynchronize a unit of work that encountered a previous thread or communication error. There can be one entry representing each thread needing resynchronization with the remote site.

sessid Two possible values can appear in this column:

1. For VTAM network connections, this column contains the VTAM-defined session instance identifier of the session on which the conversation is executing. If the session identifier is not applicable, this field contains zeros.

VTAM does not supply the entire session id to DB2. The first two digits of the session id are incorrect. Therefore, the session id, as presented in this message, is not acceptable

in VTAM commands. Use the VTAM DISPLAY NET, ID=db2-luname, SCOPE=ACT command to obtain the full session ID. The DISPLAY NET command lists all sessions (SID) for the DB2 logical unit. Scan the DISPLAY NET output for the complete SID.

2. For TCP/IP network connections, this column contains a string of the form 'local:remote', where:

- local --** specifies the local DB2 system's TCP/IP port number
- remote --** specifies the remote partner's TCP/IP port number

active

One of the following:

- V The conversation is active within VTAM or TCP/IP.
 - W The conversation is suspended in DB2 waiting for VTAM or TCP/IP notification that the function is complete.
- Blank, otherwise.

status

Status of the conversation:

- A Conversation in allocation.
 - C Session limits are being negotiated with the partner (CNOS) prior to conversation allocation.
 - D Conversation in deallocation.
 - R Receiving.
 - S Sending.
- Blank otherwise.

time

The timestamp (yydddhhmmssth) of the last message sent or received on the conversation.

The message number and subsystem recognition character are not included in this message. However, L204 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNLDDL

System Action: Command processing continues

DSNL205I DISPLAY LOCATION REPORT COMPLETE

Explanation: This message follows messages DSNL200I, DSNL201I, and DSNL202I and indicates that the -DISPLAY LOCATION report successfully completed.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNLDDL

System Action: Processing continues normally.

**DSNL206I csect-name named-command COMMAND
 INVALID, DDF NOT STARTED**

Explanation: The 'named-command' command was issued before the distributed data facility (DDF) was started. The 'named-command' command executes successfully only if the DDF is operating.

System Action: Processing continues normally.

DSNL207I DISPLAY LOCATION NO LOCATIONS FOUND

Explanation: The -DISPLAY LOCATION command was unable to find any locations associated with the specified list of locations. If all locations were specified, there is no distributed activity.

This message is issued by the following CSECT: DSNLDL

System Action: Processing completed normally.

User Response: If a location list was specified, reissue the -DISPLAY LOCATION command using the LOCATION(*) parameter to display information for all locations, if desired.

DSNL208I DISPLAY LOCATION TERMINATED WITH MAX LINES

Explanation: The message indicates the -DISPLAY LOCATION report was truncated. The report was generated in response to a command from an MVS console and more than 254 response messages were generated. Only 254 response messages are returned.

This message is issued by the following CSECT: DSNLDL

System Action: Command processing completes. The truncated report is written to the MVS console.

User Response: Reissue the -DISPLAY LOCATION request specifying a specific location or list of locations.

DSNL400E INDOUBT THREAD RESOLUTION WITH COORDINATOR *location* SHOWS HEURISTIC DAMAGE FOR *luwid=token* - REMOTE COMMIT VERSUS LOCAL ABORT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=*seq-no1* AND IN TRACE RECORD WITH IFCID=203 AND IFCID SEQUENCE NUMBER=*seq-no2*

Explanation: DB2 has participant responsibility in the logical unit of work identified by '*luwid=token*'. Resolution with the coordinator identified by '*location*' shows heuristic damage occurred. The DB2 thread representing the logical unit of work was previously resolved using the RECOVER INDOUBT command. The action taken was to abort the thread. Subsequently, communication was reestablished with the coordinator and resolution shows that the coordinator committed the thread.

- The application was told that commit succeeded.
- Any resources updated at the coordinator were committed.
- Updated resources at this DB2 were rolled back.

location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (<i>location name</i>) • The VTAM LU name (<<i>luname</i>>) • The dotted decimal IP address (<i>nnn.nnn.nnn.nnn</i>).
luwid=token	The global logical unit of work id and the local token that identify the thread.
seq-no1	The IFCID sequence number associated with the 207 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of

statistics class 4, which has a default destination of SMF. This trace record is written when the heuristic damage condition was detected and contains information about the damage condition.

seq-no2 The IFCID sequence number associated with the 203 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 203 was not active or it was active with a destination of the resident trace table only. IFCID 203 is a member of statistics class 4, which has a default destination of SMF. This trace record was written when the heuristic decision to commit or abort was made and contains information about the decision, including the names of any downstream participants.

This message is issued by the following CSECTs: DSNLTDPDI, DSNLTRPA, DSNLTRPN

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4 and locate and print the trace record with SEQUENCE NUMBER='*seq-no1*'. Call the database administrator.

Database Administrator Action: Correct the damage. This is not an easy task. Since the time of the heuristic action, the data that was aborted with the RECOVER INDOUBT command might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.
- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work and any downstream participant locations involved in the logical unit of work.
- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM Support Center for further assistance.

DSNL401E INDOUBT THREAD RESOLUTION WITH COORDINATOR *location* SHOWS HEURISTIC DAMAGE FOR *luwid=token* - REMOTE ABORT VERSUS LOCAL COMMIT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=*seq-no1* AND IN TRACE RECORD WITH IFCID=203 AND IFCID SEQUENCE NUMBER=*seq-no2*

Explanation: DB2 has participant responsibility in the logical unit of work identified by '*luwid=token*'. Resolution with the coordinator identified by '*location*' shows heuristic damage occurred. The DB2 thread representing the logical unit of work was previously resolved with the RECOVER INDOUBT command. The action taken was to commit the thread. Subse-

quently, communication was reestablished with the coordinator and resolution shows that the coordinator aborted the thread.

- The application was told that commit failed.
- Any resources updated at the coordinator were rolled back.
- Updated resources at this DB2 were committed.

location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (location name) • The VTAM LU name (<luname>) • The dotted decimal IP address (nnn.nnn.nnn.nnn).
luwid=token	The global logical unit of work id and the local token that identify the thread.
seq-no1	The IFCID sequence number associated with the 207 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF. This trace record is written when the heuristic damage condition was detected and contains information about the damage condition.
seq-no2	The IFCID sequence number associated with the 203 trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 203 was not active or it was active with a destination of the resident trace table only. IFCID 203 is a member of statistics class 4, which has a default destination of SMF. This trace record was written when the heuristic decision to commit or abort was made and contains information about the decision, including the names of any downstream participants.

This message is issued by the following CSECTs: DSNLTPDI, DSNLTRPA, DSNLTRPN

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no1'. Call the database administrator.

Database Administrator Action: Correct the damage. This is not an easy task. Since the time of the heuristic action, the data that was committed with the RECOVER INDOUBT command might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. Tools available are:

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.
- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work, and any downstream participant locations involved in the logical unit of work.

- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM Support Center for further assistance.

DSNL402I INDOUBT THREAD RESOLUTION WITH PARTICIPANT *location* SHOWS HEURISTIC DAMAGE FOR *luwid=token* - REMOTE COMMIT VERSUS LOCAL ABORT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has coordinator responsibility for the logical unit of work identified by 'luwid=token'. Resolution with a participant shows heuristic damage occurred. The participant identified by 'location' manually resolved the indoubt thread identified by 'luwid=token'. The action taken was to commit the thread. This is inconsistent with the abort decision of the coordinator.

- The application was told that commit failed.
- Any resources updated at the participant were committed.
- Updated resources at this DB2 were rolled back.

location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (location name) • The VTAM LU name (<luname>) • The dotted decimal IP address (nnn.nnn.nnn.nnn).
luwid=token	The global logical unit of work id and the local token that identify the thread.
seq-no	The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECTs: DSNLTPDI, DSNLTRCA, DSNLTRCN, DSNLTRLN, DSNLTRRA

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the participant completes.

System Programmer Response: Call the database administrator.

Database Administrator Action: Inform the database administrator at 'location' that heuristic damage occurred for the logical unit of work with LUWID='luwid'. DB2 was the coordinator for the logical unit of work and made the decision to abort the database updates made by 'luwid'. At 'location' a heuristic decision was made to COMMIT the updates made by 'luwid'.

Information about the heuristic damage continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

DSNL403I INDOUBT THREAD RESOLUTION WITH PARTICIPANT *location* **SHOWS HEURISTIC DAMAGE FOR** *luwid=token* **- REMOTE ABORT VERSUS LOCAL COMMIT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=seq-no**

Explanation: DB2 has coordinator responsibility for the logical unit of work identified by 'luwid=token'. Resolution with a participant shows heuristic damage occurred. The participant identified by 'location' manually resolved the indoubt thread identified by 'luwid=token'. The action taken was to abort the thread. This is inconsistent with the commit decision of the coordinator.

- The application was told that commit succeeded.
- Any resources updated at the participant were rolled back.
- Updated resources at this DB2 were committed.

location	The relational database name (location-name), SNA LU name (<luname>), or dotted decimal IP address of the participant.
luwid=token	The global logical unit of work id and the local token that identify the thread.
seq-no	The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECTs: DSNLTPDI, DSNLTRCA, DSNLTRCN, DSNLTRLA, DSNLTRLN, DSNLTRRA

System Action: Alert A004 is generated. A trace record with IFCID 207 is written. Indoubt resolution with the participant completes.

System Programmer Response: Call the database administrator.

Database Administrator Action: Inform the database administrator at 'location' that heuristic damage occurred for the logical unit of work with LUWID='luwid'. DB2 was the coordinator for the logical unit of work and made the decision to COMMIT the database updates made by 'luwid'. At 'location' a heuristic decision was made to back out (ABORT) the updates made by 'luwid'.

Information about the heuristic damage continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

DSNL404E PROTOCOL ERROR DURING INDOUBT THREAD RESOLUTION WITH COORDINATOR *location* **LUWID=luwid=token** **INFORMATION RECORDED IN TRACE RECORD WITH IFCID=206 AND IFCID SEQUENCE NUMBER=seq-no**

Explanation: DB2 has participant responsibility for the logical unit of work identified by 'luwid=token'. The DB2 thread associated with the logical unit of work is indoubt. A protocol error

occurred during indoubt resolution with the coordinator identified by 'location'.

location	Either the relational database name (location-name) or the logical unit name (<luname>) of the coordinator.
luwid=token	The global logical unit of work id and the local token that identify the thread.
seq-no	The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 206 was not active or it was active with a destination of the resident trace table only. IFCID 206 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECTs: DSNLTRE, DSNLTRPV

System Action: The indoubt thread remains indoubt. Alert A003 is generated. A trace record whose IFCID=206 is written.

System Programmer Response: This is an APARable error, probably at the coordinator, but possibly at the DB2 participant. The DB2 documentation required is contained in the statistics class 4 trace record that was written. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

Call the database administrator.

Database Administrator Action: DB2 does not attempt to automatically resolve the indoubt thread. The indoubt thread must be manually resolved. The commit or abort decision made at the coordinator must be determined so that the same decision can be made at this participant DB2.

Contact the database administrator at the coordinator location to determine whether the thread with LUWID=luwid committed or aborted.

If the coordinator system is another DB2, the following steps can be taken at the DB2 coordinator to determine the commit or abort decision.

1. If the coordinator DB2 system is running and a DB2 conditional restart was not performed since the error was detected at this (the participant) location, ask the database administrator at the DB2 coordinator location to issue one of the following DISPLAY THREAD TYPE(INDOUBT) commands:
 - A -DISPLAY THREAD TYPE(INDOUBT), using the LOCATION keyword and specifying the location name of the local DB2.
 - A -DISPLAY THREAD TYPE(INDOUBT) LUWID(luwid)

If a thread with LUWID=luwid appears in the display, then the display also includes the commit or abort decision. If no thread with LUWID=luwid appears in the display, the thread was aborted.

2. If the DB2 coordinator is down, or if a conditional restart was performed there, ask the database administrator at the DB2 coordinator to run DSN1LOGP, specifying SUMMARY(ONLY) FILTER LUWID(luwid). The output from DSN1LOGP includes the commit or abort decision.

Use the RECOVER INDOUBT command at this (the participant) location to resolve the indoubt thread.

DSNL405I THREAD *luwid=token* PLACED IN INDOUBT STATE BECAUSE OF COMMUNICATION FAILURE WITH COORDINATOR *location*. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=209 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: During execution of the two phase commit protocol with the coordinator identified by 'location', communication failed. Phase 1 of the protocol completed and the thread is prepared for either commit or abort.

The thread is placed in the indoubt state and appears in a DISPLAY THREAD TYPE (INDOUBT) report. Periodic attempts are made to reestablish communication with the coordinator for automatic indoubt resolution. If successful, message DSNL407 or DSNL415 is written.

luwid=token	The global logical unit of work id and the local token that identify the thread.
location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (location name) • The VTAM LU name (<lname>) • The dotted decimal IP address (nnn.nnn.nnn.nnn).
seq-no	The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 209 was not active or it was active with a destination of the resident trace table only. IFCID 209 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECT: DSNLTSCE

System Action: Alert A006 is generated. A trace record whose IFCID=209 is written.

Operator Response: If message DSNL407 or DSNL415 for the LUWID specified in the DSNL405 message does not appear in a reasonable amount of time, call the system programmer.

System Programmer Response: Determine the cause of the communication failure and have the problem fixed. DB2 periodically attempts to reestablish communication. If the problem cannot be fixed in a reasonable amount of time, call the database administrator. Manual resolution of the indoubt thread might be necessary to release locked resources.

Database Administrator Action: Take the following actions to resolve this thread using manual means (that is, take heuristic action) if it is necessary to release locks held by this thread.

- Determine the proper commit or abort decision by contacting the database administrator at the coordinator 'location' shown in this message in order to determine whether the thread with LUWID=*luwid* committed or aborted.

If the coordinator system is another DB2, the following steps can be taken at the DB2 coordinator to determine the commit or abort decision.

1. If the coordinator DB2 system is running and a DB2 conditional restart was not performed since the error was detected at this (the participant) location, ask the

database administrator at the DB2 coordinator location to issue one of the following DISPLAY THREAD TYPE(INDOUBT) commands:

- A -DISPLAY THREAD TYPE(INDOUBT), using the LOCATION keyword and specifying the location name of the local DB2.
- A -DISPLAY THREAD TYPE(INDOUBT) LUWID(*luwid*)

If a thread with LUWID=*luwid* appears in the display, then the display also includes the commit or abort decision. If no thread with LUWID=*luwid* appears in the display, then the thread was aborted.

2. If the DB2 coordinator is down or if a conditional restart was performed there, ask the database administrator at the DB2 coordinator to run DSN1LOGP, specifying SUMMARY(ONLY) FILTER LUWID(*luwid*). The output from DSN1LOGP includes the commit or abort decision.
 - Use the RECOVER INDOUBT command to commit or abort the thread.

DSNL406I THREAD *luwid=token* AT PARTICIPANT *location* MAY BE INDOUBT BECAUSE OF A COMMUNICATION FAILURE. DB2 COMMITTED THE THREAD. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=209 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: During execution of the two phase commit protocol with the participant identified by 'location', communications failed. Phase 1 of the protocol completed with the participant, which is prepared to either commit or abort. The decision to commit the thread was made, but cannot be communicated to the participant at this time. The participant is indoubt.

DB2 becomes responsible for indoubt resolution with the participant. This responsibility appears in a DISPLAY THREAD TYPE (INDOUBT) report. Periodic attempts are made to reestablish communication with the participant for automatic indoubt resolution. If successful, message DSNL423 is written.

luwid=token	The global logical unit of work id and the local token that identify the thread.
location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (location name) • The VTAM LU name (<lname>) • The dotted decimal IP address (nnn.nnn.nnn.nnn).
seq-no	The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 209 was not active or it was active with a destination of the resident trace table only. IFCID 209 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECT: DSNLTSCE

System Action: Alert A006 is generated. A trace record whose IFCID=209 is written.

Operator Response: If message DSNL423 for the LUWID specified in message DSNL406 does not appear in a reasonable amount of time, call the system programmer.

System Programmer Response: Determine the cause of the communication failure and have the problem fixed. DB2 periodically attempts to reestablish communication. If the problem cannot be fixed in a reasonable amount of time, call the database administrator. The participant might need to manually resolve the indoubt state to release locked resources.

Database Administrator Action: If the unit of work with LUWID=luwid is indoubt at 'location', inform the database administrator there that the logical unit of work with LUWID=luwid was committed to assist in manual resolution of the indoubt thread at 'location'.

DSNL407I AUTOMATIC RESOLUTION OF *luwid=token* WITH COORDINATOR *location* RESULTED IN COMMIT

Explanation: The identified indoubt logical unit of work was automatically resolved by communication with the coordinator location. After automatic resolution, this message is issued if message DSNL405 was previously issued to report the thread as indoubt. This message is not issued if message DSNL405 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token	The global logical unit of work id and the local token that identify the thread
location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (location name) • The VTAM LU name (<luname>) • The dotted decimal IP address (nnn.nnn.nnn.nnn).

This message is issued by the following CSECT: DSNLTRD

System Action: Processing continues normally.

DSNL408I INDOUBT THREAD RESOLUTION WITH COORDINATOR *location* SHOWS HEURISTIC DAMAGE AT PARTICIPANT *location* FOR *luwid=token* - COORDINATOR COMMIT VERSUS PARTICIPANT ABORT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=207 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has participant responsibility in the logical unit of work identified by 'luwid=token' for the coordinator at COORDINATOR 'location' and coordination responsibility in the same logical unit of work for the participant at PARTICIPANT 'location'. Heuristic damage occurred.

- The application was told that commit succeeded.
- Any resources updated at the coordinator and at this DB2 were committed.
- Updated resources at the participant were rolled back.

location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (location name) • The VTAM LU name (<luname>) • The dotted decimal IP address (nnn.nnn.nnn.nnn).
----------	--

luwid=token The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECT: DSNLTPDI

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'. Call the database administrator.

Database Administrator Action: Inform the database administrator at the coordinator 'location' and at the participant 'location' of the problem.

Correcting the damage at the participant is not an easy task. Since the time of the heuristic action, the data that was aborted using manual means might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. The following information that is available at DB2 might be helpful in correcting the problem:

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.
- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work at the local DB2 as well as any downstream participant locations involved in the logical unit of work. This information, while not directly related to the damage at the participant, might be useful in determining the scope of the problem.
- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM Support Center for further assistance.

DSNL409I INDOUBT THREAD RESOLUTION WITH COORDINATOR *location* SHOWS HEURISTIC DAMAGE AT PARTICIPANT *location* FOR *luwid=token* - COORDINATOR ABORT VERSUS PARTICIPANT COMMIT. INFORMATION RECORDED IN TRACE RECORD WITH IFCID 207 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has participant responsibility in the logical unit of work identified by 'luwid=token' for the coordinator at COORDINATOR 'location' and coordination responsibility in the same logical unit of work for the participant at PARTICIPANT 'location'. Heuristic damage occurred.

- The application was told that commit failed.
- Any resources updated at the coordinator and at this DB2 were rolled back.

- Updated resources at the participant were committed.

location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (location name) • The VTAM LU name (<luname>) • The dotted decimal IP address (nnn.nnn.nnn.nnn).
luwid=token	The global logical unit of work id and the local token that identify the thread.
seq-no	The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 207 was not active or it was active with a destination of the resident trace table only. IFCID 207 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECT: DSNLTPDI

System Action: Alert A004 is generated. A trace record whose IFCID=207 is written. Indoubt resolution with the coordinator completes.

System Programmer Response: Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'. Call the database administrator.

Database Administrator Action: Inform the database administrator at the coordinator 'location' and at the participant 'location' of the problem.

Correcting the damage at the participant is not an easy task. Since the time of the heuristic action, the data that was committed using manual means might have been used by many applications - read and/or write. Correcting the damage might involve reversing the effects of these applications as well. This information is available at DB2 and might be helpful in correcting the problem.

- The statistics trace class 4 contains an IFCID 207 trace record. This record contains the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message.
- The DSN1LOGP utility provides a summary report that identifies the table spaces modified by the logical unit of work at the local DB2 and any downstream participant locations involved in the logical unit of work. This information, while not directly related to the damage at the participant, might be useful in determining the scope of the problem.
- DISPLAY THREAD TYPE(INDOUBT) displays the RBA of the first DB2 log record written for the logical unit of work whose LUWID is included in this message. This information continues to appear in the DISPLAY THREAD report until it is purged with the RESET INDOUBT command.

Contact your IBM support center for further assistance.

DSNL410I WARM START CONNECTION BY PARTNER *location* REJECTED. PARTNER CHANGED AT LEAST 1 OF - OUR LOG NAME *oldourname(newourname)*, THEIR LOG NAME *oldtheirname(newtheirname)*, PA_SUPPORT *oldpa(newpa)*, FLAG_BYTE_SENT *oldfb(newfb)*, CCLUNAME_SENT *oldccls(newccls)*, AND INDOUBT THREADS REQUIRE RESOLUTION. SEE IFCID=205 TRACE RECORD WITH IFCID SEQUENCE NUMBER=*seq-no*.

Explanation: An attempt to make a warm start connection with a partner was rejected because the partner specified a different set of sync point parameters than the ones that were in use when communications were lost. DB2 has knowledge of indoubt threads that involve the partner as either the coordinator or a participant. This error might be a recoverable error if the partner can restart with the original sync point parameters. If this is not possible, then the partner must perform a cold start connection with DB2.

location	The 'location' with which the connection failed: either the relational database name (location-name) or the logical unit name (<luname>) of the partner.
oldourname	The log name for this DB2 subsystem. This value is null if the partner did not initiate the log name exchange.
newourname	The log name for this DB2 subsystem, as remembered by our partner and sent to us in the attempted warm start connection. This value is null if the partner did not initiate the log name exchange.
oldtheirname	The log name used by the partner during the last connection, as remembered by DB2.
newtheirname	The log name used by the partner in the attempted warm start connection.
oldpa	The sync point protocol used during the last connection, as remembered by the DB2 (PA - Presumed Abort, PN - Presumed Nothing).
newpa	The sync point protocol used during the last connection, as remembered by the partner (PA - Presumed Abort, PN - Presumed Nothing).
oldfb	The use of the PS header byte 2 during the last connection, as remembered by DB2 (F - used as flag byte, N - not used as flag byte).
newfb	The use of the PS header byte 2 during the last connection, as remembered by the partner (F - used as flag byte, N - not used as flag byte).
oldccls	Whether the luname of the conversation correlator was exchanged as part of the sync point protocol during the last connection, as remembered by DB2. (E - was exchanged, N - was not exchanged).
newccls	Whether the luname of the conversation correlator was exchanged as part of the sync point protocol during the last connection, as remembered by the partner (E - was exchanged, N - was not exchanged).

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 0205 was not active or it was active with a destination of the resident trace table only. IFCID 0205 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECT: DSNLTPXL

System Action: The connection with the partner is rejected. Alert A002 is generated. DB2 retains indoubt knowledge.

System Programmer Response: Call the database administrator.

Database Administrator Action: Contact the database administrator at the partner 'location' and determine if it is possible for the partner to perform a warm start with same sync point parameters as ours ('oldourname', 'oldtheirname', 'oldpa', 'oldfb', 'oldcccls'). If this is possible, the next attempt to connect will succeed.

If this cannot be done, then there are two other possible solutions:

- Have the partner 'location' perform a cold start connection with this DB2 subsystem.
- Use the RESET INDOUBT command with the FORCE option in conjunction with the LOCATION parameter to cause the next connection with the partner to be a cold start connection.

DSNL411E COLD START CONNECTION BY COORDINATOR *location* ACCEPTED. INDOUBT THREADS NEED MANUAL RESOLUTION. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has participant responsibility for indoubt threads. The coordinator informed DB2 that it performed a cold start operation and lost all knowledge of indoubt threads. The indoubt threads at this DB2 must be manually resolved with the RECOVER INDOUBT command.

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECT: DSNLTPXL

System Action: The connection with the partner is accepted. Alert A001 is generated. A trace record whose IFCID=204 is written.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is a participant with one or more indoubt threads where the coordinator is 'location'. The

DBMS at 'location' performed a cold start. The DB2 participant assumes that the coordinator recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There is probably inconsistent data at the coordinator. A list of indoubt threads involving the coordinator 'location' can be displayed using the DISPLAY THREAD command for indoubt type threads by including the LOCATION('location') parameter in the command.

The heuristic decision (that is, to commit or abort the logical unit of work) should be coordinated with any other participants. The existence of other participants might not be easy to determine. The information might be available in the coordinators recovery log even though the coordinator performed a cold start. If the coordinator is a DB2, then it might be possible to execute the DSN1LOGP utility to produce a summary report. If this is possible, the following information might be produced:

- The LUWID of the thread.
- The NID used by IMS or CICS to identify the thread.
- The name of all participants.
- The name of an upstream coordinator if the coordinator is also a participant. This could happen when an application requester accesses a DB2 AS using application-directed access, which in turn accesses another DB2 server with system-directed access. (The local DB2 might be the third system in this scenario.)

At this DB2 participant, all indoubt threads coordinated by the cold starting location must be resolved with the RECOVER INDOUBT command. Locked data remains unavailable until resolution. Threads that were already resolved with this command are discarded. Threads not yet resolved are discarded after resolution with the command.

The commit or abort decision provided using the RECOVER INDOUBT command for a logical unit of work are propagated to all downstream participants, if any.

DSNL412I PROTOCOL ERROR DETECTED IN SYNCPOINT REQUEST/RESPONSE FROM COORDINATOR *location* LUWID=*luwid=token*. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=208 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 is a participant in the logical unit of work identified by 'luwid=token'. A protocol error occurred during the SNA sync point exchange with the coordinator identified by 'location'. The protocol error fits into one of the following categories:

- An unknown SNA PS header was received.
- An SNA PS header was received in the wrong sequence.
- An invalid LU6.2 verb sequence was used to deliver the SNA PS header.
- A DEALLOCATE TYPE(ABEND_SVC) was received from the coordinator, indicating that the coordinator detected a protocol violation in the PS headers transmitted by DB2.

location Either the relational database name (location-name) or the logical unit name (<luname>) of the coordinator.

luwid=token The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 208 was not active or it was active with a destination of the resident trace table only. IFCID 208 is a member of statistics class 4, which has a default destination of SMF.

If the protocol error was detected before the commit decision, the unit of work at the DB2 system might be indoubt. DB2 does not automatically resolve such an indoubt thread.

If the protocol error was detected after the commit decision, the unit of work either completed commit or abort processing.

This message is issued by the following CSECT: DSNLTSPE

System Action: Alert A005 is generated. A trace record whose IFCID=208 is written.

System Programmer Response: This is an APARable error, probably at the coordinator, but possibly at DB2. The DB2 documentation required is contained in the statistics class 4 trace record. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

The database administrator might need to manually resolve the indoubt thread.

Database Administrator Action: Determine if the 'luwid' is indoubt by using the DISPLAY THREAD command for type indoubt threads and including the LUWID('token') parameter in the command. If the thread is indoubt, it must be manually resolved using the RECOVER INDOUBT command. The commit or abort decision made at the coordinator must be determined so that the same decision can be made at DB2.

Contact the database administrator at the coordinator location to determine whether the thread with LUWID=luwid committed or aborted.

If the coordinator system is another DB2, then the following steps can be taken at the DB2 coordinator to determine the commit or abort decision.

1. If the coordinator DB2 system is running and a DB2 conditional restart was not performed since the error was detected at this (the participant) location, ask the database administrator at the DB2 coordinator location to issue one of the following DISPLAY THREAD TYPE(INDOUBT) commands:
 - A -DISPLAY THREAD TYPE(INDOUBT), using the LOCATION keyword and specifying the location name of the local DB2.
 - A -DISPLAY THREAD TYPE(INDOUBT) LUWID(luwid)

If a thread with LUWID=luwid appears in the display, then the display also includes the commit or abort decision. If no thread with LUWID=luwid appears in the display, then the thread was aborted.

2. If the DB2 coordinator is down or if a conditional restart was performed there, ask the database administrator at the DB2 coordinator to run DSN1LOGP, specifying SUMMARY(ONLY) FILTER LUWID(luwid). The output from DSN1LOGP includes the commit or abort decision.

DSNL413I **PROTOCOL ERROR DETECTED IN SYNCPOINT REQUEST/RESPONSE FROM PARTICIPANT** *location* **LUWID=luwid=token.** **INFORMATION RECORDED IN TRACE RECORD WITH IFCID=208 AND IFCID SEQUENCE NUMBER=seq-no**

Explanation: DB2 is the coordinator of the logical unit of work identified by 'luwid=token'. A protocol error occurred during the SNA sync point exchange with the participant identified by 'location'. The protocol error fits into one of the following categories:

- An unknown SNA PS header was received.
- An SNA PS header was received in the wrong sequence.
- An invalid LU6.2 verb sequence was used to deliver the SNA PS header.
- A DEALLOCATE TYPE(ABEND_SVC) was received from the participant, indicating that the participant detected a protocol violation in the PS headers transmitted by DB2.

location The relational database name (location-name) of the participant.

luwid=token The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 208 was not active or it was active with a destination of the resident trace table only. IFCID 208 is a member of statistics class 4, which has a default destination of SMF.

If the protocol error is detected before the commit decision, the unit of work is backed out.

If the protocol error is detected after the commit decision, the outcome of the unit of work is unchanged. In this case, the remote participant might be indoubt. DB2 does not automatically resolve the indoubt thread with the partner 'location' after a protocol error is detected.

This message is issued by the following CSECT: DSNLTSPE

System Action: Alert A005 is generated. A trace record whose IFCID=208 is written.

System Programmer Response: This is an APARable error, probably at the participant, but possibly at the DB2 coordinator. The DB2 documentation required is contained in the statistics class 4 trace record. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

Call the database administrator. The participant might need to manually resolve the indoubt thread.

Database Administrator Action: The DB2 coordinator does not know the status of the thread at the participant. The DB2 coordinator assumes that it is indoubt and maintains knowledge of the indoubt participant until it is purged with the RESET INDOUBT command. If the thread is indoubt at the participant, it must be resolved using manual (heuristic) means. The status of the thread at the local DB2 (the coordinator) can be determined with the DISPLAY THREAD command for type indoubt threads by including the LUWID('token') parameter in the command.

If the 'participant' location is also a DB2, the RECOVER INDOUBT command can be used at the participant to resolve the indoubt thread.

DSNL414E **PROTOCOL ERROR DURING INDOUBT THREAD RESOLUTION WITH PARTICIPANT** *location* **LUWID=*luwid=token* INFORMATION RECORDED IN TRACE RECORD WITH IFCID=206 AND IFCID SEQUENCE NUMBER=*seq-no***

Explanation: DB2 has coordinator responsibility for the logical unit of work identified by 'luwid=token'. The DB2 thread associated with the logical unit of work is either committed or aborted. A protocol error occurred during indoubt resolution with the participant identified by 'location'.

The thread at the participant remains indoubt. DB2 rejects further attempts to automatically resolve the indoubt thread.

location The relational database name (location-name) of the participant.

luwid=token The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 206 was not active or it was active with a destination of the resident trace table only. IFCID 206 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECTs: DSNLTRE, DSNLTRPV

System Action: Alert A003 is generated. A trace record whose IFCID=206 is written.

System Programmer Response: This is an APARable error, probably at the participant, but possibly at the DB2 coordinator. The DB2 documentation required is contained in the statistics class 4 trace record. Determine the destination of statistics class 4. Locate and print the trace record with SEQUENCE NUMBER='seq-no'.

Call the database administrator. The participant might need to manually resolve the indoubt thread.

Database Administrator Action: The DB2 coordinator maintains knowledge of the indoubt participant until it is purged with the RESET INDOUBT command. If the thread is indoubt at the participant, it must be manually (heuristically) resolved. The status of the thread at the local DB2 (the coordinator) can be determined with the DISPLAY THREAD command for type indoubt threads by including the LUWID('token') parameter in the command.

If the participant is another DB2, the RECOVER INDOUBT command can be used to resolve the indoubt thread.

DSNL415I **AUTOMATIC RESOLUTION OF** *luwid=token* **WITH COORDINATOR** *location* **RESULTED IN ABORT**

Explanation: The identified indoubt logical unit of work was automatically resolved by communication with the coordinator location. After automatic resolution, this message is issued if message DSNL405 was previously issued to report the thread as indoubt. This message is not issued if message DSNL405 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token The global logical unit of work id and the local token that identify the thread

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<lname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

This message is issued by the following CSECT: DSNLTRD

System Action: Processing continues normally.

DSNL416I **COLD START CONNECTION REJECTED BY PARTNER** *location*

Explanation: DB2 attempted to make a cold-start connection with a partner location. The partner rejected this attempted connection. DB2 never rejects cold-start connections by partners.

location Either the relational database name (location-name) or the logical unit name (<lname>) of the partner.

This message is issued by the following CSECT: DSNLTPXL

System Action: The connection was not made.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is not able to connect the partner 'location' until the partner 'location' allows a cold-start connection with DB2. Contact the database administrator at the partner 'location'.

Contact your IBM Support Center for further assistance.

DSNL417E *csect-name* **COLD START DETECTED AT COORDINATOR LOCATION** *location* **FOR INDOUBT THREAD WITH** *luwid=token*. **MANUAL RESOLUTION IS REQUIRED. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 and IFC SEQUENCE NUMBER=*seq-no***

Explanation: DB2 has resync responsibility for the indoubt thread identified. The partner location informed DB2 that it had performed a cold start operation and lost all knowledge of this indoubt thread. This indoubt thread must be manually resolved with the RECOVER INDOUBT command, followed by the RESET INDOUBT command.

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<lname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token The logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF and contains information about a partner's cold start.

System Action: Alert A001 is generated. A trace record whose IFCID=204 is written.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is a participant with one or more indoubt threads where the coordinator is 'location'. The DBMS at 'location' performed a cold start. The DB2 participant assumes that the coordinator recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There may be inconsistent data at the coordinator. A list of indoubt threads involving the coordinator 'location' can be displayed using the DISPLAY THREAD command for indoubt type threads by including the LOCATION('location') parameter in the command.

The heuristic decision (that is, to commit or abort the logical unit of work) should be coordinated with any other participants. The existence of other participants might not be easy to determine. The information might be available in the coordinators recovery log even though the coordinator performed a cold start. If the coordinator is a DB2, then it might be possible to execute the DSN1LOGP utility to produce a summary report. If this is possible, the following information might be produced:

- The LUWID of the thread.
- The NID used by IMS or CICS to identify the thread.
- The name of all participants.
- The name of an upstream coordinator if the coordinator is also a participant. This could happen when an application requester accesses a DB2 AS using application-directed access, which in turn accesses another DB2 server with system-directed access. (The local DB2 might be the third system in this scenario.)

At this DB2 participant, all indoubt threads coordinated by the cold starting location must be resolved with the RECOVER INDOUBT command. Locked data remains unavailable until resolution. Threads that were already resolved with this command are discarded. Threads not yet resolved are discarded after resolution with the command.

The commit or abort decision provided using the RECOVER INDOUBT command for a logical unit of work are propagated to all downstream participants, if any.

DSNL418E *csect-name* COLD START DETECTED AT PARTICIPANT LOCATION *location* FOR INDOUBT THREAD WITH *luwid=token*. POSSIBLE DAMAGE. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 and IFC SEQUENCE NUMBER=*seq-no*.

Explanation: DB2 has coordinator responsibility for the indoubt thread identified. The partner location informed DB2 that it had performed a cold start operation and lost all know-

ledge of this indoubt thread. There might be damage at the participant.

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<lname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid=token The global logical unit of work id and the local token that identify the thread.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF.

System Action: Alert A001 is generated. A trace record whose IFCID=204 is written.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is the coordinator with indoubt thread resolution responsibility for one or more indoubt logical units of work at 'location'. The DBMS at 'location' performed a cold start. DB2 assumes that the participant recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There is probably inconsistent data at the participant. Minimally, the participant might not completely reflect the final outcome of the threads that were indoubt at the time the failure occurred. A list of indoubt threads involving the partner 'location' can be displayed using the DISPLAY THREAD command for type indoubt threads by including the LOCATION('location') parameter in the command.

Information about the indoubt participant continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

DSNL419I PARTNER *location* HAS RESOLVED WARM START STATUS AND CONNECTION IS ACCEPTED

Explanation: A successful warm start connection was made with a partner. A previous attempt to make a warm start connection with the partner was rejected with a DSNL410I message because the partner specified an incorrect log name.

location Either the relational database name (location-name) or the logical unit name (<lname>) of the partner

This message is issued by the following CSECT: DSNLTPXL

System Action: The connection was successful. Normal processing continues.

DSNL420I COLD START CONNECTION BY PARTICIPANT *location* ACCEPTED. POSSIBLE DAMAGE. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=204 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 has coordinator responsibility for indoubt threads at a participant and just connected with the participant, which lost all knowledge of indoubt threads because of a previous cold start. There might be damage at the participant.

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 204 was not active or it was active with a destination of the resident trace table only. IFCID 204 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECT: DSNLTPXL

System Action: The connection with the partner is accepted. Alert A001 is generated. A trace record whose IFCID=204 is written.

System Programmer Response: Call the database administrator.

Database Administrator Action: DB2 is the coordinator with indoubt thread resolution responsibility for one or more indoubt logical units of work at 'location'. The DBMS at 'location' performed a cold start. DB2 assumes that the participant recovery log was lost or damaged and indoubt thread resolution cannot be achieved. There is probably inconsistent data at the participant. Minimally, the participant might not completely reflect the final outcome of the threads that were indoubt at the time the failure occurred. A list of indoubt threads involving the partner 'location' can be displayed using the DISPLAY THREAD command for type indoubt threads by including the LOCATION('location') parameter in the command.

Information about the indoubt participant continues to appear in the DISPLAY THREAD TYPE(INDOUBT) report until it is purged with the RESET INDOUBT command.

DSNL421I SNA XLN PROTOCOL VIOLATION BY PARTNER *location*. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=0236 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: DB2 detected a protocol violation in the SNA Exchange Log Names (XLN) exchange with the partner at the specified location.

location Either the relational database name (location-name) or the logical unit name (<luname>) of the partner that sent the invalid XLN message.

seq-no The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, then IFCID 0236 was not active or it was active with a destination of the resident trace table only. IFCID 0236 is a member of statistics class 4, which has a default destination of SMF.

This message is issued by the following CSECTs:

DSNLCRAC DSNLCRES DSNLCXLN

System Action: The attempt to connect with the remote site fails. DB2 writes a trace record with IFCID 0236.

Operator Response: Call the system programmer.

System Programmer Response: Contact the system programmer for the remote site. The invalid XLN message is

recorded in the IFCID 0236 trace record. The system logic error that causes the invalid XLN message must be corrected at the remote site.

DSNL422I WARM START CONNECTION BY PARTNER *location* REJECTED BECAUSE THE PARTNER REMEMBERS OUR LOG NAME INCORRECTLY. OUR LOG NAME IS *name1* AND THE PARTNER REMEMBERS IT AS *name2*

Explanation: An attempt to make a warm start connection with a partner was rejected because the partner specified our log name as name2. Our log name is name1, which is the LUNAME of the local DB2. This error might be a recoverable error if the partner can restart with our log name as name1. If this is not possible, then the partner must perform a cold start connection with DB2.

location The 'location' with which the connection failed: either the relational database name (location-name) or the logical unit name (<luname>) of the partner.

name1 Our log name, as remembered by us.

name2 Our log name, as remembered by our partner and sent to us in the attempted warm start connection.

This message is issued by the following CSECT: DSNLTPXL

System Action: The connection with the partner is rejected. DB2 retains indoubt knowledge.

System Programmer Response: Call the database administrator.

Database Administrator Action: Contact the database administrator at the partner 'location' and determine if it is possible for the partner to perform a warm start with our log name specified as the LUNAME of this DB2. If this is possible, the next attempt to connect will succeed.

If this cannot be done, then there are two other possible solutions.

- Have the partner 'location' perform a cold start connection with this DB2 subsystem.
- Use the RESET INDOUBT command with the FORCE option in conjunction with the LOCATION parameter to cause the next connection with the partner to be a cold start connection.

DSNL423I AUTOMATIC RESOLUTION OF *luwid=token* WITH PARTICIPANT *location* RESULTED IN COMMIT

Explanation: The identified indoubt logical unit of work was automatically resolved through communication with the participant location. After automatic resolution, this message is issued if message DSNL406 was previously issued reporting the thread as indoubt. This message is not issued if message DSNL406 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token The global logical unit of work id and the local token that identify the thread.

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

This message is issued by the following CSECT: DSNLTRD

System Action: Processing continues normally.

DSNL424I AUTOMATIC RESOLUTION OF *luwid=token* WITH PARTICIPANT *location* RESULTED IN ABORT

Explanation: The identified indoubt logical unit of work was automatically resolved by communication with the participant location. After automatic resolution, this message is issued if message DSNL425 was previously issued reporting the thread as being indoubt. This message is not issued if message DSNL425 occurs in one restart of DDF or DB2, and automatic resolution occurs in a different restart of DDF or DB2.

luwid=token	The global logical unit of work id and the local token that identify the thread
location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (location name) • The VTAM LU name (<lname>) • The dotted decimal IP address (nnn.nnn.nnn.nnn).

This message is issued by the following CSECT: DSNLTRD

System Action: Processing continues normally.

DSNL425I THREAD *luwid=token* AT PARTICIPANT *location* MAY BE INDOUBT BECAUSE OF A COMMUNICATION FAILURE. DB2 ABORTED THE THREAD. INFORMATION RECORDED IN TRACE RECORD WITH IFCID=209 AND IFCID SEQUENCE NUMBER=*seq-no*

Explanation: During execution of the two phase commit protocol with the participant identified by 'location', communications failed. Phase 1 of the protocol completed with the participant and it is prepared for either commit or abort. The decision to abort the thread was made, but cannot be communicated to the participant at this time. The participant is indoubt.

DB2 becomes responsible for indoubt resolution with the participant. This responsibility appears in a DISPLAY THREAD TYPE (INDOUBT) report. Periodic attempts are made to reestablish communication with the participant for automatic indoubt resolution. If successful, message DSNL424 is written.

luwid=token	The global logical unit of work id and the local token that identify the thread.
location	The field contains one of the following: <ul style="list-style-type: none"> • The relational database name (location name) • The VTAM LU name (<lname>) • The dotted decimal IP address (nnn.nnn.nnn.nnn).

seq-no	The IFCID sequence number associated with the trace record. The sequence number is printed in hexadecimal format. If the sequence number is zero, IFCID 209 was not active or it was active with a destination of the resident trace table only. IFCID 209 is a member of statistics class 4, which has a default destination of SMF.
--------	---

This message is issued by the following CSECT: DSNLTSCE

System Action: Alert A006 is generated. A trace record whose IFCID=209 is written.

Operator Response: If message DSNL424 for the LUWID specified in message DSNL406 does not appear in a reasonable amount of time, call the system programmer.

System Programmer Response: Determine the cause of the communication failure and have the problem fixed. DB2 periodically attempts to reestablish communication. If the problem cannot be fixed in a reasonable amount of time, call the database administrator. The participant might need to resolve the indoubt state manually in order to release locked resources.

Database Administrator Action: If the unit of work with LUWID=*luwid* is indoubt at 'location', inform the database administrator there that the logical unit of work with LUWID=*luwid* was aborted to assist in manual resolution of the indoubt thread at 'location'.

DSNL429I INCONSISTENT DDF LOG DATA, THE FIRST CONNECTION WITH EACH REMOTE LOCATION WILL BE A COLD START CONNECTION

Explanation: DB2 detected an inconsistency in the DB2 log during restart operations. Since the log is inconsistent and cannot be trusted, DB2 performs a cold start connection with each partner LU the next time a connection with that LU is attempted. If DB2 has indoubt resolution responsibility either as a coordinator or as a participant, then this information is lost as indicated by messages DSNL438 and/or DSNL439, which might follow this message. This means that:

- All information that DB2 maintained about having coordinator responsibility for remote participants was purged. These remote participants need manual resolution for any indoubt threads for which DB2 was the coordinator. A DSNL439I message is displayed for each indoubt remote participant.
- All information that DB2 maintained about having participant responsibility for remote coordinators was purged. A DSNL438I message is displayed for each database access thread that has a remote coordinator. If a database access thread remains indoubt at the end of restart, then the thread must be manually resolved. A -DISPLAY THREAD (*) TYPE(INDOUBT) LOCATION (*) command provides a report that lists the indoubt threads that need manual resolution.

This message is issued by the following CSECT: DSNLTECS

System Action: Processing continues normally.

System Programmer Response: Call the database administrator.

Database Administrator Action: See the DSNL438I and DSNL439I messages to determine what action to take.

DSNL432I DDF IS COORDINATOR FOR *nnnn* THREADS WITH *mmmm* INDOUBT REMOTE PARTNERS

Explanation: This message is issued when DDF is started or stopped, if DDF determines that this DB2 has coordinator responsibility for one or more indoubt threads with one or more partners. This is a summary status message.

nnnn	The number of indoubt threads for which DB2 is the coordinator
------	--

mmmm The number of remote partners where the threads are indoubt

This message is issued by the following CSECT: DSNLTIDM

System Action: Processing continues normally.

Operator Response: If the message was issued as a result of DDF starting, no action is necessary. If the message was issued as a result of DDF stopping, contact the database administrator.

Database Administrator Action: If the message was issued as a result of stopping DDF, then DB2 maintained all information necessary to perform automatic resynchronization with partner locations and resolve all indoubt units of work. Issue the START DDF command to initiate this process.

If the message was issued as a result of starting DDF, then DDF started automatic resynchronization.

DSNL433I DDF IS PARTICIPANT FOR *nnnn* INDOUBT THREADS WITH *mmmm* REMOTE PARTNERS

Explanation: This message is issued when DDF is started or stopped, if DDF determines that this DB2 has participant responsibility for one or more indoubt threads with one or more partners. This is a summary status message.

nnnn The number of indoubt threads for which DB2 is the participant

mmmm The number of remote partners that have coordinator responsibility

This message is issued by the following CSECT: DSNLTIDM

System Action: Processing continues normally.

Operator Response: If the message was issued as a result of DDF starting, no action is necessary. If the message was issued as a result of DDF stopping, contact the database administrator.

Database Administrator Action: If the message was issued as a result of stopping DDF, then DB2 maintained all information necessary to perform automatic resynchronization with partner locations and resolve all indoubt units of work. Issue the START DDF command to initiate this process.

If you do not want to perform automatic resynchronization, you can still resolve the indoubt units of work for which DB2 is a participant and which hold database resources locked. Use the DISPLAY THREAD command for type indoubt threads to produce a display that lists these threads. Then use the RECOVER INDOUBT command to either commit or abort these units of work.

To avoid data inconsistency, coordinate this manual resolution with the database administrators at the locations that have coordinator responsibility for each indoubt unit of work. If any of the indoubt units of work at DB2 also have coordinator responsibility for participant locations, then you should notify the database administrators at the participant locations of the commit or abort decision so they can make the same decision.

DSNL434E DDF NOT STARTED - INCORRECT VTAM RELEASE LEVEL

Explanation: The local VTAM release level is older than the minimum release level required by DB2. When DB2 issues the VTAM OPEN macro, the VTAM release level is returned to DB2. DB2 examines the VTAM release level to determine whether the local VTAM system provides the function required by DB2.

This message is issued by the following CSECT: DSNLVACB

System Action: The attempt to START DDF fails.

Operator Response: Call the system programmer.

System Programmer Response: Install a release of VTAM that is compatible with the DB2 system. The DB2 Program Directory identifies the required VTAM release level.

DSNL438I RESYNC STATUS PURGED FOR COORDINATOR *location*. LUWID=*luwid*, URID=*urid*, STATUS=*s* INFORMATION RECORDED IN TRACE RECORD WITH IFCID=235 and IFCID SEQUENCE NUMBER=*seq-no*

Explanation: The information related to resynchronization with the remote coordinator location for the logical unit of work identified by 'luwid', which is displayed in this message, is being purged by DB2. Automatic indoubt resolution responsibility for this distributed logical unit of work can no longer be performed.

This situation can arise in one of two ways;

- A DB2 conditional restart (other than a DB2 cold start; that is, a DB2 conditional restart with STARTRBA=ENDRBA) is being performed.
- An inconsistency in the DB2 log was detected during DB2 restart processing (indicated by a DSNL429I message).

This message is issued by the following CSECT: DSNLTECS

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<lu name>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

luwid The global logical unit of work id that identifies the logical unit of work.

urid The unit of recovery identifier. This is the RBA on the DB2 recovery log of the log record that marks the beginning of the logical unit of work. This is the earliest RBA required to process the logical unit of work during restart.

s Restart status of the logical unit of work. When DB2 came down, the logical unit of work was in one of these states:

- A INABORT: The logical unit of work was in the "must-complete" phase of abort, but abort has not yet completed.
- C INCOMMIT: The logical unit of work was in the "must-complete" phase of commit, but commit has not yet completed.
- D INDOUBT: The logical unit of work completed the first phase of commit, but DB2 has not yet received the commit or abort decision from the coordinator.

- F INFLIGHT: The logical unit of work has not yet completed the first phase of commit and should be backed out.
 - U UNKNOWN: The status of the logical unit of work is not known to DB2 because of conditional restart.
- seq-no The IFCID sequence number associated with the trace record. The trace record is written to statistics class 4, which is started to SMF as a default during DB2 installation. Statistics class 4 must be started to a permanent destination (SMF or GTF) for the trace record to be accessible. The sequence number is printed in hexadecimal.

This message is issued by the following CSECT: DSNLTECS

System Action: Processing continues normally.

System Programmer Response: Call the database administrator.

Database Administrator Action: The resynchronization information that was purged by DB2 is recorded in this message. To determine the proper commit or abort decision made by the coordinator at 'location', use the status code as follows:

- A The correct decision is to abort the logical unit of work.
- C The correct decision is to commit the logical unit of work.
- D Contact the database administrator at 'location' to determine the correct decision.
- F The correct decision is to abort the logical unit of work.
- U Contact the database administrator at 'location' to determine the correct decision.

DSNL439I RESYNC STATUS PURGED FOR PARTICIPANT *location*. **LUWID=***luwid*, **URID=***urid*, **STATUS=***s* **INFORMATION RECORDED IN TRACE RECORD WITH IFCID=235 and IFCID SEQUENCE NUMBER=***seq-no*

Explanation: DB2 is purging the information related to resynchronization with the remote participant location for the logical unit of work identified by 'luwid', which is displayed in this message. Automatic indoubt resolution responsibility for this distributed logical unit of work can no longer be performed.

This situation can arise in one of two ways:

- A DB2 conditional restart (other than a DB2 cold start; that is, a DB2 conditional restart with STARTRBA=ENDRBA) is being performed.
- An inconsistency in the DB2 log was detected during DB2 restart processing (indicated by a DSNL429I message).

location The field contains one of the following:

- The relational database name (location name)
- The VTAM LU name (<luname>)
- The dotted decimal IP address (nnn.nnn.nnn.nnn).

- luwid The global logical unit of work id that identifies the logical unit of work.
- urid The unit of recovery identifier. This is the RBA on the DB2 recovery log of the log record that marks the beginning of the logical unit of work. This is the earliest RBA required to process the logical unit of work during restart.
- s Restart status of the logical unit of work. When DB2 came down, the logical unit of work was in one of these states:
 - A INABORT: The logical unit of work was in the "must-complete" phase of abort, but abort has not yet completed.
 - C INCOMMIT: The logical unit of work was in the "must-complete" phase of commit, but commit has not yet completed.
 - D INDOUBT: The logical unit of work completed the first phase of commit, but DB2 has not yet received the commit or abort decision from the coordinator.
 - F INFLIGHT: The logical unit of work has not yet completed the first phase of commit and should be backed out.
 - U UNKNOWN: The status of the logical unit of work is not known to DB2 because of conditional restart.
- seq-no The IFCID sequence number associated with the trace record. The trace record is written to statistics class 4, which is started to SMF as a default during DB2 installation. Statistics class 4 must be started to a permanent destination (SMF or GTF) for the trace record to be accessible. The sequence number is printed in hexadecimal.

This message is issued by the following CSECT: DSNLTECS

System Action: Processing continues normally.

System Programmer Response: Call the database administrator.

Database Administrator Action: The resynchronization information that was purged by DB2 is recorded in this message. When communicating the proper commit or abort decision to the database administrator at 'location', use the status code as follows:

- A Abort the logical unit of work.
- C Commit the logical unit of work.
- D See the DSNL438I message produced for the same 'luwid' and 'urid' to determine the coordinator 'location'. Contact the database administrator at 'location' to determine the correct decision.
- F Abort the logical unit of work.
- U If there is a DSNL438I message for the same 'luwid' and 'urid', proceed as described above under 'D'. Otherwise, there might be information available on the DB2 log that a DSN1LOGP summary report can provide. If this is not successful, contact the IBM Support Center.

DSNL440I *csect-name* **RESET INDOUBT COMMAND SPECIFICATION IN ERROR**

Explanation: A RESET INDOUBT command was issued, but the specification of keywords or keyword parameter values was in error.

System Action: No indoubt information was purged. System processing continues normally.

User Response: One of the following errors was made in the RESET INDOUBT command specification:

- RESET INDOUBT was issued without any other keywords specified. At least one of the following keywords must also be specified: LUNAME, IPADDR, LOCATION, or LUWID.
- RESET INDOUBT was issued with both the LUWID and LOCATION keywords specified, but a list of LOCATION keyword parameter values was specified. When both the LUWID and LOCATION keywords are specified only one LOCATION keyword parameter value is allowed.
- RESET INDOUBT was issued with at least one LOCATION keyword parameter value that began with a '<', but did not end with a '>', or the length of the bracketed value was not 1 to 8 characters. When the LOCATION keyword parameter value is specified in the <luname> format, the luname value must be bracketed with '<' and '>' and be 1 to 8 characters long.
- RESET INDOUBT was issued with an invalid IPADDR keyword parameter value. Verify that the specified IPADDRs are in the proper dotted decimal form, that there is a colon delimiter between the IPADDR and port, and that the port number is valid.

If needed, issue the DISPLAY THREAD TYPE(INDOUBT) command to display information (including LOCATION, LUWID, and LUNAME values) about all indoubt threads. Correct the RESET INDOUBT command specification, and reissue the command.

DSNL441I **KEYWORD 'LUWID' PARAMETER VALUE**
parmvalue **FORMAT IN ERROR**

Explanation: A RESET INDOUBT command with the LUWID parameter was issued, but the specified parameter value (parmvalue) has an invalid format for an LUWID. There are two correct formats for the LUWID parameter. The first correct format is called a token, and is a 1 to 5 digit decimal number. The second correct format is 'netid.luname.luwnunique.comseq', where:

- netid A 1 to 8 character network ID
- luname A 1 to 8 character luname
- luwnunique A 12 character hexadecimal number
- comseq A 4 character hexadecimal number

All fields in the second correct format must be separated by a period (.) delimiter.

This message is issued by the following CSECT: DSNLTRSI

System Action: Indoubt information about the specified logical unit of work is not purged from the system.

User Response: To determine the correct LUWID value for the unit of work indoubt information that you want to purge, issue the DISPLAY THREAD TYPE(INDOUBT) command to display all units of work for which indoubt information exists.

Then reissue the RESET INDOUBT command, specifying the correct LUWID parameter value.

DSNL442I **QUALIFYING INDOUBT INFORMATION FOR LOCATION** *location* **NOT FOUND**

Explanation: A -RESET INDOUBT LOCATION('location') command was issued, but DB2 has no indoubt information about the specified location.

location The value specified after the LOCATION keyword in the RESET INDOUBT command.

This message is issued by the following CSECT: DSNLTRSI

System Action: No indoubt information was purged. System processing continues normally.

User Response: Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to list the locations for which DB2 has indoubt information. After determining the correct location, reissue the command.

DSNL443I **QUALIFYING INDOUBT INFORMATION FOR LUWID=***value* **NOT FOUND**

Explanation: A -RESET INDOUBT LUWID('value') command was issued where 'value' is either an luwid or the local token that represents an luwid. Either DB2 has no indoubt information about the specified luwid or token, or DB2 has indoubt information that cannot be purged using the -RESET INDOUBT command with the LUWID option.

value The global logical unit of work id or the local token that was specified for the LUWID keyword in the RESET INDOUBT command.

This message is issued by the following CSECT: DSNLTRSI

System Action: No indoubt information was purged. System processing continues normally.

User Response: Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to list the indoubt information known to DB2. If the -DISPLAY THREAD output does not include information about the specified luwid, then that is the reason the message was issued. If the -DISPLAY THREAD output does include information about the specified luwid, this information cannot be purged using the -RESET INDOUBT command with the LUWID option. Refer to the description of each message produced by the -DISPLAY THREAD output that relates to the specified luwid in order to determine how to proceed. After determining the correct luwid or token, reissue the command.

DSNL444I **QUALIFYING INDOUBT INFORMATION FOR LOCATION** *location* **HAS BEEN PURGED**

Explanation: A -RESET INDOUBT LOCATION('location') command issued to purge indoubt information about the named location completed successfully and the indoubt information was purged.

location Either the relational database name (location-name) or the logical unit name (<luname>) that was specified after the LOCATION keyword on the RESET INDOUBT command.

This message is issued by the following CSECT: DSNLTRSI

System Action: The specified indoubt information was purged. System processing continues normally.

DSNL445I QUALIFYING INDOUBT INFORMATION FOR LUWID *value* HAS BEEN PURGED

Explanation: A -RESET INDOUBT LUWID('value') command, which was issued to purge indoubt information about the specified luwid, completed successfully. The indoubt information was purged.

value The value specified for the LUWID keyword in the -RESET INDOUBT LUWID(value) command that is being processed.

This message is issued by the following CSECT: DSNLTRSI

System Action: System processing continues normally.

DSNL446I COLD START WILL BE PERFORMED WITH *nettype netvalue*

Explanation: A -RESET INDOUBT LUNAME('luname') FORCE or a -RESET INDOUBT IPADDR('ipaddr') FORCE command issued to force a cold start completed successfully. The next connection with 'luname' or 'ipaddr' is a cold start.

nettype Identifies the type of network used to access the remote site. There are two possible values:

LU -- indicates that VTAM is used to connect to the remote site.

IPADDR -- indicates that TCP/IP is used to connect to the remote site.

netvalue The network address of the remote location.

- If *nettype* is LU, *netvalue* specifies the VTAM LU name of the remote location.
- If *nettype* is IPADDR, *netvalue* specifies the dotted decimal IP address of the remote location.

This message is issued by the following CSECT: DSNLTRSI

System Action: System processing continues normally.

DSNL447I CANNOT DELETE ENTRY '*value*' BECAUSE THERE IS AN INDOUBT THREAD TO BE RESOLVED FIRST

Explanation: A -RESET INDOUBT command was issued with LUNAME(value), IPADDR(value), LOCATION(value), or LUWID(value). The 'value' is an LU name, an IP address, a location, or a LUWID (or its token), that identifies a logical unit of work for which DB2 has participant indoubt resolution responsibility, coordinator indoubt resolution responsibility, or both.

This message is issued by the following CSECT: DSNLTRSI

System Action: Resynchronization responsibility information was not purged. System processing continues normally.

User Response: Use the information in this section to determine the correct action to take. Then issue the proper command to perform that action.

The two most probable causes for the problem are that the -RESET INDOUBT command was issued with the wrong

parameters, or that an incorrect 'value' was specified. Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to display the indoubt information known to DB2.

1. If the intent was to purge participant or coordinator indoubt resolution responsibility, then examine the -DISPLAY THREAD output to determine the location name, or names, for which this responsibility is to be purged. Then use the -RESET INDOUBT LUNAME(luname) command with the FORCE option or the -RESET INDOUBT IPADDR(ipaddr) command with the FORCE option to purge this responsibility.

To determine the luname or IP address and resync port for an upstream coordinator that can be used with the FORCE option, look at the coordinator information from the DSNV408I message in the -DISPLAY THREAD output. There are two tokens associated with the coordinator information that are delimited by a colon (":").

- The first token is the partner location name or "<luname>" for an SNA connection, or the dotted decimal IP address for a TCP/IP connection (nnn.nnn.nnn.nnn).
- The second token is the partner LU name for an SNA connection, or the resync port number for a TCP/IP connection.

To determine the luname or IP address and resync port for downstream participants that can be used with the FORCE option, look at the location names from the DSNV450I and DSNV446I messages. There are two or three tokens associated with the participant location which are delimited by a colon (":").

- The first token is the partner location name.
- The second token is the partner LU name for an SNA connection, or the dotted decimal IP address for a TCP/IP connection (nnn.nnn.nnn.nnn).
- The third token only appears if the second token is an IP address in which case the third token is the partner resync port number.

See the description of the -RESET INDOUBT command in *Command Reference* for more information.

Remember that the FORCE option causes DB2 to purge all knowledge of indoubt resolution responsibility involving the luname or ipaddrspecified on the command.

Use caution when using the FORCE parameter to purge participant indoubt information when no errors are precluding automatic resolution. Normally, after the use of the RECOVER INDOUBT command, automatic resolution with the coordinator determines if heuristic damage occurred. This detection is lost if RESET INDOUBT is used before automatic resolution with the coordinator can be achieved.

Use caution when using the FORCE parameter to purge coordinator indoubt information when no errors are precluding automatic resolution. Once the information is purged, any participant that is indoubt is forced to use a heuristic decision process to resolve the indoubt logical unit of work.

2. Examine the -DISPLAY THREAD output. If the value specified in the command (and displayed in the DSNL447I message) is incorrect, determine the correct value and reissue the command using the correct value.

DSNL448I UNABLE TO FORCE COLD START WITH
nettype netvalue, **SESSION STILL EXISTS**

Explanation: A -RESET INDOUBT LUNAME('luname') FORCE or a -RESET INDOUBT IPADDR('ipaddr') FORCE command was issued to force a cold start, but network connections still exist between DB2 and the partner 'luname' or 'ipaddr'. The information related to this partner was not purged, so a cold start is not performed.

nettype Identifies the type of network used to access the remote site. There are two possible values:

LU -- indicates that VTAM is used to connect to the remote site.

IPADDR -- indicates that TCP/IP is used to connect to the remote site.

netvalue The network address of the remote location.

- If *nettype* is LU, *netvalue* specifies the VTAM LU name of the remote location.
- If *nettype* is IPADDR, *netvalue* specifies the dotted decimal IP address of the remote location.

This message is issued by the following CSECT: DSNLTRSI

System Action: System processing continues normally.

User Response: For SNA, you can use the VTAM command DISPLAY NET to determine the existence of sessions between two logical units. Terminate the sessions by using the VTAM command VARY NET,TERM to allow the RESET INDOUBT to occur. For TCP/IP, terminate all connections to the IP address. Determine the correct luname or ipaddr and reissue the command.

DSNL449I DB2 HAS NO INFORMATION RELATED TO
LUNAME *luname*

Explanation: A -RESET INDOUBT LUNAME('luname') FORCE command was issued but DB2 has no knowledge of the specified 'luname'.

luname The logical unit name, as defined to VTAM, of the coordinator or participant

This message is issued by the following CSECT: DSNLTRSI

System Action: No information was purged. System processing continues normally.

User Response: Determine the correct luname as follows:

- Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to determine locations for which DB2 has indoubt responsibility.
- Query the SYSIBM.LOCATIONS table to correlate a location name with an luname. The LINKNAME column contains the luname associated with the location name in the LOCATION column.

Then reissue the command, specifying the correct luname.

DSNL450I DDF THREAD *luwid=token* **IS BETWEEN**
PHASE 1 AND PHASE 2 OF COMMIT. THREAD
IS NOW AN INDOUBT THREAD AS A RESULT
OF CANCEL REQUEST.

Explanation: The identified DDF thread was in a prepared state waiting for the commit or backout decision of the commit coordinator. The thread cannot be canceled in this state. However, the thread was removed from the active state and placed into the indoubt state. The conversation with the coordinator was deallocated. The thread is now indoubt and appears in the display thread report for indoubt threads. The resources held by the thread continue to be held. Automatic resolution of the indoubt state is attempted periodically. Resources held by the thread are released after indoubt resolution occurs.

luwid=token The global logical unit of work id and the local token that identify the thread

This message is issued by the following CSECT: DSNLTPDI

System Action: Processing continues normally.

Operator Response: If the purpose of canceling this thread was to free the resources held by the thread, call the database administrator.

Database Administrator Action: To release the resources held by the indoubt thread before automatic resolution with the coordinator, a manual commit or abort decision can be made with the RECOVER INDOUBT command. First, issue the DISPLAY THREAD command for an indoubt thread report, which includes the subject thread. From this report, determine the name of the coordinator. Contact the coordinator system and find out whether a commit or abort decision was made.

DSNL451I QUALIFYING INDOUBT INFORMATION FOR
LUNAME *luname* **NOT FOUND**

Explanation: A -RESET INDOUBT LUNAME('luname') command was issued, but DB2 has no indoubt information about the specified luname.

luname The logical unit name, as defined to VTAM, of the coordinator or participant

This message is issued by the following CSECT: DSNLTRSI

System Action: No indoubt information was purged. System processing continues normally.

User Response: Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to list the locations for which DB2 has indoubt information. Entries associated with a particular LUNAME have a location name in this form: '<luname>'. Use 'luname' (without the enclosing brackets) as the input string to RECOVER INDOUBT.

After determining the correct luname, reissue the command.

DSNL452I QUALIFYING INDOUBT INFORMATION FOR
LUNAME *luname* **HAS BEEN PURGED**

Explanation: A -RESET INDOUBT LUNAME('luname') command, which was issued to purge indoubt information about the specified luname completed successfully. The indoubt information was purged.

luname The luname specified for the LUNAME keyword in the -RESET INDOUBT LUNAME(luname) command being processed.

This message is issued by the following CSECT: DSNLTRSI

System Action: The specified indoubt information was purged. System processing continues normally.

DSNL453I *csect* **QUALIFYING INDOUBT INFORMATION FOR IP ADDRESS *ipaddr* NOT FOUND**

Explanation: A -RESET INDOUBT IPADDR('ipaddr') command was issued, but DB2 has no indoubt information about the specified IP address.

csect The CSECT name of the DB2 module that issued the message
ipaddr The dotted decimal IP address of the coordinator or participant

This message is issued by the following CSECT: DSNLTRSI

System Action: No indoubt information was purged. System processing continues normally.

User Response: Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to list the locations for which DB2 has indoubt information. Entries associated with TCP/IP have a string with this format in the LOCATION field: "nnn.nnn.nnn.nnn".

After determining the correct *ipaddr*, reissue the command.

DSNL454I *csect* **QUALIFYING INDOUBT INFORMATION FOR IP ADDRESS *ipaddr* HAS BEEN PURGED**

Explanation: A -RESET INDOUBT IPADDR('ipaddr') command, which was issued to purge indoubt information about the specified IP address completed successfully. The indoubt information was purged.

csect The CSECT name of the DB2 module that issued the message
ipaddr The IP address specified for the IPADDR keyword in the -RESET INDOUBT IPADDR(*ipaddr*) command being processed

This message is issued by the following CSECT: DSNLTRSI

System Action: The specified indoubt information was purged. System processing continues normally.

DSNL455I *csect* **DB2 HAS NO INFORMATION RELATED TO IP ADDRESS *ipaddr***

Explanation: A -RESET INDOUBT IPADDR('ipaddr') FORCE command was issued but DB2 has no knowledge of the specified 'ipaddr'.

csect The CSECT name of the DB2 module that issued the message.
ipaddr The dotted decimal TCP/IP address of the coordinator or participant

This message is issued by the following CSECT: DSNLTRSI

System Action: No information was purged. System processing continues normally.

User Response: Determine the correct luname as follows:

- Use the -DISPLAY THREAD(*) TYPE(INDOUBT) LOCATION(*) command to determine locations for which DB2 has indoubt responsibility. Entries associated with TCP/IP locations specify "nnn.nnn.nnn.nnn" in the LOCATION field.

Reissue the command; specify the correct *ipaddr*.

DSNL500I **CONVERSATION FAILED TO LOCATION=*locname***
RESOURCE=*luname.modename. convid.sessid*
RTNCD=*global vtam primary return code*
FDBK2=*global vtam secondary return code*
RCPRI=*appc-specific primary return code*
RCSEC=*appc-specific secondary return code*
SENSE=*sna sense code*

Explanation: An advanced program-to-program communications (APPC) conversation failed, or could not be allocated, because a VTAM return code indicates a conversation failure. VTAM return codes are defined in *VTAM for MVS/ESA Programming for LU 6.2*.

SNA sense codes that start with 00 represent DB2 reason codes. Refer to "Section 6. SNA Codes" on page 6-1 for a description of more common SNA sense codes returned to DB2 by VTAM.

The variables that are not return codes are described as follows:

Variable	Description
<i>locname</i>	The location name associated with the remote site.
<i>luname</i>	The VTAM LU name associated with the remote location.
<i>modename</i>	The logon mode used by DB2 to allocate the conversation.
<i>convid</i>	The conversation identifier given DB2 by VTAM when the conversation was allocated.
<i>sessid</i>	The session identifier given DB2 by VTAM when the conversation was allocated.

This message is issued by the following CSECT: DSNLVRPL

System Action: Communication on the conversation is discontinued.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming for LU 6.2* for failure analysis or "Section 4. DB2 Codes" on page 4-1 for information on reason codes.

DSNL501I **CNOS PROCESSING FAILED FOR LU *luname* AND MODE *modename***
RTNCD=*global vtam return code*
FDBK2=*global vtam secondary return code*
RCPRI=*appc-specific primary return code*
RCSEC=*appc-specific secondary return code*
SENSE=*vtam sense code*

Explanation: A failure occurred while attempting to negotiate limits with the specified location for a LU and mode. VTAM return codes are described in *VTAM for MVS/ESA Programming for LU 6.2*. VTAM sense codes that start with 00 represent DB2 reason codes.

The variables are described as follows:

Variable	Description
<i>luname</i>	The VTAM LU name associated with the remote location.
<i>modename</i>	The logon mode used by DB2 to allocate the conversation.

This message is issued by the following CSECT: DSNLVCNS

System Action: All communication to the remote location fails until the limits can be negotiated with the remote location.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming for LU 6.2* for failure analysis or "Section 4. DB2 Codes" on page 4-1 for information on reason codes.

DSNL502I *csect-name* **SYSTEM CONVERSATION FAILED TO LOCATION** *locname*
RESOURCE=*luname.modename. convid.sessid*
RTNCD=*global vtam primary return code*
FDBK2=*global vtam secondary return code*
RCPRI=*appc-specific primary return code*
RCSEC=*appc-specific secondary return code*
SENSE=*sna sense code*

Explanation: A system conversation failed, or could not be allocated, because VTAM returned a nonzero return code. VTAM return codes are defined in *VTAM for MVS/ESA Programming for LU 6.2*.

SNA sense codes that start with 00 represent DB2 reason codes. Refer to "Section 6. SNA Codes" on page 6-1 for a description of more common SNA sense codes returned to DB2 by VTAM.

The variables are described as follows:

Variable	Description
locname	The location name associated with the remote site.
luname	The VTAM LU name associated with the remote location.
modename	The logon mode used by DB2 to allocate the conversation.
convid	The conversation identifier given DB2 by VTAM when the conversation was allocated.
sessid	The session identifier given DB2 by VTAM when the conversation was allocated.

This message is issued by the following CSECT: DSNLVRPL

System Action: Communication on the conversation is not allowed.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *VTAM for MVS/ESA Programming for LU 6.2* for failure analysis or "Section 4. DB2 Codes" on page 4-1 for information on reason codes.

DSNL504I *csect-name* **RESOURCE UNAVAILABLE REASON**=*reason*
TYPE=*type* **LOCATION**=*location* **NAME**=*name*

Explanation: The requested function requires a resource that is currently unavailable. The reason code, type, location, and name identifies the resource.

Operator Response: Note the reason, type codes, location, and name.

Problem Determination: The reason for the resource's unavailability is identified by the reason code. The reason codes that appear in this message are described in "Section 4. DB2 Codes" on page 4-1. Refer to Table 3 in "Appendix B.

Problem Determination" on page X-5 for an explanation of resource type codes.

DSNL510I *csect-name* **CONVLIMIT NEGOTIATED FROM x TO y WITH LOCATION** *locname* **FOR LU** *luname* **AND MODE** *modename*

Explanation: The maximum conversation limit is changed for a mode with a remote subsystem. The limit might change when a CNOS request is received from or sent to a remote subsystem, and the limit is determined by VTAM.

x	The most recent value of CONVLIMIT before the last CNOS request was processed by advanced program-to-program communications (APPC)/VTAM for the specified mode name to the specified location.
y	The current value of CONVLIMIT for the specified mode name to the specified location.
locname	The location name associated with the remote site that sent the CNOS request to the local DB2 subsystem, or received the CNOS request from the local DB2 subsystem.
luname	The VTAM LU name associated with the remote location that had its CONVLIMIT changed.
modename	The logon mode for the specified location that had its CONVLIMIT changed.

This message is issued by the following CSECTS: DSNLVCNS, DSNLVPCS

System Action: Conversation requests are queued when the maximum conversation limit is reached for a mode to remote subsystem.

DSNL511I *csect* **TCP/IP CONVERSATION FAILED TO LOCATION** *locname* **IPADDR**=*ipaddr* **PORT**=*port* **SOCKET**=*socket* **RETURN CODE**=*'rc'X* **REASON CODE**=*'reason'X*

Explanation: A TCP/IP socket call failed with the error condition identified by *rc* and *reason*.

Variable	Description
csect	The CSECT name of the DB2 module that issued the message.
locname	The location name associated with the remote site.
ipaddr	The IP address of the remote site in dotted decimal format.
port	The TCP/IP port used by the remote site.
socket	The TCP/IP socket call that returned the error.
rc	The error condition reported by TCP/IP. The return code values are documented in <i>OS/390 OpenEdition Messages and Codes</i> .
reason	Provides further detail associated with the TCP/IP return code. The reason code values are documented in <i>OS/390 OpenEdition Messages and Codes</i> .

This message is issued by the following CSECT: DSNLxxxx

System Action: Communication on the conversation is discontinued.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *MVS/ESA Application Development Reference: Assembler Callable Services for OpenEdition MVS* for an explanation of the error.

Problem Determination: See System Programmer Response.

DSNL512I *csect* TCP/IP socket FAILED WITH RETURN CODE=*rc*X AND REASON CODE=*reason*X

Explanation: A TCP/IP socket call used to establish communication between DB2 and TCP/IP failed.

Variable	Description
csect	The CSECT name of the DB2 module that issued the message.
socket	The name of the TCP/IP socket call that failed.
# rc	The return code reported by TCP/IP. The return code values are documented in <i>OS/390 OpenEdition Messages and Codes</i> .
# reason	The reason code reported by TCP/IP. The reason code values are documented in <i>OS/390 OpenEdition Messages and Codes</i> .

This message is issued by the following CSECT: DSNLxxxx

System Action: DB2 retries the socket call periodically, so that TCP/IP communication can be reestablished.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *OS/390 OpenEdition Messages and Codes* for an explanation of the error. If you receive the message "SETRLIMIT FAILED" with reason code=1148033C, then you should define DB2 as a superuser. See *Installation Guide* for instructions on enabling DDF as a superuser.

Problem Determination: See System Programmer Response.

DSNL513I *csect* TCP/IP GETHOSTBYNAME FAILED WITH ERRNO=*errno* FOR DOMAIN *domain*

Explanation: DB2 encountered a TCP/IP gethostbyname socket call error when attempting to convert a TCP/IP domain name into an IP address.

Variable	Description
csect	The CSECT name of the DB2 module that issued the message.
errno	The error condition reported by TCP/IP. The <i>errno</i> values are documented in <i>IBM TCP/IP for MVS: Application Programming Reference</i> .
domain	The TCP/IP domain name that DB2 wants to convert into an IP address. DB2 obtains the <i>domain</i> value from the IPADDR

column of the SYSIBM.IPNAMES communications database table.

This message is issued by the following CSECT: DSNLxxxx

System Action: The row in SYSIBM.IPNAMES containing the specified *domain* in the IPADDR column is invalid. If the error occurs during DDF startup, the row in SYSIBM.IPNAMES is ignored. If the error occurs during an SQL statement, the SQL statement fails and the location associated with the SYSIBM.IPNAMES row is not available for TCP/IP communication.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *IBM TCP/IP for MVS: Application Programming Reference* for an explanation of the error. Correct the IPADDR column value in SYSIBM.IPNAMES or register the *domain* with TCP/IP.

Problem Determination: See System Programmer Response.

DSNL514I *csect-name* TCP/IP SERVICE *serv* IS NOT DEFINED

Explanation: The TCP/IP getservbyname socket call did not find a matching definition for *serv*.

Variable	Description
serv	The TCP/IP service name that DB2 wants to convert into a TCP/IP port number. DB2 obtains the service name from the PORT column of the SYSIBM.LOCATIONS communication database table.

System Action: The row in SYSIBM.LOCATIONS containing the specified service name in the PORT column is invalid. The associated LOCATION cannot be used for TCP/IP communication. If the error occurs during an SQL statement, the SQL statement fails.

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: If the value specified by *serv* is incorrect, correct the PORT column value in SYSIBM.LOCATIONS.

If the value specified by *serv* is correct, register the service name with TCP/IP.

TCP/IP service names are case sensitive, so make sure that the PORT column in SYSIBM.LOCATIONS is an exact match for the service name defined to TCP/IP.

Problem Determination: See System Programmer Response.

DSNL515I *csect* TCP/IP BIND FOR PORT *port* FAILED WITH RETURN CODE=*rc*X AND REASON CODE=*reason*X

Explanation: DB2 encountered an error on the TCP/IP bind socket call while attempting to register a TCP/IP port number with the TCP/IP instance.

Variable	Description
csect	The CSECT name of the DB2 module that issued the message.

port The TCP/IP port number DB2 wants to register with the TCP/IP instance.

rc The return code reported by TCP/IP. The return code values are documented in *OS/390 OpenEdition Messages and Codes*.

reason The reason code reported by TCP/IP. The reason code values are documented in *OS/390 OpenEdition Messages and Codes*.

This message is issued by the following CSECT: DSNLxxxx

System Action: If this error occurs for the TCP/IP port used for incoming DRDA requests, the error is probably caused by DB2 restarting on a CEC that already has another DB2 subsystem using the DRDA port number. DB2 will continue to try to activate the TCP/IP port number periodically.

If this error occurs for the DRDA resynchronization port, DB2 invokes internal processing that is equivalent to STOP DDF MODE(FORCE).

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to *MVS/ESA Application Development Reference: Assembler Callable Services for OpenEdition MVS* for an explanation of the error.

Define DB2's TCP/IP port number to the TCP/IP instance, or use the change log izxentry utility to correct the TCP/IP port number used by DB2.

Problem Determination: See System Programmer Response.

DSNL516I *csect-name* TCP/IP SERVICES NOT AVAILABLE CEEPIPI ROUTINE Language Environment CANNOT BE LOADED.

Explanation: DB2 must load the Language Environment interface module (CEEPIPI) to process TCP/IP socket calls. If the CEEPIPI module is not included in an accessible data set such as STEPLIB data sets or the LPA library, DDF is unable to call Language Environment to process TCP/IP socket requests.

System Action: DDF startup continues, but DDF users cannot use TCP/IP to communicate with other network locations.

System Programmer Response: Add the Language Environment library to the DDF STEPLIB concatenation. The Language Environment library must be APF authorized when it appears in the DDF STEPLIB concatenation.

Problem Determination: Collect the following diagnostic item listed in "Appendix B. Problem Determination" on page X-5: 1.

DSNL517I *csect-name* CEEPIPI *func* SERVICE FAILED WITH RETURN CODE=*rc*

Explanation: DB2 uses the Language Environment CEEPIPI service to issue certain TCP/IP socket calls. The Language Environment return code *rc* was not expected for the indicated Language Environment function call.

func The function requested by DB2. Possible values are:

add_entry Add an entry to the Language Environment PIP table dynamically.

call_sub Run a program that issues a TCP/IP socket call using an existing Language Environment run time environment.

del_sub Delete an entry from the Language Environment PIP table dynamically.

init_sub Create Language Environment sub run time environment.

term Terminate the Language Environment run time environment.

rc The return code received from CEEPIPI.

System Action: The attempt to issue the LE/370 request fails.

If this message is issued during DDF startup, DDF startup continues.

If this message is issued during an SQL statement, a -904 SQLCODE is returned to the calling application.

System Programmer Response: The Language Environment return codes from CEEPIPI are documented in *Language Environment for MVS & VM Programming Guide*.

Problem Determination: Collect the following diagnostic item listed in "Appendix B. Problem Determination" on page X-5: 1.

DSNL518I *csect-name* LE/370 ENCLAVE FAILED WITH RETURN CODE=*erc* AND FEEDBACK=*fi*

Explanation: DB2 uses the Language Environment CEEPIPI call_sub service to execute certain TCP/IP socket calls. The CEEPIPI interface returned information indicating a failure occurred while executing the TCP/IP socket.

erc The Language Environment enclave return code.

fi Contains one or two message identifiers. The message identifiers are constructed from the Language Environment condition token.

The message identifiers are constructed as follows:

- Single message: Facility_Id combined with Msg_No
- Two messages: Facility_Id combined with Class_Code and Facility_Id combined with Cause_Code

System Action: The SQL statement fails with SQLCODE -904.

System Programmer Response: A description of the Language Environment enclave return code and the condition token are documented in *Language Environment for MVS & VM Programming Guide*.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1. 4.

DSNL519I *csect* TCP/IP SERVICES AVAILABLE FOR PORT *tcpport*

Explanation: DB2 encountered a TCP/IP failure during DDF startup processing. The DSNL515I message identifies the cause of the failure. After the failure is detected, DDF periodically attempts to reinitialize TCP/IP to allow remote connections. This message is issued when reinitialization is successful.

Variable	Description
csect	The CSECT name of the DB2 module that issued the message.
domain	The TCP/IP port number used by this DB2 subsystem to accept incoming DRDA connection requests.

System Action: The DB2 TCP/IP port number is available to accept incoming DRDA connection requests.

DSNL520I *csect* TCP/IP SERVICES AVAILABLE FOR RESPORT *port*

Explanation: DB2 encountered a TCP/IP failure during DDF startup processing. The DSNL515I message identifies the cause of the failure. After the failure is detected, DDF periodically attempts to reinitialize TCP/IP to allow TCP/IP resynchronization to occur. This message is issued when reinitialization is successful.

Variable	Description
csect	The CSECT name of the DB2 module that issued the message.
port	The TCP/IP port number used by this DB2 subsystem to accept incoming resynchronization connection requests.

System Action: The DB2 TCP/IP port is available to accept incoming resynchronization connection requests.

DSNL521I *csect-name* INVALID DDF BSDS VALUES DETECTED (PORT=*port*,RESPORT=*rport*).

Explanation: DB2 encountered invalid values for the TCP/IP port numbers in the DDF record of the BSDS. Valid TCP/IP port numbers must obey the following rules:

- If PORT is non-zero, RESPORT must also be non-zero.
- If RESPORT is non-zero, PORT must also be non-zero.
- PORT and RESPORT must not specify the same value.

Variable	Description
port	The TCP/IP port number used by this DB2 subsystem to accept incoming DRDA SQL connection requests.
rport	The TCP/IP port number used by this DB2 subsystem to accept incoming 2-phase commit resynchronization requests.

System Action: DDF startup terminates abnormally.

System Programmer Response: Use the Change Log Inventory utility (DSNJU003) to correct the TCP/IP port numbers used by DB2.

DSNL522I *csect-name* REQUIRED TCP/IP SUPPORT NOT AVAILABLE

Explanation: The DB2 BSDS indicated that TCP/IP access was required, but the required TCP/IP interfaces were not available on this system. The required TCP/IP interfaces are provided by OS/390 Release 3.

System Action: DDF startup terminates abnormally.

System Programmer Response: Take one of the following actions:

- Install OS/390 Release 3 or later, so that the required TCP/IP interfaces are available.
- Use the Change Log Inventory utility (DSNJU003) to deactivate DB2's TCP/IP support, by specifying PORT=0 and RESPORT=0 on the DDF statement.

DSNL600I RESOURCE UNAVAILABLE CORRELATION ID=*correlation-id* CONNECTION ID=*connection-id* LUW ID=*luw-id=token* REASON=*reason-code* TYPE=*resource-type* LOCATION=*location-name* NAME=*resource-name*

Explanation: This message is produced at the requesting site when a distributed request requires a resource that is not available.

The resource identified by 'resource-name' and 'resource-type' was not available at 'location-name' due to the indicated reason code.

correlation-id	The correlation identifier of the thread associated with the requester of the resource. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.
connection-id	The connection identifier of the requester.
luw-id=token	The logical unit of work ID of the thread followed by an '=' sign and a token which may be used in place of luw-id in any DB2 command that accepts luw-id as input.

Refer to message DSNT500I under "DSNT... Messages" on page 3-201 for an explanation of the resource type and resource name.

This message is issued by the following CSECT: DSNLXQUR

System Action: The SQL statement cannot be executed.

Operator Response: See Problem Determination.

Problem Determination: The reason the resource is unavailable is identified by the reason code. The reason codes are described in "Section 4. DB2 Codes" on page 4-1. Collect the information described for the reason code received.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1.

DSNL700I *csect-name* **CDB RESOURCE UNAVAILABLE, DEFAULTS MAY BE USED REASON=*reason* TYPE=*type* NAME=*name***

Explanation: This message indicates that a requested function required the CDB which is currently unavailable. Defaults can be used to allocate conversations or set conversation limits with VTAM and TCP/IP partners.

This message is issued by the following CSECTs: DSNLVCLM, DSNLVXID, and DSNLVCIP.

System Action: If the SYSIBM.MODESELECT table is unavailable, VTAM defaults are used to allocate conversations. If the the SYSIBM.LUMODES table is unavailable, VTAM defaults can be used for conversation limits. If the SYSIBM.LOCATIONS, SYSIBM.IPNAMES, SYSIBM.LULIST, or SYSIBM.LUNAMES tables are unavailable, conversations can not be allocated to remote LOCATIONS.

Operator Response: Note the REASON code, the TYPE code, and the NAME. See Problem Determination section for an explanation of the collected data.

Problem Determination: The reason the resource is unavailable is identified by a reason code. The reason codes that appear in this message are described in "Section 4. DB2 Codes" on page 4-1. Use the table defined for message DSNT500I to find the TYPE of resource identified in the message.

DSNL701I **CDB OBJECT *object-name* DOES NOT EXIST**

Explanation: The communications database (CDB) does not contain *object-name*. The incorrect *object-name* can be the database name, the table space name, or the table name.

This message is issued by the following CSECT: DSNLVVDB

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine what caused the failure, define the object as required, and issue the -START DDF command.

Problem Determination: Print the definition of the communications database (CDB).

DSNL702I **CDB TABLE *table-name* DOES NOT HAVE PROPER COLUMN DEFINITIONS, COLUMN *column-name* IS MISSING OR INCORRECTLY DEFINED**

Explanation: The communications database (CDB) needs a definition for '*column-name*' in '*tablename*'. The current definition is missing or incorrect.

This message is issued by the following CSECT: DSNLVVDB

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine what caused the failure, define the column as required, and issue the -START DDF command.

Problem Determination: Print the definition of the communications database (CDB).

DSNL703I **CDB TABLE *table-name* DOES NOT HAVE PROPER INDEX DEFINITIONS, INDEX *index-name* IS MISSING OR INCORRECTLY DEFINED**

Explanation: The communications database (CDB) requires an index name for *table-name*. The current definition is missing or incorrect.

This message is issued by the following CSECT: DSNLVVIX

System Action: The distributed data facility (DDF) terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Define the index as required and issue the -START DDF command. Refer to Section 3 of *Installation Guide*.

Problem Determination: Print the definition of the communications database (CDB).

DSNL704I **CDB OBJECT *object-name* DOES NOT HAVE PROPER REFERENTIAL CONSTRAINT DEFINITIONS**

Explanation: The communications database (CDB) requires referential constraint definitions for '*object-name*'. The current definition is missing or incorrect.

This message is issued by the following CSECT: DSNLVVIX

System Action: Termination of the distributed data facility (DDF) is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Determine what caused the failure, define the missing referential constraint, and issue the -START DDF command. Refer to Section 3 of *Installation Guide*.

Problem Determination: Print the definition of the communications database (CDB).

DSNL705I **CDB IS UNAVAILABLE OR INCORRECTLY DEFINED**

Explanation: During start-up of the distributed data facility, the required CDB was unavailable or incorrectly defined.

This message is issued by the following CSECT: DSNLVACB

System Action: Termination of the DDF is initiated.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to the previous message that specifies the cause of the CDB failure (DSNL700I, DSNL701, DSNL702I, DSNL703I, or DSNL704I). Determine what caused the failure, fix the error condition, and issue the -START DDF command.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1.

DSNL706I *csect-name* **AN ERROR HAS OCCURRED IN DDF EXIT ROUTINE *routine***

Explanation: An error occurred following invocation of a DDF exit routine by DB2.

The variable "routine" is the name of the exit routine, DSNLHLIX, invoked by DB2.

System Action: The system abends the failing database-access agent.

DSNM... Messages

All of the DSNM... messages are sent to the IMS master terminal operator (MTO), and to the appropriate MVS console.

DSNM001I IMS/TM xxxx CONNECTED TO SUBSYSTEM yyyy

Explanation: This is an information message only. The control region of the IMS/TM system specified in the message as 'xxxx' has successfully connected to the DB2 subsystem specified in the message as 'yyyy'. The message is sent to the IMS/TM master terminal operator.

This message is issued by the following CSECT: DSNMID00

System Action: IMS/TM transactions can access DB2 resources.

DSNM002I IMS/TM xxxx DISCONNECTED FROM SUBSYSTEM yyyy RC=rc

Explanation: The IMS/TM system named 'xxxx' control region has disconnected from the DB2 subsystem named 'yyyy' for the RC, reason code, of 'rc'. The message is sent to the IMS/TM master terminal operator. The reason code values are:

Value	Description
A	IMS/TM is terminating normally (for example, /CKPT FREEZE command).
B	IMS/TM is terminating abnormally.
C	DB2 is terminating in a quiesce fashion (for example, DB2 stop quiesce command).
D	DB2 is terminating abnormally.
E	The connection between IMS/TM and the DB2 subsystem is terminating; however, both subsystems remain operational.

This message is issued by the following CSECT: DSNMINIT

System Action: The connection between IMS/TM and DB2 terminated. IMS/TM transactions can no longer access DB2 resources.

Operator Response: Notify the system programmer.

System Programmer Response: Reason code A, C, or E makes this an information message. Reason code D indicates that a serious problem occurred in the DB2 subsystem, and that the SYS1.LOGREC should be examined. For reason code B or D, determine the failing subcomponent, and if you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: SYS1.LOGREC and/or dump information may be available for reason codes B and D.

DSNM003I IMS/TM xxxx FAILED TO CONNECT TO SUBSYSTEM yyyy RC=rc

Explanation: The IMS/TM system (named 'xxxx') control region did not connect to the DB2 subsystem (named 'yyyy'). This message is sent to the IMS/TM master terminal operator. The return code 'rc' indicates the reason for the failure.

Value	Description
-------	-------------

00	The DB2 subsystem is not operational. However, a notify message has been queued and, when the DB2 subsystem is started, it will automatically connect to IMS/TM.
04	The connection attempt failed between IMS/TM and the DB2 subsystem.

This message is issued by the following CSECT: DSNMID00

System Action: IMS/TM transactions cannot access DB2 resources.

Operator Response: For return code 00, start the DB2 subsystem. For return code 04, notify the system programmer.

System Programmer Response: For return code 04, refer to Section 4 (Volume 1) of *Administration Guide* for failure analysis procedures.

Problem Determination: For return code 04, an IMS/TM attachment facility snap record (code X'5501FF') is written to the IMS/TM log to indicate the reason for the failure.

DSNM004I RESOLVE INDOUBT ENTRY(S) ARE OUTSTANDING FOR SUBSYSTEM xxxx

Explanation: The DB2 subsystem ID of 'xxxx' has 'indoubt' entry(s) remaining after the IMS/TM subsystem has attempted to resolve the work units that are indoubt. This message is sent to the IMS/TM master terminal operator.

This message is issued by the following CSECT: DSNMRI00

System Action: The connection between the DB2 and IMS/TM subsystems remains active, and applications can access DB2 resources.

Operator Response: Notify the system programmer.

System Programmer Response: Refer to Section 4 (Volume 1) of *Administration Guide* for failure analysis procedures. DB2 commands (DISPLAY THREAD and RECOVER INDOUBT) may be used to display and resolve the work unit(s) that are indoubt.

Problem Determination: Recovery information is available on the DB2 log and IMS/TM log to assist in the resolution of the work unit(s) indoubt. For each indoubt work unit, an IMS/TM attachment facility snap record (code X'5501FE') is written to the IMS/TM log.

**DSNM005I IMS/TM RESOLVE INDOUBT PROTOCOL
PROBLEM WITH SUBSYSTEM xxxx**

Explanation: The DB2 subsystem ID of 'xxxx' has protocol incompatibilities with IMS/TM. The DB2 resolve indoubt process received an unknown or invalid recovery request (RRE) from IMS/TM. The request was rejected by DB2 and kept by IMS/TM. The message is sent to the IMS/TM master terminal operator.

This message is issued by the following CSECT: DSNMRI00

System Action: The connection between the DB2 and IMS/TM subsystems remains active, and applications can access DB2 resources.

Operator Response: Notify the system programmer.

System Programmer Response: Call the support center after extracting from the IMS/TM log the IMS/TM attachment facility snap records (code X'5501FE') using the IMS/TM utility DFSERA10.

These records contain the complete request from IMS/TM to DB2, the request type is at offset X'01C', this is a four-character identifier which should contain any of the following words:

'SHOW', 'IDBT', 'COMM', or 'ABRT'.

If the IMS/TM recovery request (RRE) found in the log is an invalid one, (not 'COMM' or 'ABRT'), you may manually delete it using the IMS/TM/CHANGE SUBSYS RESET command after consulting with the support center.

If the IMS/TM request is a valid one (abort or commit), you must find the action that IMS/TM performed for that RRE by locating the X'3730' (commit) or X'3801' (abort) record in the IMS/TM log and perform the same action under DB2 by using the -RECOVER INDOUBT command. Also refer to Section 4 (Volume 1) of *Administration Guide* for more information about resolve-indoubt failure analysis.

Problem Determination: Recovery information is available on the DB2 log and IMS log to assist in the resolution of the

problem. For each indoubt work unit, an IMS/TM attachment facility snap record (code X'5501FE') is written to the IMS/TM log.

DSNM100I SUBSYSTEM xxxx NOT AVAILABLE

Explanation: The IMS/TM command facility which routes commands to the DB2 subsystem cannot perform its functions because the DB2 subsystem named 'xxxx' is considered not operational.

This message is issued by CSECT: DSNMCMD0

System Action: The connection to the DB2 subsystem failed for the command. The command is rejected.

System Programmer Response: If the DB2 subsystem is operational, and if you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem. The person entering the request may not be authorized to execute the command. If the DB2 subsystem is not operational, DB2 commands from IMS/TM cannot be processed.

Problem Determination: A snap record (X'5501FF') is written to the IMS/TM log if a connection request failed.

DSNM104I xxxx COMMAND FAILED

Explanation: The DB2 command specified by 'xxxx' failed to complete.

System Action: The command terminated without providing an output message. Commands will still be allowed by the IMS/TM attachment facility.

This message is issued by CSECT: DSNMCMD0

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: If the command failed because of anabend, a snap record (X'5501FF') is written to the IMS/TM log and SYS1.LOGREC information is available.

DSNN... Messages

**DSNN40 THE NUMBER YOU SELECTED IS NOT A
VALID SQL RETURN CODE NUMBER**

Explanation: The user looking at the SQL Return Codes Menu in DB2 HELP selected a number that is not a valid SQL return code.

This message is issued by the following CSECT: DSN4SRC

System Action: The SQL Return Codes Menu continues to be displayed.

User Response: Select a valid SQL return code number, and try again.

Operator Response: Select a valid SQL return code number, and try again.

DSNP... Messages

The DSNP-prefixed messages contain a connection ID, a correlation ID, and a logical-unit-of-work ID. Messages that have the same connection ID, correlation ID, and logical-unit-of-work ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

DSNP001I *csect – data-set-name* **IS WITHIN** *nk* **BYTES OF AVAILABLE SPACE. RC=rrrrrrr**
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: This message warns of an impending space shortage. The data space manager (DSM) extend function CSECT 'DSNPmmmm' detected the space shortage through the use of a 'hedge' quantity 'n'. Reason code 'rrrrrrr' gives some information about why space could not be obtained. (See "Section 4. DB2 Codes" on page 4-1.)

There might also be some preceding DSM and VSAM messages that can help to determine why space cannot be obtained. The connection, correlation, and logical-unit-of-work IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

This message is issued by the following CSECT: DSNPXTN0

System Action: If sufficient space is available for the current request, continue. Otherwise, message DSNP007I follows, and the current SQL request fails.

Operator Response: DSM messages are directed to the database administrator (DBA) or system administrator. However, the DBA or system administrator can request that the operator issue an MVS WRITELOG operator command (for example, 'W A') to obtain MVS SYSLOG output. The SYSLOG sometimes contains media manager messages that might be helpful to the DBA or system administrator in determining why space could not be allocated.

System Programmer Response: Based on the reason code (RC) in the message, as well as information that might be available in access method services or VSAM messages preceding this one, try one of the following:

- If you do not anticipate further extension of this table space or index, ignore the message.
- If the table space or index is backed by storage group-defined data sets and this data set is not at maximum

(123) extents, use the ALTER STOGROUP statement to add volumes to the storage group (up to 133 of them).

- If the table space or index is backed by 'user-defined' data sets, and not at maximum (123) extents for the data set, issue an ALTER ADDVOLUMES access method services command to provide additional volumes (up to 133 of them). Or, if the table space is nonpartitioned and the high allocated RBA is greater than or equal to 2GB (2,147,483,648) for the indicated data set, define the data set required for the next sequential piece. (Actually, in this case, there should be an indication in console messages or the reason code that the data set required for the next piece was not found.)
- If the data set is at maximum (123) extents, try reorganizing the table space or index into a data set or data sets having larger primary and secondary values. This process is discussed in Section 2 (Volume 1) of *Administration Guide*.

Problem Determination: Examine the console messages, SYS1.LOGREC information, and SYSLOG to determine the reason for the condition. Try to resolve it by the methods described in the Operator Response section of this message. If you feel that this message indicates a problem in an IBM program, you should provide the following sources of information about the problem:

- Console sheet showing the message and related messages that might precede or follow it.
- System log printout (obtained via MVS WRITELOG operator command) showing related VSAM/media manager messages that might appear there (usually needed only if you have a message or reason code that indicates a media manager services problem occurred).
- Integrated catalog facility (ICF) catalog listing showing characteristics of the data set in question and of the ICF catalog itself.
- VTOC listing of packs associated with the request, showing space available for data sets, catalogs, VTOC index, and the VTOC itself, as well as data set extent information.
- Any associated dumps.
- SYS1.LOGREC listing showing entries at or near the time of the problem (unless these appear in an associated dump).
- Depending on the reason code, the results of certain SQL SELECT operations on DB2 catalog tables may be needed. (See "Section 4. DB2 Codes" on page 4-1.)

DSNP002I *csect – DEFINE FAILED FOR data-set-name*
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyy, LUW-ID=logical-unit-of-work-id =token

Explanation: Data set definition failed (in CSECT 'DSNPmmmm') for the reason identified by RC. (See "Section 4. DB2 Codes" on page 4-1.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. The connection, correlation, and logical-unit-of-work IDs identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an

'=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

This message is issued by the following CSECT: DSNPDFN1

System Action: The data space manager (DSM) terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to either the database administrator or the system administrator. Bring the message to their attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding access method services messages, if any, and correct it, if possible. If an out-of-space condition exists, see the description of message DSNP001I for actions to consider.

Problem Determination: See Problem Determination of message DSNP001I for this information.

DSNP003I *csect – RESET FAILED FOR data-set-name.*
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: Reset, a data space manager (DSM) function invoked by DB2 utilities, failed in CSECT 'DSNPmmmm' for the reason identified by RC. (See "Section 4. DB2 Codes" on page 4-1.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and tie together activities involving a given user.

This message is issued by the following CSECTS: DSNPRST0, DSNPRST1

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding DB2, access method services, or VSAM messages, if any, and correct it, if possible.

It might be necessary to delete and redefine the data set using access method services. Consider making a backup copy before doing this. (Use DB2 utilities to make the copy; in general, VSAM utilities do not work on DB2 database services data sets.)

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP004I *csect – DELETE FAILED FOR data-set-name.*
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: Deletion failed in CSECT 'DSNPmmmm' for the reason identified by RC. (See "Section 4. DB2 Codes" on page 4-1.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

The value of the LUWID is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

This message is issued by the following CSECTS:

DSNPDLT1 DSNPDLLR DSNPCILR DSNPDLTE

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request. DB2 might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding access method services messages if any, and correct it, if possible. Check the data set and delete it by using access method services directly if reasonable to do so. Consider making a backup copy before doing this. (Use DB2 utilities to make the copy; in general, VSAM utilities do not work on DB2 data sets.)

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP005I *csect – COULD NOT REMOVE EXCESS VOLUMES FROM CANDIDATE LIST OF data-set-name*
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: Volumes from a storage group were entered in the data set's candidate list and could not be removed by CSECT 'DSNPmmmm' after some data space manager (DSM) operation. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

This is not a major problem. However, the data set will not properly reflect subsequent deletions from the volume list in its storage group (via ALTER STOGROUP command in SQL), because the data set's integrated catalog facility (ICF) catalog entry still contains the volume serial numbers.

If needed, the storage group in question can be identified by issuing an SQL SELECT to get information about the table space or index that is identified by the third and fourth qualifiers (database name, table space name) in the data set name.

This message is issued by the following CSECT: DSNPRMVV

System Action: Operation continues.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Look for associated DSM and access method services messages preceding this one to get additional information. Attempt an ALTER REMOVEVOLUMES access method services command, if appropriate, after issuing a LISTCAT to see which volumes are recorded as 'candidate' in the integrated catalog facility (ICF) catalog.

Problem Determination: See Problem Determination for message DSNP001I for this information. (However, there should not be a need for VTOC or SYSLOG information for this case.)

DSNP006I *csect – REQUIRED STOGROUP DEFINED DATA SET NOT AVAILABLE— data-set-name*
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: An attempt to alter the shareoptions of this data set failed. The data set could not be accessed for the reason indicated by RC. (See "Section 4. DB2 Codes" on page 4-1.) The connection ID, correlation ID, and logical-unit-of-work ID (LUWID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

The value of the LUWID is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts the logical-unit-of-work-id as input.

Messages having the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

This message is issued by the following CSECTs: DSNPATSO DSNPRNMO

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request. DB2 might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP007I *csect – EXTEND FAILED FOR data-set-name.*
RC=rrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Extension failed in CSECT 'DSNPmmmm' of the data space manager (DSM). The 'data-set-name' identifies the data set that is being extended. RC is the reason code, which indicates why the extend process failed. (See "Section 4. DB2 Codes" on page 4-1.) The 'connection ID', 'correlation ID', and 'logical-unit-of-work ID' (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the 'LUW-ID' is not an '*', the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages that have the same 'connection ID', 'correlation ID', and 'LUW-ID' relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

This message is issued by the following CSECT: DSNPXTN0

System Action: The DSM terminates its actions associated with this extend request. Higher level functions might terminate if they cannot continue without a successful extend. In this case, additional console messages and/or SQL codes are produced. In other cases, higher level functions might be able to resolve the space need without the extend, so they continue normally.

System Programmer Response: The following sources of information are available to help determine the cause of the failure:

- See the Programmer Response for message DSNP001I.
- Analyze the RC value in conjunction with the console messages.
- The reason code might apply to the data set identified in the message or to another data set that is needed for the extend process. If the reason code indicates a data set access failure, the console messages indicate the data set name. For example, if the RC indicates 'resource

unavailable', console messages identify the resource that is unavailable. Most likely, the message will be DSNT500I.

- Retrieve diagnostic information from the output of the DISPLAY DB...RESTRICT or DISPLAY UTIL(*)... commands.
- If the extend failed on a result table space, refer to "Sort Data Sets" in Section 5 (Volume 2) of *Administration Guide*.
- If the extend failed on an SQL insert or update, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.
- If you need to enlarge your data set, refer to "Out of DASD Space" in Section 4 (Volume 1) of *Administration Guide*.
- To find out how the extend function operates, refer to "Improving DASD Utilization" in Section 5 (Volume 2) of *Administration Guide*.

Operator Response: See Operator Response for message DSNP001I for this information.

System Programmer Response: See System Programmer Response for message DSNP001I for this information.

Problem Determination: See Problem Determination for message DSNP001I

DSNP008I *csect*— **REQUIRED USER-DEFINED DATA SET NOT AVAILABLE**—*data-set-name* RC=rrrrrrrr
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: One of the following actions applied against user-defined data sets failed in CSECT 'DSNPmmmm' of the data space manager (DSM):

- Create table space or index
- Extend table space or index
- Process the SQL ALTER DATABASE statement
- Process the REORG TABLESPACE utility with SHRLEVEL REFERENCE or CHANGE

Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

One or more of the data sets could not be accessed for the reason indicated by RC. (See "Section 4. DB2 Codes" on page 4-1.) The connection ID, correlation ID, and logical-unit-of-work ID (LUWID) identify the user or application that encountered the problem.

The value of the LUWID is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages having the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

If the name of the data set in the message is different from the name of the original data set (for example, '...A002' instead of '...A001'), a new data set might need to be created. A different name indicates that the original data set exceeded its limit.

This message is issued by the following CSECTs:

DSNP008I DSNPXTN0 DSNPAT50 DSNPRNM0

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request or utility. DB2 might terminate the current SQL request or utility or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Refer to the reason code in "Section 4. DB2 Codes" on page 4-1. The return code description might indicate that one of the following actions needs to be performed or it indicates the necessary steps:

- If the data set does not exist, create it before attempting the create table space/index or extend data set again.
- If the data set shareoptions are incorrect, modify the shareoptions with access method services (AMS).
- The appropriate AMS command is ALTER SHAREOPTIONS.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP009I **THE FOLLOWING ERROR MESSAGES WERE RECEIVED FOR** *operation* **ON** *data-set-name*
DSNP010I **END OF ERROR MESSAGES.**
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: Messages DSNP009I and DSNP010I enclose a block of messages that are received by the data space manager (DSM) subcomponent of DB2 in response to an access method services (AMS) operation.

operation	The access method services operation that was being performed.
data-set-name	The data set on which the operation was being performed.

The prefix of the messages in the block is usually IDC (access method services messages). However, the prefix can also be IKJ (dynamic allocation) or other system subcomponent IDs. Refer to the appropriate MVS publication for descriptions of the enclosed messages.

The operation can be DEFINE CLUSTER, ALTER ADVOLUMES, ALTER REMOVEVOLUMES, or DELETE CLUSTER. One or more other DSM messages follow this message to explain what happened as a result of the failure of this access method services request. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

This message is issued by the following CSECT: DSNPAMS2

System Action: Operation continues.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Use this information to help resolve problems indicated by other DSM messages that follow this one.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP011I *csect* – **MEDIA MANAGER SERVICES ERROR FOR** *data-set-name*. **MMRC=cccccccc**
DSMRC=ffffff CONNECTION-ID=xxxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: The MMRC is the return code that DB2 received from media manager services. Refer to the appropriate MVS publication for a description of these codes. DSMRC is a DSM reason code that indicates which of the media manager services functions, update or extend, failed. (See "Section 4. DB2 Codes" on page 4-1.) The message is from CSECT 'DSNPmmmm' of the data space manager (DSM). The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

This message is issued by the following CSECTS:

DSNPPIP DSNPXTNO DSNPRSP0 DSNPRSTO

System Action: The DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: DSM messages are directed to either the database administrator (DBA) or the system administrator. However, they can request that the operator issue an MVS WRITELOG operator command (for example, 'W A') to obtain MVS SYSLOG output. The SYSLOG sometimes contains media manager messages that might be helpful to the DBA or system administrator in determining why space could not be allocated.

System Programmer Response: This message might be preceded by one or more IEC or ICY messages on the console or in SYSLOG. These messages help to determine what happened and what action to take.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP012I *csect* – **ERROR IN ICF CATALOG LOCATE FUNCTION FOR** *data-set-name* **CTLGRC=cc**
CTLGRSN=zzzzrrrr CONNECTION-ID=xxxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: CTLGRC and CTLGRSN are the return and reason codes that DB2 received from the SVC 26 (ICF catalog locate function). The reason code is in the same format as that returned to DB2 by the SVC 26. In it, zzzz is the hexadecimal value of the last two characters of the SVC 26 CSECT that set the code. The full CSECT name is derived by appending these two characters to 'IGG0CL'; rrrr is the numeric part of the reason code, in hexadecimal.

See the description of access method services message IDC3009I in the appropriate MVS publication for explanations of the return code and the numeric portion (rrrr) of the reason code. The values documented there are decimal, whereas the value in this message is hexadecimal.

The connection ID, correlation ID, and LUW-ID identify the user or application that encountered the problem. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

An LUW-ID of '*' indicates that the thread does not have an LUW-ID. If the LUW-ID is not an '*', the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: DB2 terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

System Programmer Response: Correct the problem indicated by the catalog return and reason codes.

Problem Determination: See Problem Determination for message DSNP001I for this information.

This message is issued by the following CSECTS:

DSNPAVLR DSNPCLO0 DSNPCNP0 DSNPDFN1
DSNPGNP0 DSNPIPP DSNPSCTC DSNPSCTD
DSNPSCT0

DSNP013I **INSUFFICIENT PRIMARY ALLOCATION SPACE TO FORMAT CONTROL PAGES IN DATA SET** *data-set-name* **CONNECTION-ID=xxxxxxxx,**
CORRELATION-ID=yyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Data space manager (DSM) discovered that the primary space quantity given in the data set definition was not large enough. Formatting of required control information in the first several pages was not possible. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of

logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with 'Onn', where 'nn' is a number, identify system agents.

This message is issued by the following CSECT: DSNPIPP

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: This should occur only for table spaces or indexes that are not storage group defined. (The DB2 interpreter forces the initial allocation to be large enough if a storage group is used.) Check both the page size specification (4KB or 32KB) and the number of control pages required (2 for table space, 3 for index space). Specify the primary allocation value again so that at least (pages × page size) bytes are allocated.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP014I IRLM MANUAL LOCK REQUEST FAILED FOR
data-set-name. RC=rr,SC=sssssss,
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: DB2 requested a manual lock on a data set, but the lock could not be obtained for reasons specified in RC and SC. RC and SC are the return code and reason code from IRLM. RC and the first two digits of SC are documented in "Section 5. IRLM Messages and Codes" on page 5-1. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. DSNP001I or DSNP007I follow this message. Correlation IDs beginning with 'Onn', where 'nn' is a number, identify system agents.

If message DSNT376I was received before message DSNP014I, the lock request failed because of a timeout condition. Otherwise, refer to the IRLM return and reason codes for an explanation of the failure.

This message is issued by the following CSECT: DSNPXTN1

System Action: The current SQL or the unit of recovery that issued the request might be terminated.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the IRLM return and reason code.

Problem Determination: Provide the console sheet and a dump. A GTF trace might also be required. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem. Refer to the explanation section of this message for additional problem determination information.

DSNP015I csect – IRLM MANUAL UNLOCK REQUEST
FAILED FOR *data-set-name.*
RC=rr,SC=sssssss, CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: DB2 requested a manual unlock on a data set, but the unlock could not be performed for reasons specified in RC and SC. RC and SC are the return code and reason code from IRLM. RC and the first two digits of SC are documented in "Section 5. IRLM Messages and Codes" on page 5-1. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with 'Onn', where 'nn' is a number, identify system agents.

This message is issued by the following CSECT: DSNPXTN1

System Action: The current SQL or the unit of recovery that issued the request might be terminated.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the IRLM return and reason code.

Problem Determination: Provide the console sheet and a dump. A GTF trace might also be required. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem. See the explanation section of this message for additional problem determination information.

DSNP016I CREATE FAILED FOR *pageset-name*.
RC=rrrrrrrr CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Creation of a table space or index space failed in the data space manager (DSM) for the reason given in RC. (See "Section 4. DB2 Codes" on page 4-1.) The pageset-name format is 'dbname.tiname', where 'dbname' is the database name, and 'tiname' is the table space or index space name.

This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

This message is issued by the following CSECT: DSNPCPS0

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP0011 for this information.

DSNP017I RESET FAILED FOR *pageset-name*. **RC=rrrrrrrr**
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Reset failed in the data space manager (DSM) subcomponent of DB2 for a table space or index space for the reason given in RC. (See "Section 4. DB2 Codes" on page 4-1.) The 'pageset-name' format is 'dbname.tiname', where 'dbname' is the database name and 'tiname' is the table space or index space name.

This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an

'=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

This message is issued by the following CSECT: DSNPRSP0

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP0011 for this information.

DSNP018I DROP FAILED FOR *pageset-name*. **RC=rrrrrrrr**
CONNECTION-ID=xxxxxxx,
CORRELATION-ID=yyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id =token

Explanation: Drop failed in the data space manager (DSM) subcomponent of DB2 for a table space or index space for the reason given in RC. Refer to "Section 4. DB2 Codes" on page 4-1. The 'pageset-name' format is 'dbname.tiname', where 'dbname' is the database name and 'tiname' is the table space or index space name. This message identifies the function that was in progress at the time of a failure. The specific failure is usually identified by a preceding message. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

This message is issued by the following CSECT: DSNPDPS0

System Action: DSM terminates its actions associated with the current SQL request. Higher level functions might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages, and correct it, if possible.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP019I *csect* – REALLOCATE FAILED FOR *data-set-name*. RC=rrrrrrr CONNECTION-ID=xxxxxxx, CORRELATION-ID=yyyyyyyyyyy, LUW-ID=*logical-unit-of-work-id=token*

Explanation: After a successful ALTER REMOVEVOLUMES request, the data space manager (DSM) subcomponent of DB2 was unable to reallocate the data set for the reason indicated by RC. (See "Section 4. DB2 Codes" on page 4-1.) The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

System Action: Operation continues.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console.

System Programmer Response: The data set and corresponding page set piece or partition can usually continue to be used by the DB2 subsystem. However, they should be stopped and restarted at the earliest possible time in order to synchronize the allocation control blocks with the integrated catalog facility (ICF) catalog volume list.

Problem Determination: See Problem Determination for message DSNP001I for this information.

DSNP020I *csect-name* - USER DEFINED ATTRIBUTES INCORRECT FOR *data-set-name*. RC=rrrrrrr CONNECTION-ID=xxxxxxx, CORRELATION-ID=yyyyyyyy, LUW-ID=*logical-unit-of-work-id=token*

Explanation: The specified data set was access method services user-defined and does not have the required DB2 attributes. The connection ID, correlation ID, and LUW-ID identify the user or application that encountered the problem.

The value of the LUWID is a 'logical-unit-of-work-id' that is assigned to the thread, followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages having the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

This message is issued by the following CSECTS: DSNPATSO DSNPSC0 DSNPSC7C DSNPRNMO

Severity: 8 (error)

System Action: No action is taken with the named data set. An error code is returned and a dump is not taken.

Operator Response: Notify the system programmer.

System Programmer Response: Delete the named data set and define it with the correct attributes.

Problem Determination: Obtain an access method services LISTCAT for the named data set's attributes. Refer to Section 2 (Volume 1) of *Administration Guide* for the correct data set definition attributes.

DSNP021I *csect-name* EXTEND NOTIFY FAILED FOR *data-set-name*, SC=sssssss, NOTESC=nnnnnnnn, CONNECTION-ID=xxxxxxx, CORRELATION-ID=yyyyyyyyyyy, LUW-ID=*logical-unit-of-work-id=token*

Explanation: This is an internal error. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

An LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts the logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with '0nn', where 'nn' is a number, identify system agents.

If message DSNT376I was received before message DSNP021I, the notify request failed because of a timeout condition.

System Action: The current SQL statement or the unit of recovery that issued the request might be terminated.

Problem Determination: Obtain the console sheet and a dump. A GTF trace might also be required.

Refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNP022I *csect-name* EXTEND DBET RECORDING FAILED FOR *data-set-name*, RC=rrrrrrr, SC=sssssss, DBETSC=nnnnnnnn, CONNECTION-ID=xxxxxxx, CORRELATION-ID=yyyyyyyyyyy, LUW-ID=*logical-unit-of-work-id=token*

Explanation: This is an internal error. The connection ID, correlation ID, and logical-unit-of-work ID (LUW-ID) identify the user or application that encountered the problem.

An LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of the logical-unit-of-work-id in any DB2 command that accepts the logical-unit-of-work-id as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

ities involving a given user. Correlation IDs beginning with 'Onn', where 'nn' is a number, identify system agents.

System Action: The current SQL statement or the unit of recovery that issued the request might be terminated.

Problem Determination: Obtain the console sheet and a dump. A GTF trace might also be required.

Refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNP026I *csect-name* **DATASET IS NOT ALLOWED TO BE DELETED** *data-set-name*, **RC=rrrrrrrr**,
CONNECTION-ID=xxxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: During clean up of the shadow data set in the final step of online REORG, an error is detected due to an attempt to delete a regular table or index space data set. Refer to Section 2 of *SQL Reference* for information about online REORG. The connection ID, correlation ID, and logical unit of work ID (LUWID) identify the user or application that encountered the problem. Correlation IDs beginning with 'Onn', where 'nn' is a number, identify system agents.

The value of the LUWID is assigned to the thread followed by an '=' sign and a token value, that can be used in place of the LUWID in any DB2 command that accepts it as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

System Action: No action is taken with the named data set. An error code is returned and a dump is not taken.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the failing environment. Refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is an internal error in the online REORG of utility. See the 'Problem Determination' section of message DSNP001I for this information.

DSNP027I *csect-name* **RENAME FAILED OLD DATASET=***data-set-name*, **NEW DATASET=***data-set-name*, **RC=rrrrrrrr**,
CONNECTION-ID=xxxxxxxx,
CORRELATION-ID=yyyyyyyyyyyyyy,
LUW-ID=logical-unit-of-work-id=token

Explanation: An attempt to alter the data set name failed. The connection ID, correlation ID, and logical unit of work ID (LUWID) identify the user or application that encountered the problem. Correlation IDs beginning with 'Onn', where 'nn' is a number, identify system agents.

The value of the LUWID is assigned to the thread followed by an '=' sign and a token value, that can be used in place of the LUWID in any DB2 command that accepts it as input.

Messages that have the same connection ID, correlation ID, and LUWID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user.

Severity: 8 (error)

System Action: DB2 terminates its actions associated with the current SQL request. DB2 might terminate the current SQL request or the unit of recovery that issued the request.

Operator Response: This message is directed to the database administrator or the system administrator. Bring it to that person's attention if it appears on the MVS operator's console. The installation should consider directing DB2 messages to a console other than the operator's console.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: See 'Problem Determination' for message DSNP001I for this information.

DSNP028I *csect-name* **HSM RECALL FAILED FOR DSNAME =** *dsn*
HSMRC=rrrrrrrr,**HSMRSN=ssssssss** **CONNECTION ID=xxxxxxxx**, **CORRELATION ID=yyyyyyyyyyyyyy**, **LUW-ID=logical-unit-of-work-id=token**

Explanation: This message indicates that a required data set was migrated by HSM and an attempt to recall the data set failed, preventing DB2 from accessing the data set. The HSMRC and HSMRSN fields can be used to determine the HSM failure. See Problem Determination below. The connection ID, correlation ID, and 'logical-unit-of-work ID' (LUW-ID) identify the user or application that encountered the problem.

A LUW-ID of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a 'logical-unit-of-work-id' that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of 'logical-unit-of-work-id' in any DB2 command that accepts 'logical-unit-of-work-id' as input.

Messages that have the same connection ID, correlation ID, and LUW-ID relate to the same user. This makes it possible to scan a number of DSNP-prefixed messages and group activities involving a given user. Correlation IDs beginning with 'Onn', where 'nn' is a number, identify system agents.

System Action: DSM terminates its action with the associated data set. Higher level functions that issued the recall request might terminate.

Operator Response: Notify the system programmer.

System Programmer Response: Investigate the reason for the HSM recall failure. Use the information in this message to help resolve this problem. Additional messages on the MVS operator's console might be associated with this message.

Problem Determination: If the HSMRSN is 999, refer to the following list for the explanation:

HSMRC	Description
4	HSM is not active.
8	No storage is available for MWE in CSA.
36	Input MWE is not within user storage.
40	Allocated amount of CSA for MWEs was exceeded.
100	There was an invalid function used.

For all other reason codes (HSMRSN), refer to the *DFSMS/MVS: DFSMSHsm Managing Your Own Data* for an explanation of HSM user messages. The HSM user messages can be determined by appending the value in the HSMRC field of this message to ARC1100I (that is, HSMRC=12, HSM

message is ARC1112I). The HSMRSN reason code is referenced in the ARC1100I messages.

DSNR... Messages

The following information messages indicate the progress of DB2 through a restart process.

DSNR001I RESTART INITIATED

Explanation: This message delimits the beginning of the restart process within startup. The phases of restart are about to begin. These phases are necessary to restore the operational environment to that which existed at the time of the previous termination and to perform any recovery actions that may be necessary to return DB2-managed resources to a consistent state.

This message is issued by the following CSECT: DSNRRPRC

DSNR002I RESTART COMPLETED

Explanation: This message delimits the completion of the restart process within startup.

This message is issued by the following CSECT: DSNRRPRC

DSNR003I RESTART...PRIOR CHECKPOINT RBA=xxxxxxxxxxxx

Explanation: The message indicates the first phase of the restart process is in progress and identifies (as 'xxxxxxxxxxxx') the log positioning RBA of the checkpoint from which the restart process will obtain its initial recovery information.

This message is issued by the following CSECT: DSNRRCSR

DSNR004I RESTART...UR STATUS COUNTS IN COMMIT=nnnn, INDOUBT=nnnn, INFLIGHT=nnnn, IN ABORT=nnnn

Explanation: This message indicates the completion of the first phase of the restart process. The counts indicate the number of units of work whose execution state during a previous DB2 termination was such that (to ensure DB2 resource consistency) some recovery action must be performed during this restart process. The counts may provide an indication of the time required to perform the remaining two phases of restart (forward and backward recovery).

The IN COMMIT count specifies the number that had started but not completed phase 2 of the commit process. These must undergo forward recovery to complete the commit process.

The INDOUBT count specifies the number that were interrupted between phase 1 and phase 2 of the commit process. These must undergo forward recovery to ensure resources modified by them are unavailable until their indoubt status is resolved.

The INFLIGHT count specifies the number that neither completed phase 1 of the commit process nor began the process of backing out. These must undergo backward recovery to restore resources modified by them to their previous consistent state.

The IN ABORT count specifies the number that were in the process of backing out. These must undergo backward

recovery to restore resources modified by them to their previous consistent state.

This message is issued by the following CSECT: DSNRRCSR

DSNR005I RESTART...COUNTS AFTER FORWARD RECOVERY IN COMMIT=nnnn, INDOUBT=nnnn

Explanation: The message indicates the completion of the forward recovery restart phase. The counts indicate the number of units of work whose recovery actions could not be completed during the phase. Typically, those in an IN COMMIT state remain because the recovery actions of some subcomponents have not been completed. Those units of work in an INDOUBT state will remain until connection is made with the subsystem that acts as their commit coordinator.

This message is issued by the following CSECT: DSNRRHSR

Operator Response: No action is required unless the conditions persist beyond some installation-defined period of time. Recovery action will be initiated when the resource is brought online. Indoubt resolution will be initiated as part of the process of reconnecting the subsystems.

DSNR006I RESTART...COUNTS AFTER BACKWARD RECOVERY INFLIGHT=nnnn, IN ABORT=nnnn

Explanation: The message indicates the completion of the backward recovery restart phase. The counts indicate the number of units of work whose recovery actions could not be completed during the phase. Typically, those in either state remain because the recovery actions of some subcomponents have not been completed.

This message is issued by the following CSECT: DSNRRAUB

Operator Response: No action is required unless the condition persists beyond some installation-defined period of time. Recovery action will be initiated when the resource collection is brought online.

DSNR007I RESTART...STATUS TABLE

Explanation: This message precedes a table showing the status of units of recovery (URs) after each restart phase. The message and the table will accompany the DSNR004I, DSNR005I, or DSNR006I message after each nested phase. At the end of the current status rebuild phase, it shows the status of any URs that require processing. At the end of the forward recovery and backoutphases, it shows the status of only those URs which needed processing but were not processed. The table helps to identify the URs that were active when DB2 came down, and to determine the log scope required to bring DB2 up.

The format of the table is shown below:

```
T CONID CORRID AUTHORIZATION ID PLAN S URID DAY TIME
```

where the columns contain the following information:

T	Connection type. The values may be:
B	Batch: a batch program or QMF user.
I	Internal: a system service being performed on some user's behalf.

S	Subsystem: work that originated from an attached subsystem, either CICS or IMS/VS.
CONID	Connection identifier for related URs. Batch connections are not related to any other connection. Subsystem connections with the same identifier indicate URs that originated from the same subsystem.
CORRID	Correlation identifier; unique within a subsystem connection, it relates a UR to a particular CICS or IMS/VS transaction.
AUTHORIZATION ID	Authorization identifier of the user for whom this UR was created.
PLAN	Name of the plan allocated to the UR.
S	Restart status of the UR. When DB2 came down, the UR was in one of these situations:
A	INABORT: The UR was in the 'must-complete' phase of abort, and is yet to be completed.
C	INCOMMIT: The UR was in the 'must-complete' phase of commit, and is yet to be completed.
D	INDOUBT: The UR had completed the first phase of commit, but DB2 had not received the second phase instruction. The UR must be remembered so it can be resolved when the owning subsystem reattaches.
F	INFLIGHT: The UR had not completed the first phase of commit, and will be backed out.
URID	UR identifier, the log RBA of the beginning of this unit of work. It is the earliest RBA required to process the UR during Restart.
DAY	The day the UR was created, in the format 'ddd'. It is approximately the time of the first SQL statement of the application or the first SQL statement following a commit point.
TIME	The time the UR was created, in the format 'hh mm ss '. It is approximately the time of the first SQL statement of the application or the first SQL statement following a commit point.

This message is issued by the following CSECT: DSNRUDIS

DSNR009I STORAGE IS NOT AVAILABLE FOR THE UR DISPLAY TABLE, THE SIZE REQUESTED = xxxx, STORAGE MANAGER REASON CODE = yyyyyyy

Explanation: There was not enough storage available during the creation of the recoverable UR (RURE) display table (DSNDRUDT).

This message is issued by the following CSECT: DSNRRCSR

System Action: The system continues to restart but the RESTART... STATUS TABLE is not displayed.

System Programmer Response: Increase the region size of the *ssnmMSTR* address space before restarting DB2 again.

Operator Response: Save the console output and inform the system programmer.

Problem Determination: The size requested is approximately 110 bytes for each unit of recovery (UR). See the message DSNR004I to determine the total number of URs to process. Then get the 00E2xxxx reason code from the DSNR009I header. Use these two numbers to determine the reason for the shortage.

DSNR010I AN ERROR OCCURRED IN THE RURE STATUS TABLE SORT/TRANSLATE MODULE (DSNRUSOR), THE ERROR LOCATION CODE = xxxx

Explanation: There was an error in processing the RURE display table. One of these ERROR LOCATION CODES tells what function the module was attempting to perform:

X'0001'	Trace entry to the module
X'0002'	Sort the recoverable UR display table
X'0003'	Translate the recoverable UR table
X'0004'	Convert the store clock value for display
X'0005'	Trace exit from the module

This message is issued by the following CSECT: DSNRRCSR

System Action: The system continues to restart but the RESTART... STATUS TABLE is not displayed.

System Programmer Response: Use the error code in the message to fill in the problem description.

Operator Response: Save the console output and inform the system programmer.

Problem Determination: The ERROR CODE tells the problem area and should be used in the problem description. A record was added to the SYS1.LOGREC that contains the PSW and module at the time of the error. This error indicates an application program check of some type.

DSNR011I AN ERROR OCCURRED IN THE RURE STATUS TABLE DISPLAY MODULE (DSNRUDIS), THE ERROR LOCATION CODE = xxxx

Explanation: There was an error in processing the RURE display table. One of these ERROR LOCATION CODES tells what function the module was attempting to perform:

X'0001'	Trace entry to the module
X'0002'	Build header for the display table
X'0003'	Build entries for the display table
X'0004'	Call DSNRWTO to display the table
X'0005'	Trace exit from the module
X'0006'	Get message text

This message is issued by the following CSECTs:

DSNRRCSR DSNRRHSR DSNRRAUB

System Action: The system continues to restart but the RESTART... STATUS TABLE is not displayed.

System Programmer Response: Use the error code in the message to fill in the problem description.

Operator Response: Save the console output and inform the system programmer.

Problem Determination: The ERROR CODE describes the problem area and should be used in the problem description. A record was added to the SYS1.LOGREC containing the value DSNRUDIS, and the PSW and CSECT at the time of the error. This error indicates an application program check of some type.

Error codes other than X'0006' indicate an application program check of some type. Code X'0006' indicates an error attempting to locate the table text. The trace entry for DSNRUDIS contains the return and reason codes from the Get Text request. That information should be used to fill in the problem description.

DSNR014I EXCLUDED RURE TABLE

Explanation: This is a list of RUREs which are being bypassed because of the conditional restart. Either they were to be processed in a phase that was bypassed or they were outside the log range.

The following shows the format of the table headings. See message DSNR007I for an explanation of the table columns.

```
T CONID CORRID AUTHORIZATION ID PLAN S URID DAY TIME
```

System Action: Restart continues.

DSNR015I THE CHKPTRBA xxxxxxxxxxxx SPECIFIED IN THE CRCR IS INVALID

Explanation: The checkpoint RBA specified in the conditional restart control record (CRCR) is either not available or is not a begin checkpoint record.

This message issued by the following CSECT: DSNRIT03

System Action: Restart is abended with reason code '00D99001'.

Operator Response: Inform the system programmer.

System Programmer Response: By specifying the STARTRBA and/or ENDRBA on the CRESTART control statement, change log inventory (DSNJU003) utility selects an appropriate RBA.

Problem Determination: Print the complete checkpoint records queue by using the print log map (DSNJU004) utility. Select a checkpoint RBA from this queue or let the change log inventory (DSNJU003) utility make the selection.

DSNR016I STARTRBA xxxxxxxxxxxx VALIDATION FAILED

Explanation: A scan from the STARTRBA failed to find a complete log record. Either the entire log was scanned and no complete record was found, or the log manager found an invalid log record. The log manager sends the error messages to the console indicating a bad log record.

System Action: Restart abends.

Operator Response: Record the log manager message numbers and inform the system programmer.

System Programmer Response: Use DSN1LOGP to determine a STARTRBA to use for restart. The recovery manager uses the STARTRBA as a starting point for its search of the beginning of a valid log record.

DSNR017I RESTART IS BEING TERMINATED BECAUSE OF CSRONLY SPECIFICATION IN CRCR

Explanation: The restart procedure only completed the first phase of startup. The status displayed during this partial restart can be used to build the conditional restart control record (CRCR).

System Action: Restart is abended.

System Programmer Response: To prevent the restart control record from being reused during the next restart attempt, the current restart control record must be canceled. Use the change log inventory (DSNJU003) CRESTART CANCEL option, or create a new restart control record. The newly created restart control record will automatically cancel the previous record.

DSNR020I csect-name START MEMBER member, OR REPLY 'NO' OR 'QUIESCED'

Explanation: During a group restart, the group member issuing this message attempted to access the BSDS for member *member*, and either was not able to access the BSDS, or discovered that the BSDS was modified by the change log inventory (DSNJU003) utility since that member was last started. In either case, this DB2 is not able to perform peer restart for member *member*.

For group restart to continue, the identified member must be started.

If it is not possible to start the other member and you want to terminate this group restart, you can reply 'NO' to this message. Replying 'NO' to this message causes this DB2 to terminate with a reason code of 00D900E1. You then have to reply 'NO' to this message for all remaining members participating in this group restart.

If you are sure that the identified member was quiesced the last time it was started, that is, it was stopped with a -STOP DB2 MODE(QUIESCE) command and it stopped with no indoubt units of recovery and no distributed resynchronization responsibility, then you can reply 'QUIESCED' to this message. Replying 'QUIESCED' to this message causes message DSNR030I to be issued as a reminder that group restart will continue **without using the log** from the identified member.

System Action: This group member waits for the identified member to be started or for a valid reply to this message.

- If the identified member is started, group restart continues.
- If the reply is 'NO', this DB2 terminates with a reason code of 00D900E1.
- If the reply is 'QUIESCED', group restart continues **without using the log** from the identified member.

DSNR021I csect-name DB2 SUBSYSTEM MUST PERFORM GROUP RESTART FOR PEER MEMBERS

Explanation: This DB2 subsystem must perform the group restart phase to recover either the shared communications area (SCA) or the retained locks for nonstarting members in the data sharing group.

This message marks the beginning of group restart processing for peer members. Messages DSNR023I and DSNR024I or messages DSNR025I and DSNR026I are issued for each peer

that is processed by this DB2 subsystem. Message DSNR022I marks the end of group restart processing for peer members.

This message is issued before this DB2 member enters the group restart process. The group restart process is synchronized among all group members that are starting and therefore participating in this group restart. After this DB2 member synchronizes with other members, it is possible that no peer processing will be necessary; in that case message DSNR022I immediately follows this message.

If it is necessary to recover both the SCA and retained locks, this message is issued twice; once for SCA recovery and again for the recovery of the retained locks.

System Action: The subsystem begins group restart processing.

DSNR022I *csect-name* **DB2 SUBSYSTEM HAS COMPLETED GROUP RESTART FOR PEER MEMBERS**

Explanation: This DB2 subsystem, which previously issued message DSNR021I, completed the group restart phase to recover the shared communications area (SCA) or retained locks for nonstarting DB2 members in the data sharing group.

System Action: The subsystem continues with the next restart phase of its own subsystem.

DSNR023I *csect-name* **GROUP RESTART INITIATED TO RECOVER THE SCA FOR GROUP MEMBER**
memname

Explanation: The DB2 subsystem that issued this message is performing the group restart phase to recover the shared communications area (SCA) for nonstarting member *memname* of the data sharing group.

This message is followed by message DSNR024I after the group restart phase to recover the SCA for the identified member is complete.

System Action: The subsystem continues the group restart process.

DSNR024I *csect-name* **GROUP RESTART COMPLETED TO RECOVER THE SCA FOR GROUP MEMBER**
memname

Explanation: The DB2 subsystem that issued this message completed the group restart phase to recover the shared communications area (SCA) for member *memname* of the data sharing group.

This message is issued only if messages DSNR021I and DSNR023I were issued.

System Action: The subsystem continues the group restart process.

DSNR025I *csect-name* **GROUP RESTART INITIATED TO RECOVER RETAINED LOCKS FOR GROUP MEMBER**
memname

Explanation: The DB2 subsystem that issued this message is performing the group restart phase to recover the retained locks for nonstarting member *memname* of the data sharing group.

This message is followed by message DSNR026I after the

group restart phase to recover the retained locks for the identified member is complete.

System Action: The subsystem continues the group restart process.

DSNR026I *csect-name* **GROUP RESTART COMPLETED TO RECOVER RETAINED LOCKS FOR GROUP MEMBER**
memname

Explanation: The DB2 subsystem that issued this message completed the group restart phase to recover the retained locks for member *memname* of the data sharing group.

This message is issued only if messages DSNR021I and DSNR025I were issued.

System Action: The subsystem continues the group restart process.

DSNR030I *csect-name* **WILL CONTINUE WITHOUT THE MEMBER'S LOG, REPLY 'YES' OR 'NO'**

Explanation: The reply to message DSNR020I was 'QUIESCED'. This message is issued as a reminder that group restart will continue **without using the log** from the identified member.

If you are sure that the identified member was quiesced the last time it was started, that is, it was stopped with a -STOP DB2 MODE(QUIESCE) command and it stopped with no indoubt units of recovery and no distributed resynchronization responsibility, then reply 'YES'; otherwise, reply 'NO'.

System Action: This group member waits for a valid reply to this message.

- If the reply is 'YES', group restart continues **without using the log** from the identified member.
- If the reply is 'NO', message DSNR020I is reissued to allow you to enter a different response.

DSNR031I *csect-name* **PROCESSING LOG RECORD AT RBA**
rba1 **TO RBA**
rba2

Explanation: This message is produced periodically during the forward and backward processing phases of restart. The RBAs presented in this message can be used to monitor the progress of the phases of restart.

Forward processing occurs between messages DSNR004I and DSNR005I. During forward processing, the log is read in a forward direction.

Backward processing occurs between messages DSNR005I and DSNR006I. During backward processing, the log is read in a backward direction and will stop reading at the RBA matching the URID of the oldest in-flight or in-abort UR.

rba1 is the RBA of the log record currently being processed. *rba2* is the RBA of the last log record that will be read in this phase of restart.

System Action: DB2 restart continues.

User Response: This is an information only message.

DSNR032E *csect-name* **DB2 IS STARTING AT RELEASE LEVEL *code-level-1*, WHICH IS NOT COMPATIBLE WITH RELEASE LEVEL *code-level-2***

Explanation: The DB2 you tried to start is not at the proper code release, or does not have the correct fallback/coexistence SPE applied.

code-level-1 and *code-level-2* are a string of three numeric characters as follows:

- Version
- Release
- Modification level

code-level-1 The current release level of the starting DB2.

code-level-2 One of the following:

- In non-data-sharing, the highest release with which this DB2 has ever been started.
- In a data sharing environment, the highest release with which any DB2 in the data sharing group has ever been started. This is known as the *group release level*.

This message can occur in the following situations:

- The starting DB2 fell back from a later release and does not have the proper fallback SPE applied.
- The starting DB2 does not have the proper coexistence SPE to start in a data sharing group, which is at the higher release level.
- The starting DB2 is at a release in which coexistence with the current group release level is not supported.

System Action: DB2 terminates with reason code 00D900FA.

System Programmer Response: Verify that:

- Coexistence is supported between the releases you are trying to run.
- The startup procedure is pointing to the correct set of load libraries.
- The correct SPE has been applied.

For more information about what SPE is needed, see the program directory or preventative service planning (PSP) updates.

DSNR033E *csect-name* **MEMBER *member-name* IS AT RELEASE LEVEL *code-level-1* WHICH IS NOT COMPATIBLE WITH THE STARTING MEMBER AT RELEASE LEVEL *code-level-2***

Explanation: The code level for the started DB2 member and the starting DB2 member are not compatible until you apply the correct SPE to the lower level release.

code-level-1 and *code-level-2* are a string of three numeric characters as follows:

- Version
- Release
- Modification level

code-level-1 The release level of the active DB2 member *member-name*.

code-level-2 The release level of the starting DB2.

This message occurs when a starting DB2 member is at a higher release than can coexist with an existing DB2 member.

System Action: After detecting the first member with which it cannot coexist, DB2 terminates with reason code 00D900FA.

System Programmer Response: If you want to start a higher release level of DB2, you must ensure that all active members in the group have the proper SPE applied. If you intended to start a lower release level of DB2, make sure your startup procedure is pointing to the correct set of load libraries.

For more information about what SPE is needed, see the program directory or preventive service planning (PSP) updates.

DSNR034E *csect-name* **THERE CANNOT BE MORE THAN TWO RELEASE LEVELS OF DB2 RUNNING IN THE GROUP**

Explanation: You attempted to start a DB2 that was at a release level that cannot coexist in the data sharing group. There are already two different releases of DB2 currently running in the data sharing group.

System Action: DB2 terminates.

System Programmer Response: If you are sure that the startup procedure is pointing to the correct set of load libraries, you must stop any DB2 subsystems that cannot coexist with the one you are attempting to start.

See *Data Sharing: Planning and Administration* for more information about release coexistence in a data sharing group.

DSNR035I *csect-name* **WARNING - UNCOMMITTED UR AFTER *nn* CHECKPOINTS - CORRELATION NAME = xxxxxxxxxxxx CONNECTION ID = yyyyyyyy LUWID = logical-unit-of-work-id=token PLAN NAME = xxxxxxxx AUTHID = xxxxxxxx END USER ID = xxxxxxxx TRANSACTION NAME = xxxxxxxx WORKSTATION NAME = xxxxxxxx**

Explanation: This message indicates that during checkpoint, DB2 encountered an uncommitted UR that has an INFLIGHT status.

The value *nn* is cumulative, and it indicates the number of checkpoints taken since the beginning of the UR. CORRELATION name, CONNECTION ID, and LUWID together identify a thread associated with the UR. If the LUWID is an '*', it indicates that the thread originated at this site. *token* is a unique token number associated with the LUWID. PLAN NAME and AUTHID further identify the thread associated with the UR. If the thread was created with client End User information, the End User's ID, TRANSACTION NAME, and WORKSTATION NAME, will be displayed. Otherwise, these fields will contain an '*'.

#

System Action: DB2 continues processing. If statistics class 3 is turned on, IFCID 0313 is written.

System Programmer Response: Consult with the application programmer to determine if this is a problem UR. See Section 4 (Volume 1) of *Administration Guide* for more information about problems caused by uncommitted URs. If the UR is caused by an application program, you can use CANCEL THREAD to delete the UR, if necessary. If an uncommitted UR is deleted, DB2 will undo the changes. The amount of time required for this process depends on the amount of work done by the UR.

Programmer Response: Ensure that the application commits frequently enough, or consult with your DB2 administrator about decreasing the frequency of the check.

DSNR036I *csect-name* **UNRESOLVED UR ENCOUNTERED DURING CHECKPOINT - CORRELATION NAME = xxxxxxxxxxxx CONNECTION ID = yyyyyyyy LUWID = logical-unit-of-work-id PLAN NAME = xxxxxxxx AUTHID = xxxxxxxx**

Explanation: DB2 has detected an INDOUBT unit of recovery (UR) during a checkpoint. The purpose of this message is to remind the operator that an INDOUBT UR exists.

CORRELATION name, CONNECTION ID, and LUWID together identify a thread associated with the UR. If the LUWID is an '1', it indicates that the thread originated at this site.

PLAN NAME and AUTHID further identify the thread associated with the indoubt UR.
#

System Action: DB2 continues processing. If statistics class 3 is turned on, IFCID 0313 is written.

System Programmer Response: Consult with the application programmer to determine whether this is a problem UR. See Section 4 (Volume 1) of *Administration Guide* for more information about resolving INDOUBT URs.

DSNR037I *csect-name* **WARNING - THE TCP/IP DRDA PORT NUMBER IS CHANGED FROM *port_1* TO *port_2***

Explanation: The TCP/IP DRDA port number specified in the DB2 BSDS is different from the value used the last time a member of the DB2 data sharing group started. All members of a DB2 data sharing group must use the same TCP/IP DRDA port number.

port_1 The TCP/IP DRDA port number that was obtained from the DB2 BSDS during DB2 startup.

port_2 The TCP/IP DRDA port number that was obtained from the coupling facility during DB2 startup. This is the TCP/IP DRDA port number that was used the last time a member of the data sharing group was started.

System Action: DB2 accepts the new TCP/IP DRDA port number, and DB2 startup continues.

Operator Response: Contact the system programmer.

System Programmer Response: If the TCP/IP DRDA port number was changed inadvertently, stop DB2 immediately. Use the change log inventory utility (DSNJU003) to correct the PORT value, and restart DB2.

If this message reflects a change that you want to make to DB2's DRDA port number, no action is required. The DRDA port number stored in the coupling facility is updated, and this new port number will be used when DB2 validates each member's DRDA port number.

DSNR038I *csect-name* **WARNING - THE TCP/IP RESYNCHRONIZATION PORT NUMBER IS CHANGED FROM *port_1* TO *port_2***

Explanation: The TCP/IP resynchronization port number obtained from the DDF record of the BSDS is different than the value specified the last time DB2 started.

Changing the TCP/IP resynchronization port number can cause problems during distributed 2-phase commit processing. Remote DRDA partners record DB2's resynchronization port number in their recovery logs. The resynchronization port number is used to reconnect to the appropriate DB2 member when communication failures occur during 2-phase commit processing. If a DB2 member changes its resynchronization port number, the remote DRDA partners may be unable to resolve indoubt units of work.

port_1 The TCP/IP resynchronization port number that was obtained from the DB2 BSDS during DB2 startup.

port_2 The TCP/IP resynchronization port number that was obtained from the coupling facility during DB2 startup. This is the TCP/IP resynchronization port number that was used the last time this member was started.

System Action: DB2 accepts the new TCP/IP resynchronization port number, and DB2 startup continues.

Operator Response: Contact the system programmer.

System Programmer Response: If the DB2 resynchronization port number was changed inadvertently, stop DB2 immediately. Use the change log inventory utility (DSNJU003) to correct the RESPORT value, and restart DB2.

If this message reflects a change that you want to make to DB2's resynchronization port number, no action is required. The resynchronization port number stored in the coupling facility for this member is updated, and this new port number will be used when DB2 validates the resynchronization port number for other DB2 members.

DSNR039I *csect-name* **WARNING - TCP/IP RESYNCHRONIZATION PORT NUMBER *port_1* IS THE SAME AS MEMBER *member_name***

Explanation: The TCP/IP resynchronization port of the starting DB2 is the same as the member indicated by *member_name*.

port_1 The TCP/IP resynchronization port number that was obtained from the DB2 BSDS during DB2 startup.

member_name The member name of the DB2 data sharing member that used the same resynchronization port number.

System Action: The TCP/IP port number specified in the BSDS is accepted, and DB2 startup continues.

Operator Response: Contact the system programmer.

System Programmer Response: Each member of the DB2 data sharing group should have a unique TCP/IP resynchronization port number. Use the change log inventory utility (DSNJU003) to specify a unique RESPORT value for this DB2 member and the DB2 member identified by *member_name*.

DSNR040I *csect-name* **TRACKER RESTART ENDLRSN**
lrsn **DOES NOT MATCH ENDLRSN** *lrsn* **ASSO-**
CIATED WITH THE DATA SHARING GROUP
Explanation: This message is produced during restart of a
tracker site DB2 in a data sharing environment if the
ENDLRSN specified on the Conditional Restart Control Record
does not match the ENDLRSN in the system communications
area (SCA) structure for the data sharing group.
System Action: DB2 startup terminates.

Operator Response: Collect the SYS1.LOGREC and SVC
dump and contact the system programmer.
System Programmer Response: If the ENDLRSN value for
this member is incorrect, restore the BSDS and logs for this
tracker site DB2 from the primary DB2, insure the Conditional
Restart Control Record is correct, and restart DB2. If the
ENDLRSN value in the SCA is incorrect, the SCA structure
must be deleted and all members of the tracker site data
sharing group must be restarted with the same ENDLRSN.

DSNT... Messages

Messages issued by DSNTINST, DSNTINS1, and DSNTINS2 installation CLISTs have an internal severity level as follows:

- 0 Successful execution: CLIST progress and tracing messages (processing continues)
- 4 Warning: some adjustments might be made by the installation CLISTs (processing and JCL editing continues)
- 8 Error: unable to continue (no JCL is edited)

DSNT101I A VSAM ERROR HAS BEEN ENCOUNTERED WHILE READING THE DB2 BSDS VSAM RETURN CODE = x, VSAM REASON CODE = y

Explanation: CSECT DSNTSTR2 attempted to read the DB2 bootstrap data set (BSDS), and a VSAM error has occurred. In the message, 'x' is a 1-byte VSAM return code and 'y' is a 1-byte VSAM reason code.

This message is issued by the following CSECT: DSNTSTR2

System Action: The DB2 start up process continues. However, any references to DB2 password-protected system databases will cause a 'resource unavailable' error. Any agent-related requests for DB2 subsystem database resources will result in an SQLCODE -904. Any requests that are not agent-related for unavailable resources will result in the following messages:

DSNI001I	DSNI002I	DSNI003I	DSNI004I
DSNI005I	DSNI006I	DSNT408I	DSNT414I
DSNT415I	DSNT416I	DSNT417I	DSNT500I

Abend X'04E' with reason code X'00E30010' is also produced. However, the error results in a retry. DB2 does not terminate, but a dump is produced.

Operator Response: Notify the system programmer.

System Programmer Response: A VSAM error occurred while reading the BSDS record with key '200000001'. Either the BSDS record does not exist or an I/O error occurred (indicating that the record is bad). Further information may be obtained from a VSAM diagnostics manual. Refer to Section 4 (Volume 1) of *Administration Guide* for procedures on recovering or repairing the DB2 bootstrap data set.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 16.

DSNT102I AN INVALID DATABASE SERVICES BOOTSTRAP RECORD HAS BEEN ENCOUNTERED

Explanation: CSECT DSNTSTR2 attempted to read the DB2 bootstrap data set (BSDS), and an invalid record was read by the recovery log manager (RLM) subcomponent. This is a DB2 error.

This message is issued by the following CSECT: DSNTSTR2

System Action: The DB2 start up process continues.

However, any references to DB2 password-protected system databases will cause a 'resource unavailable' error. Any agent-related requests for DB2 subsystem database resources will result in an SQLCODE -904. Any requests that are not agent-related for unavailable resources will result in the following messages:

DSNI001I	DSNI002I	DSNI003I	DSNI004I
DSNI005I	DSNI006I	DSNT408I	DSNT414I
DSNT415I	DSNT416I	DSNT417I	DSNT500I

Abend X'04E' with reason code X'00E30010' is also produced. However, the error results in a retry. DB2 does not terminate, but a dump is produced.

Operator Response: Notify the system programmer.

System Programmer Response: Obtain a copy of SYS1.LOGREC and the SVC dump. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This message is generated when the recovery log manager (RLM) subcomponent of DB2 encounters an invalid DB2 database services password record. A copy of the BSDS record with key '200000001', which is the invalid database services record retrieved, should be obtained.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 16.

DSNT103I THE CURRENTLY LOADED DSN6SPRM IS NOT THE MVS/XA VERSION

Explanation: A -START DB2 PARM=xxxxxxx was issued where 'xxxxxxx' is the version of the system parameter CSECTs. DB2 executes in a MVS/XA environment and will not execute in any other environment.

This message is issued by the following CSECT: DSNTSTR2

System Action: The message DSNV086E is generated with a reason code of X'00E30008'. DB2 is terminated with abend code X'04F'.

Operator Response: Notify the system programmer.

System Programmer Response: Restart DB2 with a -START DB2 PARM= command, where the parameter block that follows the 'PARM=' parameter specifies an MVS/XA version of the DB2 subsystem parameters.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 3, 5, 9.

DSNT104I THE CURRENTLY LOADED DSN6SPRM IS NOT THE MVS/370 VERSION

Explanation: A -START DB2 PARM=xxxxxxx was issued, where 'xxxxxxx' is the version of the system parameter CSECTs. DB2 executes in an MVS/370 environment and does not execute in any other environment.

This message is issued by the following CSECT: DSNTSTR2

System Action: Message DSNV086E is generated with reason code X'00E30009'. DB2 is terminated with abend code X'04F'.

Operator Response: Notify the system programmer.

System Programmer Response: Restart DB2 with a -START DB2 PARM= command, where the parameter block that follows the PARM= parameter specifies an MVS/370 version of the DB2 subsystem parameters.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 3, 5, 9.

DSNT105I THE LOADED DSN6SPRM CSECT IS OBSOLETE. PLEASE REASSEMBLE THE DSN6SPRM CSECT AND RELINKEDIT THE DSNZPARM LOAD MODULE.

Explanation: DSNTSTR2 loaded an out-of-date system parameter CSECT DSN6SPRM. This error can only occur if code maintenance has been applied and CSECT DSN6SPRM has not been reassembled. This CSECT is contained in the load module specified in the 'PARM=' parameter of the -START DB2 command.

This message is issued by the following CSECT: DSNTSTR2

System Action: The message DSNV086E is generated with a reason code of X'00E30008'. DB2 is terminated with abend code X'04F'.

Operator Response: Notify the system programmer.

System Programmer Response: Reassemble DSN6SPRM, and relink-edit the DSNZPARM load module. This is done by resubmitting the install job stream, DSNTIJUZ, that built the load module that is named following the 'PARM=' parameter of the -START DB2 command.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 3, 5, 9.

DSNT106I THE LOADED DSN6SYSP CSECT IS OBSOLETE. PLEASE REASSEMBLE THE DSN6SYSP CSECT AND RELINKEDIT THE DSNZPARM LOAD MODULE.

Explanation: DSNTSTR2 loaded an out-of-date system parameter CSECT DSN6SYSP. This error can only occur if code maintenance has been applied and CSECT DSN6SYSP has not been reassembled. This CSECT is contained in the load module specified in the 'PARM=' parameter of the -START DB2 command.

This message is issued by the following CSECT: DSNTSTR2

System Action: The message DSNV086E is generated with a reason code of X'00E30008'. DB2 is terminated with abend code X'04F'.

Operator Response: Notify the system programmer.

System Programmer Response: Reassemble DSN6SYSP, and relink-edit the DSNZPARM load module. This is done by resubmitting the install job stream, DSNTIJUZ, that built the load module that is named following the 'PARM=' parameter of the -START DB2 command.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 3, 5, 9.

DSNT107I INVALID AMODE OR RMODE ATTRIBUTE FOUND FOR LOAD MODULE *module-name*

Explanation: During DB2 startup, the service controller establishes the addressability to the DB2 database services functional recovery and the emergency shutdown routines. Two load modules, DSNTF, and DSNTLCLE, are loaded into CSA. In the MVS/XA environment, DSNTLCLE must be link-edited with attributes AMODE(24) and RMODE(ANY). At least one of the modules did not have the correct addressing attribute when it was loaded. 'module-name' in the error message is the name of the first load module that has an invalid addressing mode.

This message is issued by the following CSECT: DSNTSTR2

System Action: DB2 database services start up is terminated.

Operator Response: Notify the system programmer.

System Programmer Response: Verify that all install and maintenance activities against these modules were executed using SMP. Verify that the JCLIN for SMP includes the correct AMODE and RMODE control statements, and that the linkage editor provided with the Data Facility Product (DFP) is invoked by SMP for the link edits. Correct the procedure or JCL which caused the error and rerun the necessary SMP jobs.

Problem Determination: A DB2 dump was requested to an MVS/XA SYS1.DUMP data set.

The MVS service aid AMBLIST provides linkage editor module attributes in the summary section of the LISTLOAD function output.

DSNT200I *type bind-type* FOR PLAN *plan-id* SUCCESSFUL

Explanation: A BIND, REBIND or FREE PLAN subcommand has completed successfully.

type	Indicates that a test bind was in progress. A test bind means that no plan name was specified. The token is omitted if a normal BIND PLAN was processed.
bind-type	Type of bind subcommand: BIND, REBIND, or FREE.
plan-id	Name of application plan specified in the subcommand.

This message is issued by the following CSECT: DSNTBAP2

System Action: The plan was successfully bound, rebound, or freed.

DSNT201I *type bind-type* FOR PLAN *plan-id* NOT SUCCESSFUL

Explanation: Errors have been detected during the processing of the indicated BIND, REBIND, or FREE PLAN subcommand.

type	Indicates that a test bind was in progress. A test bind means that no plan name was specified. The token is omitted if a normal BIND PLAN was processed.
bind-type	Type of bind subcommand: BIND, REBIND, or FREE.
plan-id	Name of application plan specified in the subcommand.

This message is issued by the following CSECT: DSNTBAP2

System Action: The BIND, REBIND, or FREE PLAN was not performed.

System Programmer Response: See other messages issued to determine the error that caused the bind subcommand to terminate unsuccessfully.

DSNT202I *bind-type* **FOR PLAN** *plan-id* **USING** *auth-id*
AUTHORITY EXCEEDED MESSAGE LIMIT.
MESSAGE GENERATION TERMINATED

Explanation: A fixed amount of space exists in which to generate bind subcommand messages. This message says that the indicated bind subcommand generated more messages than will fit in that space.

bind-type Type of bind subcommand: BIND, REBIND, or FREE.
plan-id Name of application plan specified in the bind subcommand.
auth-id Authorization ID of the plan owner.

This message is issued by the following CSECT: DSNTBAP2

System Action: For bind subcommands that affect a single plan, the bind subcommand process continues. However, no other messages are generated for the indicated 'plan-id', except for message DSNT200I or DSNT201I. For bind subcommands that affect more than one plan, the bind subcommand process terminates and no other messages are generated.

System Programmer Response: The 'FLAG' parameter of the bind subcommand can be used to limit the types of messages that are generated.

DSNT205I *name* **IS A DUPLICATE** *name-type*, **IT WILL BE USED ONLY ONCE**

Explanation: Name 'name' has been specified more than once in a list of names.

name Name that was specified more than once.
name-type Indicates the type of list in which the name was duplicated.

- MEMBER NAME - List of DBRM Members
- PLAN-ID - List of plan IDs
- SYSTEM NAME - List of system connection names on a DISABLE or ENABLE list.
- PACKAGE NAME - List of package IDs

This message is issued by the following CSECT: DSNTBAP2

System Action: Duplicates are removed from 'name-type' list and the bind process continues.

System Programmer Response: Verify the list that contains the duplicate. If the error is only in entering a name incorrectly, which happens to duplicate another entry, enter the name correctly and reissue the bind statement. If the entry is really a duplicate, no action is required.

DSNT207I **PROGRAM** *program-name* **WITH MARK** *release-dependency-mark* **FAILED BECAUSE IT DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALL BACK HAS OCCURRED**

Explanation: Program 'program-name' depends on a function of DB2 that is not supported by the current active release.

program-name Name of the application program.
release-dependency-mark A one-character mark showing the oldest DB2 release supporting this program.

This message is issued by the following CSECTs: DSNTBCM1, DSNTBCM2

System Action: The bind operation for this plan or package is not performed.

User Response: The program cannot be used until the DB2 subsystem is remigrated to the newer release. Notify the system programmer.

System Programmer Response: Warn users not to use plans or packages containing this program until the DB2 subsystem has been remigrated to the newer release.

DSNT208I **PROGRAM** *program-name* **PRECOMPILED WITH INCORRECT LEVEL FOR THIS RELEASE**

Explanation: Program 'program-name' was precompiled under a release not supported by the current level of DB2, or the contents of the DBRM have been modified after the pre-compilation phase.

This message is issued by the following CSECTs: DSNTBCM1, DSNTBCM2

System Action: The BIND operation was not performed.

User Response: Precompile the named program again using the current precompiler. Reissue the BIND command.

Problem Determination: If the application program was precompiled at an appropriate release, and the problem persists, collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 79, 80, 81.

DSNT209I *bind-type* **FOR PLAN** *plan-id* **WITH MARK** *release-dependency-mark* **FAILED BECAUSE PLAN DEPENDS ON FUNCTIONS OF THE RELEASE FROM WHICH FALL BACK HAS OCCURRED.**

Explanation: Plan 'plan-id' depends on a function of DB2 which is not supported by the currently active release.

bind-type REBIND
plan-id Name of the application plan
release-dependency-mark A one-character mark showing the oldest release of DB2 which can support this plan. The release dependency mark for the plan is kept in the IBMREQD columns in the DB2 catalog in SYSIBM.SYSPLAN.

This message is issued by the following CSECT: DSNTBRB

System Action: The REBIND operation for this plan is not performed.

User Response: The plan cannot be used until the DB2 subsystem is remigrated to the newer release.

Operator Response: Notify the system programmer.

System Programmer Response: Warn users not to use the plan until the DB2 subsystem has been remigrated to the newer release.

DSNT210I *bind-type* **AUTHORIZATION ERROR USING authorization ID AUTHORITY PLAN=*plan-id* PRIVILEGE=*privilege***

Explanation: The indicated authorization ID does not have the indicated privilege and therefore cannot invoke the indicated BIND subcommand against the indicated application plan.

bind-type	Type of BIND subcommand: BIND, REBIND, FREE.
authorization ID	Authorization ID of the plan owner.
plan-id	Application plan specified in the BIND subcommand.
privilege	Missing privilege: BIND, BINDADD

This message is issued by the following CSECTs:

DSNTBAP	DSNTBCM1	DSNTBFR	DSNTBRB
---------	----------	---------	---------

System Action: The BIND, REBIND, or FREE operation for '*plan-id*' is not performed.

System Programmer Response: If the indicated privilege is BINDADD, then the privilege to invoke the BIND subcommand with the ACTION(ADD) option must be granted to the indicated authorization ID. If the indicated privilege is BIND, the privilege to invoke a BIND subcommand against the indicated application plan must be granted to the indicated authorization ID.

DSNT211I **REBIND FOR PLAN *plan-id* FAILED BECAUSE IBMREQD OF *ibmreqd* IS INVALID**

Explanation: The IBMREQD column of the SYSIBM.SYSPLAN catalog table for the named plan contains an unrecognizable character.

This message is issued by the following CSECT: DSNTBRB

System Action: The REBIND operation for the plan was not performed.

System Programmer Response: You must do a BIND ACTION(REPLACE) for this plan.

DSNT212I *bind-type* **AUTHORIZATION ID *auth-id* IN THE OWNER KEYWORD IS INVALID**

Explanation: The authorization ID specified in the OWNER keyword of the BIND or REBIND subcommand is invalid. To specify an OWNER that is not the primary authorization ID, or one of the secondary IDs of the process requires additional authority. See *Command Reference* for the authority required.

bind-type	Type of bind subcommand: BIND or REBIND
auth-id	The authorization ID specified as owner.

This message is issued by the following CSECTs:

DSNTBCM1	DSNTBCM2	DSNTBRB	DSNTBRB2
----------	----------	---------	----------

System Action: The BIND or REBIND subcommand is not executed.

System Programmer Response: Rerun the subcommand and specify a valid authorization ID for the OWNER keyword. You may need to add the required authorization ID for this user to the security system.

DSNT213I **THE DCB BLOCK SIZE OF THE INPUT DBRM LIBRARY IS INVALID**

Explanation: An invalid DCB block size is specified for the DBRM library of the BIND subcommand.

This message is issued by the following CSECT: DSNTBAP1

System Programmer Response: Correct the DCB block size of the DBRM library, and reissue the BIND subcommand.

DSNT214I **I/O ERROR ON DBRM LIBRARY DBRM MEMBER= *dbrm-name* DBRM LIBRARY= *dbrm-pds-name* xxxxxx**

Explanation: An I/O error was encountered attempting to read database request module (DBRM) during a BIND subcommand. 'xxxxxx' is a portion of the message text generated by the SYNADAF macro instruction to describe the permanent I/O error. This text may contain information such as jobname, stepname, unit address, device type, ddname, operation attempted, and error description.

dbrm-name	Name of the DBRM associated with the error.
dbrm-pds-name	Partitioned data set associated with the error.

This message is issued by the following CSECT: DSNTBAP1

System Action: No application plan is created.

System Programmer Response: Determine if an incorrect dbrm-pds-name was specified in the LIBRARY parameter of the BIND subcommand, or an incorrect data set name was specified for the DBRMLIB DD statement. Check correctly specified data sets for I/O errors or modified DCB attributes.

DSNT220I **BIND ADD ERROR USING *auth-id* AUTHORITY PLAN *plan-id* ALREADY EXISTS**

Explanation: An attempt was made to use the BIND subcommand with the 'ACTION(ADD)' option that specified a '*plan-id*' that already exists.

auth-id	Authorization ID of the owner of the plan.
plan-id	Application plan specified in the BIND subcommand.

This message is issued by the following CSECT: DSNTBCM1

System Action: No application plan is created.

System Programmer Response: Check the SYSIBM.SYSPLAN catalog table for names of existing application plans. Reinvoke the BIND subcommand with a '*plan-id*' that is not in use.

DSNT221I *bind-type* **ERROR USING *auth-id* AUTHORITY PLAN *plan-id* DOES NOT EXIST**

Explanation: The indicated bind subcommand was issued against an application plan that does not exist. The individual variable fields contain:

bind-type	Type of bind subcommand: REBIND or FREE.
auth-id	Authorization ID of the plan owner.
plan-id	Application plan specified in the BIND subcommand.

This message is issued by the following CSECTs: DSNTBFR, DSNTBRB

System Programmer Response: Check the SYSPLAN catalog table for the correct 'plan-id' to use.

DSNT228I BIND ERROR, ATTEMPTING TO REPLACE PACKAGE = *package_name* WITH VERSION = (*version2*) BUT THIS VERSION ALREADY EXISTS

Explanation: An attempt is made to create a version of a package that already exists. The version specified in the REPLVER keyword is different from the version specified for the precompile. The version specified for the precompile already exists in the catalog. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE catalog table. A common mistake is that the user may believe that the version he is creating is the one specified in the REPLVER keyword. This is not the case. The version specified in the REPLVER keyword is the name of the version being replaced. The version that will be created is the version that was given to the program when it was precompiled.

package_name	Fully qualified package name
version2	Version-id of package that is to be created

This message is issued by the following CSECT: DSNTBCM2

System Action: The bind will fail.

System Programmer Response: There are two approaches to solve this problem. The first is to re-compile the program with a new version name and re-issue the original BIND subcommand. The other approach is not to do the precompile but re-issue the BIND subcommand without the REPLVER parameter.

DSNT229I BIND ERROR, ATTEMPTING TO REPLACE PACKAGE = *package-name* THERE ARE ENABLE OR DISABLE ENTRIES CURRENTLY ASSOCIATED WITH THE PACKAGE

Explanation: The BIND subcommand was issued to replace a package that has ENABLE or DISABLE entries currently associated with the package. The individual variable fields contain:

package-name	Name of the package (location.collection.package)
--------------	--

This message is issued by the following CSECT: DSNTBCM2

System Action: Package not bound.

System Programmer Response: FREE the package first and then BIND the package.

DSNT230I BIND DBRM MEMBER NAME ERROR USING *auth-id* AUTHORITY *object-type* = *object-name* MEMBER *dbrm-name* NOT FOUND IN PDS SEARCH ORDER

Explanation: The indicated 'dbrm-name' was not found in the search order in the PDSs specified on the BIND PLAN or BIND PACKAGE subcommand.

auth-id	Authorization ID of the plan or package owner
object-type	The type of object being bound: PLAN or PACKAGE
object-name	If 'object-type' is PLAN, 'object-name' is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.
dbrm-name	Member name of the DBRM that was not found.

This message is issued by the following CSECT: DSNTBAP1

System Action: The bind is unsuccessful.

System Programmer Response: Determine if an incorrect 'dbrm-member-name' or PDS was specified. Reinvoke the BIND subcommand specifying the correct names.

DSNT231I BIND DBRM ERROR USING *auth-id* AUTHORITY *object-type* = *object-name* DBRM *dbrm-name* IS IN AN INCONSISTENT STATE

Explanation: The contents of a DBRM have been modified after the precompilation process, or the DBRM contains incorrect information in the header.

auth-id	Authorization ID of the invoker of the BIND subcommand.
object-type	The type of object being bound: PLAN or PACKAGE
object-name	If 'object-type' is PLAN, 'object-name' is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.
dbrm-name	Name of the DBRM that is in error.

This message is issued by the following CSECT: DSNTBAP1

System Action: The bind is unsuccessful.

System Programmer Response: Precompile the application program associated with the indicated DBRM. Reinvoke the BIND subcommand.

DSNT232I SUCCESSFUL *bind-type* FOR PACKAGE = *package-name*

Explanation: A BIND, REBIND or FREE PACKAGE subcommand has completed successfully.

bind-type	Type of bind subcommand: BIND, REBIND, or FREE
package-name	Name of the package in the following format: 'location.collection.package.(version)'

This message is issued by the following CSECT: DSNTBAP2

System Action: The package was successfully bound, rebound, or freed.

DSNT233I UNSUCCESSFUL *bind-type* **FOR PACKAGE =**
package-name

Explanation: Errors have been detected during the processing of the indicated BIND, REBIND, or FREE PACKAGE subcommand.

bind-type Type of bind subcommand: BIND, REBIND, or FREE

package-name Name of the package in the following format:
'location.collection.package.(version)'

This message is issued by the following CSECT: DSNTBAP2

System Action: The indicated package was not bound, rebound, or freed.

System Programmer Response: See other messages issued to determine the error that caused the subcommand to terminate unsuccessfully.

DSNT234I *bind-type* **FOR PACKAGE =** *package-name*
USING *auth-id* **AUTHORITY EXCEEDED**
MESSAGE LIMIT. MESSAGE GENERATION
TERMINATED

Explanation: A fixed amount of space exists in which to generate BIND subcommand messages. This message says that the indicated subcommand generated more messages than will fit in that space.

bind-type Type of bind subcommand: BIND, REBIND, or FREE

package-name Name of the package in the following format:
'location.collection.package.(version)'

auth-id Authorization ID of the package owner

This message is issued by the following CSECT: DSNTBAP2

System Action: For bind subcommands that affect a single package, the bind subcommand process continues. However, no other messages are generated for the indicated 'package-name', except for completion message DSNT232I or DSNT233I. For bind subcommands that affect more than one package, the bind subcommand process terminates and no other messages are generated.

System Programmer Response: The 'FLAG' parameter of the bind subcommand may be used to limit the types of messages that are generated.

DSNT235I *csect-name* *bind-type* **AUTHORIZATION ERROR**
USING *auth-id* **AUTHORITY PACKAGE =**
package-name **PRIVILEGE =** *privilege*

Explanation: The authorization ID given does not have the *privilege* indicated and cannot invoke the bind subcommand on the named package.

bind-type Type of bind subcommand: BIND, REBIND, or FREE

auth-id Authorization ID of the package owner

package-name Name of the package in the following format:
'location.collection.package.(version)'

privilege

Name of the privilege not held:

BINDADD or BINDADD *
The authority to create a new package using BIND with the ADD option.

BIND
The authority to BIND (REPLACE) or REBIND a package.

BIND *
The authority to add a new version of an existing package using BIND with the ADD option.

FREE
There is no FREE privilege, but the user needs the proper authority to free the package.

COPY
The authority to COPY from the indicated package.

CREATE IN or CREATE IN *
The authority to create a package in the indicated collection.

A blank and asterisk (*) in the privilege values 'BINDADD *', 'BIND *', and 'CREATE IN *' in the message indicates that the DB2 system parameter BIND NEW PACKAGE has the value BIND. When ' *' does not appear in these privilege values, BIND NEW PACKAGE has the value BINDADD.

The system parameter BIND NEW PACKAGE affects the authorization required to add a new package or a new version of an existing package to a collection. For more information about this system parameter, see:

- "Installing, Migrating, and Updating System Parameters" (Panel: DSNTIPP) in Section 2 of *Installation Guide*.
- "Controlling Access to DB2 Objects" in Section 3 (Volume 1) of *Administration Guide*.

System Action: The indicated package is not bound, rebound, or freed.

System Programmer Response: You must grant the indicated privilege to the authorization ID of the package owner.

DSNT236I REBIND FOR PACKAGE *package-name*
FAILED BECAUSE IBMREQD OF *ibmreqd* **IS**
INVALID

Explanation: The IBMREQD column of the SYSIBM.SYSPACKAGE catalog table for the named package contains an unrecognizable character. This usually means that the package depends on a function of DB2 which is not supported by the currently active release.

This message is issued by the following CSECT: DSNTBRB2

package-name Name of the package in the following format:
'location.collection.package.(version)'

System Action: The package was not rebound.

System Programmer Response: Warn users not to use the package until the DB2 subsystem is remigrated to the newer release.

DSNT237I BIND ADD ERROR USING *auth-id* AUTHORITY PACKAGE = *package-name* ALREADY EXISTS

Explanation: An attempt is made to add a package that already exists. The combination of 'location.collection.package.version' must be unique in the SYSIBM.SYSPACKAGE table. In addition, the combination of 'location.collection.package.consistency-token' must be unique.

auth-id Authorization ID of the owner of the package.

package-name Name of the package in the following format:
'location.collection.package.(version)'

This message is issued by the following CSECT: DSNTBCM2

System Action: No package is created.

System Programmer Response: Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages. Re-invoke the BIND subcommand with a 'location.collection.package.version' that is not in use.

DSNT238I *bind-type error-type* USING *auth-id* AUTHORITY PACKAGE = *package-name* DOES NOT EXIST

Explanation: The indicated subcommand was issued against a package that does not exist. The individual variable fields contain:

bind-type Type of bind subcommand (BIND COPY | BIND REPLACE | REBIND | FREE| BIND PLAN | REBIND PLAN | DROP PACKAGE). If BIND or REBIND PLAN is specified, the *package-name* refers to a package on the PKLIST for the plan.

error-type Type of error: WARNING or ERROR.

auth-id Authorization ID of the invoker of the BIND subcommand.

package-name Name of the package in the following format
'location.collection.package.(version)'

This message is issued by the following CSECTs:

DSNTBFR2 DSNTBRB2 DSNTBCM3

System Action: Package not rebound or freed.

System Programmer Response: Check the SYSPACKAGE catalog table for the correct 'location.collection.package.version' to use.

DSNT239I PLAN *plan-id* CONTAINS NO DBRMS AND NO PACKAGES

Explanation: A plan with no DBRMs was rebound with the NOPKLIST option specified. This creates an empty plan. No SQL can be executed. The individual variable fields contain:

plan-id Plan name specified on the REBIND command.

This message is issued by the following CSECT: DSNTBRB

System Action: This is a warning message. The REBIND process will continue.

System Programmer Response: If an empty plan is not desired, reissue the REBIND command with the PKLIST keyword specifying a new list.

DSNT240I *csect-name bind-type* ERROR, ASTERISK NOT ALLOWED ON REMOTE *bind-type* PACKAGE

Explanation: When remotely rebinding or freeing a package, an asterisk (*) cannot be specified anywhere in the name of a package. In other words, it is not possible to remotely rebind or free multiple packages.

System Programmer Response: Remove the asterisk and rebind, or free a specific package. Refer to *Command Reference* for the correct syntax for REBIND or FREE PACKAGE.

DSNT241I *bind-type* AUTHORIZATION *error-type* ON PLAN *plan-id* AUTHORIZATION ID *auth-id* NOT AUTHORIZED TO EXECUTE PACKAGE = *package-name*

Explanation: The indicated authorization ID does not have EXECUTE authority on the specified package in the package list.

bind-type Type of bind subcommand: BIND or REBIND

error-type Type of error: WARNING or ERROR. If VALIDATE(BIND) was specified, this is an ERROR message. Otherwise, it is a WARNING message.

plan-id Name of application plan specified in the subcommand.

auth-id Authorization ID of the plan owner.

package-name Name of the package (collection.package). The location of the package is the local DB2 location name.

This message is issued by the following CSECT: DSNTBBP

System Action: If the bind subcommand was invoked with VALIDATE(BIND), the BIND or REBIND operation is not performed. If VALIDATE(RUN) was used then the BIND or REBIND operation will continue.

System Programmer Response: The indicated plan owner should be granted the EXECUTE privilege on the package.

DSNT242I *bind-type* ERROR USING *auth-id* AUTHORITY NO BIND OR REBIND SUBCOMMANDS ARE ALLOWED FOR THIS AUTHID

Explanation: The authorization ID is not allowed to perform the indicated '*bind-type*' against a plan or package because entries in the RLST table prohibit binding and rebinding by this authorization ID, or all authorization IDs.

bind-type Type of bind subcommand: BIND or REBIND

auth-id Authorization ID of the plan or package owner.

This message is issued by the following CSECTs: DSNTBCM, DSNTBAS

System Action: The plan or package is not bound or rebound.

System Programmer Response: If the indicated authorization ID should be allowed to bind, change the entry in the active RLST table.

**DSNT243 BIND ERROR FOR PACKAGE = pkg-id
CONTOKEN = 'contoken'X IS NOT UNIQUE SO
IT CANNOT BE CREATED**

Explanation: An attempt is made to add or replace a package with a consistency token that is not unique for that package. In other words, the combination of 'location.collection.package.consistency-token' already exists.

pkg-id Fully qualified name of the package.

contoken Consistency token in hexadecimal.

This message is issued by the following CSECTs:
DSNTBCM2, DSNTBMSG

System Action: The BIND will fail.

System Programmer Response: Check the SYSIBM.SYSPACKAGE catalog table for names of existing application packages with the indicated consistency token. Re-issue the BIND subcommand such that the 'location.collection.package.consistency-token' is unique within the catalog. The following SQL statement can be used to query the catalog,

```
SELECT COLLID,NAME
FROM loc-id.SYSIBM.SYSPACKAGE
WHERE HEX(CONTOKEN) = 'contokn';
```

**DSNT244I bind-type ERROR keyword KEYWORD IS NOT
SUPPORTED FOR REMOTE PROCESSING**

Explanation: The indicated keyword is not supported for the remote bind or rebind subcommand.

bind-type Type of bind subcommand: BIND or REBIND

keyword Name of the keyword that is not supported.

This message is issued by the following CSECT: DSNTBAP

Programmer Response: Check *Command Reference* for the correct syntax.

**DSNT245I LOCATION location CANNOT BE SPECIFIED.
THE LOCAL DB2 IS UNDEFINED**

Explanation: Since the local DB2 location name is undefined, no location name may be given when specifying a package name on a bind subcommand.

location Location specified on the bind subcommand.

This message is issued by the following CSECTs: DSNTBAP, DSNTBAP2

System Action: The bind subcommand was not performed.

System Programmer Response: The location name of the local DB2 must be defined in BSDS if the location is used in the BIND, REBIND, or FREE subcommand.

**DSNT246I bind-type FOR PACKAGE package-name WITH
MARK release-dependency-mark FAILED
BECAUSE PACKAGE DEPENDS ON FUNC-
TIONS OF THE RELEASE FROM WHICH FALL
BACK HAS OCCURRED**

Explanation: The named package depends on a function of DB2 which is not supported by the currently active release.

bind-type Type of bind subcommand: REBIND

package-name Name of the package in the following format:
'location.collection.package.(version)'

release-dependency-mark
A one-character mark showing the oldest release of the DB2 which can support this package. The release dependency mark for the package is kept in the IBMREQD column in the DB2 catalog in SYSIBM.SYSPACKAGE.

This message is issued by the following CSECT: DSNTBRB2

System Action: The 'bind-type' operation for this package is not performed.

User Response: The package cannot be bound until the DB2 subsystem is remigrated to the newer release.

System Programmer Response: Warn users not to use plans containing this package until the DB2 subsystem has been remigrated to the newer release.

**DSNT247I bind-type ERROR object-type NOT FOUND FOR
object-type = object-name**

Explanation: You attempted to FREE or REBIND multiple plans or packages using the asterisk (*) but no plans or packages were found.

bind-type Type of bind subcommand: REBIND or FREE

object-type Type of object to be freed or rebound: PLAN or PACKAGE

object-name If object-type is PLAN, object-name is the name of the application plan. Otherwise, it is the name of the package in 'location.collection.package' format.

This message is issued by the following CSECTs:

DSNTBRB DSNTBRB2 DSNTBFR DSNTBFR2

System Action: The REBIND or FREE operation is not performed.

User Response: Check the plan or package name. If it is correct, no plans or packages were found and no operation can be performed; otherwise, correct the plan or package name and reissue the REBIND or FREE subcommand.

**DSNT249I csect-name bind-type WARNING FOR PLAN
plan-name keyword LOCATION-ID location-id
NOT FOUND IN SYSIBM.LOCATION**

Explanation: A 'location-id' was specified on the PKLIST or CURRENTSERVER keyword on a bind subcommand. That location is not defined in the SYSIBM.LOCATIONS table.

bind-type Type of bind subcommand: BIND or REBIND

plan-name Name of the plan

keyword The bind subcommand containing the nonexistent location: PKLIST or CURRENTSERVER

location-id The nonexistent location

System Action: The bind process will continue.

System Programmer Response: Define the appropriate 'location-ids' in the SYSIBM.LOCATION catalog table prior to executing the plan.

DSNT250I BIND UNABLE TO OPEN DBRM LIBRARY USING *authorization-id* AUTHORITY *object-type* = *object-name*

Explanation: The BIND subcommand was unable to open the DBRM partitioned data set(s).

authorization-id Authorization ID of the invoker of the BIND subcommand.

object-type PLAN | PACKAGE

object-name If '*object-type*' is PLAN, '*object-name*' is the name of the application plan. Otherwise, it is the name of the package in '*location.collection.package*' format.

This message is issued by the following CSECT: DSNTBAP1

User Response: Contact the system programmer, providing all material associated with the error.

System Programmer Response: Determine why the BIND subcommand was unable to open the DBRM library, and correct the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 32.

DSNT251I BIND UNABLE TO LOCATE DBRM LIBRARY MEMBERS USING *authorization-id* AUTHORITY *object-type* = *object-name*

Explanation: The BIND subcommand received an I/O error while attempting to locate the specified DBRM library member(s).

authorization-id Authorization ID of the invoker of the BIND subcommand.

object-type PLAN | PACKAGE

object-name If *object-type* is PLAN, *object-name* is the name of the application plan. Otherwise, it is the name of the package in '*location.collection.package*' format.

This message is issued by the following CSECT: DSNTBAP1

System Programmer Response: Correct the reason for the I/O error, and reissue the BIND subcommand.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 32.

DSNT252I *csect-name bind-type* PARAMETERS FOR PLAN *plan-name*

ACTION	<i>bind-option1</i>	<i>bind-option2</i>

Severity: 0 (informational)

DSNT256I DBRM MEMBER *member-name* IS EMPTY, A PACKAGE CANNOT BE BOUND

Explanation: The named DBRM member is empty, a package cannot be created.

This message is issued by the following CSECT: DSNTBCM

System Action: No package is created.

DSNT257I BIND ERROR, PACKAGE *package-name* CANNOT BE CREATED BECAUSE IT HAS THE SAME NAME AS THE PACKAGE BEING COPIED

Explanation: The location and collection-id of the package being created are the same as the local location and the collection-id specified with the COPY keyword. You cannot create a package that is the same name as the package being copied.

(DLIBATCH, CICS, IMSBMP, IMSMPP, or REMOTE. REMOTE is only valid for BIND/REBIND PACKAGE)

DSNT262I *csect bind-type* **WARNING - ISOLATION** *old-iso*
NOT SUPPORTED. CHANGING TO ISOLATION
new-iso

Explanation: DB2 does not support the isolation level specified on the local BIND or REBIND PACKAGE subcommand. The isolation level specified by *new-iso* is used instead.

Severity: 4

System Action: Processing continues

User Response: If the new isolation level is not satisfactory, change the ISOLATION option on the BIND or REBIND PACKAGE subcommand and rebind the package. Use a value that DB2 supports.

DSNT263I *csect-name bind-type* **FOR** *object-type = object-name* **FAILED BECAUSE THE** *bind-type*
DEPENDS ON FUNCTIONS IN A LATER DB2
RELEASE WITH MARK *release-dependency-mark* **OR HIGHER**

Explanation: The current DB2 does not support a bind option or feature specified in the indicated bind subcommand. The bind option or feature depends on functions in a later DB2 release.

bind-type Type of bind subcommand: BIND or REBIND

object-type PLAN or PACKAGE

object-name If *object-type* is PLAN, *object-name* is the name of the plan.

If *object-type* is PACKAGE, *object-name* is the name of the package in the format 'location-id.collection-id.package-id'.

release-dependency-mark

A one-character mark indicating the oldest DB2 release that can support the bind subcommand.

This message can be issued in the following situations:

- When the DSN command explicitly or implicitly uses the name of a DB2 subsystem that does not support a bind option or feature used in the DSN bind subcommand *bind-type*, or
- When the DSN command uses a group attachment name for a DB2 data sharing group and the receiving DB2 data sharing member does not support a bind option or feature used in the DSN bind subcommand *bind-type*.

System Action: The *bind-type* operation is not performed.

User Response: In the DSN command, specify the name of a DB2 subsystem having release dependency mark *release-dependency-mark* or higher that supports all of the bind options or features used in the *bind-type* subcommand.

For a list of the DB2 release dependency marks and their meanings, refer to the IBMREQD column in the SYSIBM.SYSPLAN or SYSIBM.SYSPACKAGE DB2 catalog tables described in Appendix D of *SQL Reference*.

System Programmer Response: See the 'User Response' section of this message.

DSNT270I **THE FOLLOWING SQLCA INFORMATION WAS RETURNED FROM** *subsystem*

SQLCODE = sqlcode
SQLSTATE = sqlstate
SQLERRMT = tokens
SQLWARN = warn_fields

Explanation: A warning or error has been received from a database server using Advanced SQL protocols (ASP) of the Distributed Relational Database Architecture (DRDA), during remote program BIND processing. The tokens of the message are:

1. subsystem - the database server,
2. sqlcode - SQL return code,
3. sqlstate - additional set of return codes common to the four relational products,
4. tokens - specific tokens passed in the message portion of the SQLCA for problem determination, and
5. warn_fields - the warning information indicators.

This message is issued by the following CSECT: DSNLXMSG

System Action: See the System Action associated with the indicated SQL return code.

System Programmer Response: See the Programmer Response associated with the indicated SQLCODE and/or SQLSTATE. Take note of the warning or error (as indicated in the SQLCODE, SQLSTATE, or one or more of the SQLWARN fields), and determine if a program change is necessary. SQLWARNx fields are described in Appendix C of *SQL Reference*. A change to the application may be necessary or the system programmer may have to be consulted depending on the situation.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5.

DSNT271I **THE FOLLOWING SQLCA INFORMATION WAS RETURNED FROM** *subsystem*

SQLCODE = sqlcode
SQLSTATE = sqlstate
SQLERRMT = tokens
SQLWARN = warn_fields
STATEMENT = stmt_num

Explanation: A warning or error has been received from a database server using advanced SQL protocols (ASP) of the Distributed Relational Database Architecture (DRDA), during remote program BIND processing. The tokens of the message are:

1. subsystem - database server,
2. sqlcode - SQL return code,
3. sqlstate - additional set of return codes common to the four relational products,
4. tokens - specific tokens passed in the message portion of the SQLCA for problem determination,
5. warn_fields - the warning information indicators, and
6. stmt_num - the statement number of the failing statement.

This message is issued by the following CSECT: DSNLXMSG

System Action: See the System Action associated with the indicated SQLCODE.

System Programmer Response: Take note of the warning or error (as indicated in the SQLCODE, SQLSTATE, or one or more of the SQLWARN fields), and determine if a program change is necessary. SQLWARNx fields are described in Appendix C of *SQL Reference*. A change to the application may be necessary or the system programmer may have to be consulted depending on the situation.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in “Appendix B. Problem Determination” on page X-5: 1, 2, 5.

DSNT300I AUTH-ID *authorization-id* NOT AUTHORIZED TO PERFORM *function* ON DATABASE *dbname*. REQUEST REJECTED

Explanation: The invoker's 'authorization-id' as designated by AUTHORIZATION ID is not authorized to perform the specified database control command function on this database. The 'function' is either -START, -STOP, or -DISPLAY. The name of the database is 'dbname'.

This message is issued by the following CSECT: DSNTDMSG

System Action: The request is rejected.

User Response: Notify the system programmer.

System Programmer Response: The privilege to issue the command must be granted to the indicated 'authorization-id'.

DSNT301I INVALID DATABASE *dbname*

Explanation: The databases named in the -START, -STOP, or -DISPLAY DATABASE command do not exist. The name of the database is 'dbname'.

System Action: The request is rejected. This message may be repeated.

This message is issued by the following CSECT: DSNTDMSG

System Programmer Response: Reissue the command with a valid name.

DSNT302I INVALID NAME *sname*

Explanation: In the message, 'sname' is the name of the table space or index space. The 'sname' specified in the SPACENAM keyword on the -START, -STOP, or -DISPLAY DATABASE command does not exist.

System Action: The request is rejected. This message may be repeated.

This message is issued by the following CSECT: DSNTDMSG

System Programmer Response: Reissue the command with a valid table space name or index name.

DSNT303I SPACENAM KEYWORD ONLY VALID FOR A SINGLE DATABASE. REQUEST REJECTED

Explanation: The SPACENAM keyword may be specified only when a single database name is specified for the DATABASE keyword in the -START, -STOP, and -DISPLAY DATABASE command.

This message is issued by the following CSECT: DSNTDMSG

System Action: The request is rejected.

System Programmer Response: Reissue the command, specifying a single database name in the 'DATABASE' keyword.

DSNT304I *csect-name* INSTALLATION SYSOPR IS NOT AUTHORIZED TO CHANGE OBJECT STATUS ON DATABASE *dbname*. REQUEST IS REJECTED.

Explanation: INSTALLATION SYSOPR is not authorized to perform the START DATABASE command function on this database because the command can change an objects status in this database. INSTALL SYSOPR can use the START DATABASE command only to recover LPL pages or GRECP objects. The name of the database is *dbname*.

System Action: The request is rejected.

Operator Response: Reissue the -START DATABASE command using the correct access mode or contact your system programmer.

DSNT305I SUBSYSTEM FAILURE DURING *command-name* DATABASE COMMAND PROCESSING. RC = *yy*, REASON = *zz*

Explanation: An error was found while processing the -START, -STOP or -DISPLAY DATABASE command. In the message, 'command-name' is the string 'DISPLAY', 'STOP', or 'START' (depending upon the command processed).

This message is issued by the following CSECT: DSNTDMSG

System Action: Originating from CSECT DSNTDCST:

- For relational data system (RDS) subcomponent errors:
 - 'yy' is a 4-byte return code of 8.
 - 'zz' is a 4-byte abend code of '00E30085'.
- For data manager (DM) subcomponent errors:
 - 'yy' is a 4-byte return code consisting of a 2-byte return code and a 2-byte reason code returned by the data manager function invoked by DSNTDCST.
 - 'zz' is a 4-byte abend code '00E30086'.

A record is written to SYS1.LOGREC, and an SVC dump is requested before the execution unit is abended.

Originating from CSECT DSNTDDIS:

- 'yy' is a 4-byte return code of 12.
- 'zz' is a 4-byte abend code of '00E30089'.

The request is abended.

Originating from CSECTs DSNTDMUL or DSNTDMSG:

- 'yy' is a 4-byte return code returned by the message generator.
- 'zz' is a 4-byte abend code of '00E30084'.

The request is abended.

System Programmer Response: Refer to “Section 4. DB2 Codes” on page 4-1 for the particular abend reason code issued.

Problem Determination: Collect the following diagnostic items listed in “Appendix B. Problem Determination” on page X-5: 1, 2, 5, 17.

DSNT306I RESPONSE MESSAGE LIMIT HAS BEEN REACHED

Explanation: A fixed amount of space exists in which to generate DISPLAY, START, or STOP database command messages. This message indicates that the DISPLAY, START, or STOP database command that was specified generated more messages than will fit in that space.

This message is issued by the following CSECT: DSNTDMSG

User Response: Specify individual databases and/or table spaces rather than specifying '*' (that is, all names).

DSNT307I INVALID RANGE SPECIFICATION *string1* IS GREATER THAN *string2*

Explanation: A range was specified on a DISPLAY DB(*string1:string2*) or DISPLAY DB(..) SPACENAM(*string1:string2*) command or on a database command (START DB, STOP DB, or DISPLAY DB) on PART(*string1:string2*) keyword where the first string, specified alphanumerically, collates after the second string.

This message is issued by the following CSECT: DSNTDMSG

User Response: Specify the command again. Make sure the first string does not alphanumerically collate after the second string specified.

DSNT308I AFTER KEYWORD ONLY VALID FOR A SINGLE DATABASE OR A SINGLE TABLESPACE/INDEXSPACE WITHIN A DATABASE. REQUEST REJECTED

Explanation: The AFTER keyword may be specified by one of the following:

- A single database name after the keyword DATABASE
- A single table space name or index space name after the keyword SPACENAM.

This message is issued by the following CSECT: DSNTDMSG

User Response: Specify the command correctly.

DSNT309I *csect-name object_name* IS CURRENTLY *state*.

Explanation: One of the following is already in the requested state:

- A database listed in START DB(*list*) or STOP DB(*list*)
- A table space listed in START DB(*name*) SPACENAM(*list*) or STOP DB(*name*) SPACENAM(*list*)
- An index space listed in START DB(*name*) SPACENAM(*list*) or STOP DB(*name*) SPACENAM(*list*)
- A partition of a partitioned table space listed in START DB(*list*) SPACENAM(*list*) PART(*n*), STOP DB(*list*) SPACENAM(*list*) PART(*n*), START DB(*list*) SPACENAM(*list*), or STOP DB(*list*) SPACENAM(*list*)

In the message:

- The 'object' is the database, table space, index space or partition number with table space name or the index space name.
 - TABLESPACE, if the specified table space was currently in the requested state
 - INDEXSPACE, if the specified index space was currently in the requested state

- DATABASE, if the database was currently in the requested state
- PARTITION, if the specified partition of a partitioned table space or partitioned index was currently in the requested state

• The 'state' is:

- START RW, if the specified object is currently started read/write
- START RO, if the specified object is currently started read only
- START UT, if the specified object is currently started for utility processing
- STOPPED, if the specified object is currently stopped or is stopping
- STOP PENDING, if the specified object currently is in stop pending status.

If there are pages in the logical page list (LPL) for the object, or if the object is in group buffer pool recovery pending (GRECP) status, a START DATABASE ACCESS(RO) or START DATABASE ACCESS(RW) command triggers a recovery of that object even if this message is issued for that object. For each object that has LPL or GRECP recovery that is initiated, DB2 issues a DSNIO06 message followed by either a DSNIO21 message (when the recovery completes successfully) or a DSNIO05 message (when the recovery is unsuccessful).

User Response: No response is necessary. This message is informational only.

DSNT310I *csect-name* ALL *object* CURRENTLY *state*.

Explanation: A database and all of its table spaces and index spaces are already in the requested state. This occurred following the processing of one of these commands:

- START DB(*)
- STOP DB(*name*)
- START DB(*name*) SPACENAM(*)
- STOP DB(*name*) SPACENAM(*)

In this message:

- The 'object' is either:
 - TABLESPACE(S) if the specified table space was currently in the requested state
 - INDEXSPACE(S) if the specified index space was currently in the requested state
 - DATABASE(S) if the database was currently in the requested state.
- The 'state' is either:
 - START RW if the specified table space is currently started read/write
 - START RO if the specified table space is currently started read only
 - START UT if the specified table space is currently started for utility processing
 - STOPPED if the specified table space is currently stopped, has a stop pending against it, or is stopping.

If there are pages in the logical page list (LPL) for the object, or if the object is in group buffer pool recovery pending (GRECP) status, a START DATABASE ACCESS(RO) or

START DATABASE ACCESS(RW) command triggers a recovery of that object even if this message is issued for that object. For each object that has LPL or GRECP recovery that is initiated, DB2 issues a DSNI006 message followed by either a DSNI021 message (when the recovery completes successfully) or a DSNI005 message (when the recovery is unsuccessful).

User Response: No response is necessary. This message is informational only.

DSNT311I MESSAGE LIMIT EXCEEDED. DISPLAY IS TERMINATED.

Explanation: The number of messages generated exceeds the maximum number of messages specified in the LIMIT keyword or exceeds the system default.

This message is issued by the following CSECT: DSNTDMSG

DSNT312I *object name* MUST BE STARTED RW. NO ACTION TAKEN.

Explanation: The ACCESS keyword is either RO or UT, and the object must be started ACCESS (RW).

In the message, 'object' is either:

- TABLESPACE(S) IN if the START DB(name) SPACENAM(...) is specified, or
- DATABASE if the START DB(name) is specified.

This message is issued by the following CSECT: DSNTDMSG

DSNT313I ACCESS(FORCE) IS VALID ONLY WITH EXPLICIT TABLESPACE OR INDEXSPACE NAMES. COMMAND IS REJECTED

Explanation: The ACCESS(FORCE) keyword can be specified when either:

- A single table space or index space name appears after the keyword SPACENAM in a START DATABASE command.
- A list of table space and/or index space names appears after the keyword SPACENAM in a START DATABASE command.

This message is issued by the following CSECT: DSNTDMSG

Operator Response: Specify the command correctly.

DSNT314I *csect_name* INVALID PARTITION SPECIFICATION FOR OBJECT *object-name*

Explanation: The PART keyword is invalidly specified in a START DATABASE, STOP DATABASE, or DISPLAY DATABASE command.

The PART keyword is invalid if it is specified for:

- A nonpartitioned table space
- A nonpartitioned type 1 index
- A type 2 index not defined on a partitioned table space

The object *object-name* can be either a table space or an index space.

No action for this table space or index space is performed by the START DATABASE, STOP DATABASE or DISPLAY DATABASE command. Any other valid table space or index space specified is processed by the command.

Severity: 8 (error)

System Action: The desired command is not processed for the table space or index space in question. All other valid table spaces or index spaces specified in the command are processed.

User Response: Resubmit the command for the nonpartitioned table space or index space without using the PART keyword.

Problem Determination: SYSIBM.SYSTABLESPACE in the DB2 catalog indicates whether a table space is partitioned. SYSIBM.SYSINDEXSPACE in the DB2 catalog indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. Type 2 nonpartitioned indexes can be started, stopped, or displayed at the logical partition level; type 1 cannot.

DSNT315I *csect_name* INVALID PARTITION NUMBER OR RANGE SPECIFIED - *part-num* FOR OBJECT *object-name*

Explanation: An invalid partition number or range was specified in the PART keyword for a START DATABASE, STOP DATABASE or DISPLAY DATABASE command.

Partition number or range *part-num* is invalid for the object *object-name*.

Severity: 8 (error)

System Action: The part number or range is ignored. All other valid partitions specified are processed if PART was specified as list.

User Response: Determine the correct partition specification for the table space or index that was the subject of the specified command and resubmit the command.

Problem Determination: SYSIBM.SYSTABLESPACE in the DB2 catalog indicates the correct range of partition numbers for the table space. SYSIBM.SYSINDEXSPACE in the DB2 catalog indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. Type 2 indexes can be started, stopped, or displayed at the logical partition level; type 1 cannot.

DSNT316I *csect-name* A LOGICAL PARTITION OF AN INDEX WHICH HAS PAGES IN THE LPL OR HAS BEEN MARKED GRECP CANNOT BE STARTED FOR RW OR RO ACCESS

Explanation: The START DATABASE command was specified for a logical partition of a nonpartitioned index which has pages in the logical page list (LPL) or is marked group buffer pool recovery pending (GRECP). To start a nonpartitioned index with one of these exception conditions, the START DB command must be specified without the PART keyword.

Severity: 8 (error)

System Action: The command is not processed for the index space. All other valid table spaces or index spaces specified in the command are processed.

User Response: Submit the command for the nonpartitioned index space without using the PART keyword.

Problem Determination: If more information on the status of the index space is required, use the -DISPLAY DATABASE command.

DSNT317I *csect-name* ANY USER-DEFINED INDEXES ON DSNDDB06 COULD NOT BE *cmd-type* DUE TO A RESOURCE UNAVAILABLE ON THE CATALOG OR DIRECTORY.

Explanation: If user-defined indexes exist on DSNDDB06, they could not be displayed, started or stopped (depending on *cmd-type*) because the catalog or directory was not available. DB2-defined indexes and table spaces are not affected by this unavailability.

Programmer Response: When you get this message, correct the resource unavailable problem and reissue the command.

System Action: Any user-defined indexes on DSNDDB06 were not affected by the command issued. All other table spaces and index spaces were processed by the command.

DSNT331I *csect-name*DATABASE *name* AND ANY SPACE IT CONTAINS CANNOT BE STOPPED. IT IS THE ACTIVE COMMUNICATIONS DATABASE

Explanation: The database specified in the message cannot be stopped because it is the active communications database. In addition, spaces within the active communications database cannot be stopped.

System Action: Nothing is stopped.

Operator Response: If the database or any space within it must be stopped, you must stop the distributed data facility (STOP DDF). In a DB2 data sharing environment, you must stop the distributed data facility on all members of the DB2 data sharing group.

DSNT332I TABLESPACES AND INDEXSPACES ARE UNAVAILABLE BECAUSE DATABASE *name* IS STOPPED

Explanation: The database '*name*' is currently marked as stopped. Consequently, its table spaces and index spaces are unavailable even though they may have been started.

This message is issued by the following CSECT: DSNTDMSG

DSNT350I *luw-id* ACCESSING DATA FOR *location*

Explanation: This message follows message DSNT394I or DSNT396I for each thread reported that is participating in distributed data access (database access thread). This additional line reports the distributed identification as follows:

luw-id=token The logical-unit-of-work identifier (LUW-ID) is a unique identifier that is assigned to the thread followed by an '=' sign and a token. The token can be used in place of *luw-id* in any DB2 command that accepts *luw-id* as input.

location The LOCATION name assigned to the requesting site.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNTDMUL

DSNT358I *csect_name* INVALID PARTITION SPECIFICATION FOR OBJECT *object-name*

Explanation: Specification of the PART keyword in a DISPLAY DATABASE command is invalid.

The PART keyword is invalid if it is specified for:

- A nonpartitioned table space
- A nonpartitioned type 1 index
- A type 2 index not defined on a partitioned table space

The object *object-name* can be either a table space or an index space.

No action for this table space or index space is performed by the DISPLAY DATABASE command. Any other valid table space or index space specified is processed by the command.

Severity: 8 (error)

System Action: The desired command is not processed for the table space or index space in question. All other valid table spaces or index spaces specified in the command are processed.

User Response: Resubmit the command for the nonpartitioned table space or index space without using the PART keyword.

Problem Determination: SYSIBM.SYSTABLESPACE indicates whether a table space is partitioned. SYSIBM.SYSINDEXSPACE indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. Type 2 nonpartitioned indexes can be displayed at the logical partition level; type 1 indexes cannot.

DSNT359I *csect_name* INVALID PARTITION NUMBER SPECIFIED - *part-num* FOR OBJECT *object-name*

Explanation: An invalid partition number was specified in the PART keyword for a DISPLAY DATABASE command.

Partition number *part-num* is invalid for the object *object-name*.

Severity: 8 (error)

System Action: The part number is ignored. All other valid partitions specified are processed.

User Response: Determine the correct partition specification for the table space or index that was the subject of the specified command and resubmit the command.

Problem Determination: SYSIBM.SYSTABLESPACE in the DB2 catalog indicates the correct range of partition numbers for the table space. SYSIBM.SYSINDEXSPACE in the DB2 catalog indicates whether an index space is partitioned and whether the index space is a type 1 or a type 2 index. The PART keyword can be used to display the status of logical partitions of type 2 indexes but not type 1 indexes.

DSNT360I *****

Explanation: This message consists of 35 asterisks that begin the display of any database and the display of space names for any database.

This message is issued by the following CSECT: DSNTDMSG

DSNT361I *DISPLAY DATABASE SUMMARY* report-type-list

Explanation: This message is a multiple-line message that labels the requested set of databases, table spaces, and index spaces.

In the message, 'report-type-list' lists all options specified on the command delimited by spaces. Possible values are:

- ACTIVE All allocated databases are listed.
- GLOBAL All requested database information is listed. This title is produced if ACTIVE, DISABLED, and RESTRICT are omitted.
- LOCKS The connection identifiers and correlation identifiers of all applications holding, retaining, or waiting for locks on the specified table spaces or index spaces are displayed.
- RESTRICT All databases with restricted usage (that is, RO, started UT) are listed.
- USE The connection identifiers and correlation identifiers of all allocated applications are listed.
- CLAIMERS The connection identifiers and correlation identifiers of all applications holding claims on the specified database are displayed.
- LPL The page number ranges of the pages that are included in the logical page list for the table space or index space.

This message is issued by the following CSECT: DSNTDMSG

DSNT362I DATABASE = data-base-name STATUS = status DBD LENGTH = dbd-length

Explanation: This message signals the beginning of display information from the DISPLAY DATABASE command. It lists the name, status, and DBD length of the database. All table space and index space names listed in the following DSNT392I, DSNT394I, or DSNT396I messages are contained within this database.

- data-base-name* The database name.
- status* A combination of one or more of the following strings delimited by a comma. The maximum length of the string is 18 characters.
 - RO The database is started for read activity only.
 - RW The database is started for read and write activity.
 - STOP The database is stopped.
 - STOPP A stop is pending or is in progress for this database.
 - UT The database is started for utility processing only.

This message is issued by the following CSECT: DSNTDMSG

DSNT363I PHYSICAL ERROR PAGE RANGE FOR DATA SET data-set-name LOW=lowphy, HIGH=hiphy

Explanation: This message is the response to a -DISPLAY DATABASE command when the SPACENAM keyword is specified in order to notify the user of any physical I/O errors encountered on a data set.

In the message, 'data-set-name' is the name of the data set with errors. The variables 'lowphy' and 'hiphy' identify the range of physical pages, within the data set, that were being read when the I/O errors occurred. Physical page numbers are assigned in relationship to the beginning of the data set in which the pages reside.

This message is always preceded by messages DSNT360I and DSNT361I, which identify the name of the database and page set that the specified data set supports.

Page sets (table spaces or index spaces) are made up of supporting data sets. Physical pages are pages in supporting data sets that are numbered from the beginning of the particular data set in which they reside. This message refers to physical pages in a data set that support (are part of) some page set.

This message is issued by the following CSECT: DSNTDCST

System Action: See the Explanation section for this message.

DSNT365I NO DATABASES FOUND

Explanation: This message is produced when a DISPLAY DB(name) is entered and no databases were found to satisfy the request.

This message is issued by the following CSECT: DSNTDMSG

System Action: The process continues normally.

DSNT366I DATABASE name NOT type

Explanation: A database listed in the DISPLAY DB(...) is not of the correct type. The variables are as follows:

- name The name of the object.
- type The type of request specified: ACTIVE, RESTRICTED, ACTIVE OR RESTRICTED

Note that either DSNT301I or DSNT302I is produced if no object is found and the keywords ACTIVE and RESTRICT are omitted.

This message is issued by the following CSECT: DSNTDMSG

System Action: Processing continues normally.

DSNT367I NO INFORMATION AVAILABLE

Explanation: This message is produced when there is no LOCK or USE information available. When DISPLAY DB(...) is entered, and DB(...) is a list of databases or a list of names, this message indicates that no listed database has LOCK or USE information available.

If DISPLAY DB(...) or DISPLAY DB(...) SPACENAM(*) is entered, and DB(...) is a range or subset of databases, or all databases ('*'), this message indicates that no databases, for which the invoker has authority to display, have LOCK or USE information available. This message is produced only when the keywords USE and LOCKS are specified.

This message is issued by the following CSECT: DSNTDMSG

System Action: The process continues normally.

DSNT375I PLAN *plan-id1* WITH CORRELATION-ID *id1*
 CONNECTION-ID *id2* LUW-ID *id3*
 # THREAD-INFO *id-4* IS DEADLOCKED WITH
 # PLAN *plan-id2* WITH CORRELATION-ID *id5*
 # CONNECTION-ID *id6* LUW-ID *id7*
 # THREAD-INFO *id8* ON MEMBER *id9*

Explanation: This message is issued whenever plan 'plan-id1' with correlation 'id1', connection 'id2', and LUW 'id3' is denied an IRLM lock because of a detected deadlock. Plan 'plan-id2' identifies one of the members of the deadlock.

DB2 does not attempt to identify all survivors of a deadlock or all participants in a deadlock in the DSNT375I message. Plan 'plan-id2' in message DSNT375I might be just one of several # plans holding locks or waiting for locks on the desired # resource.

If multiple deadlocks are detected during the same deadlock- # detection interval, the blocker identified by 'plan-id2' in one DSNT375I message might be selected to break a deadlock # identified by a different DSNT375I message. The blocker iden- # tified by 'plan-id2' is not guaranteed to be a winner in all deadlocks in which it participates.

A *blocker* is the thread that is disallowing the victim from # getting its lock. The blocker might be a holder of the lock, or it # might be another waiter (one that came in before the victim) # that is incompatible with the holder's lock.

A DB2 IFCID 172 trace record contains the information needed to determine all participants in, and survivors of, a given dead- lock.

plan-id1, plan-id2

The names of the executing plans.

id1 The correlation identifier of the thread associated with 'plan-id1'. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify a system agent.

id2 The connection identifier of the thread associated with 'plan-id1'.

id3 The logical-unit-of-work identifier of the thread asso- ciated with 'plan-id1'. An asterisk (*) indicates that the thread does not have an LUW-ID. If the LUW-ID is not an asterisk, the value is a logical-unit-of-work identifier that is assigned to the thread. It is followed by an equal (=) sign and a token value, which can be used in place of the logical-unit-of-work identifier in any DB2 command that accepts a logical-unit-of-work identifier as input.

id4 This ID contains additional identifiers that define # more specific information regarding the identity of # the agent.

In many distributed configurations, the primary # authorization-ID used with DB2 is not necessarily # the user-ID of the end-user. If provided by the # client, the additional tokens further assist in identi- # fying the client end-user.

The following identifiers, separated by a colon (:), # are provided:

- # • The primary authorization-ID associated with # the thread.

- # • Workstation name of the end-user's workstation. # An asterisk (*) indicates it is not relevant to the # thread or was not provided by the client.
- # • End-user's user-ID. An asterisk (*) indicates it is # not relevant to the thread or was not provided # by the client.
- # • Application name of the end-user's application. # An asterisk (*) indicates that is not relevant to # the thread or was not provided by the client.

id5 The correlation identifier of the thread associated with 'plan-id2'.

id6 The connection identifier of the thread associated with 'plan-id2'.

id7 The logical-unit-of-work identifier of the thread asso- ciated with 'plan-id2'. An asterisk (*) indicates that the thread does not have an LUW-ID. If the LUW-ID is not an asterisk, the value is a logical-unit-of-work- identifier that is assigned to the thread followed by an equal (=) sign and a token value, which can be used in place of logical-unit-of-work identifier in any DB2 command that accepts logical-unit-of-work identifier as input.

id8 This ID contains additional identifiers that define # more specific information regarding the identity of # the agent.

In many distributed configurations, the primary # authorization-ID used with DB2 is not necessarily # the user-ID of the end-user. If provided by the # client, the additional tokens further assist in identi- # fying the client end-user.

The following identifiers, separated by a colon (:), # are provided:

- # • The primary authorization-ID associated with # the thread.
- # • Workstation name of the end-user's workstation. # An asterisk (*) indicates it is not relevant to the # thread or was not provided by the client.
- # • End-user's user-ID. An asterisk (*) indicates it is # not relevant to the thread or was not provided # by the client.
- # • Application name of the end-user's application. # An asterisk (*) indicates that is not relevant to # the thread or was not provided by the client.

id9 Identifies the member name of the DB2 subsystem on which the thread associated with *plan-id2* is exe- cuting.

An asterisk (*) can appear for PLANID2, ID4, ID5, ID6, and ID7 # if the blocking request was released by the requester or was # timed out between the detection of the deadlock and reporting # the deadlock.

DB2 can recover from a lock denial in some cases and can complete successfully. In such a case, the SQLCA is not filled in. One example is during setup of performance enhancements during bind time for execution time.

The SQLCA corresponding to correlation id 'id1', connection id 'id2', and LUW-ID 'id3' contains an SQLCODE of -904, -911, -913, or -923 and the name of the resource involved in the deadlock.

If you receive a system plan in this message, see the information about system plans in message DSNT376I.

This message is issued by the following CSECT: DSNTLSUS

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 18.

```

DSNT376I  PLAN plan-id1 WITH CORRELATION-ID id1
          CONNECTION-ID id2 LUW-ID id3
#          THREAD-INFO id4 IS TIMED OUT. ONE
          HOLDER OF THE RESOURCE IS PLAN
          plan-id2 WITH CORRELATION-ID id5
#          CONNECTION-ID id6 LUW-ID id7
          THREAD-INFO id8 ON MEMBER id9
    
```

Explanation: This message is issued whenever plan 'plan-id1' with correlation 'id1', connection 'id2', and LUW 'id3' is denied a lock by IRLM, because the amount of time to wait for a locked resource was exceeded. Plan 'plan-id2' identifies one of the plans holding a lock on the desired resource. The listed plan is not necessarily responsible for the time-out condition.

plan-id1, plan-id2

The names of the executing plans.

id1 The correlation identifier of the thread associated with 'plan-id1'. If the execution of the plan was switched by DB2 to a system agent, the correlation identifier identifies the system agent. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

id2 The connection identifier of the thread associated with 'plan-id1'. If the execution of the plan was switched by DB2 to a system agent, the connection identifier is the DB2 subsystem name.

id3 The logical-unit-of-work identifier of the thread associated with 'plan-id1'. An '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an "=" sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

id4 This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- # • The primary authorization-ID associated with the thread.
- # • Workstation name of the end-user's workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- # • End-user's user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.

• Application name of the end-user's application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id5 The correlation identifier of the thread associated with 'plan-id2'. If the execution of the plan was switched by DB2 to a system agent, the correlation identifier identifies the system agent. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

id6 The connection identifier of the thread associated with 'plan-id2'. If the execution of the plan was switched by DB2 to a system agent, the connection identifier is the DB2 subsystem name.

id7 The logical-unit-of-work identifier of the thread associated with 'plan-id2'. An '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an "=" sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

id8 This ID contains additional identifiers that define more specific information regarding the identity of the agent.

In many distributed configurations, the primary authorization-ID used with DB2 is not necessarily the user-ID of the end-user. If provided by the client, the additional tokens further assist in identifying the client end-user.

The following identifiers, separated by a colon (:), are provided:

- # • The primary authorization-ID associated with the thread.
- # • Workstation name of the end-user's workstation. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- # • End-user's user-ID. An asterisk (*) indicates it is not relevant to the thread or was not provided by the client.
- # • Application name of the end-user's application. An asterisk (*) indicates that is not relevant to the thread or was not provided by the client.

id9 Identifies the member name of the DB2 subsystem on which the thread associated with *plan-id2* is executing.

DB2 can recover from a lock denial in some cases and can complete successfully. In such a case, the SQLCA is not filled in. One example is during setup of performance enhancements during bind time for execution time.

The SQLCA corresponding to correlation-id 'id1', connection-id 'id2', and LUW-ID 'id3' contains an SQLCODE of -904 or -923 and the name of the resource involved in the timeout.

Several different system plans can appear in 'plan-id1' and 'plan-id2'. These system plans are not documented in SYSIBM.SYSPLAN. If you receive a system plan in this message, you are in contention with another user. If you are not doing an automatic rebind, message DSNT500I or DSNT501I might accompany this message and identify that resource. If you need additional information, refer to the SQLCA and any additional bind messages. If you are doing

an auto rebind, the SQLCA is not available. Refer to Section 5 of *Application Programming and SQL Guide* for more information about automatic rebinding. The system plans are:

ACT
BCT
DISTSERV
DSNBIND
STARTCT
DSNUTIL.

This message is issued by the following CSECT: DSNTLSUS

Operator Response: Notify the system programmer.

System Programmer Response: Timeouts can happen for many reasons, including factors relating to DB2 or IRLM. Some of those reasons are listed below along with possible ways to reduce or eliminate your timeout. Refer to Section 5 (Volume 2) of *Administration Guide* for more detail about the concepts discussed in this list. See also SQLCODEs -911 and -913.

Timeouts can result from the definition of objects or the structure of applications as explained below.

- If the resource involved in the timeout is listed in the DSNT500I/DSNT501I message as a table or table space, check the following items for other possible causes of timeout:
 1. Check the LOCKRULE column value in SYSIBM.SYSTABLESPACES for the table space being accessed. A lock size of TABLE or TABLESPACE could cause a timeout. If your application does not need to lock the entire table or table space, you can resolve the timeout by changing the lock size to PAGE or ANY using the ALTER statement.
 2. Check the number of LOCKS PER TABLE(SPACE), which was set at the time DB2 was installed. If a large number of page or row locks are acquired and held, a small value for LOCKS PER TABLE(SPACE) could be causing lock escalation to a table or table space lock. The timeout can be resolved by changing the value on the DSNTIPK update panel or by binding the application's plan with RELEASE(COMMIT) and doing commits more frequently.
 3. You can use EXPLAIN (described in Section 5 of *Application Programming and SQL Guide*) with the failing SQL statement and check the TSLOCKMODE column for every table/table space in the EXPLAIN output. If the competing applications are attempting to obtain incompatible locks, you might be able to resolve the timeout by running the applications sequentially rather than concurrently or by following the suggestions in other steps listed here, such as changing lock size, ACQUIRE/RELEASE parameters or ISOLATION type.
 4. Check the ACQUIRE/RELEASE values specified on the plan. ACQUIRE(ALLOCATE) acquires all locks for all tables and table spaces referenced in the plan, even if the program logic does not cause the table/table space to be accessed. Binding with RELEASE(DEALLOCATE) causes table, table space and DBD locks to be held longer than binding with RELEASE(COMMIT), possibly causing a timeout.
 5. Use the DISPLAY DB LOCKS command during program execution to verify that the locks being held at the time of the timeout are as expected. If they are not, you may need to use ALTER to change the locksize of

the table space if possible, or rebind your plan with different ACQUIRE, RELEASE or ISOLATION values.

6. ISOLATION level affects the mode of table/table space locks chosen and may be of concern if the plan is bound with RR and there is a page set scan.

- Check the ISOLATION level specified on the plan in SYSIBM.SYSPLAN. A value of RR is more likely to cause a timeout because it requires more page or row locks and also has a greater potential than CS for causing lock escalation, which can cause timeouts as noted above.
- Check the frequency of COMMITs in the application. A large number of updates without any COMMITs can cause a timeout because the more pages that are changed, the more page or row locks held, and the greater potential for lock escalation.

This condition might be caused by an undetected deadlock, for example, an agent holding a lock on the resource for a period of time that exceeds either the specified time or the IRLM default wait time.

If the time limit is too small, you can increase the limit by specifying a new IRLM locked resource wait time limit. To do this, you can either use the parameter in the DSN6SPRM assembler macro in the DSNTIJUZ job stream or update the 'wait-time' field of the DB2 installation IMS Resource Lock Manager panel, IRLMRWT. You must also specify all other parameters contained in this version of the CSECT. Then do one of the following:

- Resubmit installation job DSNTIJUZ with the link-edit SYSIN file 'NAME' parameter that matches the -START DB2 'PARM=' parameter.
- Reassemble DSN6SPRM and relink-edit DSNZPARM by resubmitting installation job DSNTIJUZ. The link-edit SYSIN file 'NAME' parameter must match the -START DB2 'PARM=' parameter.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 9, 18.

DSNT377I PLAN *plan-id1* WITH CORRELATION-ID *id1*
CONNECTION-ID *id2* LUW-ID *id3*
THREAD-INFO *id4* IS IN CONFLICT WITH AN
INDOUBT THREAD ON MEMBER *id5*

Explanation: This message is issued by the service controller subcomponent. A plan cannot gain an IRLM lock because a required resource is currently undergoing recovery. The message identifies the plan in this way:

plan-id1	The name of the executing plan.
id1	The correlation identifier (ID) of the thread associated with plan 'plan-id1'. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.
id2	The connection-ID of plan 'plan-id1'.
id3	The logical-unit-of-work ('LUW-ID') of 'plan-id1'. An '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work id that is assigned to the thread followed by an "=" sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

```
# id4      This ID contains additional identifiers that define
#          more specific information regarding the identity of
#          the agent.
#
#          In many distributed configurations, the primary
#          authorization-ID used with DB2 is not necessarily
#          the user-ID of the end-user. If provided by the
#          client, the additional tokens further assist in iden-
#          tifying the client end-user.
#
#          The following identifiers, separated by a colon (:),
#          are provided:
#
#          • The primary authorization-ID associated with
#            the thread.
#
#          • Workstation name of the end-user's work-
#            station. An asterisk (*) indicates it is not rele-
#            vant to the thread or was not provided by the
#            client.
#
#          • End-user's user-ID. An asterisk (*) indicates
#            it is not relevant to the thread or was not pro-
#            vided by the client.
#
#          • Application name of the end-user's applica-
#            tion. An asterisk (*) indicates that is not rele-
#            vant to the thread or was not provided by the
#            client.
```

```
id5      Identifies the member name of the DB2 sub-
          system on which the indoubt thread is executing.

The SQLCA corresponding to correlation-ID 'id1',
connection-ID 'id2', and LUW-ID 'id3' contains an SQLCODE
-904, -911, -913, or -923 and the name of the resource cur-
rently being recovered by DB2.
```

If you receive a system plan in this message, see the informa-
tion about system plans in message DSNT376I.

This message is issued by the following CSECT: DSNTLSUS

System Action: Processing continues.

Problem Determination: Collect the following diagnostic
items listed in "Appendix B. Problem Determination" on
page X-5: 1, 2, 4.

DSNT378I *csect-name* **PLAN** *plan-id1* **WITH**
CORRELATION-ID *id1* **CONNECTION-ID** *id2*
LUW-ID *id3* **THREAD-INFO** *id4* **TIMED OUT**
BECAUSE OF A RETAINED LOCK HELD BY
MEMBER *id5*

Explanation: A plan cannot get an IRLM lock because the
resource is held by a retained lock on behalf of another
member in the data sharing group, and the amount of time to
wait for the locked resource was exceeded. The member
holding the retained lock is either failed, or is in the process
of restarting to recover its retained locks. This message is only
issued if the RETLWAIT installation parameter in DSN6SPRM
is set to 'YES'. If RETLWAIT is set to 'NO' (this is the default),
then any IRLM lock that conflicts with a retained lock will not
wait, but instead will be immediately rejected (see reason
codes 00C900BE and 00C20254).

The following identifiers are used in the message:

```
plan-id1  The name of the executing plan.
id1       The correlation identifier (ID) of the thread asso-
          ciated with plan 'plan-id1'. Correlation IDs
          beginning with '0nn', where 'nn' is a number
          from 01 to 28, identify system agents.
```

```
id2       The connection-ID of plan 'plan-id1'.
id3       The logical-unit-of-work ('LUW-ID') of
          'plan-id1'. An '*' indicates that the thread does
          not have a LUW-ID. If the LUW-ID is not an '*',
          the value is a logical-unit-of-work id that is
          assigned to the thread followed by an "=" sign
          and a token value, which can be used in place of
          logical-unit-of-work-id in any DB2 command that
          accepts logical-unit-of-work-id as input.
```

```
# id4      This ID contains additional identifiers that define
#          more specific information regarding the identity of
#          the agent.
#
#          In many distributed configurations, the primary
#          authorization-ID used with DB2 is not necessarily
#          the user-ID of the end-user. If provided by the
#          client, the additional tokens further assist in iden-
#          tifying the client end-user.
```

```
#          The following identifiers, separated by a colon (:),
#          are provided:
#
#          • The primary authorization-ID associated with
#            the thread.
#
#          • Workstation name of the end-user's work-
#            station. An asterisk (*) indicates it is not rele-
#            vant to the thread or was not provided by the
#            client.
#
#          • End-user's user-ID. An asterisk (*) indicates
#            it is not relevant to the thread or was not pro-
#            vided by the client.
#
#          • Application name of the end-user's applica-
#            tion. An asterisk (*) indicates that is not rele-
#            vant to the thread or was not provided by the
#            client.
```

```
id5      Identifies the member name of the failed or
          restarting DB2 subsystem which holds the con-
          flicting retained lock.
```

System Action: The SQLCA corresponding to correlation-ID
'id1', connection-ID 'id2', and LUW-ID 'id3' contains an
SQLCODE -904, -911, -913 or -923 and the name of the
resource involved in the timeout.

System Programmer Response: Restart the member
holding the retained lock if it has not yet been restarted.

Problem Determination: Collect the following diagnostic
items listed in "Appendix B. Problem Determination" on
page X-5: 1, 2, 4.

DSNT379I **CANNOT IDENTIFY TO IRLM. INVALID**
SSNAME OR IRLM IS NOT CURRENTLY
ACTIVE

Explanation: Either an attempt was made to identify the
IRLM with a subsystem name not recognized by MVS, or the
IRLM is not currently active. This message is also issued if
common service area (CSA) storage is insufficient.

This message is issued by the following CSECT: DSNTLIDE

System Action: DB2 abends with a reason code of X'04E'.

Operator Response: Notify system programmer.

System Programmer Response: This is probably a user
error. Change the IRLMSID parameter in the DB2 DSN6SPRM
initialization macro to match the MVS subsystem table, or start

IRLM if IRLM is not already up. See return code 00E30079 for further information about determining the cause of the error.

**DSNT380I CANNOT IDENTIFY TO IRLM, SSNAME
ALREADY IN USE**

Explanation: Either DB2 previously terminated and did not successfully sign off from IRLM, or another subsystem is identified to IRLM with this installation-defined SSNAME. This message accompanies abend reason code X'00E30071'.

This message is issued by the following CSECT: DSNTLIDE

System Action: DB2 is abended with an abend code of X'04E'.

Operator Response: Notify the system programmer.

System Programmer Response: Either manually stop IRLM, or change the installation-defined SSNAME.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 9, 18.

**DSNT381I IRLM QUIT REQUEST FAILED, RC = xx , SC =
yy**

Explanation: During the QUIT (or signoff) request to the IMS/VS Resource Lock Manager, a return code and subcode were returned indicating an unsuccessful completion of the request. Refer to "Section 5. IRLM Messages and Codes" on page 5-1, for IRLM return codes and subcode meanings.

This message is issued by the following CSECT: DSNTLQUI

System Action: This message indicates that the DB2 subsystem shutdown could not be completed normally.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of the failure from the return code and subcode, and correct the error. Refer to "Section 5. IRLM Messages and Codes" on page 5-1, for IRLM return codes and subcode meanings. DB2 has terminated but has not signed off from IRLM. It will be necessary to issue the 'F irlmproc, ABDUMP' command to stop the IRLM. This must be done before issuing another -START DB2 command.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 9, 18.

DSNT382I IRLM AUTO-START FAILED

Explanation: During the IDENTIFY to IRLM, the AUTO-START of IRLM using SVC 34 failed. This message accompanies abend code X'00E30080'.

This message is issued by the following CSECT: DSNTLIDE

System Action: DB2 is terminated with an abend code of X'04E'.

Operator Response: Notify the system programmer.

System Programmer Response: Determine the cause of failure from the SVC 34 return code preserved in register 2.

DSNT383I csect-name IRLM AUTO-STOP FAILED

Explanation: During a sign off from IRLM caused by either DB2 normal shutdown (CSECT DSNTLQUI) or DB2 subsystem termination (CSECT DSNTLCLLE), an AUTO-STOP of IRLM using SVC 34 failed. If this occurred during normal sign off, this message accompanies abend reason code X'00E30075'.

System Action: DB2 abends.

Operator Response: Notify the system programmer.

System Programmer Response: Manually stop IRLM.

Problem Determination: Determine the cause of failure from the SVC return code preserved in register 2.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 9.

DSNT384I IRLM AUTO-START WAIT TIME EXCEEDED

Explanation: An attempt was made to automatically start IRLM. However, the wait time specified was exceeded.

This message is issued by the following CSECT: DSNTLIDE

System Action: DB2 is abended.

Operator Response: Notify the system programmer.

System Programmer Response: Either manually start IRLM or modify the installation-defined auto-start wait time. Restart DB2.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 9.

Check the IRLMID given in the IRLM procedure against the IRLMSID in macro DSN6SPRM which was in the DSNZPARM used at startup.

**DSNT388I NAME TYPE PART STATUS CONNID
CORRID CLAIMINFO**

Explanation: This message is the heading for a set of messages that display information as a result of a -DISPLAY DATABASE command when the keyword CLAIMERS is specified. The message number for this message is not displayed. This message is always followed by multiple DSNT389I messages containing the column data. Refer to message DSNT389I for a description of the data these headings identify.

This message is issued by the following CSECT: DSNTDMUL

DSNT389I space type part status conn-id corr-id claims

Explanation: This message contains the display information that results from a -DISPLAY DATABASE command when the keyword CLAIMERS is specified. This message contains the column data describing the status of a table space or index space in the database listed in message DSNT362I.

space The table space name or index space name.

type TS for a table space or IX for an index space.

part The partition number. For a nonpartitioned table space or an index on a nonpartitioned table space, it is blank. For nonpartitioned indexes on a partitioned table space, it is the logical partition number preceded by the character L (for example, L001).

status Blank, or one or more of the following, delimited by commas. The maximum length of the string is 18 characters.

CHKP The object (a table space or a partition within a table space) is in check pending status.

COPY The object (a table space or a partition within a table space) is in copy pending status. An image copy is required for this object.

GRECP The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a group buffer pool. This status value appears only on spaces. It does not apply to databases. See *Data Sharing: Planning and Administration* for information about resolving this restricted status.

LPL The object has pages or ranges of pages that are unavailable because of logical or physical damage.

LSTOP The logical partition is stopped.

PSRCP The index space is in page set recovery pending status.

RECP The object (a table space, table space partition, index space, index partition or logical index partition) is in recovery pending status. For logical partitions, the RECP status can appear as RECP*. RECP* indicates that the entire index is inaccessible to SQL applications, however only the logical partition needs to be recovered.

REST The table space or index space is being restarted.

RO The table space, table space partition, index space or index space partition is started for read-only activity.

RSTRT There are one or more DB2 subsystems that hold a retained lock on the table space or index space because the subsystem abnormally terminated while the object was being accessed and the subsystem was a member of a DB2 data sharing group. The subsystems must be restarted to restore full access to the object.

RW The table space, table space partition, index space or index space partition is started for read and write activity.

STOP The table space, table space partition, index space or index space partition is stopped.

STOPE The table space or index space was implicitly stopped because there is a problem with the log RBA in a page. Message DSNT500I or DSNT501I is

issued when the error is detected to indicate the inconsistency.

STOPP A stop is pending for the database, table space, table space partition, index space or index space partition.

UT The table space, table space partition, index space or index space partition is started for utility processing only.

UTRO A utility is in process on the table space, table space partition, index space, or index space partition that allows only RO access.

UTRW A utility is in process on the table space, table space partition, index space or index space partition that allows RW access.

UTUT A utility is in process on the table space, table space partition, index space or index space partition that allows only UT access.

If the status for a nonpartitioned index is blank, then the status information is displayed at the logical partition level.

conn-id A connection identifier for the thread.

corr-id A correlation identifier of the thread associated with the space name.

claims The type and duration of currently held claims. The claim is composed of a claim class descriptor and a claim duration descriptor. The claim class descriptor has one of the following values:

CS Cursor stability claim class
 RR Repeatable-read claim class
 WR Write claim class

The claim duration descriptor describes the duration of the claims as follows:

A The claim is held until deallocation.
 C The claim is held until the next commit point.
 H The claim is held across commit.

This message is issued by the following CSECT: DSNTDMUL

DSNT390I * DISPLAY OF DATABASE name action*

Explanation: This message indicates the end of a set of DSNT391I and DSNT392I messages, a set of DSNT393I and DSNT394I messages, or a set of DSNT395I and DSNT396I messages.

In this message:

- The 'name' is the name of the database.
- The 'action' is one of the following:

CONTINUES
 The remaining table space and index space names within this database are continued to a new display.

TERMINATED
 The remaining table space and index space names within this database are terminated.

ENDS The display for this database is complete.

This message is issued by the following CSECTS:
DSNTDMUL, DSNTDMSG

**DSNT391I NAME TYPE STATUS PHYERRLOW
PHYERRHI CATALOG PIECE**

Explanation: This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keywords LOCKS, LPL, CLAIMERS and USE are omitted. (The message appears in one continuous line across the screen, not as shown above.) This message forms the headings of the display and is always followed by multiple DSNT392I messages containing the column data. Refer to message DSNT392I for a description of the data these headings identify.

This message is issued by the following CSECT: DSNTDMUL

DSNT392I *space type part status lo-page hi-page cat-
name piece*

Explanation: This message contains the display information as a result of a DISPLAY DATABASE command when the keywords LOCK, CLAIMERS, LPL and USE are omitted. This message contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings in message DSNT391I. The message number for this message is not displayed. However, messages DSNT391I, DSNT392I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

In this message:

- The *space* is the table space name or index space name.
- The *type* is TS for a table space or IX for an index space.
- The *part* is the partition number. It is blank for a simple table space or simple index space.
- The *status* is one or more of the following, delimited by commas. The maximum length of the string is 18 characters:

CHKP	The object (a table space or a partition within a table space) is in the check pending status.
COPY	The object (a table space or a partition within a table space) is in the copy pending status. An image copy is required for this object.
GRECP	The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a group buffer pool. This status value appears only on spaces. It does not apply to databases. See <i>Data Sharing: Planning and Administration</i> for information about resolving this restricted status.
LPL	The object has pages or ranges of pages that are unavailable because of logical or physical damage.
LSTOP	The logical partition is stopped.
PSRCP	The index space is in a page set recovery pending status.
RECP	The object (a table space, table space partition, index space, index partition or logical index partition) is in the recovery pending status. For

logical partitions, the RECP status can appear as RECP*. RECP* indicates that the entire index is inaccessible to SQL applications, however only the logical partition needs to be recovered.

REST	The table space or index space is being restarted.
RO	The table space, table space partition, index space or index space partition is started for read-only activity.
RW	The table space, table space partition, index space or index space partition is started for read and write activity.
STOP	The table space, table space partition, index space or index space partition is stopped.
STOPE	The table space or index space was implicitly stopped because there is a problem with the log RBA in a page. Message DSNT500I or DSNT501I is issued when the error is detected to indicate the inconsistency.
STOPP	A stop is pending for the database, table space, table space partition, index space or index space partition.
UT	The table space, table space partition, index space or index space partition is started for utility processing only.
UTRO	A utility is in process on the table space, table space partition, index space, or index space partition that allows only RO access. If the utility was cancelled before the object was drained, the object can allow SQL access since the object was not altered by the utility.
UTRW	A utility is in process on the table space, table space partition, index space or index space partition that allows RW access.
UTUT	A utility is in process on the table space, table space partition, index space or index space partition that allows only UT access. If the utility was cancelled before the object was drained, the object can allow SQL access since the object was not altered by the utility.

- When a data set supporting the specified table space or index space has physical I/O errors, *lo-page* is a hexadecimal number identifying the lowest page number containing an I/O error. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, *hi-page* is a hexadecimal number identifying the highest page number containing an I/O error. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, *cat-name* identifies the catalog owning the data set with the I/O errors. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, *piece* is an integer number identifying the piece within the table space or index space having the error. This column is blank if there are no physical errors.

The piece number can be used to construct the name of the data set supporting the space containing the physical error as follows:

```
cat-name.DSNDBC.database-
name.space-name.I0001.Axxxx
```

The value xxxx is the piece number plus one and database-name is the name displayed in the preceding DSNT362I message. If the table space or index space is partitioned, the partition number should equal the piece number plus one.

This message is issued by the following CSECT: DSNTDMUL

**DSNT393I NAME TYPE PART STATUS CONNID
CORRID USERID**

Explanation: This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keyword USE is specified. This message contains the headings of the display. (The message appears in one continuous line across the screen, not as shown above.) This message is always followed by multiple DSNT394I messages containing the column data. Refer to message DSNT394I for a description of the data these headings identify.

This message is issued by the following CSECT: DSNTDMUL

DSNT394I space type part status conn-id corr-id user-id

Explanation: This message contains the display information resulting from a DISPLAY DATABASE command when the keyword USE is specified. This message contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by message DSNT393I containing the column headings. The message number for this message is not displayed. However, messages DSNT393I, DSNT394I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

In this message:

- The *space* is the table space name or index space name.
- The *type* is TS for a table space or IX for an index space.
- The *part* is the partition number. It is blank for a simple table space or simple index space.
- The *status* is one or more of the following, delimited by commas. The maximum length of the string is 18 characters:

CHKP	The object (a table space or a partition within a table space) is in the check pending status.
COPY	The object (a table space or a partition within a table space) is in the copy pending status. An image copy is required for this object.
GRECP	The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a group buffer pool. This status value appears only on spaces. It does not apply to databases. See <i>Data Sharing: Planning and Administration</i> for information about resolving this restricted status.
LPL	The object has pages or ranges of pages that are unavailable because of logical or physical damage.

LSTOP	The logical partition is stopped.
PSRCP	The index space is in a page set recovery pending status.
RECP	The object (a table space, table space partition, index space, index partition or logical index partition) is in the recovery pending status. For logical partitions, the RECP status can appear as RECP*. RECP* indicates that the entire index is inaccessible to SQL applications, however only the logical partition needs to be recovered.
REST	The table space or index space is being restarted.
RO	The table space, table space partition, index space or index space partition is started for read-only activity.
RW	The table space, table space partition, index space or index space partition is started for read and write activity.
STOP	The table space, table space partition, index space or index space partition is stopped.
STOPE	The table space or index space was implicitly stopped because there is a problem with the log RBA in a page. Message DSNT500I or DSNT501I is issued when the error is detected to indicate the inconsistency.
STOPP	A stop is pending for the database, table space, table space partition, index space or index space partition.
UT	The table space, table space partition, index space or index space partition is started for utility processing only.
UTRO	A utility is in process on the table space, table space partition, index space, or index space partition that allows only RO access. If the utility was cancelled before the object was drained, the object can allow SQL access since the object was not altered by the utility.
UTRW	A utility is in process on the table space, table space partition, index space or index space partition that allows RW access.
UTUT	A utility is in process on the table space, table space partition, index space or index space partition that allows only UT access. If the utility was cancelled before the object was drained, the object can allow SQL access since the object was not altered by the utility.
•	The <i>conn-id</i> is a connection identifier for the thread. It is one of the following: <ul style="list-style-type: none"> – BATCH if the thread is from a batch region. – TSO if the thread is from a TSO terminal. – UTILITY if the thread is from a utility. – 'IMS identifier' if the thread is from an IMS terminal. – 'CICS identifier' if the thread is from a CICS terminal. – CONSOLE if the thread is from the console.
•	The <i>corr-id</i> is a correlation identifier of the thread associated with the space name. It is one of the following:

- 'job name' if the thread is from a batch region.
- 'TSO logon identifier' if the thread is from a TSO terminal.
- PST#.PSBNAME if the thread is from an IMS terminal.
- 'entry ID.thread number.tran id' if the thread is from a CICS terminal.
- CONSOLE if the thread is from the console.
- '0nn', where 'nn' is a number, if the thread is for a system agent.
- For distributed database access threads, this field contains the following:

- While the thread is being created:

1. '028.DBAA nn', where nn ranges from 01 to 99. This indicates that the database access agent (DBAA) is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user's ID. Refer to "Controlling Access to a DB2 Subsystem" in *Administration Guide* for descriptions of the authorization checks that might be performed.

All RACF requests are serialized on a single DB2 RACF service task, which might increase the validation time when multiple DBAAs are being created concurrently.

- After the thread is created:

1. For threads using system-directed access and threads using application-directed access from a DB2 requester, this variable displays the correlation ID of the thread at the requesting location.
2. For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT.

- The *user-id* is one of the following:

- 'TSO logon identifier' if the thread is from a TSO terminal.
- 'sign-on id' or the LTERM if the thread is from an IMS message-driven region.
- AXBUSER if the thread is from an IMS message-driven region and RACF is used.
- 'PSB name' if the thread is from an IMS nonmessage-driven region and RACF is not used.
- 'user-id', 'term id', 'tran id' or other, as specified in the resource control table (RCT), if the thread is from CICS.

This message is issued by the following CSECT: DSNTDMUL

DSNT395I **NAME TYPE PART STATUS CONNID**
CORRID LOCKINFO

Explanation: This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keyword LOCKS is specified. This message forms the headings of the display. (The message appears in one continuous line across the screen, not as shown above.) This message is always followed by multiple DSNT396I messages containing the column data. Refer to message DSNT396I for a description of the data these headings identify.

This message is issued by the following CSECT: DSNTDMUL

DSNT396I *space type part status conn-id corr-id lock*

Explanation: This message contains the display information that results from a DISPLAY DATABASE command when the keyword LOCKS is specified. This message contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings in message DSNT395I. The message number for this message is not displayed. However, the messages DSNT395I, DSNT396I, and DSNT390I are always produced with a multiple line WTO and are never interrupted.

In this message:

- The *space* is the table space name, index space name, or table OBID.
- The *type* is TS for a table space, IX for an index space, or TB for a table.
- The *part* is the partition number. It is blank for a simple table space, simple index space, or segmented table space.
- The *status* is blank or one or more of the following, delimited by commas. The maximum length of the string is 18 characters:

- CHKP The object (a table space or a partition within a table space) is in the check pending status.
- COPY The object (a table space or a partition within a table space) is in the copy pending status. An image copy is required for this object.
- GRECP The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a group buffer pool. This status value appears only on spaces. It does not apply to databases. See *Data Sharing: Planning and Administration* for information about resolving this restricted status.
- LPL The object has pages or ranges of pages that are unavailable because of logical or physical damage.
- LSTOP The logical partition is stopped.
- PSRCP The index space is in a page set recovery pending status.
- RECP The object (a table space, table space partition, index space, index partition or logical index partition) is in the recovery pending status. For logical partitions, the RECP status can appear as RECP*. RECP* indicates that the entire

	index is inaccessible to SQL applications, however only the logical partition needs to be recovered.
REST	The table space or index space is being restarted.
RO	The table space, table space partition, index space or index space partition is started for read-only activity.
RW	The table space, table space partition, index space or index space partition is started for read and write activity.
STOP	The table space, table space partition, index space or index space partition is stopped.
STOPE	The table space or index space was implicitly stopped because there is a problem with the log RBA in a page. Message DSNT500I or DSNT501I is issued when the error is detected, indicating the inconsistency.
STOPP	A stop is pending for the database, table space, table space partition, index space or index space partition.
UT	The table space, table space partition, index space or index space partition is started for utility processing only.
UTRO	A utility is in process, on the table space, table space partition, index space, or index space partition that allows only RO access. If the utility was cancelled before the object was drained, the object can allow SQL access since the object was not altered by the utility.
UTRW	A utility is in process, on the table space, table space partition, index space or index space partition, that allows RW access.
UTUT	A utility is in process, on the table space, table space partition, index space or index space partition, that allows only UT access. If the utility was cancelled before the object was drained, the object can allow SQL access since the object was not altered by the utility.

If the status is blank, then the status information is displayed at the logical partition level.

If the *type* is TB, the *status* field is blank.

- The *conn-id* is a connection identifier for the thread. It is one of the following:
 - BATCH if the thread is from a batch region.
 - TSO if the thread is from a TSO terminal.
 - UTILITY if the thread is from a utility.
 - 'IMS identifier' if the thread is from an IMS terminal.
 - 'CICS identifier' if the thread is from a CICS terminal.
 - CONSOLE if the thread is from the console.

When the displayed lock is a P-lock or a retained lock, *conn-id* is not specified.

- The *corr-id* is a correlation identifier of the thread associated with the space name. It is one of the following:
 - 'job-name' if the thread is from a batch region.
 - 'TSO logon identifier' if the thread is from a TSO terminal.

- PST#.PSBNAME if the thread is from an IMS terminal.
- 'entry ID.thread number.tran id' if the thread is from a CICS terminal.
- CONSOLE if the thread is from the console.
- For distributed database access threads, this field contains the following:
 - While the thread is being created:
 1. '028.DBAA nn', where nn ranges from 01 to 99. This indicates that the database access agent (DBAA) is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user's ID. Refer to "Controlling Access to a DB2 Subsystem" in *Administration Guide* for descriptions of the authorization checks that might be performed.

All RACF requests are serialized on a single DB2 RACF service task, which might increase the validation time when multiple DBAAs are being created concurrently.
 - After the thread is created:
 1. For threads using system-directed access and threads using application-directed access from a DB2 requester, this variable displays the correlation ID of the thread at the requesting location.
 2. For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT.

corr-id is not specified when the displayed lock is a P-lock or a retained lock.

- The *lock* describes the type and duration of locks:
 - Transaction locks (also called L-locks) are identified by their corresponding agents' connection and correlation IDs

Multiple locks held by an agent are listed on multiple lines of the report followed by any locks the agent is currently awaiting.

Multiple P-locks or retained locks held by a DB2 data sharing member are listed on multiple lines of the report followed by any locks the member is currently awaiting.

The *lock* is composed of a 'lock status' and followed by a dash '-', a 'lock state' followed by a 'lock type', and a 'lock duration' delimited by commas.

- The 'lock status' is a value of:

H	The lock is held by the agent or the DB2 member.
W	The agent or the member is awaiting the lock.
R	The lock is retained.
- The 'lock state' describes the mode of the lock as follows:

- For L-locks and drain locks,
 - IS A lock with read intentions.
 - IX A lock with update intentions.
 - S A lock with read-only capability.
 - U A lock with update capability.
 - SIX A table space or table lock with a protocol that does not lock a page while reading, but locks the page with update intention while updating.
 - X An exclusive lock.
- For P-locks,
 - IS This DB2 member has R/O interest. The page set or partition is group buffer pool (GBP) dependent.
 - IX This DB2 member has R/W interest. The page set or partition is GBP-dependent.
 - S This DB2 member has R/O interest. The page set or partition is not GBP-dependent.
 - SIX This DB2 member has R/W interest. The page set or partition is GBP-dependent.
 - NSU This DB2 member has R/W interest. The page set or partition is GBP-dependent.
 - X This DB2 member has R/W interest. The page set or partition is not GBP-dependent.

- The 'lock type' describes the type of locking as follows:

- S A table space L-lock
- T A table L-lock
- C A cursor-stability read drain lock
- R A repeatable-read drain lock
- W A write drain lock
- P A partition L-lock
- PP A page set or partition P-lock

- If the 'lock status' is H, the 'lock duration' describes the duration of the lock:

- A The lock is freed at deallocation.
- C The lock is freed at commit.
- H The lock is freed when all cursors are closed.
- M The lock is freed by the system.
- P The lock is freed when the plan is complete.
- I The lock is a page set or partition P-lock. It is released when the pageset or partition data set is closed.

- If the 'lock status' is W, the 'lock duration' is a 2-digit number indicating the waiter's position in the local DB2 system's lock waiting queue. When this lock is acquired, its duration is the same as all locks held by the user.

- For a P-lock, the lock is owned by the system, not the user, and its duration is not related to the duration of the locks that are owned by the user.

- Retained locks do not have a lock duration.

All index spaces on tables are implicitly locked with transaction locks at the same level as the table spaces containing those tables. P-locks are acquired by DB2 on index spaces as well as on table spaces.

This message is issued by the following CSECT: DSNTDMUL

DSNT397I

Explanation: This message indicates the beginning of a multiple line display generated as a result of a DISPLAY DATABASE command. The format of this multiple line display has three parts:

- The column headers, which are dependent on the keywords issued. The headers are underlined.
- The space information for all spaces and partitions requested by the command.
- An ending message to state whether the spaces were displayed or not.

There are five different headers for the DISPLAY DATABASE commands. The headers are dependent on the presence of the keywords: CLAIMERS, LOCKS, USE, LPL, or no keyword. These five different DISPLAY DATABASE command formats are described below.

- DISPLAY DATABASE CLAIMERS

This DISPLAY DATABASE command displays the claims that are on certain table spaces, index spaces, and partitions.

The column headers in this command are as follows:

NAME TYPE PART STATUS CONNID CORRID
CLAIMINFO

- NAME is the table space name or index space name.
- TYPE is TS for a table space or IX for an index space.
- PART is the partition number. It is blank for a simple table space or simple index space. For nonpartitioned indexes on a partitioned table space, it is the logical partition number preceded by the character L (for example, L01).
- STATUS is blank, or one or more of the following, delimited by commas. The maximum length of the string is 18 characters.

CHKP The object (a table space or a partition within a table space) is in the check pending status.

COPY The object (a table space or a partition within a table space) is in the copy pending status. An image copy is required for this object.

GRECP The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a group buffer pool. This status value appears only on spaces. It does not apply to databases. See *Data Sharing: Planning and Administration* for information about resolving this restricted status.

LPL	The object has pages or ranges of pages that are unavailable because of logical or physical damage.
LSTOP	The logical partition is stopped.
PSRCP	The index space is in a page set recovery pending status.
RECP	The object (a table space, table space partition, index space, index partition or logical index partition) is in the recovery pending status. For logical partitions, the RECP status can appear as RECP*. RECP* indicates that the entire index is inaccessible to SQL applications, however only the logical partition needs to be recovered.
REST	The table space or index space is being restarted.
RO	The database, table space, table space partition, index space, or index space partition is started for read-only activity.
RW	The database, table space, table space partition, index space, or index space partition is started for read and write activity.
STOP	The database, table space, table space partition, index space, or index space partition is stopped.
STOPE	The table space or index space was implicitly stopped because there is a problem with the log RBA in a page. Message DSNT500I or DSNT501I is issued when the error is detected to indicate the inconsistency.
STOPP	A stop is pending for the database, table space, table space partition, index space, or index space partition.
UT	The database, table space, table space partition, index space, or index space partition is started for utility processing only.
UTRO	A utility is in process on the table space, table space partition, index space, or index space partition that allows only RO access. If the utility was cancelled before the object was drained, the object can allow SQL access since the object was not altered by the utility.
UTRW	A utility is in process on the table space, table space partition, index space, or index space partition that allows RW access.
UTUT	A utility is in process on the table space, table space partition, index space, or index space partition that allows only UT access. If the utility was cancelled before the object was drained, the object can allow SQL access since the object was not altered by the utility.

If the *type* is TB, the *status* field is blank.

If the status for an index is blank, then the status information is displayed at the logical partition level.

- The CONNID is a connection identifier for the thread. It is one of the following:
 - BATCH if the thread is from a batch region.

- TSO if the thread is from a TSO terminal.
- UTILITY if the thread is from a utility.
- 'IMS identifier' if the thread is from an IMS terminal.
- 'CICS identifier' if the thread is from a CICS terminal.
- CONSOLE if the thread is from the console.
- For distributed database access threads, this field contains the following:
 - For threads using system-directed access and for threads using application-directed access from a DB2 Version 3 or later requester, this variable displays the connection name of the thread at the requesting location.
 - For threads using application-directed access from a non-DB2 requester or from a DB2 Version 2 Release 3 requester, this field displays the constant SERVER.
- CORRID is a correlation identifier of the thread associated with the space name. It is one of the following:
 - 'job name' if the thread is from a batch region.
 - 'TSO logon identifier' if the thread is from a TSO terminal.
 - PST#.PSBNAME if the thread is from an IMS terminal.
 - 'entry ID.thread number.tran id' if the thread is from a CICS terminal.
 - CONSOLE if the thread is from the console.
 - '0nn', where 'nn' is a number, if the thread is for a system agent.
 - For distributed database access threads, this field contains the following:
 - While the thread is being created:
 1. '028.DBAA nn', where nn ranges from 01 to 99. This indicates that the database access agent (DBAA) is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user's ID. Refer to "Controlling Access to a DB2 Subsystem" in *Administration Guide* for descriptions of the authorization checks that might be performed.

All RACF requests are serialized on a single DB2 RACF service task, which might increase the validation time when multiple DBAAs are being created concurrently.
 - After the thread is created:
 1. For threads using system-directed access and threads using application-directed access from a DB2 requester, this variable displays the correlation ID of the thread at the requesting location.
 2. For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) param-

eter of the DDM EXCSAT command received as part of the SQL CONNECT.

- CLAIMINFO is the type and duration of currently held claims. The claim is composed of a claim class descriptor and a claim duration descriptor.

The claim class descriptor has one of the following values:

CS Cursor stability claim class
 RR Repeatable-read claim class
 WR Write claim class

The claim duration descriptor describes the duration of the claims as follows:

A The claim is held until deallocation.
 C The claim is held until the next commit point.
 H The claim is held across commit.

• DISPLAY DATABASE LOCKS

This DISPLAY DATABASE command displays the locks that are on certain table spaces, index spaces and partitions.

The column headers in this command are as follows:

NAME TYPE PART STATUS CONNID CORRID
 LOCKINFO

- The NAME column states the table space name, index space name, or table object ID.
- The TYPE column states TS for table space, IX for index, or TB for table.
- The PART, STATUS, CONNID, and CORRID columns are described in the DISPLAY DATABASE CLAIMERS section.
- The *conn-id* and *corr-id* are not specified when the displayed lock is a P-lock or a retained lock (either L-lock or P-lock). For page set P-locks, the DB2 member name is used to identify the lock.
- The LOCKINFO describes the type and duration of locks used by corresponding agents identified by their connection and correlation IDs (for transaction locks, which are also called L-locks) or used by corresponding subsystems identified by their DB2 data sharing member names (for physical locks, which are called P-locks, and retained locks). Multiple locks held by an agent are listed on multiple lines of the report followed by any locks the agent is currently awaiting. Multiple P-locks or retained locks held by a DB2 data sharing member are listed on multiple lines of the report followed by any locks the member is currently awaiting. The LOCKINFO consists of a 'lock status', followed by a dash '-', a 'lock state', a 'lock type', and a 'lock duration' delimited by commas.

- The 'lock status' is a value of:

H The lock is held by the agent or the DB2 member.
 W The agent or the member is awaiting the lock.
 R The lock is retained.

- The 'lock state' describes the mode of lock as follows:

- For L-locks and drain locks,

IS A lock with read intentions.
 IX A lock with update intentions.
 S A lock with read-only capability.
 U A lock with update capability.
 SIX A lock with a protocol that does not lock a page while reading, but locks the page with update intention while updating.
 X An exclusive lock.

- For P-locks,

IS This DB2 member has R/O interest. The page set or partition is group buffer pool (GBP) dependent.
 IX This DB2 member has R/W interest. The page set or partition is GBP-dependent.
 S This DB2 member has R/O interest. The page set or partition is not GBP-dependent.
 SIX This DB2 member has R/W interest. The page set or partition is GBP-dependent.
 NSU This DB2 member has R/W interest. The page set or partition is GBP-dependent.
 X This DB2 member has R/W interest. The page set or partition is not GBP-dependent.

- The 'lock type' describes the type of locking as follows:

S A table space L-lock
 T A table L-lock
 C A cursor-stability read drain lock
 R A repeatable-read drain lock
 W A write drain lock
 P A partition L-lock
 PP A page set or partition P-lock

- If the 'lock status' is H, the 'lock duration' describes the duration of the lock:

A The lock is freed at deallocation.
 C The lock is freed at commit.
 H The lock is freed when all cursors are closed.
 M The lock is freed by the system.
 P The lock is freed when the plan is complete.
 I The lock is a page set or partition P-lock. It is released when the page set or partition data set is closed.

- If the 'lock status' is W, the 'lock duration' is a 2-digit number indicating the waiter's position in the local DB2 system's lock waiting queue. When this lock is acquired, its duration is the same as all locks held by the user.

- For a P-lock, the lock is owned by the system, not the user, and its duration is not related to the duration of the locks that are owned by the user.
- Retained locks do not have a lock duration.

There are no explicit index space locks. However, all index spaces on tables are implicitly locked at the same level as the table spaces containing those tables. P-locks are acquired by DB2 on index spaces as well as on table spaces.

• DISPLAY DATABASE USE

This DISPLAY DATABASE command displays the user IDs that are accessing certain table spaces, index spaces, and partitions.

The column headers in this command are as follows:

NAME TYPE PART STATUS CONNID CORRID USERID

- The NAME, TYPE, PART, STATUS, CONNID, and CORRID columns are described in the DISPLAY DATABASE CLAIMERS section.
- The USERID is one of the following:
 - 'TSO logon identifier' if the thread is from a TSO terminal.
 - 'sign-on id' or the LTERM if the thread is from an IMS message-driven region.
 - AXBUSER if the thread is from an IMS message-driven region and RACF is used.
 - 'PSB name' if the thread is from an IMS nonmessage-driven region and RACF is not used.
 - 'userid', 'term id', 'tran id' or other, as specified in the resource control table (RCT), if the thread is from CICS.

• DISPLAY DATABASE LPL

NAME TYPE PART STATUS LPL PAGES

This message contains the display information resulting from a DISPLAY DATABASE command when the keyword LPL is specified. It contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings message DSNT805I. The message number for this message is not displayed.

In this message:

- The LPL PAGES column lists the pages in the specified space that are unavailable because of logical or physical damage.

• DISPLAY DATABASE (with no LOCKS, USE, LPL or CLAIMERS keyword).

This DISPLAY DATABASE command displays the error page range information for certain table spaces, index spaces, and partitions.

The column headers in this command are as follows:

NAME TYPE PART STATUS PHYERRLO PHYERRHI CATALOG PIECE

In this message:

- The NAME, TYPE, PART, and STATUS columns are described in the DISPLAY DATABASE CLAIMERS section.

- When a data set supporting the specified table space or index space has physical I/O errors, PHYERRLO is a hexadecimal number identifying the lowest page number containing an I/O error. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, PHYERRHI is a hexadecimal number identifying the highest page number containing an I/O error. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, CATALOG identifies the catalog owning the data set with the I/O errors. This column is blank if there are no physical errors.
- When a data set supporting the specified table space or index space has physical I/O errors, PIECE is an integer number identifying the piece within the table space or index space having the error. This column is blank if there are no physical errors.

The piece number can be used to construct the name of the data set supporting the space containing the physical error as follows:

cat-name.DSNDBC.database-name.space-name.I0001.Axxxx

The value xxxx is the piece number plus one and database-name is the name displayed in the preceding DSNT362I message. Note that if the table space or index space is partitioned, the partition number should equal the piece number plus one.

There are other informational messages that can be displayed that are not related to one specific keyword. They are listed below:

• -luw-id ACCESSING DATA FOR location

This message is issued for each thread reported that is participating in distributed data access (database access thread). The thread that corresponds to this message is the thread named by the correlation id and connection id of the data line preceding this message. This additional line reports the distributed identification as follows:

luw-id=token

The logical-unit-of-work identifier (LUW-ID) is a unique identifier that is assigned to the thread followed by an '=' sign and a token. The token can be used in place of luw-id in any DB2 command that accepts luw-id as input.

location The LOCATION name assigned to the requesting site.

• -MEMBER NAME member-name

This message is issued with messages DSNT389I, DSNT394I or DSNT396I for each thread in a data sharing environment. This additional line reports the member name of the DB2 subsystem accessing this object.

If the characters '(CO)' follow the member name, then this member is the castout owner for the page set or partition. The castout owner for a page set or partition is the DB2 member responsible for doing all of the castout I/O for that page set or partition.

The message number and subsystem recognition character are not included in this message.

- INVALID space-name

The space-name specified in the SPACENAM keyword on the -DISPLAY DATABASE command does not exist. The name of the table space or index space is 'space-name'. The request is rejected.

- NO SPACES FOUND

This message is produced when a DISPLAY DB(name) SPACENAM(...) is entered and no spaces were found to satisfy the request. SPACENAM(...) might have been entered as a range, a subset, or a list of spaces.

- spacetype name NOT type

This message is produced when no table space or index space listed in the DISPLAY DB(...) SPACENAM(...) satisfies your request.

spacetype TABLESPACE if the space is a table space or INDEXSPACE if the space is an index space.

name The name of the space.

type A character string that indicates the type of request specified. The string is a list of the following, delimited by 'OR':

- ACTIVE if the keyword ACTIVE is specified
- RESTRICTED if the keyword RESTRICT is specified.

- NO INFORMATION AVAILABLE

This message is produced when there is no LOCK or USE information available. When DISPLAY DB(name) SPACENAM(...) is entered, and SPACENAM(...) is a list of spaces, this message indicates that no table spaces or index spaces whose names are listed have LOCK or USE information available. If DISPLAY DB(name) SPACENAM(...) is entered, and SPACENAM(...) is a range or a subset of spaces, no table spaces and index spaces within the specified database have LOCK or USE information available. This message is produced only when the keywords USE and LOCKS are specified.

The ending message looks like this:

* DISPLAY OF DATABASE name action *

In this message:

name The name of the database

action One of the following:

CONTINUES

The remaining table space and index space names within this database are continued to a new display.

TERMINATED

The remaining table space and index space names within this database are terminated.

ENDS The display for this database is complete.

This message is issued by the following CSECT: DSNTDMUL

DSNT398I

Explanation: This message appears within a multiple line WTO message set and precedes DSNT391I, DSNT393I, and DSNT395I. It is used to underscore the column headings.

This message is issued by CSECT: DSNTDMUL

DSNT399I INVALID space-name

Explanation: The space-name specified in the SPACENAM keyword on the -DISPLAY DATABASE command does not exist. The name of the table space or index space is 'space-name'. The request is rejected.

This message is issued by the following CSECT: DSNTDMUL

DSNT400I SQLCODE = 0, SUCCESSFUL EXECUTION

Explanation: The SQLCODE was 0, indicating successful execution of the function. SQLWARN indicators may note some warnings. SQLWARNx fields are described in Appendix C of *SQL Reference*.

This message is issued by the following CSECT: DSNTIAR

DSNT401I DSNT401I WARNING - HELP IS NOT INSTALLED

Explanation: You invoked the installation process with the DSNTINST CLIST. To enable online help, you must use the DSNTINS0 CLIST instead of the DSNTINST CLIST.

This message is issued by panel: DSNTIPA1

System Action: The panel is displayed with the warning message.

User Response: No response is necessary if you do not desire online help for the panel. Press ENTER to continue with the installation process after filling in desired panel values. If panel help is desired: exit this panel, make sure BookManager or the online help reader is installed on your system, and invoke the installation process with the DSNTINS0 CLIST.

DSNT402I ONLINE BOOK DATA SET NAMES MUST END IN '.BOOK'

Explanation: All book names entered on this panel must end in ".BOOK".

This message is issued by panel: DSNTIPA0

System Action: The panel is redisplayed with the error message.

User Response: Replace the book name or names with a value that ends in ".BOOK".

DSNT404I SQLCODE = xxx, explanation

Explanation: This message contains an SQL return code and a brief explanation, with text inserted from the SQLERRM field. The SQL return code is positive, indicating a warning condition. For more information about this SQL return code, see "Section 2. SQL Return Codes" on page 2-1.

This message is issued by the following CSECT: DSNTIAR

System Programmer Response: Determine the cause for the SQL warning code, and correct the situation if needed. Rerun the application program or SQL statement.

DSNT405E csect-name DISPATCH PRIORITIES NOT IN SYNC: ccccccc1: hhh1 COMPARED TO ccccccc2: hhh2

Explanation: The dispatch priorities of task 'cccccc1' (dispatch priority 'hhh1') and task 'cccccc2' (dispatch priority 'hhh2') are found to be incorrect in relation to each other. This can cause severe performance problems and possible failure of either task 'cccccc1', task 'cccccc2', or other tasks.

System Action: DB2 continues with possible problems described above.

Operator Response: Notify the system programmer.

System Programmer Response: Modify the dispatch priority algorithms for the two tasks to meet documented requirements. For instance, IRLM must have a higher dispatch priority than DB2.

DSNT406I THE ART/ORT ESCAPE CHARACTER CAN BE ANY CHARACTER EXCEPT % OR _

Explanation: You specified the percent sign (%) or the underscore character (_) as the application registration table/object registration table (ART/ORT) escape character. The ART/ORT escape character can be any other character.

This message is issued by the following panel: DSNTIPZ

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the ART/ORT escape character value.

DSNT407I THIS FIELD HAS AN INVALID FORMAT

Explanation: The DEALLCT parameter must be NOLIMIT, 1440, 0, or minutes and seconds separated by a comma.

This message is issued by the following panel: DSNTIPA

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Correct the input.

DSNT408I SQLCODE = -xxx, explanation

Explanation: This message contains an SQL return code and a brief explanation, with text inserted from the SQLERRM field. The SQL return code is negative, indicating that an error has occurred. For more information about this SQL return code, see "Section 2. SQL Return Codes" on page 2-1.

This message is issued by the following CSECT: DSNTIAR

System Programmer Response: Determine the cause for the SQL error by using information about that specific SQLCODE. Correct the error if desired. Rerun the application program or SQL statement.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5, 14, 17.

DSNT409I BUFFERPOOL SIZES SHOWN MAY BE OBSOLETE

Explanation: The buffer pool sizes shown here were set at installation or migration time and might not be the most current. Updates might have occurred using the ALTER BUFFERPOOL command.

This message is issued by the following panels: DSNTIP1, DSNTIP2

System Action: Processing continues.

User Response: No response is required.

DSNT410I INCORRECT COMMAND PREFIX THE SUB-SYSTEM COMMAND PREFIX ENTERED IS INCORRECT

Explanation: You entered an incorrect command prefix. The first character of the command prefix must be one of the following:

@ \$ # . / ' ? " % ! <
) * + - = = ¢ : _ ; |

The remaining characters of the command prefix must be one of the above, A-Z, or 0-9.

This message is issued by the following panel: DSNTIPM

System Action: The panel is redisplayed and the cursor is placed on the field in error

User Response: Enter a valid command prefix

DSNT411I SQLCAID = xxxx, SQLCA IDENTIFIER

Explanation: The SQLCA ID field (SQLCAID) is not the expected value, C'SQLCA'.

This message is issued by the following CSECT: DSNTIAR

System Programmer Response: The SQLCA area is invalid. This type of error is usually the result of one of the following:

- Calling the DSNTIAR formatting routine before an SQL statement initializes the area
- Overlaying the SQLCA area
- Passing the wrong address to the DSNTIAR routine.

Correct the error, and rerun the application program.

DSNT412I SQLCABC = xxxx, SQLCA BYTE COUNT

Explanation: The size of the SQLCA is not the expected value (136 bytes).

This message is issued by the following CSECT: DSNTIAR

System Programmer Response: The SQLCA area is invalid. Correct the error. It is probably an overlay or an incorrect SQLCA address. Rerun the application program.

DSNT413I SQLCODE = xxxx, INVALID SQLCODE

Explanation: The SQL return code is not a valid value.

This message is issued by the following CSECT: DSNTIAR

System Programmer Response: Either the SQLCA area is invalid or the maintenance was not coordinated correctly. As a result, the SQL return code was added to the DB2 subsystem but not to the formatting routine.

An invalid SQLCA area is usually the result of one of the following:

- Calling the DSNTIAR formatting routine before an SQL statement initializes the area
- Overlaying the SQLCA area
- Passing the wrong address to the DSNTIAR routine.

If the maintenance was not coordinated correctly, the DSNTIAR and DSNTIAM CSECTs were probably not replaced in the code that is now running. Link-edit the load module, and replace DSNTIAR and DSNTIAM. Correct the error, and rerun the application program.

DSNT414I SQLERRM = xxxx, SQLCA ERROR MESSAGE INSERTION TEXT

Explanation: This message results from an SQL return code that is not recognized by DSNTIAR. SQLERRM contains error message text.

This message is issued by the following CSECT: DSNTIAR

System Programmer Response: Either the SQLCA area is invalid or the maintenance was not coordinated correctly. As a result, the SQL return code was added to the DB2 subsystem but not to the formatting routine.

An invalid SQLCA area is usually the result of one of the following:

- Calling the DSNTIAR formatting routine before an SQL statement initializes the area
- Overlaying the SQLCA area
- Passing the wrong address to the DSNTIAR routine.

If the maintenance was not coordinated correctly, the DSNTIAR and DSNTIAM CSECTs were probably not replaced in the code that is now running. Link-edit the load module, and replace DSNTIAR and DSNTIAM. Correct the error, and rerun the application program.

DSNT415I SQLERRP = xxxx, SQL PROCEDURE DETECTING ERROR

Explanation: The name of the procedure detecting the error is provided in the SQLERRP.

This message is issued by the following CSECT: DSNTIAR

System Programmer Response: (The SQL procedure detecting the error may be of help in diagnosing an error or warning.) Correct the error if there is one noted in other messages. Rerun the program or SQL statement.

DSNT416I SQLERRD = xx,xx,xx,xx,xx,xx SQL DIAGNOSTIC INFORMATION

Explanation: At least one of the six diagnostic fields is not the expected value. The expected values are:

- 00, 00, 00, 00, 00, 00 or
- 00, 00, 00, -1, 00, 00

The SQL diagnostic information for each of the six values is as follows:

1	DB2 unique internal relational data system code
2	DB2 internal data manager error code
# 3	One of the following:
#	• Number of rows inserted, updated, or deleted following an INSERT, UPDATE, or DELETE statement
#	Note: A '-1' in this field indicates that a mass delete of a table in a segmented table space was performed, wherein DB2 does not access nor count individual rows.
#	• For SQLCODE —911 or —913, a reason code that indicates whether a deadlock or timeout occurred.
#	Note: The most common reason codes are:
#	– 00C90088 — deadlock
#	– 00C9008E — timeout
4	Reserved
5	Position or column of a syntax error for PREPARE or EXECUTE IMMEDIATE
6	DB2 internal buffer manager error code

This message is issued by the following CSECT: DSNTIAR

System Programmer Response: Refer to Appendix C of *SQL Reference* for further information on the contents of the SQLERRD fields. The SQL diagnostic information may be of help in diagnosing an error or in indicating the results of successful execution. If this error or warning should not occur, correct the error. Rerun the program or SQL statement.

DSNT417I SQLWARNn-n SQL WARNINGS

Explanation: At least one of the 11 warning values is not the expected value (a blank). A nonblank value in one of the 11 warning fields has the following meaning:

SQLWARN0	Any other warning code is set.
SQLWARN1	String truncation.
SQLWARN2	Null value(s) eliminated.
SQLWARN3	Number of host variables provided did not equal degree of the table.
SQLWARN4	No WHERE clause on UPDATE or DELETE.
SQLWARN5	Not a DB2 SQL statement.
SQLWARN6	Date or timestamp value adjusted.
SQLWARN7	Conversion of decimal number from precision 31 to precision 15 caused truncation of fractional digits.
SQLWARN8	Untranslatable character replaced with substitute.

SQLWARN9 Arithmetic exceptions have been ignored during processing of COUNT DISTINCT.

SQLWARNA At least one character field of the SQLCA is invalid due to a string translation error.

This message is issued by the following CSECT: DSNTIAR

User Response: The SQL warning information may be of help in diagnosing an error or in indicating the results of successful execution. If this warning should occur, correct the error and rerun the program or SQL statement.

DSNT418I SQLSTATE = sqlstate, SQLSTATE RETURN CODE

Explanation: The SQLSTATE is a return code that indicates the outcome of the most recently executed SQL statement. The execution of every SQL statement sets SQLSTATE to a five-digit code in the range of 00000 to 65535. This has no effect on the existing use of any other field in the SQLCA.

This message is issued by the following CSECT: DSNTIAR

User Response: For further information on the meaning of an SQLSTATE return code, see the "Section 2. SQL Return Codes" on page 2-1. If necessary, correct the SQL statement and return it.

DSNT419I WARNING - MAX REMOTE ACTIVE PREVIOUSLY SPECIFIED AS 0.

Explanation: You specified a value of 0 for the number of active database access threads on a previous panel. This value might be inconsistent with a DDF STARTUP OPTION of AUTO or COMMAND.

This message is issued by the following panel: DSNTIPR

Severity: 4 (warning)

System Action: The panel is redisplayed and the cursor is placed on the DDF STARTUP OPTION field.

User Response: No response is necessary if your intent is to have DDF started with no active database access threads allocated and DDF is used as a requester only. Press ENTER to continue. Otherwise, either change the DDF STARTUP OPTION to NO or MAX REMOTE ACTIVE to the number of threads you want.

DSNT420I YOU NEED AT LEAST 1 32K DS IF THE TEMP 32K SPACE IS GREATER THAN 0

Explanation: You entered zero for the TEMP 32K DATA SETS field on the SIZES panel. You need at least one TEMP 32K DATA SET if TEMP 32K SPACE on DSNTIPD is not zero.

This message is issued by the following panel: DSNTIPD

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Enter a value of one or greater for the TEMP 32K DATA SETS field or change the TEMP 32K SPACE value to zero.

DSNT421I YOU NEED AT LEAST 1 32K BUFFER FOR THE <num32kds> 32K DATA SETS

Explanation: You specified zero for the 32KB buffers. If field TEMP 32K DATA SETS on installation panel DSNTIPD is greater than zero, you need at least one 32KB buffer on installation panel DSNTIP2.

This message is issued by the following panel: DSNTIP2

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Enter a value of 1 or more for at least one of the buffer pools (BP32K - BP32K9) on panel DSNTIP2, or change the TEMP 32K DATA SETS value to zero.

DSNT422I THE ART TABLE NAME MUST BE DIFFERENT FROM THE CRT TABLE NAME

Explanation: You entered the same name for the Application Registration Table and the Object Registration Table on the Data Definition Control Support panel.

This message is issued by the following panel: DSNTIPZ

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change either the APPL REGISTRATION TABLE field or the OBJT REGISTRATION TABLE field to make these two fields unique with respect to each other.

DSNT424I OUTPUT DATA SETS MUST BE DIFFERENT FROM THE INPUT DATA SETS

Explanation: You specified an output data set name that is the same as one of the input data set names built from the PREFIX and SUFFIX fields on the main panel DSNTIPA1.

This message is issued by the following panel: DSNTIPT

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either change the data set name under the cursor or change the PREFIX or SUFFIX fields on panel DSNTIPA1.

DSNT425I ALL THREE OUTPUT DATA SETS MUST BE UNIQUE

Explanation: You specified the same name for two or more of the output data sets.

This message is issued by the following panel: DSNTIPV

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the data set name under the cursor or the data set field(s) that are the same as the one under the cursor.

DSNT426I ALL THREE DATA SETS ARE REQUIRED FOR OUTPUT

Explanation: You specified one or more output data sets and left one or more output data set fields blank.

This message is issued by the following panel: DSNTIPT

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: You must specify all or none of the output

data set fields. Leave blank all output data set fields if you do not want the installation CLIST to edit any CLISTs or JCL.

**DSNT427I THE DATA SET OR MEMBER SPECIFIED
COULD NOT BE LOCATED**

Explanation: The input parameter member for the INPUT MEMBER NAME field or the DATA SET NAME(MEMBER) field for migration could not be found.

This message is issued by the following panel: DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Verify that you entered an existing data set and member in that data set. Also verify that the data set is cataloged.

**DSNT428I WHEN USING TIMESTAMPS, THE PREFIX
MUST BE <= preflen CHARACTERS LONG**

Explanation: YOU HAVE ENTERED AN ARCHIVE LOG
PREFIX LONGER THAN ALLOWED The archive log prefix
names must not exceed 19 characters when the TIMESTAMP
ARCHIVES value is YES and must not exceed 17 characters
when the TIMESTAMP ARCHIVES value is EXT.

This message is issued by the following panel: DSNTIPH

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce the length of the prefix or change the TIMESTAMP ARCHIVES value to NO.

**DSNT429I THE SUM OF MAX USERS AND MAX REMOTE
ACTIVE MUST BE LESS THAN OR EQUAL TO
2000**

Explanation: The total number of threads determined by MAX USERS and MAX REMOTE fields is too large.

This message is issued by the following panel: DSNTIPE

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce the MAX USERS field, or the MAX REMOTE field, or both.

**DSNT430I THIS FIELD MAY ONLY BE FILLED IN FOR
MIGRATE MODE**

Explanation: You can only specify the FROM RELEASE or DATA SET NAME(MEMBER) fields for INSTALL TYPE of MIGRATE.

This message is issued by the following panel: DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the INSTALL TYPE to MIGRATE or blank out the field under the cursor.

**DSNT431I DDF, MIXED DATA, OR DEF ENCODING
SCHEME CONFLICTS WITH CODED CHAR
SET**

Explanation: You have entered an invalid EBCDIC or ASCII coded character set (CCSID) value for the DDF, MIXED DATA, or DEF ENCODING SCHEME value you specified. The following restrictions apply to these values:

- With a MIXED DATA value of 'YES', you must choose a valid mixed CCSID value for the EBCDIC CODED CHAR SET. The ASCII CODED CHAR SET must be a valid mixed value or zero.
- With a MIXED DATA value of 'NO', you must choose a valid SBCS CCSID value or zero for EBCDIC or ASCII CODED CHAR SETS.
- With a DDF value of 'AUTO' or 'COMMAND', you must choose a non-zero value for the EBCDIC CODED CHAR SET.
- With a DEF ENCODING SCHEME value of 'ASCII', you must choose non-zero values for EBCDIC and ASCII CODED CHAR SETS.

Refer to Appendix C of *Installation Guide* for a list of the best general CCSID for each country.

This message is issued by the following panels: DSNTIPF, DSNTIPR

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Correct either the DDF, MIXED DATA, or DEF ENCODING SCHEME value or the EBCDIC or ASCII CODED CHAR SET value to correct the incompatibility.

**DSNT432I YOU CANNOT SPECIFY BOTH VS COBOL II
AND COBOL/370 COMPILER LIBRARIES**

Explanation: You have specified libraries for both VS COBOL II and COBOL/370 compilers. You must choose one or neither.

This message is issued by the following panel: DSNTIPU

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Delete the COBOL II COMPILER field, the COBOL/370 COMPILER field, or both.

**DSNT433I MAX REMOTE ACTIVE MUST BE <= MAX
REMOTE CONNECTED.**

Explanation: The number of active database access threads cannot be larger than the number of concurrent database access threads.

This message is issued by the following panel: DSNTIPE

Severity: 8 (error)

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce the MAX REMOTE ACTIVE field, increase the MAX REMOTE CONNECTED field, or both.

**DSNT434I WARNING, DATA SETS MARKED WITH
ASTERISKS EXIST AND WILL BE OVER-
WRITTEN**

Explanation: The data sets marked with asterisks already exist. If you continue, the installation process will delete the existing data set and allocate a new one for tailored job output.

This message is issued by the following panel: DSNTIPT

Severity: 4

User Response: You should:

1. Press ENTER to continue; the data set(s) will be deleted and reallocated OR
2. Press RETURN to leave the installation process; the data set(s) will not be deleted OR
3. Change the data set name(s); the new name will be checked for existence.

**DSNT435I DSNT435I OVERRIDE VALUES ARE IN
EFFECT**

Explanation: Calculated values for EDMPOOL, SORTPOOL, or RIDPOOL on panel DSNTIPC were previously overridden. Installation uses any override values displayed.

Severity: 4

System Action: Override values are used instead of calculated values, when displayed.

User Response: No response is necessary if you want to use the override values. If you want to use the calculated values, erase the values in the override column.

DSNT436I REGION SIZE MAY BE TOO LARGE

Explanation: The numbers you specified produced a region size estimate of more than 5000KB. This region size estimate does not include the storage required for SWA because it is assumed that SWA has been placed above the line. If a larger private area is permitted, you should increase the region size on the DB2 start procedures. The region size calculation is shown in the DSNT485I through DSNT487I messages and is discussed in Section 2 of *Installation Guide*.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

System Action: The CLIST continues.

User Response: Check the values entered for numbers of concurrent users and databases, buffers, and plan sizes. Check the available private region size. If this region size is not permitted, these numbers need to be reduced. If the size is permitted, this warning can be ignored.

Problem Determination: If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST. This produces tracing for error documentation.

DSNT437I REGION SIZE IS TOO LARGE

Explanation: The numbers you specified produced a region size estimate of more than 8000KB. This estimate does not include the storage required for SWA, because it is assumed that you placed SWA above the 16MB line. The region size calculation is discussed in Section 2 of *Installation Guide*.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST continues, but does not produce edited jobs.

User Response: Check the numbers entered for numbers of concurrent users and databases, buffers, and plan sizes. One or more of these numbers needs to be reduced.

Problem Determination: If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST. This produces tracing for error documentation.

**DSNT438I WARNING, IRLM LOCK MAXIMUM SPACE =
irlmreg K, AVAILABLE SPACE = irlmav K**

Explanation: You specified a maximum number of locks per user that could use a total space larger than that available to the IRLM, causing it to abend. It is not likely that all threads will have the maximum number of locks, but if the maximum exceeds the amount of space by a significant factor, the possibility of abends in the IRLM is increased.

If the CROSS MEMORY value from the DSNTIPJ installation panel is YES, the private region size is the space available for the IRLM. The available space is estimated as 60000K since extended private address space is used. If the CROSS MEMORY value is NO, then the MAXIMUM ECSA value space is available for the IRLM. The maximum space used is estimated as the MAX USERS value from the DSNTIPE panel times the number of LOCKS PER USER value on the DSNTIPJ panel times 250 bytes per lock.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

System Action: The CLIST will continue.

User Response: Choose one of the following responses:

- Ensure that you can run with the overcommitment of lock address space, or
- Lower the value of the MAX USERS or LOCKS PER USER field.

**DSNT439I IRLM NO LOCK ESCALATION OR NO USER
MAXIMUM**

Explanation: You specified the number 0 for:

- The number of table or table space locks that will cause lock escalation, or
- The number of locks that will terminate a DB2 user.

A lock escalation value of 0 turns off lock escalation and means that DB2 cannot use this means of conserving lock space. A user maximum of 0 means that the calculation noted in the DSNT438 message cannot be performed to see if the IRLM has sufficient address space for all users, since there is no maximum per user.

This message is issued by the following installation CLIST:
DSNTINST

Severity: 4 (warning)

System Action: The CLIST will continue. This is only a warning.

User Response: Turn off lock escalation and/or user lock limiting.

DSNT440I TOTAL BP SIZE TOO LARGE

Explanation: The total size of a VIRTUAL or HIPER buffer pool is too large. For buffer pool type VIRTUAL, the maximum is 1.6GB. For buffer pool type HIPER, the maximum is 8GB.

This message is issued by the following panels: DSNTIP1, DSNTIP2

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Reduce one or more of the buffer pool sizes.

DSNT441I INVALID HIPERPOOL SIZE

Explanation: If a nonzero hiperpool value is specified, the corresponding virtual buffer pool value must also have a nonzero value. For example, if a nonzero value is specified for the BP1 hiperpool size, then the value for the BP1 virtual buffer pool size must be greater than zero.

This message is issued by the following panels: DSNTIP1, DSNTIP2

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Enter a value greater than zero for the virtual buffer pool size or reduce the value for the hiperpool size to zero.

DSNT442E ERROR, VIRTUAL STORAGE OF main EXCEEDS THE SYSTEM LIMIT OF 2 GIGABYTES

Explanation: The total of all virtual storage calculations exceeds the maximum amount possible for an address space.

This message is issued by the following CLIST: DSNTINST

Severity: 8 (error)

System Action: The installation CLIST returns to the initial panel without editing the installation jobs.

User Response: Respecify installation values that determine storage sizes so that the 2 GB limit is not exceeded.

DSNT443I VALUES MARKED WITH AN ASTERISK HAVE BEEN UPDATED

Explanation: An asterisk is placed before the description of fields which were generated by the DSNTINST CLIST. This message only appears when you update field(s) from a prior panel used to generate the fields on the current panel.

This message is issued by the following panels: DSNTIPA, DSNTITPL

System Action: The panel is displayed.

User Response: Verify that the current value is what you want. If it is not, enter the desired value.

DSNT444I SCROLLING BACKWARD MAY CHANGE FIELDS MARKED WITH ASTERISKS

Explanation: The marked fields on the current panel are generated from fields on other panels. If you scroll backward, these fields may be updated to reflect new values from other panels. For example, the ARCHIVE PREFIX field is generated from the CATALOG ALIAS field on DSNTIPA2. Message DSNT443I will be displayed to inform you when fields are changed by the DSNTINST CLIST.

This message is issued by the following panels: DSNTIPA, DSNTITPL

System Action: The panel is displayed.

User Response: No action required.

DSNT445I REMOTE LOCATION NAME MUST NOT BE THE SAME AS LOCAL LOCATION

Explanation: The name entered for the remote sample location was the same as the local location name.

This message is issued by the following installation panel: DSNTIPY

System Action: The panel is displayed.

User Response: Enter a remote location name or leave the field blank to indicate that the organization sample will only be executed locally.

DSNT446I SAMPLE LOCATION MUST BE BLANK IF LOCAL LOCATION IS BLANK

Explanation: In order to edit the remote sample jobs, both the DB2 LOCATION NAME (local location) on panel DSNTIPR and the REMOTE LOCATION must have valid names. If the DB2 LOCATION NAME is unknown, leave both fields blank and the remote sample jobs will not be edited.

This message is issued by the following panel: DSNTIPY

System Action: The panel is displayed.

User Response: Either scroll back to the DISTRIBUTED DATA FACILITY panel and enter a value for the DB2 LOCATION NAME, or enter a blank in the REMOTE LOCATION field on the job editing panel.

DSNT448I RECOMMEND REAL STORAGE = size K

Explanation: This is the estimated amount of real storage recommended to support the virtual storage sizes chosen.

The amount of real storage needed will vary greatly. Some customers will find that they need several times the estimate shown. For more information on storage calculations, refer to Section 2 of *Installation Guide*.

This message is issued by the following CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

User Response: Compare this recommended value with the actual available real storage.

DSNT449I NUMBER OF LOGS REDUCED FROM old-num TO MAXIMUM OF 31

Explanation: The number of active log data sets used in the DB2 release you are migrating from is greater than the new maximum number of data sets allowed for the current release of DB2. Installation job DSNTIJUZ will update your bootstrap data sets to contain only the last 31 data sets.

This message is issued by the following panel: DSNITPL

System Action: The value is reduced to the maximum of 31 and the panel is displayed.

User Response: Update any other fields on the panel and continue.

DSNT450I type ENTRY MUST BE EXACTLY TWO CHARACTERS

Explanation: These entries are used to complete SYS1.PARMLIB member names and must be exactly two characters. The type is:

APF AUTH	For the APF-authorized library list IEAAPFxx
LINK LIST	For the link list library concatenation LNKLSTxx
MVS SUBSYS	For the MVS subsystem list IEFSSNxx

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue.

User Response: Check your entries for these fields on the MVS panel and make them exactly two characters. See job DSNTIJMV that was produced and correct the IEBUPDTE CHANGE statement.

DSNT451I WARNING-THE LOCAL DATE LENGTH OR LOCAL TIME LENGTH HAS BEEN INCREASED

Explanation: The LOCAL DATE LENGTH or LOCAL TIME LENGTH has been increased and a REBIND command must be issued for any dependent plans.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

System Action: Processing continues.

User Response: Rebind all application plans that depend upon the length of the local format that was changed.

DSNT454I ERROR CODE = errcode, CNT = count

Explanation: An error was encountered during CLIST processing for reading the parameter member. Most of these errors are caused by having a mismatch between the level of the CLIST and that of the parameter member being read.

The 'errcode' is an error code defined for the CLIST. The error code values and associated meanings are found in *TSO/E CLISTS*.

The 'count' value is the number of parameter values already read.

This message is issued by the following installation CLIST: DSNTINST

System Action: The CLIST will terminate.

User Response: Be sure the parameter member and the CLIST are at the same level.

Problem Determination: If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST in batch, so that the tracing can be sent with the error documentation. You will also need the listing of the CLIST and the parameter member being read.

DSNT456I ERROR IN VARIABLE varname, VALUE IS value

Explanation: The variable named 'varname' does not have a valid value. Its current value is 'value'. Subsequent messages will describe the reason the value is invalid and the action taken by the CLIST.

If the error is in the CONTROL value, the value was specified when the CLIST was invoked. The value is not valid, and no additional tracing will be done. The permitted values are NONE, LIST, CONLIST, and SYMLIST. Each value produces more CLIST tracing information than those which precede it. If the error is in other values, the value was specified when the CLIST was invoked on the ISPF panels.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce jobs or parameter data.

User Response: Check the subsequent messages. Exit, then invoke the CLIST with a valid value for the variable.

Problem Determination: If you suspect an error in the process, set CONTROL(CONLIST) and invoke the CLIST in batch, so that the tracing can be sent with the error documentation. The CLIST itself and the parameter member read in should be sent as well.

DSNT457I The SUBSYSTEM NAME MUST BE DIFFERENT THAN THE PROC NAME

Explanation: Internal MVS restrictions require that the IRLM subsystem name be different than the procedure name.

This message is issued by the following panel: DSNTIPI

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change either the SUBSYSTEM NAME or the PROC NAME so these fields are unique with respect to each other.

DSNT458I VALUE MUST BE NUMERIC

Explanation: The variable named in message DSNT456I must be an integer. Only digits are allowed, with no decimal point or fractions. If the value is a number suffixed by K or M, it is interpreted as the indicated number multiplied by 1024 or 1048676. If any other non-numeric character is present in the value, or if the K or M is not the final character, this message is produced.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs or parameter data.

User Response: This CLIST will continue, but will not produce edited jobs. The value of the variable has been set to the value shown in message DSNT465I. You will need to reenter the output parameter and output data set prefix. Examine the value and reset it if needed.

DSNT459I VALUE IS TOO LOW, MINIMUM IS min

Explanation: The variable named in message DSNT456I must be larger than its current value. The minimum value allowed is 'min'.

This message is issued by the following installation CLIST:
DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs. The CLIST resets the incorrect value to 'min'.

User Response: See message DSNT465I for the CLIST action.

DSNT460I VALUE IS TOO HIGH, MAXIMUM IS max

Explanation: The variable named in message DSNT456I must be smaller than its current value. The maximum value allowed is 'max'.

This message is issued by the following installation CLIST:
DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs. The CLIST resets the incorrect value to 'max'.

User Response: See message DSNT465I for the CLIST action.

DSNT461I THE BUFFER POOL MAXIMUM IS LESS THAN THE MINIMUM VALUE ENTERED

Explanation: Buffer pool maximums must be greater than or equal to the minimum value for the same buffer pool.

This message is issued by the following panel: DSNTIPE

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either reduce the minimum value or increase the maximum value for the indicated buffer pool buffer.

DSNT462I VALUE IS TOO LONG, MAXIMUM IS length CHARACTERS

Explanation: The variable named in message DSNT456I must be shorter than its current value. The maximum length allowed is 'length'.

This message is issued by the following installation CLIST:
DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs. The CLIST resets the value to the default value.

User Response: See message DSNT465I for the CLIST action.

DSNT463I DATA SHARING FIELD MUST BE BLANK IN UPDATE MODE.

Explanation: This field is not relevant in Update mode and must be blank This message is issued by panel: DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on t field in error.

User Response: Replace the value with a blank.

DSNT464I VALUES PERMITTED ARE values

Explanation: The variable named in message DSNT456I must be one of the 'values' listed.

This message is issued by the following installation CLIST:
DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs.

User Response: See message DSNT465I for the CLIST action.

DSNT465I VARIABLE varname SET TO value

Explanation: The variable, 'varname', named in message DSNT456I is in error. Possible reasons for the error are listed in messages: DSNT458I, DSNT459I, DSNT460I, DSNT462I, DSNT463I, DSNT464I.

This message is issued by the following installation CLIST:
DSNTINST

System Action: The CLIST will continue, but will not produce edited jobs. The value has been set to the value shown.

User Response: Specify the output data again on the primary install panel. You will be able to see and change the value. If this value is not acceptable, change it, noting the limits.

DSNT466I Output member CANNOT BE DSNTIDVB OR DSNTIDXA

Explanation: The OUTPUT MEMBER NAME field must not be DSNTIDVB or DSNTIDXA. These two members are shipped with DB2 and must not be overwritten.

This message is issued by the following panel: DSNTIPA1

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the value of the field under the cursor.

Note: If the member you specify already exists, it will be overwritten.

DSNT467I OUTPUT MEMBER SHOULD BEGIN WITH DSNTID

Explanation: The output parameter member will be placed into *prefix*.SDSNSAMP. This data set already has a large number of members. To avoid replacing a member that you need, a naming convention with prefix 'DSNTID' is strongly suggested. The suffixes 'VB' and 'XA' are not allowed (see message DSNT466I).

This message is issued by the following installation CLIST:
DSNTINST

Severity: 4 (warning)

System Action: The CLIST will continue.

User Response: Specify a different name for the output member.

DSNT468I ERROR(S) ENCOUNTERED, OUTPUT IS BYPASSED

Explanation: An error was detected earlier in this run. Because of the error, data set editing was not performed.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will continue, but will not produce edited jobs.

User Response: Correct the errors noted earlier, and specify the output prefix name again to produce the edited data.

DSNT469I INPUT PARAMETERS MUST BE READ BEFORE MIGRATION

Explanation: The INPUT MEMBER NAME on panel DSNTIPA1 must have a value to allow migration values to be read. This is to permit the new values to be initialized.

This message is issued by the following installation CLIST: DSNTINST

Severity: 8 (error)

System Action: The CLIST will return to the main install panel, DSNTIPA1.

User Response: Specify DSNTIDXA as the INPUT MEMBER NAME and specify the current value for the migration member.

DSNT470I WARNING, ONLY ONE VOLUME WAS SPECIFIED

Explanation: Only one volume serial number was specified on the install panel or CLIST invocation. This does not allow adequate recovery or performance unless it is intended to be a single volume test system.

This message is issued by the following installation CLIST: DSNTINST

Severity: 4 (warning)

System Action: The CLIST will continue.

User Response: If this subsystem is intended to be recoverable, more than one volume is needed. Rerun the installation tailoring process, specifying at least one more volume on the DSNTIPA2 panel. If this is just a single volume test system, be sure that you specify a single copy of the log data sets. The boot strap data sets are small and not active, so that two are recommended even on a single volume system.

DSNT471I BEGINNING PARAMETER INPUT MEMBER inmem

Explanation: The input parameter member, 'inmem', is being read. This data includes values for all of the installation parameters.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT472I WORK FILE DATABASE NAME CANNOT START WITH DSNDB EXCEPT FOR DSNDB07

Explanation: The work file database name cannot start with the characters DSNDB unless the name is DSNDB07.

This message is issued by the following panel: DSNTIPK

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the name so that it does not start with DSNDB.

DSNT473I BEGINNING CHECK PHASE

Explanation: This message indicates the following:

- The values entered on the panels are being checked.
- Values which use the K or M suffix are being translated to numbers.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT474I READING count, varname, datatype, minval, maxval, currentval

Explanation: The values are being read from the parameter member. The count, the variable name, the data type, the minimum value, the maximum value, and the current value are shown. This message occurs when the CONTROL keyword requests a trace.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT475I CHECK count, varname, type, minval, maxval, currentval

Explanation: This message indicates the following:

- The values read in or entered on the panels are being checked.
- Values which use the K or M suffix are being translated to numbers.

The count, the variable name, the data type, the minimum value, the maximum value, and the current value are shown. This message occurs when the CONTROL keyword requests a trace.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

**DSNT476I BEGINNING PARAMETER OUTPUT MEMBER
outmem**

Explanation: The output parameter member named 'outmem' is being written. This data includes values for all the install parameters.

This message is issued by the following installation CLIST:
DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

**DSNT477I OUTPUT count, varname, type, minval,
maxval, currentval**

Explanation: The values entered on the panels are being written to the output parameter member. The count, the variable name, the data type, the minimum value, the maximum value, and the current value are shown. This message occurs when the CONTROL keyword requests a trace.

This message is issued by the following installation CLIST:
DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

DSNT478I BEGINNING EDITED DATA SET OUTPUT

Explanation: The output jobs and data are being edited to tailor them. Edited JCL output was requested and no severe errors were encountered.

This message is issued by the following installation CLIST:
DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST will continue.

**DSNT479I THE IRLM GROUP NAME AND DB2 GROUP
NAME MUST BE DIFFERENT**

Explanation: You entered an IRLM group name on panel DSNTIPJ that is the same as the DB2 group name entered on panel DSNTIPK. The names must be different.

This message is issued by the following panel: DSNTIPJ

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either change the DB2 group name entered on panel DSNTIPK or the IRLM group name on panel DSNTIPJ.

**DSNT480I NAME MUST BE 1-16 CHARS, BEGIN WITH
A-Z, AND NOT INCLUDE #, @, OR \$.**

Explanation: The location name specified on panel DSNTIPR is invalid. The location name must be 1-16 alphanumeric characters, excluding the alphabetic extenders #, @ or \$, and must begin with a letter.

This message is issued by panel: DSNTIPR

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the location name to meet the allowable criteria.

**DSNT481I DSNTINST data set DATA SET SIZE MAY BE
TOO SMALL**

Explanation: The DSNTINST CLIST encountered an arithmetic overflow during calculation of this data set's size.

This message is issued by the following CSECT: DSNTINST

System Action: DSNTINST continues processing and uses 2 147 483 647 for the result of the calculation that caused the overflow. Thus, the size of the data set might be too small.

User Response: Check the data set size in installation job DSNTIJIN. If it is too small, increase it.

**DSNT482I TOO MANY CONCURRENTLY ALLOCATED
DATA SETS, opnds**

Explanation: The number (*opnds*) calculated for the number of concurrent databases, tables per database, and table spaces per database, is too large. The maximum number of # data sets that can be allocated to an MVS address space is 32 # 767 when running at OS/390 Version 2 Release 6 or a subse- # quent release. However, note that 10 000 is the maximum for # releases prior to OS/390 Version 2 Release 6 and that virtual # storage below the 16 MB line may be the limiting factor. See # DSNT436I and DSNT437I for more information.

The number of concurrently allocated data sets is calculated using the formula:

$$OPNDS = (NUMCONDB \times NUMTABLE \times NUMINDEX) + (NUMCONDB \times NUMTABSP)$$

Where **Represents**

NUMCONDB	The maximum number of concurrently active databases (DATABASES on panel DSNTIPE)
NUMTABLE	The estimated average number of tables per database (TABLES on panel DSNTIPD)
NUMINDEX	The estimated average number of indexes per table (set to 2)
NUMTABSP	The estimated average number of table spaces per database (TABLE SPACES on panel DSNTIPD)

This message is issued by the following installation CLIST:
DSNTINST

Severity: 4 (warning)

System Action: The CLIST reduces the value of NUMCONDB so that the calculated value for OPNDS is within the allowed range. CLIST processing continues.

User Response: Do one of the following:

- Accept the reduced value for NUMCONDB calculated by the CLIST.
- Reenter smaller values for NUMCONDB, NUMTABLE, or NUMTABSP on the SIZES and STORAGE SIZES panels. You can do this by either using the END key to go back to those panels or by running the CLIST again.

DSNT483I NAME MUST BE 1-8 CHARS AND MUST BEGIN WITH A-Z

Explanation: The DB2 data sharing group name specified on panel DSNTIPK or the IRLM data sharing group name specified on panel DSNTIPJ is invalid. The DB2 or IRLM group name must be 1-8 characters, and must begin with a letter.

This message is issued by panels: DSNTIPJ, DSNTIPK

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change the group name to meet the allowable criteria.

DSNT484I MUST BE BLANK IF NOT USING CICS

Explanation: All fields on panel DSNTIP3 must be blank if you are not using CICS.

This message is issued by panel: DSNTIP3

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Remove the value from the field in error.

DSNT485I type SIZE = size K

Explanation: This is the estimated main storage size for part of the DB2 database address space. This is the most constrained address space. The 'type' can be BUFFER POOL, SORT POOL SIZE, RID POOL SIZE, EDMPOOL STORAGE, DATA SET STORAGE, CODE STORAGE, or WORKING STORAGE.

The storage for buffer pools, sort pools, rid pools, EDMPOOL, and code is above the 16 MB line. Most of the main storage for data set control blocks is below the 16MB line and is included in the region size. Working storage includes storage above and below the 16MB line, but storage above the line is not included in the region. Refer to Section 2 of *Installation Guide* for more information regarding this calculation.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

DSNT486I TOTAL MAIN STORAGE = totregion K

Explanation: This is the estimated total region size. It includes storage above the 16MB line. Refer to Section 2 of *Installation Guide* for more details regarding this calculation.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

DSNT487I TOTAL STORAGE BELOW 16MB = region K (ASSUMING SWA IS ABOVE THE LINE)

Explanation: This message provides an estimate of the virtual storage required below the 16MB line to check for virtual storage constraints. This calculation presumes that you have moved the SWA for DB2 above the 16MB line. Refer to Section 2 of *Installation Guide* for details regarding this calculation.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: The CLIST continues.

User Response: Check for virtual storage constraints. Your MVS should permit at least this amount of virtual storage below the 16MB line.

DSNT488I VOLUME voln WILL REQUIRE AT LEAST nn 4K BLOCKS

Explanation: This message states the number of 4KB blocks of space that will be required for the specified volume in order to install or migrate the current release of DB2.

Volume 'voln' is specified in the VOLUME SERIAL fields on install panel DSNTIPA2, or with the VOLSDATn input parameters to the Install CLIST. The message indicates how much space will be needed on the selected volume to install or migrate this release of DB2.

This message is issued by the following installation CLIST: DSNTINST

Severity: 0 (successful execution)

System Action: Processing continues.

User Response: Ensure that the volume has at least as much available storage as the message indicates it should have. If it does not, rerun the INSTALL CLIST specifying different volumes, or create more available space on the originally specified volume.

In order to convert the number of 4KB blocks required to the number of cylinders required, use the table below. Divide the number of 4KB blocks (in the DSNT488I message) by the number of 4KB blocks per cylinder (in the table) to get the number of cylinders required.

Device Type	4KB Blocks per Cylinder	4KB Blocks per Track
3330	57	3
3340	24	2
3350	120	4
3375	96	8
3380	150	10

These size estimates are for system data only. They do not include: user data, archive logs, image copies, or temporary work data sets other than the temporary database.

DSNT489I CLIST EDITING dsname(member), explanation

Explanation: The CLIST is editing the data set and member *dsname(member)*. The *explanation* is the type of data being edited and has one of these values:

INSTALL JCL

Jobs that are edited and run as directed during the installation process.

MIGRATE JCL

Jobs that are edited and run as directed only during the migration process.

FALL BACK JCL

A job that is only run as directed when falling back to the previous release.

RECOVERY JCL

A job that is only run as directed during a recovery process. It deletes the DB2 data sets.

SAMPLE JCL

Jobs that are edited and run during installation verification to add the sample application.

SAMPLE DATA

Edited data that installation verification jobs require.

CLIST

Customized CLISTs to reflect your names used during the installation process.

This message is issued by the following installation CLISTs:

DSNTINST DSNTINS1 DSNTINS2

Severity: 0 (successful execution)

System Action: The CLIST continues.

DSNT490I SAMPLE DATA UNLOAD PROGRAM

Explanation: This is the header, indicating a normal start for the application program.

This message is issued by the following CSECT: DSNTIAUL

DSNT491I TOO MANY TABLES ENTERED (MAXIMUM OF 100 TABLES)

Explanation: The number of tables entered for unloading exceeded the maximum of 100 tables. The first 100 tables in the input should have been processed.

This message is issued by the following CSECT: DSNTIAUL

System Action: The application program is terminated.

User Response: Split the run into multiple runs, none with more than 100 tables.

Problem Determination: Check the application program input. Make sure there are no more than 100 tables.

DSNT492I SQL WARNING DURING SQL STATEMENT func, TABLE ttttttt

Explanation: The SQL statement may not be executed correctly. The function 'func' may be PREPARE, OPEN, FETCH, or CLOSE, indicating the type of SQL statement encountering the error. Table 'ttttttt' is the name of the table or view being unloaded.

This message is issued by the following CSECT: DSNTIAUL

System Action: The request may not be executed correctly.

User Response: Refer to "Section 2. SQL Return Codes" on page 2-1.

Problem Determination: Determine which SQL statement in the application program caused the warning and see if it is reproducible. Follow the diagnosis approach suggested for the warning.

DSNT493I SQL ERROR DURING SQL STATEMENT func, TABLE ttttttt

Explanation: The SQL statement may not be executed correctly. The function 'func' may be PREPARE, OPEN, FETCH, or CLOSE, indicating the type of SQL statement encountering the error. Table 'ttttttt' is the name of the table or view being unloaded.

This message is issued by the following CSECT: DSNTIAUL

System Action: The request was not executed correctly.

User Response: Refer to "Section 2. SQL Return Codes" on page 2-1.

Problem Determination: Determine which SQL statement in the application program caused the error and see if it is reproducible. Follow the diagnosis approach suggested for the SQL return code.

DSNT494I ERROR DURING OPEN OF DDNAME SYSREcnn

Explanation: The ddname listed, where 'nn' ranges from 00 to 99, could not be successfully opened. A possible reason is that the DD statement to the data set was not present in the JCL.

This message is issued by the following CSECT: DSNTIAUL

System Action: The application program is terminated.

User Response: Check the JCL to ensure that this DD statement is provided and is able to be used for output.

Problem Determination: Make sure that the same number of DD statements and table names were provided.

DSNT495I SUCCESSFUL UNLOAD n ROWS OF TABLE ttttttt

Explanation: The message indicates that 'n' rows of table or view 'ttttttt' were unloaded. The 'n' rows were counted during the unload processing.

This message is issued by the following CSECT: DSNTIAUL

System Action: The request was executed successfully.

DSNT496I UNRECOGNIZED DATA TYPE CODE OF nnnnn

Explanation: The PREPARE returned an invalid data type code of decimal 'nnnnn'.

This message is issued by the following CSECT: DSNTIAUL

System Action: The next table is processed.

User Response: Notify the system programmer.

System Programmer Response: See the Problem Determination section.

Problem Determination: There is an error in the unload program or a new data type has been added. The recognized data types are fullword integer, halfword integer, fixed-length character, variable length character, packed decimal, floating-point, fixed-length graphic, variable length graphic, and long, variable length graphic.

DSNT497I RETURN CODE FROM MESSAGE ROUTINE DSNTIAR

Explanation: The message formatting routine detected an error.

This message is issued by the following CSECT: DSNTIAUL

System Action: The application program is terminated.

User Response: Notify the system programmer.

System Programmer Response: See the Problem Determination section.

Problem Determination: There is an error in the unload program. The return code from DSNTIAR is given in the MVS output of your job. When reporting this problem, have the return code, the application program listing, and JCL available.

DSNT498I ERROR, NO VALID COLUMNS FOUND

Explanation: The PREPARE returned data which did not produce a valid output record. The data was not recognized as valid, so the columns were not unloaded.

This message is issued by the following CSECT: DSNTIAUL

System Action: The next table is processed.

User Response: Notify the system programmer.

System Programmer Response: See the Problem Determination section.

Problem Determination: There is an error in the unload program. When reporting this problem, have the application program listing and its JCL available.

DSNT499I ERROR IN INPUT PARAMETER LIST

Explanation: The parameter list specified when DSNTIAUL or DSNTPE2 was invoked contains one or more invalid values.

This message is issued by the following CSECTS: DSNTIAUL DSNTPE2

System Action: The application program is terminated.

User Response: Notify the system programmer.

System Programmer Response: Check the parameter values entered when DSNTIAUL or DSNTPE2 was invoked. For DSNTIAUL, the correct parameter value is 'SQL'. This parameter indicates that DSNTIAUL input is in complete SQL statements terminated by a semicolon. For DSNTPE2, the correct parameter values are either 'ALIGN(LHS)', 'ALIGN(MID)', 'MIXED', or 'NOMIXED'. The first two parameter values represent the two output alignment options available in DSNTPE2 where 'ALIGN(LHS)' will align the output on the left margin and 'ALIGN(MID)' will center the output. The remaining two parameter values designate whether or not DSNTPE2 will recognize mixed character data where 'MIXED' means that it will and 'NOMIXED' means that it will not recognize mixed character data.

DSNT500I csect-name RESOURCE UNAVAILABLE REASON reason TYPE type NAME name

Explanation: The requested function requires a resource that is currently unavailable. In conjunction with other messages this message will identify the system action and the action that should be taken by the installation or operator.

'type' and 'name' identify the resource that is currently unavailable. The type code identifies the type, format, and content of the resource named.

Operator Response: Note the reason code, the type code, and the name. See the Problem Determination section for an explanation of the collected data.

Problem Determination: The reason the resource is unavailable is identified by a reason code. The reason codes that appear in this message are described in "Section 4. DB2 Codes" on page 4-1. Use Table 3 in "Appendix B. Problem Determination" on page X-5 to find the type of resource identified in the message.

If type is X'D00' or X'D01', the table name can be determined by using the following SQL statement:

```
SELECT CREATOR, NAME
FROM SYSIBM.SYSTABLES
WHERE DBID = dbid AND OBID = obid;
```

However, if the failing table has been dropped, then the above SELECT fails or possibly might return an incorrect name.

Collect the following diagnostic item listed in "Appendix B. Problem Determination" on page X-5: 1.

DSNT501I csect-name RESOURCE UNAVAILABLE

CORRELATION-ID	= id1
CONNECTION-ID	= id2
LUW-ID	= id3
REASON	= reason
TYPE	= type
NAME	= name

Explanation: The requested function requires a resource that is currently unavailable. This message is issued with other messages that identify the system action and the action the installer or operator should take.

DB2 can recover from a resource not available in some cases and can complete successfully. One example is during setup of a performance enhancement during bind time for execution time. If DB2 recovers successfully, then no action is necessary.

For type=905, reason=00C90092, and name=IRLM, message DSNT501I is usually issued once. It is suppressed at the DB2 subsystem level until the IRLM out-of-storage condition is relieved.

- id1 The correlation identifier of the thread associated with the requester of the resource.
- id2 The connection identifier of the requester.
- id3 The logical-unit-of-work identifier (LUW-ID) of the thread associated with the requester of the resource. An asterisk (*) indicates that the thread does not have a LUW-ID. If the LUW-ID is not an asterisk, the value is a logical-unit-of-work-id assigned to the thread. This is followed by an equal sign (=) and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

type	The type of resource that is currently unavailable. The 'type' identifies the type, as well as the format and content, of the resource 'name'. Use Table 3 in "Appendix B. Problem Determination" on page X-5 to find the type of resource identified in the message.
name	The name of the resource that is currently unavailable.
reason	The reason code that tells why the resource is unavailable.

Operator Response: Note the 'reason' code, the 'type' code, and the 'name'.

Problem Determination: Collect the following diagnostic item listed in "Appendix B. Problem Determination" on page X-5: 1.

DSNT502I ERROR IN DSNTIAUL SQL INPUT: statement

Explanation: The DSNTIAUL input SQL statement could not be prepared.

This message is issued by the following CSECT: DSNTIAUL

System Action: The application program terminates.

User Response: Notify the system programmer.

System Programmer Response: Check that the DSNTIAUL input statement is a complete SQL statement, ending with a semicolon.

DSNT503I UNLOAD DATA SET *ddname* RECORD LENGTH SET TO *nnnnn*.

Explanation: If the *ddname* is SYSRECnn, the record length specified in the JCL for the data set is not large enough to contain an entire row of unloaded data, or the record length was not specified in the JCL.

If the *ddname* is SYSPUNCH, the record length specified in the JCL is not between 80 and 255, or the record length was not specified in the JCL.

This message is issued by the following CSECT: DSNTIAUL

System Action: DB2 sets the record length of the unload data set to the value specified in the message text.

DSNT504I UNLOAD DATA SET *ddname* BLOCKSIZE SET TO *nnnnn*.

Explanation: The block size for the SYSRECnn or SYSPUNCH data set was one of the following:

- Not specified in the JCL
- Set to zero in the JCL
- Less than the required record length
- Not an even multiple of the required record length

This message is issued by the following CSECT: DSNTIAUL

System Action: DB2 sets the block size of the unload data set to the value specified in the message text.

DSNT505I DSNTIAUL OPTIONS USED: 'nnn'.

Explanation: You specified these options when you invoked DSNTIAUL. 'SQL' is the only valid option.

Severity: 0 (informational)

This message is issued by the following CSECT: DSNTIAUL

DSNT506I INPUT STATEMENT WAS NOT SELECT * FROM A SINGLE TABLE. LOAD STATEMENT WILL NEED MODIFICATION.

Explanation: The SELECT statement used to request a table unload contained one of the following:

- A SELECT clause other than "SELECT * FROM"
- A FROM clause that does not contain exactly one table name

The table to be loaded is therefore not the same as the table from which the data is unloaded. DSNTIAUL is unable to determine the table name and all column names for the table to be loaded.

Severity: 4 (warning)

This message is issued by the following CSECT: DSNTIAUL

System Action: DSNTIAUL generates a LOAD statement containing the string 'TBLNAME' for the table name. Some column names may be blank.

User Response: Change the LOAD statement table name to the name of a table with the indicated column descriptions.

DSNT507I *csect-name* RECORD LENGTH NEEDED IS GREATER THAN MAXIMUM ALLOWED FOR TABLE *table-name*

Explanation: In order to unload table *table-name*, DB2 needs an output data set with a record length greater than the system maximum of 32760 bytes. This occurs when the table to be unloaded is in a 32KB page table space and contains a combination of long columns and a number of date, time, or timestamp columns.

Severity: 8 (error)

System Action: The application program is terminated.

DSNT508I WARNING - NONSTANDARD JOB CARD (*cardstat*), NO JOB CARDS WILL BE ADDED TO THE EDITED JOBS

Explanation: The job card you entered in field 3 of panel DSNTIPY contains one or more of the following errors:

- Less than 7 characters ('cardstat' = TOO SHORT)
- "/" missing as the first 2 characters ('cardstat' = MISSING //)
- Missing the word "JOB" ('cardstat' = MISSING "JOB"TOKEN)

This message is issued by the following installation CLIST: DSNTINST

System Action: The message is written to the screen, after all panels are displayed and before any job editing. No JCL is added to the edited jobs.

User Response: You can continue with job editing and manually add JCL to the edited jobs. Alternatively, you can repeat

the installation process and make corrections to the job card entered on panel DSNTIPY.

**DSNT510I WARNING - INPUT MEMBER *inmem* LEVEL IS *rel_ind*. LEVEL *curr_rel* IS REQUIRED.
RETURN TO PANEL DSNTIPA1 TO CHANGE INPUT MEMBER**

Explanation: The input member 'inmem' you entered in field 6 on panel DSNTIPA1 contains incorrect release indicator 'rel_ind'. It should contain the indicator for the current release ('curr_rel'). If your input member does not contain a release indicator, 'rel_ind' will be <null>. This probably indicates that you are using a down-level member.

This message is issued by the following installation CLIST:
DSNTINST

System Action: The message is written to the screen, after display of panel DSNTIPA1.

User Response: Press ENTER to proceed to the next panel, and then PF3 to return to panel DSNTIPA1 in order to enter an input member with the correct release indicator.

DSNT511I FIELDS 2 AND 5 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the IRLM SUBSYSTEM and IRLM PROC names must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these names within a group.

This message is issued by the following panel: DSNTIPI

User Response: Enter unique names in these fields for each member of a DB2 data sharing group.

DSNT512I DSNT512I WARNING: ENTER UNIQUE NAMES FOR LUNAME AND LOCATION NAME

Explanation: This warning message is issued to remind you that you must enter values for DB2 LOCATION NAME and DB2 NETWORK LUNAME fields.

LUNAME is used to uniquely identify this DB2 subsystem within the network and to uniquely identify trace records for correlation of accounting records. The NETWORK LUNAME must be unique within the network. The installation process does not check for uniqueness of this name within a data sharing group.

The LOCATION NAME must be unique within the network, but must be the same on all members within a DB2 data sharing group.

This message is issued by the following panel: DSNTIPR

User Response: Enter unique names in these fields.

DSNT513I FIELD 2 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the DB2 PROC NAME field on panel DSNTIPX or the RESYNC PORT field on panel DSNTIP5 must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these values within a group.

This message is issued by the following panels: DSNTIPX and DSNTIP5

User Response: Enter unique values in these fields for each member of a DB2 data sharing group.

DSNT514I FIELDS 2 AND 3 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the MEMBER NAME and WORK FILE DB NAME must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these names within a group.

This message is issued by the following panel: DSNTIPK

User Response: Enter unique names in these fields for each member of a DB2 data sharing group.

DSNT515I FIELD 7 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the MEMBER IDENTIFIER field on panel DSNTIPJ or the DSNZPARM NAME field on panel DSNTIPO must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these values within a group.

This message is issued by the following panels: DSNTIPJ and DSNTIPO

User Response: Enter unique values in these fields for each member of a DB2 data sharing group.

DSNT516I FIELDS 1, 2, AND 4 MUST BE UNIQUE FOR EACH NEW MEMBER INSTALLED

Explanation: This warning message is issued to remind you that the SUBSYSTEM NAME, COMMAND PREFIX, and SUBSYSTEM SEQUENCE fields must be unique for each new member installed within a DB2 data sharing group. The installation process does not check for uniqueness of these values within a group.

This message is issued by the following panel: DSNTIPM

User Response: Enter unique values in these fields for each member of a DB2 data sharing group.

DSNT518I THE VALUES FOR DRDA PORT AND RESYNC PORT CANNOT BE THE SAME

Explanation: You entered the same value for DRDA PORT and RESYNC PORT. The values for these fields must be different.

This message is issued by the following panel: DSNTIP5

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Change either the DRDA PORT or the RESYNC PORT value so that they are different.

DSNT519I IF YOU SPECIFY EITHER DRDA OR RESYNC PORT, BOTH MUST BE SPECIFIED

Explanation: You entered a value for either DRDA PORT or RESYNC PORT, but not the other. If either DRDA PORT or RESYNC PORT is specified, both must be specified.

This message is issued by the following panel: DSNTIP5

System Action: The panel is redisplayed and the cursor is placed on the field in error.

User Response: Either enter a value for the null field, or blank out both DRDA PORT and RESYNC PORT.

DSNT522I *csect-name* **REQUIRED TCP/IP SUPPORT NOT AVAILABLE**

Explanation: The DB2 BSDS indicated that TCP/IP access was required, but the required TCP/IP interfaces were not available on this system. The required TCP/IP interfaces are provided by OS/390 Release 3.

System Action: DDF startup terminates abnormally.

System Programmer Response: Take one of the following actions:

- Install OS/390 Release 3 or later, so that the required TCP/IP interfaces are available.
- Use the change log inventory utility (DSNJU003) to deactivate DB2's TCP/IP support, by specifying PORT=0 and RESPOR=0 on the DDF statement.

DSNT601I **THE DESCRIPTOR FOR type name DOES NOT EXIST IN DBD01**

Explanation: This message is issued for multiple-line WTO. The database, table space, or index space 'name' is in the DB2 catalog but a descriptor for the object does not exist in the DBD01 table space of database DSNDB01. This error can be produced when one of the following is true:

- The Release 3 catalog has been migrated into Version 2. There is an object in the Version 2 catalog but there is not a descriptor for the object in the Version 2 directory (DBD01).
- The user did not completely restore the DBD01 table space during a recovery process.
- There is a DB2 logic error.

In the message, 'type' is either 'DATABASE' or 'SPACE' and 'name' is the eight character name of the database, table space, or index space.

This message is issued by the following CSECT: DSNTDMUL

System Action: The process continues normally.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNT602I **NO SPACES FOUND**

Explanation: This message is issued for multiple line WTO. It is produced when a DISPLAY DB(name) SPACENAM(...) is entered and no spaces were found to satisfy the request. SPACENAM(...) might have been entered as a range, a subset, or a list of spaces.

This message is issued by the following CSECT: DSNTDMUL

DSNT603I **spacetype name NOT type**

Explanation: This message is issued for multiple-line WTO. It is produced when no table space or index space listed in the DISPLAY DB(...) SPACENAM(...) satisfies your request.

spacetype TABLESPACE if the space is a table space or INDEXSPACE if the space is an index space.

name The name of the space.

type A character string that indicates the type of request specified. The string is a list of the following, delimited by 'OR':

- 'ACTIVE' if the keyword ACTIVE is specified
- 'RESTRICTED' if the keyword RESTRICT is specified.

This message is issued by the following CSECT: DSNTDMUL

System Action: Message DSNT3011 or DSNT3021 is produced if no object is found and the keywords ACTIVE and RESTRICT are omitted.

DSNT604I **NO INFORMATION AVAILABLE**

Explanation: This message is issued for multiple line WTO. It is produced when there is no LOCK or USE information available. When DISPLAY DB(name) SPACENAM(...) is entered, and SPACENAM(...) is a list of spaces, this message indicates that no table spaces or index spaces whose names are listed have LOCK or USE information available. If DISPLAY DB(name) SPACENAM(...) is entered, and SPACENAM(...) is a range or a subset of spaces, no table spaces and index spaces within the specified database have LOCK or USE information available. This message is produced only when the keywords USE and LOCKS are specified.

This message is issued by the following CSECT: DSNTDMUL

DSNT694I **DATABASE name CANNOT BE STOPPED. IT CONTAINS THE DDL REGISTRATION TABLES**

Explanation: The database specified in the message cannot be stopped because it contains the application and object registration tables. Install SYSADM or install SYSOPR authority is needed to stop the database.

This message is issued by the following CSECT: DSNTDMMSG

System Action: The database specified in the message is not stopped.

User Response: Reissue the command with the proper authority.

DSNT695I **TABLESPACE name CANNOT BE STOPPED. IT CONTAINS A DDL REGISTRATION TABLE**

Explanation: The table space specified in the message cannot be stopped because it contains an application or object registration table. Install SYSADM or install SYSOPR authority is needed to stop the table space.

This message is issued by the following CSECT: DSNTDMMSG

System Action: The table space specified in the message is not stopped.

User Response: Reissue the command with the proper authority.

DSNT696I INDEXSPACE name CANNOT BE STOPPED. IT IS DEFINED ON A DDL REGISTRATION TABLE

Explanation: The index space specified in the message cannot be stopped because it is defined on an application or object registration table. Install SYSADM or install SYSOPR authority is needed to stop the index space.

This message is issued by the following CSECT: DSNTDMSG

System Action: The index space specified in the message is not stopped.

User Response: Reissue the command with the proper authority.

DSNT700I table-name IS THE ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: This is a response message to the DISPLAY RLIMIT command. The resource limit facility (governor) is currently active and is using table 'table-name' to determine resource limits.

This message is issued by the following CSECT: DSNTCDIS

System Action: The system continues normal processing.

User Response: See Operator Response.

Operator Response: To have the governor active while utilizing a different resource limit specification table, issue the START RLIMIT command specifying the ID of the desired table. If you do not want the facility to be active, issue the STOP RLIMIT command.

System Programmer Response: May be used to resolve questions about what table is being used.

DSNT701I RESOURCE LIMIT FACILITY IS INACTIVE

Explanation: This is a response message to the DISPLAY RLIMIT command. It results whenever the governor is not active.

This message is issued by the following CSECT: DSNTCDIS

System Action: Normal processing continues.

User Response: See Operator Response.

Operator Response: If you want to activate the governor, specify the ID of the resource limit specification table to be used and issue the START RLIMIT command.

System Programmer Response: If the facility is already active (that is, a DSNT703 message was previously received), verify that the DSNT703 message appeared *before* the DISPLAY RLIMIT command was entered. If uncertain, reissue the DISPLAY RLIMIT command. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5.

DSNT702I RESOURCE LIMIT FACILITY HAS BEEN STOPPED. WAS USING table-name

Explanation: This message is the normal response for a STOP RLIMIT command. Table 'table-name' was being used to determine resource limits.

This message is issued by the following CSECT: DSNTCSTP

System Action: The governor is stopped.

System Programmer Response: May be used to resolve questions about what table was being used.

DSNT703I RESOURCE LIMIT FACILITY IS ALREADY INACTIVE. STOP LIMIT COMMAND IS IGNORED

Explanation: A STOP RLIMIT command was entered but the resource limit facility was already stopped. The command is ignored.

This message is issued by the following CSECT: DSNTCSTP

System Action: The system continues normal processing.

DSNT704I table-name HAS BEEN STARTED FOR THE RESOURCE LIMIT FACILITY

Explanation: This message is the normal response for a START RLIMIT command. Table 'table-name' is currently being used to determine resource limits.

This message is issued by the following CSECT: DSNTCSRS

System Action: The governor has started utilizing the specified table.

System Programmer Response: May be used to resolve questions about what table is being used.

DSNT705I csect-name DATABASE name CANNOT BE STOPPED. IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Database *name* cannot be stopped because it contains an active resource limit specification table.

System Action: The database is not stopped.

Operator Response: If the database must be stopped, either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the database (START RLIMIT,ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the database.

DSNT706I table-name DOES NOT EXIST. START LIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because table 'table-name' does not exist.

This message is issued by the following CSECT: DSNTCSRC

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears correct, contact the system programmer.

System Programmer Response: DB2 was unable to find the specified table in the catalog. Verify that the FULLY QUALIFIED name is the one expected. The table name is built by appending the 1 or 2 character ID specified on the START RLIMIT command to the authorization ID.DSNRLST. The authorization ID is determined from the DSNZPARMs used when starting the subsystem.

If everything appears to be in order, from a TSO terminal with the proper authorization, enter the following SQL statement:

```
SELECT * FROM SYSIBM.SYSTABLES WHERE NAME=DSNRLSTxx
AND CREATOR=authorization ID
```

Where

DSNRLSTxx	Table-name starting with the DSNRLST authorization ID
	Table-name up to but not including the period.

If an entry is found, save the output and if you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items:

- Console output showing the failing START command
- The output of the SELECT command.

DSNT707I START RLIMIT COMMAND FAILED. COLUMN column-name IN TABLE table-name IS INCORRECTLY DEFINED. THE COLUMN DEFINITION IS attribute WITH LENGTH length AND NULL ATTRIBUTE null-attribute. THE COLUMN DEFINITION SHOULD BE attribute WITH LENGTH length AND NULL ATTRIBUTE null-attribute

Explanation: The START RLIMIT command has been entered but failed because TABLE 'table-name' does not have the proper column definition for a resource limit specification table. The current column definition is given as well as the proper column definition.

This message is issued by the following CSECT: DSNTCSRC

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: TABLE 'table-name' does not have the proper column definition for a resource limit specification table. Compare the current table column definition to the proper column definition given in the message.

Problem Determination: Collect the console output showing the failing START command.

DSNT708I INDEX index-name DOES NOT EXIST. START RLIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because INDEX DSNARLxx does not exist for the corresponding resource limit specification table, DSNRLSTxx.

This message is issued by the following CSECT: DSNTCSRC

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: The resource limit specification table DSNRLSTxx does not define the required index DSNARLxx. Create the required index and reissue the START RLIMIT command.

Problem Determination: Collect the console output showing the failing START command.

DSNT709I new-table-name NOW ACTIVE. old-table-name WAS OLD RESOURCE LIMIT SPECIFICATION TABLE

Explanation: A START RLIMIT command was entered while the facility was already active. The facility remains active and switches from using the old table name to the new one.

This message is issued by the following CSECT: DSNTCSRS

User Response: Notify the system programmer.

Operator Response: Notify the system programmer.

DSNT710I table-name ALREADY ACTIVE. START LIMIT COMMAND IGNORED

Explanation: A START RLIMIT command was entered and the governor is already active utilizing the specified table. The command is ignored.

This message is issued by the following CSECT: DSNTCSTR

System Action: The governor continues to use table 'table-name'.

User Response: See Operator Response.

Operator Response: Verify that the ID specified on the START RLIMIT command was the one desired. If not, reenter the command specifying the correct ID. If it is correct, no action is needed since the facility is already active and is using the desired table.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5.

DSNT711I COLUMN column-name IS MISSING IN TABLE table-name. SHOULD BE DEFINED AS attribute WITH LENGTH length AND NULL INDICATOR OF null-attribute

Explanation: The START RLIMIT command has been entered but failed because COLUMN 'column-name' in resource limit specification table 'table-name' is not defined. The proper column definition is given in the message.

This message is issued by the following CSECT: DSNTCSRC

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the

ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: TABLE 'table-name' does not have COLUMN 'column-name' defined. Use ALTER TABLE to define the column as specified in the message.

Problem Determination: Collect the console output showing the failing START command.

DSNT712I INDEX index-name IS NOT FOR TABLE table-name. START RLIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because INDEX 'index-name' is not defined for resource limit specification table 'table-name'.

This message is issued by the following CSECT: DSNTCSRC

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: INDEX 'index-name' is not defined in resource limit specification table 'table-name'. resource limit specification table DSNRLSTxx does not define the required index DSNARLxx. The last two characters of the table name correspond to the last two characters of the index. Drop the existing DSNARLxx index and create the correct index in the resource limit specification Table.

Problem Determination: Collect the console output showing the failing START command.

DSNT713I INDEX index-name IS NOT UNIQUE. START RLIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because INDEX 'index-name' in the resource limit specification table is not defined as a UNIQUE index.

This message is issued by the following CSECT: DSNTCSRC

System Action: The START RLIMIT command is ignored.

User Response: See Operator Response.

Operator Response: Verify that the 1 or 2 characters following DSNRLST are what was intended to be entered as the ID on the START RLIMIT command. If not, reenter the command specifying the proper ID. If the ID appears to be correct, contact the system programmer.

System Programmer Response: INDEX 'index-name' in resource limit specification table is not UNIQUE. Redefine it as unique.

Problem Determination: Collect the console output showing the failing START command.

DSNT714I INDEX index-name IS INCORRECTLY DEFINED. START RLIMIT COMMAND FAILED

Explanation: The START RLIMIT command has been entered but failed because INDEX 'index-name' in resource limit specification table 'table-name' is not properly defined.

This message is issued by the following CSECT: DSNTCSRC

System Action: The START RLIMIT command is ignored.

User Response: Contact the system programmer.

Operator Response: Contact the system programmer.

System Programmer Response: INDEX 'index-name' in the resource limit specification table does not have the proper definition. Refer to Section 5 (Volume 2) of *Administration Guide* for an example to define the resource limit specification table.

Problem Determination: Collect the console output showing the failing START command.

DSNT715E ERROR reason-code READING table-name. default WILL BE RESOURCE LIMIT FOR CORRELATION-ID correlation-id, CONNECTION-ID connection-id, LUW-ID luw-id =token

Explanation: An error occurred while the resource limit specification table 'table-name' was being read. The limit is determined from the default specified in the system parameters.

This default can be:

NOLIMIT No limit applies.
 NORUN Zero time limit.
 integer The limit to be used.

The reason code that defines the read error is included in the message text, as are the 'connection-ID', 'correlation-ID', and the logical-unit-of-work identifier (LUW-ID) of the thread. An LUW-ID of an '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

This message is issued by the following CSECT: DSNTCGET

System Action: Processing continues using the system-defined default.

Operator Response: Notify the system programmer.

System Programmer Response: This is an I/O error. Investigate the problem indicated by the reason code and preceding messages. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5.

DSNT716E AN ERROR OCCURRED ESTABLISHING A RESOURCE LIMIT FOR CORRELATION-ID correlation-id, CONNECTION-ID connection-id, LUW-ID luw-id =token. limit WILL BE USED AS THE LIMIT

Explanation: An internal error occurred while the resource limit for the specified requester was being established. The 'limit' is determined from the default specified in the system parameters. This default can be:

NOLIMIT No limit applies.
 NORUN Zero time limit.
 integer The limit to be used.

A logical-unit-of-work identifier (LUW-ID) of '*' indicates that the thread does not have a LUW-ID. If the LUW-ID is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

This message is issued by the following CSECT: DSNTCGET

System Action: Processing continues using the system-defined default.

Operator Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5.

DSNT717I csect-name TABLE SPACE name CANNOT BE STOPPED. IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Table space *name* cannot be stopped because it contains an active resource limit specification table.

System Action: The table space is not stopped.

Operator Response: If the table space must be stopped, either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the table space (START RLIMIT,ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the table space.

DSNT718I csect-name INDEX SPACE name CANNOT BE STOPPED. IT IS DEFINED ON AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Index space *name* cannot be stopped because it contains an index on an active resource limit specification table.

System Action: The index space is not stopped.

Operator Response: If the index space must be stopped,

either stop the resource limit facility (STOP RLIMIT), or switch it to use a different resource limit specification table that does not have an index in the index space (START RLIMIT,ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a different resource limit specification table that does not have an index in the index space.

DSNT719I TABLE table-name CANNOT BE READ. START RLIMIT COMMAND FAILED

Explanation: TABLE 'table-name' cannot be accessed. This message may be preceded by related error messages that explain why the table cannot be accessed.

This message is issued by the following CSECT: DSNTCSRC

System Action: The START RLIMIT command failed.

User Response: See Operator Response.

Operator Response: TABLE 'table-name' cannot currently be accessed for reading. In the case of a deadlock or timeout, reissue the START RLIMIT command.

DSNT720I INDEX index-name NEEDS TO BE ASCENDING

Explanation: The START RLIMIT command was entered but failed because the named index defined for the resource limit specification table is not defined properly. All the index columns need to be ascending.

This message is issued by the following CSECT: DSNTCSRC

System Action: The system ignores the START RLIMIT command.

User Response: Contact the system programmer.

Operator Response: Contact the system programmer.

System Programmer Response: The named index defined on the resource limit specification table does not have the proper definition.

Problem Determination: Collect the console output showing the failing START command.

DSNT721I csect-name DATABASE name CANNOT BE STARTED WITH ACCESS (UT). IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Database *name* cannot be started with access (UT) because it contains an active resource limit specification table.

System Action: The START DATABASE command is ignored.

Operator Response: If the database must be started with access (UT), either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the database (START RLIMIT,ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the database.

DSNT722I *csect-name* TABLE SPACE *name* CANNOT BE STARTED WITH ACCESS (UT). IT CONTAINS AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Table space *name* cannot be started with access (UT) because it contains an active resource limit specification table.

System Action: The START DATABASE command is ignored.

Operator Response: If the table space must be started with access (UT), either stop the resource limit facility (STOP RLIMIT), or switch it to use a resource limit specification table that is not in the table space (START RLIMIT, ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that is not in the table space.

DSNT723I *csect-name* INDEX SPACE *name* CANNOT BE STARTED WITH ACCESS (UT). IT IS DEFINED ON AN ACTIVE RESOURCE LIMIT SPECIFICATION TABLE

Explanation: Index space *name* cannot be started with access (UT) because it contains an index on an active resource limit specification table.

System Action: The START DATABASE command is ignored.

Operator Response: If the index space must be started with access (UT), either stop the resource limit facility (STOP RLIMIT), or switch it to use a different resource limit specification table that does not have an index in the index space (START RLIMIT, ID=xx). In a DB2 data sharing environment, you must either stop the resource limit facility on all members of the DB2 data sharing group or switch it to use a resource limit specification table that does not have an index in the index space.

DSNT724E *csect-name* ERROR *reason-code* IN READING RESOURCE LIMIT SPECIFICATION TABLE *table-name*. FOR AUTHORIZATION ID *auth-id* RUNNING THREAD WITH CORRELATION ID *correlation-id*, CONNECTION ID *connection-id*, AND LUWID *luw-id*, USE OF *operation-name* IS NOT GOVERNED.

Explanation: An error occurred reading resource limit specification table '*table-name*'. '*Auth-id*' is assumed to be allowed to perform '*operation-name*'. '*Operation-name*' is BIND or PARALLEL PROCESSING.

The reason code defining the read error is included in the message text as well as the connection ID, correlation ID, and logical unit of work (LUW) ID of the thread. An LUW-ID '**' indicates that the request originated at this site. If not an '**', the LUW-ID is assigned to the allied thread at the requesting site. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

System Action: If the '*operation-name*' is BIND, processing continues if the '*auth-id*' is authorized to perform the BIND. If

the '*operation-name*' is PARALLEL PROCESSING, query parallelism is not disabled and can be used if the value of the CURRENT DEGREE special register is 'ANY'.

User Response: Notify the system programmer.

System Programmer Response: Investigate the problem indicated by the reason code and preceding messages. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Operator Response: Notify the system programmer.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5.

DSNT725E AN ERROR OCCURRED WHILE GOVERNING BIND OPERATIONS OF *auth-id* RUNNING WITH CORRELATION-ID *correlation-id*, CONNECTION-ID *connection-id*, LUW-ID *luw-id*. *auth-id* IS ALLOWED TO PERFORM BIND OPERATIONS

Explanation: An internal error occurred while determining whether or not '*auth-id*' is allowed to perform bind operations. It is assumed that '*auth-id*' is allowed to perform bind operations.

An LUW-ID '**' indicates that the request originated at this site. If not an '**', the LUW-ID is assigned to the allied thread at the requesting site. Correlation IDs beginning with '0nn' where 'nn' is a number from 01 to 28, identify system agents.

This message is issued by the following module: DSNTCAUT

System Action: Processing occurs assuming the authorization ID is allowed to perform bind operations.

User Response: Notify the system programmer.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Operator Response: Notify the system programmer.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5.

DSNT726I *csect-name* DATABASE *name* AND ANY SPACE IT CONTAINS CANNOT BE STARTED WITH ACCESS (UT). IT IS THE ACTIVE COMMUNICATIONS DATABASE

Explanation: The database specified in the message cannot be started with access (UT) because it is the active communications database. In addition, spaces within the active communications database cannot be started with access (UT).

System Action: The START DATABASE command is ignored.

Operator Response: If the database or any space within it must be started with access (UT), you must stop the distributed data facility (STOP DDF). In a DB2 data sharing environment, you must stop the distributed data facility on all members of the DB2 data sharing group.

DSNT735I object name CANNOT BE STARTED. IT CONTAINS OR IS DEFINED ON THE DDL REGISTRATION TABLE(S)

Explanation: The object specified in the message cannot be started because it contains or is defined on the DDL registration table(s). Install SYSADM or install SYSOPR authority is needed to start the object.

In the message, 'object' is either:

- DATABASE if the specified database contains the application and object registration tables
- TABLESPACE if the specified table space contains an application or object registration table
- INDEXSPACE if the specified index space is defined on an application or object registration table

This message is issued by the following CSECT: DSNTDCST

System Action: The object specified in the message is not started.

User Response: Reissue the command with the proper authority.

DSNT736I *csect-name* STOP DATABASE ASYNCHRONOUS PROCESSING COMPLETED.

Explanation: Asynchronous processing for the STOP DATABASE command completed.

System Action: Asynchronous processing for the STOP DATABASE command is complete.

System Programmer Response: No action is required.

DSNT800I *csect-name* DB2 CANNOT IDENTIFY TO IRLM. IRLM CANNOT CONNECT TO ITS DATA SHARING GROUP. THE LOCK STRUCTURE THAT IRLM ATTEMPTED TO ACCESS WAS *strname*.

Explanation: IRLM failed to connect to the IRLM data sharing group. This message accompanies abend reason code 00E30806.

System Action: DB2 terminates abnormally with reason code 00E30806.

System Programmer Response: Some possible reasons why IRLM could not connect to its data sharing group are:

- The lock structure is not properly defined in the active MVS CFRM administrative policy. The lock structure name is a concatenation of the DB2 data sharing group name and the string 'LOCK1' separated by an underscore (_). For example, if the DB2 data sharing group name is DSNCAT, DSNCAT_LOCK1 is the lock structure name.

Ensure that the lock structure is properly defined in the active CFRM policy. The name of the lock structure that IRLM attempted to access is given in this message. IRLM issues message DXR138E to indicate that the lock structure definition could not be accessed in the active CFRM policy.

- IRLM could not connect the lock structure. The reason for the connect failure is given in IRLM message DXR135E.

- IRLM could not join its data sharing group. The reason for the join failure is given in IRLM message DXR134E.
- IRLM joined the wrong group. The set of IRLMs that are connected to a given lock structure must all be members of the same group. Ensure that the GROUP parameter is correctly specified in the IRLM startup procedure. If you give an incorrect group name, IRLM connects the lock structure, and then times out waiting for responses from other connectors. IRLM issues message DXR133I for the timeout.

DSNT801I ACTION A (ADD) DOES NOT ALLOW GENERIC DISPLAY (% IN DATA FIELD).

Explanation: You have to specify a specific data item in the DATA field.

This message is issued by the following panel: DSN8SSH

System Action: The panel is redisplayed, and the cursor is placed on the field in error.

User Response: Enter specific data in the DATA field.

DSNT802I ONLY ACTION D (DISPLAY) IS ALLOWED FOR DEPARTMENT STRUCTURE.

Explanation: You cannot add, update, or erase a department structure. You can only display it.

This message is issued by the following panel: DSN8SSH

System Action: The panel is redisplayed, and the cursor is placed on the field in error.

User Response: Change the ACTION field to D, or change the OBJECT field to DE or EM.

DSNT803I *csect-name* DB2 CANNOT IDENTIFY TO IRLM. THE REQUESTED FUNCTION LEVEL IS NOT SUPPORTED.

Explanation: An attempt was made to identify to an IRLM that does not support the level of function DB2 needs. This message accompanies abend reason code 00E30800.

System Action: DB2 terminates abnormally with reason code 00E30800.

System Programmer Response: DB2 Version 4 requires IRLM Version 2.1. DB2 Version 4 will not run with any earlier release of IRLM. Ensure that the STEPLIB statement in your IRLM startup procedure is referencing the correct IRLM code library.

DSNT804I *csect-name* THERE ARE MODIFY LOCKS OWNED BY THIS DB2 THAT HAVE BEEN RETAINED

Explanation: When DB2 disconnected from IRLM during DB2 shutdown, IRLM indicated that there were still outstanding modify locks. These locks were retained by IRLM. The retained locks continue to protect the resources on which they are held from requests from other DB2s in the data sharing group. That is, IRLM rejects any lock request from another DB2 that is incompatible with the retained state of the lock. The locks are retained until the terminating DB2 subsystem is restarted and the resources on which the locks are held are recovered.

System Action: DB2 continues with its shutdown processing.

System Programmer Response: No response is necessary.

DSNT805I **NAME TYPE PART STATUS** **LPL PAGES**

Explanation: This message indicates the beginning of a set of messages used to display information as a result of a DISPLAY DATABASE command when the keyword LPL is specified. This message contains the headings of the display. (The message appears in one continuous line across the screen, not as shown above.) This message is always followed by one or more DSNT806I messages containing the column data. Refer to message DSNT806I for a description of the data these headings identify.

This message is issued by the following CSECT: DSNTDMUL

DSNT806I *space type part status LPL pages*

Explanation: This message contains the display information resulting from a DISPLAY DATABASE command when the keyword LPL is specified. It contains the column data describing the status of a table space or index space in the database listed in the preceding DSNT362I message. This message is always preceded by its column headings message DSNT805I. The message number for this message is not displayed.

The message fields have the following meanings:

- space* The table space name or index space name.
- type* TS for a table space or IX for an index space.
- part* The partition number. It is blank for a nonpartitioned table space or index space.
- status* One or more of the following, delimited by commas. The maximum length is 18 characters:
 - CHKP The table space is in check pending status.
 - COPY An image copy is required for this object (table space or data set within this table space). STOP is also displayed. If the image copy is required because DB2 encountered a problem during RESTART, STOPE is displayed instead of STOP.
 - GRECP The object (a table space, a table space partition, index space, or index space partition) is marked recovery pending because of the failure of a group buffer pool. This status value appears only on spaces. It does not apply to databases. See *Data Sharing: Planning and Administration* for information about resolving this restricted status.
 - LPL The object has pages or ranges of pages that are unavailable because of logical or physical damage.
 - LSTOP The logical partition is stopped.

- RECP The table space or index space is in recovery pending status. The member must be restarted to restore full access to the data. For logical partitions, the RECP status can appear as RECP*. RECP* indicates that the entire index is inaccessible to SQL applications, however only the logical partition needs to be recovered.
- RO The database, table space, or index space is started for read activity only.
- RW The database, table space, or index space is started for read and write activity.
- STOP The database, table space, or index space is stopped.
- STOPE DB2 implicitly stopped the table space or index space because of an internal inconsistency. A DSNT500I or DSNT501I message is issued at time of error detection to indicate the inconsistency.
- STOPP A stop is pending or is in process for this database, table space, or index space.
- UT The database, table space, or index space is started for utility processing only.
- UTRO Although the table space or index space is started as RW, a utility is in process and only RO access is allowed.
- UTRW The table space or index space is started as RW and a utility is in process.
- UTUT Although the table space or index space is started as RW, a utility is in process and only UT access is allowed.
- LPL pages* The pages in the specified *space* that are unavailable because of logical or physical damage.

This message is issued by the following CSECT: DSNTDMUL

DSNT807I *csect-name* **IRLM PURGE OF RETAINED LOCKS FAILED. RETURN CODE = *retcode***
SUB-CODE = *subcode*

Explanation: DB2 issued a PURGE request to IRLM to purge retained locks for this DB2. The PURGE request did not complete successfully. This message shows the return code and subcode from IRLM.

This message is issued by the following CSECT: DSNTRSTE

System Action: DB2 abends with reason code 00E30808. Restart processing is terminated.

System Programmer Response: Refer to the IRLM codes.

DSNT809E *csect-name* **FEEDBACK FROM IRLM IDENTIFY INDICATED IRLM DID NOT CONNECT TO THE LOCK STRUCTURE**

Explanation: DB2 identified to IRLM, but cannot continue because IRLM did not connect to the lock structure. Global locking is ignored. This message accompanies abend reason code 00E30809.

System Action: DB2 abnormally terminates with reason code 00E30809.

System Programmer Response: This condition happens if you are running DB2 in data sharing mode, but the associated IRLM is running with local scope (SCOPE=LOCAL in the IRLM startup procedure). If you are running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL. Conversely, if you are not running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=LOCAL.

DSNT810E *csect-name* **DB2 CANNOT IDENTIFY TO IRLM. AN INVALID LOCK STRUCTURE NAME WAS DETECTED.**

Explanation: DB2 could not identify to IRLM because of an invalid lock structure name. This message accompanies abend reason code 00E30807.

System Action: DB2 startup terminates abnormally with reason code 00E30807.

System Programmer Response: This condition happens if you are not running DB2 in data sharing mode, but the associated IRLM is running with global scope (SCOPE=GLOBAL in the IRLM startup procedure). If you are not running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=LOCAL. Conversely, if you are running DB2 in data sharing mode, ensure that the associated IRLM startup procedure specifies SCOPE=GLOBAL.

DSNT811E *csect-name* **DB2 CANNOT IDENTIFY TO IRLM. REQUEST VIOLATES ONE DB2 PER IRLM RULE.**

Explanation: DB2 could not identify to IRLM because another DBMS is already identified to the IRLM. This message accompanies abend reason code 00E30802.

System Action: DB2 abends with reason code 00E30802.

System Programmer Response: IRLM Version 2.1 enforces a one to one (1:1) mapping between IRLM and DB2. Multiple DBMS subsystems can no longer use the same IRLM. Ensure that:

- Each DB2 subsystem is associated with its own IRLM subsystem.

- The correct IRLM procedure name and subsystem name are specified in the DB2 system parameters.

DSNT812I **--MEMBER NAME** *member-name*

Explanation: This message is issued with messages DSNT389I, DSNT394I or DSNT396I for each thread in a data sharing environment. This additional line reports the member name of the DB2 subsystem accessing this object.

If the characters '(CO)' follow the member name, then this member is the castout owner for the page set or partition. The castout owner for a page set or partition is the DB2 member responsible for doing all of the castout I/O for that page set or partition.

The message number and subsystem recognition character are not included in this message.

DSNT813I **----** *status(es)* *page(s)*

Explanation: This message follows message DSNT389I, DSNT392I, DSNT394I, DSNT396I or DSNT806I to display more statuses, or more pages that are in the logical page list (LPL).

LPL pages can be in two formats, single pages (represented by the page number) or a range of pages (represented by the starting page number followed by a dash and the ending page number in the range).

The message number and subsystem recognition character are not included in this message because this message is part of a DISPLAY DATABASE data line.

DSNT814I **NON-LOCAL INFORMATION UNAVAILABLE FOR** *object = name*

Explanation: One member of the DB2 data sharing group was unable to obtain information from another member for one of these reasons:

- # • Overflow of the maximum buffer area sent to the DB2 subsystem running the DISPLAY. This buffer area contains the DISPLAY information.
- # • Problems occurred while requesting DISPLAY DB information from peer DB2 subsystems.

Terms pertinent to this message:

object Either DATABASE or SPACE

name The name of the DATABASE or SPACE

User Response:

- # • Issue DISPLAY GROUP to see if any DB2 members are down or unresponsive and then reissue the DISPLAY DATABASE command.
- # • Specify individual database names or space names instead of specifying '*'.

DSNU... Messages

The severity values shown for the utility messages that follow are returned as the job-step condition code from the job step during which the message is issued. If additional messages having higher severity values are issued during the same job step, the higher value is reflected as the job-step condition code.

Severity values have the following meanings:

0	Informational	No error occurred
4	Warning	A condition was detected; the user might need to take further action
8	Error	An error was detected and processing could not continue

DSNU000I *csect-name* **OUTPUT START FOR UTILITY,**
UTILID = uuuuuuu

Explanation: This message marks the start of output for the given utility job. The utility ID used to identify the utility job is 'uuuuuuu'.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU001I *csect-name- module-name* **RELEASE DEPENDENT MODULE WAS NOT FOUND**

Explanation: The system could not find the specified module in the indicated library (private library, job library, or link library).

System Action: The utility job is abended.

User Response: Ensure that the load module library is indicated correctly and that the indicated library contains the requested program. If the indicated library does not contain the requested program, contact the system programmer.

System Programmer Response: The last three characters of the module name indicate the DB2 release level of the subsystem identified in the parameters passed to DSNU001B. However, LOAD could not find the release dependent utility module for that release in the indicated library. This is probably a maintenance problem.

DSNU002I *csect-name - module-name* **COULD NOT LOAD RELEASE DEPENDENT MODULE** *module-name*
CODE=code REASON=reason

Explanation: During the load of 'module-name', MVS returned the indicated system completion code and reason.

System Action: The utility job is abended.

User Response: Refer to the appropriate MVS publication.

DSNU003I *csect-name* **NOT INVOKED APF AUTHORIZED**
The DSNUUTILS stored procedures was not invoked authorized.
Severity: 8 (error)
System Action: The utility is not run by the stored procedure.
User Response: Notify the system programmer.
System Programmer Response: Make sure that the DSNUUTILS entry in SYSIBM.SYSPROCEDURES specifies that the stored procedure runs in a WLM-established address space (WLM_ENV not blank), make sure that the DSNUUTILS load module is link edited with AC(1), make sure the DSNUUTILS load module is in an APF authorized library, and make sure all the libraries in STEPLIB JOBLIB are APF authorized. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.
Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5 32, 46, 60, 61.

DSNU004I *csect-name* **UTILITY utility NOT SUPPORTED**

Explanation: Refer to *Utility Guide and Reference* for a description of utilities supported by the stored procedure.

Severity: 8 (error)

System Action: The utility is not run by the stored procedure.

User Response: Run the utility as a batch job.

DSNU005I *csect-name* **input record**

Explanation: This message displays the utility statements as they were provided as input to the utility parser. An additional error message follows this message and identifies why the utility statement caused a parser error.

Severity: 8 (error)

System Action: Utility processing is not initiated. No SYSIBM.SYSUTIL record is created.

User Response: Correct the input error, and resubmit the job. Do not restart the job.

DSNU006I *csect-name* **DB2 SYSTEM system-name HAS NOT BEEN STARTED**

Explanation: Utility startup processing has been unable to connect to the indicated DB2 subsystem, because a -START DB2 command has not been issued for that subsystem.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Correct your JCL to specify the correct subsystem-name on the EXEC statement, and resubmit the job. Otherwise, contact the system programmer to determine when the subsystem will be available for processing.

Operator Response: Contact the system programmer to determine if a -START DB2 command should be issued for the indicated subsystem.

System Programmer Response: Have the operator issue a -START DB2 command for the indicated subsystem.

Problem Determination: DB2 must be started in order to execute DB2 utilities.

DSNU007I *csect-name* **DB2 SYSTEM** *system-name* **DOES NOT EXIST**

Explanation: Utility startup processing has been unable to connect to the indicated DB2 subsystem, because it does not exist on this system.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Correct your JCL to specify the correct subsystem-name on the EXEC statement, and resubmit the job. Contact your system programmer if you are not sure which DB2 subsystem you should specify.

System Programmer Response: Ensure that the correct DB2 subsystem has been started via the -START DB2 command.

Problem Determination: DB2 must be started in order to execute DB2 utilities.

DSNU008I *csect-name* **SPECIFIED USER FAILED VALIDITY CHECK**

Explanation: Utility startup processing has been unable to connect to DB2, because the user failed the connection validity check.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Contact the system programmer for assistance with your installation's security checking.

System Programmer Response: Locally defined RACF or equivalent security system connection authorization have denied the user access to DB2. Permit DB2 connection authorization if this user should be allowed access.

DSNU009I *csect-name* **SPECIFIED USER NOT AUTHORIZED FOR DB2 UTILITIES**

Explanation: Utility startup processing for the user indicated on the job statement failed, because the user is not authorized to execute DB2 utilities.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Contact your system programmer for assistance with your installation's security checking.

System Programmer Response: If the USER specified something on the job statement that is incorrect, correct it, and resubmit the job. Use the SQL GRANT command to give the user the desired authority.

DSNU010I *csect-name* **UTILITY EXECUTION COMPLETE, HIGHEST RETURN CODE = rr**

Explanation: The utility completed processing with a return code of 'rr'. This indicates that no terminating error was detected.

Severity: 0 (informational) or 4 (warning)

System Action: In most cases, the SYSIBM.SYSUTIL record for this job step is deleted from SYSIBM.SYSUTIL. However, if the utility used was REORG and UNLOAD(PAUSE), the SYSIBM.SYSUTIL record remains intact so that REORG can be restarted at the RELOAD phase.

User Response: If the return code ('rr') is 0, no response is required.

If the return code ('rr') is 4, the utility output should be examined for other messages.

DSNU012I *csect-name* **UTILITY EXECUTION TERMINATED, HIGHEST RETURN CODE = rr**

Explanation: The utility execution was terminated. An error was detected that would not allow processing to continue. The return code has a value of 8.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Examine utility output for other error messages.

DSNU013I *csect-name* **JOB WITH DUPLICATE UTILID FOUND IN SYSUTIL**

Explanation: An entry with the same qualifier was found in the SYSIBM.SYSUTIL table. The current job did not specify restart.

System Action: The utility job is abended with reason code X'00E40018'.

User Response: If the job was intended to restart the utility, RESTART should be added to the EXEC parameters. If the job was intended to rerun the utility, the -TERM utility command should be used to delete the entry that has the same qualifier from the SYSIBM.SYSUTIL table. If the job had no relation to the SYSIBM.SYSUTIL entry job, a new qualifier should be used.

DSNU014I *csect-name* **JOB WITH DUPLICATE UTILID CURRENTLY EXECUTING**

Explanation: A job with the same qualifier was found to be executing.

System Action: The utility job is abended with reason code X'00E40018'.

User Response: If the job with the same qualifier that is currently executing is correct, either wait for the job to complete before using the same qualifier, or use another qualifier. If the job currently executing is incorrect, the -TERM command can be used to terminate it, and the failing job can be resubmitted. Do not -TERM UTILITY a utility job step that is currently active in REORG beyond the UNLOAD phase.

DSNU015I *csect-name* **JOB WITH UTILID NOT FOUND IN SYSUTIL FOR RESTART**

Explanation: A utility job was submitted to restart a utility job that had previously failed. The SYSIBM.SYSUTIL entry for the specified qualifier provided was not found.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Use the -DISPLAY utility command to determine the correct qualifier. The job can then be resubmitted.

DSNU016I *csect-name* **UTILITY BATCH MEMORY EXECUTION ABENDED, REASON=X0rrr**

Explanation: The utility batch address space has abended. If X'0rrr' is four characters in length (that is, X'00C1'), the abend was a system X'rrr' abend. If X'0rrr' is four characters in length and system abend X'000' was indicated, a user abend was issued. If X'0rrr' is eight characters in length, the abend was a system X'04E' abend, and X'0rrr' is an abend reason code.

System Action: The utility job is abended. The SYSIBM.SYSUTIL entry for the job is retained in the SYSUTIL table.

User Response: Consult the system programmer to obtain information on failure analysis. If the cause of the failure is correctable, the utility job can be restarted. If the error cannot be corrected, the -TERM command should be used to delete the failing job's utility id from SYSIBM.SYSUTIL.

System Programmer Response: If a system abend was encountered (4 characters), refer to the appropriate MVS publication. If an abend reason code was encountered (8 characters), refer to *Utility Guide and Reference* for problem determination.

DSNU017I *csect-name* **UTILITY DATABASE SERVICES MEMORY EXECUTION ABENDED, REASON=X0rrr**

Explanation: The database services address space has abended. If X'0rrr' is four hexadecimal digits in length (for example, X'00C1'), the abend was an MVS X'rrr' abend. If X'0rrr' is eight hexadecimal digits in length, the abend was a DB2 subsystem X'04E' abend, and X'0rrr' is an abend reason code.

System Action: The utility job is abended. The entry for the job is retained in the SYSIBM.SYSUTIL table.

User Response: Consult with the system programmer to obtain information about failure analysis. If the cause of the failure is correctable, the utility job can be restarted. If the error cannot be corrected, the -TERM command should be used to delete the failing job's utility id from SYSIBM.SYSUTIL.

System Programmer Response: If an MVS system abend was encountered (4 hexadecimal digits), refer to the appropriate MVS publication. If an abend reason code was encountered (8 hexadecimal digits), look up the reason code in "Section 4. DB2 Codes" on page 4-1, and if you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU018I *csect-name* **JOB IS NOT RESTARTABLE DUE TO -START ACCESS FORCE COMMAND**

Explanation: A utility job was submitted to restart a utility job that previously failed. Although the SYSIBM.SYSUTIL entry for the specified qualifier was found, the job is not restartable because of a -START ACCESS FORCE command. The -START ACCESS FORCE command deleted the utility-in-process state of one or more (but not all) target objects in the job.

System Action: The utility job is abended with reason code X'00E40018'.

User Response: If the specified qualifier is correct, use the -TERM UTILITY command to terminate the utility and resubmit the job as a nonrestartable job. If the -TERM UTILITY command fails, use the -START ACCESS FORCE command to force ALL target objects (table spaces and indexes) in the job. When the last object is forced, the SYSIBM.SYSUTIL record is deleted. If the qualifier is incorrect, correct it and restart the job.

DSNU019I *csect-name* **THIS UTILITY IS NOT ALLOWED AT A DB2 TRACKER SITE**

Explanation: An attempt was made to execute a utility that is not allowed at the tracker site. The DB2 subsystem is a tracker site if the subsystem parameter TRKRSITE is set to YES. The only utilities that can execute at a tracker site DB2 are:

- # • REPORT utility
- # • RECOVER INDEX (or REBUILD INDEX) utility
- # • RECOVER TABLESPACE utility without the TORBA, TOLOGPOINT, or TOCOPY options
- # • DIAGNOSE utility

Severity: 8 (error)

System Action: The utility jobstep terminates with RC8.

User Response: Contact the system programmer.

System Programmer Response: Verify whether this DB2 subsystem is indeed used as a remote site tracker system. If not, stop the DB2 subsystem and restart it with TRKRSITE=NO.

DSNU020I *csect-name* **JOB STEP INCOMPLETE**

Explanation: The REORG utility was invoked with the UNLOAD PAUSE option. This causes the immediate suspension of the job after the unload phase completes. Subsequent utilities that are invoked in the same job step are not run.

Severity: 4 (warning)

System Action: Further utility processing is terminated.

User Response: Resubmit the job with the RESTART(PHASE) parameter after the desired user action has been taken with the unload data set.

Problem Determination: Refer to *Utility Guide and Reference* for a description of the REORG utility and the UNLOAD PAUSE option.

DSNU024I *csect-name* **PARM FIELD ERROR** *parm-field*

Explanation: An error was detected in the PARM field on the EXEC statement. 'parm-field' was the input parameter field.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the indicated parameter on the EXEC DD statement, and resubmit the job.

Problem Determination: Refer to *Utility Guide and Reference* for parameter requirements.

DSNU025I *csect-name* **INVALID RESTART PARAMETER**
(restart)

Explanation: Only the following values may be specified for the *restart* parameter: NO or null, CURRENT, or PHASE.

Severity: 8 (error)

System Action: The utility is not run by the stored procedure.

User Response: Correct and re-run.

DSNU028I *csect-name* **UNABLE TO CONNECT TO DB2,**
REASON=Xreason code

Explanation: A connection to the DB2 subsystem failed. 'reason-code' is the DB2 reason code that was returned.

Severity: 8 (error)

System Action: The utility job is terminated.

User Response: Check the subsystem ID specified in the EXEC DD statement. If it is correct, the subsystem was not ready for processing. Ask the system programmer when the requested subsystem will again be available for processing.

DSNU030I *csect-name* **UNABLE TO ALLOCATE dsn,**
RC=rr, REASON=ccc

Explanation: The utility was unable to allocate a necessary image copy data set. 'dsn' is the data set name that the utility attempted to dynamically allocate. 'rr' is the return code from the MVS dynamic allocation service, and 'ccc' is the reason code associated with the return code.

System Action: The utility proceeds along one or the following paths:

If the data set was an incremental image copy data set, the utility proceeds as if it and any later incremental image copies did not exist.

If the data set was a full image copy data set, the utility attempts to use the most recent prior full image copy data set.

The allocation failure may create other problems that will cause the utility to fail. This is indicated by other messages.

User Response: If the job fails, contact the system programmer.

System Programmer Response: If the utility fails because of the allocation error (as shown by a subsequent message), correct the error, then resubmit the job.

Problem Determination: Refer to the appropriate MVS publication for a complete description of the possible return and reason codes from dynamic allocation.

DSNU031I *csect-name* **UNABLE TO UNALLOCATE dsn,**
RC=rr, REASON=ccc

Explanation: The recover utility was unable to unallocate an image copy data set. The data set name that the utility attempted to unallocate is 'dsn'. The return code from the MVS dynamic unallocation service is 'rr'. The reason code associated with the return code is 'ccc'.

System Action: The unallocation error is ignored and the utility execution continues.

Problem Determination: Refer to *MVS/ESA Programming: Authorized Assembler Services Guide* for a complete description of the possible return and reason codes from dynamic allocation.

DSNU032I **I/O ERROR ON WORKFILE, xxxxxx**

Explanation: An I/O error was encountered on a necessary OS/VS data set. 'xxxxxx' is a message that describes the error and the data set in error. This message is returned to the DB2 utility by SVC 68 (SYNADAF) from BSAM. The data set may have been needed for an unload data set, image copy data set, or load or reorganization work file data set. The utility is stopped at the beginning of the phase that used the OS/VS data set.

This message is issued by the following CSECT: DSNUGSDA

System Action: The utility job is abended. The utility job step is in the stopped state.

Operator Response: Except in the case of an unload data set during the RELOAD phase, the job can be restarted if an undamaged output data set is provided.

Problem Determination: Refer to the appropriate MVS publication for the format of the error message.

DSNU034I **DATA SET TYPE INVALID FOR DDNAME**
'ddddddd'

Explanation: A required DD statement with DDNAME='ddddddd' was found to have a data set type which is not valid for this application.

This message is issued by the following CSECTS:

DSNU034I	DSNU034I	DSNU034I	DSNU034I
DSNU034I	DSNU034I	DSNU034I	DSNU034I

Severity: 8 (error)

System Action: The utility is terminated with a return code 8.

User Response: The data set must be capable of storing intermediate data that can be retrieved by DB2. Check that the data set is not specified as type DUMMY, SYSIN, or SYSOUT. If you require assistance in specifying a valid data set type, consult the system programmer.

System Programmer Response: Correct the JCL and resubmit the job.

DSNU035I *csect-name* **UNABLE TO FIND DD CARD FOR DDNAME, 'ddddddd'**

Explanation: A DD statement with ddname = 'ddddddd' was expected, but not found.

Severity: 8 (error)

System Action: The utility is terminated with a return code 8.

User Response: If the DDNAME is one you submitted, review and correct it. If the DDNAME was not provided by you, but by the system, consult the system programmer.

System Programmer Response: Correct the JCL and resubmit the job.

DSNU036I *csect-name* **UNABLE TO OPEN DCB FOR DDNAME ddddddd**

Explanation: The DCB associated with DDNAME 'ddddddd' could not be opened.

System Action: The utility job is abended with a reason code of X'00E40070'. The utility job step is in the stopped state.

User Response: If the ddname is one you submitted, review and correct it. If the ddname was not provided by you but by the system, consult the system programmer.

System Programmer Response: Correct the job control language and resubmit the job.

DSNU037I *csect-name* - **RECFM=U FOR DDNAME ddddddd**

Explanation: A data set to be used by the utility has an undefined record format RECFM=U. All data sets must be fixed or variable, blocked or unblocked.

System Action: The utility job is abended with a reason code of X'00E40070'. The utility job step is in the stopped state.

Operator Response: Notify the system programmer.

System Programmer Response: Ensure that no data sets involved in the utility job have RECFM=U. Resubmit the job after ending the stopped utility by the TERM UTILITY command, or do a RESTART(PHASE) of the stopped utility.

DSNU038I *csect-name* **BLOCK SIZE FOR DCB, DDNAME ddddddd, IS TOO SMALL, MUST BE AT LEAST bbbbb BYTES**

Explanation: The data set with DDNAME 'ddddddd' has a block size that is too small to accommodate a record that needs to be written.

System Action: The utility job is abended with a reason code of X'00E40079'. The utility job step is left in the stopped state.

User Response: Delete the data set in error. Change the JCL so that the block size for the data set with DDNAME 'ddddddd' is at least 'bbbb' bytes. Resubmit the utility job with the RESTART(PHASE) option.

DSNU039I *csect-name* - **LRECL=0 FOR DDNAME ddddddd**

Explanation: A data set to be used by the DB2 utility has a record length of zero after OPEN. All data sets with a record format of fixed or fixed blocked must have a valid record length greater than zero.

System Action: The utility job is abended with reason code X'00E40070'. The utility job step is left in the stopped state.

User Response: If the DDNAME is for a data set that you submitted, review and correct it. It might be necessary to provide a valid LRECL in the DCB parameter in the JCL. If the DDNAME was not provided by you but by the system, consult the system programmer.

Operator Response: Notify the user or system programmer.

System Programmer Response: Correct the data set definition, or add DCB information to the JCL. Do a RESTART(PHASE) of the stopped utility, or resubmit the job after issuing a -TERM UTILITY command for the stopped utility.

DSNU040I *csect-name* **ERROR ACCESSING DDNAME ddname, DECB=Xhex string**

Explanation: An error has occurred during BSAM access of a utility temporary file identified by 'ddname'. The DECB indicating the error is given as a hexadecimal string.

System Action: The executing utility issues an X'04E' abend with abend reason code '00E40071' following this message.

User Response: Refer to the information given in the Problem Determination section of this message. Correct the problem. Either issue the -TERM command to terminate the utility job and resubmit it, or specify the RESTART parameter and resubmit it.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this may not be necessary).

Problem Determination: The DECB provided contains the ECB in the first four bytes. The first byte of the ECB contains status bits that indicate the cause of the error. Refer to the appropriate MVS publication for the meaning of the status bits.

DSNU041I *csect-name* **INVALID CONCATENATED DATA SET FOR DDNAME ddddddd**

Explanation: A non-input concatenated data set was detected. Only input data sets can be concatenated.

System Action: The utility job abended with reason code X'00E40070'. The utility job step is in the stopped state.

Operator Response: Notify the system programmer.

System Programmer Response: Remove the concatenated data sets from the data set with DDNAME 'ddddddd'. Resubmit the job after ending the stopped utility with the TERM UTILITY command, or restart the utility at the beginning of the stopped phase by using RESTART(PHASE).

DSNU042I *csect-name* **SORT PHASE STATISTICS.**
NUMBER OF RECORDS=*n* ELAPSED
TIME=*hh/mm/ss*

Explanation: This message provides statistics on the SORT phase of a utility. The number of records sorted, '*n*', and the duration of the SORT phase in hours, minutes, and seconds are provided. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: The system continues to process normally.

DSNU044I *csect-name* **ERROR FROM SORT COMPONENT RC=*n*, UTILITY STOPPED**

Explanation: A nonzero return code '*n*' was returned from an MVS sort. Error messages from sort are printed on the UTPRINT data set.

System Action: The executing utility job is placed in the stopped state.

User Response: Determine the cause of the error. If the error can be corrected, the utility may be restarted from the beginning of the sort phase by using the RESTART(PHASE) option. If the error is such that the utility cannot complete, the -TERM command should be issued to remove the stopped utility from the system. The -TERM utility option should rarely be exercised when the stopped utility is REORG.

Operator Response: An operator with SYSOPR authority can issue the -TERM UTILITY command to release the resources claimed by the stopped utility (this may not be necessary).

Problem Determination: This abend is accompanied by abend reason code X'00E40005', and an SVC dump is requested. In most cases, error messages from MVS sort identify the problem and the dump is not needed. If sort is unable to open the UTPRINT data set, only the message and the abend are provided. For example, if the UTPRINT DD statement is omitted, correct the problem with UTPRINT, and resubmit the job.

DSNU046I *csect-name* **UTILITY STATEMENT IS TOO LONG OR TOO COMPLEX**

Explanation: The utility command and associated control statements have caused internal fields to exceed DB2 subsystem limits.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Reduce the size or complexity of the utility statement where possible. For example, a LOAD into several tables may be broken up into a separate load statement for each table or the size of comparison fields for 'when', 'continueif', and 'nullif' operands may be reduced in size.

Problem Determination: Refer to *Utility Guide and Reference* for correct operand definitions.

DSNU047I *csect-name* **A REQUIRED DD CARD IS MISSING DDNAME=*missing-ddname***

Explanation: The DB2 utility being executed requires a data set to continue processing. The DDNAME for the missing data set is provided.

Severity: 8 (error)

System Action: Utility processing terminates.

Operator Response: Notify the system programmer.

System Programmer Response: Correct the JCL to include the indicated DD statement. Refer to *Utility Guide and Reference* for information about required DD statements.

DSNU048I *csect-name* **INVALID OPERAND FOR KEYWORD *kkkkkkkk***

Explanation: The utility parser has determined that the operand specified for keyword '*kkkkkkkk*' is invalid.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand in error, and resubmit the utility job. Refer to *Utility Guide and Reference* for correct operand definitions.

DSNU049I *csect-name* **- INVALID OPERAND *oooooooo* FOR KEYWORD *kkkkkkkk***

Explanation: The utility parser has determined that operand '*oooooooo*' cannot be specified for keyword '*kkkkkkkk*'. This includes a negative value following the keywords MAXRO or DELAY.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand in error, and resubmit the utility job. Refer to *Utility Guide and Reference* for proper option specifications.

DSNU050I *csect-name* ***utility-statement***

Explanation: This message echoes the utility statement that was input from SYSIN.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU051I *csect-name* **INSUFFICIENT OPERANDS FOR KEYWORD *kkkkkkkk***

Explanation: An operand that is required when the keyword '*kkkkkkkk*' is specified was omitted.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand specification, and resubmit the job. Refer to *Utility Guide and Reference* to determine the correct set of operands for '*kkkkkkkk*'.

DSNU052I *csect-name* **KEYWORD kkk INCOMPATIBLE WITH OTHER KEYWORDS OR OPERANDS**

Explanation: The specified keyword 'kkk' cannot be used with other keywords or operands.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Refer to the *Utility Guide and Reference* for the right syntax for the specified keyword.

DSNU053I *csect-name* **FIELD ccccccc NOT FOUND**

Explanation: Either the column name specified, 'ccccccc', was not found in the catalog as a valid column name for the table being processed, or a WHEN keyword field name was not found in the field name list.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the LOAD utility statement, and resubmit the job.

Problem Determination: Valid column names can be found in the SYSIBM.SYSCOLUMNS table.

DSNU054I *csect-name* **TABLESPACE ssssssss NOT FOUND**

Explanation: The operand of the TABLESPACE keyword, 'sssssss', did not specify an existing table space name.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the table space name and/or database name, and resubmit the job.

Problem Determination: Valid table space names can be found in the SYSIBM.SYSTABLESPACE catalog table.

DSNU055I *csect-name* **INDEX iiiiii NOT FOUND**

Explanation: The index name specified, 'iiiiiii', was invalid.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the index name, and resubmit the job.

Problem Determination: Valid index names can be found in the SYSIBM.SYSINDEXES catalog table.

DSNU056I *csect-name* **TABLE tttttt NOT FOUND**

Explanation: A utility specified a table name 'tttttt', but the table does not exist.

Severity: 8 (error)

System Action: The error is sufficient to terminate further processing of the utility job step. The utility job step is terminated, and resources are released to their prior state.

User Response: Correct the table name and/or database name, and resubmit the utility job step.

Problem Determination: The correct table names can be found by querying the SYSIBM.SYSTABLES catalog table.

DSNU057I *csect-name* **DATABASE database-name NOT FOUND**

Explanation: The operand of the DATABASE keyword, 'database-name', did not specify an existing database name.

Severity: 8

System Action: The error is sufficient to terminate further processing of the utility job step. The utility job step is terminated, and resources are released to their prior state.

User Response: Correct the database name and resubmit the utility job step.

Problem Determination: The correct database names can be found by querying the SYSIBM.SYSDATABASE catalog table.

DSNU058I *csect-name utility-name* **UTILITY NOT ALLOWED AGAINST AN OBJECT IN RECOVERY PENDING STATE**

Explanation: An attempt has been made to execute a utility against an object that is in RECOVERY PENDING STATE. CHECK, COPY, MODIFY, LOAD, QUIESCE, REORG, and RUNSTAT are not allowed.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the object from the RECOVERY PENDING STATE by using either LOAD REPLACE, RECOVER, or REPAIR against the object. Resubmit the job.

System Programmer Response: Determine which of the three utilities, LOAD REPLACE, RECOVER, or REPAIR, should be used to remove the object from the RECOVERY PENDING STATE.

DSNU059I *csect-name utility-name* **UTILITY NOT ALLOWED TO RUN ON A ROSHARE READ DATABASE**

Explanation: An attempt was made to execute a utility on a ROSHARE READ database. Only the RUNSTATS, DIAGNOSE, and REPAIR DBD utilities are allowed to run on read-only shared databases.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Resubmit the utility job on the owning system, if necessary.

DSNU060I *csect-name* **USER userid NOT AUTHORIZED FOR util-name UTILITY ON DATABASE dbase-name**

Explanation: User 'authorization ID' attempted to execute utility 'util-name' against an object in database 'dbase-name'. The user was either not authorized to execute utilities for the named database, or the user's authorization did not include this utility.

Severity: 12 (error)

System Action: Utility processing is not initiated.

User Response: Ensure that the correct database was specified. If the specification is correct, consult the system programmer concerning authorization.

System Programmer Response: Determine why the user was denied access. Either the authorization should be corrected, or another authorized user should invoke the utility.

Problem Determination: The following catalog tables can be examined to determine who has proper authority: SYSIBM.SYSUSERAUTH, SYSIBM.SYSDBAUTH, or SYSIBM.SYSRESAUTH.

DSNU061I *csect-name* **USER** *userid* **NOT AUTHORIZED,**
UTILID=utilid

Explanation: The named user issued a utility command and was not authorized to do so.

The -TERM UTILITY command can only be issued by:

- The submitter of the utility job.
- Users with SYSOPR, SYSADM, or SYSCTRL authority.
- Users with DBADM, DBCTRL, or DBMAINT authority over every database used by the utility.

Even for users with sufficient database authority, the TERM UTILITY command will fail in these situations:

- The user issued the command before the utility determined what databases it would access.
- The utility job included the DIAGNOSE, REPORT, or STOSPACE utility. Those utilities must be terminated by the submitter of the job or by a holder of SYSOPR, SYSCTRL, or SYSADM authority.

Any user can issue a -DISPLAY UTILITY command.

System Action: The -TERM UTILITY request for utility identifier *utilid* is rejected.

User Response: Take the appropriate action:

- Wait to allow the utility to identify the databases it will access; then reissue the command.
- Obtain the required authorization and reissue the command.
- Have another user with proper authorization issue the command.

DSNU062I *csect-name util-name* **UTILITY MAY NOT BE RUN ON OBJECT** *qualifier.object-name*

Explanation: An attempt was made to execute utility '*util-name*' against object '*qualifier.object-name*'. This is not allowed. The named object cannot be processed by the named DB2 utility.

Severity: 8 (error)

System Action: The utility job is terminated.

User Response: Remove the invalid utility control statements and resubmit the job.

DSNU064I *csect-name* **UTILITY NOT ALLOWED AGAINST SYSTEM DATABASE**

Explanation: An attempt was made to execute a utility against database DSNDB01 or DSNDB06. The following utilities are not allowed against DSNDB01:

LOAD
REORG TABLESPACE against SYSUTILX (allowed against other DSNDB01 table spaces)

CHECK DATA
REPAIR DBD
RUNSTATS
MODIFY STATISTICS

The following utilities are not allowed against DSNDB06:

LOAD (except SYSIBM.SYSSTRINGS)
CHECK DATA
REPAIR DBD

Severity: 8 (error)

System Action: Execution of the utility job is stopped.

User Response: Remove the invalid utility control statements and resubmit the job.

DSNU065I *csect-name* **UTILITY NOT ALLOWED AGAINST A WORK FILE**

Explanation: An attempt has been made to execute a utility against database DSNDB07. Utilities are not allowed against work files.

Severity: 8 (error)

System Action: Execution of the utility job is stopped.

User Response: Remove the invalid utility control statement(s) and resubmit the job.

DSNU066I *csect-name* **OPERAND** *oooooo* **NOT ALLOWED FOR** *uuuuuu* **UTILITY against** *ttttt* **TABLE**

Explanation: An attempt was made to specify the REPLACE option when executing the LOAD utility on a DB2 catalog table. It is not permissible to replace existing rows in a DB2 catalog table. Rows can only be added to the existing rows in a DB2 catalog table.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand, and resubmit the job.

DSNU070I *csect-name* **KEYWORD OR OPERAND** *x* **INVALID WITH** *y*

Explanation: The use of KEYWORD or OPERAND '*x*' is inconsistent with KEYWORD or OPERAND '*y*'.

Severity: 8 (error)

System Action: The control statement in error is rejected and processing is halted.

User Response: Correct the control statement in error and resubmit the job.

DSNU071I *csect-name* **KEYWORD** *x* **REQUIRES KEYWORD** *y*

Explanation: When keyword '*x*' is specified, keyword '*y*' must also be specified.

Severity: 8 (error)

System Action: The control statement in error is rejected and processing is halted.

User Response: Correct the control statement in error, and resubmit the job.

DSNU072I *csect-name* **INVALID KEYWORD(S) SPECIFIED FOR TABLESPACE LIST**

Explanation: The specified keyword cannot be included in a list of table spaces.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Remove the specified keyword from the list of table spaces.

DSNU073I *csect-name* - **KEYWORD 'wwwww' IGNORED**

Explanation: The keyword, 'wwwww' is no longer supported.

Severity: 0 (informational)

System Action: Utility processing proceeds.

Problem Determination: Refer to *Utility Guide and Reference* for the current syntax.

DSNU078I *csect-name* **INVALID DBCS IDENTIFIER *iiii***

Explanation: The DBCS identifier *iiii* is invalid. Reason codes are:

101	An odd number of bytes exists between the shift-out and the shift-in
102	No shift-in was found at the end of the identifier
103	DBCS blanks X'4040' are not allowed
104	There are no characters between the shift-out and the shift-in
105	Shift-out can not be the first byte of the DBCS character between the shift-out and the shift-in.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the DBCS identifier and resubmit the job.

Problem Determination: Refer to Chapter 3 of *SQL Reference* to determine the correct syntax for DBCS identifiers.

DSNU079I *csect-name* **UNBALANCED PARENS IN CONTROL STATEMENT**

Explanation: The utility parser has determined that there is an unbalanced parenthesis in the input string.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Determine the location of the missing parenthesis and insert it. The utility job can then be resubmitted.

Problem Determination: Refer to *Utility Guide and Reference* to determine the correct syntax for option specification.

DSNU080I *csect-name* **NO UTILITY STATEMENTS WERE EXECUTED**

Explanation: The SYSIN data set did not contain any text. The system might have processed the end of file prematurely, or this job requires that the utility statements be skipped.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Provide at least one utility statement, if none now exists, or verify that this job executes no utility statements.

DSNU081I *csect-name* **OPERAND 'ooooooo' EXCEEDS KEYWORD 'kkkkkkkk' MAXIMUM LENGTH**

Explanation: The utility parser has determined that operand 'ooooooo' exceeds the maximum length for keyword 'kkkkkkkk'.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the operand, and resubmit the job.

Problem Determination: Refer to *Utility Guide and Reference* to determine the correct operand specification.

DSNU082I *csect-name* **INVALID KEYWORD *kkkkkkkk***

Explanation: The given keyword was not recognized within the context of this control statement.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

DSNU083I *csect-name* **INVALID HEXADECIMAL OPERAND *hhhhhhh***

Explanation: The utility parser has determined that the operand 'hhhhhhh' is invalid as a hexadecimal operand. It either contains a character that is not hexadecimal or has an odd number of characters.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

DSNU084I *csect-name* **INVALID GRAPHIC OPERAND *gggg***

Explanation: The utility parser has determined that the operand 'gggg' is invalid as a hexadecimal operand. The graphic operand is either missing one or both of the shift characters or is not an even number of characters.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the utility statement, and resubmit the job.

DSNU085I *csect-name* **INVALID SPECIAL CHARACTER OPERAND** *ssss*

Explanation: The utility parser has determined that the operand 'ssss' is invalid as a special character operand. For a special character operand to be invalid, it must have either a shift-out or a shift-in character and be missing the corresponding shift character, or not have an even number of characters between the shift-out, shift-in characters.

Severity: 8 (error)

System Action: Processing is terminated.

User Response: Correct the utility statement, and resubmit the job.

DSNU086I *csect-name* *tttt* **I/O ERRORS ON SPACE=** *ddddddd*. **DATA SET NUMBER=** *nnn*. **I/O ERROR PAGE RANGE=** *aaaaaa*, *bbbbbb*.

Explanation: I/O errors were detected on the named table space. 'tttt' is either 'READ' or 'WRITE'. 'nnn' is the data set number. 'aaaaaa' is the first damaged page and 'bbbbbb' is the last damaged page of the data set.

Severity: 0 (informational)

System Action: Processing continues, but the pages within the error range are no longer accessible.

System Programmer Response: Determine the appropriate level of recovery, and invoke the recovery utility. If user-defined data sets are being used and full data set or table space RECOVER is to be used, then, prior to invoking the RECOVER utility, the table space must be stopped, new data set(s) defined, and the table space restarted. If the data set is part of a ROSHARE READ database, determine whether it was a link or DASD failure. If there was a link failure, then fix the link, and issue a -START DATABASE with the ACCESS(FORCE) parameter. If the error was caused by a DASD failure, then correct the problem from the system on which the database was defined as ROSHARE OWNER.

Problem Determination: Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of database recovery procedures.

There may be an IOS message on the MVS console SYSLOG indicating the type of I/O error that occurred. If an IOS message was issued, follow the Problem Determination directions for the message.

DSNU087I *csect-name* **INVALID OPERAND TYPE FOR KEYWORD** *kkkkkkkk* - *oooooooo*

Explanation: The utility parser has determined that the operand 'oooooooo' is the wrong type for the keyword 'kkkkkkkk'. An example of such an error would be a decimal operand where only a hexadecimal operand is allowed.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

Problem Determination: Refer to *Utility Guide and Reference* to determine valid operand types for the designated keyword.

DSNU088I *csect-name* **INVALID CHARACTER OPERAND** *ccccccc*

Explanation: The utility parser has determined that the operand 'ccccccc' is invalid as a character operand.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

Problem Determination: Refer to *Utility Guide and Reference* for correct specification of the character operand.

DSNU089I *csect-name* **OPERAND** *oooooooo* **IS TOO LONG**

Explanation: The utility parser has determined that the operand 'oooooooo' is too long for the keyword specified.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Correct the keyword, and resubmit the job.

Problem Determination: Refer to *Utility Guide and Reference* for correct operand length specification.

DSNU090I *csect-name* **DDNAME** *nnn* **IS INVALID FOR KEYWORD** *kkk*

Explanation: The DDNAME 'nnn' was used as an improper input of the specified keyword 'kkk' or from one of the reserved ddnames: SYSIN, SYSPRINT, UTPRINT, SORTWKnn, SORTLIB.

Severity: 8 (error)

System Action: Processing terminates.

User Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU091I *csect-name* **DDNAME** *nnn* **IS A DUPLICATE**

Explanation: The DDNAME 'nnn' was used as operand in the input statement more than once.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Change the ddname to a different one.

DSNU092I *csect-name* **NUMBER OF OPERANDS FOR KEYWORD** *kkk* **EXCEEDS MAXIMUM**

Explanation: The keyword 'kkk' contains more than the maximum number of operands.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Refer to *Utility Guide and Reference* for the limit on the number of operands for the specified keyword.

DSNU094I *csect-name* **KEYWORD 'wwwww' IS DUPLICATED**

Explanation: The keyword 'wwwww' is not allowed twice.

Severity: 8

System Action: The control statement in error is rejected and the processing is halted.

User Response: Correct the control statement in error, and resubmit the job.

DSNU095I *csect-name* **UTILITY uuuuuuuu INCONSISTENT WITH LAST INVOCATION**

Explanation: This message can occur when a utility job step is restarted and a utility statement was modified, added or deleted from SYSIN.

Severity: 8 (error)

System Action: Utility processing is terminated. The utility job step remains in SYSIBM.SYSUTIL in the stopped state.

User Response: Restart the utility job with the statements in the same order as they were in when the job was first run. If a statement was modified, change the statement back to the format in the original invocation and restart the job. Utility statements should not be altered for restart.

DSNU096I *csect-name* **OPERAND oooooooooo INCONSISTENT WITH LAST INVOCATION**

Explanation: When the utility job step was restarted, the indicated operand was found to be inconsistent with the restart point.

System Action: The restart of utility processing is not initiated.

User Response: To restart, restore the operand to its prior definition. If this is not acceptable, terminate the utility job step, take corrective action, and resubmit the job.

Operator Response: An operator with SYSOPR authority can terminate the utility job step (this may not be necessary). A REORG utility that is beyond the UNLOAD phase should rarely be terminated.

Problem Determination: Refer to *Utility Guide and Reference* for operand definitions. Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of utility restart constraints.

DSNU097I *csect-name - input* **WILL BE REQUIRED SYNTAX IN FUTURE RELEASES**

Explanation: The identified 'input' is not required in this release, but it will be part of the required syntax in future releases.

Severity: 4 (warning)

System Action: Utility processing continues.

Programmer Response: Refer to *Utility Guide and Reference* for the current syntax.

DSNU099I *csect-name - IRLM 'req-type'* **REQUEST FAILED, IRLM RETURN CODE = X' return-code' IRLM REASON CODE = X' reason-code'**

Explanation: The request to the IRLM to obtain or release a lock failed for the reasons specified in *return-code* and *reason-code*. In a non data-sharing environment, the requested lock is the utility serialization lock. In a data sharing environment, the requested lock is the utility serialization lock, the utility identifier lock, or the utility execution lock. The IRLM return and reason codes are documented in "Section 5. IRLM Messages and Codes" on page 5-1. The type of request is indicated by *req-type*.

System Action: Utility and command processing terminates.

User Response: Refer to the IRLM messages and codes section for problem determination and the appropriate action. Restart the utility by specifying the RESTART parameter, or terminate the utility with the -TERM command and then resubmit the job. If this message was received during the -DIS UTIL, -TERM UTIL, or -START DATABASE ACCESS(FORCE) command, then the command can be reissued.

System Programmer Response: Determine the cause of the IRLM error and take appropriate action.

Problem Determination: Obtain the system console log output, dump, and SYS1.LOGREC information. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU100I *csect-name* **USERID = userid MEMBER = member-name UTILID = utilid PROCESSING UTILITY STATEMENT statement-number UTILITY = utility-name PHASE = utility-phase COUNT = object-count STATUS = STOPPED**

Explanation: This message is issued in response to a DISPLAY UTILITY command. The utility job with identifier *utilid* stopped during processing. In a data sharing environment, *member-name* identifies the DB2 member. In a non data-sharing environment, *member-name* is blank. At the time of the request, *object-count* records or pages were processed. If the utility job step is restarted with the RESTART(PHASE) option, it begins with phase *utility-phase*.

However, not all utilities have phases. Those that do have phases are restarted from the beginning of that phase.

The utility stopped for one of these reasons:

- The REORG utility stopped in response to its UNLOAD(PAUSE) option. The utility is stopped in the RELOAD phase.
- The utility is stopped because of a DB2 subsystem failure or cancellation (for example, a STOP DB2 command).

COUNT indicates the number of pages or records processed in a utility phase. COUNT has different meanings for different utilities. For utilities not mentioned below, ignore this field.

- For CHECK INDEX, LOAD, RECOVER INDEX, and REORG: number of records processed (log records for the LOG phase of REORG), or 0 (for the SWITCH or BUILD2 phase of REORG).
- For COPY, MERGECOPY, RECOVER(restore phase), and RUNSTATS: number of pages processed.
- For STOSPACE: number of table spaces or indexes processed.

Counters are valid up to four billion.

Severity: 0 (informational)

System Action: DB2 waits for directions to either restart or terminate the utility.

User Response: If you have the required authority, restart or terminate the utility job step.

To restart the job step, you must have authority to run the indicated utility and to complete any other utility functions in the utility job step.

To terminate the utility with the -TERM UTILITY command, you must be the originator or have SYSOPR or SYSADM authority.

Operator Response: If necessary, and if you have SYSOPR authority, you can issue the -TERM UTILITY command to release the resources claimed by the stopped utility.

DSNU103I *csect-name* - UNABLE TO ACCESS SYSUTIL TABLE AT THIS TIME

Explanation: An -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command was issued at the same time that the DSNDDB01.SYSUTILX table space was the object of an active utility job. The utility job might be holding locks that would cause a deadlock condition to occur.

Severity: 8 (error)

System Action: The command processing is terminated.

User Response: Enter the command again. This message is issued in response to each command until the utility action on the DSNDDB01.SYSUTILX table space completes.

DSNU104I *csect-name* - DSNDDB01.SYSUTILX IN A PENDING STATE PROHIBITS FURTHER PROCESSING

Explanation: The -ALTER UTILITY, -TERM UTILITY, or -DISPLAY UTILITY command was issued when the DSNDDB01.SYSUTILX table space was in a pending state, which prohibits further processing. The pending state was either copy or recovery pending.

Severity: 8 (error)

System Action: Command processing is terminated.

User Response: Notify the system programmer so that the pending condition can be resolved.

System Programmer Response: Issue a -DISPLAY DATABASE command to determine the state of the DSNDDB01.SYSUTILX table space. If the state is copy pending, do a full image copy. If the state is recovery pending, use the RECOVER utility to recover DSNDDB01.SYSUTILX. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU105I *csect-name* - USERID=*userid* MEMBER=*member-name* UTILID=*utilid* PROCESSING UTILITY STATEMENT *n* UTILITY=*utility-name* PHASE=*phase-name* COUNT=*n* STATUS=*status*

Explanation: This message is issued in response to a DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL REFERENCE or CHANGE and DB2 estimates that

the switch phase will not start by the deadline specified by the DEADLINE phrase.

This message gives the user an estimate of how much processing the utility completed. The *utility-name* utility in the utility job step identified by *utilid* was executing in phase *utility-phase* at the time the -DISPLAY UTILITY request was made. In a data sharing environment, *member-name* identifies the DB2 member. In a non-data-sharing environment, *member-name* is blank.

COUNT *n* is the number of pages or records processed in a utility phase. COUNT has different meanings for different utilities. For utilities not mentioned below, ignore this field.

- For CHECK INDEX, LOAD, RECOVER INDEX, and REORG: number of records processed (log records for the LOG phase of REORG), or 0 (for the SWITCH or BUILD2 phase of REORG).
- For COPY, MERGECOPY, RECOVER(restore phase), and RUNSTATS: number of pages processed
- For STOSPACE: number of table spaces or indexes processed.

Counters are valid up to four billion.

Severity: 0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 estimated that the switch phase in the REORG utility with SHRLEVEL REFERENCE or CHANGE would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. A subsequent -DISPLAY UTILITY command reflects that processing.

DSNU106I *csect-name utility-name* UTILITY, MEMBER = *member-name* UTILID = *utilid* TERMINATING

Explanation: This message is issued in response to a DISPLAY UTILITY command. The *utility-name* utility in the utility job step identified by *utilid* was in the process of terminating at the time the DISPLAY UTILITY request was issued. The utility is terminating in response to a previous TERM UTILITY request.

In a data sharing environment, *member-name* identifies the DB2 member. In a non data-sharing environment, *member-name* is blank.

Severity: 0 (informational)

System Action: The system is stopping the utility and releasing all resources associated with the utility. After the utility terminates, DB2 can reuse the utility identifier.

DSNU107I *csect-name* MEMBER NAME *member-name* IS NOT A MEMBER OF THIS DATA SHARING GROUP.

Explanation: This message is issued by the DISPLAY UTILITY command when an invalid *member-name* is encountered in the member list.

Severity: 4

System Action: The DISPLAY UTILITY command ignores the invalid *member-name* and continues to process the next member name specified.

User Response: Correct the member name and reissue the command.

DSNU108I *csect-name* DATA SHARING ENVIRONMENT IS NOT ACTIVE, MEMBER KEYWORD NOT APPLICABLE.

Explanation: This message is issued by the DISPLAY UTILITY command when the MEMBER keyword is specified, but data sharing is not active.

Severity: 4

System Action: The DISPLAY UTILITY command ignores the MEMBER keyword and its associated parameters, but continues processing.

User Response: Make sure data sharing is active before issuing the DISPLAY UTILITY command with the MEMBER keyword.

DSNU109I *csect-name* UTILITY *utilid* CAN ONLY BE TERMINATED BY MEMBER = *member-name*

Explanation: The -TERM UTILITY or -ALTER UTILITY command cannot terminate or alter the utility job with identifier *utilid*, because it belongs to member *member-name* of the DB2 data sharing group. Activeutility jobs can be terminated or altered only from the system on which they were running.

Severity: 8 (error)

System Action: If this message was issued for the -TERM UTILITY command, the command ignores the *utilid* and continues to process the next *utilid*, if any. If this message was issued for the -ALTER UTILITY command, the command is rejected, and further processing of the command is ended.

User Response: Make sure the *utilid* identifies the utility you want to terminate or alter. If it does, issue the command from the DB2 member identified in the message.

DSNU110I *csect-name* UTILID = *uuuu* INVALID

Explanation: This message is issued in response to an invalid specification of a UTILID on an -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command. A UTILID is a 1- to 16-byte alphanumeric token that can contain any number of periods.

Severity: 8 (error)

System Action: The -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command is rejected. Further processing of the command is ended.

User Response: Review the UTILID provided in the message to determine why it does not conform to the syntax rules of a utility identifier token, and reissue the request.

DSNU112I *csect-name* - NO AUTHORIZED UTILITY FOUND FOR UTILID = *utilid*

Explanation: This message is issued in response to an -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY command. DB2 has no record of the utility job identified by the utility identifier *utilid*. The *utilid* might not be correct, or the utility might have already terminated.

Severity: 4 (warning)

System Action: The system rejects the -ALTER UTILITY, -DISPLAY UTILITY, or -TERM UTILITY request for the indicated utility job.

User Response: Verify that the utility identifier of the utility job to be altered, displayed, or terminated was correctly entered. To view all currently valid identifiers, issue the -DISPLAY UTILITY (*) or (partial-utility-id*) command.

DSNU114I *csect-name* UTILITY COMMANDS SUBSYSTEM FAILURE, REASON=Xcode

Explanation: This message indicates an abend has occurred in the utility commands subsystem.

System Action: The command abends. In the case of the -TERM command, termination actions taken previously under this command are backed out.

User Response: Prior messages and/or the SVC dump identify the failure. If the condition can be corrected, the command may be reissued.

Problem Determination: In most cases, the failure is not user related. In some cases, prior messages indicate a user error that may be corrected. The problem may be as simple as SYSIBM.SYSUTIL being temporarily locked by another command or a utility job. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU115I *csect-name utility-name* UTILITY WITH UTILID = *utilid* CAN ONLY BE TERMINATED BY A MEMBER WITH THE SAME RELEASE = *release*

Explanation: Command TERM UTILITY cannot terminate the utility job with identifier *utilid* because it belongs to a member with a release level identified in the message. Some utilities can be terminated only from a member of the DB2 data sharing group with the same release level.

Severity: 4 (warning)

System Action: Command TERM UTILITY is rejected for the indicated utility job.

User Response: Make sure the *utilid* identifies the utility you want to terminate. If it does, issue command TERM UTILITY from a member with a release level identified in the message in the DB2 data sharing group.

DSNU161I *csect-name utility-name* UTILITY WITH UTILID = *util-id* CAN NOT BE TERMINATED AT THE DB2 TRACKER SITE

Explanation: Certain utilities can not be terminated at the tracker site because the target objects might be left in an unpredictable state. The next recovery cycle should cause the utilities to resolve. These utilities can not be terminated at the tracker site:

- #** • COPY
- #** • LOAD
- #** • REORG
- #** • REPAIR

Severity: 8 (error)

System Action: The utility is not terminated.

User Response: Notify the system programmer.

System Programmer Response: Monitor the status of these utilities after the next tracker site recovery cycle.

DSNU160I *csect-name - utility-name* **UTILITY, UTILID =
utilid REQUESTED TO TERMINATE, PHASE =
utility-phase WAS ACTIVE**

Explanation: This message is issued in response to a -TERM UTILITY command. It acknowledges that the request for termination was received and verified. At the time the -TERM UTILITY request was received, utility 'utility-name' was ACTIVE in the utility job step identified by UTILID 'utilid'.

System Action: DB2 has accepted the request to terminate the indicated utility job step. The utility terminates at its next cleanup point.

User Response: This message is an acknowledgement that the request has been accepted and is in progress.

DSNU164I *csect-name* **ccccccc UTILITY, UTILID = uuuu
ALREADY TERMINATING**

Explanation: This message is in response to a -TERM UTILITY command. It indicates that the utility job step indicated by UTILID 'uuuuu' has already been requested to terminate and is in the process of doing so now.

Severity: 0 (informational)

System Action: DB2 is currently in the process of terminating the indicated utility job step. Upon completion, all resources will have been released to their prior state, and all tracking of the indicated UTILID will have been removed. At that point, the UTILID is available for reuse.

User Response: This message indicates that either the request was redundant, or someone else is also interested in the termination of the subject utility job step.

DSNU166I *csect-name utility-name* **UTILITY, UTILID = uid
NOT EXECUTING, CLEANUP COMPLETE**

Explanation: This message is in response to a -TERM UTILITY command. The 'utility-name' utility identified by UTILID 'uid' was found to be stopped at the time of the request to terminate.

Severity: 0 (informational)

System Action: Cleanup is performed for the indicated stopped utility. All resources held by the utility are freed and all storage of the utility job is deleted. The utility job is no longer restartable.

System Programmer Response: Resources held by this utility may have prevented applications, commands, and other utilities from executing. These have been freed, so that the inhibited tasks may now be performed.

DSNU170I *csect-name* **UTILITY JOB TERMINATED BY
TERM COMMAND**

Explanation: A -TERM UTILITY command was issued for
this utility job step.

When a timeout condition occurs causing an automatic TERM
UTIL, both the U590 and U179 messages will be issued in the
Reorg output as follows: ! DSNURDRN — RESOURCE NOT
AVAILABLE, REASON = X '00C9008E' on database.pageset.

Severity: 8 (error)

System Action: The executing utility terminates processing and frees all held resources. All storage of the utility job has been deleted. Therefore, the job is not restartable. Subsequent utilities in the same job step are not executed.

User Response: All or portions of the utility job step can be resubmitted as needed.

DSNU172I *csect-name* **UTILITY JOB TERMINATED BY
STOP DB2 COMMAND**

Explanation: A -STOP DB2 command was issued during execution of the utility job step.

Severity: 8 (error)

System Action: The executing utility stops processing but continues to hold resources. Subsequent utilities in the same job step are not executed. The storage of the utility job is retained. Therefore, the utility job step is restartable.

User Response: Following a -START DB2 command, the utility job step may be restarted. Alternatively, the utility may be terminated using the -TERM UTILITY command and resubmitted as a new job. A REORG utility that has passed the UNLOAD phase should rarely be terminated.

DSNU180I *csect-name* **UTILITY IS NOT COMPATIBLE
WITH THE utility-name UTILITY, UTILID = uid,
OBJECT = spacename.object-name.**

Explanation: Certain utilities cannot process the same table or index space at the same time. The message identifies the objects for which the incompatibility occurred.

These objects might be target objects of the utilities, a
mapping table, or they might be catalog or directory table spaces that are updated by the utilities. For example, DSNDB06.SYSCOPY is updated by LOAD.

Severity: 8 (error)

System Action: The starting utility is not initiated, and further utility processing in that utility job step is terminated.

User Response: Use -DISPLAY UTILITY with the provided 'uid' to determine when the utility that caused your utility to be rejected is completed. Refer to Section 5 (Volume 2) of *Administration Guide* for a discussion of which utilities are mutually compatible.

DSNU181I *csect-name* **RESTART NOT ALLOWED FOR
utility-name UTILITY**

Explanation: An attempt was made to restart the named utility. DB2 does not allow this utility to be restarted.

System Action: Utility processing is abended. Abend reason code 00E40018 might be issued.

User Response: Issue the -TERM UTIL command to terminate the utility job and then rerun the job without the RESTART parameter.

System Programmer Response: If necessary, take actions to prevent access to the table space before terminating the utility.

DSNU182I *csect-name utility-name* **MUST BE THE ONLY
UTILITY IN SYSIN**

Explanation: The submitted utility control statements contain a utility on the table space DSNDB01.SYSUTILX. This table space is integral to controlling the execution of utilities. Control over previous or subsequent utilities in the job step would be lost if the utility were allowed to execute. Therefore, the identified utility must be the only utility in a job step.

This message is also issued if you recover the SYSUTILX indexes, DSNLUX01 and DSNLUX02, or table space DSND01.DBD01 and include other utility control statements in the same job step.

Severity: 8 (error)

System Action: Work performed by utilities in the same utility job step prior to the starting utility persist. The utility identified and subsequent utilities are not allowed to execute, and the utility job step is placed in the stopped state.

User Response: Terminate the utility execution that received this message using the -TERM UTILITY command. Submit a subsequent job step containing only the identified utility. Execute additional utilities, if any, in a separate job step.

DSNU183I *csect-name - utility-name* **UTILITY NOT COMPATIBLE WITH OTHER ACTIVE UTILITIES**

Explanation: The utility identified by 'utility-name' is executing against table space DSND01.SYSUTILX. This table space is integral to controlling the execution of utilities. Control over other utilities running at the same time would be lost if the utility were allowed to execute. Therefore, the identified utility must be executed alone. There must be no other active DB2 utilities in the system.

Severity: 8 (error)

System Action: Utility execution is terminated.

User Response: Rerun the utility when there are no other utilities executing. Use the -DISPLAY UTILITY command to see what utilities are ACTIVE. Utilities in the STOPPED state are allowed.

DSNU184I *csect-name* **DO NOT RECOVER OBJECT** *obj-qual.obj-name* **UNTIL THE NEXT TRACKER SITE RECOVERY CYCLE**

Explanation: This message is issued when DB2 detects an inconsistency relating to a utility's status on object 'obj-qual.obj-name' at the tracker site. This event can happen if the SYSUTIL record for the utility either does not exist or reflects incorrect information about the status of the utility.

Severity: 8 (error)

System Action: ABEND04E with RC00E40009 is issued by the utility.

User Response: Notify the system programmer.

System Programmer Response: Wait for the next recovery cycle to recover the object named in this message. If the object named in this message is a catalog or directory object, you cannot recover this object, or any other objects in the list of catalog and directory objects, or any user data or indexes. Wait until the next recovery cycle to do the recovery.

DSNU200I *csect-name - ERROR RANGE ON TABLE SPACE database.tablespace-name* **PROHIBITS PROCESSING**

Explanation: The utility encountered an error range on the identified table space or partition, which prohibits it from continuing.

Severity: 8 (error)

System Action: The utility fails serialization and terminates.

User Response: Correct the error range for the table space by running RECOVER ERROR RANGE. Then resubmit the original failing utility.

DSNU201I *csect-name - ERROR RANGE ON INDEX creator.index-name* **PROHIBITS PROCESSING**

Explanation: The utility encountered an error range on the identified index space or partition which prohibits it from continuing.

Severity: 8 (error)

System Action: The utility fails serialization and terminates.

User Response: Identify the incorrect error range by issuing the DISPLAY command for the index. Run the RECOVER INDEX utility to restore the index or index partition that has the error range. Then resubmit the original failing utility.

DSNU202I *csect-name - RECOVERY PENDING ON TABLE SPACE database.tablespace-name* **PROHIBITS PROCESSING**

Explanation: An attempt was made to execute a utility against a table space that is in a recovery pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the table space from the recovery pending state by using either LOAD REPLACE, RECOVER, or REPAIR against the object. LOAD REPLACE with KEEPDICTIONARY is not allowed on a table space (with compression active) in the recover pending state. Resubmit the job.

System Programmer Response: Determine which of the three utilities, LOAD REPLACE, RECOVER, or REPAIR, should be used to remove the object from the recovery pending state.

DSNU203I *csect-name - RECOVERY PENDING ON INDEX creator.index-name* **PROHIBITS PROCESSING**

Explanation: An attempt was made to execute a utility against an index that is in a recovery pending state.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Remove the table space from the recovery pending state by using RECOVER INDEX against the index. Resubmit the job.

DSNU204I *csect-name - PAGESET RECOVERY PENDING ON INDEX creator.name* **PROHIBITS PROCESSING**

Explanation: An attempt was made to execute a utility against a logical partition of an index when the index is in PAGESET recovery pending state,

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Remove the index space from PAGESET recovery pending state by running the RECOVER INDEX utility against the entire index, not just a single logical partition. Resubmit the job.

DSNU205I *csect-name* - LOGICAL ERROR RANGE (LOGICAL PAGE LIST) ON TABLE SPACE *database.tablespace-name* PROHIBITS PROCESSING

Explanation: The utility cannot continue because it encountered a logical error range (logical page list) on the identified table space or partition.

Severity: 8 (error)

System Action: The utility terminates.

User Response: Use the -START DATABASE command to correct the logical error range (LPL) for the table space. Then resubmit the original failing utility.

DSNU206I *csect-name* - LOGICAL ERROR RANGE (LOGICAL PAGE LIST) ON INDEX *creator.index-name* PROHIBITS PROCESSING

Explanation: The utility cannot continue because it encountered a logical error range (logical page list) on the identified index space or partition.

Severity: 8 (error)

System Action: The utility terminates.

User Response: Issue the -DISPLAY command for the index to identify the logical error range (LPL). There are two ways to restore the index or index partition that has the LPL before resubmitting the original failed utility.

- Issue the START DATABASE command to clear the LPL status, then run the RECOVER INDEX utility.
- Run the RECOVER INDEX utility to recover the entire non-partitioning index (NPI).

DSNU207I *csect-name* - GROUP BUFFER POOL RECOVERY PENDING ON TABLE SPACE *database.tablespace-name* PROHIBITS PROCESSING

Explanation: You cannot execute a utility on a table space that is in a group buffer pool recovery pending status.

Severity: 8 (error)

System Action: Utility processing does not start.

User Response: Use the -START DATABASE command to remove the table space from the group buffer pool recovery pending status. Then resubmit the job.

DSNU208I *csect-name* - GROUP BUFFER POOL RECOVERY PENDING ON INDEX *creator.index-name* PROHIBITS PROCESSING

Explanation: You cannot execute a utility on an index that is in a group buffer pool recovery pending (GRECP) status.

Severity: 8 (error)

System Action: Utility processing does not start.

User Response: Run the RECOVER INDEX utility on the index to remove the table space from the group buffer pool recovery pending status. Then resubmit the job.

DSNU230I *csect-name* - COMPRESSION DICTIONARY UPDATE ERROR FOR TABLE SPACE *database.tablespace*

Explanation: This message indicates that the compression dictionary update for the specified table space object was not updated with the RBA or LRSN value corresponding to the inline copy SYSCOPY record.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 64, 85.

User Response: Notify system programmer.

DSNU231I *csect-name* DICTIONARY WITH *n* ENTRIES HAS BEEN SUCCESSFULLY BUILT FROM *m* ROWS FOR TABLE SPACE *table-space-name*

Explanation: A compression dictionary was built for the specified table space. This message is issued during the RELOAD phase of the LOAD utility and at the end of the UNLOAD phase of the REORG utility.

The variable 'n' is the number of dictionary entries: 512, 1024, 2048, 4096, or 8192. 'n' depends on the number of rows being loaded or reorganized.

'm' is the number of rows used to build the dictionary.

| Counters are valid up to four billion.

Severity: 0 (informational)

System Action: Processing continues.

User Response: None is required.

DSNU232I *csect-name* KEEPDICTIONARY REQUESTED BUT COMPRESS ATTRIBUTE NOT DEFINED FOR TABLE SPACE *table-space-name*

Explanation: The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE utility statement. This keyword should only be used with table spaces that have the COMPRESS YES attribute. Otherwise, it is ignored. The COMPRESS column of SYSIBM.SYSTABLEPART contains the current compression status.

Severity: 4 (warning)

System Action: Processing continues. If the dictionary exists, it is erased if LOAD REPLACE or REORG is specified.

User Response: None is required.

DSNU233I *csect-name* COMPRESSION DICTIONARY DOES NOT EXIST FOR TABLE SPACE *table-space-name*

Explanation: The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE utility statement for a table space that does not have a compression dictionary.

Severity: 4 (warning)

System Action: Processing continues. A dictionary is built for the table space.

User Response: None is required.

DSNU234I *csect-name* **COMPRESSION REPORT FOR TABLE SPACE** *table-space-name*

noncmpbytes KB WITHOUT COMPRESSION
cmpbytes KB WITH COMPRESSION
percsave PERCENT OF THE BYTES SAVED FROM COMPRESSED DATA ROWS
pctrowcomp PERCENT OF THE LOADED ROWS WERE COMPRESSED
noncmppages PAGES REQUIRED WITHOUT COMPRESSION
cmppages PAGES REQUIRED WITH COMPRESSION
auncmprowlen BYTES FOR AVERAGE UNCOMPRESSED ROW LENGTH
avgcmprowlen BYTES FOR AVERAGE COMPRESSED ROW LENGTH
pagesave PERCENT OF THE DB2 DATA PAGES SAVED USING COMPRESSED DATA

Explanation: The data in the table space was compressed. This message is issued at the end of the RELOAD phase for the LOAD and REORG utility. The statistics that follow apply only to the data that was loaded or reorganized. For example, RESUME(YES) reports statistics only on the additional rows that were loaded, not what was previously in the table space.

The compression statistics follow:

noncmpbytes The total number of uncompressed KB (where KB = 1024 bytes) for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.
cmpbytes The total number of compressed KB for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.
percsave The percentage of bytes saved from the loaded or reorganized data rows as a result of compression.

The values above reflect only the number of bytes for the data row and the respective row prefix (6 bytes). DB2 page and dictionary page overhead is not included.

pctrowcomp The percentage of the rows that were compressed within the total number of rows that were loaded or reorganized. The stored length and the external length of a row was compared to determine if the row was compressed. If an EDITPROC is involved, its effect on the length of the row is considered in the calculation.
noncmppages The estimated number of DB2 pages required by the uncompressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. This number was rounded up to the next integer.
cmppages The estimated number of DB2 pages required by the compressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. Dictionary pages are also included unless a LOAD RESUME(YES)

was run. This number was rounded up to the next integer.

auncmprowlen Average uncompressed row length.
avgcmprowlen Average compressed row length.
pagesave An estimate of the percentage of DB2 pages saved by compressing the loaded or reorganized data rows.

Severity: 0 (informational)

System Action: Processing continues.

User Response: None is required.

DSNU235I *csect-name* **THE COMPRESSION DICTIONARY WAS NOT BUILT FOR TABLE SPACE** *table-space-name*

Explanation: There is insufficient data to build a compression dictionary. For the LOAD utility, the input data set is empty or all of the input records were discarded. For the REORG TABLESPACE utility, the table space is empty. The data was not compressed.

Severity: 4 (warning)

System Action: Processing continues.

User Response: The input data set must contain data in order to build a compression dictionary while running the LOAD utility. Ensure that the input records are not discarded by the WHEN clause or conversion errors. For the REORG TABLESPACE utility, the table space must be populated with data in order to build a compression dictionary.

DSNU236I *csect-name* **DICTIONARY FOR TABLE SPACE** *table-space-name* **HAS BEEN ERASED.**

Explanation: The compression dictionary of the specified table space was erased.

The COMPRESS attribute of the table space is NO, and there are no active rows in this table space. In this case, the LOAD RESUME NO utility erases the dictionary.

Severity: 0 (informational)

System Action: Processing continues.

User Response: None is required.

DSNU241I *csect-name* **DICTIONARY WITH *n* ENTRIES HAS BEEN SUCCESSFULLY BUILT FROM *m* ROWS FOR TABLE SPACE** *table-space-name*, **PARTITION** *part-num*

Explanation: A compression dictionary was built for the specified partition of the table space. This message is issued during the RELOAD phase of the LOAD utility and at the end of the UNLOAD phase of the REORG utility.

The variable '*n*' is the number of dictionary entries: 512, 1024, 2048, 4096, or 8192. '*n*' depends on the number of rows being loaded or reorganized.

'*m*' is the number of rows used to build the dictionary.

Counters are valid up to four billion.

Severity: 0 (informational)

System Action: Processing continues.

User Response: None is required.

DSNU242I *csect-name* **KEEPDICTIONARY REQUESTED BUT COMPRESS ATTRIBUTE NOT DEFINED ON TABLE SPACE** *table-space-name*, **PARTITION** *part-num*

Explanation: The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE utility statement. This keyword should only be used with table space partitions that have the COMPRESS YES attribute. Otherwise, it is ignored. The COMPRESS column of SYSIBM.SYSTABLEPART contains the current compression status.

Severity: 4 (warning)

System Action: Processing continues. If the dictionary exists, it is erased if LOAD REPLACE or REORG is specified.

User Response: None is required.

DSNU243I *csect-name* **COMPRESSION DICTIONARY DOES NOT EXIST FOR TABLE SPACE** *table-space-name*, **PARTITION** *part-num*

Explanation: The KEEPDICTIONARY option was specified in the LOAD or REORG TABLESPACE utility statement for a table space partition that does not have a compression dictionary.

Severity: 4 (warning)

System Action: Processing continues. A dictionary is built for the table space partition.

User Response: None is required.

DSNU244I *csect-name* **COMPRESSION REPORT FOR TABLE SPACE** *table-space-name*, **PARTITION** *part-num*

noncmpbytes	KB WITHOUT COMPRESSION
cmpbytes	KB WITH COMPRESSION
percsave	PERCENT OF THE BYTES SAVED FROM COMPRESSED DATA ROWS
pctrowcomp	PERCENT OF THE LOADED ROWS WERE COMPRESSED
noncmppages	PAGES REQUIRED WITHOUT COMPRESSION
cmppages	PAGES REQUIRED WITH COMPRESSION
auncmprowlen	BYTES FOR AVERAGE UNCOMPRESSED ROW LENGTH
avgcmprowlen	BYTES FOR AVERAGE COMPRESSED ROW LENGTH
pagesave	PERCENT OF THE DB2 DATA PAGES SAVED USING COMPRESSED DATA

Explanation: The data in the table space partition was compressed. This message is issued at the end of the RELOAD phase for the LOAD and REORG utility. The statistics that follow apply only to the data that was loaded or reorganized. For example, RESUME(YES) reports statistics only on the additional rows that were loaded, not what was previously in the table space.

The compression statistics follow:

noncmpbytes	The total number of uncompressed KB (where KB = 1024 bytes) for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.
-------------	--

cmpbytes The total number of compressed KB for the loaded or reorganized data rows (including the row prefix). This number was rounded to the nearest KB.

percsave The percentage of bytes saved from the loaded or reorganized data rows as a result of compression.

The values above reflect only the number of bytes for the data row and the respective row prefix (6 bytes). DB2 page and dictionary page overhead is not included.

pctrowcomp The percentage of the rows that were compressed within the total number of rows that were loaded or reorganized. The stored length and the external length of a row was compared to determine if the row was compressed. If an EDITPROC is involved, its effect on the length of the row is considered in the calculation.

noncmppages The estimated number of DB2 pages required by the uncompressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. This number was rounded up to the next integer.

cmppages The estimated number of DB2 pages required by the compressed data rows that were loaded or reorganized. Space required for PCTFREE and FREEPAGE is included. Dictionary pages are also included unless a LOAD RESUME(YES) was run. This number was rounded up to the next integer.

auncmprowlen Average uncompressed row length.

avgcmprowlen Average compressed row length.

pagesave An estimate of the percentage of DB2 pages saved by compressing the loaded or reorganized data rows.

Severity: 0 (informational)

System Action: Processing continues.

User Response: None is required.

DSNU245I *csect-name* **THE COMPRESSION DICTIONARY WAS NOT BUILT FOR TABLE SPACE** *table-space-name*, **PARTITION** *part-num*

Explanation: There is insufficient data to build a compression dictionary. For the LOAD utility, the input data set is empty or all of the input records were discarded. For the REORG TABLESPACE utility, the partition is empty. The data was not compressed.

Severity: 4 (warning)

System Action: Processing continues.

User Response: The input data set must contain data in order to build a compression dictionary while running the LOAD utility. Ensure that the input records are not all being discarded by the WHEN clause or conversion errors. For the REORG TABLESPACE utility, the partition must be populated with data in order to build a compression dictionary.

DSNU246I *csect-name* **DICTIONARY FOR TABLE SPACE**
table-space-name, **PARTITION** *part-num* **HAS**
BEEN ERASED.

Explanation: The compression dictionary of the specified partition of the table space was erased.

The COMPRESS attribute of the table space partition is NO, and there are no active rows in this partition. In this case, the LOAD RESUME NO utility erases the dictionary.

Severity: 0 (informational)

System Action: Processing continues.

User Response: None is required.

DSNU250I *csect-name* **UNLOAD PHASE COMPLETE,**
ELAPSED TIME = *hh/mm/ss*

Explanation: The UNLOAD phase of the REORG utility completed normally. The time that elapsed between the beginning of the REORG utility and the completion of the UNLOAD phase was hh/mm/ss, hours, minutes, and seconds, respectively.

Severity: 0 (informational)

System Action: Action subsequent to this message depends on the UNLOAD option of the REORG utility statement:

- If the UNLOAD option is CONTINUE, execution of the utility continues into the RELOAD phase.
- If the UNLOAD option is PAUSE, execution of the utility is stopped at the beginning of the RELOAD phase.
- If the UNLOAD option is ONLY, the REORG utility is finished. Processing continues to the next utility in the utility job step, or, if there are no more utility statements, the utility job step terminates normally.

User Response: The user's response depends on the UNLOAD option in the REORG utility statement.

- If the UNLOAD option is CONTINUE, no user response is required. The message is informational only.
- If the UNLOAD option is PAUSE, the REORG utility is stopped in the reload phase. To complete the REORG process, the user must explicitly restart the utility job step using the RESTART(PHASE) option.
- If the UNLOAD option is ONLY, the REORG utility has completed, and the requested output is on the data set identified by the DD statement of the UNLDDN REORG utility statement option.

Operator Response: The operator's response depends on the UNLOAD option of the REORG statement:

- If the UNLOAD option is CONTINUE, no operator response is required. The execution of the REORG utility is proceeding.
- If the UNLOAD option is PAUSE, further processing is dependent upon restarting the utility job step with the RESTART(PHASE) option. Until that time, resources are held exclusively by the REORG utility job step.
- If the UNLOAD option is ONLY, the REORG utility processing is complete. The data set defined by the DD statement nominated by the UNLDDN option is available for installation disposition.

DSNU251I *csect-name* **UNLOAD PHASE STATISTICS.**
**NUMBER OF RECORDS UNLOADED =**
*mmmmmm* **FOR TABLESPACE** *tttttt* **PART** *nn*

Explanation: This message is issued at the completion of the UNLOAD phase of the REORG utility. It lists the number of records that were unloaded 'mmmmmm' for the indicated partition 'nn' of table space 'tttttt'. The count can indicate the amount of processing. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: Only valid table records are unloaded. Dropped table record counts are not reported.

User Response: The record count represents the current cardinality of the indicated partition. If this value differs greatly from the SYSTABLES.CARDF value, consider invoking the RUNSTATS utility and then rebinding the involved PLANs so that the SQL optimizer can bring the PLANs up to date.

DSNU252I *csect-name* **UNLOAD PHASE STATISTICS.**
**NUMBER OF RECORDS UNLOADED =**
*mmmmmm* **FOR TABLESPACE** *tttttt*

Explanation: This message is issued at the completion of the UNLOAD phase of the REORG utility. It gives the number of records that were unloaded 'mmmmmm' for the indicated table space 'tttttt'. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: Only valid table records are unloaded. Dropped table record counts are not reported.

User Response: Record count represents the current cardinality of the indicated table. If this value differs greatly from the SYSTABLES.CARDF value, invocation of the RUNSTATS utility and a subsequent rebinding of the involved PLANs should be considered so that the SQL optimizer can bring the PLANs up to date.

Operator Response: Count can be indicative of the amount of processing remaining.

DSNU253 *csect-name* **UNLOAD PHASE STATISTICS.**
**NUMBER OF RECORDS** *action=* *mmmmmm*
**FOR TABLE** *table-name*

Explanation: This message is issued at the completion of the UNLOAD phase of the REORG utility. If 'action' is "UNLOADED", the message lists the number of records 'mmmmmm' that were unloaded for the specified table name. If 'action' is "DISCARDED", then the message lists the number of records 'mmmmmm' that were discarded for the specified table name. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: Table records were unloaded or discarded.

DSNU254I *csect-name* **- RECORD COUNTS INCON-**
SISTENT FOR *pppppppp* **PHASE, NUMBER OF**
RECORDS EXPECTED = *nnnnnnnn*, **NUMBER**
OF RECORDS PROCESSED = *aaaaaaa*

Explanation: This message is issued during the 'pppppppp' phase for the REORG utility to report the condition where the number of records 'nnnnnnnn' passed to the current phase is not equal to the number of records 'aaaaaaa' processed in this phase. Counters are valid up to four billion.

Severity: 4 (warning)

System Action: Processing continues if UNLOAD PAUSE option was used.

User Response: Check if unload data set was altered by user. Determine if the inconsistent record counts between the unload and reload phases is a potential problem. If it is an internal DB2 problem, report to system programmer.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: If the unload data set was manipulated by user during restart process, make sure it was handled properly. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5.

DSNU255I *csect-name* - **KEY COUNT INCONSISTENT FOR**
pppppppp **PHASE, NUMBER OF KEYS**
EXPECTED = nnnnnnnn, NUMBER OF KEYS
PROCESSED = aaaaaaaa.

Explanation: This message is issued during the 'pppppppp' phase for the LOAD or REORG utility to report the condition where the number of keys, 'nnnnnnnn', passed to the current phase is not equal to the number of keys, 'aaaaaaa', processed in this phase. One or more of the affected indexes may be inconsistent. Counters are valid up to four billion.

Severity: 8 (error)

System Action: Processing stops and all indexes are placed in recover pending state.

User Response: TERM the utility and re-access the indexes by running REPAIR utility to reset the recover-pending states on indexes. Run the CHECK INDEX utility to determine if any of the affected indexes are inconsistent. Inconsistent indexes may be recovered by the RECOVER INDEX utility.

System Programmer Response: Determine the failing environment. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: If the working data set was manipulated by the user during the restart process, make sure it was handled properly. Refer to *Utility Guide and Reference*.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU256I *csect-name* **INVALID PARTITION SPECIFICATION**

Explanation: This message is issued by the utility in response to an invalid PART option specification.

A PART option is invalid if it is specified for a nonpartitioned table space, or if the indicated PART integer is not pertinent to the partitions existing for the indicated table space.

The utility job step is terminated.

Severity: 8 (error)

System Action: The error is sufficient to terminate further processing of the utility job step. The utility job step is terminated, and resources are released to their previous state.

User Response: Determine the correct partition specification for the table space that was the subject of the specified control utility statement, and resubmit the utility job step. Examine the SYSIBM.SYSTABLESPACE in the DB2 catalog for the correct range of partition numbers for the table space.

DSNU257I *csect-name* **UNABLE TO RESTART BUILD PHASE**

Explanation: Restarting in the BUILD PHASE of the LOAD utility with the RESUME(YES) option or the REORG utility with the PART option is not permitted.

Severity: 8 (error)

System Action: Utility processing is not initiated.

User Response: Recover all indexes within the table space which were left in a recover pending state when the LOAD or REORG utility failed.

Problem Determination: Refer to *Utility Guide and Reference* and Section 2 (Volume 1) of *Administration Guide* for a discussion of LOAD and reorganization restarting constraints.

DSNU258I *csect-name* **BUILD PHASE STATISTICS.**
NUMBER OF INDEXES = mmm

Explanation: This message is issued at normal completion of the BUILD phase of the LOAD or REORG or RECOVER INDEX utility. The number of indexes that were updated is indicated as 'mmm'.

Severity: 0 (informational)

System Action: The BUILD phase of either the LOAD or REORG or RECOVER INDEX utility is completed. Upon completion of the utility job step, they are available for REFERENCE processing.

DSNU259I *csect-name* **BUILD PHASE COMPLETE,**
ELAPSED TIME = hh/mm/ss

Explanation: This message is issued at the normal completion of the BUILD phase of the REORG, LOAD, and RECOVER INDEX utilities. The time that has elapsed between the beginning of the phase and the completion of this phase was 'hh' hours, 'mm' minutes, and 'ss' seconds.

System Action: Processing continues to the next phase of the LOAD or REORG or RECOVER INDEX utility. If this is the last phase, processing continues to the next utility statement in the utility job step, if any.

DSNU260I *csect-name* **TABLE SPACE IS EMPTY**

Explanation: This message is issued as a warning when RECOVER INDEX(ALL) or REORG TABLESPACE are executed on an empty table space.

This message is also issued when COPY detects that the first space map page in the table space or partition is missing. This is an error condition that may be caused by a delete and re-define of the data set outside of DB2, or by a previous DB2 failure that occurred on the data set.

Severity: 4 (warning) or 8 (error)

System Action: For RECOVER INDEX or REORG TABLESPACE, the return code of 4 will allow the next utility function in the job step, if any, to be initiated.

For COPY, the table space or partition being copied will be placed in recover pending status. The return code of 8 will prohibit further utility processing in the job step.

User Response: Notify the system programmer if the return code is 8. If the return code is 4, no action is required.

System Programmer Response: If the return code is 8, the table space or partition being copied should be recovered with the RECOVER utility.

DSNU270I *csect-name - table-name, column-name* **IN VIOLATION OF INSTALLATION DEFINED FIELD PROCEDURE** *procedure-name, function-code, return-code, reason-code, message-token*

Explanation: An installation-supplied field procedure has returned an error during encoding for LOAD or decoding for REORG. See SQLCODE -681 for more detail.

Severity: 8 (error)

System Action: The utility will issue a system '04E' abend with a reason code of '00E40336'.

User Response: Request the dump produced as a result of the error to the system programmer so that the cause of the error can be determined and corrected.

System Programmer Response: Examine the field procedure to determine why an error return code was generated. Refer to *Utility Guide and Reference* for more information.

DSNU272I *csect-name - FIELD PROCEDURE* *procedure-name* **COULD NOT BE LOADED**

Explanation: An installation supplied field procedure could not be loaded during encoding for LOAD or decoding for REORG. See SQLCODE -682 for more detail.

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8.

User Response: Take the job output to the system programmer.

System Programmer Response: Determine why the field procedure could not be loaded.

DSNU280I *csect-name - ERROR=X'reason-code'* **FROM EDIT ROUTINE** *procedure-name* **FOR** *table-name*

Explanation: The edit routine provided by your installation has returned an error during the load of a record into the table indicated. The reason code is set by the edit routine.

Severity: 8 (error)

System Action: The LOAD or REORG utility will receive ABEND04E RC00E40323.

User Response: Correct any errors in the input data. Ensure that the edit routine provided is correct. The utility can be restarted or terminated.

System Programmer Response: Verify that the edit routine is correct.

DSNU281I *csect-name* **RECORD (n) OF TABLE** *table-name* **VIOLATING VALID ROUTINE** *validproc-name,* **ERROR=X'reason-code'**

Explanation: The validation exit routine provided by your installation blocked the load of record 'n' into TABLE 'table-name'. The reason-code was set by the exit routine.

Severity: 4 (warning)

System Action: The LOAD utility continues to process the following input record.

User Response: Check the error input records against the error reason code returned from the validation procedure. Refer to *Utility Guide and Reference* for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU282I *csect-name* **UNABLE TO RESTART AT LAST CHECKPOINT WITH DDNAME** 'ddddddd'

Explanation: The data set with DDNAME 'ddddddd' is a concatenated data set and the utility can be restarted only at the beginning of the phase (RESTART PHASE), not at the last checkpoint (RESTART CURRENT).

Severity: 8

System Action: The utility will issue a system '04E' abend with a reason code of '00E40323'.

User Response: Change the RESTART option to RESTART PHASE and resubmit the job step.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5.

DSNU291I **MAXIMUM COMPOSITE UNLOAD RECORD SIZE TOO LARGE FOR SORT. SORTDATA KEYWORD IS IGNORED.**

Explanation: The SORTDATA keyword was specified for a REORG utility job. However, the largest possible record in the table space, prefixed by the largest key, produces a composite record that is too large to be processed by the SORT component. The SORTDATA keyword is ignored.

This message is issued by the following CSECT: DSNURFIT

Severity: 0

System Action: Processing continues normally.

User Response: If you must use SORTDATA for the table space, try reducing the size of either the largest record or key field by redefining the table. In some cases, changing a field from LONG VARCHAR to VARCHAR with a specified maximum length might help.

Problem Determination: This problem should only occur on a table space with a 32KB page size. Analyze the requirement for maximum data length in VARCHAR and LONG VARCHAR columns to see if a shorter length can be specified. It might be necessary to remove the SORTDATA keyword from the utility statement.

DSNU292I *csect-name* - -ALTER UTILITY CANNOT APPLY TO THIS UTILITY, REASON=c

Explanation: The -ALTER UTILITY command only applies to a job that is executing REORG with SHRLEVEL REFERENCE or CHANGE. In addition, if -ALTER UTILITY specifies MAXRO, LONGLOG, or DELAY, the job must be executing REORG with SHRLEVEL CHANGE.

- 1 The job is not executing REORG with SHRLEVEL REFERENCE or CHANGE.
- 2 -ALTER UTILITY specifies MAXRO, LONGLOG, or DELAY, but the job is executing REORG with SHRLEVEL REFERENCE.

Severity: 8 (error)

System Action: -ALTER UTILITY does not execute.

User Response: Apply -ALTER UTILITY to a job that is executing the proper utility.

DSNU293I *csect-name* - REORG WITH SHRLEVEL REFERENCE OR CHANGE CANNOT APPLY TO THE *name* TABLE SPACE

Explanation: REORG with SHRLEVEL REFERENCE or CHANGE cannot operate on the following catalog and directory table spaces: DSND06.SYSDBASE, DSND06.SYSDBAUT, DSND06.SYSGROUP, DSND06.SYSPLAN, DSND06.SYSVIEWS, and DSND01.DBD01.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Execute REORG with SHRLEVEL NONE.

DSNU294I *csect-name* - LARGEST COMPOSITE RECORD IS TOO BIG FOR REORG WITH SHRLEVEL CHANGE

Explanation: SHRLEVEL CHANGE was specified for a REORG utility job, and the table has a clustering index. However, the largest possible record in the table space, prefixed by the largest key, produces a composite record that is too large to be processed by the SORT component. See the computation of the length under REORG in the *Utility Guide and Reference*. If the largest possible composite record to be sorted exceeds 32760 bytes in length, which is the maximum record size for a BSAM data set, REORG cannot operate if SHRLEVEL CHANGE is specified.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Execute REORG with SHRLEVEL NONE or REFERENCE. If you must use SHRLEVEL CHANGE for the table space, try reducing the size of either the largest record or key field by redefining the table. In some cases, changing a field from LONG VARCHAR to VARCHAR with a specified maximum length might help.

Problem Determination: This problem should only occur on a table space with a 32KB page size. Analyze the requirement for maximum data length in VARCHAR and LONG VARCHAR columns to see whether a shorter length can be specified.

DSNU295I *csect-name* - IN UTILTERM PHASE OF REORG WITH SHRLEVEL REFERENCE OR CHANGE, DATA SET *name* COULD NOT BE DELETED, DFP REASON CODE = rrrrrrrr

Explanation: For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets. The original name of a data set is in the form "catname.DSNDBx.dbname.psname.I0001.Annn." The shadow name of a data set is in the form "catname.DSNDBx.dbname.psname.S0001.Annn." REORG uses such data sets for indexes as well as data.

If a data set is DB2-managed, the utilterm phase of REORG deletes the shadow data set, which was the original data set. This message indicates that the shadow data set *name* could not be deleted. rrrrrrrr indicates the DFP reason code.

Severity: 4 (warning)

System Action: REORG continues execution, but it does not delete the specified data set.

User Response: Try to delete the data set. If you cannot delete it, notify the system programmer.

System Programmer Response: Look up the DFP reason code, and try to determine why the data set could not be deleted.

DSNU296I *csect-name* - IN REORG WITH SHRLEVEL REFERENCE OR CHANGE, DATA SET *name* DOES NOT EXIST, CONTEXT=c

Explanation: For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming. The original name of a data set is in the form "catname.DSNDBx.dbname.psname.I0001.Annn." The shadow name of a data set is in the form "catname.DSNDBx.dbname.psname.S0001.Annn." The temporary name of a data set is in the form "catname.DSNDBx.dbname.psname.T0001.Annn." REORG uses such data sets for indexes as well as data.

During its initialization, REORG cannot execute if:

- data sets with the temporary names already exist ,
- DB2-managed data sets with the shadow names already exist
- user-managed data sets with the shadow names do not already exist

To exchange the names of the original and shadow data sets, REORG performs the following renaming:

- 1 In the switch phase, it renames the original data set from the original name to the temporary name
- 2 In the switch phase, it renames the shadow data set from the shadow name to the original name
- 3 In the utilterm phase, it renames the original data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary for DB2-managed data sets.

If either a -TERM UTILITY command is issued, or the REORG switch phase is restarted after REORG has begun renaming data sets, the names revert back to their original form prior to the utilterm phase of REORG:

- 4 The original data set from the shadow name to the temporary name
- 5 The shadow data set from the original name to the shadow name
- 6 The original data set from the temporary name to the original name

The context code indicates the specific type of error:

1

During the switch phase of REORG, on rename 1, REORG detected that a data set with an original name does not exist. This error condition can arise for a DB2-managed or user-managed data set.

During the switch phase restart or a -TERM UTILITY during the switch phase, on rename 4, REORG detected that a data set with an original name does not exist. This error condition can arise for a DB2-managed or user-managed data set.

2

During the switch phase of REORG, on rename 2, REORG detected that a data set with a shadow name does not exist. This error condition can arise for a DB2-managed or user-managed data set.

During the switch phase restart or a -TERM UTILITY during the switch phase, on rename 5, REORG detected that a data set with a shadow name does not exist. This error condition can arise for a DB2-managed or user-managed data set.

3

During the utilterm phase of REORG, on rename 3, REORG detected that a data set with a temporary name does not exist. This error condition can arise for a user-managed data set.

During switch phase restart or a -TERM UTILITY during the switch phase, on rename 6, REORG detected that a data set with a temporary name does not exist. This error condition can arise for DB2-managed or user-managed data sets.

Severity: 4 (warning) or 8 (error)

System Action: For context codes 1 or 2, utility processing is abended. ABEND reason code 00E4031B is issued. The object is left in a recovery pending state. For context code 3, the utility job step that caused the function to be requested continues with no renaming. The utility job is placed in the stopped state. The object is left in a recovery pending state, and a message will be issued. For context codes 1, 2, or 3, the following messages are issued:

- If the data set is part of a nonpartitioned table space, the object is the table space, and the message is DSNU562I.
- If the data set is part of a partition of a table space, the object is the partition, and the message is DSNU560I.
- If the data set is part of a nonpartitioned index, the object is the index, and the message is DSNU557I.
- If the data set is part of a partition of a partitioned index, the object is the partition of the index, and the message is DSNU559I.

User Response:

For context codes 1 or 2, execute the RECOVER TABLESPACE or RECOVER INDEX utility.

For context code 3 do nothing.

For context code 4, 5, or 6, execute the RECOVER TABLESPACE or RECOVER INDEX utility.

DSNU297I *csect-name* **COMPOSITE RECORD SIZE TOO LARGE FOR** *table-name*

Explanation: The size of the record that would be unloaded for REORG DISCARD or REORG UNLOAD EXTERNAL is greater than the allowed data set logical record length (32760 bytes).

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8.

User Response: If you are attempting to discard records during REORG, you must use SQL to DELETE the records prior to the REORG. If you are attempting to unload records in an external format, you must use an application instead.

Problem Determination: This problem will most likely occur only on a table with BLOB, CLOB, or DBCLOB columns.

DSNU298I *csect-name* - **RESTART NOT ALLOWED IN** *phase-name* **PHASE OF REORG UTILITY WITH SHRLEVEL CHANGE**

Explanation: An attempt was made to restart the REORG utility with SHRLEVEL CHANGE in the *phase-name* phase. DB2 does not allow you to restart the REORG utility with SHRLEVEL CHANGE in that phase.

Severity: 8 (error)

System Action: Utility processing abends. Abend reason code 00E40018 or 00E40310 might be issued.

User Response: Issue the -TERM UTILITY command to terminate the utility job; then rerun the job without the RESTART parameter.

System Programmer Response: If necessary, take actions to prevent access to the table space or partition before terminating the utility.

DSNU299I *csect-name* - **COLUMN 'column-name'** **REQUIRES INVALID TRANSLATION FROM** **CCSID** *ccsid* **TO** *ccsid*

Explanation: The LOAD utility was asked to translate an input value to a different coded character set, but the particular translation is not described in the SYSSTRINGS catalog table. The first *ccsid* identifies the coded character set of the input value, and the second *ccsid* identifies the coded character set to which it must be translated.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: If the CCSIDs are correct, the only corrective action is to provide for the translation by inserting a row into SYSSTRINGS. For an SBCS translation, the row must contain a translate table or the name of a user-provided translate procedure. For a DBCS translation, the row must contain the name of a user-provided translate procedure.

If the CCSIDs are incorrect, correct the CCSID specification on the LOAD statement and resubmit the job.

DSNU300I *csect-name* (RE)LOAD PHASE COMPLETE, ELAPSED TIME = *hh/mm/ss*

Explanation: The reload phase of the REORG or LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

DSNU301I *csect-name* - KEYWORD 'SORTDATA' SPECIFIED AND/OR KEYWORD 'NOSYSREC' WAS SPECIFIED BUT NO CLUSTERING INDEX EXISTS, KEYWORD IS IGNORED

Explanation: The 'SORTDATA' keyword was specified or the 'NOSYSREC' keyword was specified for a REORG utility job, or implied by the use of SHRLEVEL CHANGE. But it was found that no clustering index existed for the table space being reorganized. The keyword is ignored and processing continues normally.

This message is issued by the following CSECT: DSNURFIT

Severity: 0

System Action: Processing continues normally.

User Response: If a clustering index was expected to be found for the table space being reorganized, determine the reason the index could not be found.

Operator Response: None

System Programmer Response: None

Problem Determination: Probably a user error. Determine if a cluster index should be defined on one of the tables in the table space being reorganized. If so, define the cluster index; otherwise, remove the 'SORTDATA' and/or 'NOSYSREC' keyword from the utility statement if necessary.

DSNU302I *csect-name* (RE)LOAD PHASE STATISTICS. NUMBER OF INPUT RECORDS PROCESSED = *nnnnnnnn*

Explanation: This message is issued at the normal completion of the RELOAD phase of the REORG utility and the LOAD phase of the LOAD utility.

It indicates the number of records processed from the input record data set (that is, the data set identified either by the JCL DD statement identified in the UNLDDN option for REORG or the INDDN option for LOAD). Counters are valid up to four billion.

Severity: 0 (informational)

System Action: The LOAD or REORG utility completes the phase in which the records are (re-)introduced into the DB2 database. This is also the last phase of the utility unless there are some indexes that need to be built and/or updated.

User Response: The user can verify that the number of records (re-)loaded is consistent with expectations. For example, in REORG it matches the total number of records

unloaded. For LOAD, it matches the number of records submitted minus the number of records reported rejected.

DSNU303I *csect-name* (RE)LOAD PHASE STATISTICS. NUMBER OF RECORDS= *nnnnnn* FOR TABLE *table-name* PART=*part-number*

Explanation: This message is issued at the normal completion of the RELOAD phase of the REORG utility and the LOAD phase of the LOAD utility.

It indicates the number of records loaded into PART 'part-number' of 'table-name' from the source record data set. This data set is identified by the JCL DD statement in the UNLDDN option for REORG, or the INDDN option for LOAD.

This message is repeated for each INTO TABLE PART clause in the LOAD utility statement or each TABLESPACE PART clause in the REORG utility statement.

Severity: 0 (informational)

System Action: The LOAD or RELOAD phase maintains a separate count for each table part. Rejected rows are not included in the count. Each count is reported as a separate message at the end of the LOAD or RELOAD phase.

The user can verify the number of records loaded or reloaded into the table part. In REORG, it should match the number of records unloaded for that table part. In LOAD, it should match the number of records processed.

DSNU304I *csect-name* (RE)LOAD PHASE STATISTICS. NUMBER OF RECORDS = *nnnnnn* FOR TABLE *table-name*

Explanation: This message is issued at the normal completion of the RELOAD phase of the REORG utility and the LOAD phase of the LOAD utility.

It indicates the number of records loaded into TABLE 'table-name' from the source record data set (that is, the data set identified by the JCL DD statement identified in the UNLDDN option for REORG, or the INDDN option for LOAD).

This message is repeated for each TABLE loaded by the current REORG or LOAD utility statement.

If the LOAD or REORG was restarted in a LOAD or RELOAD phase from the last commit point (i.e., the 'RESTART' parm was specified), 'nnnnnn' indicates the number of records loaded after the restart. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: The LOAD or RELOAD phase maintains a separate count for each table populated by this phase. Rejected rows are not included in the count. Each count is reported as a separate message at the end of the LOAD or RELOAD phase.

The user can verify that the number of records (re-)loaded into the table is consistent with expectations. For example, in REORG it matches the number of records unloaded for that table. For LOAD, it matches the number of records processed.

DSNU305I *csect-name* - TABLE=*table-name* HAS AN INCOMPLETE TABLE DEFINITION

Explanation: Table '*table-name*' does not have an index defined to enforce the uniqueness of its primary key.

Severity: 8 (error)

System Action: Processing stops. No table in the table space is loaded.

User Response: The user can resubmit the LOAD job after either:

- Creating a unique index over the table's primary key
- Dropping the definition of the table's primary key.

Problem Determination: Issue SQL SELECT against the catalog to determine which indexes and relations exist against '*table-name*'. Determine whether uniqueness of the primary key has been guaranteed through omission or through faulty definition of an index.

DSNU306I *csect-name* - UNABLE TO DRAIN WRITERS FROM *object-type object-name*

Explanation: The utility was unable to drain the writers from an object because the resource was unavailable. The object is identified by type and name. Message DSNT500I tells why the resource was unavailable. If the QUIESCE utility issues this message, DSNT500I is not issued, but message DSNT501I might be issued.

Severity: 8 (error)

System Action: Utility processing terminates.

Problem Determination: Refer to message DSNT500I or DSNT501I.

DSNU307I *csect-name* PARENT TABLE *parent-table-name* OF *table-name* IN RELATIONSHIP *relationship-name* HAS AN INCOMPLETE TABLE DEFINITION

Explanation: The '*table-name*' identifies the target table of the job for the LOAD utility or the dependent table to be checked by the CHECK DATA utility. The '*parent-table-name*' identifies the parent table of the target table for the LOAD utility or the dependent table for the CHECK DATA utility in RELATIONSHIP '*relationship-name*'. The primary index of PARENT TABLE '*parent-table-name*' has been dropped.

This message is repeated for each incompletely defined parent table in each relationship where the target table is a child.

Severity: 8 (error)

System Action: The LOAD and CHECK DATA utilities stop further processing. No data is loaded by the LOAD utility and no relationships are checked by the CHECK DATA utility.

User Response: Check the existence of the primary index and its parent tables identified by RELATIONSHIP '*relationship-name*'.

Problem Determination: If the incompletely defined tables were targets of the LOAD job, message DSNU305I has been issued for each such table. Refer to the catalog to determine if any tables in the table space that were not targets of the LOAD job are incompletely defined.

DSNU308I *csect-name* INDEX KEY LIST RECORD LENGTH EXCEEDS MAXIMUM KEY BUFFER SIZE

Explanation: The length of the index key list that will be built in the Data Base Services address space while loading a data record may be larger than the maximum key buffer size. The LOAD statement may be too complex.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Examine the preceding DSNU650I INTO TABLE statements. The key size and number of indexes affected by each INTO TABLE statement are accumulative. The combination of these elements may produce a list of index keys, including header bytes, that is too large to be contained within the maximum size buffer area during the load of each input data record. It may be necessary to reduce the number of INTO TABLE statements or to drop some of the indexes that are affected by the load.

DSNU309I *csect-name* NOT ALL REQUIRED UNIQUE INDEXES HAVE BEEN DEFINED FOR TABLE *table-name*

Explanation: The table '*table-name*' was created with unique index requirements. Not all of these indexes have been defined.

Severity: 8

System Action: Processing stops. No table in the table space is loaded.

User Response: The user may resubmit the LOAD job after either:

- Creating all the required unique indexes, or
- Dropping the table and re-creating it without the unique index requirements.

Problem Determination: Determine which unique indexes need to be created. Determine if the uniqueness requirement for the table is valid.

DSNU310I *csect-name* RECORD '*n*' WILL BE DISCARDED DUE TO *field-name* CONVERSION ERROR FOR *table-name*

Explanation: The load utility found the input data provided for a field to be incorrect. The corresponding input data set record '*n*' will be placed in the DISCARDS data set.

If the NOSUBS keyword was specified, it is possible that the record was discarded because the input contained a code point that when translated from the source CCSID to the target CCSID resulted in a substitution character being placed in the target string.

Severity: 4 (warning)

System Action: The input data set record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to *Utility Guide and Reference* for a definition of LOAD input field column specifications.

DSNU311I *csect-name* RECORD 'n' WILL BE DISCARDED DUE TO INVALID *field-name* COLUMN SPECIFICATION

Explanation: The load utility calculated the location of an input data value using the field specifications supplied and VARCHAR length fields present within the input data set record. The calculated position for the field was determined to be incorrect.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to *Utility Guide and Reference* for a definition of LOAD input field column specifications.

DSNU312I *csect-name* RECORD 'n' WILL BE DISCARDED DUE TO ERROR = X'reason-code' FROM EXIT ROUTINE *procedure-name* FOR *table-name*

Explanation: The exit routine provided by your installation blocked the load of record 'n' into the table indicated. The reason-code was set by the exit routine.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. error is placed in the DISCARDS data set. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Ensure that the exit routine provided is correct. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to *Utility Guide and Reference* for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU313I *csect-name* RECORD 'n' WILL BE DISCARDED DUE TO PART OR HIGH KEY VALUE SPECIFICATION(S)

Explanation: The discarded record does not belong to any of the partitions being loaded. For a LARGE table space, this might be because the key is higher than the high key value specified for the last partition.

Counters are valid up to four billion.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to Section 2 of *Utility Guide and Reference* for a definition of LOAD input field column specifications.

System Programmer Response: Verify that the validation routine is correct.

DSNU314I *csect-name* RECORD 'n' WILL BE DISCARDED DUE TO WHEN SPECIFICATION(S)

Explanation: The discarded record satisfies none of the WHEN selection expressions provided.

Severity: 4 (warning)

System Action: The input data set record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. Refer to *Utility Guide and Reference* for a definition of LOAD input field column specifications. If FORMAT UNLOAD was specified on the load statement, the WHEN specifications are built internally. This ensures that the rows are loaded back into the same object from which they were unloaded. Refer to *Utility Guide and Reference* for a description of the FORMAT UNLOAD option of LOAD.

DSNU315I *csect-name* RECORD 'n' WILL BE DISCARDED DUE TO UNEXPECTED ERROR

Explanation: The LOAD of input data set record number 'n' was attempted but was not successful due to an unexpected error.

Severity: 8 (error)

System Action: If the error was caused because a resource was not available, a DSNT500I message will be issued.

The utility step will be abended with a system X'04E' and an abend reason code of '00E40318'. If a DSNT500I message is not issued, an SVC dump will be requested. A SYSABEND dump of batch storage is also requested.

User Response: If a DSNT500I message was issued, refer to the description under that message number. If the unavailable resource becomes available, the utility step is restartable.

If there is no DSNT500I message, the error is an unexpected internal error and you should consult your system programmer.

Operator Response: An operator with SYSOPR authority can issue a TERM UTIL to free any held resources if that is necessary.

System Programmer Response: Refer to *Command Reference* for information about the TERM UTIL command. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU316I *csect-name* - UNABLE TO DRAIN WRITERS FROM *object-type object-name* PART *part-num*

Explanation: The utility was unable to drain the class of writers from a partition of an object because the resource was unavailable. The partition is identified by object type (object-type), object name (object-name), and partition number (part-num). Message DSNT500I tells why the resource was unavailable.

Severity: 8 (error)

System Action: Utility processing terminates.

Problem Determination: Refer to message DSNT500I.

DSNU317I *csect-name* DISCARD LIMIT HAS BEEN REACHED

Explanation: The DISCARDS limit specified on the LOAD utility statement was reached.

Severity: 8 (error)

System Action: Processing abends to allow users to increase the discard limit and restart the utility.

User Response: Increase the discard limit and restart the utility. Otherwise -TERM the utility. Review the file of input records provided to LOAD and review table definitions to determine why the number of records discarded exceeds expectations.

Problem Determination: See user response.

DSNU318I *csect-name* RECORD 'n' WILL BE DISCARDED DUE TO INVALID *field-name* COLUMN SPECIFICATION FOR *table-name*

Explanation: The load utility calculated the location of an input data value using the field specifications supplied and VARCHAR length fields present within the input data set record 'n'. The calculated position for the field was determined to be incorrect.

Severity: 4 (warning)

System Action: The input data set record number is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set.

User Response: Following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, if one exists. Otherwise, correct the input field specification. Submit a RESUME(YES) LOAD invocation, which uses the DISCARDS data set and the verified LOAD utility statement and field specifications. Refer to *Utility Guide and Reference* for a definition of LOAD input field column specifications.

DSNU319I *csect-name* RESUME(YES) WAS SPECIFIED FOR EMPTY PARTITION *nn*. RESUME(NO) IS ASSUMED

Explanation: This message is issued in response to a LOAD utility request containing a partition level RESUME(YES) option. The RESUME(YES) option implies that the specified partition 'nn' is populated, but in this case it was not. The message alerts the invoker to this fact, and continues as if RESUME(YES) was not specified.

Severity: 4 (warning)

System Action: The LOAD utility, in attempting to honor the RESUME(YES), found the partition was empty, ignored the option, and continued as if RESUME(NO) was specified.

User Response: The user is alerted to the fact that the requested partition was empty rather than populated as the RESUME LOAD option implied.

DSNU320I *csect-name* RESUME(YES) WAS SPECIFIED FOR AN EMPTY TABLESPACE

Explanation: RESUME(YES) was specified within the LOAD utility statement. However, the RESUME(YES) option implies that the specified table space is populated.

Severity: 4 (warning)

System Action: Processing continues. The LOAD utility, in attempting to honor the RESUME(YES), found the table space empty, so ignored the option, and proceeded as if RESUME(NO) was specified. If this table is currently defined as COMPRESS YES, a dictionary is not built.

User Response: The user is alerted to the fact that the requested table space was empty rather than populated as the RESUME LOAD option implied. Use the RESUME(NO) option if you want a compression dictionary built.

DSNU321I *csect-name* CHECK PENDING STATE OF TABLESPACE *tsp* PROHIBITS PROCESSING

Explanation: The requested utility cannot be run against a table space or table space partition in a check pending state.

Severity: 8 (error)

System Action: Processing terminates after the check pending states of all target table spaces or partitions of the utility are analyzed.

User Response: Remove the named table space or partition from its check pending state by using the CHECK DATA or REPAIR utility. If you want more information on the extent of questionable data in the table space, query the SYSTABLES and SYSTABLEPART catalog tables.

DSNU322I *csect-name* DEFERRED STATUS OF TABLE SPACE *database-name.table-space-name* PROHIBITS PROCESSING

Explanation: The requested utility cannot be run against a table space or table space partition in a deferred state.

Severity: 8 (error)

System Action: Processing terminates after the deferred state of all target table spaces or table space partitions of the utility are analyzed.

User Response: To remove the deferred state, use the RECOVER TABLESPACE, LOAD REPLACE utility, or -START DATABASE command with ACCESS(RW) or ACCESS(RO). If you want more information on the status of the table space, use the -DISPLAY DATABASE command.

DSNU323I *csect-name* **COLUMN *ccc* IS OMITTED**

Explanation: The column '*ccc*' is a nonnullable column and is not being loaded. Field specifications must include all nonnullable columns. The identified column name was missing from the field specification.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Determine if the input data contains the nonnullable column as a field. If it does, change the field specification to include it. If the input data does not contain the nonnullable column as a field, determine which is in error, the input data or the column specification. Make the corresponding correction. Resubmit the job if that is still appropriate.

System Programmer Response: Corrective procedures may require that a table be dropped and created again. Refer to Section 2 (Volume 1) of *Administration Guide* for a discussion of how this can be accomplished. Refer to *Utility Guide and Reference* for a discussion of field specification constraints with regard to nonnullable columns.

DSNU324I *csect-name* **DEFERRED STATUS OF INDEX SPACE** *creator-name.index-name* **PROHIBITS PROCESSING**

Explanation: The requested utility cannot be run against an index space or index space partition in a deferred state.

Severity: 8 (error)

System Action: Processing terminates after the deferred state of all target index spaces or index partitions of the utility are analyzed.

User Response: The deferred state can be removed through recovery of the index space or the physical index partition. It can also be removed by the -START DATABASE command with ACCESS(RW) or ACCESS(RO). The RECOVER INDEX utility can be run at either the index space or index partition level. If more information on the status of the index space is required, use the -DISPLAY DATABASE command.

DSNU325I *csect-name* **- AN INVALID SQL/DS FORMAT RECORD WAS ENCOUNTERED**

Explanation: The LOAD utility detected an invalid SQL/DS format record type.

Severity: 8 (error)

System Action: Utility execution is terminated.

User Response: Correct the input data and resubmit the job. Data that has been transmitted from an SQL/DS unload disk data set in a VM/370 system may have extra block descriptors and record descriptors at the beginning of each record. Ensure that this situation does not exist.

Problem Determination: Refer to Section 2 (Volume 1) of *Administration Guide* for additional information regarding loading data from SQL/DS and resubmitting a partially completed load step.

DSNU326I *csect-name* **- USER NOT AUTHORIZED FOR LOAD REPLACE ON TABLESPACE**

Explanation: The indicated user attempted to use the REPLACE option of LOAD, and it will reset to empty all tables in the table space before loading data. This option requires load authorization on each table in the table space, but the user did not have authority for one or more tables.

Severity: 12 (severe error)

System Action: When LOAD REPLACE validation encounters the first nonauthorized table in the table space, the job step is terminated.

User Response: Obtaining the LOAD on DATABASE privilege for the database will allow you to proceed using the REPLACE option. The other alternative is to first delete all rows from the tables which are to be loaded, and then use the RESUME option instead of the REPLACE option.

DSNU327I *csect-name* **TABLE *b* IS NOT IN SAME TABLESPACE AS TABLE *a***

Explanation: All tables that are the subject of a single LOAD utility statement must belong to the same table space.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Remove the INTO TABLE control statement that specifies TABLE '*b*' from the current LOAD request. If the data is to be loaded into TABLE '*b*', create another LOAD utility statement that contains the INTO TABLE control statement for TABLE '*b*' and resubmit the job.

DSNU328I *csect-name* **CANNOT PROCESS THE NON-EMPTY PARTITION *nn* WITH RESUME(NO). PROCESSING TERMINATES**

Explanation: The partition level RESUME keyword either specified or defaulted to a value of NO, which requires the partition to be empty. However, the LOAD command named partition '*nn*', which was not empty.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Determine why the assumption of an empty partition was wrong. This may require consultation with the system programmer. Either remove the current partition's rows using an SQL DELETE, or change the LOAD option to RESUME YES. Resubmit the job. Refer to *Utility Guide and Reference* for a description of the partition-level RESUME option of LOAD.

System Programmer Response: Determine whether the partition should be empty. If it should, use SQL DELETE to empty it. Otherwise, instruct the user to use the RESUME(YES) option for that partition.

DSNU329I *csect-name* **- FIELD *field-name* IS NOT DEFAULTTABLE**

Explanation: You specified a NULLIF or DEFAULTIF field specification option for:

- A column defined to be not nullable or not defaultable
- A field with no column counterpart.

Severity: 8 (error)

System Action: The utility abends to allow restart.

User Response: Determine whether the field specification refers to the correct column. If it does, remove the NULLIF option from the field specification, and restart the job. Alternatively, TERM the utility. Refer to *Utility Guide and Reference* for LOAD NULLIF option constraints.

DSNU330I *csect-name* **TABLESPACE IS NOT EMPTY**

Explanation: The RESUME keyword either specified or defaulted to a value of 'NO', which requires an empty table space. However, the LOAD command named a table space that was not empty.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Determine why the assumption of an empty table space was wrong. This may require consultation with the system programmer. Either remove the current table(s) rows using an SQL DELETE, or change the LOAD option to RESUME YES. Resubmit the job. Refer to *Utility Guide and Reference* for a definition of the RESUME option of LOAD.

System Programmer Response: If the table space is used by more than one application, determine whether the table space should be empty. If it should be, use SQL DELETE to make it empty. Otherwise, instruct the user to use the RESUME(YES) option.

DSNU331I *csect-name* **FIELD LISTS ARE NOT ALLOWED WITH FORMAT KEYWORD**

Explanation: LOAD field specifications are incompatible with the FORMAT option.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Determine whether the field specifications or the FORMAT option is correct. Eliminate whichever is incorrect, and resubmit the job. Refer to *Utility Guide and Reference* for a definition of the LOAD FORMAT option constraints.

DSNU332I *csect-name* - **INPUT VALUE X'hex-data' OUT OF RANGE FOR COLUMN 'column-name'**

Explanation: The LOAD utility detected a numeric value outside of the range of permissible values for the column in the DB2 table. A loss of significant digits results if the LOAD process continues. The input data type is SMALL INTEGER, INTEGER, DECIMAL, or FLOAT and is displayed in hexadecimal.

Severity: 8 (error)

System Action: Further utility processing is terminated unless DISCARD processing is active.

User Response: Correct the input data and resubmit the job. Make sure that the 'field specification' on the LOAD statement is consistent with the table definition and the input data. This might mean changing:

- The table definition
- The LOAD statement
- The input data.

Refer to *Utility Guide and Reference* to determine input constraints. Refer to Section 2 (Volume 1) of *Administration Guide* for information on resubmitting a partially completed LOAD step.

DSNU333I *csect-name* - **INPUT VALUE 'ebcdic-data' OUT OF RANGE FOR COLUMN 'column-name'**

Explanation: The LOAD utility detected a numeric value outside the range of permissible values for the column in the DB2 table. A loss of significant digits results if the LOAD process continues. The input data type is INTEGER EXTERNAL, DECIMAL EXTERNAL, or FLOAT EXTERNAL.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Correct the input data and resubmit the job. Make sure that the 'field specification' on the LOAD statement is consistent with the table definition and the input data. This might mean changing:

- The table definition
- The LOAD statement
- The input data.

Refer to *Utility Guide and Reference* to determine input constraints. Refer to Section 2 (Volume 1) of *Administration Guide* for information on resubmitting a partially completed LOAD step.

DSNU334I *csect-name* **INPUT FIELD ffffffff INVALID FOR tttttt, ERROR CODE cc**

Explanation: The LOAD utility found the input data provided for field ffffffff in table tttttt to be incorrect. The error code cc, if present, identifies the problem. Possible error codes are:

- | | |
|----|---|
| 01 | Input numeric value is out of the range for the table column. |
| 02 | Input numeric field contains invalid numeric data. |
| 03 | There was an error converting input numeric data to floating-point data. |
| 04 | Input packed decimal data is in error. |
| 05 | Input is too long for a date column. |
| 06 | Input is too short for a date column. |
| 07 | Input is too long for a time column. |
| 08 | Input is too short for a time column. |
| 09 | Input is too long for a time stamp column. |
| 10 | Input is too short for a time stamp column. |
| 11 | Input character field is too long for the table column. |
| 12 | Input variable character field is too long for the table column. |
| 13 | Input is out of range for the date/time column. |
| 14 | Input is invalid for the date/time column. |
| 15 | Input length is incorrect for numeric column. |
| 16 | Input contains a blank character. |
| 17 | Input is too long for a graphic column. |
| 18 | Input is invalid for a graphic column. |
| 19 | Input is too long for the table column after a required CCSID conversion. |
| 20 | Input contained an invalid code point for a required CCSID conversion. |

- 21 Input does not conform to the rules for valid data for a required CCSID conversion.
- 22 Input causes an error during CCSID conversion. An example of this type of error would be an error in a user exit routine.
- # 23 Input is invalid for a *rowid* column.
- # 24 Input contained a code point that when translated from the source CCSID to the target CCSID resulted in a substitution character being placed in the target string. This condition can occur when the NOSUBS keyword was specified and no discard data set was specified.
- #
- #
- #
- #
- #
- #

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Correct the input data and resubmit the job. Make sure that the 'field specification' on the LOAD statement is consistent with the table definition and the input data. This might mean changing:

- The table definition
- The LOAD statement
- The input data.

Refer to *Utility Guide and Reference* to determine input constraints. Refer to Section 2 (Volume 1) of *Administration Guide* for information on resubmitting a partially completed LOAD step.

DSNU335I *csect-name* **INPUT FIELD 'fffffff' NOT ENTIRELY WITHIN INPUT RECORD**

Explanation: The LOAD utility found that the input field 'fffffff' extends beyond the end of the input record.

If DISCARDS processing is active, the message severity is 4 (warning).

Severity: 4 (warning) or 8 (error)

System Action: For fixed length records, with no VARCHARs included, the length needed by the LOAD utility can be calculated before processing. In this case, when the LOAD utility determines that no records can be loaded because ALL of the INTO TABLE statements require input longer than the defined lengths, the LOAD job terminates on the first record without discarding any records. Further utility processing with mixed or non-fixed length records is terminated unless DISCARDS processing is active.

User Response: Correct the input data and resubmit the job. Make sure that the 'field specification' on the LOAD statement is consistent with the table definition and the input data. This might mean changing:

- The table definition
- The LOAD statement
- The input data.

Refer to *Utility Guide and Reference* to determine input constraints. Refer to Section 2 (Volume 1) of *Administration Guide* for information on resubmitting a partially completed LOAD step.

DSNU336I *csect-name* **INVALID nullif SPECIFICATION FOR INPUT FIELD fffffff**

Explanation: The LOAD utility found the 'nullif' field specification to be incorrect.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Correct the 'nullif' specification and resubmit the job. Refer to *Utility Guide and Reference* for a description of 'nullif' field selection options and Section 2 (Volume 1) of *Administration Guide* for information on resubmitting a partially completed LOAD step.

DSNU337I *csect-name* **RECORD(n), CONCATENATED CONTINUEIF RECORD IS TOO LARGE**

Explanation: The CONTINUEIF option was specified during LOAD to concatenate multiple physical records into one logical record for loading. The resultant concatenated record is too large to be processed. The maximum length allowed is 32767 bytes. Counters are valid up to four billion.

Severity: 8

System Action: When discard processing is specified, the input data set logical record is noted and will be discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set, and the severity level is 4. When discard process is not specified, the severity is 8 and the LOAD utility will terminate.

User Response: When discard processing is specified, following the completion of the current LOAD utility invocation, examine the record in the DISCARDS data set. Correct the error in the discarded input data, and submit a RESUME(YES) LOAD invocation with the DISCARDS data set as the input data set. When discard processing is not specified: correct the error in the input data set and rerun the job.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items: "Appendix B. Problem Determination" on page X-5: 1, 2, 5.

DSNU338I *csect-name* **INVALID COLUMN SPECIFICATION FOR *column name***

Explanation: The LOAD utility found the dynamically determined column location for an input field to be incorrect.

Severity: 8 (error)

System Action: The utility abends to allow restart.

User Response: Correct the input field specification or the input data and restart the job. Alternatively, TERM the utility.

DSNU339I *csect-name* **INVALID CONTINUEIF SPECIFICATION**

Explanation: The CONTINUEIF clause of a LOAD utility extends beyond the end of the input record.

Severity: 8 (error)

System Action: The LOAD utility is terminated.

User Response: Correct the CONTINUEIF clause. The column specification must be reduced and/or the value being

compared must be shortened. The value being compared must be entirely within the input record.

DSNU340I *csect-name* - **ERROR LOADING INDEX, DUPLICATE KEY, INDEX=*index-name*, TABLE=*table-name*, RID OF INDEXED ROW=*rid-of-indexed-row*, RID OF NON-INDEXED ROW=*rid-of-non-indexed-row***

Explanation: A duplicate key was found while building the indicated index during the BUILD phase of the REORG or RECOVER INDEX utility. This violates the uniqueness rule for that index.

Severity: 8 (error)

System Action: All duplicate index entries of the indicated index are reported and the index is in RECOVERY PENDING status. Duplicate rows are present in the indexed table.

Utility processing continues with any other utility functions within the utility job step.

User Response: Duplicate rows are present in the indexed table. The system programmer should be informed, so that any applications that are dependent upon the uniqueness of the table rows are not initiated until corrective action has been taken.

Operator Response: Notify the system programmer.

System Programmer Response: Steps should be taken to inhibit any further processing until the index is repaired. If the nonunique keys are correct, DROP and recreate the index as nonunique. If the records with duplicate keys should not be in the table, use REPAIR DELETE to remove the erroneous rows. Use the RID values provided in this message as input to the REPAIR utility. After the duplicate data rows are removed or the unique index has been dropped, issue the -DISPLAY DATABASE command with RESTRICT against the target database. Use the RECOVER INDEX utility to recover any indexes that are in the RECOVER PENDING state. CHECK INDEX can be run to verify that the data and indexes are consistent.

Problem Determination: Use REPAIR LOCATE RID DUMP to view the records with duplicate keys. SQLSELECT may fail due to the inconsistent index. Use CHECK INDEX to check the validity of the index.

DSNU341I *csect-name* - **IMAGE COPY MUST BE TAKEN BEFORE REORG CAN BE RUN ON A DB2 CATALOG OR DIRECTORY TABLE SPACE**

Explanation: The DB2 catalog or directory table space being reorganized does not have an image copy that the RECOVER utility can use to recover the table space to currency. Before running the REORG utility, you must run the COPY utility to create an image copy. This prevents having to recover the DB2 catalog or directory table space to a prior point in time if a problem occurs during REORG processing.

Severity: 8

System Action: Processing terminates

User Response: Run the COPY utility to create an image copy of the DB2 catalog or directory table space. If more than one catalog or directory table space is to be reorganized, consider using the QUIESCE and COPY utilities for the set of table spaces to be reorganized.

Use the REPORT utility to view the recovery information related to the table space. The output from the REPORT utility

should indicate either the absence of an image copy, or the presence of a REORG LOG NO SYSCOPY record.

DSNU342I *csect-name* **ERROR LOADING INDEX, ERROR = *Xreason-code*, INDEX = *index-name***

Explanation: The LOAD, REORG or RECOVER INDEX utility encountered a processing error, which it could not correct, while extending the index identified by '*index-name*'. Refer to "Section 4. DB2 Codes" on page 4-1 for an explanation of the code given in '*reason-code*'.

Severity: 8 (error)

System Action: The building of index entries for the indicated index is not completed. An SVC dump of the database services address space is requested for diagnostic purposes. The extension of other indexes associated with the tables being loaded is attempted. Any subsequent attempt to use the index directly or indirectly will cause the invoker to abend.

User Response: If the indexed table is used by more than one application, the system programmer should be informed so that applications that insert rows into, or delete rows from, the table or use the index directly are inhibited until corrective action is taken.

Normal corrective action would be to use the RECOVER INDEX utility option to reconstruct the index after the processing problem identified by the reason code has been resolved. Alternatively, the index can be dropped and then created again, unless the index in question is the partitioning index.

Operator Response: The table space in question might need to be stopped and started for utility-only processing to inhibit attempted application use of the defective index.

System Programmer Response: If the index is used by more than one application, applications that either insert rows into, or delete rows from, the indexed table or use the index to access rows must be inhibited from executing. One way to accomplish this is to place the table space in question under utility only processing control via the -START and -STOP DATABASE commands until the RECOVER INDEX utility is executed.

Alternatively, the index can be dropped. Application execution can then proceed, and the index can be created again (unless the index was the partitioning index). If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem. For failure analysis procedures. Refer to "Section 4. DB2 Codes" on page 4-1 to determine the processing error indicated by the reason code. For a discussion of how a table can be dropped and created again, or what to do if a partitioning index is damaged, refer to the discussion of LOAD processing in Section 2 (Volume 1) of *Administration Guide*.

DSNU343I *csect-name* - **BUILD PHASE STATISTICS. *nnn* DUPLICATE KEY ERRORS ENCOUNTERED**

Explanation: The count of duplicate key errors encountered during processing is '*nnn*'.

Severity: 4 (warning) or 8 (error)

System Action: Processing continues. For the LOAD utility, the records causing the duplicate key errors will be deleted in a subsequent phase.

DSNU344I *csect-name* - **UNIQUE INDEX KEY DUPLICATES KEY OF INDEXED ROW AT RID *rrrr* INDEX = *index-name* TABLE = *table-name* RECNO = *input-dataset-record-number* RID = *duprid***

Explanation: The input data set record indicated was loaded into table '*table-name*' at RID '*duprid*', but it causes a unique index violation for index '*index-name*'. It duplicates the key value of a record already in the table at RID '*rrrr*'. Counters are valid up to four billion.

Severity: 4 (warning)

System Action: Processing continues. No index entry is created for the record at RID '*duprid*'. The record will be deleted in a subsequent phase of processing.

DSNU345I *csect-name* **UNIQUE INDEX KEY DUPLICATES KEY FROM INPUT DATASET RECORD *iiii* LOADED AT RID *rrrr* INDEX = *index-name* TABLE = *table-name* RECNO = *recno* RID = *duprid***

Explanation: Input data set record '*recno*' was loaded into table '*table-name*' at RID '*duprid*', but it causes a unique index violation for index '*index-name*'. It duplicates the key value of another record in the load job: the record loaded at RID '*rrrr*' from input data set record '*iiii*'. Counters are valid up to four billion.

Severity: 4 (warning)

System Action: Processing continues. Index entries are not created for either record. Both records will be deleted in a subsequent phase of processing.

DSNU346I *csect-name* **RECORD(n), CONCATENATED SQL/DS RECORD IS TOO LARGE**

Explanation: A LOAD utility was executing with FORMAT SQL/DS input data. Multiple spanned segments of the input data were concatenated into one logical record for loading. The resultant concatenated record is too large to be processed. The maximum length allowed is 32764 bytes.

Severity: 4 or 8

System Action: When discard processing is specified, the input data set logical record is noted and is discarded in the DISCARD phase. The LOAD utility continues to process additional records in the input data set and the severity is 4. When discard processing is not specified, the severity is 8 and the LOAD utility terminates.

User Response: When discard processing is specified, examine the records in the DISCARDS data set after the LOAD utility completes. Correct the error in the discarded input data. Then run the LOAD utility with the RESUME YES option using the DISCARDS data set as input. When discard processing is not specified, correct the error in the input data set and rerun the job.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5.

DSNU347I *csect-name* **DEADLINE = *yyyy-mm-dd-hh.mm.ss.mmmmmm***

Explanation: This message applies only to REORG with SHRLEVEL REFERENCE or CHANGE. It supplements message DSNU105I, which can appear for any utility (including REORG).

This message is issued in response to a -DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL REFERENCE or CHANGE and DB2 estimates that the switch phase will not start by the deadline specified by the DEADLINE phrase.

This message indicates the most recently specified values of the DEADLINE parameter to REORG. For this parameter, a previous invocation of the -ALTER UTILITY command might have specified a value. If no previous invocation of -ALTER UTILITY has specified a value, then the most recently specified value is the value that was specified with the invocation of the REORG utility.

yyyy-mm-dd-hh.mm.ss.mmmmmm indicates a timestamp, according to the most recently specified value of DEADLINE.

Severity: 0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 *estimated* that the switch phase would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. If an -ALTER UTILITY command is then executed, a subsequent -DISPLAY UTILITY command would reflect the results (if any) of the -ALTER UTILITY command.

DSNU348I *csect-name* **BUILD PHASE STATISTICS. NUMBER OF KEYS = *nnnnnnnn* FOR INDEX *index-name* PART *part-num***

Explanation: This message is issued by the BUILD phase of the RECOVER INDEX utility to report the total number of index key entries used to build the indicated index partition. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: This message indicates the number of index key entries submitted to the DB2 data manager to build the indicated index partition. Both unique and nonunique key entries are counted. Rejected key entries are not counted.

User Response: The user can verify that the number reported is consistent with expectations.

DSNU349I *csect-name* **BUILD PHASE STATISTICS. NUMBER OF KEYS = *nnnnnnnn* FOR *index-name***

Explanation: This message is issued by the BUILD phase of the LOAD, REORG or RECOVER INDEX utility. The message is repeated for each index built by the LOAD, REORG or RECOVER INDEX utility. It indicates the total number of index key entries used to build the indicated index. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: This message indicates the number of index key entries that were submitted to the DB2 data manager to

build the indicated index. Both unique and nonunique key entries are counted. Rejected key entries are not counted.

User Response: The user can verify that the number reported is consistent with expectations. For example, the user can determine if it matches the number of records loaded for the table indexed by the indicated index.

DSNU350I *csect-name* - EXISTING RECORDS DELETED FROM TABLESPACE

Explanation: A LOAD utility execution, in which REPLACE was specified, has deleted all records from the specified table space.

Severity: 0 (informational)

System Action: Processing continues.

DSNU351I *csect-name* - '*reorg-option*' OPTION IS NOT APPLICABLE FOR A DB2 CATALOG OR DIRECTORY TABLE SPACE. THE OPTION IS IGNORED.

Explanation: The identified option does not apply when reorganizing one of the following DB2 catalog or directory table spaces:

DSNDB06.SYSDBASE
DSNDB06.SYSDBAUT
DSNDB06.SYSGROUP
DSNDB06.SYSPLAN
DSNDB06.SYSVIEWS
DSNDB01.DBD01

These table spaces are processed differently than other table spaces and, consequently, do not make use of the specified *reorg-option*.

Severity: 4 (warning)

System Action: The option is ignored and processing continues.

User Response: None is required. However, you can remove the option from the utility input statement.

DSNU352I EXISTING RECORDS DELETED FROM TABLESPACE PARTITION *x*

Explanation: A LOAD utility execution, in which PART '*x*' REPLACE was specified, has deleted all data records from partition '*x*'. Index records over partition '*x*' will be deleted in a subsequent phase of processing.

This message is issued by the following CSECT: DSNURWUT

Severity: 0 (informational)

System Action: Processing continues.

DSNU353I *csect-name* RECORD '*n*' WILL BE DISCARDED DUE TO CHECK CONSTRAINT *constraint-name* VIOLATION ON TABLE *table-name*

Explanation: The discarded record violates the check constraint named *constraint-name* defined on table *table-name*. The record is not loaded and is discarded during the DISCARD phase. Counters are valid up to four billion.

Severity: 4 (warning)

System Action: The LOAD utility continues to process additional records in the input data set.

User Response: After the LOAD utility completes, examine the record in the DISCARDS data set. Correct the error in the discarded input data. Submit a RESUME(YES) LOAD job with the DISCARDS data set as the input data set.

DSNU354I *csect-name* RECORD '*n*' VIOLATES CHECK CONSTRAINT *constraint-name* ON TABLE *table-name*

Explanation: The LOAD utility cannot load record *n* into table *table-name* because the check constraint *constraint-name* would be violated. The record is not loaded. Counters are valid up to four billion.

Severity: 8 (error)

System Action: Processing terminates. An abend is requested so that the LOAD can be restarted after the error condition is corrected.

User Response: Find the failing record in the input data set, correct the condition that caused the check constraint to be violated, and restart the LOAD utility. You can optionally include a SYSDISC DD statement in the JCL input to hold copies of records that are not loaded.

DSNU355I *csect-name* INDEXVAL PHASE STATISTICS - *nnn* DUPLICATE KEY ERRORS CORRECTED BY DELETING *rrr* DATA ROWS

Explanation: This message reports the results of the INDEXVAL phase of the LOAD utility. Data rows which were added during the LOAD or RELOAD phase of this LOAD utility invocation have been deleted because they caused unique index violations in the BUILD phase. A total of '*rrr*' data rows were deleted to correct '*nnn*' unique index violations.

Unique index violations are counted in one of two ways. An input data set record which has a value for a uniquely indexed column that duplicates a value that existed in the index prior to the LOAD job is counted as one duplicate key error. Two input data set records which have like values for a uniquely indexed column are counted as two unique index errors (that is, each of the two input data set records is in error).

Severity: 4 (warning)

System Action: Processing continues.

User Response: Compare the number of duplicate key errors corrected in the INDEXVAL phase to the number of duplicate key errors detected in the BUILD phase (reported by message DSNU343I). If the counts are unequal, notify the system programmer.

If the counts are equal, following the LOAD utility execution, examine the discards file or the LOAD error summary to determine which input data set records caused the unique index violations. Revise the input records so they will not introduce duplicate values into unique indexes and reapply the input records to the table space. Alternatively, if appropriate, make the index nonunique and reapply the rejected records to the table space.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5.

DSNU356I *csect-name* INDEXVAL PHASE COMPLETE,
ELAPSED TIME = hh/mm/ss

Explanation: The INDEXVAL phase of the LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)

DSNU357I *csect-name* - 'LOG NO' OPTION REQUIRED
FOR DB2 CATALOG AND DIRECTORY TABLE
SPACES

Explanation: The LOG NO option must be specified when reorganizing a DB2 catalog or directory table space.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Add the LOG NO option to the utility input statement.

DSNU358I *csect-name* - 'UNLOAD ONLY' OPTION NOT
VALID FOR DB2 CATALOG OR DIRECTORY
TABLE SPACE

Explanation: The UNLOAD ONLY option is not permitted for DB2 catalog or directory table spaces.

Severity: 8

System Action: Processing terminates.

User Response: Determine the purpose for using the UNLOAD ONLY option. There might be alternative ways of accomplishing the required function (for example, the UNLOAD PAUSE option).

DSNU359I KEYWORD 'SORTKEYS' SPECIFIED BUT NO
INDEX OR FOREIGN KEYS EXIST, KEYWORD
IS IGNORED

Explanation: The 'SORTKEYS' keyword was specified for a LOAD or REORG utility job; however, it was found that no index and no foreign keys were defined for any of the tables being loaded or reorganized. The keyword is ignored and processing continues normally.

Severity: 0 (informational)

System Action: Processing continues normally.

User Response: If an index or foreign keys were expected to be found for the table or tables being loaded or reorganized, determine the reason the index or foreign keys could not be found.

Problem Determination: Probably a user error. Determine if an index should be defined on any of the tables in the table space, or if foreign keys should be defined. If so, define the index or foreign keys; otherwise, remove the 'SORTKEYS' keyword from the utility statement if necessary.

DSNU360I *csect-name* - IN REORG WITH SHRLEVEL REF-
ERENCE OR CHANGE, DATA SET *name*
EXISTS, CONTEXT=c

Explanation: For the area (table space or partition) being reorganized, REORG with SHRLEVEL REFERENCE or CHANGE unloads data from the original data sets and reloads data into shadow data sets. REORG then exchanges the names of the original and shadow data sets, using temporary names during the renaming. The original name of a data set is

in the form "catname.DSNDBx.dbname.pname.l0001.Annn." The shadow name of a data set is in the form "catname.DSNDBx.dbname.pname.S0001.Annn." The temporary name of a data set is in the form "catname.DSNDBx.dbname.pname.T0001.Annn." REORG uses such data sets for indexes as well as data.

During its initialization, REORG cannot execute if:

- data sets with the temporary names already exist ,
- DB2-managed data sets with the shadow names already exist
- user-managed data sets with the shadow names do **not** already exist

To exchange the names of the original and shadow data sets, REORG performs the following renaming:

- 1 In the switch phase, it renames the original data set from the original name to the temporary name
- 2 In the switch phase, it renames the shadow data set from the shadow name to the original name
- 3 In the utilterm phase, it renames the original data set from the temporary name to the shadow name (for user-managed data sets). It deletes the temporary for DB2-managed data sets.

If a -TERM UTILITY command is issued after any renaming, or
a restart of the REORG switch phase occurs after any
renaming, the data set names revert back to their original form
prior to the renaming:

- 4 The original data set from the shadow name to the temporary name
- 5 The shadow data set from the original name to the shadow name
- 6 The original data set from the temporary name to the original name

The context code indicates the specific type of error:

- 1 During the switch phase of REORG, on rename 1, REORG detected that a data set with a temporary name already exists. This error condition can arise for a DB2-managed or user-managed data set.
- 2 During the switch phase of REORG, on rename 2, REORG detected that a data set with an original name already exists. This error condition can arise for a DB2-managed or user-managed data set.
- # 3 During the utilterm phase of REORG, on rename 3, REORG detected that a data set with a shadow name already exists. This error condition can arise for a user-managed data set.
- # 4 During switch phase restart or a -TERM UTILITY during the switch phase, on rename 4, it was detected that a data set with a temporary name already exists. This error condition can arise for a DB2-managed or user-managed data set.
- # 5 During switch phase restart or a -TERM UTILITY during the switch phase, on rename 5, it was detected that a data set with a shadow name already exists. This error condition can arise for a DB2-managed or user-managed data set.
- # 6 During switch phase restart or a -TERM UTILITY during the switch phase, on rename 6, it was detected that a data set with an original name already exists. This error

condition can arise for a DB2-managed or user-managed data set.
#

- 8 During initialization of REORG, REORG detected that a data set with a temporary name already exists. This error condition can arise for a DB2-managed or user-managed data set.

Severity: 8 (error)

System Action: For context code 1, or 2, the utility job step that caused the function to be requested abends with code 00E4031B. The utility job is placed in the stopped state.

For context code 3, the utility job step that caused the function to be requested continues without performing this renaming.

For context code 4, 5, or 6, the object is left in a recovery pending state, -TERM UTILITY continues to undo renaming, and a message is issued. The objects and messages are as follows:

- If the data set is part of a nonpartitioned table space, the object is the table space, and the message is DSNU562I.
- If the data set is part of a partition of a table space, the object is the partition, and the message is DSNU560I.
- If the data set is part of a nonpartitioned index, the object is the index, and the message is DSNU557I.
- If the data set is part of a partition of a partitioned index, the object is the partition of the index, and the message is DSNU559I.

For context code 8, REORG does not execute.

User Response: For context code 1 or 2, you can choose between these actions:

- Delete the data set; then RESTART the utility.
- TERM the utility. Delete the data set before trying to execute REORG again with SHRLEVEL REFERENCE or CHANGE.

For context code 3, if you want to perform the renaming, delete the data set with the shadow name and then perform the renaming.

For context code 4, 5, or 6, execute the RECOVER TABLESPACE or RECOVER INDEX utility; then delete the shadow and temporary data sets (if they still exist).

For context code 8, delete the data set and then execute REORG.
#

DSNU361I *csect-name* FOREIGN KEY HAS NO PRIMARY KEY FOR RELATIONSHIP=*r1* INPUT RECORD NUMBER=*nnnn*, RID=*X'rrrr'*

Explanation: Input record '*nnnn*' caused a row to be loaded into table '*table*' at RID '*rrrr*' with no primary key for the relationship with the name '*r1*'. Counters are valid up to four billion.

Severity: 4 (warning)

System Action: Processing continues.

User Response: None required. The constraint violation described will be rectified later in processing.

DSNU362I *csect-name* - IN REORG WITH SHRLEVEL CHANGE, LOG HAS BECOME SHORT, BUT MAXRO IS DEFER, MEMBER=*member-name*, UTILID=*utilid*

Explanation: In execution of the REORG utility with SHRLEVEL CHANGE, if the value of MAXRO is DEFER, and the actual time for an iteration and the estimated time for the next iteration are both less than 5 seconds, then DB2 adds a 5 second pause to the next iteration. This pause limits the utility's consumption of processor time.

Within an execution of REORG, the first time that this situation occurs, DB2 produces this message, which announces the pause. On all later occurrences of this situation, DB2 still adds the pause, but DB2 sends the message only if DB2 has *not* sent the message (for this execution of REORG) within the past 30 minutes. This is a WTO message; it is sent to the console, but it is not an action message. It is not sent to SYSPRINT.

In a data sharing environment, *member-name* identifies the DB2 member. In a non-data-sharing environment, *member-name* is blank. *utilid* identifies the utility job step.

Severity: 0 (informational)

System Action: REORG continues execution, with a 5 second pause. If the conditions in the explanation above continue to be true, DB2 will continue adding 5 second pauses.

User Response: If you have been planning to wait for an appropriate time to execute the -ALTER UTILITY command to choose the value of MAXRO and thus cause REORG to finish, now might be an appropriate time. However, you are not required to take any action.

Operator Response: If you have been planning to wait for an appropriate time to execute the -ALTER UTILITY command to increase the value of MAXRO and thus cause REORG to finish, now might be an appropriate time. However, you are not required to take any action.

DSNU363I *csect-name* - ENFORCE PHASE STATISTICS - RELATIONSHIP *r1* FOREIGN KEYS CHECKED=*n* CONSTRAINT VIOLATIONS ENCOUNTERED=*m*

Explanation: This message provides statistics for the enforce phase of the load utility. For relationship '*r1*', the number of foreign keys checked is '*n*'. The number of constraint violations found is '*m*'.

Severity: 0 (informational)

System Action: Processing continues.

DSNU365I *csect-name* - USER *auth-id* DOES NOT HAVE AUTHORITY ON REORG MAPPING TABLE

Explanation: The REORG utility was run with SHRLEVEL CHANGE and a mapping table, but user *auth-id* does not have authority to delete, insert, select, and update in the mapping table specified in the utility statement.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Obtain authorization to delete, insert, select, and update in the mapping table specified in the utility statement.

DSNU366I *csect-name* - REORG MAPPING TABLE HAS WRONG COLUMNS

Explanation: A mapping table was specified for a utility job executing REORG with SHRLEVEL CHANGE. However, the table has the wrong set of columns. This message can arise for any parameters of CREATE TABLE that are missing from, added to, or different from the CREATE TABLE statement that appears for the mapping table in the REORG section of *Utility Guide and Reference*.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Create a mapping table with the correct set of columns, and no other columns, as specified under REORG in *Utility Guide and Reference*. Execute REORG.

DSNU367I *csect-name* - ENFORCE PHASE STATISTICS - n ROWS DELETED FROM TABLE t

Explanation: This message reports the results of the ENFORCE phase of the LOAD utility. Data rows added during the RELOAD phase of the LOAD utility have been deleted because they contained foreign keys which did not have a corresponding primary key. A total of 'n' data rows were deleted from table 't'.

Primary errors may cascade and remove additional records. The count is the sum of both primary and secondary constraint violations. Counters are valid up to four billion.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Determine why no primary key exists for the deleted record.

Problem Determination: All primary errors are accompanied by a DSNU361I message which identifies the relationship and input record which does not have a primary key value. The report phase will report all secondary errors and indicate the primary error record which caused this record to be deleted.

The relevant parent table can be found by querying the SYSIBM.SYSRELS catalog table. The relevant columns can be found by querying the SYSIBM.SYSFOREIGNKEYS catalog table.

DSNU368I *csect-name* - REORG MAPPING TABLE HAS WRONG INDEX

Explanation: A mapping table was specified for a utility job executing REORG with SHRLEVEL CHANGE. However, the table has the wrong index. This message can arise for any parameters of CREATE INDEX that are missing from, added to, or different from the CREATE INDEX statement that appears for the mapping table in the REORG section of *Utility Guide and Reference*. It can also arise for the existence of any other indexes on the mapping table.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Create a mapping table with the correct index, and no other indexes, as specified under REORG in *Utility Guide and Reference*. Execute REORG.

DSNU369I *csect-name* - ENFORCE PHASE COMPLETE, ELAPSED TIME = hh/mm/ss

Explanation: The ENFORCE phase of the LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)

DSNU370I *csect-name* - THE LOCAL FORMAT OPTION HAS BEEN USED WITH A DATE OR TIME AND NO LOCAL EXIT HAS BEEN INSTALLED.

Explanation: The Installation Application Programming Defaults Panel indicated that an exit for date or time was supplied, but the exit supplied by DB2 was not replaced.

Severity: 8 (error)

System Action: The statement cannot be executed.

User Response: Contact the system programmer about installation of the date or time exit.

System Programmer Response: To replace the DB2-supplied exit routine, an SMP USERMOD must be applied. If an SMP USERMOD is undesirable, the replacement module may be linked into a user library either included in the MVS LINKLIST or concatenated to the STEPLIB in the started task JCL for *ssnm*DBM1 (*ssnm* is the subsystem name).

DSNU371I *csect-name* - REORG MAPPING TABLE'S TABLE SPACE MUST BE SEGMENTED

Explanation: REORG with SHRLEVEL CHANGE specified a mapping table for a table space that is not segmented. The table space that contains the mapping table must be segmented.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Specify a mapping table that is in a table space that is segmented.

DSNU372I *csect-name* - CANNOT REORGANIZE REORG MAPPING TABLE'S TABLE SPACE

Explanation: REORG with SHRLEVEL CHANGE specified a mapping table that resides in the table space that is being reorganized. The table space that contains the mapping table must not be the table space that is being reorganized.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Specify a mapping table that is not in the table space that is being reorganized.

DSNU373I *csect-name* - IN -ALTER UTILITY OR REORG WITH SHRLEVEL REFERENCE OR CHANGE, DEADLINE HAS ALREADY OCCURRED, CONTEXT=c

Explanation: If a deadline is specified in the -ALTER UTILITY command or the REORG utility with SHRLEVEL REFERENCE or CHANGE, the deadline cannot occur before the time of execution of the -ALTER UTILITY or REORG that specified the deadline. Context codes are:

- 1 The error occurred on -ALTER UTILITY.
- 2 The error occurred on REORG.

Severity: 8 (error)

System Action: -ALTER UTILITY or REORG does not execute.

User Response: Execute -ALTER UTILITY or REORG with no deadline or with a deadline that has not already occurred. If you want to terminate an execution of REORG, use the -TERM UTILITY command.

DSNU374I *csect-name* - REORG WITH SHRLEVEL REFERENCE or CHANGE HAS BEEN TERMINATED, REASON=c

Explanation: REORG with SHRLEVEL REFERENCE or CHANGE has been terminated.

- 1 REORG with SHRLEVEL CHANGE specified LONGLOG TERM, and at the end of an iteration of log processing, the number of log records that the next iteration would process is not sufficiently lower than the number that the previous iterations processed.
- 2 DB2 estimated that the switch phase of REORG with SHRLEVEL REFERENCE or CHANGE would not start by the deadline specified in the DEADLINE phrase.

Severity: 8 (error)

System Action: REORG terminates.

User Response: For reason code 1, attempt a new invocation of reorganization later, perhaps when you expect that the application workload is lower or the maximum desired amount of time for applications to have read-only access is longer.

For reason code 2 on SHRLEVEL CHANGE, attempt a new invocation of reorganization later, perhaps when you expect to have a longer time available, you expect that the application workload is lower, or you expect that the maximum desired amount of time for applications to have read-only access is longer. For reason code 2 on SHRLEVEL REFERENCE, attempt a new invocation of reorganization later, perhaps when you expect to have a longer time available.

DSNU375I *csect-name* DISCARD PHASE STATISTICS - *nnn* INPUT DATA SET RECORDS DISCARDED

Explanation: Input data set records were rejected by the LOAD utility for one or several reasons. The rejected records have been placed in a discards data set. The number of records rejected is '*nnn*'. Message DSNU399I summarizes the errors causing the records to be rejected.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Examine the LOAD error summary and decide which of the discarded records, if any, should be corrected and reapplied to the table space.

DSNU376I *csect-name* DISCARD PHASE COMPLETE, ELAPSED TIME = *hh/mm/ss*

Explanation: The DISCARD phase of the LOAD utility has completed normally. The elapsed time for the execution was '*hh*' hours, '*mm*' minutes, and '*ss*' seconds.

Severity: 0 (informational)

DSNU377I *csect-name* - IN REORG WITH SHRLEVEL CHANGE, THE LOG IS BECOMING LONG, MEMBER=*member-name*, UTILID=*utilid*

Explanation: During log processing for REORG with SHRLEVEL CHANGE, the number of log records that the next iteration will process is not sufficiently lower than the number that the previous iterations processed. This situation means that during reorganization, the log is not being read quickly enough to catch up to the application writing the log. This is a WTO message; it is sent to the console, but it is not an action message. It is also sent to SYSPRINT.

DB2 refrains from taking the action specified in the LONGLOG phrase if any one of the following events occurs for this execution of REORG before the delay expires:

- An -ALTER UTILITY command is issued.
- A -TERM UTILITY command is issued.
- DB2 estimates that the time to perform the next iteration will be less than or equal to the time specified in the MAXRO phrase.
- REORG terminates for any reason (including the deadline).

member-name Identifies the DB2 member in a data sharing environment. Blank in a non-data-sharing environment.

utilid Identifies the utility job step.

Severity: 4 (warning)

System Action: After a delay (specified by the DELAY phrase of the REORG utility or the -ALTER UTILITY command), REORG performs the action specified by the LONGLOG phrase of the REORG utility or the -ALTER UTILITY command.

User Response: No action is required. However, if the action specified by the LONGLOG phrase is not desired, the operator (or a user-written program that is triggered by the message) can take an action. For a list of possible actions, see the description of LONGLOG in the REORG section of *Utility Guide and Reference*.

Operator Response: No action is required. However, if the action specified by the LONGLOG phrase is not desired, the operator (or a user-written program that is triggered by the message) can take an action. For a list of possible actions, see the description of LONGLOG in the REORG section of *Utility Guide and Reference*.

DSNU378I *csect-name* - REORG WITH SHRLEVEL NONE HAS INAPPROPRIATE NOSYSREC KEYWORD, REASON=c

Explanation: REORG with SHRLEVEL NONE allows the following combinations of the SORTDATA and NOSYSREC keywords:

- Neither keyword
- SORTDATA alone (without NOSYSREC)
- SORTDATA NOSYSREC

These combinations do not trigger this message. However, NOSYSREC alone (without SORTDATA) is inappropriate and does trigger this message, with a reason code of 1.

Also, for REORG with SHRLEVEL NONE, if you specify UNLOAD PAUSE or UNLOAD ONLY, NOSYSREC is inappropriate and triggers this message with a reason code of 2. If the two conditions (omission of SORTDATA and inclusion of

UNLOAD PAUSE or ONLY) are both true, NOSYSREC triggers this message with a reason code of 2.

Severity: 8 (error)

System Action: REORG does not execute.

User Response: Specify an invocation of REORG with appropriate parameters. Specifically, for reason code 1, if you want to execute REORG with SHRLEVEL NONE, add SORTDATA and/or remove NOSYSREC. For reason code 2, if you want to execute REORG with SHRLEVEL NONE, remove NOSYSREC, UNLOAD PAUSE, or UNLOAD ONLY.

DSNU379I *csect-name* - ALTER UTILITY, UTILID = *utilid*:
**SWITCH PHASE IN REORG HAS ALREADY
 STARTED, NO ALTER IS PERFORMED**

Explanation: The -ALTER UTILITY command was applied to a job that is executing REORG with SHRLEVEL REFERENCE or CHANGE. However, nothing was altered, because REORG had already started its switch phase.

Severity: 4 (warning)

System Action: ALTER UTILITY has no effect.

DSNU380I *csect-name* **TABLESPACE** *database.tablespace-name* **PARTITION** *part-num* **IS IN COPY
 PENDING**

Explanation: An image copy is required to establish a new base from which the table space partition can be recovered. Otherwise, the results of running the RECOVER utility on that table space partition are unpredictable.

If the RECOVER TABLESPACE utility with the keyword TOCOPY is being used, the START_RBA or START_LRSN value of the associated full image copy might be outside the available recovery information. To verify this, look at the REPORT utility output. The RECOVER TABLESPACE utility will process the TOCOPY keyword and put the recovering object in copy pending status.

Severity: 4 (warning)

User Response: Take an image copy of the associated table space partition. If the message was issued after the COPY utility failed, correct all specified errors for the associated table space before attempting another image copy of that table space.

DSNU381I *csect-name* **TABLESPACE** *database.tablespace-name* **IS IN COPY PENDING**

Explanation: This message is issued after:

- A LOAD or REORG utility with the LOG(NO) option left the associated table space in an unrecoverable state.
- An image copy failed because broken pages were detected or an image copy was terminated.
- A partial recovery finished successfully.
- A MODIFY RECOVERY left the associated table space in an unrecoverable state.

If the RECOVER TABLESPACE utility with keyword TOCOPY is being used, the START_RBA or START_LRSN value of the associated full image copy might be outside the available recovery information. To verify this, look at the REPORT utility output. The RECOVER TABLESPACE utility will process the TOCOPY

keyword and put the recovering object in copy pending status.

An image copy is required to establish a new base from which the table space can be recovered. Otherwise, the results of running the RECOVER utility on that table space are unpredictable.

Severity: 4 (warning)

User Response: Take an image copy of the associated table space. If the message was issued after the COPY utility failed, correct all specified errors for the associated table space before attempting another image copy on that table space.

DSNU382I *csect-name* - REORG UTILITY, UTILID = *utilid*
REQUESTED TO ALTER, PHASE = *utility-phase*

Explanation: This message is issued in response to an -ALTER UTILITY command. It acknowledges that the request for alteration was received and verified. At the time the -ALTER UTILITY request was received, REORG was in the utility job step identified by UTILID *utilid*.

Severity: 0 (informational)

System Action: DB2 has accepted the request to alter the indicated utility job step. The utility alters its parameter values.

User Response: This message is an acknowledgement that the request has been accepted and is in progress.

DSNU383I *csect-name* **CURRENT ITERATION NUMBER =
 nnnnnn WRITE ACCESS ALLOWED IN
 CURRENT ITERATION = *www* ITERATION
 BEFORE PREVIOUS ITERATION: ELAPSED
 TIME = *ha:ma:sa* NUMBER OF LOG RECORDS
 PROCESSED = *nnnnna* PREVIOUS ITERATION:
 ELAPSED TIME = *hb:mb:sb* NUMBER OF
 LOG RECORDS PROCESSED = *nnnnnb*
 CURRENT ITERATION: ESTIMATED
 ELAPSED TIME = *hc:mc:sc* ACTUAL
 ELAPSED TIME SO FAR = *hd:md:sd* ACTUAL
 NUMBER OF LOG RECORDS BEING PROC-
 ESSED = *nnnnnd* CURRENT ESTIMATE FOR
 NEXT ITERATION: ELAPSED TIME =
he:me:se NUMBER OF LOG RECORDS TO BE
 PROCESSED = *nnnnne***

Explanation: This message applies only during the LOG phase of REORG with SHRLEVEL CHANGE. It supplements message DSNU105I which can appear in any phase (including the LOG phase).

This message is issued in response to a -DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL REFERENCE or CHANGE and DB2 estimates that the switch phase will not start by the deadline specified by the DEADLINE phrase. This message provides the user with an estimate of how far the REORG utility has proceeded in the indicated utility job step.

<i>nnnnnn</i>	The current iteration number
<i>www</i>	'YES' or 'NO' according to whether write access is allowed in the current iteration of log processing

For the iteration before the previous iteration:

<i>ha:ma:sa</i>	The elapsed time for the iteration
-----------------	------------------------------------

nnnnna The number of log records processed in the iteration.

These values are 00:00:00 and 0 if the current iteration number is 1 or 2.

For the previous iteration:

hb:mb:sb The corresponding information.

nnnnnb The corresponding information.

These values are 00:00:00 and 0 if the current iteration number is 1.

For the current iteration:

hc:mc:sc The estimated elapsed time

hd:md:sd The elapsed time so far

nnnnnd The actual number of log records being processed

For the next iteration:

he:me:se The currently estimated elapsed time

nnnnne The currently estimated number of log records to be processed

Severity: 0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 estimated that the switch phase would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. A subsequent -DISPLAY UTILITY command reflects that processing.

DSNU384I *csect-name* - **MAXRO = aaaaaaaaaa SECONDS
LONGLOG = //IIIIII DELAY = bbbbbbbbbb
SECONDS**

Explanation: This message applies only to REORG with SHRLEVEL CHANGE. It supplements message DSNU105I, which can appear for any utility (including REORG).

This message is issued in response to a -DISPLAY UTILITY command.

It is also issued by the REORG utility if the user specified SHRLEVEL CHANGE and DB2 estimates that the switch phase will not start by the deadline specified by the DEADLINE phrase.

This message indicates the most recently specified values of certain parameters to REORG. For each such parameter, a previous invocation of the -ALTER UTILITY command might have specified a value. If no previous invocation of -ALTER UTILITY has specified a value, the most recently specified value is the value that was specified with the invocation of the REORG utility.

aaaaaaaaaa A number of seconds, according to the most recently specified value of MAXRO. A value of "DEFER" denotes that the log file will be deferred indefinitely.

IIIIII "CONTINUE," "TERM," or "DRAIN" according to the most recently specified value of LONGLOG

bbbbbbbbb A number of seconds, according to the most recently specified value of DELAY

Severity: 0 (informational)

System Action: The message reflects the state of DB2 at the time of the -DISPLAY UTILITY command or the time when DB2 estimated that the switch phase would not start by the deadline specified by the DEADLINE phrase.

If this message was issued for -DISPLAY UTILITY, the system continues processing. If an -ALTER UTILITY command is then executed, a subsequent -DISPLAY UTILITY command reflects the results (if any) of the -ALTER UTILITY command.

DSNU385I *csect-name* - **LOG PHASE COMPLETE,
ELAPSED TIME = hh/mm/ss**

Explanation: This message is issued at the normal completion of the LOG phase of the REORG utility. The time that has elapsed between the beginning and the completion of this phase was:

hh hours
mm minutes
ss seconds

Severity: 0 (informational)

System Action: Processing continues to the next phase of the REORG utility.

DSNU386I *csect-name* - **LOG PHASE STATISTICS.
NUMBER OF ITERATIONS = iiiiii, NUMBER OF
LOG RECORDS = rrrrrrr**

Explanation: This message is issued at the normal completion of the LOG phase of the REORG utility.

iiiiiii The number of iterations of log processing that were performed. This number includes one or more iterations during which applications have read/write access plus one final iteration during which applications have read-only access.

rrrrrrr The number of log records that were read.

Application of some of these log records might be unnecessary. Therefore, the LOG phase might apply only a subset of these log records to the shadow copy of the table space or partition.

Severity: 0 (informational)

System Action: The LOG phase of the REORG utility is completed.

DSNU387I *csect-name* - **SWITCH PHASE COMPLETE,
ELAPSED TIME = hh/mm/ss**

Explanation: This message is issued at the normal completion of the switch phase of the REORG utility. The time that has elapsed between the beginning and the completion of this phase was:

hh hours
mm minutes
ss seconds

Severity: 0 (informational)

System Action: Processing continues to the next phase of the REORG utility.

DSNU388I *csect-name* - BUILD2 PHASE COMPLETE, ELAPSED TIME = hh/mm/ss

Explanation: This message is issued at the normal completion of the BUILD2 phase of the REORG utility. The time that has elapsed between the beginning and the completion of this phase was:

hh hours
mm minutes
ss seconds

Severity: 0 (informational)

System Action: Processing continues to the next utility statement in the utility job step, if any.

DSNU389I *csect-name* - BUILD2 PHASE STATISTICS. NUMBER OF NONPARTITIONED INDEXES = mmm

Explanation: This message is issued at the normal completion of the BUILD2 phase of the REORG utility.

mmm The number of nonpartitioned indexes whose RIDs were corrected.

Severity: 0 (informational)

System Action: The BUILD2 phase of the REORG utility is completed.

DSNU390I *csect-name* INVALID CONVERSION FOR FIELD ccccccc

Explanation: The input field type for column, 'ccccccc', is incompatible with its data type (as found in the catalog).

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Correct the error, and resubmit the job. Refer to *Utility Guide and Reference* for compatible data types.

DSNU396I *csect-name* REPORT PHASE COMPLETE, ELAPSED TIME = hh/mm/ss

Explanation: The REPORT phase of the LOAD utility has completed normally. The elapsed time for the execution was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)

DSNU398I *csect-name* UNEXPECTED PROCESSING ERROR, REASON=X00E40318, ON TABLE tttttt

Explanation: When attempting to load a record into table 'tttttt', an error was encountered. Refer to "Section 4. DB2 Codes" on page 4-1 for an explanation of reason code '00E40318'.

Severity: 8 (error)

System Action: If the error was caused by a resource not being available, a DSNT500I message is issued.

The utility step is abended with a system X'04E' with an abend reason code of '00E40318'. If a DSNT500I message is not issued, an SVC dump is requested. A SYSABEND dump of batch storage is also requested.

The utility step is left in the stopped state.

User Response: If a DSNT500I message was issued, refer to its description under that message number in this manual. If the unavailable resource becomes available, the utility step is restartable.

If a DSNT500I message is not issued, the error is an internal error. Notify the system programmer.

Operator Response: An operator with SYSOPR authority can issue a TERM UTIL to free any held resources (this may not be necessary).

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU399I *csect-name* - LOAD UTILITY ERROR SUMMARY REPORT

Explanation: This message summarizes errors detected during the load job. Figure 7 shows the format of the report. It is issued only if unique index or referential constraint violations were detected.

ERROR SEVERITY	INPUT RECORD	Discard Heading	ERROR TYPE	TABLE NAME	FIELD/FANSET NAME	RELATED ERROR
sev	idsrn	ddsrn	type	name1	name2	idsrn2
.

Figure 7. LOAD Utility Error Summary Report

The report contains one line for each error. The errors are listed first by error severity and within that by *idsrn*.

The *Discard Heading* is either DISCARD RECORD or blank, depending on whether discard processing is in effect.

The report fields have the following meanings:

sev The severity of the error reported on this line:

Severity	Type of Error	Explanation
1	Primary	Primary referential integrity errors and all nonreferential integrity errors.
2	Secondary	Secondary referential integrity errors (that is, errors that result from a primary referential integrity error in an ancestor).

idsrn The relative record number in the input data set of the record causing the error reported on this line.

ddsrn The relative record number in the input data set of the record causing the error reported on this line, if discard processing is in effect. Otherwise, *ddsrn* is blank.

type A description of the type of error reported on this line, as follows:

- Conversion
- Field specification
- Validation
- Part Specification
- Unexpected
- Column specification
- Referential integrity
- Check constraint
- Duplicate key.

name1 The name of the table for which the record causing the error was targeted, if this information is pertinent for the type of error reported on this line. Oth-

otherwise, *name1* is blank. This field has nonblank values for the following error types:

- Conversion
- Validation
- Column specification
- Referential integrity (primary).
- Check constraint

name2 The name of the field or fanset involved in the error reported on this line, if this information is pertinent for the type of error reported. Otherwise, *name2* is blank. This field contains a field name for the following types of errors:

- Conversion
- Field specification
- Column specification.

For primary referential integrity errors, *name2* is a relationship name. For check constraint errors, *name2* is a check constraint name.

idsrn2 The input data set record number of a related error. For duplicate key errors, it gives the input data set record number of the record whose key is duplicated. For secondary referential integrity errors, it gives the input data set record number of the record whose primary referential integrity error cascaded to cause this secondary error. For other types of errors, this field is unused.

Severity: 4 (warning)

System Action: Processing continues.

DSNU400I *csect-name* **IMAGE COPY COMPLETE.**
NUMBER OF PAGES=nnnnnn, AVERAGE
PERCENT FREE SPACE PER PAGE = ff.ff,
PERCENT OF CHANGED PAGES = pp.pp,
ELAPSED TIME= hh/mm/ss

Explanation: This message is issued in response to the normal completion of the image copy (COPY) utility. It can also be issued from LOAD or REORG if a full image copy has been requested during a table space load or reorganization. The statistics apply to pages included in the scope of the COPY request. This can either be a full table space (DSNUM(ALL)) or a partition of a table space (DSNUM(integer)). All the pages in the table space or partition can be copied (FULL(YES)), or only the changed pages can be copied (FULL(NO)). The message variables are:

ff.ff The average percentage of free space within the copied pages. This indicates the amount of change activity that can occur without significant impairment of reference performance.

nnnnnn The number of pages written out.

 Image copies produced during LOAD or REORG will have more pages written than a full image copy produced by running the COPY utility on the same table space, because some pages will be written more than once.

pp.pp The percentage of changed pages. This indicates the amount of change activity that occurred since the last image copy or reorganization. The percentage of changed pages is obtained by dividing the number of changed pages by the number of pages in the table space. Preformatted pages consisting of all zeros are included

in the count of pages scanned. Since these preformatted pages are not copied to the output data set, the number of pages scanned is usually larger than the number of pages copied.

When this message is issued for image copies produced during LOAD or REORG, this percentage will always be reported as 100%, because the utility is resetting and reformatting the entire table space.

Counters are valid up to four billion.

System Action: The COPY, LOAD or REORG utility completed normally. Processing continues to the next utility statement in the utility job step. If there are no more utility statements, the utility job step terminates normally, and the resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

User Response: Reported statistics could suggest that either a RUNSTATS or REORG utility should be run on the table space.

DSNU401I *csect-name* **CONCURRENT COPY COMPLETE,**
ELAPSED TIME= hh:mm:ss

Explanation: The DFSMS Concurrent Copy utility completed normally.

Severity: 0 (informational)

System Action: Processing continues to the next utility statement in the utility job step. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior availability state. The utility identifier (UTILID) of the utility job step becomes available for reuse.

User Response: No action is required.

DSNU402I *csect-name* **INCREMENTAL IMAGE COPY DIS-**
ALLOWED FOR REQUESTED TABLESPACE,
FULL IMAGE COPY WILL BE TAKEN

Explanation: An incremental image copy for a table space or data set was requested. However, a full image copy is required. Possible reasons include:

- The request was for one of the DB2-maintained table spaces DSNDDB01.DBD01, DSNDDB06.SYSCOPY, or DSNDDB01.SYSUTILX.
- A LOAD or REORG utility was run on the table space or data set with no subsequent full image copy.
- No full image copy was found for the requested sites.
- Copy pending status was set for the requested table space or data set.
- The request was for an entire table space, but the most recent image copy for the table space is on the data set level.
- The previous image copy is a DFSMS concurrent copy.

The request for an incremental image copy is ignored, and a full image copy is taken.

Severity: 4 (warning)

System Action: The request to take an incremental image copy is treated as a request to take a full image copy.

User Response: The capacity of the target image copy data set might not be sufficient if its size was established assuming

an incremental image copy. If this condition occurs, terminate and then resubmit the job step.

DSNU403I *csect-name* - FULL AND INCREMENTAL COPIES OF THE SAME TABLESPACE ON THE SAME TAPE DISALLOWED DDNAME *ddname*

Explanation: The COPY utility has been invoked to take an incremental image copy of a TABLESPACE. The specified output data set is on a tape which contains another FULL or INCREMENTAL image copy of the same TABLESPACE. This is not allowed.

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8, and will not take the image copy or update the SYSCOPY table.

User Response: Change the VOLSER for the image copy output data set or use the MODIFY RECOVERY utility to delete SYSIBM.SYSCOPY records which are no longer needed for the same TABLESPACE and tape volume.

Problem Determination: Use the SQL SELECT command to look at the SYSIBM.SYSCOPY table. If the conflicting image copy data sets on the output tape are no longer needed, use MODIFY RECOVERY to eliminate the related SYSIBM.SYSCOPY records. If the data sets are still needed, you must place the new image copy on a different tape or you must take a FULL image copy.

DSNU404I *csect-name* LOCAL SITE AND RECOVERY SITE INCREMENTAL IMAGE COPIES ARE NOT SYNCHRONIZED

Explanation: No incremental image copy can be made if

1. The incremental image copy is requested only for a site other than the current site.
2. The incremental image copies are requested for both sites but the most recent full image copy was made only for the current site.
3. The incremental image copies are requested for both sites and the most recent full image copies were made for both sites, but between the most recent full image copy and current request, all incremental image copies were made for current site only.

Severity: 8(error)

System Action: The utility will terminate with a return code of 8, and will not take the image copy or update the SYSCOPY table.

User Response: Take another full image copy of the TABLESPACE for both LOCAL site and RECOVERY site or change the request to make incremental image copy only for current site.

DSNU406I FULL IMAGE COPY SHOULD BE TAKEN FOR BOTH LOCAL SITE AND RECOVERY SITE.

Explanation: The requested full image is for one site only but history shows that there were image copies taken for both local site and recovery site and the table space is in copy pending status, or point in time recover has been done on the table space, or the table space is in copy pending status and the requested full image copy is for a site other than the current site. Be aware of the following situations:

1. If the requested copy is made for current site, then the other site can only do point in time recovery.
2. If the requested copy is for the site other than the current site, then the TABLESPACE will be in the same state as before COPY has been made.

Severity: 4 (warning)

System Action: COPY, LOAD, or REORG utility will continue to process the image copy.

User Response: Take another full image copy of the TABLESPACE for both LOCAL site and RECOVERY site to guarantee the correct recovery on both sites or check DSNZPARM to ensure that the current site is the site at which the image copy is being taken.

DSNU407I *csect-name* - DATA SET ALREADY USED FOR PREVIOUS IMAGE COPY

Explanation: A COPY, LOAD, or REORG utility has been invoked to take an image copy to a data set which is a duplicate of one already recorded in SYSCOPY. If the specified data set is cataloged, a matching DSNAME exists. If the specified data set is not cataloged, a matching DSNAME, DSVOLSER, and FILESEQNO exists.

Severity: 8 (error)

System Action: The utility will terminate with a return code of 8, and will not take the image copy or update the SYSCOPY table.

User Response: Change the name of the data set or use MODIFY utility to delete the old SYSCOPY record containing the duplicate data set.

DSNU408I *csect-name* - *dsn* EXISTS WITH -VOLUME=*vol*, FILE SEQUENCE-NUMBER=*fseq*, RBA=*rba*|*lrsn*, DATE=*date*, TIME=*time*

Explanation: If this message is issued after DSNU403I, it provides information from the SYSCOPY catalog table about the previously created image copy of the table space. If this message is issued after DSNU407I, it provides information from the SYSCOPY table about the duplicate data set that was detected during image copy processing.

For copies to DASD or MSS, *fseq* is 0; for copies of cataloged data sets, *vol* is (CATG).

Severity: 8 (error)

System Action: The utility terminates with return code 8 and does not take the image copy or update the SYSCOPY table.

User Response: Use the information provided to change the name of the data set or to locate the duplicate SYSCOPY record for deletion with the MODIFY RECOVERY utility.

DSNU409I *csect-name* NO hardware-or-software SUPPORT FOR TABLE SPACE *database-name.tablespace-name* DSNUM *dsnum*

Explanation: This message is issued by the COPY or RECOVER utility for one of the following reasons.

- The COPY utility was invoked to take a DFSMS concurrent copy of a table space that resides on a device with no hardware or software support for the DFSMSdss DUMP command with the CONCURRENT option.
- The RECOVER utility invoked the DFSMSdss RESTORE command without the supporting software.

If the object is an entire table space, 'DSNUM *dsnum*' is not displayed.

Severity: 4 (for RECOVER) or 8 (for COPY)

System Action: The RECOVER utility falls back to the previous image copy data set and continues. The COPY utility job terminates.

User Response: If a list of table spaces is specified in the COPY job, remove the table space that has no hardware or software support from the list. Resubmit the job or use the DB2 COPY utility instead of the DFSMS Concurrent Copy utility.

DSNU410I *csect-name* **TABLESPACE OR DATA SET CONTAINED NO CHANGED PAGES**

Explanation: An incremental image copy (COPY option FULL(NO)), which copies only changed pages, was requested. However, no changed pages were found.

Severity: 4 (warning)

This message reflects a warning condition that did not prevent subsequent processing.

System Action: This message indicates normal completion of the image copy utility. Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

Because no output was produced, the SYSIBM.SYSCOPY catalog table remains unchanged.

The requester may want to determine why the apparent assumption that a change occurred was not true.

Operator Response: The target copy data set identified by the DD statement nominated by the COPY COPYDDN option was not required. It was not tracked in the DB2 catalog table SYSIBM.SYSCOPY. It need not be kept for subsequent re-call.

DSNU411I *csect-name* **UNABLE TO LOGICALLY COMPLETE TABLE SPACE** *database-name.tablespace-name* **DSNUM** *dsnum*, **RETURN CODE** *return-code* **REASON CODE** *reason-code*

Explanation: The DFSMSdss DUMP command with the CONCURRENT option encountered an error during the initialization of the target object being copied. The return code and reason code are from the DFSMSdss DUMP command.

If the object is an entire table space, 'DSNUM *dsnum*' is not displayed.

Severity: 8

System Action: The utility job terminates.

User Response: See the return code and reason code in *DFSMS/MVS: Administration Reference for DFSMSdss* to determine the problem. Resubmit the job after resolving the problem.

DSNU412I *csect-name* **UNABLE TO PHYSICALLY COMPLETE TABLE SPACE** *database-name.tablespace-name* **DSNUM** *dsnum*, **RETURN CODE** *return-code*

Explanation: The DFSMSdss DUMP command with the CONCURRENT option encountered an error during the backup process. The return code is from the DFSMSdss DUMP command.

If the object is an entire table space, 'DSNUM *dsnum*' is not displayed.

Severity: 8

System Action: The utility job terminates.

User Response: See the return code description in *DFSMS/MVS: Administration Reference for DFSMSdss* to determine the problem. Resubmit the job after resolving the problem, or use the DB2 Copy utility instead of the DFSMS Concurrent Copy utility for the failed table space.

DSNU413I *csect-name* - **CONCURRENT COPY SUCCESSFUL FOR TABLE SPACE** *database-name.tablespace-name* **DSNUM** *dsnum*

Explanation: The DFSMS Concurrent Copy utility completed normally for the named object. This message is repeated for every copied table space in the list.

If the object is an entire table space, 'DSNUM *dsnum*' is not displayed.

Severity: 0 (informational)

System Action: Processing continues to the next object in the list. If there are no more objects, the utility ends normally with message DSNU401I.

User Response: No action is required.

DSNU414I *csect-name* **UNABLE TO RETRIEVE LRSN FOR TABLE SPACE** *database-name.tablespace-name* **DSNUM** *dsnum*

Explanation: This message is issued by the DB2 COPY utility when an error is encountered during the retrieval of a log record sequence number (LRSN).

This error can occur in these situations:

- Another DB2 in a data sharing group terminated abnormally while trying to update the table space.
- A failure occurred while trying to communicate with other DB2s in the data sharing group.

If the object is an entire table space, 'DSNUM *dsnum*' is not displayed.

Severity: 8

System Action: The utility job terminates.

User Response: Issue a -DISPLAY DATABASE command with the USE option to determine if any other DB2 systems hold a retained lock on the table space (status = RSTRT). If so, you must restart that DB2 system before the COPY job can be successfully run.

DSNU415I *csect-name* **INVALID OUTPUT BLOCK SIZE SPECIFIED DDNAME** *ddname*

Explanation: Valid block sizes for an image copy or mergecopy data set are multiples of 4KB and less than the device limitation.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Correct the JCL statement, or use the default. Resubmit the request in a new utility job step. Refer to *Utility Guide and Reference* for a discussion of image copy and work data set constraints.

DSNU416I *csect-name* **THE OUTPUT IMAGE COPY DATA SET CANNOT BE PARTITIONED. DDNAME** *ddname*

Explanation: The use of partitioned image copy data sets is restricted. The COPY, MERGECOPY, LOAD, or REORG utility job that was submitted has a partitioned output image copy data set, specified by the COPYDDN ddname or RECOVERYDDN ddname parameter.

Severity: 8 (error)

System Action: Utility processing is terminated. The image copy will not be taken or the merge will not be done, and the SYSIBM.SYSCOPY table will not be updated.

User Response: Correct the utility job by specifying a non-partitioned data set as the output image copy data set.

DSNU417I *csect-name* **THE NUMBER OF VOLUMES USED BY THE IMAGE COPY DATA SET** *data-set-name* **HAS REACHED THE LIMIT**

Explanation: The image copy data set reached the limit of 255 volumes and another volume is required.

Severity: 8 (error)

System Action: The utility job is terminated.

User Response: You might want to use the DSNUM option of the COPY utility to identify a partition or data set within the table space to be copied, or specify a partition number to be loaded or reorganized if the copy is being produced from a LOAD or REORG. Refer to *Utility Guide and Reference* for a description of the COPY utility and the DSNUM option, and descriptions of the LOAD and REORG utilities and the PART option.

DSNU418I *csect-name* **DATA SET LEVEL IMAGE COPY DISALLOWED FOR REQUESTED TABLE SPACE**

Explanation: An image copy at the data set level was requested. However, it is not allowed for one of the following reasons:

- The table space is in copy pending status.
- The table space is not suitable for image copy at the data set level.

A copy of the entire table space is required.

Severity: 8 (error)

System Action: The COPY utility completes unsuccessfully with return code 8.

System Programmer Response: You must take a full image copy of the entire table space by specifying the DSNUM ALL option with the COPY utility.

DSNU419I *csect-name* **UTILITY CANNOT PROCESS A TABLE SPACE WITH MIXED SPECIFIC AND NONSPECIFIC VOLUME IDS.**

Explanation: The requested table space is defined using a DB2 storage group with the mixed specific and nonspecific volume IDs. A specific volume ID is represented by a string with a maximum of 6 characters. A nonspecific volume ID is represented by an asterisk (*).

Severity: 8 (error)

System Action: The utility completes unsuccessfully with return code 8.

System Programmer Response: Use the ALTER STOGROUP command to change the storage group to contain only specific or nonspecific volume IDs and rerun the job.

DSNU420I *csect-name* **INCORRECT SHARE LEVEL SPECIFIED FOR TABLE SPACE** *database-name.tablespace-name* **DSNUM** *dsnum*

Explanation: When copying a table space that is not recoverable, the share level (SHRLEVEL) must be REFERENCE.

If the object is an entire table space, 'DSNUM *dsnum*' is not displayed.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Correct the SHRLEVEL to REFERENCE, and resubmit the COPY utility in a new utility job step. Refer to *Utility Guide and Reference* for a discussion of COPY utility constraints.

DSNU421I *csect-name* **START OF DFSMS MESSAGES**

Explanation: This message indicates the beginning of the DFSMS messages; DSNU422I indicates the end.

System Action: No action is required, but subsequent DFSMS messages might require action. See the DFSMS message manual.

DSNU422I *csect-name* **END OF DFSMS MESSAGES**

Explanation: This message indicates the end of the DFSMS messages; DSNU421I indicates the beginning.

System Action: No action is required, but preceding DFSMS messages might require action. See the DFSMS message manual.

DSNU423I *csect name* **CANNOT TAKE CONCURRENT COPY WITH SHRLEVEL CHANGE OPTION FOR TABLE SPACE WITH 32K PAGE SIZE**

Explanation: The DFSMS Concurrent Copy utility is serialized at the extent level. The 32KB page size might span more than one extent. This might cause the output data set to contain inconsistent data.

Severity: 8 (error)

System Action: The COPY utility completes unsuccessfully with return code 8.

System Programmer Response: You must take a concurrent copy with the SHRLEVEL REFERENCE option or a DB2 image copy if you prefer the SHRLEVEL CHANGE option.

DSNU424I *csect-name* **INCOMPATIBLE MAINTENANCE DETECTED. REFERENCE APAR NUMBER**
apar **DO THE FOLLOWING:**

Explanation: This message indicates that there is a maintenance incompatibility detected across restart. This message is followed by the actions the user should take to resolve the incompatibility.

apar The number of the APAR with closing text that describes the incompatibility.

System Action: Utility execution is abended.

User Response: Refer to the action text in the message.

System Programmer Response: Refer to the APAR closing text.

DSNU440I

Explanation: This message gives statistical information about the results of running the COPY utility. It applies to a table space, partition, or data set, and is based on the information in the space page map at the time the utility is executed. The output contains the following information:

DBNAME	The name of the database to which the table space belongs.
TSNAME	The table space specified in the utility statement.
DSNUM	The partition or data set number of the table space. The value is ALL if information is about the entire table space.
4KB or 32KB PAGES	The total number of 4KB or 32KB pages in the partition, data set, or entire table space. This value includes preformatted pages that contain all zeroes.
EMPTY PAGES	The total number of empty pages in the data set of the segmented table space, or entire segmented table space. Empty pages can result from deletes, or are pages that are not yet formatted. They are not copied by the utility.
CHANGED	The number of pages in the partition, data set, or table space that were changed since the last time an image copy was created. If an incremental image copy is taken, this value is the number of pages that are copied.
PERCENT CHANGED	The percent of changed pages in the table space, data set, or partition specified.
ICTYPE	The type of image copy recommended for the partition, data set, or table space specified. ICTYPE is based on the comparison between the percent of changed pages and the change limit values. ICTYPE values:
I	If the percent of changed pages is greater or equal to the low CHANGELIMIT value and less

F	If the percent of changed pages is equal to or greater than the high CHANGELIMIT value. A full image copy is recommended, and COPY takes one if the REPORTONLY option is not specified.
NONE	If no pages were changed. An image copy is not recommended, and COPY does not take one.
blank	For the partition or data set if DSNUM ALL is specified, or if CONCURRENT is specified and the percent of changed pages is less than the CHANGELIMIT value.

Severity: 0 (informational)

System Action: Utility processing continues

User Response: If the message indicates, "INFORMATION CANNOT BE DETERMINED" for a table space, partition, or data set, examine the utility output for the DSNU441I message which lists the page numbers of the broken pages. See message DSNU441I for further instructions on repairing pages.

DSNU441I *csect-name* **BROKEN PAGE FOUND DBNAME = dbname TSNAME = tsname DSNUM = dsnum PAGE = page**

Explanation: The COPY utility found a broken space map page.

dbname	The name of the database to which the table space belongs.
tsname	The table space containing the broken page.
dsnum	The partition or data set number of the table space containing the broken page.
page	The hexadecimal page number of the broken page.

Severity: 8 (error)

System Action: Utility execution continues.

User Response: The data sets identified are in an indeterminate state. Use RECOVER, RECOVER PAGE, or the REPAIR utility to correct the broken page. Refer to Section 3 of *Diagnosis Guide and Reference*.

DSNU443I *csect-name type* **CHANGE LIMIT MET**

Explanation: The COPY utility is indicating whether the percent of changed pages in the specified table space, partition, or data set meets the CHANGELIMIT values. *type* values:

NO	If no CHANGELIMIT met.
INCREMENTAL	If the percent of changed pages is greater than the low CHANGELIMIT value and less than the high CHANGELIMIT value.

FULL If the percent of changed pages is greater than or equal to the high CHANGELIMIT value.

Severity: The return codes are:

- 1 (informational) If no CHANGELIMIT was met.
- 2 (informational) If the percent of changed pages is greater than the low CHANGELIMIT and less than the high CHANGELIMIT value.
- 3 (informational) If the percent of changed pages is greater than or equal to the high CHANGELIMIT value.

System Action: Utility processing continues.

User Response: If the REPORTONLY option is specified and the result of this job step is not used to conditionally execute other job steps, examine the utility messages for this table space, partition, or data set to determine if it has changed to such a degree that an image copy or other step should be performed.

DSNU445I csect-name ictype IMAGE COPY WILL BE TAKEN

Explanation: The COPY utility is indicating whether the percent of changed pages in the table space meets the change limit value, and whether an image copy will be taken. *ictype* values:

- NO If no CHANGELIMIT value met.
- INCREMENTAL If the percent of changed pages is greater than the low CHANGELIMIT value and less than the high CHANGELIMIT value.
- FULL If the percent of changed pages is greater than or equal to the high CHANGELIMIT value.

Severity: 0 (informational)

System Action: Utility processing continues. An image copy is taken if a change limit is met. If the low CHANGELIMIT value is met, then an incremental copy is taken. If the high CHANGELIMIT value is met, then a full image copy is taken.

DSNU446I csect-name - CHANGELIMIT REPORT INFORMATION UNAVAILABLE FOR REQUESTED TABLE SPACE, A FULL IMAGE COPY MUST BE TAKEN

Explanation: The changelimit dataset statistical information was requested, but is unavailable. A full image copy is required. Possible reasons are as follows:

- The request was for one of the DB2-maintained table spaces: DSNDDB01.DBD01, DSNDDB06.SYSCOPY, or DSNDDB01.SYSUTILX.
- A LOAD or REORG utility was run on the table space or data set with no subsequent full image copy.
- No full image copy was found for the requested sites.
- Copy pending status was set for the requested table space or data set.
- The request was for an entire table space, but the most recent image copy for the table space is on the data set level.
- The previous image copy is a DFSMS concurrent copy.

The statistical information report will not be generated. If REPORTONLY was omitted, then a FULL image copy is taken.

Severity: 4 (warning)

System Action: The request for CHANGELIMIT without REPORTONLY is treated as a request to take a full image copy. The request for CHANGELIMIT with REPORTONLY will not generate the report.

User Response: If REPORTONLY is specified, then submit a job to take a full image copy.

DSNU454I csect-name COPY MERGE COMPLETE. NUMBER OF COPIES = *iiii*, NUMBER OF COPIES MERGED = *ccccc*, TOTAL NUMBER OF PAGES MERGED = *ttttt*, ELAPSED TIME = *hh/mm/ss*

Explanation: This message marks the normal completion of the MERGECOPY utility. The variables are:

- iiii* The number of copies found.
- ccccc* The number of image copies that were merged. The number merged can be less than the number found if a work data set was not specified using the MERGECOPY WORKDDN option.
- ttttt* The total number of pages that were merged.

The merged incremental copies were consolidated either into a single new incremental image copy or into a new full image copy, depending upon the MERGECOPY NEWCOPY option. The DB2 catalog table SYSIBM.SYSCOPY was updated to reflect the results.

This message may indicate that prior data set entries were deleted and, consequently, that backup data set resources were freed.

Severity: 0/4 (informational/warning)

System Action: Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

User Response: You can review the reported statistics to assess the effectiveness of performing incremental image copies. You can examine the SYSIBM.SYSCOPY catalog table to review the incremental and full image copies that are subject to DB2 recovery.

The full or incremental image copy data set identified by the DD statement specified in the COPYDDN option was recorded in SYSIBM.SYSCOPY. DB2 assumes that the image copy data set is now available for subsequent recovery. Ensure that the data set is available for recovery.

DSNU458I csect-name NO IMAGE COPIES TO MERGE

Explanation: This message is issued in response to a MERGECOPY request. The MERGECOPY utility was invoked to merge existing incremental image copies. However, in checking the DB2 catalog table SYSIBM.SYSCOPY, no incremental image copies were found.

Severity: 4 (warning)

A severity 4 condition is given to alert the invoker that processing did not proceed as defined. However, processing is proceeding; nothing was encountered that would invalidate further processing.

System Action: This message indicates the completion of the MERGECOPY utility. Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources that were held become available for REFERENCE processing. The UTILID of the utility job step becomes available for reuse.

The requester may want to determine why the assumption that incremental copies existed was not true.

Operator Response: The target copy data set identified by the DD statement nominated by the MERGECOPY COPYDDN option was not required. It was not tracked in the DB2 catalog table SYSIBM.SYSCOPY. It need not be kept for subsequent re-call.

**DSNU459I SYSCOPY P RECORD ENCOUNTERED, PIT
RBA = xxxxxx**

Explanation: The utility encountered a SYSCOPY P record which requires that the SYSCOPY record at the given RBA or LRSN be used. The utility properly traverses the SYSCOPY records following this SYSCOPY P record.

This message is issued by the following CSECT: DSNUYAS2

Severity: 0 (informational)

User Response: For further information on how the SYSCOPY records are traversed, see Section 4 (Volume 1) of *Administration Guide*.

**DSNU460I csect-name IMAGE COPIES INCONSISTENT.
MERGECOPY REQUEST REJECTED**

Explanation: MERGECOPY was requested for an entire table space. However, the most recent image copy for the associated table space was on the data set level. In addition, if the associated table space was partitioned, this might indicate that any or all of its partitions were being reorganized or loaded without logging after the MERGECOPY starting point. The MERGECOPY starting point is the most recent full image copy for the entire table space.

Severity: 4 (warning)

A severity 4 condition is given to alert the user that processing did not proceed as defined. However, processing is proceeding; nothing was encountered that would invalidate further processing.

System Action: This message indicates the completion of the MERGECOPY utility. Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources that were held become available for REFERENCE processing. The UTILID of the utility job step becomes available for reuse.

No output was produced and the SYSIBM.SYSCOPY catalog table remains unchanged.

User Response: A full image copy of the associated table space should be taken. However, if it is preferred that a recovery be done on the data set level, a MERGECOPY job should be submitted by specifying 'DSNUM(data set number)' for each data set for which MERGECOPY is required.

**DSNU461I csect-name PRIMARY FULL COPY DATA SET
NOT FOUND, BACKUP WILL BE USED
INSTEAD**

Explanation: The primary full image copy cannot be found. The backup full image copy will be located and used for the merge process.

Severity: 0 (informational)

User Response: If the MERGECOPY utility can use the backup full image copy, the utility continues to process. If no backup full image copy can be used, the utility terminates.

**DSNU462I csect-name MERGECOPY DISALLOWED FOR
REQUESTED TABLE SPACE**

Explanation: MERGECOPY was requested for table space DSNDB01.DB01, DSNDB01.SYSUTIL, or DSNDB06.SYSCOPY. MERGECOPY is not permitted for one of the following reasons:

- Only full image copies are allowed on these DB2-maintained tables.
- There is no record of the full image copies in the SYSIBM.SYSCOPY catalog; the copy information is in the DB2 log.

Severity: 8 (error)

System Action: Further utility processing is terminated.

System Programmer Response: Refer to Section 4 (Volume 1) of *Administration Guide* for more information about MERGECOPY utility constraints.

**DSNU463I csect - THE xxxxxxxx IMAGE COPY DATA SET
data-set-name WITH DATE=dddddd AND
TIME=ttttt, IS PARTICIPATING IN
MERGECOPY.**

Explanation: This informational message indicates the image copy that is used in the merge process. The variables have the following meanings:

xxxxxxx	PRIMARY or BACKUP, indicating a primary or backup image copy
data-set-name	The image copy data set name
dddddd	The image copy date
ttttt	The image copy time

Severity: 0 (informational)

User Response: The utility continues to process normally.

**DSNU464I THIS IS A sitetype; outputtype WITH NEWCOPY
NO IS NOT ALLOWED.**

Explanation: The 'NEWCOPY NO' option to create incremental image copies is not supported for the current site. This error can be caused by:

- Running the MERGECOPY utility at *sitetype* LOCALSITE, but selecting the RECOVERYDDN with the 'NEWCOPY NO' option.
- Running the MERGECOPY utility at *sitetype* RECOVERYSITE, but selecting the COPYDDN with the 'NEWCOPY NO' option.

Severity: 8 (error)

System Action: The command cannot be executed.

User Response: Correct the error and resubmit the job. Refer to *Utility Guide and Reference* for detailed information.

DSNU470I DSNDB01.SYSUTILX CANNOT BE INCLUDED IN A LIST OF TABLE SPACES.

Explanation: This message is issued by the running utility when DSNDB01.SYSUTILX is found in a table space list of a utility job statement.

This message is issued by the following CSECTs: DSNUQUIA, DSNUKINP

Severity: 8(error)

System Action: The utility job terminates.

User Response: Remove DSNDB01.SYSUTILX from the table space list or run the utility on DSNDB01.SYSUTILX separately.

DSNU471I csect-name - COPY PENDING ON TABLESPACE *databaseName.tableSpaceName* PROHIBITS PROCESSING

Explanation: An attempt was made to execute a utility against a table space. Either the table space was in copy pending state or DSNDB06.SYSCOPY was in copy pending state.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: Remove the table space from the copy pending state and resubmit the job.

Problem Determination: Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of the database recovery function.

DSNU472I csect-name - TABLESPACE *tablespace-name* HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART.

Explanation: The attempt to externalize table space '*tablespace-name*' pages to the media has failed.

Severity: 4 (warning)

System Action: QUIESCE still continues but you cannot make an image copy of the table space. Processing continues for all indexes within the table space and continues to the next table space in the tablespace-list, if any.

User Response: Run DISPLAY DATABASE to determine what exception state, if any, would prevent image copy on the table space.

Problem Determination: Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of the database recovery function.

DSNU473I csect-name - UNABLE TO EXTERNALIZE TABLESPACE *tablespace-name* PAGES

Explanation: The attempt to externalize TABLESPACE '*tablespace-name*' pages to the media has failed.

Severity: 4 (warning)

System Action: QUIESCE still continues but the table space cannot be volume-dumped.

Problem Determination: The problem may be an I/O error.

DSNU474I csect-name - QUIESCE AT RBA *rrrrrrrrrr* AND AT LRSN *xxxxxxxxxx*

Explanation: This message displays the log RBA and LRSN at the time of the quiesce. This value is unique for all quiesced table spaces in the list and is recorded in the START_RBA column of the SYSCOPY catalog table entry for each quiesced table space in the list.

Severity: 0 (informational)

System Action: Processing continues.

DSNU475I csect-name - QUIESCE UTILITY COMPLETE, ELAPSED TIME=*ttttt*

Explanation: The message marks the normal completion of the QUIESCE utility. The elapsed clock time that the QUIESCE utility uses is shown by '*ttttt*'.

Severity: 0 (informational)

System Action: Processing continues to the next utility statement in the utility job step, if any. If there are no more utility statements, the utility job step is normally terminated, and the resources are released to their prior available state. The UTILID of the utility job step becomes available for reuse.

DSNU476I csect-name - INDEX *index-name* HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART

Explanation: The attempt to externalize index '*index-name*' pages to the media failed.

This message is issued by the following CSECT: DSNUQUIA

Severity: 4 (warning)

System Action: QUIESCE processing continues.

User Response: Issue the DISPLAY DATABASE command to determine the exception state,

Problem Determination: Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of the database recovery function.

DSNU477I csect-name - QUIESCE SUCCESSFUL FOR TABLESPACE=*tablespace-name*

Explanation: The QUIESCE for TABLESPACE '*tablespace-name*' and all of its indexes were successful. This message will be repeated for every quiesced table space in list.

Severity: 0 (warning)

System Action: All data and indexes held in the main buffer for the table space have been written out to the media if no message DSNU473 or DSNU479 were issued earlier. A SYSCOPY record of ICTYPE 'Q' has been recorded in SYSCOPY catalog table for the table space. The START-RBA value in this SYSCOPY record is unique for all table spaces in list. This RBA value will be printed in the message DSNU474 following this message. Processing continues to the next table space in the table space list, if any.

DSNU478I *csect-name* - INDEX *index-name* HAS PENDING STATE

Explanation: Index 'index-name' has a PENDING state. This message is repeated for all PENDING stated indexes in a table space.

Severity: 8 (error)

System Action: QUIESCE stops processing but continues to check all table spaces and indexes for any additional table space or index that has a PENDING state. There is no update in SYSCOPY table for any table space in the list.

User Response: Issue the DISPLAY DATABASE command to look at the utility status byte in the DBA table for a specified PENDING state.

Problem Determination: Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of the database recovery function.

DSNU479I *csect-name* - UNABLE TO EXTERNALIZE INDEX *index-name* PAGES

Explanation: The attempt to externalize index 'index-name' pages to the media has failed.

Severity: 4 (warning)

System Action: QUIESCE still continues but the table space cannot be volume-dumped.

Problem Determination: The problem may be an I/O error.

DSNU480I *csect-name* - UNABLE TO EXTERNALIZE TABLESPACE *tablespace-name* PARTITION *partition-number* PAGES

Explanation: The attempt to externalize TABLESPACE 'tablespace-name' PARTITION 'partition-number' pages to the media failed.

Severity: 4 (warning)

System Action: QUIESCE still continues, but the table space cannot be volume-dumped.

Problem Determination: The problem might be an I/O error.

DSNU481I *csect-name* - QUIESCE SUCCESSFUL FOR TABLESPACE=*tablespace-name* PARTITION=*partition-number*

Explanation: The QUIESCE for TABLESPACE 'tablespace-name' PARTITION 'partition-number' and all of its indexes of the specified partition was successful. This message is repeated for every quiesced table space in the list.

Severity: 0 (warning)

System Action: All data and indexes held in the main buffer for the partition were written to the media if message DSNU480 or DSNU482 was not issued earlier. A SYSCOPY record of ICTYPE 'Q' was recorded in the SYSCOPY catalog table for the table space. The START-RBA value in this SYSCOPY record is unique for all table spaces in the list. This RBA value is printed in message DSNU474 following this message. Processing continues to the next table space in the table space list, if any.

DSNU482I *csect-name* - UNABLE TO EXTERNALIZE INDEX *index-name* PARTITION *partition-number* PAGES

Explanation: The attempt to externalize index 'index-name' 'partition-number' pages to the media failed.

Severity: 4 (warning)

System Action: QUIESCE still continues, but the table space cannot be volume-dumped.

Problem Determination: The problem might be an I/O error.

DSNU483I *csect-name* - TABLESPACE *tablespace-name* PARTITION *partition-number* HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART.

Explanation: The attempt to externalize table space 'tablespace-name' partition 'partition-number' pages to the media failed.

Severity: 4 (warning)

System Action: QUIESCE still continues, but you cannot make an image copy of the table space or partition. Processing continues for the index partition and all nonpartitioned indexes within the table space, and then proceeds to the next table space in the table space list, if any.

User Response: Issue DISPLAY DATABASE to determine what exception state, if any, would prevent image copy on the table space or partition.

Problem Determination: Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of the database recovery function.

DSNU484I *csect-name* - INDEX *index-name* PARTITION *partition-number* HAS WRITE ERROR RANGE OR IS IN DEFERRED RESTART

Explanation: The attempt to externalize index 'index-name' pages partition 'partition-number' pages to the media failed.

Severity: 4 (warning)

System Action: QUIESCE processing continues.

User Response: Issue DISPLAY DATABASE to determine the exception state.

Problem Determination: Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of the database recovery function.

DSNU500I *csect-name* RECOVERY COMPLETE, ELAPSED TIME = *hh/mm/ss*

Explanation: This message is issued at the normal completion of the RECOVER utility. The time that elapsed since the beginning of the RECOVER utility to its completion was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0/4 (informational/warning)

System Action: This message indicates the normal completion of the RECOVER utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated, and the resources held become available for further processing. The UTILID of the utility job step becomes available for reuse.

User Response: The recovered data is now available for further processing.

Operator Response: The recovered resources are available for further processing.

DSNU501I *csect-name* **A PAGE HAS BEEN STOPPED DURING RECOVERY. SEE PREVIOUS DSNI012 MESSAGE**

Explanation: This message is issued at the normal completion of the RECOVER utility if the data manager subcomponent cannot apply all the log records for the page because of an inconsistent DB2 log.

Severity: 4 (warning)

System Action: This message indicates that the RECOVER utility completed normally except for the page (or pages) indicated by the previous DSNI012 messages. The data manager subcomponent marked the pages as broken. All other pages were recovered successfully. Log apply stopped at the point of the inconsistency in the DB2 log for that page.

User Response: For information about using the REPAIR utility to apply changes that should have been made by the log record in error, refer to *Utility Guide and Reference*. Then, if you were recovering to the current point in time, resubmit the RECOVER job, specifying 'PAGE(page-number) CONTINUE'. This causes DB2 to retrieve the page from DASD and apply log records starting after the faulty one.

DSNU502I *csect-name* **PAGE page number WAS NOT FOUND IN ANY IMAGE COPY DATA SET**

Explanation: The page specified for 'RECOVER page' was not found in any image copy data sets.

This is an informational message only. It does not indicate termination of processing.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing. The assumption is that the page was inserted after the last image copy was made. The page is reset and recovered from the log, starting at the log RBA recorded in the SYSCOPY record for the last image copy data set.

DSNU503I *csect-name* **PAGE page-number IS WITHIN PHYSICAL ERROR RANGE**

Explanation: The page specified for 'RECOVER page' is within the physical error range of the table space partition or data set. 'RECOVER page' cannot be effective in this case, because the page would still be within the physical error range and therefore inaccessible to the user.

Severity: 8 (error)

System Action: The RECOVER utility terminates with return code 8. No changes are made to the table space.

User Response: Resubmit the RECOVER utility specifying 'error range'.

DSNU504I *csect-name* **MERGE STATISTICS, NUMBER OF COPIES = cc, NUMBER OF PAGES MERGED = nnnnnn, ELAPSED TIME = hh/mm/ss**

Explanation: This message is issued at the completion of the MERGE process for the MERGECOPY or RECOVER utility. The message indicates the number of image copies currently processed ('cc') and the total number of pages that were merged ('nnnnn'). The same page can be obtained from more than one incremental image copy. MERGE is repeated for MERGECOPY if all of the input image copy data sets cannot be allocated and a temporary work data set has been specified.

For the RECOVER utility, MERGE is executed whether or not there are incremental image copies participating. In this case, the number of copies ('cc') is one.

The elapsed time of the MERGE is 'hh/mm/ss', hours, minutes, and seconds, respectively. Counters are valid up to four billion.

System Action: The MERGECOPY or RECOVER utility continues processing; this message is for information only.

User Response: The statistics are indicative of the processing required. For MERGECOPY, it could indicate that next time more input image copy data sets should be allocated. For example, if there was more than one MERGE pass then this message will be issued more than once. For both MERGECOPY and RECOVER, it could indicate that more frequent invocation of MERGECOPY is appropriate.

DSNU505I *csect-name* **PAGE page-number IS BEYOND END OF TABLESPACE**

Explanation: A page number was found to be beyond the end of the table space or beyond the end of the current data set.

Severity: 8 (error)

System Action: The RECOVER utility terminates with ABEND 04E reason code 00E40100. If RECOVER PAGE was specified, then the utility terminates with return code 8 and no changes are made to the table space.

User Response: Check that the image copy data set(s) in use during the RECOVER contain valid pages. If running RECOVER with the PAGE option, then resubmit the utility with the correct page specified.

DSNU506I *csect-name* **ALLOCATION OR OPEN FAILED FOR IMAGE COPY DATA SET. DSNAME= data-set-name.**

Explanation: The RECOVER utility attempted to use the indicated full or incremental image copy data set. The attempt was unsuccessful, because an allocation or open failure occurred. This message is informational only. It does not indicate termination of processing.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing, searching for a prior image copy data set.

DSNU507I *csect-name* **NO USABLE BACKUP FOR RECOVER**

Explanation: The RECOVER utility determined that a backup was required but not found. The utility encountered one of the following situations:

- An error occurred while processing the oldest available full image copy data set. This might be the only full image copy data set available.
- While scanning backward through the SYSCOPY table, a LOAD LOG(NO) or REORG log(NO) record type was found.

Any of the following is acceptable as a backup:

- A full image copy.
- A LOAD LOG(YES).
- A REORG LOG(YES).
- For RECOVER PAGE, an incremental image copy that contains the specified page.
- A 'no record found' return from the first request for a SYSCOPY record indicates that the object was entirely populated by 'inserts'. The object will be recovered from the DB2 log if its entire history lies within the scope of the log, that is, archive log data sets containing updates for the object have not been deleted.

Severity: 8 (error)

System Action: The RECOVER utility terminates.

User Response: Re-create the object that was to be recovered.

DSNU508I *csect-name* **IN FALL BACK PROCESSING TO PRIOR FULL IMAGE COPY**

Explanation: One of the following occurred:

- The RECOVER utility could not allocate the most recent full image copy data set. The prior full image copy is used. Accompanying messages indicate why the image copy data set could not be allocated.
- PAGE or ERROR RANGE was specified and the recoverable point identified an image copy that was created by the DFSMSdss DUMP command with the CONCURRENT option. Such an image copy cannot be used to process PAGE or ERROR RANGE. A prior recoverable point is located.

System Action: The RECOVER utility continues processing, searching for the prior image copy.

DSNU509I *csect-name* **- NO ERROR RANGE TO RECOVER**

Explanation: The RECOVER utility was invoked to recover the existing ERROR RANGE. However, no ERROR RANGE was found.

Severity: 4 (warning)

System Action: This message indicates the completion of the RECOVER ERROR RANGE utility. Processing continues to the next utility statement in the utility job step. If there are no more utility statements, the utility job step is normally terminated.

DSNU510I *csect-name* **NO GOOD FULL IMAGE COPY DATA SET FOR RECOVERY**

Explanation: It is not possible to locate a good image copy data set from which to recover. Either no back level image copy exists, or an I/O error occurred while reading the back level image copies. The return code that accompanies this message is 0 or 8 under the following conditions:

- The return code is 0 if a full image copy is not found in the SYSCOPY table during RECOVER initialization or during fall back processing. However, a LOG(YES) event was detected and recover continues from the log.
- The return code is 8 if the RECOVER utility is in fall back mode and no base recoverable point (a full image copy or LOG(YES) event) was found in the SYSCOPY table. Further utility processing is terminated.

Severity: 0 (informational) or 8 (error)

System Action: If the return code is 0, processing continues. If the return code is 8, further utility processing is terminated.

User Response: Notify the system programmer if the return code is 8. If the return code is 0, no action is required.

Operator Response: If the return code is 8, the table space in question should be started for utility-only processing (if it is not in this state already) until corrective action is taken. If the return code is 0, no action is required.

System Programmer Response: If the return code is 8, the data must be repaired so that an image copy can be taken. An internal error might be involved, and system support might be required. If the return code is 0, no action is required. Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of database recovery procedures.

DSNU511I *csect-name* **RECOVERY INFORMATION INDICATES THAT TABLE SPACE *database-name.tablespace-name* DSNUM *dsnum* IS NOT IN A RECOVERABLE STATE**

Explanation: The requested recovery of a table space would result in recovery entirely from the log. Because the table space is also in copy pending status, recovery might fail in log apply in these situations:

- A previous MODIFY utility job deleted the last recoverable point indicated in the SYSCOPY catalog table.
- A previous MODIFY utility job deleted all SYSCOPY entries.

In either case, the MODIFY utility leaves the table space in copy pending status and the RECOVER utility is unable to determine the reliability of recovery from the log.

Severity: 8 (error)

System Action: The RECOVER utility terminates with return code 8.

User Response: Determine the recoverability status of the table space. SYSCOPY information is probably not useful as no recoverable point (FULL IMAGE COPY, REORG LOG(YES) or LOAD REPLACE LOG(YES)) was found by the RECOVER utility. User information might be the only indication about recoverability.

To allow RECOVER to execute, copy pending status must be turned off. It is safest to make a full image copy before attempting the recovery. Then run the RECOVER utility with the TORBA or TOLOGPOINT option.

If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 2, 5.

DSNU512I *csect-name* **DATA SET LEVEL RECOVERY IS REQUIRED FOR TABLE SPACE** *tablespace-name*

Explanation: Recovery was requested for an entire table space. However, there is an image copy made for a specific data set associated with the object. Hence, the table space must be recovered by data set.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: Terminate the current RECOVER job. Then, submit a RECOVER job by specifying 'DSNUM(data set number)' for each data set for which recovery is required. Refer to *Utility Guide and Reference* for a discussion of RECOVERY utility constraints.

DSNU513I *csect-name* **RECOVER UTILITY LOG APPLY RANGE IS RBA|LRSN xxx TO RBA|LRSN yyy**

Explanation: The RECOVER utility issues this message one or more times to display the entire log range before applying updates.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of database recovery procedures.

DSNU514I *csect-name* **RECOVERY DATA DOES NOT PERMIT TABLE SPACE RECOVERY OF TABLESPACE** *tablespace-name* **DSNUM** *dsnum*

Explanation: Recovery was requested for an entire table space. However, the most recent activity on the entire table space was a REORG LOG (NO) or a LOAD LOG (NO). If full image copies have been taken at the data set level since then, recover the table space on the data set level.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: Submit a recover job by specifying DSNUM (data set number) for each data set requiring recovery. Refer to *Utility Guide and Reference* for a discussion of RECOVERY utility constraints.

DSNU515I *csect-name* **THE IMAGE COPY DATA SET** *dsn* **WITH DATE=*icdate* AND TIME=*ictime* IS PARTICIPATING IN RECOVERY**

Explanation: This message is issued by the RECOVER utility for each participating image copy data set before it opens the data set and begins the rebuild process. If an error occurs while processing, the utility searches for a new recoverable point.

This message is routed to SYSOUT.

Severity: 0 (informational)

System Action: RECOVER processing continues.

User Response: Refer to *Utility Guide and Reference* for a discussion of RECOVERY utility constraints.

DSNU516I *csect-name* **NO FULL IMAGE COPY AFTER LOAD LOG(NO) OF TABLESPACE** *tablespace-name* **DSNUM** *dsnum*

Explanation: RECOVERY was requested for a data set of a table space. However, a full image copy was not taken after a table space LOAD or REORG without logging. The table space is in an unrecoverable state.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: The associated data set is in an unrecoverable state. Notify the system programmer for corrective action.

System Programmer Response: The data must be repaired so that a full image copy can be taken. Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of database recovery procedures.

DSNU517I *csect-name* **- SYSCOPY RECORD DELETED BY MODIFY UTILITY. DSN=*dsn*, VOL=*SER=nnn*, FILESEQNO=*fff***

Explanation: This message is repeated for each volume of a multivolume data set that is deleted.

The variables have the following meanings:

- dsn* The name of the image copy data set whose record was removed from the SYSCOPY table by the MODIFY utility.
- nnn* The serial number of the volume containing the data set.
- fff* The tape file sequence number. It will be zero for DASD data sets.

Severity: 0 (informational)

System Action: The MODIFY utility continues its termination processing.

System Programmer Response: Because DB2 no longer has any knowledge of the image copy data set, you may delete it and reuse the space. If the last full image copy was deleted, ensure that another one is taken as soon as possible.

DSNU518I *csect-name* **PAGE** *page-number* **IS A BROKEN PAGE**

Explanation: A broken page, 'page number', was detected during execution of an image copy utility. The copy step is terminated and the broken page is not copied to the output data set.

Severity: 8 (error)

System Action: COPY utility completes successfully with a return code of 8.

User Response: The associated data set is in an unrecoverable state. Notify the system programmer for corrective action.

System Programmer Response: Use either the RECOVER, RECOVER PAGE, or REPAIR utility to correct the broken page. Refer to Section 4 (Volume 1) of *Administration Guide*. If

you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU519I *csect-name* **TOCOPY DATA SET NOT FOUND**

Explanation: The data set specified with the keywords TOCOPY, TOVOLUME, or TOSEQNO cannot be found in the SYSCOPY table for the object to be recovered.

This may be caused by a mismatch in granularities. If the RECOVER specifies a particular DSNUM, the data set specified with the TOCOPY keyword may be for an image copy of this DSNUM or of the entire table space. However, if the RECOVER is for the entire table space, the specified data set must be for an image copy of the entire table space.

This may also be caused if TOVOLUME is specified for a cataloged data set.

RECOVER TOCOPY can issue DSNU519I even if the data set information was correct but the data set was not for this site. For example, if DB2 is specified as LOCASITE, the user makes image copies for LOCALSITE and RECOVERSITE. Then, when entering the TOCOPY data set information, the user enters a RECOVERYSITE data set. The result is that RECOVER will issue DSNU519I and quit with a return code of 8.

Severity: 8 (error)

System Action: RECOVER processing is terminated.

User Response: Correct the input and resubmit the RECOVER job.

DSNU520I *csect-name* **RECOVER TO A PRIOR POINT IN TIME MIGHT LEAVE TABLE SPACE** *table-space-name* **INCONSISTENT**

Explanation: RECOVER DSNUM to a previous point in time (for example, using the TOLOGPOINT option) was specified for a nonpartitioned table space. You might have recovered a data set that has different compression characteristics than the replaced data set. For example, the data set to which you recovered might have been compressed with a different dictionary.

Severity: 4 (warning)

System Action: Processing continues.

User Response: The table space might be in an inconsistent state. If the dictionary was not built with the data set that was just recovered, the results are unpredictable and might jeopardize all the data in the entire table space.

Recover all of the data sets in the table space to the same point in time. Do not ignore this message unless all data sets in this table space were recovered to the same point in time. Otherwise, the state of this nonpartitioned table space is inconsistent and unpredictable.

DSNU521I *csect-name* - **RECOVER UTILITY FAILED. UNABLE TO READ REQUIRED LOG RECORDS.**

Explanation: Recovery was requested for a table space or a data set of a table space. An attempt was made to apply changes from the DB2 log, but the necessary log records could not be read from the log data set. This message is accompanied by message DSNI007I.

Severity: 8 (error)

System Action: The RECOVER utility completes unsuccessfully with return code 8.

User Response: Consult the system programmer for corrective action.

Operator Response: Provide the console listing of the DSNI007I message for the system programmer.

System Programmer Response: Run the print log map (DSNJU004) utility. Find the data set that contains the requested RBA or LRSN from the output of the utility.

Problem Determination: If no listed data set contains the required RBA or LRSN, one of the following might have occurred:

- The data set was deleted from the bootstrap data set (BSDS) by the change log inventory (DSNJU003) utility. Rerun the utility to insert the missing data set name. DB2 must be stopped to run this utility.
- The BSDS was damaged. The BSDS can be restored using the dump and the most recent archive log data set. Run the change log inventory (DSNJU003) utility to supply changes that occurred during and after the last offload operation. Changes can be determined from the operator's console listing.

If a listed log data set contains the required RBA or LRSN, this message is preceded by one or more DSNJxxx error messages. See the explanation of those messages for the appropriate action.

DSNU523I *csect-name* - **RECOVER UTILITY FAILED. NO FULL IMAGE COPY WAS AVAILABLE AND THE FIRST LOG RECORD WAS NOT THE REQUIRED INITIALIZATION RECORD.**

Explanation: RECOVER was requested for a table space or a data set of a table space and no image copy was available. Recovery was attempted from the log and failed due to missing data set initialization records. Specifically, the log records which format space map and header pages were missing.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: The associated data set has been reset to an empty state. Notify system programmer for corrective action.

System Programmer Response: Use the problem determination information given below to determine if a user error has occurred. If possible, correct the error and resubmit the RECOVER utility job for this table space or data set. Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of possible recovery procedures.

Problem Determination: This message was preceded by message DSNU513I which identifies the log RBA range being applied. Run the print log map (DSNJU004) utility for the table space in question over the indicated log RBA range.

This will show what log records are present and may assist in determining if a log data set has been damaged or deleted, or if the BSDS has been damaged. If damage to table space DSND01.SYSLGRNX is suspected, recover it and attempt the earlier failing recovery again.

DSNU524I *csect-name* **INVALID DATA SET OR PARTITION NUMBER num SPECIFIED FOR TABLESPACE**
dbname.tspname

Explanation: An invalid number was specified for the data set or partition of the database and table space named in the utility statement.

Severity: 8 (error)

System Action: Further utility processing terminates.

User Response: Correct the data set/partition number, or verify that the database/table space name is specified correctly. Then resubmit the utility statement in a new utility job step. Refer to *Utility Guide and Reference* for a description of the particular utility options.

DSNU525I *csect-name* **RECOVERY DATA DOES NOT PERMIT TABLESPACE RECOVERY OF TABLESPACE** *tablespace-name* **DSNUM** *dsnum*

Explanation: Recovery was requested for an entire table space. However, the object is not recoverable at the table space level for one of the following reasons:

- The table space was recovered to a point in time (for example, TOLOGPOINT was specified), which required fall back processing. However, no subsequent image copy was taken to establish a base for recovery.
- A partition of the table space was recovered to a point in time after the last full image copy of the table space was taken.

Severity: 8 (error)

System Action: The RECOVER utility completes unsuccessfully with return code 8.

User Response: Submit the RECOVER job with DSNUM specified for each data set for which recovery is required. Refer to *Utility Guide and Reference* for information about the RECOVER utility.

DSNU526I *csect-name* - **NO FULL IMAGE COPY AFTER PARTIAL RECOVERY OF TABLESPACE**
tablespace-name **DSNUM** *dsnum*

Explanation: Recovery was requested for a data set of a table space. However, an earlier point-in-time recovery (for example, using the TOLOGPOINT option) was specified and no subsequent image copy was taken to establish a base for recovery. The table space is in a nonrecoverable state.

Severity: 8 (error)

System Action: The RECOVER utility completes unsuccessfully with return code 8.

User Response: The associated data set is in a nonrecoverable state. Consult the system programmer for corrective action.

System Programmer Response: You can use the RECOVER utility with the TOCOPY, TORBA, or TOLOGPOINT option to force recovery to an earlier point in time. You can use the DSN1COPY utility to restore the data set to an earlier image copy. Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of database recovery procedures.

DSNU527I *csect-name* **DB2 OBJECT RECOVERED TO AN INDETERMINATE POINT**

Explanation: The image copy data set specified with the TOCOPY keyword of the RECOVER utility was one of the following:

- An image copy dataset made with the SHRLEVEL CHANGE option. In this mode, changes might have been made to the object while image copy was in progress. If a change was made to a page before image copy processed the page, the update will be in the copy data set. If a change was made to a page after image copy processed it, the change will not appear in the copy data set. The data set may contain partial updates from some transactions.
- An image copy dataset made during the LOAD REPLACE utility. An image copy produced during LOAD REPLACE will not contain updates made to the table space to correct unique index violations during the INDEXVAL phase or referential constraint violations during the ENFORCE phase. Therefore, it is not recommended as a recovery point.

When this message is issued, indexes on the table space are placed in recover pending status and dependent table spaces, if any, are placed in check pending status. The indexes placed in recover pending are identified by message DSNU557I, and the dependent table spaces placed in check pending are identified by message DSNU563I.

Severity: 4 (warning)

System Action: The utility terminates normally.

User Response: Based on the explanation above, determine if the recovery is satisfactory. Recover the indexes identified by message DSN557I in the job output. Run CHECK DATA on the table spaces identified by message DSN563I to correct any referential constraint violations.

Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of database recovery procedures.

DSNU528I **NO FULL IMAGE COPY WAS AVAILABLE AND THERE ARE NO UPDATES TO APPLY FROM THE DB2 LOG FOR TABLESPACE** *tablespace-name* **DSNUM** *dsnum*

Explanation: Recovery was requested for a table space or a data set of a table space and no image copy was available. If *dsnum* is 0, then recovery was requested at the table space level. Recovery was attempted from the log, but no log records were applied because no SYSLGRNX records corresponding to the recovery scope were found.

This message is issued by the following CSECT: DSNUCALA

Severity: 8 (error)

System Action: The associated data set was reset to an empty state and the data set was placed in RECOVER PENDING status. If RECOVER was processing a TABLESPACE list, only the associated data set was reset to an empty state but all data sets in the list were placed in RECOVER PENDING status.

User Response: If the TORBA or TOLOGPOINT option was specified, use the information in the problem determination section to verify that it is a valid RBA or LRSN. Correct the error and resubmit the RECOVER utility for the table space.

System Programmer Response: Use the information in the problem determination section to determine if a user error

occurred. Correct the error and resubmit the RECOVER utility for the table space. Also refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of possible recovery procedures.

Problem Determination: Execute the REPORT RECOVERY utility for the table space at the appropriate table space or data set level (that is, DSNUM). The output shows the recovery points (SYSCOPY records) and the update log ranges (SYSLGRNX records) that exist for the table space.

DSNU529I *csect-name* **INVALID SPECIFICATION OF TORBA = xxx**

Explanation: 'xxx' is the log RBA specified for the RECOVER utility TORBA keyword. The RBA is not within the scope of the log.

Severity: 8 (error)

System Action: The RECOVER utility terminates with a return code of 8 without making any changes to the object to be recovered. If the table space is storage group defined, it has not been reset.

User Response: Correct the input and resubmit the job. Refer to Section 4 (Volume 1) of *Administration Guide* for a discussion of database recovery procedures.

Problem Determination: The listing produced by the print log map (DSNJU004) utility will show the current extent of the DB2 log.

DSNU530I *csect-name* **DATA SET ALREADY USED FOR PREVIOUS IMAGE COPY**

Explanation: One or more of the recovery keywords TOCOPY, TOVOLUME or TOSEQNO were specified and more than one data set was found which satisfied these criteria.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: Two or more DSNU531I messages will follow this message providing more information about each duplicate data set. Select the correct data set from the DSNU531I messages and rerun the RECOVER job specifying a unique combination of TOCOPY, TOVOLUME and TOSEQNO.

DSNU531I *csect-name - dsn* **EXISTS WITH - VOLUME=vol, FILE SEQUENCE NUMBER=fseq, RBA=rba, DATE=date, TIME=time**

Explanation: This message is issued two or more times to document the duplicate data sets detected by the RECOVER utility during TOCOPY processing. See the explanation for message DSNU530I.

Severity: 8 (error)

System Action: RECOVER completes unsuccessfully with a return code of 8.

User Response: Use the information provided in all of the DSNU531I messages to determine the correct data set for this recovery. 'rba', 'date' and 'time' are provided for each data set to assist in the selection. The DSNU531I message for the

data set you select will provide the correct 'vol' and 'fseq' values to be specified on the TOVOLUME and TOSEQNO keywords respectively. Rerun the RECOVER job specifying TOCOPY and TOVOLUME(vol). Include the TOSEQNO(fseq) keyword if it is necessary to distinguish an unique data set.

DSNU532I *csect-name - RECOVER DATABASE* *database* **TABLESPACE** *tablespace* **DSNUM** *dsnum* **START**

Explanation: This message is used to separate the RECOVER messages for different table spaces when there is more than one table space to be recovered by a single RECOVER job.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RECOVER processing continues.

DSNU533I *csect-name - DUPLICATE TABLESPACE* **NAMES EXIST IN THE TABLESPACE-LIST**

Explanation: The RECOVER or COPY utility found a duplicate table space or partition of a table space in the table space list.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Correct the table space list and resubmit the job.

DSNU534I *csect-name* **TARGET RECOVERY POINT IS NOT A QUIESCE POINT**

Explanation: The RECOVER utility attempted to recover to a point in time (for example, using the TOLOGPOINT option) and cannot recover the table space set for one of the following reasons:

- The table space set is not being recovered to a quiesce point.
- Not all table spaces in the table space set have the same quiesce point.
- A table space in the set contains a dependent table with a referential constraint that was defined after the specified quiesce point.

Severity: 4 (warning)

User Response: Recover the table space set to a quiesce point. If the table space set is consistent, use the REPAIR NOCHECKPEND utility or the -START DATABASE FORCE command to reset the check pending status.

DSNU535I *csect-name - FOLLOWING TABLESPACES* **RECOVER TO A QUIESCE POINT**

Explanation: This message will be issued by the RECOVER utility when it determines that a table space set (that is, referentially related table spaces) is being recovered to a quiesce point. All table spaces in the table space set will be listed after this message heading.

Severity: 0 (informational)

System Action: No action is taken.

DSNU536I *csect-name* - RELATIONSHIP *r* ON TABLE *t*
CREATED AFTER QUIESCE POINT

Explanation: The relationship named 'r' was created on the dependent table, 't', after the quiesce point used for recovering to a point in time. The table space in which 't' resides is set to check pending beginning with the first record of 't'.

Severity: 4 (warning)

System Action: No action is taken.

User Response: Refer to Section 2 (Volume 1) of *Administration Guide* for the failure analysis procedure for the check pending state.

DSNU537I *csect-name* - DIRECTORY OR CATALOG
TABLESPACE IS NOT ALLOWED IN THE
TABLESPACE-LIST

Explanation: The RECOVER or COPY utility found a directory or catalog table space in the table space list. You cannot recover a catalog or directory table space as part of a list of table spaces. Catalog and directory objects must be recovered in a particular order because the recovery of some objects depends on information derived from others.

Severity: 8 (error)

System Action: The utility job terminates.

User Response: Remove the directory and catalog table space names from the table space list and recover them individually in the order documented in Section 4 (Volume 1) of *Administration Guide*. Then submit the RECOVER or COPY job again with the rest of the table spaces in the list.

DSNU538I RECOVER ERROR RANGE OF DSN=*dataset*
name ON VOLUME=*volser* FROM
CCHH=*X'cccchhhh'* TO CCHH=*X'cccchhhh'*
CONTAINS PHYSICAL ERROR

Explanation: This message indicates that the error range involved in the error range recover '*dataset name*' is the data set which has the physical error. The data set resides on DASD volume '*volser*' and the error range is from track address *X'cccchhhh'* to track address *X'cccchhhh'*.

If the error range of a data set covers more than one extent or more than one volume, then there will be one message per extent per volume.

This message is issued by the following CSECT: DSNUCRV0

Severity: 8 (error)

System Action: Physical I/O error is detected during error range recover, processing terminated with return code 8.

System Programmer Response: A DSNU086 message is issued to the console by DB2 while running error range recovery; this indicates that the physical error is not recovered. User must run ICKDSF or equivalent service utility to recover the physical error then re-run the error range recover again.

Problem Determination: Use the information provided by this message to run ICKDSF and then run error range recover again.

DSNU539I *csect-name* - RECOVER PROCEEDS AT THE
site-type SYSTEM

Explanation: This is an informative message to tell users that the RECOVER process is occurring at the RECOVERY SITE system and/or the TRACKER SITE system. The utility still continues.

Severity: 0 (informational)

DSNU540I *csect-name* DYNAMIC ALLOCATION FOR
DATA SET *data-set-name* WILL WAIT FOR
UNIT TO BECOME AVAILABLE

Explanation: A request to dynamically allocate a data set for a BATCH UTILITY job was refused because a unit was not available. The request was repeated after setting an indicator in the dynamic allocation parameter list to cause the job to wait until a unit becomes available.

Severity: 0 (informational)

System Action: Processing continues after a unit becomes available and is allocated.

DSNU541I UNABLE TO ALLOCATE THE PRIMARY COPY
DATASET, BACKUP COPY IS USED

Explanation: If RECOVER or MERGECOPY has an allocation error in the primary copied data set, it will locate the backup copied data set in that same system (local or recovery). The utility continues.

This message is issued by the following CSECT: DSNUBCR3

Severity: 0 (informational)

DSNU542I *csect-name* - UNABLE TO OPEN THE
PRIMARY COPY DATASET *dataset-name*,
BACKUP COPY IS USED

Explanation: If RECOVER or MERGECOPY has an open error in the primary copied data set, it will deallocate that copied data set and try to allocate the backup copied data set in that same system (local or recovery). The utility continues.

Severity: 0 (informational)

DSNU543I *csect-name* - I/O ERROR READING PAGE
page_number IN THE PRIMARY COPY
DATASET *dataset-name*, BACKUP COPY IS
USED

Explanation: If RECOVER or MERGECOPY has an I/O error when reading a page, with the specified page number, from the primary copied data set, it will locate the backup copied data set in that same system (local or recovery) and continue reading pages starting from the page number in error.

Severity: 0 (informational)

DSNU544I *csect-name* - UNABLE TO OPEN THE COPY
DATASET *dataset-name*, RC= *reason-code*

Explanation: RECOVER was unable to open the data set '*dataset-name*', because of '*reason-code*' from the open abend. The '*reason-code*' is taken from field SDWAABCC in the SDWA.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing, searching for the prior image copy or applying log records.

DSNU545I *csect-name* - I/O ERROR READING PAGE *page-number* IN THE COPY DATASET *dataset-name*

Explanation: An I/O error was detected while reading page 'page-number' from copy dataset 'dataset-name'. The message is issued when 1) The data set is the primary copy data set and there is no backup data set. 2) Open error is from the backup copy data set.

Severity: 0 (informational)

System Action: The RECOVER utility continues processing, searching for the prior image copy or applying log records.

DSNU546I LOGONLY RECOVER CANNOT PROCEED BETWEEN BEGINNING RBA 'xxxxxxxxxxxx' AND ENDING RBA 'yyyyyyyyyy' ON DSNUM *dsnum* BECAUSE A NON-RECOVERABLE EVENT HAS BEEN ENCOUNTERED FROM SYSIBM.SYSCOPY WHICH HAS DBNAME=*database-name* TSNAME=*tablespace-name* DSNUM=*dsnum* ICTYPE=*x* START_RBA=X'zzzzzzzzzzz'.

Explanation: A nonrecoverable event (for example, LOAD LOG(NO), REORG LOG(NO)) occurred within the log range between the beginning log RBA or LRSN and ending log RBA or LRSN for the RECOVER LOGONLY utility.

This message is issued by the following CSECT: DSNUCASA

Severity: 8 (error)

System Action: The RECOVER utility completes unsuccessfully with return code 8.

System Programmer Response: Find a proper prior point in time as a target recovery point and rerun the RECOVER utility job with the TORBA, TOCOPY, or TOLOGPOINT option. For a discussion of database recovery procedures, refer to Section 4 (Volume 1) of *Administration Guide*.

DSNU547I LOGONLY RECOVER CANNOT PROCEED BECAUSE THE STARTING RBA=X'xxxxxxxxxxxx' IN THE HEADER PAGE PGNO=X'xxxxxx' FOR TABLESPACE=*database-name.tablespace-name* IS INVALID.

Explanation: One of the following occurred:

- The data set was restored from an earlier release backup that does not have a starting RBA or LRSN in the header page.
- The TORBA or TOLOGPOINT option is specified to an RBA or LRSN that is lower than the starting RBA or LRSN in the header page.

This message is issued by the following CSECT: DSNUCAIN

Severity: 8 (error)

System Action: The RECOVER utility job terminates with return code 8.

System Programmer Response: Use the RECOVER utility without the LOGONLY option, if possible, or change the RBA or LRSN of the TORBA or TOLOGPOINT option to a valid RBA or LRSN value.

DSNU548I DBID=X'xxxx' and PSID=X'xxxx' IN THE HEADER PAGE OF TABLESPACE=*database.tablespace* DSNUM=*n* DO NOT MATCH THE DB2 CATALOG.

Explanation: The DBID and PSID in the header page do not match the DB2 catalog. It is likely that the wrong data sets were restored. For simple or segmented table space, n is always 0. For a partitioned table space, n is the partition number.

This message is issued by the following CSECT: DSNUCAIN

Severity: 8 (error)

System Action: The RECOVER utility job terminates with return code 8.

System Programmer Response: Find the correct data sets and rerun the job.

DSNU549I RECOVER TABLESPACE=*database-name.tablespace-name* DSNUM=*dsnum* USES ONLY DB2 LOGS STARTING FROM LOGPOINT=X'xxxxxxxxxxxx'.

Explanation: The RECOVER utility issues one message for each DB2 object (table space or partition) that uses only DB2 logs to recover. In a non data-sharing environment, the LOGPOINT value is specified by an RBA; in a data sharing environment it is specified by an LRSN.

This message is issued by the following CSECT: DSNUCALA

Severity: 0 (informational)

System Action: RECOVER utility processing continues.

DSNU550I *csect-name* INDEX NAME= *index-name* IS EMPTY

Explanation: While attempting to RECOVER the indicated index, it was determined that the table upon which the index is based is empty.

Severity: 4 (warning)

System Action: Utility processing proceeds to the next utility request, if any.

DSNU551I *csect-name* INDEX NAME= *index-name* PART=*part-num* IS EMPTY

Explanation: While attempting to RECOVER the indicated index partition, it was determined that the partition upon which the specified index partition is based is empty.

Severity: 4 (warning)

System Action: Utility processing proceeds to the next utility request, if any.

DSNU552I *csect-name* RECOVER CANNOT PROCEED BECAUSE THE *starting/ending* LOGPOINT *xxx* IS NOT WITHIN THE RECOVERY RANGE OF *xxx* AND *xxx* FOR TABLESPACE *database_name.table_space_name* DSNUM=*dsnum*

Explanation: The starting or ending LOGPOINT found for this recovery job is outside the available recovery information. A LOGPOINT value is an RBA or LRSN. RECOVER TABLESPACE cannot process this request on table space

table_space_name in database *database_name*. DSNUM is not shown if the entire table space is being recovered.

Severity: 8

System Action: The RECOVER TABLESPACE utility terminates.

User Response: Use the recovery information that is available from the REPORT utility. Execute the RECOVER utility within the available recovery range.

DSNU553I *csect-name* **INVALID PARTITION NUMBER=nnnn SPECIFIED FOR INDEX NAME=iiii**

Explanation: An invalid partition number nnnn was specified for index iiii in the utility statement.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Correct the partition number or verify that the index name is specified correctly, and resubmit the utility statement in a new utility job step. Refer to *Utility Guide and Reference* for a description of the particular utility options.

DSNU554I *csect-name* - **DUPLICATE INDEX NAMES EXIST IN THE SPECIFIED INDEX NAME LIST**

Explanation: When attempting to CHECK or RECOVER the indicated indexes, it was determined that duplicate index names were specified in the index name list.

Severity: 8 (error)

System Action: The utility job terminated.

User Response: Correct the index-name(s) in the index name list and resubmit the job.

DSNU555I *csect-name* **UNLOAD PHASE STATISTICS, NUMBER OF RECORDS=xxxx**

Explanation: This message is issued at the normal completion of the UNLOAD phase of the RECOVER INDEX utility. It gives the number of records that were unloaded (xxxx) for the specified table space. Counters are valid up to four billion.

Severity: 0 (informational)

DSNU557I *csect-name* - **INDEXSPACE= indexspace-name IS IN RECOVERY PENDING STATE**

Explanation: If the RECOVER TABLESPACE utility issued this message, the corresponding table space to this index was recovered to a point in time with keyword TOCOPY, TOLOGPOINT, or TORBA. Thus, the index was placed in recovery pending status.

If the RECOVER INDEX utility issued this message, the index is in recovery pending status. Either duplicate index entries existed during the BUILD phase of the RECOVER INDEX, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the RECOVER INDEX utility again to recover the index and remove the index from recovery pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, the index is in recovery pending status. During the renaming of a data

set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the RECOVER TABLESPACE or REORG utility (or -TERM UTILITY) issued this message, use the RECOVER INDEX utility to recover this index.

If the RECOVER INDEX utility issued this message, take one of the following actions:

- Resolve the duplicate index entries or invalid keys and rerun the RECOVER INDEX utility.
- Use the REPAIR SET NORCVRPEND utility or the START DATABASE FORCE command to reset the recovery pending status. However, these two options will not correct the index.

DSNU558I *csect-name* **ALL INDEXES OF TABLESPACE= table space-name ARE IN RECOVERY PENDING**

Explanation: The RECOVER TORBA, TOLOGPOINT, or TOCOPY utility issues this message to inform the user of the state of all indexes belonging to the recovered table space. All indexes were put in recovery pending status to prevent data and index inconsistency. All indexes should be recovered before they are used.

System Action: The RECOVER utility completed successfully.

Severity: 4 (warning)

User Response: Recover all indexes of the recovered table space.

DSNU559I *csect-name* - **INDEX= creator.index-name PART= partition number IS IN RECOVERY PENDING STATE**

Explanation: If the RECOVER TABLESPACE utility issued this message, one partition of a partitioned table space is being recovered to a point in time with keyword TOCOPY, TOLOGPOINT, or TORBA. The corresponding index for that partition was placed in recovery pending status.

If the RECOVER INDEX utility issued this message, the index or the partition of a cluster index is in recovery pending status. Either duplicate index entries existed during the BUILD phase of the RECOVER INDEX or INDEX PART, or invalid KEY/RIDs, which do not belong to the partition of the cluster index, were detected. The duplicate index entries or invalid KEY/RID entries must be resolved before starting the RECOVER INDEX utility again to recover the index and remove the index from recovery pending status.

If the REORG utility with SHRLEVEL REFERENCE or CHANGE (or -TERM UTILITY) issued this message, one partition of a partitioned index was placed in recovery pending status. During the renaming of a data set during REORG, either a data set with the source name did not yet exist or a data set with the target name already existed.

Severity: 4 (warning) or 8 (error)

User Response: If the RECOVER TABLESPACE or REORG utility (or -TERM UTILITY) issued the message, recover this index with the RECOVER INDEX utility.

If the RECOVER INDEX utility issued this message, take one of the following actions:

- Resolve duplicate index entries or invalid keys and rerun the RECOVER INDEX utility.
- Use the REPAIR SET NORCVRPEND utility or START DATABASE FORCE command to reset the recovery pending status. However, these two options will not correct the index.

DSNU560I *csect-name* - **TABLESPACE=**
database.tablespace **PART=** *partition number* **IS**
IN RECOVERY PENDING STATE

Explanation: The table space partition of a table space on which the utility was running is in recovery pending status. A RECOVER TABLESPACE at the partition level is required.

Severity: 4 (warning)

System Action: No action is taken.

User Response: Take one of the following actions:

- Run the RECOVER TABLESPACE utility on the table space partition.
- Run the LOAD REPLACE utility on the table space partition.
- Use the REPAIR SET NORCVRPEND utility or the START DATABASE FORCE command to reset the recovery pending status. However, these two options will not correct the table space.

DSNU561I *csect-name* - **TABLESPACE**
database.tablespace-name **PARTITION** *part-*
number **IS IN CHECK PENDING**

Explanation: This message is issued to report the check pending state of the specified table space partition.

Severity: 4 (warning)

User Response: Run the CHECK DATA utility against the table space to guarantee usability of the table space. Correct all errors reported by the CHECK DATA utility that put the table space in check pending state before attempting to use the table space again.

DSNU562I *csect name* - **TABLESPACE**
database.tablespace **IS IN RECOVERY**
PENDING

Explanation: The table space against which the utility was running is in recovery pending status. A RECOVER TABLESPACE is required.

Severity: 4 (warning)

System Action: No action is taken.

User Response: Take one of the following actions:

- Run the RECOVER TABLESPACE utility on the table space.
- Run the LOAD REPLACE utility on the table space.
- Use the REPAIR SET NORCVRPEND utility or the START DATABASE FORCE command to reset the recovery pending status. However, these two options will not correct the table space.

DSNU563I *csect name*- **TABLESPACE**
database.tablespace-name **IS IN CHECK**
PENDING

Explanation: This message is issued to report the check pending state of the specified table space.

Severity: 4 (warning)

User Response: Run the CHECK DATA utility against the table space to guarantee usability of the table space. Correct all errors reported by the CHECK DATA utility that put the table space in check pending state before attempting to use the table space again.

DSNU564I *csect* - **RESTART NOT ALLOWED FOR TABLE**
SPACE *tablespace-name* **DSNUM** *dsnum*

Explanation: Restart of the RECOVER TABLESPACE utility is not allowed for one of the following reasons:

1. During the RESTORE phase, access to image copies failed. Therefore, RECOVER determined an earlier point of recovery to search for available image copies. RECOVER might not be able to recreate the original failures for restart.
2. The utility uses the LOGONLY option and was previously restarted with RESTART(CURRENT). It cannot now be started with RESTART(PHASE).

Severity: 8 (error)

System Action: The utility job terminates. If RECOVER acts on a list of table spaces, the restarted job terminates with the first table space for which restart is not allowed.

User Response: For case 1, execute REPORT RECOVERY on the table space and also collect the output from the previous execution of RECOVER TABLESPACE. Using those two outputs and the console log, determine the reason for the failure during the RESTORE phase. Correct the reason for the failure, if necessary. Reissue RECOVER TABLESPACE without RESTART.

For case 2, restart the utility with RESTART(CURRENT) or restore the data sets and rerun the RECOVER job from the beginning.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1,

DSNU565I *csect-name* **CHECK CONSTRAINT** *constraint-*
name **ON TABLE** *table-name* **WAS CREATED**
AFTER THE TARGET RECOVERY POINT

Explanation: The check constraint *constraint-name* was created on table *table-name* after the target recovery point. The target recovery point is the specified time or RBA in the point-in-time recovery. The associated table space was placed in check pending status because the RECOVER utility cannot determine whether check integrity was maintained. Data in the table might have constraint violations.

Severity: 4 (warning)

System Action: RECOVER processing continues.

User Response: Refer to Section 2 (Volume 1) of *Administration Guide* for information about resolving the check pending status.

DSNU566I *csect-name* RESTORE FROM DATA SET *data-set-name* COMPLETED, ELAPSED TIME = *hh:mm:ss*

Explanation: This message is issued at the successful completion of the RESTORE phase of the RECOVER utility when the DFSMSdss RESTORE command is issued. The *data-set-name* identifies the DFSMS concurrent copy that was being restored. The elapsed time of the RESTORE is shown in hours, minutes, and seconds.

System Action: RECOVER utility processing continues.

User Response: No action is required.

DSNU567E *csect-name* AN ERROR HAS BEEN ENCOUNTERED WHILE ACCESSING THE BSDS - RETURN CODE = *rc*, REASON CODE = *rsn*

Explanation: Access to the BSDS failed. The *rc* is a 1-byte VSAM return code; *rsn* is a 1-byte VSAM reason code

Severity: 8

System Action: The utility terminates.

System Programmer Response: See the appropriate VSAM publication for a description of the VSAM return and reason codes. Take corrective action based on the information in those codes.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 85.

DSNU569I *csect-name* RESTORE FROM DATA SET *data-set-name* FAILED WITH RETURN CODE *return-code*

Explanation: This message is issued in the RESTORE phase of the RECOVER utility. The DFSMSdss RESTORE command was issued to restore the DFSMS concurrent copy named *data-set-name*. The return code is from DFSMSdss RESTORE.

Severity: 4 (warning)

System Action: The RECOVER utility searches for the next recoverable point. DFSMSdss issues ADR messages to the job output to indicate the reason for the return code.

User Response: You might want to investigate why this DFDSS RESTORE command failed. Collect any console messages. Look up the return code and any ADR messages in the appropriate DFSMSdss manual.

Problem Determination: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 85,

DSNU571I *csect-name* ALL *site* SYSCOPY RECORDS FOR TABLESPACE=*tablespace-name* PARTITION=*part-num* HAVE BEEN DELETED

Explanation: The MODIFY RECOVERY utility deleted all of the SYSCOPY table records for the specified table space or partition. Any related SYSLGRNX rows are deleted if DSNUM ALL is specified. The 'part-num' of specified table space is no longer recoverable at the 'site'. The 'site' can be 'LOCALSITE' or 'RECOVERYSITE'.

Severity: 4 (warning)

System Action: Utility processing continues.

System Programmer Response: The 'part-num' of specified table space is no longer recoverable at the 'site' after this message is received. Use the COPY utility to create one or more copies for the 'site' to establish a base for future recovery.

DSNU572I *csect-name* ALL *site* SYSCOPY RECORDS FOR TABLESPACE=*tablespace-name* HAVE BEEN DELETED

Explanation: The MODIFY RECOVERY utility deleted all of the SYSCOPY table records for the specified table space. Any related SYSLGRNX rows are deleted if DSNUM ALL is specified. The table space is no longer recoverable at the 'site'. The 'site' can be 'LOCALSITE' or 'RECOVERYSITE'.

Severity: 4 (warning)

System Action: Utility processing continues.

System Programmer Response: The table space is no longer recoverable at the 'site' after this message is received. Use the COPY utility to create one or more copies for the 'site' to establish a base for future recovery.

DSNU573I *csect-name* NO BACKUP COPIES FOUND FOR THIS TABLESPACE OR DATASET

Explanation: The MODIFY RECOVERY utility was unable to locate any SYSCOPY records older than the specified AGE or prior to the specified DATE. No records have been deleted.

Severity: 4 (warning)

System Action: Processing completes normally.

DSNU575I *csect-name* - MODIFY COMPLETED SUCCESSFULLY

Explanation: This message reports the successful completion of the MODIFY utility. The requested cleanup of old SYSIBM.SYSCOPY entries was completed.

Severity: 0 (informational)

System Action: The MODIFY utility completed normally.

DSNU577I *csect-name* MODIFY HAS NOT DELETED ALL SYSCOPY RECORDS AS REQUESTED.

Explanation: If MODIFY RECOVERY is invoked with a partition-number (DSNUM), and the table space level recoverable point is older than the user specified DATE or AGE, all SYSCOPY records after the table space level recoverable point cannot be deleted.

Severity: 4 (warning)

System Action: Processing continues normally.

DSNU578I *csect-name* SYSLGRNX INFORMATION FOR MEMBER *member-name*

Explanation: In the data sharing environment, the SYSLGRNX records reported with DSNU513 are grouped by the respective member name. Each group member has header message DSNU578 to identify the member. This message precedes DSNU513.

System Action: The RECOVER TABLESPACE utility continues with the LOGAPPLY phase.

DSNU579I *csect-name* RECOVER UTILITY LOG APPLY AT LOGPOINT xxx

Explanation: This message shows the progress of the LOGAPPLY phase of the RECOVER utility. The highest LOGPOINT that was applied is xxx. The value of logpoint is RBA in a non data-sharing environment and LRSN in a data sharing environment.

System Action: The LOGAPPLY phase continues normally.

DSNU580I *csect-name* REPORT UTILITY COMPLETE, ELAPSED TIME=*hh/mm/ss*

Explanation: The message is issued at the normal completion of the REPORT utility. The time that elapsed since the beginning of the REPORT utility to its completion was 'hh' hours, 'mm' minutes, and 'ss' seconds.

Severity: 0 (informational)

System Action: This message indicates the normal completion of the REPORT utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated, and the resources held become available for further processing. The UTILID of the utility job step becomes available for reuse.

DSNU581I *csect-name* REPORT RECOVERY TABLESPACE *dbname.tsname*

Explanation: The message is issued at the beginning of reporting the recover information for a table space.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU582I *csect-name* REPORT RECOVERY TABLESPACE *dbname.tsname* SYSCOPY ROWS

Explanation: This is the header message for the SYSCOPY section of the REPORT RECOVERY output. This section displays the SYSCOPY rows for the table space or table space partition as specified in the REPORT RECOVERY input statement. The fields in the SYSCOPY row are:

- TIMESTAMP
- ICTYPE
- DSNUM
- FILESEQNO
- START_RBA
- SHRLEVEL
- DEVTYPE
- ICBACKUP
- DSNAME
- STYPE
- PIT_RBA
- DSVOLSER

For description of the fields, see SYSIBM.SYSCOPY table in Appendix C of *SQL Reference*.

Severity: 0 (informational)

DSNU583I *csect-name* SYSLGRNX ROWS FROM REPORT RECOVERY FOR TABLESPACE *dbname.tsname*

Explanation: This is the header message for the SYSLGRNX section of the REPORT RECOVERY output. This section displays the SYSLGRNX rows for the table space or table space partition as specified in the REPORT RECOVERY input statement. The fields in the SYSLGRNX row are:

- UCDATE - Modification date
- UCTIME - Modification time
- START RBA - Starting RBA
- STOP RBA - Stopping RBA
- START LRSN - Starting LRSN
- STOP LRSN - Stopping LRSN
- DSNUM - Partition number
- MEMBER - Data sharing member

An invalid SYSLGRNX record is marked with '**' at the end. The invalid SYSLGRNX record cannot be used for recovery because the range is outside recovery. If records are marked with '**', then a DSNU594 message should have been issued prior to this.

A SYSLGRNX record created after the last FULL IMAGE COPY, LOAD REPLACE LOG YES, or REORG LOG YES is marked with '**' at the end.

Severity: 0 (informational)

System Action: Processing continues normally.

DSNU584I *csect-name* REPORT RECOVERY TABLESPACE *dbname.tsname* BSDS VOLUMES

Explanation: Message for the BSDS VOLUMES section of the REPORT RECOVERY output. This section contains BSDS volumes for the archive log records associated with the table space specified in the REPORT RECOVERY input statement. The output contains the following information:

```
START TIME  END TIME  START RBA  END RBA  UNIT  VOLSER  DATA SET NAME
start      end      rba      rba     device volume data set name
timestamp timestamp
```

An archive log record created after the last FULL IMAGE COPY, LOAD REPLACE LOG YES, or REORG LOG YES is marked with '**' at the end.

System Action: Processing continues normally

DSNU585I *csect-name* REPORT RECOVERY TABLESPACE *dbname.tsname* CURRENT

Explanation: The message is issued in response to the CURRENT option of REPORT RECOVERY utility. It indicates that only the information since the last recoverable point for the specified table space is reported.

Severity: 0 (informational)

System Action: Normal utility processing continues.

DSNU586I *csect-name* **REPORT RECOVERY**
TABLESPACE *dbname.tsname* **SUMMARY:**

Explanation: This is the header message for the SUMMARY section of the REPORT RECOVERY utility. All the volumes to be used by the RECOVER utility are summarized.

The volume name is marked with '*' at the end if any archive log record in the volume was created after the last FULL IMAGE COPY, LOAD REPLACE LOG YES, or REORG LOG YES.

System Action: Processing continues normally

DSNU587I *csect-name* **REPORT TABLESPACE SET WITH**
TABLESPACE *dbname.tsname*

Explanation: Header message for the REPORT TABLESPACESET output. The output contains all table spaces, tables, and dependent tables associated with the table space specified in the REPORT TABLESPACESET input statement.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU588I *csect-name* **NO DATA TO BE REPORTED**

Explanation: The message is issued when no data can be found for a section of the REPORT output.

Severity: 0 (informational)

System Action: Utility processing continues.

DSNU589I *csect-name* **REPORT RECOVERY**
TABLESPACE *dbname.tsname* **COMPLETE**

Explanation: The message is issued at the normal completion of reporting the RECOVERY information of the table space in REPORT RECOVERY utility.

Severity: 0 (informational)

System Action: This message indicates the normal completion of the REPORT RECOVERY utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated, and the resources held become available for further processing. The UTILID of the utility job step becomes available for reuse. The output from REPORT RECOVERY is now available for RECOVER utility use.

DSNU590I *csect-name object* **RESOURCE NOT AVAIL-**
ABLE - object-name REASON = X'reason-code'

Explanation: A required object could not be accessed
because of the reason shown in 'reason-code'. The
'object-name' can be a database, table space, or index
space. If the object is in a stopped state and has partitions,
then the stopped state applies to one or more of the partitions.

When a timeout condition occurs causing an automatic TERM
UTIL, both the U590 and U170 messages will be issued in the
Reorg output as follows: DSNURDRN — RESOURCE NOT
AVAILABLE, REASON=X'00C9008E', ON database.pageset.

Severity: 8 (error) or 4 (warning)

System Action: If the return code is 8, utility processing is terminated. If the return code is 4, utility processing continues to the next request.

User Response: Determine the cause for unavailability. The -DISPLAY DATABASE command can be used to determine the status. After ensuring the object is available, resubmit the job.

DSNU591I *csectname* **AN UNSUCCESSFUL COMPLETION**
OF A LOG READ, REASON=X'reason-code'

Explanation: The log manager subcomponent of DB2 detected an error during a LOG READ of SYSCOPY record for DSNDDB06.SYSCOPY, DSNDDB01.DBD01 or DSNDDB01.SYSUTIL.

Severity: 4 (warning)

System Action: Processing continues.

Problem Determination: Look up the reason code in "Section 4. DB2 Codes" on page 4-1 of this book for problem determination.

DSNU592I *csect-name* **REPORT RECOVERY INFORMA-**
TION FOR DATA SHARING MEMBER *member-*
name

Explanation: The REPORT RECOVERY utility displays this message as the heading for SYSLGRNX and BSDS records or BSDS summary information for each data sharing member. Records for this member follow, if there is data to report.

Severity: 0 (Informational)

System Action: Utility processing continues.

DSNU593I *csect-name* **REPORT RECOVERY ENVIRON-**
MENT INFORMATION:
MINIMUM RBA: *rba1*
MAXIMUM RBA: *rba2* **MIGRATING**
RBA: *rba3*

Explanation: The REPORT utility issues this message to display recovery environment information used by the RECOVER utility. The maximum and minimum RBAs give the range of possible recovery points on the log before the start of data sharing. The migrating RBA is the RBA at the time of migration from DB2 Version 3 to Version 4. If there is data to report, other messages from the REPORT utility follow to display SYSCOPY, SYSLGRNX and BSDS records.

Severity: 0 (Informational)

System Action: Utility processing continues.

DSNU594I *csect-name* **DB2 ENCOUNTERED SYSLGRNX**
RECORDS THAT CANNOT BE USED FOR
RECOVERY.

Explanation: The utility found one or more SYSLGRNX records that cannot be used for recovery because the range is outside recovery. Invalid SYSLGRNX records are marked with '*' at the end of the record under message DSNU583.

Severity: 4 (REPORT - warning) or 8 (RECOVER - error)

System Action: REPORT utility processing continues. RECOVER utility terminates.

System Programmer Response: Run the RECOVER utility with the TOCOPY option.

DSNU595I *csect-name* **ERROR IN GETTING THE HIGHEST MEMBER ID IN DATA SHARING.**

Explanation: The REPORT utility could not find a valid highest member ID. The highest member is the last member to join a data sharing group. This message is issued only in a data sharing environment.

Severity: 8 (error)

System Action: The REPORT utility abends.

System Programmer Response: This might be an internal DB2 problem. Refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU596I *csect-name* **ERROR IN GETTING THE MEMBER NAME FOR MEMBER ID**

Explanation: The REPORT utility could not find a valid member name for the member ID, or the member ID supplied is invalid. This message is issued only in a data sharing environment.

Severity: 8 (error)

System Action: The REPORT utility abends.

System Programmer Response: This might be a DB2 internal problem. Refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU597I *csect-name* **INVALID SYSLGRNX INFORMATION FROM REPORT RECOVERY**

Explanation: This is the header message for the invalid SYSLGRNX records section of the REPORT RECOVERY output. This section lists SYSLGRNX records containing information that is invalid for recovery purposes.

Severity: 0 (Informational)

System Action: Utility processing continues.

User Response: Examine the invalid SYSLGRNX records with a zero member ID which were generated before enabling data sharing. The MODIFY utility can be used to delete the invalid SYSLGRNX records.

DSNU598I *csect-name* **MODIFY RECOVERY IS NOT ALLOWED FOR TABLESPACE *tablespace-name* IN VERSION *version***

Explanation: The MODIFY RECOVERY utility cannot process the identified table space in this version because one or more of the indexes over the tables in the table space was defined with the COPY YES attribute. To ensure that the recovery information for the table space and its indexes are kept synchronized, the MODIFY RECOVERY utility must be run in DB2 Version 6.

Severity: 8 (error)

System Action: Utility processing is terminated.

User Response: If you are in a data sharing environment, resubmit the job on a Version 6 member. If there are no members at the Version 6 level or if you are in a non-data sharing environment, do not execute the MODIFY RECOVERY utility on this table space until the remigration to Version 6 is complete.

DSNU600I *csect-name* **INDEX *creator.index-name* POINTS TO A DIFFERENT DATABASE.**

Explanation: A specified index does not point to a table in the database selected. For a RUNSTATS Format 1 invocation, the database is the one specified (or defaulted) in the TABLESPACE parameter. For a RUNSTATS Format 2 invocation, the database is the one which contains the first index in the index-name list.

Severity: 8 (error)

System Action: All remaining RUNSTATS invocation parameters are validated and the executing utility job terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Ensure that all indexes in the list point to the same database and resubmit the RUNSTATS job.

Problem Determination: Refer to catalog table SYSIBM.SYSINDEXES to determine the table upon which the index is based. This table must be in the database and table space targeted by the RUNSTATS utility.

DSNU601I *csect-name* **INDEX *creator.index-name* POINTS TO A DIFFERENT TABLESPACE.**

Explanation: A specified index does not point to a table in the table space selected. The table space is either the one specified in the TABLESPACE parameter or the one which contains the table pointed to by the first specified index.

Severity: 8 (error)

System Action: All remaining RUNSTATS invocation parameters are validated and the executing utility job terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Ensure that all indexes in the list point to tables in the targeted table space and resubmit the RUNSTATS job.

Problem Determination: Refer to catalog table SYSIBM.SYSINDEXES to determine the table upon which the index is based. Using the table-name found in SYSIBM.SYSINDEXES, refer to catalog table SYSIBM.SYSTABLES to determine the containing table space.

DSNU603I *csect-name* - **OBJECT=*object-name* HAS AN INCOMPLETE DEFINITION**

Explanation: The identified object (TABLE or TABLESPACE) does not have a complete definition. This can be caused by one of these errors:

- Not defining any tables in the table space (RC=4).
- Not creating the accompanying partitioned index if the table space is partitioned (RC=8).

Severity: 8 (error) or 4 (warning)

System Action: If the return code is 8, utility processing terminates. If the return code is 4, utility processing continues to the next request.

User Response: Complete the table space definition by creating at least one table in the table space, or create the

accompanying partitioned index if the table space is partitioned.

Problem Determination: Issue an SQL SELECT statement on the catalog to determine if the tables or a partitioned index was not created for the table space.

DSNU604I *csect-name* **object IS EMPTY**

Explanation: The object currently to be scanned by the RUNSTATS utility contains no records. The 'object' can be TABLESPACE or INDEXSPACE.

Severity: 0 (informational)

System Action: The object currently to be scanned is recorded in the catalog as empty. The statistics for the object are updated and RUNSTATS continues to the next object, if there is one.

DSNU605I *csect-name* **ERROR OCCURRED ACCESSING TABLESPACE** *database-name.tablespace-name*

Explanation: A previous error makes it impossible for RUNSTATS to scan TABLESPACE 'creator.tbspname'.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Examine prior error messages for error identification. If the error can be corrected, resubmit the RUNSTATS utility in a new utility job step. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Prior messages identify this error. See the documentation for these messages in this manual for additional problem determination.

DSNU606I *csect-name* **USER NOT AUTHORIZED TO ACCESS TABLESPACE** *database-name.tablespace-name*

Explanation: This user is not authorized to execute the RUNSTATS utility against TABLESPACE 'creator.tbspname'.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Contact your system administrator to obtain the proper authority, or have another user with the required authority execute the utility for you.

DSNU607I *csect-name* **ERROR OCCURRED ACCESSING INDEXSPACE** *creator.index-name*

Explanation: A previous error makes it impossible for RUNSTATS to scan INDEXSPACE 'creator.indexspacename'.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No

record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Examine prior error messages for error identification. If the error can be corrected, resubmit the RUNSTATS utility in a new utility job step.

Problem Determination: Prior messages identify this error. See the documentation for these messages in this manual for additional problem determination. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU608I *csect-name* **USER NOT AUTHORIZED TO ACCESS INDEXSPACE** *creator.index-name*

Explanation: This user is not authorized to execute the RUNSTATS utility against INDEXSPACE 'creator.indexspacename'.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained in the system; therefore, it cannot be restarted.

User Response: Contact your system administrator to obtain the proper authority, or have another user with the required authority execute the utility for you.

DSNU609I *csect-name* **TABLE** *table-name* **IS IN A DIFFERENT TABLESPACE**

Explanation: A table listed in the table name list of the RUNSTATS TABLE keyword was not found in the specified table space.

Severity: 8 (error)

System Action: The executing utility job step terminates. Work performed by previous utilities in the job step remains in effect. Subsequent utility control statements are flushed. No record of the utility job step is retained by the system; therefore it cannot be restarted.

User Response: Ensure that all tables in the list are in the specified table space and resubmit the utility.

Problem Determination: Refer to the catalog table SYSIBM.SYSTABLES to determine the table space in which the table is located.

DSNU610I *csect-name catalog-table-name* **CATALOG UPDATE FOR** *object-name* **SUCCESSFUL**

Explanation: This message indicates that the updating of the statistics columns in the CATALOG TABLE 'catalog-table-name' was successful.

Severity: 0 (informational)

System Action: Processing continues with the next catalog table.

DSNU611I *csect-name* **COLUMN** *column-name* **NOT FOUND FOR TABLE** *creator.table-name*

Explanation: A column name, given as an operand of the COLUMN keyword, was not found in the specified table.

Severity: 8 (error)

System Action: Validation of the utility invocation statement is completed and the executing utility job step is terminated.

User Response: Ensure that the column name given in the message is correct for the table specified.

Problem Determination: Check that the column name specified in the utility invocation statement is identical to that found in the SYSIBM.SYSCOLUMNS catalog table. Correct any errors and reissue the utility job.

DSNU612I *csect-name* **SYSTABLESPACE CATALOG STATISTICS FOR** *tspacename* **NACTIVE =** *inactive*

Explanation: The RUNSTATS utility issues this message to report the statistics collected for table space 'tspacename'.

nactive The number of active pages in the table space

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: Refer to *Utility Guide and Reference* for a discussion of the meaning of RUNSTATS statistics.

DSNU613I *csect-name* **SYSTABLEPART CATALOG STATISTICS FOR** *table-space-name* **PARTITION** *part-num*

CARD	= cardinality
NEARINDREF	= nearindref
FARINDREF	= farindref
PERCACTIVE	= peractive
PERCDROP	= percdrop
PAGESAVE	= pagesave
# PQTY	= PQTY
# SQTY	= SQTY
# SPACE	= space

Explanation: The RUNSTATS utility issues this message to report the statistics collected. If the 'part-num' equals 0, the statistics apply to the entire table space. If the 'part-num' is not 0, the statistics apply to the specified partition of the table space.

cardinality	The number of rows in the reported partition number
nearindref	The number of rows that were relocated near their original page
farindref	The number of rows that were relocated far from their original page
peractive	The percentage of space occupied by actual data from active tables
percdrop	The percentage of space occupied by rows of data from dropped tables
pagesave	The percentage of pages saved in the table space or partition by using data compression
# PQTY	The primary space allocation for the dataset in 4K blocks
#	

# SQTY	The secondary space allocation for the dataset in 4K blocks
#	
# space	The number of kilobytes of space currently allocated for all extents
#	

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: Refer to of *Utility Guide and Reference* for a discussion of RUNSTATS statistics.

DSNU614I *csect-name* **SYSTABLES CATALOG STATISTICS FOR** *table-name*

CARD	= cardinality
CARDF	= cardinality
NPAGES	= npages
PCTPAGES	= pctpages
PCTROWCOMP	= pctrowcomp

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the specified table. The statistics follow:

cardinality	The number of rows in the table
npages	The number of pages on which rows of the table appear
pctpages	The percentage of total pages of the table space that contain rows from this table
pctrowcomp	The percentage of rows compressed within the total number of active rows in the table

For a LARGE table space, the value of CARD is set to -1.

RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: Refer to *Utility Guide and Reference* for a discussion of RUNSTATS statistics.

DSNU615I *csect-name* **SYSCOLUMNS CATALOG STATISTICS FOR** *column-name*

COLCARD	= cardinality
COLCARDF	= cardinality
HIGH2KEY	= high2key
LOW2KEY	= low2key

Explanation: The RUNSTATS utility issues this message to report the statistics collected for column 'column-name'. Message DSNU619I is issued to identify the table.

cardinality	The number of distinct values in the column
high2key	The second highest value of the column
low2key	The second lowest value of the column

If the values for 'high2key' and 'low2key' are null, the invoker of RUNSTATS is not authorized to read the table.

For a LARGE table space, the value of COLCARD is set to -1.

RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU616I *csect-name* **SYSOLDIST CATALOG STATISTICS FOR** *column-name, column-name, column-name ...*

CARDINALITY = cardinality

FREQUENCY	COLVALUE
frequency	X "hex_string"
frequency	X "hex_string"
...	...
frequency	X "hex_string"

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the indexed column 'column-name'. If more than one column is listed, then the statistics collected and the column values reported represent the concatenation of those columns.

The value for CARDINALITY is the number of distinct values for the listed columns.

The values under FREQUENCY are the same as those that are inserted into the DB2 catalog. Consider each 'frequency' as a four-digit number with an implied decimal point two places to the left of the final digit. The resulting number is the percentage of total rows in the table that contain a particular value for the named index columns.

Frequency is associated with the occurrence of a single value which is listed under COLVALUE.

Frequencies for the most frequent values are collected by default, or if the FREQVAL option is specified and given a COUNT value greater than zero. If the default is taken, then the ten most frequently occurring values are reported in descending order of frequency.

If fewer than ten values appear, then there are fewer than ten distinct values in the index.

If no values appear, then the values are uniformly distributed.

If frequencies appear but column values do not, then the invoker of RUNSTATS is not authorized to read the table. Message DSNU619I is issued to identify the table.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU617I *csect-name* **SYSINDEXES CATALOG STATISTICS FOR** *index-name*

CLUSTERED	= clustered
CLUSTERATIO	= cluster-ratio
FIRSTKEYCARD	= first-key
FIRSTKEYCARDF	= first-key
FULLKEYCARD	= full-key
FULLKEYCARDF	= full-key
NLEAF	= nleaf
NLEVELS	= nlevels

Explanation: The RUNSTATS utility issues this message to report the statistics collected for index 'index-name'.

clustered Whether the table is actually clustered by this index (YES or NO)

cluster-ratio The percentage of data rows that are in clustering order for this index

first-key The number of distinct values of the first key column

full-key The number of distinct values of the key

nleaf The number of active leaf pages in the index

nlevels The number of levels in the index tree

For a LARGE table space, the values of FIRSTKEYCARD and FULLKEYCARD are set to -1. RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU618I *csect-name* **SYSINDEXPART CATALOG STATISTICS FOR** *index-name PARTITION part-num*

CARD	= cardinality
CARDF	= cardinality
NEAROFFPOS	= near-off
NEAROFFPOSF	= near-off
FAROFFPOS	= far-off
FAROFFPOSF	= far-off
LEAFDIST	= leafdist
# PQTY	= PQTY
# SQTY	= SQTY
# SPACE	= space

Explanation: The RUNSTATS utility issues this message to report the statistics collected for index 'index-name'. If 'part-num' equals 0, the statistics apply to the entire index. If 'part-num' is not 0, the statistics apply to the specified partition of the index.

cardinality The number of rows in the partition or index

near-off The number of rows pointed to that are near but not at their optimal positions

far-off The number of rows pointed to that are far from their optimal positions

leafdist 100 times the average distance in page IDs between successive leaf pages during a sequential access of the index

PQTY The primary space allocation for the dataset in 4K blocks

SQTY The secondary space allocation for the dataset in 4K blocks

space The number of kilobytes of space currently allocated for all extents

For a LARGE table space, the values of CARD, NEAROFFPOS, and FAROFFPOS are set to -1. RUNSTATS uses floating point fields to report these statistics.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU619I *csect-name* - **USER *auth_id* DOES NOT HAVE PRIVILEGE ON TABLE *table_name***

Explanation: The RUNSTATS utility issues this message to report that authorization ID 'auth_id' does not have privilege on table 'table_name'. Some column values reported by messages DSNU615I, DSNU616I, DSNU625I, and DSNU626I contain the null value.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: To obtain the key values, the user must be granted authority on the table. The RUNSTATS utility can be rerun with the report option.

DSNU620I *csect-name* **RUNSTATS CATALOG STATISTICS STATTIME = *timestamp***

Explanation: The RUNSTATS utility issues this message to report the timestamp value when statistics were collected. The value 'timestamp' is common to all of the statistic tables that were updated.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *Utility Guide and Reference* for a description of the RUNSTATS statistics.

DSNU621I *csect-name* **RUNSTATS COMMIT/ROLLBACK FAILED**

Explanation: The RUNSTATS utility updated the catalog with gathered statistics and has tried either to commit those changes or to perform rollback processing to remove them following an error. The commit or rollback failed.

Severity: 8 (error)

System Action: RUNSTATS processing is terminated. Subsequent utility control statements in the utility job step are executed.

System Programmer Response: If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: This is an internal error.

DSNU623I *csect-name - catalog-table-name* **CATALOG NOT UPDATED WITH AGGREGATE STATISTICS FOR *object-name* BECAUSE SOME PARTITIONS HAVE NO STATISTICS**

Explanation: Aggregate statistics were requested, but partition statistics do not exist for every partition. Without partition statistics, the aggregate statistics cannot be calculated. The statistics for 'object-name' are not updated in the specified DB2 catalog table.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Run the RUNSTATS utility to collect statistics for:

- The entire table space, table, column or index, or
- Every partition.

DSNU624I *csect-name* **SYSTABSTATS CATALOG STATISTICS FOR *table-name* PARTITION *part-num***

CARD	= cardinality
NPAGES	= npages
PCTPAGES	= pctpages
NACTIVE	= nactive
PCTROWCOMP	= pctrowcomp

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the specified partition of the table space containing the table. The statistics follow:

cardinality	The number of rows in the table space partition
npages	The number of pages on which rows of the table space partition appear
pctpages	The percentage of total pages of the table space partition that contain rows from this table
nactive	The number of active pages in the table space partition
pctrowcomp	The percentage of rows compressed within the total number of active rows in the partition

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: RUNSTATS processing continues.

User Response: Refer to *Utility Guide and Reference* for a discussion of RUNSTATS statistics.

DSNU625I *csect-name* **SYSCOLSTATS CATALOG STATISTICS FOR *column-name* PARTITION *part-num***

COLCARD	= cardinality
HIGHKEY	= highkey
HIGH2KEY	= high2key
LOW2KEY	= low2key
LOWKEY	= lowkey

Explanation: The RUNSTATS utility issues this message to report the statistics collected for column 'column-name' partition 'part-num' of a table. Message DSNU619I is issued to identify the table.

cardinality	The number of distinct values in the column for the partition
highkey	The highest value of the column in the partition
high2key	The second highest value of the column in the partition
low2key	The second lowest value of the column in the partition
lowkey	The lowest value of the column in the partition

If the values for 'highkey', 'high2key', 'low2key', and 'lowkey' are null, the invoker of RUNSTATS is not authorized to read the table.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU626I *csect-name* SYSCOLDISTSTATS CATALOG STATISTICS FOR *column-name, column-name, column-name ... PARTITION part-num*

CARDINALITY = cardinality

FREQUENCY	COLVALUE
frequency	X "hex_string"
frequency	X "hex_string"
...	...
frequency	X "hex_string"

Explanation: The RUNSTATS utility issues this message to report the statistics collected for the indexed column 'column-name' partition 'part-num'. If more than one column is listed, then the statistics collected and the column values reported represent the concatenation of those columns.

The value for CARDINALITY is the number of distinct values for the listed columns.

The values under FREQUENCY are the same as those that are inserted into the DB2 catalog. Consider each 'frequency' as a four-digit number with an implied decimal point two places to the left of the final digit. The resulting number is the percentage of total rows in the table that contain a particular value for the named index columns.

Frequency is associated with the occurrence of a single value which is listed under COLVALUE.

Frequencies for the most frequent values are collected by default, or if the FREQUAL option is specified and given a COUNT value greater than zero. If the default is taken, then the ten most frequently occurring values, plus the lowest and highest values in the partition (if not already included in the ten greatest frequencies), are reported in descending order of frequency.

If fewer than ten values appear, then there are fewer than ten distinct values in the index.

If no values appear, then the values are uniformly distributed.

If frequencies appear but column values do not, then the invoker of RUNSTATS is not authorized to read the table. Message DSNU619I is issued to identify the table.

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU627I *csect-name* SYSINDEXSTATS CATALOG STATISTICS FOR *index-name PARTITION part-num*

CLUSTERRATIO	= cluster-ratio
FIRSTKEYCARD	= first-key
FULLKEYCARD	= full-key
NLEAF	= nleaf
NLEVELS	= nlevels
KEYCOUNT	= keycount

Explanation: The RUNSTATS utility issues this message to report the statistics collected for partition 'part-num' of index 'index-name'.

cluster-ratio	The percentage of data rows in the partition that are in clustering order for this index
first-key	The number of distinct values of the first key column in the partition
full-key	The number of distinct values of the key in the partition
nleaf	The number of active leaf pages in the index partition
nlevels	The number of levels in the index tree in the partition
keycount	The number of index keys (entries) in the partition

This message is routed to SYSPRINT.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to *Utility Guide and Reference* for a description of RUNSTATS statistics.

DSNU638I *csect - UTILITY NOT ALLOWED TO RUN ON TABLESPACE = tttttttt IN ROSHARE READ DATABASE = dddddddd*

Explanation: An attempt to execute STOSPACE utility on a table space defined in a ROSHARE READ database failed. The STOSPACE utility is only allowed to execute in a ROSHARE OWNER or a nonshared database.

Severity: 4 (warning)

System Action: Processing continues to the next table space or index space in the storage group, if any.

User Response: Resubmit the utility job on the system in which the database was defined with the ROSHARE OWNER attribute.

DSNU639I *csect - UTILITY NOT ALLOWED TO RUN ON INDEX SPACE = iiiiitiii IN ROSHARE READ DATABASE = dddddddd*

Explanation: An attempt to execute the STOSPACE utility on an index space defined in a ROSHARE READ database failed. The STOSPACE utility is only allowed to execute in a ROSHARE OWNER or nonshared database.

Severity: 4 (warning)

System Action: Processing continues to the next table space or index space in the storage group, if any.

User Response: Resubmit the utility job on the system in which the database was defined with the ROSHARE OWNER attribute.

DSNU640I *csect-name* **DATA SET= nnn OF TABLESPACE= tttttt IN DATABASE= dddddd HAS BEEN MIGRATED BY HSM**

Explanation: The STOSPACE utility has found that a DB2 data set has been migrated by the Data Facility Hierarchical Storage Manager. The amount of storage space used cannot be determined for DATA SET 'nnn' of TABLESPACE 'tttttt' in DATABASE 'dddddd'. The space allocation information in the catalog will not include the storage used by the migrated data set.

Severity: 0 (informational)

System Action: Processing continues to the next data set in the storage group, if any.

System Programmer Response: If required, the data set may be recalled using HSM, and the STOSPACE utility may be run again.

DSNU641I *csect-name* **DATA SET= nnn OF INDEXSPACE= iiiiii IN DATABASE= dddddd HAS BEEN MIGRATED BY HSM**

Explanation: The STOSPACE utility has found that a DB2 data set has been migrated by the Data Facility Hierarchical Storage Manager. The amount of storage space used cannot be determined for DATA SET 'nnn' of INDEXSPACE 'iiiiii' in DATABASE 'dddddd'. The space allocation information in the catalog will not include the storage used by the migrated data set.

Severity: 0 (informational)

System Action: Processing continues to the next data set in the storage group, if any.

System Programmer Response: If required, the data set may be recalled using HSM, and the STOSPACE utility may be run again.

DSNU642I *csect-name* **UNABLE TO ACCESS DBD FOR DATABASE = dddddd, TABLESPACE = tttttt**

Explanation: A database descriptor control block could not be accessed by the STOSPACE utility. Information in the DBD is required before space allocation data can be obtained from the appropriate ICF catalog. Storage space used by table space 'tttttt' in database 'dddddd' cannot be determined.

Severity: 4 (warning)

System Action: Processing continues with the next storage group.

User Response: Determine the cause for unavailability. The database may be stopped or the DBD may be marked as invalid. The -DISPLAY DATABASE command can be used to determine the status.

System Programmer Response: Determine if the reason for the DBD unavailability may require system corrective action.

Problem Determination: A DSNT501I message may have been sent to the operator console. If so, see the problem determination section for message DSNT501I in the "DSNT... Messages" on page 3-201.

DSNU643I *csect-name* **UNABLE TO ACCESS DBD FOR DATABASE = dddddd, INDEXSPACE = tttttt**

Explanation: A database descriptor control block could not be accessed by the STOSPACE utility. Information in the DBD is required before space allocation data can be obtained from the appropriate ICF catalog. Storage space used by index space 'tttttt' in database 'dddddd' cannot be determined.

Severity: 4 (warning)

System Action: Processing continues with the next storage group.

User Response: Determine the cause for unavailability. The database may be stopped or the DBD may be marked as invalid. The -DISPLAY DATABASE command can be used to determine the status.

System Programmer Response: Determine if the reason for the DBD unavailability may require system corrective action.

Problem Determination: A DSNT501I message may have been sent to the operator console. If so, see the problem determination section for message DSNT501I in the "DSNT... Messages" on page 3-201 section.

DSNU644I *csect-name* **USER user-name NOT AUTHORIZED FOR STOSPACE UTILITY**

Explanation: Utility processing for the user indicated on the job statement failed, because the user is not authorized to execute the STOSPACE utility.

Severity: 8 (error)

System Action: Utility processing is terminated without invoking the requested utility or utilities.

User Response: Contact the systems programmer for assistance with your security classification.

System Programmer Response: If the USER specified on the job statement is incorrect, correct it, and resubmit the job. To run the STOSPACE utility, the user must either have SYSADM authority or have been granted the STOSPACE privilege. Use the SQL GRANT command to give the user the desired authority.

DSNU645I *csect-name* **NO STORAGE GROUPS NAME FOUND**

Explanation: You requested the STOSPACE utility to report on all storage groups, but no storage group was found.

Severity: 4 (warning)

This condition does not prevent subsequent processing.

System Action: This message indicates completion of the STOSPACE utility. Processing continues to the next utility statement in the utility job step, if any. If not, the utility job step is normally terminated. Resources are released to their prior availability state. The UTILID of the utility job step becomes available for reuse.

User Response: This message indicates that there are no storage groups defined. Consult the system programmer to determine the reason for this condition.

System Programmer Response: This message indicates either that no storage groups were defined by the installation process (or by subsequent SQL procedures) or they have all been dropped. If this is an error, the required storage groups

must be re-created with the CREATE STOGROUP SQL statement.

DSNU646I *csect-name* **STORAGE GROUP NAME
nnnnnnnn NOT FOUND**

Explanation: This message is issued by STOSPACE when one of the requested storage groups is not found.

The following circumstances may exist:

1. When an inconsistency occurs between SYSIBM.SYSSTOGROUP at the beginning of STOSPACE execution and SYSIBM.SYSSTOGROUP during or at the end of processing. The inconsistency may be due to a storage group being dropped during the processing of STOSPACE utility.

2. The storage group name is misspelled.

Severity: 4 (warning)

System Action: Processing proceeds normally to the next storage group if any.

User Response: Verify the existence or spelling of the storage group names by referring to SYSIBM.SYSSTOGROUP. Submit another request with the correct storage group designated.

DSNU647I *csect-name* **UNAVAILABLE REASON X** *reason-code* **UNAVAILABLE TYPE X** *type-code*, **TABLESPACE NAME=** *table-space-name* **NOT FOUND**

Explanation: The indicated table space was not available for processing by the STOSPACE utility. The reason for its unavailability is given in 'reason-code'. The type of unavailability is given in 'type-code'.

This message may be issued when an inconsistency between SYSIBM.SYSSTABLESPACE and SYSIBM.SYSTABLEPART has been detected. The inconsistency may be due to a table space being dropped during the processing of the STOSPACE utility.

Severity: 4 (warning)

System Action: Processing continues to the next table space in the storage group, if any.

User Response: Use the 'reason-code' and 'type-code' to determine why the resource was unavailable. When the problem has been resolved, resubmit the STOSPACE request.

System Programmer Response: Determine if the 'reason-code' and 'type-code' require system corrective action.

Problem Determination: See the Problem Determination section for message DSNT500I on page 3-244.

DSNU648I *csect-name* **UNAVAILABLE REASON X** *reason code*, **UNAVAILABLE TYPE X** *type-code*, **INDEX NAME=** *index-name* **NOT FOUND**

Explanation: The indicated index was not available for processing by the STOSPACE utility. The reason for its unavailability is given in 'reason-code'. The type of unavailability is given in 'type-code'.

This message may be issued when an inconsistency between SYSIBM.SYSINDEXES and SYSIBM.SYSINDEXPART has been detected. The inconsistency may be due to an index being dropped during the processing of the STOSPACE utility.

Severity: 4 (warning)

System Action: Processing continues to the next index in the storage group, if any.

User Response: Use the 'reason-code' and 'type-code' to determine why the resource was unavailable. When the problem has been resolved, resubmit the STOSPACE request.

System Programmer Response: Determine if the 'reason-code' and 'type-code' require system corrective action.

Problem Determination: See the Problem Determination section for message DSNT500I on page 3-244.

DSNU650I *csect-name* **control-statement-text**

Explanation: Each control statement is returned to the invoker as a part of the normal output. If an error occurred while processing the statement, a separate error message follows this message.

Severity: 0 (informational)

System Action: The processing of the utility request continues normally.

DSNU651I *csect-name* **SET NOCOPYPEND OPERATION SUCCESSFUL**

Explanation: This message reports the successful completion of the REPAIR SET TABLESPACE NOCOPYPEND utility operation. The COPY PENDING restriction has been removed from the specified table space.

Severity: 0 (informational)

System Action: The REPAIR SET statement has completed normally.

DSNU652I *csect-name* **VERIFY OPERATION SUCCESSFUL**

Explanation: This message is issued during REPAIR utility processing in response to a VERIFY control statement. It indicates the verification requested was successful, permitting a subsequent REPLACE request to take effect.

Severity: 0 (informational)

System Action: The requested verification was successful. If this is the only verification required for the subsequent REPLACE control statement, the REPLACE control statement takes effect. If there are other verification control statements, they must also complete successfully before the subsequent REPLACE control statement takes effect.

DSNU653I *csect-name* **REPLACE OPERATION AT OFFSET** *hex-data* **WITH DATA** *hex-data* **FAILED. ATTEMPTED TO REPLACE CRITICAL NON-DATA INFORMATION ON THE PAGE** *page-num* **WITH INCORRECT INFORMATION.**

Explanation: The REPAIR utility job with the LOG YES option was unable to replace certain critical, nondata information in the page for one of these reasons:

- Some critical information on any page at the indicated offset cannot be replaced by this method.
- The page is a header page and some of the information at the indicated offset cannot be replaced by this method.

- The information can be replaced only by using the LOG NO option.

Severity: 8 (error)

System Action: REPAIR resumes executing at the next LOCATE statement. Later control statements in the same LOCATE block are not executed.

User Response: Correct the REPAIR control statements and resubmit the request in a new utility job step.

User Response: Check the OFFSET option on the REPLACE statement to be sure it does not cause critical information to be replaced. If the replacement is intentional, use the LOG NO option.

DSNU654I *csect-name* **VERIFY OPERATION FAILED, DATA IS** *hex-data*

Explanation: The verify operation requested on the control statement failed. The actual data is given as 'hex-data'.

Severity: 4 (warning)

System Action: All REPAIR REPLACE actions subject to the current LOCATE scope are ignored. Processing continues at the next LOCATE request, if any.

User Response: Determine why the data (as reported in the message) does not match the expectations of VERIFY option. Make the appropriate correction, and resubmit the REPAIR request in a new utility job step.

Problem Determination: The REPAIR DUMP option can help you determine the correct verification data. Refer to *Utility Guide and Reference* for REPAIR processing constraints.

DSNU655I *csect-name* **DELETE OPERATION SUCCESSFUL**

Explanation: This message is issued during the REPAIR utility in response to a DELETE control statement.

Severity: 0 (informational)

System Action: The data record specified on the previous LOCATE statement and all of its related INDEX entries have been deleted from the system. Processing continues.

DSNU656I *csect-name* **REPLACE OPERATION SUCCESSFUL, DATA WAS** *hex-data*

Explanation: This message is issued by the REPAIR utility in response to a REPLACE control statement request. The message indicates that replacement of the data occurred and that the replaced data had the indicated hexadecimal value ('hex-data').

Severity: 0 (informational)

System Action: The REPAIR utility located the indicated record, performed all requested verifications, and replaced the data in the record at the indicated offset with the new data as defined by the REPLACE control statement.

System Programmer Response: If a changed record is recovered before an image copy is made, and the REPAIR utility was run with LOG NO, the repair must be reapplied. If the REPAIR utility was run with LOG YES, no image copy is required before recovering the data after the repair.

DSNU657I *csect-name* **REPLACE RESET OPERATION SUCCESSFUL**

Explanation: This message is issued by the REPAIR utility in response to a REPLACE RESET control statement request. The message indicates that the broken page indicator has been reset.

Severity: 0 (informational)

System Action: The REPAIR utility has reset the broken page indicator for the specified page. Although the reset indicator has been committed, it has not been logged. If the page is recovered before an image copy is made, the REPAIR RESET must be reapplied.

However, to make the repair persist across subsequent RECOVER operations, an image copy should be taken subsequent to the completion of the REPAIR utility.

DSNU658I *csect-name* **MULTIPLE RECORDS FOUND WITH SPECIFIED KEY**

Explanation: The specified key is not unique. Several DSNU660I messages, giving possible RID values for this KEY, follow this message.

Severity: 8 (error)

System Action: Processing continues normally.

User Response: Change the LOCATE statement to locate the desired RID, and resubmit the request in a new utility job step.

DSNU659I *csect-name* **REPAIR LEVELID OPERATION DISALLOWED.**

Explanation: The REPAIR utility with the LEVELID clause is not allowed. Possible reasons are:

- The data set was in use at the time the REPAIR utility was run.
- The page set has outstanding log apply activity (an indoubt UR has interest in the page set or the page set has pages in the logical page list (LPL)).

Severity: 8 (error)

System Action: Processing ends with this operation.

User Response: The REPAIR LEVELID operation for the given table space cannot continue at this stage. If the page set is in use, you should not attempt to run REPAIR LEVELID. If the page set has log apply activity outstanding (in-doubt UR or pages in LPL), the log apply activity must complete before using REPAIR LEVELID. Submit other REPAIR control statements in a different job step.

DSNU660I *csect-name* **POSSIBLE RID** *rid*

Explanation: 'rid' is one of several records that map to the specified KEY.

Severity: 8 (error)

System Action: Other records also mapping to the specified KEY are identified by other DSNU660I messages. This message is preceded by message DSNU658I. Processing continues normally.

User Response: Change the LOCATE statement to locate the desired RID, and resubmit the request in a new utility job step. If you suspect an error in DB2, refer to Section 3 of *Diag-*

nosis Guide and Reference for information on identifying and reporting the problem.

DSNU661I *csect-name* **RECORD NOT FOUND IN PAGE,**
MAXID= hex-data

Explanation: A RID was either specified or obtained from the clustering index via the specified KEY. The PAGE indicated in the RID did not contain the RECORD indicated in the RID.

Severity: 8 (error)

System Action: Processing proceeds to the next LOCATE statement, if there is one.

User Response: Either change the LOCATE statement to locate a valid RID or KEY, or use LOCATE PAGE and resubmit the REPAIR statements in a new utility job step. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU662I *csect-name* **NO RECORD FOUND WITH SPECI-**
FIED KEY

Explanation: A KEY was specified on the LOCATE statement, but no entry exists in the clustering index for that KEY.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement, and resubmit the REPAIR statements in a new utility job step.

DSNU663I *csect-name* **PAGE hex-page-number NOT**
FOUND

Explanation: The page identified a record identifier (RID) or KEY does not exist in the specified table space.

Severity: 0 (informational) when issued by DUMP PAGES(n).
8 (error) when issued by LOCATE PAGE(n).

System Action: Processing begins at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement, and resubmit the REPAIR statements in a new utility job step.

DSNU664I *csect-name* **INVALID OFFSET OR LENGTH**
FOR xxxxx

Explanation: 'xxxxx' is 'RECORD' or 'PAGE'. The specified or default values for OFFSET and LENGTH combine to extend beyond the specified record or page.

Severity: 4 (warning)

System Action: Processing continues at the next LOCATE statement, if there is one.

User Response: Correct the OFFSET and/or LENGTH specification, and resubmit the REPAIR statements in a new utility job step. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU665I *csect-name* **NO RECORD ASSOCIATED WITH**
SPECIFIED RID

Explanation: A record identifier (RID) was specified on the LOCATE statement, but that RID is not associated with any record in the specified table space. If DELETE processing returns this message, the RID may exist but be invalid for DELETE.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one. Subsequent utilities in the same job step will not be executed.

User Response: Correct the LOCATE statement, and resubmit the REPAIR statements in a new utility job step.

Problem Determination: REPAIR DELETE will issue this message for RIDs which are internal and do not directly represent user data. The DUMP keyword may be used to view the RID, if it exists. These internal records may only be repaired using the REPLACE keyword.

DSNU666I *csect-name* **NO INDEX EXISTS**

Explanation: The KEY for this table space is not a full clustering key. The statement is invalid.

Severity: 8 (error)

System Action: Processing continues at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement to use the clustering index, or change LOCATE by PAGE or RID. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU668I *csect-name* **UNABLE TO CONVERT KEY TO**
format

Explanation: 'format' specifies the data type to which the KEY specification must be converted. The conversion has failed.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement to specify a KEY either of the indicated data type or of a compatible data-type. Then resubmit the REPAIR statements in a new utility job step. Refer to *Utility Guide and Reference* for a discussion of conversion constraints.

DSNU669I *csect-name* **INDEX NOT FOUND FOR SPECI-**
FIED TABLESPACE

Explanation: An index was specified on the LOCATE KEY statement via the INDEX keyword, but no index by that name was found related to the specified TABLESPACE.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one.

User Response: Correct the LOCATE statement and resubmit the REPAIR statements in a new utility job step.

Problem Determination: Valid index names can be found in the SYSIBM.SYSINDEXES catalog table.

DSNU670I *csect-name* **PAGE X page-id IS A BROKEN PAGE**

Explanation: The indicated page located by the REPAIR utility has been marked broken by the data manager. The 'page id' is given in hexadecimal. This page is not accessible until the broken page indicator is reset by the REPAIR REPLACE RESET option.

Severity: 4 (warning)

System Action: The message reports that the page in which the REPAIR utility is requested to REPLACE some data is broken.

User Response: Determine the cause of the broken page with the assistance of the system programmer. When it is repaired, use the REPAIR RESET option.

System Programmer Response: Determine the cause of the broken page. It could be an internal error and require support center assistance. The REPAIR DUMP option can be used to determine the contents of the page for failure analysis. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU672I *csect-name* **INDEX USED HAS MULTIPLE-FIELD KEY**

Explanation: A REPAIR LOCATE KEY operation was attempted against a table space using an index that has a multiple-field key. LOCATE KEY does not support multiple-field keys.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE scope, if any.

User Response: Change the LOCATE statement to specify PAGE and RID, and resubmit the REPAIR statements in a new utility job step.

DSNU673I *csect-name* **REPAIR LOCATE RID LOCATED A NON-DATA PAGE**

Explanation: The LOCATE RID option of the REPAIR utility was used to process a nondata page.

Severity: 8 (error)

System Action: Processing continues at the next LOCATE statement. Otherwise, processing stops.

User Response: To process nondata pages, use the LOCATE PAGE option in the REPAIR control statements and resubmit the new utility job step. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU678I *csect-name* **VERIFY, REPLACE, DUMP, OR DELETE BEFORE LOCATE**

Explanation: The REPAIR utility was requested to VERIFY, REPLACE, or DUMP or DELETE a page or record and that page or record could not be located.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE statement, if there is one. Subsequent utilities in the same job step will not be executed.

User Response: Correct the REPAIR control statements, and resubmit the request in a new utility job step. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU679I *csect-name* **MULTIPLE 'DELETE'S PER 'LOCATE' NOT ALLOWED**

Explanation: The REPAIR utility was requested to DELETE the same record more than once. Only one DELETE is allowed per LOCATE RID or LOCATE KEY.

Severity: 8 (error)

System Action: Processing begins at the next LOCATE scope, if any. Subsequent utilities in the same job step are not executed.

User Response: Remove all but one DELETE control statement from each LOCATE scope which is intended to delete a record. If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

DSNU680I *csect-name* **PAGE hex-page-number**

Explanation: This message is issued as an identifier at the top of each page dumped by the REPAIR DUMP PAGES facility. 'hex-page-number' identifies the page which is about to be dumped.

Severity: 0 (informational)

System Action: Processing continues.

DSNU681I *csect-name* **SET NOCHECKPEND OPERATION SUCCESSFUL**

Explanation: This message reports the successful completion of the REPAIR SET TABLESPACE NOCHECKPEND utility operation. The check pending restriction has been removed from the specified table space.

Severity: 0 (informational)

System Action: The REPAIR SET statement has completed normally.

DSNU682I *csect-name* **SET NORCVRPEND OPERATION SUCCESSFUL**

Explanation: This message reports the successful completion of the REPAIR SET NORCVRPEND utility operation. The RECOVERY PENDING restriction has been removed from the specified table space, from the specified index, or from all indexes of the specified table space.

Severity: 0 (informational)

System Action: The REPAIR SET statement has completed normally.

DSNU683I *csect-name* **REPAIR LEVELID OPERATION SUCCESSFUL**

Explanation: The REPAIR utility with the LEVELID clause completed successfully.

Severity: 0 (informational)

System Action: Processing completed successfully.

User Response: Submit any other REPAIR control statements in a different job step.

DSNU700I *csect-name nnnn* INDEX ENTRIES UNLOADED FROM INDEX=*iiii* PARTITION=*pppp*

Explanation: The CHECK utility UNLOAD phase unloaded nnnn records from the index named iiii and partition pppp.

Severity: 0 (informational)

System Action: Processing continues.

DSNU701I *csect-name nnnn* INDEX ENTRIES UNLOADED FROM *iiii*

Explanation: The CHECK Utility UNLOAD phase unloaded nnnn records from the index named iiii. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: Processing continues.

DSNU702I *csect-name* INVALID INDEX SPECIFICATION. INDEX=*iiii*

Explanation: All tables referenced by the INDEXES being CHECKed or RECOVERed must be in the same table space. Index 'iiii' is not over a table in the table space specified with the TABLESPACE keyword.

Severity: 8 (error)

System Action: Utility processing is discontinued.

User Response: Correct the index name and/or the TABLESPACE parameters such that a single table space is involved, and rerun the utility job.

Problem Determination: To CHECK or RECOVER ALL INDEXES in a table space, use the TABLESPACE keyword, but do not use the list option. This is one way to correct this error. If you want to correct the list of indexes specified in the index name list, the following procedure will locate the table space name related to the index 'iiii'.

The index name 'iiii' reported in the message is of the form 'creator.name'. Obtain the TBCREATOR and TBNAM columns from the DB2 catalog table SYSIBM.SYSINDEXES where columns CREATOR and NAME have the values reported in the message. Obtain the DBNAME and TSNAME columns from the DB2 catalog table SYSIBM.SYSTABLES, where columns CREATOR and NAME have the values obtained from TBCREATOR and TBNAM of SYSIBM.SYSINDEXES.

The values for DBNAME and TSNAME must be the same for all indexes specified in the index name list and must be the same as the table space name specified on the TABLESPACE keyword (if provided).

DSNU703I *csect-name* INVALID INDEX SPECIFICATION. INDEX=*iiii*

Explanation: All tables referenced by the indexes being CHECKed or RECOVERed must be in the same table space. Index 'iiii' is not over a table in the same table space as the prior indexes listed in the index name list.

Severity: 8 (error)

System Action: Utility processing is discontinued.

User Response: Correct the index name and/or the TABLESPACE parameters such that a single table space is involved, and rerun the utility job.

Problem Determination: To CHECK or RECOVER ALL INDEXES in a table space, use the TABLESPACE keyword, but do not use the list option. This is one way to correct this error. If you want to correct the list of indexes specified in the index name list, the following procedure will locate the table space name related to the index 'iiii'.

The index name 'iiii' reported in the message is of the form 'creator.name'. Obtain the TBCREATOR and TBNAM columns from the DB2 catalog table SYSIBM.SYSINDEXES, where columns CREATOR and NAME have the values reported in the message. Obtain the DBNAME and TSNAME columns from the DB2 catalog table SYSIBM.SYSTABLES, where columns CREATOR and NAME have the values obtained from TBCREATOR and TBNAM of SYSIBM.SYSINDEXES.

The values for DBNAME and TSNAME must be the same for all indexes specified in the index name list and must be the same as the table space name specified on the TABLESPACE keyword if provided.

DSNU705I *csect-name* UNLOAD PHASE COMPLETE, ELAPSED TIME=*tttt*

Explanation: The unload phase of the CHECK or RECOVER INDEX utility is complete.

Severity: 0 (informational)

System Action: Processing continues.

DSNU706I *csect-name* ROW IS IN WRONG PARTITION RID=*rrrr*, INDEX=*iiii*, KEY=*kkkk*, CORRECT PART=*pppp*, WRONG PART=*wwww*

Explanation: The row at RID 'rrrr' resides in the wrong partition. The partitioning KEY 'kkkk' for partitioning INDEX 'iiii' indicates that the row at RID 'rrrr' should reside in partition 'pppp', however the rid indicates that the row contains partition 'wwww'.

Severity: 4 (warning)

System Action: Utility processing continues.

User Response: Run RECOVER TABLESPACE utility to recover the data or run REPAIR DELETE utility to delete the row 'rrrr' followed by CHECK INDEX and CHECK DATA utility if referential constraints are involved.

Problem Determination: The inconsistency between the table space partition number of a row and the index space partition number of the row's clustering key may be due to a DB2 internal error, but is most likely due to a user using the DSN1COPY service aid to populate a target table space with data from a source table space when the clustering key values on the source and target table spaces are not identical.

DSNU707I *csect-name* INDEX ENTRY POINTS TO WRONG TABLE. OBID=*oooo*, RID=*rrrr*, INDEX=

Explanation: The CHECK utility CHECKIDX phase found that index 'iiii' contains an entry for key 'kkkk' that points to record at RID 'rrrr', but the record belongs to the table with OBID 'oooo'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the RECOVER INDEX utility for index 'iiii'.

DSNU708I *csect-name* INDEX IS NOT UNIQUE. INDEX=*iiii*,
KEY=*kkkk*

Explanation: The CHECK utility CHECKIDX phase found that unique index '*iiii*' contains a nonunique key, '*kkkk*'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Drop the unique index, and delete the duplicate rows. Re-create the index.

DSNU709I *csect-name* NO INDEX ENTRY FOR ROW.
RID=*rrrr*, INDEX=*iiii*, KEY=*kkkk*

Explanation: The CHECK utility CHECKIDX phase found that index '*iiii*' is missing an entry for the row at RID '*rrrr*' with key '*kkkk*'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the RECOVER INDEX utility for index '*iiii*'.

DSNU710I *csect-name* INDEX ENTRY CONTAINS
INVALID ZERO REPRESENTATION. RID=*rrrr*,
INDEX=*iiii*, KEY=*kkkk*

Explanation: The CHECK utility CHECKIDX phase found that index '*iiii*' has an entry that contains a negative zero. The index entry is for the row at RID '*rrrr*' with key '*kkkk*'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the RECOVER INDEX utility for index '*iiii*'.

DSNU711I *csect-name* NO ROW FOR INDEX ENTRY.
RID=*rrrr*, INDEX=*iiii*, KEY=*kkkk*

Explanation: The CHECK utility CHECKIDX phase found that the index '*iiii*' contains an entry that has no row. The index entry contained RID '*rrrr*' and key '*kkkk*', but RID '*rrrr*' is not a valid record.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the RECOVER INDEX utility for index '*iiii*'.

DSNU712I *csect-name* INDEX OUT OF SEQUENCE.
INDEX=*iiii*, KEY=*kkkk*

Explanation: The CHECK utility CHECKIDX phase found that index '*iiii*' is not in correct sequence.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the RECOVER INDEX utility for index '*iiii*'.

DSNU713I *csect-name* KEYS MISMATCH. RID=*rrrr*,
INDEX=*iiii*, KEY=*kkkk*, DATA KEY=*jjjj*

Explanation: The CHECK utility CHECKIDX phase found that index *iiii* contains an entry for the row at rid *rrrr* that is inconsistent. KEY *kkkk* does not match DATA KEY *jjjj*.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the RECOVER INDEX utility for index '*iiii*'.

DSNU715I *csect-name* MULTIPLE INDEX ENTRIES FOR
ROW. RID=*rrrr*, INDEX=*iiii*, KEY=*kkkk*

Explanation: The CHECK utility CHECKIDX phase found that index '*iiii*' has multiple index entries for the row at RID '*rrrr*' with key '*kkkk*'.

Severity: 4 (warning)

System Action: CHECK utility processing continues.

User Response: Run the RECOVER INDEX utility for index '*iiii*'.

DSNU717I *csect-name nnnn* ENTRIES CHECKED FOR
INDEX=*iiii* PARTITION=*pppp*

Explanation: The CHECK utility completed checking index *iiii* partition *pppp* and processed *nnnn* index entries. This message is issued once for each index partition checked. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: Processing continues.

DSNU718I *csect-name* NO INDEXES FOUND FOR
TABLESPACE *tttt*

Explanation: A utility has been invoked with the TABLESPACE keyword specifying a table space containing tables that have no indexes.

Severity: 4 (warning)

System Action: This message indicates completion of the utility. Processing continues to the next utility statement in the job step, if any. If there are no utility statements following, the job step is terminated normally and the UTILID of the job step becomes available for reuse.

User Response: If the table space specification is in error, correct it and resubmit the utility. If the table space specification is correct, and the table space contains no indexed tables, this is a normal indication and no response is necessary.

DSNU719I *csect-name nnnn* ENTRIES CHECKED FOR
INDEX *iiii*

Explanation: The CHECK utility has completed checking index '*iiii*' and has processed '*nnnn*' index entries. This message will be issued once for each index checked. Counters are valid up to four billion.

Severity: 0 (informational)

System Action: Processing continues.

DSNU720I *csect-name* CHECKIDX PHASE COMPLETE,
ELAPSED TIME = *tttt*

Explanation: The CHECK utility CHECKIDX phase is complete.

Severity: 0 (informational)

System Action: Processing continues.

DSNU721I *csect-name* - USER *auth-id* DOES NOT HAVE
DELETE AUTHORITY ON TABLE

Explanation: The CHECK DATA utility was run with DELETE YES, but user *auth-id* does not have authority to delete from a table specified in the utility statement or from one of its descendents.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Obtain authorization to delete from the tables specified in the utility statement and any of its descendents that are affected.

DSNU722I *csect-name* - USER *userid* DOES NOT HAVE
INSERT AUTHORITY ON EXCEPTION TABLE

Explanation: The CHECK DATA utility was run with FOR EXCEPTION specified but user '*userid*' does not have authority to insert into an exception table specified in the utility statement.

Severity: 8 (error)

System Action: Further utility processing is terminated.

User Response: Obtain authorization to insert into all of the exception tables specified in the utility statement.

DSNU725I *csect-name* DUPLICATE TABLESPACE *tsp*
NAMES EXIST IN THE TABLESPACE LIST

Explanation: This message is issued by the CHECK DATA utility when a duplicate table space '*tsp*' is found in the table space list. An entry in the list for the same table space with a partition specified is also considered a duplicate. This is because all partitions are the default when no partition is specified for a partitioned table space. The CHECK DATA utility proceeds and the duplicate entry is skipped.

Severity: 4 (warning)

System Action: Processing continues.

DSNU726I *csect-name* SCOPE PENDING IS ACTIVE, BUT
THE ENTIRE TABLE SPACE *tsp* MUST BE
CHECKED

Explanation: This message is issued by the CHECK DATA utility when checking with the option SCOPE PENDING. Table space *tsp* is in check pending status, but the utility is checking all rows in dependent tables or tables defined with check constraints in that table space.

Severity: 4 (warning)

System Action: The utility continues processing.

DSNU727I *csect-name* TABLESPACE *tsp* IS NOT CHECK
PENDING

Explanation: This message is issued when 'CHECK DATA TABLESPACE *tsp* SCOPE PENDING' is specified and the CHECK DATA utility finds that the table space is not in a check pending state. The CHECK DATA utility skips table space '*tsp*' and will continue with any other table space specified. The catalog fields that reflect the extent of a check pending state are updated to ensure that they indicate that no check is required.

Severity: 4 (warning)

System Action: Processing continues.

DSNU728I *csect-name* INVALID EXCEPTION TABLE *table2*
FOR *table1*

Explanation: This message is issued when the CHECK DATA utility finds an exception table is invalid. The exception table named '*table2*' which was specified for rows from table, '*table1*', is invalid. Either '*table2*' was missing columns of '*table1*' or '*table2*' contained incompatible column attributes. The CHECK DATA utility will terminate processing after all exception tables have been examined.

Severity: 8 (error)

System Action: The CHECK DATA utility will terminate processing after all the exception tables have been examined.

User Response: Refer to Section 2 (Volume 1) of *Administration Guide* for a definition of the CREATE TABLE command with the LIKE operand to correct the invalid exception table.

DSNU729I *csect-name* TABLE *table-name* NOT SPECIFIED
IN THE 'FOR EXCEPTION' CLAUSE

Explanation: The CHECK DATA utility did not find a required table listed in the FOR EXCEPTION clause. All tables with constraints in the table spaces being checked and their descendents must be listed in the FOR EXCEPTION clause of CHECK DATA utility.

Severity: 8 (error)

System Action: The CHECK DATA utility terminates processing after all the required tables are examined.

User Response: Examine the utility input statement to determine the reason for the missing table named in the message. Correct the input statement to include the missing table and resubmit the job. Refer to *Utility Guide and Reference* for information about the FOR EXCEPTION clause of the CHECK DATA utility and use of exception tables.

DSNU730I *csect-name* CHECKING TABLE *tab*

Explanation: This message is issued when the CHECK DATA utility begins to process a table. The name of table being checked is '*tab*'.

Severity: 0 (informational)

System Action: Processing continues.

DSNU731I *csect-name* **EXCEPTION LIMIT REACHED**

Explanation: The EXCEPTION limit specified on the CHECK utility statement has been reached.

Severity: 8 (error)

System Action: The CHECK utility terminates processing.

User Response: If required, increase the exception limit and resubmit the job.

DSNU732I **NO TABLE TO BE CHECKED FOR TABLESPACE** *tsp*

Explanation: The CHECK DATA utility determined that none of the tables in table space *tsp* has a constraint defined. Therefore, no table in that table space is checked.

This message is issued by the following CSECT: DSNUKINP

Severity: 4 (warning)

System Action: Utility processing continues.

DSNU733I *csect-name* **ROW (RID=rrrrr) HAS NO PARENT FOR** *rel*

Explanation: This message is issued when the CHECK DATA utility finds a row in a dependent table without a parent. The row with RID, 'rrrrr', has no parent for the relationship named 'rel'. This message is always preceded by a DSNU730I message that identifies the table in error.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Refer to Section 2 (Volume 1) of *Administration Guide* for a discussion of the check pending operation.

DSNU735I *csect-name* **DUPLICATE TABLESPACE** *tsp* **PARTITION** *part* **NAMES EXIST IN THE TABLESPACE LIST**

Explanation: This message is issued by the CHECK DATA utility when a duplicate table space '*tsp*' and partition '*part*' is found in the table space list. An entry in the table space list with a partition specified is considered to be a duplicate when another entry for the same table space with no partition specified (defaults to all partitions for a partitioned table space) is found. In this case, the table space list entry with no partition specified has priority and the entry with a partition specified is skipped. The CHECK DATA utility proceeds and the duplicate entry is skipped.

Severity: 4 (warning)

System Action: Processing continues.

DSNU736I *csect-name* **SCOPE PENDING IS ACTIVE, BUT THE ENTIRE TABLE SPACE** *tsp* **PARTITION** *part* **MUST BE CHECKED**

Explanation: This message is issued by the CHECK DATA utility when checking with the option SCOPE PENDING. Table space *tsp* partition *part* is in check pending status, but the utility is checking all rows in that table space partition.

Severity: 4 (warning)

System Action: The utility continues processing.

DSNU737I *csect-name* **TABLESPACE** *tsp* **PARTITION** *part* **IS NOT CHECK PENDING**

Explanation: This message is issued when 'CHECK DATA TABLESPACE *tsp* PART *part* SCOPE PENDING' is specified and the CHECK DATA utility finds that the table space partition is not in a check pending state. The CHECK DATA utility skips table space '*tsp*' partition '*part*' and continues with any other table space specified. The catalog fields that reflect the extent of a check pending state are updated to ensure that they indicate that no check is required.

Severity: 4 (warning)

System Action: Processing continues.

DSNU739I *csect-name* **CHECK TABLE** *tab* **COMPLETE,** *elapsed time=t1*

Explanation: This message is issued when the CHECK DATA utility finishes processing a table. The elapsed clock time that the check of table '*tab*' consumed is '*t1*'.

Severity: 0 (informational)

DSNU740I *csect-name* **CHECKING TABLE** *tab* **PARTITION** *part*

Explanation: This message is issued when the CHECK DATA utility begins to process a table of a partitioned table space in which a single partition was specified. The name of the table and the number of the partition being checked are identified in the message.

Severity: 0 (informational)

System Action: Processing continues.

DSNU741I *csect-name* *nn* **ROWS DELETED FROM TABLE** *tab*

Explanation: This message is issued by the CHECK DATA utility when the DELETE YES option is specified. The number of rows deleted from TABLE *tab* is the number of rows that contain referential integrity violations or check constraint violations, plus their descendent rows. The number of rows deleted from TABLE *tab* is equal to the number of rows inserted into the corresponding exception table. Counters are valid up to four billion.

Severity: 4 (warning)

System Action: Processing continues.

DSNU742I *csect-name* **ROW (RID=rrrrr) VIOLATES CHECK CONSTRAINT** *constraint-name* **ON TABLE** *table-name*

Explanation: The CHECK DATA utility found that the row with RID=*rrrrr* in table *table-name* violated check constraint *constraint-name*.

Severity: 4 (warning)

System Action: Processing continues

User Response: Refer to Section 2 (Volume 1) of *Administration Guide* for a discussion of the check pending operation and recovery procedures.

DSNU749I *csect-name* CHECK DATA COMPLETE,
ELAPSED TIME=*t1*

Explanation: This message is issued when the CHECK DATA utility is complete. The elapsed clock time that the CHECK DATA utility consumed is 't1'.

Severity: 0 (informational)

System Action: Processing ends.

DSNU750I *csect-name* CATMAINT operation STARTED

Explanation: The CATMAINT utility started for the indicated operation.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU751I *csect-name* CATALOG operation OF TABLE -
table-name

Explanation: This message is issued the first time data is operated upon for the designated table.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU752I *csect-name* CATMAINT operation COMPLETED

Explanation: The CATMAINT utility completed for the indicated operation.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU756I *csect-name* CATALOG TABLE IS EMPTY -
table-name

Explanation: This message is issued when the named table is empty.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU759I *csect-name* INCORRECT UNLOAD DATASET
HAS BEEN DETECTED

Explanation: This message indicates an inconsistency between the release level of the unloaded catalog and the DB2 release that is running the CATMAINT utility.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Review the JCL for the job to ensure that the correct unload data set is specified. Verify that the correct level of DB2 is up.

DSNU760I *csect-name* SPECIFIED USER NOT DEFINED
WITH INSTALLATION SYSADM AUTHORITY

Explanation: The utility can be run only under a user defined with the installation SYSADM authority.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Rerun the utility with the proper authorization.

DSNU762I *csect-name* DUPLICATE RECORD DETECTED
FOR TABLENAME - *table-name* SEQNO OF
THE INPUT RECORD IS - *seqno*
FOLLOWING IS UP TO 119 BYTES OF
RECORD BEING INSERTED

Explanation: An object created in the target catalog has the same name as an object being migrated from the source catalog.

Severity: 8 (error)

System Action: Utility abends.

User Response: User data should not be in the target catalog before running the CATMAINT utility. Free or drop the object from the target catalog and rerun the CATMAINT utility.

DSNU764I *csect-name* FOLLOWING IS UP TO 119 BYTES
OF RECORD FOR TABLE *table-name*, SEQNO
seqno BEING PROCESSED AT THE TIME OF
ERROR

Explanation: An abend occurred during the execution of the CATMAINT utility, during the processing of the table, 'table-name', with a sequence number of 'seqno'. The cause of the abend is one of the following:

- The record sequence number was invalid.
- An unexpected return code was received from DSNUEXLO.
- The table name was not found in the load table (DSNUELTB).
- The parent record could not be positioned.
- The position OBID was zero (DSNUELTB has incorrect value).
- The record action code is incorrect.

Following this message, up to the first 119 bytes of the record in question is displayed.

Severity: 8 (error)

System Action: Utility abends.

User Response: Verify that the record in the unloaded data set is correct.

DSNU765I *csect-name* THE DB2 CATALOG IS NOT AT
THE REQUIRED LEVEL. CATALOG NOT
UPDATED

Explanation: The DB2 catalog is not at the proper catalog level to migrate the catalog. An attempt was made to migrate the catalog from a DB2 release from which migration is not supported.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Fall back to the previous release. Migrate only from DB2 releases from which migration is supported.

DSNU766I *csect-name* **THE CATALOG HAS ALREADY BEEN MIGRATED. NO ACTION WILL BE TAKEN**

Explanation: The catalog was already successfully migrated. There is no reason to rerun the catalog migration job. Therefore, no action is taken to update the DB2 catalog.

Severity: 0 (informational)

System Action: Processing ends.

DSNU767I *csect-name* **DB2 SYSTEM MUST BE STARTED ACCESS(MAINT)**

Explanation: In order for the utility to execute, the DB2 subsystem must be started with ACCESS(MAINT). This message indicates that the subsystem was not started in this manner.

Severity: 8 (error)

System Action: -STOP DB2, and then -START DB2 with ACCESS(MAINT).

DSNU768I *csect-name* **CATMAINT CONVERT COMPLETE FOR INDEX** *index-name*

Explanation: The conversion is complete for index *index-name*.

Severity: 0 (informational)

System Action: Processing continues with the next index.

DSNU769I *csect-name* **THE BUILD PHASE FAILED FOR INDEX** *index-name* **REASON** *reason*

Explanation: The CATMAINT CONVERT build phase failed for index *index-name*. This message and others identify the actions that should be taken.

Severity: 8 (error)

Operator Response: Note the reason code and the index name. See the Problem Determination section for an explanation of the collected data.

System Action: Utility processing continues with the next index and will terminate with return code 8.

User Response: Correct the problem indicated by the reason code. Either resubmit the CATMAINT CONVERT job or recover the index that failed.

Problem Determination: The reason the build phase failed is identified by the reason code, which is described in "Section 4. DB2 Codes" on page 4-1.

DSNU770I *csect-name - DBD type* **STARTED FOR DATABASE** *database*

Explanation: This message marks the start of the REPAIR DBD type utility. In the message, 'type' can be DIAGNOSE, REBUILD, or TEST. The database name specified in the REPAIR statement is 'database'.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU771I *csect-name - DBD type* **COMPLETE FOR DATABASE** *database*

Explanation: This message marks the completion of the REPAIR DBD type utility. In the message, 'type' can be DIAGNOSE, REBUILD, or TEST. The database name specified in the REPAIR statement is 'database'.

Severity: 0 (informational)

System Action: Utility processing continues normally.

DSNU772I *csect-name - THE object-type qualifier.object-name* **IS UNAVAILABLE IN THIS RELEASE**

Explanation: This message indicates that the specified object has a dependency on a release from which fall back has occurred, and cannot be operated upon in the current release.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Check the IBMREQD column of the catalog table associated with the specified object type. If the value in the catalog table is the release dependency mark for a release of DB2 from which fall back has occurred, the utility is not operational for the current release of the targeted database.

DSNU773I *csect-name - database* **IS A SYSTEM DATABASE AND CANNOT BE PROCESSED**

Explanation: The database indicated is not eligible for processing by the type of the REPAIR DBD utility involved.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Ensure that the utility control statement specifies the correct database.

DSNU774I *csect-name - SPECIFIED DATABASE* *database* **NOT FOUND**

Explanation: The database indicated by the utility control statement was not found in catalog table SYSIBM.SYSDATABASE.

Severity: 8 (error)

System Action: Utility processing terminates.

User Response: Ensure that the database indicated by the utility control statement exists in SYSIBM.SYSDATABASE.

DSNU775I *csect-name - DROP OF DATABASE* *dbname* **FAILED WITH SQLCODE =** *sqlcode*

Explanation: An error was encountered while using the REPAIR DBD DROP utility to drop DATABASE 'dbname'. The SQL error code is indicated by 'sqlcode'.

Severity: 8 (error)

System Action: DATABASE 'dbname' is not dropped.

User Response: For a description of the SQL error code that was issued, refer to "Section 2. SQL Return Codes" on page 2-1.

```
# DSNU776I  csect-name CATMAINT operation ERROR -
#          error-text.

# Explanation: The CATMAINT utility was terminated because
# the catalog contains one or more of the following (indicated by
# error-text):
#
# • Type 1 indexes
#
# • Data set passwords
#
# • Shared read-only data
# Severity: 0 (informational)
# System Action: Utility processing terminates.
# System Programmer Response: Convert all type 1 indexes
# to type 2, remove all data set passwords, and convert all
# shared read-only data. Then retry the failing CATMAINT opera-
# tion. This message is followed by an abend04E RC00E40601.
# See the problem determination text of RC00E40601 for addi-
# tional information.
```

```
# DSNU777I  csect-name CATMAINT operation STATUS
#          status-msg

# Explanation: The CATMAINT utility is processing CATMAINT
# operation status-msg indicates where CATMAINT is in the
# operation process.
# Severity: 0 (informational)
# System Action: Utility processing continues normally.
```

```
# DSNU778I  csect-name - ERROR PROCESSING SQL
#          STATEMENT - SQL CODE IS: sql-code
#          SQL MESSAGE TOKENS: message-token(s)
#          THE FOLLOWING IS THE PROBLEM SQL
#          STATEMENT: sql-statement.

# Explanation: There was a utility abend in the DB2 database
# services address space (ssnmDBM1) during CATMAINT
# UPDATE processing. The message-tokens displayed are those
# found in the SQLERRMT field of the SQLCA, separated by
# commas, for the indicated SQLCODE sql-code. The problem
# SQL statement sql-statement: is also displayed.
# Severity: 0 (informational)
# System Action: Utility processing abends.
# System Programmer Response: This message is followed
# by an abend04E RC00E40601. The sql-code, message-tokens,
# and sql-statement listed in this message are probably sufficient
# to diagnose and correct the problem. See the problem determi-
# nation text of RC00E40601 for additional information.
```

DSNU780I *csect-name* **DSNUTILB LEVEL *rel1* INVALID WITH SUBSYSTEM LEVEL *rel2***

Explanation: JCL has been submitted which executes level '*rel1*' of DSNUTILB against a level '*rel2*' DB2 subsystem. The levels must match.

Severity: 8 (error)

System Action: The utility terminates with a return code of 8.

User Response: Determine the DB2 subsystem against which you wish to execute. Determine which STEPLIB data set contains the corresponding DSNUTILB load module. Correct the JCL to specify the correct data set on the STEPLIB DD

statement and the correct DB2 subsystem on the EXEC statement and resubmit the job.

DSNU781I *csect-name* **RESTART OF LEVEL *rel1* UTILITY AT LEVEL *rel2* INVALID**

Explanation: JCL has been submitted which attempts to RESTART a stopped utility. The utility began processing at level '*rel1*' and cannot be restarted at level '*rel2*'.

System Action: The utility job is abended with reason code X'00E40018'.

User Response: Either restart the utility at the same level it was originated or terminate the utility with the TERM command and resubmit it at the new level. Refer to *Command Reference* for special TERM command considerations.

DSNU782I *csect-name* **UNABLE TO RECOVER DUE TO ACTIVITY AT ANOTHER SYSTEM LEVEL**

Explanation: The RECOVER utility is unable to recover the specified table space. Activity at another system level has left all image copies for this table space inconsistent with the DB2 LOG.

Severity: 8 (error)

System Action: The utility terminates with a return code of 8.

User Response: The table space, in its entirety can not be recovered. Individual data sets may be recoverable using the DSNUM() keyword.

DSNU783I *csect-name* **Indexes DSNCT02, DSNLUX01, DSNLUX02 and DSNLLX02 have SUBPAGES value greater than 1 and cannot become GROUP BUFFER POOL DEPENDENT.**

Explanation: CATMAINT CONVERT TO TYPE 1 DIRECTORY alters the indexes DSNCT02, DSNLUX01, DSNLUX02, and DSNLLX02 to type 1 with more than one subpage. In a data sharing environment, there cannot be inter-DB2 R/W interest on type 1 indexes with more than one subpage (they cannot become *group buffer pool dependent*). This means that any read or update request that causes inter-DB2 R/W interest on these directory indexes is denied with a 'resource unavailable' condition.

For directory indexes, only type 2 indexes can have full R/W sharing among data sharing members.

Severity: 4 (warning)

System Action: Processing continues.

User Response: With very few exceptions, indexes on the directory will have inter-DB2 R/W interest if there are two or more members in your DB2 data sharing group. Use CATMAINT CONVERT TO TYPE 2 DIRECTORY to convert the indexes to type 2 if you plan to have two or more DB2 members.

DSNU860I *csect-name* **DIAGNOSE UTILITY COMPLETE**

Explanation: This message is issued in response to the normal completion of the DIAGNOSE utility.

Severity: 0 (informational)

System Action: This message indicates the normal completion of the DIAGNOSE utility. Processing continues to the next utility statement in the utility job step.

DSNU861I *csectname* **DISPLAY MEPL**

Explanation: This is the header message for output of the DIAGNOSE DISPLAY MEPL function. The contents of the MEPL is dumped to SYSPRINT.

Severity: 0 (informational)

System Action: This message indicates the beginning of DIAGNOSE DISPLAY MEPL processing.

DSNU863I *csect-name* **DISPLAY OBD** *dbname.tsname*

Explanation: This message is the heading message for DIAGNOSE DISPLAY OBD output.

Severity: 0 (informational)

System Action: This message indicates the start of the output for the DIAGNOSE DISPLAY OBD function.

DSNU864I *csect-name* **DISPLAY OBD, DBID=*nn* OBID=*nn*
OBD TYPE=*type***

Explanation: This message is the heading message for the OBD being displayed.

Severity: 0 (informational)

System Action: This message identifies the OBD being displayed.

DSNU865I *csect-name* **DISPLAY OBD** *dbname.tsname*
COMPLETE

Explanation: This message is issued in response to normal completion of DISPLAY OBD processing.

Severity: 0 (informational)

System Action: This message indicates the end of DISPLAY OBD processing.

DSNU866I *csect-name* **DISPLAY SYSUTIL JOB INFORMATION**

Explanation: This message is the header message for the SYSUTIL JOB INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output. This section displays the job information area of the SYSUTIL record and contains information which identifies the utility the SYSUTIL record is referencing.

Severity: 0 (informational)

System Action: This message identifies the SYSUTIL JOB INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output.

DSNU867I *csect-name* **DISPLAY SYSUTIL
CHECKPOINT/RESTART INFORMATION**

Explanation: This message is the header message for the SYSUTIL UTILITY CHECKPOINT/RESTART INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output. This section displays the utility checkpoint/restart area of the SYSUTIL record and contains information pertaining to utility processing needed for the restart of the utility.

Severity: 0 (informational)

System Action: This message identifies the SYSUTIL UTILITY CHECKPOINT/RESTART INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output.

DSNU868I *csect-name* **DISPLAY SYSUTIL UTILITY
DEPENDENT AREA**

Explanation: This message is the header message for the SYSUTIL UTILITY DEPENDENT INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output. This section displays the utility dependent area of the SYSUTIL record and contains information particular to the utility which the SYSUTIL record is referencing.

Severity: 0 (informational)

System Action: This message identifies the SYSUTIL UTILITY DEPENDENT INFORMATION section of the DIAGNOSE DISPLAY SYSUTIL output.

DSNU869I *csect-name* **DISPLAY SYSUTIL COMPLETE**

Explanation: This message is issued in response to normal completion of DISPLAY SYSUTIL processing.

Severity: 0 (informational)

System Action: This message indicates the end of DISPLAY SYSUTIL processing.

DSNU870I *csect-name* **NO SYSUTIL RECORD FOUND**

Explanation: This message is issued if no SYSUTIL records are found when DISPLAY SYSUTIL is specified.

Severity: 4 (warning)

System Action: This message indicates the end of DISPLAY SYSUTIL processing.

DSNU871I *csectname* **DISPLAY DBET DATABASE** *dbname*

Explanation: This message is the heading for display output of the database exception table (DBET) entry associated with database *dbname*.

Severity: 0 (informational)

System Action: DIAGNOSE DISPLAY DBET processing started for the named database.

DSNU872I *csectname* **DISPLAY DBET TABLE SPACE**
tsname

Explanation: This message is the heading for display output of the database exception table (DBET) entry associated with table space *tsname*.

Severity: 0 (informational)

System Action: DIAGNOSE DISPLAY DBET processing started for the named table space.

DSNU873I *csectname* **DISPLAY DBET INDEX** *index-name*

Explanation: This message is the heading for display output of the database exception table (DBET) entry associated with index *index-name*.

Severity: 0 (informational)

System Action: DIAGNOSE DISPLAY DBET processing started for the named index.

DSNU874I *csectname* NO DBET ENTRY FOUND FOR THE SPECIFIED OBJECT

Explanation: There is no database exception table (DBET) entry associated with the specified object.

Severity: 4 (warning)

System Action: Processing continues normally.

DSNU875I *csectname* DIAGNOSE WAIT AT MESSAGE=*msgno* INSTANCE=*nn* CORR ID=*id1* CONN ID=*id2* REPLY TO CONT

Explanation: The DIAGNOSE WAIT function was invoked to wait at a specified message '*msgno*' on the *nn*'th time that message was issued. The CORR ID is the correlation identifier of the thread associated with the waiting application. The CONN ID is the connection identifier of the thread.

Severity: 4 (warning)

System Action: Processing is stopped until the user responds to this message.

User Response: See operator response.

Operator Response: After diagnosis procedure in progress is completed, reply to this message to continue execution. Any reply is valid.

System Programmer Response: None required

DSNU876I *csectname* DIAGNOSE WAIT AT TRACEID=X'*trcid*' INSTANCE=*nn* CORR ID=*id1* CONN ID=*id2* REPLY TO CONT

Explanation: The DIAGNOSE WAIT function was invoked to wait at a specified traceid '*trcid*' on the *nn*'th time that traceid was encountered. The CORR ID is the correlation identifier of the thread associated with the waiting application. The CONN ID is the connection identifier of the thread.

Severity: 4 (warning)

System Action: Processing is stopped until the user responds to this message.

User Response: See operator response.

Operator Response: After diagnosis procedure in progress is complete, reply to this message to continue execution. Any reply is valid.

System Programmer Response: None required

DSNU877I *event* *modulename*+*offset*

Explanation: Event '*event*' occurred at module '*modulename*' plus '*offset*'. The DIAGNOSE utility issues this message to aid in diagnosing utility problems.

This message is issued by the following CSECTs: DSNUGCMA DSNUGCMB

Severity: 0 (informational)

System Action: Processing continues normally.

DSNU900I *csect-name* - DBD X'*xxxx*' COMPARISON STARTING

Explanation: This message marks the start of a DBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. The DBID of the DBD being compared against the DB2 Catalog is '*xxxx*'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU901I *csect-name* - OBD X'*xxxx*' *obd-type* HAS THE FOLLOWING DIFFERENCES

Explanation: This message marks the start of an OBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. This message is displayed when a difference in the OBDs has been detected. The OBDID of the OBD being compared against the DB2 catalog is '*xxxx*'. The type of OBD being displayed is '*obd-type*'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU902I *csect-name* - EXISTING OBD AT OFFSET X'*xxxxxxxx*' IN EXISTING DBD

Explanation: Following this message is a hexadecimal dump of the OBD as it exists in the DSNDB01.DBD01 page set. In the message, '*xxxxxxxx*' is the hexadecimal offset from the beginning of the existing DBD as it appears later in the REPAIR DBD DIAGNOSE output.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU903I *csect-name* - REBUILT OBD AT OFFSET X'*xxxxxxxx*' IN REBUILT DBD

Explanation: Following this message is a hexadecimal dump of the OBD that was rebuilt from the DB2 Catalog. In the message, '*xxxxxxxx*' is the hexadecimal offset from the beginning of the rebuilt DBD as it appears later in the REPAIR DBD DIAGNOSE output.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU904I *csect-name* - EXISTING VALUE X'*xx.xx*'

Explanation: This message shows a hexadecimal string which is the value of a field in the OBD as it exists on the DSNDB01.DBD01 page set. The hexadecimal string is '*xx.xx*'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU905I *csect-name* - REBUILT VALUE X'*xx.xx*'

Explanation: This message shows a hexadecimal string which is the value of a field in the OBD which was rebuilt from the DB2 catalog. The hexadecimal string is '*xx.xx*'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU906I *csect-name* - EXISTING VALUE 'cc..cc'

Explanation: This message shows a character string which is the value of a field in the OBD as it exists on the DSND01.DBD01 page set. The character string is 'cc..cc'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU907I *csect-name* - REBUILT VALUE 'cc..cc'

Explanation: This message shows a character string which is the value of a field in the OBD which was rebuilt from the DB2 catalog. The character string is 'cc..cc'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU908I *csect-name* - EXISTING OBD IS *obd-type*

Explanation: This message shows the OBD type of the OBD which exists on the DSND01.DBD01 page set.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU909I *csect-name* - REBUILT OBD IS *obd-type*

Explanation: This message shows the OBD type of the OBD which was rebuilt from the DB2 catalog.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU910I *csect-name* - EXISTING DBD

Explanation: Following this message is a hexadecimal dump of the DBD which exists on the DSND01.DBD01 page set.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU911I *csect-name* - REBUILT DBD

Explanation: Following this message is a hexadecimal dump of the DBD which was rebuilt from the DB2 Catalog.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU912I *csect-name* - *phase-completion-message* -- *nn*
ERRORS WERE FOUND

Explanation: This message marks the end of a processing phase in the DBD comparison for a REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. In the message, 'nn' indicates the number of errors detected while processing. Informational and warning messages are not added into the error count.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU913I *csect-name* - OBD X'xxxx' COMPARISON
COMPLETE -- *nn* ERRORS WERE FOUND

Explanation: This message marks the end of an OBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. This message is displayed only when a difference has been detected. If there is no difference, this message will not be displayed. The OBID of the OBD being compared against the DB2 catalog is 'xxxx'. The number of errors in this OBD is 'nn'. Informational and warning messages are not added into the error count.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU914I *csect-name* - DBD X'xxxx' COMPARISON
COMPLETE -- *nn* ERRORS WERE FOUND

Explanation: This message marks the end of a DBD comparison for the REPAIR DBD TEST or REPAIR DBD DIAGNOSE utility. The DBID of the DBD being compared against the DB2 catalog is 'xxxx'. The total number of errors found in this DBD is 'nn'.

Severity: 0 (informational)

System Action: DBD checking completed.

DSNU915I *csect-name* - OBD X'obid' E-X'xxxxxxx'
R-X'yyyyyyy' *obd-description*

Explanation: This message is used when listing the OBDs in the REPAIR DBD DIAGNOSE utility. The OBID of the OBD being listed is 'obid'. The offset to the OBD within the EXISTING DBD which is displayed later in the output is 'xxxxxxx'. The offset to the OBD within the REBUILT DBD which is displayed later in the output is 'yyyyyyy'. A short description of the state of the OBD is 'obd-description'.

Severity: 0 (informational)

System Action: DBD checking completed.

DSNU916I *csect-name* - OBDS DIFFER AT OFFSET
X'xxxxxxx' *field-name* - INFORMATION NOT
IN DB2 CATALOG

Explanation: This message indicates the value of a field in the OBD differs from the DBD which exists on the DSND01.DBD01 page set and the DBD rebuilt from the DB2 catalog. This is information which is not kept in the DB2 catalog. This is an acceptable difference and does not indicate that the OBD is damaged. The hexadecimal offset from the beginning of the OBD is 'xxxxxxx'. The name of the field is 'field-name'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU917I *csect-name* - DBDS DIFFER AT OFFSET
X'xxxxxxx' *field-name* - INFORMATION NOT
IN DB2 CATALOG

Explanation: This message indicates that the value of a field in the DBD differs from the DBD which exists on the DSND01.DBD01 page set and the DBD rebuilt from the DB2 Catalog. This is information which is not kept in the DB2 catalog. This is an acceptable difference and does not indicate that the DBD is damaged. The hexadecimal offset from the

beginning of the DBD is 'xxxxxxx'. The name of the field is 'field-name'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU919I *csect-name* - DBD X'xxxx' OBD X'yyyy' - details

Explanation: This message gives detailed information about the specified OBD. The DBID of the DBD is 'xxxx'. The OBID of the OBD is 'yyyy'. A description of the error is 'details'.

Severity: 0 (informational)

System Action: DBD checking continues normally.

DSNU920I *csect-name* - OBDS DIFFER AT OFFSET X'xxxxxxx' field-name

Explanation: This message indicates that the value of a field in the OBD differs from the DBD which exists on the DSNDB01.DBD01 page set and the DBD rebuilt from the DB2 catalog. The DB2 Catalog and DBD/OBD are inconsistent. The hexadecimal offset from the beginning of the OBD is 'xxxxxxx'. The name of the field is 'field-name'.

Severity: 4 (warning)

System Action: DBD checking continues normally.

DSNU921I *csect-name* - OBD X'xxxx' MISSING IN EXISTING DBD

Explanation: This message indicates that an OBD which was rebuilt from the DB2 catalog does not exist in the DBD which exists on the DSNDB01.DBD01 page set. The DB2 catalog and DBD/OBD are inconsistent. The OBID of the missing OBD is 'xxxx'.

Severity: 4 (warning)

System Action: DBD checking continues normally.

DSNU922I *csect-name* - OBD X'xxxx' MISSING IN REBUILT DBD

Explanation: This message indicates that an OBD in the DBD which exists on the DSNDB01.DBD01 page set does not exist in the DBD which was rebuilt from the DB2 catalog. The DB2 catalog and DBD/OBD are inconsistent. The OBID of the missing OBD is 'xxxx'.

Severity: 4 (warning)

System Action: DBD checking continues normally.

DSNU923I *csect-name*—OBdtype FOR OBD X'xxxx' DOES NOT MATCH —NO FURTHER CHECKING DONE FOR THIS OBD

Explanation: The object descriptor (OBD) that exists on the DSNDB01.DBD01 page set is different from the type of OBD that was rebuilt from the DB2 catalog. No further processing can be done because the fields of one OBD type are different from the fields of another. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent. The object identifier (OBID) of the OBD that is inconsistent is 'xxxx'.

Severity: 4 (warning)

System Action: Checking for OBD X'xxxx' stops. Checking of the DBD continues normally.

DSNU924I *csect-name*—DBDS DIFFER AT OFFSET X'xxxxxxx' field-name

Explanation: The value of a field in the database descriptor (DBD) differs from the value of the corresponding field in the DBD that exists on the DSNDB01.DBD01 page set and differs from the value of the corresponding field in the DBD that was rebuilt from the DB2 catalog.

xxxxxxx The hex offset from the beginning of the DBD.

field-name The name of the field.

Severity: 0 (informational)

System Action: Checking of the DBD continues normally.

DSNU925I *csect-name*—OBDDFILE AT OFFSET X'xxxxxxx' IN EXISTING DBD HAS OBID X'nnnn' WHICH IS NOT A FILE OBD

Explanation: The field that points to the first FILE OBD (OBDDFILE) in the database descriptor (DBD) that exists on the DSNDB01.DBD01 page set does not point to a FILE OBD. The DB2 catalog and DBD/OBD (object descriptor) are inconsistent.

xxxxxxx The hex offset from the beginning of the existing DBD.

nnnn The object identifier (OBID) of the OBD which should be a FILE OBD.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU926I *csect-name*—OBDDFILE AT OFFSET X'xxxxxxx' IN REBUILT DBD HAS OBID X'nnnn' WHICH IS NOT A FILE OBD

Explanation: The field that points to the first FILE OBD (OBDDFILE) in the database descriptor (DBD) that was rebuilt from the DB2 catalog does not point to a FILE OBD. The DB2 catalog and DBD/OBD (object descriptor) are inconsistent.

xxxxxxx The hex offset from the beginning of the rebuilt DBD.

nnnn The object identifier (OBID) of the OBD that should be a FILE OBD.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU927I *csect-name*—OBD X'xxxx' IS A HOLE IN EXISTING DBD

Explanation: The object descriptor (OBD) that exists on the DSNDB01.DBD01 page set has been logically deleted, OBDDHOLE = '1'B. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent. The object identifier (OBID) of the OBD that is a hole is 'xxxx'.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU928I *csect-name*—**OBD X'xxxx' IS A HOLE IN REBUILT DBD**

Explanation: The object descriptor (OBD) that was rebuilt from the DB2 catalog has been logically deleted, OBDHOLE = '1'B. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent. The object identifier (OBID) of the OBD that is a hole is 'xxxx'.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU929I *csect-name*—**OBD FIELD *field-name* HAS VALUE OUT OF RANGE AT OFFSET X'xxxxxxxx' IN OBD X'nnnn'**

Explanation: The object descriptor (OBD) field '*field-name*' has an unexpected value. The DB2 catalog and database descriptor (DBD)/OBD are inconsistent.

field-name The name of the field in the OBD.
xxxxxxxx The hex offset from the beginning of the OBD.
nnnn The object identifier (OBID) of the OBD.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU930I *csect-name*—**INDEX *index-name* (OBD X'xxxx') MUST BE RECOVERED**

Explanation: The index '*index-name*' must be either recovered or dropped and recreated to ensure that the index is consistent with the description in the INDEX FANSET OBD. The object descriptor (OBD) is not damaged. However, if the index is not either recovered or dropped and recreated, incorrect output can be produced when the index is used as an access path.

index-name The name of the index found in SYSIBM.SYSINDEXES.
xxxx The object identifier (OBID) of the OBD.

Severity: 8 (error)

System Action: Checking of the DBD continues normally.

DSNU931I *csect-name* - **OBDDMAX FIELD OF DBD IS TOO LARGE**

Explanation: The OBDDMAX field (maximum number of ID in the DBD) is too large. It is larger than the largest possible number of ID based upon the DBD size.

Severity: 8

System Action: Checking of the DBD continues but using the largest possible number of ID instead of the incorrect OBDDMAX.

DSNU935I *csect-name* **DATABASE *database-name* IS NOT STARTED FOR UTILITY PROCESSING ONLY**

Explanation: This message is issued when the REPAIR utility with the DBD option is run on a database that is not started for utility processing only.

Severity: 8

System Action: REPAIR DBD terminated.

User Response: Stop the database. Then start the database with the ACCESS(UT) option. Resubmit the REPAIR DBD job.

DSNU936I *csect-name* **DATABASE *database-name* IS IN USE**

Explanation: This message is issued when the REPAIR utility with the DBD option is run on a database that is in use by others.

Severity: 8

System Action: REPAIR DBD terminated.

User Response: Wait until all users are finished, then resubmit the REPAIR DBD job.

DSNU938I *csect-name*—**OBD X'xxxx' HAD DIFFERENCES WHICH WERE NOT IN A NAMED FIELD**

Explanation: There is a difference between the object descriptor (OBD) in the database descriptor (DBD) that exists on the DSND01.DBD01 page set and the DBD that was rebuilt from the DB2 catalog. This difference does not exist in a named field. Therefore, the detailed search by field name fails to find the difference. The DB2 catalog and DBD/OBD are inconsistent. The object identifier (OBID) of the OBD in error is 'xxxx'.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU939I *csect-name*—**DBD HEADER HAD DIFFERENCES WHICH WERE NOT IN A NAMED FIELD**

Explanation: There is a difference between the DBD header in the DBD that exists on the DSND01.DBD01 page set and the DBD that was rebuilt from the DB2 catalog. This difference does not exist in a named field. Therefore, the detailed search by field name fails to find the difference. The DB2 catalog and database descriptor (DBD)/object descriptor (OBD) are inconsistent.

Severity: 4 (warning)

System Action: Checking of the DBD continues normally.

DSNU971I *csect-name* **TABLESPACE *dbname.tsname* IS CHECK PENDING CORRELATION-ID *id1* CONNECTION-ID *id2* LUW-ID *id3***

Explanation: This message is sent to the console when TABLESPACE '*tsname*' is set to check pending state. The CORRELATION-ID '*id1*' is the correlation identifier of the thread requesting check pending. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents. The CONNECTION-ID '*id2*' is the correlation identifier of the thread. The LUW-ID '*id3*' is the logical-unit-of-work identifier of the thread. If the LUW-ID is an '*', the thread has no LUW-ID. If it is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in place of logical-unit-of-work-id in any DB2 command that accepts logical-unit-of-work-id as input.

Severity: 4 (warning)

System Action: Processing continues.

User Response: Refer to Section 2 (Volume 1) of *Administration Guide* for a discussion of the check pending operation.

DSNU972I *csect-name* **CATALOG UPDATING FAILURE WHILE SETTING OR RESETTING CHECK PENDING CORRELATION-ID *id1* CONNECTION-ID *id2***

Explanation: When the check pending state is set on or off, the updating of the catalog tables (SYSTABLESPACE, SYSTABLES, and SYSTABLEPART) fails. The CORRELATION-ID, '*id1*', is the correlation identifier of the thread associated with the application requesting that the check pending state be set on or off. The CONNECTION-ID, '*id2*', is the correlation identifier of the application. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents.

Severity: 0 (informational) or 4 (warning)

System Action: Processing continues.

Problem Determination: The utility being processed requested the setting of check pending either on or off. The updating of the STATUS column of SYSTABLESPACE, and of the CHECKFLAG and CHECKRID columns of SYSTABLES and SYSTABLEPART failed. Processing continues normally. However, those columns for the rows being updated now contain invalid values. Subsequent utility processing ignores these values, and the next setting or resetting of check pending for that table space corrects the error in one of the following ways:

- If the table space is set to check pending and the catalog fields are in error, the scope of check pending is escalated in the catalog. (The STATUS column of SYSTABLESPACE is set to 'P', and the CHECKFLAG and CHECKRID columns of SYSTABLES and SYSTABLEPART are set to 'C' and binary zeros.)
- If the table space is set to not check pending and the catalog fields are in error, the scope of check pending is set off in the catalog. (The STATUS column of SYSTABLES is set to an 'A', and the CHECKFLAG and CHECKRID columns of SYSTABLES and SYSTABLEPART are set to blanks.)

After the catalog fields are corrected, the setting or resetting of check pending continues as specified.

Usually message DSNT500I or DSNT501I is also issued, because the probable cause of the error is RESOURCE UNAVAILABLE. If the reason for the failure was not RESOURCE UNAVAILABLE, an SVC dump is requested and processing continues normally. To determine the cause of the failure, refer to the dump listing and the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5, 32

DSNU973I *csect-name* **TABLESPACE *dbname.tsname* IS NOT CHECK PENDING CORRELATION-ID *id1* CONNECTION-ID *id2* LUW-ID *id3***

Explanation: This message is sent to the console when TABLESPACE '*tsname*' was set to 'not check pending'. The CORRELATION-ID '*id1*' is the correlation identifier of the thread requesting the check pending state be set off. Correlation IDs beginning with '0nn', where 'nn' is a number from 01 to 28, identify system agents. The CONNECTION-ID '*id2*' is the correlation identifier of the thread. The LUW-ID '*id3*' is the logical-unit-of-work identifier of the thread. If the LUW-ID is an '*', the thread has no LUW-ID. If it is not an '*', the value is a logical-unit-of-work-id that is assigned to the thread followed by an '=' sign and a token value, which can be used in

place of the logical-unit-of-work-id in any DB2 command that accepts a logical-unit-of-work-id as input.

Severity: 0 (informational)

System Action: Processing continues.

User Response: Refer to Section 2 (Volume 1) of *Administration Guide* for a discussion of the not check pending operation.

DSNU993I *csect-name* **IMAGE COPY RESTORE TERMINATED**

Explanation: Catalog and directory initialization (image copy restore) did not complete successfully.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Examine other error messages associated with this job.

DSNU994I *csect-name* **IMAGE COPY RESTORE COMPLETED SUCCESSFULLY**

Explanation: Catalog and directory initialization (image copy restore) completed successfully.

Severity: 0 (informational)

DSNU995I *csect-name* **VSAM PUT ERROR, RPLERREG = *return-code*, RPLERRCD = *reason-code***

Explanation: VSAM PUT failed with the indicated *return-code* and *reason-code*.

Severity: 8 (error)

System Action: Processing terminates.

User Response: Notify system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to *DFSMS/MVS: Macro Instructions for Data Sets*. See also *MVS/DFP V3R3 Diagnosis Guide* for more information about the VSAM procedures.

DSNU996I *csect-name* **VSAM OPEN ERROR, ACBERRFLG = *error-code***

Explanation: VSAM OPEN failed with the indicated ACB *error-code*.

Severity: 8 (error) if error is greater than or equal to 128; otherwise, 4 (warning)

System Action: Processing terminates if the error code is greater than or equal to 128; otherwise, processing continues normally.

User Response: Notify the system programmer.

System Programmer Response: Follow standard VSAM diagnostic procedure. Refer to *DFSMS/MVS: Macro Instructions for Data Sets*. See also *MVS/DFP V3R3 Diagnosis Guide* for more information about the VSAM procedures.

DSNU997I *csect-name* **OUTPUT DATA SET NAME = *data-set-name***

Explanation: The indicated *data-set-name* is used for output.

Severity: 0 (informational)

DSNU998I *csect-name* **INPUT DATA SET NAME =** *data-set-name*

Explanation: The indicated *data-set-name* is used for input.

Severity: 0 (informational)

DSNU999I *csect-name* **START OF IMAGE COPY**
RESTORE FOR JOB *job-name step-name*

Explanation: The catalog and directory initialization (image copy restore) started.

Severity: 0 (informational)

DSNV... Messages

DSNV029E LOAD MODULE *module-name* DOES NOT HAVE AMODE(31) ATTRIBUTE

Explanation: During DB2 startup, Agent Services establishes the tasking structure for the control and resource manager address spaces. Three load modules, DSNVEUS3, DSNVEUS4, and DSNVRCT, are loaded and attached as the control programs for each subtask created. All three load modules must have been link-edited with the attributes AMODE(31) and RMODE(ANY). At least one of the modules did not have the 31-bit addressing attribute when it was loaded. The 'module-name' in the error message is the alias name of the first load module whose addressing mode was invalid.

This message is issued by the following CSECT: DSNVASIM

System Action: DB2 startup is terminated.

System Programmer Response: Verify that all installation and maintenance activities against these modules were executed using SMP, that the JCLIN for SMP includes the correct AMODE and RMODE control statements, and that the Linkage Editor provided with the Data Facility Product (DFP) for the version of MVS being used was invoked by SMP for the link-edits. Correct the procedure or JCL which caused the error and rerun the necessary SMP jobs.

Operator Response: Notify the system programmer of the failure.

Problem Determination: A DB2 dump was requested to a SYS1.DUMP data set.

Load module names and aliases are as follows:

Load module	Alias
DSNVEUS3	DSNVEU3I
DSNVEUS4	DSNVEU4I
DSNVRCT	DSNVRCTI

The MVS service aid AMBLIST provides Linkage Editor module attributes in the summary section of the LISTLOAD function output.

DSNV086E DB2 ABNORMAL TERMINATION REASON=xxxxxxx

Explanation: The DB2 subsystem is being abended, because an error that cannot be corrected has occurred. This message, which is not automatically deleted from the operator console, is issued during DB2 abnormal termination. 'REASON' is the subsystem termination reason code. If DB2 abnormal termination is invoked multiple times, the subsystem termination reason code that accompanies this message is the reason associated with the first invocation. For additional information, look up the reason code in "Section 4. DB2 Codes" on page 4-1.

This message is issued by the following CSECT: DSNVATRM

System Action: Abnormal termination processing continues.

Operator Response: Notify the system programmer, and restart DB2.

System Programmer Response: This message is accompanied by one or more dumps. Obtain a copy of SYS1.LOGREC

after DB2 completely terminates; also obtain a copy of the SVC dump(s). If you suspect an error in DB2, refer to Section 3 of *Diagnosis Guide and Reference* for information on identifying and reporting the problem.

Problem Determination: Collect the following diagnostic items listed in "Appendix B. Problem Determination" on page X-5: 1, 5.

DSNV400I ARCHIVE LOG WITH MODE(QUIESCE) CURRENTLY ACTIVE

Explanation: An -ARCHIVE LOG MODE(QUIESCE) command is currently active. This message follows the DSNV401I message as part of the -DISPLAY THREAD command report.

This message is issued by the following CSECT: DSNVDTM

System Action: This message is issued as information only. The message indicates that the -ARCHIVE LOG MODE(QUIESCE) command has not completed, and consequently, updates against DB2 resources have been temporarily suspended. This may result in active threads being suspended awaiting termination of the quiesce period. DB2 processing otherwise continues normally.

DSNV401I DISPLAY THREAD REPORT FOLLOWS -

Explanation: This message is always generated as the title for the DISPLAY THREAD command report output. It precedes the other messages generated by this command.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV402I ACTIVE THREADS-

Explanation: This message precedes the listing of active threads.

The series of messages DSNV402I through DSNV405I provide the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) when the status of active threads is requested.

The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD TYPE(ACTIVE) when LOCATION, LUWID, or DETAIL keywords are used to show distributed activity.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV403I NAME ST A REQ ID AUTHID PLAN ASID TOKEN

Explanation: This message displays the column headings for the list of threads generated by the -DISPLAY THREAD TYPE(ACTIVE) or -DISPLAY THREAD TYPE(INACTIVE) command.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV404I *name status act-ind req-ct corr-id auth-id
pname asid token*

Explanation: This message provides the status information on an active or inactive thread and is part of the response to the -DISPLAY THREAD command. Information provided is:

name A 1- to 8-character variable representing the 'connection name' used to establish the thread. For distributed database access threads, this field contains the following:

- For threads using system-directed access and for threads using application-directed access from a DB2 Version 3 or later requester, this variable displays the connection name of the thread at the requesting location.
- For threads using application-directed access from a non-DB2 requester or from a DB2 Version 2 Release 3 requester, this variable displays the constant SERVER.
- If the thread has a status of PT, the connection name contains blanks if the thread of the originating task is running on the same DB2. This helps to show that these parallel tasks are related to the originating task above. If the parallel task is running on a different DB2 for the originating task, then the connection name will be supplied and the entry will be followed by DSNV443I.

If the thread has a status of D, the connection name might be either the connection name for the allied address space or the DB2 subsystem name.

status A 1- or 2- character connection status code with the following values:

- D The thread is in the process of termination as a result of the termination of the associated allied task. If this thread is also the last (or only) DB2 thread for the address space, the associated allied task is placed in a wait state.
- DI The thread is disconnected from an execution unit. There is no TCB associated with the DB2 thread. This state is only valid when 'connection name'=RRSAF.
- N The thread is in either IDENTIFY or SIGNON status.
- PT A parallel task thread was established (plan allocated).
- QD The thread is queued for termination as a result of the termination of the associated allied task. If this thread is also the last (or only) DB2 thread for the address space, the associated

allied task is placed in a wait state.

QT The CREATE THREAD request was queued. The associated allied task is placed in a wait state.

RA The distributed thread is performing a remote access on behalf of a request from another location.

RD A distributed thread is performing a remote access on behalf of a request from another location. The thread is performing an operation that invoked DCE services. This status is displayed until DCE returns control to DB2.

RN A distributed thread is performing a remote access on behalf of a request from another location. The request actually accesses data at yet another (DB2) location, so the thread was suspended because DB2 must first connect to the partner location (establish DB2 system conversations with the partner).

When another DB2 site is being contacted for the first time using system-directed access, DB2 must establish DB2 system conversations with the partner location. A request is presented to a DB2 DDF service task that establishes a system conversation. The thread is suspended until the request is processed. If the thread remains in this status for an extended period of time, the DB2 service task that establishes the system conversations might be busy processing other requests. The DB2 DISPLAY LOCATION command ('DISPLAY LOCATION(*) DETAIL') shows you conversation activity for this DB2 system conversation (SYSCON-O) service task.

RQ A distributed thread is performing a remote access on behalf of a request from another location. The thread is suspended because the maximum number of active database access threads (as described by the MAX REMOTE ACTIVE value of the DSN6SYSP macro in the DB2 startup parameter, usually DSNZPARM) was reached. Database access agents (DBAAs) are queued until other DBAAs deallocate or go inactive, providing an available slot. The DBAA resumes when a slot becomes available, and the

DBAA is next in the queue. Alternatively, you should consider increasing the MAX REMOTE ACTIVE value.

- SP A thread is executing within a stored procedure. This status is displayed until the stored procedure terminates and returns control to DB2.
- SW A thread is waiting for a stored procedure to be scheduled. This status is displayed until the stored procedure begins execution.
- T An allied, nondistributed thread was established (plan allocated).
- TN An allied thread was distributed to access data at another DB2 location, but it was suspended because DB2 must first connect to the partner location (establish DB2 system conversations with the partner).

When another DB2 site is being contacted for the first time using system-directed access, DB2 must establish DB2 system conversations with the partner location. A request is presented to a DB2 DDF service task that establishes a system conversation. The thread is suspended until the request is processed. If the thread remains in this status for an extended period of time, the DB2 service task that establishes the system conversations might be busy processing other requests. The DB2 DISPLAY LOCATION command ('DISPLAY LOCATION(*) DETAIL') shows you conversation activity for this DB2 system conversation (SYSCON-O) service task.

- TR An allied thread was distributed to access data at another location.

act-ind An asterisk if the thread is active within DB2; blank otherwise.

req-ct A wraparound counter to show the number of DB2 requests.

corr-id A 1- to 12-character variable representing the recovery 'correlation-id' associated with the thread.

For distributed database access threads, this field contains the following:

- While the thread is being created:
 - '028.DBAA nn' - Where nn ranges from 01 to 99. This indicates that the DBAA is in its connection processing, which consists of establishing the DBAA thread, and validating and verifying the user's

ID. Refer to the "Controlling Access to a DB2 Subsystem" chapter in Section 3 (Volume 1) of *Administration Guide* for descriptions of the authorization checks that might be performed.

RACF requests are serialized on one of the DB2 RACF service tasks, which might increase the validation time when multiple DBAAs are being created concurrently.

- After the thread is created:
 - For threads using system-directed access and threads using application-directed access from a DB2 requester, this variable displays the correlation-id name of the thread at the requesting location.
 - For threads using application-directed access from a non-DB2 requester, this variable displays the first twelve characters in the DDM external name (EXTNAM) parameter of the DDM EXCSAT command received as part of the SQL CONNECT.

authorization ID The authorization ID associated with a signed-on connection. If not signed-on, this field is blank.

pname A 1- to 8-character variable representing the plan name associated with the thread. For distributed database access threads, this field contains the following:

- For threads using system-directed access and threads using application-directed access from a DB2 Version 3 or later requester, this variable displays the plan name being executed at the requesting location.
- For threads using application-directed access from a non-DB2 requester or from a DB2 Version 2 Release 3 requester, this field displays the constant DISTSERV.

For RRSAF connected threads that did not specify a plan name at connect time, the value ?RRSAF is displayed. If a thread was not established, this field is blank.

If you receive a system plan in this field, see the information about system plans in message DSNT376I.

asid A 1- to 4-character hexadecimal number representing the ASID of the home address space.

token A 1- to 5-character number representing the thread token assigned to the thread. For threads with a status value of 'N', this value will be 0.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

System Programmer Response: If you have active threads with QD or D status codes, use the information in message DSN3201I to diagnose a possible DB2 problem.

DSNV405I DISPLAY ACTIVE REPORT COMPLETE

Explanation: This message follows messages DSNV402I through DSNV404I augmented by the series of messages DSNV444I through DSNV448I when LOCATION and/or DETAIL keywords are used to show distributed activity. It indicates that the -DISPLAY THREAD TYPE(ACTIVE) report has completed successfully.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV406I INDOUBT THREADS-

Explanation: This message precedes the listing of indoubt threads.

The series of messages DSNV406I through DSNV409I, DSNV446I, DSNV449I through DSNV453I, DSNV457I through # DSNV464I, DSNV466I, DSNV467I provides the formatted report for the -DISPLAY THREAD TYPE(INDOUBT) command when the status of indoubt threads is requested.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV407I COORDINATOR STATUS RESET URID AUTHID

Explanation: This message displays the column headings for the list of threads generated by the DISPLAY THREAD TYPE (INDOUBT) command.

The message number and the subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV408I *coordinator status reset urid authid*

Explanation: This message lists status information on an indoubt thread.

coordinator	The name of the two-phase commit coordinator.
	<ul style="list-style-type: none"> • If the thread is an allied thread, the coordinator name is either the IMS connection name, the CICS connection name, OS/390 RRS (for Recoverable Resource Manager Services attachment facility connected threads) or the location name of the local DB2 (if it is not one of the above). DSNV449I is displayed if the coordinator is IMS or CICS. • If the thread is a database access thread, the coordinator name takes one of four forms:

- location:luname -- where "location" is the coordinator's relational database name and "luname" is the coordinator's SNA LU name.
- location:port -- where "location" is the coordinator's relational database name and "port" is the coordinator's TCP/IP port number for two-phase commit resynchronization.
- <luname>luname -- where "luname" is the coordinator's SNA LU name.
- nnn.nnn.nnn.nnn:port -- where "nnn.nnn.nnn.nnn" is the coordinator's IP address and "port" is the coordinator's TCP/IP port number for two-phase commit resynchronization.
- If the thread is distributed, message DSNV467I is included in the display. This message shows the logical unit of work id and the local token that identifies the distributed thread.

status

The status of the thread.

A status of ABORTED is not displayed unless DB2 believes a participant using PN protocols might be indoubt. If the status of a thread for a logical unit of work at a participant is INDOUBT, COMMITTED-H, or ABORTED-H, and the coordinator is a DB2 location that has not cold started, then the lack of any information about the thread in a DISPLAY THREAD(INDOUBT) report indicates that the decision at the coordinator was to abort the logical unit of work. In all other cases, a DSNV408I message for the thread is displayed.

- INDOUBT: The thread is indoubt and continues to appear in the display until all indoubt resolution responsibilities are complete. Additional detail lines that might appear in the report are:
 - DSNV450I and DSNV446I: The names of downstream participants who might be indoubt.
 - DSNV452I or DSNV453I: A heuristic action was taken at a downstream participant. DSNV452I or DSNV453I continues to appear in the display until DB2 resolves the indoubt status with the coordinator. If the coordinator decision is the same as the heuristic decision of the partner, then the detail line is no longer displayed. If the coordinator status is COMMITTED and the heuristic decision of the participant is ABORTED, then the message continues to appear in the display until it is deleted with the RESET INDOUBT command. The database administrators at all involved locations need to know that heuristic damage occurred and at which location.

- DSNV466I: For a database access thread participant, the elapsed time that the thread was indoubt.
- COMMITTED: The thread is committed. This status is displayed when DB2 is the coordinator and has downstream participants that might be indoubt. The thread appears in the display until all downstream participants complete indoubt resolution. Detail lines DSNV450I and DSNV446I list the downstream participants that have pending resolution. Database locks held for the thread were released.

If a participant resolved the indoubt thread with a heuristic decision, and the decision was ABORT (rollback), detail line DSNV453I is displayed. This detail line contains the name of the participant and the heuristic decision that it made. Since the coordinator committed and the participant aborted, this indicates heuristic damage. This line continues to appear in the display until it is deleted with the RESET INDOUBT command. The database administrators at all involved locations need to know that heuristic damage occurred and at which location.

- COMMITTED-H: The indoubt thread was heuristically resolved with the RECOVER INDOUBT command. The thread continues to appear in the display until the coordinator is informed of the heuristic decision, and all downstream participants, if any, complete indoubt resolution. Detail lines DSNV450I and DSNV446I list the downstream participants that have pending resolution. Additional detail lines that might appear in the report are:
 - DSNV451I is displayed if resolution with the coordinator is not complete. All database locks were released.
 - DSNV461I is displayed if resolution with the coordinator completed and heuristic damage was detected after the coordinator aborted the logical unit of work. This line continues to appear in the display until it is deleted with the RESET INDOUBT command.
- ABORTED-H: The indoubt thread was heuristically resolved with the RECOVER INDOUBT command. The thread continues to appear in the display until the coordinator is informed of the heuristic decision. Additional detail lines that might appear in the report are:
 - DSNV451I is displayed if resolution with the coordinator is not yet complete. All database locks were released.
 - DSNV461I is displayed if resolution with the coordinator completed and heuristic damage was detected after the coordinator committed the logical unit of work. This line continues to

appear in the display until it is deleted with the RESET INDOUBT command.

- ABORTED: This is a coordinator status and DB2 has one or more downstream participants using the Presumed Nothing (PN) protocol that might be indoubt. The thread appears in the display until all downstream PN participants complete indoubt resolution. Detail lines DSNV450I and DSNV446I list the downstream participants that have pending resolution. Database locks held for the thread were released.

If a participant resolved the indoubt thread with a heuristic decision, and the decision was COMMIT, detail line DSNV452I is displayed. This detail line contains the name of the participant and the heuristic decision that it made. Since the coordinator aborted and the participant committed, this indicates heuristic damage. This line continues to appear in the display until it is deleted with the RESET INDOUBT command. The database administrators at all involved locations need to know that heuristic damage occurred and at which location.

Additional detail lines might appear in an indoubt thread report, as follows:

- Cold Start: When a coordinator cold starts, indoubt participants cannot achieve automatic resolution. A DB2 participant includes message DSNV463I in the display, indicating coordinator cold start and requesting heuristic resolution. Message DSNV458I is included in the display if the coordinator cold started. This message contains information that can be used to identify the thread. This information is provided by the coordinator. A DB2 coordinator provides the connection-name used to establish the thread at the DB2 coordinator and the correlation-id used by that connection.

When a participant cold starts, the coordinator cannot fulfill its indoubt resolution responsibility. A DB2 coordinator displays message DSNV462I indicating participant cold start. The thread continues to be displayed in the report, even after resolution with all other indoubt participants, if any. The RESET INDOUBT command must be used to purge this thread from the report. The reason for this is that the cold starting participant might have been coordinating downstream participants that are now indoubt. The database administrator at these participants might need to know the status of the thread at the coordinator so correct heuristic decisions can be made.

- Protocol Errors: A communications protocol error might occur during sync point processing and during indoubt resolution processing. These protocol errors are per-

manent and prevent completion of the automatic indoubt resolution process.

An indoubt display thread report shows these protocol errors, as follows:

- A DB2 coordinator detecting a sync point protocol error by a participant, such that the coordinator believes that the participant might be indoubt, adds this thread to the indoubt thread display, if the decision is to commit. Message DSNV460I is included in the display indicating the protocol error and the potential need for heuristic action at the participant. The thread continues to be included in the report until the entry is purged with the RESET INDOUBT command. If the participant is actually indoubt, the database administrator at the participant needs to know the status of the thread so that the correct heuristic decision can be made.
- A DB2 participant detecting a sync point protocol error by a coordinator when the participant is indoubt adds this thread to the indoubt thread display. Message DSNV459I is included in the display, indicating the protocol error and requesting heuristic resolution. The thread continues to be included in the report until the thread is resolved with the RECOVER INDOUBT command. The DBA at the participant might need to contact the coordinator to determine the status of the thread.
- If a DB2 coordinator detects an indoubt resolution protocol error by a participant, message DSNV457I is included in the indoubt report, indicating the error and requesting heuristic action at the participant. The thread continues to be included in the report until the entry is purged with the RESET INDOUBT command. The database administrator at the participant needs to know the status of the thread so that the correct heuristic decision can be made.
- If a DB2 participant detects an indoubt resolution protocol error by a coordinator, and the thread status is INDOUBT, message DSNV464I is included in the indoubt report, indicating the error and requesting heuristic action. The thread continues to be included in the report until the thread is resolved with the RECOVER INDOUBT command.

reset This column contains YES if the RESET INDOUBT command must be used to purge this thread from the indoubt display.

urid The RBA of the DB2 recovery log. This point is the beginning of recovery logging for this thread.

authid The primary authorization-id associated with the thread.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues.

DSNV409I DISPLAY INDOUBT REPORT COMPLETE

Explanation: This message follows messages DSNV406I through DSNV408I and indicates that the -DISPLAY THREAD TYPE(INDOUBT) report was generated successfully.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV410I NO CONNECTION FOUND FOR NAME=*connection-name*

Explanation: The -DISPLAY THREAD TYPE(ACTIVE) or TYPE(INACTIVE) command was unable to find any connection associated with '*connection-name*'. This message is generated once for each requested connection name that was not found.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing continues.

DSNV411I NO THREADS FOUND FOR NAME=*connection-name*

Explanation: The -DISPLAY THREAD TYPE(ACTIVE) or TYPE(INACTIVE) command was unable to locate any threads associated with '*connection-name*'. This message is generated once for each connection name for which no threads were found.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing continues.

DSNV412I *csect-name* NO INDOUBT THREADS FOUND FOR NAME=*connection name*

Explanation: In this message, '*csect-name*' is the name of the command program CSECT that issued the message. '*NAME*' is the connection name specified on the command.

The named command was unable to locate any indoubt threads associated with the '*connection name*'. This message is generated once for each '*connection name*' for which no threads were found.

System Action: Command processing continues.

DSNV413I *csect-name verbname pkwname* TERMINATED, DEFAULT UNAVAILABLE

Explanation: This message indicates that the command '*verbname*' abnormally terminated because the command was entered from an MVS console and a required parameter was not supplied with the command.

csect-name The name of the command program CSECT that issued the message.

verbname The command verb as entered by the requester. The error depends on which command was entered.

- DISPLAY THREAD - neither the 'connection-name', LOCATION, nor LUWID was specified.
- RECOVER INDOUBT - neither 'connection-name' nor LUWID was specified.

pkwname The command primary keyword as entered by the requester.

System Action: Command processing terminates.

Operator Response: Reenter the command specifying one of the required parameters.

DSNV414I THREAD xxx COMMIT SCHEDULED

Explanation: In this message, 'xxx' is the recovery identifier specified with the -RECOVER INDOUBT command to identify the indoubt thread and is one of the following:

ID= The recovery correlation-id specified with the command.
 NID= The recovery network-id specified with the command.
 LUWID = Luwid=token indicates the luwid and token that identify the thread specified with the command.

This message is issued by the following CSECT: DSNVRIM

System Action: The thread specified on the -RECOVER INDOUBT command is scheduled for COMMIT recovery action.

DSNV415I THREAD xxx ABORT SCHEDULED

Explanation: In this message, 'xxx' is the recovery identifier specified with the -RECOVER INDOUBT command to identify the indoubt thread and is one of the following:

ID= The recovery correlation-id specified with the command.
 NID= The recovery network-id specified with the command.
 LUWID = The luwid=token indicates the luwid and token that identify the thread specified with the command.

The thread specified on the -RECOVER INDOUBT command is scheduled for ABORT recovery action.

This message is issued by the following CSECT: DSNVRIM

System Action: Command processing continues.

DSNV416I THREAD NID=*net-node.number* IS INVALID

Explanation: In this message, 'net-node' is the recovery 'network-id' specified with the command.

The -RECOVER INDOUBT command (NID=*net-node.number*) determined that the input format for the specified network-id is invalid.

This message is issued by the following CSECT: DSNVRIM

System Action: Command processing continues.

Operator Response: Prior to reentering the command, ensure that the network-id entered is in the correct format as specified on the -RECOVER INDOUBT command.

DSNV417I THREAD xxx NOT FOUND

Explanation: In this message, 'xxx' is the recovery identifier specified with the -RECOVER INDOUBT command to identify the indoubt thread and is one of the following:

ID= The recovery correlation-id specified with the command
 NID= The recovery network-id specified with the command
 LUWID = The luwid or token specified with the command

The -RECOVER INDOUBT command was unable to locate the specified thread to be scheduled for recovery. Either the thread identifier is incorrect, or the thread no longer is in an indoubt state.

This message is issued by the following CSECT: DSNVRIM

System Action: Command processing continues.

Operator Response: Before reentering the command, ensure that the thread still is in an indoubt state.

DSNV418I RECOVER INDOUBT REJECTED FOR ID=*correlation-id*

Explanation: In this message, 'ID=' indicates the recovery 'correlation-id' specified with the command.

The -RECOVER INDOUBT command determined that more than one 'network-id' is associated with the specified 'correlation-id'. No recovery action is taken against the indoubt threads associated with the 'correlation-id'.

This message is issued by the following CSECT: DSNVRIM

System Action: Command processing continues.

Operator Response: To indicate the specific indoubt thread to be scheduled for resolution, the 'network-id' associated with the thread must be specified.

DSNV419I NO CONNECTIONS FOUND

Explanation: The -DISPLAY THREAD command found no active or inactive connections within the system. This message is generated when the command requests thread information for all (TYPE=*), active (TYPE=ACTIVE), or inactive (TYPE=INACTIVE) connections within the system, but no active or inactive connections currently exist.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing continues.

DSNV420I NO INDOUBT THREADS FOUND

Explanation: The -DISPLAY THREAD command found no indoubt threads within the system. This message is generated when the command requests information about all (*) threads currently residing within an indoubt state (TYPE=INDOUBT) within the system, but no threads currently exist within this state.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing continues.

DSNV421I DISPLAY TERMINATED WITH MAX LINES

Explanation: This message indicates the -DISPLAY THREAD TYPE(ACTIVE) or the DISPLAY THREAD TYPE(INACTIVE) report was truncated. The report was generated in response to a command from an MVS console and more than 254 response messages were generated. Only 254 response messages are returned.

The message number and subsystem recognition character are not included in this message.

This CSECT is issued by the following CSECT: DSNVDTM

System Action: The truncated report is written to the MVS console.

Operator Response: Reissue the -DISPLAY THREAD request specifying a specific connection name, location, luwid, or a combination of these, as appropriate, to further reduce the display.

DSNV422I DISPLAY INDOUBT TERMINATED WITH MAX LINES

Explanation: This message indicates the -DISPLAY THREAD TYPE(INDOUBT) report was truncated. The report was generated in response to a command from an MVS console and more than 254 response messages were generated. Only 254 response messages are returned.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNVDTM

System Action: The truncated report is written to the MVS console.

Operator Response: Reissue the -DISPLAY THREAD request specifying a specific connection name.

DSNV423I DISPLAY THREAD MESSAGE POOL SIZE EXCEEDED

Explanation: The virtual storage requirement needed to generate a -DISPLAY THREAD response display exceeded the maximum size of the message buffer pool.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing is terminated.

User Response: Reissue the -DISPLAY THREAD request specifying TYPE(INDOUBT), TYPE(ACTIVE), or TYPE(INACTIVE) and a specific connection name, location, luwid, or a combination of these, as appropriate, to further reduce the display.

Operator Response: Refer to the User Response.

DSNV424I INACTIVE THREADS-

Explanation: This message precedes the listing of inactive threads.

The series of messages DSNV402I through DSNV405I provide the formatted report for the -DISPLAY THREAD TYPE(INACTIVE) when the status of inactive threads is requested.

The series of messages DSNV444I through DSNV448I augment the formatted report for the -DISPLAY THREAD

TYPE(INACTIVE) when LOCATION, LUWID, or DETAIL keywords are used to show idle distributed threads.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV425I DISPLAY INACTIVE REPORT COMPLETE

Explanation: This message follows messages DSNV424I, DSNV403I and DSNV404I, which are augmented by the series of messages DSNV444I through DSNV448I when LOCATION and/or DETAIL keywords are used to show idle distributed threads. It indicates that the -DISPLAY THREAD TYPE(INACTIVE) report completed successfully.

The message number and subsystem recognition character are not included in this message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV426I *csect-name* THREAD *token* HAS BEEN CANCELED

Explanation: This message is issued in response to the CANCEL THREAD command. The thread is scheduled for termination.

System Action: The specified thread is scheduled for termination. The termination of the thread does not occur unless processing is occurring within DB2.

DSNV427I *csect-name* INVALID THREAD *token* SPECIFIED

Explanation: This message is issued in response to the CANCEL THREAD command. No thread with the specified *token* was found.

System Action: The specified thread is not canceled.

User Response: Determine the correct *token* of the thread you want to cancel and reissue the command. You can use the -DISPLAY THREAD command to display all thread activity.

DSNV428I *csect-name* THREAD *token* WAS PREVIOUSLY CANCELED

Explanation: The thread with the specified token was previously canceled by either the CANCEL THREAD or CANCEL DDF THREAD command, or is already in the process of termination.

The CANCEL command terminates the thread only if the thread is processing in DB2 or is currently suspended by DB2. The thread might not be processing in DB2 in these situations:

- The thread is processing in the application and has not made a request to DB2. The DISPLAY THREAD command indicates this.
- The user placed the thread on an MVS resource using the ENQUE command. The CANCEL command has no effect on the thread until ENQUE completes and the thread returns to DB2.
- The thread is processing in VTAM and is waiting for a response from a partner. The DISPLAY THREAD DETAIL command indicates this. The thread does not terminate until VTAM returns to DB2. VTAM commands, which will terminate the session or LU, can be used to cause VTAM to return to DB2.

DSNV429I V429 CALLING PROCEDURE=proc, LOAD MODULE=loadmod, PROC=jclproc, ASID=asid, WLM_ENV=wlmenv

Explanation: This message appears in the output of the DISPLAY THREAD command when a thread is running a stored procedure.

proc The name of the stored procedure the SQL application is running.

loadmod The MVS load module associated with the stored procedure. This field will contain blanks until the load module name has been determined.

jclproc The name of the JCL PROC used to start the address space where the stored procedure is running. This field will contain blanks until the stored procedure has been assigned to a specific stored procedure address space.

asid The MVS ASID of the address space where the stored procedure is running. This field will contain 0000 until the stored procedure has been assigned to a specific stored procedure address space.

wlmenv The name of the WLM application environment where the stored procedure is running. If it is running in the DB2-established stored procedure address space, this field will contain blanks.

System Action: The DISPLAY THREAD command continues processing.

DSNV436I V436-PGM=collection.package, SEC=section, STMT=statement

Explanation: This message appears in the output of a DISPLAY THREAD report when a detail display is specified. If DB2 is currently processing an SQL statement, this message identifies the program which contains that statement and displays the SQL statement being executed.

collection The collection ID associated with *package*. If the SQL statement being executed is associated with a DBRM that was directly bound as part of the plan, and is not associated with a package, then *collection* is not applicable and is indicated by an asterisk (*).

package The package or DBRM member.

section The SQL section number associated with the package or DBRM.

statement The SQL statement number associated with the package or DBRM.

The message number and subsystem recognition character are not included in this message. However, V436 is included in the message text to identify the message.

DSNV437I V437-WORKSTATION=wsname, USERID=user-id, APPLICATION NAME=appl-name

Explanation: This message appears in the output of a DISPLAY THREAD report when a non-detail display is specified. If the appropriate information is provided by the client system, this message is issued and identifies more specific information regarding the identity of the end-user associated with this thread.

wsname The client end-user workstation name.

If not provided by the client system, this field contains an asterisk.

user-id The client end-user user-id.

If not provided by the client system, this field contains an asterisk.

appl-name The client end-user application name.

If not provided by the client system, this field contains an asterisk.

statement The SQL statement number associated with the package or DBRM.

This message number and subsystem recognition character are not included in this message. However, V437 is included in the message text to identify the message.

DSNV443I V443-PARALLELISM COORDINATOR=member-name, ORIGINATING TOKEN=token

Explanation: This message follows a DSNV404I message for each parallel task thread that is running on an assisting DB2. This message gives the DB2 member name and the originating task's thread token.

member-name The coordinating DB2 member where the originating task thread is running.

token The originating task thread token.

The message number and subsystem recognition character are not included in this message. However, V443 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing continues.

DSNV444I V444-luwid=token ACCESSING DATA AT.

Explanation: This message follows a DSNV404I message for each thread that was distributed to other locations when a nondetail display is specified. This message gives the logical-unit-of-work identifier for the distributed thread, followed by an equal sign (=) and a token, which can be used in place of luw-id in any DB2 command that accepts luw-id as input. Message DSNV446I follows with the names of the locations associated with this 'luw-id'.

luwid=token The global logical unit of work id and the local token that identifies the thread. If the thread becomes indoubt, a new token is assigned for the indoubt thread.

The message number and subsystem recognition character are not included in this message. However, V444 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing continues.

DSNV445I V445-luwid=token ACCESSING DATA FOR location

Explanation: This message follows a DSNV404I message for a database access thread. This message displays the logical-unit-of-work identifier assigned to the database access thread.

luwid=token The global logical unit of work id and the local token that identifies the thread. If the thread becomes indoubt, a new token is assigned for the indoubt thread.

location Identifies the requesting site. The value specified in *location* is one of the following:

- The relational database name of the requester or the VTAM LU name of the requester (<luname>), a colon (":") delimiter, and the LU name of the requester for SNA connections.
- The dotted decimal IP address of the requester (nnn.nnn.nnn.nnn) for TCP/IP connections.

The message number and subsystem recognition character are not included in this message. However, V445 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing continues.

DSNV446I V446--location-i location-j ...

Explanation: This message is a continuation of message DSNV444I or message DSNV450I and provides a list of 'location-i'.

location-i Identifies the name of a remote DBMS at which data is being accessed or where a thread is indoubt.

The *location-i* string includes two or three tokens delimited by a colon (":"):

- The first token is the partner location name.
- The second token is the partner LU name for an SNA connection, or the dotted decimal IP address for a TCP/IP connection (nnn.nnn.nnn.nnn).
- The third token only appears if the second token is an IP address in which case the third token is a port number.

When the message appears after message DSNV450I, the port number represents a resync port number. Otherwise the message appears after a DSNV444I message in which case it represents an SQL port number.

A 'location-i' identifier is repeated for each DBMS where data is being accessed or where a thread is indoubt.

The message number and subsystem recognition character are not included in this message. However, V446 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing continues.

DSNV447I V447--LOCATION SESSID A ST TIME

Explanation: This message forms the heading for the listing of distributed active or inactive threads in message DSNV448I. Items in this part of the heading are:

LOCATION Heading for the associated location names

SESSID Heading for the associated VTAM-defined session identifiers

A Heading for the associated active indicators

ST Heading for the associated status indicators

TIME Heading for the associated time stamps

See message DSNV448I for descriptions of these items.

The message number and subsystem recognition character are not included in this message. However, V447 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV448I V448--location sessid active status time

Explanation: This message follows the DSNV447I message for a database access thread or distributed allied thread when a detail display is specified. This message is displayed for each conversation connected to the thread. It lists detailed information about the conversations associated with the thread.

location If displaying an allied thread, the location is the name of the server; otherwise, it is the name of the requester. The name can be any of the following: the relational database name of the partner, the VTAM LU name of the partner (<luname>), or the dotted decimal IP address of the partner (nnn.nnn.nnn.nnn).

sessid There are two possible values for this field:

- For VTAM partners, this field contains the VTAM-defined session instance identifier of the session on which the conversation is executing. Zeros if the session identifier is not applicable.

VTAM does not supply the entire session id to DB2. The first two digits of the session id are incorrect. Therefore, the session id as presented in this message is not acceptable in VTAM commands. The VTAM DISPLAY NET, ID=db2-luname, SCOPE=ACT command must be used to obtain the full session ID. The DISPLAY NET command lists all sessions (SID) for the DB2 logical unit. Scan the DISPLAY NET output for the complete SID.

- For TCP/IP connections, this field contains the local DB2 TCP/IP port number, followed by the partner's TCP/IP port number. The two port numbers are separated by a colon (e.g 5001:28191).

active One of the following:

V The conversation is active within VTAM or TCPIP.

W The conversation is suspended in DB2 waiting for VTAM or TCP/IP notification that the function is complete.

Blank, otherwise.

status Status of the conversation.

This information is presented as two characters, each of which has significance.

First Character

- A Conversation in allocation.
- C Session limits are being negotiated with the partner (CNOS) prior to conversation allocation.
- D Conversation in deallocation.
- R Receiving
 - At the requesting site, this indicates that the conversation is receiving a response from a request.
 - At the server site, this indicates that the conversation is receiving or waiting for a request.
- S Sending
 - At the requesting site, this indicates that the conversation can send requests to the server.
 - At the server site, this indicates that the conversation is sending or preparing to send a response.
- X Exchanging log name information with the partner before conversation allocation to determine if the partner supports protected conversations. If the thread remains in this status for an extended period of time, the DB2 service task that exchanges log names might be busy processing other requests. The DB2 DISPLAY LOCATION command ('DISPLAY LOCATION(*) DETAIL') shows you conversation activity for this (RESYNC) service task.

Blank, otherwise.

Second Character

- 1 Unprotected conversation using system-directed access is active.
- 2 Unprotected conversation using application-directed access is active.
- 3 Protected conversation using system-directed access is active.
- 4 Protected conversation using application-directed access is active.

Blank otherwise.

time The time stamp (yyddhhmssst) of the last message sent or received on the conversation.

The message number and subsystem recognition character are not included in this message. However, V448 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing continues

DSNV449I V449-HAS NID=*nid* AND ID=*correlation-id*

Explanation: This message is a detail line, which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report.

nid	The network-id assigned by IMS or CICS or, if the connection type is RRSAF, the OS/390 RRS unit of recovery ID (URID)
correlation-id	The correlation-id assigned by IMS or CICS or if the connection type is RRSAF, the correlation-id assigned by the connected application

The message number and subsystem recognition character are not included in this message. However, V449 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

DSNV450I V450-HAS PARTICIPANT INDOUBT AT

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. This message is followed by one or more DSNV446I messages that name the 'locations' where indoubt participant threads are located. The 'luwid' of the indoubt thread is displayed in the preceding DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V450 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: The thread remains indoubt and processing continues normally.

Operator Response: See message DSNL406I for more information. The indoubt participants displayed can also result from an abnormal termination of this DB2 subsystem.

DSNV451I V451-RESYNC WITH COORDINATOR STILL PENDING

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. When an indoubt thread is manually resolved with the RECOVER INDOUBT command, this message is included in the report if indoubt resolution with the coordinator was not complete. The 'coordinator' and the 'luwid' of the indoubt thread are displayed in the previous DSNV408I message.

The message number and subsystem recognition character are not included in this message. However, V451 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: The thread remains indoubt and processing continues normally.

DSNV452I V452-HEURISTIC COMMIT BY PARTICIPANT AT LOCATION *location*

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. A decision was made at the participant to force the indoubt thread to commit without waiting for automatic resynchronization to be performed. The 'luwid' of the thread is displayed in the preceding DSNV408I message.

location	The 'location' where the HEURISTIC COMMIT was performed. The 'location' is either the relational database name (location-name), the logical unit name (<lname>), or the dotted decimal IP address (nnn.nnn.nnn.nnn) of the participant.
----------	---

The message number and subsystem recognition character are not included in this message. However, V452 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

Operator Response: See message DSNL402E for more information.

DSNV453I V453-HEURISTIC ABORT BY PARTICIPANT AT LOCATION *location*

Explanation: This message is a detail line which might be displayed with a DISPLAY THREAD TYPE (INDOUBT) report. A decision was made at the participant to force an indoubt thread to abort without waiting for automatic resynchronization to be performed. The 'luwid' of the thread that was forced to abort is displayed in the preceding DSNV408I message.

location The 'location' where the HEURISTIC ABORT was performed. The 'location' is either the relational database name (location-name), the logical unit name (<luname>), or the dotted decimal IP address (nnn.nnn.nnn.nnn) of the participant.

The message number and subsystem recognition character are not included in this message. However, V453 is included in the message text to identify the message.

This message is issued by the following CSECT: DSNVDTM

System Action: Processing continues normally.

Operator Response: See message DSNL403E for more information.

DSNV454I LOCATION OR LUWID KEYWORD INVALID WHEN DDF NOT STARTED

Explanation: The -DISPLAY THREAD TYPE(ACTIVE) command was issued with the keyword LOCATION or LUWID and it was found that the distributed data facility (DDF) was not started. The LOCATION or LUWID keyword can be used only if DDF is in operation.

This message is issued by the following CSECT: DSNVDTM

System Action: Command processing is complete.

DSNV456I INVALID PARAMETER WITH LUWID KEYWORD *luwid-parameter*

Explanation: The -DISPLAY THREAD TYPE(ACTIVE), -DISPLAY THREAD TYPE(INACTIVE), or the -RECOVER INDOUBT command was issued with the keyword LUWID and its required parameter list. However, one of the parameters was syntactically invalid as a logical-unit-of-work identifier.

This message is issued by the following CSECTs: DSNVDTM DSNVRIM

System Action: Command processing is complete.

Operator Response: The syntax of the DISPLAY THREAD and RECOVER INDOUBT commands is described in *Command Reference*. Reenter the command specifying valid LUWID values.
