# Business Process Management

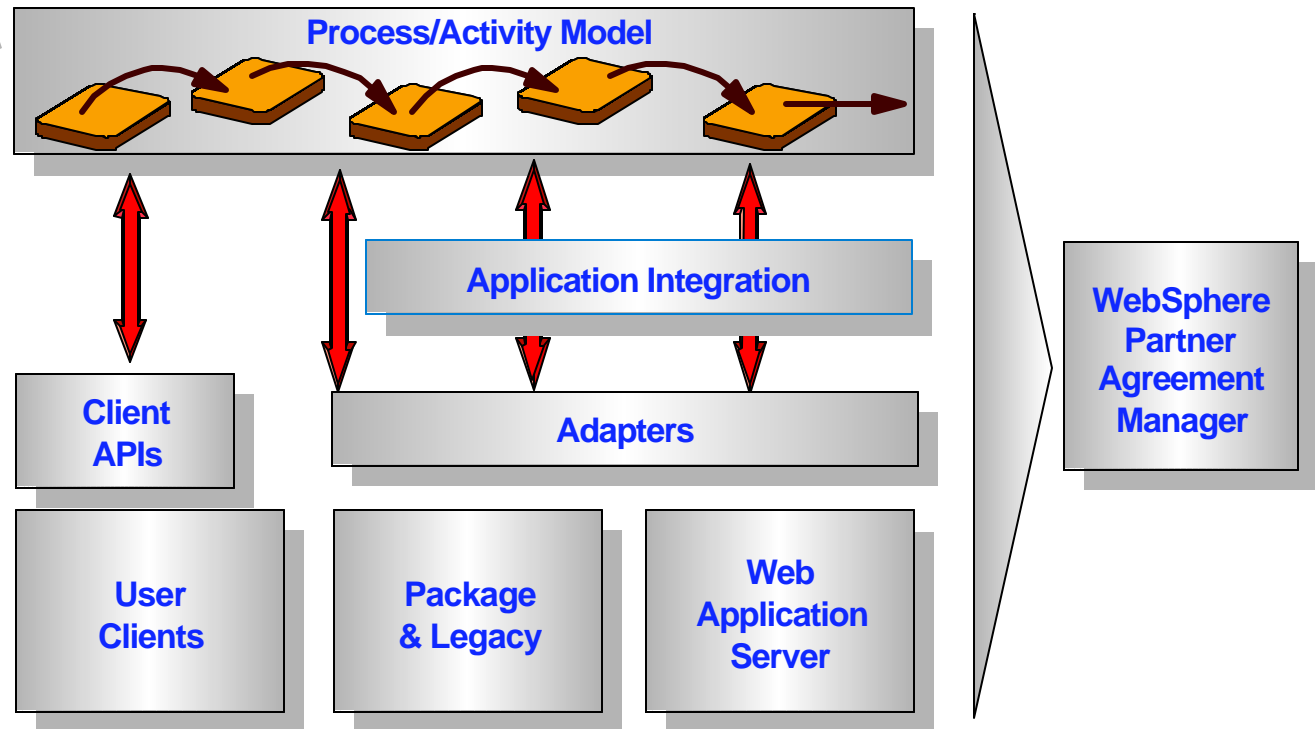

What

Define/Manage processes  
(MQSeries Workflow)

How

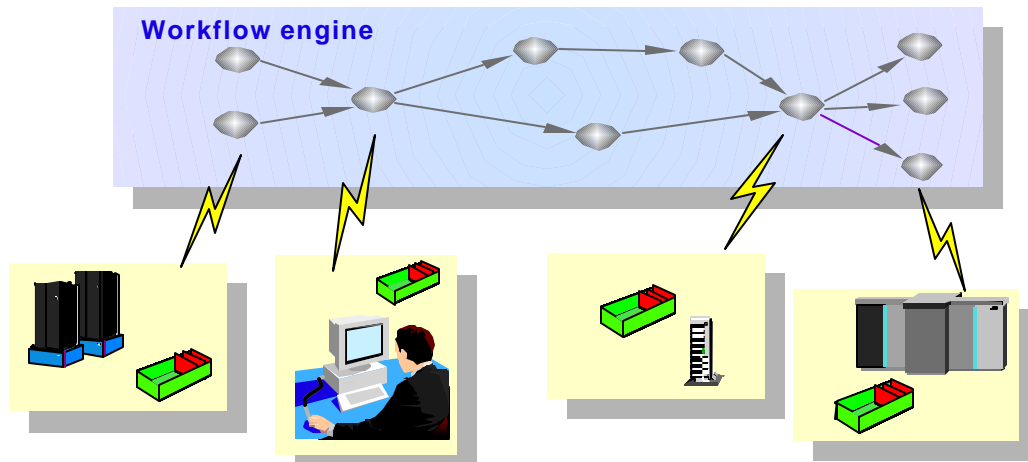

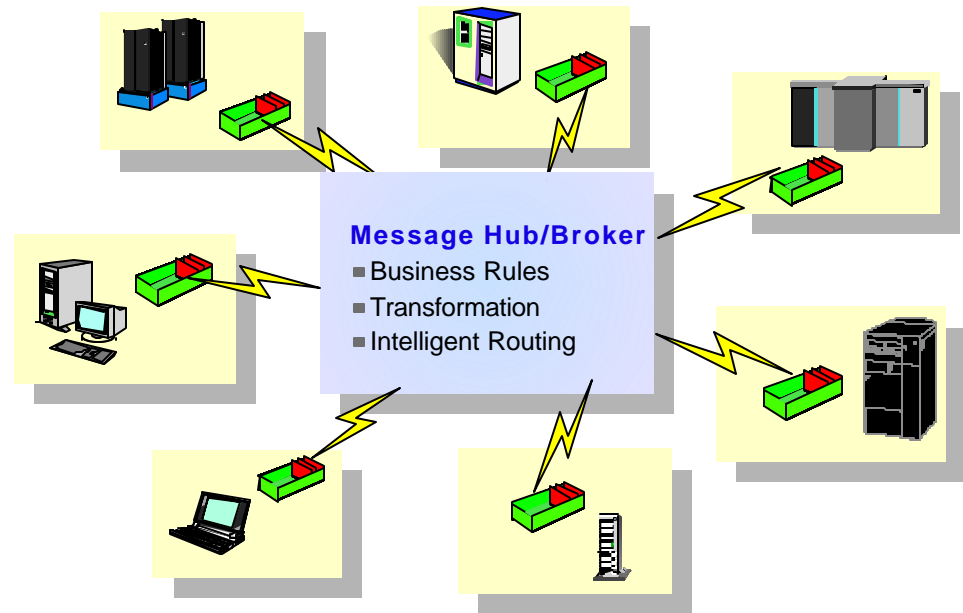

Manage your information  
(MQSeries Integrator)

Connect your applications  
(MQSeries Adapter Offering)

## MQSeries Integrator

- Message brokering hub for processing, transformation and routing of messages (including publish/subscribe)

Business logic above the integrated applications

## MQSeries Workflow

- Business process manager orchestrating and automating long-running, potentially interactive business processes

# Flow Model characteristics of ...

## MQWF

- Process
  - ▶ Sequence of steps that define a business process
  - ▶ Graph consisting of activities (program/process/block) and control/data connectors
  - ▶ Rules specified via start/exit/transition conditions
  - ▶ Resource assignment (People, IT) per activity

## MQSI

- Message Flow
  - ▶ Sequence of operations on a message
  - ▶ Graph consisting of message processing nodes (built-in nodes, custom nodes) and connectors
  - ▶ Rules specified via special nodes (e.g. filter node)

**Today:** Separate tooling (MQWF Buildtime, MQSI Control Center)

**Tomorrow:** Common tooling based on FCM/Eclipse

# Runtime characteristics...

Execution model of flow instances (process instance/message flow)

## Process Instance

- Each navigation step is a single transaction.
- Multiple threads of execution
- Persistent state in database
- Process monitoring based on instance data and / or audit trail records
- Joins

## Message Flow

- Entire flow is a single (transactional) unit of work.
- Single thread of execution
- Transient state within thread of execution, no state maintained across multiple inputs.
- "All-or-nothing" semantics
- Flow instance not observable while running, historic data about execution may be written.

# Runtime characteristics... (cont.)

Execution model of activity / node implementations

## Process Instance

- Invocation of activity implementations
  - ▶ distributed
  - ▶ heterogeneous
  - ▶ parallel(by PEA, PES or UPES)

## Message Flow

- Invocation of processing nodes within same address space as message flow
  - ▶ local
  - ▶ homogeneous
  - ▶ serial

# Summary

	<b>MQSeries Workflow</b>	<b>MQSeries Integrator</b>
General:	Process Management	Message Broker Hub
Flow Types:	Business Process Flows	Information Flows
Flow Scope:	Across units of work	Within a unit of work
Flow States:	Process State	Stateless
Message Formats:	XML (& internal)	XML & others
People Integration:	Yes	No
Application Integration:	MQSeries message PEA/PES/UPES	MQSeries message build-in nodes

# Interoperability of MQWF and MQSI via XML messages

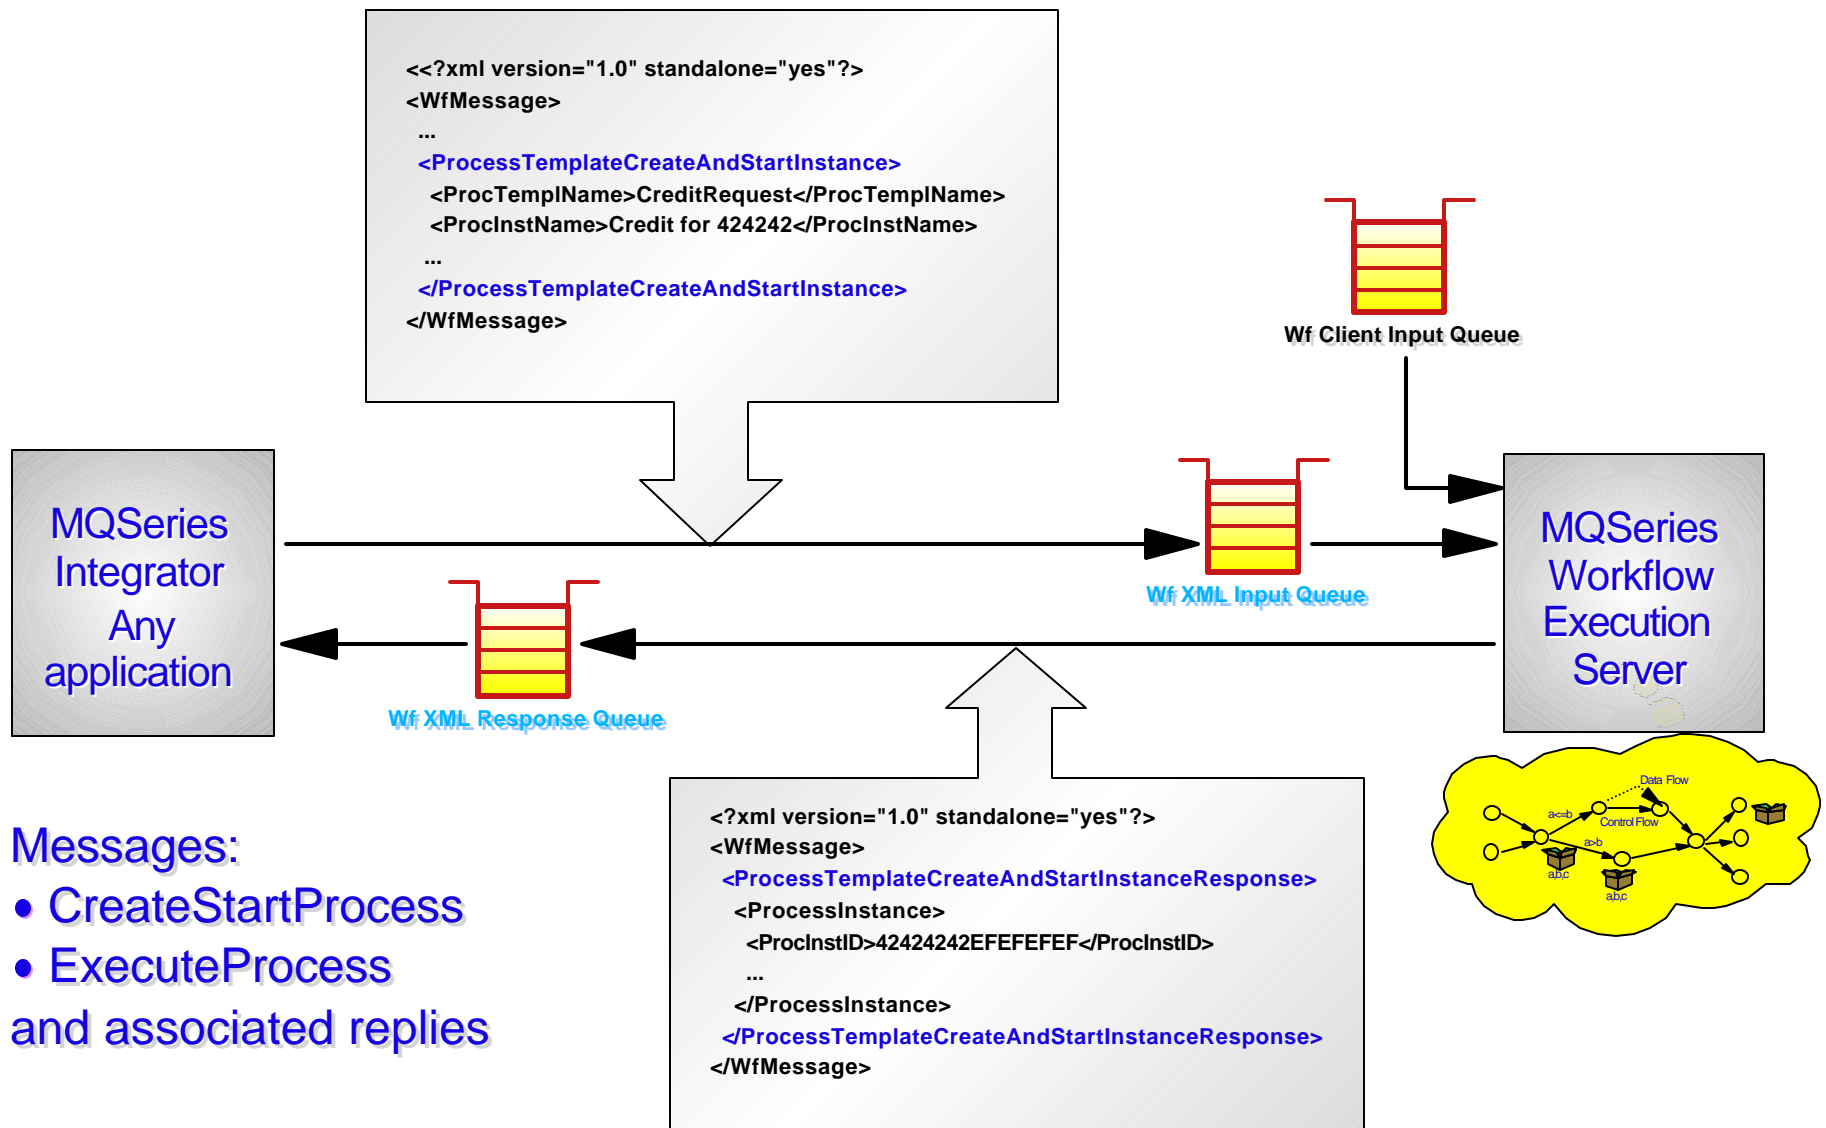

Integration of MQSeries Workflow and MQSeries Integrator by means of XML messages.

The XML message interface of MQWF V3 allows

- ▶ to start a process instance by means of an XML message
- ▶ to implement a program activity by sending an XML message to a user defined program execution server (UPES)

MQSI V2 provides XML message support to parse and create generic XML messages.

# "Call-In" -- request as XML message

- Messages:
- CreateStartProcess
  - ExecuteProcess
- and associated replies

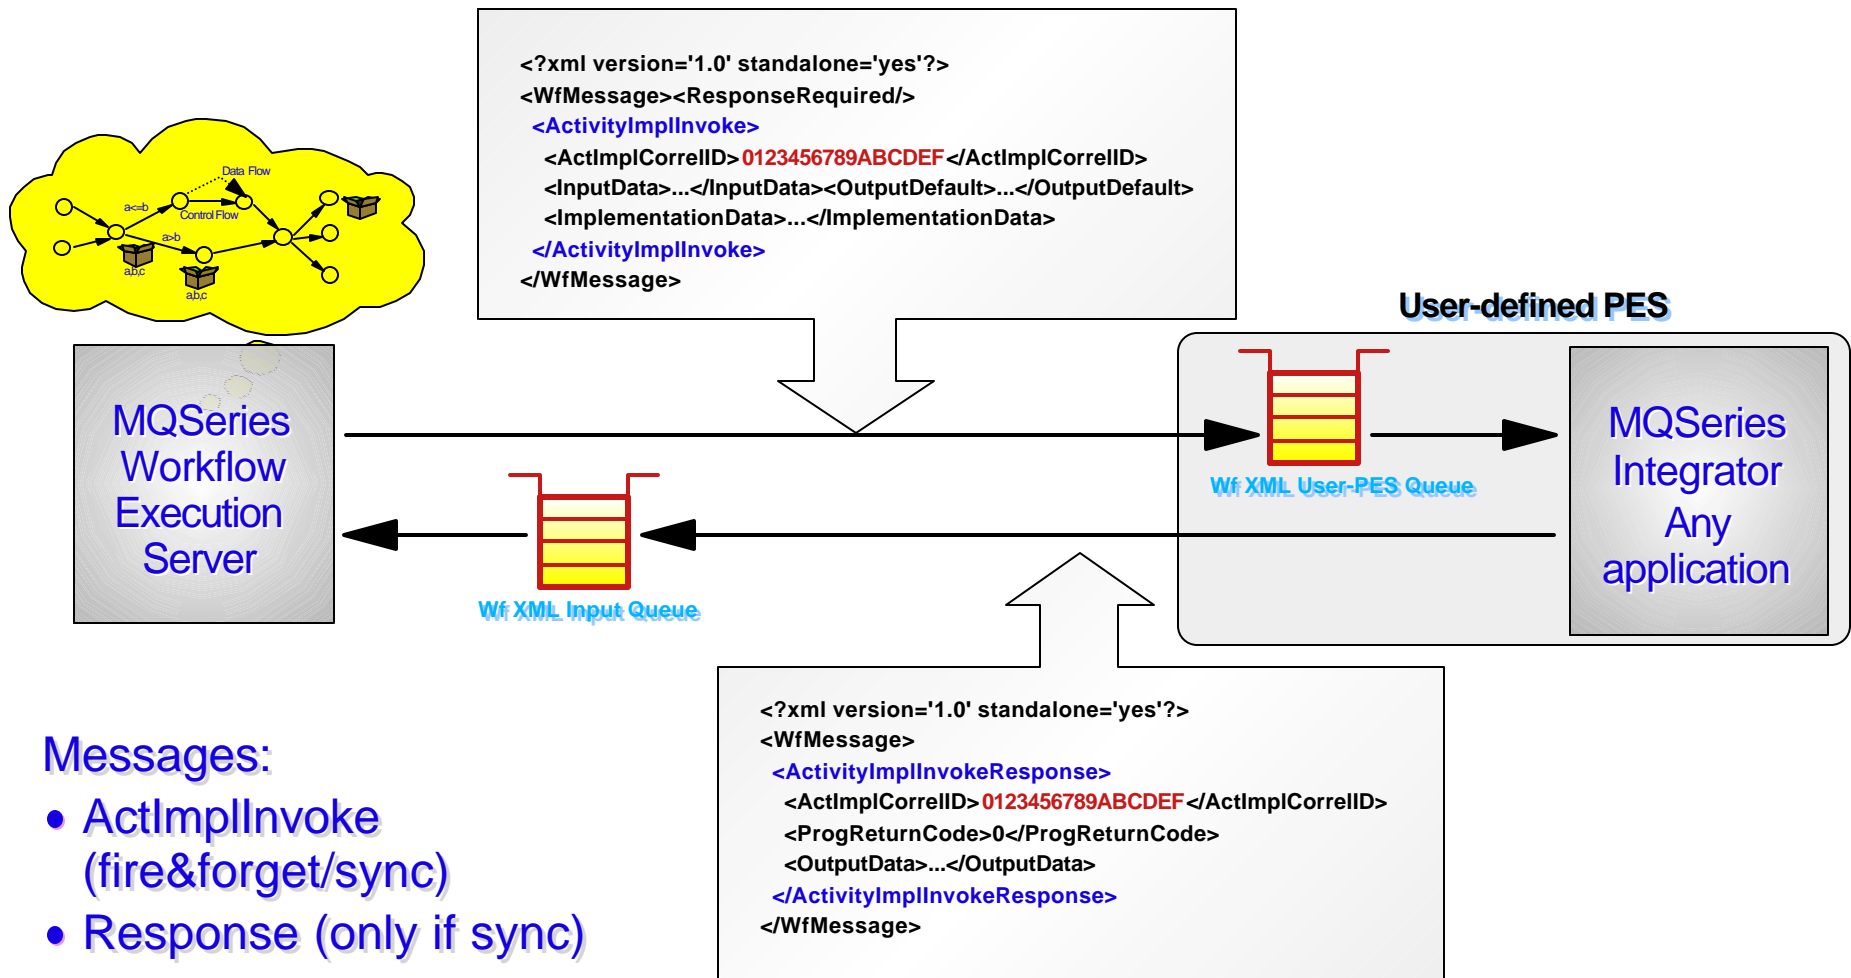

# Notes: "Call-In" -- request as XML message

Provide additional interface into Workflow server

Message-based interface

- ▶ Enables transactional requests
- ▶ Truly asynchronous, sessionless
- ▶ Reply addressing via MQ header
- ▶ Request/reply correlation via optional user context data

# "Call-Out" -- XML message as activity implementation

## Messages:

- ActImplInvoke (fire&forget/sync)
- Response (only if sync)

# Notes: "Call-Out" -- XML message as activity implementation

Provide additional callback mechanism for activity triggering from Workflow server

- Facilitates transactional activity implementation (save application)
- Synchronous invocation
  - reply required to signal completion
- "Fire and forget" invocation
  - WF server continues process navigation right away

User-defined program execution server (UPES)

- ▶ modeled during Buildtime as an abstraction of a MQ queue
- ▶ implemented by an application that processes activity implementation invocation messages and generates appropriate responses

# Summary of MQWF's XML support

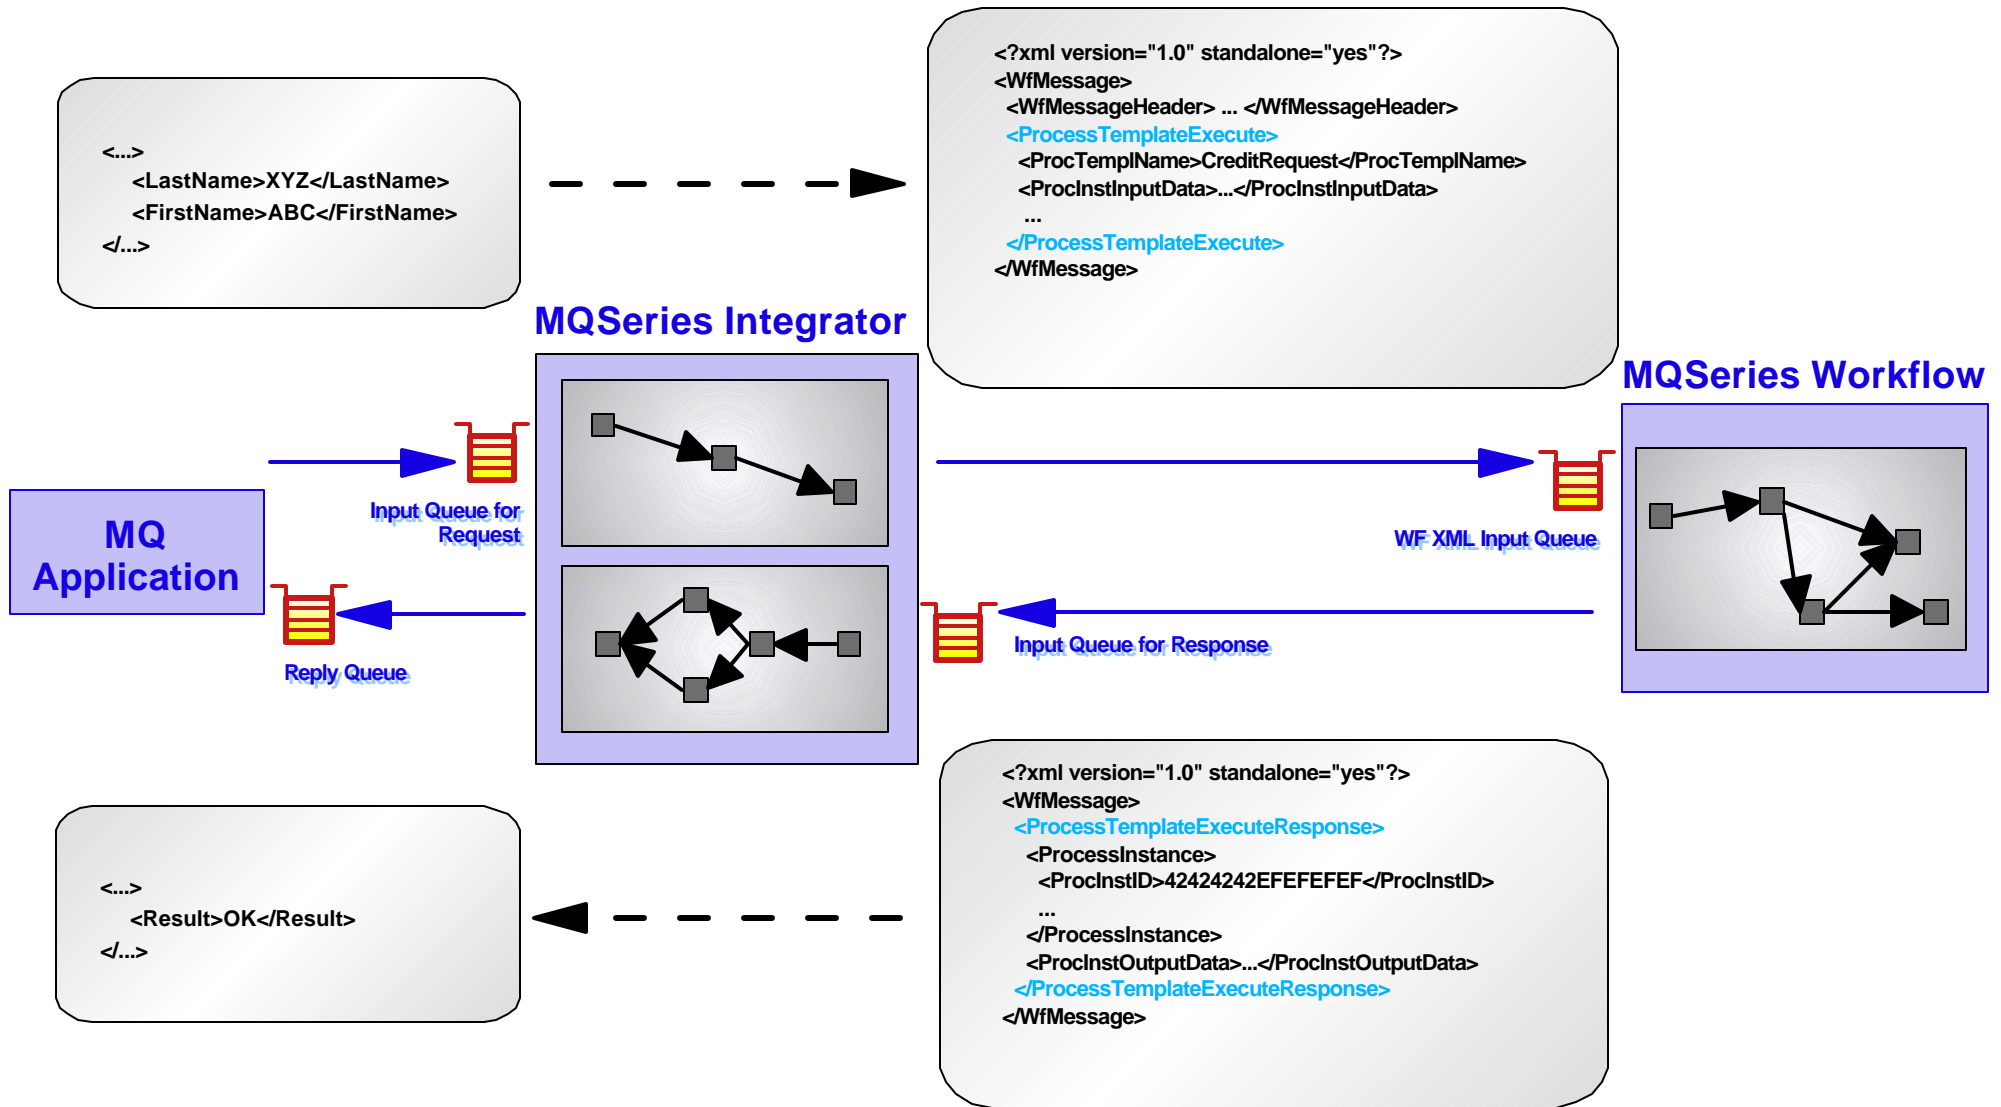

- **Direct interface with MQSeries applications**
  - ▶ Start/Execute process instance
  - ▶ Activity implementation invocation (request&reply, fire&forget)
- **Interoperability with MQSeries Integrator**
- **Integrate applications on all MQSeries platforms**
  - ▶ Exploitation of MQSeries adapters
- **Transactional application integration via MQSeries**
  - ▶ Chaining of workflow server and application transactions
  - ▶ Assured message delivery
- **Truly asynchronous, sessionless interface**
  - ▶ Request/reply correlation via optional user context data
- **XML as standard language for message content**
  - ▶ Attractive to industry solution developers and emerging application standards
  - ▶ Supported in new web browsers, and web-based AD tools

# Call-In Scenario

# Message Flow ExecCreditReq

Queue ExecCreditReqIn on queue mgr FMCQM

```
<ExecCreditReq.>
  <LName>Potter</LName>
  <FName>Harry</FName>
</ExecCreditReq.>
```

**MQInput Node**  
reads message from input queue of message flow

**Compute Node**  
transforms input message into XML message  
ProcessTemplateExecute

**MQOutput Node**  
writes message to XML input queue of  
MQS-WF

XML message to trigger execution of process CreditRequest with input container

```
<PersonInfo>
  <LastName>Potter</LastName>
  <FirstName>Harry</FirstName>
</PersonInfo>
```

Queue FMC.FMCGRP.EXE.XML on queue mgr FMCQM

# Sample Request Messages

Transformed request message

Original request message

```
... MQMD
MsgType=MQMT_REQUEST
ReplyToQ=MyReplyToQ
ReplyToQMgr=MyReplyToQMgr
...
```

```
MQ Message Body

<...>
  <FName>Harry</FName>
  <LName>Potter</LName>
</...>
```

```
... MQMD
ReplyToQ=<ReplyToQ of response msg flow>
ReplyToQMgr=<ReplyToQMgr of response msg flow>
...
```

```
MQ Message Body

<?xml version="1.0" standalone="yes"?>
<WfMessage>
  <WfMessageHeader>
    <ResponseRequired>Yes</ResponseRequired>
    <UserContext> MyReplyToQ MyReplyToQMgr
  </UserContext>
  </WfMessageHeader>
  <ProcessTemplateExecute>
    <ProcTemplName>CreditRequest</ProcTemplName>
    <ProcInstInputData>
      <PersonInfo>
        <FirstName>Harry</FirstName>
        <LastName>Potter</LastName>
      </PersonInfo>
    </ProcInstInputData>
  </ProcessTemplateExecute>
</WfMessage>
```
