See *TPF Operations* for more information about the ZGFSP commands and miscellaneous file pool functions. See *TPF Database Reference* for more information about pool maintenance.

---

**GFSP0051E A MINIMUM OF TWO DEVICES MUST BE SPECIFIED**

**Explanation:** This is the response from the ZGFSP FLB or ZGFSP RTO command when only one device type is specified.

**System Action:** The message is ignored.

**User Response:** Enter the command again and specify two or more device types.

See *TPF Operations* for more information about the ZGFSP command and miscellaneous file pool functions. See *TPF Database Reference* for more information about file pool support.

---

**GFSP0052E NUMBER OF FILE POOL ADDRESSES NOT SPECIFIED**

**Explanation:** This is the response from the ZGFSP RTO command when a count of pool addresses for each device type is not specified.

**System Action:** The message is ignored.

**User Response:** Enter the command again with a count of pool addresses for each device type specified in the command.

See *TPF Operations* for more information about the ZGFSP RTO command and miscellaneous file pool functions. See *TPF Database Reference* for more information about file pool support.

---

**GFSP0053E UNABLE TO READ CTK9 (CYYM ERROR)**

**Explanation:** An error indicator was returned to the CYF1 segment from the CYYM segment while trying to retrieve keypoint 9 (CTK9).

**System Action:** The ZGFSP command is rejected.

**User Response:** Do the following:

1. Determine the cause of the retrieval error.
2. Take the necessary corrective action.

See *TPF Operations* for more information about the ZGFSP command and miscellaneous file pool functions.

---

**GFSP0056E** *input message* **– INVALID DEVICE CODE**

**Where:**

*input message*
The command.

**Explanation:** This is the response from the ZGFSP FLB or ZGFSP RTO command when the device type specified in the message is not valid for this subsystem or the TPF system.

**System Action:** The message is ignored.

**User Response:** Enter the command again and specify a valid device type.

See *TPF Operations* for more information about the ZGFSP FLB and ZGFSP RTO commands and miscellaneous file pool functions. See *TPF Database Reference* for more information about file pool support.

---

**GFSP0057E** *input message* **— INVALID POOL FOR SYSTEM**

**Where:**

*input message*
The command.

**Explanation:** This is the response from the ZGFSP FLB or ZGFSP RTO command when the pool type specified in the message is not valid for this subsystem or the TPF system.

**System Action:** The message is ignored.

**User Response:** Enter the command again and specify a valid pool type.

See *TPF Operations* for more information about the ZGFSP FLB

and ZGFSP RTO commands and miscellaneous file pool functions. See *TPF Database Reference* for more information about file pool support.

---

**GFSP0058E INVALID SET VALUE ENTERED**

**Explanation:** This is the response from the ZGFSP SET command when the set value is out of range. The value must be between 1 and 255.

**System Action:** The message is ignored.

**User Response:** Enter the command again and specify a valid set value between 1 and 255.

See *TPF Operations* for more information about the ZGFSP SET command and miscellaneous file pool functions. See *TPF Database Reference* for more information about pool maintenance.

---

**GFSP0059E INVALID DEVICE TYPE IS ENTERED**

**Explanation:** This is the response from the ZGFSP SET command when the device type specified in the message is not valid for this subsystem or the TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the command again specifying a valid device type.

See *TPF Operations* for more information about the ZGFSP SET command and miscellaneous file pool functions. See *TPF Database Reference* for more information about pool maintenance.

---

**GFSP0060E INVALID PROCESSOR ID**

**Explanation:** This is the response from the ZGFSP SET command when the processor ID specified cannot be validated. The message indicates an error was returned from the CCIDC macro.

**System Action:** The message is ignored.

**User Response:** Do one of the following:

- Enter the command again and specify a valid processor ID.
- Determine why there was an error from the CCIDC macro.

See *TPF Operations* for more information about the ZGFSP SET command and miscellaneous file pool functions. See *TPF Database Reference* for more information about pool maintenance.

---

**GFSP0061E UNABLE TO FILE CTK9 (CYYA ERROR)**

**Explanation:** This message may be received in response to the ZGFSP SET command. An error indicator was returned to the CYF8 segment from the CYYA segment while trying to file keypoint 9 (CTK9).

**System Action:** The ZGFSP command is rejected.

**User Response:** Do the following:

1. Determine the cause of the failure.
2. Take the necessary corrective action.

See *TPF Operations* for more information about the ZGFSP SET command and miscellaneous file pool functions. See *TPF Database Reference* for more information about pool maintenance.

---

**GFSP0062E UNABLE TO READ CTK9 (CYYM ERROR)**

**Explanation:** This message may be received in response to the ZGFSP SET command. An error indicator was returned to the CYF8 segment from the CYYM segment while trying to retrieve keypoint 9 (CTK9).

**System Action:** The ZGFSP command is rejected.

**User Response:** Do the following:

1. Determine the cause of the failure.
2. Take the necessary corrective action.

See *TPF Operations* for more information about the ZGFSP SET command and miscellaneous file pool functions. See *TPF Database Reference* for more information about pool maintenance.

---

**GFSP0063E** *input message* **— INVALID FUNCTION FOR 1052/UTILITY STATE**

**Where:**

*input message*
The command.

**Explanation:** This is the response from the ZGFSP OPT command when the subsystem or the TPF system is in 1052 state, utility (UTIL) state, or the TPF system is cycling.

**System Action:** The ZGFSP command is rejected.

**User Response:**

1. Verify the state of the subsystem or the TPF system.
2. Enter the command again.

See *TPF Operations* for more information about the ZGFSP OPT command and miscellaneous file pool functions.

---

**GFSP0064E** *input message* **— POOL/DEVICE NOT IN THE CONFIGURATION**

**Where:**

*input message*
The command.

**Explanation:** This is the response from the ZGFSP RCY command when the pool type specified in the message is not valid for the specified device type.

**System Action:** The ZGFSP command is rejected.

**User Response:** Do the following:

1. Verify the pool type/device type combination.
2. Enter the command again.

See *TPF Operations* for more information about the ZGFSP RCY command and miscellaneous file pool functions.

---

**GFSP0065E** *input message* **— INVALID DEVICE TYPE**

**Where:**

*input message*
The command.

**Explanation:** This is the response from the ZGFSP RCY command when the device type specified in the message is not valid for this subsystem or the TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the ZGFSP RCY command again specifying a valid device type.

See *TPF Operations* for more information about the ZGFSP RCY command and miscellaneous file pool functions.

**GFSP0066E SPECIFIED POOL TYPE IS NOT VALID**

**Explanation:** The ZGFSP SET command was entered with a pool type specified that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZGFSP SET command again and specify a valid pool type.

See *TPF Operations* for more information about the ZGFSP SET command and miscellaneous file pool functions.

**GFSP0067E DEVICE TYPE MUST BE SPECIFIED**

**Explanation:** A ZGFSP command was entered to change the minimum available pools or maximum usage per minute of a pool type, but a device type was not specified. After ZPMIG CONVERT processing ends successfully, changes must be done by pool section.

**System Action:** The command is rejected.

**User Response:** Enter the ZGFSP command again and specify a valid device type.

See *TPF Operations* for more information about the ZGFSP and ZPMIG commands.

**GFSP0068E UNABLE TO FIND CYPDR**

**Explanation:** A find error occurred when the ZGFSP DSP, ZGFSP FLB, or ZGFSP RTO command tried to retrieve the pool descriptor record (CYPDR). CYPDR is contained in the #IBMML record type at ordinal #PDRON.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Take the necessary corrective action.

See *TPF Operations* for more information about the ZGFSP commands and miscellaneous file pool functions.

**GFSP0069E UNABLE TO FILE CYPDR**

**Explanation:** A file error occurred when the ZGFSP FLB or ZGFSP RTO command tried to write the pool descriptor record (CYPDR). CYPDR is contained in the #IBMML record type at ordinal #PDRON.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Take the necessary corrective action.

See *TPF Operations* for more information about the ZGFSP DSP and ZGFSP RTO commands and miscellaneous file pool functions.

**GFSP0071E UNABLE TO READ CTKB FOR PROCESSOR ORDINAL** *nn*

**Where:**

*nn* The processor ordinal in hexadecimal.

**Explanation:** An error occurred when the ZGFSP SET command tried to read keypoint B for an inactive processor in the loosely coupled complex.

**System Action:** Processing for the command ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Take the necessary corrective action.
3. Enter the ZGFSP SET command again.

See *TPF Operations* for more information about the ZGFSP SET command

**GFSP0072E UNABLE TO FILE CTKB FOR PROCESSOR ORDINAL** *nn*

**Where:**

*nn* The processor ordinal in hexadecimal.

**Explanation:** An error occurred when the ZGFSP SET command tried to file keypoint B for an inactive processor. Keypoint B has been updated with a new aggregate pool carve value.

**System Action:** Processing for the command ends.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Take the necessary corrective action.
3. Enter the ZGFSP SET command again.

See *TPF Operations* for more information about the ZGFSP SET command

**GFSP0073E FACS ERROR ON CY2KT ORDINAL** *nn*

**Where:**

*nn* The record ordinal number in hexadecimal.

**Explanation:** An error occurred when the ZGFSP SET command called FACS to determine the file address for the CY2KT record.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Analyze the FACE table verifying, that the #CY2KT fixed file record is correctly defined and that enough ordinals are specified.
2. Take the necessary corrective action.
3. Enter the ZGFSP SET command again.

See *TPF Operations* for more information about the ZGFSP SET command

---

**GFSP0074E FIND ERROR ON CY2KT ORDINAL** *nn*

**Where:**

*nn* The record ordinal number in hexadecimal.

**Explanation:** An error occurred when the ZGFSP SET command tried to read the CY2KT record.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Analyze the FACE table, verifying that the #CY2KT fixed file record is correctly defined and that enough ordinals are specified.
2. Take the necessary corrective action.
3. Enter the ZGFSP SET command again.

See *TPF Operations* for more information about the ZGFSP SET command

---

**GFSP0075E DEVICE TYPE NOT ALLOWED**

**Explanation:** A ZGFSP command was entered to change the minimum available pools or maximum usage per minute of a pool type with a device type specified. The ZPMIG CONVERT command must be processed successfully before changes can be done by pool section.

**System Action:** The command is rejected.

**User Response:** Enter the ZGFSP command again without a device type specified.

See *TPF Operations* for more information about the ZGFSP and ZPMIG commands.

---

**GFSP0080E - INVALID DEVICE CODE**

**Explanation:** This is the response to the ZGFSP DSP command when the device type in the pool descriptor record (CYPDR) is not valid for this subsystem or for the TPF system.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Analyze CYPDR to determine the incorrect device type.
2. Enter the ZGFSP FLB and ZGFSP RTO commands to set the correct device type.

See *TPF Operations* for more information about the ZGFSP DSP, ZGFSP FLB, and ZGFSP RTO commands.

---

**GOGO0000I GLOBAL PROCESSING COMPLETED**

**Explanation:** The load of the global area was completed for all the subsystem users (SSUs).

**System Action:** Restart processing is continued.

**User Response:** None.

---

**GOGO0001I APPLICATION FIXED CORE LOADED MODE** *mm* **SSU** *xxxx* **— I-S** *yy*

**Where:**

*mm* The mode.

*xxxx*
The subsystem user (SSU) name.

*yy* The I-stream.

**Explanation:** This message signals the successful end of processing for the designated subsystem user (SSU)/I-stream.

**System Action:** Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0003E ERROR FROM FACE ID #GLOBL ORDINAL NUMBER** *nnnnn* **SSU** *xxxx* **— I-S** *yy*

**Where:**

*nnnnn*
The ordinal number.

*xxxx*
The subsystem user (SSU) name.

*yy* The I-stream.

**Explanation:** The main storage load program detected an error on return from the file address compute program (FACE).

**System Action:** After the message is issued, control is returned to the main storage load program, where the current subsystem user (SSU) is placed in a dormant state.

Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0004E ERROR FINDING ID** *zz* **ORDINAL NUMBER** *nnnnn* **ADDRESS** *aaaaaaaa* **SSU** *xxxx* **— I-S** *yy*

**Where:**

*zz* The record ID.

*nnnnn*
The ordinal number.

*aaaaaaaa*
The file address.

*xxxx*
The subsystem user (SSU) name.

*yy* The I-stream.

**Explanation:** An error was detected on a FINDC macro for the record ID and file address referenced in the message for the specified subsystem user (SSU).

**System Action:** The current SSU is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0005E CANNOT FIND MODE REQUESTED MODE** *mm* **SSU** *xxxx* **— I-S** *yy*

**Where:**

*mm* The mode.

*xxxx*
The subsystem user (SSU) name.

*yy* The I-stream, which is displayed as a decimal number.

**Explanation:** There is no match for a global load mode in the subsystem user attribute table and the main storage allocator record.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0006E TABLES MISSING FOR CHAINED LOAD MODE** *mm* **SSU** *xxxx* **— I-S** *yy*

**Where:**

*mm* The mode.

*xxxx*
The subsystem user (SSU) name.

*yy* The I-stream.

**Explanation:** The GOA record header indicates chaining of records for the current load mode but the chained record cannot be found.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the application global area.

---

**GOGO0007E DIRECTORY INDEX OUT OF RANGE MODE** *mm* **SSU** *xxxx* **— I-S** *yy*

**Where:**

*mm* The mode.

*xxxx*
The subsystem user (SSU) name.

*yy* The I-stream.

**Explanation:** A directory index (GO1EIX) in a GOA table entry exceeds 56 for global area 1 or 68 for global area 3.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0008E TRYING TO STRIP HEADER OF KEYPOINT RECORD MODE** *mm* **SSU** *xxxx* **— I-S** *yy*

**Where:**

*mm* The mode.

*xxxx*
The subsystem user (SSU) name.

*yy* The I-stream.

**Explanation:** A global record designated as keypointable must be loaded into main storage with the header intact.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0009E TRYING TO LOAD CORE AREAS IMPROPERLY MODE** *mm* **SSU** *xxxx* **— I-S** *yy*

**Where:**

*mm* The mode.

*xxxx*
The subsystem user (SSU) name.

*yy* The I-stream.

**Explanation:** Globals must be loaded in the following sequence:

- Global area 1
- Global area 2
- Global area 3.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0011E COMMON RECORD DESIGNATED UNIQUE IN FIRST SSU MODE** *mm* **RECORD ID** *rr* **SSU** *xxxx* **— I-S** *yy*

**Where:**

*mm* The mode.

*rr* The record ID.

*xxxx*
The subsystem user (SSU) name.

*yy* The I-stream.

**Explanation:** A record designated as unique for the primary subsystem user (SSU) of a subsystem cannot be designated common by succeeding SSUs of that subsystem.

**System Action:** The current SSU is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0012E KEYPOINTABILITY DISCREPANCY WITH FIRST SSU MODE *mm* RECORD ID *rr* SSU *xxxx* — I-S *yy***

**Where:**

*mm* The mode.

*rr* The record ID.

*SSU*
The subsystem user.

*yy* The I-stream.

**Explanation:** A record must be designated as keypointable in the primary subsystem user (SSU) of a subsystem before it can be designated as keypointable in succeeding SSUs of that subsystem.

**System Action:** The current SSU is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

**GOGO0013E COMMON RECORD IDS DIFFER MODE *mm* CURRENT RECORD ID *rr* SSU *xxxx* — I-S *yy***

**Where:**

*mm* The mode.

*rr* The record ID

*xxxx*
The subsystem user

*yy* The I-stream.

**Explanation:** The record ID (GO1EID) of a common record for a non-primary subsystem user (SSU) must be identical to that of the primary SSU.

**System Action:** The current SSU is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

**GOGO0014E GLOBAL BLOCKS NOT FIRST OR IN WRONG ORDER MODE *mm* AREA *aa* SSU *xxxx* — I-S *yy***

**Where:**

*mm* The mode.

*aa* The area.

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** For each subsystem user (SSU), global blocks (records with GO1EID = GL) must be loaded in global area 1 or global area 3 before anything else.

**System Action:** The current SSU is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

**GOGO0015E CORRESPONDING GLOBAL BLOCKS DIFFER IN SIZE MODE *mm* AREA *aa* SSU *xxxx* — I-S *yy***

**Where:**

*mm* The mode.

*aa* The area.

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** The size (GO1CON0) of a global block of a common record for a non-primary subsystem user (SSU) must be identical to that of a primary SSU.

**System Action:** The current SSU is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the application global area.

**GOGO0016E GLOBAL BLOCK UNIQUENESS INCORRECT FOR AREA MODE *mm* AREA *aa* SSU *xxxx* — I-S *yy***

**Where:**

*mm* The mode.

*aa* The area.

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** A common or unique record was identified as being incorrectly located in global area 1 or global area 3. Common records must be in global area 3 and unique records in global area 1.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

**GOGO0017E DIRECTORY ITEM PREVIOUSLY USED MODE *mm* AREA *aa* SSU *xxxx* — I-S *yy***

**Where:**

*mm* The mode.

*aa* The area.

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** Each global record must have a unique directory index number (GO1EIX).

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

**GOGO0018E GLOBAL CORE NOT LOADED — UNIT TEST MODE REQUESTED SSU *xxxx* — I-S *yy***

**Where:**

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** The global load mode byte for this subsystem user (SSU) is set to all zeroes. (This is intended for test purposes only and should not occur in a live TPF system.)

**System Action:** The current SSU is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0019E GLOBAL LOAD ERROR, #GLOBAL RECORD HAD NO LOAD ENTRIES SSU *xxxx* — I-S *yy***

**Where:**

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** The GO1ENT field of the GOA record for this SSY is zero, meaning no table entries are present.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0020E BAD CPC OR I-STREAM NUMBER IN SUPERGOA SSU *xxxx* — I-S *yy***

**Where:**

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** The CPC number (GO1CID) or I-stream number (GO1HD) found in the supergoa record does not agree with the corresponding CPC or I-stream number of the system currently in control.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

---

**GOGO0021E INSUFFICIENT SPACE IN I-S SHARED GLOBAL AREA MODE *mm* AREA *aa* SSU *xxxx* — I-S *yy***

**Where:**

*mm* The mode.

*aa* The area.

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** The space reserved for the I-stream shared area through the system general GLOBAL macro is not sufficient to hold the record being loaded.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Global load is continued with the next SSU.

**User Response:** None.

---

**GOGO0022E INSUFFICIENT SPACE IN I-S UNIQUE GLOBAL AREA MODE *mm* AREA *aa* SSU *xxxx* — I-S *yy***

**Where:**

*mm* The mode.

*aa* The area.

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** The space reserved for the I-stream unique area through the system generation GLOBAL macro is not sufficient to hold the record being loaded.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Global load is continued with the next SSU.

**User Response:** None.

---

**GOGO0023E INSUFFICIENT SPACE IN EXTENDED GLOBAL AREA MODE *mm* AREA *aa* SSU *xxxx* — I-S *yy***

**Where:**

*mm* The mode.

*aa* The area.

*xxxx*
The subsystem user.

*yy* The I-stream.

**Explanation:** The space reserved for the extended global area through the system generation GLOBAL macro is not sufficient to hold the record being loaded.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Global load is continued with the next SSU.

**User Response:** None.

---

**GOGO0099I SSU *xxxx* NOW DORMANT**

**Where:**

*xxxx*
The subsystem user.

**Explanation:** This message is issued with the other GOGO*nnn*E messages.

**System Action:** The current subsystem user (SSU) is placed in a dormant state. Processing is continued with the next SSU.

**User Response:** None.

# HOLD–HPR0

**HOLD0002W F.A *fileaddr* — WAIT Q SIZE EXCEEDED THRESHOLD VALUE *yyy***

**Where:**

*fileaddr*
The 8-byte file address.

*yyy* The threshold value.

**Explanation:** An attempt was made to hold a record that is already held by another entry control block (ECB). The hold request was added to the wait queue for that record. However, with this request the wait queue size exceeded the threshold value and this warning message was sent.

**System Action:** None.

**User Response:** None.

**HPR00001I PATH SWITCH INITIATED FOR *nnn* RTP CONNECTIONS**

**Where:**

*nnn*
The number of rapid transport protocol (RTP) connections.

**Explanation:** An adjacent link station (ALS) failed; therefore, the RTP connections that were routed through that ALS need to establish a new route.

**System Action:** The TPF system starts a path switch for all of the RTP connections that were going through the ALS that failed.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about RTP connections and path switches.

**HPR00002I PATH SWITCH SUCCESSFUL FOR *nnn* RTP CONNECTIONS**

**Where:**

*nnn*
The number of rapid transport protocol (RTP) connections.

**Explanation:** In the previous 5 seconds, a path switch was completed successfully for the specified number of RTP connections.

**System Action:** Data traffic resumes on the RTP connections.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about RTP connections and path switches.

**HPR00003I PATH SWITCH FAILED FOR *nnn* RTP CONNECTIONS**

**Where:**

*nnn*
The number of rapid transport protocol (RTP) connections.

**Explanation:** In the previous 5 seconds, a path switch failed for the specified number of RTP connections.

**System Action:** The RTP connections are cleaned up along with all of the high-performance routing (HPR) LU-LU sessions that were using those RTP connections.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about RTP connections and path switches.

**HPR00004I PATH SWITCH TIMED OUT FOR *nnn* RTP CONNECTIONS**

**Where:**

*nnn*
The number of rapid transport protocol (RTP) connections.

**Explanation:** In the previous 5 seconds, a path switch timed out for the specified number of RTP connections.

**System Action:** The RTP connections are cleaned up along with all of the high-performance routing (HPR) LU-LU sessions that were using those RTP connections.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about RTP connections and path switches.

**HPR00009E NON-ACTIVATION XID FAILED FOR ALL HPR LINKS, ALL RTP CONNECTIONS ARE BEING CLEANED UP**

**Explanation:** A hardware IPL was performed for the TPF system when there were active rapid transport protocol (RTP) connections, but no links that support high-performance routing (HPR) support remained active across the IPL.

**System Action:** All RTP connections are cleaned up along with all of the HPR LU-LU sessions that were using those RTP connections.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about HPR support and RTP connections.

**HPR00010W HPRMT IS 90 PERCENT FULL**

**Explanation:** The high-performance routing message table (HPRMT) is approaching full capacity because 90% of this table is in use.

**System Action:** None.

**User Response:** Increase the size of the HPRMT to continue saving output messages for high-performance routing (HPR) LU-LU sessions. To increase the size of the HPRMT, do the following:

1. Increase the value assigned to the HPRMTSIZ parameter in the SNAKEY macro.
2. Reload keypoint record 2 (CTK2).

See *TPF ACF/SNA Data Communications Reference* for more information about the HPRMT. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

**HPR00011E HPRMT IS FULL — OUTPUT MESSAGES NOT SAVED**

**Explanation:** The high-performance routing message table (HPRMT) is full.

**System Action:** Output messages for high-performance routing (HPR) LU-LU sessions cannot be saved until space becomes available in the HPRMT.

**User Response:** Increase the size of the HPRMT to continue saving output messages for HPR LU-LU sessions. To increase the size of the HPRMT, do the following:

1. Increase the value assigned to the HPRMTSIZ parameter in the SNAKEY macro.
2. Reload keypoint record 2 (CTK2).

See *TPF ACF/SNA Data Communications Reference* for more information about the HPRMT. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

# IDOT–IFIL

**IDOT0001I COMPLETED**

**Explanation:** This message is issued to inform you that all responses to a ZIDOT command are complete.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command,

**IDOT0002I KEYWORD *keyword* INCLUDED FOR ERROR *syserr***

**Where:**

*keyword*
Identifies an area of main storage.

*syserr*
Specifies a system error number.

**Explanation:** This is the normal response to the ZIDOT command with the INCLUDE parameter specified. This message verifies that the specified main storage area will be included in the dump for the system error number referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0003I KEYWORD *keyword* OMITTED FOR ERROR *syserr***

**Where:**

*keyword*
Identifies an area of main storage.

*syserr*
Specifies a system error number.

**Explanation:** This is the normal response to the ZIDOT command with the OMIT parameter specified. This message verifies that the specified main storage area will be omitted from the dump for the system error number referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0004I KEYWORD *keyword* CREATED START—*num* END—*num***

**Where:**

*keyword*
Identifies an area of main storage.

*num*
Indicates the main storage area range.

**Explanation:** This is the normal response to the ZIDOT command with the CREATE parameter specified. This message verifies that a new keyword was created.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0005I KEYWORD *keyword* DELETED**

**Where:**

*keyword*
Identifies a main storage area.

**Explanation:** This is the normal response to the ZIDOT command with the DELETE parameter specified. This message verifies that the keyword you specified was deleted.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0006I CREATED KEYWORDS DELETED**

**Explanation:** This is the normal response to the ZIDOT command with the DELETE ALL parameters specified. This message verifies that all keywords created by the ZIDOT command were deleted.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0007I VALID KEYWORDS ARE**

**Explanation:** This is the normal response to the ZIDOT command with the DISPLAY parameter specified. This message is followed by a list of the storage area keywords currently defined, and the start and end addresses for each keyword.

If the keyword is subsystem unique, then the address specified will be for the basic subsystem (BSS).

If the keyword is I-stream unique, then the address specified will be for the main I-stream.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0011I DISPLAY COMPLETE**

**Explanation:** This message indicates that all responses to the ZIDOT DISPLAY command are complete.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0012I STORAGE INCLUDED FOR ERROR** *syserr*

**Where:**

*syserr*
Specifies a system error number.

**Explanation:** This is the normal response to the ZIDOT command with the DISPLAY STORAGE parameters specified. This message is followed by a list of keywords and their descriptions for all of the storage areas included in the dump for the system error number referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0013I OVERRIDES VIA ZIDOT FOR ERROR** *syserr*

**Where:**

*syserr*
Specifies a system error number.

**Explanation:** This is the normal response to the ZIDOT command with the DISPLAY OVERRIDES parameters specified. This message is followed by a list of keywords and their descriptions for all of the storage areas included or omitted as a result of the ZIDOT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0014I LIST OF OVERRIDES FOR ERROR** *p.senum*

**Where:**

*p.senum*
Specifies a system error number.

**Explanation:** This is the normal response to the ZIDOT command with the DISPLAY LIST parameters specified. This message is followed by a list of system error number/program name pairs for the system error number referenced in the message for which overrides exist.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0015I SUPPRESS OPTION IN EFFECT FOR ERROR** *syserr*

**Where:**

*syserr*
Specifies a system error number.

**Explanation:** This is the normal response to the ZIDOT command with the DISPLAY OVERRIDES parameters specified or the DISPLAY STORAGE parameters specified when the SUPPRESS parameter is in effect for the system error number referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0016I STORAGE OPTION IN EFFECT FOR ERROR** *syserr*

**Where:**

*syserr*
Specifies a system error number.

**Explanation:** This is the normal response to the ZIDOT command with the DISPLAY OVERRIDES parameters specified or the DISPLAY STORAGE parameters specified when the STORAGE parameter is in effect for the system error number referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0017I CREATED KEYWORDS ARE**

**Explanation:** This is the normal response to the ZIDOT command with the DISPLAY CREATE parameters specified. This message is followed by a list of keywords created by the ZIDOT command with the CREATE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0021I LIST OF ERRORS CONTAINING OVERRIDES**

**Explanation:** This is the normal response to the ZIDOT command with the DISPLAY LIST ALL parameters specified. This message is followed by a list of errors that contain overrides created by the ZIDOT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0024I LIST OF ERRORS SUPPRESSED**

**Explanation:** This is the normal response to the ZIDOT command with the DISPLAY SUPPRESS parameters specified. This message is followed by a list of errors that were suppressed by the ZIDOT suppress command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0040E ZIDOT NOT AVAILABLE — RESTART DID NOT COMPLETE.**

**Explanation:** The ZIDOT facility is not available because restart for ZIDOT (in CVRN) did not complete or completed with an error.

**System Action:** The ZIDOT command is rejected.

**User Response:** Do the following:

1. Determine the cause of the errors in restart.
2. Take the necessary corrective action.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0041E INVALID PREFIX SPECIFIED**

**Explanation:** The prefix character supplied by the user was missing or is not valid.

**System Action:** ZIDOT processing is exited.

**User Response:** Specify a valid uppercase alphabetic character or * to omit the prefix.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0042E INVALID SYSTEM ERROR NUMBER SPECIFIED**

**Explanation:** The system error number supplied by the user was missing or is not valid.

**System Action:** ZIDOT processing is exited.

**User Response:** Specify a valid system error number in the range X'000001' to X'FFFFFF'.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0043E PROGRAM NAME NOT ALLOWED**

**Explanation:** A program name may not be specified with the ZIDOT CLEAR AL command. The specified storage area was included in all dumps, regardless of program name.

**System Action:** ZIDOT processing is exited.

**User Response:** Omit the program name.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0044E INVALID PROGRAM NAME SPECIFIED**

**Explanation:** The program name specified with the ZIDOT command was too short.

**System Action:** ZIDOT processing is exited.

**User Response:** Specify a valid four character program name.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0045E DUMP OVERRIDE TABLE IS FULL — DELETE SOME OVERRIDES**

**Explanation:** The dump override table is full.

**System Action:** The ZIDOT command is rejected.

**User Response:** Do the following:

1. Enter the ZIDOT command with the CLEAR parameter specified to clear some space in the dump override table.
2. Install any overrides permanently required for system operation in the CUDP copy member of the CCUEXT CSECT (copy member CIDP in CCCPSE for IBM overrides).

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0046E NO KEYWORD SPECIFIED**

**Explanation:** A keyword must be supplied with the ZIDOT CLEAR ALL command.

**System Action:** ZIDOT processing is exited.

**User Response:** Enter the command again and specify a valid keyword.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0047E KEYWORD *keyword* INVALID**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** A keyword of DUMMY or ICORND has special

meaning in the TPF system and may not be specified with the ZIDOT command.

**System Action:** ZIDOT processing is exited.

**User Response:** Enter the command again and specify a valid keyword.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0048W KEYWORD *keyword* NOT INITIALIZED**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** A keyword specified with the ZIDOT INCLUDE or ZIDOT OMIT command has no storage range associated with it in the selective memory dump table. Either the data object is not present in the user's configuration or the code in the CSECT CCCTIN initializer, which initializes the storage range is not functioning.

**System Action:** The ZIDOT command is rejected.

**User Response:** Do the following:

1. If the data object is present, determine why the selective memory dump table (SMDT) entry for it is not being initialized.
2. Take the necessary corrective action.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0049E KEYWORD *keyword* ALREADY INCLUDED FOR ERROR *syserr***

**Where:**

*keyword*
Identifies an area of main storage.

*syserr*
Specifies a system error number.

**Explanation:** A storage area specified with the ZIDOT INCLUDE command is already included in the dump for the system error number reference in the message.

**System Action:** ZIDOT processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0050E KEYWORD *keyword* ALREADY OMITTED FOR ERROR *syserr***

**Where:**

*keyword*
Identifies an area of main storage.

*syserr*
Specifies a system error number.

**Explanation:** A storage area specified with the ZIDOT OMIT command is already omitted from the dump for the system error number referenced in the message.

**System Action:** ZIDOT processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0051E INVALID STARTING ADDRESS**

**Explanation:** The starting address of the storage range specified with the ZIDOT command with the CREATE parameter specified is beyond the end of the system virtual memory (SVM).

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a valid hexadecimal starting address.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0052E INVALID ENDING ADDRESS**

**Explanation:** The ending address of the storage range specified with the ZIDOT command with the CREATE parameter specified is beyond the end of the system virtual memory (SVM).

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a valid hexadecimal starting address.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0053E ENDING ADDRESS MUST BE GREATER THAN STARTING ADDRESS**

**Explanation:** The ending address of the storage range specified with the ZIDOT command with the CREATE parameter specified is less the starting address specified.

**System Action:** The ZIDOT command is exited.

**User Response:** Enter the ZIDOT command again and specify a valid address range.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0054E INVALID TEXT DESCRIPTOR**

**Explanation:** The text description of the storage range specified with the ZIDOT command with the CREATE parameter specified contains null characters or characters that are not valid.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a valid text descriptor enclosed in quotes.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0055E TEXT DESCRIPTOR NOT ENCLOSED IN QUOTES**

**Explanation:** The text description of the storage area specified with the ZIDOT command with the CREATE parameter specified must be enclosed in single quotes.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a valid text descriptor enclosed in quotes. If the quote character is not available, the dollar sign ($) may be used.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0056E KEYWORD *keyword* ALREADY EXISTS**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** The ZIDOT command with the CREATE parameter specified was entered with a keyword that is defined to the TPF system. already.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a different keyword.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0057E NO SPACE AVAILABLE FOR CREATED KEYWORDS — DELETE SOME KEYWORDS**

**Explanation:** All DUMMY entries in the selective memory dump table (SMDT) are in use.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command with the DELETE parameter specified to clear some space in the SMDT.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0058E KEYWORD *keyword* DOES NOT EXIST**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** The ZIDOT command with the DELETE or CLEAR ALL parameters specified was entered with a keyword that is not defined to the TPF system.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a keyword that is valid.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0059E KEYWORD *keyword* WAS NOT CREATED VIA ZIDOT**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** The ZIDOT command with the DELETE parameter specified was entered to delete a keyword that was not created by entering the ZIDOT command with the CREATE parameter specified.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a different keyword.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0060E NO CREATED KEYWORDS FOUND**

**Explanation:** The ZIDOT command with the DISPLAY CREATE parameter specified was entered but no keywords were created previously by using the ZIDOT command with the CREATE parameter specified.

**System Action:** The ZIDOT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0061E OVERRIDE NOT FOUND FOR ERROR *syserr***

**Where:**

*syserr*
Specifies a system error number.

**Explanation:** The ZIDOT command with the DISPLAY, CLEAR, or RESET parameters was specified but no override exists for the system error number specified.

**System Action:** The ZIDOT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0062E KEYWORD NOT ALLOWED**

**Explanation:** The ZIDOT command with the CLEAR parameter specified was entered with a keyword. You only need to specify a keyword when you are entering the ZIDOT command with the CLEAR ALL parameter specified.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and do not specify a parameter.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0063E KEYWORD *keyword* NOT INCLUDED/OMITTED FOM ALL DUMPS**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** The ZIDOT command with the CLEAR ALL parameter specified was entered with a keyword. However, no ZIDOT command with the INCLUDE ALL or OMIT ALL parameter specified was entered previously.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a different parameter.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0064E ALL OPTION NOT ALLOWED**

**Explanation:** The ZIDOT command with the DISPLAY STORAGE ALL, DISPLAY LIST ALL, SUPPRESS ALL, STORAGE ALL, or RESET ALL parameters specified was entered. ALL cannot be used as a system error designation when these parameters are specified on the ZIDOT command.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a valid system error number other than ALL.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0065E MD OPTION NOT ALLOWED**

**Explanation:** The ZIDOT command with the DISPLAY LIST MD or SUPPRESS MD parameters specified was entered. MD cannot be used as a system error designation when these parameters are specified on the ZIDOT command.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a valid system error number other than MD.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0066E ERRORS I000001–I000004 CANNOT BE SUPPRESSED**

**Explanation:** Dumps associated with unplanned errors (hard program checks) may not be suppressed.

**System Action:** The ZIDOT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0067E SUPPRESS OPTION ALREADY IN EFFECT FOR ERROR *syserr***

**Where:**

*syserr*
The system error.

**Explanation:** The ZIDOT command with the SUPPRESS parameter specified was entered for a system error for which SUPPRESS is in effect already.

**System Action:** The ZIDOT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0068E STORAGE OPTION ALREADY IN EFFECT FOR ERROR *syserr***

**Where:**

*syserr*
Specifies a system error number.

**Explanation:** The ZIDOT command with the STORAGE parameter specified was entered for a system error for which STORAGE is in effect already.

**System Action:** The ZIDOT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0069E SUPPRESS/STORAGE OPTIONS NOT IN EFFECT FOR *syserr***

**Where:**

*syserr*
A system error number.

**Explanation:** The ZIDOT command with the RESET parameter specified was entered for a system error for which neither the SUPPRESS or STORAGE parameters were in effect.

**System Action:** The ZIDOT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0070E REQUEST NOT PROCESSED**

**Explanation:** The ZIDOT command with the CREATE or INCLUDE/OMIT ALL parameters specified was entered but there is insufficient space on the selective memory dump table (SMDT) file record to save the results of the request. This message is followed by the 0000F0 system error message with the INSUFFICIENT SPACE ON FILE FOR ADDITIONAL SMDT ENTRIES appended.

**System Action:** The 0000F0 system error message is issued and ZIDOT processing is exited.

**User Response:** Do one of the following:

- Delete some created keywords.
- Clear some dump overrides that contain keyword that are included in or omitted from all dumps.

See *TPF Operations* for more information about the ZIDOT command.

---

**IDOT0071E KEYWORD *keyword* NOT OMITTED-REQUIRED BY IDATB/UDATB**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** The ZIDOT command with the OMIT parameter specified was entered for a keyword that is marked in IDATB or UDATB as being required in the dump so the request is ignored for the keyword.

**System Action:** ZIDOT processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0072E KEYWORD *keyword* NOT INCLUDED-REQUIRED BY IDATB/UDATB**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** The ZIDOT command with the INCL parameter specified was entered for a keyword that is marked in IDATB or UDATB as being required in every dump so the request is ignored for the keyword.

**System Action:** ZIDOT processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0073E KEYWORD *keyword* NOT OMITTED-INCLUDED VIA ZIDOT INCL ALL MESSAGE**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** The ZIDOT command with the OMIT parameter specified was entered for a keyword when a ZIDOT command with the INCLUDE ALL parameter specified was entered. Since the INCLUDE ALL parameter takes precedence, this keyword is not omitted.

**System Action:** ZIDOT processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0074E KEYWORD *keyword* NOT INCLUDED-OMITTED VIA ZIDOT OMIT ALL MESSAGE**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** The ZIDOT command with the INCL parameter specified was entered for the keyword that was omitted when a ZIDOT command with the OMIT ALL parameter specified was entered. Since the OMIT ALL parameter takes precedence, this keyword is not omitted.

**System Action:** ZIDOT processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0075W KEYWORD *keyword* NOT INITIALIZED DUE TO STORAGE CONFIGURATION CHANGE.**

**Where:**

*keyword*
Identifies an area of main storage.

**Explanation:** The ZIDOT command with the INCLU or OMIT parameter specified was entered for this keyword, which was not initialized because its storage area runs past the end of storage. The keyword will be included or omitted even though this will not affect the content of the dumps. If more storage gets added to TPF system, then the areas may be dumped and this message will not appear.

**System Action:** ZIDOT is processing continued.

**User Response:** None.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0076E ZIDOT NOT ALLOWED FOR THE FULL MANUAL DUMP**

**Explanation:** The system error used for a full manual dump cannot be overridden by entering the ZIDOT command.

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the command again and specify a valid system error number.

See *TPF Operations* for more information about the ZIDOT command.

**IDOT0077E KEYWORD MUST BEGIN WITH A LETTER**

**Explanation:** A new keyword must begin with a letter (A through Z).

**System Action:** The ZIDOT command is rejected.

**User Response:** Enter the ZIDOT command again and specify a keyword name that begins with a letter (A through Z).

See *TPF Operations* for more information about the ZIDOT command.

**IFIL0004I RECORD INITIALIZATION STARTED FOR *ffffffff***

**Where:**

*ffffffff*
The symbolic file address compute program (FACE) equate value for the records being initialized. If this FACS

equate is preceded by a pound sign (#), it will be replaced by a period (.) in the output.

**Explanation:** This is the normal response to the ZIFIL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0005I RECORD INITIALIZATION COMPLETED FOR *ffffffff***

**Where:**

*ffffffff*
The symbolic file address compute program (FACE) equate value for the records being initialized. If this FACS equate is preceded by a pound sign (#), it will be replaced by a period (.) in the output.

**Explanation:** This is the normal response to the ZIFIL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0011E SYNTAX ERROR**

**Explanation:** The format of the ZIFIL command is not valid.

**System Action:** The ZIFIL command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZIFIL command again by using the correct format.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0013E IDENTIFIER PARAMETER INVALID**

**Explanation:** The ZIFIL command was entered with an identifier value that is not valid.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify an identifier parameter that is valid.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0014E CODE CHECK PARAMETER INVALID**

**Explanation:** The ZIFIL command was entered with a code check value that is not valid.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a code check that is valid.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0015E START ORD PARAMETER INVALID**

**Explanation:** The ZIFIL command was entered with a start ordinal number value that is not valid.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a start ordinal number that is valid.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0016E END ORD PARAMETER INVALID**

**Explanation:** The ZIFIL command was entered with an end ordinal number value that is not valid.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify an end ordinal number that is valid.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0017E CHAIN PARAMETER INVALID**

**Explanation:** The ZIFIL command was entered with a chain value that is not valid.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a chain value that is valid.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0018E COPY PARAMETER INVALID**

**Explanation:** The ZIFIL command was entered with a copy value that is not valid.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a copy value that is valid.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0019E FACS ERROR**

**Explanation:** There was a FACS error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIFIL command.

---

**IFIL0020E RECORD FIND ERROR**

**Explanation:** There was a record FIND error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0021E ENDING ORDINAL NUMBER OUTSIDE ALLOWABLE RANGE**

**Explanation:** The ZIFIL command was entered with an ending ordinal number value that is more than the maximum range allowed.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify an ending ordinal number that is valid.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0022E ORDINAL NUMBER OR RCC NOT HEXADECIMAL**

**Explanation:** The ZIFIL command was specified with an ordinal number value or an RCC value that is not hexadecimal.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a value for the ordinal number or RCC that is hexadecimal.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0023E RECORD CODE CHECK DOES NOT MATCH FILE RECORD**

**Explanation:** The ZIFIL command was entered with a record code check value that does not match the file record.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a value for the record code check that is valid.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0024E ERROR OCCURRED WHILE FILING RECORD**

**Explanation:** The ZIFIL command was entered but an error occurred while filing a record so processing did not complete.

**System Action:** The ZIFIL command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0025E RECORD ID PARAMETER NOT EQUAL TO RETRIEVED RECORD**

**Explanation:** The ZIFIL command was entered with a record ID that is not equal to the record that was retrieved.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a valid record ID.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0026E ENDING ORDINAL NUMBER IS GREATER THAN STARTING ORDINAL NUMBER**

**Explanation:** The ZIFIL command was entered with ordinal numbers that are not in the correct sequence.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a valid range of ordinal numbers.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0027E INVALID I-STREAM NUMBER**

**Explanation:** The ZIFIL command was entered with an incorrect i-stream number.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a valid I-stream number.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0028E INVALID CPU ID**

**Explanation:** The ZIFIL command was entered with an incorrect cpu id.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a valid cpu id.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0029E INVALID SUBSYSTEM USER NAME**

**Explanation:** The ZIFIL command was entered with an incorrect subsystem user name.

**System Action:** The ZIFIL command is rejected.

**User Response:** Enter the ZIFIL command again and specify a valid subsystem user name.

See *TPF Operations* for more information about the ZIFIL command.

**IFIL0030E POOL RECORDS ARE NOT ALLOWED TO BE INITIALIZED**

**Explanation:** The FACE-equate entered was for a pool section. The ZIFIL command cannot initialize pool records.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct FACE-equate to use.
2. Enter the ZIFIL command again.

See *TPF Operations* for more information about the ZIFIL command. See *TPF General Macros* for more information about the SYSEQC macro.

# IMAG–IMAP

**IMAG0001I IMAGE *n* DEFINED IMAGE NAME *name* IPL AREA *i* PROGRAM AREA *p***

**Where:**

*n* The image number.

*name*
The image name.

*i* IPL area number.

*p* The program area number.

**Explanation:** The ZIMAG DEFINE command was entered to define an empty image. The image was defined successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DEFINE command. See *TPF System Installation Support Reference* for more information.

**IMAG0002I IMAGE *n* REDEFINED IMAGE NAME *name* IPL AREA *i* - WAS *j* PROGRAM AREA *p* - WAS *q***

**Where:**

*n* The image number.

*name*
The image name.

*i* The new IPL area.

*j* The old IPL area.

*p* The new program area.

*q* The old program area.

**Explanation:** The ZIMAG DEFINE command was entered to redefine an existing image. The image was redefined successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DEFINE command. See *TPF System Installation Support Reference* for more information.

**IMAG0003I IMAGE *name* ENABLED**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG ENABLE command was entered to enable an image. You can now select this image for use during IPL.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG ENABLE command. See *TPF System Installation Support Reference* for more information.

**IMAG0004I IMAGE *name* DISABLED**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG DISABLE command was entered to disable an image. The image was disabled successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DISABLE command. See *TPF System Installation Support Reference* for more information.

**IMAG0005I IMAGE *name* HAS BEEN DEFINED AS THE PRIMARY IMAGE**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG PRIMARY command was entered to define an image as the primary image. The image referenced in the message was defined successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG PRIMARY command. See *TPF System Installation Support Reference* for more information.

**IMAG0006I IMAGE DEFINITION FOR *name* CLEARED**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG CLEAR command was entered to clear an image definition from the TPF system. The image definition referenced in the message was cleared successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG

CLEAR command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0007I COPY FROM *srcname* TO *dstname* COMPLETE**

**Where:**

*srcname*
The source image name.

*dstname*
The target image name.

**Explanation:** The ZIMAG COPY command was entered to logically or physically copy the source image referenced in the message to the target image referenced in the message. The copy was completed successfully.

**System Action:** None.

**User Response:** If the IMAG0117W, IMAG0118W, or IMAG0120W message was issued preceding this message, some requested components may not have been copied. In this case, enter the ZIMAG DISPLAY command with the IMAGE parameter specified to determine which components were copied.

See *TPF Operations* for more information about the ZIMAG COPY and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0008I PHYSICAL COPY COMPLETE**

**Explanation:** The ZIMAG MAKEPHYS command was entered to phyisically copy one or more components from the logically referenced images, and the associated logical references were removed.

**System Action:** None.

**User Response:** If the IMAG0122W or IMAG0123W message was issued preceding this message, some requested components may not have been copied and the associated logical references are still in place. In this case, enter the ZIMAG DISPLAY command with the IMAGE parameter specified to determine which components were copied.

See *TPF Operations* for more information about the ZIMAG MAKEPHYS and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0009I LOGICAL REFERENCES REMOVED**

**Explanation:** The logical references of the components specified in the command were deleted.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG UNREF command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0012I CONTINUING WITH — ZIMAG KEYPT MOVE**

**Explanation:** Processing of the ZIMAG KEYPT command with the MOVE parameter specified is continuing. This message displays only after the ZIMAG KEYPT is entered with the CONTINUE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0013I CONTINUING WITH — ZIMAG KEYPT RESTORE**

**Explanation:** Processing for the ZIMAG KEYPT command with the RESTORE parameter specified is continuing. This message displays only after the ZIMAG KEYPT command is entered with the CONTINUE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0014I KEYPOINTS REMOVED FROM THE BACKUP AREA**

**Explanation:** This is the normal response to the ZIMAG KEYPT command with the DELETE parameter specified.

**System Action:** Copies of the specified keypoints were deleted from the backup area.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0015I PROGRAM AREA DISPLAY**

**Explanation:** This is the normal response to the ZIMAG DISPLAY command with the PROG parameter specified. The message is followed by a display of the E-type program areas. This message always displays the maximum number of areas, even if the associated record types (#PROG1—8) are not defined to the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DISPLAY command.

---

**IMAG0016I IPL AREA DISPLAY**

**Explanation:** This is the normal response to the ZIMAG DISPLAY command with the IPL parameter specified. Information about each of the IPL areas displays. This message always displays the maximum number of areas, even if the associated record types (#IPL1—4) are not defined to the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DISPLAY command.

---

**IMAG0017I IMAGE STATUS DISPLAY**

**Explanation:** This is normal response to the ZIMAG DISPLAY command with the ALL parameter specified. The message is followed by a display of the name, number, status, IPL area, PROG area, and CIMR areas. This message always displays the maximum number of areas, even if the associated record types (#CIMR1—8) are not defined to the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DISPLAY command.

---

**IMAG0018I PROCESSOR STATUS DISPLAY**

**Explanation:** This is the normal response to the ZIMAG DISPLAY command with the PROCESSOR parameter specified. The message is followed by a display of the images associated with each processor in the complex and the processor status.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DISPLAY command.

---

**IMAG0019I IMAGE DISPLAY**

**Explanation:** This is the normal response to the ZIMAG DISPLAY command with the IMAGE parameter specified. The message is preceded by a display of data related to the specified image.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DISPLAY command.

---

**IMAG0020I KEYPOINT STATUS DISPLAY**

**Explanation:** This is the normal response to the ZIMAG DISPLAY command with the KEYPT parameter specified. The message is followed by a display of data pertaining to the keypoints in the specified keypoint area.

**System Action:** None.

**User Response:** If there is more information than can be displayed on the screen at one time, the MORE DATA AVAILABLE, ENTER ZPAGE TO CONTINUE message displays. In this case, enter the ZPAGE command to continue displaying the next page of information.

**Note:** You must respond by entering the ZPAGE command within one minute or the remaining data will no longer be available.

See *TPF Operations* for more information about the ZPAGE and ZIMAG DISPLAY commands.

---

**IMAG0022I ENTER ZIMAG KEYPT CONTINUE — OR — ZIMAG KEYPT ABORT**

**Explanation:** A ZIMAG KEYPT command was entered with the MOVE or RESTORE parameter specified to move keypoints from a keypoint staging area to the working keypoint area or to restore keypoints to the working keypoint area from the keypoint backup area. This messages as a safeguard to prevent working copies of the keypoints from being overlaid erroneously. The keypoints are not moved until you respond to this message.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the ZIMAG KEYPT command with the CONTINUE parameter specified to continue.
- Enter the ZIMAG KEYPT command with the ABORT parameter specified to end the keypoint move or restore function.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0025I IMAGE UNCHANGED — NO REFERENCES EXIST**

**Explanation:** The status of the components remains unchanged because there were no existing logical references.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG MAKEPHYS and ZIMAG UNREF commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0026I IPL AREA *i* CLEARED**

**Where:**

*i* The IPL area number.

**Explanation:** The specified IPL area was cleared.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG CLEAR command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0027I IMAGE *n* DEFINED IMAGE NAME *name* PROGRAM AREA *p***

**Where:**

*n* Image number.

*name*
Image name.

*p* Program area number.

**Explanation:** The image referenced in the message was

defined in a non basic subsystem (BSS).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DEFINE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0028I IMAGE *n* REDEFINED IMAGE NAME *name* PROGRAM AREA *p* (WAS *q*)**

**Where:**

*n* The image number.

*name*
The image name.

*p* New program area number.

*q* Old program area number.

**Explanation:** The image referenced in the message was redefined in a non basic subsystem (BSS).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DEFINE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0029I IMAGE DISPLAY**

**Explanation:** This is the normal response to the ZIMAG DISPLAY command with the IMAGE parameter specified when CTKX is not loaded for the specified image. Because of this, no information about core image restart area (CIMR) components can be displayed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DISPLAY command.

---

**IMAG0050E REQUEST REJECTED - COPY IPL ONLY VALID IN THE BSS**

**Explanation:** A ZIMAG COPY command with the IPL parameter specified was entered in a subsystem other than the basic subsystem (BSS).

**System Action:** None.

**User Response:** Enter the ZIMAG COPY command again with the IPL parameter specified on the BSS.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0052E REQUEST REJECTED - IPL RECORDS NOT DEFINED ON SOURCE IMAGE**

**Explanation:** A ZIMAG COPY command with the IPL parameter specified was entered when there were no #IPL*x* records defined on the source image.

One of the following errors occurred:

- The image control record (ICR) was corrupted.
- An incorrect file address compute program (FACE) table (FCTB) was loaded to the active image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do the following:

1. Verify that the correct FACE table (FCTB) is loaded to the currently active image.
2. Initialize the ICR again by using a loader general file IPL, if necessary.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0053E REQUEST REJECTED - IPL RECORDS NOT DEFINED ON TARGET IMAGE**

**Explanation:** A ZIMAG COPY IPL message was entered when there were no #IPL*x* records defined on the target image.

One of the following errors occurred:

- The image control record (ICR) was corrupted.
- An incorrect file address compute program (FACE) table (FCTB) was loaded to the active image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do the following:

1. Verify that the correct FACE table (FCTB) is loaded to the currently active image.
2. Initialize the ICR again by using a loader general file IPL, if necessary.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0054E REQUEST REJECTED - SOURCE IMAGE MUST BE ENABLED**

**Explanation:** A ZIMAG COPY command with the IPL or PROG parameter specified was entered but the source image that was specified is not enabled.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do one of the following:

- Enter the command again and specify a source image that is enabled.
- Enable the source image originally specified.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0055E REQUEST REJECTED - TARGET IPL AREA REFERENCED BY AN ENABLED IMAGE**

**Explanation:** A ZIMAG COPY command with the IPL parameter specified but the IPL area defined for the target image is referenced by another image that is enabled.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the IPL parameter specified to display the images that reference the IPL area for the source image.
2. Do one of the following:
   - Disable the image that references the target IPL area.
   - Redefine the target image to reference an IPL area that is not in use already.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0056E FACS ERROR ON SOURCE IMAGE**

**Explanation:** A FACS error occurred during the copy of IPL or PROG areas.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Verify that the file address compute program (FACE) table (FCTB) on the active image is correct.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0058E FACS ERROR ON TARGET IMAGE**

**Explanation:** A FACS error occurred during the copy of IPL or PROG areas.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Verify that the file address compute program (FACE) table (FCTB) on the active image is correct.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0059E ABNORMAL END OF IPL AREA COPY**

**Explanation:** The physical end of the IPLA or IPLB records was reached but the forward chain field of the records never indicated an end of chain. The source IPL area may be corrupted.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do the following:

1. Enter the ZIMAG COPY command again and specify a different source IPL area.
2. Load the source image again with the auxiliary loader (TLDR) or the general file loader (ALDR), if necessary.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0072E REQUEST REJECTED - TARGET PROG AREA REFERENCED BY AN ENABLED IMAGE**

**Explanation:** A ZIMAG COPY command was entered with the PROG parameter specified to physically copy the program areas from the source image to the target image. However, an error occurred because the program area that was defined for the target image is referenced by another image that is enabled.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Enter the ZIMAG DISPLAY command again with the PROG parameter specified to display the images that reference the program area for the source image.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0073E REQUEST REJECTED - PROG RECORDS NOT DEFINED ON SOURCE IMAGE**

**Explanation:** A ZIMAG COPY command was entered with the PROG parameter specified to physically copy the program areas from the source image to the target image. However, an error occurred because there were no #PROG*x* records defined on the source image.

One of the following errors occurred:

- The image control record (ICR) was corrupted.
- An incorrect file address compute program (FACE) table (FCTB) was loaded to the active image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do the following:

1. Verify that the correct FACE table (FCTB) is loaded to the currently active image.
2. Initialize the ICR again by using a loader general file IPL, if necessary.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0074E REQUEST REJECTED – PROG RECORDS NOT DEFINED ON TARGET IMAGE**

**Explanation:** A ZIMAG COPY command was entered with the PROG parameter specified to physically copy the program areas from the source image to the target image. However, an error occurred because there are no # PROG*x* records defined on the target image.

One of the following errors occurred:

- The image control record (ICR) was corrupted.
- An incorrect file address compute program (FACE) table (FCTB) was loaded to the active image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do the following:

1. Verify that the correct FACE table (FCTB) is loaded to the currently active image.

2. Initialize the ICR again by using a loader general file IPL, if necessary.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0075E REQUEST REJECTED - INSUFFICIENT PROG RECORDS, BP REQUIRED**

**Explanation:** A ZIMAG COPY command was entered with the PROG parameter specified to physically copy the program areas from the source image to the target image. However, an error occurred because there are fewer #PROG*x* records on the target image than on the source image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Enter **ZIMAG COPY PROG BP** to override this condition.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0077E ERROR REQUESTING ELDR CLEAR ON TARGET IMAGE**

**Explanation:** A ZIMAG COPY command was entered with the PROG parameter specified to physically copy the program areas from the source image to the target image. However, an error occurred because the E-type loader structures on the target image were not initialized successfully.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Verify that the #OLD*x* records on the target image are not corrupted.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0078E REQUEST REJECTED - INSUFFICIENT PVR RECORDS, BP REQUIRED**

**Explanation:** A ZIMAG COPY command with the PROG parameter specified was entered to physically copy the program areas from the source image to the target image. However, an error occurred because there are fewer #PVR*x* records on the target image than on the source image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Enter **ZIMAG COPY PROG BP** to override this condition.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0079E REQUEST REJECTED - XPRG RECORDS NOT DEFINED ON SOURCE IMAGE, BP REQUIRED**

**Explanation:** A ZIMAG COPY command with the PROG parameter specified was entered to physically copy the program areas from the source image to the target image. However, an error occurred because there are no #XPRG*n* records defined on the source image.

One of the following errors occurred:

- The image control record (ICR) was corrupted.
- An incorrect file address compute program (FACE) table (FCTB) was loaded to the active image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do one of the following:

- Verify that the correct FACE table (FCTB) is loaded to the active image. A loader general file IPL may be required to initialize the ICR again.
- Enter **ZIMAG COPY PROG BP**.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0080E REQUEST REJECTED - XPRG RECORDS NOT DEFINED ON TARGET IMAGE, BP REQUIRED**

**Explanation:** A ZIMAG COPY command with the PROG parameter specified was entered to physically copy the program areas from the source image to the target image. However, an error occurred because there are no #XPRG*n* records defined on the target image.

One of the following errors occurred:

- The image control record (ICR) was corrupted.
- An incorrect file address compute program (FACE) table (FCTB) was loaded to the active image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do one of the following:

- Verify that the correct FACE table is loaded to the currently active image. A loader general file IPL may be required to initialize the ICR again.
- Enter **ZIMAG COPY PROG BP**.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0081E REQUEST REJECTED - INSUFFICIENT XPRG RECORDS, BP REQUIRED**

**Explanation:** A ZIMAG COPY command with the PROG parameter specified was entered to physically copy the program areas from the source image to the target image. However, an error occurred because there are fewer #XPRG*x* records on the target image than on the source image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Enter **ZIMAG COPY PROG BP**.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

---

**IMAG0082E REQUEST REJECTED - PVR RECORDS NOT DEFINED ON SOURCE IMAGE, BP REQUIRED**

**Explanation:** A ZIMAG COPY command with the PROG parameter specified was entered to physically copy the program areas from the source image to the target image. However, an error occurred because there were no #XPRG*n* records defined on the source image.

One of the following errors occurred:

- The image control record (ICR) was corrupted.
- An incorrect file address compute program (FACE) table was loaded to the active image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do one of the following:

- Verify that the correct FACE table is loaded to the currently active image. A loader general file IPL may be required to initialize the ICR again.
- Enter **ZIMAG COPY PROG BP**.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

**IMAG0083E REQUEST REJECTED - PVR RECORDS NOT DEFINED ON TARGET IMAGE, BP REQUIRED**

**Explanation:** A ZIMAG COPY command with the PROG parameter specified was entered to physically copy the program areas from the source image to the target image. However, an error occurred because there are no #XPRG*n* records defined on the target image.

One of the following errors occurred:

- The image control record (ICR) was corrupted.
- An incorrect file address compute program (FACE) table was loaded to the active image.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do one of the following:

- Verify that the correct FACE table is loaded to the active image. A loader general file IPL may be required to initialize the ICR again.
- Enter **ZIMAG COPY PROG BP**.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

**IMAG0084E REQUEST REJECTED - NOT ENOUGH APRG RECORDS, BP REQUIRED**

**Explanation:** A ZIMAG COPY command was entered with the PROG parameter specified to physically copy the program areas from the source image to the target image. However, an error occurred because there are fewer #APRG*n* records defined on the target image than on the source image.

**System Action:** The command is rejected.

**User Response:** Enter the ZIMAG COPY command again with the BP parameter specified to copy the program record.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about multiple TPF images.

**IMAG0101E REQUEST REJECTED — THE FOLLOWING VALUES ARE INVALID -** *keyword value*

**Where:**

*keyword*
The name of the keyword parameter.

*value*
The value that is not valid.

**Explanation:** A ZIMAG command was entered with a parameter value that is not valid.

**System Action:** The ZIMAG command is rejected.

**User Response:** Enter the command again and specify a valid parameter value.

See *TPF Operations* for more information about the ZIMAG command. See *TPF System Installation Support Reference* for more information.

**IMAG0102E REQUEST REJECTED — INCOMPLETE MESSAGE SPECIFIED**

**Explanation:** A ZIMAG command was entered with required parameters missing.

**System Action:** The ZIMAG command is rejected.

**User Response:** Enter the command again and specify the required parameters.

See *TPF Operations* for more information about the ZIMAG command. See *TPF System Installation Support Reference* for more information.

**IMAG0103E INVALID REQUEST — IPL PARAMETER RESTRICTED TO BSS SUBSYSTEM**

**Explanation:** A ZIMAG DEFINE or ZIMAG CLEAR command was entered with the IPL parameter specified. An error occurred because you can only specify the IPL parameter in the basic subsystem (BSS).

**System Action:** The ZIMAG DEFINE or ZIMAG CLEAR command is rejected.

**User Response:** Do one of the following:

- Enter the command again from a BSS and specify the IPL parameter.
- Enter the command again and do not specify the IPL parameter, from a non-BSS.

See *TPF Operations* for more information about the ZIMAG DEFINE and ZIMAG CLEAR commands. See *TPF System Installation Support Reference* for more information.

**IMAG0104E REQUEST REJECTED — IMAGE** *name* **IS ALREADY DEFINED**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG DEFINE command was entered to define an empty image or to redefine an existing image. An error occurred because the image specified is define already.

**System Action:** The ZIMAG DEFINE command is rejected.

**User Response:** Enter the ZIMAG DEFINE command again and specify a different image.

See *TPF Operations* for more information about the ZIMAG DEFINE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0105E REQUEST REJECTED — IMAGE *name* IS ENABLED**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG ENABLE command was entered to an enable an image. An error occurred because the image specified is enabled already.

**System Action:** The ZIMAG ENABLE command is rejected.

**User Response:** Do the following:

1. Enter the ZIMAG DISABLE command to disable the image.
2. Do one of the following:
   - Enter the ZIMAG ENABLE command again and specify the same image.
   - Enter the ZIMAG ENABLE command again and specify a different image.

See *TPF Operations* for more information about the ZIMAG ENABLE and ZIMAG DISABLE commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0106E REQUEST REJECTED — IMAGE *name* IS ALREADY ENABLED**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG ENABLE command was entered to an enable an image. An error occurred because the image specified is enabled already.

**System Action:** The ZIMAG ENABLE command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG ENABLE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0107E IMAGE *name* COULD NOT BE ENABLED ONE OR MORE COMPONENTS ARE NOT LOADED**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG ENABLE command was entered to enable an image but the image was not enabled because one of the following errors occurred:

- One or more IPL or core image restart (CIMR) components were not loaded to the image
- CTKX was not loaded to the image.

**System Action:** None.

**User Response:** Do one of the following:

- Ensure all IPL or CIMR components are loaded to the specified image. You can enter any of the following commands to determine which components are not loaded:
  - ZIMAG DISPLAY with the ALL parameter specified
  - ZIMAG DISPLAY with the IMAGE parameter specified
  - ZIMAG DISPLAY with the IPL parameter specified.
- For components other than IPL, enter the ZIMAG COPY command to logically or physically load the component.

See *TPF Operations* for more information about the ZIMAG ENABLE, ZIMAG COPY, and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0108E REQUEST REJECTED — IMAGE *name* IS NOT DEFINED**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG ENABLE command to enable an image but the image was not enabled because it is not defined.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the ZIMAG DEFINE command to define the image. Then enter the ZIMAG ENABLE command again and specify the original image.
- Enter the ZIMAG ENABLE command again and specify an image that is defined already.

See *TPF Operations* for more information about the ZIMAG DEFINE and ZIMAG ENABLE commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0109E IMAGE *name* COULD NOT BE ENABLED ONE OR MORE CIMR COMPONENTS ARE LOGICAL COPIES OF A DISABLED IMAGE**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG ENABLE command was entered to enable an image but the image was not enabled because one or more core image restart (CIMR) components have logical references to a disabled image.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the ALL parameter specified or the ZIMAG DISPLAY command

with the IMAGE parameter specified to determine which components have logical references to disabled images.
2. Do one of the following:
   - Enter the ZIMAG MAKEPHYS or ZIMAG UNREF command to remove the logical references to the disabled images.
   - Enter the ZIMAG ENABLE command to enable the images determined in step 1 on page 555.
3. Enter the ZIMAG ENABLE command again.

See *TPF Operations* for more information about the ZIMAG ENABLE, ZIMAG UNREF, ZIMAG MAKEPHYS, and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0110E ADDRESS MISMATCH FOR THE FOLLOWING COMPONENTS -** *comp*

**Where:**

*comp*
One of the following:
- IPL*x*, where *x* is a number 1–4
- CIMR*x*, where *x* is a number 1–8
- CTKX

**Explanation:** An error occurred because the address saved in the image control record (ICR) for the components referenced in the message does not match the address obtained online from FACS.

**System Action:** None.

**User Response:** Do the following:
1. Enter the ZIMAG CLEAR and ZIMAG DEFINE commands to initialize the image again.
2. Do one of the following:
   - Load all components.
   - Correct the file address compute program (FACE) table (FCTB).
3. Enter the command again.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0111E REQUEST REJECTED — IMAGE** *name* **NOT CURRENTLY ENABLED**

**Where:**

*name*
The image name.

**Explanation:** The image referenced in the message is not enabled in the TPF system.

**System Action:** None.

**User Response:** Do one of the following:
- Enable the image by entering the ZIMAG ENABLE command and enter the command again.
- Enter the command again and specify the name of an enabled image.

See *TPF Operations* for more information about the ZIMAG PRIMARY, ZIMAG ENABLE, and ZIMAG DISABLE commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0112E REQUEST REJECTED — IMAGE** *name* **MARKED AS PRIMARY**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG DISABLE command was entered to disable an image. However, the image referenced in the message was not disabled because it is marked as the primary image.

**System Action:** None.

**User Response:** Define another image in the TPF system by entering the ZIMAG PRIMARY commands.

See *TPF Operations* for more information about the ZIMAG DISABLE and ZIMAG PRIMARY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0113E IMAGE** *name* **COULD NOT BE DISABLED ONE OR MORE CIMR COMPONENTS ARE REFERENCED BY OTHER ENABLED IMAGES**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG DISABLE command was entered to disable an image. However, the image referenced in the message was not disabled because the components were referenced by other enabled images.

**System Action:** None.

**User Response:** Do the following:
1. Remove the references for the core image restart area (CIMR) components by doing the following:
   a. Enter the ZIMAG DISPLAY command with the IMAGE parameter specified to determine which CIMR components are referenced by other enabled images.
   b. Enter the ZIMAG COPY, ZIMAG MAKEPHYS, or ZIMAG UNREF commands to remove those references.
2. Enter the ZIMAG DISABLE command again.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0114E IMAGE** *name* **COULD NOT BE DISABLED IMAGE IS ACTIVE ON ONE OR MORE PROCESSORS**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG DISABLE command was entered to disable an image. However, the image referenced in the

message was not disabled because it is active on one or more processors.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the PROC parameter specified to the processors on which the image is active currently.
2. Deactivate the other processors or activate other images on the other processors.

   **Note:** A different image can be activated on a processor by IPLing the processor again and selecting a different image.
3. Enter the ZIMAGE DISABLE command again.

See *TPF Operations* for more information about the ZIMAG DISABLE and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0115E REQUEST REJECTED — IPL AREA IN USE**

**Explanation:** The ZIMAG CLEAR command with the IPL parameter specified was entered to clear a specified IPL area from the TPF system. However, an error occurred because the IPL area specified is in use by another enabled image.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZIMAG DISABLE command to disable all images that are by using the specified IPL area.
2. Enter the ZIMAG CLEAR command again with the IPL parameter specified.

See *TPF Operations* for more information about the ZIMAG CLEAR and ZIMAG DISABLE commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0116E REQUEST REJECTED — BP OPTION REQUIRED ONE OR MORE CIMR COMPONENTS REFERENCED BY OTHER IMAGES**

**Explanation:** The ZIMAG CLEAR command was entered to clear an image or initial program load (IPL) definition from the TPF system. An error occurred because the core image restart area (CIMR) components are referenced by other images.

**System Action:** None.

**User Response:** Do one of the following:

- Enter **ZIMAG CLEAR BP**.
- Enter the ZIMAG MAKEPHYS command to remove logical references in other images.

See *TPF Operations* for more information about the ZIMAG CLEAR and ZIMAG MAKEPHYS commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0117W ONE OR MORE CIMR COMPONENTS ARE LOGICAL COPIES IN IMAGE** *name*

**Where:**

*name*
The name of source image.

**Explanation:** The ZIMAG COPY command was entered with the CO parameter specified to copy one or more core image restart area (CIMR) components from the source image to the target image. However, one or more of the CIMR components were not processed because they are logically referenced from another image.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the IMAGE parameter specified to determine which CIMR components were processed and which were not processed because of existing logical references.
2. Enter the ZIMAGE DISPLAY command to determine which image the components reference.
3. Enter the ZIMAG COPY command to copy the CIMR components from the image that was logically referenced.

See *TPF Operations* for more information about the ZIMAG COPY and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0118W ONE OR MORE CIMR COMPONENTS ARE NOT PHYSICALLY LOADED IN IMAGE** *name*

**Where:**

*name*
The name of source image that has missing components.

**Explanation:** The ZIMAG COPY command was entered with the CO parameter specified to copy one or more core image restart area (CIMR) components from the source image to the target image. However, one or more of the CIMR components was not processed because they are physically loaded in the source image.

**System Action:** None

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the IMAGE parameter specified to determine which CIMR components were processed and which were not processed because they are not loaded physically.
2. Enter the ZIMAG COPY command to copy the CIMR components.

See *TPF Operations* for more information about the ZIMAG COPY and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0119E COPY REQUEST REJECTED SOURCE AND TARGET IMAGE CANNOT BE THE SAME**

**Explanation:** The ZIMAG COPY command was entered to copy information from the source image to the target image. An error occurred because the source image and the target

image specified are the same. The source and target images must be different.

**System Action:** None.

**User Response:** Enter the command again and specify different source and target images.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0120W FOLLOWING COMPONENTS ARE TOO LARGE FOR TARGET IMAGE** *comp*

**Where:**

*comp*
The name of the component whose physical size in the source image is larger than its allocated size in the target image's CTKX.

**Explanation:** The ZIMAG COPY command was entered with the CO parameter specified to copy one or more core image restart area (CIMR) components from the source image to the target image. An error occurred because one or more of the CIMR CIMR components were not processed because their size in the source image is larger than the allocated size in the target image.

**System Action:** None.

**User Response:** Do one of the following:

- If the source image and CIMR components were specified correctly, load a new CTKX to the target image.
- Enter the command again and specify different parameters.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0121E REQUEST REJECTED ONE OR MORE CIMR COMPONENTS ARE NOT LOGICAL COPIES**

**Explanation:** The ZIMAG MAKEPHYS or ZIMAG UNREF command was was not processed because components were specified that were not logical copies.

**Note:** This message is issued only when a list of components was specified in the command.

**System Action:** None.

**User Response:** Enter the command again and specify the correct component names.

See *TPF Operations* for more information about the ZIMAG MAKEPHYS and ZIMAG UNREF commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0122W ONE OR MORE LOGICALLY REFERENCED COMPONENTS ARE NOT LOADED**

**Explanation:** The ZIMAG MAKEPHYS command was entered but one or more requested core image restart area (CIMR) components were not processed because they are not physically loaded in the logically referenced image.

**System Action:** None.

**User Response:** Enter the ZIMAG DISPLAY command with the IMAGE parameter specified to determine which CIMR components were processed and which were not processed because they are not loaded physically.

See *TPF Operations* for more information about the ZIMAG MAKEPHYS and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0123W FOLLOWING COMPONENTS ARE TOO LARGE FOR THE SPECIFIED IMAGE -** *comp*

**Where:**

*comp*
The name of the component whose physical size in the logically referenced image is larger than its allocated size in the specified images CTKX.

**Explanation:** The ZIMAG MAKEPHYS command was specified but one or more of the requested core image restart area (CIMR) components were not processed because their size in the logically referenced image is larger than the allocated size in the specified image.

**System Action:** None.

**User Response:** Do one of the following:

1. If the components were specified correctly, a new CTKX must be loaded to the specified image
2. Enter the command again and specify different components.

See *TPF Operations* for more information about the ZIMAG MAKEPHYS command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0124E REQUEST REJECTED —** *xxxxxxxx* **IS A RESERVED NAME**

**Where:**

*xxxxxxxx*
The image name.

**Explanation:** The ZIMAG DEFINE command was entered to define an empty image or to redefine an existing image. The image definition request was not processed because the name is reserved. The name is used by ACPL, which assigns this name to image 1 by default when loading program components from the loader general file.

**System Action:** None.

**User Response:** Enter the command again and specify a new image name.

See *TPF Operations* for more information about the ZIMAG DEFINE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0125E REQUEST REJECTED — PROCESSOR MUST BE IN 1052 STATE**

**Explanation:** The ZIMAG KEYPT command was entered with the MOVE or RESTORE parameter specified on a processor that will be affected by the keypoint move or restore function. The keypoints being moved include shared keypoints

or unique keypoints for this processor. The processor must be in 1052 state.

**System Action:** None.

**User Response:** Do one of the following:

- Cycle the TPF system to 1052 state.
- Enter the command again on a processor that is in 1052 state or is not affected by the keypoint move or restore.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0126E REQUEST REJECTED — IMAGE IS DISABLED — BP REQUIRED**

**Explanation:** The ZIMAG KEYPT command was specified with the MOVE parameter specified but the move function was not processed because the image specified was disabled.

**System Action:** None.

**User Response:** Do the following:

1. Enable the image.
2. Enter the command again and specify the BP parameter.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0127E KEYPOINT MOVE REQUEST REJECTED BACKUP COPIES EXIST FOR ONE OR MORE SPECIFIED KEYPOINTS**

**Explanation:** The ZIMAG KEYPT command was entered with the MOVE parameter specified to move the keypoints from a keypoint staging area to the working keypoint area. However, the move function was not processed because one or more of the keypoints specified have copies in the backup area.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the KEYPT paramter specified to determine which keypoints exist in the backup area.
2. Enter the ZIMAG KEYPT command with the DELETE parameter specified to delete copies of these keypoints from the backup area, if necessary.
3. Enter the ZIMAGE KEYPT command again with the MOVE parameter specified to move the keypoints from a keypoint staging area to the working keypoint area.

See *TPF Operations* for more information about the ZIMAG KEYPT and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0128E KEYPOINT MOVE REQUEST REJECTED ONE OR MORE KEYPOINTS ARE NOT LOADED TO SPECIFIED IMAGE**

**Explanation:** The ZIMAG KEYPT command was entered with the MOVE parameter specified to move keypoints from a keypoint staging area to the working keypoint area. However, the move function was not processed because one or more of the keypoints specified were not loaded in the staging area of the image specified.

If this message was preceded by the IMAG0177W message, the move function may not have been processed because one or more of the keypoints specified are processor unique; separate copies of these keypoints must be available for each processor.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the KEYPT parameter specified to determine which keypoints are loaded in the staging area for the image specified.
2. Do one of the following:
   - Enter the command again and specify only keypoints that are loaded in the staging area of the image specified.
   - Load the needed keypoints to the image.

See *TPF Operations* for more information about the ZIMAG KEYPT and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0129E KEYPOINT RESTORE REQUEST REJECTED ONE OR MORE SPECIFIED KEYPOINTS DO NOT HAVE BACKUP COPIES**

**Explanation:** The ZIMAG KEYPT command was entered with the RESTORE parameter specified but the restore function was not processed because one or more of the keypoints specified do not have copies in the backup area.

If this message was preceded by the IMAG0177W message, the restore function may not have been processed because one or more of the keypoints specified are processor unique; separate copies of these keypoints must be available for each processor.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the KEYPT parameter specified to determine which keypoints exist in the backup area.
2. Enter the ZIMAG DISPLAY command again and specify only the keypoints that have copies in the backup area.

See *TPF Operations* for more information about the ZIMAG DISPLAY and ZIMAG KEYPT commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0130E NO ZIMAG KEYPT REQUEST TO BE CONTINUED**

**Explanation:** The ZIMAG KEYPT command was entered with the CONTINUE parameter specified but there is no previous ZIMAG KEYPT request to be continued.

If you entered the ZIMAG KEYPT command with the MOVE MOVE or RESTORE parameter specified previously, the timeout waiting for the ZIMAG KEYPT command with the CONTINUE or ABORT parameters specified expired and processing ended already.

**System Action:** None.

**User Response:** Enter the ZIMAG KEYPT command again with the MOVE or RESTORE parameter specified.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0131E NO ZIMAG KEYPT REQUEST TO BE ABORTED**

**Explanation:** The ZIMAG KEYPT command with the ABORT parameter specified was entered to end a move or restore function but a ZIMAG KEYPT command with the MOVE or RESTORE parameter specified was never entered to start these functions.

If a previous ZIMAG KEYPT command was entered with the MOVE or RESTORE parameter specified, the timeout waiting for a continue or abort function (the ZIMAG KEYPT command with the CONTINUE or ABORT parameter specified) expired and processing for that request ended already.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0132E REQUEST INVALID IN NON-BSS SUBSYSTEM**

**Explanation:** The ZIMAG KEYPT command was entered on a non-basic subsystem (BSS) or the parameters specified are not valid on a non-BSS.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the command again on a BSS.
- Correct the parameters specified.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0133E REQUEST REJECTED — PROGRAM AREA *prog* INVALID IPAT ASSOCIATED WITH DIFFERENT PROGRAM AREA**

**Where:**

*prog*
The program area.

**Explanation:** The ZIMAG DEFINE command was entered with the PROG parameter specified but the program area specified cannot be associated with the image specified because the IPAT for the image is referenced by, or is referencing, another image with a different program area.

**System Action:** None.

**User Response:** Do the following:

1. Remove the logical reference for the IPAT.
2. Load a new IPAT or copy a new IPAT from another image with the same program area, if it was not done before the logical reference was made.
3. Enter the ZIMAG DEFINE command again.

See *TPF Operations* for more information about the ZIMAG DEFINE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0134E COPY REQUEST REJECTED IPAT CANNOT BE LOGICALLY COPIED AS SOURCE AND TARGET IMAGE HAVE DIFFERENT PROGRAM AREAS**

**Explanation:** The ZIMAG COPY command was entered but could not be processed because the IPAT component cannot be referenced by 2 images with different program areas.

**System Action:** None.

**User Response:** Enter the ZIMAG COPY command again and do not specify the IPAT component.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0135E TIMEOUT WAITING FOR ZIMAG KEYPT CONTINUE/ABORT**

**Explanation:** A timeout occurred while waiting for a ZIMAG KEYPT command with the CONTINUE or ABORT parameter specified to process.

**System Action:** The keypoint request ends abnormally.

**User Response:** Enter the ZIMAG KEYPT command again with the MOVE or RESTORE parameter specified.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0136E REQUEST REJECTED — IMAGE *n* IS ALREADY DEFINED**

**Where:**

*n* The image number.

**Explanation:** The ZIMAG DEFINE command was entered with an image number specified that is defined already.

**System Action:** The ZIMAG DEFINE command is rejected.

**User Response:** Enter the ZIMAG DEFINE command again and specify a new image number.

See *TPF Operations* for more information about the ZIMAG DEFINE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0137E DEFINE REQUEST ABORTED**

**Explanation:** The ZIMAG DEFINE command was entered to define an empty image or to redefine an existing image but the request was not processed because an system error or an input/output (I/O) error occurred.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.

2. Take the necessary corrective action.
3. Enter the ZIMAG DEFINE command again.

See *TPF Operations* for more information about the ZIMAG DEFINE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0138E RETRIEVAL ERROR OCCURRED ON** *rectype* **ORDINAL NUMBER** *nnn*

**Where:**

*rectype*
The FACS record type (for example, PROGx).

*nnn*
The ordinal number of the record to be retrieved.

**Explanation:** An error occurred while trying to retrieve the specified record.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the input/output (I/O) error.
2. Take the necessary corrective action.
3. Enter the appropriate ZIMAG command again.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0139E UPDATE ERROR OCCURRED ON** *rectype*

**Where:**

*rectype*
The record type, which is one of the following:

- IHR
- ICR
- IPL2
- CTK6.

**Explanation:** An error occurred while trying to update the specified record.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the input/output (I/O) error.
2. Take the necessary corrective action.
3. Enter the appropriate ZIMAG command again.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0140E FACS ERROR OCCURRED ON** *rectype* **ORDINAL NUMBER** *nnn*

**Where:**

*rectype*
The FACS record type (for example, PROGx).

*nnn*
The ordinal number of the record to be located.

**Explanation:** An error occurred while trying to compute the file address of the specified record.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the FACS error.
2. Take the necessary corrective action.
3. Enter the appropriate ZIMAG command again.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0141E CSONC ERROR OCCURRED ON** *rectype* **ORDINAL NUMBER** *nnn*

**Where:**

*rectype*
The FACS record type (for example, PROGx).

*nnn*
The ordinal number of the record to be located.

**Explanation:** An error occurred while trying to compute the file address of the specified record.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the CSONC error.
2. Take the necessary corrective action.
3. Enter the appropriate ZIMAG command again.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0142E DUPLICATE CIMR COMPONENTS OR KEYPOINTS SPECIFIED**

**Explanation:** The request is not processed because duplicate core image restart area (CIMR) or KEYPT components are specified on a ZIMAG command.

**System Action:** None.

**User Response:** Do the following:

1. Determine which CIMR or KEYPT components are duplicates.
2. Enter the appropriate ZIMAG command again and do not specify duplicate CIMR or KEYPT components.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0143E INVALID CIMR COMPONENTS OR KEYPOINTS SPECIFIED**

**Explanation:** A ZIMAG command was entered but the request was not processed because core image restart area (CIMR) or KEYPT components that are not valid were specified.

**System Action:** None.

**User Response:** Do the following:

1. Determine which CIMR or KEYPT components are valid.
2. Enter the appropriate ZIMAG command again and specify valid CIMR or KEYPT components.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0144E ENABLE REQUEST ABORTED**

**Explanation:** The ZIMAG ENABLE command was entered to enable an image. However, the image was not enabled because a system error or an input/output (I/O) error occurred.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Take the necessary corrective action.
3. Enter the ZIMAG ENABLE command again.

See *TPF Operations* for more information about the ZIMAG ENABLE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0145E REQUEST REJECTED — IPL2 VALIDATION ERROR**

**Explanation:** The ZIMAG DISABLE command was entered but was not processed because the IPL2 program did not contain the identifier name in the correct position.

**System Action:** The ZIMAG DISABLE command is rejected.

**User Response:** Do the following:

1. Determine the cause of the mismatch in the IPL2 program.
2. Enter the ZIMAG DISABLE command again.

See *TPF Operations* for more information about the ZIMAG DISABLE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0146E DISABLE REQUEST ABORTED**

**Explanation:** The ZIMAG DISABLE command was entered to disable an image but the was not disabled because a system error or an input/output (I/O) error. occurred.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Take the necessary corrective action.
3. Enter the ZIMAG DISABLE command again.

See *TPF Operations* for more information about the ZIMAG DISABLE command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0147E REQUEST REJECTED — IMAGE *name* IS ALREADY MARKED AS PRIMARY**

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG PRIMARY command was entered to define an image as the primary image. However, the image name specified is marked as the primary image already.

**System Action:** The ZIMAG PRIMARY command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG PRIMARY command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0148E UPDATE ERROR OCCURRED ON *rectype* ORDINAL NUMBER *number***

**Where:**

*rectype*
The FACS record type.

*number*
The record ordinal number.

**Explanation:** A system error or an input/output (I/O) error occurred while trying to write a record at the specified file type and ordinal position.

**System Action:** The ZIMAG KEYPT command is rejected.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Take the necessary corrective action.
3. Enter the ZIMAG KEYPT command again.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0149E PRIMARY REQUEST ABORTED**

**Explanation:** The ZIMAG PRIMARY command was entered to make an image the primary image. However, a system error or an input/output (I/O) error occurred so the image specified was not made the primary image.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Take the necessary corrective action.
3. Enter the ZIMAG PRIMARY command again.

See *TPF Operations* for more information about the ZIMAG PRIMARY command. See *TPF System Installation Support Reference* for more information.

---

### IMAG0150E COPY REQUEST ABORTED

**Explanation:** The ZIMAG COPY command was entered to copy image components but the function was not completed because of error during processing.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do the following:

1. Refer to the previous messages to determine the cause of the error.
2. Take the necessary corrective action.
3. Enter the ZIMAG COPY command again.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information.

### IMAG0151E REQUEST REJECTED CIMR ADDRESS MISMATCH IN IMAGE *name*

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG COPY command was entered to copy image components but the function was not completed because the core image restart area (CIMR) address for the image referenced in the message does not match the address obtained by FACS.

**System Action:** The ZIMAG COPY command was rejected.

**User Response:** Do one of the following:

- Enter the ZIMAG COPY command again and specify a different image name.
- Load a new FCTB to determine the cause of the address mismatch.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information.

### IMAG0152E MAKEPHYS REQUEST ABORTED

**Explanation:** The ZIMAG MAKEPHYS command was entered to overlay logically referenced image components but the function did not complete because of an error during processing.

**System Action:** The ZIMAG MAKEPHYS command is rejected.

**User Response:** Do the following:

1. Refer to the previous messages to determine the cause of the error.
2. Take the necessary corrective action.
3. Enter the ZIMAG MAKEPHYS command again.

See *TPF Operations* for more information about the ZIMAG MAKEPHYS command. See *TPF System Installation Support Reference* for more information.

### IMAG0153E UNREF REQUEST ABORTED

**Explanation:** The ZIMAG UNREF command was entered to delete logically referenced image components but the function did not complete because of a system error or input/output (I/O) error during processing.

**System Action:** The ZIMAG UNREF command is rejected.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Take the necessary corrective action.
3. Enter the ZIMAG UNREF command again.

See *TPF Operations* for more information about the ZIMAG UNREF command. See *TPF System Installation Support Reference* for more information.

### IMAG0154E CLEAR REQUEST ABORTED

**Explanation:** The ZIMAG CLEAR command was entered to clear an image but the function did not complete because a system error or an input/output (I/O) error. occurred during processing.

**System Action:** The ZIMAG CLEAR command is rejected.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Take the necessary corrective action.
3. Enter the ZIMAG CLEAR command again.

See *TPF Operations* for more information about the ZIMAG CLEAR command. See *TPF System Installation Support Reference* for more information.

### IMAG0155E RECORD TYPE *rectype* IS NOT DEFINED

**Where:**

*rectype*
The FACS record type.

**Explanation:** An error occurred while trying to compute a file address for the specified record type because it is not defined in the file address compute program (FACE) table (FCTB) being used by the currently running image. The record type might exist in the FACE table (FCTB) of another image, or it might not be defined in any image.

**System Action:** None.

**User Response:** Do one of the following:

- Choose a record type that is defined, and enter the appropriate ZIMAG command again.
- Switch to another image where the record type is defined and enter the appropriate ZIMAG command again.
- Allocate the desired record type by using the offline FACE table (FCTB) generator and load the new FACE table (FCTB) to the TPF system.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

### IMAG0156E REQUEST REJECTED CTKX NOT LOADED IN IMAGE *name*

**Where:**

*name*
Image name.

**Explanation:** The ZIMAG MAKEPHYS command was entered to overlay logically referenced image components but the function did not complete because CTKX is not loaded.

**System Action:** The ZIMAG MAKEPHYS command is rejected.

**User Response:** Do one of the following:

- Enter the ZIMAG MAKEPHYS command again and specify a different image name.
- Load CTKX to the specified image and enter the ZIMAG MAKEPHYS command again.

See *TPF Operations* for more information about the ZIMAG MAKEPHYS command. See *TPF System Installation Support Reference* for more information.

### IMAG0157E REQUEST REJECTED CTKX ADDRESS MISMATCH IN IMAGE *name*

**Where:**

*name*
The image name.

**Explanation:** The ZIMAG COPY command was entered to copy image components but the function did not complete because the CTKX address for the image referenced in the message does not match the address obtained by FACS.

**System Action:** The ZIMAG COPY command is rejected.

**User Response:** Do one of the following:

- Enter the ZIMAG COPY command again and specify a different image name.
- Load a new FCTB to correct the address mismatch.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information.

### IMAG0158E DISPLAY REQUEST ABORTED

**Explanation:** The ZIMAG DISPLAY command was entered to display information about online images but the function did not complete because a system error or an input/output (I/O) error occurred.

**System Action:** The ZIMAG DISPLAY command was rejected.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Take the necessary corrective action.
3. Enter the ZIMAG DISPLAY command again.

See *TPF Operations* for more information about the ZIMAG DISPLAY command. See *TPF System Installation Support Reference* for more information.

### IMAG0159E ZIMAG REQUEST ABORTED

**Explanation:** A ZIMAG command was entered but did not complete because a system error or an input/output (I/O) error occurred.

**System Action:** The ZIMAG command is rejected.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Take the necessary corrective action.
3. Enter the appropriate ZIMAG command again.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

### IMAG0160E RETRIEVAL ERROR OCCURRED ON *rectype*

**Where:**

*rectype*
The record type, which is one of the following:

- IHR
- ICR
- IPL2
- CTK6.

**Explanation:** A ZIMAG command was entered but a system error or an input/output (I/O) error occurred while trying to retrieve the specified record.

**System Action:** The ZIMAG command is rejected.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Take the necessary corrective action.
3. Enter the appropriate ZIMAG command again.

See *TPF Operations* for more information about the ZIMAG commands. See *TPF System Installation Support Reference* for more information.

### IMAG0161E NO CIMR COMPONENTS REMAIN TO BE PROCESSED

**Explanation:** The ZIMAG COPY or ZIMAG MAKEPHYS command was entered but one of the following errors occurred for each of the specified components:

- The component was not loaded physically.
- The actual size of the component was greater than the allocated size in the target image.
- The component had a superseding logical reference in the source image (if processing a COPY request).

Because all the components failed due to one of the conditions listed previously, no work remained to be done for the request.

**System Action:** None.

**User Response:** Do the following:

1. Refer to the previous warning messages to determine the exact reasons why the request could not be completed.
2. Take the appropriate corrective action.

3. Enter the ZIMAG COPY or ZIMAG MAKEPHYS command again.

See *TPF Operations* for more information about the ZIMAG COPY and ZIMAG MAKEPHYS commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0165I NO KEYPOINTS LOADED TO IMAGE *xxxxxxxx***

**Where:**

*xxxxxxxx*
The image name.

**Explanation:** The ZIMAG DISPLAY command was entered to display information about online images. However, no information was displayed because no keypoints were loaded for the image specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DISPLAY command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0166I NO BACKUP KEYPOINTS EXIST**

**Explanation:** The ZIMAG DISPLAY command was entered to display information about online images but no information was displayed because no keypoints were saved in the backup area.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG DISPLAY command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0167E REQUEST REJECTED — NO KEYPOINTS TO BE PROCESSED**

**Explanation:** This message displays when the ZIMAG KEYPT command is entered with the KPT ALL parameter specified.

**System Action:** The ZIMAG KEYPT command is rejected because there are no keypoints to process, and the following occurs:

- If the CPU X parameter was specified, no unique keypoints are loaded for the specified processor.
- If the CPU ALL parameter was specified, each unique keypoint is missing for at least one processor.

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the KEYPT parameter specified to determine which keypoints are loaded and for which processors they are loaded.
2. Enter the ZIMAG KEYPT command again and specify the correct CPU and KPT parameters.

See *TPF Operations* for more information about the ZIMAG KEYPT and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0168E KEYPOINT DELETE REQUEST REJECTED ONE OR MORE SPECIFIED KEYPOINTS DO NOT HAVE BACKUP COPIES**

**Explanation:** The ZIMAG KEYPT command was entered with the DELETE parameter specified. This message is only issued if a list was specified in the command.

The keypoint delete function did not complete because one or more of the keypoints specified did not have copies in the backup area.

If this message was preceded by the IMAG0177W message, the keypoint delete function may not be processed because one or more of the keypoints specified are processor-unique keypoints; separate copies of these keypoints must be available for each processor.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZIMAG DISPLAY command with the KEYPT parameter specified to determine which keypoints exist in the backup area.
2. Enter the ZIMAG KEYPT command again with the DELETE parameter and only keypoints with copies in the backup area specified.

See *TPF Operations* for more information about the ZIMAG KEYPT and ZIMAG DISPLAY commands. See *TPF System Installation Support Reference* for more information.

---

**IMAG0169E ZIMAG KEYPT MOVE — REQUEST ABORTED**

**Explanation:** The ZIMAG KEYPT command with the MOVE parameter was entered but processing ended because:

- The ZIMAG KEYPT command with the ABORT parameter specified was entered.
- An error occurred during processing.

**System Action:** The ZIMAG KEYPT command is rejected.

**User Response:** If the command ended because of an error during processing, another message precedes the IMAG0169E message. Refer to the explanation of that message to determine the appropriate action.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0170E ZIMAG KEYPT RESTORE — REQUEST ABORTED**

**Explanation:** The ZIMAG KEYPT command with the RESTORE parameter specified was entered but processing ended because:

- The ZIMAG KEYPT command with the ABORT parameter specified was entered.
- An error occurred during processing.

**System Action:** The ZIMAG KEYPT command is rejected.

**User Response:** If the command ended because of an error during processing, another message precedes the IMAG0170E message. Refer to the explanation of that message to determine the appropriate action.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

### IMAG0171E ZIMAG KEYPT DELETE — REQUEST ABORTED

**Explanation:** The ZIMAG KEYPT command with the DELETE parameter specified was entered but processing ended because of an error.

**System Action:** The ZIMAG KEYPT command is rejected.

**User Response:** Another message precedes the IMAG0169E message. Refer to the explanation of that message to determine the appropriate action.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

### IMAG0172E REQUEST REJECTED — INVALID CPU ID

**Explanation:** The ZIMAG KEYPT command was entered with a CPU ID specified that is not valid.

**System Action:** The ZIMAG KEYPT command is rejected.

**User Response:** Enter the command again and specify a valid CPU ID.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

### IMAG0173E REQUEST REJECTED — CPU ALL IS REQUIRED

**Explanation:** The ZIMAG KEYPT command was entered without specifying the CPU ALL parameter. This parameter is required because the requested operation involves processor-shared keypoints.

**System Action:** The ZIMAG KEYPT command is rejected.

**User Response:** Do one of the following:

- Enter the command again with the CPU ALL parameter specified.
- Remove the shared keypoints from the list of keypoints to be copied.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

### IMAG0175E REQUEST ABORTED — PREVIOUS KEYPT REQUEST IN PROGRESS

**Explanation:** The ZIMAG KEYPT command with the MOVE or RESTORE parameter specified was entered but the function ended because another ZIMAG KEYPT command was entered previously on another subsystem.

**System Action:** The ZIMAG KEYPT command is rejected.

**User Response:** Do the following:

1. Wait for the previous ZIMAG KEYPT command to complete.
2. Enter the ZIMAG KEYPT command again with the MOVE or RESTORE parameter specified.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

### IMAG0176E REQUEST ABORTED — ERROR WHILE COPYING KEYPOINTS TO NON-PRIME MODULE

**Explanation:** The ZIMAG KEYPT command with the MOVE or RESTORE parameter specified was entered but processing ended because the time-initiated keypoint support found an error while copying the keypoint records to the next module in the keypoint rotation.

**System Action:** The ZIMAG KEYPT command is rejected.

**User Response:** Another message precedes the IMAG0176E message. Refer to the explanation of that message to determine the appropriate action.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

### IMAG0177W ONE OR MORE UNIQUE KEYPOINTS ARE NOT LOADED FOR ALL PROCESSORS

**Explanation:** The ZIMAG KEYPT command with the CPU ALL parameter specified was entered. One or more of the processor-unique keypoints that were specified in the command are not loaded for all processors.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

### IMAG0178W DUMP OVERRIDE TABLES COULD NOT BE COPIED – ZIMAG COPY CONTINUES

**Explanation:** A ZIMAG COPY command with the COMP ALL PHYS parameter specified was entered to copy the dump override tables. However, the dump override tables could not be copied completely because an error occurred while copying one of the following:

- The control program (CP)
- The dump override tables.

In either case, a previously issued error message shows the cause of the error.

**System Action:** One of the following occurs:

- If an error occurred while copying the CP, the TPF system makes no attempt to copy the dump override tables and processing of the ZIMAG COPY command continues.
- If an error occurred while copying the dump override tables, no additional dump override table records are copied and processing of the ZIMAG COPY command continues.

**User Response:** Do the following:

1. Use the error message issued before this message to determine the cause of the problem.

2. Correct the problem.
3. Enter **ZIMAG COPY COMP ALL PHYS** again to ensure that the dump override tables are copied.

See *TPF Operations* for more information about the ZIMAG COPY command. See *TPF System Installation Support Reference* for more information about the dump override tables.

---

**IMAG0211I KEYPOINTS OVERLAID IN THE WORKING AREA THE FOLLOWING PROCESSORS MUST BE IPLED - PR-*x***
⋮

**Where:**

*x* The processor ID.

**Explanation:** This message is displayed when the ZIMAG KEYPT command with the MOVE or RESTORE parameter specified completes.

**System Action:** None.

**User Response:** IPL the processors referenced in the message.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information.

---

**IMAG0221I THE FOLLOWING PROCESSORS MUST BE STOPPED - PR-*x***
⋮

**Where:**

*x* The processor ID.

**Explanation:** The processors listed in the message were affected by a ZIMAG KEYPT command that was entered with the MOVE or RESTORE parameter specified. You must stop the processors through a system reset before moving or restoring keypoints.

**System Action:** Message IMAG0022I is issued.

**User Response:** Do the following:

1. Stop each of the processors listed in the message through a system reset.
2. Respond to message IMAG0022I as appropriate.

See *TPF Operations* for more information about the ZIMAG KEYPT command. See *TPF System Installation Support Reference* for more information about TPF images.

---

**IMAP0001E IMAPD: FAILED TO BIND TO IMAPD PORT**

**Explanation:** The Internet Message Access Protocol (IMAP) server was unable to bind to well-known port 143. This indicates that another socket is using this port.

**System Action:** The entry control block (ECB) exits and the IMAP server stops.

**User Response:** Do the following:

1. Enter **ZSOCK INACT LPORT-143** to deactivate the socket using well-known port 143.
2. Enter **ZINET START S-IMAP** to start the IMAP server again.

See *TPF Operations* for more information about the ZINET and ZSOCK commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the IMAP server.

---

**IMAP0002E IMAPD: FAILED TO LISTEN TO IMAPD PORT: CODE *errno***

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The Internet Message Access Protocol (IMAP) server was unable to process the `listen` function for the socket descriptor.

**System Action:** The entry control block (ECB) exits and the IMAP server stops.

**User Response:** Do the following:

1. Check the value in `errno` to determine the cause of the problem.
2. Correct the problem.
3. Enter **ZINET START S-IMAP** to start the IMAP server again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the IMAP server.

---

**IMAP0003E IMAPD: SELECT FAILED: CODE *errno***

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The Internet Message Access Protocol (IMAP) server was unable to process the `select` function for the socket descriptor.

**System Action:** The entry control block (ECB) continues to run and issue this message until the problem is resolved or until the IMAP server is stopped.

**User Response:** Do the following:

1. Enter **ZINET STOP S-IMAP** to stop the IMAP server.
2. Check the value in `errno` to determine the cause of the problem.
3. Correct the problem.
4. Enter **ZINET START S-IMAP** to start the IMAP server again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the IMAP server.

---

**IMAP0004E IMAPD: FAILED TO ACCEPT INCOMING CONNECTION: CODE** *errno*

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The Internet Message Access Protocol (IMAP) server was unable to process the `accept` function for the socket descriptor.

**System Action:** The entry control block (ECB) continues to run.

**User Response:** Do the following:

1. Enter **ZMAIL STATUS** to determine if the IMAP server is still running.
2. If the IMAP server is still running, enter **ZINET STOP S-IMAP** to stop the server; otherwise, go to step 3.
3. Check the value in `errno` to determine the cause of the problem.
4. Correct the problem.
5. Enter **ZINET START S-IMAP** to start the IMAP server again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the IMAP server.

# INET

**INET0011I SERVER** *sname* **ADDED TO THE INETD CONFIGURATION FILE**

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** This is the normal response to the ZINET ADD command.

**System Action:** The Internet server application name specified is added to the Internet daemon configuration file (IDCF).

**User Response:** None.

See *TPF Operations* for more information about the ZINET ADD command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

**INET0012I SERVER** *sname* **ENTRY UPDATED**

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** This is the normal response to the ZINET ALTER command.

**System Action:** The Internet server application entry for the Internet server application name specified is changed in the Internet daemon configuration file (IDCF).

**User Response:** None.

See *TPF Operations* for more information about the ZINET ALTER command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

**INET0013I SERVER** *sname* **ENTRY DELETED**

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** This is the normal response to the ZINET DELETE command.

**System Action:** The Internet server application entry for the Internet server application name specified is deleted from the Internet daemon configuration file (IDCF).

**User Response:** None.

See *TPF Operations* for more information about the ZINET DELETE command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

**INET0014I START OF ZINET DISPLAY OF FILE**

**Explanation:** This is the normal response to the ZINET DISPLAY command when FILE is specified for the COPY parameter. This message is followed by a display of a single Internet daemon configuration file (IDCF) Internet server application entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZINET DISPLAY command and for an example of the informational display. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

**INET0015I START OF ZINET DISPLAY OF FILE**

**Explanation:** This is the normal response to the ZINET DISPLAY command when FILE is specified for the COPY parameter and multiple Internet server application entries match the Internet server application name selection criteria. This message is followed by a display of multiple Internet daemon configuration file (IDCF) Internet server application entries.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZINET DISPLAY command and for an example of the informational display. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

**INET0016I INETD STARTED**

**Explanation:** This is the normal response to the ZINET START command. The Internet daemon will start to accept input for Internet server application entries defined in the Internet daemon configuration file (IDCF).

**System Action:** The Internet daemon is started.

**User Response:** None.

See *TPF Operations* for more information about the ZINET

START command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

---

**INET0017I SERVER *sname* STARTED**

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** This is the normal response to the ZINET START command when an Internet server application name is specified.

**System Action:** The Internet server application name specified is started.

**User Response:** None.

See *TPF Operations* for more information about the ZINET START command.

---

**INET0018I INETD STOPPED**

**Explanation:** This is the normal response to the ZINET STOP command. The Internet daemon will no longer accept input for Internet server application entries defined in the Internet daemon configuration file (IDCF).

**System Action:** The Internet daemon is stopped.

**User Response:** None.

See *TPF Operations* for more information about the ZINET STOP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

---

**INET0019I SERVER *sname* STOPPED**

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** This is the normal response to the ZINET STOP command when an Internet server application name is specified.

**System Action:** The Internet server application name specified is stopped.

**User Response:** None.

See *TPF Operations* for more information about the ZINET STOP command.

---

**INET0020I FILE COPY CONVERSION OF INTERNET DAEMON CONFIGURATION FILE SUCCESSFUL**

**Explanation:** The conversion of the Internet daemon configuration file (IDCF) from #IBMM4 records to #IDCF-1 records was completed successfully.

**System Action:** The Internet daemon continues.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

---

**INET0026I INETD IS ACTIVE**

**Explanation:** This is the normal response to the ZINET DISPLAY command when the Internet daemon is running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZINET DISPLAY command.

---

**INET0027I INETD IS NOT ACTIVE**

**Explanation:** This is the normal response to the ZINET DISPLAY command when the Internet daemon is not running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZINET DISPLAY command.

---

**INET0028E NO PID FOUND FOR *pidnum***

**Where:**

*pidnum*
The child process identifier (ID) created by the TPF system at the start of a process.

**Explanation:** The ZINET DISPLAY command was entered with the CHILD parameter specified for a single child process ID. However, the specified child process ID does not exist.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET DISPLAY command again specifying a valid child process ID.

See *TPF Operations* for more information about the ZINET DISPLAY command.

---

**INET0029I START OF ZINET DISPLAY OF CHILD PROCESS COUNT**

**Explanation:** This is the normal response to the ZINET DISPLAY command with the CHILD parameter specified and multiple Internet server application entries match the Internet server application name selection criteria. This message is followed by a display of multiple active Internet server application names and the CHILD count.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZINET DISPLAY command and for an example of the informational display.

---

**INET0030I START OF ZINET DISPLAY OF CHILD PROCESS**

**Explanation:** This is the normal response to the ZINET DISPLAY command with the CHILD parameter specified with a single Internet server application name. This message is followed by a display of the associated child process identifiers (IDs) of the server and the time stamp when the child process was created.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZINET DISPLAY command and for an example of the informational display.

---

**INET0031I START OF ZINET DISPLAY OF ACTIVE SERVER**

**Explanation:** This is the normal response to the ZINET DISPLAY command when ACTIVE is specified for the COPY parameter. This message is followed by a display of a single active Internet server application entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZINET DISPLAY command and for an example of the informational display.

---

**INET0032I START OF ZINET DISPLAY OF ACTIVE SERVERS**

**Explanation:** This is the normal response to the ZINET DISPLAY command when ACTIVE is specified for the COPY parameter and multiple Internet server application entries match the Internet server application name selection criteria. This message is followed by a display of multiple active Internet server application entries.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZINET DISPLAY command and for an example of the informational display.

---

**INET0050I** *sname* **IS NOW ACCEPTING CONNECTIONS ON IP -** *ipaddr* **PORT -** *portnum* **PID -** *pid*

**Where:**

*sname*
The name of the Internet server application.

*ipaddr*
The Internet Protocol (IP) address.

*portnum*
The port that the Internet server application uses for IP traffic. Many Internet server applications use a *well-known port*, which must be correct or clients will not be able to connect to the server.

*pid* The process identifier (ID) of the Internet daemon listener entry control block (ECB).

**Explanation:** The Internet daemon has completed a create and bind request, and is now monitoring the socket for the Internet server application displayed in the message.

**System Action:** The Internet daemon waits until a connection request arrives from a client and then starts the specific server.

**User Response:** Do one of the following:

- If the server is supposed to be running, no action is necessary.
- If the server is not supposed to be running, enter the following:

  **ZINET STOP SERVER-***sname*
- If the server is not running on the correct port, enter the following:
  1. **ZINET STOP SERVER-***sname*
  2. **ZINET ALTER SERVER-***sname* **PORT-***portnum*
  3. **ZINET START SERVER-***sname*

  See *TPF Operations* for more information about the ZINET ALTER, ZINET START, and ZINET STOP commands.

---

**INET0051I** *sname* **IS NO LONGER ACCEPTING CONNECTIONS ON IP -** *ipaddr* **PORT -** *portnum* **PID -** *pid*

**Where:**

*sname*
The name of the Internet server application.

*ipaddr*
The Internet Protocol (IP) address.

*portnum*
The port that the Internet server application uses for IP traffic. Many Internet server applications use a *well-known port*, which must be correct or clients will not be able to connect to the server.

*pid* The process identifier (ID) of the Internet daemon listener entry control block (ECB).

**Explanation:** The Internet daemon has completed a close request and is no longer monitoring the socket for the Internet server application displayed in the message.

**System Action:** None

**User Response:** Do one of the following:

- If the server is not supposed to be running, no action is necessary.
- If the server is supposed to be running, enter:

  **ZINET START SERVER-***sname*

See *TPF Operations* for more information about the ZINET START command.

---

**INET0075E REJECTED, NO TCP/IP SUPPORT HAS BEEN GENNED ON TPF**

**Explanation:** A ZINET command was entered, but Transmission Control Protocol/Internet Protocol (TCP/IP) support (native or offload) is not installed on this processor.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the TCP/IP support parameters in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.

4. Perform an initial program load (IPL) of the TPF system again.
5. Enter the ZINET command again.

See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro. See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for TCP/IP support.

---

**INET0076E INETD HAS NOT BEEN STARTED, NO ACTIVE ENTRIES TO DISPLAY**

**Explanation:** The ZINET DISPLAY command was entered with a value of ACTIVE specified for the COPY parameter to display active Internet server applications, but the Internet daemon is not started yet and there is nothing to display.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZINET DISPLAY command.

---

**INET0077E** *parm* **PARAMETER IS NOT ALLOWED FOR MODEL TYPE -** *mtype*

**Where:**

*parm*
The parameter specified with the ZINET command.

*mtype*
The process model specified with the ZINET command.

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with a parameter specified that is not allowed for the process model specified with the MODEL parameter. For example, if you specify the TIMEOUT parameter when you specify AOR for the MODEL parameter, this message is displayed.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify the correct parameters for the process model.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands. See *TPF Application Programming* for more information about the Internet daemon and supported process models.

---

**INET0078E SERVER** *sname* **ALREADY STOPPED**

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** The ZINET STOP command was entered with the SERVER parameter, but the specified Internet server application is not currently active.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct Internet server application name, there is no more action for you to take.
- If you specified an incorrect Internet server application name, enter the ZINET STOP command again and specify the correct Internet server application name.

See *TPF Operations* for more information about the ZINET STOP command.

---

**INET0080E SERVER** *sname* **ALREADY ACTIVE**

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** The ZINET START command was entered with the SERVER parameter, but the specified Internet server application is already active.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct Internet server application name, there is no more action for you to take.
- If you specified an incorrect Internet server application name, enter the ZINET START command again and specify the correct Internet server application name.

See *TPF Operations* for more information about the ZINET START command.

---

**INET0081E INETD IS ALREADY ACTIVE**

**Explanation:** The ZINET START command was entered, but the Internet daemon is currently active. A new Internet daemon cannot be started at this time.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZINET START command.

---

**INET0082E INETD CANNOT BE STARTED BELOW CRAS STATE**

**Explanation:** The ZINET START command was entered when the TPF system was below CRAS state.

**System Action:** The command is rejected.

**User Response:** Enter the ZCYCL command to cycle the TPF system to CRAS state or above. The Internet daemon will start automatically.

See *TPF Operations* for more information about the ZINET START and ZCYCL commands.

---

**INET0083E INETD IS NOT ACTIVE**

**Explanation:** The ZINET STOP command was entered, but there is no Internet daemon currently active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZINET STOP command.

**INET0084E SERVER *sname* ALREADY DEFINED FOR PROCID - *procid***

**Where:**

*sname*
The name of the Internet server application.

*procid*
The processor identifier (ID).

**Explanation:** The ZINET ADD command was entered with an Internet server application name that is already defined in the Internet daemon configuration file (IDCF).

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZINET ADD command again and specify a different Internet server application name.
- Enter the ZINET ALTER command to change the existing Internet server application entry.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

---

**INET0085E NO SERVER FOUND FOR *sname***

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** There was no Internet server application entry in the Internet daemon configuration file (IDCF) or the Internet daemon configuration table (IDCT) that matches the Internet server application name specified in the ZINET ALTER, ZINET DELETE, ZINET DISPLAY, or ZINET START command.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ALTER, ZINET DELETE, ZINET DISPLAY, or ZINET START command again and specify a valid Internet server application name.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

---

**INET0086E INETD CONFIGURATION FILE MAX ENTRIES *maxnum* EXCEEDED**

**Where:**

*maxnum*
The maximum number of Internet daemon configuration file (IDCF) entries allowed.

**Explanation:** The ZINET ADD command was entered to add a new Internet server application entry, but the IDCF is full and no more entries can be defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZINET DELETE command to delete an existing Internet server application entry.
2. Enter the ZINET ADD command again to add the new entry.

See *TPF Operations* for more information about the ZINET ADD and ZINET DELETE commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

---

**INET0087E MODEL TYPE AOR NOT SUPPORTED FOR PROTOCOL UDP**

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with AOR specified for the MODEL parameter and UDP specified for the PROTOCOL parameter. The User Datagram Protocol (UDP) is not supported for the AOR process model.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you want to use the AOR process model, enter the ZINET ADD or ZINET ALTER command again and specify TCP for the PROTOCOL parameter.
- If you want to use the UDP protocol, enter the ZINET ADD or ZINET ALTER command again and specify a value other than AOR for the MODEL parameter.

See *TPF Operations* for more information about the ZINET ADD or ZINET ALTER command. See *TPF Application Programming* for more information about the Internet daemon and supported process models.

---

**INET0088E VALUE SPECIFIED FOR MODEL *mtype* IS NOT SUPPORTED**

**Where:**

*mtype*
The process model specified with the ZINET command.

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with a value specified for the MODEL parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify a valid value for the MODEL parameter.

See *TPF Operations* for more information about the ZINET ADD or ZINET ALTER command. See *TPF Application Programming* for more information about the Internet daemon and supported process models.

---

**INET0090E INTERNET PROTOCOL SPECIFIED FOR PROTOCOL *pvalue* IS NOT SUPPORTED**

**Where:**

*pvalue*
The Internet Protocol (IP) specified for the PROTOCOL parameter.

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with a value specified for the PROTOCOL parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify a valid value for the PROTOCOL parameter.

See *TPF Operations* for more information about the ZINET ADD or ZINET ALTER command.

---

**INET0091E IP ADDRESS SPECIFIED FOR IP *ipaddr* IS NOT SUPPORTED**

**Where:**

*ipaddr*
The Internet Protocol (IP) address specified for the IP parameter.

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with a value specified for the IP parameter that is not valid. The IP address must be a numeric IP address or the value ANY.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify a valid value for the IP parameter.

See *TPF Operations* for more information about the ZINET ADD or ZINET ALTER command.

---

**INET0092E ZINET CANNOT BE ENTERED BELOW 1052 STATE**

**Explanation:** A ZINET command was entered when the TPF system was below 1052 state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle the TPF system to 1052 state or above.
2. Enter the ZINET command again.

See *TPF Operations* for more information about the ZCYCL and ZINET commands.

---

**INET0093E SERVER *sname* CANNOT BE STARTED BELOW NORM STATE**

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** The ZINET START command was entered to start an Internet server application that is defined with STATE-NORM when the TPF system was below NORM state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle the TPF system to NORM state or above.
2. Enter the ZINET START command again.

See *TPF Operations* for more information about the ZCYCL and ZINET commands.

---

**INET0094E SYSTEM STATE SPECIFIED FOR STATE *state* IS NOT SUPPORTED**

**Where:**

*state*
The value specified for the STATE parameter.

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with a value specified for the STATE parameter that is not valid. The value for the STATE parameter must be CRAS or NORM.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify a valid value for the STATE parameter.

See *TPF Operations* for more information about the ZINET ADD or ZINET ALTER command.

---

**INET0095E START OPTION SPECIFIED FOR ACTIVATION *avalue* IS NOT SUPPORTED**

**Where:**

*avalue*
The value specified for the ACTIVATION parameter.

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with a value specified for the ACTIVATION parameter that is not valid. The value for the ACTIVATION parameter must be AUTO or OPER.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify a valid value for the ACTIVATION parameter.

See *TPF Operations* for more information about the ZINET ADD or ZINET ALTER command.

---

**INET0096E DISPLAY OPTION SPECIFIED FOR COPY *copy* IS NOT SUPPORTED**

**Where:**

*copy*
The value specified for the COPY parameter.

**Explanation:** The ZINET DISPLAY command was entered with a value specified for the COPY parameter that is not valid. The value for the COPY parameter must be FILE or ACTIVE.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET DISPLAY command again and specify a valid value for the COPY parameter.

See *TPF Operations* for more information about the ZINET DISPLAY command.

---

**INET0097E IP ADDRESS SPECIFIED FOR ADDIP *ipaddr* IS NOT VALID**

**Where:**

*ipaddr*
The Internet Protocol (IP) address specified for the ADDIP parameter.

**Explanation:** The ZINET ALTER command was entered with a value specified for the ADDIP parameter that is not valid. The value for the ADDIP parameter must be a numeric IP address.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ALTER command again and specify a valid IP address for the ADDIP parameter.

See *TPF Operations* for more information about the ZINET ALTER command.

---

**INET0098E IP ADDRESS SPECIFIED FOR DELIP** *ipaddr* **IS NOT VALID**

**Where:**

*ipaddr*
The Internet Protocol (IP) address specified for the DELIP parameter.

**Explanation:** The ZINET ALTER command was entered with a value specified for the DELIP parameter that is not valid. The value for the DELIP parameter must be a numeric IP address.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ALTER command again and specify a valid IP address for the DELIP parameter.

See *TPF Operations* for more information about the ZINET ALTER command.

---

**INET0099E IP ADDRESS SPECIFIED FOR DELIP** *ipaddr* **IS NOT DEFINED**

**Where:**

*ipaddr*
The Internet Protocol (IP) address specified for the DELIP parameter.

**Explanation:** The ZINET ALTER command was entered with the DELIP parameter specified, but the specified IP address is not defined to the Internet server application entry in the Internet daemon configuration file (IDCF).

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ALTER command again and specify a valid IP address for the DELIP parameter.

See *TPF Operations* for more information about the ZINET ALTER command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

---

**INET0100E IP ADDRESS NOT ADDED, MAX IP LIMIT REACHED**

**Explanation:** The ZINET ALTER command was entered but the maximum number of local Internet Protocol (IP) addresses has already been defined for this Internet server application.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZINET ALTER command.

---

**INET0101E IP ADDRESS SPECIFIED FOR ADDIP** *ipaddr* **IS ALREADY DEFINED**

**Where:**

*ipaddr*
The Internet Protocol (IP) address specified for the ADDIP parameter.

**Explanation:** The ZINET ALTER command was entered with the ADDIP parameter specified, but the specified IP address is already defined to the Internet server application entry in the Internet daemon configuration file (IDCF).

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ALTER command again and specify a valid IP address for the ADDIP parameter.

See *TPF Operations* for more information about the ZINET ALTER command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IDCF.

---

**INET0102E PROCESSOR ID SPECIFIED FOR PROCID** *procid* **IS NOT DEFINED TO THE SYSTEM**

**Where:**

*procid*
The processor identifier (ID) specified for the PROCID parameter.

**Explanation:** The ZINET ADD, ZINET ALTER, ZINET DELETE, or ZINET DISPLAY command with the PROCID parameter specified was entered with a processor ID that is not defined to the TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD, ZINET ALTER, ZINET DELETE, or ZINET DISPLAY command again and specify a valid processor ID.

See *TPF Operations* for more information about the ZINET commands.

---

**INET0103E VALUE SPECIFIED FOR TIMEOUT IS NOT IN THE VALID RANGE OF 0 TO 32000**

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with an incorrect value for the TIMEOUT parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify the TIMEOUT parameter with a value in the range 0–32 000.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands.

---

**INET0104E VALUE SPECIFIED FOR SERVERRORS IS NOT IN THE VALID RANGE OF 0 TO 32000**

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with an incorrect value for the SERVERRORS parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER

command again and specify the SERVERRORS parameter with a value in the range 0–32 000.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands.

---

**INET0105E VALUE SPECIFIED FOR SERVETIME IS NOT IN THE VALID RANGE OF 0 TO 32000**

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with an incorrect value for the SERVETIME parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify the SERVETIME parameter with a value in the range 0–32 000.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands.

---

**INET0106E VALUE SPECIFIED FOR MAXPROC IS NOT IN THE VALID RANGE OF 0 TO 1000**

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with an incorrect value for the MAXPROC parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify the MAXPROC parameter with a value in the range 0–1000.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands.

---

**INET0107E A NONZERO VALUE MUST BE SPECIFIED FOR MAXPROC IF TIMEOUT IS NOT SET TO ZERO**

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with a value of 0 for the MAXPROC parameter and a nonzero value for the TIMEOUT parameter. If the TIMEOUT parameter is nonzero, the MAXPROC parameter must also be nonzero.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify the MAXPROC parameter with a nonzero value.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands.

---

**INET0108E VALUE SPECIFIED FOR PORT IS NOT IN THE VALID RANGE OF 0 TO 65535**

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with an incorrect value specified for the PORT parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify the PORT parameter with a value in the range 0–65 535.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands.

---

**INET0109W MAXPROC HAS BEEN SET TO 1 BECAUSE THE MODEL TYPE IS WAIT**

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with WAIT specified for the MODEL parameter and a value other than 1 specified for the MAXPROC parameter. The MAXPROC parameter is automatically set to 1 when the process model is WAIT.

**System Action:** The ZINET ADD or ZINET ALTER command is processed with MAXPROC-1.

**User Response:** None.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands.

---

**INET0110E PORT PARAMETER MUST BE SPECIFIED**

**Explanation:** The ZINET ADD command was entered with WAIT, NOWAIT, or AOR specified for the MODEL parameter, but the PORT parameter was not specified. The PORT parameter is required for the WAIT, NOWAIT, and AOR process models.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD command again and specify the PORT parameter.

See *TPF Operations* for more information about the ZINET ADD command.

---

**INET0111E PROTOCOL PARAMETER MUST BE SPECIFIED**

**Explanation:** The ZINET ADD command was entered with WAIT, NOWAIT, or AOR specified for the MODEL parameter, but the PROTOCOL parameter was not specified. The PROTOCOL parameter is required for the WAIT, NOWAIT, and AOR process models.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD command again and specify the PROTOCOL parameter.

See *TPF Operations* for more information about the ZINET ADD command.

---

**INET0112E VALUE SPECIFIED FOR AORLENGTH IS NOT IN THE RANGE OF 0 TO 32767**

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with an incorrect value for the AORLENGTH parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify the AORLENGTH parameter with a value from 0 to 32,767.

See *TPF Operations* for more information about the ZINET ADD or ZINET ALTER commands.

---

**INET0114E CANNOT OPEN OR CREATE FILE** *filename*

**Where:**

*filename*
The name of the file that will contain the XPARM parameter data.

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with the XPARM parameter specified, but the Internet daemon cannot open or create the file that will contain the parameter data.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZFILE chmod 777 /etc** to change the access permissions and allow the Internet daemon to open or create the file for the XPARM parameter data.

   **Note:** This step is a temporary solution because you should not have to change the access permissions for the `/etc` directory.
2. See your IBM service representative to determine the cause of the error and to correct the problem.

See *TPF Operations* for more information about the ZINET ADD, ZINET ALTER, and ZFILE chmod commands.

**INET0115E CANNOT READ FILE** *filename*

**Where:**

*filename*
The name of the file that contains the XPARM parameter data.

**Explanation:** The ZINET ALTER command was entered with the XPARM parameter specified or else the ZINET START command was entered, but the Internet daemon cannot read the file that contains the XPARM parameter data. The file is corrupted, missing, or not accessible.

**System Action:** One of the following occurs:

- If the ZINET ALTER command was entered, the command is rejected.
- If the ZINET START command was entered, the Internet daemon attempts to start the Internet server application without the XPARM parameter data.

**User Response:** Do one of the following:

- If the message is in response to a ZINET START command, do the following:
  1. Enter the ZINET STOP command to stop the Internet server application.
  2. Enter **ZFILE ls /etc** to check that the group file exists in the `/etc` directory.

     If the group file does not exist, go to step 3.

     If the group file does exist, go to step 4.
  3. Enter **ZFILE ls -l** to create the group file and then go to step 10.
  4. Enter **ZFILE ls /etc/inetd.conf** to check that the XPARM parameter data file exists. The XPARM parameter data file will have a name in the form *sname.procid*, where *sname* is the name of the Internet server application and *procid* is the processor identifier (ID).

     If the XPARM parameter data file does not exist, go to step 5.

     If the XPARM parameter date file does exist, go to step 6.
  5. Enter the ZINET ALTER command with the XPARM parameter specified to re-create the file and then go to step 10.
  6. Enter **ZFILE cat /etc/inetd.conf/***sname.procid* to look at the contents of the file.

     If the file is empty or the data is corrupted, go to step 7.

     If the file is not empty or corrupted, go to step 8.
  7. Enter the ZINET ALTER command with the XPARM parameter specified to re-create the file and then go to step 10.
  8. Enter the ZINET DELETE command to delete the Internet server application.
  9. Enter the ZINET ADD command with the XPARM parameter specified to add the Internet server application to the Internet daemon configuration file (IDCF) again and re-create the XPARM parameter data file.
  10. Enter the ZINET START command again.
- If the message is in response to a ZINET ALTER command, do one of the following:
  - If the ZINET ALTER functional was entered without the XPARM parameter specified, enter the ZINET ALTER command again and specify the XPARM parameter.
  - If the ZINET ALTER command was entered with the XPARM parameter specified, do the following:
    1. Enter the ZINET DELETE command to delete the Internet server application.
    2. Enter the ZINET ADD command again and specify the XPARM parameter.

See *TPF Operations* for more information about the ZINET and ZFILE commands.

**INET0116E CANNOT CREATE DIRECTORY FOR FILE** *filename*, **PERMISSION DENIED**

**Where:**

*filename*
The name of the file that will contain the XPARM parameter data.

**Explanation:** The ZINET ADD or ZINET ALTER command was entered with the XPARM parameter specified. The specified Internet server application is the first Internet server application on the TPF system to define XPARM parameter data. When the first XPARM parameter data file is created, the Internet daemon creates the `/etc/inetd.conf` directory. This error occurs if the Internet daemon does not have the correct access permissions to create the directory.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZFILE chmod 777 /etc** to change the access permissions and allow the Internet daemon to create the `/etc/inetd.conf` directory.

**Note:** This step is a temporary solution because you should not have to change the access permissions for the `/etc` directory.

2. See your IBM service representative to determine the cause of the error and to correct the problem.

See *TPF Operations* for more information about the ZINET ADD, ZINET ALTER, and ZFILE chmod commands.

---

**INET0117E XPARM PARAMETER IS NOT ALLOWED FOR ACTION -** *action*

**Where:**

*action*
DELETE, DISPLAY, START, or STOP

**Explanation:** A ZINET command other than ZINET ADD or ZINET ALTER was entered with the XPARM parameter specified. The XPARM parameter is valid only for the ZINET ADD or ZINET ALTER command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZINET command.
2. Enter the ZINET command again and use the correct format.

See *TPF Operations* for more information about the ZINET commands.

---

**INET0118E CANNOT CREATE DIRECTORY OR FILE FOR** *filename***, MAX ARRAY SIZE EXCEEDED**

**Where:**

*filename*
The name of the file will contain the XPARM parameter data.

**Explanation:** A ZINET ADD or ZINET ALTER command was entered with the XPARM parameter specified, but the Internet daemon attempted to create a file with a file name that is too long.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative to determine the cause of the error and to correct the problem.

See *TPF Operations* for more information about the ZINET ADD or ZINET ALTER commands.

---

**INET0119E VALUE SPECIFIED FOR BACKLOG IS NOT IN THE VALID RANGE OF 1 TO 32767**

**Explanation:** A ZINET ADD or ZINET ALTER command was entered, but an incorrect value was specified for the BACKLOG parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify the BACKLOG parameter with a correct value.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands.

---

**INET0120E SERVER** *sname* **ENTRY NOT DELETED, STOP THE SERVER FIRST**

**Where:**

*sname*
The name of the Internet server application.

**Explanation:** The ZINET DELETE command was entered with the SERVER parameter specified, but the Internet server application you specified is active.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZINET STOP command with the SERVER parameter specified to stop the Internet server application.
2. Enter the ZINET DELETE command with the SERVER parameter specified to remove the Internet server application.

See *TPF Operations* for more information about the ZINET STOP and ZINET DELETE commands.

---

**INET0121E REQUEST REJECTED - PROCESSOR SPECIFIED FOR PROCID IS CURRENTLY ACTIVE**

**Explanation:** The ZINET ADD, ZINET ALTER, or ZINET DELETE command was entered with the PROCID parameter specified, but the processor specified is currently active and is a processor other than the one from which the command was entered. If you specify a processor other than one from which you enter the command, the specified processor ***must*** be inactive.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Ensure that the processor for which you want to add, change, or delete the Internet server application entry is inactive and enter the ZINET ADD, ZINET ALTER, or ZINET DELETE command again.
- Enter the ZINET ADD, ZINET ALTER, or ZINET DELETE command from the processor for which you want to add, change, or delete the Internet server application entry.

See *TPF Operations* for more information about the ZINET ADD, ZINET ALTER, and ZINET DELETE commands.

---

**INET0122E BACKLOG NOT SUPPORTED FOR PROTOCOL UDP**

**Explanation:** A ZINET ADD or ZINET ALTER command was entered with the BACKLOG parameter specified, but the protocol for the specified Internet server application is not TCP.

**System Action:** The command is rejected.

**User Response:** Enter the ZINET ADD or ZINET ALTER command again and specify the BACKLOG parameter only if the PROTOCOL parameter is set to TCP.

See *TPF Operations* for more information about the ZINET ADD and ZINET ALTER commands.

# INIP–IPDB

**INIP0001I INDIVIDUAL IP TRACE *tracename* DEFINED**

**Where:**

*tracename*
The name of the individual Internet Protocol (IP) trace that is being defined.

**Explanation:** This is the normal response to the ZINIP command with the DEFINE parameter specified.

**System Action:** Tracing for the specified individual IP trace name begins.

**User Response:** None.

See *TPF Operations* for more information about the ZINIP command.

**INIP0002I INDIVIDUAL IP TRACE *tracename* MODIFIED**

**Where:**

*tracename*
The name of the individual Internet Protocol (IP) trace that is being modified.

**Explanation:** This is the normal response to the ZINIP command with the MODIFY parameter specified.

**System Action:** The properties of the specified individual IP trace are changed.

**User Response:** None.

See *TPF Operations* for more information about the ZINIP command.

**INIP0003I INDIVIDUAL IP TRACE *tracename* DELETED**

**Where:**

*tracename*
The name of the individual Internet Protocol (IP) trace that is being deleted.

**Explanation:** This is the normal response to the ZINIP command with the DELETE and NAME parameters specified.

**System Action:** The specified individual IP trace is deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZINIP command.

**INIP0004I ALL INDIVIDUAL IP TRACES ARE DELETED**

**Explanation:** This is the normal response to the ZINIP command with the DELETE and ALL parameters specified.

**System Action:** All individual Internet Protocol (IP) traces are deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZINIP command.

**INIP0005I INDIVIDUAL IP TRACE SUMMARY**

**Explanation:** This is the normal response to the ZINIP command with the SUMMARY parameter specified.

**System Action:** Information about the individual Internet Protocol (IP) traces that have been defined are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZINIP command.

**INIP0006I INDIVIDUAL IP TRACE *tracename* DISPLAY**

**Where:**

*tracename*
The name of the individual Internet Protocol (IP) trace that is being displayed.

**Explanation:** This is the normal response to the ZINIP command with the DISPLAY parameter specified.

**System Action:** The contents of the specified individual IP trace table are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZINIP command.

**INIP0007I INDIVIDUAL IP FORMATTED TRACE *tracename* DISPLAY**

**Where:**

*tracename*
The name of the individual Internet Protocol (IP) trace that is being displayed.

**Explanation:** This is the normal response to the ZINIP command with the DISPLAY and FORMAT parameters specified.

**System Action:** The contents of the specified individual IP trace table are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZINIP command.

**INIP0008I INDIVIDUAL IP TRACE TABLE *tracename* IS EMPTY**

**Where:**

*tracename*
The name of the individual Internet Protocol (IP) trace.

**Explanation:** This is the normal response to the ZINIP command with the DISPLAY parameter specified when there are no entries in the individual IP trace table.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZINIP command with the SUMMARY parameter specified to ensure that the specified individual IP trace is not paused.
2. Do one of the following:

- If the specified individual IP trace is not paused, no additional action is necessary.
- If the specified individual IP trace is paused, enter the ZINIP command with the MODIFY and RESUME parameters specified.

See *TPF Operations* for more information about the ZINIP command.

---

**INIP0009I INDIVIDUAL IP TRACE** *tracename* **RESET**

**Where:**

*tracename*
The name of the individual Internet Protocol (IP) trace that is being reset.

**Explanation:** This is the normal response to the ZINIP command with the RESET parameter specified.

**System Action:** The specified individual IP trace table is initialized.

**User Response:** None.

See *TPF Operations* for more information about the ZINIP command.

---

**INIP0010I INDIVIDUAL IP TRACE DEFINITION RECORD RELOADED FROM FILE**

**Explanation:** During TPF system restart, the individual Internet Protocol (IP) trace definition record is reloaded from file.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about individual IP trace support.

---

**INIP0011I INDIVIDUAL IP TRACE DEFINITION RECORD HAS BEEN INITIALIZED**

**Explanation:** During TPF system restart, the individual Internet Protocol (IP) trace definition record is initialized.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about individual IP trace support.

---

**INIP0020E FORMAT OF THE ZINIP COMMAND IS NOT VALID**

**Explanation:** The ZINIP command was entered, but the combination of parameters specified is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZINIP command again and specify a valid combination of parameters.

See *TPF Operations* for more information about the ZINIP command.

---

**INIP0021E REJECTED, SYSTEM IS IN RESTART**

**Explanation:** The ZINIP command was entered, but the TPF system is in restart mode.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the TPF system to reach 1052 state.
2. Enter the ZINIP command again.

See *TPF Operations* for more information about the ZINIP command.

---

**INIP0022E REJECTED, INDIVIDUAL IP TRACE SUPPORT IS NOT DEFINED**

**Explanation:** The ZINIP command was entered, but individual Internet Protocol (IP) trace support is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the individual IP trace table support parameters in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system.
5. Enter the ZINIP command again.

See *TPF Operations* for more information about the ZINIP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for individual IP trace support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**INIP0023E REJECTED, REMOTE IP ADDRESS SPECIFIED IS NOT VALID**

**Explanation:** The ZINIP command was entered with the DEFINE and RIP parameters specified, but the specified remote Internet Protocol (IP) address is not in a valid format or is one of the following reserved IP addresses:

- 0.0.0.0
- 255.255.255.255
- 127.0.0.0

**System Action:** The command is rejected.

**User Response:** Enter the ZINIP command again with the DEFINE parameter specified, and specify a valid value for the RIP parameter.

See *TPF Operations* for more information about the ZINIP command.

---

**INIP0024E REJECTED, VALUE OF THE PORT PARAMETER IS NOT VALID**

**Explanation:** The ZINIP command was entered with the DEFINE and PORT parameters specified, but the value specified for the PORT parameter is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZINIP command again with DEFINE parameter specified, and specify a valid value for the PORT parameter.

See *TPF Operations* for more information about the ZINIP command.

---

**INIP0025E REJECTED, VALUE OF THE SIZE PARAMETER IS NOT VALID**

**Explanation:** The ZINIP command was entered with the DEFINE or MODIFY parameters specified, but the value specified for the SIZE parameter is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZINIP command again with DEFINE or MODIFY parameter specified, and specify a valid value for the SIZE parameter.

See *TPF Operations* for more information about the ZINIP command.

---

**INIP0026E REJECTED, INDIVIDUAL IP TRACE *tracename* ALREADY EXISTS**

**Where:**

*tracename*
The name of the individual Internet Protocol (IP) trace.

**Explanation:** The ZINIP command was entered with the DEFINE parameter specified, but the specified individual IP trace name is already defined.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct individual IP trace name for the ZINIP command with the DEFINE parameter specified, no additional action is necessary.
- If you specified an incorrect individual IP trace name for the ZINIP command with the DEFINE parameter specified, enter the command again and specify the correct individual IP trace name.

See *TPF Operations* for more information about the ZINIP command.

---

**INIP0027E REJECTED, INDIVIDUAL IP TRACE *tracename* DOES NOT EXIST**

**Where:**

*tracename*
The name of the individual Internet Protocol (IP) trace.

**Explanation:** The ZINIP command was entered with the DELETE, DISPLAY, MODIFY, or RESET parameter specified, but the specified individual IP trace name is not defined.

**System Action:** The command is rejected.

**User Response:** Enter the ZINIP command again and specify an individual IP trace name that is defined.

See *TPF Operations* for more information about the ZINIP command.

---

**INIP0028E REJECTED, MAXIMUM NUMBER OF INDIVIDUAL IP TRACES ALREADY DEFINED**

**Explanation:** The ZINIP command was entered with the DEFINE parameter specified, but the maximum number of individual Internet Protocol (IP) traces has already been defined.

**System Action:** The command is rejected.

**User Response:** Follow Step 1 or Step 2.

Step 1: Do the following:

1. Enter the ZINIP command with the SUMMARY parameter specified and examine all the individual IP traces defined.
2. Enter the ZINIP command with the DELETE parameter specified to delete any individual IP traces that are not needed.
3. Enter the ZINIP command again with the DEFINE parameter specified.

Step 2: Do the following:

1. Increase the value of the IPTRCNUM parameter in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system.
5. Enter the ZINIP command again.

See *TPF Operations* for more information about the ZINIP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for individual IP trace support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**INIP0029E MALOC ERROR, CANNOT DISPLAY INDIVIDUAL IP TRACE TABLE**

**Explanation:** The ZINIP command was entered with the DISPLAY parameter specified, but there is not enough storage in the TPF system to display the individual Internet Protocol (IP) trace table.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine why there is not enough storage in the TPF system.
2. Correct the problem.
3. Enter the ZINIP command again with the DISPLAY parameter specified.

See *TPF Operations* for more information about the ZINIP command. See *TPF General Macros* for more information about MALOC macro usage and storage.

---

**IPDB0001I NETWORK SERVICES DATABASE REFRESHED**

**Explanation:** This is the normal response to the ZIPDB command with the REFRESH parameter specified.

**System Action:** The TCP/IP network services database is refreshed to core storage.

**User Response:** None.

See *TPF Operations* for more information about the ZIPDB command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP network services database support.

**IPDB0010E REJECTED, SYSTEM IS IN RESTART**

**Explanation:** The ZIPDB command was entered, but the TPF system is in restart mode.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the TPF system to reach 1052 state.
2. Enter the ZIPDB command again.

See *TPF Operations* for more information about the ZIPDB command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP network services database support.

**IPDB0011E REJECTED, TCP/IP NATIVE STACK SUPPORT NOT DEFINED**

**Explanation:** The ZIPDB command was entered, but TCP/IP native stack support is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the TCP/IP native stack support parameters in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system.
5. Enter the ZIPDB command again.

See *TPF Operations* for more information about the ZIPDB command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for TCP/IP native stack support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

**IPDB0012E REJECTED, FILE /etc/services DOES NOT EXIST**

**Explanation:** The ZIPDB command was entered with the REFRESH parameter specified, but the `/etc/services` file does not exist.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Create the `/etc/services` file on the TPF file system.
2. Enter the ZIPDB command again with the REFRESH parameter specified.

See *TPF Operations* for more information about the ZIPDB command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP network services database support and the `/etc/services` file.

**IPDB0013E ERROR OPENING FILE /etc/services, ERRNO** *description*

**Where:**

*description*
The `errno` function value.

**Explanation:** The ZIPDB command was entered with the REFRESH parameter specified, but an error occurred when opening the `/etc/services` file.

**System Action:** The command is rejected.

**User Response:** Look in `errno.h` to see a description of the error and do one of the following:

- If the error indicates a file access permission error, enter **ZFILE ls -l /etc/services** to display the current file access permission settings and do one of the following:
  - If the file has read permission set, see your system programmer.
  - If the file does not have read permission set, enter the ZFILE chmod command to set the read permission for the `/etc/services` file.
- If the error indicates something other than a file access permission error, see your system programmer.

See *TPF Operations* for more information about the ZIPDB, ZFILE ls, and ZFILE chmod commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP network services database support.

**IPDB0014E TOO MANY APPLICATIONS DEFINED IN FILE /etc/services**

**Explanation:** The ZIPDB command was entered with the REFRESH parameter specified, but there are too many applications defined in the `/etc/services` file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the `/etc/services` file again with a valid number of rules defined.
2. Enter the ZIPDB command again with the REFRESH parameter specified.

See *TPF Operations* for more information about the ZIPDB command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP network services database support.

**IPDB0015E ERROR ON LINE NUMBER** *num* **IN FILE /etc/services**

**Where:**

*num*
The line number in the /etc/services file that contains the error.

**Explanation:** The ZIPDB command was entered with the REFRESH parameter specified, but there was a syntax error in one of the defined applications in the /etc/services file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Correct the error in the /etc/services file.
2. Enter the ZIPDB command again with the REFRESH parameter specified.

See *TPF Operations* for more information about the ZIPDB command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP network services database support.

---

**IPDB0016E DUPLICATE APPLICATION NAMES FOUND IN FILE /etc/services ON LINE NUMBER** *num*

**Where:**

*num*
The line number in the /etc/services file that contains the error.

**Explanation:** The ZIPDB command was entered with the REFRESH parameter specified, but a duplicate application name was found on the specified line number in the /etc/services file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Remove the duplicate application entry in the /etc/services file.
2. Enter the ZIPDB command again with the REFRESH parameter specified.

See *TPF Operations* for more information about the ZIPDB command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP network services database support.

---

**IPDB0017E DUPLICATE PORT AND PROTOCOL FOUND IN FILE /etc/services ON LINE NUMBER** *num*

**Where:**

*num*
The line number in the /etc/services file that contains the error.

**Explanation:** The ZIPDB command was entered with the REFRESH parameter specified, but a duplicate port and protocol were found on the specified line number in the /etc/services file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Remove the duplicate application entry in the /etc/services file.
2. Enter the ZIPDB command again with the REFRESH parameter specified.

See *TPF Operations* for more information about the ZIPDB command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TCP/IP network services database support.

# IPLA–IPLB

---

**IPLA0005W NO 328X PRINTER IS OPERATIONAL — RESTART CONTINUES**

**Explanation:** In a TPF system generated with 3270 native console support, IPLA found all printers specified as eligible for the system receive only (RO) (see the ROCRS parameter on the SIP CRASTB macro) to be non-operational.

**System Action:** The system RO is marked as not valid in the line status table. All message issued during restart are sent to the system prime computer room agent set (PRC) and are not duplicated to the system RO.

**User Response:** When the TPF system reaches 1052 state, enter the ZACRS command to assign a system RO. Also, you may want to check the hardware configuration.

See *TPF Operations* for more information about the ZACRS command. See *TPF Main Supervisor Reference* for more information.

---

**IPLA0050E VOLUME** *vol* **ON** *ccud* **–** *cccchhhhrr* **– ID** *xxxx* **FOUND IN** *location*

**Where:**

*vol* The volume serial number (VSN) or UNKNOWN.

*ccud*
The failing device address.

*cccchhhhrr*
The cylinder, head, record address.

*xxxx*
The record ID (in hexadecimal representation) in error.

*location*
One of the following:

**ICR**
Image Control Record

**CTK***x*
X, I, or B

**IPLB**

**KPTR**
Keypoint pointer record

**Explanation:** This message tries to identify the reason for the DASD read error or record ID check failure.

**System Action:** If the location is not KPTR, the IPL procedure is ended with a storage dump. If KPTR is specified as the location, see message IPLA0055W for information about the action taken by the TPF system.

**User Response:** Do one of the following:

- If the location is not KPTR, have your system programmer determine the cause of the error and correct it.
- If the location is KPTR, see message IPLA0055W, which accompanies this message, for the corrective action.

See *TPF Main Supervisor Reference* for more information about this error.

---

**IPLA0051T PROGRAM CHECK IN IPLA**

**Explanation:** Whenever the dump routine of the IPL program is called, the OLD PSW program is examined to determine whether a program check occurred. If so, this message and a dump is is sent to the console and the printer.

**System Action:** The IPL is ended. When the dump routine of the IPL program is entered, this message is sent if a program check was cause of the dump routine being entered.

**User Response:** Do the following:

1. Have your system programmer review the system error dump.
2. Take the necessary corrective action to correct the problem.
3. IPL the TPF system again.

See *TPF Main Supervisor Reference* for more information.

---

**IPLA0052E DEV *ccud*: START I/O FAILURE,CC=*c* DEV *ccud*: I/O ERROR**

**Where:**

*ccud*
The device unit address.

*c* 2 or 3

**Explanation:** An input/output (I/O) error is when a condition code 1 is obtained or the interrupt contained an an error condition, in which case the subchannel status word (CSW) is appended by the IPLA0053E message.

The IPL program detected an error at SIO initiation time or the IPL program detected an error at the I/O interrupt time. The I/O error indicates that the condition code is 1.

**System Action:** The IPLA0053E and IPLA00503 messages may accompany the IPLA0052E message.

The IPL procedure is ended with a storage dump.

**User Response:** See your system programmer or your IBM service representative to determine the cause of the problem and to correct it. The IPLA0053E and IPLA0050E messages should be logged for them. In addition, the IPLA0050E, IPLA0052E, and IPLA0053E messages should be reviewed.

See *TPF Main Supervisor Reference* for more information.

---

**IPLA0053E ORIGINAL DEV/SUBCH STATUS *xxyy***

**Where:**

*xx* The device status.

*yy* The subchannel status.

**Explanation:** This message does one of the following:

- Reports SENSE information for an error reported by the IPLA0052E message or an input/output (I/O) error (condition code 1).
- Retries for the case when a control or device busy were done; the busy condition is considered as persistent.

**System Action:** The IPLA0050E message may accompany this message. The IPL procedure is ended with a storage dump.

**User Response:** See your system programmer or your IBM service representative to determine the cause of the problem and to correct it.

The SENSE data, if presented, indicates the reason for the unit error.

SENSE DATA NOT AVAILABLE

SENSE DATA *ssssssss...ssssssss*

**Where:**

*ssssssss...ssssssss*
The 24 byte sense data.

CU/DEV BUSY PERSISTENT

See *TPF Main Supervisor Reference* for more information.

---

**IPLA0055W ERROR READING KEYPOINT POINTER RECORD PSEUDO KEYPOINT POINTER RECORD USED**

**Explanation:** On the initial TPF system IPL, keypoint pointer record #KEYPT does not exist in record ordinal 0 for the basic subsystem (BSS). A pseudo record is built in code for use by IPL. This should only occur on the first TPF system IPL. At any other time, the keypoint pointer record has been corrupted.

**System Action:** The TPF system IPL continues. A permanent keypoint pointer record is built during system restart and message CVZ60001A is displayed.

**User Response:** Do one of the following:

- If this is the first TPF system IPL, no action on your part is required.
- If this is not the first TPF system IPL, determine the cause of the corruption and correct the keypoint pointer record, or allow the keypoint pointer record that was built during system restart to replace the corrupted record.

  Message CVZ60001A identifies your options when the permanent or corrected keypoint pointer record is built by system restart.

---

**IPLA0056T UNABLE TO MAP KEYPOINT ORDINAL *nn,nnn***

**Where:**

*nn,nnn*
The decimal ordinal that could not be mapped.

**Explanation:** A keypoint ordinal found in the CTKX record could not be mapped to a FACE ordinal. The keypoint ordinal was zero, a negative value, or a value greater than the range mapped by the keypoint pointer record. The most likely cause is one of the following:

- The keypoint ordinals in the CTKX record are corrupted.

- The keypoint pointer record is corrupted.
- The processor being IPLed used keypoints that were part of the expanded keypoint set in a new FACE table (FCTB).

**System Action:** The TPF system IPL ends with a storage dump.

**User Response:** Do the following:

1. If the ordinal displayed is zero or a negative value, examine CTKX and correct the error.
2. If the ordinal is positive, examine CTKX:
   a. If CTKX is in error, correct the error.
   b. If CTKX is correct, make sure that the first processor that is IPLed has its keypoints in previously existing areas of the #KEYPT definition; also make sure that the ZKPTR command with the REPLACE parameter specified was entered in response to message CVZ60002A during system restart so that the keypoint record is updated.
3. IPL the TPF system.

See message CVZ60002A for options when the permanent or corrected keypoint pointer record is built by system restart. See *TPF Operations* for more information about the ZKPTR command.

---

**IPLB0001A SPECIFY SYSTEM PARAMETER (F B U VOL N)**

**Explanation:** The TPF IPL program is requested multiple database function (MDBF) IPL types.

**System Action:** The IPL program follows your specification.

**User Response:** Use one of the following responses:

**F** To initiate a FAST IPL. The IPL volume serial number (VSN) must match the VSN saved in keypoint M (CTKM) by the previous IPL. In other words, if the prime module was IPLed last time and it is still online, you can only use the F option when IPLing the prime module.

If you try using the F option to IPL the duplicate module, you will receive the IPLB0058E message.

If you must IPL a different VSN, use the U option and specify the multiple database function (MDBF) subsystems manually.

Use this option only after the MDBF configuration keypoint record (CTKM) was initialized by the IPLB and restart program. Therefore, the first time the TPF system is IPLed or when a fresh copy of CTKM is loaded, this option is rejected with an IPLB0077E message.

**Note:** Do not specify F on a loader general file at IPL because it will cause ACPL to abort.

**B** To include only the basic subsystem (BSS).

**U** To define multiple subsystems.

**VOL** The first two characters (they must be alphabetic) of the BSS volume label. Volume labels will be requested for all subsystems. The first two characters of all volume labels in a subsystem or BSS must be the same.

**N** Fallback extent index, a decimal number greater than or equal to one and less than or equal to the maximum extent number.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0002I THE SYSTEM ID IS *enterprise.complex id* ON PROCESSOR *num* MODEL *mod* LOW CPU ADDRESS *addr***

**Where:**

*enterprise*
The name of your operations center or enterprise.

*complex*
The name of your loosely coupled complex or stand-alone TPF processor.

*id* The TPF CPU identifier.

*num*
The two-character version code with the six-character CPU serial number.

*mod*
The CPU model number, for example, 3090.

*addr*
The lowest CPU address of the processor or processor partition on which the TPF system is running.

**Explanation:** This informational message displays the system ID, which consists of the:
- Enterprise name
- CPU ID
- CPU serial number
- Model Number
- Low CPU address.

**System Action:** The TPF system IPL is continued.

**User Response:** None.

---

**IPLB0003T UNABLE TO READ FALLBACK EXTENT KEYPOINT POINTER RECORD IPL TERMINATED**

**Explanation:** While trying to IPL the TPF system using keypoints from a fallback extent, an error occurred while reading the keypoint pointer record for the fallback extent.

**System Action:** The TPF system IPL ends with a storage dump.

**User Response:** Do the following:

1. Make sure the correct fallback extent was requested and that it has had the system keypoints copied to it.
2. Review the previous IPLB error messages to determine the cause of the read error.
3. If the problem can be corrected, correct the error and re-IPL the TPF system using keypoints from the original fallback extent.
4. If the problem cannot be corrected, IPL the TPF system using a different fallback extent, another module that can be IPLed, the duplicate of the prime system module, or the prime system module without using a fallback extent.

See *TPF Main Supervisor Reference* for more information about IPLing the TPF system.

---

**IPLB0004A SPECIFY SS TO BE INCLUDED (CCUD/VOL E C T)**

**Explanation:** The IPL program is requesting that you specify the next system action.

**System Action:** Depending on your specification, the IPL program includes a subsystem, cancels a subsystem, ends the IPL operation, or completes the multiple database function (MDBF) definition.

**User Response:** Use one of the following responses:

| | |
|---|---|
| **CCUD** | To include another subsystem. CCUD is a three-to-four character hexadecimal subsystem IPL device unit address. CCUD must be the first parameter followed by a slash when other options are supplied. |
| **E** | To end MDBF definition and continue IPL processing. This cannot be used with CCUD. |
| **C** | To cancel a subsystem that was defined previously. |
| **CCUD/C** | To cancel a subsystem that is specified by CCUD. |
| **CCUD/VOL** | To specify the volume checking option for the subsystem. VOL must be the first two label characters in the subsystem volume label. |
| **T** | To end IPL processing with a dump. This cannot be used with CCUD. |

Examples:

| | |
|---|---|
| **03E0** | This response includes a subsystem whose IPL device is 03E0. |
| **03E0/MA** | This response includes a subsystem whose IPL device is 03E0 and applies volume label checking.<br><br>This example indicates that the first two characters of the volume label are MA, which do not match those defined in the volume label keypoint record V (CTKV). |
| **C** | This response cancels a subsystem that was included just before this message. |
| **04C1/C** | This response cancels a subsystem that was included prior to the last definition.<br><br>This example indicates that a subsystem whose IPL device unit address is 04C1 is to be canceled and removed from the MDBF configuration. |
| **E** | This response ends the MDBF definition. |
| **T** | This response ends the IPL. |

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0005A TOD CLOCK IS NOT RUNNING, OPERATOR MUST PRESS TOD 'ENABLE SET KEY'**

**Explanation:** On certain CPU models, the CPU time will not decrement if the time-of-day (TOD) clock is running. The TPF system is trying to set the TOD clock during IPL to ensure that the CPU timer is operational.

**System Action:** IPLB sets an arbitrary value now to get the clock running. Clock restart prompts you for the correct time later in the cycle-up process.

**User Response:** Press the TOD Enable Set key to start the TOD clock.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0006T TOD CLOCK IS NOT OPERATIONAL, IPL TERMINATED**

**Explanation:** An attempt to issue a Set Clock instruction indicates that the time-of-day (TOD) clock is in the Not Operational state.

**System Action:** The IPL is ended with a disabled wait PSW.

**User Response:** See your IBM service representative to determine the cause of the TOD clock failure.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0007I IPL STARTED ON DEV *ccud* VOL *vol***

**Where:**

*ccud*
The device unit address.

*vol* The volume label.

**Explanation:** This message informs a subsystem (including a basic subsystem (BSS)) that IPL has started at the device indicated in the message with the volume label referenced in the message.

**System Action:** The TPF IPL program uses the device as the source of the subsystem keypoint records.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0008T UNABLE TO MAP KEYPOINT ORDINAL *nn,nnn* - IPL TERMINATED**

**Where:**

*nn,nnn*
The decimal ordinal that could not be mapped.

**Explanation:** A keypoint ordinal that was found in the CTKX record could not be mapped to a FACE ordinal because the keypoint ordinal was zero, a negative value, or a value greater than the range mapped by the keypoint pointer record. The most likely cause is one of the following:

- The keypoint ordinals in the CTKX record are corrupted.
- The keypoint pointer record is corrupted.
- The processor being IPLed used keypoints that were part of the expanded keypoint set in a new FACE table (FCTB).

**System Action:** The TPF system IPL ends with a storage dump.

**User Response:** Do the following:

1. If the ordinal displayed is zero or a negative value, examine and correct CTKX.
2. If the ordinal is positive, examine CTKX:
   a. If CTKX is in error, correct the error.
   b. If CTKX is correct, make sure that the first processor IPLed has its keypoints in previously existing areas of the #KEYPT definition; also make sure that the ZKPTR command with the REPLACE parameter specified was entered in response to message CVZ60002A during system restart so that the keypoint record is updated.
3. IPL the TPF system.

See message CVZ60002A for options when the permanent or corrected keypoint pointer record is built by system restart. See *TPF Operations* for more information about the ZKPTR command.

---

**IPLB0009T UNABLE TO MAP BSS KEYPOINT ORDINAL *nn,nnn* - IPL TERMINATED**

**Where:**

*nn,nnn*
The decimal ordinal that could not be mapped.

**Explanation:** A keypoint ordinal that was found in the CTKX record could not be mapped to a FACE ordinal because the keypoint ordinal was either zero, a negative value, or a value greater than the range mapped by the keypoint pointer record. The most likely cause is one of the following:

- The keypoint ordinals in the CTKX record are corrupted.
- The keypoint pointer record is corrupted.
- The processor being IPLed used keypoints that were part of the expanded keypoint set in a new FACE table (FCTB).

**System Action:** The TPF system IPL ends with a storage dump.

**User Response:** Do the following:

1. If the ordinal displayed is zero or a negative value, examine and correct CTKX.
2. If the ordinal is positive, examine CTKX:
   a. If CTKX is in error, correct the error.
   b. If CTKX is correct, make sure that the first processor IPLed has its keypoints in previously existing areas of the #KEYPT definition; also make sure that the ZKPTR command with the REPLACE parameter specified was entered in response to message CVZ60002A during system restart so that the keypoint record is updated.
3. IPL the TPF system.

See message CVZ60002A for options when the permanent or corrected keypoint pointer record is built by system restart. See *TPF Operations* for more information about the ZKPTR command.

---

**IPLB0010I SUBSYSTEM CANCEL ACCEPTED**

**Explanation:** A request to cancel a subsystem was preformed successfully.

**System Action:** The subsystem is removed from the multiple database function (MDBF) configuration.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0011E VFA IS BEING REINITIALIZED DUE TO STORAGE CONFIGURATION CHANGE**

**Explanation:** IPLB marked virtual file access (VFA) for reinitialization for one of the following reasons:

- The size of main memory was reduced, causing VFA to overlap CIO working storage.
- VFA memory was cleared or otherwise corrupted.

**System Action:** VFA is reinitialized and any data is lost.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0013E UNABLE TO MAP SS KEYPOINT ORDINAL *nn,nnn* - SS PURGED**

**Where:**

*nn,nnn*
The decimal ordinal that could not be mapped.

**Explanation:** A keypoint ordinal that was found in the CTKX record could not be mapped to a FACE ordinal because the keypoint ordinal was either zero, a negative value, or a value greater than the range mapped by the keypoint pointer record. The most likely cause is one of the following:

- The keypoint ordinals in the CTKX record are corrupted.
- The keypoint pointer record is corrupted.
- The processor being IPLed used keypoints that were part of the expanded keypoint set in a new FACE table (FCTB).

**System Action:** The subsystem is not included in the multiple database function (MDBF) configuration.

For a TPF system IPL that you initiated, the next definition is initiated with message IPLB0004A or message IPLB0009T.

For the software-initiated TPF system IPL, the next subsystem is obtained from the MDBF configuration keypoint record.

**User Response:** Do the following:

1. If the ordinal displayed is zero or a negative value, examine and correct CTKX.
2. If the ordinal is positive, examine CTKX:
   a. If CTKX is in error, correct the error.
   b. If CTKX is correct, make sure that the first processor IPLed has its keypoints in previously existing areas of the #KEYPT definition; also make sure that the ZKPTR command with the REPLACE parameter specified was entered in response to message CVZ60002A during system restart so that the keypoint record is updated.
3. IPL the TPF system.

See message CVZ60002A for options when the permanent or corrected keypoint pointer record is built by system restart. See *TPF Operations* for more information about the ZKPTR command.

---

**IPLB0014W DUPLICATE VSN *vvvvvv* FOUND ON DASD CCUD *ccud***

**Where:**

*vvvvvv*
The volume serial number (VSN).

*ccud*
The device unit address.

**Explanation:** The IPL disk roll call detected two or more devices with the same volume serial number (VSN). This message is issued once for each duplicate volume.

**System Action:** This message is always followed by the IPLB0015A message.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0015A SPECIFY CCUD OR NONE FOR VSN *vvvvvv***

**Where:**

*vvvvvv*
The volume serial number (VSN).

**Explanation:** This message is always preceded by two or more IPLB0014W messages. This message allows you to select which of the duplicate volumes the IPL will use.

**System Action:** The IPL waits for a reply.

**User Response:** Do one of the following:

- Reply with the 3 or 4 character address of the volume that you want the IPL to use from the preceding IPLB0014W messages.
- Reply with NONE if you do not want to use any of them.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0016I DASD *ccud* WILL BE USED FOR VSN *vvvvvv***

**Where:**

*ccud*
The device unit address.

*vvvvvv*
The volume serial number (VSN).

**Explanation:** This is the normal response to the IPLB0015A message.

**System Action:** The IPL proceeds by using the specified volume. The duplicate volumes is ignored.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0017E IPL VOLUME DUPLICATED, ENTER *ccud* OR RE-IPL TO CHANGE VOLUME**

**Where:**

*ccud*
The initial program load (IPL) device unit address.

**Explanation:** This message follows the IPLB0015A message when the IPL volume is duplicated. Only the IPL volume device address indicated in the message is accepted in this case. You must IPL the TPF system again to switch to one of the other duplicate IPL volumes.

**System Action:** The TPF system issues another IPLB0015A message and waits for a reply.

**User Response:** Do one of the following:

- Reply to the subsequent IPLB0015A message with the volume address indicated in the message.
- IPL the TPF system again to use one of the duplicate IPL volumes.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0017T DEVICE *device*, SUBSYSTEM ID *ssid* INVALID**

**Where:**

*device*
The device address.

*ssid* The subsystem ID.

**Explanation:** IPLB (IB04) detected a subsystem ID that is less than 1 or greater than 255.

**System Action:** None.

**User Response:** Assign a valid subsystem number that ranges from 1 to 255.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0018W ERROR READING KEYPOINT POINTER RECORD PSEUDO KEYPOINT POINTER RECORD USED**

**Explanation:** On the initial TPF system IPL, no #KEYPT keypoint pointer record exists in ordinal 0 of the subsystem being processed. A pseudo record is built in code for use by IPLB. This should only occur on the first system IPL. At any other time, the keypoint pointer record has been corrupted.

**System Action:** The TPF system IPL continues. A permanent keypoint pointer record will be built during system restart.

**User Response:** Do one of the following:

- If this is the first TPF system IPL, no action on your part is required.
- If this is not the first TPF system IPL, review the previous IPLB error messages to determine the cause of the problem and correct the keypoint pointer record, or allow the keypoint pointer record that was built during system restart to replace the corrupted record.

  Message CVZ60001A identifies your options when the permanent or corrected keypoint pointer record is built by system restart.

**IPLB0020I CONFIGURATION NOT SAME AS CTKM**

**Explanation:** During this software (FAST) IPL, the TPF system configuration is not the same as that reported in CTKM (for the previous IPL).

**System Action:** The IPLB0027A message is issued. This message prompts you to continue, end, or IPL the TPF system again.

**User Response:** Do the following:

1. Review the subsystem configuration report and verify that this configuration is keypointable.
2. Determine why a subsystem was purged during this IPL.

See *TPF Main Supervisor Reference* for more information.

**IPLB0021A VFA ACTIVE SPECIFY SYSTEM PARAMETER (F OR B)**

**Explanation:** When virtual file access (VFA) is active in the TPF system, the system must be IPLed with the same configuration as it had on the previous IPL (F) or IPLed as a basic subsystem (BSS) only configuration (B). This is to avoid corruption of the VFA area.

**System Action:** IPL program follows your specification.

**User Response:** Use one of the following responses:

**F** To initiate a FAST IPL. The IPL volume serial number (VSN) must match the VSN saved in keypoint M (CTKM) by a previous IPL. In other words, if the prime module was IPLed last time and it is still online, you can only use the F option when IPLing the prime module.

If you try using the F option to IPL the duplicate module, you will receive the IPLB0058E message.

If you must IPL a different VSN, do the following:

1. Perform an IPL by using the CLEAR option (hardware). The IPLB0001A message displays.
2. Select the U option to include the multiple database function (MDBF) subsystems.

**B** To include only the basic subsystem (BSS).

**Note:** If you perform a hard IPL with the CLEAR option, you will be able to specify the subsystems again (F, B, U, VOL, and N). When virtual file access (VFA) is active, the TPF system only prompts for the F or B options (for the same configuration or BSS only) to preserve the integrity of VFA. To include additional subsystems, memory must be cleared to force a rebuild of VFA.

See *TPF Main Supervisor Reference* for more information.

**IPLB0022A WARNING MSG HAS BEEN SENT FOR THE FOLLOWING SUBSYSTEMS — *addr* — SPECIFY U TO CONTINUE, T TO TERMINATE OR CCUD TO BE PURGED**

**Where:**

*addr*
The IPL address of the subsystems for which a warning message was sent.

**Explanation:** This message lists the IPL device unit address of all subsystems for which warning messages were sent.

**System Action:** Depends on your response.

**User Response:** Use one of the following responses:

**U** To continue.

**T** To end with a storage dump.

**CCUD** To cancel a subsystem, where CCUD is the subsystem IPL device unit address.

See *TPF Main Supervisor Reference* for more information.

**IPLB0023I SS IPL CCUD: *ccud* VOL *vol,ss* PURGED**

**Where:**

*ccud*
The device unit address.

*vol* The volume label of the subsystem IPL device.

*ss* The two character online module volume label.

**Explanation:** A subsystem was internally purged from the multiple database function (MDBF) configuration due to a failure:
- Keypoint record loading
- Disk roll call
- Program loading.

**System Action:** The IPL procedure is continued with the remaining subsystems.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0024I SUBSYSTEM CONFIGURATION REPORT**

**Explanation:** This message reports subsystem configurations by providing the following information:
- Subsystem ordinal number
- Subsystem name
- Number of subsystem users
- IPL device type (online module or general file)
- Online module IPL device unit address
- IPL device volume label
- IPL MDBF option specified.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0025I SUBSYSTEM USER CONFIGURATION REPORT**

**Explanation:** This message reports the multiple database function (MDBF) subsystem user configurations. For each defined subsystem user, an assigned subsystem user ordinal number, the subsystem user name, the parent subsystem name, and the status of the subsystem are reported.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0026T VOLUME *vol* ON *ccud* IS IPL VOLUME: NOT FOUND IN KEYPOINT 0**

**Where:**

*vol* The volume label.

*ccud*
The subsystem IPL device unit address.

**Explanation:** This message indicates the failure of the disk roll call phase to identify the subsystem IPL device.

**System Action:** The IPL procedure is ended with a storage dump.

**User Response:** Do the following:

1. Verify that the correct device is being IPLed.
2. Have your system programmer verify that the IPL device is defined in keypoint 0.

See *TPF Main Supervisor Reference* for more information.

**IPLB0026I VOLUME *vol* ON *ccud* IS IPL VOLUME: SYSTEM PRIME**

**Where:**

*vol* The volume label.

*ccud*
The subsystem IPL device unit address.

**Explanation:** This message indicates the subsystem IPL device status at the disk roll call phase.

**System Action:** IPL processing is continued.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0026I VOLUME *vol* ON *ccud* IS IPL VOLUME: SYSTEM PRIME DUPLICATE**

**Where:**

*vol* The volume label.

*ccud*
The subsystem IPL device unit address.

**Explanation:** This message indicates the subsystem IPL device status at the disk roll call phase.

**System Action:** IPL processing is continued.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0026I VOLUME *vol* ON *ccud* IS IPL VOLUME: NEITHER SYSTEM PRIME NOR DUP**

**Where:**

*vol* The volume label.

*ccud*
The subsystem IPL device unit address.

**Explanation:** This message indicates the subsystem IPL device status at the disk roll call phase.

**System Action:** IPL processing is continued.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0026I VOLUME *vol* ON *ccud* IS IPL VOLUME: LOADER GENERAL FILE**

**Where:**

*vol* The volume label.

*ccud*
The subsystem IPL device unit address.

**Explanation:** This message indicates the subsystem IPL device status at the disk roll call phase.

**System Action:** IPL processing is continued.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0026I VOLUME *vol* ON *ccud* IS IPL VOLUME: NOT FOUND IN KEYPOINT V**

**Where:**

*vol* The volume label.

*ccud*
The subsystem IPL device unit address.

**Explanation:** This message indicates the subsystem IPL device status at the disk roll call phase.

**System Action:** One of the following occurs:

- For the basic subsystem (BSS) only or for a TPF system, the IPLB0027A message is sent and you should verify that the proper pack was IPLed.
- For a subsystem, the subsystem is purged internally with the IPLB0023I message.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0027A SPECIFY U TO CONTINUE, T TO TERMINATE, ... OR RE-IPL**

**Explanation:** This message is issued for one of the following reasons:

- The IPL program suspended the operation at the end of the disk roll call to request that you analyze the disk roll call unusual ending status.
- A discrepancy was detected between the configuration discovered during this IPL and the configuration identified in CTKM.

Also see the IPLB0020I message.

**System Action:** Depends on your response.

**User Response:** Use one of the following responses:

**U** To continue.

**T** To end with a storage dump.

**Re-IPL** If a storage dump is not required.

See *TPF Main Supervisor Reference* for more information.

**IPLB0028T INSUFFICIENT STORAGE FOR DISK ROLL CALL**

**Explanation:** IPL was unable to complete because insufficient storage was available. Since this message occurs early in the IPL process, there is probably a substantial mismatch between the storage required for IPL and the amount of storage available.

**System Action:** A system error is issued to the system printer and then the TPF system goes into a disabled wait state.

**User Response:** Do the following:

1. Save the IPL dump for later problem determination. After saving the dump, you can create more storage for use during IPL.

   IPL cannot use storage that is being used for virtual file access (VFA) buffers and system tables that survive across an IPL. You should retry the IPL by using the hardware console. An IPL from the hardware console throws away tables that have a correct image on DASD, freeing this memory for IPL. No data is lost on a hardware IPL. If the hardware IPL also ends in the IPLB0028T message, then you should retry the hardware. IPL the TPF system by using the CLEAR STORAGE option on the hardware console.

   **Note:** If the CLEAR STORAGE option is used and VFA has delay file pending buffers, then the contents of the buffers is lost.
2. Have your system programmer determine the cause of the error and correct it.

**IPLB0029A RDY A PRINTER FOR DUMP**

**Explanation:** The IPL program requires the system printer to be ready for the dump.

**System Action:** The dump is resumed when the printer ready signal is received.

**User Response:** Make the system printer ready.

See *TPF Main Supervisor Reference* for more information.

**IPLB0030T IPL DUMP ENDED**

**Explanation:** The IPL completed a dumping storage to the system printer.

**System Action:** The TPF system is set to a disabled wait state.

**User Response:** Have your system programmer determine the cause of the error and correct it.

**IPLB0031I IPL PROGRAM CALLING CTIN**

**Explanation:** This message is sent to notify you when the IPL program completes the IPL functions.

**System Action:** System control is given to the nucleus initialization program.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0032I NO 328X PRINTER IS OPERATIONAL — RESTART CONTINUES**

**Explanation:** In a TPF system generated with 3270 native console support, IPLB found all printers specified as eligible for the system receive-only (RO) (see the ROCRS parameter on the SIP CRASTB macro) to be non-operational.

**System Action:** The system RO is marked as not valid in the line status table. All message issued during restart are sent to the system prime computer room agent set (PRC) and are not duplicated to the system RO.

**User Response:** When the TPF system reaches 1052 state, enter the ZACRS command to assign a system RO. In addition, you should check the hardware configuration.

See *TPF Main Supervisor Reference* for more information.

**IPLB0033A READ FAILURE ON SYSTEM CONSOLE — IPL CONTINUING ON THIS DEVICE**

**Explanation:** After sending a message to the system console, which requires a response, IPLB is not able to read data from it successfully.

**System Action:** IPLB forces selection of an alternate console (as specified in the PRCRS parameter on the SIP CRASTB macro) to which it will send the IPLB0033A message. IPL is continued on the new console.

**User Response:** Respond to the original message on the new console and check the hardware configuration to determine the cause of the console failure.

See *TPF Main Supervisor Reference* for more information.

**IPLB0034W DURING LOAD OF CORE IMAGE RESTART AREA, DUPLICATE MODULES WERE USED.**

**Explanation:** Loading of the core image restart area (CIMR) was completed by using the duplicate of the prime modules for a CIMR. An error condition with the prime module copy was detected and the load continued with the duplicate module for this CIMR.

**System Action:** The IPL is completed.

**User Response:** This message is followed by the IPLB0027A message to continue or end the IPL.

The IPLB0086E message was previously displayed to the console stating the error condition, volume number, device and record address. The record that failed should be checked and corrected as necessary.

See *TPF Main Supervisor Reference* for more information.

**IPLB0035T LOGIC ERROR — FIELD INVALID IN I/O WKBLOCK: OPERATION TYPE**

**Explanation:** The IPL program does not recognize a value in the operation type field of an input/output (I/O) block.

**System Action:** The dump routine is invoked by the IPLB and the IPL is ended.

**User Response:** IPL the TPF system again. If you cannot IPL the TPF system, see your system programmer for more information. Save the console and the dump because your

IBM service representative may request this information.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0036A SPECIFY OPTION (C: CANCEL R: REPLACE)**

**Explanation:** This form of the IPLB0036A message is issued after the IPLB0041W message is sent. You must cancel the assignment or override the current assignment.

**System Action:** If C (Cancel) is specified, the IPLB0040A message displays.

If R (Replace) is specified, the TPF CPU ID X is given to the IPLed processor at the end of restart, and the loosely coupled processor status keypoint (CTKI) is updated to reflect the status.

**User Response:** Use one of the following responses:

**C** To cancel and reassign to the TPF CPU ID.

**R** To override the current assignment.

**Note:** The processor being replaced must be manually inoperative.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0036A SPECIFY OPTION (C: CANCEL B: BYPASS)**

**Explanation:** This form of the IPLB0036A message is issued after the IPLB0042W message is sent. You must cancel the assignment or override the current assignment.

**System Action:** If C (Cancel) is specified, the IPLB0040A message displays.

If B (Bypass) is specified, the TPF CPU ID X is given to the IPLed processor at the end of restart, and the loosely coupled processor status keypoint (CTKI) is updated to reflect the status.

**User Response:** Use one of the following responses:

**C** To cancel and reassign to TPF CPU id.

**B** To override the current assignment.

**Note:** The processor being bypassed must be manually inoperative.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0038I KEYPOINT INDICATES THIS IS NOT THE FIRST PROCESSOR TO BE IPLED IN A L/C COMPLEX.**

**Explanation:** Keypoint I indicates there is another processor active in the loosely coupled complex. This message is always accompanied by the IPLB0147A message. See the IPLB0147A message for a further explanation of this message.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0039I THE IPL BYPASS FUNCTION HAS BEEN INVOKED. THIS WILL DESTROY THE L/C COMPLEX.**

**Explanation:** You replied with a D to the IPLB0147A message. This message is always accompanied by the IPLB0048A message. Refer to the IPLB0048A message for a further explanation of this message.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0040A SPECIFY TPF CPU ID**

**Explanation:** The TPF IPL program requested that you assign a CPU ID to the IPLed processor to couple into the loosely coupled complex.

**System Action:** Based on the processor status and the specified TPF CPU ID, one of the following messages displays:
- IPLB0041A
- IPLB0042A
- IPLB0043I
- IPLB0045I
- IPLB0046I
- IPLB0044I
- IPLB0076E.

**User Response:** Refer to each message section for I, E type messages.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0041W TPF CPU ID *x* ACTIVE ON PROCESSOR *serial***

**Where:**

*x* A TPF CPU ID.

*serial*
The CPU machine serial number.

**Explanation:** The IPL program determined that the TPF CPU ID referenced in the message was assigned to an active loosely coupled processor whose CPU machine serial number is as indicated in this message.

**System Action:** A message displays prompting you to:
- Reassign another TPF CPU ID
- Override the current assignment.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0042W TPF CPU ID *x* RESERVED BY PROCESSOR *serial* SPECIFY OPTION (C: CANCEL B: BYPASS)**

**Where:**

*x* A TPF CPU ID.

*serial*
A CPU machine serial number.

**Explanation:** The TPF CPU ID referenced in the message was assigned to a loosely coupled inactive processor whose

machine serial number is as referenced in this message.

**System Action:** A message displays prompting you to cancel or override the current assignment.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0043I TPF CPU ID *x* ERRONEOUSLY ACTIVE: ASSIGNED TO — *serial***

**Where:**

*x* A TPF CPU ID.

*serial*
A CPU machine serial number.

**Explanation:** The IPL program detected a condition that the loosely coupled processor status keypoint record (CTKI) contains a processor status entry that is not valid for the TPF CPU ID referenced in the message. There is no physical processor coupled to the ID, however, the active indicator is on erroneously.

**System Action:** The condition is cleared by the IPL program and the specified TPF CPU ID is assigned to the IPLed processor. The new status is reflected in the CTKI at restart time.

**User Response:** Have your system programmer check the processor DEACTIVATION procedure when the CPU with the machine serial number referenced in the message was removed from the loosely coupled complex. From another active loosely coupled processor, the current TPF CPU ID assignments must be verified.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0044I TPF CPU ID *x* COUPLING PROCEEDING ON PROCESSOR *serial* MODEL *model* CPA *cpa***

**Where:**

*x* A TPF CPU ID.

*serial*
A CPU machine serial number.

*model*
A four character CPU model number.

*cpa* The CPU address (for example CPU A in a loosely coupled complex).

**Explanation:** When the IPL program continues the processing, this message displays indicating the TPF system coupling intention. The final decision is made during the restart phase. If coupled successfully, the TPF CPU ID referenced in the message is coupled to the IPLed CPU (the machine serial number and the CPU model referenced in the message).

**System Action:** IPL processing is continued.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0045I CPU ID *x* OPERATION TO BE CONTINUED ON PROCESSOR *serial* MODEL—*model***

**Where:**

*x* A TPF CPU ID

*serial*
A CPU machine serial number.

*model*
A four character CPU model number.

**Explanation:** The IPLed CPU was coupled to the loosely coupled complex. The same TPF CPU ID is assigned automatically to the IPLed CPU (the machine serial number referenced and the CPU model referenced in the message). The loosely coupled processor status keypoint record read by the IPL program indicates that this CPU machine serial number is coupled to the TPF CPU ID referenced in this message in the record.

**System Action:** Normal coupling is continued with the IPLB0044I message.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0046I TPF CPU ID *x* OPERATION TO BE RESUMED ON PROCESSOR *serial* MODEL *model***

**Where:**

*x* A TPF CPU ID.

*serial*
A CPU machine serial number.

*model*
A four character CPU model number.

**Explanation:** The IPLed CPU with the machine serial number and CPU model referenced in this message is to be reactivated with a TPF CPU ID referenced in this message. The CPU was deactivated and removed from the loosely coupled complex previously but the TPF CPU ID was reserved for this processor.

**System Action:** Normal coupling is continued with the IPLB0044I message.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0048A SPECIFY THE WORD BYPASS TO CONTINUE OR T TO TERMINATE**

**Explanation:** You replied D to the IPLB0147A message. This message double checks the accuracy of that reply. It ensures that you are aware that the loosely coupled complex will be destroyed.

**System Action:** IPL program follows your specification.

**User Response:** Use one of the following responses:

**BYPASS** To continue destruction IPL.

**T** To end the IPL.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0049T UNABLE TO READ KEYPOINT I**

**Explanation:** The TPF IPL program failed to read the loosely coupled processor status keypoint record (CTKI).

**System Action:** IPL processing is ended with a storage dump.

**User Response:** Review the previous IPLB error messages, which indicate the type of errors.

If this is a software error, do the following:

1. Load keypoint I again with the correct record ID (CK).
2. IPL the TPF system again.

See your system programmer or IBM service representative if this message is accompanied by the IPLBB004E message.

The pack may be remounted at another device or the basic subsystem (BSS) IPL device selected again. In this case, you must IPL the TPF system again.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0050T UNABLE TO READ BSS VOL**

**Explanation:** A hardware error was detected when the IPL program read the basic subsystem (BSS) IPL device volume label.

**System Action:** IPL is ended with a storage dump.

**User Response:** Review the previous IPLB error messages, which indicate the type of errors.

See your system programmer or IBM service representative to determine the source of the hardware error.

The pack may be remounted on another device or the basic subsystem (BSS) IPL device selected again. In this case, you must IPL the TPF system again.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0051E UNABLE TO READ SS VOL. SPECIFY RETRY DEV**

**Explanation:** A hardware error was detected when the IPL program read the subsystem IPL device volume label.

**System Action:** The IPLB0004A message is sent following this message.

**User Response:** Review the previous IPLB error messages, which indicate the type of errors.

If the multiple database function (MDBF) IPL can be continued without the subsystem, the next subsystem can be defined by the IPLB0004A message.

See your system programmer or IBM service representative to determine the source of the error.

The pack may be remounted at another device or the subsystem IPL device selected again at the next IPLB0004A message.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0052T BSS IPL VOLUME VOL UNMATCH.** *ccud vol volser*

**Where:**

*ccud*
The basic subsystem (BSS) device unit address.

*vol* The two alphabetic characters of the CTKV volume label.

*volser*
The IPL device volume serial number (VSN).

**Explanation:** The two characters of the BSS IPL device volume label do not match the characters in the CTKV label.

**System Action:** The IPL is ended with a storage dump.

**User Response:** Verify that the BSS IPL device address was specified correctly.

If the BSS IPL device was specified correctly, see your system programmer to correct CTKV. A bypass volume label checking option can be used if the BSS can be included. The message displays the two volume labels that should be checked.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0053E SS IPL VOLUME VOL UNMATCH.** *ccud vol volser*

**Where:**

*ccud*
The subsystem IPL device unit address.

*vol* The two character alpha portion of the volume label specified in keypoint V (CTKV).

*volser*
The subsystem IPL device volume label.

**Explanation:** The first two characters in the subsystem device volume label do not match those in keypoint record V (CTKV).

**System Action:** The subsystem is not included or purged from the MDBF configuration.

If the IPL was software initiated, the processing is continued.

If you initiated the IPL, the IPLB0004A message displays.

**User Response:** Verify whether the specified subsystem IPL device address was correct or not.

If the SS IPL device was specified correctly, have your system programmer to correct keypoint V.

A bypass volume label checking option can be used if the subsystem can be included.

The message indicates two volume labels to be checked.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0054E SS IPL DEV** *ccud1* **PREVIOUSLY DEFINED AT DEV** *ccud2***: IGNORED**

**Where:**

*ccud1*
The IPL device unit address.

*ccud2*
The device unit address.

**Explanation:** A subsystem where the IPL device on the address referenced in the message has the same volume label as another subsystem that was defined previously. The same volume label was found at device unit address referenced in this message.

**System Action:** The current subsystem for which the IPL device unit address referenced in the message is not included in the MDBF configuration. The next MDBF definition is initiated with the IPLB0004A or IPLB0009A messages.

**User Response:** Correct the duplicate volume label condition.

To include both subsystems, the volume label on one of the packs must be changed. If the volume label is changed, the alphabetic portion must be changed in keypoint record V or the Bypass Vol Label option is required on the next IPL.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0055T UNABLE TO READ BSS KEYPOINT RECORDS. IPL TERMINATED.**

**Explanation:** IPLB failed to read the basic subsystem (BSS) keypoint records due to hardware or software errors.

**System Action:** The IPL procedure is ended with a storage dump.

**User Response:** Review the previous IPLB error messages, which indicate the type of errors.

If this is a software error, do the following:

1. Load the keypoint records again with the correct record ID (CK) or, if applicable, another fallback keypoint extent can be retried to bring the TPF system to check the problem.
2. Mount the pack again at other devices or reselect the BSS IPL device.
3. IPL the TPF system.

See your system programmer or IBM service representative, especially if this message is accompanied with the IPLBB004E message.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0056E UNABLE TO READ SS KEYPOINT RECORDS. SS IS PURGED.**

**Explanation:** IPLB failed to read the subsystem keypoint records due to hardware or software error reasons.

**System Action:** The subsystem is not included in the multiple database function (MDBF) configuration. The next definition is initiated with the IPLB0004A message or the IPLB0009A message for an IPL you initiated.

For the software-initiated IPL, the subsystem is excluded from the MDBF configuration and the next subsystem is obtained from the MDBF configuration keypoint record.

**User Response:** Review the previous IPLB error messages, which indicate the type of errors.

If a software error, the subsystem keypoint records must be loaded again with the correct record ID (CK).

If you initiated the IPL, the pack may be mounted on another device followed by another IPL.

If retry at another device is necessary for the software-initiated IPL, IPL and define each subsystem.

See your system programmer or IBM service representative, especially if this message is accompanied by the IPLB0004A message.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0058E EXPECTED VOL *volser1* ON DEV *ccud*, FOUND *volser2***

**Where:**

*volser1*
The volume label expected.

*ccud*
The device unit address.

*volser2*
The volume label found on device unit address.

**Explanation:** A software-initiated or FAST IPL detected that the volume label referenced in the message was found on the subsystem IPL device referenced in this message. According to keypoint M (CTKM) the TPF system expected to find volume *volser1* at this address.

**System Action:** If this is the basic subsystem (BSS) IPL volume, an IPL dump is taken and the IPL is ended with a disabled wait PSW.

If this is a multiple database function (MDBF) subsystem IPL volume, the subsystem is purged from the MDBF configuration and the IPL is continued with the next subsystem.

**User Response:** You must IPL the TPF system to include the missing subsystem.

Review the previous IPL log and deactivation history. If the IPL was due to an irrecoverable error, review the system error dump to be sure that keypoint M (CTKM) is valid. (keypoint M is defined by the MK0CK data macro.)

If the IPL was due to an explicit FAST IPL, then either the previous subsystem deactivation was not completed properly or the status of the BSS prime module changed since the previous IPL. This affects the CTKM that saves the address of the IPL device used. For example, if you take the prime module offline, CTKM shows the duplicate module as the IPL device. If you bring the prime module back online, CTKM shows the prime module as the IPL device, even though it was not necessarily the IPL device used. Therefore, when using the FAST IPL option, IPL the BSS prime module if it was online when the TPF system went down.

If you must IPL a different volume serial number (VSN) than that saved in Keypoint M (CTKM) by the previous IPL, do the following:

1. IPL the TPF system by using the CLEAR option (hardware). The IPLB0001A message displays.
2. Select the U option to include the MDBF subsystems.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0059T INSUFFICIENT STORAGE FOR KEYPOINT RECORDS LOADING**

**Explanation:** During a loading of subsystem keypoint records, the available remaining storage is insufficient for continued processing.

**System Action:** The IPL procedure is ended with a storage dump.

**User Response:** Do the following:

1. Decrease the number of subsystems to be included in the re-IPL.
2. IPL the TPF system again.

Have your system programmer check the valid number of maximum allowable subsystems in the MDBF configuration keypoint record (CTKM) and storage requirements for each subsystem.

See *TPF Main Supervisor Reference* for more information.

**IPLB0060E CANCEL SS INVALID CCUD**

**Explanation:** The subsystem IPL device unit address was not valid.

**System Action:** The IPLB0004A or IPLB0009A message displays requesting further action by you.

**User Response:** Reply cancel with a valid subsystem IPL device unit address.

See *TPF Main Supervisor Reference* for more information.

**IPLB0061E MAX SS EXCEEDED**

**Explanation:** The number of subsystems you defined exceeded the maximum allowed.

**System Action:** The definition that exceeded the maximum allowable subsystem number is not included. The IPL program internally generated an End Of Definition.

**User Response:** Check the validity of the maximum allowable number of subsystems in the multiple database function (MDBF) configuration keypoint record.

See *TPF Main Supervisor Reference* for more information.

**IPLB0062W SUBSYSTEM** *ccud status*

**Where:**

*ccud*
The subsystem IPL device unit address.

*status*
One of the following:
- WARNED
- PURGED
- UNACCEPTABLE.

**Explanation:** This error message informs you of the status of the subsystem.

**System Action:** Based on the status of the subsystem:

**PURGED** The subsystem was purged and the IPL process is continued without the subsystem included.

**WARNED** You must take action if the IPL continues as is.

**UNACCEPTABLE** The subsystem is purged.

**User Response:** Correct the status of the subsystem by fixing the problem reported by a previous error message.

See *TPF Main Supervisor Reference* for more information.

**IPLB0063W STATUS TRACK INITIALIZATION FAILED ON DEVICE** *ccud*

**Where:**

*ccud*
The device address.

**Explanation:** A 3990 Record Cache Subsystem (RCS) device could not be brought online because an unrecoverable error occurred while trying to re-initialize the RCS subsystem global status information.

If, during IPL, the attached RCS DASD configuration changed or if the RCS controller was unable to determine the subsystem status, the TPF system issues a diagnostic control channel command word (CCW) command to re-establish the global subsystem status information in order to bring the affected devices online to the TPF system. This message is issued when the diagnostic control CCW command recovery operation fails the affected device.

**System Action:** The device remains offline to the TPF system.

**User Response:** Do the following:

1. Make sure the attached 3990 RCS devices are properly configured.
2. Try to bring the device online by using the TPF DASD mount procedures after the problem is corrected.

See *TPF Main Supervisor Reference* for more information.

**IPLB0064T SERVICE PROCESSOR FAILED.**

**Explanation:** The service processor was not operational.

**System Action:** The IPL procedure is ended with a storage dump.

**User Response:** See your IBM service representative to determine why the service processor is not operational.

**IPLB0065T IPL LOGIC ERROR — CC2 FROM SERVICE PROCESSOR REQUEST.**

**Explanation:** A service processor request is initiated while a prior request is pending. Since IPL processes service processor requests sequentially, this is a logic error.

**System Action:** The IPL procedure is ended with a storage dump.

**User Response:** IPL the TPF system again. If the problem continues, see your system programmer for more information. Save the console and the dump because your IBM service representative may request this information.

**IPLB0066I IPL WAITING FOR RESPONSE FROM SERVICE PROCESSOR.**

**Explanation:** This is a reminder that the IPL is not hung but is waiting for a response to a service processor request.

**System Action:** This message is repeated every 5 seconds until the service processor responds.

**User Response:** If the IPL does not proceed beyond this message in a reasonable amount of time, IPL the TPF system again.

If the problem occurs repeatedly, see your IBM service representative to determine whether there is a problem with the service processor.

**IPLB0067T IPL LOGIC ERROR — UNEXPECTED EXTERNAL INTERRUPT.**

**Explanation:** An unexpected external interrupt was received.

**System Action:** The IPL procedure is ended with a storage dump.

**User Response:** Check the dump to determine the cause of the external interrupt.

**IPLB0068T SERVICE PROCESSOR ERROR. RETURN CODE IS** *retcode*

**Where:**

*retcode*
The return code.

**Explanation:** An error return code was returned from the service processor.

**System Action:** The IPL procedure is ended with a storage dump.

**User Response:** See your IBM service representative to determine why the service processor returned the error return code.

**IPLB0071W LOCKING NOT AVAILABLE ON ANY CUS**

**Explanation:** In a loosely coupled environment, IPL detected that no TPF online modules were accessed through control units, which have the limited lock facility (LLF) RPQs installed.

**System Action:** IPL processing is continued in uniprocessor mode.

**User Response:** If loosely coupled processing is not intended, no actions are required. If loosely coupled processing is intended, your system programmer and IBM service representative should be consulted.

Channel-control unit connections should be checked and keypoint record 0 (CTK0) should be verified.

See *TPF Main Supervisor Reference* for more information.

**IPLB0072W LOCKING MISSING WITH CU** *ccud*

**Where:**

*ccud*
The online module device unit address.

**Explanation:** In a loosely coupled TPF system, an online online module at the address referenced in the message was accessed without the limited lock facility (LLF).

**System Action:** The IPL procedure is continued as uniprocessor mode.

**User Response:** If loosely coupled processing is not intended, no actions are required.

If loosely coupled processing is intended, your system programmer or IBM service representative should be consulted to verify the interface and the data of keypoint record 0 (CTK0).

See *TPF Main Supervisor Reference* for more information.

**IPLB0073E I/O ERROR ON READING LLF AT** *ccud*

**Where:**

*ccud*
The online module device unit address.

**Explanation:** A hardware error was detected at the limited lock facility (LLF) RPQ when accessing a TPF online module at the address referenced in the message.

**System Action:** The IPL procedure is continued as uniprocessor mode.

**User Response:** See your system programmer or IBM service representative to check the error status that was reported by the preceding IPLBB004E message.

See *TPF Main Supervisor Reference* for more information.

**IPLB0074T INCONSISTENT INTERFACE IDS: DEV** *ccud1* **ID** *xx* **VS DEV** *ccud2* **ID** *yy*

**Where:**

*ccud1*
The device unit address.

*xx* The interface ID.

*ccud2*
The device unit address.

*yy* The interface ID.

**Explanation:** The IPL program detected two different interface IDs — ID *xx* at device *ccud1* and ID *yy* at device *ccud2*.

**System Action:** The IPL processing is ended with a storage dump.

**User Response:** Do one of the following:

- Check the channel switch on each storage control unit for the correct set
- See your system programmer or IBM service representative to correct the installation.

See *TPF Main Supervisor Reference* for more information.

**IPLB0076E INVALID TPF CPUID**

**Explanation:** In a loosely coupled TPF system, the assigned CPU ID is not found in a keypoint record I.

**System Action:** The IPLB0040A message is issued again.

**User Response:** A valid CPU ID must be assigned to the IPLed CPU.

See *TPF Main Supervisor Reference* for more information.

**IPLB0077E CTKM UNQUALIFIED — IPLED BSS ONLY**

**Explanation:** You performed a FAST IPL or TPF software IPL before the multiple database function (MDBF) configuration keypoint record was initialized.

**System Action:** The IPL processing is continued with only a basic subsystem (BSS).

**User Response:** To initialize the MDBF configuration keypoint record, define define a MDBF subsystem configuration at the first IPL time after TPF system generation or after a fresh keypoint M is loaded.

See *TPF Main Supervisor Reference* for more information.

**IPLB0078T OTHER PROCESSOR ACTIVE. UNIPROCESSING FAILED**

**Explanation:** Another processor is active so the uniprocessing failed.

**System Action:** A system error is issued and a dump is sent to the system printer. Then, the TPF system goes into a disabled wait state.

**User Response:** Do one of the following:

- Issue a DESTRUCTION IPL on the processor that receives the IPLB0078T message.
- Deactivate all other active processors.

See *TPF Main Supervisor Reference* for more information.

**IPLB0079W CU *ccud* SUBSYSTEM STORAGE INIT TIMEOUT, CACHING DEACTIVATED**

**Where:**

*ccud*
The address of the failing control unit.

**Explanation:** A caching control failed to initialize properly. All devices on the control unit are placed in DIRECT (uncaching) mode.

**System Action:** The TPF system uses the modules in DIRECT mode.

**User Response:** Check the failing control unit for hardware problems. If necessary, copy the modules from the failing control unit to a functional caching control unit.

See specific diagnostics for the failing control unit in the applicable control unit description manual.

See *TPF Main Supervisor Reference* for more information.

**IPLB0080W ZBUFC ALLOCATE IMPLEMNT RC FUNCTION PENDING**

**Explanation:** A prior ZBUFC command was entered to implement pending cache allocation changes for all 3880 Record Cache Control Units but the operation did not complete on the requesting TPF processor.

**System Action:** No action is performed. The record cache allocations remain the same as they were at the time the requesting TPF processor went down.

**User Response:** Enter another ZBUFC ALLOCATE command with the IMPLEMENT parameter specified after 1052 state to complete the cache allocation changes. Use either the new (target) or old (current) allocation ratio values.

See *TPF Operations* for more information about the ZBUFC ALLOCATE command. See *TPF Main Supervisor Reference* for more information.

**IPLB0081E VOL SER RANGES DEFINED IN CTKV OVERLAP**

**Explanation:** This message is issued when the IPL program detects that the volume serial number (VSN) ranges defined in keypoint record V for the different device types overlap.

**System Action:** If processing is for the basic subsystem (BSS), the IPL procedure is ended with a storage dump.

If processing is for a subsystem, the subsystem is purged and the IPLB0023I message is issued.

**User Response:** Have your system programmer correct the keypoint record.

See *TPF Main Supervisor Reference* for more information.

**IPLB0082x VOL *volser*, MODULE *mod*, DUPLICATE REAL TIME PACKS *ccud1* AND *ccud2***

**Where:**

*x* T, if a basic subsystem (BSS) or E, if a subsystem.

*volser*
The volume label (six characters).

*mod*
The symbolic module number.

*ccud1*
The device unit address.

*ccud2*
The device unit address.

**Explanation:** IPL program detected a TPF pack that has the volume label referenced in the message at the second address referenced in the message. The same volume label was found previously at the first address referenced in the message.

**System Action:** If the volume label is of the BSS, the IPL procedure is ended with a storage dump.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

**IPLB0085T NO DISK ADDRS IN KPT 0: CANNOT START ROLL CALL**

**Explanation:** The DASD configuration keypoint record CTK0 is not valid.

**System Action:** The IPL procedure is ended with a storage dump.

**User Response:** Have your system programmer load a correct keypoint record 0.

See *TPF Main Supervisor Reference* for more information.

**IPLB0086E VOLUME *volser* ON CCUD — *ccchhhhrr* — *error* IN *rtype* CHAIN**

**Where:**

*volser*
The volume serial number (VSN) or UNKNOWN. (UNKNOWN may appear when an error occurs on the first restart record or a keypoint record prior to reading the IPL VSN or building the subsystem cross-reference table.)

*ccchhhhrr*
The cylinder, head, or record. Keypoints use a seven digit CCUD address while restart chains use a six digit CCUD address. (When reading a volume serial number (VSN) or verifying the limited lock facility (LLF), this field is zero.)

*error*
The error description, which can be one of the following:
- I/O ERROR
- INVALID ID
- ID *cc* FOUND (where *cc* = the record ID read)
- REC NOT FOUND

*rtype*
The record type, which can be one of the following:

**TPF**
The control program load failure.

**A P**
The resident E-type program load failure.

**ICDF**
The ICDF program load failure.

**ACPL**
The ACPL program load failure.

**FCTB**
The FACE table load failure.

**SIGT**
The SIGT table load failure.

**RIAT**
The RIAT table load failure.

**IPAT**
The IPAT table load failure.

For single unchained records, the record type can be one of the following:

**KEYPOINT** The keypoint record read failure.

**RECORD #1** The first restart record read failure.

**Explanation:** This message tries to identify the reason for the DASD read error.

**System Action:** The IPL procedure is ended if the error occurred on a critical record (IPAT, ICDF, ACPL) or other basic subsystem (BSS) records (Keypoint records, resident E-type program, file address compute program (FACE) table).

In other cases, the IPL procedure is continued without subsystems that encountered the error.

**User Response:** See your system programmer or IBM service representative if the message is accompanied by the IPLBB004E message.

See *TPF Main Supervisor Reference* for more information.

**IPLB0087T PROGRAM CHECK: PSW IS *psw* INTERRUPT CODE IS *code***

**Where:**

*psw* The eight byte PSW.

*code*
The two byte interrupt code.

**Explanation:** Whenever the dump routine of the IPL program is called, the OLD PSW program is examined to determine whether a program check occurred. If so, this message displays.

**System Action:** The IPL is ended with a dump.

**User Response:** Do the following:

1. Have your system programmer review the system error dump.
2. Take the necessary corrective action.
3. IPL the TPF system again.

See *TPF Main Supervisor Reference* for more information.

**IPLB0088T CHANNEL CHECK THRESHOLD EXCEEDED. IPL TERMINATED.**

**Explanation:** CIO alerted IPLB that the allowable limit of channel check errors was exceeded.

**System Action:** The IPL is ended with a dump.

**User Response:** The IPLB0088T message is usually preceded by input/output (I/O) error messages indicating the failing device and the nature of the error. If not, review the CIO I/O trace table in the IPL dump to determine the failing device. Then, try to IPL the TPF system again.

If the problem continues, see your system programmer or IBM service representative to correct the problem.

See *TPF Main Supervisor Reference* for more information.

**IPLB0089W VSN DISCREPANCY ON THE FOLLOWING CHPIDS FOR *ssss*: CHPID *cc* — VSN *vvvvvv*, CHPID *cc* — VSN *vvvvvv***

**Where:**

*ssss* The channel path IDs (CHPIDs).

*cc* The CHIPD.

*vvvvv*
The volume serial number.

**Explanation:** IPLB tries to verify all paths to the real-time module with the symbolic device address (SDA) for the channel path IDs (CHPIDs) referenced in the message. This error message occurs when there is a discrepancy in the volume serial number (VSN) on two different channel paths. The message displays the CHPID and VSN from each path. The program assumes the first CHPID and VSN pair to be correct.

**System Action:** IPLB disables the channel path associated with the second CHPID and continues with the IPL.

**User Response:** This error indicates the presence of a cabling error, a switching error, or both. When the problem is corrected, enter the ZPATH command to bring the path back online.

See *TPF Operations* for more information about the ZPATH command. See *TPF Main Supervisor Reference* for more information.

---

**IPLB0090E** **PRIMARY | DUPLICATE MODULE** *mod* **OFFLINE IN MFST | IS IN COPY STATE SS IPL DEV ADDR** *ccud*, **VOL** *volser*

**Where:**

*mod*
The symbolic module number.

*ccud*
The subsystem IPL device unit address.

*volser*
The subsystem IPL device volume label.

**Explanation:** When IPL loads the core image restart area (CIMR), a copy state or offline condition for either the system primary module or duplicate module was detected from the module file status table (MFST).

**System Action:** If the module in error is duplicated, loading is continued from the duplicated module by the IPL program.

If the duplicated module is not available, or not configured, the IPL procedure is ended if a basic subsystem (BSS) or the subsystem is purged and the IPL is continued if non-BSS.

**User Response:** To IPL BSS or include a subsystem, at least the primary or prime duplicate module must be available.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0091E** **KPT V DOES NOT CONTAIN ANY VOLUME SERIAL NUMBERS**

**Explanation:** The basic subsystem (BSS) or a subsystem keypoint V (CTKV) does not contain an online module volume number.

**System Action:** If the condition was found for the BSS, the IPL procedure is ended with a storage dump.

If the condition is for a subsystem, the subsystem is purged and the IPLB0023I message displays.

**User Response:** Have your system programmer load the correct keypoint V.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0092E** **IPL DEVICE** *ccud* **IS IN COPY STATE (SYSTEM PRIME | SYSTEM PRIME DUPLICATE)**

**Where:**

*ccud*
The subsystem IPL device unit address.

**Explanation:** Keypoint 6 indicates that the IPL volume (either the prime or prime duplicate) is in dup-update copy state. The indicator in keypoint 6 (CTK6) is set by the ZMCPY UP command.

**System Action:** The IPL continues on the duplicate module, if available. If the duplicate module is not available, the IPL is ended with a dump. If this is a multiple database function (MDBF) subsystem and the duplicate module is not available, the subsystem is purged and the basic subsystem (BSS) IPL is continued.

**User Response:** If the duplicate module is available, the IPL is continued and no response is necessary.

If the IPL is ended, the TPF system must be IPLed again after the problem is corrected.

Have your system programmer review the system error dump and the previous IPL log to determine the validity of CTK6 and the IPL volume.

If a ZMCPY UP copy was in progress, another volume should be used for the IPL (for example, the duplicate of the volume being IPLed). You can then enter a ZMCPY RESTART command to resume the ZMCPY UP copy.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0093W** **CACHING CU** *ccud* **SUBSYSTEM STORAGE UNAVAILABLE, CACHING DEACTIVATED.**

**Where:**

*ccud*
The control unit address.

**Explanation:** An attempt to make record cache subsystem storage available to the subsystem failed. The licensed internal code detected irrecoverable equipment checks or bit failures that cannot be corrected.

**System Action:** The TPF system may display sense data but continues the IPL.

**User Response:** See your system programmer or IBM service representative to solve the problem.

The device address identifies the failing storage director. The SENSE data, if presented, may indicate the reason for failure.

After the problem is corrected, do one of the following:

- IPL the TPF system again.
- Enter the ZAMON UP command again to recover the device.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0094W CACHING CU *ccud* UNABLE TO INITIALIZE CACHE, CACHING DEACTIVATED**

**Where:**

*ccud*
The address of the failing control unit.

**Explanation:** In the channel command word (CCW) chain to initialize cache, either the CCW to initialize all interfaces or the CCW to deinitialize all interfaces failed.

**System Action:** The IPL is continued with the TPF system trying to place the failing storage director into DIRECT mode. The IPLB0096W message is issued.

**User Response:** See your system programmer or IBM service representative to solve the problem.

Check the data for the initialize CCW. If the data taken from keypoint 0 does not match the data in the initialized SD, then keypoint 0 could be in error. If the CCWs and data are valid, a licensed internal code or hardware problem could exist.

After the problem is corrected, do one of the following:

- IPL the TPF system again.
- Enter the ZAMON UP command to recover the device.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0095W CACHING CU *ccud* HAS DIAGNOSTIC MODE SWITCH SET, CACHING DEACTIVATED.**

**Where:**

*ccud*
The device address.

**Explanation:** As a result of a SENSE SUBSYSTEM STATUS command the DIAGNOSTIC MODE switch was detected as being set. This means the SD is not permitted to access the subsystem storage.

**System Action:** The IPL is continued.

**User Response:** Check the DIAGNOSTIC MODE switch. If the DIAGNOSTIC MODE switch is off, notify your system programmer or IBM service representative.

If the DIAGNOSTIC MODE switch is on, check with your system programmer and IBM service representative as to why and it may be returned to service.

After the problem is corrected, do one of the following:

- IPL the TPF system again.
- Enter the ZAMON UP command to recover the device.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0096W ACTIVATE CACHING FAILED FOR DEVICE *ccud*, VSN *volser*.**

**Where:**

*ccud*
The device address.

*volser*
The volume serial number (VSN).

**Explanation:** This message is issued when a SET SUBSYSTEM MODE command to activate caching (place a device in RECORD ACCESS MODE) fails. It is also issued when a device is placed in DIRECT MODE.

**System Action:** The IPL is continued.

**User Response:** See your system programmer or IBM service representative to solve the problem.

Determine whether the failure was caused by a hardware problem that may have been reported in other error messages. The SD may need to be MLed again.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0097W DEVICE *ccud* MAY HAVE NON-RETENTIVE DATA ENABLED, CANNOT DISABLE.**

**Where:**

*ccud*
The device address.

**Explanation:** The channel command word (CCW) command to DISABLE NON-RETENTIVE DATA failed. The state of non-retentive data is unknown.

**System Action:** The TPF system continues.

**User Response:** See your system programmer or IBM service representative. The failing CCW may be accompanied by sense data. This data may be useful in analysis. However, the TPF system does not support non-retentive data, so this failure should not disrupt the operation of the TPF system.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0098W DEVICE *ccud* MAY HAVE NON-RETENTIVE ACCESS ALLOWED, CANNOT DISALLOW.**

**Where:**

*ccud*
The device address.

**Explanation:** The channel command word (CCW) command to DISALLOW NON-RETENTIVE ACCESS failed. The state of non-retentive access is unknown.

**System Action:** The TPF system continues.

**User Response:** See your system programmer or IBM service representative. The failing CCW may be accompanied by sense data. This data may be useful in analysis. However, the TPF system does not support non-retentive access, so this failure should not disrupt the operation of the TPF system.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0099E INVALID RESPONSE**

**Explanation:** This message notifies that your previous response was not valid.

**System Action:** Request is repeated.

**User Response:** Reply in the correct format

See *TPF Main Supervisor Reference* for more information.

**IPLB0121x VOL *volser*, MODULE *mod*, *mfunc mstat mavail***

**Where:**

*x* The severity code for the message, which is one of the following:

**E** The error code.

**W** The warning code.

*volser*
The volume label.

*mod*
The symbolic module number.

*mfunc*
The module function, which is one of the following:
- SYSTEM PRIME
- SYSTEM PRIME DUP
- REAL TIME DISK.

*mstat*
The module status, which is one of the following:
- OFFLINE FROM PREVIOUS IPL — Disk roll call is reporting a volume that was marked offline in keypoint 6 during the previous IPL. The device may or may not be currently attached to the TPF system.
- NOT MOUNTED — CHECK DEVICE — Disk roll call is unable to find a volume that was marked online in keypoint 6 during the previous IPL. The hardware should be checked to determine why no paths are available to the device.

*mavail*
The availability of the duplicate volume, which is one of the following:
- DUP AVAILABLE
- DUP NOT AVAILABLE.

**Explanation:** IPLB disk roll call is reporting the status of a volume that was listed in keypoint V but is now physically unavailable or was taken offline during the previous IPL.

**System Action:** If the message is accompanied by a severity code of E, the subsystem is marked unacceptable. If the basic subsystem (BSS) is marked unacceptable, the IPL is ended automatically with a storage dump.

If the message is accompanied by severity code of W and a previously online module is not found, you are prompted through the IPLB0022A message at the end of disk roll call to do one of the following:
- Continue without the devices
- End the IPL
- Purge the subsystem.

**User Response:** Verify the volume status and respond accordingly.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0130I FARF ADDRESSING STAGE *a/b* DISPENSE MODE FARF*c***

**Where:**

*a/b* The File Address Reference Format (FARF) addresses supported by the file address compute program (FACE) table. This is either FARF3 to FARF4 or FARF4 to FARF5.

*c* The FARF addresses being dispensed. This is 3, 4, or 5.

**Explanation:** This is an informational message that is issued during restart indicating the active stage and the current dispense mode.

**System Action:** None.

**User Response:** None.

See the *TPF Migration Guide: Program Update Tapes* for more information about FARF migration.

---

**IPLB0147A SPECIFY: N — NORMAL IPL, D — L/C DESTRUCT IPL AND SELECT IMAGE T — TERMINATE, I — NORMAL IPL AND SELECT IMAGE**

**Explanation:** Keypoint I indicates that there is another processor active in the loosely coupled complex. This IPL can be a normal IPL (join the complex), a destruction IPL (destroy the loosely coupled complex), or the IPL can be ended.

**Note:** If the image selection is desired, it must be specified when this message is first issued. This message is issued again allowing you to select the IPL type.

**System Action:** The IPL program follows your specification.

**User Response:** Use one of the following responses:

**N** For a normal IPL.

**D** For destruction IPL.

**T** To end the IPL.

**I** To indicate you should be prompted for image selection.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0150I ONE ENABLED IMAGE — IMAGE SELECTION BYPASSED**

**Explanation:** An image selection request failed. Only one image is enabled. Therefore, no other selections are available.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0151I PROCESSING CONTINUES WITH IMAGE *nnnnnnnn***

**Where:**

*nnnnnnnn*
The image name.

**Explanation:** All subsystems identify the enabled image during a hard IPL.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0154A** **VALID IMAGE SELECTIONS** *image* [*status*] [*status*]
:
**SPECIFY IMAGE NAME**

**Where:**

*image*
The name of a valid (enabled) image for selection.

*status*
Status of the image. This may consist of none, one, or both of the following:

**PRIMARY** This denotes the primary image.

**ACTIVE** This denotes the last active image for this processor. This image is used when no image is explicitly specified.

**Explanation:** This message prompts you for an image selection and provides you with a list of enabled images that are available for selection.

**Note:** The default selection (achieved by pressing ENTER) is the last active image for the processor (if there is one).

**System Action:** IPL of the specified image occurs.

**User Response:** Specify one of the image names listed. If one of the listed images is marked as ACTIVE, then that image will be used if no image is specified. If none of the images are marked as ACTIVE, then a selection must be made.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0155T** **UNABLE TO READ BSS CTKX RECORD. IPL TERMINATED.**

**Explanation:** IPLB failed to read CTKX while trying to IPL another image because of hardware or software error reasons.

**System Action:** The IPL is ended.

**User Response:** Load CTKX with the proper record ID (X'00ED').

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0156T** **UNABLE TO READ IPLA CHAIN. IPL TERMINATED.**

**Explanation:** IPLB failed to read IPLA while trying to IPL another image because of hardware or software error reasons.

**System Action:** The IPL is ended.

**User Response:** Load IPLA.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0157A** **SPECIFY: I — IMAGE SELECTION, B — BYPASS SELECTION**

**Explanation:** This message prompts you to specify whether or not to prompt for image selection if there is more than one image enabled.

If I is specified, you are prompted for image selection for each subsystem.

**Note:** If I is specified and only one image is enabled in the TPF system, you are not prompted for an image name because the single, enabled image is used for the IPL.

If the you press Enter, the TPF system uses option B as the default.

If option B is selected, and there is no active image for the processor but there is more than one enabled image, you are prompted to provide an image name.

**System Action:** None.

**User Response:** Enter one of the following responses:

**I** To prompt for image selection.

**B** To bypass image selection.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB0160W** **RCS STATE CHANGE PENDING REPORTED ON DEVICE** *ccud***. OPERATION WILL BE RETRIED** *xx* **TIMES AT** *yy* **SECOND INTERVALS BEFORE BEING ABANDONED.**

**Where:**

*ccud*
The device address.

*xx* The number of times the failing operation will be retried before recovery is abandoned.

*yy* The time interval in seconds between retries.

**Explanation:** The record cache subsystem (RCS) controller rejected the DASD input/output (I/O) operation while performing a cache recovery function.

A state change interrupt will be presented when the controller is ready to accept I/O requests.

The TPF system will retry the failed operation the number of times indicated in the message before continuing the initial program load (IPL).

**System Action:** If the operation is abandoned due to retries being exhausted before the state change interrupt is received, IPL will flag the device as a dummy in the device address volume serial number (DAVSN) table and continue without it.

**User Response:** See your system programmer or your IBM service representative to determine the cause of the state change pending condition and to correct it. If the TPF system cannot be brought up without the lost device, IPL the TPF system again after the controller resumes normal operations.

---

**IPLB00A0T** **LOGIC ERROR — ZERO DEVICE ADDRESS**

**Explanation:** IB08 tried to do a DASD input/output (I/O) operation to address 000.

**System Action:** IPLB will dump and is ended.

**User Response:** Try to IPL the TPF system again. If the condition continues, see your system programmer for more information.

Verify the contents of the I/O request block (WB0WB) passed

to IB08, especially the device address field.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00A1T LOGIC ERROR — BAD CHANNEL ADDRESS**

**Explanation:** IB08 tried to do a DASD input/output (I/O) operation to a channel address that is not valid.

**System Action:** IPLB will dump and is ended.

**User Response:** IPL the TPF system again. If the condition continues, see your system programmer for more information.

Verify the contents of the I/O request block (WB0WB) passed to IB08, especially the device address field.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00A2T LOGIC ERROR — BAD CCW POINTER**

**Explanation:** IB08 tried to do a DASD input/output (I/O) operation to the channel command word (CCW) string pointer that is not valid.

**System Action:** IPLB will dump and is ended.

**User Response:** IPL the TPF system again. If the condition continues, see your system programmer for more information. Verify. the contents of the I/O request block (WB0WB) passed to IB08, especially the CCW string pointer field.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00A3T LOGIC ERROR — 2 I/Os TO SAME DEVICE, ADDRESS =** *ccud*

**Where:**

*ccud*
The device address.

**Explanation:** The IPLB DASD input/output (I/O) routine, IB08, only supports one I/O operation outstanding to any one device. An attempt was made to start a second I/O operation to the device referenced in the message while the first operation was active.

**System Action:** IPLB will dump and is ended.

**User Response:** IPL the TPF system again. This is a logic error. If the condition continues and there are no local modifications to IPLB, save the console and the IPL dump. Then, see your IBM service representative.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00A4T LOGIC ERROR — SIOSC STACK OVERFLOW**

**Explanation:** An internal table in IB08 overflowed.

**System Action:** IPLB will dump and is ended.

**User Response:** IPL the TPF system again. If the condition continues and there are no local modifications to the IPLB from your operations center or enterprise, save the console and the dump because your IBM service representative may request this information.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00A5W I/O ERROR — SUBCHANNEL LOGOUT, ADDRESS =** *ccud*, **TYPE =** *type*

**Where:**

*ccud*
The device address associated with the input/output (I/O) interrupt that signaled the channel logout.

*type*
One of the following:

**ICC** If an interface control check was received.

**CDC** If a channel data check was received.

**CCC** If a channel control check was received.

**Explanation:** The hardware channel took a temporary or permanent failure. IPLB does not save the information from the logout. The CCUD referenced in the message is the I/O address associated with the channel failure. This address indicates the channel involved. The device portion of the address may or may not be related to the channel failure. The types of channel logout correspond to bit settings in the channel status word byte 5.

**System Action:** None.

**User Response:** If the IPL continues without further incident, you can ignore this message.

If this message appears several times, in conjunction with other DASD I/O errors, or if the IPL cannot continue, fallback to backup hardware occurs. The failing channel address and the type of logout are provided in the message. This should be given to your IBM service representative if fallback was necessary.

See *TPF Main Supervisor Reference* for more information. See *370/XA Principles of Operation* for more information.

---

**IPLB00A6T I/O ERROR — UNIT CHECK ON SENSE OPERATION, ADDRESS =** *ccud*

**Where:**

*ccud*
The device address.

**Explanation:** A sense operation was initiated following a unit check on an input/output (I/O) operation to the CCUD address referenced in the message. The sense operation resulted in a second unit check. This second check should not occur.

**System Action:** A dump is issued and is ended.

**User Response:** IPL the TPF system again.

If the TPF system is still unable to IPL, verify that the address referenced in the message is an address that should be accessed by the TPF system and that the device is in working order. IPL the TPF system again.

If the TPF system is still unable to IPL, see your system programmer for more information. This should be a hardware error. Normal diagnostic operations should be run for the device referenced in this the message.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00A7T POSSIBLE GEN ERROR — NO STORAGE AVAILABLE TO CARVE I/O TABLES**

**Explanation:** There was insufficient storage available for the input/output (I/O) tables in IB08. IPLB resides in the area reserved for working storage. Working storage may have been generated too small or the processor being IPLed may have too little main storage for the TPF system being IPLed.

**System Action:** A diagnostic dump is issued and, if possible, then is ended.

If there is very little main storage available on the TPF system, the IPL dump routine may fail.

**User Response:** See your system programmer for more information. Verify the size of the processor being IPLed. If this is a High Performance Option (HPO) system, verify the subsystem configuration. Each additional subsystem adds a large main storage requirement during IPL. This message implies a large mismatch between the available storage and the storage requirements.

If the TPF system being IPLed has the minimum main storage, 2 MB, then study the TPF system generation reports to determine the size of working storage reserved. Ensure that working storage is at least 521 K + (70 K for each subsystem generated). Verify the action of the memory in the processor being IPLed. A memory failure in the first 2 MB may produce this failure.

See *TPF Main Supervisor Reference* for more information.

**IPLB00A9T LOGIC ERROR — NO RETURN ADDRESS IN I/O BLOCK**

**Explanation:** This is an interface error within IPLB code.

**System Action:** A dump is issued and then ended.

**User Response:** IPL the TPF system again. If the condition continues, see your system programmer for more information.

This is a logic error. IB08 was called with an input/output (I/O) request block (WB0WB) without a return address in the block. Verify the content of the I/O request block.

See *TPF Main Supervisor Reference* for more information.

**IPLB00AAT LOGIC ERROR — CC=1 RETURN FROM SIOSC**

**Explanation:** The IPL DASD input/output (I/O) initiator code issued an SIOSC and a condition code 1 was returned. Condition code 1 is not defined and a logic error is indicated when it is received.

**System Action:** The IPL operation is ended.

**User Response:** Have your system programmer determine why the SIOSC is returning an illegal condition code.

See *TPF Main Supervisor Reference* for more information.

**IPLB00ABT LOGIC ERROR — BAD WORKBLOCK ADDRESS RETURNED BY CIO**

**Explanation:** The IPL DASD interrupt code expects the input/output (I/O) operation work block address is returned by CIO as a parameter. If the device address in the workblock does not match the device address in SYSIDA, it is assumed the workblock address is bad. This is logically not suppose to occur.

**System Action:** The IPL operation is ended.

**User Response:** Have your system programmer determine why a bad workblock address was passed to common I/O from IPL or passed to IPL from common I/O.

See *TPF Main Supervisor Reference* for more information.

**IPLB00ACT LOGIC ERROR — SOFTWARE MOUNT FAILED FOR THE IPL VOLUME**

**Explanation:** The IPL DASD input/output (I/O) initiator code issued an MSDAC macro to software mount the IPL volume before initiating an I/O to the device. A nonzero return code (symbolic device address (SDA) does not exit or SDA is in use), was returned from the MSDAC macro. IPL does not continue if the IPL volume cannot be mounted.

**System Action:** The IPL operation is ended.

**User Response:** Verify the that DASD is online. If the DASD is online, have your system programmer determine why the mount is failing.

See *TPF Main Supervisor Reference* for more information.

**IPLB00B1x I/O OPERATION ON DEVICE** *ccud* **COMPLETED** *status*

**Where:**

*x* The severity indicator, Action Code, which may be:

**I** Informational

**E** Error

*ccud*
The channel address of the device.

*status*
The status of the input/output (I/O) operation, which is one of the following:
- NORMALLY
- ABNORMALLY.

**Explanation:** If the I/O operation completed abnormally, this message is always followed by a second message describing the cause of the failure. However, it is not normal for you to receive this notification when an input/output (I/O) operation is completed normally.

**System Action:** None.

**User Response:** Save the console and see your system programmer for more information.

See *TPF Main Supervisor Reference* for more information.

**IPLB00B2E DEVICE IS NOT PRESENT, OR REQUIRES INTERVENTION**

**Explanation:** IPLB received from DASD one of the various indications that a device is not installed, not powered on, or otherwise requires intervention. This was indicated as the result of an input/output (I/O) operation.

**System Action:** None.

**User Response:** This message is generally be followed by a

message indicating what the TPF system was trying to do when it received this status. You respond to that message.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00B3E I/O RETRY COUNT EXHAUSTED, DEVICE PERSISTENTLY BUSY**

**Explanation:** The number of retries that IPLB attempts is limited following conditions that prevent input/output (I/O) from being initiated (for example, busy conditions). This number was reached.

**System Action:** None.

**User Response:** This message is generally followed by another message indicating what the TPF system was trying to do when it received this status. You should respond to that message. The device at the address specified by the preceding IPLBB1E message should be checked. If that device is shared with another processor or is on a control unit that is shared with other processors, then the level of activity outstanding to the device or control unit should be studied.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00B4E SENSE DATA PRESENT:** *sense data* **SCSW=***statword***, CCW=***cmdword, paddr=parm*

**Where:**

*sense data*
24 or 32 bytes of sense data.

*statword*
The subchannel status word (CSW) stored at the time of the failure.

*cmdword*
The failing channel command word (CCW).

*paddr*
The address of the parameter pointed to by the failing CCW.

*parm*
The four bytes of data starting at the failing CCW parameter address.

**Explanation:** The sense data is for the device specified in the preceding IPLBB001E message.

**System Action:** None.

**User Response:** This message is generally followed by a message indicating what the TPF system was trying to do when it received this status. You should respond to that message. The type of error can be determined by looking at the publication for the control unit to which the device is attached.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00B5E TIMEOUT WHILE WAITING FOR DEVICE TO RESPOND**

**Explanation:** The DASD input/output (I/O) operations are timed in IPLB. If an I/O operation exceeds its time value, it is considered lost. I/O operations should not normally timeout.

**System Action:** None.

**User Response:** This message is generally followed by a message indicating what the TPF system was trying to do when it received this status. You should respond to that message.

This situation may be caused by lost interrupts, which are a normal, but very infrequent part of I/O operations. A re-IPL should not receive the same message if this message was caused by a lost interrupt. The device should be checked to determine why the operation did not complete in the time allotted.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00B6E RECEIVED CHANNEL PROGRAM CHECK ON I/O OPERATION**

**Explanation:** IPLB tried an input/output (I/O) operation that ended with a channel program check.

**System Action:** None.

**User Response:** This message is generally followed by a message indicating what the TPF system was trying to do when it received this status. You should respond to that message.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00B7E TYPE OF ERROR UNKNOWN, IPLB LOGIC ERROR.**

**Explanation:** The error code in the input/output (I/O) request block was not recognized by the DASD error print utility.

**System Action:** None.

**User Response:** This message is generally followed by a message indicating what the TPF system was trying to do when it received this status. You should respond to that message.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00D1E UNABLE TO SIGP PROC ADDR =** *x***:** *reason*

**Where:**

*x* The physical address of the I-stream being signalled.

*reason*
One of the following:
- SERVICE PROC FAILURE
- RECEIVER CHECK
- PERSISTENTLY BUSY
- INVALID STATUS RECVD
- EQUIPMENT CHECK
- CPU IS IN CHECK STOP
- INCORRECT STATE
- INVALID PARAMETER.

**Explanation:** IPLB was unable to issue the SIGP instruction to the specified target I-stream. This message is followed by the IPLBD003T message, which ends the IPL.

**System Action:** IPL continues to roll call all I-streams. The TPF system aborts the IPL after all I-streams were interrogated via SIGP.

**User Response:** Respond to the IPLBD003T message.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00D2I TPF WILL USE *xx* OF THE *yy* AVAILABLE I-STREAMS**

**Where:**

*xx* The number of I-streams, which is displayed as a decimal number, that are available for application program use.

*yy* The number of I-streams, which is displayed as a decimal number, that are physically installed and varied online through the hardware console.

**Explanation:** This message is for informational use only. It describes the tightly coupled configuration.

**System Action:** None.

**User Response:** None.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00D3T IPL TERMINATED, CANNOT DETERMINE STATUS OF PROC ADDR *x***

**Where:**

*x* The physical address of the failing I-stream.

**Explanation:** IPLB was unable to SIGP the specified I-stream.

**System Action:** The TPF system is dumped and the IPL is aborted.

**User Response:** Do the following:

1. Perform a system reset from the hardware operator console.
2. IPL the TPF system again. If the IPL fails the same way, IPL a backup processor. If there is no is no fallback processor, the I-stream identified in the message can be removed from the configuration by using the hardware console. The process of removing an I-stream through the hardware console may be too lengthy to use in a production environment. See *370/XA Principles of Operation* for more information about the conditions under which each type of SIGP instruction failure can occur.

The IPLBD001E message specifies the error that occurred during the SIGP instruction.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00S1T STOR MANGT: DOUBLE OPEN OF STORAGE**

**Explanation:** The storage management routine in IPLB was used incorrectly.

**System Action:** A dump is issued and is ended.

**User Response:** IPL the TPF system again. If the TPF system still cannot IPL, see your system programmer for more information.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00S2T STOR MANGT: GET/RELEASE WITHOUT AN OPEN**

**Explanation:** The storage management routine in IPLB was used incorrectly.

**System Action:** A dump is issued and is ended.

**User Response:** IPL the TPF system again. If the TPF system still cannot IPL, see your system programmer for more information.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00S3T STOR MANGT: INVALID STORAGE RELEASE**

**Explanation:** The storage management routine in IPLB was used incorrectly.

**System Action:** A dump is issued and is ended.

**User Response:** IPL the TPF system again. If the TPF system still cannot IPL, see your system programmer for more information.

See *TPF Main Supervisor Reference* for more information.

---

**IPLB00S4T STOR MANGT: INSUFFICIENT STORAGE AVAILABLE**

**Explanation:** There was insufficient storage available for the input/output (I/O) request blocks (WB0WB) in IB04. IPLB resides in the area reserved for working storage but working storage may have been generated too small or the processor being IPLed may have too little main storage for the TPF system being IPLed.

**System Action:** A diagnostic dump is issued and, if possible, is then ended. If there is very little main storage available on the TPF system, the IPL dump routine may fail.

**User Response:** See your system programmer for more information. Verify the size of the processor being IPLed. If this an High Performance Option (HPO) system, verify the subsystem configuration. Each additional subsystem adds a large main storage requirement during IPL. This message implies a mismatch between the available storage and the storage requirements. If the TPF system being IPLed has the minimum main storage, 2 MB, then study the TPF system generation reports to determine the size of the working storage reserved. Ensure that working storage is at least 521 K + (70 K for subsystem generated). Verify the action of the memory in the processor being IPLed. A memory failure in the first 2 MB may produce this failure.

See *TPF Main Supervisor Reference* for more information.

# IPTR–IUMP

---

**IPTR0001I IP TRACE TABLE**

**Explanation:** This is the normal response to the ZIPTR command.

**System Action:** The contents of the Internet Protocol (IP) trace table are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZIPTR command and for an example of the informational display. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IP trace table.

**IPTR0002I IP FORMATTED TRACE**

**Explanation:** This is the normal response to the ZIPTR command with the FORMAT parameter specified.

**System Action:** The contents of the Internet Protocol (IP) trace table are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZIPTR command and for an example of the informational display. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IP trace table.

**IPTR0005I IP TRACE TABLE IS EMPTY**

**Explanation:** This is the normal response to the ZIPTR command when there are no entries in the Internet Protocol (IP) trace table.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZTTCP DISPLAY command to ensure that IP trace is active for the resources for which you want trace information.
2. Do one of the following:
   - If IP trace is active, there is no more action for you to take.
   - If IP trace is not active, enter the ZTTCP TRACE command with the START parameter specified.
3. Enter the ZIPTR command again.

See *TPF Operations* for more information about the ZIPTR and ZTTCP commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IP trace table.

**IPTR0007E TCP/IP NATIVE STACK SUPPORT NOT DEFINED**

**Explanation:** The ZIPTR command was entered, but TCP/IP native stack support is not defined.

**System Action:** The ZIPTR command is rejected.

**User Response:** Do the following:

1. Code the TCP/IP native stack support parameters in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. Perform an initial program load (IPL) of the TPF system.
5. Enter the ZIPTR command again.

See *TPF Operations* for more information about the ZIPTR command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for TCP/IP native stack support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

**IPTR0008E MALOC ERROR, CANNOT DISPLAY IP TRACE TABLE**

**Explanation:** The ZIPTR command was entered, but there is not enough storage in the TPF system to display the Internet Protocol (IP) trace table.

**System Action:** The ZIPTR command is rejected.

**User Response:** Do the following:

1. Determine why there is not enough storage in the TPF system.
2. Correct the problem.
3. Enter the ZIPTR command again.

See *TPF Operations* for more information about the ZIPTR command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IP trace table.

**IPTR0009I IP TRACE TABLE CLEARED**

**Explanation:** This is the normal response to the ZIPTR command with the RESET parameter specified.

**System Action:** The Internet Protocol (IP) trace table is initialized.

**User Response:** None.

See *TPF Operations* for more information about the ZIPTR command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the IP trace table.

**IPTR00010E MUST BE IN 1052 STATE OR ABOVE**

**Explanation:** The ZIPTR command was entered, but the TPF system is in restart. The TPF system must be in 1052 state or above.

**System Action:** The ZIPTR command is rejected.

**User Response:** Do the following:

1. Wait for the TPF system to reach 1052 state.
2. Enter the ZIPTR command again.

See *TPF Operations* for more information about the ZIPTR command.

**IUMP0001I REQUEST PROCESSED**

**Explanation:** This is the normal response to the ZIUMP command.

**System Action:** A bit is set in keypoint record C indicating that the unsolicited directory records are to be initialized during cycle up from 1052 state.

**User Response:** None.

See *TPF Operations* for more information about the ZIUMP command.

**IUMP0004E RETRIEVAL ERROR ON KEYPOINT C**

**Explanation:** An error return was received from the keypoint retrieval program.

**System Action:** A system error is issued and processing is ended.

**User Response:** Review the system error dump to determine the cause of the error and to correct it.

See *TPF Operations* for more information about the ZIUMP command.

---

**IUMP0011E NOT VALID ABOVE UTIL STATE**

**Explanation:** Entering the ZIUMP command is not allowed once the TPF system has cycled past CODR restart processing.

**System Action:** Processing is ended.

**User Response:** Do the following:

1. Cycle the TPF system down to 1052 state.
2. Enter the command again.

See *TPF Operations* for more information about the ZIUMP command.

---

**IUMP0012E OPERAND MISSING OR INVALID**

**Explanation:** The ZIUMP command was entered and the CODER or ALL operand was not included.

**System Action:** Processing is ended.

**User Response:** Enter the ZIUMP command again and specify the correct operand.

See *TPF Operations* for more information about the ZIUMP command.

# KPTR–KPTV

---

**KPTR0001I KEYPOINT POINTER RECORD FILE REQUESTED**

**Explanation:** This is the normal response to the ZKPTR command with the REPLACE parameter specified. The request is signaled to system restart.

**System Action:** The keypoint pointer record will be updated on file and system restart will continue.

**User Response:** None.

See *TPF Operations* for more information about the ZKPTR command.

---

**KPTR0002I IPL ABORT REQUESTED**

**Explanation:** This is the normal response to the ZKPTR command with the CANCEL parameter specified. The request was sent to system restart.

**System Action:** System restart does the following:

1. Displays message CVZ60006T
2. Issues system error 005100
3. Ends the system restart entry control block (ECB).

**User Response:** None.

See *TPF Operations* for more information about the ZKPTR command.

---

**KPTR0003I IPL CONTINUE REQUESTED**

**Explanation:** This is a normal response to the ZKPTR command with the CONTINUE parameter specified. The request was sent to system restart.

**System Action:** System restart does one of the following:

- If in response to message CVZ60001A, the following occurs:
  1. Message CVZ60003E is displayed
  2. Message CVZ60001A is displayed again.
- If in response to message CVZ60002A, system restart displays message CVZ60005I and continues.

**User Response:** Do one of the following:

- If message CVZ60005I is displayed, no user response is required.
- If message CVZ60003E is displayed, enter a valid form of the ZKPTR command when message CVZ60001A is displayed.

See *TPF Operations* for more information about the ZKPTR command.

---

**KPTR0004E NO KEYPOINT POINTER RECORD UPDATE REQUESTED**

**Explanation:** This is a normal response to the ZKPTR command. The TPF system has not requested permission to update the keypoint pointer record on file.

**System Action:** None.

**User Response:** Wait until you receive a prompt and enter the ZKPTR command again.

See *TPF Operations* for more information about the ZKPTR command.

---

**KPTR0005I ENTER ZKPTR HELP FOR HELP WITH THE ZKPTR COMMAND**

**Explanation:** This message is displayed following PRSE messages when the ZKPTR command is parsed.

**System Action:** None.

**User Response:** Enter the ZKPTR command with the HELP parameter specfied to get information about command syntax and usage.

See *TPF Operations* for more information about the ZKPTR command.

---

**KPTR0006E FALLBACK EXTENT *nnn* NOT VALID - MUST BE LESS THAN 255**

**Where:**

*nnn*
The fallback extent parameter as entered on the ZKPTR command.

**Explanation:** The ZKPTR command was entered with the DISPLAY parameter and a fallback extent ordinal number specified. The fallback extent ordinal number value was not in the range 0 – 254.

**System Action:** The command is rejected.

**User Response:** Enter the ZKPTR command again with a valid fallback extent ordinal number specified.

See *TPF Operations* for more information about the ZKPTR command.

---

**KPTR0007E FALLBACK EXTENT *nnn* NOT VALID - #KFBXn NOT DEFINED ON SYSTEM**

**Where:**

*nnn*
The fallback extent ordinal number entered on the ZKPTR command.

*n* The fallback extent ordinal number with leading zeros removed. This identifies the missing fallback extent definition in the FACE table (FCTB).

**Explanation:** The ZKPTR command was entered with the DISPLAY parameter and a fallback extent ordinal number specified. The fallback extent #KFBX*n* for the specified ordinal number is not defined.

**System Action:** The command is rejected.

**User Response:** Enter the ZKPTR command with a valid fallback extent parameter.

See *TPF Operations* for more information about the ZKPTR command.

---

**KPTR0010I *cccccccc* KEYPOINT POINTER RECORD**

**Where:**

*cccccccc*
The record type of the keypoint pointer record being displayed, which is one of the following:

- #KEYPT
- #KFBX*n*, where *n* is a value in the range 0 – 254.

**Explanation:** This is a normal response to the ZKPTR command with the DISPLAY parameter specified. The keypoint pointer record matches the FACE table (FCTB) definition for its record type. No errors were detected.

This message is followed by a display of the following information for each extent:

- Extent number
- Base CCHHR address
- Base keypoint ordinal
- Number of records
- Base FACE ordinal
- If #KEYPT record type, the base CCHHR address of any fallback extents that have been used.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZKPTR command.

---

**KPTR0020I *cccccccc* KEYPOINT POINTER RECORD OUT OF SYNC**

**Where:**

*cccccccc*
The record type of the keypoint pointer record being displayed, which is one of the following:

- #KEYPT
- #KFBX*n*, where *n* is a value in the range 0 – 254.

**Explanation:** This is a normal response to the ZKPTR command with the DISPLAY parameter specified. The keypoint pointer record is out of sync with the FACE table (FCTB) definition for its record type. No other errors were detected.

This message is followed by a display of the following information for each extent of the specified record type:

- Extent number
- Base CCHHR address
- Base keypoint ordinal
- Number of records
- Base FACE ordinal.

A parallel display shows the following information for the FCTB definition for the record type:

- Base CCHHR address
- Base keypoint ordinal
- Number of records
- Base FACE ordinal.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZKPTR command.

---

**KPTR0030I *cccccccc* KEYPOINT POINTER RECORD CORRUPTED**

**Where:**

*cccccccc*
The record type of the keypoint pointer record being displayed, which is one of the following:

- #KEYPT
- #KFBX*n*, where *n* is a value in the range 0 – 254.

**Explanation:** This is a normal response to the ZKPTR command with the DISPLAY parameter specified. The keypoint pointer record is corrupted.

This message is followed by a display of the following information:

- Record ID found
- Expected record ID
- Record code check (RCC) found
- Expected record code check
- Symbolic record type found
- Expected symbolic record type
- The last program that filed the record.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZKPTR command.

**KPTV0001I RUNID COMPLETED**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

# LACL–LKTN

**LACL0001E BOTH SHUTDOWN AND RESTART VALUES MUST BE SPECIFIED**

**Explanation:** The ZLACL command requires that both the shutdown and restart values for a line be specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLACL command.

**LACL0002E ONLY SHUTDOWN AND RESTART VALUES CAN BE SPECIFIED**

**Explanation:** Only shutdown and restart values can be specified for the ZLACL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLACL command.

**LACL0003E RESTART VALUE MUST BE LESS THAN THE SHUTDOWN VALUE**

**Explanation:** Polling should not resume until the input list is smaller than it was at the time of shutdown. Therefore, the restart value must be less than the shutdown value for the ZLACL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLACL command.

**LACL0004E RESTART VALUE CANNOT BE 0**

**Explanation:** Polling resumes when the input list is less than the restart level. If the value is 0, resume would never occur because the input list size would never be less than 0.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLACL command.

**LDLS0000I BS LINE STATUS**

**Explanation:** This is the normal response to the ZLDLS command with the BS parameter specified. This message is followed by a display of the line status for the specified binary synchronous (BS) line.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS command and the format of the display.

**LDLS0002I BS LINE STATUS**

**Explanation:** This is the normal response to the ZLDLS command with the BS ALL parameters specified. This message is followed by a display of the line status for the specified binary synchronous (BS) line.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS command and the format of the display.

**LDLS0010E** *aa* **IS NOT A LEGAL BS LINE NUMBER**

**Where:**

*aa* The symbolic line number.

**Explanation:** The symbolic line number referenced in the message does not identify a binary synchronous (BS) line in the TPF system.

**System Action:** None.

**User Response:** Enter the command again and specify a BS symbolic line number.

**LDLS0012E SYSTEM HAS NO BS LINES**

**Explanation:** There are no binary synchronous lines defined for the TPF system so the request to display status is not valid.

**System Action:** None.

**User Response:** None.

**LDLS0020I LC LINE STATUS**

**Explanation:** This is the normal response to the ZLDLS command with the LC parameter specified. This message is followed by a display of the line status for the specified 3270 local line.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS command and the format of the display.

**LDLS0022I LC LINE STATUS**

**Explanation:** This is the normal response to the ZLDLS command with the LC ALL parameters specified. This message is followed by a display of the line status for the specified 3270 local line.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS command and the format of the display.

**LKST0001I LKST AI [LK] *nn* [CL]**

**Where:**

*nn* The symbolic line number.

**Explanation:** This is the normal response to the ZLKST command. This message is followed by a formatted display of the statistics for the requested synchronous link control (SLC) link or line.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLKST command.

**LKST0002E *error* INVALID INPUT**

**Where:**

*error*
The synchronous link control (SLC) line or link number that is not valid.

**Explanation:** This is an error response for the ZLKST command. A synchronous link control (SLC) line or link number that is not valid was specified or the command was too long.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the command again and specify an SLC line or link number that is valid.
- Shorten the command again before entering it.

See *TPF Operations* for more information about the ZLKST command.

**LKST0003E *error* INVALID CLEAR OPTION**

**Where:**

*error*
The parameter that is not valid.

**Explanation:** This is an error response for the ZLKST command. Something other than CL was specified after the line or link number.

**System Action:** None.

**User Response:** Enter the command with one blank and CL following the line or link number if the clear statistics option is desired. Otherwise, do not include any characters after the line or link number.

See *TPF Operations* for more information about the ZLKST command.

**LKTN0000I LINK TRACE ON OK**

**Explanation:** This is the normal response to the ZLKTN command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLKTN command.

**LKTN0002I LINK TRACE OFF OK**

**Explanation:** This is the normal response to the ZLKTF command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLKTF command.

**LKTN0051E LINK TRACE ALREADY ON**

**Explanation:** The ZLKTN command was entered when the synchronous link control (SLC) link trace was already started.

**System Action:** The SLC link trace is continued.

**User Response:** Do one of the following:

- If you wanted to start the SLC link trace, no action is necessary.
- If you want to end the SLC link trace, enter the ZLKTF command to do so.

See *TPF Operations* for more information about the ZLKTN and ZLKTF commands.

**LKTN0052E LINK TRACE NOT ON**

**Explanation:** The ZLKTF command was entered when the synchronous link control (SLC) link trace was not active.

**System Action:** None.

**User Response:** Do one of the following:

- If you wanted to stop the SLC link trace, no action is necessary.
- If you want to start the SLC link trace, enter the ZLKTN command to do so.

See *TPF Operations* for more information about the ZLKTF command.

**LKTN0053T FACE OR FIND ERROR WHEN GETTING BSS CLK RECORD**

**Explanation:** The ZLKTN command was entered to start the synchronous link control (SLC) link trace. A file address compute program (FACE) or FIND error occurred when the CIJK segment tried to retrieve the basic subsystem (BSS) clock record to obtain information for the first trace block.

**System Action:** The SLC link trace is not started. If an input/output (I/O) hardware error is the cause, the TPF system issues an I/O error message. No dump is issued.

**User Response:** Do one of the following:

1. See the operator at the prime computer room agent set (PRC). That operator should check the receive-only (RO) CRAS listing for a DASD I/O error message.
2. Enter the ZLKTN command again.

See *TPF Operations* for more information about the ZLKTF command.

---

**LKTN0054T LINK TRACE OFF DUE TO TAPE ERROR**

**Explanation:** The synchronous link control (SLC) link trace was active. An input/output (I/O) error occurred while trying to write a trace block to the LKT tape.

**System Action:** An I/O error message is issued. The LKT tape is closed and SLC link trace is ended.

**User Response:** Do one of the following:

1. See the operator at the prime computer room agent set (PRC). That operator should check for I/O error messages or dumps that are pertinent to the LKT tape and correct the problem.
2. Try to resume the SLC link trace. If necessary, resume the SLC link trace by using a different tape or tape drive.

See *TPF Operations* for more information about the ZLKTN command.

# MAIL–MATP

---

**MAIL0001I START OF RESPONSE FROM ZMAIL** *cmd*

**Where:**

*cmd*
The request processed by a ZMAIL command.

**Explanation:** This is a normal response to a ZMAIL command when the request generates normal output for the standard output (`stdout`) stream. This message is followed by a display of the normal output.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMAIL commands and for examples of the displays. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support.

---

**MAIL0002E START OF ERROR RESPONSE FROM ZMAIL** *cmd*

**Where:**

*cmd*
The request processed by a ZMAIL command.

**Explanation:** This is a normal response to a ZMAIL command when the request generates error output for the standard error (`stderr`) stream. This message is followed by a display of the error output.

**System Action:** None.

**User Response:** Take any corrective action necessary based on the error information displayed.

See *TPF Operations* for more information about the ZMAIL commands and for examples of the displays. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support.

---

**MAIL0003I** *cmd* **COMPLETED SUCCESSFULLY. NO OUTPUT TO DISPLAY**

**Where:**

*cmd*
The request processed by a ZMAIL command.

**Explanation:** This is a normal response to a ZMAIL command when the request was completed successfully and did not generate any specific output for either the standard output (`stdout`) or standard error (`stderr`) stream.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMAIL commands and for examples of the displays. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support.

---

**MAIL0007E PARAMETERS SPECIFIED ARE NOT VALID**

**Explanation:** The ZMAIL PATH command was entered with incorrect parameters specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZMAIL PATH command again with the correct parameters specified.

See *TPF Operations* for more information about the ZMAIL PATH command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support.

---

**MAIL0092E MAILDOMAIN ENVIRONMENT VARIABLE VALUE NOT IN CONFIG**

**Explanation:** A ZMAIL command was entered on a TPF system that has the MAILDOMAIN environment variable set, but the value is not defined in the TPF configuration file (`/etc/tpf_mail.conf`).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. If the MAILDOMAIN environment variable is incorrect, enter the ZFILE export command to set the environment variable to the correct value and go to step 3 on page 613. Otherwise go to step 2.
2. If the MAILDOMAIN environment variable is correct, this error indicates that the configuration file is in error or is corrupted and must be rebuilt. Do the following:
   a. Update the TPF configuration file (`/etc/tpf_mail.conf`). See *TPF Transmission Control*

*Protocol/Internet Protocol* for more information about how to update the TPF Internet mail server configuration files.

b. Enter **ZMAIL STOP** to stop the TPF Internet mail server.

c. Enter **ZMAIL START** to read in the updated configuration file. Go to step 3.

3. Enter the appropriate ZMAIL command again.

See *TPF Operations* for more information about the ZFILE export and ZMAIL commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the TPF Internet mail server configuration files.

---

**MAIL0093E SET MAILDOMAIN ENVIRONMENT VARIABLE**

**Explanation:** A ZMAIL command was entered on a TPF system that does not have the MAILDOMAIN environment variable set.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZFILE export command to set the MAILDOMAIN environment variable to the appropriate mail domain.
2. Enter the ZMAIL command again.

See *TPF Operations* for more information about the ZFILE export and ZMAIL commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support.

---

**MAIL0094E ENTER ZMAIL FROM SUBSYSTEM** *ss*

**Where:**

*ss* The TPF mail subsystem.

**Explanation:** A ZMAIL command was entered on a TPF subsystem that is not the mail subsystem.

**System Action:** The command is rejected.

**User Response:** Enter the ZMAIL command again from the subsystem displayed in the message.

See *TPF Operations* for more information about the ZMAIL commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support.

---

**MAIL0098E MAIL NOT STARTED**

**Explanation:** A ZMAIL command was entered, but the TPF Internet mail servers are not started and the TPF configuration file (`/etc/tpf_mail.conf`) has not been read into system heap storage.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZMAIL START** to start the TPF Internet mail servers and read in the TPF configuration file.
2. Enter the appropriate ZMAIL command again.

See *TPF Operations* for more information about the ZMAIL commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support.

---

**MAIL0099E MAIL SUBSYSTEM MUST BE IN CRAS STATE OR ABOVE**

**Explanation:** A ZMAIL command was entered, but the TPF subsystem in which the TPF Internet mail servers are running is below CRAS state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the TPF subsystem in which the TPF Internet mail servers are running to CRAS state or higher.
2. Enter the ZMAIL command again.

See *TPF Operations* for more information about the ZMAIL commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support.

---

**MAIL0100I PATH FOR UID** *account*

**Where:**

*account*
A TPF Internet mail account.

**Explanation:** This is the normal response to a ZMAIL PATH command when the user profile record (UPR) for the specified account is successfully found.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMAIL PATH command and for an example of the display. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support.

---

**MATP0001I IP ADDRESS DEFINED FOR LNIATA-***lniata*

**Where:**

*lniata*
The 6-digit hexadecimal line number, interchange address, and terminal address (LNIATA) for the specified device.

**Explanation:** This is the normal response to the ZMATP command with the DEFINE parameter specified.

**System Action:** The terminal address table (WGTA) entry for the specified LNIATA is updated to contain the specified Internet Protocol (IP) address and terminal type.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

---

**MATP0002I INFORMATION ALTERED FOR LNIATA-*lniata***

**Where:**

*lniata*
The 6-digit hexadecimal line number, interchange address, and terminal address (LNIATA) for the specified device.

**Explanation:** This is the normal response to the ZMATP command with the ALTER parameter specified.

**System Action:** The terminal address table (WGTA) entry for the specified LNIATA is updated to contain the specified Internet Protocol (IP) address or terminal type.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

**MATP0003E THE SPECIFIED LNIATA IS NOT VALID**

**Explanation:** The ZMATP command was entered with the ALTER, DEFINE, or DISPLAY parameter specified to define an Internet Protocol (IP) address for a device. However, the line number, interchange address, and terminal address (LNIATA) specified for this device cannot be found in the terminal address table (WGTA).

**System Action:** The command is rejected. The WGTA entry is not updated with the new IP address or terminal type, if specified.

**User Response:** Do the following:

1. Verify that the LNIATA you specified is correct.
2. Enter the ZMATP command again specifying the ALTER, DEFINE, or DISPLAY parameter.

See *TPF Operations* for more information about the ZMATP command.

**MATP0004E IP ADDRESS IS NOT VALID**

**Explanation:** The ZMATP command was entered with the ALTER or DEFINE parameter specified to change or define the Internet Protocol (IP) address associated with the specified line number, interchange address, and terminal address (LNIATA). However, the IP address specified is not valid.

**System Action:** The command is rejected. The terminal address table (WGTA) entry is not updated with the new IP address or terminal type.

**User Response:** Enter the ZMATP command again specifying a valid IP address.

See *TPF Operations* for more information about the ZMATP command.

**MATP0005E TERMINAL TYPE IS NOT VALID**

**Explanation:** The ZMATP command was entered with the ALTER or DEFINE parameter specified, and the TYPE parameter specified. However, the value specified in the TYPE parameter is not a valid terminal type.

**System Action:** The command is rejected.

**User Response:** Enter the ZMATP command again and do one of the following steps to ensure the correct terminal type is entered:

- Specify one of the following values:
  - MATIPA
  - MATIPB
  - MATIPH
  - IPBRIDGE
  - MQ.
- Specify a 2-digit hexadecimal value to represent the correct terminal type as defined in the TRMEQ selected equate macro.

See *TPF Operations* for more information about the ZMATP command.

**MATP0006I DISPLAY MATIP SESSION**

**Explanation:** This is the normal response to the ZMATP command with the DISPLAY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

**MATP0007I MATIP STARTED SUCCESSFULLY**

**Explanation:** This is the normal response to the ZMATP command with the START parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

**MATP0008I MATIP STOPPED**

**Explanation:** This is the normal response to the ZMATP command with the STOP parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

**MATP0009E SYSTEM MUST BE IN CRAS STATE OR ABOVE**

**Explanation:** A ZMATP command was entered while the TPF system was below CRAS state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle the TPF system to CRAS state or above.
2. Enter the ZMATP command again.

See *TPF Operations* for more information about the ZCYCL and ZMATP commands.

### MATP0010I NO ACTIVE MATIP SESSION FOR THIS LNIATA

**Explanation:** The ZMATP command was entered with the DISPLAY parameter specified. However, the line number, interchange address, and terminal address (LNIATA) specified is not on an active Mapping of Airline Traffic over Internet Protocol (MATIP) session for one of the following reasons:

- The device has not been defined as a MATIP device by a previous ZMATP command with the DEFINE parameter specified.
- The TPF system has not received data from this device over an active MATIP session.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Verify that the LNIATA specified is correct and enter the ZMATP command again.
- Enter the ZMATP command with the DEFINE parameter specified to define the LNIATA as a MATIP device.

See *TPF Operations* for more information about the ZMATP command.

### MATP0011E MATIP IS ALREADY STARTED

**Explanation:** The ZMATP command was entered with the START parameter specified. However, Mapping of Airline Traffic over Internet Protocol (MATIP) is already active in the TPF system. A prior ZNKEY command with the MAXASCU or MAXMATIP parameter specified may have been issued to change the parameter value.

**System Action:** The command is rejected.

**User Response:** Although MATIP is already active, if the ZNKEY command was entered to change the MAXMATIP or MAXASCU values, MATIP must be restarted to include these new values. Do the following:

1. To close ***ALL*** existing sessions, enter the ZMATP command with the STOP parameter specified.
2. To enable sessions to start, enter the ZMATP command with the START parameter specified.

See *TPF Operations* for more information about the ZMATP and ZNKEY commands.

### MATP0012I MATIP IS NOT CURRENTLY ACTIVE

**Explanation:** The ZMATP command was entered with the STOP parameter specified. However, Mapping of Airline Traffic over Internet Protocol (MATIP) is not active in the TPF system.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

### MATP0013E ERROR STARTING MATIP

**Explanation:** The ZMATP command was entered with the START parameter specified. However, there was an error when activating Mapping of Airline Traffic over Internet Protocol (MATIP) on the TPF system. The MATIP session control block could not be built for one of the following reasons:

- Transmission Control Protocol/Internet Protocol (TCP/IP) support is not defined.
- MAXASCU or MAXMATIP values, or both, are set to 0 in keypoint 2 (CTK2).

**System Action:** The command is rejected.

**User Response:** Enter the ZNKEY command with the ALL parameter specified to display the values of CLAWADP, MAXASCU, MAXMATIP, and MAXSOCK.

If CLAWADP is set to 0, TCP/IP offload support is not defined.

If MAXSOCK is set to 0, TCP/IP native stack support is not defined.

If the values for MAXASCU or MAXMATIP, or both, are set to 0, do the following:

1. Enter the ZNKEY command to change the value of MAXASCU or MAXMATIP to a value greater than 0.
2. Enter the ZMATP command with the START parameter specified to activate MATIP.

See *TPF Operations* for more information about the ZMATP and ZNKEY commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about defining TCP/IP offload support and TCP/IP native stack support.

### MATP0014E ERROR ALLOCATING MATIP HEAP AREA

**Explanation:** There is not enough contiguous heap storage to build the Mapping of Airline Traffic over Internet Protocol (MATIP) heap area. The ZNKEY command was entered with MAXASCU and MAXMATIP values defined that are too large.

**System Action:** The entry control block (ECB) ends.

**User Response:** Do one of the following:

- Increase the amount of heap storage available
- Enter the ZNKEY command with the MAXASCU parameter specified to reduce the number of agent set control units (ASCUs), or the MAXMATIP parameter specified to reduce the number of MATIP sessions.

See *TPF Operations* for more information about the ZNKEY command.

### MATP0015E ERROR ALLOCATING MATIP SESSION VECTOR

**Explanation:** There is not enough contiguous heap storage to control the requested Mapping of Airline Traffic over Internet Protocol (MATIP) sessions. The ZNKEY command was entered with a value specified for the MAXMATIP parameter that is too large.

**System Action:** The entry control block (ECB) ends.

**User Response:** Do one of the following:

- Increase the amount of heap storage available.
- Enter the ZNKEY command with the MAXMATIP parameter specified to reduce the number of sessions.

See *TPF Operations* for more information about the ZNKEY command.

---

**MATP0016E ERROR ALLOCATING MATIP ASCU VECTOR**

**Explanation:** There is not enough contiguous heap storage to control the requested Mapping of Airline Traffic over Internet Protocol (MATIP) agent set control units (ASCUs). The ZNKEY command was entered with a value specified for the MAXASCU parameter that is too large.

**System Action:** The entry control block (ECB) ends.

**User Response:** Do one of the following:

- Increase the amount of heap storage available.
- Enter the ZNKEY command with the MAXASCU parameter specified to reduce the number of ASCUs.

See *TPF Operations* for more information about the ZNKEY command.

---

**MATP0017I ASCUS ADDED FOR HOST NAME**

**Explanation:** This is the normal response to the ZMATP command with the ADD and ASCU parameters specified.

**System Action:** The specified agent set control units (ASCUs) are added to the host name on file.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

---

**MATP0018I INFORMATION DELETED**

**Explanation:** This is the normal response to the ZMATP command with the DELETE parameter specified.

**System Action:** The specified information was deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

---

**MATP0019W ASCU** *ascuname* **ALREADY ASSOCIATED WITH HOST NAME** *hostname*

**Where:**

*ascuname*
The 2-byte or 4-byte hexadecimal agent set control unit (ASCU).

*hostname*
The name of the host.

**Explanation:** The ZMATP command was entered with the DELETE parameter specified. However, the ASCU is associated with a host name that is different from the host name that was entered.

**System Action:** The ASCU is bypassed and processing continues with the next ASCU in the list.

**User Response:** Do the following:

1. Verify which host name is associated with the specified ASCU.
2. Enter the ZMATP command again with the DELETE parameter specified and the correct host name and ASCU.

See *TPF Operations* for more information about the ZMATP command.

---

**MATP0020I HOST NAME ALTERED**

**Explanation:** This is the normal response to the ZMATP command with the ALTER and RHOSTN parameters specified.

**System Action:** The host name is changed.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

---

**MATP0021I HOST NAME DEFINED**

**Explanation:** This is the normal response to the ZMATP command with the DEFINE and RHOSTN parameters entered.

**System Action:** The host name is added.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

---

**MATP0022E HOST FILE ERROR**

**Explanation:** The ZMATP command was entered with the ADD, ALTER, DEFINE, or DELETE parameters specified to run a TPFCS API. However, a database error occurred while trying to modify the host file or Agent Set Control Unit (ASCU) file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZBROW QUALIFY SET DS-MATIP_DS** to browse the database.
2. Enter **ZBROW NAME DISPLAY HOSTNAMES** to ensure the MATIP_DS database is defined.

See *TPF Operations* for more information about the ZMATP, ZBROW QUALIFY, and ZBROW NAME commands.

---

**MATP0023E INCORRECT HOST NAME**

**Explanation:** The ZMATP command was entered with the ADD, ALTER, DEFINE, or DELETE parameter specified. However, the host name that was specified is not valid.

**System Action:** The command is rejected. The file entry is not updated.

**User Response:** Do the following:

1. Verify the host name.
2. Enter the ZMATP command again with the ADD, ALTER, DEFINE, or DELETE parameter and a valid host name specified.

See *TPF Operations* for more information about the ZMATP command.

**MATP0024E HOST NAME DOES NOT EXIST IN HOST NAME FILE**

**Explanation:** The ZMATP command was entered with the ADD, ALTER, or DELETE parameter specified. However, the host name does not exist in the file.

**System Action:** The command is rejected. The file entry is not updated.

**User Response:** Do the following:

1. Enter the ZMATP command with the DEFINE parameter specified.
2. Enter the ZMATP command again specifying the ADD or ALTER parameter.

See *TPF Operations* for more information about the ZMATP command.

**MATP0025E HOST NAME ALREADY EXISTS IN HOST NAME FILE**

**Explanation:** The ZMATP command was entered with the DEFINE and RHOSTN parameters specified to define a remote host name. However, the host name already exists in the file.

**System Action:** The command is rejected. The file entry is not updated.

**User Response:** Do the following:

1. Verify the host name.
2. Enter the ZMATP command again specifying the ALTER and parameter and a valid host name.

See *TPF Operations* for more information about the ZMATP command.

**MATP0026I HOST NAME STARTED**

**Explanation:** This is the normal response to the ZMATP command with the START and RHOSTN parameters specified.

**System Action:** The session associated with the host name is started. The corresponding file entry is brought into core memory at this time.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

**MATP0027I HOST NAME STOPPED**

**Explanation:** This is the normal response to the ZMATP command with the STOP and RHOSTN parameters specified.

**System Action:** The session associated with the host name is stopped.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

**MATP0028E HOST NAME ALREADY STARTED**

**Explanation:** The ZMATP command was entered with the START and RHOSTN parameters specified for a session that is not stopped.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the host name to ensure that the session associated with it is stopped.
2. Enter the ZMATP command with the START and RHOSTN parameters specified to start a stopped session.

See *TPF Operations* for more information about the ZMATP command.

**MATP0029E HOST NAME ALREADY STOPPED**

**Explanation:** The ZMATP command was entered with the STOP and RHOSTN parameters specified for a session that is already stopped.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the host name to ensure that the session associated with it is not stopped.
2. Enter the ZMATP command with the STOP and RHOSTN parameters specified to stop a session that is not stopped.

See *TPF Operations* for more information about the ZMATP command.

**MATP0030E INCORRECT ASCU**

**Explanation:** The ZMATP command was entered with either the ADD, ALTER, DEFINE, or DELETE parameter specified and also the ASCU parameter. However, one of the following agent set control unit (ASCU) problems exist:

- The ASCUs entered are not of equal size.
- The size of the ASCUs entered does not match the size of the ASCUs currently associated with the host name.
- One of the ASCUs is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that all the ASCUs entered are either 2-byte ASCU identifiers or 4-byte ASCU identifiers.
2. Ensure that all ASCUs are valid.
3. Check the host name to verify the size of the ASCUs that are already associated with the host name.
4. Enter the ZMATP command again with either the ADD, ALTER, DEFINE, or DELETE parameter specified and also the ASCU parameter using valid ASCUs of the correct size.

See *TPF Operations* for more information about the ZMATP command.

### MATP0031E HOST SLOTS EXHAUSTED

**Explanation:** There are no more slots available for hosts in the host name table. The new host is not added to the host name table.

**System Action:** The activity that attempted to add the host ends.

**User Response:** See your system programmer to increase the number of host name slots by doing the following:

1. Enter the ZMATP command with the DEFINE parameter specified to define new host names.
2. Enter the ZMATP command with the STOP parameter specified to stop MATIP.
3. Enter the ZMATP command with the START parameter specified to start MATIP.

**Note:** Current sessions are stopped when Mapping of Airline Traffic over Internet Protocol (MATIP) is cycled this way. These sessions automatically continue when traffic continues. When MATIP starts, the number of hosts available is determined by the total of the number of hosts in the database plus 50 percent.

See *TPF Operations* for more information about the ZMATP command.

### MATP0032E LOOKUP SLOTS EXHAUSTED

**Explanation:** There are no more slots available for hosts in the host lookup table. The new host is not added to the host lookup table and may not be accessible.

**System Action:** The activity that attempted to add the host ends.

**User Response:** See your system programmer to increase the number of host name slots by doing the following:

1. Enter the ZMATP command with the DEFINE parameter specified to define new host names.
2. Enter the ZMATP command with the STOP parameter specified to stop MATIP.
3. Enter the ZMATP command with the START parameter specified to start MATIP.

**Note:** Current sessions are stopped when Mapping of Airline Traffic over Internet Protocol is cycled this way. These sessions automatically continue when traffic continues. When MATIP starts, the number of hosts in the online system determines the number of lookup slots available.

See *TPF Operations* for more information about the ZMATP command.

### MATP0033E ERROR LOADING HOST NAME *hostname*

**Where:**

*hostname*
The name of the host.

**Explanation:** A problem occurred while attempting to load a Mapping of Airline Traffic over Internet Protocol (MATIP) host name definition from TPF collection support (TPFCS) to memory during cycle-up processing or ZMATP START command processing. This is probably caused by a Domain Name System (DNS) error.

**System Action:** The indicated host name is not loaded to memory, but processing continues to attempt to load the rest of the MATIP definitions.

**User Response:** Do the following:

1. Verify the host name.
2. Verify the DNS is set up correctly.
3. Enter the ZDTCP command with the PING parameter specified and the host name that is in error.
4. Enter **ZMATP START RHOSTN-***hostname*.

See *TPF Operations* for more information about the ZDTCP and ZMATP commands.

### MATP0034E ERROR LOADING MATIP FILE TO CORE

**Explanation:** A problem occurred while attempting to load Mapping of Airline Traffic over Internet Protocol (MATIP) definitions from TPF collection support (TPFCS) to memory during cycle-up processing or ZMATP START command processing. This is probably caused by a TPFCS error.

**System Action:** MATIP definitions are not loaded to memory and all MATIP memory tables are cleaned up.

**User Response:** Do the following:

1. Determine why TPFCS is returning an error.
2. Correct the error.
3. Enter **ZMATP START**.

See *TPF Operations* for more information about the ZMATP command.

### MATP0035E ERROR SENDING MATIP *sessiontype* SESSION CLOSE

**Where:**

*sessiontype*
The type of Mapping of Airline Traffic over Internet Protocol (MATIP) session.

**Explanation:** The ZMATP command was entered with the STOP and RHOSTN parameters specified, but an error occurred while trying to send a session close packet to close a session on the specified host name.

**System Action:** The following occurs:

- The indicated session is not closed.
- The socket is closed.
- ZMATP STOP processing continues to close other sessions for the specified host.

**User Response:** None.

See *TPF Operations* for more information about the ZMATP command.

**MATP0055E NUMBER OF ASCUS EXCEEDED**

**Explanation:** The number of agent set control units (ASCUs) has been exceeded while establishing a session or defining hosts.

**System Action:** One of the following occurs:

- For a new session, the TPF 4.1 system allocates the available ASCUs for the new session and continues with a diminished number of ASCUs for the session.
- For multiple hosts, the TPF 4.1 system continues to define hosts even though ASCUs are not available.
- For a single host, the TPF 4.1 system will not define the host.

**User Response:** To increase the number of ASCUs, do the following:

1. To close ***ALL*** existing sessions, enter the ZMATP command with the STOP parameter specified.
2. To increase the maximum number of ASCUs, enter the ZNKEY command with a larger value specified for the MAXASCU parameter.
3. Selectively decrease ASCUs on file by doing the following:
   a. Entering the ZMATP command with the DELETE parameter specified to delete ASCUs for one or more hosts.
   b. Entering the ZMATP command with the STOP parameter specified to stop the hosts.
   c. Entering the ZMATP command with the START parameter specified to start the hosts.
4. To enable sessions to start, enter the ZMATP command with the START parameter specified.

See *TPF Operations* for more information about the ZNKEY and ZMATP commands.

**MATP0064E MATIP SESSIONS EXCEEDED**

**Explanation:** When the Mapping of Airline Traffic over Internet Protocol (MATIP) layer is defined, a specific number of sessions is provided either through keypoint 2 (CTK2) or by you. An error occurred because the maximum number of sessions was exceeded. The number of MATIP sessions that are available must be increased before additional sessions can start.

**System Action:** The MATIP session ends.

**User Response:** To increase the number of MATIP sessions, do the following:

1. To close ***ALL*** existing sessions, enter the ZMATP command with the STOP parameter specified.
2. To increase the maximum number of MATIP sessions, enter the ZNKEY command with the MAXMATIP parameter specified.
3. To enable sessions to start, enter the ZMATP command with the START parameter specified.

# MCFT

**MCFT0001I** *segment* **– COUPLING FACILITY** *cfname* **ADDED –** *number* **PATHS EXIST**

**Where:**

*segment*
The name of the segment that added the coupling facility(CF).

*cfname*
The name of the CF.

*number*
The number of paths that exist between the CF and the processor.

**Explanation:** The ZMCFT ADD command was entered to add a CF for a processor. This message indicates that the CF referenced in the message was added successfully for the processor.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCFT ADD command.

**MCFT0002I** *segment* **– COUPLING FACILITY** *cfname* **DELETED**

**Where:**

*segment*
The name of the segment that deleted the coupling facility(CF).

*cfname*
The name of the CF.

**Explanation:** The ZMCFT DELETE command was entered to delete a CF from the processor configuration. This message indicates that the CF referenced in the message was deleted successfully from the processor configuration.

**System Action:** None.

**User Response:** You can no longer use this CF.

See *TPF Operations* for more information about the ZMCFT DELETE command.

**MCFT0004I** *segment* **– ZMCFT DISPLAY**

**Where:**

*segment*
The name of the segment that issued this message.

**Explanation:** This is the normal response to the ZMCFT DISPLAY command with the ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCFT DISPLAY command and for an example of the informational display.

**MCFT0005T** *segment* **– COUPLING FACILITY** *cfname* **HAS NOT BEEN ADDED**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** One of the following commands was specified to a CF that was ***not*** added for the processor using the ZMCFT ADD command:

- ZMCFT CLEAR
- ZMCFT DELETE
- ZMCFT DISPLAY
- ZMCFT ENABLE
- ZMCFT REMOVE
- ZMCFT RESETLOCK.

**System Action:** The ZMCFT command is rejected.

**User Response:** Do the following:

1. Verify that you specified the correct CF name when entering the command.
2. Enter the command again, specifying the correct CF name.

See *TPF Operations* for more information about the ZMCFT commands.

---

**MCFT0006T** *segment* **– COUPLING FACILITY** *cfname* **HAS ALREADY BEEN ADDED**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ADD command was entered to add a CF for the processor. An error occurred because the CF you tried to add was already defined through a previous ZMCFT ADD command.

**System Action:** The ZMCFT ADD command is rejected.

**User Response:** Do the following:

1. Verify that you specified the correct CF name when you entered the ZMCFT ADD command.
2. Enter the ZMCFT ADD command again, specifying the correct CF name.

See *TPF Operations* for more information about the ZMCFT ADD command.

---

**MCFT0007E** *segment* **– COUPLING FACILITY** *cfname* **COULD NOT BE ENABLED**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ENABLE command was entered to resume normal operations of the CF referenced in the message. However, an error occurred because the CF that you specified is experiencing a hardware problem.

**System Action:** The ZMCFT ENABLE command is rejected.

**User Response:** Do the following:

1. Correct the hardware error on the CF. For additional help, review previous messages that detailed specific information about the hardware error.
2. Enter the ZMCFT ENABLE command again to resume normal operations of the CF.

See *TPF Operations* for more information about the ZMCFT ENABLE command.

---

**MCFT0008I** *segment* **– COUPLING FACILITY** *cfname* **ENABLED**

**Where:**

*segment*
The name of the segment that enabled the coupling facility(CF).

*cfname*
The name of the CF.

**Explanation:** The ZMCFT ENABLE command was entered to resume normal operations of the CF referenced in the message. The CF can now be used.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCFT ENABLE command.

---

**MCFT0009T** *segment* **– COUPLING FACILITY** *cfname* **NOT ADDED – SDA ERROR**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ADD command was entered with a symbolic device address (SDA) specified, and one of the following caused the error:

- A message device does not exist for the specified SDA.
- All of the message paths for the message subchannel are not connected to the same message device.
- There are no channel paths available.
- The message device is not a CF.
- An unexpected error was found while trying to initialize the message path.

**System Action:** The ZMCFT ADD command is rejected.

**User Response:** Do the following:

1. Verify that the SDA you specified is correct.
2. Determine if there are cabling errors or an incorrect specification of the input/output configuration data set (IOCDS).

3. Enter the ZMCFT ADD command again, specifying the correct SDA.

See *TPF Operations* for more information about the ZMCFT ADD command.

---

**MCFT0010T** *segment* **– COUPLING FACILITY NAME** *cfname* **IS ALREADY IN USE BY A DIFFERENT COUPLING FACILITY THAN THE ONE ATTACHED TO SDA** *sda*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

*sda* The symbolic device address (SDA).

**Explanation:** The ZMCFT ADD command was entered to add a CF for the processor. An error occurred because:

- The CF associated with the SDA specified is already known by another name
- The CF name specified exists and is already assigned to a CF.

**System Action:** The ZMCFT ADD command is rejected.

**User Response:** Do one of the following:

- Check the input/output configuration data set (IOCDS) to ensure the SDA is correct.
- Enter the ZMCFT ADD command again, specifying a valid SDA.

See *TPF Operations* for more information about the ZMCFT ADD command.

---

**MCFT0011T** *segment* **– COUPLING FACILITY** *cfname* **NOT DELETED – THERE ARE STILL STRUCTURES ALLOCATED**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT DELETE command was entered to remove a CF from a processor, but there is still one connection to at least one structure in the CF referenced in the message.

**System Action:** The ZMCFT DELETE command is rejected.

**User Response:** Do the following:

1. Enter the ZMCFT DISPLAY command to determine which structures still exist in the CF.
2. Wait until all functions using these structures have disconnected from them.
3. Enter the ZMCFT DELETE command again to remove the CF from the processor.

See *TPF Operations* for more information about the ZMCFT DELETE and ZMCFT DISPLAY commands.

---

**MCFT0019E** *segment* **– COUPLING FACILITY** *cfname* **IS ALREADY ENABLED**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ENABLE command was entered to enable the CF referenced in the message. An error occurred because this CF was not previously disabled for the processor.

**System Action:** The ZMCFT ENABLE command is rejected.

**User Response:** Do the following:

1. Verify that you specified the correct CF name when entering the command.
2. Enter the ZMCFT ENABLE command again, specifying a valid CF name.

See *TPF Operations* for more information about the ZMCFT ENABLE command.

---

**MCFT0020T** *segment* **– THE COUPLING FACILITY ATTACHED TO SDA** *sda* **HAS ALREADY BEEN ADDED WITH NAME** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*sda* The symbolic device address (SDA).

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ADD command was entered to add a CF for the processor. An error occurred because the CF associated with the SDA specified is already known by another name.

**System Action:** The ZMCFT ADD command is rejected.

**User Response:** Do one of the following:

- Check the input/output configuration data set (IOCDS) to ensure the SDA is correct.
- Enter the ZMCFT ADD command again specifying a valid SDA or CF name.

See *TPF Operations* for more information about the ZMCFT ADD command.

---

**MCFT0022T** *segment* **– COUPLING FACILITY** *cfname* **NOT ADDED – UNABLE TO DEFINE LIST NOTIFICATION VECTOR**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ADD command was entered to add a CF for a processor, but there was not enough space available

to define a message vector for the CF.

**System Action:** The ZMCFT ADD command is rejected.

**User Response:** Perform an initial program load (IPL) of the processor using the load-clear key.

See *TPF Operations* for more information about the ZMCFT ADD command.

---

**MCFT0024I** *segment* **– CF LOCK WAS RESET FOR COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that reset the coupling facility(CF) lock.

*cfname*
The name of the CF.

**Explanation:** The ZMCFT RESETLOCK command was entered to reset a CF lock, which is used as a lock to serialize operations. This message indicates that the CF referenced in the message had its CF lock reset successfully. No processor holds the CF lock for this CF.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCFT RESETLOCK command.

---

**MCFT0025E** *segment* **– UNABLE TO RESET THE CF LOCK FOR COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT RESETLOCK command was entered to reset a CF lock, which is used as a lock to serialize operations. However, an error occurred while trying to reset the CF lock for the CF referenced in the message.

**System Action:** The ZMCFT RESETLOCK command is rejected and a SNAP dump is issued.

**User Response:** Do the following:

1. Review the SNAP dump to determine the cause of the error and to correct it.
2. See your IBM service representative.

See *TPF Operations* for more information about the ZMCFT RESETLOCK command.

---

**MCFT0026E** *segment* **– COUPLING FACILITY RESTART NOT COMPLETE**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** A ZMCFT command that requires the completion of coupling facility (CF) restart was entered before restart was completed successfully.

**System Action:** The ZMCFT command is rejected.

**User Response:** Do the following:

1. Wait for CF restart to be completed.
2. Enter the ZMCFT command again.

See *TPF Operations* for more information about the ZMCFT commands.

---

**MCFT0027E** *segment* **– UNABLE TO READ COUPLING FACILITY RECORD**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** One of the following commands was entered when an error occurred while trying to read the file copy of the coupling facility status table (CFST) or the coupling facility structure block (CFSB):

- ZMCFT ADD
- ZMCFT CLEAR
- ZMCFT DELETE
- ZMCFT DISPLAY
- ZMCFT ENABLE
- ZMCFT REMOVE.

**System Action:** The ZMCFT command is rejected.

**User Response:** Do the following:

1. Review the additional messages that are displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF Operations* for more information about the ZMCFT commands.

---

**MCFT0028T** *segment* **– COUPLING FACILITY** *cfname* **NOT ADDED – COUPLING FACILITY STATUS TABLE IS FULL**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ADD command was entered to add a CF for a processor. An error occurred because there were no available entries in the coupling facility status table (CFST).

**System Action:** The ZMCFT ADD command is rejected.

**User Response:** Do the following:

1. Enter **ZMCFT DISPLAY ALL** to view the CFs defined in the processor configuration.
2. Enter the ZMCFT DELETE command to remove any CFs that are no longer needed from the processor configuration. You may need to repeat this step for other processors in the complex as well.
3. Enter the ZMCFT ADD command again to add the CF for the processor.

See *TPF Operations* for more information about the ZMCFT commands.

---

**MCFT0029I** *segment* **– COUPLING FACILITY** *cfname* **ADDED TO THE CONFIGURATION OF PROCESSOR** *procid*

**Where:**

*segment*
The name of the segment that added the coupling facility(CF).

*cfname*
The name of the CF.

*procid*
The identifier assigned to the central processing unit (CPU) to which the CF was added.

**Explanation:** The ZMCFT ADD command was entered to add a CF for a processor. This message indicates that the CF referenced in the message was added successfully for the processor.

**System Action:** The coupling facility status table (CFST) was updated to indicate that the CF was added for the processor.

**User Response:** Perform an initial program load (IPL) of the processor to which the CF was just added so you can use the CF that was just added.

See *TPF Operations* for more information about the ZMCFT ADD command.

---

**MCFT0030T** *segment* **– COUPLING FACILITY** *cfname* **NOT ADDED – CF LOCK ERROR**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ADD command was entered to add a CF for a processor. However, an error occurred while trying to update the CF lock, which is used to serialize operations.

**System Action:** The ZMCFT ADD command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZMCFT ADD command.

---

**MCFT0031I** *segment* **– NO COUPLING FACILITY STATUS TABLE ENTRIES WERE AVAILABLE FOR DISPLAY**

**Where:**

*segment*
The name of the segment that issued this message.

**Explanation:** An error occurred because there were no entries in the coupling facility status table (CFST) when one of the following occurred:

- The ZMCFT DISPLAY command with the ALL parameter specified was entered to display status information for all coupling facilities (CFs) in the processor configuration.
- The ZMCFT DISPLAY command with the ALL parameter and a processor ID specified was entered to display status information for all CFs in the processor configuration.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCFT DISPLAY command.

---

**MCFT0032T** *segment* **– COUPLING FACILITY** *cfname* **NOT ADDED – PROCESSOR ID SPECIFIED NOT VALID**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ADD command was entered to add a CF for a processor, but the processor identifier (ID) specified was not valid because:

- The processor ID is not defined for the complex.
- The processor ID is for the central processing unit (CPU) processing the ZMCFT ADD command.

**System Action:** The ZMCFT ADD command is rejected.

**User Response:** Do one of the following:

- Enter the ZMCFT ADD command again, specifying a processor ID that is already defined in the complex.
- If you are not adding a CF to another processor configuration, enter the ZMCFT ADD command again, specifying a symbolic device address (SDA) rather than a processor ID.

See *TPF Operations* for more information about the ZMCFT ADD command.

---

**MCFT0033T** *segment* **– COUPLING FACILITY** *cfname* **NOT ADDED – COUPLING FACILITY DOES NOT EXIST FOR THIS PROCESSOR**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT ADD command was entered to add a CF for a processor other than the processor processing the ZMCFT ADD command, but the CF has not been added to this processor configuration.

**System Action:** The ZMCFT ADD command is rejected and the CF is not added to the processor that is specified in the ZMCFT ADD command.

**User Response:** Do one of the following:

- Enter the ZMCFT ADD command again from a processor that already has the CF defined.
- Do the following:

1. Enter the ZMCFT ADD command again to add the CF to the processor that is processing the ZMCFT ADD command.
2. Enter the ZMCFT ADD command again to add the CF to the other processor.

See *TPF Operations* for more information about the ZMCFT ADD command.

---

**MCFT0034T** *segment* **– INCORRECT PROCESSOR ID SPECIFIED**

**Where:**

*segment*
The name of the segment that detected the error.

**Explanation:** An error occurred because the processor ID specified for the ZMCFT command is not defined in the complex.

**System Action:** The command is rejected.

**User Response:** Enter the ZMCFT command again and specify a valid processor ID.

See *TPF Operations* for more information about the ZMCFT command.

---

**MCFT0035I** *segment* **– COUPLING FACILITY** *cfname* **CLEARED**

**Where:**

*segment*
The name of the segment that cleared the coupling facility (CF).

*cfname*
The name of the CF.

**Explanation:** The ZMCFT CLEAR command was entered to remove CF structures from a CF.

**System Action:** The CF structures were removed successfully.

**User Response:** None.

See *TPF Operations* for more information about the ZMCFT CLEAR command.

---

**MCFT0036E** *segment* **– COUPLING FACILITY** *cfname* **COULD NOT BE CLEARED**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT CLEAR command was entered to remove CF structures from the CF referenced in the message. However, an error occurred because the CF that you specified is experiencing a hardware problem.

**System Action:** The ZMCFT CLEAR command is rejected.

**User Response:** Do the following:

1. Correct the hardware error on the CF. For additional help, review previous error messages that detailed specific information about the hardware error.
2. Enter the ZMCFT CLEAR command again to remove CF structures from the CF.

See *TPF Operations* for more information about the ZMCFT CLEAR command.

---

**MCFT0038E** *segment* **– CONNECTION** *connname* **DELETED FOR STRUCTURE** *strname* **ON CF** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*conname*
The name of the connection.

*strname*
The name of the coupling facility (CF) structure.

*cfname*
The name of the CF.

**Explanation:** The ZMCFT ENABLE command was entered to resume normal operations of a CF that was active previously but became inactive when an error occurred. During the processing of this command, an attempt to verify the existence of the CF structure referenced in the message revealed that it is no longer allocated on the CF referenced in the message. This error condition usually indicates that the CF has been reinitialized while it was disabled, causing a loss of all data in the CF.

**System Action:** The CF control blocks are updated to indicate that the connection no longer exists.

**User Response:** Do the following:

1. Stop all applications that are using the connection referenced in the message.
2. If the CF was not restarted while it was disabled, review the console log for an indication of why the CF structure is no longer allocated.
3. Correct the error.

See *TPF Operations* for more information about the ZMCFT ENABLE command.

---

**MCFT0039E** *segment* **– STRUCTURE** *strname* **DELETED ON CF** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*strname*
The name of the coupling facility (CF) structure.

*cfname*
The name of the CF.

**Explanation:** The ZMCFT ENABLE command was entered to resume normal operations of a CF that was active previously but became inactive when an error occurred. During the processing of this command, an attempt to verify the existence of the CF structure referenced in the message revealed that it

is no longer allocated on the CF referenced in the message. This error condition usually indicates that the CF has been reinitialized while it was disabled, causing a loss of all data in the CF.

**System Action:** The CF control blocks are updated to indicate that the CF structure no longer exists.

**User Response:** Do the following:

1. If the CF was not restarted while it was disabled, review the console log for an indication of why the CF structure is no longer allocated.
2. Correct the error.

See *TPF Operations* for more information about the ZMCFT ENABLE command.

---

**MCFT0040E** *segment* **– UNABLE TO OBTAIN SUFFICIENT RETRY BUFFERS FOR COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the coupling facility (CF).

**Explanation:** A ZMCFT ADD or ZMCFT ENABLE command was entered, but the TPF system was unable to obtain suffficient retry buffers for the specified CF. This error is usually received after one or more TPF systems attached to the specified CF did not have an initial program load (IPL) performed again or were not deactivated after a system failure.

**System Action:** One of the following occurs:

- If this message is received in response to a ZMCFT ADD command, the specified CF is added to the system configuration.
- If this message is received in response to a ZMCFT ENABLE command, the specified CF is enabled.

Normal CF operations are unaffected. However, the TPF system may not be able to perform the appropriate error recovery procedure in the event that certain CF errors are encountered.

**User Response:** Enter the ZPSMS command to properly deactivate any TPF systems that were attached to the specified CF when a system failure occurred.

See *TPF Operations* for more information about the ZMCFT ADD, ZMCFT ENABLE, and ZPSMS commands.

---

**MCFT0041T** *segment* **– COUPLING FACILITY** *cfname* **– SPECIFIED PROCESSOR ID STILL ACTIVE**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the CF.

**Explanation:** The ZMCFT ADD, ZMCFT DELETE, or ZMCFT REMOVE command was entered to perform an action for another processor while the processor is still active.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Ensure the processor is inactive.
- Enter the ZMCFT ADD, ZMCFT DELETE, or ZMCFT REMOVE command directly to the processor rather than from another processor.

See *TPF Operations* for more information about the ZMCFT ADD, ZMCFT DELETE, or ZMCFT REMOVE command.

---

**MCFT0042T** *segment* **– COUPLING FACILITY** *cfname* **NOT DELETED – SPECIFIED PROCESSOR ID NOT VALID**

**Where:**

*segment*
The name of the segment that detected the error.

*cfname*
The name of the CF.

**Explanation:** The ZMCFT DELETE command was entered, but the processor identifier (ID) specified was not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZMCFT DELETE command again specifying a valid processor ID.

See *TPF Operations* for more information about the ZMCFT DELETE command.

---

**MCFT0043I** *segment* **– COUPLING FACILITY** *cfname* **DELETED FROM THE CONFIGURATION OF PROCESSOR** *procid*

**Where:**

*segment*
The name of the segment that deleted the coupling facility (CF).

*cfname*
The name of the CF.

*procid*
The identifier (ID) assigned to the central processing unit (CPU) from which the CF was deleted.

**Explanation:** The ZMCFT DELETE command was entered to delete a CF from a processor. This message indicates that the CF referenced in the message was deleted successfully from the processor.

**System Action:** The coupling facility status table (CFST) is updated to indicate that the CF was deleted from the processor.

**User Response:** None.

See *TPF Operations* for more information about the ZMCFT DELETE command.

---

**MCFT0047I** *segment* **– ZMCFT DISPLAY**

**Where:**

*segment*
The name of the segment that issued this message.

**Explanation:** This is the normal response to the ZMCFT DISPLAY command with a specific coupling facility (CF) specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCFT DISPLAY command and for an example of the informational display.

---

**MCFT0048I** *segment* **– CONNECTION TO STRUCTURE** *strname* **ON COUPLING FACILITY** *cfname* **WAS REMOVED FOR PROCESSOR** *procid*

**Where:**

*segment*
The name of the segment that removed the connection.

*strname*
The name of the coupling facility (CF) structure.

*cfname*
The name of the CF.

*procid*
The identifier assigned to the central processing unit (CPU) for which the connection was removed.

**Explanation:** The ZMCFT REMOVE command was entered to remove a processor connection to a CF structure and the processor connection was removed successfully.

**System Action:** The processor connection to a CF structure has been removed.

**User Response:** None.

See *TPF Operations* for more information about the ZMCFT REMOVE command.

---

**MCFT0049E** *segment* **– CONNECTION TO STRUCTURE** *strname* **ON COUPLING FACILITY** *cfname* **COULD NOT BE REMOVED – COUPLING FACILITY ERROR**

**Where:**

*segment*
The name of the segment that detected the error.

*strname*
The name of the coupling facility (CF) structure.

*cfname*
The name of the CF.

**Explanation:** The ZMCFT REMOVE command was entered to remove a processor connection to a CF structure, but an error occurred because the CF specified is experiencing a hardware problem.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Correct the hardware problem on the CF. For additional help, review previous error messages that describe specific information about the hardware error.
2. Enter the ZMCFT REMOVE command again to remove the processor connection to the CF structure.

See *TPF Operations* for more information about the ZMCFT REMOVE command.

---

**MCFT0050E** *segment* **– CONNECTION TO STRUCTURE** *strname* **ON COUPLING FACILITY** *cfname* **COULD NOT BE REMOVED – THERE ARE STILL ACTIVE CONNECTIONS**

**Where:**

*segment*
The name of the segment that detected the error.

*strname*
The name of the coupling facility (CF) structure.

*cfname*
The name of the CF.

**Explanation:** The ZMCFT REMOVE command was entered to remove a processor connection to a CF structure, but an error occurred because the processor still has active connections to the CF structure in main storage.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Use the appropriate method to stop the function from using the CF structure; for example, enter the ZCFLK DELETE command to remove a CF from the CF locking configuration.
2. Enter the ZMCFT REMOVE command again.

See *TPF Operations* for more information about the ZMCFT REMOVE and ZCFLK DELETE commands.

---

**MCFT0051E** *segment* **– STRUCTURE** *strname* **DOES NOT EXIST ON COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*strname*
The name of the coupling facility (CF) structure.

*cfname*
The name of the CF.

**Explanation:** The ZMCFT REMOVE command was entered to remove a processor connection to a CF structure, but an error occurred because the CF structure specified does not exist on the CF specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMCFT DISPLAY command to display the status of the CF in the processor configuration.
2. Verify that you specified the correct CF structure name when you entered the ZMCFT REMOVE command.

3. Enter the ZMCFT REMOVE command again and specify the correct CF structure name.

See *TPF Operations* for more information about the ZMCFT REMOVE and ZMCFT DISPLAY commands.

---

**MCFT0052E** *segment* **– PROCESSOR** *procid* **NOT CONNECTED TO STRUCTURE** *strname* **ON COUPLING FACILITY** *cfname*

**Where:**

*segment*
The name of the segment that detected the error.

*procid*
The identifier (ID) assigned to the central processing unit (CPU) for which the connection was attempting to be removed.

*strname*
The name of the coupling facility (CF) structure.

*cfname*
The name of the coupling facility (CF).

**Explanation:** The ZMCFT REMOVE command was entered to remove a processor connection to the CF structure, but an error occurred because the processor is not connected to the CF structure.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMCFT DISPLAY command to display the processors that are connected to a CF structure.
2. Do one of the following:
   - Enter the ZMCFT REMOVE command again on a processor that is connected to a CF structure.
   - Enter the ZMCFT REMOVE command again and specify a valid processor ID.

See *TPF Operations* for more information about the ZMCFT REMOVE and ZMCFT DISPLAY commands.

# MCHR–MCPY

---

**MCHR0001I** *mchr record_type record_size*

**Where:**

*mchr*
The address of the MCHR.

*record_type*
The record type.

*record_size*
The size of the record.

**Explanation:** This is a display of the MCHR for the address requested. In addition, information about the record type and the size of the record are provided.

This is an informational message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCHR command.

---

**MCHR0050E INVALID FARF ADDRESS**

**Explanation:** A character that is not valid was found in the file address reference format (FARF) address input parameter or the address provided was too long or too short.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCHR command.

---

**MCHR0051E FARF ADDRESS DOES NOT CONVERT**

**Explanation:** The address provided could not be converted to a file address reference format (FARF) address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCHR command.

---

**MCHR0052E INVALID FORMAT**

**Explanation:** Additional data was detected after the address parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCHR command.

---

**MCPY0010W ****** WARNING ****** ATTENTION OPERATIONS/COVERAGE ****** MCPY** *copynbr* **: COPY END-OF-JOB COULD NOT TALK TO PROCESSOR** *cpuid* **PROCESSOR MAY BE OUT OF SYNCH AND MAY NEED TO BE IPL'ED**

**Where:**

*copynbr*
The slot number of the module that is being copied.

*cpuid*
The ID of the central processing unit (CPU).

**Explanation:** A ZMCPY command was entered but a condition was detected that would not let processing complete on the processor indicated in the message.

**System Action:** Processing ends.

**User Response:** Do the following:

1. See your system programmer to determine if an initial program load (IPL) is necessary.
2. If necessary, IPL the processor.
3. Enter the ZMCPY command again.

See *TPF Operations* for more information about the ZRIPL command and IPLing the TPF system.

**MCPY0201T MCPY *copynbr* INVALID PARAMETERS. TRY 'ZMCPY HELP'**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The format of the ZMCPY command is not correct.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZMCPY command.
2. Enter the ZMCPY command again using the correct format.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0202T MCPY *copynbr* INVALID MODULE NUMBER**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The device address specified does not contain valid hexadecimal characters or contains more than 4 characters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ALL command.

**MCPY0203T MCPY *copynbr* COPY PROCEEDING TO ABORT**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This is the normal response to the ZMCPY ABORT command.

**System Action:** The ZMCPY function that was active ends.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ABORT command.

**MCPY0204T MCPY *copynbr* UNABLE TO READ CTKM**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** Copy requested the CTKM keypoint to be read but the TPF system was unable to do so.

**System Action:** Copy is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0205T MCPY *copynbr* MODULE ALREADY IN COPY**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** An attempt was made to start a new copy when there is already a copy active on one of the subsystems. The active copy must be allowed to complete before starting a new copy or the active copy must be aborted by entering the ZMCPY ABORT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0206T MCPY *copynbr* FROM/TO DEVICE ADDRESS NOT FOUND IN CTK0**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The specified device address was not found in CTK0, which is suppose to contain all the valid module addresses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ALL command.

**MCPY0207T MCPY *copynbr* COPY NOT ACTIVE IN THIS SUBSYSTEM**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** A ZMCPY command was entered but the specified copy is not active on this subsystem.

**System Action:** The command is rejected.

**User Response:** Enter the ZMCPY command again and specify the correct copy number from the correct subsystem.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0208T MCPY *copynbr* COPY SLOT ALREADY ACTIVE. CHECK ALL PROCESSORS**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** A ZMCPY command was entered but the specified copy is already active.

**System Action:** The command is rejected.

**User Response:** Enter the ZMCPY command again and specify the correct copy number.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0209I MCPY *copynbr* COPY STARTING...**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This is the normal response to the ZMCPY UP, ZMCPY ALL, or ZMCPY RESTART command.

**System Action:** The copy function is started.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY UP, ZMCPY ALL, or ZMCPY RESTART command.

---

**MCPY0210T MCPY *copynbr* UNABLE TO CLEAR CONTROL UNIT LOCKS FOR 'TO' MOD**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** While trying to mount the TO device, the TPF system tried to clear the limited lock facility (LLF) lock table in the control unit and was not successful.

**System Action:** Copy is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0211T MCPY *copynbr* COPY NOT ACTIVE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** A ZMCPY command was entered but the specified copy is not active on any subsystem.

**System Action:** The command is rejected.

**User Response:** Enter the ZMCPY command again and specify the correct copy number from the correct subsystem.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0212T MCPY *copynbr* RESTART ERROR - MOD NOT IN COPY STATE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The ZMCPY RESTART command was specified but the from module is not currently marked in copy state.

**System Action:** Any active copy is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY RESTART command.

---

**MCPY0213T MCPY *copynbr* 'FROM' MOD IS OFFLINE TO SUBSYSTEM**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The specified FROM device is currently marked offline in the subsystem.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0214T MCPY *copynbr* UNABLE TO READ CTK6**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** Copy requested the CTK6 keypoint to be read but the TPF system was unable to do so.

**System Action:** Copy is not started or, if it is already active, copy is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0215T MCPY *copynbr* UNABLE TO READ CTKV**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** Copy requested that CTKV keypoint be read but the TPF system was unable to do so.

**System Action:** Copy is not started or, if it is already active, copy is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0216T MCPY *copynbr* UNABLE TO ACCESS MODULE VERIFICATION TABLE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** Copy requested that the MVT be read but the TPF system was unable to do so.

**System Action:** Copy is not started or, if it is already active, copy is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0217T MCPY *copynbr* UNABLE TO ACCESS 'TO' MOD**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The TPF system was unable to issue a successful input/output (I/O) request to the TO device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0218I MCPY *copynbr copytype* STARTED**

**Where:**

*copynbr*
The slot number of the module that is being copied.

*copytype*
One of the following:

- DUPE UPDATE
- ALL FILE COPY

**Explanation:** This is the normal response to the ZMCPY ALL command.

**System Action:** The copy function is started.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ALL command.

**MCPY0219T MCPY *copynbr* 'TO' MOD IS IN-USE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The specified TO device is currently in use for some other function.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0220T MCPY *copynbr* INVALID COPY NUMBER**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** A ZMCPY command was entered with a module copy number specified that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZMCPY command again and specify a valid module copy number.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0221T MCPY *copynbr* I/O ERROR ON VSN OF 'FROM' MODULE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The function received an input/output (I/O) error while trying to write BADPAK on the FROM module during copy end-of-job processing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0222T MCPY *copynbr* I/O ERROR ON VSN OF COPY MODULE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The copy function saves the original volume serial number (VSN) of the TO module in CTKB and changes the VSN on the TO pack to *ccnnnn*. This message occurs when the function receives an input/output (I/O) error while trying to write the VSN while entering a ZMCPY ALL command.

**System Action:** The copy request ends.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0223T MCPY *copynbr* PATHID FOR COPY 'TO' CONTROL UNIT IS INVALID**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The value of the path ID for the control unit of the TO device is the same as the values for the path IDs of the other control units (CU).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0224T MCPY *copynbr* *TO* VSN PREFIX IS *xx* SHOULD BE *yy***

**Where:**

*copynbr*
The slot number of the module that is being copied.

*xx* The alphabetic prefix found on the module.

*yy* The alphabetic prefix in CTKV for this subsystem.

**Explanation:** The function issues this message when processing a ZMCPY request if the volume serial number (VSN) prefixes are not equal.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY command.

---

**MCPY0225E** *segment* **– A COUPLING FACILITY RECONFIGURATION IS IN PROGRESS – PLEASE RETRY THE ZMCPY COMMAND WHEN THE RECONFIGURATION HAS COMPLETED**

**Where:**

*segment*
The name of the segment that encountered the error.

**Explanation:** A ZMCPY ALL, ZMCPY RESTART, or ZMCPY UP command was entered while a change in the coupling facility (CF) locking configuration is active. Because the change in the CF locking configuration may change the residency of the copy lock, and the copy lock is not moved in move locks, it is better to wait until the CF locking configuration change has been completed before entering any of these ZMCPY commands again.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the change in the CF locking configuration to complete.
2. Enter the appropriate ZMCPY command.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0226T** **MCPY** *copynbr* **NO RECORD FOUND ON WRITE, CYL** *xxxx* **HD** *yy* **CHECK MOD FORMAT**

**Where:**

*copynbr*
The slot number of the module that is being copied.

*xxxx*
The cylinder address of track in error.

*yy* The head address of track in error.

**Explanation:** While writing a track to the TO module, the device signaled it was unable to locate the specified record. This usually is caused by an improperly formatted module.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0227T** **MCPY** *copynbr* **COPY NOW NOT ACTIVE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** A ZMCPY ABORT command was entered but there is no active copy to abort.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ABORT command.

---

**MCPY0228T** **MCPY** *copynbr copytype* **COMPLETED**

**Where:**

*copynbr*
The slot number of the module that is being copied.

*copytype*
One of the following:

- DUPE UPDATE
- ALL FILE COPY

**Explanation:** This is the normal response to the ZMCPY ALL command.

**System Action:** Processing is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ALL command.

---

**MCPY0229E** **MCPY** *copynbr* **WRITE ERR CYL** *xxxx* **HD** *yy* **NOT COPIED**

**Where:**

*copynbr*
The slot number of the module that is being copied.

*xxxx*
The cylinder number.

*yy* The head number.

**Explanation:** Copy was unable to write the specified track for some reason other than an improperly formatted track.

**System Action:** The track is skipped and copy is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0230E** **MCPY** *copynbr* **UNABLE TO WRITE CYL** *xxxx* **HD** *yy* **RCD** *zz*

**Where:**

*copynbr*
The slot number of the module that is being copied.

*xxxx*
The cylinder number.

*yy* The head number.

*zz* The record number.

**Explanation:** Copy was unable to write the specified record for some reason.

**System Action:** The record is skipped and copy is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY command.

---

**MCPY0231E MCPY** *copynbr* **UNABLE TO READ CYL** *xxxx* **HD** *yy* **RCD** *zz*

**Where:**

*copynbr*
The slot number of the module that is being copied.

*xxxx*
The cylinder number.

*yy* The head number.

*zz* The record number.

**Explanation:** Copy was unable to read the specified record for some reason.

**System Action:** A zeroed record is written and copy is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0232E MCPY** *copynbr* **READ ERR CYL** *xxxx* **HD** *yy* **NOT COPIED**

**Where:**

*copynbr*
The slot number of the module that is being copied.

*xxxx*
The cylinder number.

*yy* The head number.

**Explanation:** Copy was unable to read the specified track for some reason.

**System Action:** The track is skipped and copy is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0233I MCPY** *copynbr* **NOW COPYING CYL** *xxxx* **HD** *yy*

**Where:**

*copynbr*
The slot number of the module that is being copied.

*xxxx*
The hexadecimal device address of the module being copied.

*yy* The hexadecimal device address of the module to which you are copying.

**Explanation:** This is the normal response to the ZMCPY ALL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ALL command.

---

**MCPY0234T MCPY** *copynbr* **INVALID VSN FOUND ON SPECIFIED DISK**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The function issues this message when processing a ZMCPY request of the volume serial number (VSN) for the module specified does not match the volume serial number in keypoint V.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY command.

---

**MCPY0235W MCPY** *copynbr* **UNABLE TO ACCESS CTK6, ABORT CONTINUES**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The ABORT function was unable to read the CTK6 keypoint.

**System Action:** The ABORT function ignores any required updates and continues with the process of aborting the active copy.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ABORT command.

---

**MCPY0236T MCPY** *copynbr copytype* **ABORTED**

**Where:**

*copynbr*
The slot number of the module that is being copied.

*copytype*
One of the following:

- ALL FILE COPY
- ALL COPIES
- DUPE UPDATE

**Explanation:** This is the normal response to the ZMCPY ABORT command or an indication that the TPF system has ended a ZMCPY command because of an internal error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0237T MCPY *copynbr* NO COPY TO RESTART**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** A ZMCPY RESTART command was entered but there is no active copy to restart according to the TPF keypoints.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY RESTART command.

**MCPY0238I MCPY *copynbr* START IPC MSG RCVD**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This is the normal response to the ZMCPY ALL command in a loosely coupled complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ALL command.

**MCPY0239T MCPY *copynbr* MODULE DOWN**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The copy FROM device was taken off line by CCSONS because of some hardware failure.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0241T MCPY *copynbr* ERROR MANIPULATING COPY LOCKS**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** Copy received an input/output (I/O) error while trying to change the special copy lock in the control unit for the FROM device.

**System Action:** Copy is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0242T MCPY *copynbr* FROM/TO DEVICES INCOMPATIBLE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The device types of the FROM and TO devices are not compatible. They must be the same device type.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands

**MCPY0243I MCPY *copynbr* VSN MAY BE DESTROYED, ABORT COPY AND RETRY**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** While trying to write the IPL programs to the device, an input/output (I/O) error was encountered that may have caused the track to be erased.

**System Action:** None.

**User Response:** Do the following:

1. Abort the copy.
2. Try the copy again. If it still fails, the device should be reformatted and the copy tried again.

See *TPF Operations* for more information about the ZMCPY commands

**MCPY0244T MCPY *copynbr* SUBSYSTEM *aaaa* HAS A COPY ACTIVE IN THE SON FILE TABLE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

*aaaa*
The subsystem name (four characters).

**Explanation:** The subsystem named in the message has a module marked in copy. The copy must be allowed to complete or be aborted before a new copy can be started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

**MCPY0245I MCPY *copynbr* IPL RECORDS SUCCESSFULLY COPIED**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This is a normal message from copy stating that the IPL records on cylinder 0 track 0 were written successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY command.

---

**MCPY0246I MCPY *copynbr* UNABLE TO COPY IPL RECORDS**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** Copy was unable to successfully copy the IPL records to the TO device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0247I MCPY *copynbr* ENTERING EOJ**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This is the normal response to the ZMCPY ALL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ALL command.

---

**MCPY0248I MCPY *copynbr* ABORT IPC MSG RCVD**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This is the normal response to the ZMCPY ABORT command as well as an error message for the ZMCPY ALL command.

This message is issued only when there is more than one active processor in the complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0249T MCPY *copynbr* UNABLE TO RESTART, MASTER PROCESSOR ACTIVE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** Copy will not allow a restart request other than from the original (master) logical processor. If the master is not capable of processing, it must be deactivated before copy allows a restart from some other logical processor.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0250T MCPY *copynbr* RESTART ABORTED, NO COPY LOCK FOUND**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** Copy will not allow a restart when the copy lock is still not in the correct control unit for the type of copy being processed.

**System Action:** Copy will abort the copy when the lock is missing because that means that the data on the TO device was not kept current.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0251T MCPY *copynbr* TO DEVICE NOT DEFINED TO SYSTEM**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The specified TO device address was not defined in the IOCP generation for the hardware processor. CIO did not find a subchannel for the specified device number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0252T MCPY *copynbr* TO DEVICE IS UNUSABLE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This error occurs during processing of the ZMCPY command. An attempt was made to mount a device through CPAB but an input/output (I/O) error occurred while trying to mount the 3990 Record Cache Subsystem device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0258T MCPY *copynbr* NO COPY TO PAUSE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The ZMCPY PAUSE command was entered and no copies were active or the specified copy was not active.

**System Action:** The command is rejected.

**User Response:** Enter the ZMCPY PAUSE command again and specify the correct number of the copy that you want to pause.

See *TPF Operations* for more information about the ZMCPY PAUSE command.

**MCPY0261I MCPY *copynbr* COPY PAUSED**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This is the normal response to the ZMCPY PAUSE command.

**System Action:** The module copy function is paused.

**User Response:** Enter the ZMCPY RESTART command to restart the module copy function when appropriate.

See *TPF Operations* for more information about the ZMCPY PAUSE and ZMCPY RESTART commands.

**MCPY0264T MCPY *copynbr* MAX # OF COPIES IN COMPLEX ALREADY ACTIVE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The ZMCPY ALL command was entered but the number of active module copies in the processor complex is already equal to the maximum number that was set by using the ZMCPY SET command.

**System Action:** The ZMCPY ALL command is rejected.

**User Response:** Do the following:

1. Wait for a module copy to be completed.
2. Enter the ZMCPY ALL command again.

See *TPF Operations* for more information about the ZMCPY ALL and ZMCPY SET commands.

**MCPY0265T MCPY *copynbr* MAX # OF COPIES THIS CPU ALREADY ACTIVE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The ZMCPY ALL command was entered but the number of active module copies on the processor is already equal to the maximum number that was set by using the ZMCPY SET command.

**System Action:** The ZMCPY ALL command is rejected.

**User Response:** Do the following:

1. Wait for a module copy to be completed.
2. Enter the ZMCPY ALL command again.

See *TPF Operations* for more information about ZMCPY ALL and ZMCPY SET commands.

**MCPY0266T MCPY *copynbr* MAX # OF COPIES THIS CHANNEL ALREADY ACTIVE**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The ZMCPY ALL command was entered but the number of active module copies on the channel is already equal to the maximum number that was set by using the ZMCPY SET command.

**System Action:** The ZMCPY ALL command is rejected.

**User Response:** Do the following:

1. Wait for a module copy to be completed.
2. Enter the ZMCPY ALL command again.

See *TPF Operations* for more information about the ZMCPY ALL and ZMCPY SET commands.

**MCPY0267T MCPY *copynbr* MAX # OF COPIES THIS CTL UNIT ALREADY ACTIVE**

**Explanation:** The ZMCPY ALL command was entered but the number of active module copies on the control unit is already equal to the maximum number that was set by using the ZMCPY SET command.

**System Action:** The ZMCPY ALL command is rejected.

**User Response:** Do the following:

1. Wait for a module copy to be completed.
2. Enter the ZMCPY ALL command again.

See *TPF Operations* for more information about the ZMCPY ALL and ZMCPY SET commands.

**MCPY0268I MCPY *copynbr* COPY PAUSING**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This is the normal response to the ZMCPY PAUSE command.

**System Action:** The module copy function is in the process of pausing.

**User Response:** Enter the ZMCPY RESTART command to restart the module copy function when appropriate.

See *TPF Operations* for more information about the ZMCPY PAUSE and ZMCPY RESTART commands.

**MCPY0270T MCPY *copynbr* MAXIMUM NUMBER IS TOO HIGH**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The ZMCPY SET command was entered with a specified value that is greater than the maximum number allowed by the TPF system.

**System Action:** The ZMCPY SET command is rejected.

**User Response:** Do the following:

1. Verify the slot number of the module.
2. Enter the ZMCPY SET command again and specify the correct slot number of the module.

See *TPF Operations* for more information about the ZMCPY SET command.

---

**MCPY0271I MCPY *copynbr* ABORT IPC MSG SENT**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** This is the normal response to the ZMCPY ABORT command as well as an error message for the ZMCPY ALL command.

This message is issued only when there is more than one active processor in the complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY ABORT and ZMCPY ALL commands.

---

**MCPY0272E ****** ERROR RETRIEVING KEYPOINT V ******

**Explanation:** A ZMCPY function that was running before a TPF system restart was not successful because keypoint V (CTKV) did not contain the address of the copy control record.

**System Action:** The ZMCPY function ends.

**User Response:** Do the following:

1. Determine which ZMCPY function failed.
2. Enter the ZMCPY command again.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0273E ****** UNEXPECTED FS0/FS1 INFORMATION ******

**Explanation:** A ZMCPY function that was running before a TPF system restart was not successful because the file status table (FSTB) information did not contain the expected information.

**System Action:** The ZMCPY function ends.

**User Response:** Do the following:

1. Determine ZMCPY function failed.
2. Enter the ZMCPY command again.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0274T MCPY *copynbr* RESTART MUST BE FROM SAME PROCESSOR AS START**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** The ZMCPY RESTART command was entered to restart a module copy function from a different processor from which it was started.

**System Action:** The ZMCPY RESTART command is rejected.

**User Response:** Enter the ZMCPY RESTART command again on the processor from which the module copy was started.

See *TPF Operations* for more information about the ZMCPY RESTART command.

---

**MCPY0275T MCPY *copynbr* COPY NOT RUNNING ON THIS SUBSYSTEM**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** A ZMCPY command was entered and either no copies are active or a specified copy is not active on this subsystem.

**System Action:** The command is rejected.

**User Response:** Enter the ZMCPY command again and specify the correct copy number from the correct subsystem.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0276I MCPY *copynbr* MAXIMUM NUMBER OF COPIES ALLOWED: COMPLEX = *maxplex* CHANNEL = *maxchan* CU = *maxcu* PROCESSOR = *maxproc***

**Where:**

*copynbr*
The slot number of the module that is being copied.

*maxplex*
The maximum number of module copies that can run concurrently in a processor complex.

*maxchan*
The maximum number of module copies that can run concurrently on a channel.

*maxcu*
The maximum number of module copies that can run concurrently on a control unit (CU).

*maxproc*
The maximum number of module copies that can run concurrently on a processor.

**Explanation:** This is the normal response to the ZMCPY SET command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY SET command.

---

**MCPY0277T MCPY *copynbr* SYSTEM STILL IN RESTART... TRY LATER...**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** A ZMCPY command was entered but the TPF system did not respond because it is in system restart.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for system restart to be completed.
2. Enter the ZMCPY command again.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0278T MCPY *copynbr* COPY ALREADY ACTIVE IN ANOTHER SUBSYSTEM**

**Where:**

*copynbr*
The slot number of the module that is being copied.

**Explanation:** A ZMCPY command was entered but the specified copy is already active on another subsystem.

**System Action:** The command is rejected.

**User Response:** Enter the ZMCPY command again and specify the correct copy number from the correct subsystem.

See *TPF Operations* for more information about the ZMCPY commands.

---

**MCPY0290I COPY *copynbr* - *copystatus* ON PROC *cpuid***

**Where:**

*copynbr*
The slot number of the module that is being copied.

*copystatus*
One of the following:

- ALL FILE COPY ACTIVE
- ALL FILE COPY ABORTING
- ALL FILE COPY PAUSING
- ALL FILE COPY PAUSED
- DUPE UPDATE ACTIVE
- DUPE UPDATE ABORTING
- DUPE UPDATE PAUSING
- DUPE UPDATE PAUSED

*cpuid*
The identifier (ID) of the processor.

**Explanation:** This is the normal response to the ZMCPY STATUS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY STATUS command.

---

**MCPY0291W MOD *xxx* MAY NOT BE IN DIRECT MODE**

**Where:**

*xxx* The symbolic module number.

**Explanation:** The ZMCPY DOWN command was entered to take a device offline, but there may have been an error that prevented the device from being put in direct mode. Putting the device in direct mode allows other processors not running the TPF system to access the device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the the ZMCPY DOWN command. See *TPF Database Reference* for more information about direct mode.

---

**MCPY0292W ATT: THESE COPIES ARE OWNED BY ANOTHER SUBSYSTEM**

**Explanation:** The ZMCPY STATUS command was entered from one subsystem and there are ZMCPY functions being performed by another subsystem.

See *TPF Operations* for more information about the ZMCPY STATUS command.

**System Action:** None.

**User Response:** None.

---

**MCPY0293E ATT: THIS PROCESSOR IS OUT OF SYNCH AND NEEDS AN IPL!!! BEFORE YOU RETRY ZMCPY ENTRIES, PLEASE, IPL THIS PROCESSOR.**

**Explanation:** A ZMCPY command was entered but the function could not be completed because an internal processor synchronization error occurred while trying to file the copy control record.

**System Action:** Processing ends.

**User Response:** Do the following:

1. See your system programmer to determine if an initial program load (IPL) is necessary.
2. If necessary, IPL the processor.
3. Enter the ZMCPY command again.

See *TPF Operations* for more information about the ZRIPL command and IPLing the TPF system.

---

**MCPY0294I OK MOD *xxx* OFF DEVICE *yyyy***

**Where:**

*xxx* The symbolic module number.

*yyyy*
The device address.

**Explanation:** This is the normal response when the ZMCPY DOWN command is completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY DOWN command.

**MCPY0295T UNABLE TO FIND KEYPOINT 6**

**Explanation:** The ZMCPY DOWN command was entered but an error occurred while trying to retrieve keypoint 6 (CTK6).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY DOWN command.

**MCPY0296T MOD *xxx* NOT ON DEVICE *yyyy***

**Where:**

*xxx* The symbolic module number.

*yyyy*
The device address.

**Explanation:** The ZMCPY DOWN command was entered but an error occurred for one of the following reasons:

- The device address specified does not correspond to the device address in the module file status table (MFST) for the specified module.
- The module number specified does not correspond to the module number in the module cross-reference table.
- The module does not belong to the subsystem processing the message.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY DOWN command.

**MCPY0297T MOD *xxx* OFFLINE**

**Where:**

*xxx* The symbolic module number.

**Explanation:** The ZMCPY DOWN command was entered but the module cannot be taken down because it is already offline.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY DOWN command

**MCPY0298T MOD *xxx* IN UTILITY STATUS**

**Where:**

*xxx* The symbolic module number.

**Explanation:** The ZMCPY DOWN command was entered to take a module offline but the module cannot be taken offline.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY DOWN command.

**MCPY0299T DUP OF MOD *xxx* NOT USABLE**

**Where:**

*xxx* The symbolic module number.

**Explanation:** The ZMCPY DOWN command was entered but an error occurred because section 0 of the module file status table (MFST) indicates that the module is not available or is being copied.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMCPY DOWN command.

# MEAS–MPIF

**MEAS0001I STARTING**

**Explanation:** This is the normal response to a command starting data collection.

**System Action:** None.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

**MEAS0002I TERMINATION REQUESTED**

**Explanation:** A command was entered to stop data collection. Data collection stops at the end of the current sampling mode period and at the end of the current continuous mode interval.

**System Action:** None.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

**MEAS0003I TERMINATED**

**Explanation:** This is the normal response when data collection finishes successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and*

*Measurement Reference* for more information about system performance.

**MEAS0004I STARTING (NO COMPLEXWIDE DATA WILL BE COLLECTED)**

**Explanation:** This is the normal response to a command starting data collection on a CPU excluded from collecting complex-wide data.

**System Action:** None.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

**MEAS0005I TERMINATED (NO COMPLEXWIDE DATA WAS COLLECTED)**

**Explanation:** This is the normal response when data collection finishes successfully on a CPU excluded from collecting complex-wide data.

**System Action:** None.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

**MEAS0006I NOT ACTIVE**

**Explanation:** A command specified that data collection was to be stopped even though it was not active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

**MEAS0007I ALREADY ACTIVE**

**Explanation:** There was an attempt to start data collection when it was already active. In addition, an incorrectly spelled ZMEAS END command can generate this message.

**System Action:** None.

**User Response:** Do one of the following:

- Stop data collection by entering the ZMEAS END command.
- Wait until data collection completes.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

**MEAS0008I TERMINATION ALREADY IN PROGRESS**

**Explanation:** A command was entered to stop data collection even though the terminate condition already exists.

**System Action:** None.

**User Response:** Do one of the following:

- Wait for the current sampling mode period to complete.
- Wait for the current continuous mode interval to complete.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

**MEAS0009E SAMPLING PERIOD MUST BE 3 SEC GT THE SUM OF INTERVALS**

**Explanation:** A command specifying a sampling mode request has the sum of the interval plus three seconds greater than or equal to the cycle time. To start collection in this situation, increase the cycle time or decrease the interval time.

**System Action:** None.

**User Response:** Correct the command input.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

**MEAS0010E INVALID COLLECTOR NAME – MUST BE S, F, M, OR P**

**Explanation:** A program collector code that is not valid was found in the sampling mode or continuous mode request. The only collectors activated are:

- S for System Collector
- F for File Collector
- M for Message Collector
- P for Program Collector.

**System Action:** None.

**User Response:** Enter the command again by using the correct format.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

**MEAS0011E INVALID TIME PERIOD SPECIFIED**

**Explanation:** A time field in the input message contained a non-numeric character or a zero.

**System Action:** None.

**User Response:** Enter the command again and specify valid time parameters.

**Note:** If the sampling mode V (variable) task is requested, an interval time must be specified for each collector requested. Also, if the task mode is V, an error in the time parameter is flagged before an error in the collector names.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

### MEAS0012E MORE THAN 'INTVL' PERIODS IN THE LIFE OF DATA COLLECTION

**Explanation:** The number of sampling periods specified (indirectly) in the ZMEAS sampling mode message must not exceed the limit set by the INTVL parameter of the system initialization program (SIP) DATACO macro.

**System Action:** None.

**User Response:** Indicate fewer sampling periods by specifying a shorter duration for the life of data collection in the sampling mode or a longer duration for each sampling period.

The format of the relevant part of the ZMEAS sampling mode message is */mmss/* where *mm* indicates the duration in minutes and *ss* is the duration in seconds. Decrease *mm* to specify a shorter duration for the life of data collection in sampling mode. Increase *ss* to specify a longer duration for each sampling period.

The number of sampling periods is calculated by converting the minutes (*mm*) in the life of data collection to seconds (*mm* *60) and dividing by the seconds (*ss*) in each sampling period. The number of sampling periods may not exceed the INTVL limit.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

### MEAS0013E DUPLICATE COLLECTORS SPECIFIED

**Explanation:** A collector mode (S, F, P, or M) was duplicated in a command specifying sampling mode.

**System Action:** None.

**User Response:** To start collection, submit the request again with unduplicated collector modes.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

### MEAS0014I I/O ERROR READING CTKA

**Explanation:** An input/output (I/O) error occurred when the driver segment attempted to read CTKA.

**System Action:** Collection is continued.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

### MEAS0015I I/O ERROR READING RCIT

**Explanation:** An input/output (I/O) error occurred when the driver segment tried to read an RCIT record.

**System Action:** Collection is continued.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

### MEAS0016I I/O ERROR READING UAT

**Explanation:** An input/output (I/O) error occurred when the driver segment tried to read a UAT record.

**System Action:** Collection is continued.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

### MEAS0017I I/O ERROR READING CTKI

**Explanation:** An input/output (I/O) error occurred when the driver segment tried to read CTKI.

**System Action:** Collection is continued.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

### MEAS0018E SYSTEM IN 1052/UTIL STATE OR CYCLING

**Explanation:** An attempt was made to start data collection when the TPF systemwas in 1052 state, in utility (UTIL) state, or during cycling.

**System Action:** Collection is aborted.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Start collection again.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

### MEAS0019E MOUNT RTC TAPE AND REISSUE ZMEAS

**Explanation:** This message is displayed when an attempt is made to start data collection before the RTC tape is mounted.

**System Action:** None.

**User Response:** Do the following:

1. Mount the RTC tape.
2. Enter the command again.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

### MEAS0020E INVALID INPUT MESSAGE

**Explanation:** An incorrect message to start or stop data collection was entered.

**System Action:** None.

**User Response:** Enter the command again and specify a valid tertiary action code (that is, S, I, V, or END) to start or stop data collection.

See *TPF Operations* and *TPF System Performance and*

*Measurement Reference* for more information about system performance. Also see *TPF Operations* for more information about the correct format for the commands.

---

**MEAS0021E DESIGNATED CPU NOT SYSGENED**

**Explanation:** A request to start data collection was rejected because the CPU designated to collect exclusively complex-wide data was not generated into the TPF system. This prevents the CPU from collecting any data. Data collection starts only when it is reasonable to expect complex-wide data to be collected somewhere in the sysplex.

**System Action:** None.

**User Response:** Select another CPU for data collection. The one selected is not defined to the TPF system.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

---

**MEAS0022E DESIGNATED CPU NOT ACTIVE**

**Explanation:** The request to start data collection is rejected because the CPU designated to collect exclusively complex-wide data is not active. This prevents it from collecting any data. Data collection starts only when it is reasonable to expect complex-wide data to be collected somewhere in the sysplex.

**System Action:** None.

**User Response:** Do one of the following:

- Activate the CPU, if appropriate.
- Refrain from trying to start data collection on that CPU.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

---

**MEAS0023E BSS CYCLING ON DESIGNATED CPU**

**Explanation:** The request to start data collection is rejected because the basic subsystem (BSS) is cycling on the CPU designated to collect exclusively complex-wide data. This prevents it from collecting any data. Data collection starts only when it is reasonable to expect complex-wide data to be collected somewhere in the sysplex.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the TPF system to finish cycling.
2. Enter the data collection command again.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

---

**MEAS0024E BSS BELOW CRAS STATE ON DESIGNATED CPU**

**Explanation:** The request to start data collection is rejected because the basic subsystem (BSS) on the CPU designated to collect exclusively complex-wide data is below the computer room agent set (CRAS) state. This prevents it from collecting any data. Data collection starts only when it is reasonable to expect complex-wide data to be collected somewhere in the sysplex.

**System Action:** None.

**User Response:** Cycle the TPF system to the appropriate state (probably NORM state) by entering the ZCYCL command.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

---

**MEAS0025I RTC TAPE NOT USABLE**

**Explanation:** Data collection detected an error with the RTC tape.

**System Action:** Data collection is ended. Data on the tape should be considered unusable.

**User Response:** None.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

---

**MEAS0026I RTC TAPE TOO SLOW**

**Explanation:** The RTC tape queue threshold was reached.

**System Action:** An attempt is made to collect the end-of-episode records. The RTC tape probably can be reduced.

**User Response:** Do one of the following:

- Do nothing but try to reduce the RTC tape,
- Increase the value of the SKIP parameter of the SIP DATACO macro (this decreases the volume of data collected on the RTC tape),
- Increase the value of the RTCQUEUE symbol of the DC0DC macro (this increases the RTC tape queue threshold), or
- Rerun data collection when the load on the TPF systemis less.

See *TPF Operations* and *TPF System Performance and Measurement Reference* for more information about system performance.

---

**MEAS0027E INVALID SKIP SPECIFIED**

**Explanation:** The skip value specified on the ZMEAS command is not valid because a non-numeric value was specified.

**System Action:** None.

**User Response:** Enter the ZMEAS command again and specify a skip value between 0 and 9999. If you do not specify a skip value, the default value is 99.

See *TPF Operations* for more information about system performance operations and *TPF System Generation* for more information about the skip value.

---

**MEAS0028I DATA COLLECTION HAS BEEN RESET**

**Explanation:** The ZMEAS RESET command has completed.

**System Action:** The TPF 4.1 system assumes that data collection failed and clears any residual data collection status that may otherwise prevent data collectionfrom running again.

The TPF system does the following:

- The data collection hooks are disengaged.
- The data collection common block is returned.
- The data collection lock is released.
- The state-vector portion of the data collection control area is cleared.
- The data collection lethal utility switches (SW@DCOL) are turned off.
- The standby RTC tape is dismounted.
- The active RTC tape is dismounted.

**User Response:** None.

See *TPF Operations* for information about the unusual conditions for which the ZMEAS RESET command is intended.

**MEAS0029I** *cccc* **CURRENT** *pppp* **PREVIOUS** *oooo* **ORIGINAL TAPE THRESHOLDS**

**Where:**

*cccc*
The current RTC tape queue threshold value.

*pppp*
The previous RTC tape queue threshold value.

*oooo*
The original (for example, SIP) RTC tape queue threshold value.

**Explanation:** The ZMEAS Q command has completed. It is used to display and alter the RTC tape queue threshold. The RTC tape is the Data Collection/Reduction tape. When the length of the RTC tape queue reaches this threshold, Data Collection quiesces.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMEAS Q command.

**MEAS0030I ALREADY STARTING**

**Explanation:** The ZMEAS command was entered to start data collection when it was started already.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the ZMEAS END command to stop data collection.
- Wait for data collection to complete.

See *TPF Operations* for more information about the ZMEAS and ZMEAS END commands. See *TPF System Performance and Measurement Reference* for more information about system performance.

**MIGR0001I CTKI CONVERSION COMPLETED, SUBSYSTEM STATE TABLE HAS BEEN MOVED FROM CTKI TO FIXED FILE RECORD TYPE #CN1ST**

**Explanation:** This is a normal response to the ZMIGR command with the CTKI and CONVERT parameters specified.

**System Action:** The subsystem state table has been moved from IC0SST in CTKI to fixed file record type #CN1ST.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0002I CTKI FALLBACK COMPLETED, SUBSYSTEM STATE TABLE HAS BEEN MOVED FROM FIXED FILE RECORD TYPE #CN1ST TO CTKI**

**Explanation:** This is a normal response to the ZMIGR command with the CTKI and FALLBACK parameters specified.

**System Action:** The subsystem state table has moved from fixed file record type #CN1ST to IC0SST in CTKI.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0003I CTKI IS NOT CONVERTED, SUBSYSTEM STATE TABLE IS RESIDENT IN CTKI**

**Explanation:** This is a normal response to the ZMIGR command with the CTKI and STATUS parameters specified.

**System Action:** The current location of the subsystem state table is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0004I CTKI IS CONVERTED, SUBSYSTEM STATE TABLE IS RESIDENT IN FIXED FILE RECORD TYPE #CN1ST**

**Explanation:** This is a normal response to the ZMIGR command with the CTKI and STATUS parameters specified.

**System Action:** The current location of the subsystem state table is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0005T PARAMETER IS NOT VALID**

**Explanation:** The ZMIGR command was entered with an incorrect or missing parameter.

**System Action:** The ZMIGR command help message is displayed.

**User Response:** Enter the ZMIGR command with the correct parameters specified.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0006T UNABLE TO CONVERT DUE TO UNMIGRATED PROCESSORS**

**Explanation:** The ZMIGR command was entered with the CONVERT parameter specified, but all the processors in the loosely coupled complex are not migrated to 32-way loosely coupled processor support. All processors in the loosely coupled complex must be migrated to 32-way loosely coupled processor support before this command is entered.

**System Action:** Data remains in the unconverted format and the entry control block (ECB) exits.

**User Response:** Do the following:

1. Make sure that all active processors in the loosely coupled complex have been IPLed with an image containing 32-way loosely coupled processor support.
2. Enter the ZMIGR command again with the CONVERT parameter specified.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0007W CTKI IS ALREADY IN REQUESTED STATE**

**Explanation:** One of the following occurred:

- The ZMIGR command was entered with the CTKI and CONVERT parameters specified, but CTKI was in 32-way loosely coupled format.
- The ZMIGR command was entered with the CTKI and FALLBACK parameters specified, but CTKI is not in 32-way loosely coupled format.

**System Action:** Data format is unchanged and the entry control block (ECB) exits.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0008T CONVERSION NOT ALLOWED WITH MORE THAN 8 PROCESSORS**

**Explanation:** The ZMIGR command was entered with the CONVERT or FALLBACK parameter specified in a loosely coupled complex with more than eight processors generated. This is not allowed because processor data beyond the eighth processor would be lost.

**System Action:** Data format is unchanged and the entry control block (ECB) exits.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0009I** *record* **CONVERSION COMPLETED**

**Where:**

*record*
The record type whose keypoint control record was converted.

**Explanation:** This is the normal response to the ZMIGR command with the KEYPOINT and CONVERT parameters specified. The keypoint control record for the specified record type was converted to 32-way loosely coupled format.

**System Action:** Conversion continues with the next record type.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0010I KEYPOINT** *function* **REQUEST COMPLETED**

**Where:**

*function*
The KEYPOINT function parameter: CONVERT, FALLBACK, or STATUS.

**Explanation:** This is the normal response to the ZMIGR command with the KEYPOINT parameter specified. All keypoint records are processed.

**System Action:** The function specified in the ZMIGR command is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0011I** *record* **FALLBACK COMPLETED**

**Where:**

*record*
The record type for which fallback of the control record is completed.

**Explanation:** This is the normal response to the ZMIGR command with the KEYPOINT and FALLBACK parameters specified. Fallback is completed for the keypoint control record of the specified record type.

**System Action:** FALLBACK parameter processing continues with the next record type.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0012T ZMIGR KEYPOINT - ACTION NOT SUPPORTED**

**Explanation:** The ZMIGR command was entered with the KEYPOINT parameter and a second parameter specified, but the second parameter specified is not a support function.

**System Action:** The command ends with no action taken.

**User Response:** Enter the ZMIGR command again with the correct parameters specified.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0013I** *record* **CONVERTED**

**Where:**

*record*
The record type of the keypoint control record for which status was requested.

**Explanation:** This is the normal response to the ZMIGR command with the KEYPOINT and STATUS parameters specified. The control record for the specified record type is in 32-way loosely coupled processor format.

**System Action:** The status request continues.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0014I** *record* **NOT CONVERTED**

**Where:**

*record*
The record type of the keypoint control record for which status was requested.

**Explanation:** This is the normal response to the ZMIGR command with the KEYPOINT and STATUS parameters specified. The control record for the specified record type is not in 32-way loosely coupled processor format.

**System Action:** The status request continues.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0015T ZMIGR KEYPOINT - ACTION INDEX NOT VALID**

**Explanation:** The ZMIGR command was entered with the KEYPOINT parameter and a second parameter specified, but the second parameter's internal index value is not valid.

**System Action:** A 00510C system error with a SNAPC dump is started. The command ends with no action taken.

**User Response:** Do the following:

1. Examine the ZMIGR command. If it was entered in error, correct the command and reenter.
2. If the ZMIGR command is correct, analyze the dump, correct the problem, and reenter the command.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0016W** *record* **IS ALREADY IN THE REQUESTED STATE**

**Where:**

*record*
The record type of the keypoint control record.

**Explanation:** One of the following occurred:

- The ZMIGR command was entered with the KEYPOINT and CONVERT parameters specified, but the keypoint control record for the record type is in 32-way loosely coupled processor format
- The ZMIGR command was entered with the KEYPOINT and FALLBACK parameters specified, but the keypoint control record for the record type is not in 32-way loosely coupled processor format

**System Action:** The CONVERT or FALLBACK parameter request continues.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0017T ZMIGR KEYPOINT - TOO MANY PARAMETERS**

**Explanation:** The ZMIGR command was entered with the KEYPOINT parameter and more than one additional parameter specified. There can be only one parameter following the KEYPOINT parameter.

**System Action:** The command ends with no action taken.

**User Response:** Enter the ZMIGR command correctly.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0018T UNABLE TO CONVERT, RECORD ID OF #CN1ST ORDINAL *nn* INDICATES AN UNEXPECTED STATE**

**Where:**

*nn* The ordinal number of the #CN1ST record that contains the unexpected record ID.

**Explanation:** While processing a ZMIGR command with the CTKI parameter and the CONVERT or FALLBACK parameter specified, a #CN1ST ordinal was found in an unexpected state. One of the following occurred:

- If the CONVERT parameter was specified, a nonzero record ID was found indicating that the record was already converted or used. A record ID of zero is expected when the CONVERT parameter is specified.
- If the FALLBACK parameter was specified, a zero or unexpected record ID was found indicating that the record is not valid for processing. A record ID of X'FC81' is expected when the FALLBACK parameter is specified.

**System Action:** One of the following occurs:

- If *nn* is the ordinal of the first record, the data is unchanged and the conversion is ended.
- If *nn* is not the ordinal of the first record, the conversion is ended, but all records before the failing record have been converted or restored.

**User Response:** This error can occur if conversion indicator IC032LC does not reflect the current state of the data. Verify that the correct version of keypoint I (CTKI) is loaded and that IC032LC is set as expected. This flag is set by the ZMIGR command or by the CTKI32LC parameter of the CONFIG macro during system initialization package (SIP) processing of a new CTKI.

See *TPF Operations* for more information about the ZMIGR command. See *TPF System Generation* for more information about SIP and the CONFIG macro.

---

**MIGR0019I #CN1ST ORDINALS HAVE BEEN INITIALIZED**

**Explanation:** This is a normal response when the following occurs:

1. A new TPF system has been generated with 32-way loosely coupled processor support .
2. The CONFIG macro was specified with the CTKI32LC parameter set to YES indicating that CTKI has been converted to 32-way loosely coupled format.
3. The #CN1ST ordinals had not been populated by a ZMIGR command.

**System Action:** TPF system restart initializes the new #CN1ST ordinals and continues.

**User Response:** None. Because the system has been initialized and is now using the #CN1ST ordinals, you do not need to enter the ZMIGR command with the CTKI and CONVERT parameters specified.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0020T REQUEST REJECTED, ZMIGR CTKI IS VALID IN THE BSS ONLY**

**Explanation:** The ZMIGR command was entered with the CTKI parameter specified from a multiple database function (MDBF) subsystem other than the basic subsystem (BSS). CTKI requests are only allowed in the basic subsystem because subsystem state table record type #CN1ST is resident in the basic subsystem.

**System Action:** The ZMIGR command ends and the entry control block (ECB) exits.

**User Response:** Enter the ZMIGR command with the CTKI parameter specified from the basic subsystem.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0021I 32-WAY LC MIGRATION STATUS PROCESSOR** *procid* **STATUS** *status*

**Where:**

*procid*
The processor ID.

*status*
The 32-way loosely coupled processor support migration status of the processor, which is one of the following:

**MIGRATED**
The processor is running with 32-way loosely coupled processor support.

**UNMIGRATED**
The processor is not running with 32-way loosely coupled processor support.

**INACTIVE**
The processor is not active.

**Explanation:** This is a normal response to the ZMIGR command with the PROCESSOR and STATUS parameters specified. The 32-way loosely coupled processor support migration status for each processor is listed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

---

**MIGR0022W** *record* **READ ERROR**

**Where:**

*record*
The record type for which the keypoint control record is being processed.

**Explanation:** The ZMIGR command uses the read function of the ZIMAG command to read the keypoint control record. This function reported an error while reading the record. There is an accompanying IMAG message that explains the error.

**System Action:** No action is taken on the record that was read in error and the command continues with the next record.

**User Response:** Do one of the following:

- If the record type is a #KSA*n* record type that has not been defined, no action is required.
- For all other record types, follow the User Response for the IMAG message.

See *TPF Operations* for more information about the ZMIGR and ZIMAG commands.

---

**MIGR0023W** *record* **FILE ERROR**

**Where:**

*record*
The record type for which the keypoint control record is being processed.

**Explanation:** The ZMIGR command uses the write function of the ZIMAG command to read the keypoint control record. This function reported an error while filing the record. There is an accompanying IMAG message that explains the error.

**System Action:** No action is taken on the record filed in error and the command continues with the next record.

**User Response:** Do the following:

1. Follow the User Response for the IMAG message.
2. After correcting the problem, enter the ZMIGR command again.

Records that were previously processed will be reported and records that were not processed will be updated.

See *TPF Operations* for more information about the ZMIGR and ZIMAG commands.

---

### MIGR0025T REQUEST REJECTED, ZMIGR MPIF IS VALID IN THE BSS ONLY

**Explanation:** The ZMIGR command was entered with the MPIF parameter specified from a multiple database function (MDBF) subsystem other than the basic subsystem (BSS). MPIF requests are only allowed in the basic subsystem because subsystem state table record type #CN1ST is resident in the basic subsystem.

**System Action:** The ZMIGR command ends and the entry control block (ECB) exits.

**User Response:** Enter the ZMIGR command with the MPIF parameter specified from the basic subsystem.

See *TPF Operations* for more information about the ZMIGR command.

### MIGR0030I RECOUP CONVERSION COMPLETED

**Explanation:** This is a normal response to the ZMIGR command with the RECOUP and CONVERT parameters specified. The 1052 FC33 record has been moved to its location for 32-way loosely coupled processor support and the migration indicator is set to converted.

**System Action:** The conversion is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

### MIGR0031I RECOUP CONVERSION FALLBACK COMPLETED

**Explanation:** This is a normal response to the ZMIGR command with the RECOUP and FALLBACK parameters specified. The 1052 FC33 record has been returned to the location it had before conversion to 32-way loosely coupled processor support, and the migration indicator is set to not converted. This message only occurs when a processor in a loosely coupled complex falls back from 32-way loosely coupled processor support to a previous level of support.

**System Action:** Fallback processing is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

### MIGR0032I RECOUP MIGRATION STATUS - RECOUP CONVERSION COMPLETED

**Explanation:** This is a normal response to the ZMIGR command with the RECOUP and STATUS parameters specified. The 1052 FC33 record has been moved to the location for 32-way loosely coupled processor support.

**System Action:** The status request is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

### MIGR0033I RECOUP MIGRATION STATUS - RECOUP CONVERSION NOT COMPLETED

**Explanation:** This is a normal response to the ZMIGR command with the RECOUP and STATUS parameters specified. The 1052 FC33 record is not in the fixed record ordinal location for 32-way loosely coupled processor support.

**System Action:** The status request is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

### MIGR0034E RECOUP CONVERSION HAS ALREADY COMPLETED

**Explanation:** The ZMIGR command was entered with the RECOUP and CONVERT parameters specified, but the 1052 FC33 record had already been moved to the fixed record ordinal location for 32-way loosely coupled processor support.

**System Action:** The ZMIGR command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

### MIGR0035E RECOUP CONVERSION FALLBACK HAS ALREADY COMPLETED

**Explanation:** The ZMIGR command was entered with the RECOUP and FALLBACK parameters specified, but the 1052 FC33 record is not in the location for 32-way loosely coupled processor support. Fallback processing had already been requested.

**System Action:** The ZMIGR command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

### MIGR0036I ALL NEW FC33 RECORDS INITIALIZED

**Explanation:** This is the normal response to the ZMIGR command with the RECOUP and INIT parameters specified. All new FC33 records are initialized.

**System Action:** The initialization request is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

### MIGR0037E NEW FC33 RECORDS ALREADY INITIALIZED

**Explanation:** The ZMIGR command was entered with the RECOUP and INIT parameters specified. All new FC33 records had been previously initialized.

**System Action:** The initialization request is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0038E FACS ERROR ON FC33, ORDINAL** *yyy*

**Where:**

*yyy* The FC33 record ordinal number for which the error occurred.

**Explanation:** The ZMIGR command was entered with the RECOUP parameter specified, but an error occurred while calculating the file address for the FC33 record.

**System Action:** The ZMIGR command is ended.

**User Response:** Do the following:

1. Analyze the FACE table (FCTB) and verify the following:
   - The FC33 records are correctly allocated.
   - Enough ordinals were defined so that the ordinal specified in the message exists.
2. Correct the FCTB.
3. Enter the ZMIGR command again with the RECOUP parameter specified.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0039E FIND ERROR ON FC33, ORDINAL** *yyy*

**Where:**

*yyy* The FC33 record ordinal number for which the error occurred.

**Explanation:** The ZMIGR command was entered with the RECOUP parameter specified, but a find error occurred while accessing the FC33 record.

**System Action:** The ZMIGR command is ended.

**User Response:** Do the following:

1. Determine why the FC33 record could not be found.
2. Correct the problem.
3. Enter the ZMIGR command again with the RECOUP parameter specified.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0040I CTKC CONVERSION COMPLETED**

**Explanation:** The ZMIGR command was entered with the CTKC and CONVERT parameters specified. Keypoint C (CTKC) has been converted to 32-way loosely coupled format.

**System Action:** The conversion request is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0041I CTKC FALLBACK COMPLETED**

**Explanation:** The ZMIGR command was entered with the CTKC and FALLBACK parameters specified. Keypoint C (CTKC) has been returned to the format it had before conversion to 32-way loosely coupled format.

**System Action:** The fallback request is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0042I CTKC IS NOT CONVERTED**

**Explanation:** This is a normal response to the ZMIGR command with the CTKC and STATUS parameters specified. Keypoint C (CTKC) is not in 32-way loosely coupled format.

**System Action:** The status request is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0043I CTKC IS CONVERTED**

**Explanation:** This is a normal response to the ZMIGR command with the CTKC and STATUS parameters specified. Keypoint C (CTKC) is in 32-way loosely coupled format.

**System Action:** The status request is completed.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0044W CTKC ALREADY IN REQUESTED STATE**

**Explanation:** One of the following occurred:

- The ZMIGR command was entered with the CTKC and CONVERT parameters specified, but keypoint C (CTKC) was already in 32-way loosely coupled format.
- The ZMIGR command was entered with the CTKC and FALLBACK parameters specified, but keypoint C (CTKC) was not in 32-way loosely coupled format.

**System Action:** CTKC is unchanged and the entry control block (ECB) ends.

**User Response:** None.

See *TPF Operations* for more information about the ZMIGR command.

**MIGR0045T REQUEST REJECTED, ZMIGR CTKC IS VALID IN THE BSS ONLY**

**Explanation:** The ZMIGR command was entered with the CTKC parameter specified from multiple database function (MDBF) subsystem other than the basic subsystem (BSS). The CTKC parameter can only be entered when in the BSS.

**System Action:** The ZMIGR command is terminated and the entry control block (ECB) ends.

**User Response:** Enter the ZMIGR command with the CTKC parameter specified from the BSS.

See *TPF Operations* for more information about the ZMIGR command.

**MODE0003E FARF*m* DISPENSING MODE NOT ALLOWED WITHIN STAGE FARF*s***

**Where:**

*m* The current dispensing mode.

*s* The current migration stage.

**Explanation:** The parameter for the ZMODE command was a valid file address reference format (FARF) addressing mode or a display request but it was not valid for the current FARF migration stage.

**System Action:** None.

**User Response:** Enter the ZMODE command again and specify a valid parameter for the current FARF migration stage.

See *TPF Operations* for more information about the ZMODE command.

**MODE0004I CURRENT DISPENSING MODE IS ALREADY FARF*m***

**Where:**

*m* The current dispensing mode.

**Explanation:** The dispensing mode specified is currently in effect.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMODE command.

**MODE0005E CANNOT ACTIVATE FARF6 DURING RESTART**

**Explanation:** The ZMODE command was entered to dispense FARF6 addresses while the TPF system was in restart. FARF6 address dispensing cannot be activated during restart.

**System Action:** The command is rejected.

**User Response:** Enter the ZMODE command again after the TPF system completes restart processing.

See *TPF Operations* for more information about the ZMODE command.

**MODE0006E CANNOT ACTIVATE FARF6 UNTIL CTK9 CONVERSION IS COMPLETE**

**Explanation:** The ZMODE command was entered to activate FARF6 addressing, but conversion to 32-way loosely coupled pool support format is not completed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZPMIG CONVERT** to convert the pool data structures for each subsystem to 32-way loosely coupled pool support format.
2. When conversion is completed, enter the ZMODE command again.

See *TPF Operations* for more information about the ZMODE and ZPMIG commands. See *TPF Migration Guide: Program Update Tapes* for more information about converting the entire complex to 32-way loosely coupled pool support format.

**MODE0007E FARF6 ADDRESSING IS ALREADY ACTIVE ON THIS PROCESSOR**

**Explanation:** The ZMODE command was entered to activate FARF6 addressing, but FARF6 addressing is already active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMODE command.

**MODE0008E REQUEST INCOMPLETE — ERROR *err* KEYPOINT 9**

**Where:**

*err* The type of error: either RETRIEVING or FILING.

**Explanation:** The ZMODE command was entered to activate FARF6 addressing, but an error when retrieving or filing keypoint 9 (CTK9) occurred during processing.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZMODE command again.

See *TPF Operations* for more information about the ZMODE command.

**MODE0009I IN STAGE FARF*s*, DISPENSING MODE IS FARF*m* FARF6 ADDRESSING IS *status***

**Where:**

*s* The current FARF migration stage; for example, 3/4 or 4/5.

*m* The current dispensing mode.

*status*
The status of FARF6 addressing: either AVAILABLE or NOT AVAILABLE.

**Explanation:** This is the normal response to the ZMODE command. This message displays the file address reference format (FARF) migration stage that is currently active and the FARF dispensing mode. In the FARF3 migration stage, dispensing is either in FARF3 or FARF4 formatted addresses. In the FARF4 migration stage, dispensing is either in FARF4 or FARF5 formatted addresses. An indication that FARF6 addressing is available means that the TPF system is ready to support FARF6 8-byte file addresses. This does not mean that FARF6 addresses are being used.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMODE command.

**MODE0010E VALID ZMODE PARAMETER IS 3, 4, 5, 6, OR D**

**Explanation:** The ZMODE command was entered with a parameter that is not valid. The parameter must be a valid file address reference format (FARF) addressing mode (3, 4, 5, or 6) or a display request (D).

**System Action:** None.

**User Response:** Enter the ZMODE command again and specify a valid parameter.

See *TPF Operations* for more information about the ZMODE command.

**MODE0011I SYSTC BIT SB8BFAD SET ON ALL I-STREAMS**

**Explanation:** This is a normal response to the ZMODE command with the 6 parameter specified to activate FARF6 addressing. This message indicates that the correct system bits were set for a processor in the complex. When FARF6 addressing is activated, this message is displayed on each processor in the complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMODE command.

**MODE0012I KEYPOINT 9 UPDATED**

**Explanation:** This is a normal response to the ZMODE command with the 6 parameter specified to activate FARF6 addressing. This message indicates that keypoint 9 (CTK9) was successfully updated with information indicating that FARF6 addressing is active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMODE command.

**MPIF0001I PATH PARAMETERS DEFINED**

**Explanation:** This is the normal response to the ZMPIF DEFINE PATH command. The message is followed by a display of the defined path parameters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DEFINE PATH command.

**MPIF0004I SYSTEM PARAMETERS SET**

**Explanation:** This is the normal response to the ZMPIF SET command. This message is followed by a display of the system parameters and their settings.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF SET command.

**MPIF0005I COMPLEX PARAMETERS SET**

**Explanation:** This is the normal response to the ZMPIF SET command with the COMPLEX parameter specified. This message is followed by a display of the complex parameters and their settings.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF SET command.

**MPIF0006I CLASS PARAMETERS SET**

**Explanation:** This is the normal response to the ZMPIF SET command. This message is followed by a display of the class parameters and their settings.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF SET command.

**MPIF0010I TRACE STARTED**

**Explanation:** This is the normal response to the ZMPIF TRACE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

**MPIF0011I MSRB TRACE TABLE WILL NOT BE LOGGED TO TAPE**

**Explanation:** This is the normal response to the ZMPIF TRACE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

**MPIF0012I TRACE STOPPED**

**Explanation:** This is the normal response to the ZMPIF TRACE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

**MPIF0013I MSRB DISPLAY**

**Explanation:** This is the normal response to the ZMPIF TRACE command. This message is followed by a display of the MSRB trace table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

**MPIF0014I ACTIVE CONNECTION PARAMETERS**

**Explanation:** This is the normal response to the ZMPIF DISPLAY command. This message is followed by a display of the active connection parameters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DISPLAY command.

**MPIF0015I ACTIVE PATH PARAMETERS**

**Explanation:** This is the normal response to the ZMPIF DISPLAY command. This message is followed by a display of the active path parameters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DISPLAY command.

**MPIF0016I STATUS INFORMATION**

**Explanation:** This is the normal response to the ZMPIF DISPLAY command. This message is followed by a display of the status information.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DISPLAY command.

**MPIF0017I ACTIVITY INFORMATION**

**Explanation:** This is the normal response to the ZMPIF DISPLAY command. This message is followed by a display of the activity information.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DISPLAY command.

**MPIF0018I DEVICE PARAMETERS DEFINED**

**Explanation:** This is the normal response to the ZMPIF DEFINE command with the DEVICE parameter specified. This message is followed by a display of the defined device parameters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DEFINE command.

**MPIF0019I ACTIVE DEVICE PARAMETERS**

**Explanation:** This is the normal response to the ZMPIF DISPLAY command. This message is followed by a display of the active device parameters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DISPLAY command.

**MPIF0026I DEVICE PURGED**

**Explanation:** This is the normal response to the ZMPIF STOP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF STOP command.

**MPIF0026I PATH(S) PURGED**

**Explanation:** This is the normal response to the ZMPIF STOP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF STOP command.

**MPIF0027I PATH(S) QUIESCING**

**Explanation:** This is the normal response to the ZMPIF STOP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF STOP command.

**MPIF0028I DEVICE STARTED**

**Explanation:** This is the normal response to the ZMPIF START command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF START command.

**MPIF0028I DEVICE STOPPED**

**Explanation:** This is the normal response to the ZMPIF STOP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF STOP command.

**MPIF0028I PATH(S) STARTED**

**Explanation:** This is the normal response to the ZMPIF START command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF START command.

**MPIF0030I ACTIVE SYSTEM PARAMETERS**

**Explanation:** This is the normal response to the ZMPIF DISPLAY command. This message is followed by a display of the active system parameters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DISPLAY command.

**MPIF0031I ACTIVE COMPLEX PARAMETERS**

**Explanation:** This is the normal response to the ZMPIF DISPLAY command. This message is followed by a display of the active complex parameters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DISPLAY command.

**MPIF0032I ACTIVE CLASS PARAMETERS**

**Explanation:** This is the normal response to the ZMPIF DISPLAY command. This message is followed by a display of the active class parameters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DISPLAY command.

**MPIF0034W PATH(S) ALREADY STARTED — WILL CONTINUE WITH PRIMING OF LINKS**

**Explanation:** The paths associated with the given request are already in started status.

**System Action:** Processing is continued with priming of the device links. Paths in the process of being stopped, that is in QUIESCE state, are unaffected and will eventually be stopped.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF START command.

**MPIF0035A DEVICE ALREADY STARTED**

**Explanation:** The requested device was already started.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF START command.

**MPIF0036E INVALID INPUT FORMAT**

**Explanation:** The format of the ZMPIF TRACE command is not valid. For example, a parameter is spelled incorrectly or there were characters specified that are not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0037E TRACE BLOCK – INVALID LENGTH**

**Explanation:** The length of the trace block is not valid. For example, the length may be greater than 4 KB.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0038E SUBCHANNEL NOT FOUND IN CCWA**

**Explanation:** The subchannel pair specified in the command was not found in the Multi-Processor Interconnect Facility (MPIF) hardware table (HDREC).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that the subchannel pair specified in the command is a valid set in your configuration.
2. Enter the command again.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0040E TERMINATED PATH**

**Explanation:** The path specified in the command was marked as ended in the channel command word area (CCWA).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0041E INVALID SUBCHANNEL**

**Explanation:** The subchannel specified in the command is not in the channel command word area (CCWA).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0042I SUBCHANNELS NOT FOUND**

**Explanation:** No entries were found in the trace table for the subchannels specified in the command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0043E INVALID MPIF COMMAND**

**Explanation:** The trace block types specified in the command do not match the following trace block types, which are recognized by the TPF system:

- SS
- HH
- CC
- II.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0044E MPIF TRACE POINTER ERROR**

**Explanation:** There is no trace table defined in the TPF system. For example, the address of the trace table is zero.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0045E SUBCHANNEL ERROR**

**Explanation:** The channel command word (CCW) indicator or channel command in the trace table is in error.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0046E INVALID LNIATA FOR PRINTER**

**Explanation:** The line number, interchange address, and terminal address (LNIATA) specified is not in the terminal address table (WGTA) or is not a printer.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a correct printer LNIATA.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0047E INVALID SUBCHANNEL RANGE**

**Explanation:** The subchannel range specified was not found in the channel command word area (CCWA) table.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a subchannel range that is valid for your configuration.

See *TPF Operations* for more information about the ZMPIF commands.

**MPIF0051A SYNTAX ERROR**

**Explanation:** The command has a syntax error.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again.

See *TPF Operations* for more information about the ZMPIF command.

**MPIF0052A *xxxxx* PARAMETER INVALID**

**Where:**

*xxxxx*
The parameter name.

**Explanation:** A command was entered and the parameter referenced in the message has an incorrect value. A CLASS parameter condition that is not valid can indicate that no path classes were defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct parameter value to specify with the command.
2. Enter the command again and specify the correct parameter value.

See *TPF Operations* for more information about the ZMPIF command.

**MPIF0053A TOO MANY PARAMETERS**

**Explanation:** A DISPLAY command was entered with too many parameters.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct parameters to specify with the command.
2. Enter the command again and specify the correct parameters.

See *TPF Operations* for more information about the ZMPIF DISPLAY command.

---

**MPIF0054A NO INFORMATION IS AVAILABLE FOR DISPLAY**

**Explanation:** The paths or devices associated with the request were not defined to the TPF system in the path definition record (PDR) (CB9PD) or the Multi-Processor Interconnect Facility (MPIF) hardware table definition record (HDREC), respectively. No parameters were defined through the ZMPIF SET command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct path or device name to be used.
2. Enter the command again and specify the correct path or device name. You can use the ZMPIF SET command to define the parameters.

See *TPF Operations* for more information about the ZMPIF SET or ZMPIF DEFINE PATH command.

---

**MPIF0056E MPIF USER NAME NOT FOUND IN RFND**

**Explanation:** The specified user name was not found in the resident function name directory (DCTRNF).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

---

**MPIF0057E PATH NAME NOT FOUND IN PDT**

**Explanation:** The specified path name was not found in the path definition table (DCTPDT).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

---

**MPIF0058E GENERIC NAME NOT FOUND IN CWA**

**Explanation:** The specified generic device name was not found in the 3088 CWA table (DCTCWA).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

---

**MPIF0059E NUMBER OF PATHS IN TRACE REQUEST EXCEEDS MAXIMUM**

**Explanation:** The format of the command is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command and the correct parameter value.
2. Enter the command again by using the correct format and specify the correct parameter value.

See *TPF Operations* for more information about the ZMPIF TRACE command.

---

**MPIF0062E NO PATHS DEFINED IN PDT**

**Explanation:** No paths are defined in the path definition table (DCTPDT).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

---

**MPIF0063E NO CONNECTIONS FOUND IN CDB**

**Explanation:** No connections are defined in the connection definition block table (DCTCDB).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

---

**MPIF0064E NO CCW ENTRIES FOUND IN CWA**

**Explanation:** No devices are defined in the Multi-Processor Interconnect Facility (MPIF) hardware table (HDREC).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

---

**MPIF0065E NO USER NAMES FOUND IN RFND**

**Explanation:** No MPIF user names were found in the resident function name directory (DCTRFN).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

---

**MPIF0066W MSRB TRACE WILL BE STOPPED BECAUSE OF SHORTAGE OF 4K BLOCKS**

**Explanation:** In the CBQ3 segment, while dumping the in core MSRB trace table to tape, it was discovered that the

number of 4K blocks available has fallen below the input list shutdown level.

**System Action:** MSRB trace is stopped. The PDT entries are cleaned up.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

---

**MPIF0069I DEVICE DELETED**

**Explanation:** This is the normal response to the ZMPIF DELETE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DELETE command.

---

**MPIF0069I PATH DELETED**

**Explanation:** This is the normal response to the ZMPIF DELETE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF DELETE command.

---

**MPIF0070A UNABLE TO STOP DEVICE, PATH(S) NOT STOPPED**

**Explanation:** The device was not stopped since one or more paths were found to be using the device. All paths using a device must first be stopped before the device can be stopped unless the PURGE option is specified on the ZMPIF STOP DEVICE command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMPIF STOP PATH command again to stop any active paths on the device.
2. Enter the ZMPIF STOP DEVICE command.

See *TPF Operations* for more information about the ZMPIF STOP command.

---

**MPIF0072A DEVICE NOT DEFINED**

**Explanation:** The named device (generic device name) was not found in the MPIF CWA table (DCTCWA).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct device name to be used.
2. Enter the command again and specify the correct device name.

See *TPF Operations* for more information about the ZMPIF START and ZMPIF STOP commands.

---

**MPIF0072A PATH(S) NOT DEFINED**

**Explanation:** The paths associated with the given request are not defined to the TPF system.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct path name to be used.
2. Enter the command again and specify the correct path name.

See *TPF Operations* for more information about the ZMPIF START and ZMPIF STOP commands.

---

**MPIF0073A UNABLE TO STOP, PATH(S) PROTECTED**

**Explanation:** A request to stop a specific path was not satisfied or a request to stop more than one path was not completely satisfied. The last path of a protected class of paths will never be stopped by Multi-Processor Interconnect Facility (MPIF). This message, thus, indicates that the last path of one or more protected path classes was not stopped. Any non-protected paths were stopped.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Start another path of the same classes or classes to the same TPF system.
2. Enter the ZMPIF STOP PATH command again to stop the original path.

See *TPF Operations* for more information about the ZMPIF STOP command.

---

**MPIF0074A** *xxxxxx* **DEVICE ALREADY STOPPED OR QUIESCING**

**Where:**

*xxxxxx*
Is either DEVICE or PATH(S).

**Explanation:** The device or path you requested (by entering the ZMPIF STOP command) is already in stopped status or is in the process of being stopped.

**System Action:** The ZMPIF STOP command is not processed.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF STOP command.

---

**MPIF0078A PDR RECORDS ARE FULL**

**Explanation:** The Multi-Processor Interconnect Facility (MPIF) Path Definition Records (CB9PD) are full.

**System Action:** The command is rejected.

**User Response:** Have your system programmer allocate more records for the PDR record type.

See *TPF Operations* for more information about the ZMPIF DEFINE PATH command.

---

**MPIF0079A HDW RECORDS ARE FULL**

**Explanation:** The Multi-Processor Interconnect Facility (MPIF) hardware definition records (HDRECs) are full.

**System Action:** The command is rejected.

**User Response:** Have your system programmer allocate more records for this record type.

See *TPF Operations* for more information about the ZMPIF DEFINE DEVICE command.

**MPIF0080A UNABLE TO DELETE, PATH|DEVICE NOT STOPPED**

**Explanation:** A path or device must be inactive or stopped to be deleted.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Stop the paths to be deleted.
2. Enter the ZMPIF DELETE command again.

See *TPF Operations* for more information about the ZMPIF DELETE command.

**MPIF0084W TRACE ALREADY ACTIVE**

**Explanation:** Trace is already active and the command entered was to start trace.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

**MPIF0085W TRACE NOT ACTIVE**

**Explanation:** Trace is already not active and the command entered was to stop trace.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

**MPIF0086E ERROR OCCURRED WHEN WRITING MSRB TRACE BLOCK TO TAPE**

**Explanation:** An error occurred when Multi-Processor Interconnect Facility (MPIF) was trying to write a trace record to the real-time tape.

**System Action:** The MSRB trace is stopped.

**User Response:** None.

See *TPF Operations* for more information about the ZMPIF TRACE command.

**MPIF0090E MESSAGE IS NOT VALID AT THIS TIME**

**Explanation:** A ZMPIF KPE REP or ZMPIF KPE BYPASS command was entered but was not expected by the Multi-Processor Interconnect Facility (MPIF) restart program.

**System Action:** The command is ignored.

**User Response:** The command should not be repeated. The ZMPIF KPE command is valid only after MPIF restart has requested it. See the CBR20006A message for more information.

See *TPF Operations* for more information about the ZMPIF KPE command.

**MPIF0091E VALID RESPONSES ARE ZMPIF KPE REP OR ZMPIF KPE BYPASS REENTER MESSAGE**

**Explanation:** A response to a CBR20006A message was not a ZMPIF KPE REP or ZMPIF KPE BYPASS command.

**System Action:** The command is ignored.

**User Response:** Enter the correct command.

See *TPF Operations* for more information about the ZMPIF KPE command.

**MPIF0092E MESSAGE IS NOT VALID AT THIS TIME**

**Explanation:** A ZMPIF PDR|HDW INIT or ZMPIF PDR|HDW BYPASS command was entered but was not expected by the Multi-Processor Interconnect Facility (MPIF) restart program.

**System Action:** The command is ignored.

**User Response:** The command should not be repeated. The ZMPIF PDR|HDW commands are valid only after MPIF restart had requested them. See the CBR00101W command.

See *TPF Operations* for more information about the ZMPIF PDR and ZMPIF HDW commands.

**MPIF0093E VALID RESPONSES ARE ZMPIF PDR|HDW INIT OR ZMPIF PDR BYPASS REENTER MESSAGE**

**Explanation:** A response to the CBR00101W message was not the ZMPIF PDR|HDW INIT or ZMPIF PDR|HDW BYPASS commands.

**System Action:** The command is ignored.

**User Response:** Enter the correct command.

See *TPF Operations* for more information about the ZMPIF PDR and ZMPIF HDW commands.

# MQID–MQIT

**MQID0011I MQI CHANNEL -*name* ADDED**

**Where:**

*name*
The channel name.

**Explanation:** This is the normal response to the ZMQID DEFINE command.

**System Action:** The channel name specified is added to the Message Queue Interface (MQI) channel directory by using the parameters provided.

**User Response:** None.

See *TPF Operations* for more information about the ZMQID DEFINE command.

---

**MQID0012I START OF ZMQID DISPLAY**

**Explanation:** This is the normal response to the ZMQID DISPLAY command. The message is followed by a display of a single Message Queue Interface (MQI) channel directory entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQID DISPLAY command and for an example of the informational display.

---

**MQID0013I START OF ZMQID DISPLAY**

**Explanation:** This is the normal response to the ZMQID DISPLAY command when multiple channel entries match the channel name selection criteria. The message is followed by a display of multiple Message Queue Interface (MQI) change directory entries.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQID DISPLAY command and for an example of the informational display.

---

**MQID0014I START OF ZMQID DISPLAY**

**Explanation:** This is the normal response to the ZMQID DISPLAY command when multiple channel entries match the queue manager name selection criteria. The message is followed by a display of multiple Message Queue Interface (MQI) channel directory entries.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQID DISPLAY command and for an example of the informational display.

---

**MQID0015I CHANNEL -***name* **ENTRY UPDATED**

**Where:**

*name*
The channel name.

**Explanation:** This is the normal response to the ZMQID ALTER command.

**System Action:** The channel entry for the channel name specified is changed in the Message Queue Interface (MQI) channel directory by using the parameters provided.

**User Response:** None.

See *TPF Operations* for more information about the ZMQID ALTER command.

---

**MQID0016I MQI CHANNEL** *name* **DELETED**

**Where:**

*name*
The channel name.

**Explanation:** This is the normal response to the ZMQID DELETE command.

**System Action:** The channel entry for the channel name specified is removed from the Message Queue Interface (MQI) channel directory.

**User Response:** None.

See *TPF Operations* for more information about the ZMQID DELETE command.

---

**MQID0091E NO CHANNEL FOUND FOR** *object* **-** *name*

**Where:**

*object*
CHANNEL or QMNAME.

*name*
The channel or queue manager name.

**Explanation:** There was no channel entry in the Message Queue Interface (MQI) channel directory that matches the channel name or queue manager name specified in the ZMQID ALTER, ZMQID DEFINE, ZMQID DELETE, or ZMQID DISPLAY command.

**System Action:** The ZMQID ALTER, ZMQID DEFINE, ZMQID DELETE, or ZMQID DISPLAY command is rejected.

**User Response:** Enter the ZMQID ALTER, ZMQID DEFINE, ZMQID DELETE, or ZMQID DISPLAY command again and specify a valid channel or queue manager name.

See *TPF Operations* for more information about the ZMQID ALTER, ZMQID DEFINE, ZMQID DELETE, or ZMQID DISPLAY command.

---

**MQID0092E MQI CHANNEL -** *name* **ALREADY DEFINED**

**Where:**

*name*
The channel name.

**Explanation:** There was already an entry in the Message Queue Interface (MQI) channel directory that matches the channel name specified in the ZMQID DEFINE command.

**System Action:** The ZMQID DEFINE command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQID DEFINE command again and specify a different channel name.
- Enter the ZMQID ALTER command to change the existing channel entry.

See *TPF Operations* for more information about the ZMQID DEFINE and ZMQID ALTER commands.

**MQID0093E MQI MAX CHANNEL DIRECTORY ENTRIES *number* EXCEEDED**

**Where:**

*number*
The maximum number of Message Queue Interface (MQI) channel directory entries allowed.

**Explanation:** The MQI channel directory is full; no more entries can be defined.

**System Action:** The ZMQID DEFINE command is rejected.

**User Response:** You must delete an existing MQI channel directory entry before you can define a new one. To do so, enter the ZMQID DEFINE command.

See *TPF Operations* for more information about the ZMQID DEFINE command.

**MQID0094E INCORRECT -*object*-, THE FIRST CHARACTER MUST BE ALPHA AND THE REST MUST BE ALPHANUMERIC**

**Where:**

*object*
NETID or LUNAME.

**Explanation:** The NETID or LUNAME specified with the CONNECTION parameter is incorrect. SNA network identifier names and logical unit (LU) names must be alphanumeric with the first character restricted to alphabetic. The NETID or LUNAME specified does not follow this rule.

**System Action:** The ZMQID DEFINE or ZMQID ALTER command is rejected.

**User Response:** Enter the ZMQID DEFINE or ZMQID ALTER command again and specify a valid Systems Network Architecture (SNA) network identifier or LU name.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE command.

**MQID0097E INCORRECT -*object*-, THE MAXIMUM LENGTH IS 8 CHARACTERS LONG.**

**Where:**

*object*
NETID or LUNAME.

**Explanation:** The SNA network identifier or logical unit (LU) name specified is greater than 8 characters.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID DEFINE or ZMQID ALTER command again and specify a valid SNA network identifier or LU name.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE command.

**MQID0099E THE VALUE SPECIFIED FOR -MAXMSGL- *number* IS TOO LARGE, THE VALUE MUST BE LESS THAN *maxvalue***

**Where:**

*number*
The value of the MAXMSGL parameter.

*maxvalue*
The maximum value of MAXMSGL.

**Explanation:** The value specified for the MAXMSGL parameter is too large.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID DEFINE or ZMQID ALTER command again and specify a valid value for the MAXMSGL parameter.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE command.

**MQID0100E INCORRECT -*object*-, THE MAXIMUM LENGTH IS 32 CHARACTERS LONG**

**Where:**

*object*
SENDD, RCVD, or SCYD.

**Explanation:** The value specified for the SENDDATA, RCVDATA, or SCYDATA parameter is too long.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID DEFINE or ZMQID ALTER command again and specify a valid value for the SENDDATA, RCVDATA, or SCYDATA parameter.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE command.

**MQID0101E INCORRECT -*object*-, EXTRA CHARACTERS FOLLOWING THE LAST DELIMITER**

**Where:**

*object*
SENDD, RCVD, or SCYD.

**Explanation:** One of the following errors has occurred.

- The information following the delimiter character on the SENDDATA, RCVDATA, or SCYDATA parameter is not correct.
- The delimiter character on the SENDDATA, RCVDATA, or SCYDATA parameter is not correct.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID DEFINE or ZMQID ALTER command again and specify a valid value for the SENDDATA, RCVDATA, or SCYDATA parameter.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE command.

**MQID0102E INCORRECT CHANNEL OR QMNAME -*name*-. FOR DISPLAY, WILDCARD CHARACTER MUST BE THE LAST CHARACTER OF A CHANNEL OR QMNAME**

**Where:**

*name*
The channel name or queue manager name.

**Explanation:** The channel name or queue manager name included a wildcard character that was not specified correctly. The wildcard character must be the last character of the channel name or queue manager name.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID DISPLAY command again and specify the channel name or queue manager name with the wildcard character as the last character of the name.

See *TPF Operations* for more information about the ZMQID DISPLAY command.

---

**MQID0103E MQI CHANNEL DIRECTORY I/O ERROR, *function* FAILED**

**Where:**

*function*
The I/O function that encountered an error.

**Explanation:** The function specified in the message returned an error while ZMQID ALTER, ZMQID DEFINE, ZMQID DELETE, or ZMQID DISPLAY processing tried to access the Message Queue Interface (MQI) channel directory. The fixed file records containing the MQI channel directory may be corrupted.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine whether the MQI channel directory should be redefined by entering the ZMQID DISPLAY command to display individual entries in the MQI channel directory.
2. If necessary, enter the ZMQID DEFINE and ZMQID ALTER commands to define the lost entries.

See *TPF Operations* for more information about the ZMQID ALTER, ZMQID DEFINE, ZMQID DELETE, or ZMQID DISPLAY command.

---

**MQID0104E INPUT DATA FOR -*object*-, MUST BE ENCLOSED IN PAIR OF / OR PAIR OF SINGLE QUOTES**

**Where:**

*object*
SENDD, RCVD, or SCYD.

**Explanation:** The value specified for the SENDDATA, RCVDATA, or SCYDATA parameter is not enclosed in a matching pair of division slashes (//) or single quotes (').

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID DEFINE or ZMQID ALTER command again and specify a valid value for the SENDDATA, RCVDATA, or SCYDATA parameter.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE command.

---

**MQID0105E ZMQID REQUEST FAILED**

**Explanation:** One of the processing steps for the ZMQID ALTER, ZMQID DEFINE, ZMQID DELETE, or ZMQID DISPLAY command found an unknown error.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.

See *TPF Operations* for more information about the ZMQID ALTER, ZMQID DEFINE, ZMQID DELETE, or ZMQID DISPLAY command.

---

**MQID0106E THE NAME SPECIFIED FOR -CONNECTION- IS NOT SUPPORTED FOR APPC TRPTYPE**

**Explanation:** The ZMQID ALTER or ZMQID DEFINE command was entered, but the network ID and LU name specified for the CONNECTION parameter were not in the correct format. Only one dot is allowed between the network ID and LU name.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID ALTER or ZMQID DEFINE command again and specify a valid network ID and LU name.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE command.

---

**MQID0107E THE -CONNECTION- PARAMETER IS REQUIRED WHEN TRPTYPE IS CHANGED**

**Explanation:** The ZMQID ALTER command was entered with the TRPTYPE parameter specified. The CONNECTION parameter is required when the TRPTYPE parameter is specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID ALTER command again and specify the TRPTYPE and CONNECTION parameters.

See *TPF Operations* for more information about the ZMQID ALTER command.

---

**MQID0108E THE -TRPTYPE- MUST BE EITHER APPC OR TCP**

**Explanation:** The ZMQID ALTER or ZMQID DEFINE command was entered, but an error occurred because the type of communication protocol specified for the TRPTYPE parameter was not APPC or TCP.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID ALTER or ZMQID DEFINE command again and specify a valid communication protocol for the TRPTYPE parameter.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE command.

---

**MQID0109E THE -MODE- PARAMETER IS NOT VALID WHEN TRPTYPE IS TCP**

**Explanation:** The ZMQID ALTER or ZMQID DEFINE command was entered with the MODE parameter specified. The MODE parameter is not a valid parameter when TCP is specified for the TRPTYPE parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID ALTER or ZMQID DEFINE command again without specifying the MODE parameter.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE commands.

---

**MQID0110E THE -TPNAME- PARAMETER IS NOT VALID WHEN TRPTYPE IS TCP**

**Explanation:** The ZMQID ALTER or ZMQID DEFINE command was entered with the TPNAME parameter specified. The TPNAME parameter is not a valid parameter when TCP is specified for the TRPTYPE parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQID ALTER or ZMQID DEFINE command again without specifying the TPNAME parameter.

See *TPF Operations* for more information about the ZMQID ALTER or ZMQID DEFINE command.

---

**MQIT0001W NO MQI TRACE TABLE DEFINED FOR THE SYSTEM**

**Explanation:** An error occurred because no space was allocated by the TPF system for the Message Queue Interface (MQI) trace table. The value of keypoint 2 (CTK2) for MQITRC is zero.

**System Action:** None.

**User Response:** Determine whether you want to run the TPF system with an MQI trace table. If yes, add the MQITRC parameter to the SNAKEY definition in CTK2, reassemble CTK2 and load it to the TPF system.

See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro and using it to define MQITRC. See *TPF Operations* for more information about the ZMQIT command.

---

**MQIT0002W NO MQI TRACE TABLE ENTRIES**

**Explanation:** The Message Queue Interface (MQI) trace table is currently empty. No MQI functions were processed on the TPF system since it was last activated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQIT command.

---

**MQIT0004I MQI TRACE TABLE DISPLAY**

**Explanation:** This is the normal response to the ZMQIT command. This message is followed by Message Queue Interface (MQI) trace table entries that match the specified selection criteria.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQIT command and for an example of the informational display.

# MQSC

---

**MQSC0001I DEFINE PROFILE SUCCESSFUL**

**Explanation:** This is the normal response to the ZMQSC DEF MQP command.

**System Action:** The TPF MQSeries profile is created in the TPF system.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEF MQP command.

---

**MQSC0002I ALTER PROFILE SUCCESSFUL**

**Explanation:** This is the normal response to the ZMQSC ALT MQP command.

**System Action:** The TPF MQSeries profile is changed in the TPF system.

**User Response:** Do the following:

1. Enter **ZMQSC STOP QMGR** to stop the queue manager.
2. Enter **ZMQSC START QMGR** to restart the queue manager and apply the changes.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0003E PROFILE ALREADY EXISTS**

**Explanation:** The ZMQSC DEF MQP command was entered to create the TPF MQSeries profile. However, the TPF MQSeries profile is already defined to the TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC ALT MQP command to change the TPF MQSeries profile.

See *TPF Operations* for more information about the ZMQSC DEF MQP and ZMQSC ALT MQP commands.

---

**MQSC0004I DEFINE CHANNEL SUCCESSFUL**

**Explanation:** This is the normal response to the ZMQSC DEF CHL command.

**System Action:** A message channel for TPF MQSeries is created.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEF CHL command.

---

**MQSC0005E CHANNEL DEFINITION ALREADY EXISTS**

**Explanation:** The channel name specified in the ZMQSC DEF CHL command already exists in the TPF system.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC DEF CHL command again specifying a new channel name.

- Enter the ZMQSC ALT CHL command to change the TPF MQSeries channel definition.

See *TPF Operations* for more information about the ZMQSC DEF CHL and ZMQSC ALT CHL commands.

---

**MQSC0006I ALTER CHANNEL DEFINITION SUCCESSFUL**

**Explanation:** This is the normal response to the ZMQSC ALT CHL command.

**System Action:** The TPF MQSeries channel definition is changed in the TPF system.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC ALT CHL command.

---

**MQSC0007E CHANNEL DEFINITION DOES NOT EXIST**

**Explanation:** The TPF MQSeries channel definition specified in a ZMQSC command does not exist.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC command again specifying a valid TPF MQSeries channel definition.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0009E SYSTEM MUST BE IN NORM STATE**

**Explanation:** A ZMQSC command was entered below NORM state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Enter the ZMQSC command again.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0010I DELETE CHANNEL DEFINITION SUCCESSFUL**

**Explanation:** This is the normal response to the ZMQSC DEL command with the CHL parameter specified.

**System Action:** The TPF MQSeries channel definition is deleted from the TPF system.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEL command.

---

**MQSC0012E TARGQ REQUIRED FOR ALIAS Q DEFINITION**

**Explanation:** The ZMQSC DEF QA command was entered without specifying the TARGQ parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC DEF QA command again specifying the TARGQ parameter.

See *TPF Operations* for more information about the ZMQSC DEF QA command.

---

**MQSC0013E PARAMETER VALUE *parmval* NOT RECOGNIZED - MUST BE ON OR OFF**

**Where:**

*parmval*
The parameter value.

**Explanation:** The ZMQSC TRACE command was entered with the CONSOLE or TAPE parameter specified, but the value specified was incorrect.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC TRACE command again specifying a correct value for the CONSOLE or TAPE parameter.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0014I DELETE ALIAS QUEUE SUCCESSFUL**

**Explanation:** This is the normal response to the ZMQSC DEL command with the QA parameter specified.

**System Action:** The TPF MQSeries alias queue is deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEL command.

---

**MQSC0018I DELETE REMOTE QUEUE SUCCESSFUL**

**Explanation:** This is the normal response to the ZMQSC DEL command with the QR parameter specified.

**System Action:** The remote MQSeries queue definition is deleted from the TPF system.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEL command.

---

**MQSC0019I START QUEUE MANAGER SUCCESSFUL**

**Explanation:** This is the normal response to the ZMQSC START command with the QMGR parameter specified.

**System Action:** The TPF MQSeries queue manager is started in the TPF system.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC START command.

---

**MQSC0020I STOP QUEUE MANAGER SUCCESSFUL**

**Explanation:** This is the normal response to the ZMQSC STOP command with the QMGR parameter specified.

**System Action:** The TPF MQSeries queue manager is stopped in the TPF system.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC STOP command.

---

**MQSC0026W MANAGER ALREADY STARTED**

**Explanation:** The ZMQSC START command with the QMGR parameter specified was entered to start the TPF MQSeries queue manager. However, the queue manager is already started.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC START command.

---

**MQSC0027E PROFILE NOT DEFINED**

**Explanation:** A ZMQSC command was entered and an error occurred because the TPF MQSeries profile has not been defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC DEF MQP command to create the TPF MQSeries profile.
2. Enter the original ZMQSC command again.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0028I CHANNEL *name* ADDED TO FUNCTION TRACE TABLE**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is the normal response to the ZMQSC TRACE command with the CHL or CHANNEL parameter and the FUNCTION and ON parameters specified.

**System Action:** The specified channel name is added to the function trace table.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0029I CHANNEL *name* REMOVED FROM FUNCTION TRACE TABLE**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is the normal response to the ZMQSC TRACE command with the CHL or CHANNEL parameter and the FUNCTION and OFF parameters specified.

**System Action:** The specified channel name is removed from the function trace table.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0030I QUEUE *qname* ADDED TO FUNCTION TRACE TABLE**

**Where:**

*qname*
The queue name.

**Explanation:** This is the normal response to the ZMQSC TRACE command with the QUEUE and ON parameters specified.

**System Action:** The specified queue name is added to the function trace table.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0031I QUEUE *name* REMOVED FROM FUNCTION TRACE TABLE**

**Where:**

*name*
The queue name.

**Explanation:** This is the normal response to the ZMQSC TRACE command with the QUEUE and OFF parameters specified.

**System Action:** The specified queue name is removed from the function trace table.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0032I CHANNEL *name* ADDED TO COMMS TRACE TABLE**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is the normal response to the ZMQSC TRACE command with the CHL or CHANNEL parameter and the COMMS and ON parameters specified.

**System Action:** The specified channel name is added to the communications trace table.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0033I CHANNEL *name* REMOVED FROM COMMS TRACE TABLE**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is the normal response to the ZMQSC TRACE command with the CHL or CHANNEL parameter and

the COMMS and OFF parameters specified.

**System Action:** The specified channel name is removed from the communications trace table.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0035E THE ENTRY WAS NOT FOUND IN THIS TRACE TABLE**

**Explanation:** The ZMQSC TRACE command was entered with the CHL, CHANNEL, or QUEUE parameter and the OFF parameter specified to remove a name from the trace table. However, the name specified does not exist in the trace table.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct channel or queue name, there is no more action for you to take.
- If you specified an incorrect channel or queue name, enter the ZMQSC TRACE command again and specify the correct name.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0036W THE TRACE STATUS WAS NOT SAVED TO EXTERNAL STORAGE AND WILL BE RESET TO ITS PREVIOUS SETTING IF THE QUEUE MANAGER IS RESTARTED.**

**Explanation:** The ZMQSC TRACE command was entered to change the trace parameters, but the changed parameters were not written to external storage. If the queue manager is restarted, the trace parameters will be reset to their previous settings.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0042E MAXMSGL EXCEEDS THE MAXIMUM DEFINED IN PROFILE**

**Explanation:** A ZMQSC command was entered with a value specified for the MAXMSGL parameter that was greater than the specified maximum in the TPF MQSeries profile.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC DISPLAY command with the QMGR parameter specified to view the maximum message length allowed.
2. Enter the original ZMQSC command again specifying a valid value for the MAXMSGL parameter.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0045E CHANNEL- *name* IS STILL ACTIVE**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The ZMQSC DEL command with the CHL parameter specified was entered to delete a TPF MQSeries channel definition. However, the specified channel is active and cannot be deleted.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC STOP command with the CHL parameter specified to stop the requested channel.
2. Enter the ZMQSC DEL command with the CHL parameter specified to delete a TPF MQSeries channel definition.

See *TPF Operations* for more information about the ZMQSC DEL andZMQSC STOP commands.

---

**MQSC0046W THE TRACE STATUS COULD NOT BE RESTORED**

**Explanation:** An error occurred when the ZMQSC START command was entered with the QMGR parameter specified because the trace status information could not be restored.

**System Action:** Processing of the ZMQSC START command continues.

**User Response:** Enter the ZMQSC TRACE command with the appropriate parameters specified to reset the trace settings you want to use.

See *TPF Operations* for more information about the ZMQSC START and ZMQSC TRACE commands.

---

**MQSC0047I TRACE PARAMETERS ALTERED SUCCESSFULLY**

**Explanation:** This is the normal response to the ZMQSC TRACE command with one of the following parameters specified:

- CHL or CHANNEL with a value of ALL
- QUEUE with a value of ALL
- ADMIN
- CONSOLE
- TAPE.

**System Action:** The specified trace parameter is changed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0048I TRACE STARTED**

**Explanation:** This is the normal response to the ZMQSC TRACE command with the START parameter specified.

**System Action:** Tracing starts according to the current trace parameters.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0049I TRACE STOPPED**

**Explanation:** This is the normal response to the ZMQSC TRACE command with the STOP parameter specified.

**System Action:** Tracing stops.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0050E PURGE VALUE MUST BE ALL FOR COMMON QUEUE *qname***

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEL command was entered with the QL and PURGE parameters specified for a processor shared queue, but the value for the PURGE parameter was not ALL.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC DEL command again and specify a value of ALL for the PURGE parameter.

See *TPF Operations* for more information about the ZMQSC DEL command.

---

**MQSC0057I QUEUE SWING OF *tqname* HAS BEEN RESET**

**Where:**

*tqname*
The transmit queue name.

**Explanation:** The ZMQSC SWQ command was entered with the same transmission queue name specified for the FROMQ and TOQ parameters.

**System Action:** The swing status of the queue is reset.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC SWQ command.

---

**MQSC0058E NEW QUEUE MANAGER NAME IS ALREADY IN USE**

**Explanation:** One of the following occurred:

- The ZMQSC ALT MQP command was entered with the NEWNAME parameter specified, but the new queue manager name provided is the same as a remote queue manager name for a local definition of a remote queue.
- The ZMQSC DEF QR or ZMQSC ALT QR command was entered with the RQMNAME parameter specified, but the remote queue manager name provided is the same as the local queue manager name.

**System Action:** The command is rejected.

**User Response:** Enter the appropriate command again and specify a different name for the NEWNAME or RQMNAME parameter.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0060E INCORRECT MIGRATION STATE**

**Explanation:** The ZMQSC MIGRATE command was entered with the BEGIN parameter specified and one of the following occurred:

- The processor was migrated already.
- A fallback was interrupted.
- The queue manager was in a migrate committed state.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the processor is already migrated or the queue manager is in a migrate committed state, no action is necessary.
- If a fallback was interrupted, enter the ZMQSC MIGRATE command again and specify the FORCE parameter.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

---

**MQSC0061E QUEUE MANAGER NOT STARTED**

**Explanation:** A ZMQSC command was entered to perform a task that requires the TPF MQSeries queue manager to be started. However, the queue manager has not been started.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC START command with the QMGR parameter specified to start the TPF MQSeries queue manager.
2. Enter the original ZMQSC command again.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0064E QUEUE *qname* IS BEING DELETED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QA, QL, or QR, or ZMQSC ALT QA, QL, or QR, or ZMQSC DEL command with the QA, QL, or QR parameter was entered without the PURGE parameter specified. However, a previous ZMQSC DEL command with the QA, QL, or QR parameter specified was processed for a queue of the same name.

**System Action:** The queue has not been completely deleted. The command is rejected.

**User Response:** Do the following:

1. Do one of the following:
   - Wait for all the processors to delete their copy of the queue.

- Delete the queue by entering the ZMQSC DEL command with the QA or QR parameters specified, or the QL and PURGE parameters specified.

2. Enter the ZMQSC DEF QA, QL, or QR, or ZMQSC ALT QA, QL, or QR command again.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0065W QUEUE *qname* IS REPLACED IN MEMORY TABLE**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QA, QL, or QR command was entered and the queue name was not in use in the queue definition dictionary, but a nondeleted queue of the same name existed in the queue definition table in memory. The definition in memory was replaced by the new definition.

**System Action:** The queue is defined successfully.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEF QA, QL, or QR command.

---

**MQSC0066E NO HEAP AVAILABLE**

**Explanation:** The ZMQSC START command was entered with the QMGR parameter specified, but the request failed because there are not enough heap frames in the TPF system.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Do one of the following:
   - Enter the ZCTKA ALTER command to increase the number of heap frames.
   - Release some heap frames from other applications.
2. Enter the ZMQSC START command again.

See *TPF Operations* for more information about the ZCTKA ALTER and ZMQSC START commands.

---

**MQSC0067E *xxx* FAILED FOR QUEUE *qname*, ERROR CODE *nn***

**Where:**

*xxx* DEFINE, ALTER, or DELETE.

*qname*
The queue name.

*nn* The error code.

**Explanation:** The ZMQSC DEF QA, QL, or QR, ZMQSC ALT QA, QL, or QR, or the ZMQSC DEL command with the QA, QL, or QR parameter specified was entered on this or another processor, but the memory copy of the queue definition could not be updated.

**System Action:** The queue definition is defined or updated on file, but not in memory.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0069I LOCAL QUEUE *qname* DEFINED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QL command for the specified queue was processed successfully.

**System Action:** The local queue has been defined.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEF QLcommand.

---

**MQSC0070E QUEUE *qname* ALREADY DEFINED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QA, QL, or QR command was entered for the queue indicated in the message, but this queue is already defined and not deleted.

**System Action:** The command is rejected.

**User Response:** Verify the spelling of the queue name and do one of the following:

- If the queue name is spelled correctly and the queue is defined, no action is required.
- If the queue is not defined correctly, do the following:
  1. Modify the queue definition by entering the ZMQSC ALT QA, QL, or QR command or delete the definition by entering the ZMQSC DEL command with the QA, QL, or QR parameter specified..
  2. Enter the ZMQSC DEF QA, QL, or QR command again.
- If the queue name is spelled incorrectly, enter the ZMQSC DEF QA, QL, or QR command again specifying a queue name that is correct.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0073E QUEUE *qname* IS NOT AN ALIAS QUEUE**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC ALT QA command or else the ZMQSC DEL or ZMQSC DISPLAY command with the QA parameter specified was entered, but the specified queue is not an alias queue.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC ALT QA command or else the ZMQSC DEL or ZMQSC DISPLAY command with the QA parameter specified again and specify a valid alias queue name.

- If the queue name specified is a local queue name, enter the ZMQSC ALT QL command or else the ZMQSC DEL or ZMQSC DISPLAY command with the QL parameter specified.
- If the queue name specified is a remote queue name, enter the ZMQSC ALT QR command or else the ZMQSC DEL or ZMQSC DISPLAY command with the QR parameter specified.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0078E QUEUE *qname* IS NOT A REMOTE QUEUE**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC ALT QR command or else the ZMQSC DISPLAY or ZMQSC DEL command with the QR parameter specified was entered. However, the specified queue is not a remote queue.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC ALT QR command or else the ZMQSC DISPLAY or ZMQSC DEL command with the QR parameter specified again and specify a valid remote queue name.
- If the queue name specified is a local queue name, enter the ZMQSC ALT QL command or else the ZMQSC DISPLAY or ZMQSC DEL command with the QL parameter specified.
- If the queue name specified is an alias queue name, enter the ZMQSC ALT QA command or else the ZMQSC DISPLAY or ZMQSC DEL command with the QA parameter specified.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0079E QUEUE *qname* IS NOT A LOCAL QUEUE**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC ALT QL command or else the ZMQSC DISPLAY or ZMQSC DEL command with the QL parameter specified was entered. However, the specified queue is not a local queue.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC ALT QL command or else the ZMQSC DISPLAY or ZMQSC DEL command with the QL parameter specified again and specify a valid local queue name.
- If the queue specified is a remote queue name, enter the ZMQSC ALT QR command or else the ZMQSC DEL or ZMQSC DISPLAY command with the QR parameter specified.
- If the queue name specified is an alias queue name, enter the ZMQSC ALT QA command or else the ZMQSC DEL or ZMQSC DISPLAY command with the QA parameter specified.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0080I RECEIVER CHANNEL *name* STARTED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is the normal response when a receiver channel has started.

**System Action:** None.

**User Response:** None.

---

**MQSC0081E REQUEST RECEIVED TO START RECEIVER CHANNEL *name* RECEIVER CHANNEL FAILED TO START - RC *retcode***

**Where:**

*name*
The TPF MQSeries channel name.

*retcode*
The return code.

**Explanation:** This message is displayed when an unexpected error causes the receiver channel to fail to start.

**System Action:** None.

**User Response:** See your system programmer to determine the cause of the problem.

---

**MQSC0083E QUEUE *qname* HAS BEEN SWUNG TO THIS QUEUE**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEL command with the QL parameter specified was entered to delete a queue. However, the queue is the object of a swing from another queue.

**System Action:** The queue is not deleted.

**User Response:** Enter the ZMQSC SWQ command with the FROMQ parameter specified using the queue name indicated in this message and the TOQ parameter specified as a queue name other than the one you are deleting.

See *TPF Operations* for more information about the ZMQSC DEL and ZMQSC SWQ commands.

---

**MQSC0085I CHANNEL - *name action***

**Where:**

*name*
The TPF MQSeries channel name.

*action*
The action, which is one of the following:

- Binding
- Closing
- Ready

- Started
- Starting
- Stopped.

**Explanation:** This is the normal response to the ZMQSC DISPLAY command with the CHS parameter specified.

**System Action:** The current status of the specified channel is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

---

**MQSC0086E PARAMETER VALUE *value* NOT VALID**

**Where:**

*value*
The parameter value.

**Explanation:** A ZMQSC command was entered with a parameter value specified that is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid parameter value.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0088I QUEUE SWING *xxx* TO *yyy* SUCCESSFUL**

**Where:**

*xxx* The name of the queue sending the message.

*yyy* The name of the queue receiving the message.

**Explanation:** This is the normal response to the ZMQSC SWQ command.

**System Action:** Messages from the sending queue are placed on the receiving queue.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC SWQ command.

---

**MQSC0090E REMOTE QUEUE *name* USES THIS XMIT QUEUE**

**Where:**

*name*
The queue name.

**Explanation:** The ZMQSC DEL command was entered to delete a transmission queue. However, the transmission queue is being used by a remote queue.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC DEL command with the QR parameter specified to delete the remote queue.
- Enter the ZMQSC ALT QR command to change the transmission queue that the remote queue is using, and enter the ZMQSC DEL command again.

See *TPF Operations* for more information about the ZMQSC DEL and ZMQSC ALT QR commands.

---

**MQSC0092E QUEUE SWING FAILED - QUEUE *qname* IS NOT SUBJECT OF SWINGQ**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC SWQ command with the FROMQ and TOQ parameters specified, was entered with the same queue name. This form of the message is intended to undo the effects of a previous ZMQSC SWQ command that was entered, but the specified queue is not currently having its messages sent to another queue.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC SWQ command.

---

**MQSC0093E QUEUE SWING FAILED - FROMQ *fqname* IS NOT DEFINED**

**Where:**

*fqname*
The source transmission queue name.

**Explanation:** The ZMQSC SWQ command with the FROMQ parameter specified was entered, but the queue is not defined.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC SWQ command again specifying an existing transmission queue for the FROMQ parameter.

See *TPF Operations* for more information about the ZMQSC SWQ command.

---

**MQSC0094E QUEUE SWING FAILED - TOQ *tqname* IS NOT DEFINED**

**Where:**

*tqname*
The target transmission queue name.

**Explanation:** The ZMQSC SWQ command with the TOQ parameter specified was entered, but the queue name is not defined.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC SWQ command again specifying an existing transmission queue for the TOQ parameter.

See *TPF Operations* for more information about the ZMQSC SWQ command.

---

**MQSC0095E QUEUE SWING FAILED - FROMQ *fqname* IS NOT A TRANSMIT QUEUE**

**Where:**

*fqname*
The source transmission queue name.

**Explanation:** The ZMQSC SWQ command with the FROMQ parameter specified was entered, but the queue name is not a transmission queue.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC SWQ command again specifying an existing transmission queue for the FROMQ parameter.

See *TPF Operations* for more information about the ZMQSC SWQ command.

**MQSC0096E QUEUE SWING FAILED - TOQ*tqname* IS NOT A TRANSMIT QUEUE**

**Where:**

*tqname*
The target transmission queue name.

**Explanation:** The ZMQSC SWQ command with the TOQ parameter specified was entered, but the queue name is not a transmission queue.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC SWQ command again specifying an existing transmission queue for the TOQ parameter.

See *TPF Operations* for more information about the ZMQSC SWQ command.

**MQSC0097E QUEUE SWING FAILED - FROMQ *fqname* IS SUBJECT OF SWINGQ**

**Where:**

*fqname*
The source transmission queue name.

**Explanation:** The ZMQSC SWQ command was entered with the FROMQ parameter specified. However, the queue name was specified for the FROMQ parameter in a previous ZMQSC SWQ command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC SWQ command, specifying the same queue name for the FROMQ and TOQ parameters to reset the queue.
2. Enter the ZMQSC SWQ command again with the original queue name that was used.

See *TPF Operations* for more information about the ZMQSC SWQ command.

**MQSC0098E QUEUE SWING FAILED - FROMQ *fqname* IS OBJECT OF SWINGQ FROM QUEUE *qname***

**Where:**

*fqname*
The source transmission queue name.

*qname*
The queue name.

**Explanation:** The ZMQSC SWQ command was entered with the FROMQ parameter specified. However, the queue name was specified for the TOQ parameter in a previous ZMQSC SWQ command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC SWQ command, specifying the same queue name for the FROMQ and TOQ parameters to reset the queue.
2. Enter the ZMQSC SWQ command again with the original queue name that was used.

See *TPF Operations* for more information about the ZMQSC SWQ command.

**MQSC0099E QUEUE SWING FAILED - TOQ *tqname* IS SUBJECT OF SWINGQ**

**Where:**

*tqname*
The target transmission queue name.

**Explanation:** The ZMQSC SWQ command was entered with the TOQ parameter specified. However, the queue name was specified for the FROMQ parameter in a previous ZMQSC SWQ command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC SWQ command, specifying the same queue name for the FROMQ and TOQ parameters to reset the queue.
2. Enter the ZMQSC SWQ command with the original queue name again.

See *TPF Operations* for more information about the ZMQSC SWQ command.

**MQSC0100E QUEUE SWING FAILED - TOQ *tqname* MAXMSGL IS SMALLER THAN FROMQ *fqname*.**

**Where:**

*tqname*
The target tranmission queue name.

*fqname*
The source transmission queue name.

**Explanation:** The ZMQSC SWQ command was entered with the TOQ and FROMQ parameters specified, but the maximum message length allowed for the TOQ queue name is smaller than that for the FROMQ queue name.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC ALT QL command to increase the maximum message value for the TOQ queue name to be at least as large as that for the FROMQ queue name, and enter the ZMQSC SWQ command again.
- Enter the ZMQSC ALT QL command to decrease the maximum message value for the FROMQ queue name to be no greater than that for the TOQ queue name, and enter the ZMQSC SWQ command again.
- Enter the ZMQSC SWQ command, specifying a different TOQ queue name that is a transmission queue whose maximum message value is at least as large as that for the FROMQ queue name.

See *TPF Operations* for more information about the ZMQSC SWQ and ZMQSC ALT QL commands.

---

**MQSC0101E INCORRECT LOCAL IP ADDRESS SPECIFIED**

**Explanation:** ZMQSC ALT CHL or ZMQSC DEF CHL was entered with the LOCALIP parameter specified, but the Internet Protocol (IP) address specified is not valid.

**System Action:** The command is rejected

**User Response:** Do the following:

- Ensure that the specified IP address is correct.
- Enter the ZMQSC ALT CHL or ZMQSC DEF CHL command again specifying the LOCALIP parameter correctly.

See *TPF Operations* for more information about the ZMQSC ALT CHL and ZMQSC DEF CHL commands.

---

**MQSC0102E UNEXPECTED DASH**

**Explanation:** A ZMQSC command was entered with an unexpected dash.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0103E UNEXPECTED LEFT PAREN**

**Explanation:** A ZMQSC command was entered with an unexpected left parenthesis.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0104E UNEXPECTED RIGHT PAREN**

**Explanation:** A ZMQSC command was entered with an unexpected right parenthesis.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0105E UNEXPECTED COMMA**

**Explanation:** A ZMQSC command was entered with an unexpected comma.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0106E UNEXPECTED NUMBER** *num*

**Where:**

*num*
The decimal number.

**Explanation:** A ZMQSC command was entered with an unexpected number specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0107E PRIMARY PARAMETER** *parm* **NOT VALID**

**Where:**

*parm*
The parameter.

**Explanation:** A ZMQSC command was entered specifying a parameter that was not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0108E SECONDARY PARAMETER NOT SPECIFIED**

**Explanation:** A ZMQSC command was entered without specifying the secondary parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying valid parameters.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0109E SECONDARY PARAMETER *parm* NOT VALID**

**Where:**

*parm*
The parameter.

**Explanation:** A ZMQSC command was entered with a secondary parameter specified that was not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying valid parameters.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0110E *parm* NOT VALID FOR THIS COMMAND**

**Where:**

*parm*
The parameter.

**Explanation:** A ZMQSC command was entered with a parameter specified that is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying valid parameters.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0111E *parm* - DASH EXPECTED**

**Where:**

*parm*
The parameter.

**Explanation:** A ZMQSC command was entered without a dash following the specified parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0112E *value* - STRING EXPECTED**

**Where:**

*value*
The value.

**Explanation:** A ZMQSC command was entered with a character string value that was not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0113E *name* -CONTAINS INCORRECT CHARACTERS**

**Where:**

*name*
The TPF MQSeries object name.

**Explanation:** When a ZMQSC command was entered, the value that was specified for the object name contains characters that are not valid for TPF MQSeries objects.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid object name.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0115E PARAMETER *parm* NOT VALID**

**Where:**

*parm*
The parameter.

**Explanation:** A ZMQSC command was entered with a parameter specified that is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid parameter.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0116E CHLTYPE MUST BE SPECIFIED AFTER CHANNEL NAME**

**Explanation:** When the ZMQSC DEF CHL command was entered, the CHLTYPE parameter did not follow the channel name.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC DEF CHL command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC DEF CHL command.

---

**MQSC0117E** *value* **- NUMBER EXPECTED**

**Where:**

*value*
A numeric value.

**Explanation:** A ZMQSC command was entered without specifying a numeric value.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0118E** *value* **- VALUE OUT OF RANGE**

**Where:**

*value*
A numeric value.

**Explanation:** A ZMQSC command was entered with a numeric value that was not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid numeric value.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0119E PLUS CHARACTER NOT VALID IN PARAMETER VALUE**

**Explanation:** A ZMQSC command was entered with a plus (+) character in the value specified for the object name. Plus characters are not valid for TPF MQSeries objects.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid object name.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0123E VALUE TYPE** *value* **NOT SUPPORTED**

**Where:**

*value*
The numeric representation of the value.

**Explanation:** A ZMQSC command was entered, but the parameter specified was not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0125E PARAMETER** *parm* **TOO LONG**

**Where:**

*parm*
The parameter.

**Explanation:** A ZMQSC command was entered with a parameter specified that exceeded the maximum parameter length allowed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid value for the parameter.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0126E NUMBER** *value* **TOO LONG**

**Where:**

*value*
A numeric value.

**Explanation:** A ZMQSC command was entered with a numeric value that exceeds the maximum number length allowed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid value.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0127E TERMINATOR OF NUMBER** *value* **NOT VALID**

**Where:**

*value*
The numeric value.

**Explanation:** A ZMQSC command was entered, but an

alphabetic character was found within the numeric value specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid numeric value.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0128E CHARACTER *char* NOT VALID**

**Where:**

*char*
The character.

**Explanation:** A ZMQSC command was entered with a character specified that is not a valid part of a numeric value.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid numeric value.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0129E STRING *string* TOO LONG**

**Where:**

*string*
The string value.

**Explanation:** A ZMQSC command was entered with a string value specified that exceeds the maximum length allowed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid string value.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0130E STRING *string* ENDED UNEXPECTEDLY**

**Where:**

*string*
The string value that was specified.

**Explanation:** A ZMQSC command was entered with a string value specified that ended unexpectedly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0131E TOO MANY ATTRIBUTES**

**Explanation:** A ZMQSC command was entered with a number of attributes specified that exceeds the maximum number allowed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid value.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0132E CHARACTER ATTRIBUTE BUFFER EXCEEDED**

**Explanation:** A ZMQSC command was entered, but the parameter specified exceeds the maximum buffer length.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid value.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0133E ON OR OFF MUST BE SPECIFIED**

**Explanation:** The ZMQSC TRACE command was entered with the CHL, CHANNEL, QUEUE, ADMIN, or ALL parameter specified, but the ON or OFF parameter was not specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC TRACE command again and specify either the ON or OFF parameter.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0134E CONFLICTING PARAMETERS SPECIFIED (*parm1*/*parm2*)**

**Where:**

*parm1*
A ZMQSC command parameter.

*parm2*
A ZMQSC command parameter.

**Explanation:** A ZMQSC command was entered with two parameters specified that conflict with each other. For example, this message occurs if you enter the ZMQSC TRACE command with both the ON and OFF parameters specified.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Determine the correct format for the ZMQSC command.

- Enter the ZMQSC command again and specify the correct parameter.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0135E COMMON NOT VALID FOR TRANSMIT QUEUE** *qname*

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QL command was entered with the XMITQ value specified for the USAGE parameter and the YES value specified for the COMMON parameter. The YES value is allowed only for a normal queue.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC DEF QL command again and specify the NORMAL value for the USAGE parameter or omit the parameter altogether.
- Enter the ZMQSC DEF QL command again and specify the NO value for the COMMON parameter or omit the parameter altogether.

See *TPF Operations* for more information about the ZMQSC DEF QL command.

---

**MQSC0136E CPU ID NOT VALID**

**Explanation:** The ZMQSC command was entered with a processor identifier (ID) specified for the CPU parameter that was not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the format of the ZMQSC command.
2. Enter the command again specifying a valid processor ID.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0137E MAXMSGL FOR LOCAL QUEUE** *qname* **EXCEEDS THE MAXIMUM DEFINED IN THE MQSERIES PROFILE**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QL or ZMQSC ALT QL command was entered with the MAXMSGL parameter specified, but the value specified for this parameter was greater than the limit specified or implied for the queue manager in the ZMQSC DEF MQP or ZMQSC ALT MQP command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC DISPLAY command with the QMGR parameter specified to view the value.
2. Enter the ZMQSC DEF QL, or ZMQSC ALT QL command again and specify a value for the MAXMSGL parameter that is less than or equal to the maximum value specified for the queue manager.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0138E LOW STORAGE ERROR**

**Explanation:** When a ZMQSC command was entered, TPF system storage could not be obtained to process the request.

**System Action:** The command is rejected.

**User Response:** See your system programmer to determine why the TPF system storage could not be obtained.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0139E CHANNEL DOES NOT EXIST IN MEMORY**

**Explanation:** The ZMQSC DISPLAY command with the CHS parameter specified or the ZMQSC START command with the CHL parameter specified was entered to access a specified TPF MQSeries channel. However, the channel does not exist in memory.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that the TPF MQSeries channel name is specified correctly.
2. Enter the ZMQSC command again specifying a valid channel name.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0142E CHANNEL***xxx* **FOR QUEUE** *qname* **MUST BE STOPPED AND NOT IN DOUBT**

**Where:**

*xxx* The channel name.

*qname*
The queue name.

**Explanation:** The ZMQSC SWQ command was entered, but the source transmission queue name specified for the FROMQ parameter is associated with a channel that is either not stopped or is in an in-doubt condition.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the channel is not stopped, enter the ZMQSC STOP command with the CHL parameter specified and then enter the ZMQSC SWQ command again.
- If the channel is in an in-doubt condition, enter the ZMQSC RESOLVE command to resolve the channel and then enter the ZMQSC SWQ command again.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0143I ALIAS QUEUE *qname* DEFINED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QA command for the queue indicated was processed successfully.

**System Action:** The alias queue is defined.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEF QA command.

**MQSC0144E QUEUE MANAGER NAME DOES NOT EXIST IN TPF**

**Explanation:** The ZMQSC ALT MQP command was entered referencing a TPF MQSeries queue manager that is not defined to the TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC ALT MQP command with the correct queue manager name.

See *TPF Operations* for more information about the ZMQSC ALT MQP command.

**MQSC0145I REMOTE QUEUE *qname* DEFINED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QR command for the queue indicated in the message was processed successfully.

**System Action:** The remote queue is defined.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEF QR command.

**MQSC0146I LOCAL QUEUE *qname* ALTERED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC ALT QL command for the queue indicated was processed successfully.

**System Action:** The local queue definition is changed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC ALT QL command.

**MQSC0147E QUEUE *qname* DOES NOT EXIST**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC ALT QA, QL, or QR command or ZMQSC DEL command with the QA, QL, or QR parameter specified was entered, but the queue indicated in the message does not exist.

**System Action:** The command is rejected.

**User Response:** Verify the spelling of the queue name and do one of the following:

- If the queue name is not spelled correctly, enter the command again.
- If the queue name is spelled correctly, do one of the following:
  - If the ZMQSC ALT QA, QL, or QR command was entered, enter the ZMQSC DEF QA, QL, or QR command instead.
  - If the ZMQSC DEL command with the QA, QL, or QR parameter specified was entered, no action is required.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0148I ALIAS QUEUE *qname* ALTERED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC ALT QA command for the queue indicated was processed successfully.

**System Action:** The alias queue definition is changed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC ALT QA command.

**MQSC0149I REMOTE QUEUE *qname* ALTERED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC ALT QR command for the queue indicated was processed successfully.

**System Action:** The remote queue definition is changed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC ALT QR command.

**MQSC0153E INCORRECT ZMQSC FUNCTION ENTERED**

**Explanation:** A ZMQSC command was entered that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter **ZMQSC HELP** to determine the correct format of the command.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0156W** *command* **OPERATION COMPLETED, BUT ERRORS OCCURRED**

**Where:**

*command*
The type of ZMQSC command.

**Explanation:** A ZMQSC command was entered and completed successfully, but errors occurred. The TPF system sends an additional message for each error, describing the nature of the error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0157E QUEUE DEFINITION DOES NOT EXIST**

**Explanation:** The ZMQSC DISPLAY command was entered with the QA, QL, or QR parameter specified. However, the queue referenced is not defined to the TPF system.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the queue name was spelled incorrectly, enter the ZMQSC DISPLAY command again with the correct spelling specifying the appropriate parameter.
- If the queue name was spelled correctly, enter the ZMQSC DEF QA, QL, or QR command to identify the queue.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0159I QUEUES DEFINED:**

**Explanation:** This is the normal response to the ZMQSC DISPLAY command with the QUEUE and ALL parameters specified.

**System Action:** A list of all the queue definitions in the TPF system is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0162E NAME CANNOT BE ALL**

**Explanation:** The ZMQSC DEF CHL, ZMQSC DEF QA, ZMQSC DEF QL, or ZMQSC DEF QR command was entered to define a channel or queue with a name of ALL. The name ALL cannot be used as the channel or queue name.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC DEF CHL command with a channel name other than ALL to define a channel.
- Enter the ZMQSC DEF QA, ZMQSC DEF QL or ZMQSC DEF QR command with a queue name other than ALL to define a queue.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0163E XMITQ AND CONNAME REQUIRED FOR SENDER CHANNEL**

**Explanation:** The ZMQSC DEF CHL command was entered to define a sender channel. However, the XMITQ and CONNAME parameters were not specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC DEF CHL command with the XMITQ and CONNAME parameters specified.

See *TPF Operations* for more information about the ZMQSC DEF CHL command

**MQSC0164E ACTION PARAMETER REQUIRED**

**Explanation:** The ZMQSC RESOLVE command was entered to resolve a sender channel. However, the ACTION parameter was not specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC RESOLVE command with the ACTION parameter (either COMMIT or BACKOUT) specified.

See *TPF Operations* for more information about the ZMQSC RESOLVE command

**MQSC0166E THIS NAME IS ALREADY IN THE TRACE TABLE**

**Explanation:** The ZMQSC TRACE command was entered with a CHL, CHANNEL, or QUEUE parameter and the ON parameter specified to add a name to the trace table. However, the name specified already exists in the trace table.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct channel or queue name, there is no more action for you to take.
- If you specified an incorrect channel or queue name, enter the ZMQSC TRACE command again and specify the correct name.

See *TPF Operations* for more information about the ZMQSC TRACE command.

**MQSC0167E** *command* **REJECTED - MIGRATE COMMIT REQUIRED**

**Where:**

*command*
The type of ZMQSC command.

**Explanation:** A ZMQSC command was entered before migration was committed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZMQSC MIGRATE COMMIT**.
2. Enter the appropriate ZMQSC command again.

See *TPF Operations* for more information about ZMQSC MIGRATE and other ZMQSC commands.

**MQSC0168E MQSERIES CHECKPOINT RECORDS NOT ALLOCATED**

**Explanation:** A ZMQSC command was entered, but the #IMQCK record type was not allocated in the file address compute (FACE) table.

**System Action:** The command is not processed.

**User Response:** Modify the FACE table definition to include the #IMQCK record type and restart the TPF system.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0169E QUEUE MANAGER MUST BE STOPPED**

**Explanation:** The ZMQSC MIGRATE command was entered with the FALLBACK parameter specified, but the queue manager on the processor where the command was entered was not stopped.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Stop the queue manager by entering the ZMQSC STOP command with the QMGR parameter specified.
2. Enter the ZMQSC MIGRATE command again with the FALLBACK parameter specified.

See *TPF Operations* for more information about the ZMQSC MIGRATE and ZMQSC STOP commands.

**MQSC0170E THIS PROCESSOR HAS NOT MIGRATED**

**Explanation:** The ZMQSC START command was entered with the QMGR parameter specified, but the processor on which the command was entered has not been migrated.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC MIGRATE command with the BEGIN parameter specified to migrate the processor.
2. Enter the ZMQSC START command again with the QMGR parameter specified.

See *TPF Operations* for more information about the ZMQSC MIGRATE and ZMQSC START commands.

**MQSC0171E THE FOLLOWING PROCESSORS HAVE NOT MIGRATED: *x***

**Where:**

*x* A comma-separated list of processor IDs.

**Explanation:** The ZMQSC MIGRATE command was entered with the COMMIT parameter specified, but one or both of the following conditions exists for the specified processors:

- Messages still exist on old format queues.
- The ZMQSC MIGRATE command with the BEGIN parameter specified was not processed successfully.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC MIGRATE command with the BEGIN parameter specified on the specified processors.
- Enter the ZMQSC MIGRATE command again with the COMMIT parameter specified.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

**MQSC0172E PROCESSOR NOT IN MIGRATE UNCOMMITTED STATE**

**Explanation:** The ZMQSC MIGRATE command was entered with the FALLBACK parameter specified, but either migration has already been committed or the processor has not been migrated.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If migration is already committed, no action is required. The TPF system can no longer process a fallback request.
- If the processor has not been migrated, no action is required.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

**MQSC0173I ALL QUEUES SUCCESSFULLY MIGRATED**

**Explanation:** The ZMQSC MIGRATE command with the BEGIN parameter specified was processed successfully.

**System Action:** All old format queues have been converted to the new format and their messages have been moved to the new queues.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

**MQSC0174E NO CHANGE PARAMETERS SPECIFIED**

**Explanation:** The ZMQSC ALT MQP command was entered with no parameters specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC ALT MQP command again, specifying at least one parameter.

See *TPF Operations* for more information about the ZMQSC ALT MQP command.

**MQSC0175E QUEUE *qname* IS DELETED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC ALT QA, QL, or QR, or ZMQSC DEL QA, QL, or QR command, or ZMQSC DISPLAY command with the QA, QL, or QR parameter specified was entered, but the queue indicated in the message was deleted previously.

**System Action:** The command is rejected.

**User Response:** Verify the spelling of the queue name. If it is spelled correctly, then do one of the following:

- If the ZMQSC ALT QA, QL, or QR command was entered, enter the ZMQSC DEF QA, QL, or QR command instead.
- If the ZMQSC DEL command was entered with the QA, QL, or QR parameter specified, no action is required.
- If the ZMQSC DISPLAY command was entered with the QA, QL, or QR parameter specified, enter the ZMQSC DEF QA, QL, or QR command to define the queue and enter the ZMQSC DISPLAY command again specifying the QA, QL, or QR parameter.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0176E XMITQ, CONNAME, AND LOCALIP ONLY APPLY TO SENDER CHANNEL**

**Explanation:** Either the ZMQSC ALT CHL or the ZMQSC DEF CHL command was entered with the XMITQ, CONNAME, or LOCALIP parameter specified, but the XMITQ, CONNAME, and LOCALIP parameters are only valid with a sender channel.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC ALT CHL or the ZMQSC DEF CHL command again without specifying the XMITQ, CONNAME, or LOCALIP parameter.

See *TPF Operations* for more information about the ZMQSC ALT CHL and ZMQSC DEF CHL commands.

---

**MQSC0177I TRACE STATUS DISPLAY**

**Explanation:** This is the normal response to the ZMQSC TRACE command with the DISPLAY parameter specified.

**System Action:** The current trace status is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC TRACE command.

---

**MQSC0178E GET SYNC RECORD FAILED**

**Explanation:** This message is displayed if the process of obtaining a synchronization record fails while checkpointing a receiver channel during the TPF MQSeries checkpoint process.

**System Action:** The current checkpoint channel process exits.

**User Response:** None. The TPF system will automatically restart the checkpoint process when it reaches the checkpoint interval.

---

**MQSC0179E SWEEP NOT VALID FOR COMMON QUEUE** *qname*

**Where:**

*qname*
The queue name.

**Explanation:** One of the following occurred:

- The ZMQSC DEF QL command was entered with the YES value specified for the COMMON parameter, and the SWEEP parameter specified. An error occurred because the SWEEP parameter cannot be specified for a common queue.
- The ZMQSC ALT QL command was entered with the SWEEP parameter specified for a queue that was defined previously as a processor unique queue.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZMQSC DEF QL, or ZMQSC ALT QL command again specifying NO for the COMMON parameter or omit the parameter altogether.
- Enter the ZMQSC DEF QL, or ZMQSC ALT QL command again without specifying the SWEEP parameter.

See *TPF Operations* for more information about the ZMQSC ALT QL and ZMQSC DEF QL commands.

---

**MQSC0180E UNABLE TO SET UP RECOUP INDEX FOR MQSERIES**

**Explanation:** One of the following occurred:

- The ZMQSC START command was entered with the QMGR parameter specified or the ZMQSC MIGRATE command was entered with the BEGIN parameter specified, but an error occurred while attempting to change the recoup definition for the data store (DS) dictionary from homogeneous to heterogeneous.
- The ZMQSC DEF MQP command was entered, but an error occurred while creating recoup definitions for the MQSeries queue manager.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZMQSC DEF MQP, ZMQSC MIGRATE, or ZMQSC START command.

---

**MQSC0181E ERROR CREATING RECOUP INDEX FOR TRACE ENTRY**

**Explanation:** Either the ZMQSC DEF MQP, the ZMQSC MIGRATE command with the BEGIN parameter specified, or the ZMQSC START command with the QMGR parameter specified was entered, but an error occurred while retrieving a list of valid CPU IDs that are used to create one or more entries in the TPF collection support (TPFCS) data store (DS) user dictionary recoup index for the TPF MQSeries trace structure.

**System Action:** The command is rejected, but entries in the TPFCS DS user dictionary recoup index for TPF MQSeries trace records will not be created. TPF recoup will not find these records, and database corruption may occur if pool records being used by TPF MQSeries are allowed to be processed.

**User Response:** Have your system programmer determine why storage is depleted or why a list of valid CPU IDs could not be obtained.

See *TPF Operations* for more information about the ZMQSC DEF MQP, ZMQSC MIGRATE, or ZMQSC START command.

---

**MQSC0200I REMOTE QUEUE DISPLAY:**

**Explanation:** This is the normal response to the ZMQSC DISPLAY command with the QR parameter specified, or with the QUEUE parameter with a remote queue name specified.

**System Action:** The definition for the specified remote queue is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0201I LOCAL QUEUE DISPLAY:**

**Explanation:** This is the normal response to the ZMQSC DISPLAY command with the QL parameter specified, or with the QUEUE parameter with a local queue name specified.

**System Action:** The definition for the specified local queue is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0202I CHANNEL DEFINITION DISPLAY:**

**Explanation:** This is the normal response to the ZMQSC DISPLAY command with the CHL parameter specified.

**System Action:** The definition for the specified channel is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0203I QUEUE MANAGER PROFILE DISPLAY**

**Explanation:** This is the normal response to the ZMQSC DISPLAY command with the QMGR parameter specified.

**System Action:** The current TPF MQSeries profile is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0204I ALIAS QUEUE DISPLAY:**

**Explanation:** This is the normal response to the ZMQSC DISPLAY command with the QA parameter specified.

**System Action:** The definition for the specified alias queue is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0205I ALL CHANNELS STOPPING**

**Explanation:** This is the normal response to the ZMQSC STOP command when ALL is specified for the CHL parameter. This message is displayed immediately after entering the command and throughout the stopping process.

**System Action:** The TPF system begins stopping all TPF MQSeries channels.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC STOP command.

**MQSC0206I ALL CHANNELS STOPPED**

**Explanation:** This is the normal response to the ZMQSC STOP command when ALL is specified for the CHL parameter. This message is displayed when the stopping process is completed successfully.

**System Action:** All TPF MQSeries channels are stopped.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC STOP command.

**MQSC0207E NO CHANNELS DEFINED**

**Explanation:** The ZMQSC STOP command was entered to stop all TPF MQSeries channels, but no channels were defined.

**System Action:** The command is rejected.

**User Response:** Enter **ZMQSC DISPLAY CHL ALL** to verify if any channels have been defined.

See *TPF Operations* for more information about the ZMQSC STOP and the ZMQSC DISPLAY commands.

**MQSC0208I CHANNEL STATUS DISPLAY:**

**Explanation:** This is the normal response to the ZMQSC DISPLAY command when ALL is specified for the CHS parameter.

**System Action:** The current status of all channels is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0210E MIGRATE FAILED BECAUSE OF INDOUBT CHANNELS:**

**Explanation:** The ZMQSC MIGRATE command was entered with the BEGIN or FALLBACK parameter specified, but in-doubt sender channels were detected.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you want to continue with migration in spite of the in-doubt status of channels and you specified the BEGIN or FALLBACK parameter, enter the ZMQSC MIGRATE command again and specify the FORCE parameter.
- If you specified the BEGIN parameter, do the following:

1. Perform an initial program load (IPL) of the TPF system without APAR PJ27023 applied.
2. Enter the ZMQSC RESOLVE command to resolve the in-doubt channels.
3. Perform an IPL of the TPF system with APAR PJ27023 applied.
4. Enter the ZMQSC MIGRATE command again.

- If you specified the FALLBACK parameter, do the following:
  1. Enter the ZMQSC RESOLVE command to resolve the in-doubt channels.
  2. Enter the ZMQSC MIGRATE command again.

See *TPF Operations* for more information about the ZMQSC MIGRATE or ZMQSC RESOLVE commands.

---

**MQSC0211E MIGRATE FAILED BECAUSE OF TPF COLLECTION SUPPORT ERRORS**

**Explanation:** The ZMQSC MIGRATE command was entered, but TPF collection support (TPFCS) errors occurred while retrieving channel definitions from TPFCS.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

---

**MQSC0212E ALTER CHANNEL DEFINITION FAILED - CHANNEL IS ACTIVE**

**Explanation:** The ZMQSC ALT CHL command was entered, but the specified channel name is active and cannot be changed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC STOP command with the CHL parameter specified to stop the channel.
2. Enter the ZMQSC ALT CHL command to change the parameters.

See *TPF Operations* for more information about the ZMQSC STOP and ZMQSC ALT CHL commands.

---

**MQSC0213E ALTER CHANNEL DEFINITION FAILED - CHANNEL IS INDOUBT**

**Explanation:** The ZMQSC ALT CHL command was entered, but the specified channel name has outstanding batches that have not been processed completely.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC RESOLVE command with the CHL and ACTION parameters specified to resolve the channel.
2. Enter the ZMQSC ALT CHL command to change the parameters.

See *TPF Operations* for more information about the ZMQSC RESOLVE and ZMQSC ALT CHL commands.

---

**MQSC0217E QUEUE - *qname* IS NOT VALID FOR MOVE**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC MOVEMSGS command was entered, but the specified queue is not a processor unique normal local queue.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC MOVEMSGS command again and specify a valid queue.

See *TPF Operations* for more information about the ZMQSC MOVEMSGS command.

---

**MQSC0218E PROCESSOR NOT DEACTIVATED**

**Explanation:** The ZMQSC MOVEMSGS command was entered, but the processor associated with the CPU ID is not deactivated.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC MOVEMSGS command again and specify a deactivated processor for the CPU ID.

See *TPF Operations* for more information about the ZMQSC MOVEMSGS command.

---

**MQSC0219I ALL MESSAGES REMOVED FROM LOCAL QUEUE *qname***

**Where:**

*qname*
The name of the queue.

**Explanation:** This is the normal response to the ZMQSC CLEAR QL command

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC CLEAR QL command.

---

**MQSC0220I *number* MESSAGES MOVED FROM QUEUE-*qname* SUCCESSFULLY**

**Where:**

*number*
The number of messages moved from the processor.

*qname*
The queue name.

**Explanation:** The ZMQSC MOVEMSGS command for the specified queue was processed successfully.

**System Action:** The messages on the specified queue are moved from the processor specified for the CPU parameter.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC MOVEMSGS command.

---

**MQSC0221E MOVE MESSAGES FAIL, MOVE ABORTED**

**Explanation:** The ZMQSC MOVEMSGS command was entered, but an error occurred during the move.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Review the previous dump to determine the problem.
2. Enter the ZMQSC MOVEMSGS command again.

See *TPF Operations* for more information about the ZMQSC MOVEMSGS command.

---

**MQSC0222E** *number* **MESSAGES MOVED FROM QUEUE-***qname***, MOVE ABORTED, UNABLE TO GET MESSAGES WITH REASON CODE** *rcode*

**Where:**

*number*
The number of messages moved from the processor.

*qname*
The queue name.

*rcode*
The reason code returned by a TPF MQSeries application programming interface (API).

**Explanation:** The ZMQSC MOVEMSGS command was entered to move the messages on the specified queue name, but an error occurred because a TPF MQSeries API function call was unable to move the message from the queue.

**System Action:** TPF MQSeries continues to try to move the messages for 15 minutes. If it cannot move the messages, the command fails and the messages are lost.

**User Response:** Do the following:

1. See *MQSeries Application Programming Reference* for the reason code.
2. Make sure the queue is enabled for retrieving messages.
3. Make sure the maximum message length is long enough for the messages that are being moved.
4. Make sure the queue has not been deleted or is pending deletion.
5. Correct the error.

See *TPF Operations* for more information about the ZMQSC MOVEMSGS command.

---

**MQSC0223E** *number* **MESSAGES MOVED FROM QUEUE-***qname***, MOVE ABORTED, UNABLE TO PUT MESSAGES WITH REASON CODE** *rcode*

**Where:**

*number*
The number of messages moved from the processor.

*qname*
The queue name.

*rcode*
The reason code returned by a TPF MQSeries application programming interface (API).

**Explanation:** The ZMQSC MOVEMSGS command was entered to move the messages on the specified queue name, but an error occurred because a TPF MQSeries API function call was unable to put the message to the target queue.

**System Action:** TPF MQSeries continues to try to move the messages for 15 minutes. If it cannot move the messages, the command fails and the messages are lost.

**User Response:** Do the following:

1. See *MQSeries Application Programming Reference* for the reason code.
2. Make sure the queue is enabled for retrieving messages.
3. Make sure the maximum message length is long enough for the messages that are being moved.
4. Make sure the queue has not been deleted or is pending deletion.
5. Correct the error.

See *TPF Operations* for more information about the ZMQSC MOVEMSGS command.

---

**MQSC0224E MOVE MESSAGES IS IN PROGRESS, MOVE ABORTED**

**Explanation:** The ZMQSC MOVEMSGS command was entered, but an outstanding move is processing or ended with an error.

**System Action:** The command is rejected.

**User Response:** Do the following:

- If the previous ZMQSC MOVEMSGS command is still processing, let it end successfully.
- If the previous ZMQSC MOVEMSGS command ended with an error, enter the ZMQSC MOVEMSGS command again with the FORCE parameter specified.

See *TPF Operations* for more information about the ZMQSC MOVEMSGS command.

---

**MQSC0225I CHANNEL DISPLAY FOR PROCESSOR** *cpuid***:**

**Where:**

*cpuid*
The identifier (ID) of the processor.

**Explanation:** This is the normal response when you enter ZMQSC DISPLAY CHL-ALL.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

---

**MQSC0226E MREXIT AND MRDATA VALID FOR RECEIVER CHANNEL ONLY**

**Explanation:** ZMQSC DEF CHL or ZMQSC ALT CHL was entered with the MREXIT or MRDATA parameter specified, but CHLTYPE-RCVR was not specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct syntax.
2. Enter the appropriate command again with the correct parameters specified.

See *TPF Operations* for more information about the ZMQSC DEF CHL and ZMQSC ALT CHL commands.

**MQSC0227E IPADDR OR SOCKET CANNOT BE USED WITH CHS-ALL**

**Explanation:** ZMQSC DISPLAY CHS-ALL was entered with the IPADDR or SOCKET parameter specified, but neither parameter is allowed when CHS-ALL is specified.

**System Action:** The command is rejected

**User Response:** Do one of the following:

- Enter **ZMQSC DISPLAY CHS-ALL** again without specifying the IPADDR or SOCKET parameter.
- Enter **ZMQSC DISPLAY CHS-***name* and the IPADDR or SOCKET parameter.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0230I ALL CHANNELS STARTED**

**Explanation:** This is the normal response when ZMQSC START CHL-ALL is entered, indicating that all channels have been started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC START command.

**MQSC0232E ALTER CHANNEL DEFINITION FAILED - CHANNEL HAS DIFFERENT CHANNEL TYPE**

**Explanation:** ZMQSC ALT CHL was entered with the CHLTYPE parameter specified, but that channel type does not match the channel definition for the specified channel.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct syntax.
2. Enter the ZMQSC ALT CHL command correctly.

See *TPF Operations* for more information about the ZMQSC ALT CHL command.

**MQSC0233E IPADDR AND SOCKET NOT VALID FOR THE SPECIFIED CHANNEL**

**Explanation:** ZMQSC DISPLAY CHS-*name* was entered with the IPADDR or SOCKET parameter specified, but the specified channel name is not a server connection channel.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct syntax.
2. Enter the ZMQSC DISPLAY command correctly.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0234E CHANNEL *name* NOT DEFINED OR ACTIVE**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** ZMQSC DISPLAY CHS-*name* was entered with IPADDR-ALL specified, but the specified channel name is not defined or is not active.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that the specified channel name is a defined channel.
2. Ensure that the specified channel name is active.
3. Enter the ZMQSC DISPLAY command again, specifying the correct syntax.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0235I CHANNEL INSTANCE DISPLAY FOR *name*:**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is the normal response when you enter ZMQSC DISPLAY CHS-*name* with the IPADDR-ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0236E BATCHSZ AND SEQWRAP DO NOT APPLY TO A SVRCONN CHANNEL**

**Explanation:** ZMQSC DEF CHL or ZMQSC ALT CHL was entered with the BATCHSZ or SEQWRAP parameter specified, but the BATCHSZ and SEQWRAP parameters are not allowed for a server connection channel.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC DEF CHL or ZMQSC ALT

CHL command again without specifying the BATCHSZ or SEQWRAP parameter.

See *TPF Operations* for more information about the ZMQSC DEF CHL and ZMQSC ALT CHL commands.

**MQSC0237E SOCKET CANNOT BE SPECIFIED WITH IPADDR-ALL PARAMETER**

**Explanation:** ZMQSC DISPLAY CHS-*name* was entered with the IPADDR-ALL and SOCKET parameters specified, but this is not allowed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct syntax.
2. Enter the ZMQSC DISPLAY command correctly.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0301E START SENDER CHANNEL - *name* FAILED SOCKET ERROR**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel, but a socket error occurred when the message channel agent (MCA) tried to issue a socket call.

**System Action:** None.

**User Response:** Determine if any Transmission Control Protocol/Internet Protocol (TCP/IP) malfunctions caused the socket error.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0304E START SENDER CHANNEL - *name* FAILED SETSOCKETOPT ERROR**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** When an attempt was made to start a TPF MQSeries sender channel, the message channel agent (MCA) tried to reuse the socket that caused the error.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause for the socket error and correct it.
2. Enter the ZMQSC START command to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0305E START SENDER CHANNEL - *name* FAILED BIND ERROR**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel. The message channel agent received an error when issuing BIND to the local socket.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the socket error and correct it.
2. Enter the ZMQSC START command to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0306E START SENDER CHANNEL - *name* FAILED UNABLE TO CONNECT TO REMOTE HOST**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel. The message channel agent (MCA) received an error when issuing CONNECT to the remote system that has MQSeries installed.

**System Action:** None.

**User Response:** Do the following:

1. Ensure that the remote host listener is started.
2. Enter the ZMQSC START command to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0307E START SENDER CHANNEL - *name* FAILED COMMUNICATIONS ERRORS**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel. The message channel agent received generic Transmission Control Protocol/Internet Protocol (TCP/IP) errors on issuing socket calls.

**System Action:** None.

**User Response:** Do the following:

1. Enter the appropriate ZCLAW command to ensure that the TCP/IP installation in the TPF system is correct.
2. Ensure that the local TCP/IP box is operational.
3. Enter the ZMQSC START command to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0308E START SENDER CHANNEL - *name* FAILED INCORRECT CONFIGURATION**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel. The message channel agent (MCA) received generic Transmission Control Protocol/Internet Protocol (TCP/IP) errors on issuing socket calls.

**System Action:** None.

**User Response:** Do the following:

1. Enter the appropriate ZCLAW command to ensure that the TCP/IP installation in the TPF system is correct.
2. Ensure that the local TCP/IP box is operational.
3. Enter the ZMQSC START command to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0309E START SENDER CHANNEL - *name* FAILED ROUTING PROBLEM**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel. The message channel agent (MCA) received an error when issuing CONNECT to the remote system that has MQSeries installed.

**System Action:** The network may be unable to connect to the remote host because of network problems.

**User Response:** Do the following:

1. Ensure that the network is operational.
2. Try to connect to the remote host again.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0310E CHANNEL - *name* NOT ACTIVE**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The ZMQSC STOP command with the CHL parameter specified was entered to stop a TPF MQSeries channel. However, the channel is not active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC STOP command.

---

**MQSC0311I CHANNEL - *name* STOPPED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is the normal response to the ZQMSC STOP command.

**System Action:** The specified channel is stopped.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC STOP command.

---

**MQSC0312E START CHANNEL FAILED FOR *name* BAD CHANNEL TYPE FOUND**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** One of the following occurred:

- A request was received to start a TPF MQSeries receiver channel from a remote MQSeries system. However, the channel name is not defined as a receiver channel in the TPF MQSeries system.
- The ZMQSC START command with the CHL parameter specified was entered to start a sender channel. However, the channel name is not defined as a sender channel in the TPF MQSeries system.

**System Action:** If the request was entered by a command, the command is rejected; otherwise no system action occurs.

**User Response:** Ensure that the channel name is defined correctly at both ends of the connection.

See *TPF Operations* for more information about the ZMQSC START command.

---

**MQSC0313E RECEIVER CHANNEL - *name* STOPPED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is a normal response when a request was received to stop the channel.

**System Action:** None.

**User Response:** None.

---

**MQSC0314E CHANNEL *name* IS ACTIVE**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel. However, the channel is already active.

**System Action:** None.

**User Response:** None.

---

**MQSC0315I START SENDER CHANNEL - *name* SUCCESSFUL**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** This is the normal response to the ZMQSC START command with the CHL parameter specified.

**System Action:** The specified channel is started.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC START command.

**MQSC0316I CHANNEL - *name* HAS BEEN RESET**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** This is the normal response to the ZMQSC RESET command with the CHL parameter specified.

**System Action:** The specified channel is reset.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC RESET command.

**MQSC0317E CHANNEL - *name* RESET FAILED BECAUSE OF INCORRECT SEQUENCE NUMBER**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The ZMQSC RESET command with the CHL parameter specified was entered to reset a TPF MQSeries sender channel. However, the number specified is not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that the specified sequence number is correct.
2. Enter the ZMQSC RESET command again specifying the CHL parameter.

See *TPF Operations* for more information about the ZMQSC RESET command.

**MQSC0318E CHANNEL - *name* STOPPED ABNORMALLY**

**Where:**

*name*
The TPF MQSeries receiver channel name.

**Explanation:** The active channel detected a communications error. The remote system may have closed the channel's socket.

**System Action:** The channel is stopped.

**User Response:** Investigate the communications trace from the remote MQSeries to determine the cause of the error.

**MQSC0319E START SENDER CHANNEL - *name* FAILED CHANNEL IS INDOUBT**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel. The message channel agent (MCA) tried to resolve the channel that is in doubt (an outstanding batch of messages left from the previous session has not been sent completely).

**System Action:** None.

**User Response:** Enter the ZMQSC RESOLVE command with the CHL, ACTION, and BACKOUT parameters specified to resolve the sender channel.

See *TPF Operations* for more information about the ZMQSC RESOLVE command.

**MQSC0320I RESOLVE CHANNEL - *name* SUCCESSFUL**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** This is the normal response to the ZMQSC RESOLVE command with the CHL parameter specified.

**System Action:** The specified channel is resolved.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC RESOLVE command.

**MQSC0321E RESOLVE CHANNEL - *name* FAILED NOT SENDER CHANNEL**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The ZMQSC RESOLVE command was entered with the CHL parameter specified to resolve a TPF MQSeries sender channel. However, the channel name specified is not a sender channel.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that the channel name is a sender channel.
2. Enter the ZMQSC RESOLVE command again specifying a valid send channel name.

See *TPF Operations* for more information about the ZMQSC RESOLVE command.

**MQSC0322E CHANNEL - *name* IS NOT INDOUBT**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The ZMQSC RESOLVE command with the CHL parameter specified was entered to resolve a TPF MQSeries

sender channel. However, the channel is not in doubt.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct channel name, there is no more action for you to take.
- If you specified an incorrect channel name, enter the ZMQSC RESOLVE command again and specify the correct channel name.

See *TPF Operations* for more information about the ZMQSC RESOLVE command.

---

**MQSC0323E RESOLVE CHANNEL - *name* FAILED CHANNEL DEFINITION HAS BEEN CHANGED RESOLVE WITH BACKOUT REQUIRED**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The ZMQSC RESOLVE command was entered with the CHL, ACTION, and COMMIT parameters specified to resolve a TPF MQSeries sender channel. However, the channel definition has been changed.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC RESOLVE command again with the BACKOUT parameter specified.

See *TPF Operations* for more information about the ZMQSC RESOLVE command.

---

**MQSC0324E CHANNEL - *name* IS IN USE**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The ZMQSC RESET command was entered with the CHL parameter specified or the ZMQSC RESOLVE command was entered with the CHL parameter specified to reset or resolve a TPF MQSeries sender channel. However, the channel is active.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC STOP command with the CHL parameter specified to stop the channel.
2. Enter the ZMQSC RESET or the ZMQSC RESOLVE command again with the CHL parameter specified.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0325E START CHANNEL FAILED FOR *name* CHANNEL NOT DEFINED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** A request was received to start a TPF MQSeries channel from a remote MQSeries system, but the channel name is not defined in the TPF MQSeries system.

**System Action:** None.

**User Response:** Do the following:

1. Ensure that the channel name is defined correctly.
2. Restart the channel from the remote MQSeries system.

---

**MQSC0326E CHANNEL - *name* STOPPED DUE TO TO2 ERRORS**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The TPF MQSeries channel detected TPF collection support (TPFCS) errors and is unable to continue.

**System Action:** None.

**User Response:** Determine the cause of the TPFCS errors.

---

**MQSC0327E RESOLVE CHANNEL - *name* FAILED RESOLVE WITH BACKOUT REQUIRED**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The ZMQSC RESOLVE command was entered with the CHL, ACTION, and COMMIT parameters specified to resolve a TPF MQSeries sender channel.

**System Action:** The command is rejected and the message channel agent (MCA) is unable to resolve the channel.

**User Response:** Enter the ZMQSC RESOLVE command again with the BACKOUT parameter specified to resolve the TPF MQSeries sender channel.

See *TPF Operations* for more information about the ZMQSC RESOLVE command.

---

**MQSC0328E RESOLVE CHANNEL - *name* FAILED DUE TO TO2 ERRORS**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The ZMQSC RESOLVE command with the ACTION and BACKOUT parameters specified was entered to resolve the channel. However, TPF collection support (TPFCS) errors were detected.

**System Action:** The command is rejected.

**User Response:** Determine the cause of the TPFCS errors.

See *TPF Operations* for more information about the ZMQSC RESOLVE command.

---

**MQSC0329E START CHANNEL FAILED FOR *name* QUEUE MANAGER NOT STARTED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** A request was received to start a TPF MQSeries channel from a remote MQSeries system, but the TPF MQSeries queue manager is not started.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZMQSC START command with the QMGR parameter specified to start the TPF MQSeries queue manager.
2. Restart the channel from the remote MQSeries system.

See *TPF Operations* for more information about the ZMQSC START command.

**MQSC0330E RESOLVE CHANNEL - *name* FAILED BATCH LIST CORRUPTED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The ZMQSC RESOLVE command with the ACTION and BACKOUT parameters specified was entered to resolve the channel. However, the batch list is corrupted.

**System Action:** Messages in the batch are lost.

**User Response:** Do the following:

1. Delete the channel.
2. Define the channel again.

See *TPF Operations* for more information about the ZMQSC RESOLVE command.

**MQSC0332E CHANNEL - *name* STOPPED CHANNEL SECURITY CHECK FAILED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The channel was not started because of one of the following causes:

- The ZMQSC START command with the CHL parameter specified was entered to start the sender channel. However, the channel security exit detected an error.
- A request was received to start a receiver channel. However, the channel security exit detected an error.

**System Action:** The channel is not started. If a command was entered, it is rejected.

**User Response:** Ensure that the channel security data defined at both ends of the channel are correct.

See *TPF Operations* for more information about the ZMQSC START command.

**MQSC0333E START SENDER CHANNEL - *name* FAILED CHANNEL STARTUP IN PROGRESS**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The ZMQSC START command with the CHL parameter specified was entered to start a TPF MQSeries sender channel, but the channel is already being started.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct sender channel name, there is no more action to take.
- If you specified an incorrect sender channel name, enter the ZMQSC START command again and specify the correct sender channel name for the CHL parameter.

See *TPF Operations* for more information about the ZMQSC START command.

**MQSC0334E START RECEIVER CHANNEL - *name* FAILED CHANNEL DISABLED**

**Where:**

*name*
The TPF MQSeries receiver channel name.

**Explanation:** A request from a remote MQSeries system was received to start a TPF MQSeries receiver channel, but the channel is disabled.

**System Action:** The request is rejected.

**User Response:** Enter the ZMQSC START command with the CHL parameter specified to enable the receiver channel.

See *TPF Operations* for more information about the ZMQSC START command.

**MQSC0335I RECEIVER CHANNEL - *name* ENABLED**

**Where:**

*name*
The TPF MQSeries receiver channel name.

**Explanation:** This is the normal response to the ZMQSC START command with the CHL parameter specified for a receiver channel that was disabled.

**System Action:** The specified receiver channel is enabled.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC START command.

**MQSC0336E RECEIVER CHANNEL - *name* ALREADY ENABLED**

**Where:**

*name*
The TPF MQSeries receiver channel name.

**Explanation:** A ZMQSC START command with the CHL parameter specified was entered to enable a TPF MQSeries

receiver channel, but the channel is not disabled.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct receiver channel name, there is no more action to take.
- If you specified an incorrect receiver channel name, enter the ZMQSC START command again and specify the correct receiver channel name for the CHL parameter.

See *TPF Operations* for more information about the ZMQSC START command.

---

**MQSC0337I RECEIVER CHANNEL - *name* DISABLED**

**Where:**

*name*
The TPF MQSeries receiver channel name.

**Explanation:** This is the normal response to the ZMQSC STOP command with the CHL parameter specified for a receiver channel.

**System Action:** The specified receiver channel is disabled.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC STOP command.

---

**MQSC0338E START SENDER CHANNEL - *name* FAILED TRANSMISSION QUEUE NOT DEFINED**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** A ZMQSC START command with the CHL parameter specified was entered to start a TPF MQSeries sender channel. However, the transmission queue associated with the sender channel is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC DEF QL command to define the transmission queue name.
2. Enter the ZMQSC START command again to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC DEF QL and ZMQSC START commands.

---

**MQSC0339E START SENDER CHANNEL - *name* FAILED TRANSMISSION QUEUE NOT DEFINED CORRECTLY**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** A ZMQSC START command with the CHL parameter specified was entered to start a TPF MQSeries sender channel. However, the transmission queue associated with the sender channel is not defined as a type XMITQ.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC DISPLAY command with the CHL parameter specified to display the sender channel and the associated transmission queue name.
2. Enter the ZMQSC DEL command with the QA, QL, or QR parameter specified to delete the transmission queue name.
3. Enter the ZMQSC DEF QL command and specify the value XMITQ for the USAGE parameter to define the transmission queue.
4. Enter the ZMQSC START command again to start the channel.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0340E START SENDER CHANNEL - *name* FAILED TRANSMISSION QUEUE BEING USED BY ANOTHER SENDER CHANNEL**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** A ZMQSC START command with the CHL parameter specified was entered to start a TPF MQSeries sender channel. However, the transmission queue associated with the sender channel is being used by another sender channel.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC DISPLAY command with the QL parameter specified to display the transmission queue name and find out which channel is using this transmission queue.
2. Enter the ZMQSC STOP command with the CHL parameter specified to stop the channel that is currently using the transmission queue.
3. Enter the ZMQSC START command again to start the sender channel you want to use.

See *TPF Operations* for more information about theZMQSC DISPLAY, ZMQSC STOP, and ZMQSC START commands.

---

**MQSC0341E START SENDER CHANNEL - *name* FAILED NO SYSTEM HEAP MEMORY AVAILABLE FOR ALLOCATING BATCH LISTS**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel. However, the amount of TPF system heap storage was not enough to allocate batch lists for the channel.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Investigate the TPF system resources to determine the amount of system heap storage.
2. Change the batch size of the channel to a smaller one.

3. Enter the ZMQSC START command to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC START command. See the ZCTKA DISPLAY command in *TPF Operations* for more information on system heap storage.

---

**MQSC0342E START SENDER CHANNEL - *name* FAILED XMITQ HAVING OUTSTANDING BATCHES WITH A PREVIOUS CHANNEL**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** An attempt was made to start a TPF MQSeries sender channel. However, the transmission queue associated with the channel was previously used by another channel that has outstanding batches.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZMQSC DISPLAY command with the CHL parameter specified to display the channel name and determine the associated transmission queue.
2. Enter the ZMQSC DISPLAY command with the QL parameter specified to display the channel that is using the transmission queue.
3. Enter the ZMQSC RESOLVE command with the CHL, ACTION, and either the BACKOUT or COMMIT parameters specified to resolve the channel.
4. Enter the ZMQSC START command to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0343E START SENDER CHANNEL - *name* FAILED INCORRECT CONNECTION NAME**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The ZMQSC START CHL command was entered in an attempt to start a TPF MQSeries sender channel. The message channel agent (MCA) determined that either the Internet Protocol (IP) address or the remote host name was not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Obtain the correct IP address or remote host name.
2. Enter the ZMQSC ALT CHL command and the correct IP address or host name.
3. Enter the ZMQSC START command to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC ALT CHL andZMQSC START commands.

---

**MQSC0344E CHANNEL - *name* STOPPED BECAUSE OF NO TEMPORARY STORAGE AVAILABLE**

**Where:**

*name*
The MQSeries channel name.

**Explanation:** The specified channel name was stopped because of a shortage of temporary storage for holding input/output (I/O) messages.

**System Action:** The specified channel is stopped.

**User Response:** Do the following:

1. Determine why there was not enough storage.
2. Increase the amount of system storage.

---

**MQSC0345W CHANNEL - *name* RESTART IS IN PROGRESS BECAUSE OF BROKEN CONNECTION**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The specified sender channel is attempting to restart because the channel connection was taken down by the network or a remote channel receiver.

**System Action:** The TPF MQSeries system attempts to start the sender channel automatically.

**User Response:** None.

---

**MQSC0346E CHANNEL - *name* STOPPED BECAUSE OF MESSAGE CONVERSION FAILURE**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The specified channel name was stopped because the conversion of either an input or an output message failed.

**System Action:** The specified channel name is stopped.

**User Response:** Investigate the local and remote coded character set identifiers (CCSIDs) associated with the channel to determine if the TPF system supports the code page for the CCSID message conversion.

---

**MQSC0347E CHANNEL - *name* STOPPED BECAUSE OF MESSAGE SEQUENCE ERRORS**

**Where:**

*name*
The TPF MQSeries receiver channel name.

**Explanation:** The specified channel name was stopped because the input messages received from a remote MQSeries sender channel did not carry the sequence numbers as the receiver channel expected.

**System Action:** The specified channel name is stopped.

**User Response:**

1. Do one of the following:

- For the remote side, use the MQSeries reset command to reset the sequence number of the sender channel in the TPF system.
- For the local side, use the ZMQSC RESET command with the CHL parameter specified to reset the receiver channel to the sequence number that is expected for the next input message.

2. Start the remote sender channel again.

See *TPF Operations* for more information about the ZMQSC RESET command.

---

**MQSC0348E CHANNEL - *name* STOPPED BECAUSE OF PROTOCOL ERRORS**

**Where:**

*name*
The TPF MQSeries receiver channel name.

**Explanation:** The specified channel name was stopped because the input message violated MQSeries protocol.

**System Action:** The specified channel name is stopped.

**User Response:** Do the following:

1. Perform a TPF MQSeries communications function trace.
2. Provide your IBM service representative with the trace results for further investigation of the protocol errors.

---

**MQSC0349E CHANNEL - *name* STOPPED NO DEAD LETTER QUEUE**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The specified channel name was stopped because an attempt was made to place the input message on the dead-letter queue (DLQ). The DLQ that is defined in the TPF MQSeries profile does not exist.

**System Action:** The specified channel name is stopped.

**User Response:** Do the following:

1. Enter the ZMQSC ALT MQP command to define a DLQ.
2. See your IBM representative for additional information.

---

**MQSC0350E CHANNEL - *name* START ERROR - *exitname***

**Where:**

*name*
The TPF MQSeries channel name.

*exitname*
The name of the channel user exit.

**Explanation:** The channel was not started because one of the following occurred:

- ZMQSC START was entered with the CHL parameter specified, but the channel user exit closed the channel or suppressed the function.
- A request was received to start a channel, but the channel user exit closed the channel or suppressed the function.

**System Action:** The channel is not started. If a command was entered, it is rejected.

**User Response:** Do the following:

1. Determine why the channel user exit closed the channel or suppressed the function.
2. Correct the problem.
3. Start the channel.

See *TPF Operations* for more information about the ZMQSC START command. See *TPF System Installation Support Reference* for more information about the channel user exit.

---

**MQSC0351I SVRCONN CHANNEL - *name* ENABLED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is the normal response to the ZMQSC START command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC START command.

---

**MQSC0352E SVRCONN CHANNEL - *name* ALREADY ENABLED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The ZMQSC START command was entered with the CHL parameter specified, but the server connection channel was aready started.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC START command.

---

**MQSC0353I SVRCONN CHANNEL - *name* DISABLED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** This is the normal response to the ZMQSC STOP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC STOP command.

---

**MQSC0354E CHANNEL OF TYPE SVRCONN CANNOT BE RESET**

**Explanation:** The ZMQSC RESET command was entered, but the channel is a server connection channel, which cannot be reset.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC RESET command.

**MQSC0355E CHANNEL - *name* STOPPED PUT TO DEAD LETTER QUEUE FAILED**

**Where:**

*name*
The TPF MQSeries channel name.

**Explanation:** The channel tried to put a message to the dead-letter queue, but could not because the dead letter queue is not defined, is disabled, or has some other problem.

**System Action:** The message stays on the transmission queue.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

**MQSC0401E CHANNEL - *name* STOPPED REMOTE CHANNEL DEFINITION NOT FOUND**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** A request was made to start a TPF MQSeries sender channel. However, the receiver channel in the remote system that has MQSeries installed is not defined.

**System Action:** The command is rejected.

**User Response:** Ensure that the channel name is defined as a receiver channel in the remote system that has MQSeries installed.

**MQSC0402E CHANNEL - *name* STOPPED REMOTE CHANNEL TYPE INCORRECT**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** A request was made to start a TPF MQSeries sender channel. However, the channel name defined in the remote system that has MQSeries installed is not a receiver channel.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that the channel name is defined as a receiver channel in the remote system.
2. Enter the ZMQSC START command with the CHL parameter specified to restart the sender channel.

**MQSC0403E CHANNEL - *name* STOPPED REMOTE QUEUE MANAGER NOT AVAILABLE**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** A request was made to start a TPF MQSeries sender channel. However, the remote queue manager is not available.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Ensure that the remote queue manager is started.
2. Enter the ZMQSC START command with the CHL parameter specified to restart the sender channel.

**MQSC0404E CHANNEL - *name* STOPPED MESSAGE OUT OF SEQ, EXPECTED SEQUENCE NUMBER - *nextnum* FIRST MESSAGE SEQUENCE NUMBER IN THE LAST BATCH SENT - *firstnum***

**Where:**

*name*
The TPF MQSeries sender channel name.

*nextnum*
The next message sequence number to be received by the remote MQSeries.

*firstnum*
The first message sequence number to be sent by MQSeries.

**Explanation:** A request was made to start a TPF MQSeries sender channel. However, the remote system that has MQSeries installed rejected the previous batch because the message sequence number is not in sequence.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC RESET command with the CHL and SEQNUM parameters specified to reset a new sequence number for the channel and to restart the sender channel.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0405E CHANNEL - *name* STOPPED REMOTE QUEUE MANAGER TERMINATING**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote queue manager is stopping and acknowledges that the channel is being closed.

**System Action:** None.

**User Response:** None.

**MQSC0406E CHANNEL - *name* STOPPED REMOTE QUEUE MANAGER CANNOT STORE MESSAGE**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote queue manager cannot store received messages because of storage constraints.

**System Action:** None.

**User Response:** None.

**MQSC0407I CHANNEL - *name* STOPPED CHANNEL HAS BEEN CLOSED BY USER**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote queue manager acknowledges that the channel has been closed by the MQSeries applications.

**System Action:** None.

**User Response:** None.

**MQSC0408E CHANNEL - *name* STOPPED CHANNEL CLOSED BECAUSE TIMEOUT EXPIRED**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** No messages were sent by the channel for a specified period of time, so the remote queue manager closed the channel.

**System Action:** None.

**User Response:** None.

**MQSC0409E CHANNEL - *name* STOPPED RECEIVING MCA WAS NOT ABLE TO OPEN THE TARGET QUEUE**

**Where:**

*name*
The TPF MQSeries sender channel name

**Explanation:** The remote queue manager acknowledged that the target queue specified by MQSeries cannot be opened for MQPUT.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the problem on the remote host.
2. Correct the problem.

**MQSC0410E CHANNEL - *name* STOPPED PROTOCOL ERROR - UNKNOWN SEGMENT TYPE**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote MQSeries acknowledged that the messages sent by MQSeries are not valid.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

**MQSC0411E CHANNEL - *name* STOPPED PROTOCOL ERROR - DATA LENGTH ERROR**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote MQSeries acknowledged that the data length of the entire message sent by TPF MQSeries is incorrect.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

**MQSC0412E CHANNEL - *name* STOPPED PROTOCOL ERROR - INCORRECT DATA**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote MQSeries acknowledged that the messages sent by TPF MQSeries contain incorrect data.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

**MQSC0413E CHANNEL - *name* STOPPED PROTOCOL ERROR - SEGMENTATION ERROR**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote system that has MQSeries installed acknowledged that the segmented messages sent by TPF MQSeries are incorrect.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

**MQSC0414E CHANNEL - *name* STOPPED PROTOCOL ERROR - ID EYECATCHER ERROR**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote system that has MQSeries installed acknowledged that the message sent by TPF MQSeries may be corrupted.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

---

**MQSC0415E CHANNEL - *name* STOPPED PROTOCOL ERROR - MSH EYECATCHER ERROR**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote system that has MQSeries installed acknowledged that the message sent by TPF MQSeries may be corrupted.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

---

**MQSC0416E CHANNEL - *name* STOPPED PROTOCOL ERROR - GENERAL FAILURE**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote system that has MQSeries installed acknowledged that the message sent by TPF MQSeries may be corrupted.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

---

**MQSC0417E CHANNEL - *name* STOPPED BATCH SIZE FAILURE**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote system that has MQSeries installed acknowledged that the size of batch messages sent by TPF MQSeries does not follow the protocol.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

---

**MQSC0418E CHANNEL - *name* STOPPED MESSAGE LENGTH ERROR**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote system that has MQSeries installed acknowledged that the length of the message sent by TPF MQSeries is incorrect.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

---

**MQSC0419E CHANNEL - *name* STOPPED SEGMENT NUMBER ERROR**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote system that has MQSeries installed acknowledged that the segment number of a segmented message sent by TPF MQSeries is incorrect.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

---

**MQSC0420E CHANNEL - *name* STOPPED SECURITY FAILURE**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote system that has MQSeries installed acknowledged that a security check failure occurred when receiving the message sent by TPF MQSeries.

**System Action:** None.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

---

**MQSC0421E CHANNEL - *name* STOPPED CHANNEL SEQUENCE NUMBER WRAP VALUE ERROR LOCAL VALUE *value* REMOTE VALUE *value***

**Where:**

*name*
The TPF MQSeries sender channel name.

*value*
The local TPF MQSeries or the remote MQSeries sequence number wrap value.

**Explanation:** The remote system that has MQSeries installed acknowledged that the sequence number wrap value is incorrect.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZMQSC DISPLAY command with the CHL parameter specified to display the channel definition and ensure that the sequence number wrap value is valid.
2. Enter the ZMQSC ALT CHL command with the SEQWRAP value specified to define a valid sequence number wrap value.

See *TPF Operations* for more information about the ZMQSC DISPLAY and ZMQSC ALT CHL commands.

---

**MQSC0422E CHANNEL - *name* STOPPED REMOTE CHANNEL UNAVAILABLE**

**Where:**

*name*
The TPF MQSeries sender channel name.

**Explanation:** The remote system that has MQSeries installed acknowledged that the receiver channel is not currently available.

**System Action:** None.

**User Response:** Determine why the remote channel is not available and correct the problem.

**MQSC0512W QUEUE*qname* HIGHWATER MARK *nummsg* WAS EXCEEDED BY *numover***

**Where:**

*qname*
The TPF MQSeries queue name.

*nummsg*
The user-defined number of messages that can reside on the TPF MQSeries queue.

*numover*
The number of messages currently in the TPF MQSeries queue that are over the user-defined number of messages, as entered in the ZMQSC DEF QL command with the QDEPTHHI parameter specified.

**Explanation:** The total number of messages on the TPF MQSeries queue is above the user-defined number.

**System Action:** This message is sent to the operator at each scan time as defined by the ZMQSC DEF MQP command with the QDT parameter specified until the number of messages in the queue becomes less than or equal to the user-defined number.

**User Response:**

If the queue name is a normal local queue, ensure that the TPF application that services the queue is operational. If the queue name is a transmission queue, do one of the following:

- Ensure that the sender channels are sending messages to the adjacent queue.
- Enter the ZMQSC SWQ command to move the transmission queue to a transmission queue associated with an active channel.
- Assign the channel over a wider transport facility band.
- Stop TPF applications that use the transmission queue.

See *TPF Operations* for more information about the ZMQSC commands.

**MQSC0600E MAXDEPTH NOT VALID FOR COMMON QUEUE *qname***

**Where:**

*qname*
The queue name.

**Explanation:** One of the following occurred:

- The ZMQSC DEF QL command was entered to define a processor shared local queue with YES specified for the COMMON parameter and the MAXDEPTH parameter specified.
- The ZMQSC ALT QL command was entered with the MAXDEPTH parameter specified to change a processor shared local common queue definition.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC DEF QL or ZMQSC ALT QL command again without specifying the MAXDEPTH parameter.

See *TPF Operations* for more information about the ZMQSC DEF QL and ZMQSC ALT QL commands.

**MQSC0601E QDEPTHHI NOT VALID FOR COMMON QUEUE *qname***

**Where:**

*qname*
The queue name.

**Explanation:** One of the following occurred:

- The ZMQSC DEF QL command was entered to define a processor shared local queue with YES specified for the COMMON parameter and the QDEPTHHI parameter specified.
- The ZMQSC ALT QL command was entered with the QDEPTHHI parameter specified to change a processor shared local common queue definition.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC DEF QL or ZMQSC ALT QL command again without specifying the QDEPTHHI parameter.

See *TPF Operations* for more information about the ZMQSC DEF QL and ZMQSC ALT QL commands.

**MQSC0602E UNCOMMITTED MSGS EXIST ON QUEUES - END ALL TRANSACTIONS OR SPECIFY FORCE**

**Explanation:** A ZMQSC MIGRATE command was entered with the FALLBACK parameter specified while uncommitted messages still existed in queues.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Wait until all running transactions end or end them manually.
- Enter the ZMQSC MIGRATE command again and specify the FALLBACK and FORCE parameters.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

**MQSC0603E QUEUE *qname* IS ALREADY DELETED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEL command was entered with the QA, QL, or QR parameter specified, but the queue specified had already been deleted.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the queue name is specified correctly, no action is required.
- If the queue is not correct, enter the ZMQSC DEL command again and specify a valid queue name for the QA, QL or QR parameter.

See *TPF Operations* for more information about the ZMQSC DEL command.

---

**MQSC0604E** *qname* **CANNOT BE USED AS A QUEUE NAME**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QA, QR, or QL command was entered with a reserved queue name specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC DEF QA, QR, or QL command again and specify a different queue name.

See *TPF Operations* for more information about the ZMQSC DEF QA, QR, or QL commands.

---

**MQSC0605E QUEUE** *qname* **CANNOT BE ALTERED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC ALT QL command was entered for a reserved queue name.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC ALT QL command.

---

**MQSC0606E QUEUE** *qname* **CANNOT BE DELETED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEL command was entered with the QL parameter specified, but the queue to be deleted was required by the TPF system.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEL command.

---

**MQSC0607I DELETION OF QUEUE** *qname* **STARTED**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEL command was entered with the QL parameter specified for a queue that still has messages on it, or that is used by an active channel on one of the processors.

**System Action:** The TPF system waits until the queue is empty and no active channels are using it before it is deleted. Before it is deleted, no messages can be added to the queue and a queue of the same name cannot be defined.

**User Response:** None

See *TPF Operations* for more information about the ZMQSC DEL command.

---

**MQSC0608I DELETION OF QUEUE** *qname* **COMPLETE**

**Where:**

*qname*
The queue name.

**Explanation:** One of the following occurred:

- Within five minutes of the appearance of MQSC0607I message, all processors indicated that the requested queue could be deleted.
- The ZMQSC DEL command was entered with the QL parameter specified and ALL specified for the PURGE parameter.

**System Action:** The queue is deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEL command.

---

**MQSC0609I DELETION OF QUEUE** *qname* **WAITING FOR PROCESSORS** *x, y,...*

**Where:**

*qname*
The queue name.

*x,y,...*
A list of processor names that are separated by commas.

**Explanation:** Five minutes have elapsed since message MQSC0607I was displayed and there is at least one processor preventing the queue from being deleted.

**System Action:** The TPF system continues to check the queue and deletes it when and if all processors indicate that it can be deleted.

**User Response:** Do one of the following:

- Enter the ZMQSC DEL command with the QL parameter specified and ALL specified for the PURGE parameter.
- Enter the ZMQSC DEL command with the QL parameter specified for each processor that is preventing the queue from being deleted, and the processor ID of the processor preventing the deletion specified for the PURGE parameter.

See *TPF Operations* for more information about the ZMQSC DISPLAY and ZMQSC DEL commands.

---

**MQSC0610I MIGRATE FALLBACK COMPLETED SUCCESSFULLY**

**Explanation:** The ZMQSC MIGRATE command with the FALLBACK parameter specified was processed successfully.

**System Action:** All new format queues have been deleted and their messages moved to the old format queues.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

---

**MQSC0611I MIGRATE COMMIT COMPLETED SUCCESSFULLY**

**Explanation:** The ZMQSC MIGRATE command with the COMMIT parameter specified was processed successfully.

**System Action:** Migration is now committed. All old format queues have been deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

---

**MQSC0612I MIGRATE STATUS DISPLAY**

**Explanation:** This is the normal response when the ZMQSC MIGRATE command is entered with the STATUS parameter specified.

**System Action:** The current queue migration status is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

---

**MQSC0613E EMPTY THE DEAD LETTER QUEUE OR SPECIFY FORCE**

**Explanation:** The ZMQSC MIGRATE command was entered with the COMMIT parameter specified, but the old version of the dead-letter queue still has messages on it.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Fall back to an image without turbo enhancements for TPF support of MQSeries local queue manager applied and process the messages from the dead-letter queue by doing the following:
  1. Enter the ZMQSC MIGRATE command with the FALLBACK parameter specified.
  2. Perform an Initial program load (IPL) of your old image and process the dead-letter queue.
  3. IPL your new image with turbo enhancements for TPF support of MQSeries local queue manager.
  4. Enter the ZMQSC MIGRATE command with the BEGIN parameter specified.
  5. Enter the ZMQSC MIGRATE command with the COMMIT parameter specified again.
- Enter the ZMQSC MIGRATE command with the COMMIT and FORCE parameters specified. For this condition, if you do not have an application to handle the messages on the old version of the dead-letter queue, the messages will be lost.

See *TPF Operations* for more information about the ZMQSC MIGRATE command.

---

**MQSC0614E *qname* CANNOT BE USED AS A BASE QUEUE**

**Where:**

*qname*
The queue name.

**Explanation:** The ZMQSC DEF QA or ZMQSC ALT QA command was entered with the TARGQ parameter, but the TARGQ parameter specifies a reserved queue name.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC DEF QA or ZMQSC ALT QA command again, specifying a different name for the TARGQ parameter.

See *TPF Operations* for more information about the ZMQSC DEF QA and ZMQSC ALT QA commands.

---

**MQSC0615E FROMQ PARAMETER REQUIRED**

**Explanation:** The ZMQSC SWQ command was entered, but the FROMQ parameter was not specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC SWQ command again, specifying both the FROMQ and TOQ parameters.

See *TPF Operations* for more information about the ZMQSC SWQ command.

---

**MQSC0616E TOQ PARAMETER REQUIRED**

**Explanation:** The ZMQSC SWQ command was entered, but the TOQ parameter was not specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC SWQ command again, specifying both the FROMQ and TOQ parameters.

See *TPF Operations* for more information about the ZMQSC SWQ command.

---

**MQSC0617E FROMQ *tqname* IS DELETED**

**Where:**

*tqname*
The transmission queue name.

**Explanation:** The ZMQSC SWQ command was entered with the FROMQ parameter specified, but the transmission queue specified has been deleted or is in the process of being deleted.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC SWQ command again with a different queue name.

See *TPF Operations* for more information about the ZMQSC SWQ command.

---

**MQSC0618E TOQ *tqname* IS DELETED**

**Where:**

*tqname*
The transmission queue name.

**Explanation:** The ZMQSC SWQ command was entered with the TOQ parameter specified, but this transmission queue has been deleted or is in the process of being deleted.

**System Action:** The command is rejected.

**User Response:** Enter the ZMQSC SWQ command again, specifying a different queue for the TOQ parameter.

See *TPF Operations* for more information about the ZMQSC SWQ command.

---

**MQSC0619E *xxx* FAILED FOR QUEUE MANAGER, ERROR CODE *nn***

**Where:**

*xxx* DEFINE or ALTER

*nn* The error code.

**Explanation:** The ZMQSC DEF MQP or ZMQSC ALT MQP command was entered on this or another processor, but the memory copy of the queue manager profile could not be updated.

**System Action:** The queue manager profile is defined or updated on file, but not in memory.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZMQSC DEF MQP and ZMQSC ALT MQP commands.

---

**MQSC0700I PROCESS-*processname* DEFINITION COMPLETED SUCCESSFULLY**

**Where:**

*processname*
The name of the process.

**Explanation:** This is the normal response to the ZMQSC DEF PROCESS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEF PROCESS command.

---

**MQSC0701I MQSERIES TABLES SUCCESSFULLY REBUILT FROM PREVIOUS IPL**

**Explanation:** MQSeries control tables used by TPF MQSeries local queue manager support have been successfully rebuilt during TPF system restart.

**System Action:** None.

**User Response:** None.

---

**MQSC0702W MQSERIES TABLES INITIALIZED ON FILE**

**Explanation:** During TPF system restart, the MQSeries queue manager (QM) determined that the MQSeries control tables on file did not exist yet. Therefore, the MQSeries QM initialized these tables and saved them to file.

**System Action:** The MQSeries control records on file are initialized.

**User Response:** None.

---

**MQSC0703W *numrec* IMQCK RECORDS BELOW SUGGESTED MINIMUM OF *min***

**Where:**

*numrec*
The number of #IMQCK record ordinals allocated.

*min* The suggested minimum number of #IMQCK record ordinals that should be allocated.

**Explanation:** The TPF system detected that the number of #IMQCK records allocated for the MQSeries checkpoint is below the suggested minimum. The suggested minimum is equivalent to twice the number of system work blocks (SWBs) allocated to the TPF system.

**System Action:** None.

**User Response:** Do the following:

- Determine the true number of #IMQCK records that are needed to store the entire MQSeries checkpoint by calculating the number of SWBs allocated to the TPF system that will be used by MQSeries support and multiply this number by 2.
- If there are not enough #IMQCK records allocated during the time-initiated MQSeries checkpointing process, a catastrophic system error will be issued.
  - If the number of #IMQCK records is below this calculated number, it may be necessary to load a new FACE table (FCTB) with the correct fixed file allocation.
  - If the number of #IMQCK records is above this calculated number, no action is necessary.

See *TPF Database Reference* for more information about the #IMQCK fixed file record ordinals.

---

**MQSC0704E PROCESS-*processname* ALREADY EXISTS**

**Where:**

*processname*
The name of the process.

**Explanation:** ZMQSC DEF PROCESS-*processname* was entered, but the specified process already exists.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Check the process name to make sure that it is unique to the TPF complex.
- Enter **ZMQSC DISPLAY PROCESS-*processname*** to make sure that you specified the correct process name.

See *TPF Operations* for more information about the ZMQSC DEF PROCESS and ZMQSC DISPLAY commands.

**MQSC0705E PROCESS-*processname* DEFINITION DOES NOT EXIST**

**Where:**

*processname*
The name of the process.

**Explanation:** A ZMQSC command was entered with a process name specified that does not exist.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct process name.
2. Enter the ZMQSC command again with the correct process name specified.

See *TPF Operations* for more information about ZMQSC commands.

**MQSC0706I MQSERIES TRANSACTIONS SUCCESSFULLY RECOVERED FOR CPU *cpuid***

**Where:**

*cpuid*
The processor ID for the transactions recovered.

**Explanation:** During TPF system restart, or in response to the ZPSMS command with the PR and DEACT parameters specified, the MQSeries resource manager (RM) determined that there were oustanding MQSeries transaction branches to recover on the recovery log.

**System Action:** All outstanding transactions are successfully recovered.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

**MQSC0707E MQSERIES ACTIVITY PROHIBITED FOR PROCESSOR *cpuid***

**Where:**

*cpuid*
The processor ID for which MQSeries processing is not allowed.

**Explanation:** During TPF system restart, or while processing the ZMQSC DEF MQP command, the TPF system detected that there are no fixed files of record type #IMQCK defined for this processor.

**System Action:** No MQSeries activity is allowed for this TPF processor.

**User Response:** Do the following:

1. Allocate the necessary number of #IMQCK fixed file records.
2. Perform an Initial program load (IPL) of the TPF system.

See *TPF Operations* for more information about the ZMQSC DEF MQP command. See *TPF Database Reference* for more information about #IMQCK fixed file records.

**MQSC0708E MQSERIES GETPC ERROR *x* LOCKING CMQS IN MEMORY**

**Where:**

*x* A return code from the `getpc` function.

**Explanation:** While attempting to lock MQSeries dynamic link library (DLL) CMQS into memory, the `getpc` function failed with return code *x*.

**System Action:** The TPF restart program continues.

**User Response:** Determine why the `getpc` function failed.

See the*TPF C/C++ Language Support User's Guide* for a description of the errors returned by the `getpc` function.

**MQSC0721I PROCESS-*processname* DEFINITION ALTERED SUCCESSFULLY**

**Where:**

*processname*
The name of the process.

**Explanation:** This is the normal response when you enter ZMQSC ALT PROCESS-*processname*.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC ALT PROCESS command.

**MQSC0722I TPF MQSERIES PROCESS DISPLAY**

**Explanation:** This is the normal response when you enter ZMQSC DISPLAY PROCESS-*processname*.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DISPLAY command.

**MQSC0723I PROCESS-*processname* DELETED SUCCESSFULLY**

**Where:**

*processname*
The name of the process.

**Explanation:** This is the normal response when you enter ZMQSC DEL PROCESS-*processname*.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DEL command.

**MQSC0724E *parm* NOT VALID FOR XMITQ *queuename***

**Where:**

*parm*
The name of the parameter.

*queuename*
The name of the specified transmission queue.

**Explanation:** A ZMQSC command was entered with a parameter that is not allowed with the XMITQ parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZMQSC command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0725E PROCESS DEFINITION TABLES ARE NOT INITIALIZED**

**Explanation:** A ZMQSC command was entered with the PROCESS parameter specified, but the process definition tables are not initialized. Process definition tables are initialized by stopping and starting the queue manager after enhancements to TPF MQSeries local queue manager support code have been installed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Review the migration steps for enhancements to TPF MQSeries local queue manager support that are listed in *TPF Migration Guide: Program Update Tapes* and make sure that they are done correctly.
2. Enter the ZMQSC command again.

See *TPF Migration Guide: Program Update Tapes* for more information about enhancements to TPF MQSeries local queue manager support. See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC0801I SWEEP FOR *qname* IS COMPLETED**

**Where:**

*qname*
The queue name.

**Explanation:** The messages on this queue have been moved from memory to file. The next access of the queue will move the messages from file back to memory.

**System Action:** None.

**User Response:** None.

---

**MQSC0802I UNSWEEP FOR *qname* IS COMPLETED**

**Where:**

*qname*
The queue name.

**Explanation:** When the queue was accessed again, it moved the messages from file back to memory.

**System Action:** None.

**User Response:** No action is necessary. Note: If you're getting this message too frequently, you may want to change your sweeptime with the ZMQSC ALT QL command.

See *TPF Operations* for more information about the ZMQSC ALT QL command.

---

**MQSC0900I DBREBUILD COMPLETED SUCCESSFULLY**

**Explanation:** This is the normal response to the ZMQSC DBREBUILD command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZMQSC DBREBUILD command.

---

**MQSC0901E DBREBUILD FAILED**

**Explanation:** The ZMQSC DBREBUILD command was entered, but one or more errors were found that prevented the TPF system from rebuilding all of the TPF MQSeries definitions.

**System Action:** Some TPF MQSeries definitions were not rebuilt, but the definitions that were not rebuilt are still stored in their original collections. The TPF system sends an additional message for each error, describing the nature of the error.

**User Response:** Do the following:

1. Examine any error messages accompanying this one.
2. See your IBM service representative to determine what action is necessary to correct the error and to rebuild your TPF MQSeries definitions successfully.

See *TPF Operations* for more information about the ZMQSC DBREBUILD command.

---

**MQSC0950E *command* REJECTED - MORE THAN ONE PROCESSOR ACTIVE**

**Where:**

*command*
The type of ZMQSC command.

**Explanation:** A ZMQSC command was entered, but more than one processor is active in a loosely coupled environment.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Bring down all processors except the one where you want to enter the command.
2. Enter the appropriate ZMQSC command again.

See *TPF Operations* for more information about ZMQSC commands.

---

**MQSC0951E DBREBUILD REJECTED - QMGR NOT STOPPED**

**Explanation:** The ZMQSC DBREBUILD command was entered, but the TPF MQSeries queue manager is active on the subsystem where you entered the command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZMQSC STOP QMGR** to stop the queue manager.
2. Enter **ZMQSC DBREBUILD** again.

See *TPF Operations* for more information about the ZMQSC DBREBUILD and ZMQSC STOP commands.

---

**MQSC9996E MQSERIES UNEXPECTED TO2 ERROR** *source_file mqseries_routine TO2_error*

**Where:**

*source_file*
The location of the source file where the error occurred.

*mqseries_routine*
An error code and detailed information about the MQSeries function that failed because of the error.

*TO2_error*
Detailed information from TPF collection support (TPFCS) about the error.

**Explanation:** An unexpected logic error occurred during processing.

**System Action:** The MQSeries function that was being processed has ended and an error condition has been reported to the application that started the function.

**User Response:** See your IBM service representative and provide the information that was included in the error message.

---

**MQSC9997E MQSERIES UNEXPECTED COMMIT ROLLBACK ERROR** *source_file mqseries_routine* **tx return code=***n*

**Where:**

*source_file*
The location of the source file where the error occurred.

*mqseries_routine*
An error code and detailed information about the MQSeries function that failed because of the error.

*n* The return code that provides detailed information from TPF collection support (TPFCS) about the error.

**Explanation:** An unexpected logic error occurred during processing.

**System Action:** The MQSeries function that was being processed has ended and an error condition has been reported to the application that started the function.

**User Response:** See your IBM service representative and provide the information that was included in the error message.

---

**MQSC9998E UNEXPECTED CHANNEL ERROR** *errornum*

**Where:**

*errornum*
The error number.

**Explanation:** An unexpected error occurred during channel processing. Generally these represent logic errors.

**System Action:** Channel processing does not complete successfully.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

See *TPF Operations* for more information about the ZMQSC commands.

---

**MQSC9999E UNEXPECTED ERROR** *errornum*

**Where:**

*errornum*
The error number. Some error numbers and explanations follow:

**3** Storage error; not enough memory.

**4** An error occurred while processing a Collections Support database request.

**5** An error occurred while processing a Transaction Manager request.

**8** An error occurred while processing a Collections Support database request.

**Explanation:** A ZMQSC command was entered, but an unexpected error occurred. Generally these represent logic errors.

**System Action:** The command is rejected.

**User Response:** See your IBM representative to determine the cause of the error and to correct the problem.

See *TPF Operations* for more information about the ZMQSC commands.

# NACT–NCNS

---

**NACT0000I REACTIVATE OUTPUT COMPLETE**

**Explanation:** This is the normal response to the ZNACT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNACT command.

---

**NACT0010E INVALID NODENAME**

**Explanation:** The node name specified in the command is not valid.

**System Action:** None.

**User Response:** Enter the command again and specify a valid node name.

See *TPF Operations* for more information about the ZNACT command.

---

**NACT0011E DATABASE RETRIEVAL ERROR**

**Explanation:** An input/output (I/O) problem was encountered in trying to retrieve a required table entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNACT command.

---

**NACT0012E DATABASE ERROR**

**Explanation:** The node name specified in the command was validated but an input condition that is not valid was generated by an internal conversion routine. This would imply a database problem.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNACT command.

---

**NACT0013E NODE NOT A HARDCOPY DEVICE**

**Explanation:** The node referenced in the command is not a printer.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNACT command.

---

**NACT0014E OUTPUT ALREADY REACTIVATED**

**Explanation:** The device specified is already active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNACT command.

---

**NACT0015E REJECTED, DUPLICATE LU NAME** *node name*, **NETID REQUIRED**

**Where:**

*node name*
The node name for the logical unit (LU).

**Explanation:** The node name referenced in the command is not a qualified name and a duplicate name exists in the network.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a fully qualified node name.

See *TPF Operations* for more information about the ZNACT command.

---

**NACT0016E REJECTED, SYSTEM NOT IN OR ABOVE CRAS STATE**

**Explanation:** The TPF system must be in or above the computer room agent set (CRAS) state for Systems Network Architecture (SNA) to be activated.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Bring the TPF system above 1052 state.
2. Enter the command again.

See *TPF Operations* for more information about the ZNACT command.

---

**NALS0001I BEGIN ZNALS DISPLAY**

**Explanation:** This is the normal message from the ZNALS command. It is followed by a display of the ALS status.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNALS command.

---

**NALS0003I NO ALS WITH SPECIFIED STATUS**

**Explanation:** This is a normal message from the ZNALS command. It is entered when there are no adjacent link stations (ALSs) with the specified status parameter (ACTIVE or INACTIVE).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNALS command.

---

**NALS0050E INVALID ALS NAME**

**Explanation:** The adjacent link stations (ALS) name specified in the command was not found in the resource vector table (RVT).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNALS command.

---

**NALS0051E INVALID ZNALS FORMAT**

**Explanation:** The status parameter following ALL on the command was not ACTIVE or INACTIVE.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNALS command.

---

**NALT0001I OMT Q SWITCHED FROM** *nodename* **TO** *nodename*

**Where:**

*nodename*
The node name.

**Explanation:** This is the normal response to the ZNALT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNALT command.

**NALT0002E FROM OR TO *nodename* NOT A PRINTER**

**Where:**

*nodename*
The node name.

**Explanation:** The node name referenced in the command is not a printer.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNALT command.

**NALT0003E INVALID RID**

**Explanation:** An error was returned from the RIDCC macro. This is a possible database problem.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNALT command.

**NALT0004E *nodename* — INVALID NODENAME**

**Where:**

*nodename*
The node name.

**Explanation:** The node name specified in the command is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNALT command.

**NALT0005E INVALID MESSAGE FORMAT**

**Explanation:** The format of the command is not valid. The second parameter was the same as the first parameter or the second parameter was not specified.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZNALT command.

**NALT0006E *node name* — HAS AN ALTERNATE ASSIGNED**

**Where:**

*node name*
The node name.

**Explanation:** The TO device has an alternate assigned to it.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNALT command.

**NALT0007E REJECTED, DUPLICATE LU NAME *node name*, NETID REQUIRED**

**Where:**

*node name*
The node name for the logical unit (LU).

**Explanation:** The node name referenced in the command is not a qualified name and a duplicate name exists in the network.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a fully qualified node name.

See *TPF Operations* for more information about the ZNALT command.

**NALT0008E REJECTED, SYSTEM NOT IN OR ABOVE CRAS STATE**

**Explanation:** The TPF system must be in or above the computer room agent set (CRAS) state for Systems Network Architecture (SNA) to be activated.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Bring the TPF system above 1052 state.
2. Enter the command again.

See *TPF Operations* for more information about the ZNALT command.

**NAPN0001I APPN-LEN SWITCH SET TO APPN**

**Explanation:** This is the normal response to the ZNAPN command with the APPN parameter is specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNAPN command.

**NAPN0002I APPN-LEN SWITCH SET TO LEN**

**Explanation:** This is the normal response to the ZNAPN command with the LEN parameter is specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNAPN command.

**NAPN0003I APPN-LEN SWITCH IS** *var*

**Where:**

*var* This is APPN or LEN.

**Explanation:** This is the normal response to the ZNAPN command with the STATUS parameter is specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNAPN command.

**NAPN0004I CP-CP SESSIONS EXIST ON PROCESSOR** *x*

**Where:**

*x* The CPU ID of the TPF processor with the C-CP sessions.

**Explanation:** This is the normal response to the ZNAPN command with the STATUS parameter is specified, the TPF system is running in APPN mode, and CP-CP sessions exist.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNAPN command.

**NAPN0005W APPN-LEN SWITCH ALREADY SET TO** *var*

**Where:**

*var* This is either APPN or LEN.

**Explanation:** One of the following errors occurred:

- The ZNAPN command was entered with the LEN parameter specified, but the APPN-LEN switch is already set to LEN.
- The ZNAPN command was entered with the APPN parameter specified, but the APPN-LEN switch is already set to APPN.

**System Action:** The ZNAPN command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNAPN command.

**NAPN0006E REJECTED, APPN SUPPORT NOT AVAILABLE**

**Explanation:** The ZNAPN command was entered with the APPN parameter specified but APPN support has not been incorporated in the TPF system. This indicates that no local:

- CP was included in the ANT deck.
- TPF/APPC LU was defined in the ANT deck.

**System Action:** The ZNAPN command is rejected.

**User Response:** Do the following:

1. Define a local CP or local TPF/APPC LU with the MSGRTA macro in SIP.
2. Run SIP to create a new ANT deck.
3. Run OSTG by using the new ANT deck.
4. Load the new OSTG to the TPF system.
5. Enter the ZNAPN command again.

See *TPF Operations* for more information about the ZNAPN command. See *TPF ACF/SNA Network Generation* for more information about the OSTG deck.

**NAPN0007E REJECTED, LEN SUPPORT NOT AVAILABLE**

**Explanation:** The ZNAPN command was entered with the LEN parameter specified but LEN support has not been incorporated in the TPF system. This indicates that no local control point logical units (CLUs) have been included in the OSTG deck.

**System Action:** The ZNAPN command is rejected.

**User Response:** Do the following:

1. Define CLUs in the OSTG deck.
2. Load the new OSTG to the TPF system.
3. Enter the ZNAPN command again.

See *TPF Operations* for more information about the ZNAPN command. See *TPF ACF/SNA Network Generation* for more information about the OSTG deck.

**NAPN0008E REJECTED, SNA RESTART HAS NOT COMPLETED**

**Explanation:** The ZNAPN command was entered before Systems Network Architecture (SNA) restart processing completed.

**System Action:** The ZNAPN command is rejected.

**User Response:** Enter the ZNAPN command after SNA restart processing ends.

See *TPF Operations* for more information about the ZNAPN command.

**NAPN0009E REJECTED, UNABLE TO ACCESS APPN TAPST RECORD**

**Explanation:** An I/O or FACS program error occurred while trying to access the TAPST file record.

**System Action:** The ZNAPN command is rejected.

**User Response:** Review the system error dump that precedes this message to determine the cause of the error.

See *TPF Operations* for more information about the ZNAPN command.

**NAPN0010E REJECTED, CP-CP SESSIONS ACTIVE ON PROCESSOR** *x*

**Where:**

*x* The CPU ID of the TPF processor with the CP-CP sessions.

**Explanation:** The ZNAPN command was entered with the LEN parameter specified while APPN CP-CP sessions were active.

**System Action:** The ZNAPN command is rejected.

**User Response:** Do the following:

1. Enter the ZNETW INACT command to deactivate the CP-CP sessions.
2. Enter the ZNAPN command again.

See *TPF Operations* for more information about the ZNAPN and ZNETW INACT commands.

---

**NAPN0011I BEGIN ZNAPN TOPOLOGY DISPLAY**

**Explanation:** This is the normal response to the ZNAPN command with the TOPOLOGY parameter specified. It is followed by a display of one or more active links.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNAPN command and an example of the informational display.

---

**NAPN0013E REJECTED, CPU ID SPECIFIED IS NOT VALID**

**Explanation:** The ZNAPN command was entered with a CPU ID that is not valid.

**System Action:** The ZNAPN command is rejected.

**User Response:** Enter the ZNAPN command again and omit the CPU parameter or specify a valid CPU ID.

See *TPF Operations* for more information about the ZNAPN command.

---

**NAPN0014E REJECTED, CP NAME SPECIFIED IS NOT VALID**

**Explanation:** The ZNAPN command was entered specifying a CP name containing a network ID or name that is more than 8 characters.

**System Action:** The ZNAPN command is rejected.

**User Response:** Enter the ZNAPN command again and omit the CP parameter or specify a valid CP name.

See *TPF Operations* for more information about the ZNAPN command.

---

**NAPN0015I NO ACTIVE LINKS MEETING THE SEARCH CRITERIA**

**Explanation:** The ZNAPN command was entered with the TOPOLOGY parameter specified, but there were no active links meeting the search criteria specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNAPN command.

---

**NCCB0000E INVALID NODENAME**

**Explanation:** The ZNCCB function issues this message when you specify a node name that is not valid in the command.

**System Action:** None.

**User Response:** Enter the command again and specify a valid node name.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0001E REJECTED, MULTIPLE LUS WITH SAME NAME**

**Explanation:** More than one logical unit (LU) matches the node name specified in the ZNCCB command.

**System Action:** The ZNCCB command is rejected.

**User Response:** Include the network identifier in the command to distinguish the multiple node names.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0005E CCB ORDINAL OUT OF RANGE**

**Explanation:** The ZNCCB function issues this message when you specify an ordinal number that is zero or exceeds the total number of conversation control blocks (CCBs).

**System Action:** The ZNCCB command is rejected.

**User Response:** Enter the command again and specify a valid CCB ordinal number.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0006E THERE ARE NO CCBS DEFINED IN THE SYSTEM**

**Explanation:** The ZNCCB function issues this message when you try to process the command in a TPF system that does not have any conversation control blocks (CCBs) defined.

**System Action:** None.

**User Response:** The ZNCCB command is valid only in conjunction with TPF Advanced Program-to-Program Communications (TPF/APPC) support. To use this support, you must define the maximum number of CCBs to be used in the TPF system by specifying the MAXCCB parameter on the SNAKEY macro.

See *TPF Operations* for more information about the ZNCCB command. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro. See *TPF ACF/SNA Data Communications Reference* for more information about the TPF/APPC support in general.

---

**NCCB0007E INVALID CONVERSATION STATE**

**Explanation:** The ZNCCB function issues this message when you specify an incorrect state value on the ZNCCB DC command.

**System Action:** None.

**User Response:** Enter the command again with a valid state code.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0008I NO ACTIVE CONVERSATIONS**

**Explanation:** The ZNCCB function issues this message when you specify a logical unit (LU) that has no associated active conversations.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0020I CCB CONTENTS FORMATTED**

**Explanation:** This is the normal response to the ZNCCB command with the DF parameter specified. This message is followed by a formatted display of the content of the TPF/APPC conversation control block (CCB).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0021I CCB CONTENTS**

**Explanation:** This is the normal response to the ZNCCB command with the DU parameter specified. This message is followed by an unformatted display of the content of the TPF/APPC conversation control block (CCB).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0022I CCB INITIALIZATION COMPLETE**

**Explanation:** This is the normal response to the ZNCCB command with the INIT parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0023I CCB SUMMARY INFORMATION**

**Explanation:** This is the normal response to the ZNCCB command with the DC SUM parameters specified. This message is followed by a display of the number of active and inactive conversation control blocks (CCB).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0024I CCB CONVERSATION STATES**

**Explanation:** This is the normal response to the ZNCCB command with the DC ALL parameters specified. This message is followed by a display of the number of conversation control blocks (CCB) in each conversation state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0025I** *number* **CCBS IN STATE** *num* **—** *state*

**Where:**

*number*
The number of conversation control blocks (CCBs) currently in the specified state.

*num*
The state specified on the command.

*state*
The state name.

**Explanation:** This is the normal response to the ZNCCB command with the DC parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0026I CCBID LIST FOR** *net ID.node name*

**Where:**

*net ID*
The network ID.

*node name*
The node name.

**Explanation:** This is the normal response to the ZNCCB command with the DC N parameters specified. This message is followed by a list of conversation control block identifiers (CCBIDs) for the conversations associated with the specified remote LU.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0027E SYSTEM NOT IN NORM STATE**

**Explanation:** This message occurs when you enter a ZNCCB INIT command while the TPF system is below NORM state.

**System Action:** The ZNCCB INIT command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Enter the command again.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0028I ACTIVE TPF MAPPED CONVERSATIONS**

**Explanation:** This is the normal response to the ZNCCB command with the DC ALL MAPPED parameters specified. This message is followed a display of all active mapped conversation control blocks (CCBs) by state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0040E INVALID STATE** *state* **IN CCB ORDINAL NUMBER** *ordnum*

**Explanation:** The ZNCCB DC ALL function enters this message when the conversation control block (CCB) with the specified ordinal number is in an incorrect conversation state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCCB0041E INVALID MAPPED STATE** *state* **IN CCB ORDINAL NUMBER** *ordnum*

**Where:**

*state*
The state of the TPF system.

*ordnum*
The ordinal number.

**Explanation:** The ZNCCB DC ALL MAPPED function enters this message when the conversation control block (CCB) with the specified ordinal number supports an active mapped conversation and is in an incorrect mapped conversation state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCCB command.

---

**NCNS0001I REQUEST COMPLETED FOR LU–***luname* **MODE–***modename*

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** This is the normal response to the ZNCNS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0002I REQUEST COMPLETED FOR LU–***luname* **MODE–***modename* **LIMIT–***totsess*, **CONW–***winners*, **CONL–***losers*

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

*totsess*
The total number of sessions.

*winners*
The total number of contention winners.

*losers*
The total number of contention losers.

**Explanation:** This is the normal response to the ZNCNS command. This command completed successfully but the values were negotiated. The new values are displayed in this message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0003I REQUEST ACCEPTED FOR LU–***luname* **MODE–***modename*

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** This is the normal response to the ZNCNS command, indicating that the request was accepted and processing started.

**System Action:** Another message follows when processing is complete.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0004E REQUEST REJECTED FOR LU–***luname* **MODE–***modename* **ALLOCATION ERROR, RETRY LATER**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the control operator conversation cannot be allocated successfully.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the command again later.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0005E REQUEST REJECTED FOR LU–*luname* MODE–*modename* ALLOCATION ERROR, NO RETRY**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the control operator conversation cannot be allocated successfully.

**System Action:** The ZNCNS command is rejected.

**User Response:** Do not enter the ZNCNS command again.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0006E REQUEST REJECTED FOR LU–*luname* MODE–*modename* COMMAND RACE REJECT**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the source logical unit (LU) or the target LU is currently processing another CNOS transaction for the same mode name.

**System Action:** The ZNCNS command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0007E REQUEST REJECTED FOR LU–*luname* MODE–*modename* LIMIT PARAMETER MUST BE GREATER THAN ZERO**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the value specified for the LIMIT parameter is less than or equal to zero.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the command again specifying a LIMIT parameter with a value greater than zero.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0008E REQUEST REJECTED FOR LU–*luname* MODE–*modename* SUM OF CONW AND CONL CANNOT EXCEED SESSION LIMIT**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the sum of the values specified for the CONW and CONL parameters is greater than the value specified for the LIMIT parameter.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the command again specifying the CONW and CONL parameter with values less than or equal to the LIMIT parameter value.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0009E REQUEST REJECTED FOR LU–*luname* MODE–*modename* RESP PARAMETER INVALID**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the value specified for the RESP parameter is not valid.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the ZNCNS command again specifying SOURCE or TARGET for the RESP parameter.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0011E REQUEST REJECTED FOR LU–*luname* MODE–*modename* INSUFFICIENT RESOURCES – NO RETRY**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when a resource failure causes the control operator conversation to be deallocated prematurely. This might be caused by a session outage, a protocol error, or other errors.

**System Action:** The ZNCNS command is rejected.

**User Response:** Do not enter the ZNCNS command again.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0012E REQUEST REJECTED FOR LU–*luname* MODE–*modename* CHANGE LIMIT REQUEST FOR SNASVCMG NOT ALLOWED**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when you specify the SNASVCMG mode name on a change request.

**System Action:** The ZNCNS command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0013E REQUEST REJECTED FOR LU–*luname* MODE–*modename* SYSTEM MUST BE IN CRAS STATE OR ABOVE**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The TPF system must be in or above computer room agent set (CRAS) state to enter this command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Bring the TPF system above 1052 state.
2. Enter the command again.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0014E REQUEST REJECTED FOR LU–*luname* MODE–*modename* VERB ONLY VALID FOR PARALLEL SESSIONS**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when you issue the CHANGE verb and specify a single session mode name.

**System Action:** The ZNCNS command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0015E REQUEST REJECTED FOR LU–*luname* MODE–*modename* INVALID OR UNKNOWN LU NAME**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the value specified on the LU parameter is not the name of a remote LU that is type LU62 or type ANY. This message is also issued when a remote APPN control point (CP) is specified because CNOS requests are not valid for these LUs.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the command again specifying a valid logical unit (LU) name.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0016E REQUEST REJECTED FOR LU–*luname* MODE–*modename* SESSION LIMIT NOT INITIALIZED**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS CHANGE command issues this message when the limits for the (logical unit (LU), mode name) pair specified were never initialized.

**System Action:** The ZNCNS CHANGE command is rejected.

**User Response:** Initialize the session limits.

See *TPF Operations* for more information about the ZNCNS CHANGE command.

---

**NCNS0017E REQUEST REJECTED FOR LU–*luname* MODE–*modename* INVALID OR UNKNOWN MODENAME**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the TPF system or the target logical unit (LU) does not recognize the mode name. This message is also issued when reserved mode name CPSVCMG is specified because this mode name is reserved for APPN CP-CP sessions and is not valid for CNOS requests.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the ZNCNS command again specifying a valid mode name.

See *TPF Operations* for more information about the ZNCNS commands.

**NCNS0018E REQUEST REJECTED FOR LU–*luname* MODE–*modename* DRAIN PARAMETER INVALID**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the value specified for the DRAIN parameter is not valid.

**System Action:** The ZNCNS command is rejected.

**User Response:** Do one of the following:

- Enter the ZNCNS command again specifying SOURCE, TARGET, or BOTH for the DRAIN parameter.
- Enter the command again without the DRAIN parameter.

See *TPF Operations* for more information about the ZNCNS commands.

**NCNS0019E REQUEST REJECTED FOR LU–*luname* MODE–*modename* RESP PARAMETER INVALID FOR INITIALIZE VERB**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when you specify the RESP parameter with the INITIALIZE function.

**System Action:** The ZNCNS command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

**NCNS0020E REQUEST REJECTED FOR LU–*luname* MODE–*modename* SESSION LIMIT ALREADY RESET**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when you specify RESET when the session limit is already zero.

**System Action:** The ZNCNS command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

**NCNS0021E REQUEST REJECTED FOR LU–*luname* MODE–*modename* MAX SESSION LIMIT IS 64K**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the LIMIT parameter is greater than 64 KB. The maximum session limit value is 64 KB.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the ZNCNS command again specifying a lower session limit.

See *TPF Operations* for more information about the ZNCNS commands.

**NCNS0022E REQUEST REJECTED FOR LU–*luname* MODE–*modename* LOCAL PARAMETER NOT VALID FOR THIS VERB**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the LOCAL parameter is issued for this verb. The LOCAL parameter is only valid with the INITIALIZE verb.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the ZNCNS command again without

specifying the LOCAL parameter.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0023E REQUEST REJECTED FOR LU–*luname* MODE–*modename* LOCAL LU SPECIFIED CANNOT BE USED**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS INIT function issues this message under one of the following conditions:

- The local logical unit (LU) specified by the LOCAL parameter does not match the local LU that is already in session with the remote LU specified on the LUNAME parameter.
- The remote LU is in session with a local secondary LU (SLU) thread, but the LU specified by the LOCAL parameter was not an SLU thread.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the ZNCNS command again specifying a valid LU name for the LOCAL parameter.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0024E REQUEST REJECTED FOR LU–*luname* MODE–*modename* INVALID OR UNKNOWN CDRM NAME**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS INIT function issues this message when you specify a cross-domain resource manager name that is not valid on the CDRM parameter.

**System Action:** The ZNCNS INIT command is rejected.

**User Response:** Enter the ZNCNS INIT command again specifying a valid cross-domain resource manager (CDRM) name.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0025E REQUEST REJECTED FOR LU–*luname* MODE–*modename* CDRM PARAMETER NOT VALID FOR THIS VERB**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when you specify the CDRM parameter with a function other than INITIALIZE. The CDRM parameter is valid only for the INITIALIZE function.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the ZNCNS command again without specifying the CDRM parameter.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0026E REQUEST REJECTED FOR LU–*luname* MODE–*modename* CDRM SESSION NOT ACTIVE**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS INIT function issues this message when there is no active cross-domain resource manager–cross-domain resource manager (CDRM-CDRM) session with the CDRM name specified.

**System Action:** The ZNCNS INIT command is rejected.

**User Response:** Do the following:

1. Activate the CDRM-CDRM session.
2. Enter the command again.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0027E REQUEST REJECTED FOR LU–*luname* MODE–*modename* CP PARAMETER NOT VALID FOR THIS VERB**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when you specify the CP parameter on a ZNCNS command other than the ZNCNS INITIALIZE command. The CP parameter is valid only for the ZNCNS INITIALIZE command.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the appropriate ZNCNS command again and do not specify the CP parameter.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0028E REQUEST REJECTED FOR LU–*luname* MODE–*modename* CP NAME NOT VALID**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when you enter the ZNCNS INITIALIZE command with a control point (CP) name specified that is not valid on the CP parameter.

**System Action:** The ZNCNS INITIALIZE command is rejected.

**User Response:** Enter the ZNCNS INITIALIZE command again and specify a valid CP name.

See *TPF Operations* for more information about the ZNCNS INITIALIZE command.

---

**NCNS0029E REQUEST REJECTED FOR LU–*luname* MODE–*modename* REMOTE CP NOT AVAILABLE**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS INITIALIZE function issues this message when there is no active adjacent link station (ALS) between the TPF system and the control point (CP) specified on the CP parameter.

**System Action:** The ZNCNS INITALIZE command is rejected.

**User Response:** Do the following:

1. Activate an ALS between the TPF system and remote CP.
2. Enter the ZNCNS INITIALIZE command again.

See *TPF Operations* for more information about the ZNCNS INITIALIZE command.

---

**NCNS0030E REQUEST REJECTED FOR LU–*luname* MODE–*modename* CDRM AND CP NOT ALLOWED**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS INITIALIZE function issues this message when you specify both the CDRM and CP parameters.

**System Action:** The ZNCNS INITIALIZE command is rejected.

**User Response:** Enter the ZNCNS INITIALIZE command again and specify the CDRM parameter, the CP parameter, or neither parameter.

See *TPF Operations* for more information about the ZNCNS INITIALIZE command.

---

**NCNS0038E REQUEST REJECTED FOR LU–*luname* MODE–*modename* SESSION LIMIT ALREADY INITIALIZED**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** This message is issued when you enter the ZNCNS INITIALIZE command for a (logical unit (LU), mode name) pair that is already initialized.

**System Action:** The ZNCNS command is rejected.

**User Response:** Enter the ZNCNS CHANGE command to change the session limits to the desired values.

See *TPF Operations* for more information about the ZNCNS INITIALIZE and ZNCNS CHANGE commands.

---

**NCNS0039E REQUEST REJECTED FOR LU–*luname* MODE–*modename* SESSION LIMIT CLOSED**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS INITIALIZE command was entered to raise the limit of the number of sessions for a specified (logical unit (LU), mode name pair) but the remote LU rejects the request and the limit remains zero.

**System Action:** The ZNCNS INITIALIZE command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS INITIALIZE command.

---

**NCNS0040E REQUEST REJECTED FOR LU–*luname* MODE–*modename* INVALID OR UNKNOWN LOCAL LU NAME**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** This message is issued when the ZNCNS INITIALIZE command is entered with a local LU name that is not valid specified on the LOCAL parameter.

**System Action:** The ZNCNS INITIALIZE command is rejected.

**User Response:** Enter the ZNCNS INITIALIZE command again specifying a valid local LU name.

See *TPF Operations* for more information about the ZNCNS INITIALIZE command.

---

**NCNS0041E REQUEST REJECTED FOR LU–*luname* MODE–*modename* SESSIONS EXIST WITH REMOTE LU ON ANOTHER PROCESSOR**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the remote LU specified by the LU parameter already has sessions with another processor in the loosely coupled complex.

**System Action:** The ZNCNS command is rejected.

**User Response:** Do the following:

1. Enter the ZNDLU command and specify the remote LU name on the ID parameter to see which TPF host in the loosely coupled complex has sessions with this remote LU.
2. Enter the ZNCNS command on the TPF host that was returned in the ZNDLU display.

See *TPF Operations* for more information about the ZNCNS and ZNDLU commands.

---

**NCNS0042E REQUEST REJECTED FOR LU–*luname* MODE–*modename* LOCAL LU NOT ACTIVE**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when the local LU specified (or the default LU, if none was specified) is not active.

**System Action:** The ZNCNS command is rejected.

**User Response:** Do the following:

1. Enter the ZNETW ACT and ZROUT START commands to activate the local LU.
2. Enter the ZNCNS command again.

See *TPF Operations* for more information about the ZNCNS, ZNETW ACT, and ZROUT START commands.

---

**NCNS0046I REQUEST COMPLETED FOR LU–*luname* MODE–*modename* RESP NEGOTIATED TO SOURCE**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** This is the normal response to the ZNCNS command with the RESET parameter specified.

**System Action:** The command completed successfully and the source (TPF) logical unit (LU) is now responsible for deactivating sessions.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0047I REQUEST COMPLETED FOR LU–*luname* MODE–*modename* FORCE AS SPECIFIED**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** This is the normal response to the ZNCNS command with the RESET FORCE parameters and the source (TPF) logical unit (LU) specified as responsible for deactivating sessions.

**System Action:** The CNOS request or reply completes successfully.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

---

**NCNS0048I REQUEST COMPLETED FOR LU–*luname* MODE–*modename* FORCE AS SPECIFIED, RESP FORCED TO SOURCE**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** This is the normal response to the ZNCNS command with the RESET FORCE parameters and the target (remote) logical unit (LU) specified as responsible for deactivating sessions.

**System Action:** The session limit is reset to zero for the specified (LU, mode name) pair and the source (TPF) LU is now responsible for deactivating the sessions.

**User Response:** None.

See *TPF Operations* for more information about the ZNCNS commands.

**NCNS0056E REQUEST REJECTED FOR LU–*luname* MODE–*modename* CANNOT RESET SNASVCMG UNLESS ALL OTHER MODES RESET TO ZERO**

**Where:**

*luname*
The logical unit (LU) name specified on the LU parameter.

*modename*
The mode name specified on the MODE parameter.

**Explanation:** The ZNCNS function issues this message when you try to reset the session limit and contention polarities for the SNASVCMG mode name before all the other mode names for the specified logical unit (LU) are reset.

**System Action:** The ZNCNS command is rejected.

**User Response:** Do the following:

1. Reset the session limits for all other mode names to zero.
2. Enter the command again for the SNASVCMG mode name.

See *TPF Operations* for more information about the ZNCNS commands.

# NCVT–NERR

**NCVT0001I BEGIN ZNCVT DISPLAY**

**Explanation:** This is the normal response to the ZNCVT command. This message is followed by a display of the Systems Network Architecture (SNA) resource address or identification.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCVT command.

**NCVT0002E INVALID DATA FORMAT**

**Explanation:** The format of the command is not correct, for example, an incorrect length, hexadecimal format, or missing delimiters.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZNCVT command.

**NCVT0003E INVALID REQUEST TYPE**

**Explanation:** The request data type is not one of the 6 valid types.

**System Action:** None.

**User Response:** Enter the command again and specify a valid data type.

See *TPF Operations* for more information about the ZNCVT command.

**NCVT0004E REQUESTED DATA NOT FOUND**

**Explanation:** The input data could not be found in the data retrieval tables.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCVT command.

**NCVT0005E NOT IN 1052 STATE**

**Explanation:** The ZNCVT command was issued prior to 1052 state.

**System Action:** The ZNCVT command is rejected.

**User Response:** Do the following:

1. Bring the TPF system to 1052 state or above.
2. Enter the ZNCVT command again.

See *TPF Operations* for more information about the ZNCVT command.

**NCVT0006E UNABLE TO COMPLETE — DATA NOT AVAILABLE**

**Explanation:** The requested data cannot be retrieved by using the given input. For example:

- When the input is a PLIT, the data is retrieved by using the resource identifier (RID) from the WGTA. If the resource is not yet in session, the RID will be zero and no other data can be retrieved.
- When the input is a session control block identifier (SCBID) and the SCB was never assigned, there is no data to display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCVT command.

**NCVT0007I BEGIN ZNCVT DISPLAY**

**Explanation:** This is the normal response to the ZNCVT command when the resource to be displayed is a high-performance routing (HPR) LU-LU session. This message is followed by information about the resource.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNCVT command.

---

**NDLU0013I LU — *lunetid.luname* PCID — *cpnetid.cpname.pcid***

**Where:**

*lunetid*
The network identifier for the logical unit (LU).

*luname*
The name of the LU.

*cpnetid*
The control point network identifier for the procedure correlation identifier (PCID).

*cpname*
The control point name for the PCID.

*pcid*
The procedure correlation identifier.

**Explanation:** This is the normal response to the ZNDLU command when the command was entered to display information about a particular logical unit (LU) that contain in their associated resource vector table (RVT) entry a procedure correlation identifier (PCID).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0014I LU NOT FOUND**

**Explanation:** There are no logical units (LUs) that match the LU selection criteria specified in the ZNDLU command.

**System Action:** None.

**User Response:** Enter the ZNDLU command again, and specify different LU selection criteria.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0016E NO SESSION CONTROL BLOCKS EXIST FOR THIS LU**

**Explanation:** The ZNDLU command was entered with the MODE parameter specified but there are nospecified for the session control blocks (SCBs) associated with the specified logical unit (LU).

**System Action:** None.

**User Response:** Enter the ZNDLU command again and do not specify the MODE parameter.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0017E MODE KEYWORD NOT VALID EXCEPT WITH UNIQUE LUNAME**

**Explanation:** The ZNDLU command was entered with the MODE parameter specifed. This parameter can be specified only when the ID parameter is specified, followed by a unique logical unit (LU) name. A unique LU name is one that does not contain any wildcard characters.

**System Action:** None.

**User Response:** Do one of the following:

- Enter the ZNDLU command again, and specify a unique LU name for the ID parameter.
- Enter the ZNDLU command again, and do not specify the MODE parameter.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0018E INVALID NETID LENGTH IN ID PARAMETER**

**Explanation:** The ZNDLU command was entered with the ID parameter specified. However, the network identifier specified for the ID parameter contains more than 8 characters.

**System Action:** None.

**User Response:** Enter the ZNDLU command again, ensuring that the network identifier specified for the ID parameter contains no more than 8 characters.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0019E INVALID NODENAME LENGTH IN ID PARAMETER**

**Explanation:** The logical unit (LU) name specified for the ID parameter in the ZNDLU command contains more than 8 characters.

**System Action:** None.

**User Response:** Enter the ZNDLU command again ensuring the LU name specified for the ID parameter contains between 1 and 8 characters.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0020E INVALID PROCEDURE PARAMETER SPECIFIED**

**Explanation:** The ZNDLU command was entered with a value for the PROCEDURE parameter that is not valid. The value must be either BIND or UNBIND.

**System Action:** The ZNDLU command is rejected.

**User Response:** Enter the ZNDLU command and specify BIND or UNBIND for the PROCEDURE parameter.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0021E INVALID TYPE PARAMETER SPECIFIED**

**Explanation:** The ZNDLU command was entered with a value for the TYPE parameter that is not valid. The value must be 0, 1, 2, 3, 6.2, ANY, or PLU.

**System Action:** The ZNDLU command is rejected.

**User Response:** Enter the command again and specify a valid value for the TYPE parameter.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0022E INVALID ALS PARAMETER SPECIFIED**

**Explanation:** The ZNDLU command was entered with a value for the ALS parameter that is not valid.

**System Action:** None.

**User Response:** Enter the ZNDLU command again ensuring the name of an adjacent link station (ALS), network control program (NCP), or channel-to-channel (CTC) resource is specified for the ALS parameter.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0023E ERROR RETRIEVING ALS PARAMETER RVT ENTRY**

**Explanation:** An error occurred while trying to retrieve the resource vector table (RVT) entry associated with the adjacent link station (ALS) name, network control program (NCP) name, or channel-to-channel (CTC) name that was specified for the ALS parameter in the ZNDLU command.

**System Action:** None.

**User Response:** Check the RVT1 area for possible corruption.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0024E THE SPECIFIED ALS PARAMETER RESOURCE IS NOT ACTIVE**

**Explanation:** The adjacent link station (ALS), network control program (NCP), or channel-to-channel (CTC) resource specified for the ALS parameter in the ZNDLU command is not active.

**System Action:** None.

**User Response:** Enter the ZNDLU command again, ensuring that the ALS, NCP, or CTC resource specified for the ALS parameter is active.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0025E THE SPECIFIED ALS RESOURCE IS NOT AN NCP, ALS OR CTC**

**Explanation:** The value specified for the ALS parameter in the ZNDLU command is a valid resource name, but it is not the name of an adjacent link station (ALS), network control program (NCP), or channel-to-channel (CTC) resource.

**System Action:** None.

**User Response:** Enter the ZNDLU command again ensuring the name of an ALS, NCP, or CTC resource is specified for the ALS parameter.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0026E INVALID APPL PARAMETER SPECIFIED**

**Explanation:** The ZNDLU command was entered with a value for the APPLICATION parameter that is not valid.

**System Action:** None.

**User Response:** Enter the ZNDLU command again ensuring the name of a TPF application program or the value NS is specified for the APPLICATION parameter.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0027E ERROR RETRIEVING APPL PARAMETER RVT ENTRY**

**Explanation:** An error occurred while trying to retrieve the resource vector table (RVT) entry associated with the TPF application program that was specified for the APPLICATION parameter in the ZNDLU command.

**System Action:** None.

**User Response:** Check the RVT1 area for possible corruption.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0028E THE SPECIFIED APPL RESOURCE IS NOT AN APPLICATION**

**Explanation:** The ZNDLU command was entered with a value specified for the APPLICATION parameter that is a valid resource name but is not the name of a TPF application program.

**System Action:** The ZNDLU command is rejected.

**User Response:** Enter the ZNDLU command again ensuring the name of a TPF application program is specified for the APPLICATION parameter.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0029E THE SPECIFIED RTP INDEX IS NOT VALID**

**Explanation:** The ZNDLU command was entered with the RTP parameter specified, but the rapid transport protocol control block (RTPCB) index was not valid.

**System Action:** The ZNDLU command is rejected.

**User Response:** Enter the ZNDLU command again, specifying a valid value for the RTP parameter.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0030E REJECTED, SYSTEM IS BELOW 1052 STATE**

**Explanation:** You can enter the ZNDLU command only in 1052 state or higher.

**System Action:** None.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNDLU command again.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDLU0031I BEGIN ZNDLU DISPLAY**

**Explanation:** This is the normal response to the ZNDLU command. This message is followed by a display of information about one or more logical units (LUs).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNDLU command and its display.

---

**NDLU0032I BEGIN ZNDLU DISPLAY**

**Explanation:** This is the normal response to the ZNDLU command when the command was entered to display information about a particular remote LU that has TPF Advanced Program-to-Program Communications (TPF/APPC) sessions.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNDLU command.

---

**NDYN0000E PARAMETERS SPECIFIED FOR ZNDYN ARE NOT VALID**

**Explanation:** One or more of the parameters specified for the ZNDYN command are not valid.

**System Action:** The ZNDYN command is rejected.

**User Response:** Enter the ZNDYN command again specifying the correct parameters.

See *TPF Operations* for more information about the ZNDYN commands.

---

**NDYN0004E REJECTED, SNA RESTART IS NOT COMPLETE**

**Explanation:** You cannot enter the ZNDYN command until Systems Network Architecture (SNA) restart ends.

**System Action:** The ZNDYN command is rejected.

**User Response:** Do the following:

1. Wait for SNA restart to end.
2. Enter the appropriate ZNDYN command again.

See *TPF Operations* for more information about the ZNDYN commands.

---

**NDYN0005I RVTS RECYCLED FROM TERMINATION LIST – *xxxxxx* RVTS NOW ON AVAILABLE LIST – *yyyyyy***

**Where:**

*xxxxxx*
The number of resource vector table (RVT) entries removed from the RVT termination list.

*yyyyyy*
The number of RVT entries on the RVT available list.

**Explanation:** This is the normal response to the ZNDYN RECYCLE command.

**System Action:** The TPF system removes the RVT entries that are on the RVT termination list and places them on the RVT available list.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN RECYCLE command. See *TPF ACF/SNA Data Communications Reference* for more information about the RVT available list and the RVT termination list.

---

**NDYN0006I THERE ARE NO RVTS ON THE TERMINATION LIST**

**Explanation:** The ZNDYN RECYCLE command was entered when there were no resource vector table (RVT) entries on the RVT termination list to recycle.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN RECYCLE command. See *TPF ACF/SNA Data Communications Reference* for more information about the RVT termination list.

---

**NDYN0020I *** ZNDYN DISPLAY ALL *****

**Explanation:** This is the normal response to the ZNDYN DISPLAY command with the ALL parameter specified. This message is followed by a display of statistical information about the distribution of resources in the resource name hash (RNH) tables.

**System Action:** The TPF system displays the requested information.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN DISPLAY command and an example of the informational display. See *TPF ACF/SNA Data Communications Reference* for more information about the RNH tables.

---

**NDYN0030I *** ZNDYN DISPLAY NAME *****

**Explanation:** This is the normal response to the ZNDYN DISPLAY command with the NAME parameter specified. This message is followed by a display of information from the resource name hash (RNH) tables about the specified resource.

**System Action:** The TPF system displays the requested information.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN DISPLAY command and an example of the informational display. See *TPF ACF/SNA Data Communications Reference* for more information about the RNH tables.

---

**NDYN0040I *** ZNDYN DISPLAY RID ***

**Explanation:** This is the normal response to the ZNDYN DISPLAY command with the RID parameter specified. This message is followed by a display of information from the resource name hash (RNH) tables about the specified resource.

**System Action:** The TPF system displays the requested information.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN DISPLAY command and an example of the informational display. See *TPF ACF/SNA Data Communications Reference* for more information about the RNH tables.

**NDYN0050I *** ZNDYN DISPLAY SYNONYM ***

**Explanation:** This is the normal response to the ZNDYN DISPLAY command with the SYNONYM parameter specified. This message is followed by a display of information from the resource name hash (RNH) tables about the resources on the RNHET synonym chain for the specified resource.

**System Action:** The TPF system displays the requested information.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN DISPLAY command and an example of the informational display. See *TPF ACF/SNA Data Communications Reference* for more information about the RNH tables and the RNHET synonym chain.

**NDYN0061E NETID OR RESOURCE NAME CONTAINS TOO MANY CHARACTERS**

**Explanation:** The resource specified for the ZNDYN command contains too many characters in either the network identifier or the resource name.

**System Action:** The ZNDYN command is rejected.

**User Response:** Enter the ZNDYN command again and specify no more than 8 characters each for the network identifier and resource name.

See *TPF Operations* for more information about the ZNDYN commands.

**NDYN0062E CANNOT LOCATE THE RNHPT FOR THE SPECIFIED RESOURCE**

**Explanation:** An error occurred while trying to locate the resource name hash prime table (RNHPT) entry for the specified resource.

**System Action:** The ZNDYN command is rejected.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about the RNHPT entries.

**NDYN0063E RESOURCE NAME DOES NOT EXIST**

**Explanation:** The specified resource is not defined on this TPF processor. However, it may be defined on another processor in the loosely coupled TPF system.

**System Action:** The ZNDYN request is rejected.

**User Response:** Enter the ZNDYN command again and specify the name of a resource that is defined on this processor.

See *TPF Operations* for more information about the ZNDYN commands.

**NDYN0064I SPECIFIED RID IS FOR A SPARE RVT**

**Explanation:** The resource identifier (RID) specified for the ZNDYN DISPLAY command is the RID of a resource vector table (RVT) entry that is not currently assigned to a resource on this processor. It is a *spare* RVT entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN DISPLAY command. See *TPF ACF/SNA Data Communications Reference* for more information about spare RVT entries.

**NDYN0065E MUST SPECIFY A RID, SCBID NOT VALID**

**Explanation:** The value specified for the RID parameter in the ZNDYN DISPLAY command was a session control block identifier (SCBID), not a resource identifier (RID).

**System Action:** The ZNDYN DISPLAY command is rejected.

**User Response:** Enter the ZNDYN DISPLAY command again and specify a valid RID for the RID parameter.

See *TPF Operations* for more information about the ZNDYN DISPLAY command.

**NDYN0066E SPECIFIED RID IS NOT VALID**

**Explanation:** The resource identifier (RID) specified for the RID parameter in the ZNDYN DISPLAY command is not valid.

**System Action:** The ZNDYN DISPLAY command is rejected.

**User Response:** Enter the ZNDYN DISPLAY command again and specify a valid RID for the RID parameter.

See *TPF Operations* for more information about the ZNDYN DISPLAY command.

**NDYN0070E VALUE SPECIFIED FOR SUBAREA PARAMETER IS NOT IN THE RANGE OF 1–255**

**Explanation:** The value specified for the SUBAREA parameter is not valid. It is not in the 1–255 range.

**System Action:** The ZNDYN request is rejected.

**User Response:** Enter the ZNDYN ADD or ZNDYN CHANGE command again and specify a valid subarea.

See *TPF Operations* for more information about the ZNDYN ADD and ZNDYN CHANGE commands.

**NDYN0072E RESOURCE IS NOT AN ALS, CTC, CDRM, OR NCP**

**Explanation:** The ZNDYN CHANGE command can be used to change the resource name of only an adjacent link station (ALS), channel-to-channel (CTC), cross-domain resource manager (CDRM), or network control program (NCP) resource.

**System Action:** The ZNDYN CHANGE command is rejected.

**User Response:** Enter the ZNDYN CHANGE command again and specify the name of an ALS, CTC, CDRM, or NCP resource for the OLD parameter.

See *TPF Operations* for more information about the ZNDYN CHANGE command.

---

**NDYN0073E SUBAREA PARAMETER NOT VALID WHEN CHANGING AN ALS RESOURCE**

**Explanation:** You cannot specify the SUBAREA parameter when changing the name of an adjacent link station (ALS) resource. ALS resources do not have a subarea.

**System Action:** The ZNDYN CHANGE command is rejected.

**User Response:** Enter the ZNDYN CHANGE command again and do not specify the SUBAREA parameter if you are changing the name of an ALS resource.

See *TPF Operations* for more information about the ZNDYN CHANGE command.

---

**NDYN0074I RESOURCE NAME *oldname* WAS CHANGED TO *newname***

**Where:**

*oldname*
The old resource name.

*newname*
The new resource name.

**Explanation:** This is the normal response to the ZNDYN CHANGE command.

**System Action:** The TPF system changes the name of the resource.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN CHANGE command.

---

**NDYN0075I SUBAREA FOR *name* WAS CHANGED FROM *oldsub* TO *newsub***

**Where:**

*name*
The new name of the resource.

*oldsub*
The old subarea.

*newsub*
The new subarea.

**Explanation:** This is the normal response to the ZNDYN CHANGE command when it is entered to change the subarea as well as the name of a resource.

**System Action:** The TPF system changes the subarea of the resource.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN CHANGE command.

---

**NDYN0077E VALUE SPECIFIED FOR WINSIZE PARAMETER IS NOT IN THE RANGE OF 1–255**

**Explanation:** The value specified for the WINSIZE parameter is not valid. It is not in the 1–255 range.

**System Action:** The ZNDYN ADD command is rejected.

**User Response:** Enter the ZNDYN ADD command again, and specify a valid value for the WINSIZE parameter or use the default value.

See *TPF Operations* for more information about the ZNDYN ADD command.

---

**NDYN0078E VALUE SPECIFIED FOR VRTO PARAMETER IS NOT IN THE RANGE OF 0–65535**

**Explanation:** The value specified for the VRTO parameter is not valid. It is not in the 0–65 535 range.

**System Action:** The ZNDYN ADD command is rejected.

**User Response:** Enter the ZNDYN ADD command again, and specify a valid value for the VRTO parameter or use the default value.

See *TPF Operations* for more information about the ZNDYN ADD command.

---

**NDYN0079E VALUE SPECIFIED FOR VRILTO PARAMETER IS NOT IN THE RANGE OF 0–255**

**Explanation:** The value specified for the VRILTO parameter is not valid. It is not in the 0–255 range.

**System Action:** The ZNDYN ADD command is rejected.

**User Response:** Enter the ZNDYN ADD command again, and specify a valid value for the VRILTO parameter or use the default value.

See *TPF Operations* for more information about the ZNDYN ADD command.

---

**NDYN0080I *resname* RESOURCE ADDED SUCCESSFULLY**

**Where:**

*resname*
The name of the resource.

**Explanation:** This is the normal response to the ZNDYN ADD command.

**System Action:** The TPF system creates a resource definition for the specified resource.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN ADD command.

**NDYN0081E SUFFICIENT NON-LU RESOURCES ARE NOT AVAILABLE FOR ZNDYN ADD**

**Explanation:** The specified resource could not be added because the non-LU section in the resource vector table (RVT) is full.

**System Action:** The ZNDYN ADD command is rejected.

**User Response:** Increase the size of the non-LU section in the RVT by doing the following:

1. Increase the value assigned to the NUMALS parameter in the SNAKEY macro.
2. Reload keypoint record 2 (CTK2).

See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

**NDYN0082E RESOURCE NOT ADDED, COULD NOT UPDATE NAT**

**Explanation:** The network address table (NAT) could not be updated with information about the specified resource. Therefore, the resource was not added to the TPF system.

**System Action:** The ZNDYN ADD command is rejected.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about adding resources to the TPF system.

**NDYN0083E RESOURCE NAME ALREADY EXISTS**

**Explanation:** The specified resource name is already defined for another resource on this processor.

**System Action:** The ZNDYN command is rejected.

**User Response:** Enter the ZNDYN ADD or ZNDYN CHANGE command again and specify a unique resource name.

See *TPF Operations* for more information about the ZNDYN ADD and ZNDYN CHANGE commands.

**NDYN0084E SPECIFIED SUBAREA IS ALREADY IN USE**

**Explanation:** The specified subarea is already being used by another resource on this processor.

**System Action:** The ZNDYN command is rejected.

**User Response:** Enter the ZNDYN ADD or ZNDYN CHANGE command again and specify a subarea that is not already in use.

See *TPF Operations* for more information about the ZNDYN ADD and ZNDYN CHANGE commands.

**NDYN0085E THE SPECIFIED RESOURCE NAME WAS NOT FOUND**

**Explanation:** The old resource name specified for the ZNDYN CHANGE command does not exist on this processor.

**System Action:** The ZNDYN CHANGE command is rejected.

**User Response:** Enter the ZNDYN CHANGE command again and specify the name of a resource that exists on this processor.

See *TPF Operations* for more information about the ZNDYN CHANGE command.

**NDYN0086E CANNOT CHANGE THE NAME OF AN ACTIVE RESOURCE**

**Explanation:** The resource specified for the ZNDYN CHANGE command is active.

**System Action:** The ZNDYN CHANGE command is rejected.

**User Response:** Do the following:

1. Deactivate the resource.
2. Enter the ZNDYN CHANGE command again.

See *TPF Operations* for more information about the ZNDYN CHANGE command.

**NDYN0087E MAXIMUM NUMBER OF CTC LINKS ALREADY DEFINED FOR THE SPECIFIED SUBAREA**

**Explanation:** The maximum number of channel-to-channel (CTC) links, which is 2, is already defined for the specified subarea.

**System Action:** The ZNDYN command is rejected.

**User Response:** Enter the ZNDYN ADD or ZNDYN CHANGE command again and specify a subarea that does not have the maximum number of CTC links defined.

See *TPF Operations* for more information about the ZNDYN ADD or ZNDYN CHANGE commands.

**NDYN0088E RESOURCE NAME CHANGED, BUT COULD NOT UPDATE NAT**

**Explanation:** An error occurred while changing the name of a resource. Although the resource name and subarea (if a new subarea was specified) were changed, the network address table (NAT) could not be updated.

**System Action:** Processing continues for the ZNDYN CHANGE command.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about changing the name and subarea of a resource. See *TPF Operations* for more information about the ZNDYN CHANGE command.

### NDYN0089E CANNOT CHANGE THE NAME OF THE LOCAL SSCP

**Explanation:** You cannot use the ZNDYN CHANGE command to change the name of the local system services control point (SSCP).

**System Action:** The ZNDYN CHANGE command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNDYN CHANGE command.

### NDYN0090E A CDRM RESOURCE IS NOT DEFINED FOR THE SPECIFIED SUBAREA

**Explanation:** A cross-domain resource manager (CDRM) resource must be defined for the subarea that you specified when adding or changing the channel-to-channel (CTC) resource.

**System Action:** The ZNDYN command is rejected.

**User Response:** Do one of the following:

- Enter the ZNDYN ADD or ZNDYN CHANGE command again and specify a subarea for which a CDRM resource is defined.
- Define a CDRM for the specified subarea first.

See *TPF Operations* for more information about the ZNDYN ADD and ZNDYN CHANGE commands.

### NDYN0091E CANNOT CHANGE THE SUBAREA OF A CDRM THAT HAS CTC LINKS DEFINED

**Explanation:** The subarea for the specified cross-domain resource manager (CDRM) has channel-to-channel (CTC) links defined. Therefore, you cannot change the subarea for that CDRM resource.

**System Action:** The ZNDYN CHANGE command is rejected.

**User Response:** Do the following:

1. Determine the name of the CTC resources that have the same subarea as the CDRM resource that you specified.
2. Enter the ZNDYN CHANGE command to change the name and subarea of those CTC resources.
3. Enter the ZNDYN CHANGE command to change the name and subarea of the CDRM resource.

See *TPF Operations* for more information about the ZNDYN CHANGE command.

### NDYN0092E SPECIFIED RESOURCE NAME IS NOT VALID

**Explanation:** The specified resource name contains characters that are not valid.

**System Action:** The ZNDYN command is rejected.

**User Response:** Enter the ZNDYN ADD or ZNDYN CHANGE command again and specify a valid resource name.

See *TPF Operations* for more information about the ZNDYN ADD and ZNDYN CHANGE commands.

### NERR0050 INVALID REQUEST TYPE USE EITHER DSPY OR ZERO

**Explanation:** One of the following errors occurred:

- The request type was not the DSPY or the ZERO parameter.
- There was no space following the request type.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify the correct request type or format.

See *TPF Operations* for more information about the ZNERR command.

### NERR0055 INVALID INPUT NSC ADDR

**Explanation:** The native subchannel address (NSC) specified in the command could not be found in the 3705 keypoint record.

**System Action:** The command is ignored.

**User Response:** Verify that the NSC address was specified correctly. If it was not, enter the command again with the correct NSC address. If the NSC address was specified correctly, contact your system programmer about the problem.

See *TPF Operations* for more information about the ZNERR command.

### NERR0060 NO 3705S DEFINED TO SYSTEM

**Explanation:** No 3705s were generated for this TPF system.

**System Action:** The input message is ignored.

**User Response:** None.

See *TPF Operations* for more information about the ZNERR command.

## NETW

### NETW0001E INVALID NAU NAME

**Explanation:** The ZNETW function issues this message if:

- The network addressable unit (NAU) name specified on the ID parameter for the ZNETW command is not valid. The network identifier (if specified) can be 1 to 8 characters and the node name can be 1 to 8 characters.
- The NAU name cannot be located in the resource vector table (RVT).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct NAU name.
2. Enter the command again and specify the correct NAU name.

See *TPF Operations* for more information about the ZNETW commands.

### NETW0002I CTC CTCNODES ACT PROCESSING BEGUN

**Explanation:** This is a normal response to the ZNETW ACT command when CTCNODES is specified as the ID.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

### NETW0003I SDA *yyyy function* PROCESSING COMPLETE

**Where:**

*yyyy*
Symbolic device address of a 37x5.

*function*
One of the following:

**MOUNT**
Normal mount.

**MOUNT,F**
Mount with the FORCE option.

**Explanation:** This is the normal response to the ZNETW MOUNT command when the SDA is mounted successfully.

**System Action:** The specified SDA is mounted.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW MOUNT command.

### NETW0004E LOGON PARAMETER IS REQUIRED WITH CDRM PARAMETER

**Explanation:** A ZNETW ACT command was issued with the CDRM parameter, but without the LOGON parameter. The LOGON parameter is required if you specify CDRM.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Enter the command again and specify the LOGON parameter and the CDRM parameter.

**Note:** LOGON and CDRM are not valid if the resource specified on the ID parameter is a local resource.

See *TPF Operations* for more information about the ZNETW ACT command.

### NETW0005E REJECTED, SYSTEM NOT IN OR ABOVE CRAS STATE

**Explanation:** The ZNETW command was issued when the TPF system was below the computer room agent set (CRAS) state.

**System Action:** The ZNETW command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to CRAS state or above.
2. Enter the command again.

See *TPF Operations* for more information about the ZNETW commands.

### NETW0006I CTC CTCNODES ACT PROCESSING COMPLETED

**Explanation:** This is a normal response to the ZNETW ACT command when activating CTCNODES.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

### NETW0007E NETID IS REQUIRED IN ID PARAMETER

**Explanation:** There are multiple resources defined in the TPF system with the same node name as the one specified on the ID parameter. The name specified needs the network identifier (NETID) to be fully qualified.

**System Action:** None.

**User Response:** Enter the command again and specify the NETID on the ID parameter.

See *TPF Operations* for more information about the ZNETW commands.

### NETW0008E REJECTED, SDA *yyyy* NOT FOUND IN SDAT OR NOT AVAILABLE

**Where:**

*yyyy*
The symbolic device address (SDA).

**Explanation:** The ZNETW MOUNT function issues this message if you specify a symbolic device address (SDA) that:

- Is not in the symbolic device address table (SDAT), which contains the list of valid SDAs that can be used as link stations
- Returns a status of not available (that is, not linked) from the CIOSC MOUNT macro.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify the address to be mounted or attach the SDA to the TPF system.
2. Enter the command again with the valid SDA.

See *TPF Operations* for more information about the ZNETW MOUNT command. See *TPF System Macros* for more information about the CIOSC macro.

### NETW0009E INVALID CDRM NAME

**Explanation:** The ZNETW command was entered with a name specified for the CDRM parameter that is not valid.

**System Action:** The ZNETW command is rejected.

**User Response:** Do the following:

1. Determine the correct cross-domain resource manager (CDRM) name.

2. Enter the command again and specify the correct CDRM name.

See *TPF Operations* for more information about the ZNETW commands.

---

**NETW0010E** *type nau func* **REJECTED, NETW INPUT MSG LIMIT EXCEEDED**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

*func*
Function, for example ACT or INACT.

**Explanation:** The network command status table (NCST) is currently full. Therefore, no ZNETW command can be processed.

**System Action:** The ZNETW command is rejected.

**User Response:** Do the following:

1. Enter the ZNNCS command to check the current activity in the NCST.
2. Wait for an NCST slot to become available.
3. Enter the ZNETW command again.

See *TPF Operations* for more information about the ZNETW and ZNNCS commands.

---

**NETW0011I** *type nau func* **PROCESSING BEGUN**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

*func*
Function, for example the ACT or INACT parameters.

**Explanation:** This is the normal response to the ZNETW command.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW commands.

---

**NETW0012E** *type nau* **ACT REJECTED, SYMBOLIC DEVICE ADDRESS NOT FOUND IN SDAT**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT function issues this message if:

- The symbolic device address (SDA) specified on the SDA parameter is not valid.
- The SDA for the channel-to-channel (CTC) or NCP device specified on the ID parameter is not in the symbolic device address table (SDAT).

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify a valid SDA.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0013I** **SDA** *yyyy function* **PROCESSING BEGUN**

**Where:**

*yyyy*
Symbolic device address of a 37x5.

*function*
One of the following:

**MOUNT**
Normal mount.

**MOUNT,F**
Mount with the FORCE option.

**Explanation:** This is the initial response to the ZNETW MOUNT command.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW MOUNT command.

---

**NETW0014E** *type nau* **ACT REJECTED, DUPLICATED SDA ASSIGNED**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The symbolic device address (SDA) specified on the SDA parameter is assigned to another Network Control Program/Adjacent Link Station (NCP/ALS/CTC).

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify a valid SDA that is not in use.

See *TPF Operations* for more information about the ZNETW commands.

---

**NETW0019E** *type nau* **ACT REJECTED, CIOSC MOUNT SDA ERROR**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** An error was detected by the CIOSC while trying to mount the Network Control Program (NCP) indicated by the SDA parameter.

**System Action:** The ZNETW command is rejected.

**User Response:** Do the following:

1. Ensure that the NCP is available.
2. Enter the command again.

See *TPF Operations* for more information about the ZNETW commands.

---

**NETW0020E** *type nau* **ACT REJECTED, NCP/CTC NOT POLLING**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** A ZNETW ACT or INACT command was issued for a cross-domain resource and the adjacent link station (ALS), Network Control Program (NCP) or channel-to-channel (CTC) of the owning cross-domain resource manager (CDRM) was not polling. The check is based on the CDRM parameter of the ZNETW ACT command or the CCW index field of the resource's RVT.

**System Action:** The ZNETW command is rejected.

**User Response:** Do the following:

1. Verify that the request was issued for the correct resource.
2. Check the status of NCP/ALS/CTC of the owning CDRM.
3. Enter the command again.

See *TPF Operations* for more information about the ZNETW commands.

---

**NETW0021E** *type nau* **ACT REJECTED, SESSION LIMIT EXCEEDED**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The Network Control Program (NCP) activation request cannot be processed because the maximum number adjacent link stations (ALSs) defined in the Systems Network Architecture (SNA) keypoint (CTK2) is zero or all the CCW areas have been used.

**System Action:** The ZNETW command is rejected.

**User Response:** Do the following:

1. Define additional ALSs with the MAXALS parameter on the SNAKEY macro.
2. Load new CTK2.
3. IPL
4. Enter the command again.

See *TPF Operations* for more information about the ZNETW commands. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**NETW0022E** *type nau* **ACT REJECTED, ACT OF CD–LU REQUIRES LOGON PARAMETER**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The activation of a cross-domain logical unit (LU) was requested without indicating the local application program that it should be logged to. The activation of a CD-LU by the TPF system requires the use of the LOGON parameter.

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify the LOGON parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0023E** *type nau* **ACT REJECTED, ACT OF NCP REQUIRES SDA PARAMETER**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The activation of a local Network Control Program (NCP) was requested without indicating its symbolic device address (SDA). The activation of an NCP requires the use of the SDA parameter.

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify the SDA parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0024E** *type nau func* **REJECTED, NO PATH FOUND**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

*func*
Function, for example ACT or INACT.

**Explanation:** The activation or deactivation of a cross domain NAU was rejected, because its owning subarea is not known, therefore a path to the NAU cannot be found.

**System Action:** The ZNETW command is rejected.

**User Response:** If the ZNETW ZCT command was entered, do the following:

1. Determine the owning subarea of the NAU and insure that the CDRM and NCP to that CDRM are active.
2. Enter the command again.

If the ZNETW INACT command was entered, no action is necessary.

See *TPF Operations* for more information about the ZNETW INACT command.

---

**NETW0025E** *type nau* **ACT REJECTED, NCP/CTC ALREADY HAS SDA ASSIGNED**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT command was entered but the Network Control Program (NCP) resource specified is already active.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** If the symbolic device address (SDA) the one needed for the NCP, do the following:

1. Deactivate the resource.
2. Enter the ZNETW ACT command again and specify the new SDA.

See *TPF Operations* for more information about the ZNETW ACT and ZNKEY commands.

---

**NETW0027E** *type nau* **ACT REJECTED, SDA NOT VALID FOR THIS DEVICE TYPE**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT command with the SDA parameter specified was entered but the device type of the symbolic device address (SDA) specified does not match the device type of the resource specified on the ID parameter.

For example, if you specify an Network Control Program (NCP) resource on the ID parameter and a channel-to-channel (CTC) resource on the SDA parameter, the function enters this message.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Enter the command again and specify the same device type on both the ID and SDA parameters.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0028E** *type nau* **ACT REJECTED, PRIMARY LU** *luname* **NOT ACTIVE**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT command was entered for a secondary logical unit (SLU) thread but the thread's owning PLU is not active.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Enter the ZNETW ACT command to activate the PLU.
2. Enter the command again.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0029W** **CDRM** *nau* **INACT I SAVESESS REMOTE CDRM DOES NOT SUPPORT DACTCDRM TYPE 4 ESCALATED TO FORCED, SESSION OUTAGE NOTIFICATION**

**Where:**

*nau* The 1 to 8 character CDRM name.

**Explanation:** The requested remote CDRM does not support nondisruptive CDRM inactivation. The CDRM is inactivated by using session outage notification (SON), DACTCDRM type 3.

**System Action:** For the TPF system to perform SON, the immediate inactivation is automatically escalated to a forced inactivation.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW INACT command.

---

**NETW0030E** *type nau* **INACT REJECTED, I AND F PARAMETERS ARE MUTUALLY EXCLUSIVE**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW INACT command issues this message if you specify both the I (immediate) and F (forced) inactivation parameters. You can specify one of these parameters, but not both.

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify either the I or the F parameter.

See *TPF Operations* for more information about the ZNETW INACT command.

---

**NETW0031E** **REJECTED, SDA** *yyyy* **NOT MOUNTED SUCCESSFULLY**

**Where:**

*yyyy*
The symbolic device address (SDA) of a 37x5.

**Explanation:** The ZNETW MOUNT command was entered but the symbolic device address (SDA) specified was found in the symbolic device address table (SDAT) but was unable to be mounted by using the CIOSC MOUNT macro.

**System Action:** The SDA is not mounted.

**User Response:** Do the following:

1. Verify that the SDA is attached and online to the TPF system.
2. Verify that the SDA is not in an error state.
3. Enter the command again.

See *TPF Operations* for more information about the ZNETW MOUNT command. See *TPF System Macros* for more information about the CIOSC MOUNT macro.

---

**NETW0032E REJECTED, SDA *yyyy* ALREADY MOUNTED. FORCE OPTION REQUIRED**

**Where:**

*yyyy*
The symbolic device address (SDA) of a 37x5.

**Explanation:** The ZNETW MOUNT command was entered but the symbolic device address (SDA) specified was already mounted to the TPF system.

If you want to override the message and remount (that is, dismount and remount) the SDA, you must specify the FORCE option.

**Note:** Dismounting the SDA of the link station can disrupt communications.

**System Action:** The SDA is not mounted.

**User Response:** Do the following:

1. Determine whether you want to use the SDA that is already mounted or if you want to remount that SDA.
2. If you want to remount the SDA, enter the ZNETW MOUNT command again with the FORCE parameter specified.

See *TPF Operations* for more information about the ZNETW MOUNT command.

---

**NETW0033I *type nau func* PROCESSING COMPLETE**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

*func*
Function, for example the ACT or INACT parameters.

**Explanation:** This is the normal response to the ZNETW command when processing is complete.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW commands.

---

**NETW0034E *type nau* ACT ACTIVATION OF APPC SESSIONS NOT ALLOWED WITH ZNETW**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource

**Explanation:** The ZNETW ACT function issues this message if you specify a local TPF/APPC LU on the LOGON parameter. Sessions with this LU cannot be activated with the ZNETW command.

**System Action:** The request is rejected.

**User Response:** Do one of the following:

- Enter the appropriate ZNCNS command to set up the session limit.
- Allocate will activate the session.

See *TPF Operations* for more information about the ZNETW ACT and ZNCNS commands.

---

**NETW0035E *type nau* INACT REJECTED, SAVESESS ONLY VALID FOR INACT I OR F ON A REMOTE CDRM**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW INACT command was entered with the following specified:

- The SAVESESS parameter for a normal inactivation. The SAVESESS parameter is only valid when issuing an immediate or forced inactivation for a remote cross-domain resource manager (CDRM).
- The SAVESESS parameter but the resource specified on the ID parameter is not a CDRM.

**System Action:** The ZNETW INACT command is rejected.

**User Response:** Do the following:

1. Check the NAU type and the type of inactivation required.
2. Enter the appropriate command again.

See *TPF Operations* for more information about the ZNETW INACT command.

---

**NETW0036E *type nau* ACT REJECTED, CDRM NOT ACTIVE**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT command was entered but the the owning CDRM is not active and bound or is in data flow reset state.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Activate the CDRM.
2. Enter the command again.

See *TPF Operations* for more information about the ZNETW ACT command.

**NETW0037E** *type nau* **ACT REJECTED, REQUESTED RESOURCE ALREADY ACTIVE AND BOUND**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT command was entered but the resource specified for activation is already active and bound.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do one of the following:

- If the current session partner is the requested partner, no further action is required.
- If the current session partner is not the requested partner:
  1. Inactivate this resource.
  2. Enter the ZNETW ACT command again.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0038E** *type nau* **ACT REJECTED, ACTIVATION OF ALS IS INVALID**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT command was entered but the adjacent link station (ALS) specified on the ID parameter. An ALS cannot be activated from the TPF system.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Verify the resource you want to activate.
2. If the resource an ALS, activate the ALS from the communications management configuration (CMC)
3. If the resource is not an ALS, enter the command again with the correct ID.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0039E** *type nau* **ACT REJECTED, NO SLU THREADS EXIST**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW function issues this message if you specify a primary LU (PLU) for the ID and LOGON parameters, but the local PLU specified on the LOGON parameter does not have any secondary LU (SLU) threads.

**System Action:** The request is rejected.

**User Response:** Do one of the following:

- Enter the ZNETW ACT command and specify a remote SLU on the ID parameter to establish a session between the local PLU and the remote SLU.
- Enter the ZNETW ACT command and specify a local PLU that has SLU threads on the LOGON parameter to establish sessions between the remote PLU and all the SLU threads of the local PLU.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0040E** *type nau* **ACT REJECTED, NCP NOT ACTIVE**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT command was entered and an error occurred because cross-domain resource and the adjacent link station (ALS), channel-to-channel (CTC) or Network Control Program (NCP) of the owning cross-domain resource manager (CDRM) is not active.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Verify that the request was entered for the correct resource.
2. Check the status ALS, NCP, CTC of the owning CDRM and be sure that it is active.
3. Enter the command again.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0041E** *type nau* **ACT REJECTED, APPL-APPL SESSION ALREADY EXISTS**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT function issues this message if:

- All the secondary LU (SLU) threads of the specified local primary LU (PLU) are already in session.
- The control LU (CLU) specified on the LOGON parameter is already in session.

**System Action:** The request is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0043E** *type nau* **ACT REJECTED, LOGON NAME NOT A LOCAL APPL**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT function issues this message if a functional management message routing (FMMR) resource was specified on the ID parameter, but the resource specified on the LOGON parameter was not an FMMR.

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify a valid, local application on the LOGON parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0045E** *type nau* **ACT REJECTED, INVALID REMOTE PLU OWNING SUBAREA**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT function issues this message if the CDRM parameter was not specified and the owning subarea of the remote primary LU (PLU) is zero.

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify a valid CDRM resource on the CDRM parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0046E** *type nau* **ACT REJECTED, LOGON ONLY ALLOWED WITH CD TPF APPL**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT function issues this message if you specify the LOGON parameter and do not specify a cross-domain application program on the ID parameter. The LOGON parameter is only permitted when initiating sessions between local and cross domain application programs.

**System Action:** The request is rejected.

**User Response:** Do one of the following:

- If the resource specified on the ID is correct, enter the ZNETW command again without the LOGON parameter.
- Enter the ZNETW command again and specify a remote application on the ID parameter and a local application on the LOGON parameter to activate sessions between the remote and local applications.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0047E** *type nau* **ACT REJECTED, LOGON NOT ALLOWED WITH SDA**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT function issues this message if you specify both the LOGON parameter and the SDA parameter. You can specify one of these parameters, but not both.

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify either the LOGON or the SDA parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0049E** *type nau* **ACT REJECTED, SDA VALID ONLY FOR ACTIVATION OF NCP/CTC**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT function issues this message if you specify the SDA parameter but the resource specified is not a Network Control Program (NCP) or channel-to-channel (CTC) resource. The SDA parameter is valid only for initiating an NCP or CTC session.

**System Action:** The request is rejected.

**User Response:** Do one of the following:

- Determine the correct NCP or CTC name and enter the command again.
- If the NAU being activated is not an NCP or CTC, enter the command again and do not specify the SDA parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0050I** **ROUTE INFORMATION STATUS FOR** *NCP name*

**Where:**

*NCP name*
The NCP name.

**Explanation:** This is a normal response to the ZNETW ROUTE command. This message is followed by a display of the routing information for the specified Network Control Program (NCP) or CTC.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ROUTE command.

---

### NETW0052E SPECIFIED NAU IS NOT AN NCP OR CTC

**Explanation:** The network addressable unit (NAU) specified in the ZNETW ROUTE command is not a Network Control Program (NCP) or a CTC. Requests for routing information are only valid with NCPs or CTCs.

**System Action:** None.

**User Response:** Verify that the NAU specified is an NCP or CTC.

See *TPF Operations* for more information about the ZNETW ROUTE command.

### NETW0053I INACT CTCNODES PROCESSING COMPLETE

**Explanation:** This is a normal response to the ZNETW ACT command when inactivating CTCNODES.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

### NETW0054I CTC CTCNODES INACT PROCESSING BEGUN

**Explanation:** This is the normal response to the ZNETW INACT command with CTCNODES specified for the ID parameter.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW INACT command.

### NETW0055E REJECTED, *type func* IN PROGRESS FOR *nau*

**Where:**

*type*
One of the following:
LOCAL
REMOTE

*func*
One of the following:
ACT
INACT
INACT,I
INACT,F

*nau* The name of the resource with the conflicting action.

**Explanation:** The ZNETW function issues this message when there is a conflicting entry in the network command status table (NSCT) for the specified resource.

**System Action:** The request is rejected.

**User Response:** Wait until processing is completed on the conflicting resource as enter the command again, if necessary.

See *TPF Operations* for more information about the ZNETW commands.

### NETW0056E *type nau* ACT REJECTED, LOGON PARAMETER RESOURCE NOT ACTIVE

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT command was entered with the LOGON parameter specified. An error occurred because the resource specified on the LOGON parameter is not active.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Enter the ZNETW ACT command and specify the resource on the ID parameter to activate that local resource (that is, the resource on the LOGON parameter).
2. Enter the original ZNETW ACT command again and specify that resource on the LOGON parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

### NETW0057E *type nau* ACT REJECTED, LOGON PARAMETER RESOURCE NOT LOCAL

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT function issues this message if you specify a resource on the LOGON parameter that is not local.

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify a valid, local resource on the LOGON parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

### NETW0058E *type nau* ACT REJECTED, LOGON PARAMETER RESOURCE NOT STARTED

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** The ZNETW ACT command was entered with the LOGON parameter specified. An error occurred because you specified a resource on the LOGON parameter that:

- Is not started
- Was stopped
- Is in the process of being stopped.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Enter a ZROUT START command for the application name in the ZNETW ACT command when specifying the LOGON parameter.

2. Enter the ZNETW ACT command again.

See *TPF Operations* for more information about the ZROUT START and ZNETW ACT commands.

---

**NETW0059E** *type nau* **ACT REJECTED, UNABLE TO ASSIGN A CLU NETWORK ADDRESS**

**Where:**

*type*
The device type of the resource in the ID parameter.

*nau* Name of the resource.

**Explanation:** A ZNETW command was entered to activate a control LU-control LU (CLU-CLU) session over a channel-to-channel (CTC) link but the network address could not be assigned.

**System Action:** The ZNETW command is rejected.

**User Response:** Check the local element table or the network address table to determine why these tables are full.

See *TPF Operations* for more information about the ZNETW commands.

---

**NETW0060I** **SUBAREA DISPLAY NAU TYPE STATUS IN-PROG**

**Explanation:** This is the normal response to the ZNETW DISPLAY command. This message is followed by a display of the status of the network subareas.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW DISPLAY command.

---

**NETW0061I** *nau func* **PROCESSING** *count* **SESSIONS PENDING**

**Where:**

*nau* Name of the resource being inactivated.

*func*
Function in process, which can be one of the following:
INACT
INACT,I

*count*
The count of sessions pending inactivation.

**Explanation:** The ZNETW INACT command was entered. The TPF system monitors the inactivation request on a time initiated basis. This message is issued to report the status of the inactivation request.

**System Action:** The event is restarted to await completion of the ZNETW INACT command.

**User Response:** Do the following:

1. Enter the ZNDLU command with the PROCEDURE-UNBIND parameter specified to identify the pending sessions.
2. Enter a more powerful ZNETW INACT command for these LUs to force the inactivation of these sessions.

See *TPF Operations* for more information about the ZNETW INACT and ZNDLU commands.

---

**NETW0062I** **ALSNODES PROCESSING BEGUN**

**Explanation:** The ZNETW ACT command was entered with ALSNODES specified for the ID parameter.

**System Action:** Processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0063I** **ALSNODES ACT PROCESSING COMPLETED**

**Explanation:** The processing of a ZNETW ACT ID-ALSNODES message has completed.

**System Action:** Exit the ECB.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0064I** **ALSNODES ACT PROCESSING BEGUN**

**Explanation:** The ZNETW INACT command was entered with ALSNODES specified for the ID parameter.

**System Action:** Processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW INACT command.

---

**NETW0065I** **ALSNODES INACT PROCESSING COMPLETED**

**Explanation:** The ZNETW INACT command was entered with ALSNODES specified for the ID parameter.

**System Action:** Processing completed successfully. The entry control block exits.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW INACT command.

---

**NETW0066E** **INCORRECT CNT VALUE, SPECIFY 1 TO 255**

**Explanation:** The ZNETW ACT command was entered with the CNT parameter specified. An error occurred because the value specified is not correct.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Enter the ZNETW ACT command again specifying a valid value for the CNT parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0067I** *x* **SLU SESSIONS REQUESTED,** *y* **INITIATED**

**Where:**

*x* The number of secondary logical unit (SLU) sessions requested.

*y* The number of SLU sessions initiated.

**Explanation:** This is the normal response to the ZNETW ACT command with the CNT parameter specified.

**System Action:** Session activation continues.

**User Response:** Enter the ZNDLU command if you want to display the active SLU sessions.

See *TPF Operations* for more information about the ZNETW ACT and ZNDLU commands.

**NETW0069I** *func nau* **REQUEST OVERRIDDEN BY A MORE POWERFUL COMMAND**

**Where:**

*func*
One of the following:
ACT
INACT
INACT,I

*nau* Name of the resource.

**Explanation:** A ZNETW command was entered. This message displays when:

- A more powerful command is issued for a given resource.
- A more powerful command is issued for a controlling resource to the resource in the network command status table (NCST).

**System Action:** The following happens:

1. The less powerful command is purged from the NCST.
2. A message is sent to both the originator of the message in the NCST and the originator of the current ZNETW command request to notify each about the purge. (If the requests were made from the same device, then only one message is sent.)

**User Response:** Do the following:

1. Wait for processing to complete for the more powerful resource.
2. Enter the command again, if necessary.

See *TPF Operations* for more information about the ZNETW commands.

**NETW0100I CPCP ACT PROCESSING BEGUN**

**Explanation:** This is the normal response to the ZNETW ACT command with CPCP specified for the ID parameter.

**System Action:** Processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

**NETW0101I CPCP ACT PROCESSING COMPLETE, CP** *cpname* **SELECTED**

**Where:**

*cpname*
The name of the remote CP with which the TPF system now has CP-CP sessions.

**Explanation:** This is the normal response to the:

- ZNETW ACT command with CPCP specified for the ID parameter.
- ZNETW ACT command with the resource of a remote CP specified for the ID parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

**NETW0103E LINK** *alsname* **IS QUIESCED**

**Where:**

*alsname*
The name of the adjacent link station (ALS) specified for the LINK parameter on the ZNETW ACT command.

**Explanation:** The ZNETW ACT command was entered, but the ALS specified for the LINK parameter is quiesced. A quiesced link cannot be used to start any new sessions.

**System Action:** The ZNETW ACT request is rejected.

**User Response:** Enter the command and specify an ALS for the LINK parameter that is not quiesced.

See *TPF Operations* for more information about the ZNETW ACT command.

**NETW0104E CP-CP SESSIONS ALREADY EXIST ON PROCESSOR** *x*

**Where:**

*x* The CPU ID of the TPF processor with the CP-CP sessions.

**Explanation:** The ZNETW ACT command was entered with the CPCP option for the ID parameter, but the TPF system already has active CP-CP sessions. Only 1 TPF processor in the loosely coupled complex is allowed to have CP-CP sessions at any given time.

**System Action:** The ZNETW ACT request is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

**NETW0105E CANNOT ACTIVATE CP-CP SESSIONS, LINK** *alsname* **NOT ACTIVE**

**Where:**

*alsname*
The name of the adjacent link station (ALS) specified for the LINK parameter on the ZNETW ACT command.

**Explanation:** The ZNETW ACT command was entered, but the ALS specified for the LINK parameter is not active.

**System Action:** The ZNETW ACT request is rejected.

**User Response:** Do one of the following:

- Activate the ALS and then enter the ZNETW ACT command again.
- Enter the ZNETW ACT command again and do not specify the LINK parameter and the TPF system will select an active link.
- Enter the ZNETW ACT command again and specify an active ALS for the LINK parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0106E LINK *alsname* NOT CONNECTED TO REMOTE CP *cpname***

**Where:**

*alsname*
The name of the adjacent link station (ALS) specified for the LINK parameter on the ZNETW ACT command.

*cpname*
The name of the remote CP specified for the ID parameter on the ZNETW ACT command.

**Explanation:** The ZNETW ACT command was entered, but the ALS specified for the LINK parameter is not connected to the remote CP specified for the ID parameter.

**System Action:** The ZNETW ACT request is rejected.

**User Response:** Do one of the following:

- Enter the ZNETW ACT command and do not specify the LINK parameter and the TPF system will select an active link that is connected to the specified remote CP.
- Enter the ZNETW ACT command again and specify an ALS for the LINK parameter that is connected to the specified remote CP.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0107E LINK *alsname* DOES NOT SUPPORT CP-CP SESSIONS**

**Where:**

*alsname*
The name of the adjacent link station (ALS) specified for the LINK parameter on the ZNETW ACT command.

**Explanation:** The ZNETW ACT command was entered, but the ALS specified for the LINK parameter does not support CP-CP sessions.

**System Action:** The ZNETW ACT request is rejected.

**User Response:** Do one of the following:

- Enter the ZNETW ACT command again and do not specify the LINK parameter and the TPF system will select an active link that supports CP-CP sessions.
- Enter the ZNETW ACT command again and specify an ALS for the LINK parameter that does support CP-CP sessions.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0108E NO LINKS ACTIVE THAT SUPPORT CP-CP SESSIONS**

**Explanation:** The ZNETW ACT command was entered without the LINK parameter specified and CPCP was specified for the ID parameter. One of the following errors occurred:

- The TPF system was unable to find an active link that supports CP-CP sessions. This means that there are no active links that support CP-CP sessions.
- There are active links that support CP-CP sessions, but all of those links are quiesced.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Activate a link that supports CP-CP sessions.
2. Enter the ZNETW ACT command again.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0109E LINK *alsname* DOES NOT EXIST**

**Where:**

*alsname*
The name of the adjacent link station (ALS) specified for the LINK parameter on the ZNETW ACT command.

**Explanation:** The ZNETW ACT command was entered but, the resource specified for the LINK parameter does not exist or is not an ALS.

**System Action:** The ZNETW ACT request is rejected.

**User Response:** Enter the ZNETW ACT command again and specify a valid ALS name for the LINK parameter.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0110E REJECTED, NO CP-CP SESSIONS TO PROCESS LOGON REQUEST**

**Explanation:** The ZNETW ACT command was entered with the LOGON parameter specified but there were no active CP-CP sessions to process the session activation request.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Activate CP-CP sessions.
2. Enter the ZNETW ACT command again.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0111E REJECTED, TPF NOT RUNNING IN APPN MODE**

**Explanation:** The ZNETW ACT command was entered to start CP-CP sessions but the TPF system is not running in APPN mode.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Enter the ZNAPN command to switch the TPF system to APPN mode.
2. Enter the ZNETW ACT command again.

See *TPF Operations* for more information about the ZNETW ACT and ZNAPN commands.

---

**NETW0112E REJECTED, LOCAL CP *cpname* NOT ACTIVE**

**Where:**

*cpname*
The name of the local APPN CP in the TPF system.

**Explanation:** The ZNETW ACT command was entered to start CP-CP sessions but the local CP is not active.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Enter the ZNETW ACT and ZROUT START commands to start the local CP.
2. Enter the original ZNETW ACT command again.

See *TPF Operations* for more information about the ZNETW ACT and ZROUT START commands.

---

**NETW0113E INSUFFICIENT RESOURCES TO START CP-CP SESSIONS**

**Explanation:** The ZNETW ACT command was entered to start CP-CP sessions, but the necessary resources are not available. This could be because there are no session control blocks (SCBs) defined, SCBs are defined but all in use, or the selected ALS is already at its maximum session limit.

**System Action:** The ZNETW ACT request is rejected.

**User Response:** Enter the ZNKEY command and specify the MAXSCB parameter to determine if SCBs are defined and do one of the following:

- If no SCBs are defined, define them to the TPF system by specifying the MAXSCB parameter on the SNAKEY macro in keypoint 2 (CTK2).
- If SCBs are defined, enter the ZNSCB command and specify the SUM parameter to determine how many SCBs are in use. If all of the SCBs are in use, increase the number of SCBs defined to the TPF system by increasing the value of the MAXSCB parameter on the SNAKEY macro in CTK2.
- If SCBs are available, the link specified or selected is at its session limit, so do the following:
  1. Enter the ZNMON command with the ALS parameter specified to determine the current session count for each active link.
  2. Enter the ZNETW ACT command with ALS specified on the LINK parameter that is not at its session limit.

See *TPF Operations* for more information about the ZNETW ACT, ZNKEY, and ZNMON commands.

---

**NETW0114E REJECTED, CANNOT ACCESS APPN TAPST RECORD**

**Explanation:** The ZNETW ACT command was entered to start CP-CP sessions, but the APPN TAPST record on file could not be examined.

**System Action:** The ZNETW ACT request is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**NETW0115E REJECTED, NO CP-CP SESSIONS EXIST**

**Explanation:** The ZNETW INACT command was entered with the CPCP option specified for the ID parameter, but there were no CP-CP sessions active.

**System Action:** The ZNETW INACT request is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW INACT command.

---

**NETW0116E REJECTED, CP-CP SESSIONS EXIST ON PROCESSOR *x***

**Where:**

*x* The CPU ID of the TPF processor that owns the CP-CP sessions.

**Explanation:** The ZNETW INACT command was entered with the CPCP option specified for the ID parameter, but this TPF processor does not own the CP-CP sessions. If the FORCE parameter was specified, the TPF processor that owns the CP-CP sessions is still active. Therefore, this processor cannot deactivate those CP-CP sessions.

**System Action:** The ZNETW INACT request is rejected.

**User Response:** Enter the ZNETW INACT command from the TPF processor that owns the CP-CP sessions.

See *TPF Operations* for more information about the ZNETW INACT command.

---

**NETW0117W COMPLETED, PROCESSOR *x* NO LONGER OWNS CP-CP SESSIONS**

**Where:**

*x* The CPU ID of the TPF processor that owned the CP-CP sessions.

**Explanation:** The ZNETW INACT command was entered with the FORCE parameter and the CPCP option for the ID parameter. The TPF processor that owns the CP-CP sessions was found to be inactive.

**System Action:** The APPN structures in the TPF system are updated to indicate that CP-CP sessions no longer exist in the loosely coupled complex.

**User Response:** While the APPN structures in the TPF system are cleaned up, it may be necessary to deactivate the CP-CP sessions from the remote CP.

See *TPF Operations* for more information about the ZNETW INACT command.

**NETW0118E CP-CP SESSION ACTIVATION WITH CP *cpname* HAS FAILED**

**Where:**

*cpname*
The name of the remote CP with which the TPF system tried to start CP-CP sessions.

**Explanation:** The ZNETW ACT command was entered to start CP-CP sessions but the activation failed.

**System Action:** The ZNETW ACT request is rejected.

**User Response:** Review the path information unit (PIU) trace to determine why the CP-CP sessions could not be activated.

See *TPF Operations* for more information about the ZNETW ACT command.

**NETW0119E REJECTED, CP-CP ACTIVATION VALID ONLY IN NORM STATE**

**Explanation:** The ZNETW ACT command was entered to start APPN CP-CP sessions while the TPF system was below NORM state.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Enter the ZNETW ACT command again.

See *TPF Operations* for more information about the ZNETW ACT command.

**NETW0120E REJECTED, NO ACTIVE APPN LINKS ON THIS HOST**

**Explanation:** The ZNETW ACT command was entered but no APPN links are active on the TPF processor.

**System Action:** The ZNETW ACT command is rejected.

**User Response:** Do the following:

1. Activate an APPN link on that TPF processor.
2. Enter the ZNETW ACT command again.

See *TPF Operations* for more information about the ZNETW ACT command.

# NKEY–NNCS

**NKEY0004W SINCE MAXSRT IS ZERO, *keyword* IS IGNORED BY THE SYSTEM**

**Where:**

*keyword*
The keyword of the field in keypoint record 2 (CTK2).

**Explanation:** The value in the keyword field in the Systems Network Architecture (SNA) communications keypoint (CTK2) is not used because SNA message recovery was not invoked.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNKEY command.

**NKEY0011E INVALID FORMAT**

**Explanation:** The ZNKEY command was issued incorrectly.

**System Action:** The ZNKEY command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZNKEY command.

**NKEY0012E INVALID PARAMETER**

**Explanation:** The ZNKEY command was entered with a value specified for the KEYWORD parameter that is not found in the ZNKEY parameter table (CSK0).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZNKEY command.

**NKEY0013E INVALID ALTER REQUEST**

**Explanation:** The ZNKEY command was entered with a value specified for the KEYWORD parameter that cannot be altered.

**System Action:** The ZNKEY command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNKEY command.

**NKEY0014E INVALID VALUE PARAMETER**

**Explanation:** The alter value specified was not valid.

**System Action:** The request is rejected.

**User Response:** Enter the command again and specify a valid parameter value.

See *TPF Operations* for more information about the ZNKEY command.

**NKEY0015E VALUE NOT WITHIN VALID RANGE**

**Explanation:** The ZNKEY command was entered with an alter value specified that was not within the valid range for the KEYWORD parameter.

**System Action:** The ZNKEY command is rejected.

**User Response:** Enter the command again and specify a valid parameter value.

See *TPF Operations* for more information about the ZNKEY command.

**NKEY0016E UNABLE TO RETRIEVE ZNKEY OPERAND TABLE, CSK0**

**Explanation:** An error was detected while trying to access the ZNKEY operand table in the CSK0 segment.

**System Action:** The request is rejected.

**User Response:** See your system programmer for more information.

See *TPF Operations* for more information about the ZNKEY command.

---

**NKEY0018E UNABLE TO FILE KEYPOINT RECORD –2–, CTK2**

**Explanation:** An error was detected while trying to file the Systems Network Architecture (SNA) communications keypoint. The in-core copy of the keypoint was altered but not the file copy.

**System Action:** The request is rejected.

**User Response:** See your system programmer for more information.

See *TPF Operations* for more information about the ZNKEY command.

---

**NKEY0023I CPUID** *x keyword — value*

**Where:**

*x* The CPU ID

*keyword*
The keyword of the field in keypoint record 2 (CTK2).

*value*
The value in the field in keypoint record 2 (CTK2).

**Explanation:** This is the normal response to the ZNKEY command that requests a display of a specific field in the keypoint record 2 (CTK2).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNKEY command.

---

**NKEY0024I CPUID** *x keyword – value*
⋮

**Where:**

*x* The CPU ID

*keyword*
The keyword of the field in keypoint record 2 (CTK2).

*value*
The value in the field in keypoint record 2 (CTK2).

**Explanation:** This is the normal response to the ZNKEY command that requests a display of all of the fields in the keypoint record 2 (CTK2).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNKEY command.

---

**NKEY0025I CPUID** *x keyword — value* **WAS** *nvalue*

**Where:**

*x* The CPU ID

*keyword*
The keyword of the field in keypoint record 2 (CTK2).

*value*
The old value in the field in keypoint record 2 (CTK2).

*nvalue*
The new value in the field in keypoint record 2 (CTK2).

**Explanation:** This is the normal response to the ZNKEY command with the ALTER parameter specified. The value in the keypoint record 2 field specified is changed to the new value referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNKEY command.

---

**NKEY0026E SNDWN MUST BE LESS THAN RESTART LEVEL, SNRST**

**Explanation:** The value specified for the SNDWN parameter must be less than the value assigned to the SNRST parameter.

**System Action:** The ZNKEY command is rejected.

**User Response:** Enter the ZNKEY command again and specify the correct value.

See *TPF Operations* for more information about the ZNKEY command.

---

**NKEY0027E SNRST MUST BE GREATER THAN SHUTDOWN LEVEL, SNDWN**

**Explanation:** The ZNKEY command was entered with the SNRST parameter specified. An error occurred because the value specified must be greater than the value specified for the SNDWN parameter.

**System Action:** The ZNKEY command is rejected.

**User Response:** Enter the ZNKEY command again and specify the correct value for the SNRST parameter.

See *TPF Operations* for more information about the ZNKEY command.

---

**NKEY0121E SINCE THERE ARE NO CCBS AND NO SOCKETS DEFINED, MAXSDD CAN NOT BE ALTERED**

**Explanation:** The ZNKEY command was entered with a request to change the value of the MAXSDD parameter, but there are no conversation control blocks (CCBs) defined; that is, the MAXCCB parameter equals 0, and there are no sockets defined; that is, the MAXSOCK parameter equals 0.

**System Action:** The ZNKEY command is rejected.

**User Response:** Do the following:

1. Do one of the following:
   - Define the maximum CCB entries that can be active in a TPF system by using the MAXCCB parameter on the SNAKEY macro.
   - Define the maximum number of socket entries that can be active in a TPF system by using the MAXSOCK parameter of the SNAKEY macro.
2. Load the new Systems Network Architecture (SNA) keypoint record 2 (CTK2).
3. IPL the TPF system.
4. Enter the ZNKEY command again.

See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro. See *TPF Operations* for more information about the ZNKEY command.

---

**NKEY0122E SINCE MAXCCB PLUS 2 PLUS MAXSOCK MUST EXCEED MAXHCT, MAXHCT CAN NOT BE UPDATED**

**Explanation:** The ZNKEY command was entered, but the value specified on a request to change the MAXHCT parameter was too high compared to the value of the MAXCCB parameter and to the value of the MAXSOCK parameter. The value of MAXHCT must be less than the MAXCCB parameter −2 plus the MAXSOCK parameter.

**System Action:** The ZNKEY command is rejected.

**User Response:** Do one of the following:

- Enter the ZNKEY command again and specify a valid value for the MAXHCT parameter.
- Do the following:
  1. Do one of the following:
     - Define additional conversation control block (CCB) entries with the MAXCCB parameter of the SNAKEY macro
     - Define additional sockets with the MAXSOCK parameter of the SNAKEY macro
  2. Load the new Systems Network Architecture (SNA) keypoint record 2 (CTK2).
  3. IPL the TPF system.
  4. Enter the ZNKEY command again and specify a valid value for the MAXHCT parameter.

See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro. See *TPF Operations* for more information about the ZNKEY command.

---

**NLM00001I LM COMMAND ACCEPTED**

**Explanation:** The ZNLM command was entered.

**System Action:** Processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZNLM command.

---

**NLM00004E REJECTED, SYSTEM IS BELOW CRAS STATE**

**Explanation:** The ZNLM command was entered when the TPF system was not in CRAS state or above. You can only enter the ZNLM command when the TPF system is in CRAS state or above.

**System Action:** The ZNLM command is rejected.

**User Response:** Do the following:

1. Ensure the TPF system is in CRAS state or above.
2. Enter the ZNLM command again.

See *TPF Operations* for more information about the ZNLM command.

---

**NLM00010E LM COMMAND REJECTED—NO CLU_CLU SESSION ACTIVE**

**Explanation:** The ZNLM command was entered but there is no CLU-CLU session available to handle the request.

**System Action:** The ZNLM command is rejected.

**User Response:** Do the following:

1. Activate a CLU-CLU session.
2. Enter the ZNLM command again.

See *TPF Operations* for more information about the ZNLM command. See *TPF ACF/SNA Data Communications Reference* for more information about activating sessions.

---

**NLM00011E LM COMMAND REJECTED—INVALID NAME ENTERED**

**Explanation:** The ZNLM command was entered, however, the name specified is not a valid control LU (CLU) or adjacent link station (ALS).

**System Action:** The request is rejected.

**User Response:** Enter the ZNLM command with a valid name or do not specify a name. In this case TPF will select an active CLU_CLU session to use.

See *TPF Operations* for more information about the ZNLM command.

---

**NLM00012E LM COMMAND REJECTED—INVALID INPUT**

**Explanation:** The ZNLM command was entered, however, the message parser determined that the message format was incorrect.

**System Action:** The request is rejected.

**User Response:** Verify that the ZNLM command was entered with an optional name, followed by a required comma, followed by the message for the remote CLU to process.

See *TPF Operations* for more information about the ZNLM command.

---

### NMON0002I BEGIN ZNMON DISPLAY

**Explanation:** This is the normal response to the ZNMON command with the ALS parameter specified. This message is followed by a display of statistical information about the sessions through each adjacent link station (ALS), Network Control Program (NCP), and channel-to-channel (CTC) resource in the network.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNMON command.

### NMON0004I NO ACTIVE ALS FOUND

**Explanation:** There are currently no active adjacent line station (ALS), Network Control Program (NCP), or channel-to-channel (CTC) resources.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNMON command.

### NMON0006E REJECTED, SYSTEM IS BELOW 1052 STATE

**Explanation:** You can enter the ZNMON command only in 1052 state or above.

**System Action:** None.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNMON command again.

See *TPF Operations* for more information about the ZNMON command.

### NNCB0001I INITIALIZATION COMPLETE

**Explanation:** This is the normal response to the ZNNCB command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB command.

### NNCB0006E INVALID MOD NUMBER

**Explanation:** The ZNNCB command was entered with a module number that is not valid.

**System Action:** The ZNNCB command is rejected.

**User Response:** Enter the ZNNCB command again and specify a valid module number.

See *TPF Operations* for more information about the ZNNCB command.

### NNCB0007E INVALID NODENAME

**Explanation:** The ZNNCB command was entered with a resource name that is not valid.

**System Action:** The ZNNCB command is rejected.

**User Response:** Enter the ZNNCB command again and specify a valid resource name.

See *TPF Operations* for more information about the ZNNCB command.

### NNCB0008E MOD OFFLINE

**Explanation:** The ZNNCB command was entered with the MOD parameter specified but the module name specified is not online.

**System Action:** The ZNNCB command is rejected.

**User Response:** Do the following:

1. Bring the module online.
2. Enter the ZNNCB command again with the MOD parameter specified.

See *TPF Operations* for more information about the ZNNCB command.

### NNCB0010I INITIALIZATION COMPLETE — ACTIVE NODES SKIPPED

**Explanation:** This is a normal response to the ZNNCB command. Only the node control block (NCB) records for the logical unit (LU) resources that do not have active sessions were initialized.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB command.

### NNCB0012I NCB NOT INITIALIZED — SESSION ACTIVE

**Explanation:** The TPF system cannot initialize the specified node control block (NCB) record because the logical unit (LU) has one or more active sessions.

**System Action:** The ZNNCB command is rejected.

**User Response:** Do the following:

1. Wait until the LU sessions end.
2. Enter the ZNNCB command again with the NAME or NOD parameter specified.

See *TPF Operations* for more information about the ZNNCB command.

### NNCB0013E DUPLICATED NODE NAMES EXIST

**Explanation:** More than one logical unit (LU) matches the resource name specified for the ZNNCB command.

**System Action:** The ZNNCB command is rejected.

**User Response:** Include the network identifier in the ZNNCB

command to distinguish the multiple resource names.

See *TPF Operations* for more information about the ZNNCB command.

**NNCB0015E REJECTED, SYSTEM IS BELOW 1052 STATE**

**Explanation:** You can enter the ZNNCB command only in 1052 state or higher.

**System Action:** The ZNNCB command is rejected.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNNCB command again.

See *TPF Operations* for more information about the ZNNCB command.

**NNCB0016I START INITIALIZING NCB**

**Explanation:** This is the normal response to the ZNNCB command. This message is also displayed when the TPF system begins initializing node control block (NCB) records during a fresh load.

**System Action:** The TPF system initializes the NCB records.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB command. Also see *TPF ACF/SNA Data Communications Reference* for more information about fresh loads.

**NNCB0018E RESOURCE NAME WAS NOT FOUND**

**Explanation:** The resource specified for the ZNNCB command does not exist.

**System Action:** The ZNNCB command is rejected.

**User Response:** Enter the ZNNCB command again and specify the name of a resource that exists in the TPF system.

See *TPF Operations* for more information about the ZNNCB command.

**NNCB0019E AN ERROR OCCURRED INITIALIZING *luname* NCB**

**Where:**

*luname*
One of the following:

- The name of the logical unit (LU) resource that is assigned the node control block (NCB) record.
- UNUSED if the NCB record is not currently assigned to an LU resource.

**Explanation:** The TPF system could not initialize the NCB record for the specified LU resource.

**System Action:** Processing for the NCB initialization function ends.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB initialization function.

**NNCB0020E AN ERROR OCCURRED RETRIEVING THE NCBCR**

**Explanation:** The TPF system cannot retrieve the NCB control record.

**System Action:** The ZNNCB command is rejected.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB control record. See *TPF Operations* for more information about the ZNNCB command.

**NNCB0021E CANNOT INITIALIZE NCBS WHILE REORG IS ACTIVE**

**Explanation:** An attempt was made to initialize one or more node control block (NCB) records while the NCB reorganization function was active.

**System Action:** The ZNNCB REORG command is rejected.

**User Response:** Do the following:

1. Do one of the following:
   - Wait until the NCB reorganization function ends.
   - Enter the ZNNCB REORG command again and specify ABORT parameter to cancel the NCB reorganization function.
2. Enter the ZNNCB REORG command again to initialize the NCB records.

See *TPF Operations* for more information about the ZNNCB REORG command.

**NNCB0022E SPECIFIED RESOURCE IS NOT AN LU**

**Explanation:** You can enter the ZNNCB command only for a logical unit (LU) resource because only LU resources use node control block (NCB) records.

**System Action:** The ZNNCB command is rejected.

**User Response:** Enter the ZNNCB command again and specify the name of an LU resource.

See *TPF Operations* for more information about the ZNNCB command.

**NNCB0023E AN ERROR OCCURRED RETRIEVING THE NCBDR**

**Explanation:** The TPF system cannot retrieve an NCB directory record.

**System Action:** Processing for the ZNNCB command ends.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about NCB directory records. See *TPF Operations* for more information about the ZNNCB command.

### NNCB0024E CANNOT INITIALIZE NCBS WHILE RECON IS ACTIVE

**Explanation:** An attempt was made to initialize one or more node control block (NCB) records while the NCB reconciliation function was active.

**System Action:** The ZNNCB RECON command is rejected.

**User Response:** Do the following:

1. Do one of the following:
   - Wait until the NCB reconciliation function ends.
   - Enter the ZNNCB RECON command with the ABORT parameter specified to cancel the NCB reconciliation function.
2. Enter the ZNNCB RECON command again to initialize the NCB records.

See *TPF Operations* for more information about the ZNNCB RECON command.

### NNCB0026E PARAMETERS SPECIFIED FOR ZNNCB ARE NOT VALID

**Explanation:** One or more of the parameters specified for the ZNNCB command are not valid.

**System Action:** The ZNNCB command is rejected.

**User Response:** Enter the ZNNCB command again and specify the correct parameters.

See *TPF Operations* for more information about the ZNNCB command.

### NNCB0027E REJECTED, GFS IS NOT ACTIVE

**Explanation:** The ZNNCB RECON command was entered when the get file storage (GFS) function was not active.

**System Action:** The ZNNCB RECON command is rejected.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle the TPF system above 1052 state.
2. Enter the ZNNCB RECON command again.

See *TPF Operations* for more information about the ZNNCB RECON and ZCYCL commands.

### NNCB0028E CPU HAS NOT INCORPORATED CURRENT RRT DEFINITIONS

**Explanation:** The ZNNCB command was entered to initialize node control block (NCB) records on a processor that has not incorporated the latest resource definitions.

**System Action:** The ZNNCB command is rejected.

**User Response:** Do the following:

1. Enter the ZRIPL or the ZNOPL MERGE command to incorporate the new RRT definitions.
2. Enter the ZNNCB command again.

See *TPF Operations* for more information about the ZNNCB, ZRIPL, and ZNOPL MERGE commands.

### NNCB0029I NO NCBS EXIST FOR THE SPECIFIED RESOURCE

**Explanation:** The ZNNCB DISPLAY command was entered for a resource that does not have any node control block (NCB) records.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB DISPLAY command.

### NNCB0030E NETID OR RESOURCE NAME CONTAINS TOO MANY CHARACTERS

**Explanation:** The resource specified for the ZNNCB command contains too many characters in either the network identifier or the resource name.

**System Action:** The ZNNCB command is rejected.

**User Response:** Enter the ZNNCB command again and specify no more than 8 characters each for the network identifier and resource name.

See *TPF Operations* for more information about the ZNNCB command.

### NNCB0031E NCB INITIALIZATION IS ACTIVE

**Explanation:** An attempt was made to start the node control block (NCB) reorganization function or the NCB reconciliation function while the NCB initialization function was active.

**System Action:** The ZNNCB RECON or ZNNCB REORG command is rejected.

**User Response:** Do the following:

1. Wait until the NCB initialization function ends.
2. Enter the ZNNCB RECON or ZNNCB REORG command.

See *TPF Operations* for more information about the ZNNCB command.

### NNCB0032E NCB REORGANIZATION IS ACTIVE

**Explanation:** An attempt was made to start the node control block (NCB) reconciliation function while the NCB reorganization function was active.

**System Action:** The ZNNCB REORG command is rejected.

**User Response:** Do the following:

1. Do one of the following:
   - Wait until the NCB reorganization function ends.
   - Enter the ZNNCB REORG command with the ABORT parameters specified to cancel the NCB reorganization function.
2. Enter the ZNNCB RECON command again.

See *TPF Operations* for more information about the ZNNCB command.

**NNCB0033E NCB RECONCILIATION IS ACTIVE**

**Explanation:** An attempt was made to start the node control block (NCB) reorganization function while the NCB reconciliation function was active.

**System Action:** The ZNNCB RECON command is rejected.

**User Response:** Do the following:

1. Do one of the following:
   - Wait until the NCB reconciliation function ends.
   - Enter the ZNNCB RECON command again with the ABORT parameter specified to cancel the NCB reconciliation function.
2. Enter the ZNNCB REORG command again.

See *TPF Operations* for more information about the ZNNCB command.

**NNCB0034E ERROR FROM DHASHC MACRO**

**Explanation:** An error was returned by the DHASHC macro while trying to locate a node control block (NCB) directory record.

**System Action:** Processing for the ZNNCB RECON command ends.

**User Response:** See your system programmer for more information.

See *TPF System Macros* for more information about the DHASC macro. See *TPF Operations* for more information about ZNNCB RECON command.

**NNCB0035E NCB INITIALIZATION COMPLETE, BUT CANNOT RESET CONTROL BIT IN NCBCR**

**Explanation:** The node control block (NCB) records were initialized; however, the TPF system could not reset the NCB initialization bit in the NCB control record.

**System Action:** The TPF system cannot start the NCB reorganization or NCB reconciliation functions until the NCB initialization bit is reset in the NCB control record.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB control record and NCB initialization.

**NNCB0070I** *rectype* **DATABASE INITIALIZATION STARTED**

**Where:**

*rectype*
The type of record being initialized, either NCBN4 or NCBN5.

**Explanation:** This message is displayed when the TPF system begins initializing the NCBN4 or NCBN5 node control block (NCB) directory records.

**System Action:** The TPF system begins to initialize the NCBN4 or NCBN5 NCB directory records.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB directory records.

**NNCB0071I** *rectype* **DATABASE INITIALIZATION COMPLETED**

**Where:**

*rectype*
The type of record being initialized, either NCBN4 or NCBN5.

**Explanation:** This message is displayed when the TPF system completes initializing the NCBN4 or NCBN5 node control block (NCB) directory records.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB directory records.

**NNCB0072E FACS ERROR ON RECORD TYPE** *rectype*

**Where:**

*rectype*
The type of record being initialized, either NCBN4 or NCBN5.

**Explanation:** A file address retrieval program (FACS) error occurred while initializing the NCBN4 or NCBN5 node control block (NCB) directory records.

**System Action:** The ZNNCB command is rejected.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB directory records. See *TPF Operations* for more information about the ZNNCB command.

**NNCB0073W MUST SPECIFY BP PARAMETER TO ABORT RECON FROM THIS CPU**

**Explanation:** The ZNNCB RECON command was entered with the ABORT parameter from a processor that did not start the node control block (NCB) reconciliation function.

**System Action:** The ZNNCB RECON command is rejected.

**User Response:** Do one of the following:

- Enter the ZNNCB RECON command again and specify both the ABORT and BP parameters.
- Enter the ZNNCB RECON command with the ABORT parameter specified from the processor where the NCB reconciliation function was started.

  **Note:** Enter the ZNNCB DISPLAY command with the ALL parameter specified to determine the processor where the NCB reconciliation function was started.

See *TPF Operations* for more information about the ZNNCB RECON and ZNNCB DISPLAY commands.

### NNCB0074I NCB RECONCILIATION ABORT INITIATED

**Explanation:** This is the normal response to the ZNNCB RECON command with the ABORT parameter specified.

**System Action:** The TPF system starts ending the NCB reconciliation function.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB RECON command.

### NNCB0075I NCB RECONCILIATION ABORTED

**Explanation:** This message is displayed when the node control block (NCB) reconciliation function is canceled by specifying the ABORT parameter in the ZNNCB RECON command.

**System Action:** Processing for the NCB reconciliation function ends.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB RECON command.

### NNCB0076I NCB RECONCILIATION STARTED

**Explanation:** This is the normal response to the ZNNCB RECON command with the ALL, NAME, or NOD parameters specified.

**System Action:** The TPF system begins the node control block (NCB) reconciliation function.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB RECON command.

### NNCB0077I NCB RECONCILIATION COMPLETED

**Explanation:** This message is displayed when the node control block (NCB) reconciliation function is completed. Following this message is a display of information about the results of the NCB reconciliation function.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB RECON command and an example of the informational display.

### NNCB0078I NCB RECONCILIATION RESTARTED

**Explanation:** This message is displayed when the node control block (NCB) reconciliation function is restarted because an initial program load (IPL) was performed before the NCB reconciliation function could end.

**System Action:** The TPF system starts the NCB reconciliation function again.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB RECON command.

### NNCB0079E RECON IS NOT ACTIVE

**Explanation:** The ZNNCB RECON command was entered with the ABORT parameter specified when the node control block (NCB) reconciliation function was not running.

**System Action:** The ZNNCB RECON command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB RECON command.

### NNCB0080E NO ENTRY EXISTS IN THE NCBDR FOR THE SPECIFIED RESOURCE

**Explanation:** The ZNNCB RECON command was entered for a logical unit (LU) resource that does not have an entry in the node control block (NCB) directory records.

**System Action:** The ZNNCB RECON command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB RECON command.

### NNCB0083W MUST SPECIFY BP PARAMETER TO ABORT REORG FROM THIS CPU

**Explanation:** The ZNNCB REORG command was entered with the ABORT parameter from a processor that did not start the node control block (NCB) reorganization function.

**System Action:** The ZNNCB REORG command is rejected.

**User Response:** Do one of the following:

- Enter the ZNNCB REORG command again and specify both the ABORT and BP parameters.
- Enter the ZNNCB REORG command with the ABORT parameter from the processor where the NCB reconciliation function was started.

  **Note:** Enter the ZNNCB DISPLAY command with the ALL parameter specified to determine the processor where the NCB reorganization function was started.

See *TPF Operations* for more information about the ZNNCB REORG and ZNNCB DISPLAY commands.

### NNCB0084I ABORT INITIATED FOR NCB DATABASE REORG

**Explanation:** This is the normal response to the ZNNCB REORG command with the ABORT parameter specified.

**System Action:** The TPF system starts ending the NCB reorganization function.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB REORG command.

### NNCB0085I NCB REORG DATABASE SWITCH INITIATED

**Explanation:** This is the normal response to the ZNNCB REORG command with the SWITCH parameter specified.

**System Action:** The TPF system switches the current and staged node control block (NCB) directory records.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB REORG command.

### NNCB0086I NCB REORG DATABASE SWITCH COMPLETED

**Explanation:** This message is displayed when the node control block (NCB) directory records are switched during the NCB reorganization function.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB reorganization function.

### NNCB0087E REORG IS NOT ACTIVE

**Explanation:** The ZNNCB REORG command was entered with the ABORT parameter when the node control block (NCB) reorganization function was not running.

**System Action:** The ZNNCB REORG command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB REORG command.

### NNCB0088E REORG IS ABORTING

**Explanation:** The ZNNCB REORG command was entered with the ABORT parameter when the node control block (NCB) reorganization function was already in the process of being canceled.

**System Action:** The ZNNCB REORG command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB REORG command.

### NNCB0089E REORG COPY FAILED

**Explanation:** An error occurred while copying the current node control block (NCB) directory records to the staged NCB directory records.

**System Action:** Processing for the NCB reorganization function ends.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB reorganization function.

### NNCB0090E RECOUP IS ACTIVE

**Explanation:** An attempt was made to start the node control block (NCB) reorganization function while the online file recoup function was active

**System Action:** The ZNNCB REORG command is rejected.

**User Response:** Do the following:

1. Do one of the following:
   - Wait until the online file recoup function ends.
   - Enter the ZRECP command with the ABORT parameter specified to end the online file recoup function.
2. Enter the ZNNCB REORG command again.

See *TPF Operations* for more information about the ZNNCB REORG and ZRECP ABORT commands.

### NNCB0091E NCBDR INITIALIZATION ERROR

**Explanation:** An error occurred while initializing the node control block (NCB) directory records.

**System Action:** Processing for the NCB reorganization function ends.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB directory records and the NCB reorganization function.

### NNCB0092E REORG COPY NOT COMPLETED

**Explanation:** The ZNNCB REORG command was entered with the SWITCH parameter before the current node control block (NCB) directory records were copied to the staged NCB directory records.

**System Action:** The ZNNCB REORG command is rejected.

**User Response:** Enter the ZNNCB REORG command again with the SWITCH parameter when you are prompted to do so by the TPF system.

See *TPF Operations* for more information about the ZNNCB REORG command. Also see *TPF ACF/SNA Data Communications Reference* for more information about the NCB reorganization function.

### NNCB0093I NCB REORG DATABASE COPY TASK BEGUN

**Explanation:** This is the normal response to the ZNNCB REORG command with the START parameter specified.

**System Action:** The TPF system begins copying the current node control block (NCB) directory records to the staged NCB directory records.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB REORG command.

**NNCB0094W A STAGED NCB DIRECTORY RECORD IS FULL**

**Explanation:** The current node control block (NCB) directory records cannot be copied to the staged NCB directory records because a staged NCB directory record is full.

**System Action:** The ZNNCB REORG command is rejected.

**User Response:** Do the following:

1. Enter the ZNNCB DISPLAY command with the ALL parameter specified to determine the record type for the staged NCB directory records.
2. Increase the number of staged NCB directory records that are defined in the TPF system.
3. Enter the ZNNCB REORG command again.

See *TPF Operations* for more information about the ZNNCB DISPLAY and ZNNCB REORG commands.

---

**NNCB0096E FACS ERROR CURRENT NCBDR** *ordnum*

**Where:**

*ordnum*
The ordinal number of the node control block (NCB) directory record.

**Explanation:** A file address retrieval program (FACS) error occurred while trying to locate the specified NCB directory record.

**System Action:** Processing for the NCB reorganization command ends.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about NCB directory records and the NCB reorganization function.

---

**NNCB0097I NCB REORG DATABASE COPY COMPLETED ENTER ZNNCB REORG SWITCH**

**Explanation:** This message is displayed after the current node control block (NCB) directory records are copied to the staged NCB directory records.

**System Action:** None.

**User Response:** Enter the ZNNCB REORG command with the SWITCH parameter to switch the current and staged NCB directory records. This will complete the NCB reorganization function.

See *TPF Operations* for more information about ZNNCB REORG command.

---

**NNCB0098I NCB REORG ABORTED**

**Explanation:** This message is displayed when the node control block (NCB) reorganization function is canceled by specifying the ABORT parameter in the ZNNCB REORG command.

**System Action:** Processing for the NCB reorganization function ends.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB REORG command.

---

**NNCB0099I NCB REORG COPY RESTARTED AT ORDINAL** *ordnum*

**Where:**

*ordnum*
The ordinal number of the node control block (NCB) directory record.

**Explanation:** This message is displayed when the NCB reorganization function is restarted because an initial program load (IPL) was performed before the NCB reorganization function could end.

**System Action:** The TPF system starts the NCB reorganization function again.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB REORG command.

---

**NNCB0100E REORG SWITCH IS IN PROGRESS - ABORT COMMANDS ARE NOT ALLOWED**

**Explanation:** You cannot cancel the node control block (NCB) reorganization function while the current and staged NCB directory records are being switched.

**System Action:** The NCB reorganization function continues.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the NCB reorganization function.

---

**NNCB0110I *** NCB CONTROL RECORD DISPLAY ***

**Explanation:** This is the normal response to the ZNNCB DISPLAY command with the ALL parameter specified. This message displays information contained in the node control block (NCB) control record.

**System Action:** The TPF system displays the requested information.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB DISPLAY command and an example of the informational display.

---

**NNCB0130I NCB INFORMATION FOR** *netid.name*

**Where:**

*netid*
The network ID of the resource.

*name*
The name of the resource.

**Explanation:** This is the normal response to the ZNNCB DISPLAY command with the NAME or NOD parameter specified. This message is followed by a display of information about the NCB records for the resource.

**System Action:** The TPF system displays the requested information.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB DISPLAY command and an example of the informational display.

---

**NNCS0000I BEGIN ZNNCS DISPLAY**

**Explanation:** This is the normal response to the ZNNCS command. This message is followed by a display of the network command status table (NCST).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCS command.

---

**NNCS0001I NO ACTIVITY IN NETWORK COMMAND STATUS TABLE**

**Explanation:** No network addressable units (NAU) are in the process of being activated or deactivated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCS command.

---

**NNCS0016E REJECTED, SYSTEM IS BELOW 1052 STATE**

**Explanation:** The ZNNCS command was entered when the TPF system was not in 1052 state or above.

**System Action:** The ZNNCS command is rejected.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state or above.
2. Enter the ZNNCS command again.

See *TPF Operations* for more information about the ZNNCS command.

# NOPL–NPRG

---

**NOPL0001I DYNAMIC LOAD ACTIVE RESOURCE REPORT**

**Explanation:** The ZNOPL UPDATE or ZNOPL FALLBACK command tried to delete or redefine an active logical unit (LU) resource. Following this message, there is a display that shows a list of these LU resources and the associated error.

**System Action:** The TPF system displays an additional message to further describe the errors that occurred.

**User Response:** See the additional message that is displayed for more information.

See *TPF Operations* for more information about the ZNOPL UPDATE and ZNOPL FALLBACK commands.

---

**NOPL0002I SNA RESOURCE DEFINITION STATUS**

**Explanation:** This is the normal response to the ZNOPL STATUS command. This message is followed by the time, date, and user description of the current and new (alternate) resource resolution table (RRT) sections and if the active processors are by using the current Systems Network Architecture (SNA) resource definitions.

**System Action:** The TPF system displays the requested information.

**User Response:** None.

See *TPF Operations* for more information about the ZNOPL STATUS command.

---

**NOPL0003I ONLINE MERGE RESOURCE REPORT**

**Explanation:** The ZNOPL MERGE command was not successful. Following this message, there is a display that shows a list of the resources that caused the online merge function to fail and the reasons.

**System Action:** Processing for the online merge function ends.

**User Response:** Do the following:

1. See the online merge resource report.
2. Correct the errors that occurred.
3. Perform another Systems Network Architecture (SNA) dynamic load to load the resource definitions to the TPF system.

See *TPF Operations* for more information about the ZNOPL MERGE command. See *TPF ACF/SNA Data Communications Reference* for more information about performing a SNA dynamic load.

---

**NOPL0030E UNABLE TO PERFORM FUNCTION, LOAD IN PROGRESS.**

**Explanation:** A ZNOPL command was entered when a load request was processing.

**System Action:** The ZNOPL command is rejected.

**User Response:** Enter the ZNOPL command again when the load processing is completed.

See *TPF Operations* for more information about the ZNOPL commands.

---

**NOPL0031E UNABLE TO PERFORM FUNCTION, UPDATE IN PROGRESS.**

**Explanation:** A ZNOPL command was entered when an update request was processing.

**System Action:** The ZNOPL command is rejected.

**User Response:** Enter the ZNOPL command again when the update processing is completed.

See *TPF Operations* for more information about the ZNOPL commands.

---

**NOPL0032E UNABLE TO PERFORM FUNCTION, FALLBACK IN PROGRESS.**

**Explanation:** A ZNOPL command was entered when a fallback request was processing.

**System Action:** The ZNOPL command is rejected.

**User Response:** Enter the ZNOPL command again when the fallback processing is completed.

See *TPF Operations* for more information about the ZNOPL commands.

**NOPL0033E UPDATE IS DISABLED.**

**Explanation:** You cannot enter the ZNOPL UPDATE command at this time. You can enter the ZNOPL UPDATE command only after you enter the ZNOPL LOAD command with the DYNAMIC parameter.

**System Action:** The ZNOPL UPDATE command is rejected.

**User Response:** Do the following:

1. Enter the ZNOPL LOAD command and specify the DYNAMIC parameter.
2. Wait for the load to be completed.
3. Enter the ZNOPL UPDATE command again.

See *TPF Operations* for more information about the ZNOPL UPDATE and ZNOPL LOAD commands.

**NOPL0034E FALLBACK IS DISABLED.**

**Explanation:** You cannot enter the ZNOPL FALLBACK command at this time because there are no Systems Network Architecture (SNA) resource definitions in the new (alternate) resource resolution table (RRT). You can enter the ZNOPL FALLBACK command only after you perform a dynamic load by entering the ZNOPL LOAD command.

**System Action:** The ZNOPL FALLBACK command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNOPL FALLBACK and ZNOPL LOAD commands.

**NOPL0035E UNABLE TO FALLBACK, ALTERNATE DEFINITIONS ARE UNUSABLE**

**Explanation:** The ZNOPL FALLBACK command was entered to fall back to the previous Systems Network Architecture (SNA) resource definitions contained in the new (alternate) resource resolution table (RRT). However, the new (alternate) RRT is not usable.

**System Action:** The ZNOPL FALLBACK command is rejected.

**User Response:** Enter the ZNOPL LOAD command to load the previous SNA resource definitions again.

See *TPF Operations* for more information about the ZNOPL FALLBACK and ZNOPL LOAD commands.

**NOPL0036E PILOT ID MISMATCH, REQUESTED—*x* READ—*y*.**

**Where:**

*x* The pilot ID specified in the ZNOPL LOAD command.

*y* The pilot ID of the input data set.

**Explanation:** The pilot ID of the input data set does not match the pilot ID specified in the ZNOPL LOAD command.

**System Action:** The ZNOPL LOAD command is rejected.

**User Response:** Verify that the correct data set is mounted and that the correct pilot ID is specified for the ZNOPL LOAD command.

See *TPF Operations* for more information about the ZNOPL LOAD command.

**NOPL0037W RESOURCES EXCEED MAXRVT, MAXRVT–*xxxx* THIS LOAD–*yyyy* PROCESSING CONTINUES**

**Where:**

*xxxx*
The maximum number of resource vector table (RVT) entries allowed.

*yyyy*
The number of RVT entries required for the load.

**Explanation:** The TPF system does not have enough space allocated in the RVT for this load.

**System Action:** As many resources as possible are loaded to the TPF system.

**User Response:** Do the following:

1. Increase the size of the RVT.
2. Load the Systems Network Architecture (SNA) resource definitions to the TPF system again.

See *TPF ACF/SNA Network Generation* for more information about increasing the size of the RVT. See the *TPF ACF/SNA Data Communications Reference* for more information about loading SNA resource definitions.

**NOPL0039E INSUFFICIENT RRT RECORDS ALLOCATED, ALLOCATED—*xxxx* THIS LOAD—*yyyy***

**Where:**

*xxxx*
The number of records of type #RRTRI that are allocated to the online system.

*yyyy*
The number of records of type #RRTRI that are required for this load.

**Explanation:** Not enough records of type #RRTRI are allocated to the online TPF system. This load cannot be completed successfully.

**System Action:** Processing for the load function ends.

**User Response:** Do the following:

1. Allocate more #RRTRI records.

2. Load the Systems Network Architecture (SNA) resource definitions to the TPF system again.

See the *TPF ACF/SNA Data Communications Reference* for more information about loading SNA resource definitions.

---

**NOPL0040A ACTIVE DELETES—*xxxx* ACTIVE DEF CHANGES—*yyyy*, UPDATE FAILED, INACTIVATE ACTIVE RESOURCES AND RE-TRY ZNOPL UPDATE.**

**Where:**

*xxxx*
The number of active resource definitions trying to be deleted.

*yyyy*
The number of active resource definitions trying to be changed.

**Explanation:** The ZNOPL UPDATE command was entered to update the resource resolution table (RRT) definitions after a dynamic load. However, update processing was not successful because the new resource definitions attempted to delete or redefine active logical unit (LU) resources.

**System Action:** The TPF system displays the dynamic load active resources report, which contains a list of all the active LU resources.

**User Response:** Do the following:

1. See the dynamic load active resource report.
2. Deactivate the active resources.
3. Enter the ZNOPL UPDATE command again.

See *TPF Operations* for more information about the ZNOPL UPDATE command.

---

**NOPL0042A ACTIVE DELETES—*xxxx* ACTIVE DEF CHANGES—*yyyy*, FALLBACK FAILED, INACTIVATE ACTIVE RESOURCES AND RE-ENTER ZNOPL FALLBACK.**

**Where:**

*xxxx*
The number of active resource definitions trying to be deleted.

*yyyy*
The number of active resource definitions trying to be changed.

**Explanation:** The ZNOPL FALLBACK command was entered to fall back to the previous resource definitions. However, fallback processing was not successful because the previous definitions attempted to delete or redefine active logical unit (LU) resources.

**System Action:** The TPF system displays the dynamic load active resources report, which contains a list of all the active LU resources.

**User Response:** Do one of the following:

- Deactivate the active resources and enter the ZNOPL FALLBACK command again.
- Enter the ZNOPL FALLBACK command with the FRESH parameter specified.

**Note:** The FRESH parameter will end ***all*** of the active sessions on ***all*** of the processors in the loosely coupled TPF system.

See *TPF Operations* for more information about the ZNOPL FALLBACK command.

---

**NOPL0043E GDS ERROR, REASON CODE *x***

**Where:**

*x* The reason code.

**Explanation:** An error occurred while accessing the input general data set (GDS).

**System Action:** None.

**User Response:** See *TPF General Macros* for more information about the GDSNC macro to interpret the reason code.

---

**NOPL0044E INSUFFICIENT NCBS. NUMBER NEEDED THIS LOAD — *nnnnnnnn*, GENNED — *mmmmmmmm*, MAXRVT — *pppppppp***

**Where:**

*nnnnnnnn*
The number of fixed file node control block (NCB) records required for this load.

*mmmmmmmm*
The number of fixed file NCB records generated in the TPF system.

*pppppppp*
The number of entries in the resource vector table (RVT).

**Explanation:** The number of fixed file NCB records generated in the TPF system is not sufficient to load the current Systems Network Architecture (SNA) resource definitions. The number of fixed file NCB records generated should exceed the maximum number of resources that you plan to define to the TPF system by using the offline ACF/SNA table generation (OSTG) program.

**System Action:** Load processing ends.

**User Response:** Do the following:

1. Increase the number of fixed file NCB records in the TPF system.
2. Load the SNA resource definitions to the TPF system again.

See *TPF ACF/SNA Data Communications Reference* for more information about loading SNA resource definitions to the TPF system.

---

**NOPL0045E OPERATION FAILED. POSSIBLE ACTIVE RID—*xxxxxxxx*, MAXRVT *yyyyyyyy***

**Where:**

*xxxxxxxx*
The resource identifier (RID) where the error occurred.

*yyyyyyyy*
The number of entries in the resource vector table (RVT).

**Explanation:** The RVT on the processor from which the

ZNOPL UPDATE command was entered is not large enough to load the Systems Network Architecture (SNA) resource definitions.

**System Action:** Processing for the update function ends.

**User Response:** Do one of the following:

- Enter the ZNOPL UPDATE command from another processor in the loosely coupled TPF system.
- Increase the size of the RVT on this processor by increasing the value of the MAXRVT parameter in the SNAKEY macro.

See *TPF Operations* for more information about the ZNOPL UPDATE command. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**NOPL0046E DDNAME SNA NOT DEFINED. USE ZDSMG TO DEFINE**

**Explanation:** The ZNOPL LOAD command was entered but the Systems Network Architecture (SNA) data definition name was not defined to the TPF system.

**System Action:** The ZNOPL LOAD command is rejected.

**User Response:** Do the following:

1. Enter the ZDSMG DEFINE command to define the SNA data definition name to the TPF system.
2. Enter the ZNOPL LOAD command again.

See *TPF Operations* for more information about the ZDSMG DEFINE and ZNOPL LOAD commands.

---

**NOPL0047E DDNAME SNA DEFINED INCORRECTLY, REDEFINE**

**Explanation:** The ZNOPL LOAD command was entered but the device type specified for the Systems Network Architecture (SNA) data definition name was not correct.

**System Action:** The ZNOPL LOAD command is rejected.

**User Response:** Do the following:

1. Enter the ZDSMG RELEASE command to remove the incorrect SNA data definition name from the TPF system.
2. Enter the ZDSMG DEFINE command to redefine the SNA data definition name to the TPF system and specify a device type of either GFDS or TAPE.
3. Enter the ZNOPL LOAD command again.

See *TPF Operations* for more information about the ZDSMG DEFINE, ZDSMG RELEASE, and ZNOPL LOAD commands.

---

**NOPL0052A FALLBACK COMPLETE ON CPU—*cpuid*, DISPLAY STATUS AND ZRIPL IF NECESSARY.**

**Where:**

*cpuid*
The name of the processor.

**Explanation:** This is the normal response to the ZNOPL FALLBACK command when the FRESH parameter is specified. A fresh fallback was completed on the processor referred to in the message.

**System Action:** This message is sent to all active processors in the loosely coupled TPF system to notify you of the completed fallback.

**User Response:** Do the following:

1. Enter the ZNOPL STATUS command to determine the processors where you must perform an initial program load (IPL) to incorporate the previous resource definitions.
2. Enter the ZRIPL command on the processors that require an IPL.

See *TPF Operations* for more information about the ZNOPL FALLBACK and ZRIPL commands.

---

**NOPL0060A FRESH LOAD COMPLETE ON CPU—*cpuid*, ZRIPL TO INCORPORATE NEW DEFINITIONS.**

**Where:**

*cpuid*
The name of the processor.

**Explanation:** This is the normal response to the ZNOPL LOAD command with the FRESH parameter specified. A fresh load completed on the processor referred to in the message.

**System Action:** This message is sent to all active processors in the loosely coupled TPF system to notify you of the completed load.

**User Response:** Enter the ZRIPL command on each processor in the TPF system to incorporate the latest resource definitions.

See *TPF Operations* for more information about the ZNOPL LOAD and ZRIPL commands.

---

**NOPL0061A SUCCESSFUL DYNAMIC LOAD, UPDATE ENABLED.**

**Explanation:** This is the normal response to the ZNOPL LOAD command with the DYNAMIC parameter is specified. The dynamic load was completed.

**System Action:** Update processing is enabled.

**User Response:** Enter the ZNOPL UPDATE functional from any processor in the loosely coupled TPF system to continue the dynamic load function.

See *TPF Operations* for more information about the ZNOPL LOAD and ZNOPL UPDATE commands.

---

**NOPL0062A UPDATE COMPLETE ON CPU—*cpuid*. ENTER ZNOPL MERGE TO INCORPORATE NEW DEFINITIONS.**

**Where:**

*cpuid*
The name of the processor.

**Explanation:** This is the normal response to the ZNOPL UPDATE command. Update processing was completed on the processor referred to in the message.

**System Action:** This message is sent to all active processors to notify you that update processing is completed and they

need to enter the ZNOPL MERGE command to incorporate the latest resource definitions.

**User Response:** Enter the ZNOPL MERGE command on each processor in the TPF system to incorporate the latest resource definitions and complete the dynamic load function.

See *TPF Operations* for more information about the ZNOPL UPDATE command.

---

**NOPL0063A FALLBACK COMPLETE ON CPU—*cpuid* DISPLAY STATUS AND ENTER ZNOPL MERGE IF NECESSARY**

**Where:**

*cpuid*
The name of the processor.

**Explanation:** This is the normal response to the ZNOPL FALLBACK command. Fallback processing completed on the processor referred to in the message.

**System Action:** This message is sent to all active processors in the loosely coupled TPF system to notify you that fallback processing is completed and they need to enter the ZNOPL MERGE command to incorporate the previous resource definitions.

**User Response:** Do the following:

1. Enter the ZNOPL STATUS command to determine the processors where you must enter the ZNOPL MERGE command to incorporate the previous resource definitions.
2. Enter the ZNOPL MERGE command on those processors.

See *TPF Operations* for more information about the ZNOPL FALLBACK and ZNOPL MERGE commands.

---

**NOPL0064I ONLINE MERGE STARTED.**

**Explanation:** This is the normal response to the ZNOPL MERGE command. It indicates that the online merge function was started.

**System Action:** The TPF system starts merging the current resource resolution table (RRT) with the resource vector table (RVT).

**User Response:** None.

See *TPF Operations* for more information about the ZNOPL MERGE command.

---

**NOPL0065I ONLINE MERGE COMPLETE.**

**Explanation:** This message is displayed when the online merge function ends.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the online merge function.

---

**NOPL0066E ONLINE MERGE NOT ALLOWED, NO PREVIOUS UPDATE EXISTS**

**Explanation:** You cannot enter the ZNOPL MERGE command at this time. You can enter the ZNOPL MERGE command only after you enter the ZNOPL UPDATE or ZNOPL FALLBACK command.

**System Action:** The ZNOPL MERGE command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNOPL MERGE, ZNOPL UPDATE, and ZNOPL FALLBACK commands.

---

**NOPL0067E UNABLE TO PERFORM FUNCTION, ONLINE MERGE IN PROGRESS**

**Explanation:** You cannot enter a ZNOPL command while the online merge function is in progress.

**System Action:** The ZNOPL command is rejected.

**User Response:** Do the following:

1. Wait until the online merge function ends.
2. Enter the ZNOPL command again.

See *TPF Operations* for more information about the ZNOPL commands.

---

**NOPL0068E BUILD ALREADY IN EFFECT, ZRIPL REQUIRED**

**Explanation:** The ZNOPL BUILD command was already entered for this processor. A fresh load will be performed on this processor during the next initial program load (IPL).

**System Action:** The ZNOPL BUILD command is rejected.

**User Response:** Enter the ZRIPL command to force a fresh load.

See *TPF Operations* for more information about the ZNOPL BUILD and ZRIPL commands.

---

**NOPL0069A BUILD COMPLETE, ZRIPL TO FORCE FRESH LOAD FROM CURRENT RRT.**

**Explanation:** This is the normal response to the ZNOPL BUILD command. A fresh load will be performed on this processor during the next initial program load (IPL).

**System Action:** None.

**User Response:** Enter the ZRIPL command to force a fresh load.

See *TPF Operations* for more information about the ZNOPL BUILD and ZRIPL commands.

---

**NOPL0072E ONLINE MERGE NOT ALLOWED ON GENERAL FILE LOAD**

**Explanation:** You cannot enter the ZNOPL MERGE command while the TPF system is loading a general file.

**System Action:** The ZNOPL MERGE command is rejected.

**User Response:** Do the following:

1. Perform an initial progral load (IPL) on the prime module.
2. Enter the ZNOPL MERGE command again.

See *TPF Operations* for more information about the ZNOPL MERGE command.

---

**NOPL0073E ONLINE MERGE FAILED, NO MORE RESOURCE NAMES CAN BE INCORPORATED DUE TO INSUFFICIENT RESOURCE**

**Explanation:** The online merge function was not successful because there are no spare entries in the resource vector table (RVT) to add more resources.

**System Action:** Processing for the online merge function ends.

**User Response:** Do one of the following:

- Enter the ZNDYN RECYCLE command to recycle some RVT entries and then enter the ZNOPL MERGE command again.
- Increase the number of RVT entries in the TPF system by increasing the value of the MAXRVT parameter in the SNAKEY macro.

See *TPF Operations* for more information about the ZNDYN RECYCLE command. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**NOPL0074E FACS/FIND ERROR OCCURRED ON RRT FILE, ONLINE MERGE FAILED**

**Explanation:** A file address retrieval program (FACS) or FIND error occurred while retrieving the resource resolution table (RRT) record during the online merge function.

**System Action:** Processing for the online merge function ends.

**User Response:** See your system programmer for more information.

See *TPF ACF/SNA Data Communications Reference* for more information about the online merge function.

---

**NOPL0075E ONLINE MERGE IS DISABLED IN THIS PROCESSOR.**

**Explanation:** You cannot enter the ZNOPL MERGE command at this time because the processor is already using the current resource resolution table (RRT) definitions.

**System Action:** The ZNOPL MERGE command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNOPL MERGE and ZNOPL UPDATE commands.

---

**NOPL0076E UNABLE TO PERFORM FUNCTION, ZRIPL IS REQUIRED TO INCORPORATE NEW DEFINITIONS.**

**Explanation:** You cannot enter a ZNOPL command at this time because a fresh load was performed and this processor has not incorporated the most recent Systems Network Architecture (SNA) resource definitions.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZRIPL command to incorporate the most recent resource definitions.
2. Enter the appropriate ZNOPL command again.

See *TPF Operations* for more information about the ZNOPL and ZRIPL commands.

---

**NOPL0077E LOCAL DELETES—*xxxx* ACTIVE DELETES/DEF CHANGES—*yyyy*, UPDATE FAILED, BAD OSTG WAS LOADED.**

**Where:**

*xxxx*
The number of local resource definitions trying to be deleted.

*yyyy*
The number of active resource definitions trying to be changed or deleted.

**Explanation:** The ZNOPL UPDATE command was entered to update the resource resolution table (RRT) definitions after a dynamic load. However, update processing was not successful because the new resource definitions attempted to delete a local resource. The new resource definitions may have also attempted to delete or change active logical unit (LU) resources.

**System Action:** The TPF system displays the dynamic load active resources report, which contains a list of all the local and active LU resources.

**User Response:** Enter the ZNOPL LOAD command with the FRESH parameter to perform a fresh load or do the following:

1. See the dynamic load active resources report.
2. Correct the offline ACF/SNA table generation (OSTG) so that it no longer deletes the local resources.
3. Deactivate the active resources.
4. Enter the ZNOPL LOAD command again with the DYNAMIC parameter.
5. Enter the ZNOPL UPDATE command again.

**Note:** The FRESH parameter will end ***all*** of the active sessions on ***all*** of the processors in the loosely coupled TPF system.

See *TPF Operations* for more information about the ZNOPL UPDATE and ZNOPL LOAD commands.

---

**NOPL0078E REJECT, THE SYSTEM IS BELOW 1052 STATE**

**Explanation:** You cannot enter the ZNOPL MERGE command when the TPF system is below 1052 state.

**System Action:** The ZNOPL MERGE command is rejected.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNOPL MERGE command again.

See *TPF Operations* for more information about the ZNOPL MERGE command.

---

**NOPL0148E INSUFFICIENT RV1RU. NUMBER NEEDED THIS LOAD—*xxxx*, GENNED—*yyyy*.**

**Where:**

*xxxx*
The number of records currently allocated.

*yyyy*
The number of records required to complete the load.

**Explanation:** You did not allocate enough #RV1RU fixed file records to the online system. This load cannot complete successfully.

**System Action:** Processing for the load function ends.

**User Response:** Do the following:

1. Allocate more #RV1RU fixed file records in the TPF system.
2. Enter the ZNOPL LOAD command again.

See *TPF Operations* for more information about the ZNOPL LOAD command.

---

**NOPL0149E INSUFFICIENT RV2RU. NUMBER NEEDED THIS LOAD—*xxxx*, GENNED—*yyyy*.**

**Where:**

*xxxx*
The number of records currently allocated.

*yyyy*
The number of records required to complete the load.

**Explanation:** You did not allocate enough #RV2RU fixed file records to the online system. This load cannot complete successfully.

**System Action:** Processing for the load function ends.

**User Response:** Do the following:

1. Allocate more #RV2RU fixed file records in the TPF system.
2. Enter the ZNOPL LOAD command again.

See *TPF Operations* for more information about the ZNOPL LOAD command.

---

**NPIU0004I PIU TRACE TABLE**

**Explanation:** This is the normal response to the ZNPIU command with the COMPACT parameter specified. This message is followed by a display of the path information unit (PIU) trace table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPIU command and for an example of the informational display.

---

**NPIU0005I PIU TRACE TABLE**

**Explanation:** This is the normal response to the ZNPIU command with the FORMAT or LONG parameter specified. This message is followed by a display of the path information unit (PIU) trace table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPIU command and for an example of the informational display.

---

**NPIU0050E ILLEGAL PARAMETER — MUST BE A NUMBER BETWEEN 1 AND 999**

**Explanation:** The value specified for the ZNPIU command was not between 1 and 999

**System Action:** None.

**User Response:** Enter the ZNPIU command again and specify ALL or a value between 1 and 999.

See *TPF Operations* for more information about the ZNPIU command.

---

**NPIU0051E NOT ACTIVE BELOW 1052 STATE**

**Explanation:** You can enter the ZNPIU command only in 1052 state or above.

**System Action:** None.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNPIU command again.

See *TPF Operations* for more information about the ZNPIU command.

---

**NPIU0052E UNABLE TO MALLOC STORAGE FOR ZNPIU DISPLAY**

**Explanation:** An attempt to obtain malloc storage in order to copy the PIU trace table failed.

**System Action:** None.

**User Response:** Enter the ZNPIU command again. If the error occurs again, check the size of the PIU trace table specified in the TRACSZ parameter of the SNAKEY macro.

See *TPF Operations* for more information about the ZNPIU command.

---

**NPOL0001I *xxxx* STARTED**

**Where:**

*xxxx*
The symbolic device address (SDA) for which polling was started.

**Explanation:** This is the normal response to the ZNPOL START command.

**System Action:** The TPF system starts polling the specified device.

**User Response:** None.

See *TPF Operations* for more information about the ZNPOL START command.

---

**NPOL0003E ADDRESS NOT FOUND**

**Explanation:** The symbolic device address (SDA) specified for the ZNPOL START or ZNPOL STOP command was not found.

**System Action:** None.

**User Response:** Do the following:

1. Verify the SDA.
2. Enter the ZNPOL START or ZNPOL STOP command again.

See *TPF Operations* for more information about the ZNPOL START or ZNPOL STOP command.

---

**NPOL0004E SDA *xxxx* IS INVALID**

**Segment Reference:** CSNF

**Where:**

*xxxx*
The symbolic device address (SDA).

**Explanation:** A symbolic device address (SDA) of zero was specified on a ZNPOL START or STOP command. An SDA of zero is not valid.

**System Action:** The ECB is exited.

**User Response:** Enter the ZNPOL START or STOP command again and specify a valid SDA value.

See *TPF Operations* for more information about the ZNPOL START or ZNPOL STOP command.

---

**NPOL0005I *xxxx* STOPPED**

**Where:**

*xxxx*
The symbolic device address (SDA).

**Explanation:** This is the normal response to the ZNPOL STOP command.

**System Action:** The TPF system stops polling the specified device.

**User Response:** None.

See *TPF Operations* for more information about the ZNPOL STOP command.

---

**NPOL0006E LOAD/DUMP IN CONTROL**

**Explanation:** The specified device cannot handle the request because the device is currently being loaded or a dump is occurring on the device.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the load or dump to complete.
2. Enter the ZNPOL START or ZNPOL STOP command again.

See *TPF Operations* for more information about the ZNPOL START and ZNPOL STOP commands.

---

**NPOL0009E REJECTED, SYSTEM IS BELOW 1052 STATE**

**Explanation:** You can enter the ZNPOL command only in 1052 state or above.

**System Action:** None.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNPOL START or ZNPOL STOP command again.

See *TPF Operations* for more information about the ZNPOL START or ZNPOL STOP command.

---

**NPRG0002I QUEUE FOR *nodename* PURGED TO TAPE PLM, MSG CT — *xx***

**Where:**

*nodename*
The node name.

*xx* The message count.

**Explanation:** The node control block (NCB) message queue for the requested resource was purged to the PLM tape.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPRG command.

---

**NPRG0003I NO MESSAGES ON QUEUE**

**Explanation:** There are no messages on the node control block (NCB) queue to purge or repeat.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPRG command.

---

**NPRG0010W NOT ALLOWED BELOW CRAS STATE**

**Explanation:** The TPF system must be in the computer room agent set (CRAS) state or above before the request can be processed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPRG command.

---

**NPRG0013E INVALID RID**

**Explanation:** The output message transmitter (OMT) message purge routines detected a resource identifier (RID) error. This can indicate a possible database problem.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPRG command.

---

**NPRG0014E INVALID NODENAME**

**Explanation:** The node name specified in the command is not valid or could not be found in the system network tables.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid node name.

See *TPF Operations* for more information about the ZNPRG command.

---

**NPRG0015E NODE NOT A PRINTER**

**Explanation:** The node specified in the command is not a printer.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid node name.

See *TPF Operations* for more information about the ZNPRG command.

---

**NPRG0016E CONVERSION ERROR**

**Explanation:** A RIDCC macro error occurred, which indicates a possible database problem.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPRG command. See *TPF General Macros* for more information about the RIDCC macro.

---

**NPRG0018T UNABLE TO RETRIEVE NCB FOR** *nodename*

**Where:**

*nodename*
The name of the node for the node control block (NCP).

**Explanation:** The node control block (NCB) for the requested resource could not be retrieved.

**System Action:** The message queue is not purged and processing is ended.

**User Response:** None.

See *TPF Operations* for more information about the ZNPRG command.

---

**NPRG0020E REJECTED, DUPLICATE LU NAME** *nodename*, **NETID REQUIRED**

**Where:**

*nodename*
The name of the node for the logical unit (LU).

**Explanation:** The node referenced in the command is not a qualified name and a duplicate name exists in the network.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a fully-qualified LU name.

See *TPF Operations* for more information about the ZNPRG command.

# NRPT–NSID

---

**NRPT0001I MESSAGE REPEATED TO** *nodename*

**Where:**

*nodename*
The name of the node.

**Explanation:** This is the normal response to the ZNRPT command.

**System Action:** The last message sent to the requested resource was sent again.

**User Response:** None.

See *TPF Operations* for more information about the ZNRPT command.

---

**NRPT0003I NO MESSAGES ON QUEUE**

**Explanation:** There are no messages on the node control block (NCB) queue to purge or repeat.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRPT command.

---

**NRPT0010W NOT ALLOWED BELOW CRAS STATE**

**Explanation:** The TPF system must be in the computer room agent set (CRAS) state or above before the request can be processed.

**System Action:** The ZNRPT command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to the CRAS state or above.
2. Enter the ZNRPT command again.

See *TPF Operations* for more information about the ZNRPT command.

---

**NRPT0014E INVALID NODENAME**

**Explanation:** The resource is not found in the network or the node name specified in the command is not valid.

**System Action:** The ZNRPT command is rejected.

**User Response:** Enter the command again and specify a valid node name.

See *TPF Operations* for more information about the ZNRPT command.

---

**NRPT0015E NODE NOT A PRINTER**

**Explanation:** The node specified in the command is not a printer.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid node name.

See *TPF Operations* for more information about the ZNRPT command.

**NRPT0016E CONVERSION ERROR**

**Explanation:** A RIDCC macro error occurred, which indicates a possible database problem.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRPT command. See *TPF General Macros* for more information about the RIDCC macro.

**NRPT0017A NODE UNABLE TO RECEIVE**

**Explanation:** The node is in STOP state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRPT command.

**NRPT0020E REJECTED, DUPLICATE LU NAME *nodename*, NETID REQUIRED**

**Where:**

*nodename*
The name of the node for the logical unit (LU).

**Explanation:** The node referenced in the command is not a qualified name and a duplicate name exists in the network.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a fully-qualified LU name.

See *TPF Operations* for more information about the ZNRPT command.

**NRTP0001I BEGIN ZNRTP DISPLAY**

**Explanation:** This is the normal response to the ZNRTP DISPLAY command with the ALL, ALS, CP, or STATUS parameter specified. This message is followed by information about one or more active rapid transport protocol (RTP) connections.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP DISPLAY command and for an example of the informational display.

**NRTP0002I BEGIN ZNRTP SUMMARY**

**Explanation:** This is the normal response to the ZNRTP SUMMARY command. This message is followed by statistical information about the rapid transport protocol (RTP) connections.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP SUMMARY command and for an example of the informational display.

**NRTP0003I RTPCB ENTRY CONTENTS**

**Explanation:** This is the normal response to the ZNRTP DISPLAY command with the RTP parameter specified. This message is followed by a display of the specified rapid transport protocol control block (RTPCB) table entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP DISPLAY command and for an example of the informational display.

**NRTP0004I RTPCB ENTRY CONTENTS FORMATTED**

**Explanation:** This is the normal response to the ZNRTP DISPLAY command with the RTP and FORMAT parameters specified. This message is followed by a formatted display that shows the key fields in the specified rapid transport protocol control block (RTPCB) table entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP DISPLAY command and for an example of the informational display.

**NRTP0005I HPR SUPPORT IS NOW ENABLED**

**Explanation:** This is the normal response to the ZNRTP HPR command with the ENABLE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP HPR command.

**NRTP0006I HPR SUPPORT IS NOW DISABLED**

**Explanation:** This is the normal response to the ZNRTP HPR command with the DISABLE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP HPR command.

**NRTP0007I HPR SUPPORT *status* FOR THE COMPLEX HPR SUPPORT IS *status* FOR THIS PROCESSOR**

**Where:**

*status*
Either ENABLED or DISABLED.

**Explanation:** This is the normal response to the ZNRTP HPR command with the STATUS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP HPR command.

**NRTP0008I NO RTP CONNECTIONS MEET THE SEARCH CRITERIA**

**Explanation:** The ZNRTP DISPLAY command was entered with the ALL, ALS, CP, or STATUS parameter specified, but there were no active rapid transport protocol (RTP) connections that meet the specified search criteria.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP DISPLAY command.

**NRTP0011I DEACTIVATION OF ALL RTP CONNECTIONS COMPLETED**

**Explanation:** This is the normal response to the ZNRTP INACT command with the ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP INACT command.

**NRTP0012I RTP CONNECTION-*rtpcb* CP-*netid.cpname* DEACTIVATION COMPLETED**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

*netid.cpname*
The network-qualified control point (CP) name of the remote RTP endpoint.

**Explanation:** This is the normal response to the ZNRTP INACT command with the RTP parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP INACT command.

**NRTP0015I INITIALIZATION OF ALL RTPCB ENTRIES COMPLETED**

**Explanation:** This is the normal response to the ZNRTP INITIALIZE command with the ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP INITIALIZE command.

**NRTP0016I INITIALIZATION OF RTPCB *rtpcb* COMPLETED**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

**Explanation:** This is the normal response to the ZNRTP INITIALIZE command with the RTP parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP INITIALIZE command.

**NRTP0018I RTP CONNECTION ROUTE INFORMATION**

**Explanation:** This is the normal response to the ZNRTP ROUTE command. This message is followed by information about the route for the specified rapid transport protocol (RTP) connection.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP ROUTE command and for an example of the informational display.

**NRTP0019I RTP CONNECTION-*rtpcb* CP-*netid.cpname* NO ROUTE INFORMATION AVAILABLE**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

*netid.cpname*
The network-qualified control point (CP) name of the remote RTP endpoint.

**Explanation:** The ZNRTP ROUTE command was entered with an RTP connection specified that is either starting or doing a path switch. When an RTP connection is in one of these states, no route information is available.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP ROUTE command.

**NRTP0020I RTP CONNECTION-*rtpcb* CP-*netid.cpname* PATH SWITCH STARTED**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

*netid.cpname*
The network-qualified control point (CP) name of the remote RTP endpoint.

**Explanation:** This is the normal response to the ZNRTP SWITCH command.

**System Action:** Processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP SWITCH command.

**NRTP0021I RTP CONNECTION-*rtpcb* CP-*netid.cpname* PATH SWITCH COMPLETED**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

*netid.cpname*
The network-qualified control point (CP) name of the remote RTP endpoint.

**Explanation:** This is the normal response to the ZNRTP SWITCH command when the path switch is completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP SWITCH command.

**NRTP0040E REJECTED, ALS NAME SPECIFIED IS NOT VALID**

**Explanation:** The ZNRTP DISPLAY command was entered with the ALS parameter specified, but the adjacent link station (ALS) name was not valid.

**System Action:** The ZNRTP DISPLAY command is rejected.

**User Response:** Enter the ZNRTP DISPLAY command again, specifying a valid ALS name for the ALS parameter.

See *TPF Operations* for more information about the ZNRTP DISPLAY command.

**NRTP0041E REJECTED, CP NAME SPECIFIED IS NOT VALID**

**Explanation:** The ZNRTP DISPLAY command was entered with the CP parameter specified, but the control point (CP) name was not valid.

**System Action:** The ZNRTP DISPLAY command is rejected.

**User Response:** Enter the ZNRTP DISPLAY command again, specifying a valid CP name for the CP parameter.

See *TPF Operations* for more information about the ZNRTP DISPLAY command.

**NRTP0042E REJECTED, RTPCB INDEX SPECIFIED IS NOT VALID**

**Explanation:** A ZNRTP command was entered with the RTP parameter specified, but the rapid transport protocol control block (RTPCB) index was not valid.

**System Action:** The ZNRTP command is rejected.

**User Response:** Enter the ZNRTP command again, specifying a valid RTPCB index for the RTP parameter.

See *TPF Operations* for more information about the ZNRTP commands.

**NRTP0043E REJECTED, SNA RESTART NOT COMPLETE**

**Explanation:** The ZNRTP DISPLAY, ZNRTP HPR, ZNRTP INITIALIZE, ZNRTP ROUTE, or ZNRTP SWITCH command was entered before Systems Network Architecture (SNA) restart was completed.

**System Action:** The ZNRTP command is rejected.

**User Response:** Enter the ZNRTP command again when SNA restart is completed.

See *TPF Operations* for more information about the ZNRTP commands.

**NRTP0044E REJECTED, HPR SUPPORT IS ALREADY *status***

**Where:**

*status*
Either ENABLED or DISABLED.

**Explanation:** The ZNRTP HPR command was entered with the DISABLE parameter specified when high-performance routing (HPR) support was already disabled; or the ZNRTP HPR command was entered with the ENABLE parameter specified when HPR support was already enabled.

**System Action:** The ZNRTP command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP HPR command. See *TPF ACF/SNA Data Communications Reference* for more information about HPR suppport.

**NRTP0045E REJECTED, CANNOT ENABLE HPR SUPPORT WHILE IN LEN MODE**

**Explanation:** The ZNRTP HPR command was entered with the ENABLE parameter specified when the TPF system was running in low-entry networking (LEN) mode. The TPF system must be running in Advanced Peer-to-Peer Networking (APPN) mode before high-performance routing (HPR) support can be enabled.

**System Action:** The ZNRTP HPR command is rejected.

**User Response:** Do the following:

1. Enter **ZNAPN APPN** to place the TPF system in APPN mode.

2. Enter the ZNRTP HPR command again.

See *TPF Operations* for more information about the ZNAPN and ZNRTP HPR commands. See *TPF ACF/SNA Data Communications Reference* for more information about APPN mode, LEN mode, and HPR support.

---

**NRTP0046E REJECTED, UNABLE TO ACCESS APPN TAPST RECORD**

**Explanation:** The ZNRTP HPR command was entered, but an input/output (I/O) error or a file address retrieval program (FACS) error occurred while trying to access the TAPST file record.

**System Action:** The ZNRTP HPR command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP HPR command.

---

**NRTP0047E REJECTED, SYSTEM NOT IN OR ABOVE CRAS STATE**

**Explanation:** The ZNRTP INACT command was entered when the TPF system was not in CRAS state or higher.

**System Action:** The ZNRTP INACT command is rejected.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle the TPF system to at least CRAS state.
2. Enter the ZNRTP INACT command again.

See *TPF Operations* for more information about the ZCYCL and ZNRTP INACT commands.

---

**NRTP0048E REJECTED, SYSTEM NOT IN NORM STATE**

**Explanation:** The ZNRTP SWITCH command was entered when the TPF system was not in NORM state.

**System Action:** The ZNRTP SWITCH command is rejected.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle the TPF system to NORM state.
2. Enter the ZNRTP SWITCH command again.

See *TPF Operations* for more information about the ZCYCL and ZNRTP SWITCH commands.

---

**NRTP0050E REJECTED, SPECIFIED RTP CONNECTION IS NOT ACTIVE**

**Explanation:** One of the following occurred:

- The ZNRTP INACT, ZNRTP INITIALIZE, ZNRTP ROUTE, or ZNRTP SWITCH command was entered with a rapid transport protocol (RTP) connection specified that is not active.
- The ZNRTP DISPLAY command was entered with the RTP and FORMAT parameters specified. However the RTP connection was not active.

**System Action:** The ZNRTP command is rejected.

**User Response:** Enter the ZNRTP command again, specifying an active RTP connection.

See *TPF Operations* for more information about the ZNRTP commands. See *TPF ACF/SNA Data Communications Reference* for more information about RTP connections.

---

**NRTP0051E RTP CONNECTION- *rtpcb* CP-*netid.cpname* PATH SWITCH ALREADY IN PROGRESS**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

*netid.cpname*
The network-qualified control point (CP) name of the remote RTP endpoint.

**Explanation:** The ZNRTP SWITCH command was entered for an RTP connection that was already doing a path switch.

**System Action:** The ZNRTP SWITCH command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP SWITCH command. See *TPF ACF/SNA Data Communications Reference* for more information about path switches.

---

**NRTP0052E RTP CONNECTION-*rtpcb* CP-*netid.cpname* NOT IN VALID STATE FOR PATH SWITCH**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

*netid.cpname*
The network-qualified control point (CP) name of the remote RTP endpoint.

**Explanation:** The ZNRTP SWITCH command was entered for an RTP connection that was not in a valid state to start a path switch. The RTP connection was either starting, being deactivated, or performing the RTP connection resynchronization process.

**System Action:** The ZNRTP SWITCH command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP SWITCH command. See *TPF ACF/SNA Data Communications Reference* for more information about path switches, RTP connections, and the RTP connection resynchronization process.

---

**NRTP0053E RTP CONNECTION-*rtpcb* CP-*netid.cpname* PATH SWITCH FAILED, CURRENT ROUTE IS STILL USED**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

*netid.cpname*
The network-qualified control point (CP) name of the remote RTP endpoint.

**Explanation:** The ZNRTP SWITCH command was entered, but a new route for the specified RTP connection could not be found. Either no alternate route exists in the network, or a timeout condition occurred while trying to find a new route.

**System Action:** The specified RTP connection continues to use its current route.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP SWITCH command. See *TPF ACF/SNA Data Communications Reference* for more information about RTP connections.

---

**NRTP0054E REJECTED, VALUE OF THE STATUS PARAMETER IS NOT VALID**

**Explanation:** The ZNRTP DISPLAY command was entered with a value for the STATUS parameter specified that is not valid.

**System Action:** The ZNRTP DISPLAY command is rejected.

**User Response:** Enter the ZNRTP DISPLAY command again specifying a valid value for the STATUS parameter.

See *TPF Operations* for more information about the ZNRTP DISPLAY command.

---

**NRTP0055E REJECTED, HPR SUPPORT NOT DEFINED ON THIS PROCESSOR**

**Explanation:** A ZNRTP command was entered from a processor where high-performance routing (HPR) support is not defined.

**System Action:** The ZNRTP command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP commands.

See *TPF ACF/SNA Data Communications Reference* for more information about how to define HPR support to the TPF system.

---

**NRTP0056E REJECTED, CP-CP SESSIONS ARE NOT ACTIVE**

**Explanation:** The ZNRTP SWITCH command was entered when CP-CP sessions were not active in the TPF system. CP-CP sessions are needed to perform a path switch for a rapid transport protocol (RTP) connection.

**System Action:** The ZNRTP SWITCH command is rejected.

**User Response:** Do the following:

1. Activate CP-CP sessions.
2. Enter the ZNRTP SWITCH command again.

See *TPF Operations* for more information about the ZNRTP SWITCH command. See *TPF ACF/SNA Data Communications Reference* for more information about how to activate CP-CP sessions and the patch switches.

---

**NRTP0057I RTP CONNECTION- *rtpcb* CP-*netid.cpname* PATH SWITCH ENDED, ALREADY USING OPTIMAL ROUTE**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

*netid.cpname*
The network-qualified control point (CP) name of the remote RTP endpoint.

**Explanation:** The ZNRTP SWITCH command was entered, but the new route calculated by the network node server (NNS) for the RTP connection is the same as the current route. Either no alternate route exists in the network or the current route is the optimal route to use.

**System Action:** The specified RTP connection continues to use its existing route.

**User Response:** None.

See *TPF Operations* for more information about the ZNRTP SWITCH command. See *TPF ACF/SNA Data Communications Reference* for more information about RTP connections.

---

**NRVT0000E INVALID NODENAME**

**Explanation:** The network identifier and node name specified in the command cannot be found in the resource vector table (RVT).

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid node name.

See *TPF Operations* for more information about the ZNRVT command.

---

**NRVT0001E REJECTED, MULTIPLE LUS WITH SAME NAME**

**Explanation:** More than one resource vector table (RVT) entry matches the node name specified in the command.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify the network identifier to distinguish the multiple node names.

See *TPF Operations* for more information about the ZNRVT command.

---

**NRVT0002E INVALID RID**

**Explanation:** The ZNRVT function issues this message when you specify a value for the resource identifier (RID) (R) parameter that is not valid on the command.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid RID value.

See *TPF Operations* for more information about the ZNRVT command.

---

**NRVT0006E REJECTED, SNA RESTART NOT COMPLETE**

**Explanation:** You can enter the ZNRVT command only in 1052 state or above.

**System Action:** None.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNRVT command again.

See *TPF Operations* for more information about the ZNRVT command.

**NRVT0020I RVT CONTENTS FORMATTED**

**Explanation:** This is the normal response to the ZNRVT command with the DF parameter specified. This message is followed by a formatted display of the content of the resource vector table (RVT).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRVT command.

**NRVT0030I MODES**

**Explanation:** This is the normal response to the ZNRVT command with the MODES parameter. This message is followed by a display of the mode names associated with the specified node.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRVT command.

**NRVT0031I NO MODE NAMES INITIALIZED**

**Explanation:** This is the normal response to the ZNRVT command with the MODES parameter specified when no mode names are initialized for the specified remote LU.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRVT command.

**NRVT0099I RVT CONTENTS**

**Explanation:** This is the normal response to the ZNRVT command with the DU parameter specified. This message is followed by an unformatted display of the content of the resource vector table (RVT).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRVT command.

**NSCB0001I SCB CONTENTS FORMATTED**

**Explanation:** This is the normal response to the ZNSCB command with the DF parameter specified. This message is followed by a formatted display of the content of the session control block (SCB).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSCB command.

**NSCB0002I SCB CONTENTS**

**Explanation:** This is the normal response to the ZNSCB command. This message is followed by an unformatted display of the content of the session control block (SCB).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSCB command.

**NSCB0003I SCB SUMMARY INFORMATION**

**Explanation:** This is the normal response to the ZNSCB command with the SUM parameter specified. This message is followed by a display of the number of active and inactive session control blocks (SCBs).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSCB command.

**NSCB0010I INITIALIZATION COMPLETE**

**Explanation:** This is the normal response to the ZNSCB INITIALIZE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSCB INITIALIZE command.

**NSCB0011I INITIALIZATION OF ALL SCBS COMPLETED SUCCESSFULLY**

**Explanation:** This is the normal response to the ZNSCB INITIALIZE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSCB INITIALIZE command.

### NSCB0016E REJECTED, UNKNOWN SCBID SPECIFIED

**Explanation:** The ZNSCB function issues this message when the specified SCBID is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid SCBID.

See *TPF Operations* for more information about the ZNSCB command.

### NSCB0017E THERE ARE NO SCBS DEFINED IN THE SYSTEM

**Explanation:** The ZNSCB function issues this message when you try to process the command in a TPF system that does not have any session control blocks (SCBs) defined.

**System Action:** The command is rejected.

**User Response:** The ZNSCB command is only valid with TPF Advanced Program-to-Program Communications (TPF/APPC) support. To use this support, you must define the maximum number of SCBs to be used in the TPF system by using the MAXSCB parameter on the SNAKEY macro.

See *TPF Operations* for more information about the ZNSCB command. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro. See *TPF ACF/SNA Data Communications Reference* for more information about TPF/APPC support.

### NSCB0018E REJECTED, SYSTEM NOT IN NORM STATE

**Explanation:** The TPF system must be in NORM state before entering the ZNSCB command.

**System Action:** The ZNSCB command is rejected.

**User Response:** Do the following:

1. Ensure the TPF system is in NORM state.
2. Enter the ZNSCB command again.

See *TPF Operations* for more information about the ZNSCB command.

### NSCB0019E REJECTED, THERE ARE NO SCBS TO BE INITIALIZED

**Explanation:** This message is issued when you try to process the ZNSCB command in a TPF system that does not have any session control blocks (SCBs) defined.

**System Action:** The command is rejected.

**User Response:** The ZNSCB INITIALIZE command is only valid with TPF/Advanced Program-to-Program Communications (TPF/APPC) support. To use this support, you must define the maximum number of SCBs to be used in the TPF system by using the MAXSCB parameter on the SNAKEY macro.

See *TPF Operations* for more information about the ZNSCB INITIALIZE command. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro. See *TPF ACF/SNA Data Communications Reference* for more information about TPF/APPC support.

### NSCB0020E REJECTED, SNA RESTART NOT COMPLETE

**Explanation:** You can enter the ZNSCB command only in 1052 state or above.

**System Action:** None.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNSCB command again.

See *TPF Operations* for more information about the ZNSCB command.

### NSID0001I NEW ENTRY ADDED TO SIDE INFORMATION TABLE

**Explanation:** This is the normal response to the ZNSID command with the ADD or CHANGE parameters specified.

**System Action:** The side information table is altered as requested.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0002I SIDE INFORMATION ENTRY DISPLAY

**Explanation:** This is the normal response to the ZNSID command with the DISPLAY parameter specified. This message is followed by a display of the requested entry in the side information table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0003I SIDE INFORMATION ENTRY REMOVED

**Explanation:** This is the normal response to the ZNSID command with the REMOVE parameter specified.

**System Action:** The desired entry in the side information table is deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0004I SIDE INFORMATION TABLE INITIALIZED

**Explanation:** This is the normal response to the ZNSID command with the INITIALIZE parameter specified. The side information table is clear and is ready to receive new side information entries. Any data previously contained in the side information table is erased.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0005I NEW SIDE INFORMATION TABLE ENTRIES LOADED**

**Explanation:** This is the normal response to the ZNSID command with the LOAD parameter specified. Entries with previously unknown symbolic destination names are added to the table and those with known names overwrite the previous data. Any entries specified to be removed from the table are removed. This message is followed by a display giving statistics for the load.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0006A NEW ENTRY ADDED TO SIDE INFORMATION TABLE, ENTRY IS INCOMPLETE**

**Explanation:** This is the normal response to the ZNSID command with the ADD parameter specified when you do not specify one or more of the following parameters for the side information entry:

- TP for the transaction program name
- LU for the logical unit (LU) name
- Mode for the mode name.

**System Action:** The entry is added by using the parameters provided but the missing parameters must be added entering the ZNSID CHANGE command before the entry can be used.

**User Response:** Enter the ZNSID command with the CHANGE parameter specified to add the missing information.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0007E ONLINE SIDE INFORMATION TABLE DOES NOT EXIST**

**Explanation:** This response follows any ZNSID command when there are no fixed-file records allocated for the side information table.

**System Action:** The command is rejected.

**User Response:** Allocate the required number of fixed-file records.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0008E ONLINE CAPACITY EXCEEDED, UNABLE TO ADD** *sym_dest_name*

**Where:**

*sym_dest_name*
The symbolic destination name for the entry in the online side information table.

**Explanation:** This response follows a ZNSID command with the ADD or LOAD parameter specified when there is no space to add the specified entry to the online side information table.

**System Action:** If this error is encountered during a tape load, the load is aborted.

**User Response:** Increase the size of the table.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0009E REJECTED, NAME PARAMETER NOT FOUND IN TABLE**

**Explanation:** The ZNSID function issues this message when the requested entry does not exist in the side information table.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid name.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0010E REJECTED, AN ENTRY WITH THAT NAME ALREADY EXISTS**

**Explanation:** The ZNSID function issues this message when you try to add an entry with a name that already exists in the table.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify an unused name.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0011E SIDE INFORMATION** *dstype* **RECORD HEADER IS INVALID**

**Where:**

*dstype*
TAPE or GDS.

**Explanation:** This response follows a ZNSID command with the LOAD parameter is specified when the header of the offline side information tape contains data that is not valid.

**System Action:** The tape load is ended.

**User Response:** Do the following:

1. Regenerate the offline side information tape.
2. Reload the offline side information tape.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0012E SIDE INFORMATION *dstype* READ ERROR**

**Where:**

*dstype*
TAPE or GDS.

**Explanation:** This response follows a ZNSID command with the LOAD parameter specified when a tape or general data set (GDS) read macro fails. A display giving statistics for the load follows this response.

**System Action:** The tape load is ended.

**User Response:** Do the following:

1. Regenerate the offline side information tape.
2. Reload the offline side information tape.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0013E SIDE INFORMATION *dstype* ENTRY ERROR DUMP**

**Where:**

*dstype*
TAPE or GDS.

**Explanation:** This response follows a ZNSID command with the LOAD parameter specified when one of the entries contained in the offline side information data set is not valid. A display describing the fields that are not valid and a dump of the entry follows this response.

**System Action:** The tape load is ended.

**User Response:** Do the following:

1. Regenerate the offline side information tape.
2. Reload the offline side information tape.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0014E PARTIAL SIDE INFORMATION TABLE LOAD TERMINATED DUE TO ERROR**

**Explanation:** This response follows a ZNSID command with the LOAD parameter specified when the load cannot be completed because of an error reading the tape or because of data that is not valid in the offline side information data set. Any side information entries that were loaded successfully before the error remain in the side information table. A display giving statistics for the load follows this response.

**System Action:** The tape load is ended.

**User Response:** Do the following:

1. Regenerate the offline side information data set.
2. Reload the offline side information data set.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0015E SPECIFY 'TP-', 'LU-' AND/OR 'MODE-'**

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE parameter specified when you do not specify any of the following parameters for the side information entry:

- TP for the transaction program name
- LU for the logical unit (LU) name
- Mode for the mode name.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify the desired parameters.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0016E RECORD ID CHECK FAILURE, CHECK SIDE INFORMATION TABLE INITIALIZATION**

**Explanation:** This response follows any ZNSID command when a FIND macro returns a record ID check error. The online side information table is probably not initialized. If the side information table is initialized, this response implies a malfunction in ZNSID command processing.

**System Action:** The command is rejected.

**User Response:** If the side information table requires initialization, enter the ZNSID INITIALIZE command.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0017I USER TEXT FROM SIDE INFORMATION *dstype***

**Where:**

*dstype*
TAPE or GDS.

**Explanation:** This is a normal response to the ZNSID command with the LOAD parameter specified. This message is followed by a display of the offline data set.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0018I SIDE INFORMATION ENTRY CHANGED**

**Explanation:** This is a normal response to the ZNSID command with the CHANGE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0019A SIDE INFORMATION ENTRY CHANGED, ENTRY IS INCOMPLETE

**Explanation:** This is the normal response to the ZNSID command with the CHANGE parameter specified when you do not specify one or more of the following parameters for the side information entry:

- TP for the transaction program name
- LU for the logical unit (LU) name
- Mode for the mode name.

**System Action:** The entry is changed by using the parameters specified.

**User Response:** Enter the ZNSID command with the CHANGE parameter specified to add the missing information.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0021E *parameter* IS LONGER THAN 8 CHARACTERS

**Where:**

*parameter*
NETWORK ID, LU NAME, or MODE

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE parameter specified when the specified parameter is longer than 8 characters, which is the Systems Network Architecture (SNA)-specified maximum length for these values. A display showing the parameter in error and the location of the error follows this response.

**System Action:** The side information table is not modified.

**User Response:** Enter the ZNSID command again and specify the correct parameter value.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0024E TP NAME CONTAINS HEX SUBSTRING WITH ODD NUMBER OF DIGITS

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE parameter specified when the specified TP parameter contains an odd number of digits between 2 dollar signs ($) delimiting a substring specified in hexadecimal. A display showing the parameter in error and the location of the error follows this response.

**System Action:** The side information table is not modified.

**User Response:** Enter the ZNSID command again and specify the correct TPF value.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0025E TP NAME CONTAINS INVALID CHARACTER IN HEX SUBSTRING

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE command specified when the specified TP parameter contains a character other than a hexadecimal digit (0 through 9, A through F) between 2 dollar signs ($) delimiting a substring specified in hexadecimal. A display showing the parameter in error and the location of the error follows this response.

**System Action:** The side information table is not modified.

**User Response:** Enter the ZNSID command again and specify the correct TP value.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0026E TP NAME ENDS WITH INCOMPLETE HEX SUBSTRING

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE parameter specified when the specified TP parameter ends in a hexadecimal substring with no terminating dollar sign ($). A display showing the parameter in error and the location of the error follows this response.

**System Action:** The side information table is not modified.

**User Response:** Enter the ZNSID command again and specify the correct TP value.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0027E TP NAME CONTAINS '$' NOT FOLLOWED BY SECOND '$' OR HEX DIGIT

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE parameter specified when the specified TP parameter contains a dollar sign ($) indicating the beginning of a substring specified in hexadecimal, but is followed by a character other than a hexadecimal digit (0 through 9, A through F) or another dollar sign. A display showing the parameter in error and the location of the error follows this response.

**System Action:** The side information table is not modified.

**User Response:** Enter the ZNSID command again and specify the correct TP value.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

### NSID0028E TP NAME IS LONGER THAN 64 BYTES

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE parameter specified when the specified TP parameter, after converting any hexadecimal substrings to byte values, is longer than 64 bytes, which is the Systems Network Architecture (SNA)-specified maximum length for the TP name. A display showing the parameter in error and the location of the error follows this response.

**System Action:** The side information table is not modified.

**User Response:** Enter the ZNSID command again and specify the correct TP value.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0029E TP NAME CONTAINS AN EMBEDDED SPACE CHARACTER**

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE parameter specified when the specified TP parameter includes a hexadecimal substring containing a byte value of X'40', which is the EBCDIC code for a space character. A display showing the parameter in error and the location of the error follows this response.

**System Action:** The side information table is not modified.

**User Response:** Enter the ZNSID command again and specify the correct TP value.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0030E REJECTED, SYSTEM IS BELOW 1052 STATE**

**Explanation:** You can enter the ZNSID command only in 1052 state or above.

**System Action:** None.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNSID command again.

See *TPF Operations* for more information about the ZNSID command.

---

**NSID0031E GDS ERROR, REASON CODE** *gdserror*

**Where:**

*gdserror*
The reason code for the general data set (GDS) error.

**Explanation:** The ZNSID function issues this message when a general data set (GDS) file operation is unsuccessful. The macro that performs the operation returns the error code referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0032E TAPE OR GDS NAME MUST BE SPECIFIED FOR LOAD**

**Explanation:** The ZNSID function issues this message when you do not specify a tape name or a general data set (GDS) name for the ZNSID command with the LOAD parameter specified.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a tape name or a GDS name, but not both, by using the TAPE or GDS parameter.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0033E TAPE AND GDS MAY NOT BOTH BE SPECIFIED**

**Explanation:** The ZNSID function issues this message when you specify both a tape name and a general data set (GDS) name for the ZNSID command with the LOAD parameter specified.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a tape name or a GDS name, but not both, by using the TAPE or GDS parameter.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0034E OPEN FAILURE FOR** *dstype dsname*

**Where:**

*dstype*
TAPE or GDS.

*dsname*
The data set name.

**Explanation:** This message follows a ZNSID command with the LOAD parameter specified when the data set specified by the TAPE or GDS parameter cannot be opened.

**System Action:** The command is rejected.

**User Response:** Enter the ZNSID command again with the LOAD parameter specified and with a valid data set name.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0035E INVALID SUBSYSTEM** *subsystem*

**Where:**

*subsystem*
The name of the subsystem.

**Explanation:** This message follows a ZNSID command when the LOAD parameter is specified when the subsystem on which the data set is to be loaded is not valid for the specified TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the ZNSID command again with the LOAD parameter specified and with a valid subsystem.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

---

**NSID0036E SUBSYSTEM *subsystem* IS INACTIVE**

**Where:**

*subsystem*
The name of the subsystem.

**Explanation:** This message follows a ZNSID command with the LOAD parameter specified when the subsystem on which the data set is to be loaded is inactive.

**System Action:** The ZNSID command is rejected.

**User Response:** Do the following:

1. Activate the subsystem.
2. Enter the ZNSID command again with the LOAD parameter specified.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0037I LOADING SIDE INFORMATION DATA**

**Explanation:** This is a normal response to the ZNSID command with the LOAD parameter specified when the offline data set does not specify a subsystem. This message indicates that data from the offline data set is being loaded to the online side information table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0038I LOADING SIDE INFORMATION DATA TO SUBSYSTEM *subsystem***

**Where:**

*subsystem*
The name of the subsystem.

**Explanation:** This is a normal response to the ZNSID command with the LOAD parameter specified and indicates that data from the offline data set is being loaded to the online side information table in the subsystem (referenced in the message) specified by the offline data set.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0039E *parameter* CONTAINS CHARACTERS THAT ARE NOT VALID**

**Where:**

*parameter*
NETWORK ID, LU NAME, or MODE

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE parameter specified when the specified parameter contains a character that is not valid. A display showing the parameter in error and the location of the error follows this response.

**System Action:** The side information table is not modified.

**User Response:** Enter the ZNSID command again and specify the correct parameter value.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

**NSID0040E *parameter* DOES NOT BEGIN WITH A VALID CHARACTER**

**Where:**

*parameter*
NETWORK ID, LU NAME, or MODE

**Explanation:** This response follows a ZNSID command with the ADD or CHANGE parameter specified when the specified parameter does not begin with a valid character. A display showing the parameter in error and the location of the error follows this response.

**System Action:** The side information table is not modified.

**User Response:** Enter the ZNSID command again and specify the correct parameter value.

See *TPF Operations* for more information about the ZNSID command. See *TPF ACF/SNA Data Communications Reference* for more information about the side information table.

# NSPA–NTRP

**NSPA0001I INITIALIZATION COMPLETE**

**Explanation:** This is the normal response to the ZNSPA command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0002E NOT USED**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0003E INVALID INPUT**

**Explanation:** The ZNSPA command was issued with input that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify the correct input.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0006E INVALID MOD NUMBER**

**Explanation:** The ZNSPA command was issued with a module number that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid module number.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0007E INVALID NODENAME**

**Explanation:** A node name that is not valid was specified on the ZNSPA command.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid node name.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0008E MOD OFFLINE fd**

**Explanation:** The ZNSPA command was issued to initialize the scratch pad area for a module that is offline.

**System Action:** The ZNSPA command is rejected.

**User Response:** Do the following:

1. Bring the module online.
2. Enter the command again.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0011E INVALID/NOTVAL SS/SSU ID**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0013E DUPLICATED NODE NAMES EXIST**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0014E REJECTED, SYSTEM IS BELOW 1052 STATE**

**Explanation:** You can enter the ZNSPA command only in 1052 state or above.

**System Action:** None.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNSPA command again.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0017I START INITIALIZING SPA**

**Explanation:** This is the normal response to the ZNSPA command.

**System Action:** The TPF system is initializing the scratch pad area (SPA).

**User Response:** None.

See *TPF Operations* for more information about the ZNSPA command.

**NSPA0036E NO SPA ORDINAL ASSIGNED TO THE RESOURCE NAME**

**Explanation:** The resource name was not assigned a valid scratch pad area (SPA) ordinal.

**System Action:** None.

**User Response:** None.

**NTRP0001I PIU TRACE STARTED FOR** *resource*

**Where:**

*resource*
The name of the resource being traced.

**Explanation:** This is the normal response to the ZNTRP command with the START parameter specified when the path information unit (PIU) trace facility is started for a specific resource.

**System Action:** The TPF system starts the PIU trace facility for the specified resource.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

**NTRP0002I PIU TRACE STARTED FOR ALL RESOURCES**

**Explanation:** This is the normal response to the ZNTRP command with the START parameter specified when the path information unit (PIU) trace facility is started for all resources.

**System Action:** The TPF system starts the PIU trace facility for all resources.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

**NTRP0003I PIU TRACE STOPPED FOR** *resource*

**Where:**

*resource*
The name of the resource being traced.

**Explanation:** This is the normal response to the ZNTRP command with the STOP parameter specified when the path

information unit (PIU) PIU trace facility is stopped for a specific resource.

**System Action:** The TPF system stops the PIU trace facility for the specified resource.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0004I PIU TRACE STOPPED FOR ALL RESOURCES**

**Explanation:** This is the normal response to the ZNTRP command with the STOP and ALLR parameters specified.

**System Action:** The TPF system stops the path information unit (PIU) trace facility for all resources.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0005I START WRITING PIU TABLE TO REAL TIME TAPE**

**Explanation:** This is the normal response to the ZNTRP command with the START and TAPE parameters specified.

**System Action:** The TPF system starts writing the path information unit (PIU) trace table to the real-time tape.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0006I STOP WRITING PIU TABLE TO REAL TIME TAPE**

**Explanation:** This is the normal response to the ZNTRP command with the STOP and TAPE parameters specified.

**System Action:** The TPF system stops writing the path information unit (PIU) trace table to the real-time tape.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0008I PIU TRACE STARTED FOR ALL RESOURCES CHOSEN WITH SELECTION CRITERIA —— NAME-** *criteria*

**Where:**

*criteria*
The selection criteria used to specify the group of resource names.

**Explanation:** This is the normal response to the ZNTRP command with the START parameter specified when the path information unit (PIU) trace facility is started for all resources that have a name beginning or ending with a common string of characters.

**System Action:** The TPF system starts the PIU trace facility for the specified resources.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0009I PIU TRACE STOPPED FOR ALL RESOURCES CHOSEN WITH SELECTION CRITERIA —— NAME-** *criteria*

**Where:**

*criteria*
The selection criteria used to specify the group of resource names.

**Explanation:** This is the normal response to the ZNTRP command with the STOP parameter specified when the path information unit (PIU) trace facility is stopped for all resources that have a name beginning or ending with a common string of characters.

**System Action:** The TPF system stops the PIU trace facility for the specified resources.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0010I PIU TRACE STARTED FOR ALL NCP/CTC/ALS CHOSEN WITH SELECTION CRITERIA —— NAME-** *criteria*

**Where:**

*criteria*
The selection criteria used to specify the group of resource names.

**Explanation:** This is the normal response to the ZNTRP command with the START and VRONLY parameters specified when the path information unit (PIU) trace facility is started for all resources that have a name beginning or ending with a common string of characters.

**System Action:** The TPF system starts the PIU trace facility for the specified resources.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0011I PIU TRACE STARTED FOR ALL HPR TRAFFIC**

**Explanation:** This is the normal response to the ZNTRP command with the START and HPR parameters specified.

**System Action:** The TPF system starts the path information unit (PIU) trace facility for all high-performance routing (HPR) traffic, which includes all network layer packets (NLPs) on all rapid transport protocol (RTP) connections and all ROUTE_SETUP commands.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and HPR support.

---

**NTRP0012I PIU TRACE STOPPED FOR ALL HPR TRAFFIC. INDIVIDUAL TRACES REMAIN ACTIVE**

**Explanation:** This is the normal response to the ZNTRP command with the STOP and HPR parameters specified.

**System Action:** The TPF system stops the path information unit (PIU) trace facility for all high-performance routing (HPR) traffic. If the PIU trace facility was started for a specific logical unit (LU) or rapid transport protocol (RTP) connection, that trace remains active.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and HPR support.

---

**NTRP0013I TRACING *rusz* BYTES OF RU FOR USER DATA MESSAGES**

**Where:**

*rusz*
The number of request or response unit (RU) bytes being stored in the path information unit (PIU) trace table for data messages on LU-LU sessions.

**Explanation:** This is the normal response to the ZNTRP command with the RUSZ parameter specified.

**System Action:** The TPF system stores the specified number of bytes of the RU in the PIU trace table for data messages on LU-LU sessions.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0014I TRACING *crusz* BYTES OF RU FOR SNA COMMANDS**

**Where:**

*crusz*
The number of request or response unit (RU) bytes being stored in the path information unit (PIU) trace table for Systems Network Architecture (SNA) commands, data flowing on CDRM-CDRM sessions, and data flowing on CP-CP sessions.

**Explanation:** This is the normal response to the ZNTRP command with the CRUSZ parameter specified.

**System Action:** The TPF system stores the specified number of bytes of the RU in the PIU trace table for SNA commands, data flowing on CDRM-CDRM sessions, and data flowing on CP-CP sessions.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0015I PIU TRACE STARTED FOR RTP CONNECTION *rtpcb***

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

**Explanation:** This is the normal response to the ZNTRP command with the START and RTP parameters specified.

**System Action:** The TPF system starts the path information unit (PIU) trace facility for all traffic on the specified RTP connection.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and RTP connections.

---

**NTRP0016I PIU TRACE STOPPED FOR RTP CONNECTION *rtpcb***

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

**Explanation:** This is the normal response to the ZNTRP command with the STOP and RTP parameters specified.

**System Action:** The TPF system stops the path information unit (PIU) trace facility for all traffic on the specified RTP connection.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and RTP connections.

---

**NTRP0017I PIU TRACE STARTED FOR STATE CHANGES ON ALL RTP CONNECTIONS**

**Explanation:** This is the normal response to the ZNTRP command with the START, HPR, and STATCHNG parameters specified.

**System Action:** The TPF system starts the path information unit (PIU) trace facility for state changes on all rapid transport protocol (RTP) connections. State changes include ROUTE_SETUP commands, connections starting, connections stopping, and path switches.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and RTP connections.

---

**NTRP0018I PIU TRACE STARTED FOR ALL RESOURCES WITH VRONLY OPTION**

**Explanation:** This is the normal response to the ZNTRP command with the START, VRONLY, and ALL parameters specified.

**System Action:** The TPF system starts the path information unit (PIU) trace facility for network control commands, virtual route (VR) pacing requests, and VR pacing responses for all resources.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

**NTRP0019I PIU TRACE STOPPED FOR ALL RESOURCES. INDIVIDUAL TRACES REMAIN ACTIVE**

**Explanation:** This is the normal response to the ZNTRP command with the STOP and ALL parameters specified.

**System Action:** The TPF system stops the path information unit (PIU) trace facility for all resources. If the PIU trace facility was started for a specific logical unit (LU) or rapid transport protocol (RTP) connection, that trace remains active.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

**NTRP0038I PIU TRACE IS ACTIVE FOR ALL RESOURCES WITH VRONLY OPTION AND FOR ALL HPR TRAFFIC**

**Explanation:** This is the normal response to the ZNTRP command with the DISPLAY parameter specified when the path information unit (PIU) trace facility is active for all network control commands, all virtual route (VR) pacing requests, all VR pacing responses, and all high-performance routing (HPR) traffic. HPR traffic includes all network layer packets (NLPs) on all rapid transport protocol (RTP) connections and all ROUTE_SETUP commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and HPR support.

**NTRP0039I PIU TRACE IS ACTIVE FOR ALL RESOURCES WITH VRONLY OPTION AND FOR STATE CHANGES ON ALL RTP CONNECTIONS**

**Explanation:** This is the normal response to the ZNTRP command with the DISPLAY parameter specified when the path information unit (PIU) trace facility is active for all network control commands, all virtual route (VR) pacing requests, all VR pacing responses, and state changes on all rapid transport protocol (RTP) connections. State changes include ROUTE_SETUP commands, connections starting, connections stopping, and path switches.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and RTP connections.

**NTRP0041I PIU TRACE IS NOT ACTIVE**

**Explanation:** This is the normal response to the ZNTRP command with the DISPLAY parameter specified when the path information unit (PIU) trace facility is not active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

**NTRP0042I PIU TRACE IS ACTIVE FOR ALL RESOURCES**

**Explanation:** This is the normal response to the ZNTRP command with the DISPLAY parameter specified when the path information unit (PIU) trace facility is active for all resources.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

**NTRP0043I PIU TRACE IS ACTIVE FOR ALL RESOURCES WITH VRONLY OPTION**

**Explanation:** This is the normal response to the ZNTRP command with the DISPLAY parameter specified when the path information unit (PIU) trace facility is active for all all network control commands, all virtual route (VR) pacing requests, and all VR pacing responses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

**NTRP0045I PIU TRACE OPTIONS INFORMATION**

**Explanation:** This is the normal response to the ZNTRP command with the DISPLAY and OPTIONS parameters specified. This message is followed by information about the status of the path information unit (PIU) trace facility.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command and for an example of the informational display. See *TPF ACF/SNA Data Communications Reference* for more

information about the PIU trace facility.

---

**NTRP0046I PIU TRACE IS ACTIVE FOR ALL HPR TRAFFIC**

**Explanation:** This is the normal response to the ZNTRP command with the DISPLAY parameter specified when the path information unit (PIU) trace facility is active for all high-performance routing (HPR) traffic. HPR traffic includes all network layer packets (NLPs) on all rapid transport protocol (RTP) connections and all ROUTE_SETUP commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and RTP connections.

---

**NTRP0047I PIU TRACE IS ACTIVE FOR STATE CHANGES ON ALL RTP CONNECTIONS**

**Explanation:** This is the normal response to the ZNTRP command with the DISPLAY parameter specified when the path information unit (PIU) trace facility is active for state changes on all rapid transport protocol (RTP) connections. State changes include ROUTE_SETUP commands, connections starting, connections stopping, and path switches.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and RTP connections.

---

**NTRP0048I PIU TRACE ACTIVE FOR THE FOLLOWING SELECTED RESOURCES**

**Explanation:** This is the normal response to the ZNTRP command with the DISPLAY parameter specified when the path information unit (PIU) trace facility is active for one or more specific resources. This message is followed by a list of the resources for which PIU trace is active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command and for an example of the informational display. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0050E PIU TRACE TO REAL TIME TAPE ALREADY INACTIVE**

**Explanation:** The ZNTRP command with the STOP and TAPE parameters specified was entered when the path information unit (PIU) trace table was not being written to the real-time tape.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0051E PIU TRACE ALREADY ACTIVE TO REAL TIME TAPE**

**Explanation:** Ths ZNTRP command with the START and TAPE parameters specified was entered when the path information unit (PIU) trace table was already being written to the real-time tape.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0053E** *resource* **NOT DEFINED**

**Where:**

*resource*
The name of the resource.

**Explanation:** The resource specified for the ZNTRP command with the START or STOP parameter specified was not defined in the resource vector table (RVT).

**System Action:** None.

**User Response:** Enter the ZNTRP command again and specify a valid resource name.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0054E NO RESOURCES FOUND WITH SELECTION CRITERIA —— NAME-** *criteria*

**Where:**

*criteria*
The selection criteria used to specify the resource name.

**Explanation:** No resource names were found that match the selection criteria specified for the ZNTRP command with the START or STOP parameter specified.

**System Action:** None.

**User Response:** Enter the ZNTRP command again and specify a valid selection criteria.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the path information unit (PIU) trace facility.

---

**NTRP0055E** *resource* **IS NOT THE NAME OF AN NCP OR CTC**

**Where:**

*resource*
The name of the resource.

**Explanation:** The resource name specified for the ZNTRP command with the START and VRONLY parameters specified was not the name of a Network Control Program (NCP) or

CTC. The path information unit (PIU) trace facility can be started with the VRONLY option for a specific resource only if the resource is an NCP or CTC.

**System Action:** None.

**User Response:** Enter the ZNTRP command again and specify the resource name of an NCP or CTC.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0056E NO CTCS OR NCPS FOUND WITH SELECTION CRITERIA —— NAME-** *criteria*

**Where:**

*criteria*
The selection criteria used to specify the Network Control Program (NCP) or CTC names.

**Explanation:** No NCP or CTC names were found that match the selection criteria specified for the ZNTRP command with the START and VRONLY parameters specified.

**System Action:** None.

**User Response:** Enter the ZNTRP command again and specify valid selection criteria.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the path information unit (PIU) trace facility.

---

**NTRP0057E START REJECTED. TRACE ALL IS ACTIVE**

**Explanation:** A request was made to start the path information unit (PIU) trace facility for all resources. However, the trace facility was already active for all resources.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0058E STOP REJECTED. TRACE IS NOT ACTIVE**

**Explanation:** A request was made to stop the path information unit (PIU) trace facility when it was not active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0060E START REJECTED. TRACE IS ACTIVE FOR** *resource*

**Where:**

*resource*
The name of the resource.

**Explanation:** A request was made to start the path information unit (PIU) trace facility for a specific resource when the PIU trace facility was already active for that resource.

**System Action:** None.

**User Response:** None.

---

**NTRP0062E START REJECTED. TRACE HPR IS ACTIVE**

**Explanation:** A request was made to start the path information unit (PIU) trace facility for all high-performance routing (HPR) traffic. However, the PIU trace facility was already active for all HPR traffic.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and HPR support.

---

**NTRP0063E RU SIZE IS NOT VALID. SPECIFY A SIZE BETWEEN 8 AND 3840**

**Explanation:** The ZNTRP command was entered with the RUSZ or CRUSZ parameter specified, but the number of bytes specified was not valid.

**System Action:** None.

**User Response:** Enter the ZNTRP command again, specifying a valid value for the RUSZ or CRUSZ parameter.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility.

---

**NTRP0064E RTP INDEX** *rtpcb* **IS NOT VALID**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

**Explanation:** The ZNTRP command was entered with the RTP parameter specified, but the RTPCB index was not valid.

**System Action:** None.

**User Response:** Enter the ZNTRP command again, specifying a valid value for the RTP parameter.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and RTP connections.

---

**NTRP0065E START REJECTED. TRACE IS ACTIVE FOR RTP CONNECTION** *rtpcb*

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

**Explanation:** A request was made to start the path information unit (PIU) trace facility for a specific RTP

connection when the PIU trace facility was already active for that RTP connection.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and RTP connections.

---

**NTRP0066E RTP CONNECTION *rtpcb* IS NOT ACTIVE**

**Where:**

*rtpcb*
The rapid transport protocol control block (RTPCB) index of the rapid transport protocol (RTP) connection.

**Explanation:** A request was made to start the path information unit (PIU) trace facility for a specific RTP connection when that RTP connection was not active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNTRP command. See *TPF ACF/SNA Data Communications Reference* for more information about the PIU trace facility and RTP connections.

---

**NTRP0068E NOT ACTIVE BELOW 1052 STATE**

**Explanation:** You can enter the ZNTRP command only in 1052 state or above.

**System Action:** None.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZNTRP command again.

See *TPF Operations* for more information about the ZNTRP command.

# OLDF–OLDR

---

**OLDF0001E UNABLE TO SYNC OLD TAPE WITH PROCESSOR *x* - IPC RETURN FOR CR PGM OVERLAY**

**Where:**

*x* The processor ID.

**Explanation:** This message appears only in a loosely coupled complex. The specified processor cannot read the SIPCC message to initiate the core-resident program overlay process.

**System Action:** The E-type loader completes its task on the initiating processor and all other processors in the complex.

**User Response:** Do the following:

1. Wait for the E-type loader fallback, load, or restart function to complete on all processors.
2. IPL the processor that failed to refresh its program base.

See *TPF System Installation Support Reference* for more information about the loaders function.

---

**OLDF0002E UNABLE TO FILE INTERFACE RECORDS - NO PGM SYNC DONE**

**Explanation:** This message appears only in a loosely coupled complex. The controlling processor is not able to file the interface records needed by the other processors to synchronize the E-type loader function.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the E-type loader fallback, load, or restart function to complete on the controlling processor.
2. IPL each of the other processors if core resident programs are included in the loader function.

See *TPF System Installation Support Reference* for more information about the loaders function.

---

**OLDF0003E UNABLE TO SYNC OLD TAPE WITH PROCESSOR *x* - IPC RETURN FOR FR PGM VFA FLUSH AND PST CLEANUP**

**Where:**

*x* The processor ID.

**Explanation:** This message appears only in a loosely coupled complex. The specified processor cannot read the SIPCC message to initiate the process of flushing loaded file resident programs from virtual file access (VFA) and setting their associated program allocation table (PAT) slots to not be in main storage. The specified processor may be running with the back level versions of the file-resident programs included in the E-type loader function, depending on the activity on those programs.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the E-type loader fallback, load, or restart function to complete on all processors.
2. IPL the failing processor if a back level version of a file-resident program remains in main storage.

See *TPF System Installation Support Reference* for more information about the loaders function.

---

**OLDF0004E E-TYPE LOADER EVENT -SYSOLDEV- ALREADY EXISTS - EXISTING EVENT HAS BEEN POSTED ERRONEOUSLY**

**Explanation:** This message appears only in a loosely coupled complex. The E-type loader encountered the DUPNAM condition when creating an event (by using the EVNTC macro) to track the completion of the core-resident program overlay process on all processors. An earlier load attempt may have exited before posting completion of the event. The existing event is removed from the event table by posting it erroneously. The SYSOLDEV event is then redefined for the current load attempt.

**System Action:** The E-type loader function continues normally.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the loaders function.

---

**OLDH0005I PROCESSOR *x* REQUESTED PROGRAMS HAVE BEEN *xxxx***

**Where:**

*x* The name of the processor.

*xxxx*
LOADED or RESTORED

**Explanation:** This message displays at the prime computer room agent set (CRAS) console in a loosely coupled complex only to inform you of one of the following situations:

- Programs are loaded on this processor by a request from the processor referenced in the message.
- Programs are restored on this processor by a request from the processor referenced in the message. When a FALLBACK ALL is requested, this message is printed after the fallback of each set of 25 programs being restored.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the loaders function.

---

**OLDH0006E UNABLE TO READ INTERFACE RECORDS - CR PGM OVERLAY NOT PERFORMED**

**Explanation:** This message appears only in a loosely coupled complex. A support processor is not able to read the interface records needed to perform the E-type loader core-resident program overlay function.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the E-type loader fallback, load, or restart function to complete on the controlling processor.
2. IPL the support processor that failed to refresh its program base.

See *TPF System Installation Support Reference* for more information about the loaders function.

---

**OLDH0007E UNABLE TO READ INTERFACE RECORDS - FR PGM VFA FLUSH AND PST CLEANUP NOT PERFORMED**

**Explanation:** This message appears only in a loosely coupled complex. A support processor is not able to read the interface records needed to perform the following E-type loader functions for file-resident programs:

- Flush the program from virtual file access (VFA).
- Mark the program as not in main storage in the program allocation table (PAT).

The support processor may be running with back level versions of the file-resident programs included in the E-type loader function, depending on the activity on those programs.

**System Action:** None.

**User Response:** Do the following:

1. Wait for the E-type loader fallback, load, or restart function to complete on all other processors.
2. IPL the failing processor if a back level version of a file-resident program remains in main storage.

See *TPF System Installation Support Reference* for more information about the loaders function.

---

**OLDJ0008E PROCESSOR *x* DID NOT COMPLETE E-TYPE LOADER CR PGM OVERLAY WITHIN 10 SEC TIME-OUT INTERVAL**

**Where:**

*x* The processor ID.

**Explanation:** This message, which displays on the prime computer room agent set (CRAS) console in a loosely coupled complex only, is issued on the processor that initiated the E-type loader function (load, fallback, or restart) to inform you that the specified processor did not complete the overlay of loaded core-resident programs within the 10 second time-out interval.

**System Action:** None.

**User Response:** Do the following:

1. Determine why the specified processor did not complete the core-resident program overlay.
2. IPL the specified processor if the loaded versions of the core-resident programs are not overlaid in main storage.

See *TPF System Installation Support Reference* for more information about the loaders function.

---

**OLDR0100E *cccc* - THE ELT IS CORRUPTED, RUN E-TYPE LOADER RECLAIM**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader record table (ELT) is damaged and no E-type loader records can be returned or obtained.

**System Action:** The TPF system cannot return or obtain any E-type loader records for the E-type loader functions.

**User Response:** Enter the ZOLDR RECLAIM command to run the E-type loader reclaim function. This function rebuilds the ELT and recovers the E-type loader records.

In addition, you may need to enter the ZOLDR CLEAR command to resolve the problem if the capture and restore utility was involved.

See *TPF Operations* for more information about the ZOLDR RECLAIM command. See *TPF System Installation Support Reference* for more information about the capture and restore utility.

---

**OLDR0101W** *cccc* **- THE NUMBER OF E-TYPE LOADER RECORDS AVAILABLE IS** *recnum* **AND BELOW THE THRESHOLD VALUE OF** *threshold*

**Where:**

*cccc*
The name of the segment that detected the condition.

*recnum*
The number of available records.

*threshold*
The user-defined threshold.

**Explanation:** The number of available E-type loader records in the E-type loader record table (ELT) has fallen below the user-defined threshold.

**System Action:** The TPF system issues this message to the prime computer room agent set (CRAS) console and the receive-only (RO) console for every active processor in the complex.

**User Response:** Do one of the following:

- Enter the ZOLDR RECLAIM command to run the E-type loader reclaim function. This function rebuilds the ELT and recovers the E-type loader records.
- Allocate more #OLDx records and then enter the ZOLDR RECLAIM command.
- You can also recover E-type loader records by accepting loadsets or by deleting the loadsets that you no longer use. To accept a loadset, enter the ZOLDR ACCEPT command. To delete a loadset, enter the ZOLDR DELETE command.

See *TPF Operations* for more information about the ZOLDR RECLAIM, ZOLDR ACCEPT, and ZOLDR DELETE commands.

---

**OLDR0102E** *cccc* **- THE ELT IS EMPTY. NO E-TYPE LOADER RECORDS ARE AVAILABLE**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader record table (ELT) is empty and cannot return or obtain anymore E-type loader records.

**System Action:** The TPF system issues this message to the prime computer room agent set (CRAS) console and the receive-only (RO) console for every active processor in the complex.

**User Response:** Do one of the following:

- Enter the ZOLDR RECLAIM command to run the E-type loader reclaim function. This function rebuilds the ELT and recovers the E-type loader records.
- Allocate more #OLDx records and then enter the ZOLDR RECLAIM command.
- You can also recover E-type loader records by accepting loadsets or by deleting the loadsets that you no longer use. To accept a loadset, enter the ZOLDR ACCEPT command. To delete a loadset, enter the ZOLDR DELETE command.

See *TPF Operations* for more information about the ZOLDR RECLAIM, ZOLDR ACCEPT, and ZOLDR DELETE commands.

---

**OLDR0103E** *cccc* **- THE ELT IS INVALID. NO E-TYPE LOADER RECORDS ARE AVAILABLE**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader record table (ELT) is not valid and no E-type loader records can be returned.

**System Action:** None.

**User Response:** Enter the ZOLDR RECLAIM command to run the E-type loader reclaim function. This function rebuilds the ELT and recovers the E-type loader records.

See *TPF Operations* for more information about the ZOLDR RECLAIM command.

---

**OLDR0104E** *cccc* **- UNABLE TO OBTAIN FILE COPY OF THE PROCESSORS WRT - WRT NOT SAVED ON THIS PROCESSOR**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The TPF system could not obtain a file copy of the working record table (WRT).

**System Action:** The TPF system continues processing but some WRT records may be lost.

**User Response:** Do the following:

1. Enter the ZOLDR RECLAIM command to recover any lost records.
2. Determine why the TPF system could not obtain the WRT.
3. Take the appropriate action to correct the problem.

See *TPF Operations* for more information about the ZOLDR RECLAIM command.

---

**OLDR0110E** *cccc* **- I/O ERROR** *reading/writing structure* **- FILE ADDRESS** *addr* **- SUD** *yy* **SUG** *zz*

**Where:**

*cccc*
The name of the segment that detected the condition.

*reading/writing*
Indicates whether the error occurred while reading an E-type loader structure or while writing to an E-type loader structure.

*structure*
The name of the E-type loader structure.

*addr*
The file address found on the data level where the error occurred.

*yy* The CE1SUD value of the entry control block (ECB).

*zz* The CE1SUG value of the ECB.

**Explanation:** An E-type loader function called the WAITC macro and the WAITC macro returned with an error condition.

**System Action:** The TPF system displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the additional messages that were displayed and to the system error indicators of the ECBs to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF General Macros* for more information about the WAITC macro.

---

**OLDR0201T** *cccc* **- E-TYPE LOADER RECLAIM REQUEST ENDED, UNABLE TO CONTINUE DUE TO AN I/O ERROR**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An input/output (I/O) error occurred while running the E-type loader reclaim function.

**System Action:** The TPF system ends the E-type loader reclaim function.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the error.
2. Correct the error.
3. Enter the ZOLDR RECLAIM command again.

See *TPF Operations* for more information about the ZOLDR RECLAIM command.

---

**OLDR0202T** *cccc* **- E-TYPE LOADER RECLAIM REQUEST ENDED, E-TYPE LOADER RECLAIM ALREADY IN PROGRESS ON CPU-***id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

**Explanation:** The E-type loader reclaim function is already running on this subsystem.

**System Action:** The TPF system ends the E-type loader reclaim function.

**User Response:** Wait until the E-type loader reclaim process completes and enter the ZOLDR RECLAIM command again, if necessary.

See *TPF Operations* for more information about the ZOLDR RECLAIM command.

---

**OLDR0203T** *cccc* **- E-TYPE LOADER RECLAIM REQUEST ENDED, CANNOT PERFORM E-TYPE LOADER RECLAIM WHILE ZOLDR LOAD IS IN PROGRESS ON THIS SUBSYSTEM - LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The E-type loader reclaim function cannot be started while the E-type loader load function is running.

**System Action:** The TPF system ends the E-type loader reclaim function.

**User Response:** Do the following:

1. Wait until the E-type loader load function is complete.
2. Enter the ZOLDR RECLAIM command again.

See *TPF Operations* for more information about the ZOLDR RECLAIM command.

---

**OLDR0204T** *cccc* **- E-TYPE LOADER RECLAIM REQUEST ENDED, DECREASING THE NUMBER OF FIXED FILE RECORDS FOR E-TYPE LOADER OPERATIONS REQUIRES A ZOLDR CLEAR ALL**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader reclaim function cannot start because the number of E-type loader fixed-file records (#OLDx) decreased.

**System Action:** The TPF system ends the E-type loader reclaim function.

**User Response:** Do the following:

1. Enter the ZOLDR CLEAR command to clear and initialize all file-resident E-type loader structures.
2. IPL the TPF system. The E-type loader restart routine starts the E-type loader reclaim function automatically.

See *TPF Operations* for more information about the ZOLDR RECLAIM and ZOLDR CLEAR commands.

---

**OLDR0205T** *cccc* **- E-TYPE LOADER RECLAIM REQUEST ENDED, NOT ENOUGH FIXED FILE RECORDS ALLOCATED FOR THE E-TYPE LOADER**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** There are not enough E-type loader fixed-file records (#OLDx) to run the E-type loader reclaim function.

**System Action:** The TPF system ends the E-type loader reclaim function.

**User Response:** Do the following:

1. Allocate more #OLDx records for this subsystem.
2. Enter the ZOLDR RECLAIM command again.

See *TPF Operations* for more information about the ZOLDR RECLAIM command. See *TPF System Generation* for more information about allocating #OLDx records.

---

**OLDR0206I** *cccc* **- E-TYPE LOADER RECLAIM STARTED ON CPU-***id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

**Explanation:** The E-type loader reclaim function was started on the specified processor.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader reclaim function.

---

**OLDR0207T** *cccc* **- E-TYPE LOADER RECLAIM ENDED ON CPU-***id* **DUE TO AN I/O ERROR**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

**Explanation:** An input/output (I/O) error occurred on the specified processor while running the E-type loader reclaim function.

**System Action:** The TPF system ends the E-type loader reclaim function.

**User Response:** Do the following:

1. Review any previous error messages to determine the cause of the error.
2. Take the appropriate action to correct the problem.
3. Enter the ZOLDR RECLAIM command again.

See *TPF Operations* for more information about the ZOLDR RECLAIM command. See *TPF System Installation Support Reference* for more information about the E-type loader reclaim function.

---

**OLDR0208T** *cccc* **- E-TYPE LOADER RECLAIM ENDED ON CPU-***id***, UNABLE TO OBTAIN** *bytes* **STORAGE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*bytes*
The number of bytes of storage.

**Explanation:** The E-type loader reclaim function cannot obtain enough storage.

**System Action:** The TPF system ends the E-type loader reclaim function.

**User Response:** Do the following:

1. Determine why there is not enough storage.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader reclaim function.

---

**OLDR0209T** *cccc* **- E-TYPE LOADER RECLAIM JOB DETECTION ENDED ON CPU-** *id* **BUT DID NOT SUCCESSFULLY COMPLETE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

**Explanation:** The E-type loader reclaim job detection routine encountered an input/output (I/O) error.

**System Action:** The TPF system ends the E-type loader reclaim function.

**User Response:** Do the following:

1. Review any previous error messages to determine the cause of the error.
2. Take the appropriate action to correct the problem.
3. Enter the ZOLDR RECLAIM command again.

See *TPF System Installation Support Reference* for more information about the E-type loader reclaim function and the E-type loader job detection routine. See *TPF Operations* for more information about the ZOLDR RECLAIM command.

---

**OLDR0210T** *cccc* **- E-TYPE LOADER RECLAIM ENDED ON CPU-** *id* **BUT DID NOT SUCCESSFULLY COMPLETE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

**Explanation:** The E-type job loader detection routine discovered that the E-type loader reclaim function did not complete successfully. The E-type loader reclaim function will not complete if it was ended because of a system condition or initial program load (IPL).

**System Action:** The ZOLDR LOAD, ZOLDR EXCLUDE, and ZOLDR REINCLUDE commands are rejected.

**User Response:** Do the following:

1. View the previous error message that was displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.
3. Enter the ZOLDR RECLAIM command again.

See *TPF Operations* for more information about the ZOLDR RECLAIM, ZOLDR LOAD, ZOLDR EXCLUDE, and ZOLDR REINCLUDE commands. See *TPF System Installation Support Reference* for more information about the E-type loader reclaim function and the E-type loader job detection routine.

---

**OLDR0211E** *cccc* **- E-TYPE LOADER RECLAIM DETECTED A CORRUPTED RECORD -** *rec lsname fileaddr*

**Where:**

*cccc*
The name of the segment that detected the condition.

*rec* The name of the corrupted record.

*lsname*
The name of the loadset.

*fileaddr*
The address of the file.

**Explanation:** The E-type reclaim function detected a damaged record in the loadset directory (LSD), the E-type loader program directory (EPD), or an E-type loader program record (PGM). This message is followed by a display that lists the type of record, the name of the loadset, and the file address of the record. Other records in the LSD or EPD may also be damaged.

**System Action:** The TPF system continues the E-type loader reclaim function and issues this message for as many as 20 damaged records.

**User Response:** Do one of the following:

- If the damaged record is an EPD record or a PGM record, enter **ZOLDR DELETE** to delete the loadset associated with that EPD or PGM.
- If the damaged record is an LSD record, enter **ZOLDR CLEAR ALL** to reinitialize all file resident E-type loader structures.

See *TPF Operations* for more information about the ZOLDR DELETE and ZOLDR CLEAR commands and for examples of the informational displays.

---

**OLDR0213I** *cccc* **- E-TYPE LOADER RECLAIM COMPLETED ON CPU-***id***,** *y* **out of** *z* **OLD***x* **RECORDS AVAILABLE.**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier associated with the processor.

*y* The number of E-type loader fixed-file records available.

*z* The total number of E-type loader fixed-file records.

*x* The program base number.

**Explanation:** The E-type loader reclaim function completed successfully on the specified processor. The number of fixed-file records that are available for other E-type loader functions is listed.

**System Action:** None.

**User Response:** If the number of fixed-file records available for other E-type loader functions is not enough, enter the ZOLDR DELETE command to delete any unnecessary loadsets or allocate more fixed-file records.

See *TPF Operations* for more information about the ZOLDR DELETE command. See *TPF System Installation Support Reference* for more information about allocating fixed-file records.

---

**OLDR0214E** *cccc* **- E-TYPE LOADER RECLAIM DETECTED** *number* **CORRUPTED E-TYPE LOADER LSD, EPD OR PGM RECORDS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*number*
The number of damaged records in the loadset directory (LSD), the E-type loader program directory (EPD) record, or E-type loader program records (PGM).

**Explanation:** The E-type loader reclaim function detected damaged records in the LSD, EPD, or program records. This message is preceded by another message that displays where the data corruption was found.

If this message was received on a CRAS console, check the RO CRAS console for a list of records that were corrupted.

**System Action:** The TPF system continues the E-type loader reclaim function.

**User Response:** Do the following:

1. If this message was received on a prime computer room agent set (CRAS) console, check the receive-only (RO) CRAS console for a list of damaged records.
2. Repair all the damaged records.
3. Enter the ZOLDR RECLAIM command again.

See *TPF Operations* for more information about the ZOLDR RECLAIM command.

---

**OLDR0500I** *cccc* **- E-TYPE LOADER RESTART COMPLETE**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader restart routine completed successfully for this subsystem. You can now enter E-type loader commands for this subsystem.

**System Action:** The TPF system starts the E-type loader restart routine for the next subsystem or performs the next task in the restart schedule.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader restart routine.

---

**OLDR0501E** *cccc* **- UNABLE TO START E-TYPE LOADER POLICING - ERROR READING ERD**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An error occurred while reading the E-type loader rules database (ERD) record during the E-type loader restart routine.

**System Action:** The TPF system cannot start the E-type loader policing routine.

**User Response:** Do the following:

1. Review the previous error message for information about the read error.
2. Take the appropriate action to correct the error.
3. IPL the TPF system.

See *TPF System Installation Support Reference* for more information about E-type loader restart routine.

---

**OLDR0502I** *cccc* **- E-TYPE LOADER POLICING STARTED**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader policing routine was started.

**System Action:** The TPF system creates entry control blocks (ECBs) to process requests that are scheduled by E-type loader functions.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader policing routine.

---

**OLDR0503E** *cccc* **- ERROR READING E-TYPE LOADER MASTER RECORD TABLE**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An error occurred while reading the master E-type loader record table (ELT).

**System Action:** The TPF system continues the E-type loader restart routine. However, the TPF system cannot process the ZOLDR LOAD, ZOLDR EXCLUDE, and ZOLDR REINCLUDE commands.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the read error.
2. Enter the ZOLDR RECLAIM command to rebuild the E-type loader record table structure.

See *TPF Operations* for more information about the ZOLDR RECLAIM, ZOLDR LOAD, ZOLDR EXCLUDE, and ZOLDR REINCLUDE commands.

---

**OLDR0504E** *cccc* **- UNABLE TO RETRIEVE E-TYPE LOADER LOADSET DIRECTORY RECORD**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An error occurred while reading the loadset directory (LSD) record for the E-type loader restart routine.

**System Action:** The TPF system continues the E-type loader restart routine. However, the TPF system may not be able to process E-type loader commands.

**User Response:** Do the following:

1. Review the previous error message to determine the cause of the read error.
2. Take the appropriate action to correct the read error.
3. IPL the TPF system.

See *TPF System Installation Support Reference* for more information about the E-type loader restart routine.

---

**OLDR0505E** *cccc* **- STATE CHANGE DISABLED - E-TYPE LOADER RESTART ERROR ENCOUNTERED LOADSET REACTIVATION BYPASSED**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An error occurred during the E-type loader restart routine for this subsystem.

**System Action:** The TPF system disables state change. Loadsets activated before the initial program load (IPL) was performed are no longer active.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the error.
2. Take the appropriate action to correct the problem.
3. IPL the subsystem.

See *TPF System Installation Support Reference* for more information about the E-type loader restart routine.

---

**OLDR0507E** *cccc* **- STATE CHANGE DISABLED - E-TYPE LOADER RESTART ERROR ENCOUNTERED**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An error occurred during the E-type loader restart routine for this subsystem.

**System Action:** The TPF system disables state change.

**User Response:** Do the following:

1. Review the previous messages to determine the cause of the error.
2. Take the appropriate action to correct the problem.

3. IPL the subsystem.

See *TPF System Installation Support Reference* for more information about the E-type loader restart routine.

---

**OLDR0508E** *cccc* **– NO MORE EAT SLOTS AVAILABLE**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The TPF system ran out of ECB activation table (EAT) slots while reactivating loadsets during the E-type loader restart routine.

**System Action:** The TPF system disables state change. Loadsets activated before the initial program load (IPL) was performed are no longer active.

**User Response:** Do the following:

1. Allocate more EAT slots for the TPF system by increasing the value at the EATSIZE label in the CT38 copy member in the CCCTIN CSECT in the control program (CP).
2. Perform the IPL again.

---

**OLDR0901T** *cccc* **- E-TYPE LOADER CLEAR ENDED, ERROR READING EMR**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader clear function cannot read the E-type loader master record (EMR) record.

**System Action:** The TPF system ends the E-type loader clear function.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the error.
2. Take the appropriate action to correct the error.
3. Enter the ZOLDR CLEAR command again and specify the BP parameter.

See *TPF Operations* for more information about the ZOLDR CLEAR command.

---

**OLDR0902T** *cccc* **- E-TYPE LOADER CLEAR ENDED, E-TYPE LOADER RECLAIM IS RUNNING**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The ZOLDR CLEAR command cannot be entered while the E-type loader reclaim function is running.

**System Action:** The TPF system ends the E-type loader clear function.

**User Response:** Do one of the following:

- Wait until the E-type loader reclaim function completes and then enter the ZOLDR CLEAR command again.
- Enter the ZOLDR CLEAR command again and specify the BP option.

See *TPF Operations* for more information about the ZOLDR CLEAR command.

---

**OLDR0903T** *cccc* **- E-TYPE LOADER CLEAR ENDED, ERROR READING LSD**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader clear function cannot locate the primary loadset directory (LSD) record.

**System Action:** The TPF system ends the E-type loader clear function.

**User Response:** Do one of the following:

- Review the previous messages to determine the cause of the error and then take the appropriate action to correct the error.
- Enter the ZOLDR CLEAR command again and specify the BP option.

See *TPF Operations* for more information about the ZOLDR CLEAR command.

---

**OLDR0904T** *cccc* **- E-TYPE LOADER CLEAR ENDED, LOAD IN PROGRESS FOR LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR CLEAR command cannot be entered while the E-type loader load function is running.

**System Action:** The TPF system ends the E-type loader clear function.

**User Response:** Do one of the following:

- Wait until the E-type loader load function completes and then enter the ZOLDR CLEAR command again.
- Enter the ZOLDR CLEAR command again and specify the BP option.

See *TPF Operations* for more information about the ZOLDR CLEAR command.

---

**OLDR0905T** *cccc* **- E-TYPE LOADER CLEAR ENDED, ACCEPT -OVERLAY- IN PROGRESS FOR LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR CLEAR command cannot be entered while the E-type loader accept function is running.

**System Action:** The TPF system ends the E-type loader clear function.

**User Response:** Do one of the following:

- Wait until the E-type loader accept function completes and then enter the ZOLDR CLEAR command again.
- Enter the ZOLDR CLEAR command again and specify the BP option.

See *TPF Operations* for more information about the ZOLDR CLEAR command.

---

**OLDR0906T** *cccc* **- E-TYPE LOADER CLEAR ENDED, UNABLE TO CHECK ON THE STATUS OF E-TYPE LOADER RECLAIM**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader clear function could not determine whether the E-type loader reclaim function was running.

**System Action:** The TPF system ends the E-type loader clear function.

**User Response:** Do one of the following:

- Review the previous messages to determine the cause of the error and then take the appropriate action to correct the error.
- Enter the ZOLDR CLEAR command again and specify the BP option.

See *TPF Operations* for more information about the ZOLDR CLEAR command.

---

**OLDR0910I** *cccc* **- E-TYPE LOADER CLEAR PROCESSING COMPLETED**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader clear function completed successfully during the E-type loader restart routine.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader clear function.

---

**OLDR0911A** *cccc* **- E-TYPE LOADER CLEAR PROCESSING COMPLETED, THIS PROCESSOR MUST BE RE-IPLED IMMEDIATELY**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader clear function completed successfully on this processor. An initial program load (IPL) must be performed on the processor to clean up all core resources for the E-type loader.

**System Action:** The TPF system ignores all E-type loader commands, except for the ZOLDR CLEAR command.

**User Response:** Perform an initial program load (IPL) on this processor and on all processors that are running the same program base.

See *TPF Main Supervisor Reference* for more information about performing an IPL on the TPF system.

---

**OLDR0912A** *cccc* **- E-TYPE LOADER CLEAR HAS BEEN INITIATED ON CPU-*id*, THIS PROCESSOR MUST BE RE-IPLED IMMEDIATELY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

**Explanation:** The E-type loader clear function completed successfully on another processor that is running the same program base. An initial program load (IPL) must be performed on this processor to clean up all core resources for the E-type loader.

**System Action:** The TPF system ignores all E-type loader commands, except for the ZOLDR CLEAR command.

**User Response:** Perform an initial program load (IPL) on the processor to clean up all core resources for the E-type loader.

See *TPF Main Supervisor Reference* for more information about performing an IPL on the TPF system.

---

**OLDR0913E** *cccc* **- E-TYPE LOADER CLEAR ERROR, NOT ALL E-TYPE LOADER RECORDS INITIALIZED. RECORD INITIALIZATION WILL BE RETRIED DURING E-TYPE LOADER RESTART**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An input/output (I/O) error occurred while running the E-type loader clear function. The initialization of E-type loader records was not completed. The TPF system tries to initialize the records again during the E-type loader restart routine.

**System Action:** The TPF system continues to run the E-type loader clear function. The TPF system ignores any E-type loader commands, except for the ZOLDR CLEAR command, until the E-type loader clear function is complete.

**User Response:** Do one of the following:

- Review the previous messages to determine the cause of the error.
- Take the appropriate action to correct the error.
- Enter the ZOLDR CLEAR command again.

See *TPF Operations* for more information about the ZOLDR CLEAR command.

**OLDR0914T** *cccc* **- E-TYPE LOADER CLEAR ERROR, NO OLD***x* **RECORDS HAVE BEEN ALLOCATED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*x* The program base number.

**Explanation:** The E-type loader clear function determined that no E-type loader records (#OLDx) exist for this subsystem and program base.

**System Action:** The TPF system ends the E-type loader clear function.

**User Response:** Do the following:

1. Ensure that you entered the ZOLDR CLEAR command for the correct subsystem.
2. Determine whether #OLDx records need to be defined and allocated for the subsystem and program base.

See *TPF Operations* for more information about the ZOLDR CLEAR command.

---

**OLDR1001T** *cccc* **- ZOLDR REQUESTS DISABLED**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader function could not be started for one of the following reasons:

- The E-type loader restart routine was in progress.
- The E-type loader restart routine did not complete successfully.
- The E-type loader is not defined to the TPF system.
- The ZOLDR CLEAR command was entered but an initial program load (IPL) was not performed on the TPF system.

**System Action:** The TPF system ends the E-type loader function.

**User Response:** Determine why the E-type loader function could not be started and do one of the following:

- Enter the E-type loader command again when the E-type loader restart routine is complete.
- Refer to the message that was previously displayed by the TPF system to determine why the E-type loader function did not complete successfully.
- Define the E-type loader to the TPF system.
- IPL the TPF system.

See *TPF System Installation Support Reference* for more information about the E-type loader.

---

**OLDR1011E** *cccc* **- MUST SPECIFY AT LEAST ONE PROGRAM CHARACTERISTIC AFTER PROGCHAR**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The ZOLDR ALTER PROGCHAR command was entered without specifying any program characteristics.

**System Action:** The TPF system ends the E-type loader alter function.

**User Response:** Enter the ZOLDR ALTER PROGCHAR command again and specify the appropriate program characteristics.

See *TPF Operations* for more information about the ZOLDR ALTER PROGCHAR command.

---

**OLDR1015E** *cccc* **-** *function* **NOT A VALID ZOLDR FUNCTION NAME**

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function.

**Explanation:** The specified function is not a valid E-type loader function.

**System Action:** The TPF system displays a list of the valid E-type loader functions.

**User Response:** Enter the ZOLDR command again and specify the name of a valid E-type loader function.

See *TPF Operations* for more information about the ZOLDR commands.

---

**OLDR1016I** *cccc* **-** *function* **REQUEST RECEIVED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function.

**Explanation:** The TPF system received the request to start the E-type loader function.

**System Action:** The TPF system starts the E-type loader function.

**User Response:** None.

See *TPF Operations* for more information about E-type loader functions.

---

**OLDR1056E** *cccc* **- DEACTIVATE ENDED FOR LOADSET** *lsname* **- INPUT CPU ID** *id* **INVALID**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR DEACTIVATE command was entered to deactivate a loadset on a specific processor. However, the CPU ID specified for the processor is not valid.

**System Action:** The TPF system ends the E-type loader deactivate function.

**User Response:** Enter the ZOLDR DEACTIVATE command again and specify a valid CPU ID.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE command.

---

**OLDR1057I** *cccc* **- DEACTIVATE LOADSET** *lsname* **FOR CPU** *id* **COMPLETE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset was deactivated on the specified processor.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about deactivating a loadset.

---

**OLDR1058I** *cccc* **- DEACTIVATE LOADSET** *lsname* **FOR CPU** *id* **COMPLETE AS REQUESTED BY CPU** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset was deactivated on the specified processor.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about deactivating a loadset.

---

**OLDR1059I** *cccc* **- SCHEDULED ACTIVATE FOR LOADSET** *lsname* **REMOVED FOR CPU** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The ZOLDR DEACTIVATE command was entered to deactivate a loadset on a specific processor. That loadset is not currently active on the processor. However, it is scheduled to be activated.

**System Action:** The TPF system does not activate the loadset.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about deactivating a loadset.

---

**OLDR1060E** *cccc* **- DEACTIVATE ENDED FOR LOADSET** *lsname* **- ALREADY SCHEDULED FOR DEACTIVATE ON CPU** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The ZOLDR DEACTIVATE command was entered to deactivate a loadset on a specific processor. However, the loadset is already scheduled to be deactivated on that processor.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about deactivating a loadset.

---

**OLDR1061E** *cccc* **- DEACTIVATE ENDED FOR LOADSET** *lsname* **- ACCEPT IN PROGRESS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be deactivated because it is in the process of being accepted.

**System Action:** The TPF system ends the E-type loader deactivate function.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about deactivating and accepting a loadset.

---

**OLDR1062E** *cccc* **- DEACTIVATE ENDED FOR LOADSET** *lsname* **- LOADSET DOES NOT EXIST**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be deactivated because it does not exist on this subsystem.

**System Action:** The TPF system ends the E-type loader deactivate function.

**User Response:** Enter the ZOLDR DEACTIVATE command again and specify the correct loadset name and subsystem.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE command.

---

**OLDR1063E** *cccc* **- DEACTIVATE ENDED FOR LOADSET** *lsname* **- UNABLE TO COMPLETE DEACTIVATE FOR CPU** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset cannot be deactivated on the specified processor because of a previous error.

**System Action:** The TPF system ends the E-type loader deactivate function.

**User Response:** Do the following:

1. Refer to any messages that were issued to describe the cause of the previous error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about deactivating a loadset.

---

**OLDR1064W** *cccc* **- UNABLE TO REMOVE LOADSET** *lsname* **FROM ECR**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An input/output (I/O) error occurred while deactivating the specified loadset. The E-type loader control record (ECR) could not be updated. Although no new entry control blocks (ECBs) can access the programs in the loadset, the loadset is still considered active. Therefore, the next time the TPF system performs an initial program load (IPL), the loadset is activated again.

**System Action:** None.

**User Response:** Do the following:

1. Correct the I/O error.
2. Enter the ZOLDR DEACTIVATE command again.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE command.

---

**OLDR1065E** *cccc* **- DEACTIVATE ENDED FOR LOADSET** *lsname* **- NOT ACTIVE ON CPU** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The ZOLDR DEACTIVATE command was entered to deactivate the loadset on the specified processor. However, the loadset is not active on that processor.

**System Action:** The TPF system ends the E-type loader deactivate function.

**User Response:** Enter the ZOLDR DEACTIVATE command again and specify the correct loadset name and subsystem.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE command.

---

**OLDR1067W** *cccc* **- DEACTIVATE ENDED FOR LOADSET** *lsname* **- INVALID ACTIVATION NUMBER** *actnum* **DETECTED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*actnum*
The activation number.

**Explanation:** An error occurred while deactivating a loadset that was selectively activated. The slot in the entry control block (ECB) activation table (EAT) that corresponds to the last program allocation table (PAT) slot associated with the loadset was not found. Either the EAT slot or the PAT slot associated with the loadset is damaged.

**System Action:** The TPF system deactivates the PAT slots associated with the loadset. However, the EAT is not updated. Therefore, the TPF system may not be able to clean up the deactivated PAT slots.

**User Response:** Do the following:

1. Determine whether the EAT or the PAT is damaged.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for more information about deactivating a loadset.

---

**OLDR1068W** *cccc* **- LOADSET** *lsname* **NOT ACTIVE ON CPU** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The ZOLDR DEACTIVATE command was entered to deactivate a loadset on a specific processor. However, the loadset is not active on that processor.

**System Action:** The TPF system ends the E-type loader deactivate function.

**User Response:** Enter the ZOLDR DEACTIVATE command again and specify the correct loadset name and subsystem.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE command.

---

**OLDR1069I** *cccc* **- DEACTIVATE ENDED FOR LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The loadset was deactivated on the current processor.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about deactivating a loadset.

---

**OLDR1071E** *cccc* **– NO MORE EAT SLOTS AVAILABLE ON CPU** *id* **– PROGRAMS IN LOADSET** *lsname* **WILL CONTINUE TO BE USED UNTIL THE NEXT IPL**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** No more ECB activation table (EAT) slots were available to process a ZOLDR DEACTIVATE command.

**System Action:** The loadset is marked as deactivated. However, if any of the programs in the loadset are entered by new entry control blocks (ECBs), they will continue to be used until an initial program load (IPL) of the TPF system is performed.

**User Response:** Do the following:

1. Perform an initial program load (IPL) of the TPF system to discontinue use of the programs in the deactivated loadset.
2. If the number of loadsets active at the same time is expected to remain high, increase the number of EAT slots in the TPF system. You can do this by increasing the value at the EATSIZE label in the CT38 copy member in the CCCTIN CSECT of the control program (CP).

See *TPF Operations* for more information about the ZOLDR DEACTIVATE command.

---

**OLDR1072E** *cccc* **– MAXIMUM ACTIVATION NUMBER REACHED ON CPU** *id* **– PROGRAMS IN LOADSET** *lsname* **WILL CONTINUE TO BE USED UNTIL THE NEXT IPL**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** A ZOLDR DEACTIVATE command was entered, but the request could not be completed because the current system activation number had already reached its maximum value.

**System Action:** The loadset is marked as deactivated. However, if any of the programs in the loadset are entered by new entry control blocks (ECBs), they will continue to be used until an initial program load (IPL) of the TPF system is performed.

**User Response:** IPL the TPF system to discontinue use of the programs in the deactivated loadset and to reset the value of the current system activation number.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE command.

---

**OLDR1200I** *cccc* **- BEGIN LOADSET INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** This is the normal response to the ZOLDR DISPLAY command with the LOADSET parameter specified. It is followed by a display of information that describes one or more loadsets.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR DISPLAY command and an example of the informational display.

---

**OLDR1220I** *cccc* **- BEGIN LOADSET INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** This is the normal response to the ZOLDR DISPLAY command with the ALL or ACTIVATE parameter specified. It is followed by a display of information that describes one or more loadsets.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR DISPLAY command and an example of the informational display.

---

**OLDR1221T** *cccc* **- DISPLAY ENDED - UNABLE TO DISPLAY LOADSET INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The TPF system cannot display information about the loadsets because an error occurred while reading the prime or chained loadset directory (LSD) records.

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the read error.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for more information about the E-type loader display function and the LSD.

---

**OLDR1222I** *cccc* **- DISPLAY ENDED - NO LOADSETS EXIST**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** There are no loadsets or no active loadsets in the TPF system. Therefore, no information can be displayed.

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader display function.

---

**OLDR1223T** *cccc* **- DISPLAY ENDED - ERROR OBTAINING LOADSET STATUS INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The TPF system cannot display information about the specified loadset because an error occurred while reading the E-type loader master record (EMR).

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the read error.
2. Take the appropriate action to correct the problem.

See *TPF Operations* for more information about the E-type loader display function.

---

**OLDR1224I** *cccc* **- LOADSET INFORMATION CONTINUED**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** This is the normal response when the ZPAGE command is entered to continue displaying the output for the ZOLDR DISPLAY command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR DISPLAY and ZIPAGE commands.

---

**OLDR1240I** *cccc* **- BEGIN PROGRAM DISPLAY**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** This is the normal response to the ZOLDR DISPLAY command with the PROG parameter specified. It is followed by a display of all loadsets that contain the specified programs.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR DISPLAY command and an example of the informational display.

---

**OLDR1241T** *cccc* **- DISPLAY ENDED - UNABLE TO DISPLAY PROGRAM INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An error occurred while reading the prime or chained loadset directory (LSD) records.

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the read error.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for more information about the E-type loader display function and the LSD.

---

**OLDR1242I** *cccc* **- DISPLAY ENDED - NO LOADSETS EXIST**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** No loadsets exist for this subsystem. Therefore, the program or programs specified in the ZOLDR DISPLAY command with the PROG parameter specified do not exist in any loadsets.

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR DISPLAY command.

---

**OLDR1243T** *cccc* **- DISPLAY ENDED - ERROR WHILE DISPLAYING PROGRAM INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An error occurred while reading an E-type loader loadset directory (LSD).

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** Do the following:

1. Review the previous error message to determine the cause of the read error.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for more information about the E-type loader display function and the LSD.

---

**OLDR1300W** *cccc* **- E-LOADER CLEAN UP UNABLE TO UPDATE LSD FOR LOADSET** *lsname* **ON CPU** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** A file input/output (I/O) error occurred while updating the loadset directory (LSD) to indicate that there are no program allocation table (PAT) slots that refer to specified loadset on the specified processor.

**System Action:** The TPF system continues the E-type loader PAT clean up routine. The next time the TPF system starts the PAT clean up routine, it attempts to update the LSD again with this entry.

**User Response:** Do the following:

1. See the previous I/O error message to determine the cause of the problem.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for more information about the LSD and the E-type loader PAT clean up routine.

---

**OLDR1301W** *cccc* **- UNABLE TO READ LSD DURING E-LOADER CLEAN UP**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader program allocation table (PAT) clean up routine encountered an error while reading the loadset directory (LSD) to determine whether or not entries need to be updated.

**System Action:** The TPF system continues the E-type loader PAT clean up routine. The next time the TPF systemstarts the PAT clean up routine, it attempts to read the LSD again.

**User Response:** Do the following:

1. See the previous input/output (I/O) error message to determine the cause of the problem.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for more information about the LSD and the E-type loader PAT clean up routine.

---

**OLDR2001T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **- UNABLE TO READ EMR**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An error occurred while retrieving the E-type loader master record (EMR). Therefore, the specified loadset cannot be activated.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Do the following:

1. Refer to the message that was issued before this message to determine why the EMR could not be retrieved.
2. Take the appropriate action to correct the problem.
3. Enter the ZOLDR ACTIVATE command again.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command.

---

**OLDR2002T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **- UNABLE TO READ LSD**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An error occurred while retrieving the E-type loader loadset directory (LSD) record. Therefore, the specified loadset cannot be activated.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Do the following:

1. Refer to the message that was issued before this message to determine why the LSD could not be retrieved.
2. Take the appropriate action to correct the problem.
3. Enter the ZOLDR ACTIVATE command again.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command.

---

**OLDR2003T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **DOES NOT EXIST**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because it was not loaded.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Do the following:

1. Ensure that the loadset is loaded.
2. Enter the ZOLDR ACTIVATE command again and specify the correct loadset name and subsystem.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command. See *TPF System Installation Support Reference* for more information about loading a loadset.

---

**OLDR2004T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **CURRENTLY BEING LOADED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because it is in the process of being loaded.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Enter the ZOLDR ACTIVATE command again when the loadset is loaded.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command.

---

**OLDR2005T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **IS BEING ACCEPTED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because it is in the process of being accepted.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** None. There is no need to activate a loadset once the loadset is accepted.

See *TPF System Installation Support Reference* for more information about the E-type loader activate and accept functions.

---

**OLDR2006T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **IS MARKED AS DELETE PENDING**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because it is in the process of being deleted.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Do one of the following:

- If the loadset is being deleted by the E-type loader delete function, you can load the loadset again by using the ZOLDR LOAD command, and then enter the ZOLDR ACTIVATE command to activate the loadset.
- If the loadset is being deleted by the E-type loader accept function, there is no need to activate the loadset. An accepted loadset becomes part of the base program set and is available to all processors.

See *TPF Operations* for more information about the ZOLDR LOAD and ZOLDR ACTIVATE commands. See *TPF System Installation Support Reference* for more information about accepting a loadset.

---

**OLDR2007T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **- CPUID IS NOT VALID**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR ACTIVATE command was entered to activate a loadset on a specific processor. However, the CPU ID specified for the processor is not valid.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Enter the ZOLDR ACTIVATE command again and specify a valid CPU ID.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command.

---

**OLDR2008T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **ALREADY ACTIVE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR ACTIVATE command was entered to activate a loadset on a specific processor. However, the loadset is already active on that processor.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Ensure that you specified the correct CPU ID for the ZOLDR ACTIVATE command.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command.

---

**OLDR2009T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **ALREADY ACTIVE ON ALL PROCESSORS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR ACTIVATE command was entered to activate a loadset on all processors. However, the loadset is already active on all the processors.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command.

---

**OLDR2010T** *cccc* **- ACTIVATE ENDED - ERROR DETERMINING STATUS OF LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR ACTIVATE commands was entered to activate a loadset on all processors or on a specific processor. However, the TPF system found an error while retrieving the E-type loader control record (ECR) for a processor and could not determine whether the loadset was already active on that processor.

**System Action:** The TPF system ends the E-type loader activate function and does not activate the loadset on any processor.

**User Response:** Do the following:

1. Refer to the message that was issued before this message to determine why the ECR could not be retrieved.
2. Take the appropriate action to correct the problem.
3. Enter the ZOLDR ACTIVATE command again.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command.

---

**OLDR2011T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **- UNABLE TO SCHEDULE REQUEST**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because the E-type loader master record (EMR) is full. Therefore, the TPF system cannot schedule an activate request.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Do the following:

1. Ensure that the E-type loader policing routine is running on the processor where you want to activate the loadset.
2. If the policing routine is running, determine whether any errors occurred while processing the requests in the EMR.
3. Take the appropriate action to correct the problem.
4. Enter the ZOLDR ACTIVATE command again.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command. See *TPF System Installation Support Reference* for more information about the policing routine and the EMR.

---

**OLDR2012T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **- SELECTIVE ACTIVATION NOT SUPPORTED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR ACTIVATE command was entered to selectively activate a loadset. However, the specified loadset cannot be selectively activated because your installation does not support selective activation.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Do one of the following:

- Enter the ZOLDR ACTIVATE command again and do not specify the SEL parameter.
- Use the selective activation user exits to provide support for selective activation.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command. See *TPF System Installation Support Reference* for more information about the selective activation user exits.

---

**OLDR2013T** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **ALREADY SCHEDULED TO BE ACTIVATED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR ACTIVATE command was entered to activate the loadset on a specific processor. However, the loadset is already scheduled to be activated on that processor.

**System Action:** None.

**User Response:** Do the following:

1. Ensure that the E-type loader policing routine is running on the processor where you want to activate the loadset.
2. If the policing routine is running, determine whether any errors occurred while processing the requests in the E-type loader master record (EMR).
3. Take the appropriate action to correct the problem.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command.

---

**OLDR2014W** *cccc* **- ACTIVATE ENDED - LOADSET** *lsname* **PROGRAMS ARE ALL EXCLUDED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR ACTIVATE command was entered to activate the specified loadset. However, the loadset cannot be activated because all the programs in that loadset were excluded.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Do the following:

1. Enter the ZOLDR REINCLUDE command to reinclude the programs that you want to activate in the loadset.
2. Enter the ZOLDR ACTIVATE command again.

See *TPF Operations* for more information about the ZOLDR REINCLUDE and ZOLDR ACTIVATE commands.

---

**OLDR2015I** *cccc* **- LOADSET** *lsname* **ASSIGNED ACTIVATION NUMBER** *actnum* **ON CPU** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*actnum*
The activation number assigned to the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The ZOLDR ACTIVATE command was entered to activate a loadset. The TPF system assigned the loadset the specified activation number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command. See *TPF System Installation Support Reference* for more information about activation numbers.

---

**OLDR2016T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- UNABLE TO FIND LOADSET** *lsname* **IN LSD**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because the TPF system cannot find the loadset in the loadset directory record (LSD).

**System Action:** The TPF system ends the E-type loader activate function and does not allow any other E-type loader functions to be started until this error is corrected.

**User Response:** See your IBM service representative.

In addition, you may need to enter the ZOLDR CLEAR command to resolve the problem if the capture and restore utility was involved.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function, LSD, and capture and restore utility.

---

**OLDR2017T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- EPD ERROR**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because an error occurred while reading an E-type loader program directory (EPD).

**System Action:** The TPF system ends the E-type loader activate function and does not allow any other E-type loader functions to be started until this error is corrected.

**User Response:** Do the following:

1. Refer to the message that was issued before this message to determine why the read error occurred.
2. Take the appropriate action to correct the error.
3. You may also need to enter the ZOLDR CLEAR command to resolve the problem if the capture and restore utility was involved.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function, EPD, and capture and restore utility.

---

**OLDR2018T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- INSUFFICIENT EXTRA PAT AREA RESOURCES**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because there are no slots available in the extra program allocation table (XPAT) for the new program versions contained in the loadset.

**System Action:** The TPF system ends the E-type loader activate function and does not allow any other E-type loader functions to be started on the processor where this error occurred until the error is corrected.

**User Response:** Do the following to increase the number of extra PAT slots that are available:

1. Enter the ZOLDR DELETE command to delete the loadsets that you no longer use.
2. Enter the ZOLDR ACCEPT command to accept loadsets.
3. If you still need more extra PAT slots, enter the ZCTKA command to increase the number of extra PAT slots that are available and IPL the TPF system.

See *TPF Operations* for more information about the ZOLDR ALTER, ZOLDR ACCEPT, and ZOLDR DELETE commands.

---

**OLDR2019T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- ERROR CALCULATING FILE ADDRESS FOR PROGRAM** *progname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** The loadset cannot be activated because an error occurred while calculating the file address of a program in the loadset.

**System Action:** The TPF system ends the E-type loader activate function and does not allow any other E-type loader functions to be started on the processor where this error occurred until the error is corrected. The TPF system also displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the additional messages that were displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function.

---

**OLDR2020T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- UNABLE TO READ ERD TO DYNAMICALLY ALLOCATE PROGRAM** *progname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** The unallocated program cannot be activated because an error occurred while reading the E-type loader rules database (ERD).

**System Action:** The TPF system ends the E-type loader activate function and does not allow any other E-type loader functions to be started on the processor where this error occurred until the error is corrected. The TPF system also displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the additional messages that were displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function and the ERD.

---

**OLDR2021T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- ECR ERROR**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The loadset cannot be activated because an error occurred while adding the activated loadset to the E-type loader control record (ECR).

**System Action:** The TPF system ends the E-type loader activate function and does not allow any other E-type loader functions to be started on the processor where this error occurred until the error is corrected. The TPF system also displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the additional messages that were displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function and the ECR.

---

**OLDR2022T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- MAXIMUM NUMBER OF LOADSETS ALREADY ACTIVE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because the maximum number of loadsets are already active on the processor.

**System Action:** The TPF system ends the E-type loader activate function.

**User Response:** Do one of the following:

- Enter the ZOLDR DEACTIVATE command to deactivate the specified loadset on the processor where the error occurred. This removes the activate request from the E-type loader control record (ECR).
- If the error was encountered on this processor, enter the ZOLDR DEACTIVATE command with the FORCE parameter specified to deactivate a loadset that is currently active on this processor. Specify the FORCE parameter to avoid scheduling a deactivate request in the ECR behind the activate request that caused the error.
- Increase the maximum number of loadsets that can be activated on the processor by doing the following:
  1. Modify the ELD_MAX_NUM_ACTIVATE_LOADSETS constant value in `c$idselv`
  2. Recompile all the E-type loader programs.
  3. Enter the ZOLDR CLEAR command to clear and initialize the E-type loader structures.
  4. IPL the TPF system for all the processors.
  5. Enter the ZOLDR LOAD command to load the loadsets that were active previously, including the loadset that caused the error.
  6. Enter the ZOLDR ACTIVATE command to activate the loadsets.

See *TPF Operations* for more information about the ZOLDR commands.

**OLDR2023T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- GETPC ERROR ON PROGRAM** *progname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** A GETPC error occurred while activating the specified program in the specified loadset. The program that caused the error is a program that must be in core or a program that had a GETPC call issued on its base version.

**System Action:** The TPF system ends the E-type loader activate function and does not allow any other E-type loader functions to be started on the processor where the error occurred until the error is corrected.

**User Response:** do the following:

1. Enter the ZRPGM command for all I-streams to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Macros* for more information about the GETPC macro. See *TPF Operations* for more information about the ZRPGM command.

**OLDR2024T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- UNABLE TO FILE LSD FOR LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The loadset cannot be activated because an input/output (I/O) error occurred. The loadset directory (LSD) cannot be updated to indicate that the specified processor has extra program allocation table (PAT) slots for the loadset.

**System Action:** The TPF system ends the E-type loader activate function and does not allow any other E-type loader functions to be started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Refer to the message that was issued before this message to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function and the LSD.

**OLDR2025W** *cccc* **- SYSTC SWITCH SELACT NOT ON - SELACT MUST BE ON IN ORDER TO SELECTIVELY ENTER LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR ACTIVATE *lsname* SEL command was entered. The selective activate SYSTC switch (SELACT) is off. For selected ECBs to use selectively activated loadsets, the SELACT switch must be on.

**System Action:** The TPF system issues the warning message and processing is continued.

**User Response:** Enter the ZSYSG command to set the SELACT switch on.

---

**OLDR2026T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- SHARED LIBRARY REDEFINITION ERROR FOR PROGRAM** *progname* **BASE TYPE-***type* **NEW TYPE-***type*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*progname*
The name of the program.

*type*
One of the following:

**LIBRARY**
Run-time (nondynamic) library.

**DLM**
Dynamic load module.

**BAL**
Basic Assembler Language (BAL) segment.

**TPFC**
TARGET(TPF) C segment.

**DLL**
Dynamic link library.

**Explanation:** An inconsistency was found in the program type while activating the specified program in the specified loadset. Segments that are run-time shared libraries in the base version (the version at the allocated address) must remain libraries for all activated versions; segments that are not libraries in the base version must not be changed to libraries in activated versions.

**System Action:** The TPF system ends the E-type loader activate function. No other E-type loader functions are started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Deactivate and delete the loadset.
2. Choose a new name for the program or rebuild the program by using the correct program type.
3. If the program is a new library added by the loadset, modify the allocator by changing a spare slot to the library and allocate the program on the online system.
4. Rebuild the loadset with the corrected program and load it online.

See *TPF Operations* for more information about the ZOLDR commands.

---

**OLDR2028T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- LIBRARY ORDINAL** *ord* **FOR LIBRARY** *libname1* **ALREADY IN USE BY LIBRARY** *libname2*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*ord* The ordinal assigned to the library.

*libname1*
The name of the library.

*libname2*
The name of the library.

**Explanation:** The TPF system cannot activate the specified library in the specified loadset because the ordinal number assigned to the library is already in use by another library.

**System Action:** The TPF system ends the E-type loader activate function. No other E-type loader functions are started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Determine which library is incorrect. If the library already using the ordinal number is an unallocated program in an E-type loader loadset, the loadset can be deactivated and deleted.
2. Deactivate and delete the loadset.
3. Choose a new, unused library ordinal number.
4. Rebuild the library interface, the library executable object, and any segments that were linked with call linkage stubs built by using the incorrect library interface definition.
5. Rebuild the loadset with the corrected library and load it online.

See *TPF Operations* for more information about the ZOLDR commands.

---

**OLDR2029T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- LIBRARY** *libname* **ORDINAL** *ord1* **PREVIOUSLY DEFINED WITH ORDINAL** *ord2*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*libname*
The name of the library.

*ord1*
The ordinal assigned to the library in the loadset.

*ord2*
The ordinal previously assigned to the library.

**Explanation:** The TPF system cannot activate the specified library in the specified loadset because the library was previously defined with a different ordinal number.

**System Action:** The TPF system ends the E-type loader activate function. No other E-type loader functions are started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Deactivate and delete the loadset.
2. Choose whether to use the previously defined ordinal number (if this is a new version of the existing library) or use a different library name for the new ordinal number (if this is a different library).
3. Rebuild the library interface, the library executable object, and any segments that were linked with call linkage stubs built by using the incorrect library interface definition.
4. Rebuild the loadset with the corrected library and load it online.

See *TPF Operations* for more information about the ZOLDR commands.

---

**OLDR2030I ACTIVATE OF LOADSET** *lsname* **COMPLETED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was activated.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function.

---

**OLDR2031I SELECTIVE ACTIVATE OF LOADSET** *lsname* **COMPLETED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was selectively activated.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about selective activation.

---

**OLDR2032W** *cccc* **- ACTIVATE FOR CPU** *id* **ON CPU** *id* **- LOADSET** *lsname* **- SHARED LIBRARY REDEFINITION WARNING FOR PROGRAM** *progname* **BASE TYPE-**_type_ **NEW TYPE-**_type_

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*progname*
The name of the program.

*type*
One of the following:

**LIBRARY**
ISO-C shared library.

**DLM**
ISO-C dynamic load module (DLM).

**BAL**
Basic Assembler Language (BAL) segment.

**TPFC**
TARGET(TPF) C segment.

**Explanation:** An inconsistency was found in the program type while activating the specified program in the specified loadset. Segments that are not libraries in the base version must not be changed to libraries in activated versions.

**System Action:** The TPF system continues the E-type loader activate function.

**User Response:** Do the following:

1. Determine if the mismatch in the program type is valid. It may be valid if the base version of the program was never loaded. If the mismatch is valid, no action is necessary.
2. If the mismatch is not valid, deactivate and delete the loadset.
3. Choose a new name for the program or build the program again by using the correct program type.
4. If the program is a new library added by the loadset, modify the allocator by changing a spare slot to the library and allocate the program on the online system.
5. Build the loadset again with the corrected program and load it online.

See *TPF Operations* for more information about the ZOLDR commands.

---

**OLDR2035I EXCLUDE FROM LOADSET** *lsname* **COMPLETED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The programs were excluded from the loadset.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude function.

---

**OLDR2036I ACTIVATE OF LOADSET** *lsname* **SCHEDULED FOR CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset is scheduled to be activated on the specified processor.

**System Action:** When other pending E-type loader requests are complete, the TPF system activates the loadset on the specified processor.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function.

---

**OLDR2037I SELECTIVE ACTIVATE OF LOADSET** *lsname* **SCHEDULED FOR CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset is scheduled to be selectively activated on the specified processor.

**System Action:** When other pending E-type loader requests are complete, the TPF system selectively activates the loadset on the specified processor.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about selective activation.

---

**OLDR2038I DEACTIVATE OF LOADSET** *lsname* **SCHEDULED FOR CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset is scheduled to be deactivated on the specified processor.

**System Action:** When other pending E-type loader requests are complete, the TPF system deactivates the loadset on the specified processor.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader deactivate function.

---

**OLDR2039I DEACTIVATE EXIT OF LOADSET** *lsname* **SCHEDULED FOR CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset is scheduled to be deactivated on the specified processor.

**System Action:** When other pending E-type loader requests are complete, the TPF system deactivates the loadset on the specified processor and causes any ECBs by using the programs in the loadset to exit.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader deactivate function.

---

**OLDR2040I DEACTIVATE SERRC OF LOADSET** *lsname* **SCHEDULED FOR CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset is scheduled to be deactivated on the specified processor.

**System Action:** When other pending E-type loader requests are complete, the TPF system deactivates the loadset on the specified processor, causes any ECBs by using the programs in the loadset to exit, and displays a system error dump.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader deactivate function.

---

**OLDR2041I EXCLUDE FROM LOADSET** *lsname* **SCHEDULED FOR CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The programs are scheduled to be excluded from the loadset on the specified processor.

**System Action:** When other pending E-type loader requests are complete, the TPF system excludes the programs from the loadset on the specified processor.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude function.

---

**OLDR2042I ACCEPT OF LOADSET** *lsname* **SCHEDULED FOR CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset is scheduled to be accepted on the specified processor.

**System Action:** When other pending E-type loader requests are complete, the TPF system accepts the loadset on the specified processor.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader accept function.

**OLDR2043I** **ACTIVATE OF LOADSET** *lsname* **COMPLETED FOR CPU** *id* **AS REQUESTED BY CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset was activated on the specified processor.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function.

---

**OLDR2044I** **SELECTIVE ACTIVATE OF LOADSET** *lsname* **COMPLETED FOR CPU** *id* **AS REQUESTED BY CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The loadset was selectively activated on the specified processor.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about selective activation.

---

**OLDR2048I** **EXCLUDE FROM LOADSET** *lsname* **COMPLETED FOR CPU** *id* **AS REQUESTED BY CPU** *id*

**Where:**

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** The programs were excluded from the loadset on the specified processor.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude function.

---

**OLDR2049E** *cccc* **- EMR FULL - UNABLE TO ADD ENTRY**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An E-type loader task cannot be scheduled for the request because the E-type loader master record (EMR) is full. Therefore, the request cannot be processed.

**System Action:** The TPF system displays another message that describes the effect of this error on the E-type loader request.

**User Response:** Do the following:

1. Ensure that the E-type loader policing routine is running on the processor.
2. When other pending E-type loader tasks are complete, enter the E-type loader request again.
3. If the problem continues, refer to the other message that is displayed to determine the cause of the problem and take the appropriate action.

See *TPF System Installation Support Reference* for more information about the loader functions.

---

**OLDR2050T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- GETPC ERROR ON PROGRAM** *progname* **GETPC RETURN CODE -** *rc*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*progname*
The name of the program.

*rc* The return code from the GETPC function.

**Explanation:** A GETPC error occurred while activating the specified program in the specified loadset. The program that caused the error is a program that must be in core or a program that had a GETPC call issued on its base version.

**System Action:** The TPF system ends the E-type loader activate function and does not allow any other E-type loader functions to be started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Enter the ZRPGM command for all I-streams to determine the cause of the error.
2. Take the appropriate action to correct the error.

See the *TPF C/C++ Language Support User's Guide* for more information about the return codes from the `getpc` function. See *TPF System Macros* for more information about the GETPC macro. See *TPF Operations* for more information about the ZRPGM command.

---

**OLDR2051T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- PROGRAM** *progname* **NOT ALLOCATED AS SHARED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** The TPF system cannot activate the specified program in the specified loadset because the program is a C load module, but it is not allocated as a shared program. C load modules are only allowed to be allocated as shared programs.

**System Action:** The TPF system ends the E-type loader activate function. No other E-type loader functions are started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Deactivate the loadset.
2. Enter **ZDPAT** to display the allocation characteristics of the program.
3. Enter **ZAPAT** to change the program to a shared program.
4. Enter the activate request again.
5. If the existing program cannot be changed to a shared program, use a new program name for the new version of the program.

See *TPF Operations* for more information about the ZOLDR, ZDPAT, and ZAPAT commands.

---

**OLDR2052T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- UNABLE TO OBTAIN STORAGE FOR ARRAY OF LIBRARY ADDRESSES**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The TPF system cannot activate the specified loadset because there is not enough storage available. The storage is needed to build an internal table for the array of library addresses. This table needs to be built because the loadset contains at least one library C load module.

**System Action:** The TPF system ends the E-type loader activate function. No other E-type loader functions are started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Deactivate the loadset.
2. Determine why there is not enough storage.
3. Take the appropriate action to correct the error.
4. Enter the activate request again when there is less system activity.

See *TPF Operations* for more information about the ZOLDR ACTIVATE and ZOLDR DEACTIVATE commands.

---

**OLDR2053T** *cccc* **- ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **- LOADSET** *lsname* **- DLL CODE FOUND IN RUN-TIME LIBRARY** *libname1*

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

*libname*
The name of the library.

**Explanation:** The TPF system cannot activate the specified library in the specified loadset because the library contains DLL code.

**System Action:** The TPF system ends the E-type loader activate function. No other E-type loader functions are started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Deactivate and delete the loadset.
2. Remove the DLL module from the run-time library or change the DLL module to be a non-DLL module.
3. Rebuild the library interface, the library executable object, and any segments that were linked with call linkage stubs built by using the incorrect library interface definition.
4. Rebuild the loadset with the corrected run-time library and load it online.

See *TPF Operations* for more information about the ZOLDR commands.

---

**OLDR2054T** *cccc* **– ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **– LOADSET** *lsname* **– NO MORE EAT SLOTS AVAILABLE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because there are no slots available in the ECB activation table (EAT).

**System Action:** The TPF system ends the E-type loader activate function and does not process any other E-type loader scheduled tasks on the processor where this error occurred until the error is corrected.

**User Response:** Do the following:

1. Enter the ZOLDR DEACTIVATE command to remove the scheduled activate of the loadset.
2. Allocate more EAT slots for the TPF system by increasing the value at the EATSIZE label in the CT38 copy member in the CCCTIN CSECT of the control program (CP).

See *TPF Operations* for more information about the ZOLDR ACTIVATE and ZOLDR DEACTIVATE commands.

---

**OLDR2055T** *cccc* **– ACTIVATE FOR CPU** *id* **ENDED ON CPU** *id* **– LOADSET** *lsname* **– MAXIMUM ACTIVATION NUMBER REACHED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be activated because the current system activation number is already at its maximum value.

**System Action:** The TPF system ends the E-type loader activate function and does not process any other E-type loader scheduled tasks on the processor where this error occurred until the error is corrected.

**User Response:** Do the following:

1. Enter the ZOLDR DEACTIVATE command to remove the scheduled activate of the loadset.
2. Perform an initial program load (IPL) of the TPF system to reset the value of the current system activation number.
3. Try to activate the loadset again.

See *TPF Operations* for more information about the ZOLDR ACTIVATE and ZOLDR DEACTIVATE commands.

---

**OLDR2080T** *cccc* **– ACTIVATE ENDED – LOADSET** *lsname* **– CANNOT ACTIVATE UFA2 WHEN TPFDF DATA COLLECTION IS ACTIVE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An attempt was made to activate the UFA2 program while TPFDF data collection is active on one or more of the processors affected by the ZOLDR ACTIVATE command. Since the UFA2 program is used to collect TPFDF data, and it is not entered by using standard enter/back mechanisms, a new version cannot be activated by using the E-type loader.

**System Action:** The TPF system ends the E-type loader activate function. All programs in the loadset remain inactive.

**User Response:** Do the following:

1. Stop TPFDF data collection on all processors affected by the ZOLDR ACTIVATE command.
2. Enter the ZOLDR ACTIVATE command that caused this error message.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command. See the TPFDF library for more information about the IBM TPFDF product.

---

**OLDR2081T** *cccc* **- ACTIVATE ENDED – LOADSET** *lsname* **– INVALID WHEN TPFDF FAST-LINK PROGRAMS ARE ACTIVE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An attempt was made to activate a loadset containing TPFDF fast-link table build programs. However, a previous loadset containing TPFDF fast-link programs is already active on one or more of the processors affected by the ZOLDR ACTIVATE command.

**System Action:** The TPF system ends the E-type loader activate function. All programs in the loadset remain inactive.

**User Response:** Do the following:

1. Accept or deactivate the active loadset on all processors affected by the ZOLDR ACTIVATE command that caused this error message.
2. Enter the ZOLDR ACTIVATE command that caused this error message.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command. See the TPFDF library for more information about the IBM TPFDF product.

---

**OLDR2082T** *cccc* **– ACTIVATE ENDED - LOADSET** *lsname* **– INVALID WHEN TPFDF FAST-LINK TABLE BUILD PROGRAMS ARE ACTIVE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An attempt was made to activate a loadset with either TPFDF fast-link or fast-link table build programs. However, a previous loadset containing TPFDF fast-link table build programs is already active on one or more of the processors affected by the ZOLDR ACTIVATE command.

**System Action:** The TPF system ends the E-type loader activate function. All programs in the loadset remain inactive.

**User Response:** Do the following:

1. Accept or deactivate the active loadset on all processors affected by the ZOLDR ACTIVATE command that caused this error message.
2. Enter the ZOLDR ACTIVATE command that caused this error message.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command. See the TPFDF library for more information about the IBM TPFDF product.

---

**OLDR2083T** *cccc* **– ACTIVATE ENDED – LOADSET** *lsname* **– CANNOT ACTIVATE TPFDF FAST-LINK AND FAST-LINK TABLE BUILD PROGRAMS AT THE SAME TIME**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An attempt was made to activate a loadset that contains both TPFDF fast-link and fast-link table build programs.

**System Action:** The TPF system ends the E-type loader activate function. All programs in the loadset remain inactive.

**User Response:** Do the following:

1. Divided the loadset into two to separate the fast-link programs from the fast-link table build programs.
2. Be sure one of the loadsets is activated and accepted.
3. Activate the second loadset.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command. See the TPFDF library for more information about the IBM TPFDF product.

---

**OLDR2085T** *cccc* **– ACTIVATE ENDED – LOADSET** *lsname* **– CANNOT ACTIVATE UF0A, UFAX, OR UFAY WHEN TPFDF DATA COLLECTION IS ACTIVE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An attempt was made to activate the UF0A, UFAX, or UFAY program while TPFDF data collection is active on one or more of the processors affected by the ZOLDR ACTIVATE command. Since the fast-link table entries for the UF0A, UFAX, and UFAY programs are altered during TPFDF data collection and are restored when collection is stopped, new versions cannot be activated by using the E-type loader.

**System Action:** The TPF system ends the E-type loader activate function. All programs in the loadset remain inactive.

**User Response:** Do the following:

1. Stop TPFDF data collection on all processors affected by the ZOLDR ACTIVATE command.
2. Enter the ZOLDR ACTIVATE command that caused this error message.

See *TPF Operations* for more information about the ZOLDR ACTIVATE command. See the TPFDF library for more information about the IBM TPFDF product.

---

**OLDR3000I** *cccc* **- LOADSET** *lsname* **HAS BEEN LOADED FROM DDNAME** *ddname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*ddname*
The data definition name of the input device.

**Explanation:** This is the normal response to the ZOLDR LOAD command. The loadset was loaded to the TPF system from the specified input device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3001I** *cccc* **- LOAD FOR DDNAME** *ddname* **COMPLETED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** This is the normal response to the ZOLDR LOAD command. The loadsets contained on the specified input device were loaded to the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3002T** *cccc* **- LOAD ENDED - DDNAME** *ddname* **NOT FOUND**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The data definition name specified in the ZOLDR LOAD command is not defined in the TPF system.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Ensure that you specified the correct data definition name for the ZOLDR LOAD command.
2. Use the ZDSMG DEFINE command to define the data definition name, if necessary.

See *TPF Operations* for more information about the ZOLDR LOAD andZDSMG DEFINE commands.

**OLDR3003T** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- ERROR READING FROM INPUT DEVICE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** One of the following errors occurred while opening or reading from the specified input device:

- The input device was already opened.
- A record read from the input device was not 4 K in length.
- The input device was not mounted.
- A hardware error occurred.

**System Action:** The TPF system ends the E-type loader load request.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Take the appropriate action to correct the error.
3. Enter the ZOLDR LOAD command again.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3004T** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- UNEXPECTED INPUT RECORD DETECTED FOR STATE** *x*

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

*x* The current state of the E-type loader load function.

**Explanation:** The records read from the specified input device were not in the correct format. The TPF system expects the following records, depending on the current state of the E-type loader load function:

| State | Expected Record |
|---|---|
| **1** | The first record, which indicates the subsystem name and provides a summary of the loadsets. |
| **2** | One of the following:<br>• Another record that indicates the subsystem name and provides a summary of the loadsets<br>• The first program allocation table (PAT) record<br>• The first loadset header record. |
| **3** | One of the following:<br>• Another PAT record<br>• The first loadset header record<br>• The end of job record. |
| **4** | The first program record for the loadset. |
| **5** | A program version code record. |
| **6** | One of the following:<br>• Another program record for the loadset<br>• Another loadset header record<br>• The end of job record. |

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Use the E-type loader offline job routine to rebuild the input device. If you use a different offline job routine, ensure that the records are put in the correct order.

See *TPF System Installation Support Reference* for more information about the E-type loader load function and the offline job routine.

---

**OLDR3005T** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- END OF DEVICE ENCOUNTERED BEFORE END OF JOB**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The TPF system reached the end of the input device before an end of job record was encountered.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Use the E-type loader offline job routine to rebuild the input device. Ensure that the input device contains an end of job record.

See *TPF System Installation Support Reference* for more information about the E-type loader offline job routine.

---

**OLDR3006T** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- NOT RUNNING ON SUBSYSTEM INDICATED IN INPUT -** *subsystem*

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

*subsystem*
The subsystem name on the input device.

**Explanation:** The name of the subsystem from which the ZOLDR LOAD command was entered does not match the name of the subsystem specified on the input device.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do one of the following:

- Enter the ZOLDR LOAD command on the correct subsystem.
- Rebuild the input device and specify the correct subsystem.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3007T** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- ZOLDR RECLAIM IS RUNNING**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The E-type loader load function cannot be started while the E-type loader reclaim function is running.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Wait for the E-type loader reclaim function to end.
2. Enter the ZOLDR LOAD command again.

See *TPF Operations* for more information about the ZOLDR LOAD command. See *TPF System Installation Support Reference* for more information about the E-type loader reclaim function.

---

**OLDR3008W** *cccc* **- LOADSET** *lsname* **SKIPPED FOR DDNAME** *ddname* **- LOADSET ALREADY EXISTS ON ONLINE SYSTEM**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*ddname*
The data definition name of the input device.

**Explanation:** A loadset with the specified loadset name already exists on this subsystem.

**System Action:** The TPF system does not load the duplicate loadset but continues the E-type loader load function.

**User Response:** Do one of the following:

- If you want to replace the existing loadset, do the following:
  1. Enter the ZOLDR DELETE command to delete the existing loadset from the subsystem.
  2. Enter the ZOLDR LOAD command again to load the new loadset.
- If you want change the name of the new loadset, do the following:
  1. Enter the ZOLDR DISPLAY command to view the loadset names that are currently used.
  2. Use the E-type loader offline job routine to rebuild the input device and specify a different name for the loadset.
  3. Enter the ZOLDR LOAD command again to load the new loadset.

See *TPF Operations* for more information about the ZOLDR LOAD and ZOLDR DISPLAY commands.

---

**OLDR3009T** *cccc* **- LOAD ENDED FOR DDNAME** *ddname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** An error occurred during the E-type loader load function.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Review the previous error message to determine the cause of the error.
2. Take the appropriate action to correct the error.
3. Enter the ZOLDR LOAD command again.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3010W** *cccc* **- NO VERSION CODE OR ASSEMBLY DATE INFORMATION FOUND FOR PROGRAM** *progname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

**Explanation:** The name of the program specified in the program version record (PVR) does not match the name of the program specified in the program record.

**System Action:** The TPF system continues the E-type loader load function but does not update the PVR with a version code or assembly date for the program.

**User Response:** Do the following:

1. Enter the ZOLDR DELETE command to delete the loadset in which the program is contained.
2. Use the E-type loader offline job routine to rebuild the input device.
3. Ensure that the input device creates program version code records in the correct format.
4. Enter the ZOLDR LOAD command again.

See *TPF Operations* for more information about the ZOLDR LOAD and ZOLDR DELETE commands.

---

**OLDR3011W** *cccc* **- LOADSET** *lsname* **NOT LOADED FOR DDNAME** *ddname* **- NOT FOUND ON INPUT DEVICE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*ddname*
The data definition name of the input device.

**Explanation:** The loadset specified in the ZOLDR LOAD command does not exist on this input device.

**System Action:** The TPF system continues the E-type loader load function.

**User Response:** Do one of the following:

- Enter the ZOLDR LOAD command again and ensure that the loadset name and data definition name are correct.
- Create an input device that contains the loadset.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3012T** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- NO PAT RECORDS FOUND ON INPUT DEVICE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The ZOLDR LOAD command was entered to load updates to the program allocation table. However, the updated PAT was not found on the input device.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Update the load deck to specify a version code on the PATVERS= card.
2. Use the E-type loader offline job routine to rebuild the input device.
3. Enter the ZOLDR LOAD command again.

See *TPF Operations* for more information about the ZOLDR LOAD command. See *TPF System Installation Support Reference* for more information about the E-type loader offline job routine.

---

**OLDR3013E** *cccc* **- LOAD FOR LOADSET** *lsname* **ON DDNAME** *ddname* **DID NOT COMPLETE - LOADSET DELETED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*ddname*
The data definition name of the input device.

**Explanation:** The E-type loader load function encountered a system interruption while loading programs in the specified loadset from the input device to E-type loader fixed-file records (#OLDx).

**System Action:** The TPF system ends the E-type loader load function and updates loadset directory (LSD) to indicate that the load did not complete.

**User Response:** Enter the ZOLDR LOAD command again.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3014W** *cccc* **- LOADSET NAME** *lsname* **APPEARS MORE THAN ONCE IN INPUT MESSAGE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The same loadset name was specified more than once in the ZOLDR LOAD command.

**System Action:** The TPF system ignores the duplicate loadset name.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3015T** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- TIMESTAMP MISMATCH DETECTED BETWEEN OFFLINE IPAT AND ONLINE PAT**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The time stamp in the online program allocation table (PAT) does not agree with the time stamp from the PAT in the input file, which was copied from the offline IPAT. This means that the program allocation characteristics in the online system may not agree with those used while running the offline job that was used to prepare the E-type loader input file.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do one of the following:

- Run the offline job again and specify the correct version of the offline PAT.
- Run the offline job again and specify PATVERS=NONE to avoid checking the compatibility between the offline IPAT and the online PAT.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3016T** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- ERROR DURING RECLAIM CHECK**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** While checking for E-type loader reclaim status, an error occurred. This message is preceded by a detailed message of the specific error.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** See the user response from the preceding message for more information.

See *TPF Operations* for more information about the ZOLDR LOAD command.

---

**OLDR3200T** *cccc* **- ACCEPT ENDED - LOADSET** *lsname* **NOT ACCEPTED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** One of the following errors occurred:

- The specified loadset does not contain any programs.
- An error occurred while searching the E-type loader master record (EMR).
- An error occurred while searching the loadset directory (LSD).
- An error occurred while searching the E-type loader control record (ECR).
- An error occurred while searching the E-type loader program directory (EPD).
- The TPF system cannot schedule an accept request in the EMR.
- An error occurred while processing a program load module.
- An error occurred while trying to hold a master extra program record (MXP).
- An error occurred while obtaining the next available #OLD record.
- The TPF system ran out of extra #XPRG records.
- An error occurred while trying to find an #XPRG record.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Review the previous messages to determine the cause of the error.
2. Take the appropriate action to correct the error.
3. Enter the ZOLDR ACCEPT command again.

See *TPF Operations* for more information about the ZOLDR ACCEPT command.

---

**OLDR3201T** *cccc* **- ACCEPT ENDED - LOADSET** *lsname* **DOES NOT EXIST**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The loadset name specified for the ZOLDR ACCEPT command is not valid.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Enter the ZOLDR ACCEPT command again and specify a valid loadset name.

See *TPF Operations* for more information about the ZOLDR ACCEPT command.

---

**OLDR3202T** *cccc* **- ACCEPT ENDED - LOADSET** *lsname* **PENDING DELETION**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is being deleted and cannot be accepted.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Enter the ZOLDR LOAD command to load the loadset again.
2. Enter the ZOLDR ACTIVATE command to activate the loadset.
3. Enter the ZOLDR ACCEPT command to accept the loadset.

See *TPF Operations* for more information about the ZOLDR LOAD, ZOLDR ACCEPT, and ZOLDR ACCEPT commands.

---

**OLDR3203T** *cccc* **- ACCEPT ENDED - LOADSET** *lsname* **SELECTIVELY ACTIVATED ON PROCESSORS-** *id id***...**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The name of the processor where the loadset is selectively activated.

**Explanation:** The specified loadset is selectively activated. You cannot accept a selectively activated loadset.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Enter the ZOLDR DEACTIVATE command to deactivate the loadset.
2. Enter the ZOLDR ACTIVATE command to activate the loadset on all processors. Do not specify the selective activate option.
3. Enter the ZOLDR ACCEPT command to accept the loadset.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE, ZOLDR ACTIVATE and ZOLDR ACCEPT commands.

---

**OLDR3204T** *cccc* **- ACCEPT ENDED - LOADSET** *lsname* **NOT ACTIVE ON PROCESSORS-** *id id***...**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The name of the processor where the loadset is not activated.

**Explanation:** The specified loadset must be active on all the processors in the complex before it can be accepted.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Enter the ZOLDR ACTIVATE command to activate the loadset on all the processors in the complex.
2. Enter the ZOLDR ACCEPT command to accept the loadset.

See *TPF Operations* for more information about the ZOLDR ACTIVATE and ZOLDR ACCEPT commands.

---

**OLDR3205T** *cccc* **- ACCEPT ENDED - LOADSET** *lsname* **CONTAINS UNALLOCATED PROGRAMS - UNABLE TO REPORT PROGRAMS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset contains unallocated programs. All programs in the loadset must be allocated before it can be accepted. There was not enough core storage available to display a list of the unallocated programs.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Convert any unallocated programs to allocated programs.
2. Enter the ZOLDR ACCEPT command again.

See *TPF System Installation Support Reference* for information about converting unallocated programs to allocated programs. See *TPF Operations* for more information about the ZOLDR ACCEPT command.

---

**OLDR3206T** *cccc* **- ACCEPT ENDED - LOADSET** *lsname* **CONTAINS UNALLOCATED PROGRAMS - SEE RO FOR DETAILS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset contains unallocated programs. All programs in the loadset must be allocated before it can be accepted.

**System Action:** The TPF system ends the E-type loader accept function and displays a list of the unallocated programs on the receive-only (RO) computer room agent set (CRAS) console.

**User Response:** Do the following:

1. Convert any unallocated programs to allocated programs.
2. Enter the ZOLDR ACCEPT command again.

See *TPF System Installation Support Reference* for information about converting unallocated programs to allocated programs. See *TPF Operations* for more information about the ZOLDR ACCEPT command.

---

**OLDR3207T** *cccc* **- ACCEPT ENDED - LOADSET** *lsname* **INTERSECTS WITH PREVIOUSLY ACTIVATED LOADSETS - SEE RO FOR DETAILS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset contains versions of one or more programs that are also contained in other loadsets.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do one of the following:

- Enter the ZOLDR ACCEPT command to accept the loadsets in the same order that they were activated. This ensures that the most recently activated version of the program is copied to the allocated address.
- Enter the ZOLDR EXCLUDE command to exclude the versions of the programs from the other loadsets.
- Enter the ZOLDR DEACTIVATE command to deactivate the other loadsets that contain versions of the programs.

See *TPF Operations* for more information about the ZOLDR ACCEPT, ZOLDR EXCLUDE, and ZOLDR DEACTIVATE commands.

---

**OLDR3208E** *cccc* **- PROGRAMS IN LOADSET** *lsname* **ARE ALL EXCLUDED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** All the programs in the specified loadset were excluded from that loadset.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Enter the ZOLDR REINCLUDE command to include the appropriate programs in the loadset again.
2. Enter the ZOLDR ACCEPT command again.

See *TPF Operations* for information about the ZOLDR REINCLUDE and ZOLDR ACCEPT commands.

---

**OLDR3209E** *cccc* **- LOADSET** *lsname* **NOT FOUND IN LSD - UNABLE TO CHECK FOR INTERSECTIONS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be found in the loadset directory (LSD) because data is damaged in the LSD, the E-type loader control record (ECR), or the E-type loader master record (EMR).

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Determine which file structure was damaged and how the damage occurred.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for information about the file structures.

---

**OLDR3210E** *cccc* **- UNABLE TO COMPLETE ACCEPT OF LOADSET** *lsname* **- ACCEPT WILL BE RETRIED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The programs in the specified loadset were accepted. However, the loadset cannot be deleted because an error occurred while searching the loadset directory (LSD) or the E-type loader control record (ECR).

**System Action:** The TPF system tries again to delete the accepted loadset.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the problem.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for information about the E-type loader accept function.

---

**OLDR3211E** *cccc* **- UNABLE TO COMPLETE ACCEPT OF LOADSET** *lsname* **- LOADSET NOT FOUND IN LSD**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The programs in the specified loadset were accepted. However, the loadset cannot be deleted because it was not found in the loadset directory (LSD).

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Determine the cause of the problem in the LSD.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for information about the LSD.

---

**OLDR3212E** *cccc* **- ACCEPT OF LOADSET** *lsname* **INCOMPLETE - ACCEPT WILL BE RETRIED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The TPF system cannot accept programs in the specified loadset because an error occurred reading or writing a fixed file record that is needed during the accept process.

**System Action:** The TPF system ends the E-type loader accept function. The E-type loader policing routine tries again to accept the loadset.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the problem.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for information about the E-type loader accept function and the E-type loader policing routine.

---

**OLDR3213E** *cccc* **- ACCEPT OF LOADSET** *lsname* **INCOMPLETE - LOADSET NOT FOUND IN LSD**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The programs in the specified loadset were not accepted because the loadset was not found in the loadset directory (LSD).

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for more information about the LSD and the E-type loader accept function.

---

**OLDR3214W** *cccc* **- PROGRAM NAME MISMATCH FOR LOADSET** *lsname* **NAME IN EPD ENTRY IS** *progname* **NAME IN PROGRAM RECORD IS** *progname* **ALLOCATED ADDRESS NOT OVERLAID**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** The program name in the E-type loader program directory (EPD) does not match the program name in the program record in the loadset. Therefore, the program in the loadset cannot be accepted.

**System Action:** An empty record has been filed out for this program and accept processing continues.

**User Response:** Do the following:

1. Determine whether the problem occurred in the EPD or the program record of the loadset.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for information about the EPD and the E-type loader accept function.

---

**OLDR3215T** *cccc* **- ACCEPT ENDED - ACCEPT IS ALREADY IN PROGRESS FOR LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is already in the process of being accepted.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader accept function.

---

**OLDR3216I** *cccc* **- LOADSET** *lsname* **ACCEPTED AND SCHEDULED FOR DEACTIVATION AND DELETION**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** This is the normal response to the ZOLDR ACCEPT command. The specified loadset was accepted and is now scheduled to be to be deleted.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for information about the ZOLDR ACCEPT command.

---

**OLDR3217E** *cccc* **- UNABLE TO REMOVE EMR TASK FOR ACCEPTED LOADSET** *lsname* **- ACCEPT WILL BE RETRIED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The E-type loader accept request cannot be removed from the E-type loader master record (EMR).

**System Action:** The TPF system tries again to remove the accept request from the EMR.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the problem.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for information about the EMR and the E-type loader accept function.

---

**OLDR3218E** *cccc* **- UNABLE TO ADD EMR TASK FOR ACCEPTED LOADSET** *lsname* **- ACCEPT WILL BE RETRIED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The E-type loader accept request cannot be added to the E-type loader master record (EMR).

**System Action:** The TPF system tries again to add the accept request to the EMR.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the problem.
2. Take the appropriate action to correct the problem.

See *TPF System Installation Support Reference* for information about the EMR and the E-type loader accept function.

---

**OLDR3219W** *cccc* **- GETPC ERROR ON PROGRAM** *progname* **- ACCEPT OF LOADSET** *lsname* **CONTINUES**

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

*lsname*
The name of the loadset.

**Explanation:** An error occurred in the GETPC macro while locking the new version of the base program in core.

**System Action:** The TPF system continues the E-type loader accept function.

**User Response:** Do the following:

1. Enter the ZRPGM command to lock the program in core.
2. Review any error messages that display to determine the cause for the error in the GETPC macro.

See *TPF Operations* for information about the ZRPGM command. See *TPF System Macros* for more information about the GETPC macro.

---

**OLDR3220E** *cccc* **- UNABLE TO UPDATE PROGRAM VERSION RECORD FOR PROGRAM** *progname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

**Explanation:** The program was accepted, however the version code and assembly date for the program were not updated in the program version record (PVR).

**System Action:** The TPF system continues the E-type loader accept request.

**User Response:** Do the following:

1. Review the previous error messages to determine the cause of the error.
2. Manually update the PVR with the new version code and assembly date.

See *TPF System Installation Support Reference* for information about the PVR and the E-type loader accept function.

---

**OLDR3221E** *cccc* **- UNABLE TO UPDATE PROGRAM VERSION RECORD FOR PROGRAM** *progname* **- PROGRAM NOT ALLOCATED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

**Explanation:** The specified program is not allocated and therefore does not have an entry in the program version records (PVRs).

**System Action:** The TPF system continues the E-type loader function.

**User Response:** Do the following:

1. Convert the unallocated program to an allocated program.
2. Enter the ZOLDR command again.

See *TPF System Installation Support Reference* for information about converting unallocated programs to allocated programs. See *TPF Operations* for more information about the ZOLDR commands.

---

**OLDR3222W** *cccc* **- LOADSET** *lsname* **HAS BEEN DEACTIVATED AFTER IT WAS ACCEPTED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The ZOLDR DEACTIVATE command was entered with the Force option while the E-type loader accept function was in progress.

**System Action:** The TPF system continues the E-type loader accept function and ignores the deactivate request.

**User Response:** After the E-type loader accept function completes, enter the ZOLDR ACCEPT command again to accept the correct loadset.

See *TPF Operations* for information about the ZOLDR ACCEPT command.

---

**OLDR3223T** *cccc* **- ACCEPT ENDED - LOADSET** *lsname* **CONTAINS THESE UNALLOCATED PROGRAMS-**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset contains unallocated programs. All programs in the loadset must be allocated before it can be accepted.

**System Action:** The TPF system ends the E-type loader accept function and displays this message on the receive-only (RO) computer room agent set (CRAS) console.

**User Response:** Do the following:

1. Convert any unallocated programs to allocated programs.
2. Enter the ZOLDR ACCEPT command again.

See *TPF System Installation Support Reference* for information about converting unallocated programs to allocated programs. See *TPF Operations* for more information about the ZOLDR ACCEPT command.

---

**OLDR3224T** *cccc* **- LOADSET** *lsname* **INTERSECTS WITH PREVIOUSLY ACTIVATED LOADSETS-**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset contains versions of one or more programs that are also contained in other loadsets. This message is followed by a display of the programs that are also contained in other loadsets.

**System Action:** The TPF system ends the E-type loader accept function and displays this message on the receive-only (RO) computer room agent set (CRAS) console.

**User Response:** Do one of the following:

- Enter the ZOLDR ACCEPT command to accept the loadsets in the same order that they were activated. This ensures that the most recently activated version of the program is copied to the allocated address.
- Enter the ZOLDR EXCLUDE command to exclude the versions of the programs from the other loadsets.
- Enter the ZOLDR DEACTIVATE command to deactivate the other loadsets that contain versions of the programs.

See *TPF Operations* for more information about the ZOLDR ACCEPT, ZOLDR EXCLUDE, and ZOLDR DEACTIVATE commands.

---

**OLDR3225T** *cccc* **– ACCEPT ENDED – INSUFFICIENT EXTRA PROGRAM RECORDS AVAILABLE FOR LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The TPF system cannot accept programs in the specified loadset because there are not enough extra program records (#XPRGn) available.

**System Action:** The TPF system ends the E-type loader accept function.

**User Response:** Do the following:

1. Define additional ordinals in the #XPRGn record type for the program base.
2. Load the new FACE table that has the additional records by using either the auxiliary loader or the general file loader.
3. Enter the accept request again.

See *TPF System Installation Support Reference* for information about the E-type loader accept function, the E-type loader policing routine, the auxiliary loader, and the general file loader.

---

**OLDR3226W** *cccc* **– PROGRAM CANNOT BE ACCEPTED, LOADSET** *lsname* **NAME IN EPD ENTRY IS** *progname* **AN EMPTY RECORD HAS BEEN FILED FOR THIS PROGRAM.**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** The TPF system cannot accept the specified program in the specified loadset. This message is preceded by an error message indicating the error that prevented the program from being accepted.

**System Action:** An empty record has been filed out for this program and the accept processing continues.

**User Response:** Do the following:

1. Review the previous messages to determine the error that prevented the program from being accepted.
2. Take the appropriate actions as listed in the User Response information for the previous error.
3. Reload the program that was reported in error.

See *TPF System Installation Support Reference* for information about the E-type loader accept function.

---

**OLDR3227W** *cccc* **– ADATA WILL NOT BE AVAILABLE IN BASE VERSION OF PROGRAM** *progname*

**Where:**

*cccc*
The name of the segment that detected the error.

*progname*
The name of the program.

**Explanation:** An error occurred during E-type loader (OLDR) ACCEPT processing while attempting to accept a program that was loaded with an ADATA file. A detailed message describing the problem precedes this message.

**System Action:** The program will be accepted without the ADATA file.

**User Response:** Do the following:

1. Review the previous message to determine the error that prevented the program from being accepted.
2. Take the appropriate action as listed in the User Response information for the previous error.
3. Load the program that was reported in error again.

See *TPF System Installation Support Reference* for more information about the OLDR ACCEPT function.

**OLDR3228W** *cccc* **– UNABLE TO READ MASTER APRG RECORD ADATA WILL NOT BE ACCEPTED, LOADSET** *isname*

**Where:**

*cccc*
The name of the segment that detected the error.

*isname*
The name of the loadset.

**Explanation:** An error occurred during E-type loader (OLDR) ACCEPT processing while trying to read the master APRG record (#APRG*n* ordinal 0).

**System Action:** All programs in the loadset will be accepted without the ADATA file.

**User Response:** Do one of the following:

- If the ADATA file is not required for the specified program, do nothing.
- If the ADATA file is required, do one of the following:
  - Load the specified program again with the ADATA file by using OLDR and perform testing by using the debugger without accepting the program.
  - Determine the cause of the error by examining existing program and ADATA records and correcting the problem. See your system programmer for help with these data structures.
  - Allocate #APRG*n* records and load the program again.

See *TPF System Installation Support Reference* for more information about loader functions.

---

**OLDR3229W** *cccc* **– NOT ENOUGH ADATA RECORDS - ADATA WILL NOT BE AVAILABLE IN BASE VERSION OF PROGRAM** *progname*

**Where:**

*cccc*
The name of the segment that detected the error.

*progname*
The name of the program.

**Explanation:** E-type loader ACCEPT processing attempted to accept one or more ADATA files for a real-time program and determined that there were not enough #APRG*n* records available.

**System Action:** The ACCEPT process continues; however, the loader does not attempt to accept ADATA files for any real-time programs after the error occurred.

**User Response:** To accept real-time programs with ADATA files after this error occurs, allocate additional #APRG*n* records and reload programs with the ADATA file by using the E-type loader (OLDR).

See *TPF System Installation Support Reference* for more information about loader functions. See *TPF System Generation* for more information about changing record allocations.

---

**OLDR3400T** *cccc* **- UNABLE TO DISPLAY INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader information cannot be displayed because one of the following errors occurred:

- The specified loadset does not contain any programs.
- An error occurred while searching the E-type loader master record (EMR).
- An error occurred while searching the loadset directory (LSD).
- An error occurred while searching the E-type loader control record (ECR).
- An error occurred while searching the E-type loader program directory (EPD).
- The name of the loadset cannot be found in the LSD.

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** Do the following:

1. Review the previous messages to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader display function.

---

**OLDR3401T** *cccc* **- LOADSET** *lsname* **DOES NOT EXIST**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The E-type loader information cannot be displayed because the specified loadset does not exist on this subsystem.

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** Enter the ZOLDR DISPLAY command again and specify the subsystem where the loadset exists.

See *TPF Operations* for more information about the ZOLDR DISPLAY command.

---

**OLDR3402T** *cccc* **- LOADSET** *lsname* **IS NOT ACTIVE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is not active on the subsystem. The ZOLDR DISPLAY command can be entered with the Inter option only for an active loadset.

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** Enter the ZOLDR DISPLAY INTER command again and specify the name of an active loadset or specify the subsystem ID for the loadset.

See *TPF Operations* for more information about the ZOLDR DISPLAY command.

---

**OLDR3403I** *cccc* **- NO OTHER LOADSET INTERSECTS WITH LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset does not intersect with any other active loadsets. Loadsets intersect when they contain common programs.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader display function.

---

**OLDR3404I** *cccc* **- LOADSET** *lsname* **INTERSECTS WITH THESE PREVIOUSLY ACTIVATED LOADSETS-**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** This is the normal response to the ZOLDR DISPLAY command when the Inter option is specified. This message is followed by a display of all active loadsets that contain programs common to the loadset specified in this command. It also displays the names of the programs that are common to both loadsets.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR DISPLAY command and an example of the informational display.

---

**OLDR4001E** **FACS ERROR CALCULATING ADDRESS OF** *structure* **- RECORD TYPE** *rectype* **- ORDINAL NUMBER** *ordnum*

**Where:**

*structure*
The type of structure, which can be one of the following:

**ELT**
E-type loader record table

**EMR**
E-type loader master record

**EPD**
E-type loader program directory

**ERD**
E-type loader rules database

**LSD**
Loadset directory (LSD) record

**PGM**
Program.

**XPRG**
Extra program record.

*rectype*
The record type of the structure.

*ordnum*
The ordinal number of the record.

**Explanation:** The file address compute program for symbolic record types (FACS) returned an error while calculating the file address of a processor shared E-type loader structure. Either the FACE table is damaged or the E-type loader record type does not exist.

**System Action:** The TPF system displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the additional messages that were displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF Application Programming* for more information about the FACS and the FACE table.

---

**OLDR4002E** **FACS ERROR CALCULATING ADDRESS OF** *structure* **- CPU ID** *id* **- RECORD TYPE** *rectype* **- ORDINAL NUMBER** *ordnum*

**Where:**

*structure*
The type of structure, which can be one of the following:

**ECR**
E-type control record.

**WRT**
Working record table.

*id* The identifier assigned to the processor.

*rectype*
The record type of the structure.

*ordnum*
The ordinal number of the record.

**Explanation:** The file address compute program for symbolic record types (FACS) returned an error while calculating the file address of a processor unique E-type loader structure. Either the FACE table is damaged or the E-type loader record type does not exist.

**System Action:** The TPF system displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the additional messages that were displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF Application Programming* for more information about the FACS and the FACE table.

---

**OLDR4003E FACS ERROR CALCULATING ADDRESS OF RECORD TYPE** *rectype* **- ORDINAL NUMBER** *ordnum*

**Where:**

*rectype*
The record type of the structure.

*ordnum*
The ordinal number of the record.

**Explanation:** The file address compute program for symbolic record types (FACS) returned an error while calculating the file address of a structure that is not dedicated to the E-type loader. Either the FACE table is damaged or the E-type loader record type does not exist.

**System Action:** The TPF system displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the additional messages that were displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF Application Programming* for more information about the FACS and the FACE table.

---

**OLDR4004E I/O ERROR READING** *structure* **- FILE ADDRESS** *address* **- SUG** *ii* **- SUD** *jj*

**Where:**

*structure*
The type of structure, which can be one of the following:

**ELT**
E-type loader record table

**EMR**
E-type loader master record

**EPD**
E-type loader program directory

**ERD**
E-type loader rules database

**LSD**
Loadset directory record

**PGM**
Program.

**XPRG**
Extra program record.

*address*
The file address of the E-type loader structure

*ii* The gross data level error indicator.

*jj* The detail data level error indicator.

**Explanation:** An error occurred while reading a processor shared E-type loader structure at the specified file address.

**System Action:** The TPF system displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the SUG, SUD, and the additional messages that were displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.
3. You may also need to enter the ZOLDR CLEAR command to resolve the problem if the capture and restore utility was involved.

See *TPF General Macros* for more information about the SUG and the SUD. See *TPF System Installation Support Reference* for more information about the capture and restore utility.

---

**OLDR4005E I/O ERROR READING** *structure* **- CPU ID** *id* **- FILE ADDRESS** *address* **- SUG** *ii* **- SUD** *jj*

**Where:**

*structure*
The type of structure, which can be one of the following:

**ECR**
E-type loader control record

**WRT**
Working record table.

*id* The identifier assigned to the processor.

*address*
The file address of the E-type loader structure.

*ii* The gross data level error indicator.

*jj* The detail data level error indicator.

**Explanation:** An error occurred while reading a processor unique E-type loader structure at the specified file address on the specified processor.

**System Action:** The TPF system displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the SUG, SUD, and the additional messages that were displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.
3. You may also need to enter the ZOLDR CLEAR command to resolve the problem if the capture and restore utility was involved.

See *TPF General Macros* for more information about the SUG and the SUD. See *TPF System Installation Support Reference* for more information about the capture and restore utility.

---

**OLDR4006E I/O ERROR READING FILE ADDRESS** *address* **- SUG** *ii* **- SUD** *jj*

**Where:**

*address*
The file address of the structure.

*ii* The gross data level error indicator.

*jj* The detail data level error indicator.

**Explanation:** An error occurred while reading a structure at the specified file address. This structure is not dedicated to the E-type loader.

**System Action:** The TPF system displays additional messages that describe the error.

**User Response:** Do the following:

1. Refer to the SUG, SUD, and the additional messages that were displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.
3. You may also need to enter the ZOLDR CLEAR command to resolve the problem if the capture and restore utility was involved.

See *TPF General Macros* for more information about the SUG and the SUD. See *TPF System Installation Support Reference* for more information about the capture and restore utility.

---

**OLDR4010E UNABLE TO PROCESS SCHEDULED E-TYPE LOADER TASKS - ERROR READING EMR ON CPU** *id*

**Where:**

*id* The identifier assigned to the processor.

**Explanation:** An error occurred while retrieving the E-type loader master record (EMR). Therefore, the E-type loader requests scheduled in the EMR cannot be processed on the specified processor.

**System Action:** The TPF system displays another message that describes why the EMR cannot be retrieved.

**User Response:** Do the following:

1. Refer to the message that is displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the EMR.

---

**OLDR4011E E-TYPE LOADER PROCESSING OF SCHEDULED TASKS ENDED DUE TO AN ERROR CONDITION. THESE TASKS WILL BE RE-TRIED ON THE NEXT E-TYPE LOADER POLICING INTERVAL**

**Explanation:** An error occurred while processing the E-type loader requests scheduled in the E-type loader master record (EMR). These requests cannot be processed.

**System Action:** The TPF system displays another message that describes why the error occurred.

**User Response:** Do the following:

1. Refer to the message that is displayed to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the EMR.

---

**OLDR4023I ACTIVATE OF LOADSET** *lsname* **SCHEDULED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was scheduled to be activated.

**System Action:** When other pending E-type loader requests are complete, the TPF system activates the loadset.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader activate function.

---

**OLDR4024I SELECTIVE ACTIVATE OF LOADSET** *lsname* **SCHEDULED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was scheduled to be selectively activated.

**System Action:** When other pending E-type loader requests are complete, the TPF system selectively activates the loadset.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader selective activate function.

---

**OLDR4025I DEACTIVATE OF LOADSET** *lsname* **SCHEDULED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was scheduled to be deactivated.

**System Action:** When other pending E-type loader requests are complete, the TPF system deactivates the loadset.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader deactivate function.

---

**OLDR4026I DEACTIVATE EXIT OF LOADSET** *lsname* **SCHEDULED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was scheduled to be deactivated with the Exit option.

**System Action:** When other pending E-type loader requests are complete, the TPF system deactivates the loadset and causes any ECBs by using the programs in the loadset to exit.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader deactivate function.

---

**OLDR4027I DEACTIVATE SERRC OF LOADSET *lsname* SCHEDULED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was scheduled to be deactivated with the SERRC option.

**System Action:** When other pending E-type loader requests are complete, the TPF system deactivates the loadset. If any entry control blocks (ECBs) were using the programs in the loadset, those ECBs exit and a system error dump is taken.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader deactivate function.

---

**OLDR4028I EXCLUDE FROM LOADSET *lsname* SCHEDULED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified programs were scheduled to be excluded from the loadset.

**System Action:** When other pending E-type loader requests are complete, the TPF system excludes the programs from the loadset.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude function.

---

**OLDR4029I ACCEPT OF LOADSET *lsname* SCHEDULED**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was scheduled to be accepted.

**System Action:** When other pending E-type loader requests are complete, the TPF system accepts the loadset.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader accept function.

---

**OLDR4100I *cccc* - NEW PROGRAMS REPLACED SPARE ENTRIES IN CORE PAT - SEE RO FOR DETAILS**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** One or more spare entries in the program allocation table (PAT) were replaced with new allocated programs. The online PAT was updated to reflect these changes.

**System Action:** The TPF system displays information about the programs that replaced the spare entries in the PAT on the receive-only (RO) computer room agent set (CRAS) console.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the PAT.

---

**OLDR4101I *cccc* - PROGRAM *progname* REPLACED A SPARE ENTRY IN CORE PAT**

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

**Explanation:** A spare entry in the program allocation table (PAT) was replaced with a new allocated program. The online PAT was updated to reflect the change.

**System Action:** The TPF system displays the name of the new allocated program on the receive-only (RO) computer room agent set (CRAS) console.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the PAT.

---

**OLDR4102W *cccc* - MISMATCH BETWEEN NEW AND EXISTING CHARACTERISTICS FOR PROGRAM *progname* - NEW CHARACTERISTICS NOT AVAILABLE UNTIL IPL**

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

**Explanation:** Updates were made to the program allocation table (PAT) and loaded to the TPF system by entering the ZOLDR LOAD command. The allocation characteristics of the specified program differ from the allocation characteristics in the online PAT. This message is displayed only on the receive-only (RO) computer room agent set (CRAS) console

**System Action:** The TPF system continues to use the previously defined allocation characteristics for the program until an initial program load (IPL) is performed on the TPF system.

**User Response:** IPL the TPF system if you want to use the new program characteristics.

See *TPF System Installation Support Reference* for more information about program allocation characteristics and the E-type loader load function.

---

**OLDR4103E *cccc* - UNABLE TO REPLACE SPARE ENTRIES IN CORE PAT WITH NEW PROGRAMS**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** A system error occurred while updating the online program allocation table (PAT). Some of the new programs were not added to the PAT.

**System Action:** The TPF system continues to use the online PAT. If the E-type loader police routine is active, the TPF system tries again to update the online PAT.

**User Response:** Do the following:

1. View the messages displayed on the receive-only (RO) computer room agent set (CRAS) console to determine which programs were not added to the PAT.
2. Determine the cause of the error.
3. Take the appropriate action to correct the error.
4. If you are not able to correct the error, load a new PAT to the TPF system by using the general file loader (ALDR) or the auxiliary loader (TLDR).

See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4104E** *cccc* **- NO AVAILABLE EXTRA PAT SLOTS. UNABLE TO REPLACE SPARE ENTRIES IN CORE PAT WITH NEW I-STREAM UNIQUE PROGRAMS**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** There were not enough extra program allocation table (PAT) slots available to add the new programs to the PAT.

**System Action:** The TPF system continues to use the online PAT. If the E-type loader police routine is active, the TPF system tries again to update the online PAT.

**User Response:** View the receive-only (RO) computer room agent set (CRAS) console to determine which programs were added to the PAT and then do one of the following:

- Enter the ZOLDR DEACTIVATE command to deactivate one or more loadsets and return extra PAT slots to the TPF system.
- Enter the ZCTKA ALTER command to increase the number of extra PAT slots.
- Load a new PAT to the TPF system by using the general file loader (ALDR) or the auxiliary loader (TLDR).

See *TPF Operations* for more information about the ZOLDR DEACTIVATE and ZCTKA ALTER commands. See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4105I** *cccc* **- END OF PAT UPDATE REPORT**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** Updates were made to the online program allocation table (PAT) by entering the ZOLDR LOAD command. This message is entered after information about those updates is displayed on the receive-only (RO) console.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader load function.

---

**OLDR4120E** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- THE OFFLINE ALLOCATOR IS LARGER THAN THE ONLINE PAT - IT IS INCOMPATIBLE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The E-type loader load function ended for the specified input device because the offline allocator being loaded to the TPF system is larger than the online program allocation table (PAT).

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Ensure that you are loading the correct version of the offline allocator.
2. If the offline allocator is larger than the online PAT, load a new PAT to the TPF system by using the general file loader (ALDR) or the auxiliary loader (TLDR).

See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4121W** *cccc* **- COMPATIBILITY CHECKING NOT PERFORMED FOR DDNAME** *ddname* **NOT ENOUGH MALLOC STORAGE AVAILABLE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** Updates were made to the online program allocation table (PAT) by entering the ZOLDR LOAD command. However, there was not enough storage available to run the compatibility check for the offline allocator and the online PAT.

**System Action:** The TPF system continues the E-type loader load function but does not perform any compatibility checking for the offline allocator and the online PAT. The TPF system ignores the changes in the offline allocator.

**User Response:** Do one of the following:

- Enter the ZOLDR LOAD command again when there is less system activity.
- Load a new PAT to the TPF system by using the general file loader (general file loader) or the auxiliary loader (TLDR).

See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4122E** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- ERROR RETRIEVING E-TYPE LOADER RULES RECORD**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** An error occurred while retrieving the E-type loader rules record.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Review any previous error messages to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader load function.

---

**OLDR4123E** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- E-TYPE LOADER RECLAIM IN PROGRESS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The E-type loader load function cannot be started while the E-type loader reclaim function is running.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Wait for the E-type loader reclaim function to end.
2. Enter the ZOLDR LOAD command again.

See *TPF Operations* for more information about the ZOLDR LOAD function.

---

**OLDR4124E** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- ERROR PROCESSING SCHEDULED TASKS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The E-type loader load function ended because the TPF system. cannot process another E-type loader request.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Review any previous error messages to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader load function.

---

**OLDR4125E** *cccc* **- OFFLINE ALLOCATOR DOES NOT AGREE WITH ONLINE PAT- PROGRAM** *progname* **IS AT OFFSET** *offset* **IN THE OFFLINE ALLOCATOR AND IS AT OFFSET** *offset* **IN THE ONLINE PAT**

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

*offset*
The offset in the offline allocator or the online program allocation table (PAT).

**Explanation:** The specified program was found at different locations in the offline allocator and the online PAT. This message is issued only to the receive-only (RO) computer room agent set (CRAS) console.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Ensure that you are loading the correct version of the offline allocator.
2. If the version is correct and the program is at a different offset, use the general file loader (ALDR) or the auxiliary loader (TLDR) to load a new online PAT.

See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4126E** *cccc* **- MORE INCOMPATIBILITIES WERE DETECTED - MAXIMUM REPORT LIMIT HAS BEEN REACHED**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The TPF system reported the maximum number of incompatible program allocation table (PAT) slots and cannot report any more, although more may exist.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Ensure that you are loading the correct version of the offline allocator.
2. If the version is correct, use the general file loader (ALDR) or the auxiliary loader (TLDR) to load a new online PAT.

3. You can also enter the ZOLDR ALTER command to increase the maximum number of incompatible PAT slots to report.

See *TPF Operations* for more information about the ZOLDR ALTER command. See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4127E** *cccc* **- OFFLINE ALLOCATOR DOES NOT AGREE WITH ONLINE PAT - PROGRAM** *progname1* **IS AT OFFSET** *offset* **IN THE OFFLINE ALLOCATOR PROGRAM** *progname2* **IS AT THIS OFFSET IN THE ONLINE PAT**

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname1*
The name of the program in the offline allocator.

*offset*
The offset in the offline allocator.

*progname2*
The name of the program in the online program allocation table (PAT).

**Explanation:** The offline allocator does not match the online program allocation table (PAT). Two different programs were found at the specified offset in the offline allocator and the online PAT. This message is issued only to the receive-only (RO) computer room agent set (CRAS) console.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Ensure that you are loading the correct version of the offline allocator.
2. If the version is correct and the program are different, use the general file loader (ALDR) or the auxiliary loader (TLDR) to load a new online PAT.

See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4128E** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- OFFLINE ALLOCATOR IS INCOMPATIBLE WITH ONLINE PAT - SEE RO FOR DETAILS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The offline allocator is not compatible with the online program allocation table (PAT).

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Review the message displayed on the receive-only (RO) computer room agent set (CRAS) console for information about why the offline allocator and online PAT are not compatible.
2. Ensure that you are loading the correct version of the offline allocator.
3. If the version is correct, use the general file loader (ALDR) or the auxiliary loader (TLDR) to load a new online PAT.

See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4129E** *cccc* **- OFFLINE ALLOCATOR DOES NOT AGREE WITH ONLINE PAT - TRANSFER VECTOR** *vectorname* **IN THE OFFLINE ALLOCATOR DOES NOT HAVE THE SAME ATTRIBUTES AS IN THE ONLINE PAT**

**Where:**

*cccc*
The name of the segment that detected the condition.

*vectorname*
The name of the transfer vector.

**Explanation:** The offline allocator does not match the online program allocation table (PAT). The attributes of the specified transfer vector are different in the offline allocator and the online PAT.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Ensure that you are loading the correct version of the offline allocator.
2. If the version is correct and the attributes of the transfer vector are different, use the general file loader (ALDR) or the auxiliary loader (TLDR) to load a new online PAT.

See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4130W** *cccc* **- OFFLINE ALLOCATOR DOES NOT AGREE WITH ONLINE PAT - PROGRAM CHARACTERISTICS DIFFER FOR ONE OR MORE PROGRAMS - SEE RO FOR DETAILS**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The offline allocator does not match the online program allocation table (PAT). The allocation characteristics for one or more programs are different from the allocation characteristics in the online PAT. Details about the differences are displayed on the receive-only (RO) computer room agent set (CRAS) console.

**System Action:** The TPF system continues the E-type loader load function and uses the previously defined allocation characteristics for the programs until the next initial program load (IPL) is performed on the TPF system.

**User Response:** Do the following:

1. Ensure that you are loading the correct version of the offline allocator.
2. If changes were made to the online PAT, ensure those changes are reflected in the offline allocator.
3. If the version is correct and the changes are not reflected in the offline allocator, use the general file loader (ALDR) or the auxiliary loader (TLDR) to load a new online PAT.

See *TPF System Installation Support Reference* for more information about the E-type loader load function.

---

**OLDR4131W** *cccc* **- PROGRAM CHARACTERISTICS DIFFER BETWEEN OFFLINE ALLOCATOR VERSION** *version* **TIMESTAMP** *timestamp* **ONLINE PAT VERSION** *version* **TIMESTAMP** *timestamp* **PROGRAM CHARACTERISTICS IN ONLINE PAT REMAIN UNCHANGED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*version*
The version code.

*timestamp*
The date and time stamp for the offline allocator and the online program allocation table (PAT).

**Explanation:** The offline allocator does not match the online PAT. The allocation characteristics for one or more programs are different from the allocation characteristics in the PAT.

**System Action:** The TPF system continues the E-type loader load function and uses the previously defined allocation characteristics for the programs. The TPF system also displays other messages that describe the differences between the offline allocator and the online PAT.

**User Response:** Do the following:

1. Ensure that you loaded the correct version of the offline allocator.
2. Review the other messages that are displayed for information about differences between the offline allocator and the online PAT.

See *TPF System Installation Support Reference* for more information about E-type loader load function.

---

**OLDR4132W** *cccc* **- PROGRAM CHARACTERISTICS DIFFER FOR PROGRAM** *progname* **OFFLINE –** *progchar* **ONLINE –** *progchar*

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

*progchar*
A list of program characteristics.

**Explanation:** The offline allocator does not match the online program allocation table (PAT). The allocation characteristics for the specified program are different in the offline allocator and the online PAT.

**System Action:** The TPF system continues the E-type loader load function and uses the previously defined allocation characteristics for the program.

**User Response:** Do the following:

1. Ensure that you specified the correct version of the offline allocator when running the E-type loader offline job.
2. If changes were made to the online PAT, ensure that the changes were also made to the offline allocator.

See *TPF System Installation Support Reference* for more information about E-type loader load function.

---

**OLDR4133W** *cccc* **- END OF PROGRAM CHARACTERISTICS MISMATCH REPORT**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The offline allocator does not match the online program allocation table (PAT) because the program allocation characteristics are different. This is the end of the display that lists the program characteristics of the offline allocator and the online PAT.

**System Action:** The TPF system continues the E-type loader load function and uses the previously defined allocation characteristics for the program.

**User Response:** Do the following:

1. Ensure that you specified the correct version of the offline allocator when running the E-type loader offline job.
2. If changes were made to the online PAT, ensure that the changes were also made to the offline allocator.

See *TPF System Installation Support Reference* for more information about E-type loader load function.

---

**OLDR4134W** *cccc* **- END OF PROGRAM CHARACTERISTICS MISMATCH REPORT - INSUFFICIENT STORAGE TO DISPLAY MORE INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The offline allocator does not match the online program allocation table (PAT) because the program allocation characteristics are different. There is not enough storage available to display the information that describes the differences between the offline allocator and the online program allocation table (PAT).

**System Action:** The TPF system continues the E-type loader load function and uses the previously defined allocation characteristics for the program.

**User Response:** Do the following:

1. Ensure that you specified the correct version of the offline allocator when running the E-type loader offline job.
2. If changes were made to the online PAT, ensure that the changes were also made to the offline allocator.

See *TPF System Installation Support Reference* for more information about the E-type loader load function.

---

**OLDR4135W** *cccc* **- OFFLINE ALLOCATOR MAY NOT AGREE WITH ONLINE PAT - INSUFFICIENT STORAGE TO TRACK POTENTIAL DIFFERENCES BETWEEN PROGRAM CHARACTERISTICS FOR E-TYPE LOADER PROGRAMS**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The offline allocator does not match the online program allocation table (PAT) because the program allocation characteristics are different. There is not enough storage to display the differences in the allocation characteristics.

**System Action:** The TPF system continues the E-type loader load function and uses the previously defined allocation characteristics for the program.

**User Response:** Do the following:

1. Ensure that you specified the correct version of the offline allocator when running the E-type loader offline job.
2. If changes were made to the online PAT, ensure that the changes were also made to the offline allocator.

See *TPF System Installation Support Reference* for more information about the E-type loader load function.

---

**OLDR4136E** *cccc* **- LOAD ENDED FOR DDNAME** *ddname* **- UNABLE TO COMPLETE THE COMPATIBILITY CHECKING BETWEEN THE OFFLINE ALLOCATOR AND THE ONLINE PAT**

**Where:**

*cccc*
The name of the segment that detected the condition.

*ddname*
The data definition name of the input device.

**Explanation:** The TPF system was not able to complete the compatibility check between the offline allocator and the online program allocation table (PAT).

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Review any previous error messages to determine the cause of the error.
2. Take the appropriate action to correct the error.
3. If the error cannot be corrected, load a new online PAT to the TPF system by using the general file loader (ALDR) or the auxiliary loader (TLDR).

See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4137E** *cccc* **- OFFLINE ALLOCATOR DOES NOT AGREE WITH ONLINE PAT - PROGRAM** *progname* **IS NOT DEFINED AS A TRANSFER VECTOR**

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

**Explanation:** The offline allocator does not agree with the online program allocation table (PAT). The specified program is defined as a transfer vector in the online PAT but it is not defined as a transfer vector in the offline allocator.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Ensure that you loaded the correct version of the offline allocator.
2. If the version is correct and the program is no longer defined as a transfer vector, load a new online PAT by using the general file loader (ALDR) or the auxiliary loader (TLDR).

See *TPF System Installation Support Reference* for more information about ALDR and TLDR.

---

**OLDR4138E** *cccc* **- OFFLINE ALLOCATOR DOES NOT AGREE WITH ONLINE PAT - PROGRAM** *progname* **CANNOT BE CHANGED TO A TRANSFER VECTOR BECAUSE IT IS ALREADY ACTIVE AS AN UNALLOCATED PROGRAM**

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

**Explanation:** The specified program is defined as a transfer vector in the offline allocator but it is already active as an unallocated program on the online system. This message is displayed on the receive-only (RO) console.

**System Action:** The TPF system ends the E-type loader load function and may issue additional messages that describe other incompatibilities between the offline allocator and online PAT.

**User Response:** Do the following:

1. Enter the ZOLDR DEACTIVATE command to deactivate the loadset that contains the specified unallocated program.
2. Update the offline allocator.
3. Enter the ZOLDR LOAD command to load the new revisions.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE and ZOLDR LOAD commands.

**OLDR4139E** *cccc* **- END OF PAT INCOMPATIBILITY REPORT**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The offline allocator is not compatible with the online PAT. Previous messages explain the incompatibilities.

**System Action:** The TPF system ends the E-type loader load function.

**User Response:** Do the following:

1. Review the previous messages to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader load function.

---

**OLDR4140W** *cccc* **– END OF PROGRAM CHARACTERISTICS MISMATCH REPORT - MAXIMUM REPORT LIMIT HAS BEEN REACHED**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The offline allocator does not match the online program allocation table (PAT) because the program allocation characteristics are different. The TPF system reported the maximum number of program characteristics that do not match and can not report any more, although more may exist.

**System Action:** The TPF system continues the E-type loader load function and uses the previously defined allocation characteristics for the program.

**User Response:** Do the following:

1. Ensure that you specified the correct version of the offline allocator when running the E-type loader offline job.
2. If changes were made to the online PAT, ensure that the changes were also made to the offline allocator.
3. You can also enter the ZOLDR ALTER command to increase the maximum number of mismatched program allocation characteristics to report.

See *TPF System Installation Support Reference* for more information about the E-type loader load and E-type loader alter functions.

---

**OLDR5000E** *cccc* **- POLICE VALUE CANNOT BE GREATER THAN DETECT VALUE**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The ZOLDR ALTER command was entered to change the time interval for starting the E-type loader police routine or to change the time interval for starting the E-type loader long running job detection routine and the E-type loader reclaim detection routine. The time interval for starting the police routine cannot be greater than the time interval for starting the long running job detection routine and the reclaim detection routine.

**System Action:** The TPF system ends the E-type loader alter function.

**User Response:** Enter the ZOLDR ALTER command again and specify a valid time interval.

See *TPF Operations* for more information about the ZOLDR ALTER command.

---

**OLDR5001I** *cccc* **- E-TYPE LOADER POLICING STOPPED**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The ZOLDR ALTER command was entered to change the time interval for starting the E-type loader police routine to 0. This value ends the police routine.

**System Action:** The TPF system ends the E-type loader police routine.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR ALTER command.

---

**OLDR5002E** *cccc* **- DETECT VALUE MUST BE A MULTIPLE OF POLICE VALUE**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The ZOLDR ALTER command was entered to change the time interval for starting the E-type loader police routine or to change the time interval for starting the E-type loader long running job detection routine and the E-type loader reclaim detection routine. The time interval for starting the long running job detection routine and the reclaim detection routine must be a multiple of the time interval for starting the police routine.

**System Action:** The TPF system ends the E-type loader alter function.

**User Response:** Enter the ZOLDR ALTER command again and specify a valid time interval.

See *TPF Operations* for more information about the ZOLDR ALTER command.

---

**OLDR5003E** *cccc* **- UNABLE TO ALTER DATA**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The ZOLDR ALTER command was entered to change the E-type loader values. However, the E-type loader rules database (ERD), the E-type loader record table (ELT), or keypoint record A (CTKA) is not available.

**System Action:** The TPF system ends the E-type loader alter function.

**User Response:** Do the following:

1. Review the previous error messages and any dumps to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader alter function.

---

**OLDR5005I** *cccc* **– VALUES ALTERED SUCCESSFULLY OLD VALUES –** *oldvalue* **and** *oldvalue* **NEW VALUES –** *newvalue* **and** *newvalue* **THE NEW VALUES TAKE EFFECT IMMEDIATELY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*oldvalue*
The old E-type loader value.

*newvalue*
The new E-type loader value.

**Explanation:** This is the normal response to the ZOLDR ALTER POLICE DETECT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR ALTER command.

---

**OLDR5006I** *cccc* **– VALUES ALTERED SUCCESSFULLY OLD VALUES –** *oldvalue oldvalue...* **NEW VALUES –** *newvalue newvalue...* **THE NEW VALUES TAKE EFFECT IMMEDIATELY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*oldvalue*
The old E-type loader value.

*newvalue*
The new E-type loader value.

**Explanation:** This is the normal response to the ZOLDR ALTER command with the PROGCHAR parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR ALTER command.

---

**OLDR5007I** *cccc* **– VALUE ALTERED SUCCESSFULLY OLD VALUE –** *oldvalue* **NEW VALUE –** *newvalue* **THE NEW VALUE TAKES EFFECT IMMEDIATELY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*oldvalue*
The old E-type loader value.

*newvalue*
The new E-type loader value.

**Explanation:** This is the normal response to the ZOLDR ALTER command with the XPAT THRESHOLD, RECORD THRESHOLD, or PAT REPORT parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR ALTER command.

---

**OLDR5100E** *cccc* **- UNABLE TO DISPLAY INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The ZOLDR DISPLAY command was entered to display the E-type values. However, the E-type loader rules database (ERD), the E-type loader record table (ELT), or keypoint record A (CTKA) is not available.

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** Do the following:

1. Review the previous error messages and any dumps to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader display function.

---

**OLDR5101I** *cccc* **- E-TYPE LOADER VALUES**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** This is the normal response to the ZOLDR DISPLAY command with the VALUES parameter specified. The message is followed by a display of the values of the E-type loader variables.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR DISPLAY command and an example of its display.

---

**OLDR5200T** *cccc* **- DELETE REQUEST ENDED DUE TO A FIND ERROR**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An input/output (I/O) error occurred while retrieving the E-type loader master record (EMR) or the loadset directory (LSD).

**System Action:** The TPF system ends the E-type loader delete function.

**User Response:** Do the following:
1. Review the previous error messages and any dumps to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5201T** *cccc* **- DELETE REQUEST ENDED, LOADSET** *lsname* **DOES NOT EXIST**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The loadset name specified for the ZOLDR DELETE command was not found in the loadset directory (LSD).

**System Action:** The TPF system ends the E-type loader delete function.

**User Response:** Enter the ZOLDR DELETE command again and specify a valid loadset name.

See *TPF Operations* for more information about the ZOLDR DELETE command.

---

**OLDR5202T** *cccc* **- DELETE REQUEST ENDED, LOADSET** *lsname* **ALREADY SCHEDULED TO BE DELETED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is already being deleted.

**System Action:** The TPF system ends the E-type loader function.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5203T** *cccc* **- DELETE REQUEST ENDED, LOADSET** *lsname* **IS IN THE PROCESS OF BEING ACCEPTED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is being accepted and will be deleted as part of the E-type loader accept function.

**System Action:** The TPF system ends the E-type loader delete function.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5204T** *cccc* **- DELETE REQUEST ENDED, LOADSET** *lsname* **IS IN THE PROCESS OF BEING LOADED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is being loaded. Therefore, the loadset cannot be deleted.

**System Action:** The TPF system ends the E-type loader delete function.

**User Response:** Do the following:
1. Wait until the E-type loader load function completes.
2. Enter the ZOLDR DELETE command again.

See *TPF Operations* for more information about the ZOLDR DELETE command.

---

**OLDR5205E** *cccc* **- DELETE REQUEST ENDED, LOADSET** *lsname* **IS ACTIVE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is active and cannot be deleted.

**System Action:** The TPF system ends the E-type loader delete function.

**User Response:** Do the following:
1. Enter the ZOLDR DEACTIVATE command to deactivate the loadset.
2. Enter the ZOLDR DELETE command again.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE and ZOLDR DELETE commands.

---

**OLDR5206T** *cccc* **- DELETE REQUEST ENDED DUE TO A FILE ERROR**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An input/output (I/O) error occurred while filing the loadset directory (LSD).

**System Action:** The TPF system ends the E-type loader delete function.

**User Response:** Do the following:
1. Review previous messages to determine the cause of the file error.

2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5207I** *cccc* **- LOADSET** *lsname* **IS NOW SCHEDULED FOR DELETION**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was scheduled to be deleted.

**System Action:** When there is no more activity on the loadset, the TPF system deletes the loadset and makes the E-type loader resources available for use.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5208I** *cccc* **- LOADSET** *lsname1* **RENAMED TO** *lsname2*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname1*
The name of the loadset specified in the ZOLDR DELETE command.

*lsname2*
The new name for the loadset.

**Explanation:** The loadset specified in the ZOLDR DELETE command was renamed successfully to the new loadset name.

**System Action:** The TPF system ends the E-type loader delete function.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5209W** *cccc* **- UNABLE TO SCHEDULE DELETE PHASE 2**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** The E-type loader delete function detected an error while trying to schedule phase 2 of its processing. This message is preceded by another message that explains the error.

**System Action:** The loadset name was changed and the TPF system ends the E-type loader delete function.

**User Response:** See the user response from the preceding message for more information.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5250T** *cccc* **- LSD STRUCTURE CORRUPTION DETECTED - FILE ADDRESS -** *addr*

**Where:**

*cccc*
The name of the segment that detected the condition.

*addr*
The file address.

**Explanation:** An error occurred while deleting the loadset. The loadset directory (LSD) record was not found or the record ID on the specified data level of the entry control block (ECB) does not match the ID on the header of the record.

**System Action:** The TPF system ends the E-type loader delete function.

**User Response:** Do the following:

1. Review previous messages to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5251T** *cccc* **– LSD STRUCTURE CHAIN HAS MISSING LINK, FILE ADDRESS** *addr* **NOT FOUND**

**Where:**

*cccc*
The name of the segment that detected the condition.

*addr*
The file address.

**Explanation:** An error occurred while deleting the loadset. The forward chain field in the loadset directory (LSD) does not point to a valid LSD record.

**System Action:** The TPF system ends the E-type loader delete function.

**User Response:** Do the following:

1. Review previous messages to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5252I** *cccc* **- LOADSET** *lsname* **DELETED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** This is the normal response to the ZOLDR DELETE and ZOLDR ACCEPT commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR DELETE and ZOLDR ACCEPT commands.

---

**OLDR5300I** *cccc* **- E-TYPE LOADER RULES**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** This is the normal response to the ZOLDR DISPLAY command with the RULES parameter specified. The message is followed by a display of the E-type loader rules.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOLDR DISPLAY command and an example of its display.

---

**OLDR5260E** *cccc* **- DELETE PHASE 2 ERROR WHILE FINDING LOADSET** *lsname* **LSD ENTRY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An input/output (I/O) error occurred while retrieving the loadset directory (LSD) during delete phase 2 function.

**System Action:** The TPF system ends the E-type loader delete function and does not allow any other E-type loader functions to be started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Review the previous error messages and any dumps to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader delete function.

---

**OLDR5261E** *cccc* **- DELETE PHASE 2 UNABLE TO FILE LSD FOR LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An input/output (I/O) error occurred. The loadset directory (LSD) cannot be updated to indicate that there are no program allocation table (PAT) slots on the processor referencing the loadset. Therefore, file resource clean up for this loadset cannot take place.

**System Action:** The TPF system ends the E-type loader delete function and does not allow any other E-type loader functions to be started on the processor where the error occurred until the error is corrected.

**User Response:** Do the following:

1. Refer to the message that was issued before this message to determine the cause of the error.
2. Take the appropriate action to correct the error.

---

**OLDR5301E** *cccc* **- UNABLE TO DISPLAY INFORMATION**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An error occurred while retrieving the E-type loader rules database (ERD) for the E-type loader display function.

**System Action:** The TPF system ends the E-type loader display function.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader display function.

---

**OLDR5800T** *cccc* **- UNABLE TO OBTAIN THE EMR**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** An error occurred while retrieving the E-type loader master record (EMR) for the E-type loader exclude function or the E-type loader reinclude function.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** Do the following:

1. Review the previous error messages and any dumps to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude and reinclude functions.

---

**OLDR5801T** *cccc* **- EXCLUDE PHASE 2 ENDED ON LOADSET** *lsname* **DUE TO AN LSD ERROR ON PROCESSOR** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** An error occurred during the E-type loader exclude function. The specified loadset cannot be found in the

E-type loader loadset directory (LSD).

**System Action:** The TPF system ends the E-type loader exclude function.

**User Response:** Do the following:

1. Review the previous error messages and any dumps to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude function.

---

**OLDR5802T** *cccc* **- NOT ENOUGH E-TYPE LOADER FIXED FILE RECORDS AVAILABLE**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** There are not enough E-type loader fixed-file (#OLDx) records available to perform the E-type loader exclude or reinclude function.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** Do one of the following:

- Enter the ZOLDR RECLAIM command to recover any lost E-type loader fixed-file record ordinals.
- Enter the ZOLDR EXCLUDE or ZOLDR REINCLUDE command again when other E-type loader functions end and release E-type loader fixed-file record ordinals.
- Enter the ZOLDR CLEAR command to reinitialize the E-type loader structures.

See *TPF Operations* for more information about the ZOLDR RECLAIM, ZOLDR EXCLUDE, ZOLDR REINCLUDE, and ZOLDR CLEAR commands.

---

**OLDR5803T** *cccc* **- EXCLUDE PHASE 2 ENDED ON LOADSET** *lsname* **DUE TO AN EPD ERROR ON PROCESSOR** *id*

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*id* The identifier assigned to the processor.

**Explanation:** An error occurred while searching the E-type loader program directory (EPD) for excluded programs. The chain of EPD records did not end normally.

**System Action:** The TPF system ends the E-type loader exclude function.

**User Response:** Do the following:

1. Review the previous error messages and any dumps to determine the cause of the error.
2. Take the appropriate action to correct the error. Exclude Phase 2 resumes during the next E-type loader police interval.

If the error continues, do the following:

1. Enter the ZOLDR DELETE command to delete the loadset.
2. Enter the ZOLDR LOAD command to load the loadset again.
3. Enter the ZOLDR EXCLUDE command again.

See *TPF Operations* for more information about the ZOLDR DELETE, ZOLDR LOAD, and ZOLDR EXCLUDE commands.

---

**OLDR5804T** *cccc* **-** *function* **ENDED - E-TYPE LOADER RECLAIM IN PROGRESS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function, either EXCLUDE or REINCLUDE.

**Explanation:** The E-type loader exclude or reinclude function cannot be started while the E-type loader reclaim function is running.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** Enter the ZOLDR EXCLUDE or ZOLDR REINCLUDE command again when the E-type loader reclaim function ends.

See *TPF Operations* for more information about the ZOLDR EXCLUDE and ZOLDR REINCLUDE commands.

---

**OLDR5805T** *cccc* **-** *function* **ENDED - LOADSET** *lsname* **DOES NOT EXIST**

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function, either EXCLUDE or REINCLUDE.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset cannot be found.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** Enter the ZOLDR EXCLUDE or ZOLDR REINCLUDE command again and specify a valid loadset name.

See *TPF Operations* for more information about the ZOLDR EXCLUDE and ZOLDR REINCLUDE commands.

---

**OLDR5806T** *cccc* **-** *function* **ENDED - LOADSET** *lsname* **WAS ACCEPTED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function, either EXCLUDE or REINCLUDE.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was accepted. You cannot perform the E-type loader exclude or reinclude functions on loadsets that are accepted.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude and reinclude functions.

---

**OLDR5807T** *cccc* **-** *function* **ENDED - LOADSET** *lsname* **WAS DELETED**

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function, either EXCLUDE or REINCLUDE.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset was deleted. You cannot perform the E-type loader exclude or reinclude functions on loadsets that are deleted.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude and reinclude functions.

---

**OLDR5808T** *cccc* **-** *function* **ENDED - LOADSET** *lsname* **LOAD IN PROGRESS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function, either EXCLUDE or REINCLUDE.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is currently being loaded. You cannot perform the E-type loader exclude or reinclude functions on a loadset while it is being loaded.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** Enter the ZOLDR EXCLUDE or ZOLDR REINCLUDE command again when the E-type loader load function ends.

See *TPF Operations* for more information about the ZOLDR EXCLUDE and ZOLDR REINCLUDE commands.

---

**OLDR5809W** *cccc* **- CANNOT DETERMINE LOADSET** *lsname* **STATUS ON ALL PROCESSORS**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** An error occurred while querying the status of the loadsets on all the processors.

**System Action:** The TPF system ends the E-type loader exclude function.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude function.

---

**OLDR5810T** *cccc* **-** *function* **ENDED - LSD ENTRY COULD NOT BE RETRIEVED FOR LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function, either EXCLUDE or REINCLUDE.

*lsname*
The name of the loadset.

**Explanation:** An error occurred while finding the loadset directory (LSD).

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** Do the following:

1. Review previous messages to determine the cause of the find error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude and functions.

---

**OLDR5811T** *cccc* **- REINCLUDE ENDED - LOADSET** *lsname* **IS ACTIVE**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

**Explanation:** The specified loadset is active. You cannot reinclude programs in an active loadset.

**System Action:** The TPF system ends the E-type loader reinclude function.

**User Response:** Do the following:

1. Enter the ZOLDR DEACTIVATE command to deactivate the loadset.
2. Enter the ZOLDR REINCLUDE command again.

See *TPF Operations* for more information about the ZOLDR DEACTIVATE and ZOLDR REINCLUDE commands.

---

**OLDR5812I** *cccc* **– EXCLUDE COMPLETED THE FOLLOWING PROGRAMS ARE EXCLUDED FROM LOADSET** *lsname progname progname progname... progname progname progname...* **ANY DUPLICATE NAMES IGNORED END OF DISPLAY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** This is the normal response to the ZOLDR EXCLUDE command. The specified programs were excluded from the loadset.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the E-type loader exclude function.

---

**OLDR5813I** *cccc* **– REINCLUDE COMPLETED THE FOLLOWING PROGRAMS RE-INCLUDED IN LOADSET** *lsname progname progname progname... progname progname progname...* **ANY DUPLICATE NAMES IGNORED END OF DISPLAY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** This is the normal response to the ZOLDR REINCLUDE command. The specified programs were reincluded in the loadset.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the E-type loader reinclude function.

---

**OLDR5814T** *cccc* **– EXCLUDE ENDED THE FOLLOWING PROGRAMS DO NOT EXIST IN LOADSET** *lsname progname progname progname... progname progname progname progname...* **THE FOLLOWING PROGRAMS ALREADY EXCLUDED FROM LOADSET** *lsname progname progname progname... progname progname progname progname...* **ANY DUPLICATE NAMES IGNORED END OF DISPLAY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** The specified programs were not found in the loadset or they were already excluded from the loadset.

**System Action:** The TPF system ends the E-type loader exclude function.

**User Response:** Enter the ZOLDR EXCLUDE command again and specify valid program names.

See *TPF Operations* for more information about the ZOLDR EXCLUDE command.

---

**OLDR5815T** *cccc* **– REINCLUDE ENDED THE FOLLOWING PROGRAMS DO NOT EXIST IN LOADSET** *lsname progname progname progname... progname progname progname progname...* **THE FOLLOWING PROGRAMS ALREADY INCLUDED IN LOADSET** *lsname progname progname progname... progname progname progname...* **ANY DUPLICATE NAMES IGNORED END OF DISPLAY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*lsname*
The name of the loadset.

*progname*
The name of the program.

**Explanation:** The specified programs were not found in the loadset or they were never excluded from the loadset.

**System Action:** The TPF system ends the E-type loader reinclude function.

**User Response:** Enter the ZOLDR REINCLUDE command again and specify valid program names.

See *TPF Operations* for more information about the ZOLDR REINCLUDE command.

---

**OLDR5816I** *cccc* **– PROGRAM DISPLAY CONTINUES -** *progname progname progname... progname progname progname...* **ANY DUPLICATE NAMES IGNORED END OF DISPLAY**

**Where:**

*cccc*
The name of the segment that detected the condition.

*progname*
The name of the program.

**Explanation:** The specified programs were excluded from the loadset or reincluded in the loadset.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude or reinclude functions.

---

**OLDR5817T** *cccc* **-** *function* **ENDED - EPD FIND ERROR ON LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function, either EXCLUDE or REINCLUDE.

*lsname*
The name of the loadset.

**Explanation:** A find error occurred while copying the E-type loader program directory (EPD) for the loadset.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** Do the following:

1. Review the previous error messages and any dumps to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude and reinclude functions.

---

**OLDR5818T** *cccc* **-** *function* **ENDED - ERROR FILING EPDS FOR LOADSET** *lsname*

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function, either EXCLUDE or REINCLUDE.

*lsname*
The name of the loadset.

**Explanation:** An error occurred while filing the E-type loader program directory (EPD) for the loadset.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** Do the following:

1. Review the previous error messages and any dumps to determine the cause of the error.
2. Take the appropriate action to correct the error.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude and reinclude functions.

---

**OLDR5819T** *cccc* **- EXCLUDE ENDED - TOTAL NUMBER OF PROGRAMS TO EXCLUDE EXCEEDS THE MAXIMUM**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** You cannot exclude more than 4000 programs from a loadset at one time. The global file-name characters specified in the ZOLDR EXCLUDE command resolve to more than this maximum.

**System Action:** The TPF system ends the E-type loader exclude function.

**User Response:** Enter the ZOLDR EXCLUDE command again and specify less than 4000 programs to exclude from the loadset.

See *TPF Operations* for more information about the ZOLDR EXCLUDE command.

---

**OLDR5820T** *cccc* **- REINCLUDE ENDED - TOTAL NUMBER OF PROGRAMS TO REINCLUDE EXCEEDS THE MAXIMUM**

**Where:**

*cccc*
The name of the segment that detected the condition.

**Explanation:** You cannot reinclude more than 4000 programs in a loadset at one time. The global file-name characters you specified in the ZOLDR REINCLUDE command resolve to more than this maximum.

**System Action:** The TPF system ends the E-type loader reinclude function.

**User Response:** Enter the ZOLDR REINCLUDE command again and specify less than 4000 programs to reinclude in the loadset.

See *TPF Operations* for more information about the ZOLDR REINCLUDE command.

---

**OLDR5822T** *cccc* **-** *function* **ENDED - UNABLE TO CHECK ON THE STATUS OF E-TYPE LOAD RECLAIM**

**Where:**

*cccc*
The name of the segment that detected the condition.

*function*
The name of the E-type loader function (either exclude or reinclude).

**Explanation:** The E-type loader exclude or reinclude function could not determine whether the E-type loader reclaim function was running.

**System Action:** The TPF system ends the E-type loader exclude or reinclude function.

**User Response:** Do the following:

- Review the preceding messages to determine the cause of the error.
- Take the appropriate action to correct the error.
- Enter the ZOLDR EXCLUDE or ZOLDR REINCLUDE command again.

See *TPF System Installation Support Reference* for more information about the E-type loader exclude and reinclude functions. See *TPF Operations* for more information about the ZOLDR commands.

---

**OLDR5823E** *cccc* **— NO MORE EAT SLOTS AVAILABLE ON CPU** *id* **— EXCLUDED PROGRAMS IN LOADSET** *lsname* **WILL CONTINUE TO BE USED UNTIL THE NEXT IPL**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** No more ECB activation table (EAT) slots were available to process a ZOLDR EXCLUDE command.

**System Action:** The programs are marked as excluded from the loadset. However, if any of the excluded programs in the loadset are entered by new entry control blocks (ECBs), they will continue to be used until an initial program load (IPL) of the TPF system is performed.

**User Response:** Do the following:

1. Perform an initial program load (IPL) of the TPF system to discontinue use of the excluded programs in the loadset.
2. If the number of loadsets active at the same time is epcted to remain high, increase the number of EAT slots in the TPF system. You can do this by increasing the value at the EATSIZE label in the CT38 copy member in the CCCTIN CSECT of the control program (CP).

See *TPF Operations* for more information about the ZOLDR EXCLUDE command.

---

**OLDR5824E** *cccc***– MAXIMUM ACTIVATION NUMBER REACHED ON CPU** *id* **– EXCLUDED PROGRAMS IN LOADSET** *lsname* **WILL CONTINUE TO BE USED UNTIL THE NEXT IPL**

**Where:**

*cccc*
The name of the segment that detected the condition.

*id* The identifier assigned to the processor.

*lsname*
The name of the loadset.

**Explanation:** A ZOLDR EXCLUDE command was entered, but could not be completed because the current system activation number had already reached its maximum value.

**System Action:** The programs in the loadset are marked as excluded. However, if any of the excluded programs are entered by new entry control blocks (ECBs), they will continue to be used until an initial program load (IPL) of the TPF system is performed.

**User Response:** IPL the TPF system to discontinue use of the excluded programs in the loadset and to reset the value of the current system activation number.

See *TPF Operations* for more information about the ZOLDR EXCLUDE command.

# OODB

---

**OODB0001I TO2 INITIALIZED WITHOUT ERRORS**

**Explanation:** This is the normal response to the ZOODB INIT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB INIT command.

---

**OODB0002I TO2 INITIALIZATION REQUEST COMPLETED**

**Explanation:** This is the normal response to the ZOODB INIT command. This message is displayed whether ZOODB INIT was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, determine the cause of the error, correct it, and enter the ZOODB INIT command again.

See *TPF Operations* for more information about the ZOODB INIT command.

---

**OODB0006I REQUEST COMPLETED FOR DD** *ddname*

**Where:**

*ddname*
The data definition name.

**Explanation:** This is the normal response to the ZOODB DEFINE command with the DD parameter specified. This message is displayed whether the ZOODB DEFINE command with the DD parameter was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, enter the ZOODB DEFINE command again specifying the DD parameter.

See *TPF Operations* for more information about the ZOODB DEFINE command.

---

**OODB0007I DD** *ddname* **DEFINED**

**Where:**

*ddname*
The data definition name.

**Explanation:** This is the normal response to the ZOODB DEFINE command with the DD parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB DEFINE command.

---

**OODB0011I REQUEST COMPLETED FOR DS** *dsname*

**Where:**

*dsname*
The data store name.

**Explanation:** This is the normal response to the ZOODB DEFINE command with the DS parameter specified. This message is displayed whether ZOODB DEFINE DS was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, determine the cause of the error, correct it, and enter the ZOODB DEFINE command again specifying the DS parameter.

See *TPF Operations* for more information about the ZOODB DEFINE command.

---

**OODB0012I DATA STORE** *dsname* **DEFINED**

**Where:**

*dsname*
The data store name.

**Explanation:** This is the normal response to the ZOODB DEFINE command with the DS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB DEFINE command.

---

**OODB0014I DATA STORE** *dsname* **CHANGED**

**Where:**

*dsname*
The data store (DS) name.

**Explanation:** This is the normal response to the ZOODB CHANGE command with the DS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB CHANGE command.

---

**OODB0021I DATA STORE LIST DISPLAY**

**Explanation:** This is the normal response to the ZOODB DISPLAY command with the DS and ALL parameters specified.

**System Action:** Information about a formatted display of all defined data stores with the persistent identifier (PID) of their inventory follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

---

**OODB0022I DISPLAY COMPLETED FOR DS** *dsname*

**Where:**

*dsname*
The data store name, if provided.

**Explanation:** This is the normal response to the ZOODB DISPLAY command with the DS parameter specified. This message is displayed whether ZOODB DISPLAY DS was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, determine the cause of the error, correct it, and enter the ZOODB DISPLAY command again.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

---

**OODB0025I START OF ATTRIBUTE DISPLAY**

**Explanation:** This is the normal response to the ZOODB DISPLAY command with the DS parameter and a specific data store name specified, or the DD parameter and a specific data definition specified.

**System Action:** A formatted display of the attributes associated with the data store or data definition specified follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

---

**OODB0026I DATA DEFINITION LIST DISPLAY**

**Explanation:** This is the normal response to the ZOODB DISPLAY command with the DD and ALL parameters specified.

**System Action:** A tabular display of all data definitions for the specified data store follows this message.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

---

**OODB0027I DISPLAY COMPLETED FOR DD** *ddname*

**Where:**

*ddname*
The data definition name, if provided.

**Explanation:** This is the normal response to the ZOODB DISPLAY command with the DD parameter specified. This message is displayed whether ZOODB DISPLAY DD was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, determine the cause of the error, correct it, and enter the ZOODB DISPLAY command

again specifying the DD parameter.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

---

**OODB0030I CHANGE COMPLETED FOR DS** *dsname*

**Where:**

*dsname*
The data store (DS) name.

**Explanation:** This is the normal response to the ZOODB CHANGE command with the DS parameter specified. This message is displayed whether ZOODB CHANGE was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** Do the following:

1. Determine the cause of the error if the change is not successful.
2. Correct the error.
3. Enter the ZOODB CHANGE command again specifying the DS parameter.

See *TPF Operations* for more information about the ZOODB CHANGE command.

---

**OODB0031I CHANGE COMPLETED FOR DD** *ddname*

**Where:**

*ddname*
The data definition name.

**Explanation:** This is the normal response to the ZOODB CHANGE command with DD parameter specified. This message is displayed whether ZOODB CHANGE DD was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, determine the cause of the error, correct it, and enter the ZOODB CHANGE command again specifying the DD parameter.

See *TPF Operations* for more information about the ZOODB CHANGE command.

---

**OODB0032I DD** *ddname* **CHANGED**

**Where:**

*ddname*
The data definition name.

**Explanation:** This is the normal response to the ZOODB CHANGE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB CHANGE command.

---

**OODB0039E NO OPTIONS SPECIFIED. DD NOT CHANGED**

**Explanation:** The ZOODB CHANGE command was entered to change the attributes of a data definition (DD) without specifying an option.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB CHANGE command again specifying either DATARID, FORCE, NOFORCE, INDEXRID, DIRECTRID, SHADOW, or NOSHADOW.

See *TPF Operations* for more information about the ZOODB CHANGE command.

---

**OODB0041I DELETE COMPLETED FOR DD** *ddname*

**Where:**

*ddname*
The data definition name.

**Explanation:** This is the normal response to the ZOODB DELETE command with the DD parameter specified. This message is displayed whether ZOODB DELETE DD was or was not successful.

**System Action:** Another message is displayed if an error occurs.

**User Response:** If an error occurs, determine the cause of the error, correct it, and enter the ZOODB DELETE command again specifying the DD parameter.

See *TPF Operations* for more information about the ZOODB DELETE command.

---

**OODB0042I DD** *ddname* **DELETED**

**Where:**

*ddname*
The data definition name.

**Explanation:** This is the normal response to the ZOODB DELETE command with the DD parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB DELETE command.

---

**OODB0046E DELETE FAILED FOR DS** *dsname*

**Where:**

*dsname*
The data store name.

**Explanation:** An error occurred while processing a ZOODB DELETE command with the DS parameter specified. This message is accompanied by another, more specific error message.

**System Action:** Processing ends and the data store is not deleted.

**User Response:** Do the following:

1. Examine the accompanying online message to determine the cause of the error.

2. Correct the error.
3. Enter the ZOODB DELETE command again specifying the DS parameter.

See *TPF Operations* for more information about the ZOODB DELETE command.

---

**OODB0047I DELETE OF DS *dsname* COMPLETED**

**Where:**

*dsname*
The data store name.

**Explanation:** This is the normal response to the ZOODB DELETE command with the DS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB DELETE command.

---

**OODB0051I SET REQUEST COMPLETED**

**Explanation:** This is the normal response to the ZOODB SET command. This message is displayed whether ZOODB SET was or was not successful.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB SET command.

---

**OODB0060I MIGRATE OF DS *dsname* STARTED**

**Where:**

*dsname*
The data store name.

**Explanation:** This is the normal response to the ZOODB MIGRATE command with the DS parameter specified.

**System Action:** Data store migration continues.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB MIGRATE command.

---

**OODB0061E MIGRATE FAILED FOR DS *dsname***

**Where:**

*dsname*
The data store name.

**Explanation:** An error occurred while processing a ZOODB MIGRATE command with the DS parameter specified. This message is accompanied by another, more specific error message.

**System Action:** Processing ends and the data store is not migrated.

**User Response:** Do the following:

1. Examine the accompanying online message to determine the cause of the error.
2. Correct the error.
3. Enter the ZOODB MIGRATE command again specifying the DS parameter.

See *TPF Operations* for more information about the ZOODB MIGRATE command.

---

**OODB0062I MIGRATE OF DS *dsname* COMPLETED**

**Where:**

*dsname*
The data store name.

**Explanation:** This is the normal response to the ZOODB MIGRATE command with the DS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB MIGRATE command.

---

**OODB0063E MIGRATE OF COLLECTION *colname* FAILED**

**Where:**

*colname*
The collection name.

**Explanation:** An error occurred while processing a ZOODB MIGRATE command with the DS parameter specified. The collection indicated could not be migrated. This message is accompanied by another, more specific error message.

**System Action:** Migration processing continues.

**User Response:** Do the following:

1. Examine the accompanying online message to determine the cause of the error.
2. Correct the error.
3. Enter the ZOODB MIGRATE command again specifying the DS parameter.

See *TPF Operations* for more information about the ZOODB MIGRATE command.

---

**OODB0064E MIGRATE OF PID IN #INODE RECORD ORDINAL *ordnum* FAILED**

**Where:**

*ordnum*
The ordinal number.

**Explanation:** An error occurred while processing a ZOODB MIGRATE command with the DS parameter specified. The collection whose persistent identifier (PID) is embedded in the #INODE fixed file record with the indicated ordinal number could not be migrated. This message is accompanied by another, more specific error message.

**System Action:** Migration processing continues.

**User Response:** Do the following:

1. Examine the accompanying online message to determine the cause of the error.

2. Correct the error.
3. Use the `TO2_migrateCollection` function call to migrate the collection or enter the ZOODB MIGRATE command again specifying the DS parameter.

See *TPF Operations* for more information about the ZOODB MIGRATE command and see the *TPF C/C++ Language Support User's Guide* for information about the `TO2_migrateCollection` function call.

---

**OODB0065W MIGRATE OF DS *dsname* COMPLETED WITH ERRORS**

**Where:**

*dsname*
The data store name.

**Explanation:** An error occurred while processing a ZOODB MIGRATE command with the DS parameter specified. One or more collections could not be migrated. This message is accompanied by another, more specific error message.

**System Action:** Migration processing ends.

**User Response:** Do the following:

1. Examine the accompanying online message to determine the cause of the error.
2. Correct the error.
3. Use the `TO2_migrateCollection` function call to migrate the collection or enter the ZOODB MIGRATE command again specifying the DS parameter.

See *TPF Operations* for more information about the ZOODB MIGRATE command and see the *TPF C/C++ Language Support User's Guide* for information about the `TO2_migrateCollection` function call.

---

**OODB0071E RE-CREATE FAILED FOR DS *dsname***

**Where:**

*dsname*
The data store name.

**Explanation:** An error occurred while processing a ZOODB RECREATE command with the DS parameter specified. This message is accompanied by another, more specific error message.

**System Action:** Processing ends and the data store is not re-created.

**User Response:** Do the following:

1. Examine the accompanying online message to determine the cause of the error.
2. Correct the error.
3. Enter the ZOODB RECREATE command again specifying the DS parameter.

See *TPF Operations* for more information about the ZOODB RECREATE command.

---

**OODB0072I RE-CREATE OF DS *dsname* COMPLETED**

**Where:**

*dsname*
The data store name.

**Explanation:** This is the normal response to the ZOODB RECREATE command with the DS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB RECREATE command.

---

**OODB0098E TPFCS ERROR, ERROR CODE *errcode errtext***

**Where:**

*errcode*
The internal error code.

*errtext*
The text that describes the error.

**Explanation:** ZOODB command processing could not be completed because an error occurred. This error may or may not be internal. The error code from the associated environment block is displayed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check for other errors that preceded this message to help determine why TPF collection support (TPFCS) was unable to process the information for the specified request.
2. See your IBM service representative if you determine that the error is internal.

See *TPF Operations* for more information about the ZOODB commands and see the *TPF C/C++ Language Support User's Guide* for a TPFCS error code summary.

---

**OODB0099E TO2 INTERNAL ERROR, ERROR CODE *errcode errtext***

**Where:**

*errcode*
The internal error code.

*errtext*
The text that describes the error.

**Explanation:** A ZOODB command could not be completed because an internal error occurred. The error code from the associated environment block is displayed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the internal error.
2. Correct the internal error.
3. Enter the ZOODB command again.
4. See your IBM service representative for more information if you are unable to correct the internal error.

See *TPF Operations* for more information about the ZOODB commands and see the *TPF C/C++ Language Support User's Guide* for a TPF collection support (TPFCS) error code summary.

**OODB0101E INIT NOT ALLOWED. TO2 IS ALREADY INITIALIZED**

**Explanation:** A ZOODB INIT command was entered to initialize TPF collection support after it was already initialized.

**System Action:** The command is rejected and the system is initialized.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB INIT command.

**OODB0105E GFS DISABLED, ZOODB INIT NOT PERMITTED**

**Explanation:** A ZOODB INIT command cannot be entered when get file storage (GFS) is disabled.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the system above CRAS state.
2. Enable GFS on the current subsystem.
3. Enter the ZOODB INIT command again.

See *TPF Operations* for more information about the ZOODB INIT command.

**OODB0106E ERRORS ON REQUEST, TO2 NOT INITIALIZED**

**Explanation:** An internal error occurred while entering a ZOODB INIT command to initialize TPF collection support.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZOODB INIT command.

**OODB0121E ERROR ON REQUEST, DATA STORE *dsname* NOT DEFINED**

**Where:**

*dsname*
The data store name.

**Explanation:** An internal error occurred while entering a ZOODB DEFINE command with the DS parameter specified to define a data store.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZOODB DEFINE command.

**OODB0122E DATA STORE *dsname* ALREADY EXISTS**

**Where:**

*dsname*
The data store name.

**Explanation:** An error occurred while entering a ZOODB DEFINE command to define a new data store when a data store with that name already exists.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DEFINE command again specifying a unique data store name.

See *TPF Operations* for more information about the ZOODB DEFINE command.

**OODB0123E ERROR ON REQUEST, DATA STORE *dsname* NOT CHANGED**

**Where:**

*dsname*
The data store (DS) name.

**Explanation:** An internal error occurred while entering a ZOODB CHANGE command with the DS parameter specified to change a data store.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZOODB CHANGE command.

**OODB0130E INCORRECT VALUE FOR DELETE, MUST BE DELAY OR IMMED**

**Explanation:** An error occurred while entering a ZOODB DEFINE or ZOODB CHANGE command with the DS parameter specified. The value entered for the DELETE parameter was not DELAY or IMMED, which are the only valid parameters.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DEFINE or ZOODB CHANGE command again specifying a valid value for the DELETE parameter.

See *TPF Operations* for more information about the ZOODB DEFINE and ZOODB CHANGE commands.

**OODB0131E DSNAME TPFDB RESERVED. TPFDB DEFINED BY ZOODB INIT**

**Explanation:** An error occurred while entering a ZOODB DEFINE command with the DS parameter specified to define a data store. The data store name selected, TPFDB, was already created when TPF collection support was initialized. The TPF 4.1 system reserves all data store names that begin with I or TPF.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DEFINE command again specifying a valid data store name.

See *TPF Operations* for more information about the ZOODB DEFINE command.

### OODB0132E DATARID VALUE NOT VALID, VALUE NOT LONG ENOUGH

**Explanation:** A ZOODB DEFINE or ZOODB CHANGE command was entered with a value specified for the DATARID parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DEFINE or ZOODB CHANGE command again specifying a valid value for the DATARID parameter.

See *TPF Operations* for more information about the ZOODB DEFINE and ZOODB CHANGE commands.

### OODB0133E DIRECTRID VALUE NOT VALID, VALUE NOT LONG ENOUGH

**Explanation:** A ZOODB DEFINE or ZOODB CHANGE command was entered with a value specified for the DIRECTRID parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DEFINE or ZOODB CHANGE command again specifying a valid value for the DIRECTRID parameter.

See *TPF Operations* for more information about the ZOODB DEFINE and ZOODB CHANGE commands.

### OODB0134E INDEXRID VALUE NOT VALID, VALUE NOT LONG ENOUGH

**Explanation:** A ZOODB DEFINE or ZOODB CHANGE command was entered with a value specified for the INDEXRID parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DEFINE or ZOODB CHANGE command again specifying a valid value for the INDEXRID parameter.

See *TPF Operations* for more information about the ZOODB DEFINE and ZOODB CHANGE commands.

### OODB0135E GFS DISABLED, DATABASE MODIFICATION NOT PERMITTED

**Explanation:** A ZOODB DEFINE, ZOODB CHANGE, or ZOODB DELETE command cannot be entered when get file storage (GFS) is disabled on the current subsystem.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the system above CRAS state.
2. Enable GFS on the current subsystem.
3. Enter the appropriate ZOODB command again.

See *TPF Operations* for more information about the ZOODB commands.

### OODB0136E SHADOW NOT SUPPORTED FOR TEMP DD DEFINITION

**Explanation:** A ZOODB DEFINE command with the DD, SHADOW, and TEMP parameters specified was entered. The SHADOW and TEMP parameters are mutually exclusive.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DEFINE command again specifying either DD with the SHADOW parameter or DD with the TEMP parameter.

See *TPF Operations* for more information about the ZOODB DEFINE command.

### OODB0141E DISPLAY REQUEST IGNORED. DS PARAMETER REQUIRED

**Explanation:** A ZOODB DISPLAY command was entered with the DS parameter without specifying a data store name.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DISPLAY command again specifying a data store name.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

### OODB0142E DISPLAY REQUEST IGNORED. DS AND ALL ARE MUTUALLY EXCLUSIVE

**Explanation:** A ZOODB DISPLAY command with the DS parameter was entered with the ALL parameter and a data store name specified. These parameters are mutually exclusive and cannot be specified at the same time.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DISPLAY command again specifying either the data store name or ALL parameter, but not both.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

### OODB0143E ERROR RETRIEVING DATA STORE *dsname* INFORMATION

**Where:**

*dsname*
The data store name.

**Explanation:** An internal error occurred when a ZOODB DISPLAY command was entered with the DS parameter specified to access the data store (DS) referenced in this message. However, the data store was not accessed because it is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZOODB DEFINE command specifying the DS parameter.
2. Enter the ZOODB DISPLAY command again.
3. If you are unable to determine the cause of the error, see your IBM service representative.

See *TPF Operations* for more information about the ZOODB DEFINE and ZOODB DISPLAY commands.

---

**OODB0144E ERROR RETRIEVING DATA STORE NAME LIST**

**Explanation:** An internal error occurred when a ZOODB DISPLAY command was entered with the DS and ALL parameters specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZOODB DISPLAY command again specifying either the DS or ALL parameter, but not both.
2. If you are unable to determine the cause of the error, see your IBM service representative.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

---

**OODB0145E DATA STORE *dsname* NOT DEFINED**

**Where:**

*dsname*
The data store name.

**Explanation:** A ZOODB command with the DEFINE parameter specified was entered with a data store name that is not defined.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DEFINE command again specifying the name of a defined data store.

See *TPF Operations* for more information about the ZOODB commands.

---

**OODB0151E DISPLAY REQUEST IGNORED. DD PARAMETER REQUIRED**

**Explanation:** A ZOODB DISPLAY command with the DD parameter specified was entered without specifying a data definition (DD) name.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DISPLAY command again specifying a data definition name.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

---

**OODB0152E DISPLAY REQUEST IGNORED. DD AND ALL ARE MUTUALLY EXCLUSIVE**

**Explanation:** A ZOODB DISPLAY command with the DD parameter was entered with the ALL parameter and a data definition name specified. These parameters are mutually exclusive and cannot be specified at the same time.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DISPLAY command again specifying either the data definition or ALL parameter, but not both.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

---

**OODB0153E ERROR ON REQUEST, DD *ddname* NOT DEFINED**

**Where:**

*ddname*
The data definition name.

**Explanation:** The data definition (DD) could not be defined for a ZOODB DEFINE command with the DD parameter specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Make sure that all necessary parameters are valid on the ZOODB DEFINE command and that the data definition is not already defined.
2. Enter the ZOODB DEFINE command again specifying the DD parameter.

See *TPF Operations* for more information about the ZOODB DEFINE command.

---

**OODB0154E ERROR RETRIEVING DD *ddname***

**Where:**

*ddname*
The data definition name.

**Explanation:** A ZOODB DISPLAY command with the DD parameter specified was entered to display the data definition name referenced in the message. An error occurred because the data definition name specified was not defined.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

---

**OODB0155E ERROR RETRIEVING DD NAME LIST**

**Explanation:** An internal error occurred when the data definition (DD) names could not be defined for a ZOODB DEFINE command with the DD or ALL parameter specified.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Make sure that all necessary parameters are included on the ZOODB DEFINE command and that the data definition is not already defined.
2. Enter the ZOODB DEFINE command again specifying either the DD or ALL parameter.

See *TPF Operations* for more information about the ZOODB DEFINE command.

---

**OODB0156E SPECIFIED COLLECTION IS EMPTY**

**Explanation:** An error occurred while processing a ZOODB DISPLAY command.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZOODB DISPLAY command.

**OODB0164E SUBSYSTEM *subsystem* NOT IN NORM STATE. FILE SYSTEM NOT INITIALIZED FOR THAT SUBSYSTEM**

**Where:**

*subsystem*
The name of the subsystem.

**Explanation:** An error occurred because the subsystem referenced in the message was not in NORM state.

**System Action:** The file system was not initialized for that particular subsystem.

**User Response:** Do the following:

1. Enter the ZFINT command with the ON parameter specified for the subsystem referenced in the message to ensure the file system is initialized for that subsystem.
2. Initialize the TPF system to NORM state.

See *TPF Operations* for more information about the ZFINT command.

**OODB0171E ERROR CHANGING DD *ddname* INFORMATION**

**Where:**

*ddname*
The data definition name.

**Explanation:** An error occurred while entering the ZOODB CHANGE command to update the data definition (DD) referenced in the message.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that the data definition was specified correctly.
2. Enter the ZOODB CHANGE command again with the DD parameter specified.

See *TPF Operations* for more information about the ZOODB CHANGE command.

**OODB0191E ERROR DELETING DD *ddname***

**Where:**

*ddname*
The data definition name.

**Explanation:** A ZOODB DELETE command was entered to delete the data definition (DD) name referenced in the message. An error occurred because the data definition name specified was not found.

**System Action:** The ZOODB DELETE command is rejected.

**User Response:** Do the following:

1. Verify that the data definition was specified correctly.
2. Enter the ZOODB DELETE command again specifying the correct data definition name.

See *TPF Operations* for more information about the ZOODB DELETE command.

**OODB0192E DELETE NOT ALLOWED FOR DEFAULT DD**

**Explanation:** A ZOODB DELETE command was entered with a default data definition (DD) name specified. The default data definition name cannot be specified when entering this command.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB DELETE command again specifying a valid data definition name.

See *TPF Operations* for more information about the ZOODB DELETE command.

**OODB0201E MTRACE VALUE NOT VALID, VALUE MUST BE ON OR OFF**

**Explanation:** A ZOODB SET command was entered with a value specified for the MTRACE parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB SET command again specifying a valid value for the MTRACE parameter.

See *TPF Operations* for more information about the ZOODB SET command.

**OODB0202E TEXTDUMP VALUE NOT VALID, VALUE MUST BE ON OR OFF**

**Explanation:** A ZOODB SET command was entered with a value specified for the TEXTDUMP parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB SET command again specifying a valid value for the TEXTDUMP parameter.

See *TPF Operations* for more information about the ZOODB SET command.

**OODB0203E SET REQUEST IGNORED. NO PARAMETERS SPECIFIED**

**Explanation:** A ZOODB SET command was entered without specifying any parameters.

**System Action:** The command is rejected.

**User Response:** Enter the ZOODB SET command again specifying a valid parameter.

See *TPF Operations* for more information about the ZOODB SET command.

**OODB0204E ERROR ON SET MTRACE REQUEST**

**Explanation:** The ZOODB SET command that was entered with the MTRACE parameter specified did not end successfully.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZOODB SET command.
2. Enter the ZOODB SET command using the correct format.

See *TPF Operations* for more information about the ZOODB SET command.

**OODB0205E ERROR ON SET TEXTDUMP REQUEST**

**Explanation:** The ZOODB SET command that was entered with the TEXTDUMP parameter specified did not end successfully.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZOODB SET command again using the correct format.

See *TPF Operations* for more information about the ZOODB SET command.

**OODB0211E CREATE ENVIRONMENT FAILED FOR DATA STORE** *dsname*

**Where:**

*dsname*
The data store name.

**Explanation:** An internal error occurred while processing a ZOODB command.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZOODB commands.

**OODB0212E DATA STORE REQUEST MADE FROM NON-OWNING SUBSYSTEM**

**Explanation:** A ZOODB command was entered with a data store specified that is owned by a subsystem other than the subsystem from which the command was entered.

**System Action:** The command is rejected.

**User Response:** None.

Enter the ZOODB command again from the subsystem that owns the specified data store.

See *TPF Operations* for more information about the ZOODB commands.

# OSAE–OSA0

**OSAE0001I OSA-***osaname* **DEFINED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** This is the normal response to the ZOSAE command with the DEFINE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0002I OSA-***osaname* **MODIFIED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** This is the normal response to the ZOSAE command with the MODIFY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0003I OSA-***osaname* **DELETED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** This is the normal response to the ZOSAE command with the DELETE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0004I VIPA-***vipaddr* **DEFINED TO OSA-***osaname*

**Where:**

*vipaddr*
The virtual IP address (VIPA).

*osaname*
The name of the OSA-Express connection.

**Explanation:** This is the normal response to the ZOSAE command with the ADD parameter specified.

**System Action:** None

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0005I VIPA-*vipaddr* DELETED**

**Where:**

*vipaddr*
The virtual IP address (VIPA).

**Explanation:** This is the normal response to the ZOSAE command with the REMOVE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0006I VIPAS ON OSA-*osaold* SWUNG TO OSA-*osanew***

**Where:**

*osaold*
The name of the OSA-Express connection to which the virtual IP addresses (VIPAs) were associated.

*osanew*
The name of the OSA-Express connection to which the VIPAs are now associated.

**Explanation:** This is the normal response to the ZOSAE command with the SWING parameter specified, or else an OSA-Express connection failed and VIPAs were swung from one OSA-Express connection to another OSA-Express connection.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0007I BEGIN OSA DISPLAY**

**Explanation:** This is the normal response to the ZOSAE command with the DISPLAY and OSA parameters specified. This message is followed by a display of information about the specified OSA-Express connection.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command and for an example of the informational display.

**OSAE0008I BEGIN PROCESSING OSA DATAFLOW STATISTICS**

**Explanation:** This is the normal response to the ZOSAE command with the DATAFLOW parameter specified.

**System Action:** The TPF system begins the process of determining the number of Internet Protocol (IP) packets sent and received across each active Open Systems Adapter (OSA)-Express connection.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0009I OSA DATAFLOW STATISTICS FOR A 5-SECOND INTERVAL**

**Explanation:** This is the normal response to the ZOSAE command with the DATAFLOW parameter specified.

**System Action:** This message is followed by a display of the number of Internet Protocol (IP) packets sent and received across each active Open Systems Adapter (OSA)-Express connection in a 5-second interval.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command and for an example of the informational display.

**OSAE0010I NO OSA CONNECTIONS ACTIVE IN THE SYSTEM**

**Explanation:** The ZOSAE command was entered with the DATAFLOW parameter specified, but no Open Systems Adapter (OSA)-Express connections are active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0012I MOVABLE VIPA-*x.x.x.x* IS CURRENTLY NOT OWNED BY ANY PROCESSOR IN THE COMPLEX**

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that is no longer owned by any of the processors.

**Explanation:** The ZOSAE command was entered with the DELETE or REMOVE parameter specified to delete the definition for a movable VIPA from the processor that currently owned the VIPA. The VIPA is defined on other processors in the loosely coupled TPF complex, but the VIPA is not currently owned by any processor.

**System Action:** None.

**User Response:** Enter the ZVIPA command with the MOVE parameter specified to move the VIPA to an available processor.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0020E OSA-*osaname* DOES NOT EXIST**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** A ZOSAE command was entered with an OSA-Express connection name specified for the OSA parameter that does not exist.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again with a valid OSA-Express connection name specified for the OSA parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0021E VIPA-*vipaddr* ALREADY DEFINED TO OSA-*osaname***

**Where:**

*vipaddr*
The virtual IP address (VIPA).

*osaname*
The name of the OSA-Express connection that owns the VIPA.

**Explanation:** A ZOSAE command was entered with the ADD parameter specified; however, the VIPA specified is already associated with another OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again with a VIPA specified that is not already defined.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0022E OSA-*osaname* IS NOT DEFINED AS A PRIMARY CONNECTION**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** A ZOSAE command was entered with the ADD parameter specified; however, the OSA-Express connection name specified is not defined as a primary connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again with the OSA parameter specified with the name of a primary OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0024E VIPA-*vipaddr* NOT REMOVED BECAUSE OSA-*osaname* IS ACTIVE**

**Where:**

*vipaddr*
The virtual IP address (VIPA).

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the REMOVE parameter specified; however, the VIPA to be removed is assigned to an active OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP INACTIVATE command to deactivate the OSA-Express connection.
2. Enter the ZOSAE command again with the REMOVE parameter specified.

See *TPF Operations* for more information about the ZOSAE and ZTTCP INACTIVATE commands.

---

**OSAE0025E OSA-*osaname* IS ACTIVE, CANNOT BE DELETED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DELETE parameter specified; however, the OSA-Express connection specified is active. An active OSA-Express connection cannot be deleted.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP INACTIVATE command to deactivate the OSA-Express connection.
2. Enter the ZOSAE command again with the DELETE parameter specified.

See *TPF Operations* for more information about the ZOSAE and ZTTCP INACTIVATE commands.

---

**OSAE0026E OSA-*primeosa* NOT DELETED, ALTERNATE OSA-*altosa* EXISTS**

**Where:**

*primeosa*
The name of the primary OSA-Express connection.

*altosa*
The name of the alternate OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DELETE parameter specified; however, the primary OSA-Express connection specified cannot be deleted because an alternate OSA-Express connection is defined for this primary OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZOSAE command with the DELETE parameter specified and the name of the alternate OSA-Express connection to delete the alternate connection.
2. Enter the ZOSAE command again with the DELETE parameter specified and the name of the primary OSA-Express connection to delete the primary connection.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0028E VIPA SPECIFIED IS NOT VALID**

**Explanation:** A ZOSAE command was entered with the VIPA parameter; however, the VIPA is not in a valid format or is a reserved Internet Protocol (IP) address.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again with a valid value specified for the VIPA parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0029E IP ADDRESS SPECIFIED IS NOT VALID**

**Explanation:** A ZOSAE command was entered with the IP parameter specified; however, the Internet Protocol (IP) address is not in a valid format or is a reserved IP address.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again with a valid value specified for the IP parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0031E OSA-*osaname* IS ALREADY DEFINED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DEFINE parameter specified; however, the OSA-Express connection specified is already defined.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command with the MODIFY parameter specified to modify the definition of the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0032E SDA-*sda* ALREADY DEFINED TO OSA-*osaname***

**Where:**

*sda* The symbolic device address (SDA).

*osaname*
The name of the OSA-Express connection to which the SDA is defined..

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the SDA specified with the READ or DATA parameter is already defined to another OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying an SDA that is not already defined for the READ or DATA parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0033E SDA-*sda* IS NOT A VALID VALUE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the value for the READ or DATA parameter was not a valid SDA.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a valid SDA for the READ or DATA parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0034E IP-*osaipaddr* IS IN THE SAME SUBNET AS VIPA-*vipaddr***

**Where:**

*osaipaddr*
The name of the real Internet Protocol (IP) address of the OSA-Express connection.

*vipaddr*
The virtual IP address (VIPA).

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter and also the PRIMARY parameter specified; however, the real IP address of the alternate OSA-Express connection being defined is in the same subnet as one of the VIPAs already defined to the primary OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you defined the real IP address by entering the ZOSAE command, enter it again, specifying a real IP address that is not in the same subnet as the VIPA.
- If the real IP address was already defined to this OSA-Express connection, enter the ZOSAE command with the DELETE parameter specified to delete the definition and define the OSA definition again with a real IP address that is not in the same subnet as the VIPA.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0035E FORMAT OF THE ZOSAE MESSAGE IS NOT VALID**

**Explanation:** The ZOSAE command was entered; however, the combination of parameters specified was not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a valid combination of parameters.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0036E LINK-*num* IS NOT VALID**

**Where:**

*num*
The logical link number.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the value specified for the LINK parameter is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a valid value for the LINK parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0037E NET-*type* IS NOT VALID**

**Where:**

*type*
The network type.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter and the NET parameter specified; however, the NET parameter is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying the DEFINE or MODIFY parameter and a valid value for the NET parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0038E MTU-*size* IS NOT VALID**

**Where:**

*size* The maximum transmission unit (MTU) size.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified, and the MTU parameter specified; however, the MTU parameter does not have a valid value.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying the DEFINE or MODIFY parameter and a valid value for the MTU parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0039E MASK-*mask* IS NOT VALID**

**Where:**

*mask*
The subnet mask.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified, and the MASK parameter specified; however, the MASK parameter is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying the DEFINE or MODIFY parameter and a valid value for the MASK parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0040E OSA-*osaname* CANNOT BE MODIFIED WHILE ACTIVE**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the MODIFY parameter specified; however, the OSA-Express connection is active. The only parameters that can be modified while a connection is active are MTU, GATEWAY1, and GATEWAY2.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP INACTIVATE command to deactivate the OSA-Express connection.
2. Enter the ZOSAE command again, specifying the MODIFY parameter.

See *TPF Operations* for more information about the ZOSAE and ZTTCP INACTIVATE commands.

---

**OSAE0041E OSA-*osaname* IS NOT ACTIVE, CANNOT SWING**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** Either the ZOSAE command was entered with the SWING parameter specified or a connection failed and a swing should take place; however, the OSA-Express connection that the virtual IP addresses (VIPAs) were being swung to is not active.

**System Action:** The swing does not take place, and the command is rejected if it was entered.

**User Response:** Do the following:

1. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.
2. Enter the ZOSAE command again, specifying the SWING parameter.

See *TPF Operations* for more information about the ZOSAE and ZTTCP ACTIVATE commands.

---

**OSAE042E OSA IP ADDRESS TABLE IS FULL**

**Explanation:** The ZOSAE command was entered with the ADD, DEFINE, or MODIFY parameter specified; however, the Internet Protocol (IP) address cannot be defined because the Open Systems Adapter (OSA) IP address table is full.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Delete the definitions for some IP addresses that are used by OSA-Express support by doing one of the following:
   - Delete the definitions for virtual IP addresses (VIPAs) by entering the ZOSAE command with the REMOVE parameter specified
   - Delete the definitions of OSA-Express connections by entering the ZOSAE command with the DELETE parameter specified.
2. Enter the ZOSAE command again, specifying the ADD, DEFINE, or MODIFY parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE043E OSA DEFINITION TABLE IS FULL**

**Explanation:** The ZOSAE command was entered with the DEFINE parameter specified; however, the OSA-Express connection cannot be defined because the OSA definition table is full.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZOSAE command, specifying the DELETE parameter to delete the definitions for OSA-Express connections that are no longer needed.
2. Enter the ZOSAE command again, specifying the DEFINE parameter.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0044E VIPA-*vipaddr* IS NOT IN THE CORRECT SUBNET**

**Where:**

*vipaddr*
The virtual IP address (VIPA).

**Explanation:** The ZOSAE command was entered with the ADD parameter specified; however, the VIPA specified is in the same subnet as the specified OSA-Express connection or its alternate OSA-Express connection if one exists.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a VIPA that is not in the same subnet as the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0045E IP-*ipaddr* IS ALREADY DEFINED TO OSA-*osaname***

**Where:**

*ipaddr*
The Internet Protocol (IP) address.

*osaname*
The name of the OSA-Express connection to which the IP address is defined.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the IP address is already defined to another OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying an IP address that is not already defined.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0046E IP-*ipaddr* IS ALREADY DEFINED TO CDLC IP ROUTERS**

**Where:**

*ipaddr*
The Internet Protocol (IP) address.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the IP address is already defined to IP routers that use the channel data link control (CDLC) protocol. An IP address cannot be shared by CDLC IP routers and OSA-Express connections.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying an IP address that is not already defined.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0047E VIPA-*vipaddr* IS ALREADY DEFINED TO CDLC IP ROUTERS**

**Where:**

*vipaddr*
The virtual IP address (VIPA).

**Explanation:** The ZOSAE command was entered with the ADD parameter specified; however, the specified VIPA is already defined to IP routers that use the channel data link control (CDLC) protocol. An IP address cannot be shared by CDLC IP routers and OSA-Express connections.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a VIPA that is not already defined.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0048E CONFLICTING SDAS FOR THIS OSA**

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the values for the symbolic device addresses (SDAs) specified for the DATA and READ parameters conflict.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying valid SDA combinations for the DATA and READ parameters.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0049E GATEWAY-*ipaddr* IS NOT IN THE CORRECT SUBNET**

**Where:**

*ipaddr*
The Internet Protocol (IP) address.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the IP address specified for the GATEWAY1 or GATEWAY2 parameter is not in the subnet associated with the OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a gateway IP address that is in the correct subnet.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0050E GATEWAY-*ipaddr* IS ALREADY IN USE FOR THIS OSA**

**Where:**

*ipaddr*
The Internet Protocol (IP) address.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the IP address specified for the GATEWAY1 or GATEWAY2 parameter is already defined as the real IP address of the OSA-Express connection or as the other default gateway for this definition.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a gateway IP address that is not already defined to the OSA-Express definition.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0051E PRIMARY-*osaname* DOES NOT EXIST**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the OSA-Express connection specified for the PRIMARY parameter does not exist.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a valid OSA-Express connection name for the PRIMARY parameter.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0052E PRIMARY-*osaname* IS DEFINED AS AN ALTERNATE OSA**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter and the PRIMARY parameter specified; however, the value for the PRIMARY parameter specified is an alternate OSA-Express connection rather than a primary OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a value for the PRIMARY parameter that is a primary OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0053E OSA-*osaname* ALREADY HAS AN ALTERNATE OSA DEFINED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the primary OSA-Express connection already has an alternate OSA-Express connection defined.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a primary OSA-Express connection that does not have an alternate OSA-Express connection already defined.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0054E VIPA-*vipaddr* DOES NOT EXIST**

**Where:**

*vipaddr*
The virtual IP address (VIPA).

**Explanation:** The ZOSAE command was entered with the REMOVE parameter specified; however, the specified VIPA does not exist.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a valid VIPA.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0055E REJECTED, OSA SUPPORT IS NOT DEFINED**

**Explanation:** A ZOSAE command was entered; however, OSA-Express support is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the OSA-Express support parameters in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system.
5. Enter the ZOSAE command again.

See *TPF Operations* for more information about the ZOSAE command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for OSA-Express support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**OSAE0056E REJECTED, SYSTEM IS IN RESTART**

**Explanation:** A ZOSAE command was entered while the TPF system was in system restart.

**System Action:** The ZOSAE command is rejected.

**User Response:** Do the following:

1. Wait for the TPF system to reach 1052 state.
2. Enter the command again.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0057E VIPA-*vipaddr* IS DEFINED AS A REAL IP ADDRESS**

**Where:**

*vipaddr*
The virtual IP address (VIPA).

**Explanation:** The ZOSAE command was entered with the REMOVE parameter specified; however, the specified VIPA is a real Internet Protocol (IP) address for an OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a valid VIPA.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0058E REJECTED, IP ROUTING TABLE ENTRIES EXIST FOR IP ADDRESS**

**Explanation:** The ZOSAE command was entered with the DELETE or REMOVE parameter specified; however, an Internet Protocol (IP) address associated with the OSA-Express connection cannot be deleted or the virtual IP address (VIPA) cannot be removed because the IP address is used in one or more IP routing table entries.

**System Action:** The command is rejected.

**User Response:** Do the following:

- Enter the ZTRTE command with the DELETE parameter and the IP address specified. This deletes all IP routing table (IPRT) entries using the IP address.
- Enter the ZOSAE command again.

See *TPF Operations* for more information about the ZOSAE and ZTRTE commands.

**OSAE0060E OSA-*osaname* ALREADY HAS AN IP ADDRESS DEFINED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** A ZOSAE command was entered with the MODIFY and IP parameters specified; however, an Internet Protocol (IP) address has already been defined for the OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the IP address that is defined is the one you want to use, there is no action for you to take.
- If the IP address that is defined is not the one you want to use, do the following:
  1. Enter the ZOSAE command, specifying the DELETE parameter to delete the OSA-Express connection.
  2. Enter the ZOSAE command again, specifying the DEFINE parameter to define a new OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0061E OSA-*osaname* DOES NOT HAVE A SUBNET MASK DEFINED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** A ZOSAE command was entered with the ADD, DEFINE, or MODIFY parameter specified; however, the OSA-Express connection does not have a subnet mask defined. The subnet mask must be defined before attempting to define a gateway or virtual IP address (VIPA) for this connection.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZOSAE command, specifying the MODIFY and MASK parameters to define a subnet mask for the OSA-Express connection.
2. Enter the ZOSAE command again, specifying the ADD or MODIFY parameter to define a gateway or to add a VIPA to the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0062E GATEWAY-*ipaddr* IS NOT VALID**

**Where:**

*ipaddr*
The Internet Protocol (IP) address.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified, and the GATEWAY1 or GATEWAY2 parameter specified; however, the gateway specified is not in a valid format or is a reserved IP address.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a gateway that is valid.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0063E PRIMARY-*osaname* ALREADY DEFINED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified, and the PRIMARY parameter specified; however, this alternate OSA-Express connection already has a primary connection defined to it.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the primary Open Systems Adapter (OSA) name that is defined is the one you want to use, there is no action for you to take.
- If the primary OSA name that is defined is not the one you want to use, do the following:
  1. Enter the ZOSAE command, specifying the DELETE parameter to delete the OSA-Express connection.
  2. Enter the ZOSAE command again, specifying the DEFINE parameter to define a new OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0064E OSA-*osaname* DOES NOT HAVE AN IP ADDRESS DEFINED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the ADD, DEFINE, or MODIFY parameter specified, and the GATEWAY1 or GATEWAY2 parameter specified; however, the OSA-Express connection does not have an Internet Protocol (IP) address defined. The IP address of the OSA-Express connection must be defined before attempting to define a gateway or virtual IP address (VIPA).

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZOSAE command, specifying the MODIFY and IP parameters to define the IP address of the OSA-Express connection.
2. Enter the ZOSAE command again, specifying the ADD or MODIFY parameter to define a gateway or add a VIPA to this OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command.

---

**OSAE0065E VIPA-*vipaddr* NOT REMOVED BECAUSE IT IS THE DEFAULT IP ADDRESS**

**Where:**

*vipaddr*
The virtual IP address (VIPA).

**Explanation:** The ZOSAE command was entered with the REMOVE parameter specified; however, the VIPA to be removed is the default local Internet Protocol (IP) address.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP CHANGE command, specifying the DEFIP parameter to change the default local IP address to another IP Address.
2. Enter the ZOSAE command again, specifying the REMOVE parameter.

See *TPF Operations* for more information about the ZOSAE and ZTTCP CHANGE commands.

---

**OSAE0066E OSA-*osaname* NOT DELETED BECAUSE IP-*ipaddr* IS THE DEFAULT IP**

**Where:**

*osaname*
The name of the OSA-Express connection.

*ipaddr*
The default local Internet Protocol (IP) address.

**Explanation:** The ZOSAE command was entered with the DELETE parameter specified; however, the OSA-Express connection could not be deleted because the real IP address or one of the virtual IP addresses (VIPAs) associated with the connection is the default local IP address.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP CHANGE command, specifying the DEFIP parameter to change the default local IP address to an IP address that is not associated with this OSA-Express connection.
2. Enter the ZOSAE command again, specifying the DELETE parameter.

See *TPF Operations* for more information about the ZOSAE and ZTTCP CHANGE commands.

---

**OSAE0067E OSA-*altosa* NOT DELETED, VIPAS MUST BE SWUNG FIRST**

**Where:**

*altosa*
The name of the alternate OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DELETE parameter specified; however, the alternate OSA-Express connection that was specified cannot be deleted because it has virtual IP addresses (VIPAs) associated with it.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZOSAE command, specifying the SWING parameter to swing the VIPAs to the primary OSA-Express connection.
2. Enter the ZOSAE command again, specifying the DELETE parameter.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0068E CONNECTION NOT SWUNG, ALREADY USING OSA-*osaname***

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the SWING parameter specified; however, virtual IP addresses (VIPAs) already use the specified OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0069E NO VIPAs ARE DEFINED FOR OSA-*osaname***

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the SWING parameter specified; however, there are no virtual IP addresses (VIPAs) defined to this OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0070E OSA-*osaname* IS NOT VALID**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the OSA or PRIMARY parameter specified; however, the format of the parameter is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a valid value for the OSA or PRIMARY parameter.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0071E PORT-*portname* IS NOT VALID**

**Where:**

*portname*
The name of the port for this OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified and the PORT parameter specified; however, the format of the PORT parameter is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying a valid value for the PORT parameter.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0073E OSA-*osaname* ALREADY HAS A SUBNET MASK DEFINED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** A ZOSAE command was entered with the MODIFY and MASK parameters specified; however, a subnet mask is already defined for the OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the subnet mask that is defined is the one you want to use, there is no action for you to take.
- If the subnet mask that is defined is not the one you want to use, do the following:
  1. Enter the ZOSAE command, specifying the DELETE parameter to delete the OSA-Express connection.
  2. Enter the ZOSAE command again, specifying the DEFINE parameter to define a new OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0074E PRIMARY-*osaname* IS ALREADY DEFINED TO ANOTHER OSA CONNECTION**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the primary OSA-Express connection already has an alternate OSA-Express connection defined to it.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying the DEFINE or MODIFY parameter to associate this alternate OSA-Express connection to another primary connection.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0075E PRIMARY OSA CANNOT BE DEFINED TO ITSELF**

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the primary OSA-Express connection specified cannot be the same as the OSA-Express connection you are attempting to define or modify.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again, specifying the DEFINE or MODIFY parameter to associate an alternate OSA-Express connection to another primary connection.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0076E VIPA-*vipaddr* NOT REMOVED BECAUSE ALTERNATE OSA-*osaname* IS ACTIVE**

**Where:**

*vipaddr*
The virtual IP address (VIPA).

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the REMOVE parameter specified; however, the VIPA cannot be removed because it is assigned to an active OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP INACTIVATE command to deactivate the OSA-Express connection.
2. Enter the ZOSAE command again, specifying the REMOVE parameter.

See *TPF Operations* for more information about the ZOSAE and ZTTCP INACTIVATE commands.

**OSAE0077E OSA-*osaname* CANNOT BE MADE AN ALTERNATE, IT ALREADY HAS VIPAS DEFINED TO IT**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZOSAE command was entered with the MODIFY parameter specified; however, the OSA-Express connection cannot be made an alternate connection because virtual IP addresses (VIPAs) have been previously defined to it.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZOSAE command, specifying the REMOVE parameter to remove the VIPAs from the OSA-Express connection.
2. Enter the ZOSAE command again, specifying the MODIFY parameter.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0100E IP-*x.x.x.x* ALREADY DEFINED TO CPU-*y***

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that was specified for the ZOSAE command.

*y* The processor ID.

**Explanation:** The ZOSAE command was entered with the DEFINE or MODIFY parameter specified; however, the Internet Protocol (IP) address is already defined to another TPF processor in the loosely coupled TPF complex.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again and specify the DEFINE or MODIFY parameter with an IP address that is not already defined to another TPF processor in the loosely coupled TPF complex.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0101E VIPA-*x.x.x.x* ALREADY DEFINED TO THE COMPLEX AS MOVABLE**

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that was specified for the ZOSAE command.

**Explanation:** The ZOSAE command was entered with the ADD and STATIC parameters specified; however, the VIPA is already defined to the loosely coupled TPF complex as movable.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again without specifying the STATIC parameter, or use another VIPA.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0102E VIPA-*x.x.x.x* ALREADY DEFINED TO THE COMPLEX AS STATIC**

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that was specified for the ZOSAE command.

**Explanation:** The ZOSAE command was entered with the ADD parameter specified; however, the VIPA is already defined to the loosely coupled TPF complex as a static VIPA.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again and specify a VIPA that is not already defined.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0103E VIPA-*x.x.x.x* ALREADY DEFINED TO THE COMPLEX AS A REAL IP ADDRESS**

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that was specified for the ZOSAE command.

**Explanation:** The ZOSAE command was entered with the ADD parameter specified; however, the VIPA is already defined to the loosely coupled TPF complex as a real Internet Protocol (IP) address.

**System Action:** The command is rejected.

**User Response:** Enter the ZOSAE command again and specify another VIPA for the ADD parameter.

See *TPF Operations* for more information about the ZOSAE command.

**OSAE0104E ERROR ACCESSING OSIT**

**Explanation:** The ZOSAE command was entered, but the OSA shared Internet Protocol address table (OSIT) is not accessible.

**System Action:** The system issues the 0078E1 system error dump and the command is rejected.

**User Response:** Do the following:

1. Examine the 0078E1 system error dump to determine the cause of the error.
2. Correct the error.

See *TPF Operations* for more information about the ZOSAE command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about OSIT.

**OSA00001I OSA TABLES HAVE BEEN BUILT**

**Explanation:** This message is displayed during TPF system restart after the tables used by OSA-Express support are built.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about OSA-Express support.

**OSA00002I OSA CONFIGURATION RECORD HAS BEEN INITIALIZED**

**Explanation:** This message is displayed during TPF system restart when the Open Systems Adapter (OSA) configuration record is initialized.

**System Action:** None.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about OSA-Express support.

**OSA00024E OSA-*osaname* FAILED, SDA-*sda* CANNOT BE MOUNTED**

**Where:**

*osaname*
The name of the OSA-Express connection.

*sda* The symbolic device address (SDA).

**Explanation:** An OSA-Express connection failed because the specified SDA cannot be mounted during TPF system restart.

**System Action:** The OSA-Express connection is cleaned up.

**User Response:** Attach the SDA to the TPF system.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the OSA-Express connection.

**OSA00025E GATEWAY-*ipaddr* FOR OSA-*osaname* HAS FAILED**

**Where:**

*ipaddr*
The Internet protocol (IP) address of the gateway.

*osaname*
The name of the OSA-Express connection.

**Explanation:** The specified default gateway for the specified OSA-Express connection failed.

**System Action:** Sockets that were using the failed gateway are rerouted to the other default gateway if one has been defined for this OSA-Express connection and is active.

**User Response:** Do one of the following:

- Do the following:
  1. Correct the problem with the failed gateway.
  2. Activate the gateway again.
- Enter the ZOSAE command, specifying the MODIFY parameter to define a different default gateway for the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the OSA-Express connection.

**OSA00026A NO DEFAULT GATEWAYS ACTIVE FOR OSA-*osaname***

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The last default gateway that was active for the specified OSA-Express connection has failed.

**System Action:** Output packets will be queued for sockets that were using the default gateways for this OSA-Express connection until one of the default gateways is activated again. In addition, no new sockets requiring a gateway can be started across this OSA-Express connection until one of the default gateways is activated again.

**User Response:** Do one of the following:

- Do the following:
  1. Correct the problem with the default gateways.
  2. Activate the gateways again.
- Enter the ZOSAE command specifying the MODIFY parameter to define a different default gateway for the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the OSA-Express connection.

**OSA00027I GATEWAY-*ipaddr* FOR OSA-*osaname* IS NOW ACTIVE**

**Where:**

*ipaddr*
The Internet protocol (IP) address of the gateway.

*osaname*
The name of the OSA-Express connection.

**Explanation:** The specified default gateway for the specified OSA-Express connection has become active and can be used by the TPF system.

**System Action:** If this is the first default gateway to become active for this OSA-Express connection and there are packets queued waiting to be sent to the network, those packets are now sent to the default gateway.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the OSA-Express connection.

---

**OSA00072E ACTIVATION FAILURE, ALL OSA CONTROL BLOCKS ARE IN USE**

**Explanation:** An OSA-Express connection failed to activate during system restart because all the OSA-Express control blocks are in use.

**System Action:** The OSA-Express connection is deactivated and all subsequent activations during system restart are canceled.

**User Response:** Do the following:

1. Increase the value of the MAXOSA parameter in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system.
5. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for OSA-Express support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

# PAGE–PRSE

---

**PAGE0050I NO OUTSTANDING CONTINUATION**

**Explanation:** This message is issued if you enter the ZPAGE command more than one minute after being prompted for output continuation. Any pending output from the original message is no longer available.

**System Action:** None.

**User Response:** Enter the original command again (this is the message that prompted for output continuation). When prompted again to enter the ZPAGE command, be sure to specify it within one minute of being prompted.

See *TPF Operations* for more information about the ZPAGE command.

---

**PATH0010I ZPATH PROCESS COMPLETED ON VALID DASD SDA**

**Explanation:** This is a normal response for the ZPATH command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0015I STATUS DISPLAY FOLLOWS**

**Explanation:** This is the normal response to the ZPATH command with the DISPLAY parameter specified.

This message is followed by one of two displays that show one of the following:

- The status of all paths to a single symbolic device address
- The status of all paths to devices within a specified address range.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPATH command and for an example of the informational display.

---

**PATH0016I STATUS DISPLAY FOLLOWS (DOWN PATHS ONLY)**

**Explanation:** This is the normal response to the ZPATH command with the DISPLAY parameter specified.

This message is followed by one of two displays that show one of the following:

- The status of all paths to a single symbolic device address that are down
- The status of all paths to devices within a specified address range that are down.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPATH command and for an example of the informational display.

---

**PATH0017I STATUS DISPLAY FOLLOWS (ALL DOWN PATHS) THE FOLLOWING PATHS ARE DOWN:** *path1 path2 path3 path4...*

**Where:**

*path1, path2, path3, path4*
The DASD paths that are down.

**Explanation:** This is the normal response to the ZPATH command with the DISPLAY DOWN parameter specified. This message displays all the paths in the TPF system that are down.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0020I MAXIMUM NUMBER OF DEVICES DISPLAYED — TO DISPLAY MORE: REENTER ZPATH COMMAND WITH NEW PARAMETERS**

**Explanation:** The display function only displays a certain number of lines. It has reached this limit but has not processed every device in the specified range.

**System Action:** None.

**User Response:** Enter the command again and specify a range that begins where the display ended.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0025I THERE ARE NO PATHS DOWN**

**Explanation:** This is the normal response to the ZPATH command with the DISPLAY DOWN parameter specified when no paths are down to any device in the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0029I END OF DISPLAY**

**Explanation:** This is the normal response to the ZPATH command with the DISPLAY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0051T INVALID RANGE SPECIFIED**

**Explanation:** The ZPATH command was entered, but the first symbolic device address (SDA) specified is greater than the second SDA.

**System Action:** The ZPATH command is rejected.

**User Response:** Do the following:

1. Check the SDA range.
2. Enter the command again.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0052T ALREADY PROCESSING ZPATH**

**Explanation:** The ZPATH command was entered while a previous request was in progress.

**System Action:** The ZPATH command is rejected.

**User Response:** Do the following:

1. Wait for completion of the previous request.
2. Enter the command again.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0053T INPUT SDA ALL INVALID**

**Explanation:** This message is issued to warn you that all the input symbolic device addresses (SDAs) were not valid.

**System Action:** The ZPATH command is rejected.

**User Response:** Do the following:

1. Determine the correct DASD SDA to bring the path online.
2. Enter the command again.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0054I SOME NON-DASD SDA FOUND**

**Explanation:** This message is issued to warn you that in the input symbolic device address (SDA) range, some SDAs were not DASD.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0055I INPUT SDA NOT MOUNTED OR NON-DASD**

**Explanation:** This message is issued in two cases:

- When the symbolic device address (SDA) requested is not mounted
- When the SDA requested is not a DASD.

**System Action:** None.

**User Response:** Do one of the following:

- If the requested SDA is a DASD, then make sure the SDA specifies the correct DASD to bring the path online.
- If the DASD needs to be mounted, mount the DASD and enter the command again.
- If the requested SDA is not a DASD, the requested SDA cannot be used to bring the path online. Determine a DASD SDA and enter the command again.

See *TPF Operations* for more information about the ZPATH command.

---

**PATH0056I INVALID PARAMETERS ENTERED**

**Explanation:** The ZPATH command was not specified correctly.

**System Action:** The ZPATH command was rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZPATH command.

---

**PLMT0002I QUEUE FOR *lniata* PURGED TO TAPE PLM, MSG CNT — *msgcount***

**Where:**

*lniata*
The requested line number, interchange address, and terminal address (LNIATA).

*msgcount*
The message count.

**Explanation:** The XLMA message queue for the requested

LNIATA/LEID was purged to the PLM tape.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PLMT0003I NO MESSAGES ON QUEUE**

**Explanation:** There are no messages on the XLMA queue to purge or repeat.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PLMT0004I QUEUE FOR *lniata* PURGED, MSG CNT — *msgcount***

**Where:**

*lniata*
The requested line number, interchange address, and terminal address (LNIATA).

*msgcount*
The message count.

**Explanation:** The XLMA message queue for the requested LNIATA/LEID was purged without a PLM tape.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PLMT0010W NOT ALLOWED BELOW CRAS STATE**

**Explanation:** The TPF system must be computer room agent set (CRAS) state or above before the request can be processed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PLMT0011E INVALID LNIATA — *lniata***

**Where:**

*lniata*
The line number, interchange address, and terminal address (LNIATA) that is not valid.

**Explanation:** The LNIATA/LEID specified in the command is not valid or could not be found in the system network tables.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PLMT0012E INVALID FORMAT**

**Explanation:** The format of the ZPLMT command is incorrect to the input line number, interchange address, and terminal address (LNIATA) or or contains characters that are not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PLMT0013E INVALID RID**

**Explanation:** The output message transmitter (OMT) message purge routines detected a resource identifier (RID) error. This may indicate a possible database problem.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PLMT0015E NODE NOT A PRINTER**

**Explanation:** The pseudo line number, interchange address, and terminal address (LNIATA) specified in the command is not a printer.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PLMT0018T UNABLE TO RETRIEVE NCB FOR *lniata***

**Where:**

*lniata*
The requested line number, interchange address, and terminal address (LNIATA).

**Explanation:** The node control block (NCB) for the requested LNIATA/LEID could not be retrieved.

**System Action:** The message queue is not purged and processing is ended.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PLMT0019T UNABLE TO RETRIEVE XLMA FOR *lniata***

**Where:**

*lniata*
The line number, interchange address, and terminal address (LNIATA).

**Explanation:** The XLMA record for the requested LNIATA could not be retrieved.

**System Action:** The message queue is not purged and processing is ended.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

---

**PMIG0001I POOL CONVERSION COMPLETE**

**Explanation:** This is the normal response to the ZPMIG command with the CONVERT parameter specified. The conversion to the new pool format provided by 32-way loosely coupled pool support is completed. The pool data structures that reside in storage for each of the migrated processors, and that are stored on DASD, are in 32-way loosely coupled pool support format.

**System Action:** The conversion process is completed. All pool data structures in storage and on DASD are in 32-way loosely coupled pool support format.

**User Response:** None.

See *TPF Operations* for more information about the ZPMIG command.

---

**PMIG0002I POOL CONVERSION FALLBACK COMPLETED**

**Explanation:** This is a normal response to the ZPMIG command with the FALLBACK parameter specified. Fallback from the 32-way loosely coupled pool support format is completed.

**System Action:** All pool data structures that reside on DASD are in the pool expansion (PXP) format.

**User Response:** None.

See *TPF Operations* for more information about the ZPMIG command.

---

**PMIG0003T UNABLE TO CONVERT DUE TO UNMIGRATED PROCESSORS**

**Explanation:** The ZPMIG command was entered with the CONVERT parameter specified to begin pool conversion. Pool conversion changes the pool data structures from pool expansion (PXP) format to 32-way loosely coupled pool format. However, pool conversion is not completed because one or more of the active processors do not have 32-way loosely coupled pool support installed. The pool data structures cannot be converted until all active processors in the complex are IPLed from an image containing 32-way loosely coupled pool support.

**System Action:** The pool conversion process ends. All pool data structures on DASD remain in PXP format.

**User Response:** Do the following:

1. Enter the ZDFPC command on each active processor in the complex. This ensures that all pool data structures in storage on each processor are in 32-way loosely coupled pool format.
2. Enter the ZPMIG command with the STATUS parameter specified to display the migration state for each active processor in the complex. The migration state can be MIGRATED, UNMIGRATED, or INACTIVE.
3. IPL all processors listed as UNMIGRATED from an image containing 32-way loosely coupled pool support.
4. Enter the ZPMIG command with the STATUS parameter specified on each active processor in the complex. If message PMIG0011I is returned, the processor on which the command is entered is using 32-way loosely coupled pool support. If any other message is returned, the processor is not using 32-way loosely coupled pool support and must be re-IPLed using an image containing 32-way loosely coupled pool support before you can enter the ZPMIG command with the CONVERT parameter.
5. Enter the ZPMIG command with the CONVERT parameter specified to convert the pool data structures on DASD to 32-way loosely coupled pool format.

See *TPF Operations* for more information about the ZDFPC and ZPMIG commands. See *TPF Migration Guide: Program Update Tapes* for more information about pool migration and pool conversion.

---

**PMIG0006W POOL DATA STRUCTURES ARE ALREADY IN THE REQUESTED STATE**

**Explanation:** This is a normal response to the ZPMIG command with the CONVERT or FALLBACK parameter specified. You attempted to do one of the following:

- Begin converting the pool data structures to 32-way loosely coupled pool format when they are already in that format.
- Return pool data structures to pool expansion (PXP) format when they are already in that format.

**System Action:** The command ends and the ECB exits. The pool data structures are not changed.

**User Response:** Do the following:

1. Verify that each active processor in the complex is in the correct migration state by entering the ZPMIG command with the STATUS parameter specified. The migration state can be MIGRATED, UNMIGRATED, or INACTIVE.
2. Do one of the following:
   - If the processor is already in the appropriate migration state, there is no additional action for you to take.
   - If you want to begin pool conversion and the pool data structures are in PXP format, enter the ZPMIG command with the CONVERT parameter specified.
   - If you want to return to PXP format and the pool data structures are in 32-way loosely coupled pool format, enter the ZPMIG command with the FALLBACK parameter specified.

See *TPF Operations* for more information about the ZPMIG command.

---

**PMIG0007T PARAMETER IS NOT VALID**

**Explanation:** One of the following errors occurred:

- The ZPMIG command was entered with a parameter that is not valid.
- The ZPMIG command was entered with no parameter specified.

**System Action:** The help message for the ZPMIG command is displayed showing you the list of valid parameters that you can specify.

**User Response:** Enter the ZPMIG command again and specify the correct parameter.

See *TPF Operations* for more information about the ZPMIG command.

---

**PMIG0008T POOL DATA STRUCTURES ARE IN AN INVALID CONVERSION STATE**

**Explanation:** The pool data structures are in a pool conversion state that is not possible at the point the error was detected.

**System Action:** The function ends and the ECB exits.

**User Response:** Verify the pool conversion state of the pool data structures and the pool data structure conversion bits set in keypoint 9 (CTK9).

---

**PMIG0009T POOL CONVERSION PROCESSING IS TERMINATED**

**Explanation:** This is a normal response to the ZPMIG command with the CONVERT or FALLBACK parameter specified. An error occurred during pool conversion and pool conversion has ended.

**System Action:** Pool conversion ends and the ECB exits.

**User Response:** See the error message that was displayed before this message because it provides information about the problem with the pool conversion process.

See *TPF Operations* for more information about the ZPMIG command.

---

**PMIG0011I 32–WAY LC POOL MIGRATION STATUS THE POOL DATA STRUCTURES ARE** *state* **PROCESSOR** *procid* **STATUS** *status*

**Where:**

*state*
The conversion state of the pool data structures, which must be one of the following:
- BEING CONVERTED
- FALLING BACK
- NOT CONVERTED
- CONVERTED

*procid*
The processor ID.

*status*
The current status of each processor in the complex. Valid status is:
- UNMIGRATED
- MIGRATED
- INACTIVE

**Explanation:** This is a normal response to the ZPMIG command with the STATUS parameter specified. Information is provided about the migration status of 32-way loosely coupled pool support for each processor in the complex.

**System Action:** The migration and conversion information for each processor in the complex is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZPMIG command.

---

**PMIG0012E UNABLE TO FIND #CY2KT**

**Explanation:** An error occurred during pool conversion while attempting to find the #CY2KT fixed file record type.

**System Action:** Pool conversion ends and the ECB exits. All the pool data structures on DASD remain in pool expansion (PXP) format.

**User Response:** Do the following:

1. Verify that the #CY2KT fixed file record type is correctly defined in the FACE table (FCTB) because it may be missing from the FACE table or not defined with enough ordinals.
2. Correctly define the #CY2KT fixed file record type and generate and load a new FACE table.

See *TPF Operations* for more information about the ZPMIG command.

---

**PMIG0013E UNABLE TO FIND #STPUR**

**Explanation:** An error occurred during pool conversion while attempting to find the #STPUR fixed file record type.

**System Action:** Pool conversion ends and the ECB exits. All pool data structures on DASD remain in pool expansion (PXP) format.

**User Response:** Do the following:

1. Verify that the #STPUR fixed file record type is correctly defined in the FACE table (FCTB) for each processor in the complex because it may be missing from the FACE table or not defined with enough ordinals.
2. Correctly define the #STPUR fixed file record type and generate and load a new FACE table.

See *TPF System Generation* for more information about the #STPUR fixed file record and *TPF Operations* for more information about the ZPMIG command.

---

**PMIG0014E UNABLE TO FIND #STPCR**

**Explanation:** An error occurred during pool conversion fallback while attempting to find the #STPCR fixed file record type.

**System Action:** Pool conversion fallback ends and the ECB exits. All the pool data structures on DASD remain in 32-way loosely coupled pool format.

**User Response:** Do the following:

1. Verify that the #STPCR fixed file record type is correctly defined in the FACE table (FCTB) because it may be missing from the FACE table or not defined with enough ordinals.
2. Correctly define the #STPCR fixed file record type and generate and load a new FACE table.

See *TPF System Generation* for more information about the #STPCR fixed file record and see *TPF Operations* for more information about the ZPMIG command.

---

**PMIG0015E FALLBACK NOT ALLOWED WITH MORE THAN 8 PROCESSORS**

**Explanation:** The ZPMIG command was entered with the FALLBACK parameter specified in a loosely coupled complex with more than eight processors generated. This is not allowed because processor data beyond the eighth processor would be lost.

**System Action:** Pool data structures remain unchanged and the entry control block (ECB) exits.

**User Response:** None.

See *TPF Operations* for more information about the ZPMIG command.

**POP30001E POP3D: FAILED TO BIND TO POP3D PORT**

**Explanation:** The Post Office Protocol (POP) server was unable to bind to well-known port 110. This indicates that another socket is using this port.

**System Action:** The entry control block (ECB) exits and the POP server stops.

**User Response:** Do the following:

1. Enter **ZSOCK INACT LPORT-110** to deactivate the socket using well-known port 110.
2. Enter **ZINET START S-POP3** to start the POP server again.

See *TPF Operations* for more information about the ZINET and ZSOCK commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the POP server.

**POP30002E POP3D: FAILED TO LISTEN TO POP3D PORT: CODE** *errno*

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The Post Office Protocol (POP) server was unable to process the `listen` function for the socket descriptor.

**System Action:** The entry control block (ECB) exits and the POP server stops.

**User Response:** Do the following:

1. Check the value in `errno` to determine the cause of the problem.
2. Correct the problem.
3. Enter **ZINET START S-POP3** to start the POP server again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the POP server.

**POP30003E POP3D: SELECT FAILED: CODE** *errno*

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The Post Office Protocol (POP) server was unable to process the `select` function for the socket descriptor.

**System Action:** The entry control block (ECB) continues to run and issue this message until the problem is resolved or until the POP server is stopped.

**User Response:** Do the following:

1. Enter **ZINET STOP S-POP3** to stop the POP server.
2. Check the value in `errno` to determine the cause of the problem.
3. Correct the problem.
4. Enter **ZINET START S-POP3** to start the POP server again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the POP server.

**POP30004E POP3D: FAILED TO ACCEPT INCOMING CONNECTION: CODE** *errno*

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The Post Office Protocol (POP) server was unable to process the `accept` function for the socket descriptor.

**System Action:** The entry control block (ECB) continues to run.

**User Response:** Do the following:

1. Enter **ZMAIL STATUS** to determine if the POP server is still running.
2. If the POP server is still running, enter **ZINET STOP S-POP3** to stop the server; otherwise, go to step 3.
3. Check the value in `errno` to determine the cause of the problem.
4. Correct the problem.
5. Enter **ZINET START S-POP3** to start the POP server again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the POP server.

**PROT0000E INVALID MSG FORMAT**

**Explanation:** Too many or too few input characters were specified on the ZPROT command request.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0001E INVALID FUNCTION CODE**

**Explanation:** The secondary action code specified was not recognized on the ZPROT command request.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0002E INVALID RESOURCE TYPE**

**Explanation:** The resource type was not specified as UT or TP on the ZPROT command request.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0003E INVALID DEVICE ADRS/NAME**

**Explanation:** A tape device address or utility name that is not valid was specified on the ZPROT command request.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0004E INVALID FUNCTION FOR TAPE RESOURCE**

**Explanation:** Display (DSP) is the only valid tape function available for a ZPROT command request.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0005E DEVICE/UTILITY NOT IN PROT**

**Explanation:** The device or utility is not in the processor resource ownership table (PROT).

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0006E PROT IS FULL**

**Explanation:** The processor resource ownership table (PROT) is full.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0008E SS INACTIVE**

**Explanation:** The subsystem name specified for a ZPROT utility (UT) function was found to be marked inactive.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0009E DEVICE ADRS RANGE ERROR**

**Explanation:** A tape device address range greater than 255 devices was specified on a ZPROT command request.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0013E UTILITY IS ACTIVE**

**Explanation:** A request to release the BUFC utility was made but the BUFC utility was found to be currently active on the TPF system.

**System Action:** The ZPROT command is rejected.

**User Response:** Wait for the BUFC utility to complete before trying to release from this processor.

See *TPF Operations* for more information about the ZPROT command.

**PROT0014E PROT IS EMPTY**

**Explanation:** The processor resource ownership table (PROT) is empty.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0015E PROC NOT IN PID TABLE**

**Explanation:** The processor identification indicated for a utility owner was not found in the system processor ID (PID) table.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

**PROT0018E RESTRICTED BELOW 1052**

**Explanation:** An attempt was made to the Display (DSP) utility or tape information from the processor resource ownership table (PROT) for all processors while the TPF system was cycling to 1052 state.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0020E INVALID SUBSYSTEM NAME**

**Explanation:** The subsystem name specified on a ZPROT request is not a valid subsystem defined to the TPF system.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0021E ENTRY ALREADY IN PROT**

**Explanation:** A request was made to add a utility name to the processor resource ownership table (PROT) but the utility name was already defined in the PROT.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0022E DEVICE/UTILITY CURRENTLY ASSIGNED**

**Explanation:** A request was made to delete a utility name from the processor resource ownership table (PROT) but the utility name is currently assigned.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0023E REQUEST VALID FROM BASIC SUBSYSTEM ONLY**

**Explanation:** The request is only valid from the basic subsystem (BSS).

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0050I PROT DSP UT** *parm*

**Where:**

*parm*
Is one of the following:

- ALL
- The utility name and subsystem name).

**Explanation:** This is a normal message for the ZPROT command. This message is followed by a display indicating the processors and their system utilities or the processor associated with a specified entry in the processor resource ownership table (PROT).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0051A PROT** *parm1* **UT** *utilname subsname parm2*

**Where:**

*parm1*
Is ASN or REL.

*utilname*
The utility name.

*subsname*
The subsystem name.

*parm2*
Is ASSIGNED or RELEASED.

**Explanation:** This is the normal message for the ZPROT command with the ASN or REL parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0052I PROT DSP TP** *parm*

**Where:**

*parm*
Is one of the following:

- ALL
- *addr1* (the specified tape device)
- *addr1 addr2* (a range of tape device addresses).

**Explanation:** This is the normal response to the ZPROT command. The display that follows this message depends on the parameter that is specified:

- If no tape address is specified, any tapes currently defined in the processor resource ownership table (PROT) for the requesting processor are displayed.
- If ALL is specified, all tape device addresses and owning processor IDs defined in the PROT are displayed.
- If a single tape device address is specified, that tape device address and the owning processor ID are displayed if found in the PROT.
- If a range of device addresses is specified, then the device address and owning processor IDs are displayed.

If an asterisk (*) is displayed, this indicates that the device address is not in PROT.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0053A** **PROT** *parm1* **UT** *utilname subsname parm2*

**Where:**

*parm1*
Is ADD or DEL.

*utilname*
The utility name.

*subsname*
The subsystem name.

*parm2*
Is ADDED or DELETED.

**Explanation:** This is the normal message for the ZPROT command with the ADD or DEL parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0054E** **PROT REL UT** *utilname subsname* **RELEASE AN UNASSIGNED ENTRY**

**Where:**

*utilname*
The utility name.

*subsname*
The subsystem name.

**Explanation:** A request to release ownership of a utility is issued but the utility is not found in the processor resource ownership table (PROT).

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0055E** **PROT ASN UT** *utilname subsname* **ALREADY ASSIGNED TO THE PROCESSOR**

**Where:**

*utilname*
The utility name.

*subsname*
The subsystem name.

**Explanation:** A request to assign ownership of a utility is made but the utility is already owned by the requesting processor.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT command.

---

**PROT0056E** **PROT ASN UT** *utilname subsname* **ALREADY ASSIGNED TO ANOTHER PROCESSOR**

**Where:**

*utilname*
The utility name.

*subsname*
The subsystem name.

**Explanation:** A request to assign ownership of a utility is made but the utility is already owned by another processor.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT commands. See *TPF Main Supervisor Logic* for more information.

---

**PROT0057E** **PROT REL UT** *utilname subsname* **NOT RELEASED-PROC ACTIVE**

**Where:**

*utilname*
The utility name.

*subsname*
The subsystem name.

**Explanation:** A request to release ownership of a utility is issued but the utility is found to be owned by another currently active processor.

**System Action:** The ZPROT command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPROT commands. See *TPF Main Supervisor Logic* for more information.

---

**PROT0058E** **POOL UTILITY CAN ONLY BE ASSIGNED TO ONE OF THE FIRST 8 PROCESSORS IN THE COMPLEX**

**Explanation:** The ZPROT command was entered with the ASN parameter and the POOL utility specified. The command was entered on a processor other than one of the first eight processors in the loosely coupled complex. The owner of the POOL utility can only be one of the first eight processors in a loosely coupled complex.

**System Action:** The ZPROT command is rejected.

**User Response:** Enter the ZPROT command with the ASN parameter and the POOL utility specified on one of the first eight processors in the loosely coupled complex.

See *TPF Operations* for more information about the ZPROT command.

---

**PRSE0001E** *string* **– TOO MANY PARAMETERS ENTERED** *parameters*

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

*parameters*
May contain additional information regarding the error. It may contain LAST VALID PARAMETER IS and a parameter.

**Explanation:** Too many parameters were specified in the input string during the parsing of the string for the cccc function.

**System Action:** None. Processing is completed for parsing the input string.

**User Response:** Enter the input string again with the appropriate number of parameters.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

---

**PRSE0004E** *string* **– INVALID USE OF PERIOD.**

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

**Explanation:** The period (.) was used in a way that is deemed illegal by the parser.

**System Action:** None. Processing is completed for parsing the input string.

**User Response:** Enter the input string again correctly.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

---

**PRSE0005E** *string* **– INVALID ALPHANUMERIC CHARACTER**

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

**Explanation:** An alphanumeric character was required by a parameter during the parsing of the string for the cccc function but a non-alphanumeric character was specified

**System Action:** Processing is completed for parsing the input string.

**User Response:** Enter the input string again correctly.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

---

**PRSE0006E** *string* **– INVALID DECIMAL CHARACTER**

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

**Explanation:** A decimal character was required by a parameter during the parsing of the string for the cccc function but a non-decimal character was specified.

**System Action:** Processing is completed for parsing the input string.

**User Response:** Enter the input string again correctly.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

---

**PRSE0007E** *string* **– INVALID CHARACTER**

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

**Explanation:** An uppercase letter was required by a parameter during the parsing of the string for the cccc function but a non-uppercase letter was specified.

**System Action:** Processing is completed for parsing the input string.

**User Response:** Enter the input string again correctly.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

---

**PRSE0008E** *string* **– INVALID HEXADECIMAL CHARACTER**

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

**Explanation:** A hexadecimal character was required by a parameter during the parsing of the string for the cccc function but a non-hexadecimal character was specified.

**System Action:** Processing is completed for parsing the input string.

**User Response:** Enter the input string again correctly.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

---

**PRSE0009E** *string* **— MANDATORY PARAMETER NOT GIVEN** *parameters*

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

*parameters*
This may contain the text PARAMETER IN ERROR and the parameter that was in error.

**Explanation:** A mandatory parameter was not found in the input string during the parsing of the string for the cccc function.

**System Action:** Processing is completed for parsing the input string.

**User Response:** Enter the input string again correctly.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

---

**PRSE0011E** *string* **— INVALID INPUT PARAMETER** *parameters.*

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

*parameters*
Possible additional information regarding the error. It may contain either LAST VALID PARAMETER IS and a parameter or KEYWORD IN ERROR and the keyword name.

**Explanation:** A mandatory parameter was not found in the input string during the parsing of the string for the cccc function.

If a keyword is in error, it is identified in the error message. Otherwise, the TPF system tries to provide the last valid parameter in the error message.

**System Action:** Processing is completed for parsing the input string.

**User Response:** Enter the input string again correctly.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

---

**PRSE0014E** *string* **– TOO MANY CHARACTERS ENTERED**

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

**Explanation:** Too may characters were specified for a specific parameter.

**System Action:** Processing is completed for parsing the input string.

**User Response:** Enter the input string again correctly.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

---

**PRSE0015E** *string* **– TOO FEW CHARACTERS ENTERED FOR PARAMETER**

**Where:**

*string*
The string that identifies the function calling IPRSE_parse.

**Explanation:** Too few characters were specified for a specific parameter.

**System Action:** Processing is completed for parsing the input string.

**User Response:** Enter the input string again correctly.

See the *TPF C/C++ Language Support User's Guide* for more information about IPRSE_parse and the format of the syntax for the cccc function.

# PSMS–PUMP

---

**PSMS0000I CPUORD CPUID SERIAL PIDT CTKI**

**Explanation:** This is the normal response to the ZPSMS command with the DISPLAY PR parameter specified. This message is followed by a display of the status of all processors in the complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

---

**PSMS0001I SS ORD SSU ORD SS NAME SSU NAME STATE AVAILABILITY**

**Explanation:** This is the normal response to the ZPSMS command with the DISPLAY MDBF parameter specified. This message is followed by a display of the status of all subsystems in the complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

---

**PSMS0002I CPUORD CPUID STATE**

**Explanation:** This is the normal response to the ZPSMS command with the DISPLAY PRSS parameter specified. This message is followed by a display of the status of this subsystem in the complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

---

**PSMS0003E SUBSYSTEM** *subsystem* **INVALID**

**Where:**

*subsystem*
The subsystem name that is not valid.

**Explanation:** This message occurs when you specify a subsystem in the ZPSMS command with the SS parameter specified is not valid.

**System Action:** None.

**User Response:** Enter the command again and specify a valid subsystem ID.

See *TPF Operations* for more information about the ZPSMS command.

---

**PSMS0004E SYSTEM HAS ACTIVE TAPES**

**Explanation:** This message occurs when you enter a ZPSMS command with the PROCESSOR DEACTIVATE or SS DEACTIVATE parameter specified when there are active tapes on the TPF system.

**User Response:** Do the following:

1. Dismount the tapes.
2. Enter the command again.

See *TPF Operations* for more information about the ZPSMS command.

**PSMS0005E SYSTEM NOT IN 1052 STATE**

**Explanation:** This message occurs when you enter a ZPSMS command with the PROCESSOR DEACTIVATE or SS DEACTIVATE parameter specified when the TPF system is not in 1052 state.

**System Action:** The ZPSMS command is rejected.

**User Response:** Do the following:

1. Bring the TPF system up to 1052 state.
2. Enter the command again.

See *TPF Operations* for more information about the ZPSMS command.

**PSMS0006I PROCESSOR *procid* DEACTIVATED**

**Where:**

*procid*
The processor ID.

**Explanation:** This is the normal response to the ZPSMS command when the PROCESSOR DEACTIVATE parameter is specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

**PSMS0007E PROCESSOR *procid* NOT ACTIVE**

**Where:**

*procid*
The processor ID.

**Explanation:** This message occurs when you try to deactivate a processor that is already inactive.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

**PSMS0008E ENTRY ONLY VALID FROM BSS**

**Explanation:** This message occurs when you enter the ZPSMS command with the PROCESSOR DEACTIVATE, SS ACTIVATE, or SS DEACTIVATE parameters specified from a TPF system other than the basic subsystem (BSS).

**System Action:** None.

**User Response:** Enter the command again from the BSS.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

**PSMS0009I CYCLE ENABLED**

**Explanation:** This is the normal response to the ZPSMS command with the CYCLE ENABLE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

**PSMS0010E SUBSYSTEM NOT ACTIVE**

**Explanation:** This message occurs when you try to deactivate a subsystem that is already inactive.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

**PSMS0011I CYCLING INHIBITED**

**Explanation:** This is the normal response to the ZPSMS command with the CYCLE DISABLE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

**PSMS0012I SUBSYSTEM DEACTIVATED**

**Explanation:** This is the normal response to the ZPSMS command with the SS DEACTIVATE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

**PSMS0013I PROC *procid* SUBSYSTEM *subsystem* CYCLING FROM *state1* TO *state2* STATE**

**Where:**

*procid*
The processor ID.

*subsystem*
The subsystem name.

*state1*
The state from which the cycling began.

*state2*
The state to which you want to cycle.

**Explanation:** This is the normal response to the ZPSMS command and to the ZCYCL command with the NORM parameter specified. It may also occur during the IPL process.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS and ZCYCL commands. See *TPF Main Supervisor Logic* for more information.

---

**PSMS0014I PROC** *procid* **SUBSYSTEM** *subsystem* **IN** *state* **STATE**

**Where:**

*procid*
The processor ID.

*subsystem*
The subsystem name.

*state*
The state.

**Explanation:** This is the normal response to the ZPSMS command to the ZCYCL command with the NORM parameter specified. It may also occur during the IPL process..

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS and ZCYCL commands. See *TPF Main Supervisor Logic* for more information.

---

**PSMS0015E CYCLE INHIBITED**

**Explanation:** The cycle function for this processor was disabled because the ZPSMS command was entered or because of a TPF system problem.

**System Action:** None.

**User Response:** Do the following:

1. Determine why the cycle function was disabled.
2. Enter the ZPSMS command to enable cycling.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

---

**PSMS0016E FUNCTION NOT ALLOWED IN L/C ENVIRONMENT**

**Explanation:** The ZPSMS command was entered with the SS ACTIVATE or SS DEACTIVATE parameter, which is not valid in a loosely coupled environment.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

---

**PSMS0017E INVALID OR INCORRECT NUMBER OF PARAMS**

**Explanation:** This message occurs when you enter the ZPSMS command with a number of parameters that are not valid or are not correct.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

---

**PSMS0018E PROCESSOR ID** *procid* **INVALID**

**Where:**

*procid*
The processor ID.

**Explanation:** This message occurs when you specify a processor ID that is not valid in the ZPSMS command with the PR parameter specified.

**System Action:** None.

**User Response:** Enter the command again and specify a valid processor ID.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

---

**PSMS0019I SUBSYSTEM ACTIVATED**

**Explanation:** This is the normal response to the ZPSMS command with the SS ACTIVATE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

---

**PSMS0020E CYCLE NOT INHIBITED**

**Explanation:** This message occurs when you try to inhibit cycling when the processor is not in the required state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

---

**PSMS0021E UNABLE TO RETRIEVE CTKI — MSG NOT PROCESSED**

**Explanation:** This is an error response from the ZPSMS command with the DISPLAY parameter specified. The information needed for this display is contained in keypoint I (CN1ST). However, the function was not able to reserve it.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

**PSMS0022E DEACTIVATION NOT COMPLETED, ACTIVE ECBS IN THE SYSTEM**

**Explanation:** This message occurs when you try to deactivate a processor while there are active ECBs in the TPF system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

**PSMS0023E DEACTIVATION NOT COMPLETED, CTKI RETRIEVAL TIME OUT. CHECK RECORD HOLD TABLE**

**Explanation:** This message occurs when you try to deactivate a processor while another processor is holding keypoint I (CN1ST).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

**PSMS0024I IPC TRAFFIC TO PROCESSOR** *procid* **STOPPED**

**Where:**

*procid*
The processor ID.

**Explanation:** This is the normal response to the ZPSMS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

**PSMS0025E CYCLING ALREADY INHIBITED**

**Explanation:** This message occurs when you try to disable cycling when it is already disabled.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

**PSMS0026E SUBSYSTEM ALREADY ACTIVE**

**Explanation:** This message occurs when you try to activate a subsystem that is already active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

**PSMS0027W UNABLE TO CLEAR ALL ACTIVE IMAGE NUMBERS**

**Explanation:** This message occurs when you deactivate a processor and an error occurs clearing the last active image number for all subsystems. The processor is still deactivated but on the next IPL of the processor you may not be forced to go through image selection.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command. See *TPF Main Supervisor Logic* for more information.

**PSMS0028E FUNCTION NOT ALLOWED IN NON L/C ENVIRONMENT**

**Explanation:** The ZPSMS command was entered with the CYCLE ENABLE or CYCLE DISABLE parameters specified. These parameters are not valid in a non-loosely coupled environment.

**System Action:** The ZPSMS command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZPSMS command.

**PTCH0001I ITEM ADDED TO PATCH DECK** *deckname*

**Where:**

*deckname*
The 1 to 6 character patch deck name.

**Explanation:** This is the normal response to the ZPTCH command. This message is displayed after each ZACOR, ZADCA, or ZAPGM command that is queued successfully on the patch deck.

**System Action:** None.

**User Response:** Do one of the following:

- Continue queueing messages on the current patch deck by entering another ZACOR, ZADCA, or ZAPGM command.
- Enter the ZPTCH command with the STOP parameter specified to end queueing on the current patch deck.

See *TPF Operations* for more information about the ZPTCH, ZACOR, ZADCA, and ZAPGM commands.

**PTCH0002I PATCH DECK** *deckname* **PURGED**

**Where:**

*deckname*
The 1 to 6 character patch deck name.

**Explanation:** This is the normal response to the ZPTCH command. The patch deck referenced in the message was deleted.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPTCH command and for an example of the informational display.

**PTCH0003I QUEUEING FOR PATCH DECK** *deckname* **STARTED**

**Where:**

*deckname*
The 1 to 6 character patch deck name.

**Explanation:** This is the normal response to the ZPTCH command. This is a new patch deck; no messages are currently queued on it. The patch deck referenced in the message is ready to accept messages to be queued. All subsequent ZACOR, ZADCA, and ZAPGM commands entered on this console are queued on this deck.

**System Action:** None.

**User Response:** Queue messages on the current patch deck by entering the ZACOR, ZADCA, or ZAPGM commands. When finished, enter the ZPTCH command with the STOP parameter specified to end queueing on the current patch deck.

See *TPF Operations* for more information about the ZPTCH, ZACOR, ZADCA, and ZAPGM commands.

**PTCH0004I PATCH DECK** *deckname* **ACTIVATED**

**Where:**

*deckname*
The 1 to 6 character patch deck name.

**Explanation:** This is the normal response to the ZPTCH command. The patch deck referenced in the message is one that already exists. The patch deck is ready to accept messages to its queue. All subsequent ZACOR, ZADCA, and ZAPGM commands entered on this console are added to any messages that already exist on this deck.

**System Action:** None.

**User Response:** Queue messages on the current patch deck by entering the ZACOR, ZADCA, or ZAPGM commands. When finished, enter the ZPTCH command with the STOP parameter specified to end queueing on the current patch deck.

See *TPF Operations* for more information about the ZPTCH, ZACOR, ZADCA, and ZAPGM commands.

**PTCH0005I QUEUEING FOR PATCH DECK** *deckname* **STOPPED**

**Where:**

*deckname*
The 1 to 6 character patch deck name.

**Explanation:** This is the normal response to the ZPTCH command.

**System Action:** Queueing on the current patch deck ended.

**User Response:** None.

See *TPF Operations* for more information about the ZPTCH command and for an example of the informational display.

**PTCH0006I DISPLAY OF PATCH DECK** *deckname*

**Where:**

*deckname*
The 1 to 6 character patch deck name.

**Explanation:** This is the normal response to the ZPTCH command. This message is followed by a display of the entries in the patch deck.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPTCH command and for an example of the informational display.

**PTCH0007I BEGIN DISPLAY OF ROOT FILE**

**Explanation:** This is the normal response to the ZPTCH command. This message is followed by a display of patch deck names and their corresponding file addresses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPTCH command and for an example of the informational display.

**PTCH0008I PATCH DECK ENTRY REMOVED**

**Explanation:** This is the normal response to the ZPTCH command.

**System Action:** An entry was removed from a patch deck.

**User Response:** None.

See *TPF Operations* for more information about the ZPTCH command and for an example of the informational display.

**PTCH0009I EXECUTION STARTING FOR PATCH DECK** *deckname display of alter display of alter* **EXECUTION COMPLETE FOR PATCH DECK** *deckname*

**Where:**

*deckname*
The 1 to 6 character patch deck name.

*display of alter*
When the LIST option is specified with the ZPTCH command with the EXECUTE parameter specified, the EXECUTION STARTING message is followed by a before and after display for each alter that is processed out of the patch deck. When the NOLIST option is specified with the ZPTCH command with the EXECUTE parameter specified, the EXECUTION STARTING message is not followed by a display of the alters. LIST is the default option on the ZPTCH EXECUTE command.

**Explanation:** This is the normal response to the ZPTCH command. This message is displayed during the run of the specified patch deck.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPTCH

command and for an example of the informational display.

**PTCH0010E PATCH DECK EMPTY**

**Explanation:** This is an error response for the ZPTCH command. There are no entries in the specified patch deck.

**System Action:** This error message is issued and the ECB is exited.

**User Response:** None.

See *TPF Operations* for more information about the ZPTCH command.

**PTCH0011E ENTRY NUMBER OUT OF RANGE**

**Explanation:** The ZPTCH command was entered with the REMOVE parameter specified but the entry number is not valid.

**System Action:** This error message is issued and the ECB is exited.

**User Response:** Do the following:

1. Enter the ZPTCH command with the DISPLAY parameter specified to view the list of entries in the patch deck.

   **Note:** Pay attention to the valid entry numbers that preface each entry.
2. Enter the ZPTCH command again with the REMOVE parameter specified and a valid entry number specified.

See *TPF Operations* for more information about the ZPTCH command.

**PTCH0012E UPDATE IN PROGRESS**

**Explanation:** This is an error response for the ZPTCH command. The patch deck referenced in the message is currently in use.

**System Action:** This error message is issued and the ECB is exited.

**User Response:** Enter the ZPTCH command again.

See *TPF Operations* for more information about the ZPTCH command.

**PTCH0013E INVALID OR NO CURRENT PATCH DECK**

**Explanation:** This is an error response for the ZPTCH command when one of the following errors occurred:

- You may have neglected to specify a patch deck name.
- You may have specified a patch deck name that does not exist.
- You may have requested display of ALL patch decks when there were no patch decks defined.
- You may have entered a ZPTCH command with the STOP parameter specified before entering a ZPTCH command with a BEGIN parameter specified (for example, a patch deck was not active when you entered the ZPTCH STOP command).

**System Action:** This error message is issued and the ECB is exited.

**User Response:** Do one of the following:

- If you neglected to specify a patch deck name or specified a name that does not exist, enter the ZPTCH command with the DISPLAY NAME-ALL parameter specified to view the list of valid patch decks. Then, enter your original ZPTCH command again and specify one of the valid patch decks that is listed.
- If you requested a display of ALL patch decks and you received this message, there are currently no patch decks defined. You can create the first patch deck by entering a ZPTCH command with the BEGIN parameter specified.
- Is you entered the ZPTCH command with the STOP parameter specified and received this error message, it means that there is no patch deck currently open. You can open a patch deck by entering a ZPTCH command with the BEGIN parameter specified.

See *TPF Operations* for more information about the ZPTCH command.

**PTCH0014E QUEUEING STILL ACTIVE FOR PATCH DECK** *deckname*

**Where:**

*deckname*
The 1 to 6 character patch deck name.

**Explanation:** This is an error response for the ZPTCH command. You entered a second ZPTCH command with the BEGIN parameter specified before entering a ZPTCH command with the STOP parameter specified. The patch deck name referenced in the message is still open. The ZPTCH BEGIN command is disallowed until queueing on the current patch deck is completed.

**System Action:** This error message is issued and the ECB is exited.

**User Response:** Do one of the following:

- You may continue queueing ZACOR, ZADCA, and ZAPGM commands on the current patch deck.
- You may close the current patch deck by entering a ZPTCH command with the STOP parameter specified.

See *TPF Operations* for more information about the ZPTCH, ZACOR, ZADCA, and ZAPGM commands.

**PTCH0015E PATCH DECK FULL**

**Explanation:** The ZPTCH command was entered and an attempt was made to queue a ZACOR, ZADCA, or ZAPGM command on a patch deck that already contained the maximum number of allowed entries.

**System Action:** This error message is issued and the ECB is exited.

**User Response:** Do the following:

1. Enter a ZPTCH command with the STOP parameter specified to close the current patch deck.
2. Remove entries from the patch deck to make room for other entries or start queueing entries on a new patch deck.

See *TPF Operations* for more information about the ZPTCH, ZACOR, ZADCA, and ZAPGM commands.

---

**PTCH0016E ALL IS AN ILLEGAL PATCH DECK NAME**

**Explanation:** This is an error response for the ZPTCH command. You entered a ZPTCH command with the BEGIN parameter specified with the name ALL. The name ALL is reserved for the ZPTCH command with the DISPLAY parameter specified when it is used to display the list of all available patch decks.

**System Action:** This error message is issued and the ECB is exited.

**User Response:** Enter the ZPTCH command again with the BEGIN parameter specified and name other than ALL specified.

See *TPF Operations* for more information about the ZPTCH command.

---

**PTCH0017E INITIALIZATION NOT COMPLETE, CYCLE TO NORM FIRST**

**Explanation:** The ZPTCH command was entered and an error occurred. ZPTCH maintains its patch decks in pool file records. Therefore, the TPF system must be cycled above 1052 state at least once so that ZPTCH restart can retrieve its pool file addresses.

**System Action:** This error message is issued and the ECB is exited.

**User Response:** Do the following:

1. Cycle the TPF system up to NORM state.
2. Enter the ZPTCH command again.

See *TPF Operations* for more information about the ZPTCH command.

---

**PTCH0018E ROOT FILE FULL**

**Explanation:** This is an error response for the ZPTCH command. The maximum number of allowed patch decks was already defined. Any attempts to create a new patch deck (the ZPTCH command with the BEGIN parameter specified) are disallowed until one or more patch decks are purged (the ZPTCH command with the PURGE parameter specified).

**System Action:** This error message is issued and the ECB is exited.

**User Response:** Do one of the following:

- You may purge existing patch deck to make room for other patch decks.
- You may queue ZACOR, ZADCA, and ZAPGM commands on patch decks that were defined already.

See *TPF Operations* for more information about the ZPTCH, ZACOR, ZADCA, and ZAPGM commands.

---

**PTCH0092E EXECUTION ABORTED FOR PATCH DECK** *deckname* **PATCH ENTRY IN ERROR IS NUMBER** *entry*

**Where:**

*deckname*
The 1 to 6 character patch deck name.

*entry*
The 1 or 2 digit number of the patch deck failing entry.

**Explanation:** An error occurred while trying to process one of the ZACOR, ZADCA, and ZAPGM commands queued on the specified patch deck.

**System Action:** This error message is issued and the ECB is exited.

**User Response:** Do the following:

1. Inspect the patch deck entry referenced in this error message.
2. Make any necessary corrections.
3. Initiate the processing of the patch deck again.

See *TPF Operations* for more information about the ZPTCH, ZACOR, ZADCA, and ZAPGM commands.

---

**PTVL0001I LAST MESSAGE BLOCK PROCESSED BL***blockname msgtext*

**Where:**

*blockname*
The block name.

*msgtext*
The message text of END OF MSGS FROM TAPE STV NOW IDLE or the message text of PAUSE REQUESTED STV NOW IDLE

**Explanation:** One of the following errors occurred:

- The system test vehicle (STV) expects a ZSTVS STOPT command to end the job or a ZSTVS START command if the multi-reel processing procedure is followed.
- A ZSTVS START or ZSTVS STOPT command is expected to either continue or end processing of the program test vehicle (PTV) input tape (TUT).

**System Action:** None.

**User Response:** Do the following to process more than one PTV TUT:

1. Dismount the TUT manually. (Do not use the TAPE OFF command.)
2. Mount and ready the new PTV input tape on the same tape unit.
3. Enter the appropriate ZSTVS START command.

See *TPF Operations* for more information about the ZSTVS START command.

---

**PTVL0005I STV STOPPED DISMOUNT RTL**

**Explanation:** The system test vehicle (STV) stopped the dismounting of the real-time tape (RTL).

**System Action:** None.

**User Response:** Do the following:

1. Cycle down the TPF system to 1052 state.
2. Dismount the RTL.

**Note:** The STV output tape is ready for post processing after you enter the ZSTVS STOPT command.

**PUMP0001I REQUEST PROCESSED**

**Explanation:** This is the normal response to the ZPUMP command.

**System Action:** The police unsolicited message queue program is activated.

**User Response:** None.

See *TPF Operations* for more information about the ZPUMP command.

**PUMP0010E SYSTEM NOT IN NORM STATE**

**Explanation:** The ZPUMP command can be entered only when the TPF system is in NORM state.

**System Action:** Processing is ended.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Enter the command again.

See *TPF Operations* for more information about the ZPUMP command.

# RCBI–RCSC

**RCBI0000I** *modnumber* **PROCESSED NUMBER INITIALIZED** *rcb* **INVAL TERM ADDRS** *rcb* **INVAL TERM TYPES** *rcb* **NUMBER ATTEMPTED** *rcb*

**Where:**

*modnumber*
The module number.

*rcb* The routing control blocks (RCBs).

**Explanation:** This is the normal response to the ZRCBI command with the MOD or ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0001E INVALID FUNCTION**

**Explanation:** The parameter specified for the ZRCBI command is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0002E INVALID MODULE NUMBER**

**Explanation:** The parameter specified for the ZRCBI command is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0003E PROCESSING ABORTED—UAT RETRIEVAL ERROR**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0004E INVALID CPU ID**

**Explanation:** The CPU ID specified in the ZRCBI command is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0005I RCB INITIALIZATION COMPLETE**

**Explanation:** This is the normal response to the ZRCBI command with the SGL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0006E INVALID TERMINAL ADDRESS FORMAT**

**Explanation:** This message is sent from the SGL function.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0007E INVALID TERMINAL ADDRESS**

**Explanation:** There was an error return from WGR1. This message is sent in case of a single initialization only (sent from the SGL function).

**System Action:** RCBI does not initialize RCB involved in the error. The 000472 system error is issued and processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0008E INVALID TERMINAL TYPE IN UAT**

**Explanation:** This message is sent from the SGL function.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0009E PROCESSING ABORTED—RCB RETRIEVAL ERROR**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0010E TERMINAL ADDRESS NOT DEFINED IN UAT**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0011E INVALID REQUEST—SELF INITIALIZATION NOT ALLOWED**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0012E INVALID REQUEST—GLOBAL CORE NOT LOADED**

**Explanation:** This message is sent from the ALL, MOD, or SGL functions.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCBI0013E INVALID REQUEST—PRIME/RO CRAS INIT. NOT ALLOWED**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCBI command.

**RCSC0001W DASD LOCK TABLE FULL ON RCS SSID** *ssid*

**Where:**

*ssid* The record cache subsystem (RCS) subsystem identifier (SSID).

**Explanation:** The DASD control unit attached to the RCS specified in the message has no lock space available.

**System Action:** None.

**User Response:** Do the following:

1. Review the current lock space size.
2. Make any needed modifications.

# RECP0000A–RECP00BEI

**RECP0000A SIPC TIMEOUT ON THE FOLLOWING MESSAGE/FUNCTION** *function procid* **PROCESSOR CHAIN CHASE NOT STARTED** *addlinfo*

**Where:**

*function*
The function is one of the following:

**BKP6RTAS2 or BKP6BJ05**
The calling program is BKP6.

**BKP3RTAS2 or BKP3BJ05**
The calling program is BKP3.

*procid*
The processor ID.

*addlinfo*
One of the following:

- VFA ALSO NOT FILED OUT
- PROCESSOR GLB/SW NOT CLRD
- TPFCS POOL REUSE TABLE NOT CLEARED

**Explanation:** One of the following occurred:

- An attempt to send a chain chase message to another processor during recoup phase 1 processing failed because SIPCC macro return processing cannot communicate with the intended processor. Additionally, virtual file access (VFA) files or processor globals are not cleared.
- An attempt to send a clear TPF collection support (TPFCS) pool reuse table message to another processor during

recoup phase 1 processing failed because SIPCC macro return processing cannot communicate with the intended processor.

**System Action:** Recoup processing stops.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again. If you cannot start recoup processing again, enter **ZRECP ABORT** or **ZRECP ABORT BP** and then start recoup processing.

See *TPF Operations* for more information about the recoup function, and the ZRECP ABORT command. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0000A SIPC TIMEOUT ON THE FOLLOWING MESSAGE/FUNCTION** *function procid* **PROCESSOR RTA NOT SWITCHED** *addlinfo*

**Where:**

*function*
The function is one of the following:

**BKP6RTA**
Captures the long-term file pool directory records onto the phase 1 captured SONRI directory (#STPKP).

**BKP6RTAP3**
Captures the long-term file pool directory records onto the phase 3 captured SONRI directory (#SONCP).

*procid*
The processor ID.

*addlinfo*
One of the following:

- VFA ALSO NOT FILED OUT
- PROCESSOR GLB/SW NOT CLRD

**Explanation:** An attempt to switch RTA tapes at the start of recoup phase 1 processing failed because SIPCC macro return processing cannot communicate with the intended processor. Additionally, virtual file access (VFA) files or processor globals are not cleared.

**System Action:** Recoup processing stops on the indicated processor and can end abnormally.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. If recoup processing ends abnormally, start recoup processing again.
4. If recoup processing does not end abnormally and does not continue, enter **ZRECP ABORT** or **ZRECP ABORT BP** and then start recoup processing again.

See *TPF Operations* for more information about the recoup function, and the ZRECP ABORT command. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0000E SIPC TIMEOUT ON THE FOLLOWING FUNCTION: ZRECP PROC** *cpuid* **START**

**Where:**

*cpuid*
One of the following:

- The name of the processor if it can be determined.
- (UNABLE TO FIND PROC. ID) if the name of the processor cannot be determined.

**Explanation:**

**Explanation:** The ZRECP START command was entered specifying the PROC parameter but a timeout has occurred in SIPCC processing.

**System Action:** The command fails and takes a system error.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP START command specifying the PROC parameter again.

See *TPF Operations* for more information about the ZRECP START command.

---

**RECP0000E SIPC TIMEOUT ON THE FOLLOWING FUNCTION: ZRECP PROC** *cpuid* **STOP**

**Where:**

*cpuid*
One of the following:

- The name of the processor if it can be determined.
- (UNABLE TO FIND PROC. ID) if the name of the processor cannot be determined.

**Explanation:** The ZRECP STOP command was entered specifying the PROC parameter but a timeout has occurred in SIPCC processing.

**System Action:** The command fails and takes a system error.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP STOP command specifying the PROC parameter again.

See *TPF Operations* for more information about the ZRECP STOP command.

---

**RECP0000E SIPC TIMEOUT ON THE FOLLOWING FUNCTION: ZRECP PROC** *cpuid* **EXIT**

**Where:**

*cpuid*
One of the following:

- The name of the processor if it can be determined.
- (UNABLE TO FIND PROC. ID) if the name of the processor cannot be determined.

**Explanation:** The ZRECP EXIT command was entered

specifying the PROC parameter but a timeout has occurred in SIPCC processing.

**System Action:** The command fails and takes a system error.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP EXIT command specifying the PROC parameter again.

See *TPF Operations* for more information about the ZRECP EXIT command.

---

**RECP0000E SIPC TIMEOUT ON THE FOLLOWING FUNCTION: ZRECP PROC** *cpuid* **RESTART**

**Where:**

*cpuid*
One of the following:

- The name of the processor if it can be determined.
- (UNABLE TO FIND PROC. ID) if the name of the processor cannot be determined.

**Explanation:** The ZRECP RESTART command was entered specifying the PROC parameter but a timeout has occurred in SIPCC processing.

**System Action:** The command fails and takes a system error.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RESTART command specifying the PROC parameter again.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**RECP0000E SIPC TIMEOUT ON THE FOLLOWING FUNCTION: ZRECP PROC** *cpuid* **LEVEL-***ecblevel*

**Where:**

*cpuid*
One of the following:

- The name of the processor if it can be determined.
- (UNABLE TO FIND PROC. ID) if the name of the processor cannot be determined.

*ecblevel*
The number of entry control blocks (ECBs).

**Explanation:** The ZRECP LEVEL command was entered specifying the PROC parameter but a timeout has occurred in SIPCC processing.

**System Action:** The command fails and takes a system error.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP LEVEL command specifying the PROC parameter again.

See *TPF Operations* for more information about the ZRECP LEVEL command.

---

**RECP0000E SIPC TIMEOUT ON THE FOLLOWING FUNCTION: ZRECP PROC** *cpuid* **STATUS**

**Where:**

*cpuid*
One of the following:

- The name of the processor if it can be determined.
- (UNABLE TO FIND PROC. ID) if the name of the processor cannot be determined.

**Explanation:** The ZRECP STATUS command was entered specifying the PROC parameter but a timeout has occurred in SIPCC processing.

**System Action:** The command fails and takes a system error.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP STATUS command specifying the PROC parameter again.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**RECP0000E SIPC TIMEOUT ON THE FOLLOWING FUNCTION: ZRECP PROC** *cpuid* **REPORT**

**Where:**

*cpuid*
One of the following:

- The name of the processor if it can be determined.
- (UNABLE TO FIND PROC. ID) if the name of the processor cannot be determined.

**Explanation:** The ZRECP REPORT command was entered specifying the PROC parameter but a timeout has occurred in SIPCC processing.

**System Action:** The command fails and takes a system error.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP REPORT command specifying the PROC parameter again.

See *TPF Operations* for more information about the ZRECP REPORT command.

---

**RECP0000E SIPC TIMEOUT ON THE FOLLOWING FUNCTION: ZRECP PROC** *cpuid* **FLUSH**

**Where:**

*cpuid*
One of the following:

- The name of the processor if it can be determined.
- (UNABLE TO FIND PROC. ID) if the name of the processor cannot be determined.

**Explanation:** The ZRECP FLUSH command was entered specifying the PROC parameter but a timeout has occurred in SIPCC processing.

**System Action:** The command fails and takes a system error.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP FLUSH command specifying the PROC parameter again.

See *TPF Operations* for more information about the ZRECP FLUSH command.

---

**RECP0000I BEGIN GROUP ID -** *charid*,'*hexid*' **VSN -** *version*

**Where:**

*charid*
The 2-character representation of the record ID that is being processed.

*hexid*
The 4-character hexadecimal representation of the record ID that is being processed.

*version*
The version of the record ID.

**Explanation:** This is a normal message during recoup processing, indicating that the specific group has just begun chain chase processing.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0000I DIRECTORY CAPTURE IN PROGRESS - ORD#** *ordnum*

**Where:**

*ordnum*
The ordinal number of a released pool address (FC33) record.

**Explanation:** This is a normal response to the ZRECP STATUS command, or the ZRECP LEVEL command was entered while recoup processing is in the directory capture portion of phase 1.

**System Action:** None.

**User Response:** Do one of the following:

- If this message is in response to the ZRECP STATUS command, do nothing.
- If this message is in response to the ZRECP LEVEL command, do the following:
  1. Wait until the directory capture portion of recoup phase 1 processing ends.
  2. Enter the ZRECP LEVEL command again.

See *TPF Operations* for more information about the ZRECP STATUS and ZRECP LEVEL commands.

---

**RECP0000I PSEUDO DIRECTORY/ID TABLE INIT IN PROGRESS**

**Explanation:** The ZRECP STATUS or ZRECP LEVEL command was entered, but recoup phase 1 is initializing the recoup pseudo directory (#SONRPE) or ID table.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait until recoup phase 1 ends initializing the recoup pseudo directory (#SONRPE) or ID table.
2. Enter the ZRECP STATUS or ZRECP LEVEL command again.

See *TPF Operations* for more information about the ZRECP STATUS and ZRECP LEVEL commands.

---

**RECP0000I LEVEL ENTRY INCORRECT AT THIS TIME AUTO PAUSE IN PROGRESS**

**Explanation:** The ZRECP LEVEL command was entered, but the BRMK segment has detected from the recoup keypoint (BK0TBL) that an internal pause is in progress. An internal pause occurs when the number of active recoup entry control blocks (ECBs) equals the number of ECBs that are looping in the BPM1 segment.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait until recoup resumes processing after all ECBs have completed processing.
2. Enter the ZRECP LEVEL command again.

See *TPF Operations* for more information about the ZRECP LEVEL command.

---

**RECP0000I WAITING FOR SECONDARY PROCESSORS TO COMPLETE, CHECKING ONCE A MINUTE**

**Explanation:** The ZRECP STATUS command was entered specifying the PROC parameter or an internal status request was processed, but the primary processor is waiting to receive responses from the secondary processors.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**RECP0000I TOTAL NUMBER OF FIXED ERRORS** *errnum*

**Where:**

*errnum*
The number of fixed errors.

**Explanation:** This is a normal response to the ZRECP STATUS command indicating the number of fixed errors that have occurred during phase 1 chain chase.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**RECP0000I RECP LEVEL COMPLETE**

**Explanation:** This is a normal response to the ZRECP LEVEL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP LEVEL command.

---

**RECP0000I ADR READ ERROR – INPUT BLOCK LOST**

**Explanation:** There is only one possible error during recoup phase 5. This occurs when there is a problem reading the input ADR tape.

**System Action:** The program tries to keep reading the ADR to continue processing.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0000I PHASE1 TIME — *hours* HRS. *minutes* MINS.**

**Where:**

*hours*
The hours.

*minutes*
The minutes.

**Explanation:** This is the normal response to the ZRECP RERUN and ZRECP RESUME commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RERUN and ZRECP RESUME commands.

---

**RECP0000I RECP LEVEL COMPLETE**

**Explanation:** This is the normal response to the ZRECP LEVEL command. It is followed by the recoup status message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP LEVEL command.

---

**RECP0000I START OF RECOUP SELD - LOST ADDRESSES FIRST**

**Explanation:** This is a normal response to the ZRECP DUMP command indicating that lost address processing has begun.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DUMP command.

---

**RECP0000I RECP SELD - START OF ERRONEOUSLY AVAILABLE ADDRS**

**Explanation:** This is a normal response to the ZRECP DUMP command indicating that erroneously available address processing has begun.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DUMP command.

---

**RECP0000I RECP SELD COMPLETED**

**Explanation:** This is the normal response to the ZRECP DUMP command indicating that erroneously available address processing has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DUMP command.

---

**RECP0000I *records1* RECORDS READ / *records2* RECORDS WRITTEN**

**Where:**

*records1*
The records read.

*records2*
The records written.

**Explanation:** This is the normal response to the ZRECP LOAD command with the ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP LOAD command.

---

**RECP0000T RECP SELD ABORTED**

**Explanation:** This is the normal response to the ZRECP DUMP ABORT command.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0000T RECP SELD ALREADY ACTIVE**

**Explanation:** The ZRECP DUMP command was entered, but a selective dump is already active.

**System Action:** Recoup processing ends.

**User Response:** Determine why the ZRECP DUMP command was entered twice.

See *TPF Operations* for more information about the ZRECP DUMP command.

**RECP0000T IN CORE DIRECTORY CAPTURE TIME-OUT ON PROCESSOR** *cpuid*

**Where:**

*cpuid*
The name of the processor.

**Explanation:** The directory capture did not complete in the allowed time. The time allowed for the directory capture is set by the DIRTIM parameter in the ZRECP PROFILE command.

**System Action:** Begin abort processing.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF Operations* for more information about the ZRECP PROFILE command. See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP0000T RECP DUMP OPTION ERROR RETRY ENTRY**

**Explanation:**

**Explanation:** The ZRECP DUMP command was entered, but an error condition was detected by a FACS-type call or the FINWC macro while trying to retrieve the recoup master keypoint (BK0RP).

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP DUMP command again.

See *TPF Operations* for more information about the ZRECP DUMP command. See *TPF System Macros* and *TPF Application Programming* for more information about the FACS program and the FACS interface.

**RECP0000T RECP TAPE READ ERROR - INPUT BLOCK LOST.**

**Explanation:** The ZRECP DUMP command was entered, but recoup processing found an ADR tape read error.

**System Action:** None.

**User Response:** Determine the cause of the problem.

See *TPF Operations* for more information about the ZRECP DUMP command.

**RECP0000T RECP SELD — TAPE READ ERROR — MAX 209 RECS LOST**

**Explanation:** The ZRECP DUMP command was entered, but there was a problem reading the input ADR tape.

**System Action:** Recoup processing continues.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP DUMP command.

**RECP0000T UNABLE TO READ KEYPOINT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 1 or recoup phase 3 is unable to read the recoup keypoint (RCPK) record.

**System Action:** The recoup function will either abort or need to be aborted manually.

**User Response:** Do the following:

1. Correct the RCPK record.
2. Start the recoup function again.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP0000T RECP L8E8 READ ERROR - INPUT BLOCK LOST.**

**Explanation:** The ZRECP DUMP command was entered specifying the RESTART parameter but an error condition was detected by a FACE-type call while trying to retrieve or the FINWC macro while trying to find the L8 (lost addresses) record or the E8 (erroneously available addresses) record.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP DUMP command specifying the RESTART parameter again.

See *TPF Operations* for more information about the ZRECP DUMP command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**RECP0001E SONRPE RECORD INITIALISATION INCOMPLETE**

**Explanation:** During recoup restart processing, a status check fails.

**System Action:** Recoup processing fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP0001I RESTART**

**Explanation:** This is the normal response to the ZRECP RESTART command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**RECP0001I BEGIN GROUP ID -** *charid*,'*hexid*' **VSN -** *version*

**Where:**

*charid*
The 2-character representation of the record ID that is being processed.

*hexid*
The 4-character hexadecimal representation of the record ID that is being processed.

*version*
The version of the record ID.

**Explanation:** This is a normal message during recoup processing, indicating that the specific group has just begun chain chase processing.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0001I STARTING GROUP ID -** *charid*,'*hexid*' **VSN -** *version* **FOR SSU -** *ssun* **, PROC -** *cpuid* **, ISTREAM -** *istreamnum*

**Where:**

*charid*
The 2-character representation of the record ID that is being processed.

*hexid*
The 4-character hexadecimal representation of the record ID that is being processed.

*version*
The version of the descriptor group.

*ssun*
The four-character subsystem user (SSU) name.

*cpuid*
The name of the processor.

*istreamnum*
The I-stream, which is displayed as a decimal number.

**Explanation:** This is a normal message during recoup processing, indicating that a unique instance of the specific group has just begun chain chase processing.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0002I T-***records1* **C-***records2* **MAX ENT-***entry1* **DIFF-***ecb* **SE-***errors1* **I-***xx charid*,'*hexid*' **VSN** *version status*

**Where:**

*records1*
The total number of fixed record types and data stores to be processed during chain chase processing.

*records2*
The total number of fixed record types and data stores completed.

*entry1*
The maximum number of entry control blocks (ECBs) currently allowed.

*ecb* The number of created ECBs that are currently active.

*errors1*
The number of timeout errors issued up to this point.

*xx* The I-stream, which is displayed as a decimal number, that is the I-stream owner of the records currently being chain chased.

*charid*
The 2-character representation of the record ID that is being processed.

*hexid*
The 4-character hexadecimal representation of the record ID that is being processed.

*version*
The version of the record ID that is being processed.

*status*
The status of chain chase processing (COMPLETED or PROCESSING).

**Explanation:** This is the standard message that is displayed automatically:

- During recoup phase 1 processing.
- If you enter the ZRECP STATUS command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**RECP0002T UNABLE TO WRITE KEYPOINT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A recoup program was not able to file the recoup keypoint (RCPK) record successfully.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the error.

2. End the recoup function.
3. Start the recoup function again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0003I PSEUDO DIRECTORY INITIALIZATION STARTED**

**Explanation:** This is a normal message during recoup phase 1 processing indicating that pseudo directory initialization has begun.

**System Action:** Recoup processing continues.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0004I RECP PRIM COMPLETE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is the normal response to the ZRECP PRIM command. It is followed by the recoup status message.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0005W INIT OF PROCESSOR -** *cpuid*'**S PSEUDO DIRECTORIES TAKING LONGER THAN EXPECTED.**

**Where:**

*cpuid*
The name of the processor.

**Explanation:** The time it has taken for recoup processing to initialize pseudo directories has exceeded the time that was set using the ZRECP PROFILE command.

**System Action:** Recoup processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROFILE command. See *TPF Database Reference* for more information about recoup functions and procedures

---

**RECP0006T ILLEGAL ACTION** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The format of the command is not valid or an attempt was made to run recoup while the TPF system is not in the correct state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the command again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0008I SWITCHING RTA** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Switching the primary RTA tape from the active to the standby.

**System Action:** The TPF system switches the RTA tapes.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0009W VFA ERROR FLUSHING OUT PROC -** *cpuid* **PSEUDO DIRECTORY (***dirname***), ORD NBR -** *ordnum*, **ADDRESS -** *faddr*

**Where:**

*cpuid*
The name of the processor.

*dirname*
The name of the pseudo directory.

*ordnum*
The hexadecimal ordinal number of the pseudo directory record.

*faddr*
The file address of the pseudo directory record.

**Explanation:** During recoup processing, the FLVFC macro has taken more than 10 significant errors on the pseudo directory. This value is set in the BRV0 segment.

**System Action:** None.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP000CA ENSURE THE RGF DATA SET IS MOUNTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is an informational message to remind you to have the recoup general file data set mounted prior to inputting any more messages.

**System Action:** None.

**User Response:** Ensure that the general file is mounted.

See *TPF Operations* for more information about the recoup function.

---

**RECP000EA CYCLE-DOWN SYSTEM** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0010A ENTER RECALL MESSAGE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This message is the response to the ZRECP RESTART command, which is used when the recoup function was started previously and processing needs to be redone.

**System Action:** None.

**User Response:** Enter the ZRECP RECALL command.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP0010E TAPE DATA CHECK ENCOUNTERED. ATTEMPTING INTERNAL RECOUP RESTART**

**Explanation:** During recoup phase 1 processing, a data check error occurred while trying to write to the RCP tape.

**System Action:** Recoup processing tries to do an internal restart to continue.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0010E TAPE CHECK ENCOUNTERED. INTERNAL RESTART FAILED - MANUAL RESTART REQUIRED.**

**Explanation:** During recoup phase 1 processing, a data check error occurred while trying to write to the RCP tape.

**System Action:** Recoup processing fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0012A FIXED ERROR — RESPOND** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0013W MOUNT RCP TAPE FOR OUTPUT**

**Explanation:** Recoup phase 1 requires that the RCP tape be mounted for output on that subsystem.

**System Action:** Recoup phase 1 does not continue to run.

**User Response:** Mount an RCP tape for output.

---

**RECP0014A DEFERRING UNTIL SEL RECOUP COMPLETE OR CONTINUE RESPOND** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** During recoup phase 1 processing, one or more fixed records were found to be in error.

**System Action:** The recoup function pauses until you respond.

**User Response:** Do one of the following:

- Enter the ZRECP CONTINUE command to complete recoup phase 1.
- Enter the ZRECP SEL ID MMCCHHRR command for each fixed record to be reprocessed once is corrected.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP0016I PHASE I COMPLETED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message indicating that recoup phase 1 processing has finished.

**System Action:** Recoup processing continues with phase 2.

**User Response:** See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0018I PHASE III COMPLETED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message indicating that recoup phase 3 processing has finished.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP001AT RECOUP ABORTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The recoup function is unable to continue and it is exited from the TPF system.

**System Action:** The recoup function is exited.

**User Response:** Do the following:

1. Correct the problem that is causing the abort. Use the messages that appear prior to the ABORT message and the 041001 system error to determine the problem.
2. Start the recoup function again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP001CW SEQUENCE ERROR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The message is out of sequence for this point in recoup processing.

**System Action:** None.

**User Response:** Enter the correct command.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP001EA DESTRUCTIVE SEGMENT-RESPOND** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 3 is waiting to roll-in updated file pool directories or to skip to the end of recoup phase 3.

**System Action:** None.

**User Response:** Respond with either the recoup SKIP or PROCEED message.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0020A ENSURE RCP TAPE MOUNTED FOR OUTPUT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message during recoup processing to remind you to have the RCP tape mounted.

**System Action:** None.

**User Response:** Ensure that the RCP tape is mounted.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0022T CANNOT WRITE RCP** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The recoup output writer segment was not able to write to the RCP tape.

**System Action:** The recoup function is stopped because of a tape problem.

**User Response:** Do the following:

1. Correct the tape problem.
2. Enter **ZRECP RESTART** to start the recoup function again.

See *TPF Operations* for more information about the recoup function and the ZRECP RESTART command.

---

**RECP0026I CAPTURE FINISHED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message during recoup processing indicating that recoup phase 1 has finished capturing the pool rollin directory (#SONRI) to the phase 1 captured SONRI directory (#STPKP) or to the phase 3 captured SONRI directory (#SONCP).

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP0028A SYSTEM MAY BE CYCLED-UP** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** During a recoup phase 1 start in 1052 state, the TPF system is now ready to be cycled to NORM state.

**System Action:** None.

**User Response:** Cycle the TPF system to NORM state, or not, as desired.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP002AA ERROR — RETRY OR ABORT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A problem was encountered trying to read the recoup phase 3 input RPE tape.

**System Action:** The recoup function is paused and waiting for a response.

**User Response:** Do the following:

1. Determine the cause of the problem. You can use the recoup system error dump that immediately preceded this message to help with problem resolution.
2. Correct the problem.
3. Enter the ZRECP RETRY or the ZRECP ABORT command.

See *TPF Operations* for more information about the recoup function, and the ZRECP RETRY and ZRECP ABORT commands.

**RECP002CI DIRECTORY ROLL-IN COMPLETED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 3 finished writing the new file pool directories to file.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP002EA ENTER RETRY OR ABORT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** During recoup processing, there was a sequence error during file pool directory reading.

**System Action:** Recoup processing is paused and waiting for a response.

**User Response:** Enter one of the following:

- **ZRECP RETRY**
- **ZRECP ABORT**

See *TPF Operations* for more information about the recoup function, and the ZRECP RETRY and ZRECP ABORT commands.

**RECP0034A UNABLE TO FIND DESCRIPTOR — CHECK INPUT —** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP SEL command was entered or the ZRECP RECALL command was entered with the SEL parameter specified, but recoup processing was unable to find the record to be processed.

**System Action:** Recoup processing does one of the following:

- If you entered the ZRECP RECALL command with the SEL parameter specified and the VSN parameter with a version number that does not exist, recoup processing ends abnormally.
- For any other entry, recoup processing pauses until you correct the entry.

**User Response:** Enter the command correctly.

See *TPF Operations* for more information about the ZRECP SEL and ZRECP RECALL commands.

**RECP0036I SELECTIVE RECOUP OF ID FILE/ADR FIN** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Selective processing for the specified record is complete.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP0038I SON DIR CAPT STARTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message during recoup processing indicating that recoup phase 1 has started capturing the pool rollin directory (#SONRI) to the phase 1 captured SONRI directory (#STPKP) or to the phase 3 captured SONRI directory (#SONCP).

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP003AI SON DIR ROLLIN STARTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 3 has started to file the new file pool directory records.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP003CA ENTER ZRECP RECALL WHEN READY** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal response to the ZRECP RESUME command if ADR-YES was previously specified with the ZRECP PROFILE command. This message follows RECP0048A, which requests you to mount an ADR tape.

**System Action:** Recoup processing is paused and waiting for a response.

**User Response:** Once you have mounted the ADR tape, enter ZRECP RECALL.

See *TPF Operations* for more information about the ZRECP RECALL command.

**RECP003EA IPL SYSTEM AND REENTER RERUN REQUEST** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP RERUN command was entered, but recoup processing is unable to rerun recoup phase 3 without a system IPL.

**System Action:** The command fails.

**User Response:** Do the following:

1. IPL the TPF system if the recoup phase 3 run is to be rerun.
2. Enter the ZRECP RERUN command again.

See *TPF Operations* for more information about the ZRECP RERUN command.

**RECP0040I RETRY** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is the normal response to the ZRECP RETRY command.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP0042T ABORT DUE TO RCI ERROR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 1 was unable to read or process information on the RCI input tape.

**System Action:** The recoup function is ended and is exited from the TPF system.

**User Response:** Do the following:

1. Determine the cause of the problem.

2. Correct the problem.
3. Run recoup phase 1 again from the start.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0044A MOUNT THE FIRST RCI TAPE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 1 was restarted at the point where it needs to read the RCI input tape.

**System Action:** The recoup function is waiting for the RCI tape to be mounted.

**User Response:** Mount the first RCI tape.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0046T ERROR FILING SAT/SRT RECORDS** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 1 tried to file the subarea address table (SAT) and the system recovery table (SRT) records in core. During this process, one of the following errors occurred:

- A hardware or software error occurred during the filing operation or the file address of the record could not be computed. This symptom is accompanied by a CTL-4A7 dump.
- The SAT or SRT records in core were corrupted. Corruption is detected by performing a validation check on the *validity bits* and if that check fails, the data in those records may not be valid.

**System Action:** The filing of the SAT and SRT records is stopped immediately. Recoup phase 1 is aborted.

**User Response:** Do one of the following:

- If the problem is a hardware or software error, check the cause of the filing error in the CTL-4A7 dump.
- If the problem is due to core corruption, determine which program or application program is corrupting the core and correct that situation.

---

**RECP0048A MOUNT ADR TAPE FOR LOST/EA POOL ADDRESS ANALYSIS** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal response to the ZRECP RESUME command if ADR-YES was previously specified with the ZRECP PROFILE command.

**System Action:** None.

**User Response:** Mount the ADR tape.

See *TPF Operations* for more information about the ZRECP RESUME and ZRECP PROFILE commands.

---

**RECP004AT PROGRAM** *progname* **NOT ACTIVE - RECOUP ABORTED** *originid*

**Where:**

*progname*
The program name.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** An INDEX macro statement was entered with the MET=(PROG,*method*) parameter specified, but an active version of the user-defined *method* (a program used for recoup chain chase processing) was not found.

**Note:** All programs that were allocated will automatically have at least one active version online. Programs that have not been allocated can still receive control provided that they were loaded and activated through the E-type loader. This message, therefore, can only occur when the program is not allocated and has not been activated by the E-type loader.

**System Action:** Recoup phase 1 is ended abnormally.

**User Response:** Do one of the following:

- Allocate the program and load it.
- Load the program through the E-type loader and enter the ZOLDR ACTIVATE command to activate it.

See *TPF Operations* for more information about the recoup function and the ZOLDR ACTIVATE command.

---

**RECP004CA ENSURE STANDBY RTA AND ALT TAPE MOUNTED FOR PHASE 1** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal response to the ZRECP START command.

**System Action:** None.

**User Response:** If not already mounted, mount the RTA and ALT tapes.

See *TPF Operations* for more information about the ZRECP START command.

---

**RECP004EI RECOUP ABORT IN PROGRESS** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is the normal response to the ZRECP ABORT command. This message is also displayed if recoup ends internally.

**System Action:** Recoup is aborting.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ABORT command.

---

**RECP0050W SSU** *ssu* **NOT ACTIVE** *originid*

**Where:**

*ssu* The subsystem user (SSU).

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In an MDBF environment.) The SSU referenced in the message is not available for recoup phase 1 processing. On a RECALL SEL ID process, the RECP0052W message is not given.

**System Action:** On a RECALL SEL ID process, recoup phase 1 is ended.

**User Response:** If this is not a RECALL SEL ID process, then this is just an informational message. It is up to you or the system programmer to determine whether this SSU must be activated prior to the RECALL message.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0051E IL** *recordid* **—** *recordaddr* **—** *originid*

**Where:**

*recordid*
The ID of the record.

*recordaddr*
The address of the record.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Trying to find an illegal address (that is not valid in this TPF system).

**System Action:** Recoup phase 1 is continued.

**User Response:** Do the following:

1. Determine the cause of this error.
2. Ignore the error or correct it and selectively recoup this record at the end of recoup phase 1.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0052W ACTIVATE PRIOR TO RECALL** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In an MDBF environment). The subsystem user (SSU) that is referenced in the message is not available for recoup phase 1 processing.

This is an informational message.

**System Action:** Recoup phase 1 is continued.

**User Response:** Your system programmer should determine whether this SSU must be activated prior to the RECALL message.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0053E CL** *recordid* **—** *recordaddr* **—** *originid*

**Where:**

*recordid*
The ID of the record.

*recordaddr*
The address of the record.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** An index that is not valid was encountered in this record.

**System Action:** Recoup phase 1 is continued.

**User Response:** Do the following:

1. Determine the cause of this error.
2. Ignore the error or correct it and selectively recoup this record at the end of recoup phase 1.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0054W PHASE 1 RESULTS MAY BE INVALID** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In an MDBF environment). One or more subsystem users (SSUs) were not available to recoup for phase 1 processing.

**System Action:** Recoup phase 1 is continued.

**User Response:** Do the following:

1. Determine whether the unavailable SSUs will cause the recoup phase 1 run to be invalidated.
2. Continue with the recoup phase 1 or start recoup phase 1 over with the missing SSUs activated.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0055E** **ID** *recordid — recordaddr — id, ssu originid*

**Where:**

*recordid*
The ID of the record.

*recordaddr.*
The address of the record.

*id* The ID actually found.

*ssu* The name of the subsystem user (SSU) where the target record resides.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 1 was trying to find this record and it did not have the ID expected.

**System Action:** Recoup phase 1 is continued.

**User Response:** Do the following:

1. Determine the cause of this error.
2. Ignore the error or correct it and selectively recoup this record at the end of recoup phase 1.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0056I** **ONE OR MORE SSUS WERE NOT ACTIVE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0057E** **HD** *recordid — recordaddr — originid*

**Where:**

*recordid*
The ID of the record.

*recordaddr*
The address of the record.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A hardware error was encountered while trying to find this record.

**System Action:** Recoup phase 1 is continued.

**User Response:** Do the following:

1. Determine the cause of this error.
2. Ignore the error or correct it and selectively recoup this record at the end of recoup phase 1.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0059E** **FA** *recordid—faceordnum originid*

**Where:**

*recordid*
The ID of the record.

*face* The file address compute program (FACE) record type.

*ordnum*
The ordinal number.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** An error occurred while trying to find this record in FACE.

**System Action:** Recoup phase 1 is continued.

**User Response:** Do the following:

1. Determine the cause of this error.
2. Ignore the error or correct it and selectively recoup this record at the end of recoup phase 1.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP005AI** **RESTARTING IN SSU** *ssu originid*

**Where:**

*ssu* The subsystem user (SSU) name.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is the response to a recoup phase 1 RESTART message in a multiple database function (MDBF) environment.

**System Action:** Recoup phase 1 is continued.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP005CW UNABLE TO FIND CORRECT SSU FOR RESTART** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In an MDBF environment). One of the following errors occurred:

- On a RESTART message, recoup phase 1 was unable to determine the subsystem user (SSU) in which it was last processing
- On a RECALL SEL ID entry, the SSU requested was not valid.

**System Action:** Phase 1 is continued or on an SEL ID error recoup phase 1 is exited.

**User Response:** Do one of the following:

- On a restart, recoup phase 1 continues by restarting in the first SSU.
- On a SEL ID, recoup phase 1 must be aborted and then started again with the correct SEL ID message.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP005EI RESTARTING IN PRIME SSU** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This message is the response to a recoup phase 1 restart message in a multiple database function (MDBF) environment.

**System Action:** Phase 1 is continued.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0060E INVALID INFO UNABLE TO PROC BKD** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In an MDBF environment). Recoup phase 1 is unable to read one of its descriptor records.

**System Action:** Recoup phase 1 is exited.

**User Response:** Do the following:

1. Determine the cause of the problem in the descriptor record.
2. Correct the problem.
3. Start recoup phase 1 again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0061E TO** *recordid* **—** *recordaddr* **—** *originid*

**Where:**

*recordid*
The ID of the record.

*recordaddr*
The address of the record.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This record exceeded the processing time allowed for its chain-chase processing.

**System Action:** Recoup phase 1 is continued.

**User Response:** Do the following:

1. Determine the cause of this error.
2. Ignore the error or correct it and selectively recoup this record at the end of recoup phase 1.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0064E SS NOT AVAIL VIA SSUT FOR PROC** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In an MDBF environment). Recoup phase 1 is unable to set a correct response from the subsystem user table.

**System Action:** Recoup phase 1 is exited.

**User Response:**
1. Determine the cause of the problem with the BSSU segment or the subsystem user table.
2. Correct the problem.
3. Start recoup phase 1 again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0066E INVALID SS/SSU NAME IN BSSU** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In an MDBF environment). Recoup phase 1 is unable to get a correct response from the subsystem user table.

**System Action:** Recoup phase 1 is exited.

**User Response:**
1. Determine the cause of the problem with the BSSU segment or the subsystem user table.
2. Correct the problem.
3. Start recoup phase 1 again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0068I RECOUP ABORT IN PROGRESS** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal response to the ZRECP ABORT command.

**System Action:** Recoup processing ends.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ABORT command.

---

**RECP0070E INPUT MESSAGE PROCESSOR ID INVALID** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In a loosely coupled environment). When entering the ZRECP PRIM command, the primary processor ID (PID) specified is not valid.

**System Action:** The recoup function is continued.

**User Response:** Do the following:
1. Determine the correct processor ID (PID).
2. Enter the command again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0072E PHASE 1 MUST BE PAUSED OR ACTIVE PROCESSOR DOWN** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In a loosely coupled environment). When entering **ZRECP PRIM** *x* **MOVE**, the recoup function was not paused and the active processor is not down.

**System Action:** The recoup function is continued.

**User Response:** Do the following:
1. Pause the recoup function.
2. Enter the command again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0074E REQUESTED PROCESSOR NOT ACTIVE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In a loosely coupled environment). The recoup function is trying to step to a processor that is not active.

**System Action:** The entry is exited.

**User Response:** Enter **ZRECP PRIM** *x* **MOVE** again and specify the correct processor.

See *TPF Operations* for more information about the recoup function and for more information about the ZRECP PRIM command.

---

**RECP0076E FACE ERROR CALCULATING KEYPOINT ADDRESS** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In a loosely coupled environment). The BKP0 program was unable to access the recoup keypoint record.

**System Action:** The entry that is causing this error is exited.

**User Response:** Do the following:
1. Correct the error.
2. Enter the command again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0077E** *type/ordnum* **FACE ERROR-NOT LOADED.**

**Where:**

*type*
An 8 character fixed-file record type.

*ordnum*
The decimal ordinal number.

**Explanation:** During processing of the BKD tape, the file address compute program (FACE) program was unable to calculate the disk address of a descriptor container record.

**System Action:** The record is bypassed and the load function is continued.

**User Response:** Do the following:
1. Make sure a correctly formatted BKD tape was created and mounted.
2. Make sure no other online segment opened the BKD tape.
3. Enter **ZRECP LOAD ALL** to activate the descriptor load function.

See *TPF Operations* for more information about the recoup function and the ZRECP LOAD command.

---

**RECP0078I INPUT NOT FROM PRIMARY/ACTIVE PROCESSOR(S)** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A ZRECP command was entered on a processor that is not being used in recoup processing.

**System Action:** The command fails.

**User Response:** Do one of the following:

- Enter the ZRECP command from a processor that is participating in the recoup run if a processor that is running recoup is available.
- If a processor that is running recoup is not available, do the following:
  1. Enter ZRECP ABORT BP from any processor.
  2. Start recoup processing again.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0079E BKD TAPE IS NO LONGER SUPPORTED**

**Explanation:** The ZRECP LOAD command was entered, but is no longer supported.

**System Action:** The command is rejected.

**User Response:** None.

---

**RECP007AE WRITE TAPE MARKS ON RCP AND DISMOUNT IT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In a loosely coupled environment). During a primary processor move, when the active processor is down, this message is to ensure that the RCP is closed out properly.

**System Action:** The recoup function is continued.

**User Response:** Write the tape marks on RCP and save it for recoup phase 2 use.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP007CE DISMOUNT RCI TAPE FROM OTHER PROCESSOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In a loosely coupled environment). On a primary processor move, if the RCI tape was mounted in the other processor, it must be dismounted.

**System Action:** The recoup function is continued.

**User Response:** Dismount the RCI tape.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP007EI STEPPING TO NEXT PROCESSORS** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In a loosely coupled environment) Recoup phase 1 chain chasing for processor-unique records exists and the recoup function is stepping to the next processor to begin processing there.

**System Action:** The recoup function is continued.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0080I RECOUP STARTING IN SECONDARY PROCESSOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** In a loosely coupled environment, recoup phase 1 chain chase processing for processor-unique records is beginning in the secondary processor.

**System Action:** Recoup processing continues.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0082I STARTING AGAIN IN PRIMARY PROCESSOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP PRIM *cpuid* MOVE command was entered and recoup begins chain-chasing on the specified primary processor.

**System Action:** Chain-chasing continues on the specified primary processor.

**User Response:** None.

---

**RECP0084A UNABLE TO INHIBIT CYCLE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** (In a loosely coupled environment). During recoup start processing, the recoup function was unable to inhibit system state cycling during directory capture.

**System Action:** Recoup is exited.

**User Response:** Do the following:

1. Correct the problem, which is usually caused by the processors not being in the correct states.
2. Start the recoup function again by entering the ZRECP START command.

See *TPF Operations* for more information about the ZRECP START command. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0086A V. F. A. FILE ERROR (PHASE 1 ONLY)** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The attempt to file virtual file access (VFA) buffers at the start of recoup phase 1 has failed.

**System Action:** Recoup is exited.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again from the start of phase 1.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0088I RECOUP CHAIN CHASE BEGINS** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal response to the ZRECP RECALL command indicating that recoup chain chase processing has started.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP008AA CYCLE ALL OTHER PROCESSORS TO 1052 STATE, ABORT RECOUP AND START RECOUP AGAIN** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP START command was entered with the PROC parameter specified, but the primary recoup processor is in 1052 state and this processor is not.

**System Action:** The command fails.

**User Response:** Do the following:

1. Cycle all secondary recoup processors to 1052 state.
2. Enter **ZRECP ABORT** to end recoup.
3. Run recoup again.

See *TPF Operations* for more information about the ZRECP START and ZRECP ABORT commands.

---

**RECP0096I MULTIPROCESSOR RECOUP RUN HAS BEEN DISALLOWED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP RECALL command was entered, but an error condition was detected during initialization processing while trying to find or file a multiprocessor recoup keypoint (#MPRECP) record.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP0099W RANGE ERROR**

**Explanation:** An internal error occured during recoup processing. An attempt was made to use an equate branch value that is not valid.

**System Action:** Recoup processing continues.

**User Response:** See your IBM service representative.

---

**RECP0099I GLOBALS AND FUNCTION SWITCH RESET IN THIS PROCESSOR**

**Explanation:** (In a loosely coupled environment). This message denotes that recoup phase 1 was aborted or recoup phase 3 was completed in the primary processor. This message will appear on all active processors containing the subsystem

being recouped. It ensures that all recoup switches and globals were reset in all processors.

**System Action:** The recoup function is continued.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP009AE FACE ERROR ON A MULTIPLE-PROCESSOR RECOUP KEYPOINT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP RECALL command was entered, but recoup was unable to calculate the file address of a processor-unique keypoint record.

**System Action:** Recoup processing ends abnormally.

**User Response:**

1. Determine the cause of the problem. (Perhaps a bad FCTB was loaded.)
2. Correct the problem.
3. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP009CE UNABLE TO FIND MULTIPLE-PROCESSOR RECOUP KEYPOINT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP RECALL command was entered, but recoup was unable to find a processor-unique keypoint record

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP00A0E ERROR FILE-ING MULTIPLE-PROCESSOR RECOUP KEYPOINT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP RECALL command was entered, but a file error occurred during initialization when attempting to file a multiprocessor recoup keypoint (#MPRECP) record.

**System Action:** Recoup continues but running chain chasing on multiple processors will not be allowed.

**User Response:**

1. Determine the cause of the problem.
2. Correct the problem.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP00A2I INCORRECT ENTRY WHILE A MULTIPLE-PROCESSOR RECOUP RUN IS ACTIVE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A ZRECP PRIM command was entered while a multiprocessor recoup chain chase was active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PRIM command.

---

**RECP00A4I INCORRECT ENTRY WHENEVER ZRECP PRIM ENTRY HAS BEEN ENTERED BEFORE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP PRIM command was entered while a multiprocessor recoup chain chase was active

**System Action:** The ZRECP message is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PRIM command.

---

**RECP00A6I ZRECP PROC** *cpuid* **START COMPLETE** *originid*

**Where:**

*cpuid*
The name of the processor.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is the normal response to the ZRECP START command specifying the PROC parameter.

**System Action:** Multiprocessor chain chase begins on the target processor

**User Response:** None.

See *TPF Operations* for more information about the ZRECP START command.

---

**RECP00A8I INCORRECT ENTRY - REQUESTED PROCESSOR EITHER STARTED/STOPPED/COMPLETED WORK** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP START command with the PROC parameter specified was entered for a target processor that has completed chain chase processing or has been forced to stop or exit.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP START command.

---

**RECP00AAE INCORRECT RETRIEVAL OF MULTI-PROCESSOR RECOUP KEYPOINT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:**

**System Action:** None.

**User Response:** None.

---

**RECP00ACE ERROR UPDATING THE RECOUP KEYPOINT IN PRIMARY/ACTIVE PROCESSOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** During recoup processing, a secondary processor tried to update the primary processor keypoint but the status in the processor ID shows the primary processor to be no longer active.

**Note:** The primary processor must always be active during a recoup.

**System Action:** Recoup processing continues

**User Response:** Abort recoup.

---

**RECP00AEA RECOUP RUN ABORTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** An error occurred during multiprocessor recoup processing that caused a secondary processor, which was active, to end recoup abnormally.

**System Action:** Recoup processing ends abnormally on the secondary processor.

**User Response:** Enter the ZRECP EXIT command with the PROC parameter specified to allow recoup processing to continue on the primary processor.

See *TPF Operations* for more information about the ZRECP EXIT command.

---

**RECP00B0T RECOUP RUN COMPLETED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup successfully completed running on a secondary processor and all entry control blocks (ECBs) are exited.

**System Action:** None.

**User Response:** None.

---

**RECP00B2W RECOUP FIXED ERRORS OCCURRED ON THIS RUN** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup chain chasing on this secondary processor found fixed errors.

**System Action:** Recoup is completing.

**User Response:** Ensure that all fixed errors are reprocessed on the primary processor at the end of recoup phase 1.

---

**RECP00B4A OPERATOR REQUIRED TO EXIT RECOUP RUN FROM ABORTED PROCESSOR IN ORDER TO FINISH PHASE-I** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** During multiprocessor recoup, processing has ended abnormally on a secondary processor and operator

intervention is required for processing to continue on the primary processor.

**System Action:** None.

**User Response:** Enter the ZRECP EXIT command with the PROC parameter specified to allow recoup to continue on the primary processor.

See *TPF Operations* for more information about the ZRECP EXIT command.

---

**RECP00B6E ENTRY VALID ONLY WHEN CHAIN-CHASE IN PROGRESS** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A ZRECP command specifying the PROC parameter was entered at the wrong time.

**System Action:** The command is rejected.

**User Response:** None.

---

**RECP00B8I INCORRECT ENTRY, REQUESTED PROCESSOR SHOWS NO ACTIVE RECOUP** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A ZRECP command specifying the PROC parameter was entered for a target processor but the target processor is not performing a chain chase

**System Action:** The command is rejected.

**User Response:** None.

---

**RECP00BAI INCORRECT ENTRY, REQUESTED PROCESSOR IS THE PRIMARY/ACTIVE PROCESSOR.** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A ZRECP command was entered specifying the PROC parameter for a processor which is currently the primary processor.

**System Action:** The command is rejected.

**User Response:** None.

---

**RECP00BCI INCORRECT REQUEST, MULTIPROCESSOR OPTION NOT ACTIVE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A ZRECP command was entered specifying the PROC parameter for a target processor but the target processor is not performing a chain chase.

**System Action:** The command is rejected.

**User Response:** None.

---

**RECP00BEI ZRECP PROC** *cpuid* **STOP COMPLETE** *originid*

**Where:**

*cpuid*
The name of the processor.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP STOP command was entered specifying the PROC parameter for a target processor.

**System Action:** The target processor will stop performing chain chase

**User Response:** None.

# RECP00C0I–RECP0400E

---

**RECP00C0I ZRECP PROC** *cpuid* **EXIT COMPLETE** *originid*

**Where:**

*cpuid*
The name of the processor.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal response to the ZRECP EXIT command specifying the PROC parameter for a target processor.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP EXIT command.

---

**RECP00C2I INCORRECT ENTRY - REQUESTED PROCESSOR EITHER STOPPED/EXITED/COMPLETED WORK** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP STOP or ZRECP EXIT command was entered specifying the PROC parameter for a target processor but the target processor has already completed chain chasing, or it has been previously stopped or exited.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STOP and ZRECP EXIT commands.

---

**RECP00C4I ZRECP PROC** *cpuid* **RESTART COMPLETE** *originid*

**Where:**

*cpuid*
The name of the processor.

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is the normal response to the ZRECP RESTART command specifying the PROC parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**RECP00C6I INCORRECT TO START PROCESSOR ORDINAL 0, WHEN THE PRIMARY PROCESSOR IS > 0** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP START command was entered specifying the PROC parameter but the specified processor was the first processor in the loosely-coupled complex and cannot be chosen to be a secondary processor.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Start recoup from another secondary processor.
- Make sure you use processor 0 as a primary processor.

See *TPF Operations* for more information about the ZRECP START command.

---

**RECP00C8E ERROR - DUPLICATE ID'S AND VERSION NUMBERS FOUND, CONTACT PROGRAMMER.** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:**

**Explanation:** The ZRECP START command was entered, but there is more than one record ID with the same ID in the set of recoup descriptors.

**Note:** Recoup requires that whenever two or more descriptors (meaning GROUP ID=XX,USE=BASE) are loaded with the same ID, then the VER= parameter on the GROUP macro (only when USE=BASE coded) must be used to distinguish one ID from another.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

- Contact a system programmer to fix the descriptor records.
- Have the system programmer load and ready the changed descriptor records.
- Start recoup again.

See *TPF Operations* for more information about the ZRECP START command. See *TPF System Macros* for more information about the GROUP macro.

---

**RECP00CAE INCORRECT ENTRY, MULTIPROCESSOR RECOUP HAS COMPLETED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP START command was entered specifying the PROC parameter for a target processor, but multiprocessor recoup as already completed.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP START command.

---

**RECP00CCW UNPROCESSED RECORD IDS WILL NOW BE PROCESSED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Segment B1BK has detected that some record IDs did not complete processing at the end of traditional recoup. The B1BK segment will chain chase these records.

**System Action:** Recoup processing continues.

**User Response:** Determine why some record IDs did not complete chain chasing. Primary causes could be that a descriptor with CPUID=X was coded but that processor was not active, or IDCOMP= was coded which conflicted with

another descriptor's IDCOMP=. Recoup will still perform the chain chase of these descriptors as a necessary safety precaution.

---

**RECP00CEI RECOUP RUN STOPPED IN THIS PROCESSOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal response to the ZRECP STOP command specifying the PROC parameter indicating that the target processor has stopped all chain chasing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STOP command.

---

**RECP00D0I RECOUP RUN EXITED FROM THIS PROCESSOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal response to the ZRECP EXIT command specifying the PROC parameter indicating that the target processor has exited all recoup activity.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP EXIT command.

---

**RECP00D2I PSEUDO DIRECTORY INIT STARTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message during recoup phase 1 processing indicating that recoup pseudo directory initialization has started on this processor.

**System Action:** Recoup processing continues.

**User Response:** None.

---

**RECP00D4I PSEUDO DIRECTORY INIT COMPLETE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message during recoup phase 1 processing indicating that recoup pseudo directory initialization has completed on this processor.

**System Action:** Recoup processing continues.

**User Response:** None.

---

**RECP00D6E UNABLE TO FIND THE DESCRIPTOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 1 processing was unable to find a descriptor segment that was scheduled for chain chase processing.

**System Action:** Recoup processing ends without completing.

**User Response:** None.

---

**RECP00DAE CANNOT START RECOUP ON EXITED PROCESSOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP START command was entered specifying the PROC parameter with the processor that was previously exited by entering the ZRECP EXIT command specifying the PROC parameter.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STOP and ZRECP EXIT commands.

---

**RECP00DCI REQUESTED PROCESSOR ALREADY EXITED FROM THIS RUN** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** A ZRECP command was entered specifying the PROC parameter with the processor that had already been previously exited by entering the ZRECP EXIT command specifying the PROC parameter.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP EXIT command.

**RECP00DEI STOP ISSUED AND WILL TAKE EFFECT WHEN ALL ECBS ARE COMPLETE. IF THIS TAKES TOO LONG, ISSUE STOP AGAIN** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP STOP command was entered specifying the PROC parameter for a target processor but all ECBs have not completed.

**System Action:** All recoup chain chase activity stops on the specified processor when the chain chasing of the current file ends. Message RECP00CEI should follow in a few seconds to indicate that the target processor has been stopped.

**User Response:** If chain chasing does not stop on the specified processor in a few seconds, enter the ZRECP STOP command specifying the PROC parameter for the target processor again.

See *TPF Operations* for more information about the ZRECP STOP command.

---

**RECP00E0I ID COUNTS RESTORED BACK TO TPF STATUS IF TPFDF RECOUP IS RUNNING, OTHERWISE THE COUNTS ARE CLEARED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP EXIT command was entered specifying the PROC parameter for a target processor and the ID counts for the processor are reset to their beginning recoup values or the ID counts are cleared.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP EXIT command.

---

**RECP00E2E FIND/FACE ERROR ON ID COUNTS RECORD. TPF RECOUP COUNTS NOT RESTORED CORRECTLY** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP EXIT command was entered specifying the PROC parameter but an error occurred while restoring the ID counts record of the specified processor.

**System Action:** The command stops restoring the ID counts record but recoup processing continues. When recoup ends, the ID counts for the specified processor will not be correct.

**User Response:** If the recoup run is not critical, do the following:

1. Enter **ZRECP ABORT** to end recoup.
2. Determine the cause of the problem.
3. Correct the problem.
4. Start the entire recoup run again.

See *TPF Operations* for more information about the ZRECP EXIT and ZRECP ABORT commands.

---

**RECP00E4I PSEUDO DIRECTORY MERGE COMPLETE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message, during recoup processing, indicating that a set of recoup pseudo directories has been merged with the processor-unique master copy.

**System Action:** Recoup processing continues.

**User Response:** None.

---

**RECP00E6I TPF RECOUP ID COUNTS COPIED TO SAVEAREA** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message, when TPF recoup ends chain chasing and before TPFDF recoup begins, indicating that the ID counts records have been saved.

**System Action:** None.

**User Response:** None.

---

**RECP00E8E ERROR - TPF RECOUP ID COUNTS NOT COPIED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** TPF recoup has completed but the ID counts records were not saved. If the ZRECP EXIT command is entered before TPFDF recoup ends on this processor, ID counts will be incorrect.

**System Action:** Recoup processing continues.

See *TPF Operations* for more information about the ZRECP EXIT command.

**User Response:** Determine the cause of the error.

---

**RECP00EAA TARGET CPU STILL PERFORMING CHAIN CHASE. ENTER ZRECP PROC X STOP OR RE-IPL THE CPU** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP EXIT command was entered specifying the PROC parameter for a processor that was still performing chain chase.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP STOP command specifying the PROC parameter before entering the ZRECP EXIT command specifying the PROC parameter.

See *TPF Operations* for more information about the ZRECP STOP and ZRECP EXIT commands.

---

**RECP00ECT PSEUDO DIRECTORY CHECKS FAILED. SEE 41210 SNAP DUMP. RECOUP IS ABORTING** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The processor-unique recoup pseudo directories have been corrupted or were not filed out correctly from virtual file access (VFA) and an older, incorrect copy of them is being used. This can be the result of a hard-IPL with a loss of whatever delay-file records were in VFA.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start recoup again.

---

**RECP00EEW PSEUDO DIRECTORY INTEGRITY COUNTS ADJUSTED. WERE WITHIN PROPER THRESHOLD** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The count of pools chain chased is lower or slightly higher than the count of pools found to be in use by recoup (according to the recoup pseudo directories). This condition is usually caused by an IPL of the TPF system.

**System Action:** Recoup processing continues.

**User Response:** If this was not caused by an IPL, contact a system programmer.

---

**RECP00F0I PSEUDO DIRECTORY MERGE STARTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message, during recoup processing, indicating that a set of recoup pseudo directories has started to be merged with the processor-unique master copy.

**System Action:** None.

**User Response:** None.

---

**RECP00F2I PSEUDO DIRECTORY COPY STARTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message, during recoup processing, indicating that a set of recoup pseudo directories has started to be copied into another set.

**System Action:** None.

**User Response:** None.

---

**RECP00F4I PSEUDO DIRECTORY COPY COMPLETE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message, during recoup processing, indicating that a set of recoup pseudo directories has been copied into another set.

**System Action:** Recoup processing continues.

**User Response:** None.

---

**RECP00F6I PSEUDO DIRECTORY VERIFY STARTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message, during recoup processing, indicating that a set of recoup pseudo directories has started to be verified.

**System Action:** Recoup processing continues.

**User Response:** None.

**RECP00F8I PSEUDO DIRECTORY VERIFY COMPLETE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message, during recoup processing, indicating that a set of recoup pseudo directories has been verified.

**System Action:** Recoup processing continues.

**User Response:** None.

**RECP00FAI PSEUDO DIRECTORY FLUSH STARTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message, during recoup processing, indicating that a set of recoup pseudo-directories has started to be flushed from virtual file access (VFA).

**System Action:** Recoup processing continues.

**User Response:** None.

**RECP00FCI PSEUDO DIRECTORY FLUSH COMPLETE** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is a normal message, during recoup processing, indicating that a set of recoup pseudo-directories has been flushed from virtual file access (VFA).

**System Action:** Recoup processing continues.

**User Response:** None.

**RECP00FEI PHASE 2 START** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is the normal response to the ZRECP RECALL command, indicating that recoup phase 2 is starting.

**System Action:** Recoup phase 2 starts.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

**RECP0300I RECP WAITING FOR PROC** *cpuid* **TO FINISH** *chasetype*

**Where:**

*cpuid*
The name of the processor.

*chasetype*
The type of recoup chain chase processing (TPF for TPF, or PH-1 for TPFDF).

**Explanation:** This is a normal message from the primary processor during multiprocessor recoup processing indicating the TPF or TPFDF recoup status on another processor.

**System Action:** None.

**User Response:** None.

**RECP0300E SONRPE RECORD INITIALIZATION INCOMPLETE**

**Explanation:** The ZRECP RESTART command was entered, but the recoup pseudo directory (#SONRPE) record could not be initialized.

**System Action:** Recoup processing ends abnormally.

**User Response:** Start recoup processing again, from the beginning.

See *TPF Operations* for more information about the ZRECP RESTART command.

**RECP0301E ECB/ORDINAL TABLE RESTART INCOMPLETE**

**Explanation:** The ZRECP RESTART command was entered specifying the PROC parameter but a FACE-type, find, or wait error condition was detected while trying to retrieve the ordinal backup table.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP RESTART command again.

See *TPF Operations* for more information about the ZRECP RESTART command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**RECP0301I TPF RECOUP COMPLETED ON CPU-** *cpuids***.**

**Where:**

*cpuids*
The name of the processor or processors.

**Explanation:** This is a normal message indicating that TPF recoup chain chase processing has completed on the specified processor or processors.

**System Action:** Recoup processing continues.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0302E BRR5 - INCORRECT PROFILE OPTION**

**Explanation:** The ZRECP PROFILE command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZRECP PROFILE HELP** to see all of the parameters that are allowed.
2. Enter the ZRECP PROFILE command again using correct parameters.

See *TPF Operations* for more information about the ZRECP PROFILE command.

---

**RECP0303W VFA DELAYED FILES DISABLED BY OPERATOR**

**Explanation:** During recoup initialization of pseudo directories, virtual file access (VFA) was disabled by the operator.

**System Action:** Recoup processing continues.

**User Response:** None.

---

**RECP0304W VFA DELAYED FILES DISABLED BY SYSTEM**

**Explanation:** During recoup initialization of pseudo directories, virtual file access (VFA) was disabled by the operator.

**System Action:** Recoup processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**RECP0305W RECOUP ECB LEVEL PAUSED**

**Explanation:** This is the normal response to the ZRECP RESTART command.

**System Action:** Recoup processing is paused.

**User Response:** Enter the ZRECP LEVEL command to continue with recoup processing.

See *TPF Operations* for more information about the ZRECP RESTART and ZRECP LEVEL commands.

---

**RECP0306W ZRECP SEL WAS IN PROGRESS PRIOR TO IPL**

**Explanation:** The ZRECP RESTART command was entered following a system IPL, but selective recoup processing was occurring at the time of the IPL.

**System Action:** None.

**User Response:** Enter the ZRECP SEL command again to start selective recoup processing again.

See *TPF Operations* for more information about the ZRECP RESTART and ZRECP SEL commands.

---

**RECP0307A RE-ENTER PREVIOUS ZRECP SEL ENTRY TWICE IN ORDER TO PROCESS THAT FILE ADDRESS AGAIN**

**Explanation:** The ZRECP RESTART command was entered following a TPF system IPL, but selective recoup processing was occurring at the time of the IPL.

**System Action:** None.

**User Response:** Enter the ZRECP SEL command again to start selective recoup processing again.

See *TPF Operations* for more information about the ZRECP RESTART and ZRECP SEL commands.

---

**RECP0308I PHASE 2 RESTART**

**Explanation:** This is the normal response to the ZRECP RESTART command if recoup was in phase 2 when recoup stopped.

**System Action:** Recoup phase 2 starts again.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**RECP0310W VFA DELAYED FILES DISABLED BY SYSTEM** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** During recoup processing, keypoint B indicator does not show virtual file access (VFA) delayed files to be functionally disabled, yet they are.

**System Action:** Processing continues.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0311I RESTART BEING INITIATED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is the normal response to the ZRECP RESTART command specifying the PROC parameter.

**System Action:** Recoup processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**RECP0312A MOUNT RCP TAPE FOR OUTPUT** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 1 is ready to process and there is no RCP tape mounted.

**System Action:** Recoup processing waits until the RCP tape is mounted.

**User Response:** Mount an RCP tape.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0313W RECOUP ECB LEVEL PAUSED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** Recoup phase 1 processing has internally paused after determining that virtual file access (VFA) delayed files have been disabled either by an operator or by the TPF system.

**System Action:** Recoup processing pauses.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Restart recoup processing.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0314E UNABLE TO DO RESTART PROCESS** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP RESTART command was entered specifying the PROC parameter but an error switch was passed to the B0SH segment indicating that a temporary keypoint could not be built

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Start the function again.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**RECP0315I RECOUP RESTARTED** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** This is the normal response to the ZRECP RESTART command.

**System Action:** Recoup processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**RECP0316E RECOUP ALREADY ACTIVE THIS PROCESSOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** The ZRECP RESTART command was entered specifying the PROC parameter but recoup is already be active on the specified processor.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RESTART command.

---

**RECP0319W VFA DELAYED FILES DISABLED BY OPERATOR** *originid*

**Where:**

*originid*
The processor ID of the originating processor. This is appended to the message only if the message was originally generated on a different processor.

**Explanation:** During recoup processing, keypoint B was found to have an indicator set showing that virtual file access (VFA) delayed files have been functionally disabled.

**System Action:** Recoup processing continues.

**User Response:** None.

See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0361E BEWA - NO PARM LIST FOUND ON LEVEL 8**

**Explanation:** The ZRECP ONEL command was entered, but an error condition was detected because the BEWA segment was called without a core block on level 8.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.

2. Correct the problem.
3. Enter the ZRECP ONEL command again.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0362I BEWA - ONLINE ERROR LOG - NOT ACTIVE**

**Explanation:** This is a normal response to the ZRECP ONEL command specifying the STA parameter indicating that online error logging is not active.

**System Action:** None.

**User Response:** None, if you do not want online error logging active, or enter **ZRECP ELOG ON** to make online error logging active.

See *TPF Operations* for more information about the ZRECP ONEL and ZRECP ELOG commands.

---

**RECP0363I BEWA - ONLINE ERROR LOG - ACTIVE**

**Explanation:** This is a normal response to the ZRECP ONEL command specifying the STA parameter indicating that online error logging is active.

**System Action:** None.

**User Response:** None, if you want online error logging active, or enter **ZRECP ELOG OFF** to make online error logging inactive.

See *TPF Operations* for more information about the ZRECP ONEL and ZRECP ELOG commands.

---

**RECP0364E BEWA - INCORRECT DISPLAY REQUEST - CHECK INPUT**

**Explanation:** The ZRECP ONEL command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZRECP ONEL command again using the correct format.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0365E BEWA - INCORRECT FORMAT - MISSING RUN NUMBER**

**Explanation:** The ZRECP ONEL command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZRECP ONEL command again using the correct format.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0366E BEWA - INCORRECT PARAMETER REQUEST**

**Explanation:** The ZRECP ONEL command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZRECP ONEL command again using the correct format.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0371E BEWB - ERROR ON ADD TO ONLINE ERROR LOG**

**Explanation:** Recoup processing was trying to display errors found during chain chase processing or the ZRECP ONEL command was entered, but an error condition was detected when the BEWB segment issued a TPFDF DBADD macro and was unable to add a logical record (LREC) to the online error log.

**System Action:** Chain chase processing errors cannot be displayed and the error log is closed.

**User Response:** Do the following:

1. Extract data from the RCP tape because the online error log for this recoup run is not correct.
2. Enter **ZRECP ELOG OFF** to turn off the online error log.
3. Advise a system programmer of the problem.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0372E BEWB - I/O ERROR FOUND**

**Explanation:** Recoup processing was trying to display errors found during chain chase processing or the ZRECP ONEL command was entered, but an I/O error condition was detected when the BEWB segment attempted to initialize an online error log set (both LREC and detail files).

**System Action:** Chain chase processing errors cannot be displayed.

**User Response:** Do the following:

1. Extract data from the RCP tape because the online error log for this recoup run is not correct.
2. Enter **ZRECP ELOG OFF** to turn off the online error log.
3. Advise a system programmer of the problem.

See *TPF Operations* for more information about the ZRECP ONEL and ZRECP ELOG commands.

---

**RECP0373E BEWB - INCORRECT ALG OR ITEM NOT FOUND**

**Explanation:** Recoup processing was trying to display errors found during chain chase processing or the ZRECP ONEL command was entered, but an error condition was detected when the BEWB segment tried to find an algorithm or an item.

**System Action:** Chain chase processing errors cannot be displayed.

**User Response:** Do the following:

1. Extract data from the RCP tape because the online error log for this recoup run is not correct.
2. Enter **ZRECP ELOG OFF** to turn off the online error log.
3. Advise a system programmer of the problem.

See *TPF Operations* for more information about the ZRECP ONEL and ZRECP ELOG commands.

---

**RECP0374E BEWB - FACE ERROR FOUND**

**Explanation:** Recoup processing was trying to display errors found during chain chase processing or the ZRECP ONEL command was entered, but an error condition was detected by a FACE-type call when the BEWB segment tried to initialize an online error log set (both LREC and detail files).

**System Action:** Chain chase processing errors cannot be displayed.

**User Response:** Do the following:

1. Extract data from the RCP tape because the online error log for this recoup run is not correct.
2. Enter **ZRECP ELOG OFF** to turn off the online error log.
3. Advise a system programmer of the problem.

See *TPF Operations* for more information about the ZRECP ONEL and ZRECP ELOG commands. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**RECP0375E BEWB - ERROR ON DELETE**

**Explanation:** Recoup processing was trying to display errors found during chain chase processing or the ZRECP ONEL command was entered, but an unspecified error condition was detected when the BEWB segment tried to initialize an online error log set (both LREC and detail files).

**System Action:** Chain chase processing errors cannot be displayed.

**User Response:** Do the following:

1. Extract data from the RCP tape because the online error log for this recoup run is not correct.
2. Enter **ZRECP ELOG OFF** to turn off the online error log.
3. Advise a system programmer of the problem.

See *TPF Operations* for more information about the ZRECP ONEL and ZRECP ELOG commands.

---

**RECP0376E BEWB - ERROR ADDING INDEX DATE LREC**

**Explanation:** Recoup processing was trying to display errors found during chain chase processing or the ZRECP ONEL command was entered, but an error condition was detected when the BEWB segment tried to add (using the TPFDF DBADD macro) the first LREC to a newly initialized set of online error logs.

**System Action:** Chain chase processing errors cannot be displayed.

**User Response:** Do the following:

1. Extract data from the RCP tape because the online error log for this recoup run is not correct.
2. Enter **ZRECP ELOG OFF** to turn off the online error log.
3. Advise a system programmer of the problem.

See *TPF Operations* for more information about the ZRECP ONEL and ZRECP ELOG commands.

---

**RECP0377I BEWB - DUMP UTILITY PROCESSING COMPLETED**

**Explanation:** This is a normal message during recoup processing indicating that errors found during recoup chain chase processing have been written to RCP tape.

**System Action:** None.

**User Response:** None.

---

**RECP0378E BEWB - INCORRECT PARAMETER REQUEST**

**Explanation:** The ZRECP ONEL command was entered, but the BEWB segment was passed an unsupported keyword.

**System Action:** The command is rejected.

**User Response:** Contact a system programmer.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0379I BEWB - NO MATCHING DATA FOUND**

**Explanation:** This is a normal response to the ZRECP ONEL command specifying the ERR parameter when no errors are found for the specified error type.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0381E BEWG - BAD KEYWORD FOUND -** *keywerr*

**Where:**

*keywerr*
is the keyword parameter value that is incorrect.

**Explanation:** The ZRECP ONEL command was entered specifying an incorrect parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the ZRECP ONEL command again using the correct format.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0382E BEWG - INCORRECT ERR- VALUE ENTERED -** *keywerr*

**Where:**

*keywerr*
is the keyword parameter value that is incorrect.

**Explanation:** The ZRECP ONEL command was entered specifying an incorrect value with the ERR parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZRECP ONEL HELP** to display error types collected for the online error log.
2. Enter the ZRECP ONEL command again specifying a correct error type.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0383E BEWG - INCORRECT RUN- VALUE**

**Explanation:** The ZRECP ONEL command was entered specifying an incorrect value with the RUN parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP ONEL command again specifying a correct RUN parameter value.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0384E BEWG - INCORRECT RID-** *ridnum*

**Where:**

*ridnum*
is the RID parameter value that is incorrect.

**Explanation:** The ZRECP ONEL command was entered specifying an incorrect value with the RID parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP ONEL command again specifying a correct RID parameter value.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0385E BEWG - INCORRECT EID- STRING** *excludedids* **MAX OF 4 EID ITEMS ALLOWED**

**Explanation:** The ZRECP ONEL command was entered specifying an incorrect record ID with the EID parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP ONEL command again specifying a correct EID parameter value.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0386E BEWG - INCORRECT EID- STRING** *excludedids*

**Where:**

*excludedids*
is the string of excluded IDs that was entered with the EID parameter.

**Explanation:** The ZRECP ONEL command was entered specifying too many record IDs with the EID parameter. A maximum of 4 record IDs are allowed.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP ONEL command again specifying 4 or less IDs with the EID parameter.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0387E BEWG - INCORRECT EID COUNT- STRING** *excludedids*

**Where:**

*excludedids*
is the string of excluded IDs that was entered with the EID parameter.

**Explanation:** The ZRECP ONEL command was entered with the EID parameter specified but a maximum of 4 record IDs are allowed in requesting a display of the online error log by exclusion.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP ONEL command again specifying 4 or less IDs with

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0388E BEWG - LNIATA NOT REFERENCED IN WGTA TABLE**

**Explanation:** The ZRECP ONEL command was entered, but the LNIATA specified with the PTR parameter was incorrect.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP ONEL command again specifying a correct LNIATA address for the printer.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0391E BEWC - NO INPUT BLK FOUND ON LEVEL 8**

**Explanation:** The ZRECP ONEL command was entered, but the BEWC segment was called without a core block on level 8. A parameter list is expected on that level.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0392E BEWC - FATAL ERROR ON READ OF INDEX**

**Explanation:** The ZRECP ONEL command was entered, but an error condition was detected by the DFRED macro while trying to read an index record using the index keylist for the online error log (SRHH1P). The index structure for the online error log was built incorrectly.

**System Action:** The command fails.

**User Response:** Do the following:

- Contact a system programmer to correct the problem.
- If needed, extract error reports from the RCP tape until the problem is fixed.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0393E BEWC - INCORRECT ERROR INDI FOUND**

**Explanation:** The ZRECP ONEL command was entered, but an incorrect error indicator was detected by the BEWC segment while trying to read the online error log (SRHH1P) to get a count of the error types.

**System Action:** Continues processing.

**User Response:** None.

**RECP0394E BEWC - INCORRECT LOG PARAMETER**

**Explanation:** The BEWC segment was internally passed a parameter that is not supported.

**System Action:** The function call is rejected.

**User Response:** See your IBM service representative.

**RECP0395I ONLINE ERROR LOG DISPLAY FOR** *ddmon*

**Where:**

*ddmon*
The current day and month.

**Explanation:** This is the normal response to the ZRECP ONEL command with the REC-SUM parameter specified. This is followed by a display containing the summary of the total error counts by record ID.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0396E BEWC - ENTRY NOT ALLOWED - POOLS NOT AVAILABLE**

**Explanation:** The ZRECP ONEL command was entered to display all of the detail records but the TPF system is in 1052 state with no get file storage (GFS) available.

**System Action:** None.

**User Response:** If the TPF system can be cycled to NORM state, do the following:

1. Cycle the TPF system to NORM state.
2. Enter the ZRECP ONEL command again.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0397I ONLINE ERROR LOG DISPLAY FOR** *ddmon*

**Where:**

*ddmon*
The current day and month.

**Explanation:** This is the normal response to the ZRECP ONEL command with the REC-ALL parameter specified. This is followed by a display containing the details of all the individual errors.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0400E BEWD - NO INPUT BLK FOUND ON LEVEL 8**

**Explanation:** The ZRECP ONEL command was entered, but an error condition was detected when the BEWD segment was called without a core block on level 8. A parameter list is expected on that level.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ONEL command.

# RECP0401E–RECP0798E

**RECP0401E BEWD - ERROR ON READ OF FIRST INDEX**

**Explanation:** The ZRECP ONEL command was entered with the LOG parameter specified, but an error occured while trying to access the first entry in the online error log (SRHH1P) file.

**System Action:** The command fails.

**User Response:** Do the following:

- Contact a system programmer to correct the problem.
- If needed, extract error reports from the RCP tape until the problem is fixed.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0402E BEWD - ERROR ON READ OF NEXT INDEX**

**Explanation:** The ZRECP ONEL command was entered with the LOG parameter specified, but an error occured while trying to access the an entry other than the first entry in the online error log (SRHH1P) file.

**System Action:** The command fails.

**User Response:** Do the following:

- Contact a system programmer to correct the problem.
- If needed, extract error reports from the RCP tape until the problem is fixed.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0404I ONLINE ERROR LOG DISPLAY FOR LOG**

**Explanation:** This is the normal response to the ZRECP ONEL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0410I BEWP - EXCEEDED ONEL THRESHOLD FOR ID *charid/hexid*. POOL ERRORS WILL BE WRITTEN TO RCP TAPE ONLY**

**Where:**

*charid*
The 2-character representation of the record ID that is being processed.

*hexid*
The 4-character hexadecimal representation of the record ID that is being processed.

**Explanation:** During recoup processing, the number of errors in the online error log (SRHH1P) has exceeded the allowed number that was set using the ZRECP PROFILE command.

**System Action:** Errors are written only to the RCP tape.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROFILE command.

---

**RECP0411E BEWE - FATAL ERROR ON READ OF INDEX**

**Explanation:** The ZRECP ONEL command was entered, but an error condition was detected by the DFRED macro while trying to read an index record using the index keylist for the online error log (SRHH1P). The index structure for the online error log was built incorrectly.

**System Action:** None.

**User Response:** Do the following:

- Contact a system programmer to correct the problem.
- If needed, extract error reports from the RCP tape until the problem is fixed.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0412E BEWE - FATAL ERROR ON READ OF DETAIL**

**Explanation:** The ZRECP ONEL command was entered, but an error condition was detected by the DFRED macro while trying to read a detail record from the index structure for the online error log (SRHH1P).

**System Action:** None.

**User Response:** Do the following:

- Contact a system programmer to correct the problem.
- If needed, extract error reports from the RCP tape until the problem is fixed.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0415E BEWF - ERROR TAKEN ON DISPLAY CALL**

**Explanation:** The ZRECP ONEL command was entered, but an error An error was detected occured while trying to display the temporary file GW01SR.

**System Action:** The command fails.

**User Response:** Do the following:

- Contact a system programmer to correct the problem.
- If needed, extract error reports from the RCP tape until the problem is fixed.

See *TPF Operations* for more information about the ZRECP ONEL command.

---

**RECP0416E BEWF - ERROR ON ADD TO DISPLAY WORK FILE**

**Explanation:** The ZRECP ONEL command was entered, but an error condition was detected by the DFADD macro while trying to add a new logical record (LREC) to the work file mapped by GW01SR.

**System Action:** The command displays information that is not accurate.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. If the problem persists, enter **ZRECP ELOG OFF** to deactivate online error logging.

See *TPF Operations* for more information about the ZRECP ONEL and ZRECP ELOG commands.

---

**RECP0417I MSG SENT TO PRINTER**

**Explanation:** This is the normal response to the ZRECP ONEL command with the PTR parameter specified..

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0418I ONLINE ERROR LOG DISPLAY - NO DATA**

**Explanation:** The ZRECP ONEL command was entered with the REC-SUM or REC-ALL parameter specified, but there is no data in the online error log because online error logging was not active for the specified recoup run.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ONEL command.

**RECP0421I RECOUP PHASE 4 CREATE CONTINUING**

**Explanation:** This is the normal response to the ZRPDU CREATE command indicating that recoup phase 4 is still running.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU CREATE command.

**RECP0431I RECOUP ABORT STARTED**

**Explanation:** This is the normal response to the ZRECP ABORT command or an internal recoup abort.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP ABORT command.

**RECP0432I RECOUP ABORT IN PROGRESS**

**Explanation:** The BRPE segment was entered to internally abort recoup but recoup is already aborting.

**System Action:** None.

**User Response:** None.

**RECP0433I RECOUP PHASE 4 CREATE IS COMPLETE TOTAL LOST ADDRESSES =** *lacnt* **TOTAL ERRONEOUSLY AVAILABLE ADDRESSES =** *eacnt*

**Where:**

*lacnt*
The total number of lost addresses (LA).

*eacnt*
The total number of erroneously available addresses (EA).

**Explanation:** This is the normal response to the ZRPDU CREATE command indicating that recoup phase 4 is completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU CREATE command.

**RECP0434E BOF6 - FILE ERROR ON SONUP ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of the pool directory update (PDU) pseudo directory (#SONUP) record.

**Explanation:** The ZRECP PHASE4 command was entered, but an error condition was detected while trying to file the specified ordinal.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PHASE4 command again.

See *TPF Operations* for more information about the ZRECP PHASE4 command.

**RECP0435E BOF6 - FACE ERROR ON SONUP ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of the pool directory update (PDU) pseudo directory (#SONUP) record.

**Explanation:** The ZRECP PHASE4 command was entered, but an error condition was detected by a FACS-type call while trying to use the PDU pseudo directory (#SONUP) ordinal.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PHASE4 command again.

See *TPF Operations* for more information about the ZRECP PHASE4 command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

**RECP0436E BOF6 - FACE ERROR ON SONROLL ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of the recoup rollin directory (#SONROLL) record.

**Explanation:** The ZRECP PHASE4 command was entered, but an error condition was detected by a FACS-type call while trying to use the recoup rollin directory (#SONROLL) ordinal.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PHASE4 command again.

See *TPF Operations* for more information about the ZRECP PHASE4 command. See *TPF System Macros* and *TPF Application Programming* for more information about the file address compute (FACE) program and the FACE interface.

---

**RECP0437E BOF6 - FIND ERROR ON SONUP ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of the pool directory update (PDU) pseudo directory (#SONUP) record.

**Explanation:** The ZRECP PHASE4 command was entered, but an error condition was detected while trying to find the specified ordinal.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PHASE4 command again.

See *TPF Operations* for more information about the ZRECP PHASE4 command.

---

**RECP0438E BOF6 - FIND ERROR ON SONROLL ORDINAL** *ordnum*

**Where:**

*ordnum*
The hexadecimal ordinal number of the recoup rollin directory (#SONROLL) record.

**Explanation:** The ZRECP PHASE4 command was entered, but an error condition was detected while trying to find the specified ordinal.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRECP PHASE4 command again.

See *TPF Operations* for more information about the ZRECP PHASE4 command.

---

**RECP0500E BRR2 - INCORRECT OPTION SPECIFIED, TPFDF REQUIRED**

**Explanation:** The ZRECP PROFILE command was entered using a parameter that requires the TPFDF product.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP PROFILE command again without any parameters that require the TPFDF product.

---

**RECP0501E BRR2 - INCORRECT INPUT MESSAGE**

**Explanation:** The ZRECP PROFILE command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZRECP PROFILE HELP** to see all of the parameters that are allowed.
2. Enter the ZRECP PROFILE command again using correct parameters.

See *TPF Operations* for more information about the ZRECP PROFILE command.

---

**RECP0502E BRR5 - INCORRECT PROFILE OPTION**

**Explanation:** The ZRECP PROFILE command was entered specifying an incorrect parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZRECP PROFILE HELP** to see all of the parameters that are allowed.
2. Enter the ZRECP PROFILE command again using correct parameters.

See *TPF Operations* for more information about the ZRECP PROFILE command.

---

**RECP0503E BRR5 - NO OPTION IS SPECIFIED**

**Explanation:** The ZRECP PROFILE command was entered without specifying a parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter **ZRECP PROFILE HELP** to see all of the parameters that are allowed.
2. Enter the ZRECP PROFILE command again using correct parameters.

See *TPF Operations* for more information about the ZRECP PROFILE command.

---

**RECP0504I RECOUP OPTIONS**

**Explanation:** This is the normal response to the ZRECP PROFILE command and this message is also displayed during recoup processing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP PROFILE command.

---

**RECP0520I RECOUP KEYPOINT UNAVAILABLE**

**Explanation:** The ZRECP STATUS command was entered, or an internal status request was made, but the recoup keypoint is not in main storage. This is usually because a recoup run is not active, or recoup phase 1 processing is not in progress.

This can also mean that a recoup restart is required.

**System Action:** None.

**User Response:** Do the following:

- Check if other messages were sent to the system console indicating that a recoup restart is required.
- If a recoup restart is required, enter ZRECP RESTART to restart recoup processing.

See *TPF Operations* for more information about the ZRECP STATUS and ZRECP RESTART commands.

---

**RECP0521I PHASE 1 COMPLETED**

**Explanation:** This is the normal response to the ZRECP STATUS command, or an internal status request, indicating that recoup phase 1 processing has completed.

**System Action:** None

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**RECP0522I RECALL HAS NOT BEEN DONE YET**

**Explanation:** The ZRECP STATUS command was entered, or an internal status request was made, but the ZRECP RECALL command has not been entered to recall recoup processing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS and ZRECP RECALL commands.

---

**RECP0523I DIRECTORY CAPTURE IN PROGRESS**

**Explanation:** This is a normal response to the ZRECP STATUS command or an internal status request indicating that directory capture processing is in progress.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**RECP0524I NO RESTART AREAS ACTIVE**

**Explanation:** This is a normal response to the ZRECP STATUS command or an internal status request indicating that recoup phase 1 processing is not processing a TPF group or TPFCS data store now.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command.

---

**RECP0525I RECOUP RESTART REQUIRED ON PROCESSOR** *cpuid*

**Where:**

*cpuid*
One of the following:

- The name of the processor if it can be determined.
- (UNABLE TO FIND PROC. ID) if the name of the processor cannot be determined.

**Explanation:** ZRECP PROC *cpuid* STATUS was entered and the returned message indicates that recoup processing on processor *cpuid* failed and must be restarted.

**System Action:** None.

**User Response:** Do the following:

1. Enter **ZRECP PROC** *cpuid* **RESTART** to restart recoup processing on processor *cpuid*.

See *TPF Operations* for more information about the ZRECP RESTART and ZRECP STATUS commands. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0531I RECOUP STATUS REPORT**

**Explanation:** This is a normal response to the ZRECP STATUS command or to an internal status request, displaying information about the active restart areas. This header is followed by a formatted display of information about the active restart areas.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0533I RECOUP STATUS REPORT COMPLETED**

**Explanation:** This is a normal response to the ZRECP STATUS command or to an internal status request.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0601I RECOUP INITIALIZATION STARTED**

**Explanation:** This is the normal response to the ZRECP SETUP command when recoup has begun.

**System Action:** Recoup initialization continues.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP SETUP command.

---

**RECP0602I CREATING RECOUP SCHEDULER**

**Explanation:** This is the normal response to the ZRECP SETUP and ZRECP RECALL commands when the recoup scheduling control table (IRSCT) has started to be built.

**System Action:** Recoup initialization continues.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP SETUP and ZRECP RECALL commands.

**RECP0603I CREATING ACTIVE ROOT TABLE TEMPLATE**

**Explanation:** This is the normal response to the ZRECP SETUP command when the recoup active root table (IRART) template has started to be built.

**System Action:** Recoup initialization continues.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP SETUP command.

**RECP0604I CREATING ACTIVE ROOT TABLE FOR PROC** *procID*

**Where:**

*procID*
The processor ID.

**Explanation:** This is the normal response to the ZRECP SETUP command when the recoup active root tables (IRARTs) have started to be built.

**System Action:** Recoup initialization continues.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP SETUP command.

**RECP0605I RECOUP INITIALIZATION COMPLETED**

**Explanation:** This is the normal response to the ZRECP SETUP command when recoup initialization has completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP SETUP command.

**RECP0606I RECOUP INITIALIZATION RESET**

**Explanation:** This is the normal response to the ZRECP SETUP command with the RESET parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP SETUP command.

**RECP0650E UNABLE TO PROCESS - RECOUP SETUP IN PROGRESS**

**Explanation:** The ZRECP SETUP or ZRECP START command was entered while recoup setup processing was in progress.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Allow recoup initialization processing to complete and then repeat the command request.
- Enter the ZRECP SETUP command with the RESET parameter specified to reset the setup in progress indicator, allowing subsequent ZRECP START or ZRECP SETUP commands to be accepted.

See *TPF Operations* for more information about the ZRECP commands.

**RECP0651E CANNOT SET UP RECOUP - GFS NOT ACTIVE**

**Explanation:** The ZRECP SETUP command was entered to initialize recoup, but the command could not be processed because recoup could not obtain pool records.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle the subsystem to a state where get file storage (GFS) is active.
2. Enter the ZRECP SETUP command again.

See *TPF Operations* for more information about the ZRECP SETUP and ZCYCL commands.

**RECP0652E CANNOT SET UP RECOUP - RECOUP ACTIVE**

**Explanation:** The ZRECP SETUP command was entered to initialize recoup, but the command could not be processed because recoup is active.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Wait for recoup processing to end and enter the ZRECP SETUP command again.
- Enter the ZRECP ABORT command and then enter the ZRECP SETUP command again.

See *TPF Operations* for more information about the ZRECP SETUP and ZRECP ABORT commands.

**RECP0653E UNABLE TO CREATE ENVIRONMENT FOR DS -** *dsName*

**Where:**

*dsName*
The name of the data store (DS).

**Explanation:** A ZRECP command was entered, but a TPF collection support (TPFCS) environment could not be created for the data store indicated. This could be the result of TPFCS not being initialized, the recoup data store not being initialized on the subsystem that the command was entered from, database corruption, or an internal error.

**System Action:** Recoup processing continues.

**User Response:** Do one of the following:

- If the data store indicated is TPFDB, do one of the following:
  - Restore your TPF database to the latest version in which TPFCS is not corrupt.
  - Reinitialize TPFCS and use a utility to restore all data and TPFCS data stores.

    **Note:** Reinitializing TPFCS clears all TPFCS data stores and makes all data inaccessible through TPFCS.
  - See your IBM service representative.
- If the data store indicated begins with IRCP, do the following:
  1. Enter the ZRECP SETUP command to reinitialize internal recoup structures.
  2. Restore your TPF database to the latest version in which TPFCS is not corrupt.
  3. Reinitialize TPFCS and use a utility to restore all data and TPFCS data stores.

     **Note:** Reinitializing TPFCS clears all TPFCS data stores and makes all data inaccessible through TPFCS.
  4. If the problem continues, see your IBM service representative.
- If the data store indicated is not TPFDB or does not begin with IRCP, do the following:
  1. Examine other accompanying errors and determine the cause of the problem.
  2. Correct the problem.
  3. Run recoup again.

See *TPF Operations* for more information about the ZOODB INIT and ZRECP SETUP commands.

---

**RECP0654E UNABLE TO CREATE RECOUP DATA STORE -** *dsName errorText*

**Where:**

*dsName*
The name of the TPFCS data store (DS).

*errorText*
An additional description of the error, if available.

**Explanation:** The ZRECP SETUP command was entered, but the TPF collection support (TPFCS) recoup data store indicated could not be created in the TPFCS database because of corruption to the system dictionary (DS_SYSTEM_DICT) or the browser dictionary (DS_BROWSE) in the TPFDB data store, or because of an internal error.

**System Action:** The command is rejected.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the ZRECP SETUP command.

---

**RECP0655E ERROR ACCESSING SYSTEM COLLECTION -** *colName* **IN DS-***dsName function errorText*

**Where:**

*colName*
The name of the system collection.

*dsName*
The name of the TPFCS data store (DS) where the system collection resides.

*function*
The name of the TPF collection support (TPFCS) function that was not successful.

*errorText*
An additional description of the error, if available.

**Explanation:** A ZRECP command was entered, but an error occurred while trying to perform the TPFCS function indicated on the system collection indicated.

**System Action:** If ZRECP SETUP was the command entered, the command is rejected. Otherwise, recoup processing ends abnormally.

**User Response:** Do the following:

1. Determine why the system collection indicated is corrupted.
2. Correct the error.
3. If the problem continues, see your IBM service representative.

See *TPF Operations* for more information about the ZRECP commands.

---

**RECP0656E ERROR ACCESSING RECOUP SCHEDULER -** *function errorText*

**Where:**

*function*
The name of the TPF collection support (TPFCS) function that was not successful.

*errorText*
An additional description of the error, if available.

**Explanation:** A ZRECP command was entered, but an error occurred while trying to access the recoup scheduling control table (IRSCT).

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Enter the ZRECP SETUP command from the subsystem that attempted the ZRECP command to access the IRSCT.
2. Enter the appropriate ZRECP command again.
3. If the problem continues, see your IBM service representative.

See *TPF Operations* for more information about the ZRECP commands.

---

**RECP0657E CANNOT UPDATE RECOUP SCHEDULER - GFS NOT ACTIVE**

**Explanation:** The ZRECP RECALL command was entered to run a full recoup, but the command could not be processed because the recoup scheduling control table (IRSCT) could not acquire more pool records needed to store record ID and data store (DS) information.

**System Action:** Recoup ends abnormally before recoup phase 1 has been completed.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle the subsystem to a state where get file storage (GFS) is active.
2. Enter the ZRECP SETUP command from the subsystem that attempted the ZRECP RECALL command to reinitialize the IRSCT.
3. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL, ZRECP SETUP, and ZCYCL commands. See The *TPF Database Reference* for more information about recoup functions and procedures.

**RECP0658E FACE ERROR ON DESCRIPTOR CONTROL RECORD**

**Explanation:** A ZRECP command was entered, but an error occurred while trying to access the recoup descriptor control record (#BKDCTL).

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Ensure the FACE table (FCTB) is built correctly.
2. Ensure the #BKDCTL is allocated correctly.
3. Enter the appropriate ZRECP command again.

See *TPF Operations* for more information about the ZRECP commands. See *TPF System Generation* for more information about the FACE table.

**RECP0659E UNDEFINED FACE RECORD TYPE FOUND RECID-***recID* **DSCR-***descriptor*

**Where:**

*recID*
The record ID.

*descriptor*
The name of the descriptor containing the group with the undefined record type.

**Explanation:** A ZRECP command was entered, but an error occurred while trying to access the indicated record ID, which is specified in the descriptor shown.

**System Action:** Recoup processing continues with the next record ID.

**User Response:** Do the following:

1. Ensure the FACE table (FCTB) is built correctly.
2. Ensure the symbolic FACE record types specified in the TYP parameter on the GROUP macro statements for this descriptor, contain FACE record types that are defined in the FACE table. If they do not, do the following:
   a. Correct the GROUP macro statements for the descriptor.
   b. Assemble the changed descriptor.
   c. Load the changed descriptor to the TPF system.
   d. If the version number of the descriptor has changed, enter the ZRBKD command with the MOVE parameter specified to update the descriptor control record.
3. Enter the appropriate ZRECP command again.

See *TPF Operations* for more information about ZRECP commands and the ZRBKD command. See *TPF System Generation* for more information about the FACE table.

**RECP0660E GROUP COUNT MISMATCH NUMBER PROCESSED - *numProcessed* KEYPOINT VALUE - *kpValue***

**Where:**

*numProcessed*
The total number of groups processed and added to the recoup scheduling control table (IRSCT).

*kpValue*
The number of groups as stored in the recoup keypoint.

**Explanation:** A ZRECP command was entered that resulted in the IRSCT being built. However, validation of the table failed because the number of groups processed and added to the IRSCT did not match the recoup keypoint value of the expected number of groups.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Make sure all descriptors are up to date and correctly loaded on the subsystem.
2. Enter the appropriate ZRECP command again.

See *TPF Operations* for more information about the ZRECP commands. See *TPF Database Reference* for more information about recoup functions and procedures.

**RECP0662E SEQUENCE COUNTER ERROR DURING CHECKPOINT**

**Explanation:** During an internal checkpoint while phase 1 of recoup was running, a sequence counter error occurred on the recoup active root table (IRART). This indicates that an attempt was made to checkpoint a copy of the IRART that was older than the version already filed.

**System Action:** The checkpoint attempt is rolled back and recoup processing continues.

**User Response:** None.

**RECP0663E ERROR LOCKING RECOUP SCHEDULER *errorText***

**Where:**

*errorText*
An additional description of the error, if available.

**Explanation:** A ZRECP command was entered, but an error occurred while attempting to lock the recoup scheduling control table (IRSCT) by creating a locking cursor on it.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Enter the ZRECP SETUP command to reinitialize the internal recoup structures.
2. Start recoup processing again.
3. If the problem continues, see your IBM service representative.

See *TPF Operations* for more information about the ZRECP commands.

---

**RECP0664E ERROR UNLOCKING RECOUP SCHEDULER** *errorText*

**Where:**

*errorText*
An additional description of the error, if available.

**Explanation:** A ZRECP command was entered, but an error occurred while attempting to unlock the recoup scheduling control table (IRSCT).

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Determine the cause of the error and correct it.
2. Enter the appropriate ZRECP command again.
3. If the problem continues, see your IBM service representative.

See *TPF Operations* for more information about the ZRECP commands.

---

**RECP0665E ERROR ACCESSING TEMPLATE ROOT TABLE -** *function errorText*

**Where:**

*function*
The name of the TPF collection support (TPFCS) function that was not successful.

*errorText*
An additional description of the error, if available.

**Explanation:** The ZRECP SETUP command was entered, but an error occurred while trying to access the recoup active root table (IRART) template.

**System Action:** Setup processing ends abnormally.

**User Response:** Do the following:

1. Enter ZRECP SETUP from the same subsystem again.
2. If the problem continues, see your IBM service representative.

See *TPF Operations* for more information about the ZRECP commands.

---

**RECP0666E ERROR ACCESSING ACTIVE ROOT TABLE -** *function errorText*

**Where:**

*function*
The name of the TPF collection support (TPFCS) function that was not successful.

*errorText*
An additional description of the error, if available.

**Explanation:** A ZRECP command was entered, but an error occurred while trying to access one of the recoup active root tables (IRARTs).

**System Action:** If the error occurred while reading the IBM recoup active root table (IRART), recoup aborts. Otherwise, if the error occurred while filing the IRART, the checkpoint is rolled back and recoup processing continues.

**User Response:** Do the following:

1. Enter the ZRECP SETUP command from the subsystem that attempted the ZRECP command to reinitialize the IRARTs.
2. Enter the appropriate ZRECP command again.
3. If the problem continues, see your IBM service representative.

See *TPF Operations* for more information about the ZRECP commands.

---

**RECP0667E ERROR UPDATING RECOUP SCHEDULER -** *function errorText*

**Where:**

*function*
The name of the TPF collection support (TPFCS) function that was not successful.

*errorText*
An additional description of the error, if available.

**Explanation:** A ZRECP command was entered, but an error occurred while trying to access the recoup scheduling control table (IRSCT). This could be caused by database corruption, possibly including the data store system dictionary (DS_SYSTEM_DICT) for the appropriate recoup data store.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Enter the ZRECP SETUP command from the subsystem that attempted the ZRECP command to reinitialize the IRSCT.
2. Enter the appropriate ZRECP command again.
3. If the problem continues, see your IBM service representative.

See *TPF Operations* for more information about the ZRECP commands.

---

**RECP0668E ERROR OCCURRED WHILE CLEARING TPFCS POOL REUSE TABLE**

**Explanation:** The ZRECP RECALL command was entered, but an error occurred while trying to clear the TPF collection support (TPFCS) pool reuse table (CMMTO2P). This problem could be caused by database corruption.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Enter the ZRECP RECALL command again.
2. If the problem continues, see your IBM service representative.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP0701I PROCESSING STARTING FOR DS** *dsname*

**Where:**

*dsname*
The data store (DS) name.

**Explanation:** This is the normal response to the ZRECP RECALL command.

**System Action:** Processing for the data store displayed in the message begins.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP0702I PROCESSING COMPLETED FOR DS** *dsname*

**Where:**

*dsname*
The data store (DS) name.

**Explanation:** This is the normal response to the ZRECP RECALL command.

**System Action:** Processing for the data store displayed in the message has been completed.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP0706I ZRECP SEL PID — COMPLETE**

**Explanation:** This is the normal response to the ZRECP SEL command with the PID parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP SEL command.

---

**RECP0708I REST AREA-***restartarea* **SSU-***ssu*

**Where:**

*restartarea*
The index of the restart area whose statistics are being displayed.

*ssu* The subsystem user (SSU) associated with the restart area.

**Explanation:** This is the normal response to the ZRECP STATUS command or when the processing of an item is completed. This is the display of information about a recoup restart area that is processing a TPF collection support (TPFCS) data store or persistent identifier (PID).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRECP STATUS command and for an example of the informational display. See *TPF Database Reference* for more information about recoup functions and procedures.

---

**RECP0771E ERROR BUILDING DS PID LIST —** *function errortext*

**Where:**

*function*
The name of the TPF collection support (TPFCS) function that was not successful.

*errortext*
An additional description of the error, if available.

**Explanation:** An internal error occurred during the TPFCS recoup function. The list of system collections for a particular data store could not be processed.

**System Action:** Processing for this data store ends and TPF recoup processing continues.

**User Response:** Examine other messages to determine which data store is being processed, correct the errors, and run recoup processing again. If the problem continues, see your IBM service representative.

See *TPF Database Reference* for more information about the recoup function.

---

**RECP0772E ERROR ACCESSING PID DS NAME PID –** *pid* **REF –** *ref*

**Where:**

*pid* The persistent identifier (PID) of the collection being recouped.

*ref* The file address or PID of the collection that references the collection being recouped. The reference may be an embedded reference or an internal TPFCS reference to an associated collection. A value of all zeros indicates that the collection being recouped is a system collection.

**Explanation:** The data store (DS) to which the collection being recouped belongs could not be determined. This error can occur for one of the following reasons:

- The recoup index describing the embedded PID is not correct.
- The data at that location is not a valid PID.
- A ZRECP SEL command with the PID parameter specified was entered with an incorrect PID (internal or embedded).
- An internal error occurred during the TPF recoup function.

**System Action:** The following will occur:

- The collection indicated by *pid* is not recouped.
- Processing for this collection ends and processing continues with the next item.

**User Response:** Do one of the following:

- If the recoup index entry is not correct, update the recoup index entry and run recoup again.
- Make sure data is stored correctly in the collection element and run recoup again.
- If an incorrect PID was entered, enter the ZRECP RECALL or ZRECP SEL command again specifying a correct PID value.

- If an internal error occurred, see your IBM service representative.

See *TPF Operations* for more information about the recoup function and the ZRECP RECALL and ZRECP SEL commands.

---

**RECP0773E ERROR ACCESS DATA STORE -** *dsName* **-** *function errortext*

**Where:**

*dsName*
The name of the data store (DS).

*function*
The name of the TPF collection support (TPFCS) function that was not successful.

*errortext*
An additional description of the error, if available.

**Explanation:** An internal error occurred during the TPF recoup function. The TPFCS data store subsystem information could not be verified.

**System Action:** The specified data store is not recouped and recoup processing continues.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the recoup function.

---

**RECP0774E ERROR RECOUPING COLLECTION** *errortext* **PID –** *pid* **REF –** *ref*

**Where:**

*errortext*
An additional description of the error, if available.

*pid* The persistent identifier (PID) of the collection being recouped.

*ref* The file address or PID of the collection that references the collection being recouped. The reference may be an embedded reference or an internal TPFCS reference to an associated collection. A value of all zeros indicates that the collection being recouped is a system collection.

**Explanation:** An error occurred while processing a particular TPF collection support (TPFCS) collection during phase 1 of recoup processing. If the PID specified was not valid, a recoup index might have been used to locate PIDs embedded in a collection and this PID was retrieved incorrectly because of an error in the index or in the application that manages the collection.

**System Action:** Processing for this collection ends and processing continues with the next item.

**User Response:** Do the following:

1. Determine the cause of the failure by examining the data store being processed and the relevant file addresses. These are contained in the PID.
2. Run recoup processing again.

See *TPF Operations* for more information about the recoup function.

---

**RECP0775E ERROR RECOUPING CHAIN —** *function errortext* **PID –** *pid*

**Where:**

*function*
The TPF collection support (TPFCS) function that was not successful.

*errortext*
An additional description of the error, if available.

*pid* The persistent identifier (PID) of the collection being recouped.

**Explanation:** An internal error occurred during the TPF recoup function. The internal collections associated with the collection being recouped could not be accessed.

**System Action:** The collections internally associated with the collection being recouped are not recouped and recoup continues.

**User Response:** See your IBM service representative.

See *TPF Database Reference* for more information about the recoup function.

---

**RECP0776E ERROR ACCESSING RECOUP INDEX** *index* **—** *function errortext* **PID –** *pid* **REF –** *ref*

**Where:**

*index*
The name of the recoup index that could not be accessed.

*function*
The TPF collection support (TPFCS) function that was not successful.

*errortext*
An additional description of the error, if available.

*pid* The persistent identifier (PID) of the collection being recouped.

*ref* The file address or PID of the collection that references the collection being recouped. The reference may be an embedded reference or an internal TPFCS reference to an associated collection. A value of all zeros indicates that the collection being recouped is a system collection.

**Explanation:** An internal error occurred during the TPF recoup function. The TPFCS recoup index associated with the collection being recouped could not be accessed.

**System Action:** Processing for this collection ends and processing continues with the next item.

**User Response:**

- Enter the ZBROW RECOUP command with the DISPLAY parameter specified to get the PID of the recoup index and to review the recoup index.
- See your IBM service representative.

See *TPF Operations* for more information about the ZBROW RECOUP command.

---

**RECP0777E RECOUP INDEX PARAMETER NOT VALID — *parameter* RECOUP INDEX – *indexname***

**Where:**

*parameter*
The recoup index field that is not valid, such as ACCESSTYPE, COLTYPE, or ENTRYTYPE.

*indexname*
The name of the recoup index.

**Explanation:** An error occurred while trying to access embedded TPFCS persistent identifiers (PIDs) or file addresses in a particular collection during the TPF recoup function. This is most likely the result of the recoup index not being valid.

**System Action:** Processing for this collection ends and processing continues with the next item.

**User Response:** Do the following:

1. Determine the cause of the failure by examining the recoup index being used to access embedded information.
2. Correct the recoup index.
3. Run recoup processing again.

See *TPF Operations* for more information about the ZBROW RECOUP command, that can be used to modify recoup indexes.

**RECP0778E ERROR ACCESSING COLLECTION — *function errortext* PID – *pid* REF – *ref***

**Where:**

*function*
The TPF collection support (TPFCS) function that was not successful.

*errortext*
An additional description of the error, if available.

*pid* The persistent identifier (PID) of the collection being recouped.

*ref* The file address or PID of the collection that references the collection being recouped. The reference may be an embedded reference or an internal TPFCS reference to an associated collection. A value of all zeros indicates that the collection being recouped is a system collection.

**Explanation:** An internal error occurred during the recoup function. The collection being recouped could not be accessed to retrieve embedded PIDs or file addresses.

**System Action:** Processing for this collection ends and processing continues with the next item.

**User Response:** See your IBM service representative.

See *TPF Operations* for more information about the recoup function.

**RECP0779E ERROR READING COLLECTION INDEX – *indexname* PID – *pid* REF – *ref***

**Where:**

*indexname*
The name of the recoup index.

*pid* The persistent identifier (PID) of the collection being recouped.

*ref* The file address or PID of the collection that references the collection being recouped. The reference may be an embedded reference or an internal TPFCS reference to an associated collection. A value of all zeros indicates that the collection being recouped is a system collection.

**Explanation:** The ZRECP RECALL command was entered, but an error occurred because embedded PIDs or file addresses could not be read. This may occur because the access type associated with the recoup index entries is not compatible with the collection type. For example, a key sorted set cannot be associated with a heterogeneous recoup index that accesses elements by index.

**System Action:** Processing for this PID ends and processing continues with the next PID.

**User Response:** Do the following:

1. Determine the cause of the failure by checking the collection for corruption.
2. Run the recoup function again.

See *TPF Operations* for more information about the recoup function and the ZRECP RECALL command.

**RECP0782E TPFCS ERROR THRESHOLD REACHED**

**Explanation:** The maximum number of TPF collection support (TPFCS) errors to report to the computer room agent set (CRAS) terminal has been reached for the data store being processed. This number is set by the ZRECP PROFILE command with the CSERRMAX parameter.

**System Action:** Recoup will continue to run but will not report any additional errors to the CRAS terminal for that data store.

**User Response:** If it is desired for more errors to be sent to the CRAS terminal on future recoup runs, use the ZRECP PROFILE command with the CSERRMAX parameter to increase the TPFCS recoup error threshold prior to your next run of recoup.

See *TPF Operations* for more information about the ZRECP PROFILE command.

**RECP0784E UNABLE TO FIND DESCRIPTOR EMBEDDED DATA - *embeddata* PID-*pid***

**Where:**

*embeddata*
The embedded file address entry in the collection element, which is displayed as hexadecimal character data.

*pid* The persistent identifier (PID) of the collection being recouped.

**Explanation:** TPF recoup processing tried to chain-chase a TPF record embedded in a TPF collection support (TPFCS) collection, but a descriptor for the embedded record was not found.

**System Action:** The embedded file address reference is bypassed and processing continues.

**User Response:** Do the following:

1. Ensure that the appropriate descriptor is loaded.
2. Run recoup processing again.

See *TPF Operations* for more information about the ZRECP commands.

---

**RECP0785E EMBEDDED FILE ADDRESS REFERENCE FLAG NOT VALID EMBEDDED DATA -** *embeddata* **PID-***pid*

**Where:**

*embeddata*
The embedded file address entry in the collection element, which is displayed as hexadecimal character data.

*pid* The persistent identifier (PID) of the collection being recouped.

**Explanation:** The embedded reference flag in the embedded file address entry is not valid. The only allowed values are TO2_RECOUP_DSCR_NO and TO2_RECOUP_DSCR_YES.

**System Action:** The embedded file address reference is bypassed and processing continues.

**User Response:** Do the following:

1. Update your data to make sure the embedded file address entry contains a valid embedded reference flag.
2. Run recoup processing again.

See *TPF Operations* for more information about the ZRECP commands.

---

**RECP0786E EMBEDDED REFERENCE LENGTH NOT VALID PID-***pid*

**Where:**

*pid* The persistent identifier (PID) of the collection being recouped.

**Explanation:** TPF recoup attempted to retrieve an embedded reference from a collection, but the length of the embedded reference was too short to represent an embedded reference.

**System Action:** The embedded reference is bypassed and processing continues with the next embedded reference.

**User Response:** Do the following:

1. Determine if the recoup index associated with the collection containing the embedded reference needs to be corrected.
2. Determine if the embedded reference was stored in the collection incorrectly.
3. Correct the errors.
4. Run recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP0787E EMBEDDED ADDRESS FORMAT NOT VALID EMBEDDED DATA -** *embeddata* **PID-***pid*

**Where:**

*embeddata*
The embedded file address entry in the collection element, which is displayed as hexadecimal character data.

*pid* The persistent identifier (PID) of the collection being recouped.

**Explanation:** TPF recoup attempted to extract an embedded file address from a collection, but the file address format indicator was not valid.

**System Action:** The embedded file address is bypassed and processing continues with the next embedded reference.

**User Response:** Do the following:

1. Check the file address indicator in the embedded reference data to be sure it is set up correctly.
2. Correct the errors.
3. Run TPF recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL command.

---

**RECP0788E TPFCS RECOUP TIMEOUT PID-***pid* **REF-***ref*

**Where:**

*pid* The persistent identifier (PID) of the collection that did not end normally when the timeout occurred.

*ref* The file address or PID of the collection that references the collection being recouped. The reference may be an embedded reference or an internal TPFCS reference to an associated collection. A value of all zeros indicates that the collection being recouped is a system collection.

**Explanation:** TPF recoup could not confirm that an entry control block (ECB) used to process a particular PID was completed in the specified amount of time. It is possible that the ECB either ended abnormally or continued to run after the timeout threshold was reached.

**System Action:** TPF recoup continues.

**User Response:** Do either of the following:

- If the ECB ended abnormally, examine the resulting errors.
- If the ECB was active when the timeout occurred, do one of the following:
  - If the PID was being processed normally, enter the ZRECP PROFILE command with the CSTIMEOUT parameter specified to increase the amount of time before a timeout condition occurs.
  - If the PID does not process normally, determine why the PID could not be recouped and run TPF recoup processing again.

See *TPF Operations* for more information about the ZRECP PROFILE command.

---

**RECP0789E PID NOT FOUND IN ECB TABLE PID-*pid***

**Where:**

*pid* The persistent identifier (PID) of the collection being recouped.

**Explanation:** A recoup entry control block (ECB) that was processing a collection exited, but a corresponding entry could not be located in the recoup active root table (IRART) for the processor where the ECB was running. This could result from a timeout occurring and the ECB entry in the IRART being removed by the system.

**System Action:** The ECB exits and processing continues.

**User Response:** Do one of the following:

- If the specified PID timed out, increase the timeout threshold by entering the ZRECP PROFILE command with the CSTIMEOUT parameter specified.
- Determine why processing could not be completed in the amount of time allocated.
- See your IBM service representative for more information if an internal error occurred.

See *TPF Operations* for more information about the ZRECP PROFILE command.

**RECP0790E HEX CONVERSION ERROR ON PID PARAMETER**

**Explanation:** A ZRECP SEL command was entered with the PID parameter specified. This command was not processed because the hexadecimal value specified for the PID parameter contained one of the following:

- An odd number of hexidecimal digits.
- Digits that are not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZRECP SEL command again specifying a valid hexadecimal value for the PID parameter.

See *TPF Operations* for more information about the ZRECP SEL command.

**RECP0791E DESCRIPTOR *dscr* VERSION MISMATCH BEFORE CHAIN CHASE**

**Where:**

*dscr*
The name of the descriptor.

**Explanation:** The ZRECP RECALL command was entered, but the active descriptor version in core memory did not match the version stored in the BKD load control record (#BKDCTL).

**System Action:** The command fails and recoup processing ends abnormally.

**User Response:** Do the following:

1. Determine which version of the descriptor is correct.
2. Do one of the following:
   - If the correct version of the descriptor is loaded into memory, enter the ZRBKD command to load the correct version of the descriptor into the BKD load control record (#BKDCTL).
   - If the correct version of the descriptor is loaded in the BKD load control record (#BKDCTL), load the correct version of the descriptor into memory.
3. Start recoup processing again.

See *TPF Operations* for more information about the ZRBKD command.

**RECP0792E DESCRIPTOR *dscr* NOT CORE RESIDENT BEFORE CHAIN CHASE**

**Where:**

*dscr*
The name of the descriptor.

**Explanation:** The ZRECP RECALL command was entered, but the active descriptor version is not core resident.

**System Action:** The command fails and recoup processing ends abnormally.

**User Response:** Do the following:

1. Define the recoup descriptor as core resident.
2. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL command.

**RECP0793E DESCRIPTOR *dscr* VERSION MISMATCH ON PRIMARY PROCESSOR**

**Where:**

*dscr*
The name of the descriptor.

**Explanation:** Recoup chain chase processing on the primary processor accessed a descriptor with an active descriptor version in core memory that did not match the version stored in the BKD load control record (#BKDCTL).

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Determine which version of the descriptor is correct.
2. Do one of the following:
   - If the correct version of the descriptor is loaded in memory, enter the ZRBKD command to load the correct version of the descriptor into the BKD load control record (#BKDCTL).
   - If the correct version of the descriptor is loaded in the BKD load control record (#BKDCTL), load the correct version of the descriptor into memory.
3. Start recoup processing again.

See *TPF Operations* for more information about the ZRBKD command.

**RECP0794E DESCRIPTOR *dscr* NOT CORE RESIDENT ON PRIMARY PROCESSOR**

**Where:**

*dscr*
The name of the descriptor.

**Explanation:** Recoup chain chase processing on the primary processor accessed a descriptor version that is not core resident.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Define the recoup descriptor as core resident.
2. Start recoup processing again.

See *TPF Operations* for more information about the ZRECP RECALL command.

**RECP0795E DESCRIPTOR *dscr* VERSION MISMATCH ON SECONDARY PROCESSOR**

**Where:**

*dscr*
The name of the descriptor.

**Explanation:** Recoup chain chase processing on the secondary processor accessed a descriptor with an active descriptor version in core memory that did not match the version stored in the BKD load control record (#BKDCTL).

**System Action:** Recoup processing does not chain chase the accessed version of the descriptor on this processor, but will chase it on the primary processor.

**User Response:** Ensure that all processors that are running recoup are at the same program update tape (PUT) level.

**RECP0796E DESCRIPTOR *dscr* NOT CORE RESIDENT ON SECONDARY PROCESSOR**

**Where:**

*dscr*
The name of the descriptor.

**Explanation:** Recoup chain chase processing on a secondary processor accessed a descriptor that was not core resident.

**System Action:** Recoup processing does not chain chase the accessed descriptor on this processor, but will chase it on the primary processor.

**User Response:** Ensure that all processors that are running recoup are at the same program update tape (PUT) level.

**RECP0797E FACE ERROR ON DESCRIPTOR CONTROL RECORD**

**Explanation:** A ZRECP command was entered, but an error occurred while trying to access the recoup descriptor control record (#BKDCTL).

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Ensure the FACE table (FCTB) is built correctly.
2. Ensure the #BKDCTL record is allocated correctly.
3. Enter the appropriate ZRECP command again.

See *TPF Operations* for more information about the ZRECP commands. See *TPF System Generation* for more information about the FACE table.

**RECP0798E DUPLICATE RECID / VERSION FOUND DESCRIPTOR CONTROL RECORD SLOTS *slot1*, *slot2* RECID-*recID* VERSION- *version***

**Where:**

*slot1*
The slot number of the first descriptor with the duplicate record ID and version.

*slot2*
The slot number of the second descriptor with the duplicate record ID and version.

*recID*
The duplicate record ID in 4-byte hexadecimal format.

*version*
The duplicate version, if available.

**Explanation:** A ZRECP command was entered that resulted in the recoup scheduling control table (IRSCT) being built. However, validation of the table failed because two entries were found that had the same record ID and version number.

**System Action:** Recoup processing ends abnormally.

**User Response:** Do the following:

1. Examine the descriptor control record whose slots are indicated and make sure each record ID and version are unique for the subsystem.
2. Make sure all descriptors are up to date and correctly loaded on the subsystem.
3. Enter the appropriate ZRECP command again.

See *TPF Operations* for more information about the ZRECP commands. See *TPF Database Reference* for more information about recoup functions and procedures.

# RFPC–ROUT

**RFPC0001I — STARTED RECONCILIATION OF SON POOL COUNTS**

**Explanation:** This is a normal response to the ZRFPC command after an entry into DYDC.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRFPC command.

**RFPC0002I — END OF JOB OF SON POOL RECONCILIATION**

**Explanation:** This is a normal response to the ZRFPC command.

**System Action:** The reconciliation of the file pool directories completed successfully.

**User Response:** None.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0003T — KEYPOINT 9 FIND ERROR, JOB CANCELLED**

**Explanation:** This is the response to the ZRFPC command when segment DYDC or DYDL is unable to retrieve keypoint 9.

**System Action:** If reconcile was being run while the TPF system was in 1052 state, segment DYDC was unable to retrieve keypoint 9. Reconcile was canceled, and the pool counts and shutdown and reorder indicators were not updated for any pool section.

If reconcile was being run while the TPF system was in NORM state, segment DYDL was unable to retrieve keypoint 9. Segment DYDL ends and the pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 for the long-term pool section that was being processed by DYDL are not updated. Reconcile processing for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Determine why keypoint 9 was not available.
2. Correct the error.
3. Enter the ZRFPC command again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0004T — KEYPOINT 9 FILE ERROR, JOB TERMINATED ABNORMALLY**

**Explanation:** This is a response to the ZRFPC command when segment DYDC or DYDL is unable to file keypoint 9.

**System Action:** If reconcile was being run while the TPF system was in 1052 state, segment DYDC was unable to file keypoint 9 and reconcile was canceled. The pool counts and shutdown and reorder indicators were not updated for any pool section.

If reconcile was being run while the TPF system was in NORM state, segment DYDL was unable to file keypoint 9 and segment DYDL ends. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 for the long-term pool section that was being processed by DYDL are not updated. Reconcile processing for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Correct the error.
2. Enter the ZRFPC command again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0005W — DIRECTORY *dirname* FIND ERROR**

**Where:**

*dirname*
The name of the directory.

**Explanation:** This message is issued when the directory referenced in the message could not be retrieved. This message is a warning that the directory's counts will not be included in the section's total count. If this directory is subsequently made available the section counts will be adversely and incorrectly affected.

The possible causes of the error are:

- An error from FACS
- Soft find error, for example, there is no directory for this record code check
- A hard find error, for example, the device is varied off line.

**System Action:** None.

**User Response:** Do the following:

1. Determine the reason for the lack of availability.
2. Correct the error, if possible.
3. Run the reconcile again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0007T — MASTER CONTROL RECORD *record* FIND FAILED, JOB TERMINATED**

**Where:**

*record*
The ordinal number of the master control record.

**Explanation:** This message is issued when a short-term master control header record could not be retrieved during processing in DYDS for that section.

**System Action:** The reconcile for the short-term pool section represented by this master control record is canceled. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 (CTK9) are not updated for this section. The reconcile for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Correct the error.
2. Run the reconcile again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0008T — MASTER CONTROL RECORD *record* FILE FAILED, JOB TERMINATED**

**Where:**

*record*
The ordinal number of the master control record.

**Explanation:** This message is issued when a short-term master control header record could not be filed during processing in DYDS for that section.

**System Action:** The reconcile for the short-term pool section represented by this master control record is canceled. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 (CTK9) are not updated for this section. The reconcile for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Correct the error.
2. Run the reconcile again.

It is possible that the TPF system may not cycle up to NORM state because of the configuration that is not valid. In addition, counts for this section may not reflect the sum of the individual directory's counts.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0009T — SUBRECORDS UNAVAILABLE FOR *pooltype* ON *devicetype*, JOB TERMINATED**

**Where:**

*pooltype*
The pool type.

*devicetype*
The device type.

**Explanation:** This message is issued when subrecords for the short-term master control record or the short-term processor control record could not be retrieved for the pool type and the device type referenced in the message.

**System Action:** The reconcile for the short-term pool section referenced in this message is canceled. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 (CTK9) are not updated for this section. The reconcile for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Correct the error.
2. Run the reconcile again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0010T — SUBRECORD FILE FAILED FOR *pooltype* ON *devicetype*, JOB TERMINATED**

**Where:**

*pooltype*
The pool type.

*devicetype*
The device type.

**Explanation:** This message is issued when the subrecords for the short-term master control record or the short-term processor control record could not be filed for the pool type and device type referenced in the message.

**System Action:** The reconcile for the short-term pool section referenced in this message is canceled. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 (CTK9) are not updated for this section. The reconcile for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Correct the error.
2. Run the reconcile again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0011W — DIRECTORY *dirname* FILE FAILED**

**Where:**

*dirname*
The name of the directory.

**Explanation:** This message is issued when the directory referenced in the message could not be filed. This message is warning that its counts will not be included in the section's total count. If this directory is subsequently made available the section counts will be adversely and incorrectly affected.

**System Action:** None.

**User Response:** Do the following:

1. Determine the reason for the failure.
2. Correct the error, if possible.
3. Run reconcile again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0012T —INVALID TIMESTAMPS EXIST FOR *pooltype* ON *devicetype*, JOB TERMINATED**

**Where:**

*pooltype*
The pool type.

*devicetype*
The device type.

**Explanation:** A test was provided to determine whether all the directory ordinals that should be present in a short-term section master control record are present. This test is a check-summing of the ordinal numbers from the first (CY2FDR) to the last (CY2LDR). When each individual time stamp is processed, a running check sum is kept. When the section processing is completed, these two check sums (running and computed) are compared. If they are not equal, this error message is displayed.

**System Action:** The reconcile for the short-term pool section referenced in this message is canceled. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 (CTK9) are not updated for this section. The reconcile for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Determine the cause for the error. The most likely cause of the error is that there is the same directory ordinal on more than one time stamp record and one or more is missing. You may need to work with your system programmer to identify these and to correct the ordinal numbers.
2. Correct the error, if possible.
3. Run the reconcile again to recompute the counts.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0014T — DUPLICATE TIMESTAMPS FOUND FOR *pooltype* ON *devicetype*, JOB TERMINATED**

**Where:**

*pooltype*
The pool type.

*devicetype*
The device type.

**Explanation:** After a short-term section has been processed, the number of directories processed is compared to the generated number. If the number of directories is greater than the generated number, this error message is issued for the pool type and device shown in the message. The most probable cause is that there are one or more duplicate time-stamp entries, representing the same short-term pool directory.

**System Action:** The reconcile for the short-term pool section referenced in this message is canceled. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 (CTK9) are not updated for this section. The reconcile for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Review the short-term master control record to identify the duplicate directories.
2. Delete the duplicate entries and reset the pointers.
3. Run the reconcile again to recalculate the counts.

See *TPF Operations* for more information about the ZRFPC command.

**RFPC0015T — TIMESTAMPS LOST FOR *pooltype* ON *devicetype*, JOB TERMINATED**

**Where:**

*pooltype*
The pool type.

*devicetype*
The device type.

**Explanation:** After a short-term section has been processed the number of directories processed is compared to the generated number. If the number of directories is less than the generated number this error message is issued for the pool type and device shown in the message.

The most probable cause is that the number of time stamps in the directory does not match the number generated, indicating that time stamps have been lost.

**System Action:** Reconcile for the short-term pool section referenced in this message is cancelled. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 are not updated for this section. Reconcile for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Review the short term master control record to identify the lost directories.
2. Include the lost directories and reset the pointers.
3. Run the reconcile again to recompute the counts.

See *TPF Operations* for more information about the ZRFPC command.

**RFPC0016W — DIRECTORY *dirname* HAS AN INVALID CHECK SUM**

**Where:**

*dirname*
The name of the directory.

**Explanation:** This message is issued when the DYDQ calculated check sum does not match that in the check sum field of the directory. It is marked as unowned, with controls that are not valid, and it is not counted.

**System Action:** None.

**User Response:** Run a recoup or a directory update.

See *TPF Operations* for more information about the ZRFPC command.

**RFPC0018W — DIRECTORY *dirname* HAS INVALID CONTROLS**

**Where:**

*dirname*
The name of the directory.

**Explanation:** This message is issued when DYDQ finds that directory referenced in the message is marked with controls that are not valid. This directory is not counted.

**System Action:** None.

**User Response:** Run a recoup or a directory update.

See *TPF Operations* for more information about the ZRFPC command.

**RFPC0019T — INVALID SHUT DOWN CONFIGURATION, FOR *pooltype* ON *devicetype*, JOB TERMINATED**

**Where:**

*pooltype*
The pool type.

*devicetype*
The device type.

**Explanation:** This is the response to the ZRFPC command when the configuration table in segment DYDS does not match the values in the CY$RSx, ICY$RSN, CY1SHT, and CY1REO fields. This usually indicates a condition that reconcile would handle incorrectly if it were to continue. A 000697 system error dump is issued to display the problem areas and help correct the error. The following are possible causes:

- Most probable, a change to the values of the various fields by restart or reorder and a subsequent failure to update the configuration table in segment DYDS.
- One of the header records (short-term master control record (STCCR), short-term processor control record (STPCR), or pool keypoint 9) was overwritten.
- A software problem in any program that processes any of the records mentioned previously, placing data that is not valid into one or more of the fields.

**System Action:** A system error dump occurs and the ECB exits. Reconcile processing for the short-term pool section referenced in the message is ended. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 (CTK9) are not updated for the pool section. Reconcile processing for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.
3. Enter the ZRFPC command again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0021T — POOL KEYPOINT TABLE** *record* **FIND FAILED**

**Where:**

*record*
The ordinal of the fixed file copy of the pool keypoint table (CY2KT).

**Explanation:** This message is issued when segment DYDL is unable to find the fixed file copy of the pool keypoint table (CY2KT).

**System Action:** Reconcile processing for the long-term pool section represented by the pool keypoint table (CY2KT) ends. The pool count in CY2KT and the shutdown and reorder indicators in keypoint 9 are not updated for this pool section. Reconcile processing for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Determine why the fixed file copy of CY2KT was not available.
2. Correct the error.
3. Enter the ZRFPC command again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0022T — PROCESSOR CONTROL RECORD** *record* **FOR PROC** *proc* **FIND FAILED**

**Where:**

*record*
The record ordinal of the processor control record.

*proc*
The processor ID of the processor represented by the failing processor control record.

**Explanation:** This message is issued when segment DYDS is unable to find the short-term processor control record.

**System Action:** Reconcile processing for the short-term pool section represented by the processor control record ends. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 are not updated for this pool section. Reconcile processing for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Determine why the short-term processor control record was not available.
2. Correct the error.
3. Enter the ZRFPC command again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0023T — PROCESSOR CONTROL RECORD** *record* **FOR PROC** *proc* **FILE FAILED**

**Where:**

*record*
The ordinal of the processor control record.

*proc*
The processor ID of the processor represented by the failing processor control record.

**Explanation:** This message is issued when segment DYDS is unable to file a short-term processor control header.

**System Action:** Reconcile processing for the short-term pool section represented by the processor control record ends. The pool count in the pool keypoint table (CY2KT) and the shutdown and reorder indicators in keypoint 9 are not updated for this pool section. Reconcile processing for all other pool sections proceeds normally.

**User Response:** Do the following:

1. Correct the error.
2. Enter the ZRFPC command again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0128T — EVENT TIMEOUT WAITING FOR RECONCILE OF** *pooltype* **ON** *devtype*, **JOB TERMINATING**

**Where:**

*pooltype*
The type of pool file.

*devtype*
The type of the device.

**Explanation:** The ZRFPC command was entered but reconciliation processing timed out.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRFPC command again.

See *TPF Operations* for more information about the ZRFPC command.

---

**RFPC0255T - TERMINAL ERRORS - RECONCILE JOB TERMINATED**

**Explanation:** The ZRFPC command was entered but errors ocurred that caused reconciliation processing to fail.

**System Action:** The command fails.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZRFPC command again.

See *TPF Operations* for more information about the ZRFPC command.

**RHLD0000I LOCK DELETIONS COMPLETE**

**Explanation:** This is the normal response to the ZRHLD DELETE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRHLD DELETE command.

**RHLD0001I LOCK DISPLAY COMPLETE**

**Explanation:** This is the normal response at the end of the display generated by the ZRHLD DISPLAY command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRHLD DISPLAY command.

**RHLD0002I HOLDERS AND WAITERS INFORMATION NOT AVAILABLE**

**Explanation:** This message is issued when the TPF system is unable to display the holders and waiters information returned because the TPF system has not cycled high enough to fill in the PI1DT table.

**System Action:** None.

**User Response:** None.

**RHLD0003E PROCESSOR SPECIFICATION NOT IN PIDT**

**Explanation:** The command contains an incorrect processor specification. It does not match any processor known in the processor table (PIDT).

**System Action:** None.

**User Response:** Enter the command again and specify a valid CPU ID.

See *TPF Operations* for more information about the ZRHLD DISPLAY command.

**RHLD0005E SPECIFIED PROCESSOR HAS NO LOCK ID IN PIDT**

**Explanation:** The processor specification that is given by the CPU ID in the command is not valid because no corresponding lock ID exists in the processor table (PIDT).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRHLD DISPLAY command.

**RHLD0006E SPECIFIED CONTROL UNIT OUTSIDE LEGAL DEVICE LIMITS**

**Explanation:** The specified device is greater than the highest device address found at IPL time.

**System Action:** None.

**User Response:** Enter the command again and specify a valid device address.

See *TPF Operations* for more information about the ZRHLD commands.

**RHLD0007E SPECIFIED CONTROL UNIT IS INACTIVE.**

**Explanation:** The control unit specified in the ZRHLD command is not presently active.

**System Action:** None.

**User Response:** Do the following:

1. Determine that the control unit is active.
2. Enter the command again.

See *TPF Operations* for more information about the ZRHLD commands.

**RHLD0008E SONIC RETURNED SPECIFIED FILE ADR AS INVALID**

**Explanation:** The specified file address is not valid.

**System Action:** None.

**User Response:** Enter the command again and specify a valid file address.

See *TPF Operations* for more information about the ZRHLD commands.

**RHLD0009E SPECIFIED FILE ADR CANNOT BE DECODED BY CSONC**

**Explanation:** The specified file address cannot be resolved into a file address for the module.

**System Action:** None.

**User Response:** Enter the command again and specify a file address that can be resolved.

See *TPF Operations* for more information about the ZRHLD commands.

### RHLD0010E THIS FUNCTION IS PERMITTED ONLY IN THE BSS

**Explanation:** This variation of the ZRHLD command may not be entered except from the basic subsystem (BSS).

**System Action:** None.

**User Response:** Enter the command again from the BSS.

See *TPF Operations* for more information about the ZRHLD commands.

### RHLD0011E LOCK HARDWARE NOT INSTALLED

**Explanation:** The ZRHLD command was entered to display or delete locks but no lock hardware is installed within the processing complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRHLD commands.

### RHLD0016E I/O ERROR READING LOCKS FROM SDA *sda*

**Where:**

**sda** The symbolic device address (SDA) that received the input/output (I/O) error.

**Explanation:** A ZRHLD command was entered to read locks from the displayed SDA but an I/O error occurred.

**System Action:** None.

**User Response:** Take the appropriate action to recover from this hardware error.

See *TPF Operations* for more information about the ZRHLD commands.

### RHLD0017E I/O ERROR PURGING LOCK *lockname* FROM SDA *sda*

**Where:**

*lockname*
The lock name.

*sda* The symbolic device address (SDA) that received the input/output (I/O) error.

**Explanation:** RHLD processing encountered an I/O error while trying to access the device to delete the displayed lock name.

**System Action:** The command is rejected.

**User Response:** Using the information the system module support should have displayed on the console, you should take the appropriate action to recover the device.

See *TPF Operations* for more information about the ZRHLD commands.

### RHLD0021I LOCK DELETION COMPLETE, CTL-38 MAY OCCUR

**Explanation:** This message indicates that the requested delete function was performed successfully. However, it warns that some of the deleted locknames may be owned by active ECBs which, now being deprived of their locknames, may incur unpredictable results in so far as ongoing input/output (I/O), possibly a CTL-38 system error for attempting to unlock a lock just deleted from the control unit.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRHLD commands.

### RHLD0022E MODULE CONTAINING REQUESTED FILE ADDRESS NOT ONLINE

**Explanation:** This message indicates that the specified file address resides on a module that is not online. Therefore, the ZRHLD command is unable to determine which control unit might contain the lock for the specified file address.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRHLD commands.

### RHLD0024W ECB *ecb* FORCED TO EXIT DUE TO HOLDING SPECIFIED RECORD

**Where:**

*ecb* The ECB.

**Explanation:** This message indicates that the requested delete function completed successfully and that the deleted lock name was owned by an active entry control block (ECB) that was forced to exit.

**System Action:** Processing is continued.

**User Response:** Check the ECB that was forced to exit.

See *TPF Operations* for more information about the ZRHLD commands.

### RHLD0025E SPECIFIED LOCKS MAY BE FOUND IN COUPLING FACILITY

**Explanation:** This message indicates that the requested ZRHLD command is referring to a set of locks that are not set in multi-path lock facility (MPLF) or limited lock facility (LLF) control units (CUs). Rather, the set of locks is associated with records residing on a set of modules that use the coupling facility (CF) for external locking.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCFLK DISPLAY command to determine which modules are using a CF as an external locking device.
2. Enter the appropriate ZDLCK command to perform actions on the locks associated with the records that reside on these modules.

See *TPF Operations* for more information about the ZCFLK and ZDLCK commands.

**RHLD0026E NO OUTSTANDING DISPLAY TO BE CONTINUED**

**Explanation:** The ZRHLD command was entered to continue a previous lock display but one of the following errors occurred:

- No previous display existed.
- You waited too long and the display was purged from the TPF system.
- You entered an intervening display request that caused the previous display to be purged from the TPF system.

**System Action:** None.

**User Response:** Check and correct the situations listed in the explanation.

See *TPF Operations* for more information about the ZRHLD commands.

**RHLD0027I SPECIFIED LOCKS NOT FOUND**

**Explanation:** The ZRHLD DELETE or ZDLCK DELETE command was entered to delete a lock, but an error occurred because the lock was not found in the external lock facility (XLF) (either the multi-path lock facility (MPLF) or the coupling facility (CF)).

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZRHLD DELETE and ZDLCK DELETE commands.

**RHLD0029E THE SPECIFIED DEVICE IS NOT ONLINE**

**Explanation:** The device specified on the ZRHLD DISPLAY command with the DEVICE parameter specified is currently not online to the TPF system.

**System Action:** None.

**User Response:** Enter the command again and specify an online device.

See *TPF Operations* for more information about the ZRHLD DISPLAY command.

**RHLD0030E INCONSISTENT OPTIONS ON DISPLAY REQUEST, SL/PR/VSYNC**

**Explanation:** The ZRHLD DISPLAY command was entered with the SL, PR, and VSYNC parameters specified. Only one parameter can be specified at a time.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine which parameter is required.
2. Enter the command again and specify the correct parameter.

See *TPF Operations* for more information about the ZRHLD DISPLAY command.

**RHLD0037E THE SPECIFIED LOCK NAME IS LESS THAN 16 CHARACTERS IN LENGTH**

**Explanation:** The lock name specified on the ZRHLD command was not valid because the name contained fewer than 16 characters. The lock name must contain at least 16 characters.

**System Action:** The command is rejected.

**User Response:** Enter the ZRHLD command again specifying a valid lock name.

See *TPF Operations* for more information about the ZRHLD command.

**RHLD0038I LOCK DELETION COMPLETE, CTL-4627 MAY OCCUR**

**Explanation:** The ZRHLD DELETE command was entered to delete locks from the coupling facility (CF) lock tables.

**System Action:** The locks are deleted from the CF lock tables.

**User Response:** None.

See *TPF Operations* for more information about the ZRHLD DELETE command.

**RHLD0040E THE SPECIFIED FILE ADDRESS IS NOT 16 OR 8 CHARACTERS IN LENGTH**

**Explanation:** The file address specified for a ZRHLD command does not contain 16 or 8 characters. A valid file address must have a length of 16 or 8 characters.

**System Action:** The command is rejected.

**User Response:** Enter the ZRHLD command again and specify a file address that contains 16 or 8 characters.

See *TPF Operations* for more information about the ZRHLD commands.

**RHLD0111I**

**Explanation:** This is the normal response to the ZRHLD DISPLAY command. As many as 22 lines of lock table entries are displayed. The text `MORE LOCKS LEFT` is included in the message when more locks are left to display.

**System Action:** None.

**User Response:** If the text `MORE LOCKS LEFT` is included in the message, enter the ZRHLD DISPLAY command with the CONTINUE parameter specified to continue to the next group.

See *TPF Operations* for more information about the ZRHLD DISPLAY command.

**RIPL0000I ZRIPL—OK**

**Explanation:** This is the normal response to the ZRIPL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRIPL command.

**RIPL0009E ZRIPL—INVALID PARAMETER**

**Explanation:** A parameter other than BP was specified with the ZRIPL command.

**System Action:** ZRIPL processing is exited.

**User Response:** Enter the command again and specify a valid parameter or allow it to default.

See *TPF Operations* for more information about the ZRIPL command.

**RIPL0010E ZRIPL—INHIBITED ON LOADER GENERAL FILE**

**Explanation:** The ZRIPL command is not allowed when the last IPL of the TPF system was from the loader general file.

**System Action:** ZRIPL processing is exited.

**User Response:** Initiate a hardware IPL if desired.

See *TPF Operations* for more information about the ZRIPL command.

**RIPL0011E ZRIPL ALREADY IN PROGRESS**

**Explanation:** A ZRIPL command was entered while another is in progress.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Wait for the first ZRIPL command to complete processing and issue the command again.
- Issue the ZRIPL command with the BP parameter specified.

See *TPF Operations* for more information about the ZRIPL command.

**RLMT0001I MESSAGE REPEATED TO** *lniata*

**Where:**

*lniata*
The line number, interchange address, and terminal address (LNIATA)/logical end -point identifier (LEID).

**Explanation:** The last message sent to the requested LNIATA/LEID was resent.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRLMT command.

**RLMT0003I NO MESSAGES ON QUEUE**

**Explanation:** There are no messages on the XLMA queue to purge or repeat.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRLMT command.

**RLMT0010W NOT ALLOWED BELOW CRAS STATE**

**Explanation:** The TPF system must be in computer room agent set (CRAS) state or above before the request can be processed. This only applies when the input is a pseudo line number, interchange address, and terminal address (LNIATA).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRLMT command.

**RLMT0011E INVALID LNIATA —** *lniata*

**Where:**

*lniata*
The line number, interchange address, and terminal address (LNIATA)/logical end-point identifier (LEID).

**Explanation:** The LNIATA/LEID specified in the command is not valid or could not be found in the system network tables.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRLMT command.

**RLMT0012E INVALID FORMAT**

**Explanation:** The format of the ZRLMT command is not correct or the input line number, interchange address, and terminal address (LNIATA) contains characters that are not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRLMT command.

**RLMT0015E NODE NOT A PRINTER**

**Explanation:** The pseudo line number, interchange address, and terminal address (LNIATA) specified in the command is not a printer.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRLMT command.

**RLMT0017E NODE UNABLE TO RECEIVE**

**Explanation:** The pseudo line number, interchange address, and terminal address (LNIATA) is in STOP stage.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRLMT command.

**RLMT0019T UNABLE TO RETRIEVE XLMA FOR** *lniata*

**Explanation:** The XLMA record for the requested line number, interchange address, and terminal address (LNIATA) could not retrieved.

**System Action:** The message queue is not purged and processing is ended.

**User Response:** None.

See *TPF Operations* for more information about the ZRLMT command.

**ROUT0002E INVALID REQUEST, SYSTEM BELOW 1052 STATE**

**Explanation:** A ZROUT command can only be entered when the TPF system is not below 1052 state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Check the state of the TPF system.
2. Enter the command again.

See *TPF Operations* for more information about the ZROUT commands.

**ROUT0003E APPLICATION** *applname* **NOT IN RCAT**

**Where:**

*applname*
The name of the application program.

**Explanation:** The application program name specified in the ZROUT command is not defined in the routing control application table (RCAT).

**System Action:** None.

**User Response:** Do the following:

1. Check the name of the application program.
2. Enter the command again.

See *TPF Operations* for more information about the ZROUT commands.

**ROUT0004E APPLICATION** *applname* **IS NOT IN THIS PROCESSOR**

**Where:**

*applname*
The name of the application program.

**Explanation:** The application name specified in the ZROUT command does not reside in the processor where the command is entered.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZDRCT command to display the name of the program.
2. Enter the ZROUT command again from the processor where the application program resides.

See *TPF Operations* for more information about the ZROUT and ZDRCT commands.

**ROUT0005E SS/SSU FOR APPLICATION** *applname* **IS NOT AVAILABLE**

**Where:**

*applname*
The name of the application program.

**Explanation:** The subsystem or the subsystem user (SSU) for the specified application program is not active.

**System Action:** None.

**User Response:** Do the following:

1. Enter the ZDRCT command to display the name of the program.
2. Enter the ZROUT command again from the processor where the application program resides.

See *TPF Operations* for more information about the ZROUT and ZDRCT command.

**ROUT0006E APPLICATION** *applname* **STOP IN PROGRESS**

**Where:**

*applname*
The name of the application program.

**Explanation:** The application program referenced in the message is in shutdown mode, for example, the stop request is in progress. The application program will be stopped when the 15 minutes waiting time is expired.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT commands.

**ROUT0007E APPLICATION** *applname* **ALREADY ACTIVE**

**Where:**

*applname*
The name of the application program.

**Explanation:** The application program referenced in the message and specified in the ZROUT START command is already active.

**System Action:** None.

**User Response:** Enter the ZDRCT command to display the status of the application program.

See *TPF Operations* for more information about the ZROUT START command.

**ROUT0008I APPLICATION** *applname* **MADE ACTIVE**

**Where:**

*applname*
The name of the application program.

**Explanation:** The application program referenced in the

message and specified in the ZROUT START command was made active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT START command.

---

**ROUT0009E STOP PROHIBITED FOR PERMANENT APPLICATION**

**Explanation:** The application name specified in the ZROUT STOP command is a permanent application such as SMPx and CLGx.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT STOP command.

---

**ROUT0010E APPLICATION *applname* ALREADY STOPPED**

**Where:**

*applname*
The name of the application program.

**Explanation:** The application program referenced in the message and specified in the ZROUT STOP command is already stopped.

**System Action:** None.

**User Response:** Enter the ZDRCT STOP command to display the status of the application program.

See *TPF Operations* for more information about the ZROUT STOP command.

---

**ROUT0011E APPLICATION *applname* STOP ALREADY REQUESTED**

**Where:**

*applname*
The name of the application program.

**Explanation:** The TPF system was IPLed while a previous ZROUN STOP request was in progress. The application program is still marked as ACTIVE in the routing control application table (RCAT) because the system was IPLed before the RCAT was keypointed.

**System Action:** The application program is marked as SHUTDOWN. The application program is stopped when the 15 minutes waiting time is expired.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT STOP command.

---

**ROUT0012E FACS ERROR DURING RCST CALCULATION**

**Explanation:** FACS returned an error during file address calculation of the application stop table (record type #IBMM4, ordinal 53 — #RCSTSTP).

**System Action:** The error message is displayed and the ECB is exited.

**User Response:** Enter the ZDREC command to display the application stop table.

If the problem continues, see your system administrator who can check the CRAA program where the FACS is invoked.

See *TPF Operations* for more information about the ZROUT and the ZDREC commands.

---

**ROUT0013E FIND ERROR IN RCAT STOP TABLE**

**Explanation:** FIWHC returns an error while retrieving the application stop table (record type #IBMM4, ordinal #RCSTSTP).

**System Action:** Display the error message and exit the ECB.

**User Response:** Enter the ZDREC command to display the application stop table.

If the problem continues, see your system programmer who can check the CRAA program where the FIWHC is issued.

See *TPF Operations* for more information about the ZROUT and the ZDREC commands.

---

**ROUT0014I APPLICATION *applname* STOPPING**

**Where:**

*applname*
The name of the application program.

**Explanation:** All validation of the ZROUT STOP request is completed.

**System Action:** The application program is marked as SHUTDOWN in the routing control application table (RCAT), and an entry is added to the application stop table.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT STOP command.

---

**ROUT0015E APPLICATION *applname* NOT IN RCST**

**Where:**

*applname*
The name of the application program.

**Explanation:** The CRAA program cannot find the application program in the application stop table (record type #IBMM4, ordinal #RCSTSTP).

**System Action:** The error message is displayed and the ECB is exited.

**User Response:** See your system programmer who can determine the cause of the error by examining the CRAA program, the application stop table, and the system console log.

See *TPF Operations* for more information about the ZROUT STOP command.

---

**ROUT0016E APPLICATION *applname* IN RCST BUT NOT IN RCAT**

**Where:**

*applname*
The name of the application program.

**Explanation:** The CRAA program cannot find the application program in the routing control application table (RCAT).

**System Action:** The error message is displayed and the ECB is exited.

**User Response:** See your system programmer who can determine the cause of the error by examining the CRAA program, the application stop table, and the system console log.

See *TPF Operations* for more information about the ZROUT commands.

---

**ROUT0017I APPLICATION *applname* STOPPED**

**Where:**

*applname*
The name of the application program.

**Explanation:** The application program referenced in the message and specified in the ZROUT STOP command is stopped.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT STOP commands.

# RPCR–RTCU

---

**RPCR0001A RPC ERROR REQUIRING ACTION — EUVR*msgid reason***

**Where:**

*msgid*
The IBM OpenEdition DCE message ID.

*reason*
The text explaining the error.

**Explanation:** The meaning of the message can be found in the OpenEdition DCE publications.

**System Action:** The remote procedure call (RPC) server attempts to continue processing.

**User Response:** Depending on the reason for the error, you are required to take the appropriate action as described in the OpenEdition DCE publications.

See *OpenEdition Distributed Computing Environment Base Services MVS: Messages and Codes* and reference the EUVR message ID in the message for more information about the message.

---

**RPCR0002E RPC ERROR — EUVR*msgid reason***

**Where:**

*msgid*
The IBM OpenEdition DCE message ID.

*reason*
The text explaining the error.

**Explanation:** The meaning of the message can be found in the OpenEdition DCE publications.

**System Action:** The remote procedure call (RPC) server attempts to continue processing.

**User Response:** Depending on the reason for the error, you are required to take the appropriate action as described in the OpenEdition DCE publications.

See *OpenEdition Distributed Computing Environment Base Services MVS: Messages and Codes* and reference the EUVR message ID in the message for specific information for the reason text.

---

**RPCR0003I RPC INFORMATION — EUVR*msgid reason***

**Where:**

*msgid*
The IBM OpenEdition DCE message ID.

*reason*
The text explaining the error.

**Explanation:** The meaning of the message is provided in the OpenEdition DCE publications.

**System Action:** The remote procedure call (RPC) server continues processing.

**User Response:** None

See *OpenEdition Distributed Computing Environment Base Services MVS: Messages and Codes* and reference the EUVR message ID in the message for specific information for the reason text.

---

**RPCR0004I RPC SERVER *name* SHUTDOWN IS COMPLETE**

**Where:**

*name*
The name of the remote procedure call (RPC) server that is shut down.

**Explanation:** The RPC server completed a normal shutdown after detecting one of the following conditions:

- The system was cycling from NORM state to a state where RPC is not active.
- The ZINET STOP command was entered to stop the RPC server.

See *TPF Operations* for more information about the ZINET STOP command.

**System Action:** The RPC server is shut down.

**User Response:** None.

---

**RPCR0005E RPC ERROR —** *reason*

**Where:**

*reason*
Variable text containing the reason for the message, such as:

- tpf_rpc_cthdnum_mutex_init_fail
- tpf_rpc_cthdnum_mutex_lock_fail
- tpf_rpc_cthdnum_mutex_unlock_fail
- tpf_rpc_server_shutdown_mutex_init_fail
- tpf_rpc_server_shutdown_mutex_lock_fail
- tpf_rpc_server_shutdown_mutex_unlock_fail

**Explanation:** This message is displayed from the remote procedure call (RPC) server. The meaning of the message is provided in the OpenEdition DCE publications.

**System Action:** The RPC server attempts to continue processing.

**User Response:** Depending on the reason, you may need to take appropriate action. See *OpenEdition Distributed Computing Environment Base Services MVS: Messages and Codes* for more information about the reason text.

---

**RPGM0001I PROGRAM** *progname* **LOADSET** *lsname* **LOCKED IN CORE AT ADDRESS** *addr*

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

*addr*
The core address of the program.

**Explanation:** This is the normal response to the ZRPGM command when it is used to lock a program in core or to display the storage address of a specific program that is locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

---

**RPGM0002I TRANSFER VECTOR PARENT** *progname* **LOADSET** *lsname* **LOCKED IN CORE at ADDRESS** *addr.*

**Where:**

*progname*
The name of the parent program of the transfer vector.

*lsname*
The name of the loadset.

*addr*
The core address of the program.

**Explanation:** This is the normal response to the ZRPGM command when it is used to lock a transfer vector program in core or to display the storage address of a specific transfer vector program that is locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

---

**RPGM0003I PROGRAM** *progname* **LOADSET** *lsname* **UNLOCKED**

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

**Explanation:** This is the normal response to the ZRPGM command when it is used to unlock a program that was previously locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

---

**RPGM0004I TRANSFER VECTOR PARENT** *progname* **LOADSET** *lsname* **UNLOCKED**

**Where:**

*progname*
The name of the parent program of the transfer vector.

*lsname*
The name of the loadset.

**Explanation:** This is the normal response to the ZRPGM command when it is used to unlock a transfer vector program that was previously locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

---

**RPGM0005W PROGRAM** *progname* **LOADSET** *lsname* **NOT LOCKED IN CORE**

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

**Explanation:** The ZRPGM command was entered to unlock a program or to display the storage address of a program that is not locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

---

**RPGM0006W TRANSFER VECTOR PARENT** *progname* **LOADSET** *lsname* **NOT LOCKED IN CORE**

**Where:**

*progname*
The name of the parent program of the transfer vector.

*lsname*
The name of the loadset.

**Explanation:** The ZRPGM command was entered to unlock a transfer vector or to display the storage address of a transfer vector whose parent program is not locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

**RPGM0007W NO VERSIONS OF PROGRAM** *progname* **LOCKED IN CORE**

**Where:**

*progname*
The name of the program.

**Explanation:** No versions of the specified program are locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

**RPGM0008W NO VERSIONS OF TRANSFER VECTOR PARENT** *progname* **LOCKED IN CORE**

**Where:**

*progname*
The name of the parent program of the transfer vector.

**Explanation:** No versions of the parent program of the specified transfer vector are locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

**RPGM0012E TRANSFER VECTOR PARENT** *progname* **LOADSET** *lsname* **PRIVATE CANNOT LOCK**

**Where:**

*progname*
The name of the parent program of the transfer vector.

*lsname*
The name of the loadset.

**Explanation:** The ZRPGM command was entered to lock a transfer vector in core whose parent program was allocated as private. Private programs cannot be locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

**RPGM0013W PROGRAM** *progname* **LOADSET** *lsname* **ALREADY LOCKED IN CORE AT ADDRESS** *addr*

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

*addr*
The core address of the program.

**Explanation:** The ZRPGM command was entered to lock a program in core that is already locked in core at the address referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

**RPGM0014W TRANSFER VECTOR PARENT** *progname* **LOADSET** *lsname* **ALREADY LOCKED IN CORE AT ADDRESS** *addr*

**Where:**

*progname*
The name of the parent program of the transfer vector.

*lsname*
The name of the loadset.

*addr*
The core address of the program.

**Explanation:** The ZRPGM command was entered to lock a transfer vector in core whose parent program is already locked in core at the address referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

**RPGM0015E I-STREAM** *istreamnum* **UNDEFINED**

**Where:**

*istreamnum*
The I-stream, which is displayed as a decimal number.

**Explanation:** The I-stream number referenced in the message is not active or it is not defined.

**System Action:** None.

**User Response:** Enter the command again and specify a valid I-stream number.

See *TPF Operations* for more information about the ZRPGM command.

**RPGM0016E INVALID PROGRAM NAME**

**Explanation:** The program name specified is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

---

**RPGM0017I PROGRAMS LOCKED ON I-STREAM** *istreamnum*

**Where:**

*istreamnum*
The I-stream, which is displayed as a decimal number.

**Explanation:** This is the normal response to the ZRPGM command when it is entered to display the storage address of all the programs that are locked in core. This message is followed by a display of the storage addresses of the programs.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command and for an example of the informational display.

---

**RPGM0018E UNABLE TO RETRIEVE** *progname* **LOADSET** *lsname*, **CANNOT LOCK**

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

**Explanation:** A find error occurred while trying to retrieve the program referenced in the message from file. The program is not locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

---

**RPGM0019E TRANSFER VECTOR PARENT** *progname* **LOADSET** *lsname*, **CANNOT LOCK**

**Where:**

*progname*
The name of the parent program of the transfer vector.

*lsname*
The name of the loadset.

**Explanation:** A find error occurred while trying to retrieve the program referenced in the message from file. The program is not locked in core.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command.

---

**RPGM0020E UNABLE TO FIND ACTIVE VERSION OF PROGRAM** *progname* **LOADSET** *lsname*, **CANNOT LOCK/UNLOCK**

**Where:**

*progname*
The name of the program.

*lsname*
The name of the loadset.

**Explanation:** Either the program referenced in the message does not exist for the loadset referenced in the message or the loadset is not active.

**System Action:** None.

**User Response:** Ensure that the program is contained in the specified loadset and that the specified loadset is active.

See *TPF Operations* for more information about the ZRPGM command and for more information about activating a loadset.

---

**RPGM0021E UNABLE TO FIND ACTIVE VERSION OF PROGRAM TRANSFER VECTOR PARENT** *progname* **LOADSET** *lsname*, **CANNOT LOCK/UNLOCK**

**Where:**

*progname*
The name of the parent program of the transfer vector.

*lsname*
The name of the loadset.

**Explanation:** Either the program referenced in the message does not exist for the loadset referenced in the message or the loadset is not active.

**System Action:** None.

**User Response:** Ensure that the program is contained in the specified loadset and that the specified loadset is active.

See *TPF Operations* for more information about the ZRPGM command and for more information about activating a loadset.

---

**RPGM0023E LOADSET NAME** *lsname* **IS NOT VALID-MUST BE GREATER THAN 4 CHARACTERS IF NOT LOADSET-BASE**

**Where:**

*lsname*
The name of the loadset.

**Explanation:** Loadset names must be between 5 and 8 characters.

**System Action:** None.

**User Response:** Enter the command again and specify a loadset name that is between 5 and 8 characters long.

---

**RPGM0033I VERSIONS OF PROGRAM** *progname* **LOCKED ON I-STREAM** *istreamnum*

**Where:**

*progname*
The name of the program.

*istreamnum*
The I-stream, which is displayed as a decimal number.

**Explanation:** This is the normal response to the ZRPGM command when it is entered to display the storage address of a specific program and more than one version of that program is locked in core. This message is followed by a display of the storage addresses of the programs.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPGM command and an example of the informational display.

---

**RSTT0001W FOLLOWING CTK6 MODULE STATUS MISMATCH FOR SS** *ssname* **REL MOD MFST CTK6** *modnum position position* **END OF DISPLAY**

**Where:**

*ssname*
The subsystem name.

*modnum*
The relative module number of module with the mismatch.

*position*
ON or OFF

**Explanation:** The online/offline indicator in Keypoint 6 (CTK6) does not match the online/offline indicator in section 0 of the module file status table (MFST) for the specified module.

**System Action:** The RSTT0004A message follows, which prompts you to replace keypoint 6 or cancel the IPL.

**User Response:** Respond to the RSTT0004A message.

See *TPF Operations* for more information about the ZRSTT command.

---

**RSTT0002W FOLLOWING MVT MASTER PATH MISMATCH FOR SS** *ssname* **REL MOD .MFST SEC1 MVT FILE** *modnum cud cud* **END OF DISPLAY**

**Where:**

*ssname*
The subsystem name.

*modnum*
The relative module number of module with the mismatch.

*cud* The module address (CUD).

**Explanation:** The module device unit addresses specified in the RSTT0003W message are not using the same channel and control unit paths as all other loosely coupled processors in the complex.

**System Action:** The RSTT0005A message follows, which prompts you to replace the module address or cancel the IPL.

**User Response:** Respond to the RSTT0005A message.

See *TPF Operations* for more information about the ZRSTT command.

---

**RSTT0004A RSTT0001W OR CSS30050W MESSAGE WAS ISSUED. TO CONTINUE RESTART AND REPLACE KEYPOINT 6 – ENTER : ZRSTT REP TO ABORT THE IPL – ENTER : ZRSTT CAN**

**Explanation:** This message follows the RSTT0001W or CSS30050W messages.

**System Action:** Restart processing is suspended awaiting your response.

**User Response:** See your system programmer before responding to the message. It is possible that keypoint 6 on file was corrupted. If a response to cancel is issued, the TPF system issues the 00041B message and disables the state change.

See *TPF Operations* for more information about the ZRSTT command.

---

**RSTT0005A RSTT0002W MESSAGE WAS ISSUED. TO CONTINUE RESTART AND UPDATE THE MODULE STATUS (MVT) ON FILE — ENTER : ZRSTT REP TO ABORT THE IPL – ENTER : ZRSTT CAN**

**Explanation:** This message follows the RSTT0002W message.

**System Action:** Restart processing is suspended awaiting your response.

**User Response:** See your system programmer before responding. In a loosely coupled complex, use of different control units by different processors may result in contamination of the database. If a response to cancel is issued, the TPF system issues error 00041B message and disables the state change.

See *TPF Operations* for more information about the ZRSTT command.

---

**RSTT0006I CTK6 FOR SS** *ssid* **FILED ACCORDING TO OPTION**

**Where:**

*ssid* The subsystem (SS) ID.

**Explanation:** This is a normal response to the ZRSTT REP command that was entered due to the request in the RSTT0004A message.

**System Action:** Restart processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0007I MVT FOR SS *ssid* FILED WITH REVISED DASD STATUS**

**Where:**

*ssid* The subsystem (SS) ID.

**Explanation:** This is a normal response to the ZRSTT REP command that was entered due to the request in the RSTT0005A message.

**System Action:** Restart processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0050T TO ENSURE CORRECT CTK6, REIPL IS NECESSARY**

**Explanation:** This message indicates that the update counter for the core and file copies of CTK6 are not equal.

**System Action:** None.

**User Response:** IPL the TPF system in accordance with the action you took for the RST0004A message.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0051T CTK6 READ ERROR FOR SS *ssname***

**Where:**

*ssname*
The subsystem name.

**Explanation:** The TPF system issues this message when an error occurs while reading CTK6 from file for the subsystem specified in the ZRSTT command. The RSTT0099T message follows this message.

**System Action:** The 00041C error message is issued and the restart is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0052T MVT READ ERROR FOR SS *ssname***

**Where:**

*ssname*
The subsystem name.

**Explanation:** The TPF system issues this message when an error occurs while reading MVT from file for the subsystem specified in the ZRSTT command. The RSTT0099T message follows this message.

**System Action:** The 00041C error message is issued and the restart is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0053T CTK6 WRITE ERROR FOR SS *ssname***

**Where:**

*ssname*
The subsystem name.

**Explanation:** The TPF system issues this message when an error occurs while writing CTK6 from file for the subsystem specified in the ZRSTT command. The RSTT0099T message follows this message.

**System Action:** The 00041C error message is issued and the restart is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0054T MVT WRITE ERROR FOR SS *ssname***

**Where:**

*ssname*
The subsystem name.

**Explanation:** The TPF system issues this message when an error occurs while writing MVT from file for the subsystem specified in the ZRSTT command. The RSTT0099T message follows this message.

**System Action:** The 00041C error message is issued and the restart is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0055T CTKV READ ERROR FOR SS *ssname***

**Where:**

*ssname*
The subsystem name.

**Explanation:** The TPF system issues this message when an error occurs while reading CTKV from file for the subsystem specified in the ZRSTT command. The RSTT0099T message follows this message.

**System Action:** The 00041C error message is issued and the restart is aborted.

**User Response:** None.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0097E VALID RESPONSES ARE ZRSTT REP OR ZRSTT CAN — REENTER MESSAGE.**

**Explanation:** The ZRSTT command was entered with a parameter specified that is not valid.

**System Action:** None.

**User Response:** Enter the command again and specify the correct parameter.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0098E MESSAGE NOT VALID AT THIS TIME**

**Explanation:** A ZRSTT command was entered when the TPF system was not waiting for one.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRSTT command.

**RSTT0099T RESTART ABORTED**

**Explanation:** This is the normal response to the ZRSTT command with the CAN parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRSTT command.

**RTCU0001I RECORD TYPE** *record1* **CONVERTS TO DECIMAL** *record2*, **HEX** *record3*

**Where:**

*record1*
The character record type from the message.

*record2*
The decimal value of the converted record type.

*record3*
The hexadecimal value of the converted record type.

**Explanation:** This is the normal response to the ZRTCU command with the CTON parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTCU command.

**RTCU0002E RECORD TYPE** *record* **DOES NOT CONVERT**

**Where:**

*record*
The character record type from the ZRTCU command.

**Explanation:** The character record type could not be converted by entering the ZRTCU command with the CTON parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTCU command.

**RTCU0003I RECORD TYPE DECIMAL** *record1*, **HEX** *record2* **CONVERTS TO** *record3*

**Where:**

*record1*
The decimal value of the specified record type.

*record2*
The hexadecimal value of the specified record type.

*record3*
The converted character record type.

**Explanation:** This is the normal response to the ZRTCU command with the NTOC parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTCU command.

**RTCU0004E RECORD TYPE** *record* **DOES NOT CONVERT**

**Where:**

*record*
The numeric record type from the ZRTCU command.

**Explanation:** The numeric record type could not be converted by entering the ZRTCU command with the NTOC parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTCU command.

**RTCU0005I RECORD TYPE DECIMAL** *record1*, **HEX** *record2* **SPANS** *decimalnum* **EXTENTS MMCCHHR** *modnum cvalue hvalue rvalue* **TO MMCCHHR** *modnum cvalue hvalue rvalue*

**Where:**

*record1*
The decimal value of the specified record type.

*record2*
The hexadecimal value of the specified record type.

*decimalnum*
The decimal number of extents.

*modnum*
The symbolic module number.

*cvalue*
The cylinder value.

*hvalue*
The head value.

*rvalue*
The record value.

**Explanation:** This is the normal response to the ZRTCU command with the EXTENTS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTCU command.

**RTCU0008E** *function* **IS AN INVALID FUNCTION**

**Where:**

*function*
The name of the function that is not valid.

**Explanation:** The function referenced in the message is not valid for the ZRTCU command. The TPF system follows with the valid format.

**System Action:** None.

**User Response:** Enter the command again specifying the correct function.

See *TPF Operations* for more information about the ZRTCU command.

**RTCU0009E** *keyword* **IS AN INVALID ARGUMENT**

**Where:**

*keyword*
The keyword that is not valid.

**Explanation:** The keyword referenced in the message is not valid for the ZRTCU command. The TPF system follows with the valid format.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRTCU command.

**RTCU0010E INVALID NUMBER OF PARAMETERS**

**Explanation:** The input message contained too many parameters for the ZRTCU command. The TPF system follows with the valid format.

**System Action:** None.

**User Response:** Enter the command again and specify the correct parameters.

See *TPF Operations* for more information about the ZRTCU command.

# RTDM–RTLP

**RTDM0002I** *function* **PROCESSING COMPLETED**

**Where:**

*function*
DISPLAY or MODIFY.

**Explanation:** Processing of the ZRTDM command to display or modify the record ID attribute table (RIAT) is complete.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0003I POOL OVERRIDES ARE— VFALT—***stat* **VFAST—***stat* **RCSLT—***stat1***, RCSST—***stat1*

**Where:**

*stat* DELAY, IMMED, NO, or RIAT.

*stat1*
DFW, RET, CFWS, CFWD, NO, or RIAT.

**Explanation:** This message displays the current pool overrides.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0004I** *function* **PROCESSING COMPLETED FOR IMAGE** *name*

**Where:**

*function*
DISPLAY or MODIFY.

*name*
The image name.

**Explanation:** Display or modification of the record ID attribute table (RIAT) is complete.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0005I ZRTDM RESET COMPLETED SUCCESSFULLY**

**Explanation:** This is the normal response to the ZRTDM RESET command. The control value in the record ID attribute table (RIAT) control record has been reset to indicate there is no ZRTDM MODIFY command in progress.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTDM RESET and ZRTDM MODIFY commands.

**RTDM0006I FILE COPY HAS CONTROL VALUE OF** *ctlval*

**Where:**

*ctlval*
The 8-hexadecimal-digit control value of the record ID attribute table (RIAT) control record.

**Explanation:** This is the normal response to the ZRTDM DISPLAY command with the CTLVAL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTDM DISPLAY command.

**RTDM0007I UPDATE SENT TO PROCESSOR *procid* BY SIPC**

**Where:**

*procid*
The processor ID.

**Explanation:** The ZRTDM MODIFY command was entered to modify a specific entry or a group of entries in the record ID attribute table (RIAT). This message tells you which processors in the complex received the updates.

**System Action:** The ZRTDM MODIFY command is sent to all processors in the complex.

**User Response:** None.

See *TPF Operations* for more information about the ZRTDM MODIFY command.

---

**RTDM0010I RECID–*id*, VFAF–*stat1*, VFAP–*stat1*, XCP–*stat2*, LOG–*stat2*, RESTORE–*stat2*, UEXIT–*stat2*, LOCKF–*stat3*, LOCKP–*stat3*, RCSF–*stat4*, RCSP–*stat4*, * – *text***

**Where:**

*id* The 2-byte character or 4-byte hexadecimal ID.

*stat1*
DELAY, IMMED, SDELAU, SIMMED, NO, *DELAY, *IMMED, *SDELAY, *SIMMED, or *NO.

*stat2*
YES or NO.

*stat3*
DASD or PROC.

*stat4*
DFW, RET, CFWS, CFWD, or NO.

*text* VFA IN STAGED MODE

**Explanation:** This message displays the current contents of the in-core record ID attribute table (RIAT) entry for the specified ID.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRTDM commands.

---

**RTDM0032E VFAF-SIMMED/SDELAY AND LOCKF-PROC ARE NOT COMPATIBLE**

**Explanation:** One of the following conditions caused an error because there is a conflict between the lock location on file and the synchronization attribute of the fixed file record ID:

- You entered the ZRTDM MODIFY command with the VFAF parameter specified as SIMMed or SDELay ***and*** the LOCKF parameter specified as PROC. You ***cannot*** specify these parameters at the same time.
- You entered the ZRTDM MODIFY command with the VFAF parameter specified as SIMMed or SDELay when LOCKF is specified as PROC in the record ID attribute table (RIAT). You ***cannot*** specify the VFAF parameter when LOCKF is specified as PROC in the RIAT.
- You entered the ZRTDM MODIFY command with the LOCKF parameter specified as PROC when VFAF is specified as SIMMed or SDELay in the RIAT. You ***cannot*** specify the LOCKF parameter when VFAF is specified as SIMMed or SDELay in the RIAT.

Locks must be stored on an external locking facility such as an IBM 3990 Model 3 or later model with the multi-path lock facility (MPLF) installed whenever virtual file access (VFA) synchronization is active for the fixed file record ID.

**System Action:** The command is rejected and the record ID attribute table (RIAT) is not updated.

**User Response:** Do one of the following:

- Change the fixed file record ID from a VFA synchronization candidate to a VFA candidate before changing lock residency to processor only.
- Change lock residency to disk before updating the synchronization attribute of the fixed file record ID.

See *TPF Operations* for more information about the ZRTDM MODIFY command.

---

**RTDM0033E VFAP-SIMMED/SDELAY and LOCKP-PROC ARE NOT COMPATIBLE**

**Explanation:** One of the following conditions caused an error because there is a conflict between the lock location on file and the synchronization attribute of the fixed file record ID:

- You entered the ZRTDM MODIFY command with the VFAP parameter specified as SIMMed or SDELay ***and*** the LOCKP parameter specified as PROC. You ***cannot*** specify these parameters at the same time.
- You entered the ZRTDM MODIFY command with the VFAP parameter specified as SIMMed or SDELay when LOCKP is specified as PROC in the record ID attribute table (RIAT). You ***cannot*** specify the VFAP parameter when LOCKP is specified as PROC in the RIAT.
- You entered the ZRTDM MODIFY command with the LOCKF parameter specified as PROC when VFAP is specified as SIMMed or SDELay in the RIAT. You ***cannot*** specify the LOCKP parameter when VFAP is specified as SIMMed or SDELay in the RIAT.

Locks must be stored on an external locking facility such as an IBM 3990 Model 3 or later model with the multi-path lock facility (MPLF) installed whenever virtual file access (VFA) synchronization is active for the pool record ID.

**System Action:** The command is rejected and the record ID attribute table (RIAT) is not updated.

**User Response:** Do one of the following:

- Change the pool record ID from a VFA synchronization candidate to a VFA candidate before changing lock residency to processor only.
- Change lock residency to disk before updating the synchronization attribute of the pool record ID.

See *TPF Operations* for more information about the ZRTDM MODIFY command.

---

**RTDM0050E INVALID OPTION SPECIFIED —** *option*

**Where:**

*option*
The option that is not valid.

**Explanation:** The TPF system issues this message when you issue the ZRTDM MODIFY or ZRTDM DISPLAY command.

**System Action:** None.

**User Response:** Enter the command again and specify valid parameters.

See *TPF Operations* for more information about the ZRTDM MODIFY and the ZRTDM DISPLAY commands.

**RTDM0051E INVALID KEYWORD SPECIFIED —** *keyword*

**Where:**

*keyword*
The parameter that is not valid.

**Explanation:** A ZRTDM command was entered with a parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid parameter.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0052E DUPLICATE KEYWORD SPECIFIED –** *keyword*

**Where:**

*keyword*
The duplicate parameter.

**Explanation:** A ZRTDM command was entered with a duplicate parameter specified.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify the correct parameters.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0053E RECID OR OVERRIDE PARAMETER NOT SPECIFIED**

**Explanation:** One of the mandatory parameters, RECID or OVERRIDE, was not specified on the ZRTDM MODIFY command.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again and specify the RECID or OVERRIDE parameter.

See *TPF Operations* for more information about the ZRTDM MODIFY command.

**RTDM0054E INVALID PARAMETER SPECIFIED —** *parameter*

**Where:**

*parameter*
The parameter that is not valid.

**Explanation:** This message is issued when you specify a parameter that is not valid for the ZRTDM commands.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again and specify the correct parameter.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0055E NO ID SPECIFIED IN INPUT MESSAGE**

**Explanation:** No ID was specified on the ZRTDM command.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again and specify at least one ID.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0056E NO KEYWORD SPECIFIED IN INPUT MESSAGE**

**Explanation:** No parameters were specified on the ZRTDM MODIFY command.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again and specify at least one parameter.

See *TPF Operations* for more information about the ZRTDM MODIFY command.

**RTDM0057E INVALID SYNTAX IN INPUT MESSAGE**

**Explanation:** The syntax of the ZRTDM command is incorrect.

**System Action:** None.

**User Response:**
1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0058E NO OPTION SPECIFIED IN INPUT MESSAGE**

**Explanation:** The ZRTDM DISPLAY command or the ZRTDM MODIFY command was entered without specifying a parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the ZRTDM DISPLAY or the ZRTDM MODIFY command.

See *TPF Operations* for more information about the ZRTDM DISPLAY and ZRTDM MODIFY commands.

**RTDM0059E NO PARAMETER SPECIFIED IN INPUT MESSAGE**

**Explanation:** A parameter was specified on the ZRTDM MODIFY command without a corresponding parameter.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZRTDM MODIFY command.

**RTDM0060E RECORD ID *recordid* DOES NOT EXIST IN RIAT**

**Where:**

*recordid*
The record ID.

**Explanation:** The record ID specified on the ZRTDM command was not found in the in core record ID attribute table (RIAT).

**System Action:** None.

**User Response:** Do the following:

1. Check to make sure that the record ID specified in the ZRTDM command was the desired ID.
2. Enter the command again and specify the correct ID.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0061E ILLEGAL RCS DEFINITION FOR ID *id* — CFWS PARAMETER MAY ONLY BE MODIFIED TO CFWD**

**Where:**

*id* Represents a two byte character or four byte hexadecimal ID.

**Explanation:** An attempt was made to change the record caching attribute for the record ID referenced in the message from a cache fast write simplex (CFWS) to an attribute other than cache fast write duplex (CFWD).

**System Action:** None.

**User Response:** Enter the ZRTDM command again and specify the CFWD attribute for either the RCSF or RCSP parameters. Ensure that the duplex records are filed to both prime and duplicate volumes before subsequently changing the record cache subsystem (RCS) attribute to an attribute other than CFWD.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0065E ERROR CALCULATING RIAT FILE ADDRESS FOR ID *recordid***

**Where:**

*recordid*
The record ID.

**Explanation:** An error was encountered in the CIPX segment (file address calculation routines) while trying to calculate the file address of the record ID attribute table (RIAT) record containing the entry for the specified record ID.

**System Action:** Processing for the command is aborted and a system error (SERRC) is generated.

**User Response:** Do the following:

1. Review the system error dump.
2. Take the necessary corrective action.

**RTDM0066E PROCESSING ABORTED**

**Explanation:** Processing for the command was aborted.

**System Action:** None.

**User Response:** This message is preceded by an explanatory error message. Review the console to determine why processing was aborted.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0069E ERROR CALCULATING RIAT FILE ADDRESS**

**Explanation:** An error was encountered in the CIPX segment (file address calculation routines) while calculating the file address of the record ID attribute table (RIAT) RIAT record containing the pool overrides.

**System Action:** Processing for the command is aborted and a system error (SERRC) is generated.

**User Response:** Do the following:

1. Review the system error dump.
2. Take the necessary corrective action.

See *TPF Operations* for more information about the ZRTDM commands.

**RTDM0071E CONTROL VALUE MISMATCH BETWEEN FILE AND INPUT**

**Explanation:** A ZRTDM RESET command was entered specifying a record ID attribute table (RIAT) control value that

did not match the control value stored in the RIAT control record.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZRTDM DISPLAY command specifying the CTLVAL parameter to view the correct RIAT control value on file.
2. Enter the ZRTDM RESET command again specifying the RIAT control value.

See *TPF Operations* for more information about the ZRTDM DISPLAY and ZRTDM RESET commands.

---

**RTDM0072E CONTROL VALUE ON INPUT TO ZRTDM RESET IS NOT VALID**

**Explanation:** A ZRTDM RESET command was entered specifying a record ID attribute table (RIAT) control value that was not verified successfully. One of the following errors occurred:

- The RIAT control value was not provided.
- The RIAT control value was not the correct length.
- The RIAT control value contained nonhexadecimal characters.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZRTDM DISPLAY command specifying the CTLVAL parameter to view the correct RIAT control value on file.
2. Enter the ZRTDM RESET command again specifying the RIAT control value.

See *TPF Operations* for more information about the ZRTDM DISPLAY and ZRTDM RESET commands.

---

**RTDM0082E CONTROL VALUE MISMATCH DURING MODIFY PROCESSING**

**Explanation:** The ZRTDM MODIFY command that was passed by a SIPC message to participating processors in the complex contains a copy of the control value set in the record ID attribute table (RIAT) control record by the activating processor. If, upon retrieval of the control record, the passed value does not match the control value in the file copy of the control record, data corruption may occur.

**System Action:** The command is rejected and a system error is issued. Data corruption may also occur.

**User Response:** Do the following:

1. Verify that the control value in the RIAT control record was not corrupted.
2. Enter the ZRTDM RESET command to reset the control value, if necessary.
3. Enter the ZRTDM MODIFY command again.

See *TPF Operations* for more information about the ZRTDM MODIFY and ZRTDM RESET commands.

---

**RTDM0083E MODIFY ALREADY ACTIVE – RESET MAY BE REQUIRED**

**Explanation:** An error occurred for one of the following reasons:

- A second ZRTDM MODIFY command was entered before the first command completed processing
- More than one ZRTDM MODIFY command was entered at the same time.
- The ZRTDM MODIFY command was entered from multiple processors in the complex at the same time.
- The ZRTDM MODIFY command was entered before resetting the control value in the record ID attribute table (RIAT) control record (which is done by entering the ZRTDM RESET command).
- The ZRTDM MODIFY command was sent to all processors in the loosely coupled complex by entering **ALL/ZRTDM MODIFY**.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZRTDM MODIFY command from only one processor in the complex.
- If this message displays after detecting an error from a previous ZRTDM MODIFY command:
  1. Ensure the RIAT control value was not corrupted.
  2. Enter the ZRTDM RESET command to reset the RIAT control value in the RIAT control record.
  3. Enter the ZRTDM MODIFY command again.

See *TPF Operations* for more information about the ZRTDM MODIFY command.

---

**RTDM0084E PROCESSOR TIME-OUT ON SIPC NOTIFICATION**

**Explanation:** The ZRTDM MODIFY command was entered to modify a specific entry or a group of entries in the record ID attribute table (RIAT), but a timeout error occurred.

**System Action:** The command is rejected and the control value in the RIAT control record remains in an active state.

The in-core copy of the control value of the RIAT control record being processed when the error occurred may not match across all processors in the complex.

If the control value of the RIAT control record was being changed when the error occurred, the processor from which the ZRTDM MODIFY command was entered and any processors in the complex that updated the file copy of the RIAT successfully may remain in staging mode if the synchronization attribute of the record is being modified.

**User Response:** Do the following:

1. Determine why the timeout condition occurred.
2. Enter the ZRTDM RESET command to reset the control value in the RIAT control record as necessary.
3. Enter theZRTDM MODIFY command again.

See *TPF Operations* for more information about theZRTDM MODIFY and ZRTDM RESET commands.

---

**RTDM0089E RECID, OVERRIDE or CTLVAL PARAMETER NOT SPECIFIED**

**Explanation:** One of the following mandatory parameters was not specified on the ZRTDM DISPLAY command:

- RECID
- OVERRIDE
- CTLVAL.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format for the ZRTDM DISPLAY command.
2. Enter the ZRTDM DISPLAY command again specifying the RECID, OVERRIDE, or CTLVAL parameter.

See *TPF Operations* for more information about the ZRTDM DISPLAY command.

**RTDM0096E RECORD ID *recordid* CAN NOT BE A VFA CANDIDATE**

**Where:**

*recordid*
The record ID.

**Explanation:** The record ID specified in the ZRTDM MODIFY command cannot be a virtual file access (VFA) candidate.

**System Action:** The command is rejected and the record ID attribute table (RIAT) is not updated.

**User Response:** Do the following:

1. Verify the record ID.
2. If incorrect, enter the command with the correct record ID.

See *TPF Operations* for more information about the ZRTDM MODIFY command.

**RTDM0097E POOL TYPE *pooldevtype* HAS NOT BEEN GENERATED**

**Where:**

*pool*
The type of pool.

*devtype*
The type of device.

**Explanation:** A ZRTDM MODIFY command was entered with the RTP parameter specified, but a pool of the specified pool type and device type has not been generated.

**System Action:** The command is rejected.

**User Response:** Enter the ZRTDM MODIFY command again and specify a pool and device type that has been generated.

See *TPF Operations* for more information about the ZRTDM MODIFY command.

**RTLP0001I RCAT LOADED**

**Explanation:** The routing control application table was loaded successfully.

**System Action:** The TPF system continues with the restart activities.

**User Response:** None.

**RTLP0002E NO I/S SHARED GLOBAL 3 FOR RCAT**

**Explanation:** CONN determined that no main storage has been set aside for global area 3.

**System Action:** The TPF system ends its attempt to load router tables and continues with other restart activities.

**User Response:** Review the space allocation for the global area 3 of the basic subsystem (BSS).

**RTLP0004E RCIT FIND ERROR, PGM NAME *record***

**Where:**

*record*
The name of the program record.

**Explanation:** An GETPC/FINWC failed when CONN attempts to retrieve the RCIT program record referenced in the message.

**System Action:** The TPF system ends its attempt to load router tables and continues with other restart activities.

**User Response:** Validate the program record referenced in the message.

**RTLP0006E INSUFFICIENT SLOTS IN GLOBY FOR RCAT**

**Explanation:** The router table loader package determined that there are insufficient directory slots for the records that are to be loaded into global area 3.

**System Action:** The TPF system ends its attempt to load router tables and continues with other restart activities.

**User Response:** Review the number of slots allocated and the number records allocated.

Review the system initialization program (SIP) input for the MAXAP parameter of the MSGRT macro, which is used to calculate the number of records required. Refer to the routing control application table (RC0AT).

**RTLP0007E INSUFFICIENT SPACE IN GLOBAL 3 FOR RCAT**

**Explanation:** The router table loader determined that there is not enough room for the records that are to be loaded into global area 3.

**System Action:** The TPF system ends its attempt to load router tables and continues with other restart activities.

**User Response:** Review the space allocation for global area 3 of the basic subsystem (BSS).

It may be necessary to increase the number of blocks defined for the I-stream shared subsystem global area.

**RTLP0008E RCAT ENTRY ALREADY IN TABLE** *progname*

**Where:**

*progname*
The application program name (4 characters).

**Explanation:** In building an routing control application table (RC0AT) entry from the routing control initialization record (RC1IT) entries, CRIJ determined that the application program referenced in the message already has an entry in the RCAT.

**System Action:** The TPF system ignores the application program named in the message and continues with the next RCIT entry.

**User Response:** Review the RCIT entries to see whether there are duplicate entries with the same name (RC1APP).

Review the COHA through COHH program records for duplicate entries.

**RTLP0009E RCAT FULL, NO ROOM FOR** *progname*

**Where:**

*progname*
The application program name (4 characters).

**Explanation:** In building the routing control application table during a fresh load of the router tables, the CONN program CONN detected an RCAT table full condition.

**System Action:** The TPF system ends its attempt to build RCAT entries and continues with other restart activities.

**User Response:** It may be necessary to allocate more # RCATU and I-stream shared global 3 records.

Check the value specified in the MAXAP parameter of the system initialization program (SIP) MSGRT macro. It must be greater than or equal to the number of system-generated application programs plus the number of user-defined applications programs.

**RTLP0033E RCATU FIXED FILE RECORD FIND ERROR WITH FILE ADDRESS** *fileaddr*

**Where:**

*fileaddr*
The file address that was specified incorrectly.

**Explanation:** An attempt to find a #RCATU fixed file record with the file address specified in the message has failed.

**System Action:** The TPF system ends its attempt to load router tables and continues with other restart activities.

**User Response:** Do the following:

1. Verify the file address specified in the message.
2. Review the #RCATU fixed file record and correct the file address in error.

See *TPF System Generation* for more information about allocating fixed file records.

**RTLP0055E FACE ERROR FOR RECORD TYPE RCATU, ORDINAL NUMBER** *ordnum*

**Where:**

*ordnum*
The ordinal number of the failing fixed file record.

**Explanation:** The router table loader program received an error return from the file address compute (FACE) program.

**System Action:** The TPF system ends its attempt to load router tables and continues with other restart activities.

**User Response:** Do the following:

1. Ensure that the #RCATU fixed file record type is defined in the SYSEQ macro.
2. Ensure that the ordinal number is in the range specified in the FACE table (FCTB).

See *TPF Data Communications Services Reference* for more information about the router table loader. See *TPF System Generation* for more information about the FCTB.

# SIPC–SPER

**SIPC0001I TOTALS FOR HOST–***procid*

**Where:**

*procid*
The host processor ID.

**Explanation:** This is a normal response to the ZSIPC DISPLAY command for Multi-Processor Interconnect Facility Interprocessor Communications (MPIF IPC). This message is followed by a display of the system interprocessor communications (SIPC) transmission counts for the host processor.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSIPC DISPLAY command and for an example of the informational display..

**SIPC0001I COUNTS FOR DEST–***procid*

**Where:**

*procid*
The destination processor ID.

**Explanation:** This is a normal response to the ZSIPC command for Multi-Processor Interconnect Facility Interprocessor Communications (MPIF IPC). This message is followed by a display of the system interprocessor communications (SIPC) transmission counts for the destination processor.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSIPC commands and an example of the informational display..

**SIPC0002I COUNTS ZEROED**

**Explanation:** This is a normal response to the ZSIPC ALTER command for Multi-Processor Interconnect Facility Interprocessor Communications (MPIF IPC).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0005I INTERVALS SET**

**Explanation:** This is a normal response to the ZSIPC ALTER command for Multi-Processor Interconnect Facility Interprocessor Communications (MPIF IPC).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0006I MAXIMUM NUMBER OF PATHS ALTERED TO** *value*

**Where:**

*value*
The value to which the maximum number of paths was altered.

**Explanation:** This is a normal response to the ZSIPC ALTER command for Multi-Processor Interconnect Facility Interprocessor Communications (MPIF IPC).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0007I IPC CLASS ALTERED TO** *value*

**Where:**

*value*
The value to which the IPC class was altered.

**Explanation:** This is a normal response to the ZSIPC ALTER command for Multi-Processor Interconnect Facility Interprocessor Communications (MPIF IPC).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0008I IPC RESTART TIMEOUT VALUE ALTERED TO** *value*

**Where:**

*value*
The value to which the IPC restart timeout was altered.

**Explanation:** This is a normal response to the ZSIPC ALTER command for Multi-Processor Interconnect Facility Interprocessor Communications (MPIF IPC).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0050E ACTION IS NOT DISPLAY OR ALTER**

**Explanation:** The ZSIPC ALTER command was entered with an action code specified that is not valid for Multi-Processor Interconnect Facility Interprocessor Communications (MPIF IPC).

The action code must be DISPLAY or ALTER.

**System Action:** The ZSIPC ALTER command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZSPIC ALTER command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0052E INVALID DISPLAY SUBJECT GIVEN**

**Explanation:** The ZSIPC DISPLAY command was entered with a subject specified that is not valid.

The following subjects are valid:

- COUNTS
- STATUS.

**System Action:** The ZSIPC DISPLAY command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZSIPC DISPLAY command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZSIPC DISPLAY command.

**SIPC0053E INVALID ALTER SUBJECT**

**Explanation:** The ZSIPC ALTER command was entered with a subject specified that is not valid.

The following subjects are valid:

- COUNTS
- PATHS
- CLASS
- INTERVALS.

**System Action:** The ZSIPC ALTER command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZSIPC ALTER command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0054E INVALID PROCESSOR ID**

**Explanation:** The ZSIPC DISPLAY command was entered with the COUNTS parameter specified and a processor ID that is not valid.

The processor ID must be one of the following:

- A one character CPU ID of one or the TPF systemin the SDPS complex
- The word ALL.

**System Action:** The ZSIPC DISPLAY command is rejected.

**User Response:** Do the following:

1. Ensure that a processor in the SDPS complex exists with the CPU ID that is being specified.
2. Determine the correct format of the ZSIPC DISPLAY command.
3. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZSIPC DISPLAY command.

**SIPC0055E INVALID VALUE FOR *TIME OR TOUT***

**Explanation:** The ZSIPC ALTER command was entered with the INTERVALS parameter specified and a time or timeout count that is not valid.

**System Action:** The ZSIPC ALTER command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZSIPC ALTER command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0071E IPC INOPERATIVE, REQUEST REJECTED**

**Explanation:** The system is not a shared database (loosely coupled) system.

**System Action:** The ZSIPC command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZSIPC commands.

**SIPC0071T IPC INOPERATIVE, REQUEST REJECTED**

**Explanation:** The system is not a shared database (loosely coupled) system.

**System Action:** The ZSIPC command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZSIPC commands.

**SIPC0072E INVALID PATH PARAMETER**

**Explanation:** The ZSIPC ALTER command was entered with the PATHS parameter specified and a maximum number of paths that is not valid.

**System Action:** The ZSIPC ALTER command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZSIPC ALTER command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0073E INVALID CLASS PARAMETER**

**Explanation:** The ZSPIC ALTER command was entered with the CLASS parameter specified and a class ID that is not valid.

**System Action:** The ZSIPC ALTER command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZSIPC ALTER command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0074E UNABLE TO RETRIEVE KEYPOINT RECORD –E–**

**Explanation:** An error code was returned from CYYM when trying to retrieve Keypoint record E (CTKE) while processing the ZSIPC ALTER command.

**System Action:** The ZSIPC ALTER command is rejected and the segment is exited.

**User Response:** Have your system programmer review the CTL-0FB dump from the CYYM segment.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0075E UNABLE TO FILE KEYPOINT RECORD –E–**

**Explanation:** An error code was returned from CYYA when trying to file keypoint record E (CTKE) while processing a ZSIPC ALTER command.

**System Action:** The ZSIPC ALTER command is rejected and the program is exited.

**User Response:** Have your system programmer review the CTL-0F2 dump from the CYYA segment.

See *TPF Operations* for more information about the ZSIPC ALTER command.

**SIPC0076E INTERVALS NOT SET — TIME AND TOUT NOT SPECIFIED**

**Explanation:** An error resulted from a request to alter the system interprocessor communications (SIPC) timeout interval when the ZSIPC ALTER command with the INTERVAL

parameter specified was entered. A new TIME or a new interval (TOUT) was not specified. One or both need to be specified.

**System Action:** The ZSIPC ALTER command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZSIPC ALTER command.
2. Enter the command again by using the correct format and specify a new TIME or a new interval as necessary.

See *TPF Operations* for more information about the ZSIPC ALTER command.

---

**SIPC0077E IPC INTERVAL NOT SET — VALUE TOO LARGE**

**Explanation:** The ZSIPC ALTER command was entered with the RESTART parameter specified and a restart timeout value that is too large. The value must be between 0 and 65535.

**System Action:** The ZSIPC ALTER command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZSIPC ALTER command.
2. Enter the command again and specify a restart timeout value of 0 through 65535.

See *TPF Operations* for more information about the ZSIPC ALTER command.

---

**SMTP0001E SMTPD: FAILED TO BIND TO SMTPD PORT**

**Explanation:** The Simple Mail Transfer Protocol (SMTP) server was unable to bind to well-known port 25. This indicates that another socket is using this port.

**System Action:** The entry control block (ECB) exits and the SMTP server stops.

**User Response:** Do the following:

1. Enter **ZSOCK INACT LPORT-25** to deactivate the socket using well-known port 25.
2. Enter **ZINET START S-SMTP** to start the SMTP server again.

See *TPF Operations* for more information about the ZINET and ZSOCK commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the SMTP server.

---

**SMTP0002E SMTPD: FAILED TO LISTEN TO SMTPD PORT: CODE** *errno*

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The Simple Mail Transfer Protocol (SMTP) server was unable to process the `listen` function for the socket descriptor.

**System Action:** The entry control block (ECB) exits and the SMTP server stops.

**User Response:** Do the following:

1. Check the value in `errno` to determine the cause of the problem.
2. Correct the problem.
3. Enter **ZINET START S-SMTP** to start the SMTP server again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the SMTP server.

---

**SMTP0003E SMTPD: SELECT FAILED: CODE** *errno*

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The Simple Mail Transfer Protocol (SMTP) server was unable to process the `select` function for the socket descriptor.

**System Action:** The entry control block (ECB) continues to run and issue this message until the problem is resolved or until the SMTP server is stopped.

**User Response:** Do the following:

1. Enter **ZINET STOP S-SMTP** to stop the SMTP server.
2. Check the value in `errno` to determine the cause of the problem.
3. Correct the problem.
4. Enter **ZINET START S-SMTP** to start the SMTP server again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the SMTP server.

---

**SMTP0004E SMTPD: FAILED TO ACCEPT INCOMING CONNECTION: CODE** *errno*

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The Simple Mail Transfer Protocol (SMTP) server was unable to process the `accept` function for the socket descriptor.

**System Action:** The entry control block (ECB) continues to run.

**User Response:** Do the following:

1. Enter **ZMAIL STATUS** to determine if the SMTP server is still running.
2. If the SMTP server is still running, enter **ZINET STOP S-SMTP** to stop the server; otherwise, go to step 3.
3. Check the value in `errno` to determine the cause of the problem.
4. Correct the problem.

5. Enter **ZINET START S-SMTP** to start the SMTP server again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the SMTP server.

---

**SMTP0005E SMTPD: USE ZMAIL START OR ZMAIL START ACCEPT TO START SMTP**

**Explanation:** ZINET START S-SMTP was entered to start the Simple Mail Transfer Protocol (SMTP) server for the first time. You must enter **ZMAIL START** or **ZMAIL START ACCEPT** to start the SMTP server for the first time.

**System Action:** The entry control block (ECB) exits and the SMTP server stops.

**User Response:** Enter **ZMAIL START** or **ZMAIL START ACCEPT** to start the SMTP server.

See *TPF Operations* for more information about the ZINET and ZMAIL commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about TPF Internet mail server support and the SMTP server.

---

**SNAP0001I CPU-*cpuid* SS-*ssname* SSU-*ssu* IS-*istreamnum* PSW–*psw* PGM–*progname* CODE–*errorcode* TERM–*ta***

**Where:**

*cpuid*
CPU ID

*ssname*
The subsystem name.

*ssu* The subsystem user (SSU).

*istreamnum*
The I-stream, which is displayed as a decimal number.

*psw* The program status word (PSW).

*progname*
The program name.

*errorcode*
Snapshot error code. The first character is the prefix.

*ta* The terminal address (TA).

**Explanation:** This message is the snapshot dump header.

**System Action:** None.

**User Response:** Look up the snapshot error code (*lccccccc*) in *Messages (System Error and Offline)* to determine the corrective action to take.

See *TPF General Macros* for more information about the SNAPC macro.

---

**SNAP0002W SNAPC TAPE WRITE ABORTED, NO *tape* TAPE AVAILABLE.**

**Where:**

*tape*
The system dump tape (RTL or RTA).

**Explanation:** The system dump tape is not available.

**System Action:** None.

**User Response:** Mount the system dump tape.

See *TPF General Macros* for more information about the SNAPC macro.

---

**SNDA0001I REQUEST PROCESSED**

**Explanation:** This is the normal response to the ZSNDA command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSNDA command.

---

**SNDA0007E APPLICATION NAME INVALID OR NOT ACTIVE**

**Explanation:** The ZSNDA command was entered with an application name specified that is not valid or whose program is not currently active.

**System Action:** The ZSNDA command is rejected.

**User Response:** Do one of the following:

- If the application name is not valid, enter the ZSNDA command again with the correct application name.
- If the application program is not active, activate it by entering the appropriate ZROUT command. Then enter the ZSNAD command again.

See *TPF Operations* for more information about the ZSNDA and ZROUT commands.

---

**SNDA0009E INVALID CHARACTER(S) IN FIRST OPERAND**

**Explanation:** The ZSNDA command was entered with characters that are not valid. The first operand contains characters other than:

- A through Z
- 1 through 9
- $, #, or @.

**System Action:** Processing is ended.

**User Response:** Enter the ZSNDA command again by using the correct characters for the first operand.

See *TPF Operations* for more information about the ZSNDA command.

---

**SNDA0010E SYSTEM NOT IN NORM STATE**

**Explanation:** You can only enter the ZSNDA command when the TPF system is in NORM state.

**System Action:** The ZSNDA command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Enter the ZSNDA command again.

See *TPF Operations* for more information about the ZSNDA command.

**SNDA0012E OPERAND MISSING OR INVALID**

**Explanation:** The ZSNDA command was entered with a required operand that is not valid or is missing.

**System Action:** Processing is ended.

**User Response:** Enter the ZSNDA command again with the correct operand.

See *TPF Operations* for more information about the ZSNDA command.

**SNDA0013E NO EOM FOUND IN MESSAGE**

**Explanation:** The ZSNDA command was entered without an end-of-message (EOM) character.

**System Action:** The ZSNDA command is rejected.

**User Response:** Do the following:

1. Enter the command again.
2. If the problem continues, see your coverage programmer.

See *TPF Operations* for more information about the ZSNDA command.

**SNDA0016E TEXT GREATER THAN 255 CHARACTERS**

**Explanation:** The ZSNDA command was entered with text greater than 255 characters.

**System Action:** The ZSNDA command is rejected.

**User Response:** Do the following:

1. Shorten the text to less than 255 characters.
2. Enter the ZSNDA command again.

See *TPF Operations* for more information about the ZSNDA command.

**SNDA0018E APPLICATION NAME TOO LONG**

**Explanation:** The ZSNDU command was entered with an application name longer than 4 characters. The application name must be from 1 to 4 characters.

**System Action:** the ZSNDU command is rejected.

**User Response:** Enter the ZSNDU command again and specify an application name that is from 1 to 4 characters.

See *TPF Operations* for more information about the ZSNDA command.

**SNDU0001I REQUEST PROCESSED**

**Explanation:** This is the normal response to the ZSNDU command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSNDU command.

**SNDU0009E INVALID CHARACTER(S) IN FIRST OPERAND**

**Explanation:** The ZSNDU command was entered with characters that are not valid in the first operand, which is the address operand or the CPU ID.

The following characters are valid for the address operand:

- A through F
- 0 through 9.

The following characters are valid for the CPU ID:

- A through Z
- 0 through 9.

**System Action:** Processing is ended.

**User Response:** Enter the ZSNDU command again and specify the correct characters for the first operand.

See *TPF Operations* fo more information about the ZSNDU command.

**SNDU0010E SYSTEM NOT IN NORM STATE**

**Explanation:** The ZSNDU command was entered when the TPF system was not in NORM state.

**System Action:** The ZSNDU command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Enter the ZSNDU command again.

See *TPF Operations* for more information about the ZSNDU command.

**SNDU0012E OPERAND MISSING OR INVALID**

**Explanation:** The ZSNDU command was entered with a required operand that is not valid or is missing.

**System Action:** The ZSNDU command is rejected.

**User Response:** Enter the ZSNDU command again with the correct operand.

See *TPF Operations* for more information about the ZSNDU command.

**SNDU0013E NO EOM FOUND IN MESSAGE**

**Explanation:** The ZSNDU command was entered without an end-of-message (EOM) character.

**System Action:** The ZSNDU command is rejected.

**User Response:** Do the following:

1. Enter the ZSNDU command again.
2. If the problem continues, see your coverage programmer.

See *TPF Operations* for more information about the ZSNDU command.

### SNDU0016E TEXT GREATER THAN 255 CHARACTERS

**Explanation:** The ZSNDU command was entered with text greater than 255 characters.

**System Action:** The ZSNDU command is rejected.

**User Response:** Do the following:

1. Shorten the text to less than 255 characters.
2. Enter the ZSNDU command again.

See *TPF Operations* for more information about the ZSNDU command.

### SNDU0019E INVALID FORMAT IN ADDRESS OPERAND

**Explanation:** The ZSNDU command was entered with an address specified in an incorrect format.

**System Action:** The ZSNDU command is rejected.

**User Response:** Enter the ZSNDU command again by using the correct address format.

See *TPF Operations* for more information about the ZSNDU command and for a description of the correct address format.

### SNMP0001I SNMP CONFIGURATION FILE REFRESHED SUCCESSFULLY

**Explanation:** This is the normal response to the ZSNMP command with the REFRESH parameter specified or to a successful refresh when cycling the TPF system to NORM state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about Simple Network Management Protocol (SNMP) agent support.

### SNMP0002E SNMP CONFIGURATION FILE DOES NOT EXIST

**Explanation:** The ZSNMP command was entered with the REFRESH parameter specified, but the `/etc/snmp.cfg` Simple Network Management Protocol (SNMP) configuration file does not exist in the TPF file system.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Create the `snmp.cfg` SNMP configuration file.
2. Transfer the file to the `/etc` directory in the TPF file system.
3. Enter the ZSNMP command again with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

### SNMP0003E ERROR OPENING SNMP CONFIGURATION FILE, ERRNO–*number*

**Where:**

*number*
The 1-byte number that indicates the error in the `errno.h` file.

**Explanation:** The ZSNMP command was entered with the REFRESH parameter specified, but an error occurred when opening the `/etc/snmp.cfg` Simple Network Management Protocol (SNMP) configuration file.

**System Action:** The command is rejected.

**User Response:** Review the `errno.h` file to determine the error and do the following:

1. Enter **ZFILE ls -l** to allow the `/etc/snmp.cfg` SNMP configuration file to get the current file access permission settings.
2. If the configuration file does not have read permission set, do the following:
   a. Enter **ZFILE chmod** to set read permission for the `/etc/snmp.cfg` SNMP configuration file.
   b. Enter the ZSNMP command with the REFRESH parameter specified to apply the changes.
3. If the configuration file has read permission set, see your system programmer.

See *TPF Operations* for more information about the ZFILE chmod, ZFILE ls, and ZSNMP commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

### SNMP0004E DESTINATION SNMP MANAGER ADDRESS *hostname* COULD NOT BE RESOLVED

**Where:**

*hostname*
The first 30 characters of the Simple Network Management Protocol (SNMP) host name that could not be resolved.

**Explanation:** The host name of the SNMP manager could not be resolved.

**System Action:** The SNMP enterprise-specific trap message is not sent.

**User Response:** Review the `/etc/snmp.cfg` SNMP configuration file to ensure that the host name is coded correctly on the TRAPIP keyword and do one of the following:

- If the host name is coded correctly, examine the remote Domain Name System (DNS) server defined to the TPF system.
- If the host name is coded incorrectly, do the following:
  1. Code the correct TRAPIP keyword.
  2. Enter the ZSNMP command with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0005E DESTINATION SNMP MANAGER ADDRESS WAS NOT SPECIFIED**

**Explanation:** The ZSNMP command was entered with the REFRESH parameter specified, but the trap destination Internet Protocol (IP) address that indicates where to send trap protocol data units (PDUs) was not specified in the `/etc/snmp.cfg` Simple Network Management Protocol (SNMP) configuration file.

**System Action:** The command is rejected.

**User Response:** Review the `/etc/snmp.cfg` SNMP configuration file to ensure that the IP addresses or host names are coded on the TRAPIP keyword and do one of the following:

- If you want to disable traps, do the following:
  1. Code the TRAPIP keyword with a value of NONE in the `/etc/snmp.cfg` SNMP configuration file.
  2. Enter the ZSNMP command again with the REFRESH parameter specified to apply the changes.
- If you want to use traps, do the following:
  1. Define one or more SNMP managers in the `/etc/snmp.cfg` SNMP configuration file.
  2. Enter the ZSNMP command again with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0006E SNMP COMMUNITY NAME WAS NOT SPECIFIED**

**Explanation:** The ZSNMP command was entered with the REFRESH parameter specified, but a community name was not specified in the`/etc/snmp.cfg` SNMP configuration file.

**System Action:** The command is rejected.

**User Response:** Review the `/etc/snmp.cfg` SNMP configuration file to ensure that the community name is coded on the COMMNAME keyword and do the following:

1. If the community name is not coded, code a valid value for the COMMNAME keyword in the `/etc/snmp.cfg` SNMP configuration file.
2. Enter the ZSNMP command again with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0007E SNMP OBJECT IDENTIFIER WAS NOT SPECIFIED**

**Explanation:** The ZSNMP command was entered with the REFRESH parameter specified, but a system object identifier for this TPF processor was not specified in the `/etc/snmp.cfg` SNMP configuration file.

**System Action:** The command is rejected.

**User Response:** Review the `/etc/snmp.cfg` SNMP configuration file to ensure that the system object identifier is coded on the SYSOBJID keyword and do the following:

1. If the system object identifier is not coded, code a valid value for the SYSOBJID keyword in the `/etc/snmp.cfg` SNMP configuration file.
2. Enter the ZSNMP command again with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0008E SNMP TRAP MESSAGE COULD NOT BE SENT TO SNMP MANAGER** *ipaddress*

**Explanation:** An attempt was made to send a Simple Network Management Protocol (SNMP) trap message, but an active link could not be found to allow the TPF system to send the trap.

**System Action:** The SNMP trap message is discarded.

**User Response:** Do one of the following:

- Ensure that the default Internet Protocol (IP) address is associated with an active link.
- Create entries in the IP routing table to send traps out to multiple links.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0009E SNMP MANAGER** *ipaddress* **IS NOT ACCEPTING SNMP TRAP MESSAGES, ICMP ERROR–***error*

**Where:**

*ipaddress*
The Internet Protocol (IP) address of the Simple Network Management Protocol (SNMP) destination manager.

*error*
The error number received on the Internet control message protocol (ICMP) message that is returned from the SNMP destination manager.

**Explanation:** An attempt was made to send an SNMP enterprise-specific trap message, but an ICMP message was received indicating an error.

**System Action:** None.

**User Response:** Verify that the destination IP address is set up as an SNMP manager and do one of the following:

- If the destination IP address is set up as an SNMP manager, ensure the manager application is set up correctly
- If the destination IP address is not set up as an SNMP manager, do the following:
  1. Code a valid SNMP manager address in the `/etc/snmp.cfg` SNMP configuration file.
  2. Enter the ZSNMP command with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0010W SNMP CONFIGURATION FILE HAS NOT BEEN SUCCESSFULLY REFRESHED**

**Explanation:** An attempt was made to refresh the `/etc/snmp.cfg` Simple Network Management Protocol (SNMP) configuration file during cycle-up, but the configuration file could not be refreshed.

**System Action:** The `/etc/snmp.cfg` SNMP configuration file is not refreshed and support is disabled on the TPF system.

**User Response:** Do one of the following:

- To use SNMP agent support, do the following:
  1. Correct the error in the `snmp.cfg` SNMP configuration file.
  2. Transfer the file to the `/etc` directory in the TPF file system.
  3. Enter the ZSNMP command with the REFRESH parameter specified to apply the changes.
- If you do not want to use SNMP agent support, ignore this message.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0011E REJECTED, TCP/IP NATIVE STACK SUPPORT NOT DEFINED**

**Explanation:** The ZSNMP command was entered with the REFRESH parameter specified, but TCP/IP native stack support is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the TCP/IP native stack support parameters in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system.
5. Enter the ZSNMP command again with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for TCP/IP native stack support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

**SNMP0012E ERROR READING SNMP CONFIGURATION FILE, LINE–*number***

**Where:**

*number*
The line in the `/etc/snmp.cfg` Simple Network Management Protocol (SNMP) configuration file where the error was found.

**Explanation:** The ZSNMP command was entered with the REFRESH parameter specified, but an error occurred while reading a line in the `/etc/snmp.cfg` SNMP configuration file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Locate the line in the `/etc/snmp.cfg` SNMP configuration file that contains the error.
2. Ensure that the length of the value of the keyword in the `/etc/snmp.cfg` SNMP configuration file is from 1 to 255 characters.
3. Ensure that the keyword names are valid.
4. Enter the ZSNMP command again with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0013E SYSTEM MUST BE IN CRAS STATE OR ABOVE**

**Explanation:** The ZSNMP command was entered with the REFRESH parameter specified, but the TPF system was below CRAS state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Cycle the TPF system to CRAS state or higher.
2. Enter the ZSNMP command again with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0014E INCORRECT SNMP OBJECT IDENTIFIER, LINE–*number***

**Where:**

*number*
The line in the `/etc/snmp.cfg` Simple Network Management Protocol (SNMP) configuration file where the error was found.

**Explanation:** The ZSNMP command was entered with the REFRESH parameter specified, but the system object identifier in the `/etc/snmp.cfg` SNMP configuration file does not begin with 1.3.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Locate the line in the `/etc/snmp.cfg` SNMP configuration file that contains the error.
2. Ensure that the system object identifier begins with 1.3.
3. Enter the ZSNMP command again with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0015E SNMP CONFIGURATION FILE HAS NOT BEEN SUCCESSFULLY REFRESHED**

**Explanation:** An attempt was made to access fields from the `/etc/snmp.cfg` Simple Network Management Protocol (SNMP) configuration file, but the configuration file has not been refreshed.

**System Action:** The SNMP agent server stops.

**User Response:** Do the following:

1. Create the `snmp.cfg` SNMP configuration file.
2. Transfer the file to the `/etc` directory in the TPF file system.
3. Enter the ZSNMP command with the REFRESH parameter specified to apply the changes.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0016E SNMP AGENT CAN ONLY RUN IN THE BSS**

**Explanation:** An attempt was made to process a Simple Network Management Protocol (SNMP) request in a subsystem other than the basic subsystem (BSS).

**System Action:** The SNMP agent server stops.

**User Response:** Do the following:

1. Delete the Internet daemon from the non-BSS server by entering the ZINET DELETE command.
2. Define the SNMP server to the Internet daemon in the BSS by entering the ZINET ADD command.
3. Start the SNMP server in the BSS by entering the ZINET START command.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about SNMP agent support.

**SNMP0017E ERROR RECEIVING SNMP PROTOCOL DATA UNIT, SOCKERRNO–***number*

**Where:**

*number*
The socket error number.

**Explanation:** An error occurred when the Simple Network Management Protocol (SNMP) agent was receiving a protocol data unit (PDU) from the TCP/IP network.

**System Action:** The SNMP agent server exits.

**User Response:** Do the following:

1. Determine the cause of the socket error.
2. Correct the error.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about socket errors and SNMP agent support.

**SNMP0018I SNMP MIB RETRIEVAL DISPLAY**

**Explanation:** This is the normal response to the ZSNMP command with the DISPLAY parameter specified.

**System Action:** The Management Information Base (MIB) variables that were retrieved from the TPF MIB database are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZSNMP command and for an example of the informational display. See *TPF Transmission Control Protocol/Internet Protocol* for more information about Simple Network Management Protocol (SNMP) agent support.

**SNMP0019I SNMP MIB RETRIEVAL CONTENTS SENT TO FILE** *file*

**Where:**

*file* The name of the file in which the Management Information Base (MIB) variables were saved.

**Explanation:** This is the normal response to the ZSNMP command with the DISPLAY and FILE parameters specified.

**System Action:** The MIB variables that were retrieved from the TPF MIB database are sent to the specified file.

**User Response:** None.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about Simple Network Management Protocol (SNMP) agent support.

**SNMP0020E SNMP ERROR** *error* **RETRIEVING MIB VALUE** *mibval*

**Where:**

*error*
One of the following:

**NOSUCHNAME**
The specified Management Information Base (MIB) variable does not exist.

**GENERR**
An error occurred while encoding the MIB value.

*mibval*
The specified MIB variable.

**Explanation:** The ZSNMP command was entered with the DISPLAY parameter specified, but an error occurred while attempting to retrieve the MIB value.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If *error* is NOSUCHNAME, enter the ZSNMP command again and specify a MIB variable that exists.
- If *error* is GENERR, see your system programmer.

See *TPF Operations* for more information about the ZSNMP command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about Simple Network Management Protocol (SNMP) agent support.

**SNMP0021E ERROR OPENING *filename* - ERROR *errno***

**Where:**

*filename*
The name of the file specified on the command.

*errno*
The error number that was returned from the `open` function.

**Explanation:** The ZSNMP command was entered with the DISPLAY and FILE parameters specified, but an error occurred while attempting to open the specified file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Examine the return codes from the `open` function to determine why the error occurred.
2. Correct the error.
3. Enter the ZSNMP command again with the DISPLAY and FILE parameters specified.

See *TPF Operations* for more information about the ZSNMP command. See the *TPF C/C++ Language Support User's Guide* for more information about the `open` function. See *TPF Transmission Control Protocol/Internet Protocol* for more information about Simple Network Management Protocol (SNMP) agent support.

**SNMP0022E ERROR WRITING TO *filename* - ERROR *errno***

**Where:**

*filename*
The name of the file specified on the command.

*errno*
The error number that was returned from the `write` function.

**Explanation:** The ZSNMP command was entered with the DISPLAY and FILE parameters specified, but an error occurred while attempting to write to the specified file.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Examine the return codes from the `write` function to determine why the error occurred.
2. Correct the error.
3. Enter the ZSNMP command again with the DISPLAY and FILE parameters specified.

See *TPF Operations* for more information about the ZSNMP command. See the *TPF C/C++ Language Support User's Guide* for more information about the `write` function. See *TPF Transmission Control Protocol/Internet Protocol* for more information about Simple Network Management Protocol (SNMP) agent support.

**SOCK0001E IP TABLE FULL – OFFLOAD RESTART ABORTED, ADAPTER ID–*adapterid* PATH ID–*pathid***

**Where:**

*adapterid*
The adapter block address for the TCP/IP offload device.

*pathid*
The path ID for the TCP/IP offload device.

**Explanation:** During the restart of a TCP/IP offload device, the TPF system tried to create an Internet Protocol (IP) entry for an interface address on the TCP/IP offload device but there were no more entries available in the IP table.

**System Action:** Restart of the TCP/IP offload device ends.

**User Response:** Do the following:

1. Increase the value of the CLAWIP parameter in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system again.

See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the values to specify for the TCP/IP parameters in the SNAKEY macro.

**SOCK0002E ADAPTER ID–*adapterid* PATH ID–*pathid* OFFLOAD RESTART RESPONSE ERROR**

**Where:**

*adapterid*
The adapter block address for the TCP/IP offload device.

*pathid*
The path ID for the TCP/IP offload device.

**Explanation:** While restarting the TCP/IP offload device, the TPF system tried to issue a `claw_send` request to send a restart response to the TCP/IP offload device, and an error occurred.

**System Action:** None.

**User Response:** Do the following:

1. Check the status of the TCP/IP offload device and restart the offload application if necessary.
2. Send additional messages through the TCP/IP offload device again.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the `claw_send` function.

**SOCK0003E SOCKET DESCRIPTOR–*filedescriptor* ADDRESS–*address* FILE DESCRIPTOR RELEASE ERROR**

**Where:**

*filedescriptor*
The socket number for the file descriptor.

*address*
The address of the file descriptor.

**Explanation:** An error occurred when the TPF system tried to release a file descriptor.

**System Action:** The file descriptor specified by the socket client is not released and processing continues.

**User Response:** Do the following:

1. Process the 009102 system error dump.
2. Have your system programmer review the system error dump to determine the cause of the problem and correct the error.

---

**SOCK0004E ADAPTER ID–*adapterid* PATH ID–*pathid* ADDRESS–*address* IP ENTRY RELEASE ERROR**

**Where:**

*adapterid*
The adapter block address for the TCP/IP offload device.

*pathid*
The path ID for the TCP/IP offload device.

*address*
The address of the Internet Protocol (IP) entry.

**Explanation:** An error occurred when the TPF system tried to release an entry in the IP table after issuing a `claw_disconnect` to a TCP/IP offload device.

**System Action:** The IP entry specified by the socket client is not released and processing continues.

**User Response:** Do the following:

1. Process the 009102 system error dump.
2. Have your system programmer review the system error dump to determine the cause of the problem and correct the error.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the `claw_disconnect` function.

---

**SOCK0010I SOCKET CONTENTS FORMATTED**

**Explanation:** This is the normal response to the ZSOCK command with the DISPLAY and FORMAT parameters specified. This message is followed by a formatted display of the Transmission Control Protocol/Internet Protocol (TCP/IP) native stack support socket control block information associated with the specified parameters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0011I SOCKET CONTENTS**

**Explanation:** This is the normal response to the ZSOCK command with the DISPLAY parameter specified. This message is followed by a display of the Transmission Control Protocol/Internet Protocol (TCP/IP) native stack support socket control block information associated with the specified parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0012E SYSTEM MUST BE IN CRAS STATE OR ABOVE**

**Explanation:** The ZSOCK command was entered while the TPF system was below CRAS state.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZCYCL command to cycle the TPF system to CRAS state or above.
2. Enter the ZSOCK command again.

See *TPF Operations* for more information about the ZCYCL and ZSOCK commands.

---

**SOCK0013E TCP/IP NATIVE STACK SUPPORT IS NOT DEFINED**

**Explanation:** The ZSOCK command was entered, but Transmission Control Protocol/Internet Protocol (TCP/IP) native stack support has not been defined for this TPF system.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. In keypoint record 2 (CTK2), update SNAKEY parameters MAXSOCK, MAXIPCCW, IPMTSIZE, IPRBUFFS, and IPRBUFSZ to define TCP/IP native stack support.
2. Assemble CTK2.
3. Load CTK2 to the TPF system.
4. Perform an initial program load (IPL) of the TPF system.
5. Enter the ZTTCP DEFINE command with the IP parameter specified to define local IP addresses for the channel-attached IP routers.
6. Enter the ZTTCP DEFINE command with the IP and SDA parameters specified to define local symbolic device addresses (SDAs) for the channel-attached IP routers.
7. Enter the ZTTCP ACTIVATE command with the ALL or SDA parameter specified to activate links to the channel-attached IP routers.
8. Enter the ZSOCK command again.

See *TPF Operations* for more information about the ZSOCK, ZTTCP ACTIVATE, and ZTTCP DEFINE commands.

---

**SOCK0014E REQUIRED PARAMETERS NOT SUPPLIED**

**Explanation:** The ZSOCK command was entered, but one or more of the required parameters was not specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZSOCK command again, specifying all required parameters.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0015E** *sockdesc* **OUT OF ALLOWED RANGE OF SOCKET DESCRIPTORS**

**Where:**

*sockdesc*
The Transmission Control Protocol/Internet Protocol (TCP/IP) native stack support socket descriptor.

**Explanation:** The ZSOCK command was entered with the SOCKET parameter specified to find a socket control block, but the specified socket descriptor is not in the valid range for TCP/IP native stack support socket descriptors.

**System Action:** The command is rejected.

**User Response:** Enter the ZSOCK command again, specifying the correct socket descriptor for the SOCKET parameter.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0016I** **SOCKET** *sockdesc* **IS NOW INACTIVE**

**Where:**

*sockdesc*
A Transmission Control Protocol/Internet Protocol (TCP/IP) native stack support socket descriptor.

**Explanation:** This is the normal response to the ZSOCK command with the INACT and SOCKET parameters specified.

**System Action:** The socket is closed. For a TCP socket, the TCP connection, if established or in the process of being established, is reset.

**User Response:** None.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0017E** **SOCKET** *sockdesc* **IS NOT ACTIVE**

**Where:**

*sockdesc*
A Transmission Control Protocol/Internet Protocol (TCP/IP) native stack support socket descriptor.

**Explanation:** The ZSOCK command was entered with the SOCKET parameter specified, but the socket is not active.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the socket descriptor was correct, there is no further action needed.
- If the socket descriptor was not correct, enter the ZSOCK command again, specifying the correct socket descriptor.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0018I** **INACT COMPLETE,** *numsocks* **SOCKETS CLOSED**

**Where:**

*numsocks*
The number of sockets closed.

**Explanation:** This is the normal response to the ZSOCK command with the INACT parameter specified and the LIP, RIP, LPORT, RPORT, or PROTOCOL parameters specified.

**System Action:** All sockets matching the selection criteria specified by the LIP, RIP, LPORT, RPORT, or PROTOCOL parameters have been closed. Any corresponding Transmission Control Protocol (TCP) connections have been reset.

**User Response:** None.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0019I** **BEGIN CONVERT DISPLAY**

**Explanation:** This is the normal response to the ZSOCK command with the CONVERT parameter specified. This message is followed by a display of the local IP address, local port, remote IP address, remote port, protocol, and socket descriptor for the selected socket.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0020E** **REQUEST HAS MULTIPLE ENTIRES**

**Explanation:** The ZSOCK command was entered with the CONVERT or DISPLAY parameter specified, but the search resulted in multiple socket descriptors that matched the selection criteria specified by the LIP, LPORT, RIP, RPORT, or PROTOCOL parameters.

**System Action:** The command is rejected.

**User Response:** Enter the ZSOCK command again with the correct selection criteria as specified by the LIP, LPORT, RIP, ZSOCK, or PROTOCOL parameters.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0021I** **SOCKET SUMMARY INFORMATION**

**Explanation:** This is the normal response to the ZSOCK command with the SUMMARY parameter specified. This message is followed by a display of all the socket descriptors matching the selection criteria provided by the RIP, RPORT, LIP, LPORT, or PROTOCOL parameters along with selected Transmission Control Protocol/Internet Protocol (TCP/IP) native stack support socket control block fields.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0022E** **NO SOCKET MATCHING SEARCH CRITERIA**

**Explanation:** The ZSOCK command was entered with the CONVERT or DISPLAY parameter specified, but the search resulted in no sockets that matched the selection criteria specified by the LIP, LPORT, RIP, RPORT, or PROTOCOL parameters.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the selection criteria was correct , there is no further action needed.
- If the selection criteria was not correct , enter the ZSOCK command again with the correct selection criteria specified by the LIP, LPORT, RIP, RPORT, or PROTOCOL parameters.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0023E INCORRECT VALUE *value* NOT SUPPORTED FOR *keyword***

**Where:**

*value*
The value specified for the keyword.

*keyword*
The requested keyword.

**Explanation:** The ZSOCK command was entered, but the value is incorrect or not supported for the specified keyword.

**System Action:** The command is rejected.

**User Response:** Enter the ZSOCK command again, specifying the correct value for the keyword.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0024I BEGIN PROCESSING SOCKET DATAFLOW STATISTICS**

**Explanation:** This is the normal response to the ZSOCK command with the DATAFLOW parameter specified.

**System Action:** The TPF system begins the process of determining the number of bytes sent and received across the specified socket.

**User Response:** None.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0025I SOCKET DATAFLOW STATISTICS FOR A 5-SECOND INTERVAL**

**Explanation:** This is the normal response to the ZSOCK command with the DATAFLOW parameter specified.

**System Action:** This message is followed by a display of the number of bytes sent and received across the specified socket in a 5-second interval.

**User Response:** None.

See *TPF Operations* for more information about the ZSOCK command and for an example of the informational display.

---

**SOCK0026E SOCKET-*socket* DOES NOT EXIST**

**Where:**

*socket*
The socket descriptor.

**Explanation:** The ZSOCK command was entered with the DATAFLOW and SOCKET parameters specified, but the socket descriptor specified with the SOCKET parameter does not exist or became inactive in the 5-second interval.

**System Action:** The command is rejected.

**User Response:** Enter the ZSOCK command again and specify the SOCKET parameter with a socket descriptor that is valid.

See *TPF Operations* for more information about the ZSOCK command.

---

**SOCK0027E SOCKET-*socket* IS NOT THE RIGHT TYPE**

**Where:**

*socket*
The socket descriptor.

**Explanation:** The ZSOCK command was entered with the DATAFLOW and SOCKET parameters specified, but the socket descriptor specified with the SOCKET parameter is not a Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) socket in the TPF system.

**System Action:** The command is rejected.

**User Response:** Enter the ZSOCK command again and specify the SOCKET parameter with a socket descriptor that is either a TCP or UDP socket.

See *TPF Operations* for more information about the ZSOCK command.

---

**SONS0001I HALT TIMEOUT VALUE IS *value***

**Where:**

*value*
Decimal value

**Explanation:** This message is a response to the ZSONS ALTER HALT and ZSONS DISPLAY HALT commands. This message shows the current CCSONS halt timeout value.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSONS ALTER HALT and ZSONS DISPLAY HALT commands.

---

**SONS0002I SCAN TIME VALUE IS *value***

**Where:**

*value*
Decimal value

**Explanation:** This message is a response to the ZSONS ALTER SCAN command with the TIME parameter specified or the ZSONS DISPLAY SCAN command. This message shows the current CYED scan interval time value.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSONS ALTER SCAN and the ZSONS DISPLAY SCAN commands.

**SONS0003I ERROR LIMITS COUNT–*value*, INTERVAL–*value***

**Where:**

*value*
Decimal values

**Explanation:** This message is a response to the ZSONS ALTER ERROR LIMITS and ZSONS DISPLAY ERROR LIMITS commands. This message shows the current CCSONS error limits threshold values.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSONS ALTER ERROR LIMITSand ZSONS DISPLAY ERROR LIMITS commands.

**SONS0004I *hour.minute.second* MOD USE DEV COR UNC**

**Where:**

*hour*
The hours.

*minute*
The minutes.

*second*
The seconds.

**Explanation:** This is the normal response to the ZSONS command. A display of module numbers and error counts follows.

The following gap message that is not valid is entered within the display where appropriate:

*modnum1*INVALID UP TO MOD *modnum2*

Where:

*modnum1*
The first module number that is not valid.

*modnum2*
The last module number that is not valid (or is not used) for the module number gap that is not valid..

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSONS commands.

**SONS0005I ALL ERROR COUNTERS CLEARED**

**Explanation:** This message indicates that all the error counters (correctable and irrecoverable) in the module file status table (MFST) section 1 were cleared.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSONS commands.

**SONS0006I *modnum* & FOLLOWING MODS OFFLINE**

**Where:**

*modnum*
The input module number.

**Explanation:** This message only occurs for an online-only request when no modules were found to be online, starting from the module number provided in the message text.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSONS commands.

**SONS0007I RCS STATE-CHANGE-PENDING TIMEOUT VALUE IS *value***

**Where:**

*value*
Decimal value

**Explanation:** This message is a response to the ZSONS ALTER SCP and ZSONS DISPLAY SCP commands. This message shows the current RCS state change pending timeout value.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSONS ALTER SCP and ZSONS DISPLAY SCP commands.

**SONS0052T EITHER A MODULE NUMBER OR ALL REQUIRED**

**Explanation:** The ZSONS ALTER ERROR COUNTS command was entered without specifying the starting module number or the ALL parameter.

**System Action:** The command is rejected.

**User Response:** Specify one of the following, as appropriate:

- The number of the module that you want
- The start of a series of module numbers followed by the two-digit count
- The ALL parameter.

See *TPF Operations* for more information about the ZSONS commands.

**SONS0053T THIS FUNCTION OF ZSONS IS VALID ONLY FOR THE BSS**

**Explanation:** The ZSONS command was entered to alter or display the halt or error limit values from a subsystem other than the basic subsystem (BSS).

The system only uses these values from the BSS. Therefore, only the BSS can display or set the values.

**System Action:** None.

**User Response:** Enter the ZSCONS command again from the BSS.

See *TPF Operations* for more information about the ZSONS commands.

**SONS0054E INVALID STARTING MODULE NUMBER**

**Explanation:** The ZSONS ALTER ERROR COUNTS or ZSONS DISPLAY ERROR COUNTS command was entered with a general file pseudo module number or a real-time disk symbolic module number that is not valid.

Also, if any module in the range specified for an ALTER request is offline, the function issues this message, stops processing of the command, and exits.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a general file pseudo module number or a real-time disk symbolic module number that is valid.

See *TPF Operations* for more information about the ZSONS commands.

**SPER0001I PER TRACE** *keyword* **ACTIVE, ADDR** *address1 – address2* **{Printer–***printername* **Data–***data***}**

**Where:**

*keyword*
Is replaced by the appropriate keyword for the currently active program event recording (PER) trace facility. The valid keywords are BRANCH, INSTRUCT, and STORE.

*address1 – address2*
Represents the address range.

*printername*
The printer name specified by the operator when PER is activated. The printer information is installation specific.

*data*
Data specified by the operator when PER is activated.

**Explanation:** This is the normal response to the ZSPER command with the DISPLAY parameter specified. If the DATA or PRINTER parameter is specified, the second line is displayed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSPER command.

**SPER0002I PER TRACE STARTED**

**Explanation:** This is the normal response to the ZSPER command with the BRANCH, INSTRUCT, or STORE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSPER command.

**SPER0003I PER TRACE ENDED**

**Explanation:** This is the normal response to the ZSPER command with the END parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSPER command.

**SPER0005I PER STOPPED — INTERRUPT LIMIT EXCEEDED**

**Explanation:** This is an unsolicited message sent to the operator that indicates that the number of program event recording (PER) interrupts received in the last monitoring interval was greater than the limit allowed. The limit is set for a maximum of 10 PER interrupts during a 10 second interval.

**System Action:** The PER trace facility is stopped.

**User Response:** Enter the ZSPER command again with an address range that reduces the number of PER interrupts. This user response may be an iterative process.

Use of the DATA parameter does not affect this situation because the hardware PER interrupt occurs on the address whether or not DATA is specified.

See *TPF Operations* for more information about the ZSPER command.

**SPER0006E PER TRACE ALREADY ACTIVE**

**Explanation:** An attempt was made to start the program event recording (PER) monitoring while the PER trace facility was currently active.

**System Action:** The ZSPER command is rejected.

**User Response:** Do the following:

1. End the active PER trace facility.
2. Enter the ZSPER command again.

See *TPF Operations* for more information about the ZSPER command.

**SPER0007E PER TRACE NOT ACTIVE**

**Explanation:** The response to a ZSPER DISPLAY or ZSPER END command when the program event recording (PER) monitor is not active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSPER command.

**SPER0008E BRANCH TRACE RESTRICTED TO PER-2 PROCESSORS**

**Explanation:** The response to an attempt to start PER BRANCH monitoring on a IBM System/370 processor. IBM System/370 processors provide PER storage alteration and instruction fetching functions in a TPF native environment.

IBM System/390 processors provide PER storage allocation, instruction fetching, and branching functions support in a TPF native environment.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSPER command.

---

**SPER0009E ADDRESS WRAP AROUND NOT SUPPORTED**

**Explanation:** The address plus the length specified by RANGE or INTO exceeded the maximum 31-bit address (X'7FFFFFFF'). This caused a wrap around condition, which is not supported.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSPER command.

---

**SPER0010E INVALID ADDRESS**

**Explanation:** The high-order bit in the address specified by RANGE or INTO is on. This is not a valid 31-bit address. Any address X'80000000' or higher is not accepted.

**System Action:** None.

**User Response:** Enter an address that is less than X'80000000'.

See *TPF Operations* for more information about the ZSPER command.

---

**SPER0011E INVALID LENGTH**

**Explanation:** The ZSPER command was entered with the RANGE or INTO parameter but the length specified is zero.

**System Action:** The ZSPER command is rejected.

**User Response:** Enter the ZSPER command again and specify a length greater than zero.

See *TPF Operations* for more information about the ZSPER command.

---

**SPER0012I PER TRACE ACTIVE**

**Explanation:** This is a reminder message that the program event recording (PER) trace facility is active on this processor. The PER trace facility can degrade performance and should not be left on inadvertently.

**System Action:** None.

**User Response:** If the PER trace facility is no longer needed, then deactivate the trace by entering the ZSPER command with the END parameter specified.

See *TPF Operations* for more information about the ZSPER command.

# SQLD–SSLD

---

**SQLD0011I SDD ENTRY FOR RDB *rdbname* ADDED**

**Where:**

*rdbname*
The name of the relational database (RDB) definition.

**Explanation:** The ZSQLD command was entered with the ADD parameter specified to add a new RDB definition to the structured query language (SQL) database management system directory (SDD) in memory and on file.

**System Action:** Processing is completed for the command.

**User Response:** Review this message for your information.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the ZSQLD function.

---

**SQLD0014I SDD INITIATLIZED**

**Explanation:** The ZSQLD command was entered with the INITIALIZE parameter specified to initialize the structured query language (SQL) database management system directory (SDD) in memory and on file.

**System Action:** Processing is completed for the command.

**User Response:** Review this message for your information.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the ZSQLD function.

---

**SQLD0015I SDD ENTRY FOR RDB–*rdbname* MODIFIED**

**Where:**

*rdbname*
The name of the relational database (RDB) definition.

**Explanation:** The ZSQLD command was entered with the MODIFY parameter specified to modify the information associated with the RDB in the structured query language (SQL) database management system directory (SDD).

**System Action:** Processing is completed for the command.

**User Response:** Review this message for your information.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the ZSQLD function.

---

**SQLD0016I SDD ENTRIES FOR RDB–*rdbname* REMOVED**

**Where:**

*rdbname*
The name of the relational database (RDB) definition.

**Explanation:** The ZSQLD command was entered with the REMOVE parameter specified to remove the RDB and its associated information from the structured query language (SQL) database management system directory (SDD) in memory and on file.

**System Action:** Processing is completed for the command.

**User Response:** Review this message for your information.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the ZSQLD function.

---

**SQLD0081I TRACING ADDED FOR ALL RDBS. OVERRIDES SELECTIVE TRACING**

**Explanation:** The ZSQLD command was entered to begin global tracing on all relational database (RDB) names. Global tracing overrides selective tracing although the settings for selective tracing remain unchanged.

**System Action:** The system begins to collect trace entries for all relational database names.

**User Response:** Enter the ZSTTD command to display the trace entries.

See *TPF Operations* for more information about the ZSQLD and ZSTTD commands. See the *TPF Application Requester User's Guide* for more information.

---

**SQLD0082E THE VALUE OF THE PARAMETER MUST BE EITHER ON OR OFF**

**Explanation:** The ZSQLD command was entered with selective tracing specified but the ON or OFF parameters were not specified.

**System Action:** The ZSQLD command is rejected.

**User Response:** Enter the ZSQLD command again and specify the ON parameter to start the selective tracing of relational database entries or the OFF parameter to stop selective tracing.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information.

---

**SQLD0083E THE CCSID SPECIFIED FOR *kind*, *ccsid* IS INCORRECT**

**Where:**

*kind*
The CCSID or TPFCCSID parameter.

*ccsid*
The coded character set identifier (CCSID).

**Explanation:** The ZSQLD command was entered with a coded character set number specified for a coded character set identifier that is not correct. The coded character set identifier must be defined as either single or mixed style when specified alone or as single, double, or mixed style according to the position when specified as part of a single-byte CCSID.double-byte CCSID.mixed-byte CCSID.

The term *style* refers to the CSMNC macro STYLE parameter that specifies whether a coded character set identifier is single-byte, double-byte, or mixed-byte.

**System Action:** The ZSQLD command is rejected.

**User Response:** Ensure that the coded character set identifier that you specified has the correct style (single, double, or mixed) for the position where it is being used to specify a CCSID or TPFCCSID parameter. The style for coded character set identifier can be found in the CSNAM data set.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information.

---

**SQLD0084E A VALUE MUST BE SPECIFIED FOR A CCSID**

**Explanation:** The ZSQLD command was entered with the CCSID or TPFCCSID parameter specified that did not contain a coded character set number. For example, zero (0) is not a valid character set number.

**System Action:** The ZSQLD command is rejected.

**User Response:** Ensure that the coded character set identifier that you specified has correct coded character set numbers with correct styles (single, double, or mixed) for the position where they are being used to specify a CCSID or TPFCCSID parameter.

The term *style* refers to the CSMNC macro STYLE parameter that specifies whether a coded character set identifier is single-byte, double-byte, or mixed-byte.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information.

---

**SQLD0085E THE *kind* SPECIFIED AS *ccsid* IS NOT AVAILABLE**

**Where:**

*kind*
The CCSID or TPFCCSID parameter.

*ccsid*
The coded character set identifier (CCSID).

**Explanation:** The number specified on the ZSQLD command as a coded character set number was not found in the code set registry table. The coded character set identifier (CCSID) must be defined in the CSNAM data set so it can be used.

**System Action:** The ZSQLD command is rejected.

**User Response:** Ensure that the number that you specified is defined in the CPGS table before trying to use it. Otherwise, substitute another CCSID of the appropriate style.

The term *style* refers to the CSMNC macro STYLE parameter that specifies whether a coded character set identifier is single-byte, double-byte, or mixed-byte.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information.

---

**SQLD0086I SELECTIVE TRACING STOPPED**

**Explanation:** Selective tracing of TPF Application Requester entries for a particular relational database (RDB) stops.

**System Action:** The system stops collecting trace entries for the relational database.

**User Response:** Enter the ZSQLD command with the SELECT parameter specified to continue collecting trace entries.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information.

---

**SQLD0087I SELECTIVE TRACING STARTED**

**Explanation:** Selective tracing of TPF Application Requester entries starts for a particular relational database (RDB).

**System Action:** The system begins collecting trace entries for the relational database.

**User Response:** Enter the ZSQLD command with the SELECT parameter specified to stop collecting trace entries.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information.

---

**SQLD0088I GLOBAL TRACING STOPPED. SELECTIVE TRACING ENABLED**

**Explanation:** The ZSQLD command was entered to end global tracing on all relational databases (RDBs). Although global tracing overrides selective tracing, the settings for selective tracing remain unchanged during global tracing. When global tracing stops, selective tracing continues on any relational database names that have selective tracing defined.

**System Action:** The system begins collecting trace entries only for relational databases that are specified for selective tracing.

**User Response:** Enter the ZSTTD command to display the trace entries.

See *TPF Operations* for more information about the ZSQLD and ZSTTD commands. See the *TPF Application Requester User's Guide* for more information.

---

**SQLD0089E THE TPF CCSID SPECIFIED IS NOT INSTALLED**

**Explanation:** The ZSQLD command was entered with a coded character set identifier (CCSID) for the TPFCCSID parameter that is not installed.

**System Action:** The ZSQLD command is rejected.

**User Response:** Do the following:

1. See your system programmer for more information about installed CCSIDS.
2. Enter the command and specify a CCSID that is installed.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information.

---

**SQLD0091E REQUEST FAILED –THE ENTRY FOR RDB–*rdbname* WAS NOT FOUND**

**Where:**

*rdbname*
The name of the relational database (RDB) definition.

**Explanation:** The ZSQLD command was entered with the MODIFY, REMOVE, or DISPLAY parameter specified but the request was canceled because the RDB was not found in the structured query language (SQL) database management system directory (SDD).

**System Action:** Processing is completed for the command request.

**User Response:** Verify that you specified the correct RDB name and whether it is in the SDD.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the function.

---

**SQLD0092E ENTRY for RDB–*rdbname* NOT ADDED --ONE ALREADY EXISTS**

**Where:**

*rdbname*
The name of the relational database (RDB) definition.

**Explanation:** The ZSQLD command was entered with the ADD parameter specified to add the RDB definition to the structured query language (SQL) database management system directory (SDD) and the request was canceled because the definition is already in the SDD. in the SDD.

**System Action:** Processing is completed for the command.

**User Response:** Check whether you have entered the correct RDB name.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the function.

---

**SQLD0093E REQUEST FAILED –THE SDD IS INVALID. INITIALIZATION IS REQUIRED**

**Explanation:** The ZSQLD command was entered but the request was canceled because the structured query language (SQL) database management system directory (SDD) must be initialized first.

**System Action:** Processing is completed for the message request.

**User Response:** Initialize the SDD.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the function.

---

**SQLD0094E ENTRY for RDB–*rdbname* NOT ADDED –THE MAXIMUM NUMBER OF SDD ENTRIES HAVE ALREADY BEEN DEFINED**

**Where:**

*rdbname*
The name of the relational database (RDB) definition.

**Explanation:** The ZSQLD command was entered with the ADD parameter specified but the request was because the maximum number of structured query language (SQL) database management system directories (SDD) specified by MAXSDD in CTK2 are already defined to the TPF system.

**System Action:** Processing is completed for the command.

**User Response:** Do the following:

1. Ensure you have defined the appropriate SDD entries.

2. If all the existing SDD entries are required, do the following:
   a. Enter the ZNKEY command to increase the number of SDD entries.
   b. IPL the TPF system again.
   c. Add the new SDD entry.

See *TPF Operations* for more information about the ZSQLD and ZNKEY commands. See the *TPF Application Requester User's Guide* for more information about the function. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**SQLD0095E THE VALUE SPECIFIED FOR *parameter, value*, IS TOO LARGE –VALUE MUST BE BETWEEN 0 and 65535**

**Where:**

*parameter*
MAXHC or CCSID. MAXHC is the number of hot conversations allowed. CCSID is the coded character set identifier.

*value*
The incorrect value specified.

**Explanation:** The ZSQLD command was entered with a value specified for the ADD or MODIFY parameter that is not valid. The value must be between 0 and 65535.

**System Action:** Processing is completed for the command request.

**User Response:** Do the following:

1. Check the value that is specified for MAXHC or CCSID.
2. Enter the ZSQLD command again and specify a valid value for the ADD or MODIFY parameter.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the function.

---

**SQLD0096E ZSQLD REQUEST FAILED**

**Explanation:** The ZSQLD command was entered but an unknown error occurred so the request is canceled.

**System Action:** Processing is completed for the command.

**User Response:** Check for dumps that may have occurred because of the error.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the function.

---

**SQLD0097E REQUEST FAILED —THE SDD IS NOT AVAILABLE. RESTART MUST COMPLETE FIRST**

**Explanation:** The ZSQLD command was entered but the request was canceled because the structured query language (SQL) database management system directories (SDD) were not loaded yet.

**System Action:** Processing is completed for the ZSQLD command.

**User Response:** Do the following:

1. Ensure the TPF system is in 1052 state.
2. Enter the ZSQLD command again.

See *TPF Operations* for more information about the ZSQLD command. See the *TPF Application Requester User's Guide* for more information about the function.

---

**SQLD0098E TPF CCSID SPECIFIED IS NOT INSTALLED**

**Explanation:** The ZSQLD command was entered with a coded character set identifier (CCSID) specified that was not found in the code set registry table. You must define the coded character set identifier in the CSNAM data set to use it.

**System Action:** The ZSQLD command is rejected.

**User Response:** Do one of the following:

- If you want to use the coded character set identifier specified, define it in the CSNAM data set.
- Use another coded character set identifier of the appropriate style.

The term *style* refers to the CSMNC macro STYLE parameter that specifies whether a coded character set identifier is single-byte, double-byte, or mixed-byte.

See *TPF Operations* and the *TPF Application Requester User's Guide* for more information about the ZSQLD command.

---

**SQLD0117I START OF ZSQLD DISPLAY RDB NETID LU HOSTNAME ----- -------- ---- --------**
*rdbname netid luname hostname* **CCSID (S.D.M) TPFCCSID (S.D.M) MAXHC SEL PORT**
**---------- ---------- ------- -----**
***----- ccsid tpfccsid maxhc selectset port***
**SRVRLSLV –** *srvrlslv* **SRVNAM –** *srvnam*
**SRVCLSNM –** *srvclsnm* **TRACE –** *traceset*
**MODE –** *mode* **AVAIL HC –** *nnnn* **NEXT HC ADDR –** *addr* **END OF ZSQLD DISPLAY**

**Where:**

*rdbname*
The name of the remote database management system (DBMS).

*netid*
The network ID where the DBMS resides, or N/A if this DBMS is accessed by Transmission Control Protocol/Internet Protocol TCP/IP.

*luname*
The logical unit (LU) name where the DBMS resides, or N/A if this DBMS is accessed by LU 6.2.

*hostname*
The Internet Protocol (IP) address or host name where the DBMS resides, or N/A if this DBMS is accessed by TCP/IP.

*ccsid*
The coded character set identifiers (CCSIDs) for the DBMS.

*tpfccsid*
The coded character set identifiers for the TPF system DBMS.

*maxhc*
The maximum number of hot conversations or hot connections (hotcons) allocated to this DBMS.

*sel* The setting of the SELECT switch for the DBMS.

*port*
The port number for the database on the remote application server.

*srvrlslv*
The server release level.

*srvrnam*
The server name.

*srvclsnm*
The server class name.

*traceset*
The setting of the SQL TRACE switch.

*mode*
The APPC mode used for this relational database (RDB), or N/A if this DBMS is accessed by TCP/IP.

*nnnn*
The number of available hotcons.

*addr*
The next hotcon entry.

**Explanation:** This is the normal response to the ZSQLD command with the DISPLAY LONG parameter specified to display the detailed database management system (DBMS) information in the structured query language (SQL) database management directory (SDD).

**System Action:** Processing is completed for the command.

**User Response:** Review this message for your information.

See *TPF Operations* for more information about the ZSQLD command.

---

**SQLD0118I** **START OF ZSQLD DISPLAY RDB NETID LU ----- -------- ---- *rdbname netid luname* MAXHC SEL HOSTNAME ---------- ---------- ------- ----- *maxhc sel hostname* END OF ZSQLD DISPLAY**

**Where:**

*rdbname*
The name of the remote database management system (DBMS).

*netid*
The network ID where the DBMS resides.

*luname*
The logical unit (LU) name where the DBMS resides, or N/A if this DBMS is accessed by TCP/IP.

*maxhc*
The maximum number of hot conversations or hot connections (hotcons) allocated to this DBMS.

*sel* The setting of the SELECT switch for the DBMS.

*hostname*
The Internet Protocol (IP) address or host name where the DBMS resides, or N/A if this DBMS is accessed by LU 6.2.

**Explanation:** This is the normal response to the ZSQLD command with the DISPLAY SHORT parameter specified to display the database management system (DBMS) names and associated information in the structured query language (SQL) database management system directory (SDD).

**System Action:** Processing is completed for the command.

**User Response:** Review this message for your information.

See *TPF Operations* for more information about the ZSQLD command.

---

**SQLD0151W** **SDD ENTRY FOR RDB–*rdbname* ADDED WITH WARNINGS *warning text warning text* END OF WARNINGS**

**Where:**

*rdbname*
The name of the relational database (RDB) definition.

*warning text*
Any combination of the following:

- --THERE IS NO RVT ENTRY FOR THE LU NAME IN THIS ENTRY --AN RVT ENTRY MUST BE ADDED BEFORE THIS RDB CAN BE ACCESSED
- --THE SPECIFIED MAXHC VALUE WOULD EXCEED SYSTEM LIMITS --MAXHC IS REDUCED TO *nnnn*
- --THE RVT ENTRY FOR THE LU NAME IS NOT OF THE CORRECT TYPE --THE LU MUST BE PRIMARY, USE LU6.2, AND BE REMOTE
- --THE HOST NAME SPECIFIED COULD NOT BE CORRECTLY RESOLVED TO AN IP ADDRESS --THE DNS MUST BE ABLE TO RESOLVE THIS NAME BEFORE THE RDB CAN BE ACCESSED

**Explanation:** The ZSQLD command was entered with the ADD parameter specified to add the RDB definition entry to the structured query language (SQL) database management system directory (SDD) in memory and on file.

The warning messages indicate something is wrong with the entry.

If the host name could not be resolved, one of the following reasons may be the cause:

- The message was entered while the TPF system was in 1052 state.
- There is no primary or secondary address defined for the Domain Name System (DNS).
- There is a primary or secondary address defined for the DNS, but the DNS was unable to resolve the host name.
- There was a communication error while connecting to the DNS.

**System Action:** Processing is completed for the command.

**User Response:** Verify that the RDB entry is correct and modify the entry if it is not correct.

See *TPF Operations* for more information about the ZSQLD command.

---

**SQLD0152W SDD ENTRY FOR RDB-*rdbname* MODIFIED WITH WARNINGS *warning text warning text* END OF WARNINGS**

**Where:**

*rdbname*
The name of the relational database (RDB) definition.

*warning text*
Any combination of the following:

- --THERE IS NO RVT ENTRY FOR THE LU NAME IN THIS ENTRY --AN RVT ENTRY MUST BE ADDED BEFORE THIS RDB CAN BE ACCESSED
- --THE SPECIFIED MAXHC VALUE WOULD EXCEED SYSTEM LIMITS --MAXHC IS REDUCED TO nnnn
- —THE RVT ENTRY FOR THE LU NAME IS NOT OF THE CORRECT TYPE —THE LU MUST BE PRIMARY, USE LU6.2, AND BE REMOTE
- --THE HOST NAME SPECIFIED COULD NOT BE PROPERLY RESOLVED TO AN IP ADDRESS --THE DNS MUST BE ABLE TO RESOLVE THIS NAME BEFORE THE RDB CAN BE ACCESSED
- --AT LEAST ONE OF THE PARAMETERS IS NOT VALID FOR THE CURRENT CONNECTION PROTOCOL --THE VALUES HAVE BEEN ACCEPTED BUT WILL NOT BE USED UNTIL THE PROTOCOL CHANGES.

**Explanation:** The ZSQLD command was entered with the MODIFY parameter specified to modify the RDB definition in the structured query language (SQL) database management system directory (SDD) in memory and on file.

The warning messages indicate something is wrong with the modification.

If the host name could not be resolved, one of the following reasons may be the cause:

- The message was entered in 1052 state.
- There is no primary or secondary address defined for the Domain Name System (DNS).
- There is a primary or secondary address defined for the DNS, but the DNS was unable to resolve the host name.
- There was a communication error while connecting to the DNS.

An LU- type parameter was entered, but the RDB was not configured for LU (NETID/MODE).

**System Action:** Processing is completed for the command.

**User Response:** Verify that the RDB entry is correct and modify the entry if it is not correct.

See *TPF Operations* for more information about the ZSQLD command.

---

**SSCP0001I *type name action* PROCESSING COMPLETE**

**Where:**

*type*
The type of device.

*name*
The name of the device.

*action*
The type of action, which can be:

- ACT
- INACT.

**Explanation:** This is a normal response to the ZNETW command. This message has different meanings based on the type of resource:

- Network Control Program (NCP), which means this message is issued only when the virtual route between NCP and the TPF 4.1 system is active.
- CDRM, which means this message is issued only when the CDRM-to-CDRM session is activated and the Start Data Traffic (SDT) was received by the TPF 4.1 system.
- System Services Control Point (SSCP), which means this message is issued when the SSCP and all local resources under the SSCP hierarchy are activated. No SNA data flow takes place in this case.
- Local Logical Unit (LU), which means this message is issued when the resource is activated. No SNA data flow takes place in this case.
- Cross Domain (CD) LU, which means this message is issued only when the LU-to-LU session is activated and the SDT is received by the TPF 4.1 system.

**System Action:** None.

**User Response:** None.

---

**SSCP0002I CDRM *nau* 0858 SENSE TO ACTCDRM, AUTOMATIC RESEND OF ACTCDRM IN PROGRESS**

**Where:**

*nau* The network addressable unit (NAU) for the CDRM session.

**Segment Reference:** CSCP

**Explanation:** An operator is trying to reactivate the CDRM session after the remote system services control point (SSCP) initiated and completed a nondisruptive CDRM inactivation.

If the remote SSCP initiated the nondisruptive CDRM inactivation, the remote SSCP rejects the first ACTCDRM request because it interprets it as an attempt at automatic recovery. The TPF 4.1 system automatically sends the ACTCDRM request again.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**SSCP0003I LU *luname* LU DELETED/REDEFINED DURING DYNAMIC LOAD**

**Where:**

*luname*
The logical unit (LU) name.

**Segment Reference:** CSDL

**Explanation:** A session initiation request was received for a logical unit (LU) that was deleted by a dynamic load.

**System Action:** The session initiation request is rejected.

**User Response:** Do one of the following:

- Enter the ZNOPL FALLBACK command to establish the LU session.
- Load a new offline ACF/SNA table generation (OSTG) tape/general data set (GDS) that contains the LU.

See *TPF Operations* for more information about the ZNOPL commands.

---

**SSCP0004E** **LU *luname* LUNAMES/OSTG GEN NUMBERS MISMATCH BETWEEN RVT1/NCB, SESSION DEACTIVATED**

**Where:**

*luname*
The logical unit (LU) name.

**Segment Reference:** CSDL

**Explanation:** The response to SDT was received for a logical unit (LU) whose LU name or the offline ACF/SNA table generation (OSTG) generation number in the resource vector table (RVT) is different from that in the node control block (NCB).

**System Action:** The session is deactivated.

**User Response:** Do one of the following:

- Check the RVT1 and the NCB to determine whether the LU names match. If the LU names do not match, enter the ZNNCB NOD command.
- If the OSTG generation numbers do not match, perform a fresh load of the OSTG tape/general data set.

See *TPF Operations* for more information about the ZNNCB command.

---

**SSCP0021I** *nauname* **ER 0 NOW OPERATIONAL**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** Explicit Route 0 to the Network Control Program (NCP) name is operational. This is normally a part of the NCP activation sequence.

**Note:** This message is issued only on a test system. It does not appear on a production system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**SSCP0022I** *nauname* **ER 0 NOW ACTIVE**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** Explicit Route 0 to the Network Control Program (NCP) *name* is active. This is normally a part of the NCP activation sequence.

**Note:** This message is issued only on a test system. It does not appear on a production system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**SSCP0023I** *nauname* **VR 0 NOW ACTIVE**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** Virtual Route 0 to the Network Control Program (NCP) *name* is active. This is not normally a part of the NCP activation sequence.

**Note:** This message is issued only on a test system. It does not appear on a production system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command. See *TPF ACF/SNA Data Communications Reference* for more information about FID4 considerations.

---

**SSCP0024I** *nauname* **ER 1 NOW OPERATIONAL**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** Explicit Route 1 to the Network Control Program (NCP) *name* is operational. This is normally a part of the NCP activation sequence.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**SSCP0025I** *nauname* **ER 1 NOW ACTIVE**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** Explicit Route 1 to the Network Control Program (NCP) *name* is active. This is normally a part of the NCP activation sequence.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW ACT command.

---

**SSCP0026I** *nauname* **FORCED NC-DACTVR RECEIVED**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** A forced NC-DACTVR was received for the Network Control Program (NCP). Clean up process is initiated for the NCP.

**System Action:** None.

**User Response:** None.

---

**SSCP0027I** *nauname* **VR 1 NOW ACTIVE**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** Virtual Route 1 to the Network Control Program (NCP) referenced is the message is active. This is normally a part of the NCP activation sequence.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for the ZNETW ACT command. See *TPF ACF/SNA Data Communications Reference* for more information about FID4 considerations.

---

**SSCP0028I** *nauname* **VR RESYNC PROCESSING BEGUN**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** Virtual route resynchronization is activated on the Network Control Program (NCP) specified by the name referenced in the message. This is normally a part of NCP virtual route resynchronization following a software or hardware IPL

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about hardware IPL considerations and FID4 considerations.

---

**SSCP0029I** *device name* **ZNRVT INITIALIZATION COMPLETE**

**Where:**

*device*
The type of device.

*name*
The name of the device.

**Explanation:** This is the normal response to the ZNRVT INITIALIZE command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNRVT INITIALIZE command.

---

**SSCP0030I** *nauname* **VR RESYNC PROCESSING COMPLETE**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** Virtual route resynchronization is complete on the Network Control Program (NCP) specified by *name*. This is normally a part of NCP virtual route resynchronization following a software or hardware IPL.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information about the hardware IPL considerations and FID4 considerations.

---

**SSCP0031E** *nauname* **VR RESYNC FAILED**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSCP

**Explanation:** Virtual route resynchronization failed on the Network Control Program (NCP) specified by *name*. A failure occurred because of one of the following errors:

- A control vector X'3B'l was returned in the response to the ROUTE-TEST command
- The response to the ROUTE-TEST command was not in Format 2.

**System Action:** The TPF 4.1 system issues a DISCONTACT request to disconnect the NCP.

**User Response:** Start the network again.

See *TPF ACF/SNA Data Communications Reference* for more information about the hardware IPL considerations and FID4 considerations.

---

**SSCP0032I** *type name* **NOW BEING SLOW POLLED**

**Where:**

*type*
The type of device.

*name*
The name of the device.

**Segment Reference:** CSDM

**Explanation:** The TPF 4.1 system received an indication that a network addressable unit (NAU) became inoperable. Therefore, the TPF 4.1 system has started slow polling of that node.

**System Action:** None.

**User Response:** None.

---

**SSCP0035I LU *luname* INOPERATIVE**

**Where:**

*luname*
The logical unit (LU) name.

**Segment Reference:** CSDM

**Explanation:** A data message sent on an LU-LU session was rejected with a sense code indicating that the remote LU is no longer active.

**System Action:** The TPF system starts lost terminal processing to clean up the LU-LU session.

**User Response:** Do the following:

1. Activate the remote LU again.
2. Start the LU-LU session again.

See *TPF ACF/SNA Data Communications Reference* for more information about LU-LU sessions and sense code processing.

---

**SSCP0036I *nauname* VR RESYNC FAILED DUE TO TIME-OUT**

**Where:**

*nauname*
The network addressable unit (NAU) name.

**Segment Reference:** CSJP

**Explanation:** Virtual route resynchronization failed on the Network Control Program (NCP) specified by *name*. Failure occurred because the virtual route resynchronization was unable to recover the virtual route sequence number from the NCP within the time-out limit.

**System Action:** If the response to the deactivate virtual route request (DACTVR) is outstanding, the TPF 4.1 system handles the time-out as a good response to DACTVR. Otherwise, the TPF 4.1 system issues a DISCONTACT request to disconnect the NCP.

**User Response:** Start the network again if the NCP is shut down.

See *TPF ACF/SNA Data Communications Reference* for more information about the hardware IPL considerations and FID4 considerations.

---

**SSCP0039I *type name* AUTO NETWORK SHUTDOWN COMPLETE**

**Where:**

*type*
The type of device.

*name*
The name of the device.

**Segment Reference:** CSCP

**Explanation:** The TPF 4.1 system received an auto network shutdown complete (ANSC) input path information unit (PIU). After this message is issued, lost terminal processing is invoked to clean up the system resources.

**System Action:** None.

**User Response:** None.

---

**SSCP0040E CDRM *devicename* CDRM ACTIVATION CONTENTION**

**Where:**

*devicename*
The name of the device.

**Segment Reference:** CSJA

**Explanation:** Contention status was discovered while trying to activate a CDRM. A negative response with sense code X'80D' is issued.

**System Action:** None.

**User Response:** None.

---

**SSCP0041E CDRM *devicename* CDRM DEACTIVATION CONTENTION**

**Where:**

*devicename*
The name of the device.

**Segment Reference:** CSJE

**Explanation:** A cross domain terminate (CDTERM) request was received for a logical unit (LU) that is already involved in a CDTERM operation.

**System Action:** None.

**User Response:** None.

---

**SSCP0042I CDRM *devicename* NOW ACTIVE**

**Where:**

*devicename*
The name of the device.

**Segment Reference:** CSDM

**Explanation:** A cross domain terminate (CDRM) request is active due to the CDRM activation procedure (ACTCDRM).

**System Action:** None.

**User Response:** None.

---

**SSCP0043I CDRM *devicename* NOW INACTIVE**

**Where:**

*devicename*
The name of the device.

**Segment Reference:** CSDM

**Explanation:** A cross domain terminate (CDRM) request is

inactive due to a CDRM deactivation procedure (DACTCDRM).

**System Action:** None.

**User Response:** None.

---

**SSCP0050E** *type name* **ACTIVATE FAILED DUE TO TIMEOUT**

**Where:**

*type*
The type of device.

*name*
The name of the device.

**Segment Reference:** CSDT

**Explanation:** The TPF 4.1 system sent out an SNA start date traffic (SDT) and did not receive a response resulting in the cleaning up of the session.

**System Action:** None.

**User Response:** None.

---

**SSCP0051E** *type name* **SESSION INITIATION FAILED DUE TO NO RESPONSE**

**Where:**

*type*
The type of device.

*name*
The name of the device.

**Segment Reference:** CSDT

**Explanation:** The TPF 4.1 system sent out an SNA bind and did not receive a response resulting in the cleaning up of the session.

**System Action:** None.

**User Response:** None.

---

**SSCP0058E** **LU** *devicename* **ACT FAILED — NAU NOT AVAILABLE....**

**Where:**

*devicename*
The name of the device.

**Segment Reference:** CSCN

**Explanation:** The TPF 4.1 system sent a request to a logical unit (LU) that is not available.

**System Action:** None.

**User Response:** None.

---

**SSCP0072I** *type name* **NODE HAS GONE INOPERATIVE**

**Where:**

*type*
The type of device

*name*
The name of the device

**Segment Reference:** CSDO

**Explanation:** The TPF 4.1 system received an inoperative input path information unit (PIU) indicating that a node became inoperable. After this message is issued, lost terminal processing is entered to clean up the TPF control blocks for that node.

**System Action:** None.

**User Response:** None.

---

**SSCP0073E** *type name* **START FAILED FOR NODE**

**Where:**

*type*
The type of device.

*name*
The name of the device.

**Explanation:** The node was not started because the wrong Network Control Program (NCP) was loaded from the IBM Virtual Telecommunications Access Method (VTAM).

**System Action:** None.

**User Response:** None.

---

**SSCP0079E** *type name* **START FAILED — UNABLE TO ESTABLISH A SESSION**

**Where:**

*type*
The type of device.

*name*
The name of the device.

**Segment Reference:** CSDO

**Explanation:** The TPF 4.1 system received a response from the path information unit (PIU) with a sense code indicating the reason of failure during the starting of a session in sequence. Depending upon the SNA command sent, the TPF 4.1 system aborts, cleans up, or notifies the failed node.

**System Action:** None.

**User Response:** None.

---

**SSCP0089E** *type name* **WRONG NCP LOADED, 37X5–***vtamncp* **TPF–***tpfncp*

**Where:**

*type*
The type of device.

*name*
The name of the device.

*vtamncp*
The Network Control Program (NCP) that was loaded from the IBM Virtual Telecommunications Method (VTAM).

*tpfncp*
The NCP that was specified in the activation request from the TPF 4.1 system.

**Explanation:** An activate request was made for an NCP that was not loaded by VTAM. A different load module was loaded from VTAM.

**System Action:** None.

**User Response:** None.

---

**SSCP0090E** *type name* **LU** *luname* **FUNCTIONAL CONSOLE FAILURE**

**Where:**

*type*
The type of device.

*name*
The name of the device.

*luname*
The logical unit (LU) name.

**Segment Reference:** CMTL

**Explanation:** During an output message transmitter (OMT) lost terminal processing, it is discovered that the failing network addressable unit (NAU) is a functional console. After cleaning up the node control block (NCB), this message is issued to inform the operator of the failure.

**System Action:** None.

**User Response:** None.

---

**SSCP0099E** *type name* **–FME SENSE–***sense* **CMD–***command*

**Where:**

*type*
The type of device.

*name*
The name of the device.

*sense*
The sense data.

*command*
The command.

**Segment Reference:** CSCN

**Explanation:** A network service input path information unit (PIU) is received with sense data included. This message provides that sense data.

**System Action:** None.

**User Response:** None.

# STAT–SYSL

**STAT0001E INVALID PARAMETERS**

**Explanation:** The ZSTAT command was entered with parameters specified that are not valid.

**System Action:** The ZSTAT command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the ZSTAT command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZSTAT command. See *TPF Main Supervisor Reference* for more information.

**STAT0002I STATUS MSG CANCELLED**

**Explanation:** End time-initiated display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTAT command. See *TPF Main Supervisor Reference* for more information.

**STAT0003E INVALID DECIMAL DIGITS**

**Explanation:** A time that is not valid was given for time initialed display value.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTAT command. See *TPF Main Supervisor Reference* for more information.

**STAT0004E** *interval* **MINUTE CRET ALREADY ACTIVE**

**Where:**

*interval*
The interval for the currently active time-initiated display.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTAT command. See *TPF Main Supervisor Reference* for more information.

**STAT0005I CRET DISPLAY STARTED**

**Explanation:** For a time-initiated display.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTAT command. See *TPF Main Supervisor Reference* for more information.

**STAT0006E VALUE INVALID – RANGE 1 TO 99**

**Explanation:** The number of minutes for a time-initiated display must be from 1 to 99.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTAT command. See *TPF Main Supervisor Reference* for more information.

**STAT0011I SYSTEM UTILIZATION DISPLAY**

**Explanation:** This is the normal response to the ZSTAT command with the U parameter specified. The I-stream will be displayed as a decimal number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTAT command and for an example of the informational display.

**STAT0012I SYSTEM STATUS DISPLAY**

**Explanation:** This is the normal response to the ZSTAT command with a single or time-initiated display request.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTAT command and for an example of the informational display.

**STMA0001E INVALID REQUEST**

**Explanation:** The first parameter of the ZSTIM command must be one of the following:

- A for add
- D for display
- C for cancel
- I for initialize.

Otherwise, the request is not recognized.

In addition, if you enter the ZSTIM A or the ZSTIM C command and do not specify a parameter, this message is displayed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM commands. See *TPF Main Supervisor Reference* for more information.

**STMA0001I MSG ADDED TO TIM TBL**

**Explanation:** The text of the ZSTIM A command was inserted into the time-initiated message table successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM A command. See *TPF Main Supervisor Reference* for more information.

**STMA0003E TIME INITIATED FUNCTION NOT AVAILABLE**

**Explanation:** The time-initiated package is not supported for this system.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM command. See *TPF Main Supervisor Reference* for more information.

**STMA0004E PARAMETER INCOMPATIBILITY**

**Explanation:** The ZSTIM command was entered with FREQ and TIME parameters specified that are not compatible.

**System Action:** The ZSTIM command is rejected.

**User Response:** Enter the ZSTIM command again and specify FREQ and TIME parameters that are compatible.

See *TPF Operations* for more information about the ZSTIM command. See *TPF Main Supervisor Reference* for more information.

**STMA0005E REQUIRED KEYWORD PARAMETER MISSING**

**Explanation:** The ZSTIM command was entered without both the FREQ and TIME parameter specified.

One of the following stages must be specified for the TIME parameter:

- 1052S
- 1052E
- CYCLU
- CYCLD
- NORM.

The MSG parameter must be specified.

**System Action:** The ZSTIM command is rejected.

**User Response:** Enter the ZSTIM command again and specify the correct parameters.

See *TPF Operations* for more information about the ZSTIM command. See *TPF Main Supervisor Reference* for more information.

**STMA0006E TIM TBL FULL MSG NOT ADDED**

**Explanation:** The ZSTIM A command was entered with text that is too long to fit into the time-initiated message table.

**System Action:** The ZSTIM A command is rejected.

**User Response:** Do the following:

1. Shorten the text so it fits into the time-initiated message table.
2. Enter the ZSTIM A command again.

See *TPF Operations* for more information about the ZSTIM A command. See *TPF Main Supervisor Reference* for more information.

**STMA0007E I/O ERR ON TIM TBL REC**

**Explanation:** The time-initiated message table cannot be retrieved from external storage.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM command. See *TPF Main Supervisor Reference* for more information.

**STMA0008E FREQ INCORRECTLY SPECIFIED**

**Explanation:** The ZSTIM command was entered with a FREQ parameter that is incorrect. The FREQ parameter must be specified as one of the following:

- IN
- AT
- DAILY
- EVERY.

**System Action:** The ZSTIM command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the ZSTIM command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZSTIM command. See *TPF Main Supervisor Reference* for more information.

**STMA0009E TIME INCORRECTLY SPECIFIED**

**Explanation:** The ZSTIM command with the TIME parameter was entered, but the parameter was specified incorrectly. For a stage-initiated time message, the TIME parameter must be one of the following:

- 1052S
- 1052E
- CYCLU
- CYCLD
- NORM.

If the time parameter is specified in minutes, zero minutes are not allowed. The minutes are only valid in decimal.

The time in hours and minutes must be less than or equal to 23 hours and 59 minutes. The maximum for minutes is 59.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM command. See *TPF Main Supervisor Reference* for more information.

**STMA0010E MSG GT 72 CHAR**

**Explanation:** The ZSTIM command was entered with the MSG parameter specified but the message length is longer than 72 characters.

**System Action:** The ZSTIM command is rejected.

**User Response:** Do the following:

1. Shorten the message text to be less than 72 characters.
2. Enter the ZSTIM command again and specify the MSG parameter.

See *TPF Operations* for more information about the ZSTIM command. See *TPF Main Supervisor Reference* for more information.

**STMA0010E INVALID FUNC MSG SPECIFIED**

**Explanation:** The ZSTIM A command was entered with the MSG parameter specified. The format of the MSG parameter is not valid.

**System Action:** The ZSTIM A command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the ZSTIM A command.
2. Enter the command again and specify the MSG parameter in the correct format.

See *TPF Operations* for more information about the ZSTIM A command. See *TPF Main Supervisor Reference* for more information.

**STMA0011E CLOCK NOT RUNNING, TI MSG NOT ACCEPTED**

**Explanation:** The ZSTIM A command was entered to move the message into the time- initiated table. The message cannot be moved because the system clocks are not running.

**System Action:** The ZSTIM A command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM A command. See *TPF Main Supervisor Reference* for more information.

**STMA0012E APL INCORRECTLY SPECIFIED**

**Explanation:** The ZSTIM A command was entered with the APL parameter specified incorrectly. The parameter must:

- Be no longer than 4 characters
- Begin with an alphabetic character.

**System Action:** The ZSTIM A command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the ZSTIM A command.
2. Enter the ZSTIM A command again by using the correct format.

See *TPF Operations* for more information about the ZSTIM A command. See *TPF Main Supervisor Reference* for more information.

**STMA0013E FSC INCORRECTLY SPECIFIED**

**Explanation:** The ZSTIM A command was entered, but the FSC keyword parameter was specified incorrectly.

The parameter must be one of the following:

- A numeric 1 through 16
- PRC
- RO
- TAPE
- DASD
- AUDT
- COMM.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM A command. See *TPF Main Supervisor Reference* for more information.

**STMA0014E PAST INCORRECTLY SPECIFIED**

**Explanation:** The ZSTIM A command was entered, but the value specified for the PAST parameter was not valid.

The parameter must be one character long and must be one of the following characters:

| Character | Description |
|---|---|
| **Y** | Process past-due time-initiated messages. This is the default. |
| **N** | Do not process past-due time-initiated messages. |

**System Action:** The request is ignored.

**User Response:** Enter the command again by using the correct format for the parameter.

See *TPF Operations* for more information about the ZSTIM A command. See *TPF Main Supervisor Reference* for more information.

**STMC0001E INVALID INDEX**

**Explanation:** One of the following errors occurred:

- The ZSTIM C command was entered with an index number that is not valid. The number must be less than or equal to three decimal digits.
- The index number was not found in the table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM commands. See *TPF Main Supervisor Reference* for more information.

**STMC0001I MSG CANCELLED FROM TIM TBL**

**Explanation:** This is the normal response to the ZSTIM C command. The index number specified was canceled successfully from the time-initiated message table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM C command. See *TPF Main Supervisor Reference* for more information.

**STMC0002E NO MSGS IN TBL**

**Explanation:** The ZSTIM C command was entered but there is no message in the table to cancel.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM C command. See *TPF Main Supervisor Reference* for more information.

**STMC0003E INDEX CHANGED**

**Explanation:** The ZSTIM C command was entered but the system cannot cancel any message in the table because the time-initiated table was updated since it was last displayed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM C command. See *TPF Main Supervisor Reference* for more information.

**STMC0005E I/O ERROR**

**Explanation:** The ZSTIM C command was entered but the time-initiated table cannot be retrieved from external storage.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM C command. See *TPF Main Supervisor Reference* for more information.

**STMD0001E INVALID INDEX**

**Explanation:** One of the following errors occurred:

- The ZSTIM D command was entered with an index number that is not valid. The index number must be less than or equal to three decimal digits.
- The index number was not found in the table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM D command. See *TPF Main Supervisor Reference* for more information.

**STMD0001I TIME-INITIATED MSG** *msgtext*

**Where:**

*msgtext*
The message text with the index number.

**Explanation:** This is the normal response to the ZSTIM D command. This message is followed by a display of the message specified with the index number as referenced in this message.

If the ZSTIM D command is entered without a specific index number, *nnn* will be TBL and all message are displayed.

The user text text cannot exceed the maximum of 30 characters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM D command. See *TPF Main Supervisor Reference* for more information.

---

**STMD0002E NO MSGS IN TBL**

**Explanation:** There are no messages in the table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM commands. See *TPF Main Supervisor Reference* for more information.

---

**STMD0003E INDEX CHANGED**

**Explanation:** The ZSTIM D command was entered but the system cannot display any message in the table because the time-initiated table was updated since it was last displayed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM D command. See *TPF Main Supervisor Reference* for more information.

---

**STMD0005E I/O ERROR**

**Explanation:** The ZSTIM D command was entered but the time-initiated table cannot be retrieved from external storage.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM D command. See *TPF Main Supervisor Reference* for more information.

---

**STMI0001I TIM TBL INITIALIZED**

**Explanation:** This is the normal response to the ZSTIM I command. The time-initiated table was initialized successfully. All messages in the table are cleared to zeros.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM I command. See *TPF Main Supervisor Reference* for more information.

---

**STMI0002E TIM TBL I/O ERROR**

**Explanation:** The Time-Initiated Table cannot be retrieved from external storage.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSTIM commands. See *TPF Main Supervisor Reference* for more information.

---

**STPP0003T *** RTL DUMP RECORD VALIDITY CHECK FAILED *****

**Explanation:** A DP record was encountered on the dump tape whose header contains a series of byte counts that, when added together, do not match the count of data bytes actually read. This indicates a problem with the online system (copy member CEDT of the CCCPSE CSECT).

This message is sent to the printer only.

**System Action:** The STPP program abends with a U2222 error. The tape record that caused the error is dumped to the SNAPDD data set.

**User Response:** The dump data cannot be postprocessed. See your IBM service representative to review the system error dump.

R4 contains the sum of the byte counts extracted from the record header. R8 contains the actual count of data bytes read, obtained from the DCB real-time (RTL) tape and adjusted by the size of the record header and trailer. This information, along with the dump tape when possible, should be forwarded to IBM for problem determination and correction.

See *TPF Program Development Support Reference* for more information about the diagnostic output formatter.

---

**STPP0004T SPANNED DUMP ENCOUNTERED, NEXT TAPE VOLUME MAY BE REQUIRED**

**Explanation:** An end-of-file was encountered unexpectedly while postprocessing dumps. The next tape volume may be required to complete dump processing.

This message is sent to the printer only.

**System Action:** The STPP program is abended with a U2999 error.

**User Response:** Do the following:

1. If you want the remaining dump output, modify the volser list on the SYS000 DD statement of the postprocessor JCL to include the missing tape volumes.
2. Run the job again.

See *TPF Program Development Support Reference* for more information about the diagnostic output formatter.

---

**STPP0005T *** INVALID TAPE — NO DATA ON TAPE *****

**Explanation:** An end-of-file was encountered unexpectedly while postprocessing a tape, before any data records were read.

This message is sent to the printer only.

**System Action:** The STPP program is abended with a U2999 error.

**User Response:** None. The tape cannot be postprocessed.

See *TPF Program Development Support Reference* for more information about the diagnostic output formatter.

---

**STPP0006T *** TAPE VOLUME IS CONTINUATION FROM PREVIOUS - FIRST VOLUME REQUIRED TO PROCESS ***

**Explanation:** You requested one or more dumps from a dump tape but an end-of-file was encountered before a DX record was read. This indicates that no dumps begin on this volume.

This message is sent to the printer only.

**System Action:** The STPP program is abended with a U2999 error.

**User Response:** Do the following:

1. Locate the volume that contains the first dump record for the desired dumps.
2. Add this volume to the volser list on the SYS000 DD statement of the postprocessor JCL.
3. Run the job again.

See *TPF Program Development Support Reference* for more information about the diagnostic output formatter.

---

**STPP0007T *** RTL DX RECORD VALIDITY CHECK FAILED ***

**Explanation:** The amount of dump label table data read from one or more DX records on the tape exceeds the actual size of the dump label table. This indicates a problem with the online system (copy member CEDT of the CCCPSE CSECT).

This message is sent to the printer only.

**System Action:** The STPP program is abended with a U2222 error.

**User Response:** The tape cannot be postprocessed. See your IBM service representative to review the IBM Multiple Virtual Storage (MVS) dump.

R3 points to the header of the current DX record. R8 contains the amount of DX record data read so far. This information, along with the dump tape when possible, should be forwarded to IBM for problem determination and correction.

See *TPF Program Development Support Reference* for more information about the diagnostic output formatter.

---

**STPP0008W *** VOLSER LIST OUT OF SEQUENCE ***

**Explanation:** The tape volumes that appear in the volser list on the SYS000 DD statement of the postprocessor JCL for multivolume postprocessing are not listed in the same order in which the TPF 4.1 system wrote to them.

This message is sent to the printer only.

**System Action:** The dump continues to be processed.

**User Response:** Do the following:

1. Change the order of the volume serial numbers in the volser list.
2. Run the job again.

See *TPF Program Development Support Reference* for more information about the diagnostic output formatter.

---

**STRC0001E ERROR ACCESSING CTKA**

**Explanation:** An error occurred while trying to update the trace options on file.

**System Action:** Processing of the ZSTRC command is exited.

**User Response:** Determine the cause of the find error and correct it.

See *TPF Operations* for more information about the ZSTRC command.

---

**STRC0007I SYSTEM TRACE OPTIONS**

**Explanation:** This is the normal response to the ZSTRC command. This message is followed by a display of the system trace options currently in effect.

**System Action:** The current system trace options are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZSTRC command.

---

**STRC0008I IDLE TIMER IS IGNORED BECAUSE TPF IS RUNNING NATIVE OR UNDER DEDICATED PR/SM**

**Explanation:** When the TPF system is running native or under dedicated PR/SM, the idle timer option is ignored. The idle timer option is only used when the idle timer is turned on and the TPF system is running under the IBM Virtual Machine (VM) system or shared PR/SM.

**System Action:** The idle timer option remains turned on, but is ignored under the current environment. Central processing unit (CPU) timer interrupts will occur at their regular frequency.

**User Response:** None.

See *TPF Operations* for more information about the ZSTRC command.

---

**SYSD0000E FORMAT OF XPARM PARAMETER IS INCORRECT**

**Explanation:** The ZINET START command was entered, but an error occurred because a ZINET ADD or ZINET ALTER command was entered previously with an incorrect value specified for the XPARM parameter.

**System Action:** The entry control block (ECB) exits and the syslog daemon stops.

**User Response:** Do the following:

1. Enter the ZINET ALTER command to correct the values specified for the XPARM parameter.

2. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the syslog daemon and the correct values for the XPARM parameter.

---

**SYSD0001E SYSLOGD: FAILED TO OPEN /tmp/Syslog_Pipe; EXITING**

**Explanation:** The syslog daemon was unable to open the `/tmp/Syslog_Pipe` file. This is the file that is created to hold the messages that are to be logged by the syslog daemon.

**System Action:** The entry control block (ECB) exits and the syslog daemon stops.

**User Response:** Do the following:

1. Enter the ZFILE ls command to check that the `/tmp` directory exists and that the access permission is set to 777, which allows others to read, write, and execute (or search) that directory.
2. If the directory does not exist, enter **ZFILE mkdir /tmp** to create the directory.
3. After you create the directory, or if the directory exists but the access permission is incorrect, enter **ZFILE chmod 777 /tmp** to set the access permission to allow others read, write, and execute permission.
4. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.

If the previous steps do not correct the problem, see your IBM representative for more information.

See *TPF Operations* for more information about the ZFILE and ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the syslog daemon.

---

**SYSD0002E SYSLOGD: FAILED TO OPEN /tmp/syslog.debug FILE; IGNORING DEBUG MODE**

**Explanation:** The syslog daemon was started with the -d argument for debugging mode, but the syslog daemon could not create or open the `/tmp/syslog.debug` file. The syslog daemon must be able to create and open this file to log the debug messages.

**System Action:** The syslog daemon continues with debug mode disabled.

**User Response:** Do the following:

1. Enter the ZFILE ls command to check that the `/tmp` directory exists and that the access permission is set to 777, which allows others to read, write, and execute (or search) that directory.
2. If the directory does not exist, enter **ZFILE mkdir /tmp** to create the directory.
3. After you create the directory, or if directory exists but the access permission is incorrect, enter **ZFILE chmod 777 /tmp** to set the access permission to allow others read, write, and execute permission.
4. Enter **ZINET STOP S-SYSLOGD** to stop the syslog daemon.
5. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.

See *TPF Operations* for more information about the ZFILE and ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the syslog daemon and enabling debug mode.

---

**SYSD0003E SYSLOGD: FAILED TO BIND TO SYSLOGD PORT**

**Explanation:** The syslog daemon was unable to bind to well-known port 514. This indicates that another socket is using this port.

**System Action:** If the syslog daemon is running in debug mode, processing continues. Otherwise, the entry control block (ECB) exits and the syslog daemon stops.

**User Response:** Do one of the following:

- If the syslog daemon is running in debug mode, do the following:
  1. Enter **ZINET STOP S-SYSLOGD** to stop the syslog daemon.
  2. Enter **ZSOCK INACT LPORT-514** to deactivate the socket using well-known port 514.
  3. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.
- If the syslog daemon is not running in debug mode, do the following:
  1. Enter **ZSOCK INACT LPORT-514** to deactivate the socket using well-known port 514.
  2. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.

See *TPF Operations* for more information about the ZINET and ZSOCK commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the syslog daemon.

---

**SYSD0004E SYSLOGD: SELECT FAILED: CODE** *errno*

**Where:**

*errno*
The value set in `errno`.

**Explanation:** The syslog daemon was unable to process the `select` function for the socket descriptor or file descriptor.

**System Action:** If the syslog daemon is running in debug mode, processing continues. Otherwise, the entry control block (ECB) exits and the syslog daemon stops.

**User Response:** Do one of the following:

- If the syslog daemon is running in debug mode, do the following:
  1. Check the debug messages and the value set in `errno` to determine the problem.
  2. Enter **ZINET STOP S-SYSLOGD** to stop the syslog daemon.
  3. Correct the problem.

4. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.

- If the syslog daemon is not running in debug mode, do the following:
  1. Check the value in `errno` to determine the cause of the problem.
  2. Correct the problem.
  3. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.
  4. If the problem continues, go to step 5; otherwise, there is no additional action for you to take.
  5. Enter **ZINET STOP S-SYSLOGD** to stop the syslog daemon.
  6. Enter the ZINET ALTER command and specify the -d argument for the XPARM parameter to enable debug mode.
  7. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.
  8. Check the debug messages to determine the cause of the problem.
  9. Enter **ZINET STOP S-SYSLOGD** to stop the syslog daemon.
  10. Correct the problem.
  11. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the syslog daemon.

---

**SYSD0005E SYSLOGD: FAILED TO READ FROM /tmp/Syslog_Pipe**

**Explanation:** The syslog daemon was unable to read the `/tmp/Syslog_Pipe` file.

**System Action:** The entry control block (ECB) exits and the syslog daemon stops.

**User Response:** Do the following:

1. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.
2. Check the messages from the server as it attempts to re-create the `/tmp/Syslog_Pipe` file to determine the cause of the problem.
3. Enter **ZINET STOP S-SYSLOGD** to stop the syslog daemon.
4. Correct the problem.
5. Enter **ZINET START S-SYSLOGD** to start the syslog daemon again.

See *TPF Operations* for more information about the ZINET commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the syslog daemon.

---

**SYSD0006I SYSLOGD: START OF DEBUG DISPLAY**

**Explanation:** The syslog daemon is in debug mode. This message is followed by various debug messages from the server.

**System Action:** Processing continues. When the syslog daemon stops, these messages are flushed.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the syslog daemon.

---

**SYSD0007I SYSLOGD: CONFIG FILE READ AGAIN SUCCESSFULLY**

**Explanation:** This is the normal response when a ZFILE kill command with a SIGHUP signal specified is entered to force the syslog daemon to read the configuration file again.

**System Action:** The syslog daemon configuration file is read again and processing continues.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the syslog daemon.

---

**SYSG0001I FILE COPY OF SYSTEM GENERATION BITS UPDATED AN IPL MUST BE DONE TO IMPLEMENT THE NEW SYSTEM GENERATION BIT**

**Explanation:** This is a normal response to the ZSYSG ALTER command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG ALTER command.

---

**SYSG0002I SYSTEM GENERATION BIT *bit* NOT UPDATED, WAS ON**

**Where:**

*bit* The system generation bit.

**Explanation:** This is a normal response to the ZSYSG ALTER command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG ALTER command.

---

**SYSG0003I SYSTEM GENERATION BIT *bit* NOT UPDATED, WAS OFF**

**Where:**

*bit* The system generation bit.

**Explanation:** This is a normal response to the ZSYSG ALTER command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG ALTER command.

---

**SYSG0004I SYSTEM GENERATION BIT SETTINGS**

**Explanation:** This is the normal response to the ZSYSG DISPLAY command with the ALL parameter specified. This message is followed by a display of all system generation bit settings.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG DISPLAY command.

**SYSG0005I CORE COPY OF SYSTEM GENERATION BIT SETTINGS FOR CP0GEN*bit***

**Where:**

*bit* The system generation bit.

**Explanation:** This is the normal response to the ZSYSG DISPLAY command. This message is followed by a display of all keywords representing system generation bits within CP0GEN.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG DISPLAY command and an example of the informational display.

**SYSG0006I SYSTEM GENERATION BIT SETTINGS FOR USRGEN*number***

**Where:**

*number*
A decimal number.

**Explanation:** This is the normal response to the ZSYSG command with the USRGEN parameter specified. This message is followed by a display of all keywords representing system generation bits within USRGEN.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG commands.

**SYSG0007I SYSTEM GENERATION BIT *keyword* IS *bitsetting*, *value1* UPDATEABLE, SS *value2***

**Where:**

*keyword*
Keyword for the system generation bit.

*bitsetting*
Setting for the system generation bit (this can be OFF, ON, or RESERVED).

*value1*
NOT or left blank.

*value2*
SHARED or UNIQUE.

**Explanation:** This is the normal response to the ZSYSG command with the DISPLAY parameter specified. This message is followed by a display of the valid keyword for the system generation bit.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG commands.

**SYSG0008I SYSTEM GENERATION BIT *bit* IS RESERVED**

**Where:**

*bit* The system generation bit.

**Explanation:** This is the normal response to the ZSYSG command when the keyword for the system generation bit is reserved.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG commands.

**SYSG0050E INVALID INPUT MESSAGE**

**Explanation:** The format of the ZSYSG command is not valid.

**System Action:** None.

**User Response:** Do the following:

1. Determine the correct format of the ZSYSG command.
2. Enter the ZSYSG command again by using the correct format.

See *TPF Operations* for more information about the ZSYSG commands.

**SYSG0051E INVALID SYNTAX, KEYWORD POINTING TO KEYWORD**

**Explanation:** The syntax is not valid because a keyword is point to a keyword.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG commands.

**SYSG0052E ZSYSG ALTER, KEYWORD PARAMETER REQUIRED**

**Explanation:** The ZSYSG ALTER command was entered without the keyword parameter, which is required.

**System Action:** None.

**User Response:** Enter the ZSYSG ALTER command again with a keyword parameter.

See *TPF Operations* for more information about the ZSYSG ALTER command.

**SYSG0053E ZSYSG ALTER, INVALID KEYWORD INPUT**

**Explanation:** The keyword specified with the ZSYSG ALTER command is not valid.

**System Action:** None.

**User Response:** Enter the ZSYSG ALTER command again with a keyword that is valid.

See *TPF Operations* for more information about the ZSYSG ALTER command.

**SYSG0054E SYSTEM GENERATION BIT ..... CANNOT BE UPDATED**

**Explanation:** A ZSYSG ALTER command was entered to a bit that cannot be updated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG ALTER command.

**SYSG0055E SYSTEM GENERATION BIT IS RESERVED**

**Explanation:** A ZSYSG ALTER command or a ZSYSG DISPLAY command was entered to a reserved bit.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG DISPLAY and the ZSYSG ALTER commands.

**SYSG0056E SYSTEM GENERATION BIT ..... CAN ONLY BE ALTERED FROM THE BSS**

**Explanation:** A ZSYSG ALTER command was entered on a subsystem shared bit from a non-basic subsystem (BSS).

**System Action:** None.

**User Response:** To update a subsystem shared bit, you must enter the ZSYSG ALTER command from the BSS.

See *TPF Operations* for more information about the ZSYSG ALTER command.

**SYSG0057E INVALID ZSYSG DISPLAY MESSAGE**

**Explanation:** A ZSYSG DISPLAY command was entered with extra parameters.

**System Action:** None.

**User Response:** Enter the ZSYSG DISPLAY command again without the extra parameters.

See *TPF Operations* for more information about the ZSYSG DISPLAY command.

**SYSG0058E ZSYSG DISPLAY, INVALID KEYWORD INPUT**

**Explanation:** A ZSYSG DISPLAY command was entered with a keyword specified that is not valid.

**System Action:** None.

**User Response:** Enter the ZSYSG DISPLAY command again with a valid keyword specified.

See *TPF Operations* for more information about the ZSYSG DISPLAY command.

**SYSG0059E INVALID ZSYSG DISPLAY CP0GEN MESSAGE**

**Explanation:** A ZSYSG DISPLAY command was entered with a value specified for the COPGEN parameter that is not valid. The value must be between 0 and 11.

**System Action:** None.

**User Response:** Enter the ZSYSG DISPLAY command again with a valid value for the COPGEN parameter specified.

See *TPF Operations* for more information about the ZSYSG commands.

**SYSG0060E INVALID ZSYSG DISPLAY USRGEN MESSAGE**

**Explanation:** A ZSYSG DISPLAY command was entered with a value specified for the USRGEN parameter that is not valid. The value must be between 0 and 7.

**System Action:** None.

**User Response:** Enter the ZSYSG DISPLAY command again with a valid value specified for the USRGEN parameter.

See *TPF Operations* for more information about the ZSYSG DISPLAY command.

**SYSG0064E ZSYSG ALTER CORE NOT ALLOWED**

**Explanation:** A ZSYSG ALTER command with the CORE parameter specified was entered and this is not allowed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSG commands.

**SYSL0002I CURRENT SHUTDOWN LEVELS FOR CLASS** *ecb*

**Where:**

*ecb* The entry control block (ECB) priority class.

**Explanation:** This is the normal response to the ZSYSL command with the DISPLAY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSL command and for an example of the informational display.

**SYSL0003I OLD SHUTDOWN LEVELS FOR CLASS** *ecb*

**Where:**

*ecb* The entry control block (ECB) priority class.

**Explanation:** This is the normal response to the ZSYSL command with the ALTER parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSL command and for an example of the informational display.

**SYSL0004E KEYPOINT A RETRIEVAL ERROR, ZSYSL FUNCTION ENDED**

**Explanation:** A retrieval error occurred while retrieving keypoint A from file.

**System Action:** The ZSYSL command is rejected. A system error dump is issued.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.

See *TPF Operations* for more information about the ZSYSL command.

**SYSL0005E KEYPOINTING INHIBITED, ZSYSL FUNCTION ENDED**

**Explanation:** Keypoint A cannot be retrieved or changed because of some TPF utilities that are running.

**System Action:** The ZSYSL command ends.

**User Response:** Enter the ZSYSL command again when the utility has completed successfully.

See *TPF Operations* for more information about the ZSYSL command.

**SYSL0006E ZSYSL NOT ALLOWED ON GENERAL FILE IPL**

**Explanation:** You cannot enter the ZSYSL command until the general file is IPLed.

**System Action:** The ZSYSL command ends.

**User Response:** None.

See *TPF Operations* for more information about the ZSYSL command.

**SYSL0007E PARAMETER SPECIFIED IS NOT VALID**

**Explanation:** The ZSYSL command is not valid.

**System Action:** The ZSYSL command is rejected. The help information for the ZSYSL command is displayed automatically.

**User Response:** Do the following:

1. Determine the correct format of the ZSYSL command.
2. Enter the ZSYSL command again by using the correct format.

See *TPF Operations* for more information about the ZSYSL command.

**SYSL0008E SHUTDOWN PERCENTAGE VALUE IS NOT VALID**

**Explanation:** The percentage value for one of the block types exceeds 100 or is less than 0.

**System Action:** The ZSYSL command is rejected.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.
3. Enter the ZSYSL command again.

See *TPF Operations* for more information about the ZSYSL command.

**SYSL0009E CLASS KEYWORD MISSING OR HAS INCORRECT VALUE**

**Explanation:** One of the following errors occurred:

- The class keyword was not specified.
- The class keyword that was specified is not a valid class name.

**System Action:** The ZSYSL command is rejected.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.
3. Enter the ZSYSL command again.

See *TPF Operations* for more information about the ZSYSL command.

# TCTL–TRCC

**TCTL0001E** *name tapename address* **CC***code* **CCW–***command* **CSW–***word* **SNS–***dat*

**Where:**

*name*
Subsystem user name or Basic subsystem (BSS) name.

*tapename*
Symbolic tape name (for example, RTL).

*address*
The device address.

**Note:** Where two paths are defined for the drive, the address given is that used for the failing operation.

*code*
SIO condition code. When a deferred SIOF condition code occurs the deferred condition code is given.

*command*
The channel command that was not successful.

**Note:** When a data chained channel program specified through the TDCTC macro fails, the operation code given is that of the first CCW in the chain.

*word*
Channel status word. This is the CSW associated with the error.

**Note:** For SIO condition code 3 (not operational), the CSW is not meaningful and is not included in the message.

*data*
Sense data. The sense data is only included in the message for unit-check conditions. The number of sense bytes displayed is dependent on the device type. There are 24 bytes displayed for the IBM 3400 series tape drives.

If an input/output (I/O) error prevents the successful sensing of the device, the UNABLE word is displayed in place of the sense data.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

---

**TERM0000E INVALID INPUT**

**Explanation:** The ZTERM command was entered an input that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTERM command.

---

**TERM0001E INVALID LNIATA**

**Explanation:** The ZTERM command was entered with an address that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTERM command.

---

**TFTP0001E TFTP DETECTED AN ERROR ON LINE** *line* **OF CONFIGURATION FILE** *file***:** *desc*

**Where:**

*line* The line number in the Trivial File Transfer Protocol (TFTP) configuration file where the error was detected.

*file* The name of the TFTP configuration file (`/etc/tftp.conf`).

*desc*
A description of why the line is not valid.

**Explanation:** The TFTP server attempted to configure itself using the directives in the configuration file, but found a directive that is not valid on the line specified in the message.

**System Action:** The TFTP server ignores the directive. If no valid directive is found, the TFTP server uses the default value.

**User Response:** Edit the configuration file and correct the directive that is not valid.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the TFTP configuration file.

---

**TFTP0002E TFTP WAS UNABLE TO ACCESS CONFIGURATION FILE** *file***:** *desc*

**Where:**

*file* The name of the Trivial File Transfer Protocol (TFTP) configuration file (`/etc/tftp.conf`).

*desc*
A description of the error that was found.

**Explanation:** The TFTP server attempted to configure itself, but was unable to access the configuration file. This will happen, for example, if TFTP is not authorized to read the configuration file.

**System Action:** The TFTP server continues to use the default configuration. The default settings deny access to all files, so the transfer is denied.

**User Response:** Ensure the configuration file is available and that the TFTP server is authorized to read the file.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the TFTP configuration file.

---

**TMSL0002I EXISTING TIME-SLICE NAMES** *value name*

**Where:**

*value*
ON FILE or IN CORE.

*name*
The time-slice name found in the time-slice name table. Additional time-slice names may follow.

**Explanation:** This is the normal response to the ZTMSL command with the DISPLAY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTMSL command and for an example of the informational display.

---

**TMSL0003I TIME SLICE ATTRIBUTES FOR NAME** *name value*

**Where:**

*name*
The time-slice name.

*value*
ON FILE or IN CORE.

**Explanation:** This is the normal response to the ZTMSL command with the DISPLAY parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTMSL command and for an example of the informational display.

---

**TMSL0004I NEW TIME SLICE ATTRIBUTES FOR NAME** *name value*

**Where:**

*name*
The time-slice name.

*value*
ON FILE or IN CORE.

**Explanation:** This is the normal response to the ZTMSL command with the ADD parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTMSL command.

---

**TMSL0005I OLD TIME SLICE ATTRIBUTES FOR NAME** *name value*

**Where:**

*name*
The time-slice name.

*value*
ON FILE or IN CORE.

**Explanation:** This is the normal response to the ZTMSL command with the CHANGE parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTMSL command and for an example of the informational display.

---

**TMSL0006E ERROR READING OR WRITING TIME-SLICE NAME RECORD**

**Explanation:** The time-slice name table (file copy) cannot be read or written to file.

**System Action:** The ZTMSL command is rejected. A system error dump is issued.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.
3. Ensure that the file copy contains the appropriate time-slice names and attributes.

See *TPF Operations* for more information about the ZTMSL command.

---

**TMSL0007E PARAMETER SPECIFIED IS NOT VALID**

**Explanation:** The ZTMSL command was not specified with the correct positional parameters and keywords.

**System Action:** The ZTMSL command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZTMSL command.
2. Enter the ZTMSL command again by using the correct format.

See *TPF Operations* for more information about the ZTMSL command.

---

**TMSL0008E VALUE OUT OF RANGE**

**Explanation:** The ZTMSL command was entered and one of the following errors occurred:

- The value specified for the RUNTIME keyword is not between 10 and 500.
- The value specified for the MAXTIME keyword is not between 0 and 9999999.
- The value specified for the MINSUSP keyword is not between 0 and 9999.
- The value specified for the MAXECB keyword is not between 0 and 9999.

**System Action:** The ZTMSL command is rejected.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.
3. Enter the ZTMSL command again and specify a valid value.

See *TPF Operations* for more information about the ZTMSL command.

---

**TMSL0009E TIME-SLICE NAME NOT FOUND** *value*

**Where:**

*value*
ON FILE or IN CORE.

**Explanation:** The name specified does not exist in the time-slice name table.

**System Action:** The ZTMSL command is rejected.

**User Response:** Do the following:

1. Determine the cause of the problem.
2. Correct the problem.
3. Enter the ZTMSL command again and specify a valid time slice name.

See *TPF Operations* for more information about the ZTMSL command.

---

**TMSL0010I TIME-SLICE NAME** *name* **HAS BEEN REMOVED** *value*

**Where:**

*name*
The time-slice name.

*value*
ON FILE or IN CORE.

**Explanation:** The time-slice name specified has been removed. If this operation was performed on the core copy of the time-slice name table, the entry that contains this name is

set to *NOT VALID*. This entry cannot be used again until the next initial program load (IPL).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTMSL command.

---

**TMSL0011E NO SPACE AVAILABLE IN THE TIME SLICE NAME TABLE** *value*

**Where:**

*value*
ON FILE or IN CORE.

**Explanation:** The time-slice name table is full. You cannot add an additional time-slice name.

**System Action:** The ZTMSL command ends.

**User Response:** Do one of the following:

- For a core copy update, IPL the processor again to clear out slots in the core copy of the time-slice name table for names that were deleted.
- Do the following:
  1. Enter the ZTMSL command with the REMOVE parameter specified to delete some unused time-slice names.
  2. IPL the TPF system again.
  3. Enter the ZTMSL command with the ADD parameter specified to add additional time-slice names.

See *TPF Operations* for more information about the ZTMSL command.

---

**TMSL0013E TIME-SLICE NAME ALREADY EXISTS** *value*

**Where:**

*value*
ON FILE or IN CORE.

**Explanation:** The time-slice name specified on the ZTMSL command already exists.

**System Action:** The ZTMSL command is rejected.

**User Response:** Do the following:

1. Determine whether the time-slice name specified is correct.
2. Enter the ZTMSL command again and specify a valid time-slice name.

See *TPF Operations* for more information about the ZTMSL command.

---

**TMSL0014E CORE COPY OPERATION NOT VALID DURING RESTART**

**Explanation:** The ZTMSL command was entered with the CORE COPY parameter specified while the TPF system is in restart.

**System Action:** The ZTMSL command ends.

**User Response:** Do one of the following:

- Update the file copy.
- Enter the ZTMSL command again when the TPF system reaches 1052 state.

See *TPF Operations* for more information about the ZTMSL command.

---

**TMSL0015E COPY PARAMETER SPECIFIED IS NOT VALID**

**Explanation:** The format of the ZTMSL command is not correct.

**System Action:** The ZTMSL command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the ZTMSL command.
2. Enter the ZTMSL command again by using the correct format.

See *TPF Operations* for more information about the ZTMSL command.

---

**TPLD0001I STARTING LOAD TO IMAGE** *imagename* **FROM DDNAME** *name*

**Where:**

*imagename*
A 5 to 8 character image name.

*name*
A 1 to 16 character alphanumeric data definition name of the input device (general data set (GDS), tape, virtual reader, or user-define device) that contains the program data.

**Explanation:** Auxiliary loader processing is starting for the image and data definition referenced in the message.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

---

**TPLD0002I** *namecode* **LOADED**

**Where:**

*name*
The component name.

*code*
The version code.

**Explanation:** The specified component was loaded successfully.

**System Action:** Processing is continued.

**User Response:** None.

See *TPF System Installation Support Reference* for more information.

---

**TPLD0003I** *number* **E-TYPE PROGRAMS LOADED**

**Where:**

*number*
The number of E-type programs loaded.

**Explanation:** The specified number of E-type programs were loaded successfully.

**System Action:** Processing continues.

**User Response:** None.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0004I LOAD COMPLETE**

**Explanation:** The auxiliary loader processing completed successfully.

**System Action:** None.

**User Response:** If the input file contained all of the necessary program components, you can now use the ZIMAG ENABLE command to enable the newly-loaded image to be used.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0099I ZTPLD** *imagename name*

**Where:**

*imagename*
A 5 to 8 character image name.

*name*
A 1 to 16 character alphanumeric data definition name of the input device (general data set (GDS), tape, virtual reader, or user-define device) that contains the program data.

**Explanation:** The help menu requested for the ZTPLD command is displayed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0101E REQUEST REJECTED – IMAGE** *imagename* **IS ENABLED**

**Where:**

*imagename*
The image name.

**Explanation:** The image referenced in the message is enabled. Therefore, programs cannot be loaded to it.

**System Action:** None.

**User Response:** Do one of the following:

- Disable the image referenced in the message
- Load to another image.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0102E REQUEST REJECTED – IMAGE** *imagename* **IS NOT DEFINED**

**Where:**

*imagename*
The image name.

**Explanation:** The ZTPLD command was entered with an image name specified that is not defined.

**System Action:** The ZTPLD command is rejected.

**User Response:** Enter the ZTPLD command again specifying the name of a defined image.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0103E REQUEST REJECTED — DDNAME** *name* **CANNOT BE OPENED**

**Where:**

*name*
A 1 to 16 character alphanumeric data definition name of the input device (general data set (GDS), tape, virtual reader, or user-define device) that contains the program data.

**Explanation:** The ZTPLD command was entered with a tape name, GDS name, virtual reader name, or user-defined media that cannot be opened.

This message is preceded by other messages that provide further details about why the tape name, TDS name, VRDR name, or user-defined media cannot be opened.

**System Action:** The ZTPLD command is rejected.

**User Response:** Refer to the previous messages for more information about correcting this error.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0104E REQUEST REJECTED — IPL AREA IN USE**

**Explanation:** The initial program load (IPL) area defined to the specified image is in use by another enabled image.

**System Action:** None.

**User Response:** Do one of the following:

- Disable all other images using the same IPL area.
- Associate another IPL area with the specified image by entering the ZIMAG DEFINE command.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0105E REQUEST REJECTED — PROG AREA IN USE**

**Explanation:** The program area defined to the specified image is in use by another enabled image.

**System Action:** None.

**User Response:** Do one of the following:

- Disable all other images using the same IPL area.
- Associate another IPL area with the specified image by entering the ZIMAG DEFINE command.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0106E REQUEST ABORTED**

**Explanation:** An error occurred during auxiliary loader processing.

**System Action:** Auxiliary load processing is ended.

**User Response:** This message is preceded by other messages that provide further details about the type of error that occurred. Refer to the explanation of those messages to determine the appropriate action.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0107E REQUEST REJECTED — ADDRESS MISMATCH FOR THE FOLLOWING COMPONENTS** *name*

**Where:**

*name*
The component name, which is one of the following:

- IPL*x*, where *x* is a number from 1 through 4.
- CIMR*x*, where *x* is a number from 1 through 8.
- CTKX.

**Explanation:** The address saved in the image control record for the listed areas does not match the address obtained online from FACS.

**System Action:** The auxiliary load processing is ended.

**User Response:** Do the following:

1. Use the ZIMAG CLEAR and ZIMAG DEFINE commands to reinitialize
2. Load all components.

Otherwise, correct the file address computer program (FACE) table (FCTB) and enter the request again.

See *TPF Operations* for more information about the ZTPLD, ZIMAG CLEAR, and ZIMAG DEFINE commands. See *TPF System Installation Support Reference* for more information.

**TPLD0108E REQUEST REJECTED — LOAD NOT FOR CORRECT SUBSYSTEM**

**Explanation:** The input file was generated for a subsystem other than from where the ZTPLD command was entered.

**System Action:** Auxiliary load processing is ended.

**User Response:** Enter the ZTPLD command again from the correct subsystem.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0109E REQUEST ABORTED COMPONENT** *name* **IS TOO LARGE FOR TARGET IMAGE DEFINED SIZE -** *size1* **ACTUAL SIZE -** *size2*

**Where:**

*name*
The name of the CIMR component that is larger on the input file than that defined in the image CTKX record.

*size1*
The defined size of the component in the CTKX record.

*size2*
The actual size of the component on the input file.

**Explanation:** The load request was not processed because a component in the input file is larger than the area defined for the component in the image CTKX record.

**System Action:** The auxiliary load processing is ended.

**User Response:** Do one of the following:

- Load a new CTKX record to the specified image.
- Create an input file without the specified component.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0110W INVALID KEYPT** *keypoint* **FOR THIS SUBSYSTEM**

**Where:**

*keypoint*
The name of the keypoint that resides only in the basic subsystem (BSS).

**Explanation:** The input file contains a BSS-only keypoint record, while the auxiliary loader is running for a non-BSS subsystem.

**System Action:** The keypoint record is ignored and processing is continued.

**User Response:** Do not include the specified keypoint in the input deck when running the offline job (TLDR) for a non-BSS subsystem.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0111E REQUEST ABORTED — CTKX MUST BE LOADED FIRST**

**Explanation:** One of the following errors occurred:

- CTKX was not loaded previously to the image and the input file does not contain CTKX.
- CTKX is not the first data item within the input file.

**System Action:** The auxiliary load processing is ended.

**User Response:** Do one of the following:

- Create an input file that contains CTKX and load it to the image.
- Verify that your input deck to the offline job (TLDR) is correct.
- Enter the ZIMAG COPY command to copy the CTKX from another image.

See *TPF Operations* for more information about the ZTPLD and ZIMAG COPY commands. See *TPF System Installation Support Reference* for more information.

**TPLD0114E REQUEST ABORTED — EXPECTED ITEM NOT FOUND IN INPUT FILE PREMATURE EOF WHILE READING DDNAME** *name*

**Where:**

*name*
A 1 to 16 character alphanumeric data definition name of the input device (general data set (GDS), tape, virtual reader, or user-define device) that contains the program data.

**Explanation:** The auxiliary loader expected to read additional records from the input file but the end of the input file occurred prematurely.

**System Action:** A system error dump is issued and load processing is ended.

**User Response:** Do one of the following:

- Verify that the input deck to the offline job (TLDR) is correct.
- Check to see whether the input file was truncated.
- Run the offline job (TLDR) again to generate a new tape or general data set (GDS).
- Analyze the OPR-07C system dump to determine the cause of the problem.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0115W E-TYPE LOADER CONTROL RECORDS NOT AFFECTED BY LOAD**

**Explanation:** This message is issued only when E-type programs are loaded by the auxiliary loader. The E-type loader control records were not cleared because the ELDR CLEAR option was not specified in the input deck when running the offline job (TLDR). This means that after the auxiliary loader has completed processing, the image may still contain E-type programs that were loaded previously with the E-type loader. These programs may now be obsolete because of E-type programs included in the input file for the auxiliary loader. However, these previous versions of programs are still available for processing.

**System Action:** Auxiliary load processing is continued.

**User Response:** Exercise caution with any programs that were loaded previously using the E-type loader. Ensure that there are no compatibility problems between the programs that were loaded previously (by entering the ZOLDR LOAD command) and the programs that are loaded now (by entering the ZTPLD command).

Otherwise, you can clear out the programs that were previously loaded by entering the ZOLDR CLEAR or ZOLDR DELETE commands, or by using the ELDR CLEAR option in the input deck for the offline job (TLDR).

See *TPF Operations* for more information about the ZTPLD and ZOLDR commands. See *TPF System Installation Support Reference* for more information.

**TPLD0116E REQUEST ABORTED — ERROR WRITING IHR**

**Explanation:** A system error or an input/output (I/O) error occurred while trying to update the image history record, which contains information about components loaded in each image.

**System Action:** The auxiliary load processing is ended.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Correct the error.
3. Enter the ZTPLD command again.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0117E REQUEST ABORTED — ERROR WRITING RECORD TO** *rectype* **ORDINAL NUMBER** *ordnum*

**Where:**

*rectype*
The FACS record type.

*ordnum*
The record ordinal number.

**Explanation:** A system error or an input/output (I/O) error occurred while trying to write a record at the specified file type and ordinal position.

**System Action:** The auxiliary load processing is ended.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Correct the error.
3. Enter the ZTPLD command again.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0118E REQUEST ABORTED — EXPECTED ITEM NOT FOUND IN INPUT FILE TLDR OUTPUT MAY HAVE BEEN CORRUPTED**

**Explanation:** The auxiliary loader did not find an expected data item within the input file.

**System Action:** The OPR-07C system dump is issued and the load processing is ended.

**User Response:** Do one of the following:

- Verify that the input deck to the offline job (TLDR) is correct.
- Check to see whether the input file was damaged.
- Run the offline job (TLDR) again to generate a new tape or general data set (GDS).
- Analyze the OPR-07C system dump to determine the cause of the problem.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0119E REQUEST ABORTED — ERROR WRITING CTKX FOR IMAGE** *imagenum*

**Where:**

*imagenum*
The image number.

**Explanation:** A system error or an input/output (I/O) error occurred while trying to update the CTKX record for the specified image number.

**System Action:** The auxiliary load processing is ended.

**User Response:** Do the following:

1. Determine the cause of the system error or the I/O error.
2. Correct the error.
3. Enter the ZTPLD command again.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0120W UNABLE TO CHECK IPAT COMPATIBILITY**

**Explanation:** A system error or an input/output (I/O) error occurred while trying to retrieve the IPAT record for the target image to do IPAT compatibility checking.

**Note:** This checking is only done when the input file for ZTPLD does not include IPAT and includes components that may depend upon the allocator (anything other than CP, CTKX, file address compute program (FACE) table (FCTB)).

**System Action:** Auxiliary load processing is continued.

**User Response:** Do one of the following:

- Load IPAT to the target image with the auxiliary loader (offline program TLDR and online ZTPLD command).
- Enter the ZIMAG COPY command to copy the IPAT to the target image.

See *TPF Operations* for more information about the ZTPLD and ZIMAG COPY commands. See *TPF System Installation Support Reference* for more information.

**TPLD0121E REQUEST ABORTED — RECORD ID** *record1* **FOUND IN INPUT FILE WHILE EXPECTING RECORD ID** *record2*

**Where:**

*record1*
The actual record ID from the input file.

*record2*
The record ID that was expected.

**Explanation:** The auxiliary loader did not find an expected data item within the input file. The expected data item would have had the record ID specified in the message but a different record ID was found.

**System Action:** A system error dump is issued and load processing is ended.

**User Response:** Do one of the following:

- Verify that the input deck to the offline job (TLDR) is correct.
- Check to see whether the input file was damaged.
- Run the offline job (TLDR) again to generate a new tape, general data set (GDS), virtual reader (VRDR), or user-defined media.
- Analyze the OPR-07C system dump to determine the cause of the problem.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0123W TIME STAMP MISMATCH DETECTED BETWEEN OFFLINE IPAT AND ONLINE PAT**

**Explanation:** The time stamp in the online program allocation table (PAT) does not agree with the time stamp from the PAT in the input file, which was copied from the offline PAT. This means that the program allocation characteristics in the online system may not agree with those used while running the offline job (TLDR) that was used to prepare the auxiliary loader input file.

If the input file does not include any program components other than CP, CTKX, and FCTB, it is safe to continue load processing because these components are unaffected by a PAT mismatch.

**System Action:** Auxiliary load processing is continued.

**User Response:** Do the following:

1. Determine the cause of the PAT mismatch.
2. Do one of the following:
   - Verify that when the offline job (TLDR) was run, it referred to the correct data sets for the offline PAT.
   - Load a new IPAT to the specified image.

See *TPF Operations* for more information about the ZTPLD command. See *TPF System Installation Support Reference* for more information.

**TPLD0124W ADATA FILES WILL BE IGNORED**

**Explanation:** The auxiliary loader attempted to load one or more real-time programs with ADATA files, however, these ADATA files could not be loaded because #APRG*n* records are not allocated.

**System Action:** The loader does not attempt to load ADATA files for any real-time programs.

**User Response:** To load real-time programs with ADATA files, do one of the following:

- Allocate #APRG*n* records and reload programs with ADATA using the auxiliary loader.
- Load the programs containing ADATA files by using the E-type loader. This method works because ADATA files loaded by the E-type loader are stored in #OLD*n* records. If #APRG*n* records are not allocated, ADATA files will not be accepted.

See *TPF System Installation Support Reference* for more information about loaders.

---

**TPLD0125E LOADING** *ccccvv* **FOR PROCESSOR** *nn* **KEYPOINT CONTROL RECORDS NOT CONVERTED FOR 32-WAY LOOSELY COUPLED**

**Where:**

*ccccvv*
The keypoint and version being loaded.

*nn* The decimal processor ordinal for the keypoint being loaded.

**Explanation:** While loading keypoints, the auxiliary loader (ALDR) has detected a keypoint for processor ordinals 8 – 31. The keypoint control records have not been converted to 32-way loosely coupled format and only support processor ordinals 0 – 7. A loss of keypoint status would result if unconverted keypoint control records were filed.

**System Action:** Keypoint load processing is ended.

**User Response:** Enter the ZMIGR command to remove keypoints for processor ordinals 8 – 31 from the load until the keypoint control records have been migrated to 32-way loosely coupled format.

See *TPF Operations* for more information about the ZMIGR command.

---

**TPLD0126E UNABLE TO LOAD** *ccccvv* **FOR PROCESSOR** *nn* **CTKX FOR IMAGE** *imagename* **ONLY SUPPORTS** *gg* **PROCESSORS**

**Where:**

*ccccvv*
The keypoint and version being loaded.

*nn* The decimal processor ordinal for the keypoint being loaded. Processor ordinal numbers start with 0.

*imagename*
The name of the TPF system image being loaded.

*gg* The total number of processors supported by the version of keypoint X (CTKX) currently loaded on the TPF system image.

**Explanation:** The auxiliary loader tryed to load keypoints for processor *nn* to the keypoint staging area for the TPF system image *imagename*. When doing the load, the keypoint ordinals for the processor are obtained from the CTKX for this TPF system image. The CTKX was generated for a maximum of *gg* processors and does not contain keypoint ordinal number for processor *nn*.

**System Action:** Keypoint load processing is ended.

**User Response:** Include in the TPF system image a version of CTKX that was generated for all of the processors for which keypoints are being loaded.

---

**TPRD0001E** *name tapename devaddr* **CC***code* **CCW–***command* **CSW–***word* **SNS–***data*

**Where:**

*name*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*tapename*
The symbolic tape name (for example, RTL).

*devaddr*
The device address.

**Note:** Where two paths are defined for the drive, the address given is that used for the failing operation.

*code*
The SIO condition code. When a deferred SIOF condition code occurs the deferred condition code is given.

*command*
The channel command that was not successful.

**Note:** When a data chained channel program specified through the TDCTC macro fails, the operation code given is that of the first CCW in the chain.

*word*
The channel status word. This is the CSW associated with the error.

**Note:** For the SIO condition code 3 (not operational), the CSW is not meaningful and is not included in the message.

*data*
The sense data. The sense data is only included in the message for unit-check conditions. The number of sense bytes displayed is dependent on the device type. There are 24 bytes displayed for the IBM 3400 series tape drives. If an input/output (I/O) error prevents the successful sensing of the device, the UNABLE word is displayed in place of the sense data.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

---

**TPXD0001A LOAD TAPE VOLUME** *volser* **INTO DRIVE** *devaddr* **MOUNTED AS** *tapename*

**Where:**

*volser*
The volume serial label of the tape.

*devaddr*
The device address to use when mounting the tape.

*tapename*
The symbolic tape name.

**Explanation:** An application program has issued a `TPFxd_open` call and the tape referenced in the positioning string map was not found in the tape status table (TSTB).

**System Action:** Processing is suspended for the entry control block (ECB) that issued the `TPFxd_open` call until the request is satisfied or the timeout value indicated has elapsed.

**User Response:** Mount the tape for input on the device specified by using the tape name specified.

See the *TPF C/C++ Language Support User's Guide* for more information about the `TPFxd_open` C function.

**TPXD0002I** *nnnnnnnnnn...nnnn*

**Where:**

*nnnnnnnnnnn...nnnn*
The text provided by either a `TPFxd_open`, `TPFxd_nextVolume`, or `tape_access` call if the requested tape could not be located in the time indicated.

**Explanation:** A `TPFxd_open`, `TPFxd_nextVolume`, or `tape_access` call was attempted and the required tape was not available in the time specified. A message that is provided with the function call is sent to the console.

**System Action:** A timeout error condition is returned to the application program and processing continues.

**User Response:** Do the following:

1. Determine why the tape was not mounted in the time specified by the application program.
2. Activate the application program that contains the `TPFxd_open`, `TPFxd_nextVolume`, or `tape_access` function calls again.

See the *TPF C/C++ Language Support User's Guide* for more information about the `TPFxd_open`, `TPFxd_nextVolume`, and `tape_access` C functions.

**TRCC0001I ECB CHECKING ACTIVATION COMPLETED**

**Explanation:** ECB checking was activated successfully.

**System Action:** None.

**User Response:** None.

**TRCC0002I ECB CHECKING INACTIVATION COMPLETED**

**Explanation:** ECB checking was inactivated successfully.

**System Action:** None.

**User Response:** None.

**TRCC0003E PARAMETER INVALID**

**Explanation:** The parameter is not valid. Valid parameters are:

- EBA
- EBD
- D.

**System Action:** None.

**User Response:** None.

**TRCC0004W ECB CHECKING ALREADY ACTIVE**

**Explanation:** A request to activate ECB checking was rejected because ECB checking was already active.

**System Action:** None.

**User Response:** None.

**TRCC0005W ECB CHECKING ALREADY INACTIVE**

**Explanation:** A request to inactivate ECB checking was rejected because ECB checking was already inactive.

**System Action:** None.

**User Response:** None.

**TRCC0006I ECB CHECKING ACTIVE**

**Explanation:** This message is displayed in response to a request for ECB checking status.

**System Action:** None.

**User Response:** None.

**TRCC0007I ECB CHECKING INACTIVE**

**Explanation:** This message is displayed in response to a request for ECB checking status.

**System Action:** None.

**User Response:** None.

# TRTE – TSIO

**TRTE0001I IP ROUTING TABLE ENTRY CREATED,** *number* **ENTRIES AVAILABLE**

**Where:**

*number*
The number of Internet Protocol (IP) routing table entries available for use.

**Explanation:** This is the normal response to the ZTRTE

command with the ADD parameter specified.

**System Action:** The in-core IP routing table is updated with the new entry and the table contents are filed out.

**User Response:** None.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0002I IP ROUTING TABLE ENTRY DELETED, *number* ENTRIES AVAILABLE**

**Where:**

*number*
The number of Internet Protocol (IP) routing table entries available for use.

**Explanation:** This is the normal response to the ZTRTE command with the DELETE parameter specified.

**System Action:** The entry is removed from the in-core IP routing table and the table contents are filed out.

**User Response:** None.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0003I IP ROUTING TABLE ENTRY MODIFIED, *number* ENTRIES AVAILABLE**

**Where:**

*number*
The number of Internet Protocol (IP) routing table entries available for use.

**Explanation:** This is the normal response to the ZTRTE command with the MODIFY parameter specified.

**System Action:** The entry is modified in the in-core IP routing table and the table contents are filed out.

**User Response:** None.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0004I IP ROUTING TABLE DISPLAY**

**Explanation:** This is the normal response to the ZTRTE command with the DISPLAY parameter specified.

**System Action:** All Internet Protocol (IP) routing table entries that match the values specified by the RIP, NETMASK, and LIP parameters are displayed in table format. If the ALL parameter is specified, all the table entries are displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0005I IP ROUTING TABLE STATISTICS**

**Explanation:** This is the normal response to the ZTRTE command with the STAT parameter specified.

**System Action:** The following Internet Protocol (IP) routing table header information is displayed:

- The total number of in-core entries
- The number of available in-core entries
- The number of in-core entries in use
- The number of IP routing table fixed file records (#IPRTE)
- The number of fixed file entries available
- The number of fixed file entries in use.

**User Response:** None.

See *TPF Operations* for more information about the ZTRTE command. See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

---

**TRTE0050E IP ROUTING TABLE NOT DEFINED**

**Explanation:** The ZTRTE command was entered, but the Internet Protocol (IP) routing table has not been defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZNKEY command specifying the MAXRTE parameter to define the number of entries that will be allocated for the IP routing table.
2. Perform an initial program load (IPL) of the TPF system.
3. Enter the ZTRTE command again.

See *TPF Operations* for more information about the ZTRTE and ZNKEY commands.

---

**TRTE0051E ZTRTE CANNOT BE ENTERED BELOW 1052 STATE**

**Explanation:** The ZTRTE command was entered before the TPF system reached 1052 state.

**System Action:** The command is rejected.

**User Response:** When the TPF system reaches 1052 state, enter the ZTRTE command again.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0053E INCORRECT IP ADDRESS OR NETMASK**

**Explanation:** The ZTRTE command was entered, but the Internet Protocol (IP) address or subnet mask specified for the RIP, LIP, NEWLIP, or NETMASK parameter was either not in correct numeric format or is not allowed by the Transmission Control Protocol/Internet Protocol (TCP/IP) architecture.

**System Action:** The command is rejected.

**User Response:** Enter the ZTRTE command again, specifying the correct IP address or subnet mask for the RIP, LIP, NEWLIP, or NETMASK parameter in correct numeric format..

See *TPF Operations* for more information about the ZTRTE command.

---

### TRTE0054E LOCAL IP ADDRESS IS NOT DEFINED

**Explanation:** The ZTRTE command was entered, but the Internet Protocol (IP) address specified for the LIP or NEWLIP parameter is not defined on the TPF system.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the correct IP address was specified, but is not defined on the TPF system, do the following:
  1. Enter the ZTTCP DEFINE command to define the local IP address.
  2. Enter the ZTRTE command again.
- If the incorrect IP address was specified, enter the ZTRTE command again, specifying the correct IP address for the LIP or NEWLIP parameter.

See *TPF Operations* for more information about the ZTRTE and ZTTCP DEFINE commands.

### TRTE0055E IP ROUTING TABLE ENTRY NOT FOUND

**Explanation:** The ZTRTE command was entered with the DELETE, MODIFY or DISPLAY parameter specified, but no Internet Protocol (IP) routing table entry was found that matched the selection criteria.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZTRTE command again, specifying the correct IP address for the selection criteria.
- Enter the ZTRTE command again, specifying the ADD parameter to add your entry to the IP routing table.

See *TPF Operations* for more information about the ZTRTE command.

### TRTE0056E IP ROUTING TABLE ENTRY ALREADY EXISTS

**Explanation:** The ZTRTE command was entered with the ADD or MODIFY parameter specified, but an Internet Protocol (IP) routing table entry was found that matched the values of the RIP, LIP, NEWLIP, or NETMASK parameters. Entries in the IP routing table must be unique.

**System Action:** The command is rejected.

**User Response:** Enter the ZTRTE command again, specifying the correct information for the RIP, LIP, NEWLIP, or NETMASK parameters.

See *TPF Operations* for more information about the ZTRTE command.

### TRTE0057E IP ROUTING TABLE IS EMPTY

**Explanation:** The ZTRTE command was entered with the DISPLAY, DELETE, or MODIFY parameter specified, but there are no entries in the Internet Protocol (IP) routing table.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZTRTE command.

### TRTE0058E NO IP ROUTING TABLE RECORDS AVAILABLE

**Explanation:** The ZTRTE command was entered with the ADD parameter specified, but there are no more Internet Protocol (IP) routing table fixed file records (#IPRTE) available to save the new IP routing table entry.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Allocate additional #IPRTE records.
2. Perform an initial program load (IPL) of the TPF system.
3. Enter the ZTRTE command again, specifying the ADD parameter.

See *TPF Operations* for more information about the ZTRTE command. See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

### TRTE0059E NEXTHOP IP ADDRESS IS DEFINED AS A LOCAL IP ADDRESS

**Explanation:** The ZTRTE command was entered with the ADD and NEXTHOP parameters specified, but the Internet Protocol (IP) address specified for the NEXTHOP parameter is defined on the TPF system as a local IP address.

**System Action:** The command is rejected.

**User Response:** Enter the ZTRTE command again with the ADD parameter specified and a valid IP address for the NEXTHOP parameter.

See *TPF Operations* for more information about the ZTRTE command and the ZTTCP DISPLAY command for more information on displaying local IP addresses.

### TRTE0060E IP ROUTING TABLE IS FULL

**Explanation:** The ZTRTE command was entered with the ADD parameter specified, but the Internet Protocol (IP) routing table was full.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If a larger IP routing table is required, do the following:
  1. Enter the ZNKEY command specifying the MAXRTE parameter to define the number of entries that will be allocated for the IP routing table.
  2. Perform an initial program load (IPL) of the TPF system.
  3. Enter the ZTRTE command again, specifying the ADD parameter.
- If a larger IP routing table is not required, do the following:
  1. Enter the ZTRTE command with the DISPLAY parameter specified.
  2. Examine the contents of the IP routing table and determine if there are entries that need to be deleted.
  3. Delete those entries by entering the ZTRTE command with the DELETE parameter specified.

4. Enter the ZTRTE command again, specifying the ADD parameter.

See *TPF Operations* for more information about the ZTRTE and ZNKEY commands.

---

**TRTE0061E NATIVE TCP/IP SUPPORT IS NOT ENABLED**

**Explanation:** The ZTRTE command was entered, but Transmission Control Protocol/Internet Protocol (TCP/IP) native stack support is not enabled in the TPF system.

**System Action:** The command is rejected.

**User Response:** Do the following to define TCP/IP native stack support:

1. In keypoint record 2 (CTK2), update SNAKEY parameters MAXSOCK, MAXIPCCW, IPMTSIZE, IPRBUFFS, and IPRBUFSZ to define TCP/IP native stack support.
2. Assemble CTK2.
3. Load CTK2 to the TPF system.
4. Perform an initial program load (IPL) of the TPF system.
5. Enter the ZTTCP DEFINE command with the IP parameter specified to define local IP addresses for the channel-attached IP routers.
6. Enter the ZTTCP DEFINE command with the IP and SDA parameters specified to define local symbolic device addresses (SDAs) for the channel-attached IP routers.
7. Enter the ZTTCP ACTIVATE command with the ALL or SDA parameter specified to activate links to the channel-attached IP routers.
8. Enter the ZTRTE command again.

See *TPF Operations* for more information about the ZTRTE, ZTTCP DEFINE, and ZTTCP ACTIVATE commands. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**TRTE0062E NO STORAGE AVAILABLE FOR MALOC**

**Explanation:** The ZTRTE command was entered, but an attempt to issue MALOC for heap storage failed.

**System Action:** The command is rejected.

**User Response:** See your system administrator to determine why heap storage was depleted.

See *TPF Operations* for more information about the ZTRTE command. See the CORREQ macro in *TPF System Generation* for more information about defining frames of system heap storage. See *TPF General Macros* for more information about the MALOC macro.

---

**TRTE0063E FACS ERROR ON IPRTE RECORD FOR IP ROUTING TABLE**

**Explanation:** The ZTRTE command was entered but is unable to retrieve the Internet Protocol (IP) routing table fixed file records (#IPRTE) because of a file address compute program (FACS) error.

**System Action:** The command is rejected and the 007831 system dump is issued.

**User Response:** Do the following:

1. Examine the dump to determine why the FACS error occurred.
2. Correct the error.

See *TPF Operations* for more information about the ZTRTE command. See *TPF System Generation* and *TPF ACF/SNA Network Generation* for more information about the #IPRTE fixed file record type.

---

**TRTE0064E LIP AND NEXTHOP CANNOT BE SPECIFIED AT THE SAME TIME**

**Explanation:** The ZTRTE command was entered with the ADD or DELETE parameter specified and with both the LIP and NEXTHOP parameters specified. The LIP and NEXTHOP parameters cannot be specified at the same time.

**System Action:** The command is rejected.

**User Response:** Enter the ZTRTE command again, specifying either the LIP or NEXTHOP parameter, but not both.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0065E NETMASK DOES NOT CORRESPOND WITH RIP**

**Explanation:** The ZTRTE command was entered with the ADD parameter specified, but the network mask specified by the NETMASK parameter does not correspond to the correct subnet of Internet Protocol (IP) addresses as indicated by the RIP parameter.

**System Action:** The command is rejected.

**User Response:** Enter the ZTRTE command again, specifying a remote IP address and network mask that correspond to one another.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0066E REQUIRED PARAMETERS MISSING**

**Explanation:** The ZTRTE command was entered, but one of the key parameters was not specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZTRTE command again, specifying the appropriate parameters.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0067E LIP, NEXTHOP, OR NETMASK CANNOT BE SPECIFIED AT THE SAME TIME**

**Explanation:** The ZTRTE command was entered with the DISPLAY parameter specified, but more than one of the following parameters were specified:

- LIP
- NEXTHOP
- NETMASK.

Only one of these parameters can be specified at a time.

**System Action:** The command is rejected.

**User Response:** Enter the ZTRTE command again, specifying either the LIP, NEXTHOP, or NETMASK parameter.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0068E ENTRY EXISTS FOR THE RIP WITH A DIFFERENT NETMASK**

**Explanation:** The ZTRTE command was entered with the ADD parameter specified, but an entry already exists in the Internet Protocol (IP) routing table with the specified remote IP address but a different network mask or subnet. A remote IP address cannot be associated with more than one network mask.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Examine the IP routing table entry for the specified remote IP address and determine which network mask should be associated with the remote IP address.
2. Do one of the following:
   - Enter the ZTRTE command again, specifying the ADD parameter and an appropriate value for the NETMASK parameter.
   - Enter the ZTRTE command again, specifying the DELETE parameter to delete the entry.
   - Enter the ZTRTE command again, specifying the MODIFY parameter to modify the entry.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0069E LIP OR NEXTHOP PARAMETER IS REQUIRED**

**Explanation:** The ZTRTE command was entered with the ADD parameter specified, but the LIP or NEXTHOP parameter was not specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZTRTE command again with the ADD parameter and either the LIP or NEXTHOP parameter specified.

See *TPF Operations* for more information about the ZTRTE command.

---

**TRTE0070E NO OTHER PARAMETER ALLOWED WITH ALL**

**Explanation:** The ZTRTE command was entered with the DELETE or DISPLAY parameter and the ALL parameter specified along with additional parameters. If the ALL parameter is specified, the LIP, RIP, NEXTHOP, NETMASK, and STAT parameters are not allowed.

**System Action:** The command is rejected.

**User Response:** Enter the ZTRTE command again with the DELETE or DISPLAY parameter and the ALL parameter specified.

See *TPF Operations* for more information about the ZTRTE command.

---

**TSIO0001E** *name tapenameyyy devaddr* **CC***code* **CCW–***command* **CSW–***word* **SNS–***data*

**Where:**

*name*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*tapename*
The symbolic tape name (for example, RTL).

*devaddr*
The device address.

**Note:** Where two paths are defined for the drive, the address given is that used for the failing operation.

*code*
The SIO condition code. When a deferred SIOF condition code occurs the deferred condition code is given.

*command*
The channel command that was not successful.

**Note:** When a data chained channel program specified through the TDCTC macro fails, the operation code given is that of the first CCW in the chain.

*word*
The channel status word. This is the CSW associated with the error.

**Note:** For the SIO condition code 3 (not operational), the CSW is not meaningful and is not included in the message.

*data*
The sense data. The sense data is only included in the message for unit-check conditions. The number of sense bytes displayed is dependent on the device type. There are 24 bytes displayed for the IBM 3400 series tape drives. If an input/output (I/O) error prevents the successful sensing of the device, the UNABLE word is displayed in place of the sense data.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

# TTCP–TWRT

---

**TTCP0001I LOCAL IP ADDRESS** *ipaddr* **DEFINED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP DEFINE command with the IP parameter specified.

**System Action:** The specified local IP address is defined.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP DEFINE command.

**TTCP0002I IP ROUTER SDA-*sda* IP-*ipaddr* DEFINED**

**Where:**

*sda* The symbolic device address (SDA).

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP DEFINE command with the SDA parameter specified.

**System Action:** The specified IP router is defined.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP DEFINE command.

**TTCP0003I LOCAL IP ADDRESS *ipaddr* CHANGED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP CHANGE command with the IP parameter specified.

**System Action:** The properties of the specified IP address are changed.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP CHANGE command.

**TTCP0004I IP ROUTER SDA-*sda* NOW USING IP-*ipnew***

**Where:**

*sda* The symbolic device address (SDA).

*ipnew*
The new local Internet Protocol (IP) address associated with the IP router.

**Explanation:** This is the normal response to the ZTTCP CHANGE command with the SDA parameter specified.

**System Action:** The local IP address associated with the specified IP router is changed to use the specified local IP address.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP CHANGE command.

**TTCP0005I LOCAL IP ADDRESS *ipaddr* IS NOW THE DEFAULT**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP CHANGE command with the DEFIP parameter specified.

**System Action:** The default local IP address is changed.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP CHANGE command.

**TTCP0006I LOCAL IP ADDRESS *ipaddr* DELETED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP DELETE command with the IP parameter specified.

**System Action:** The specified local IP address definition is deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP DELETE command.

**TTCP0007I IP ROUTER SDA-*sda* DELETED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** This is the normal response to the ZTTCP DELETE command with the SDA parameter specified.

**System Action:** The specified Internet Protocol (IP) router is deleted.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP DELETE command.

**TTCP0010I IP ROUTER SDA-*sda* ACTIVATION STARTED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** This is the normal response to the ZTTCP ACTIVATE command with the SDA parameter specified.

**System Action:** Processing to activate the specified Internet Protocol (IP) router continues.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

**TTCP0011I ACTIVATION OF IP ADDRESS *ipaddr* STARTED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP ACTIVATE command with the IP parameter specified.

**System Action:** Processing to activate the IP routers associated with the specified IP address continues.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

**TTCP0013I IP ROUTER SDA-*sda* DEACTIVATION COMPLETED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** This is the normal response to the ZTTCP INACTIVATE command with the SDA parameter specified.

**System Action:** The specified Internet Protocol (IP) router is deactivated.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP INACTIVATE command.

**TTCP0014I INACTIVATION OF IP ADDRESS *ipaddr* STARTED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP INACTIVATE command with the IP parameter specified.

**System Action:** Processing to deactivate the IP routers associated with the specified IP address continues.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP INACTIVATE command.

**TTCP0016I ACTIVATION OF IP ADDRESS *ipaddr* COMPLETED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP ACTIVATE command with the IP parameter specified.

**System Action:** The IP routers associated with the specified IP address are activated.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

**TTCP0018I INACTIVATION OF IP ADDRESS *ipaddr* COMPLETED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP INACTIVATE command with the IP parameter specified.

**System Action:** The IP routers associated with the specified IP address are deactivated.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP INACTIVATE command.

**TTCP0021I LOCAL IP ADDRESS DISPLAY**

**Explanation:** This is the normal response to the ZTTCP DISPLAY command with the LOCIPS parameter specified, or the IP parameter with an OSA Internet Protocol (IP) address specified.

**System Action:** Information about the local IP addresses that are defined to the TPF system is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP DISPLAY command.

**TTCP0023I IP CONNECTIONS DISPLAY**

**Explanation:** This is the normal response to the ZTTCP DISPLAY command with the SDA parameter specified, or with the IP parameter specified with a value that is a channel data link control (CDLC) address.

**System Action:** Information about Internet Protocol (IP) routers and OSA-Express connections is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP DISPLAY command.

**TTCP0030I IP TRACE FOR LOCAL IP ADDRESS *ipaddr* STARTED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP TRACE command with the START and IP parameters specified.

**System Action:** Tracing for all IP routers associated with the specified channel data link control (CDLC) IP address begins or else tracing of the Open Systems Adapter (OSA) IP address begins.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0031I IP TRACE FOR IP ROUTER SDA-*sda* STARTED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** This is the normal response to the ZTTCP TRACE command with the START and SDA parameters specified.

**System Action:** Tracing for the specified Internet Protocol (IP) router begins.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0032I IP TRACE STARTED FOR ALL RESOURCES**

**Explanation:** This is the normal response to the ZTTCP TRACE command with the START and ALL parameters specified.

**System Action:** Tracing for all Internet Protocol (IP) routers and OSA-Express connections in the TPF system begins.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0033I IP TRACE TO TAPE STARTED**

**Explanation:** This is the normal response to the ZTTCP TRACE command with the START and TAPE parameters specified.

**System Action:** The TPF system begins writing the Internet Protocol (IP) trace data to tape.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0034I TRACING OF ROUTING INFORMATION PROTOCOL MESSAGES HAS STARTED**

**Explanation:** This is the normal response to the ZTTCP TRACE command with the RIP parameter specified.

**System Action:** Routing Information Protocol (RIP) messages will be included in the Internet Protocol (IP) trace.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0035I TRACING OF ROUTING INFORMATION PROTOCOL MESSAGES HAS STOPPED**

**Explanation:** This is the normal response to the ZTTCP TRACE command with the NORIP parameter specified.

**System Action:** Routing Information Protocol (RIP) messages will not be included in the Internet Protocol (IP) trace.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0040I IP TRACE FOR LOCAL IP ADDRESS *ipaddr* STOPPED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** This is the normal response to the ZTTCP TRACE command with the STOP and IP parameters specified.

**System Action:** Tracing for all IP routers associated with the specified channel data link control (CDLC) IP address stops or else tracing of the Open Systems Adapter (OSA) IP address stops.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0041I IP TRACE FOR IP ROUTER SDA-*sda* STOPPED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** This is the normal response to the ZTTCP TRACE command with the STOP and SDA parameters specified.

**System Action:** Tracing for the specified Internet Protocol (IP) router stops.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0042I IP TRACE STOPPED FOR ALL RESOURCES**

**Explanation:** This is the normal response to the ZTTCP TRACE command with the STOP and ALL parameters specified.

**System Action:** Tracing for all Internet Protocol (IP) routers and OSA-Express connections in the TPF system stops.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0043I IP TRACE TO TAPE STOPPED**

**Explanation:** This is the normal response to the ZTTCP TRACE command with the STOP and TAPE parameters specified.

**System Action:** The TPF system stops writing the Internet Protocol (IP) trace data to tape.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0045I NOW TRACING *size* BYTES OF EACH MESSAGE**

**Where:**

*size* The number of bytes of each message to trace.

**Explanation:** This is the normal response to the ZTTCP TRACE command with the SIZE parameter specified.

**System Action:** The specified number of bytes of each message is traced.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0047I INACTIVATION OF ALL SOCKETS COMPLETED**

**Explanation:** This is the normal response to the ZTTCP INACTIVATE command with the SOCKETS parameter specified.

**System Action:** All active sockets are deactivated.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP INACTIVATE command.

**TTCP0060I OSA-*osaname* ACTIVATED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** This is the normal response to the ZTTCP ACTIVATE command with the OSA parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

**TTCP0061I OSA-*osaname* HAS BEEN DEACTIVATED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** This is the normal response to the ZTTCP INACTIVATE command with the OSA parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP INACTIVATE command.

**TTCP0062I OSA-*osaname* ACTIVATION STARTED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** This is the normal response to the ZTTCP ACTIVATE command with the OSA parameter specified.

**System Action:** Processing to activate the specified OSA-Express connection continues. Activating the connection takes 16 seconds or more to be completed.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

**TTCP0065I IP TRACE FOR OSA-*osaname* STARTED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** This is the normal response to the ZTTCP TRACE command with the START and OSA parameters specified.

**System Action:** Tracing for the specified OSA-Express connection begins.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0066I IP TRACE FOR OSA-*osaname* STOPPED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** This is the normal response to the ZTTCP TRACE command with the STOP and OSA parameters specified.

**System Action:** Tracing for the specified OSA-Express connection stops.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0090W *num* SOCKETS CLEANED UP BECAUSE OF EXTENDED NETWORK OUTAGES**

**Where:**

*num*
The number of sockets cleaned up.

**Explanation:** The specified number of sockets were cleaned up by the socket sweeper because the network associated with those sockets was down for an extended period of time.

**System Action:** The sockets are cleaned up.

**User Response:** Examine the network to determine the cause of the extended outages.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the socket sweeper.

**TTCP0091W *num* SOCKETS CLOSED BECAUSE OF NO APPLICATION ACTIVITY**

**Where:**

*num*
The number of sockets that were closed.

**Explanation:** The specified number of sockets were closed by the socket sweeper because no application issued any socket calls for these sockets for an extended period of time.

**System Action:** The sockets are closed.

**User Response:** None.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the socket sweeper.

**TTCP0100E FORMAT OF THE ZTTCP COMMAND IS NOT VALID**

**Explanation:** A ZTTCP command was entered, but the combination of parameters specified was not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the ZTTCP command.
2. Enter the ZTTCP command again, specifying a valid combination of parameters.

See *TPF Operations* for more information about the ZTTCP commands.

**TTCP0101E REJECTED, RESTRICT PARAMETER VALUE MUST BE YES OR NO**

**Explanation:** The ZTTCP CHANGE or ZTTCP DEFINE command was entered with a value for the RESTRICT parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP CHANGE or ZTTCP DEFINE command again and specify either YES or NO for the RESTRICT parameter.

See *TPF Operations* for more information about the ZTTCP commands.

**TTCP0102E REJECTED, MPS PARAMETER VALUE IS NOT VALID**

**Explanation:** The ZTTCP CHANGE or ZTTCP DEFINE command was entered with a value for the MPS parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP CHANGE or ZTTCP DEFINE command again and specify a valid value for the MPS parameter.

See *TPF Operations* for more information about the ZTTCP commands.

**TTCP0103E REJECTED, SYSTEM IS IN RESTART**

**Explanation:** A ZTTCP command was entered, but the TPF system is in restart.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the TPF system to reach 1052 state.
2. Enter the ZTTCP command again.

See *TPF Operations* for more information about the ZTTCP commands.

**TTCP0104E REJECTED, TCP/IP NATIVE STACK SUPPORT NOT DEFINED**

**Explanation:** A ZTTCP command was entered, but TCP/IP native stack support is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the TCP/IP native stack support parameters in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. Perform an initial program load (IPL) of the TPF system.
5. Enter the ZTTCP command again.

See *TPF Operations* for more information about the ZTTCP commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for TCP/IP native stack support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

**TTCP0105E REJECTED, IP ADDRESS SPECIFIED IS NOT VALID**

**Explanation:** The ZTTCP DEFINE command was entered with the IP parameter specified, but the specified Internet Protocol (IP) address is one of the following reserved IP addresses:

- 0.0.0.0
- 255.255.255.255
- 127.0.0.0

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP DEFINE command again and specify a valid value for the IP parameter.

See *TPF Operations* for more information about the ZTTCP DEFINE command.

**TTCP0106E REJECTED, SDA PARAMETER VALUE IS NOT VALID**

**Explanation:** The ZTTCP DEFINE command was entered with a value for the SDA parameter that is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP DEFINE command again and specify a valid value for the SDA parameter.

See *TPF Operations* for more information about the ZTTCP DEFINE command.

**TTCP0110E REJECTED, LOCAL IP ADDRESS *ipaddr* ALREADY DEFINED**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** The ZTTCP DEFINE command was entered with the IP parameter specified, but the specified local IP address is already defined.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct IP address with the ZTTCP DEFINE command, there is no more action for you to take.

- If you specified an incorrect IP address with the ZTTCP DEFINE command, enter the command again and specify the correct IP address.

See *TPF Operations* for more information about the ZTTCP DEFINE command.

---

**TTCP0111E REJECTED, MAXIMUM NUMBER OF LOCAL IP ADDRESSES ALREADY DEFINED**

**Explanation:** The ZTTCP DEFINE command was entered with the IP parameter specified, but the maximum number of local Internet Protocol (IP) addresses that can be defined are already defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP DISPLAY command and examine the local IP addresses that are defined.
2. Enter the ZTTCP DELETE command to delete any local IP addresses that are not needed.
3. Enter the ZTTCP DEFINE command again.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0112E REJECTED, IP ROUTER SDA-*sda* ALREADY DEFINED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The ZTTCP DEFINE command was entered with the SDA parameter specified, but the specified Internet Protocol (IP) router is already defined.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct IP router with the ZTTCP DEFINE command, there is no more action for you to take.
- If you specified an incorrect IP router with the ZTTCP DEFINE command, enter the command again and specify the correct IP router.

See *TPF Operations* for more information about the ZTTCP DEFINE command.

---

**TTCP0113E REJECTED, MAXIMUM NUMBER OF IP ROUTERS ALREADY DEFINED**

**Explanation:** The ZTTCP DEFINE command was entered with the SDA parameter specified, but the maximum number of Internet Protocol (IP) routers that can be defined are already defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP DISPLAY command and examine the IP routers that are defined.
2. Enter the ZTTCP DELETE command to delete any IP routers that are not needed.
3. Enter the ZTTCP DEFINE command again.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0114E REJECTED, LOCAL IP ADDRESS *ipaddr* DOES NOT EXIST**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** A ZTTCP command was entered with the IP parameter specified, but the specified local IP address is not defined.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZTTCP command again and specify a local IP address that is defined.
- Enter the ZTTCP DEFINE command with the IP parameter specified to define the local IP address and then enter the ZTTCP command again.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0115E REJECTED, IP ROUTER SDA-*sda* DOES NOT EXIST**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** A ZTTCP command was entered with the SDA parameter specified, but the specified Internet Protocol (IP) router is not defined.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Enter the ZTTCP command again specifying an IP router that is defined.
- Enter the ZTTCP DEFINE command with the SDA parameter specified to define the IP router and then enter the ZTTCP command again.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0116E REJECTED, IP ROUTER SDA-*sda* IS ACTIVE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The ZTTCP CHANGE or ZTTCP DELETE command was entered, but the specified Internet Protocol (IP) router is active.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP INACTIVATE command to deactivate the IP router.
2. Enter the ZTTCP CHANGE or ZTTCP DELETE command again.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0117E REJECTED, LOCAL IP ADDRESS *ipaddr* IS IN USE**

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** The ZTTCP DELETE command was entered with the IP parameter specified, but the specified local IP address is in use.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP INACTIVATE command with the IP parameter specified to deactivate all IP routers that are using the local IP address that you want to delete.
2. Enter the ZTTCP DELETE or ZTTCP CHANGE command to ensure there are no IP routers assigned to the local IP address that you want to delete.
3. Enter the ZTTCP DELETE command with the IP parameter specified again.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0118E REJECTED, THE DEFAULT LOCAL IP ADDRESS CANNOT BE DELETED**

**Explanation:** The ZTTCP DELETE command was entered with the IP parameter specified, but the specified local Internet Protocol (IP) address is defined as the default local IP address. The default local IP address cannot be deleted when more than one local IP address exists.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTTCP CHANGE command with the DEFIP parameter specified to change the default local IP address.
2. Enter the ZTTCP DELETE command again and specify the IP parameter.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0120E REJECTED, IP ROUTER SDA-*sda* IS ALREADY ACTIVE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The ZTTCP ACTIVATE command was entered, but the specified Internet Protocol (IP) router is already active.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct IP router on the ZTTCP ACTIVATE command, there is no more action for you to take.
- If you specified an incorrect IP router on the ZTTCP ACTIVATE command, enter the command again and specify the correct IP router.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

---

**TTCP0121E REJECTED, IP ROUTER SDA-*sda* CANNOT BE MOUNTED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The ZTTCP ACTIVATE command was entered, but the device cannot be mounted.

**System Action:** The command is rejected.

**User Response:** Verify that the specified SDA is correct and that the Internet Protocol (IP) router is channel-attached to the TPF system.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

---

**TTCP0122E REJECTED, IP ROUTER SDA-*sda* IS NOT ACTIVE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The ZTTCP INACTIVATE command was entered, but the specified Internet Protocol (IP) router is not active.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct IP router on the ZTTCP INACTIVATE command, there is no more action for you to take.
- If you specified an incorrect IP router on the ZTTCP INACTIVATE command, enter the command again and specify the correct IP router.

See *TPF Operations* for more information about the ZTTCP INACTIVATE command.

---

**TTCP0125E REJECTED, IP TRACE ALREADY ACTIVE FOR LOCAL IP ADDRESS *ipaddr***

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** The ZTTCP TRACE command was entered with the START and IP parameters specified, but IP trace is already active for the specified local IP address.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct local IP address on the ZTTCP TRACE command, there is no more action for you to take.
- If you specified an incorrect local IP address on the ZTTCP TRACE command, enter the command again and specify the correct local IP address.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0126E REJECTED, IP TRACE ALREADY ACTIVE IP ROUTER SDA-***sda*

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The ZTTCP TRACE command was entered with the START and SDA parameters specified, but IP trace is already active for the specified Internet Protocol (IP) router.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct IP router on the ZTTCP TRACE command, there is no more action for you to take.
- If you specified an incorrect IP router on the ZTTCP TRACE command, enter the command again and specify the correct IP router.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0127E REJECTED, IP TRACE TO TAPE ALREADY ACTIVE**

**Explanation:** The ZTTCP TRACE command was entered with the START and TAPE parameters specified, but writing the Internet Protocol (IP) trace data to tape is already started.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0128E REJECTED, IP TRACE NOT ACTIVE FOR LOCAL IP ADDRESS** *ipaddr*

**Where:**

*ipaddr*
The local Internet Protocol (IP) address.

**Explanation:** The ZTTCP TRACE command was entered with the STOP and IP parameters specified, but IP trace is not active for the specified local IP address.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct local IP address on the ZTTCP TRACE command, there is no more action for you to take.
- If you specified an incorrect local IP address on the ZTTCP TRACE command, enter the command again and specify the correct local IP address.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0129E REJECTED, IP TRACE NOT ACTIVE FOR IP ROUTER SDA-***sda*

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** The ZTTCP TRACE command was entered with the STOP and SDA parameters specified, but Internet Protocol (IP) trace is not active for the specified IP router.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If you specified the correct IP router on the ZTTCP TRACE command, there is no more action for you to take.
- If you specified an incorrect IP router on the ZTTCP TRACE command, enter the command again and specify the correct IP router.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0130E REJECTED, IP TRACE TO TAPE NOT ACTIVE**

**Explanation:** The ZTTCP TRACE command was entered with the STOP and TAPE parameters specified, but writing the Internet Protocol (IP) trace data to tape is not active.

**System Action:** The command is rejected.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0131E REJECTED, VALUE OF THE SIZE PARAMETER IS NOT VALID**

**Explanation:** The ZTTCP TRACE command was entered with the SIZE parameter specified, but the value specified is not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP TRACE command again and specify a valid value for the SIZE parameter.

See *TPF Operations* for more information about the ZTTCP TRACE command.

**TTCP0150E REJECTED, IP ROUTING TABLE ENTRIES EXIST FOR IP ADDRESS**

**Explanation:** The ZTTCP DELETE command was entered with the IP parameter specified, but the local Internet Protocol (IP) address specified by the IP parameter cannot be deleted because it is used in one or more IP routing table entries.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZTRTE command specifying the DELETE parameter and the local IP address. This deletes all IP routing table entries using the local IP address.
2. Enter the ZTTCP DELETE command again, specifying the IP parameter.

See *TPF Operations* for more information about the ZTRTE and ZTTCP DELETE commands.

---

**TTCP0151E REJECTED, OSA-*osaname* DOES NOT EXIST**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** A ZTTCP ACTIVATE, ZTTCP INACTIVATE, or ZTTCP TRACE command was entered with the OSA parameter specified; however, the specified OSA-Express connection is not defined.

**System Action:** The command is rejected.

**User Response:** Enter the appropriate command again, specifying an OSA-Express connection that is defined.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0152E REJECTED, OSA-*osaname* IS ALREADY ACTIVE**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZTTCP ACTIVATE command was entered with the OSA parameter specified; however, the OSA-Express connection is already active.

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP ACTIVATE command again with the correct OSA-Express connection specified.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

---

**TTCP0153E REJECTED, SDA-*sda* FOR OSA-*osaname* CANNOT BE MOUNTED**

**Where:**

*sda* The symbolic device address (SDA).

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZTTCP ACTIVATE command was entered with the OSA parameter specified; however, the specified SDA cannot be mounted.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Verify that the specified SDA is attached to the TPF system.
2. Enter the ZTTCP ACTIVATE command again.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

---

**TTCP0154E REJECTED, OSA-*osaname* IS NOT ACTIVE**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZTTCP INACTIVATE command was entered; however, the specified OSA-Express connection is not active.

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP INACTIVATE command again with the correct OSA-Express connection specified.

See *TPF Operations* for more information about the ZTTCP INACTIVATE command.

---

**TTCP0155E REJECTED, IP TRACE ALREADY ACTIVE FOR OSA-*osaname***

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZTTCP TRACE command was entered with the START and OSA parameters specified; however, the Internet Protocol (IP) trace is already active for the specified OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP TRACE command again with the correct OSA-Express connection specified.

See *TPF Operations* for more information about the ZTTCP TRACE command.

---

**TTCP0156E REJECTED, IP TRACE NOT ACTIVE FOR OSA-*osaname***

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZTTCP TRACE command was entered with the STOP and OSA parameters specified; however, the Internet Protocol (IP) trace is not active for the specified OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP TRACE command again with the correct OSA-Express connection specified.

See *TPF Operations* for more information about the ZTTCP TRACE command.

---

**TTCP0157E REJECTED, IP-*ipaddr* IS ALREADY DEFINED TO OSA**

**Where:**

*ipaddr*
The Internet Protocol (IP) address.

**Explanation:** The ZTTCP DEFINE command was entered with the IP parameter specified; however, the specified Internet Protocol (IP) address is already defined to an OSA-Express connection.

**System Action:** The command is rejected.

**User Response:** Enter the ZTTCP DEFINE command again, specifying an IP address that is not already defined.

See *TPF Operations* for more information about the ZTTCP DEFINE command.

---

**TTCP0158E OSA-*osaname* ACTIVATION FAILED, ALL OSA CONTROL BLOCKS IN USE**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed to activate because all the OSA-Express control blocks are in use.

**System Action:** The OSA-Express connection is not activated.

**User Response:** Do the following:

1. Increase the number of OSA-Express control blocks defined to the TPF system by using the MAXOSA parameter on the SNAKEY macro in keypoint 2 (CTK2).
2. Enter the ZTTCP ACTIVATE command.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro and the MAXOSA parameter. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the MAXOSA parameter.

---

**TTCP0162E OSA-*osaname* DEFINITION NOT COMPLETE, CANNOT ACTIVATE**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** The ZTTCP ACTIVATE command was entered; however, the definition for the specified OSA-Express connection is not completed.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Enter the ZOSAE command again with the MODIFY parameter specified to define all the required parameters for an OSA-Express connection definition.
2. Enter the ZTTCP ACTIVATE command again.

See *TPF Operations* for more information about the ZTTCP ACTIVATE and ZOSAE commands.

---

**TTCP0163E REJECTED, OSA SUPPORT IS NOT DEFINED**

**Explanation:** A ZTTCP ACTIVATE, ZTTCP INACTIVATE, or ZTTCP TRACE command was entered with the OSA parameter specified; however, OSA-Express support is not defined.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the OSA-Express support parameters in the SNAKEY macro.
2. Reassemble keypoint 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system.
5. Enter the appropriate command again.

See *TPF Operations* for more information about the ZTTCP commands. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for OSA-Express support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**TTCP0182I BEGIN ZTTCP STATS DISPLAY**

**Explanation:** This is the normal response to the ZTTCP DISPLAY command with the STATS parameter specified.

**System Action:** Information about the resources used by TCP/IP native stack support is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP DISPLAY command.

---

**TTCP0183I COMPLETED, TCP/IP STATS CLEARED**

**Explanation:** This is the normal response to the ZTTCP CLEAR command with the STATS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP CLEAR command.

---

**TTCP0184I IP CONNECTIONS DISPLAY**

**Explanation:** This is the normal response to the ZTTCP DISPLAY command with the ALL parameter specified.

**System Action:** Information about Internet Protocol (IP) routers and OSA-Express connections is displayed.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP DISPLAY command.

---

**TTCP0185I ACTIVATION OF ALL IP CONNECTIONS STARTED**

**Explanation:** This is the normal response to the ZTTCP ACTIVATE command with the ALL parameter specified.

**System Action:** Processing to activate all Internet Protocol (IP) connections in the TPF system continues.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP ACTIVATE command.

---

**TTCP0186I INACTIVATION OF ALL IP CONNECTIONS STARTED**

**Explanation:** This is the normal response to the ZTTCP INACTIVATE command with the ALL parameter specified.

**System Action:** Processing to deactivate all Internet Protocol (IP) connections in the TPF system continues.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP INACTIVATE command.

**TTCP0187I ACTIVATION OF ALL IP CONNECTIONS COMPLETED**

**Explanation:** This is the normal response to the ZTTCP ACTIVATE command with the ALL parameter specified.

**System Action:** None.

**User Response:** Enter **ZTTCP DISPLAY ALL** to determine which IP connections or OSA-Express connections were actually activated.

See *TPF Operations* for more information about the ZTTCP commands.

**TTCP0188I INACTIVATION OF ALL IP CONNECTIONS COMPLETED**

**Explanation:** This is the normal response to the ZTTCP INACTIVATE command with the ALL parameter specified.

**System Action:** All Internet Protocol (IP) connections in the TPF system are deactivated.

**User Response:** None.

See *TPF Operations* for more information about the ZTTCP INACTIVATE command.

**TTCP0201E IP ROUTER SDA-*sda* FAILED, SDA CANNOT BE MOUNTED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An Internet Protocol (IP) router failed because the device cannot be mounted during TPF system restart.

**System Action:** The IP router is cleaned up.

**User Response:** See your network administrator to determine the error and correct the problem.

**TTCP0202E IP ROUTER SDA-*sda* FAILED, ALL IP CCW AREAS IN USE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An Internet Protocol (IP) router failed because the TPF system is unable to allocate an IP channel command word (CCW) area entry. All IP CCW area entries are in use.

**System Action:** The IP router is cleaned up.

**User Response:** Do the following:

1. Increase the value of the MAXIPCCW parameter in the SNAKEY macro to define more IP CCW area entries.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. Perform an initial program load (IPL) of the TPF system again.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about IP CCW area entries. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

**TTCP0203I IP ROUTER SDA-*sda* ACTIVATED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An Internet Protocol (IP) router is activated.

**System Action:** None.

**User Response:** None.

**TTCP0204E IP ROUTER SDA-*sda* ACTIVATION FAILED, CONTACT FAILURE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** Activation of an Internet Protocol (IP) router failed because the CONTACT channel command was rejected during exchange identification (XID) processing

**System Action:** The IP router is cleaned up.

**User Response:** See your network administrator to determine the error and correct the problem.

**TTCP0205E IP ROUTER SDA-*sda* ACTIVATION FAILED, CV22 RECEIVED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** Activation of an Internet Protocol (IP) router failed. During the activation process, an exchange identification (XID) with control vector (CV) X'22' was received, indicating an error.

**System Action:** The IP router is cleaned up.

**User Response:** See your network administrator to determine the error and correct the problem.

**TTCP0206E IP ROUTER SDA-*sda* ACTIVATION FAILED ON PRE-NEG XID**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** Activation of an Internet Protocol (IP) router failed during the prenegotiation exchange identification (XID) phase.

**System Action:** The IP router is cleaned up.

**User Response:** See your network administrator to determine the error and correct the problem.

---

**TTCP0207E IP ROUTER SDA-*sda* ACTIVATION FAILED ON NEG-PROC XID**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** Activation of an Internet Protocol (IP) router failed during the negotiation proceeding exchange identification (XID) phase.

**System Action:** The IP router is cleaned up.

**User Response:** See your network administrator to determine the error and correct the problem.

---

**TTCP0208W LOST INTERRUPT ON IP ROUTER SDA-*sda*, OPERATION-*op***

**Where:**

*sda* The symbolic device address (SDA).

*op* The input/output (I/O) operation that was in progress.

**Explanation:** An I/O operation was started for an Internet Protocol (IP) router, but the operation was not completed successfully because an interrupt was not received.

**System Action:** The TPF system tries the operation again.

**User Response:** None.

---

**TTCP0209E IP ROUTER SDA-*sda* FAILED, PERMANENT LOST INTERRUPT ON OPERATION-*op***

**Where:**

*sda* The symbolic device address (SDA).

*op* The input/output (I/O) operation that was in progress.

**Explanation:** An I/O operation was started twice in a row for an Internet Protocol (IP) router, but the operation was not completed successfully because an interrupt was not received.

**System Action:** The IP router is cleaned up.

**User Response:** See your network administrator to determine the error and correct the problem.

---

**TTCP0210E IP ROUTER SDA-*sda* DEACTIVATED DUE TO SLOWDOWN TIME OUT**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An Internet Protocol (IP) router was in slowdown mode for an extended period of time.

**System Action:** The IP router is cleaned up.

**User Response:** See your network administrator to determine the error and correct the problem.

---

**TTCP0211I IP ROUTER SDA-*sda* HAS BEEN DEACTIVATED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An Internet Protocol (IP) router was deactivated normally.

**System Action:** None.

**User Response:** None.

---

**TTCP0212E IP ROUTER SDA-*sda*, CHANNEL ERROR RETRY IN PROGRESS OPERATION-*op* CSW-*status***

**Where:**

*sda* The symbolic device address (SDA).

*op* The input/output (I/O) operation that was in progress.

*status*
The channel status word (CSW) associated with the I/O operation.

**Explanation:** A channel error was detected during an I/O operation for an Internet Protocol (IP) router.

**System Action:** The TPF system tries the I/O operation for the IP router again.

**User Response:** See your network administrator to determine the error and correct the problem.

---

**TTCP0213E IP ROUTER SDA-*sda* FAILED, ROUTER FOUND INOPERATIVE OPERATION-*op* CSW-*status***

**Where:**

*sda* The symbolic device address (SDA).

*op* The input/output (I/O) operation that was in progress.

*status*
The channel status word (CSW) associated with the I/O operation.

**Explanation:** The TPF system attempted to start an I/O operation for an Internet Protocol (IP) router, but the device was not operating.

**System Action:** The IP router is cleaned up.

**User Response:** See your network administrator to determine the error and correct the problem.

---

**TTCP0214E IP ROUTER SDA-*sda* FAILED, UNRECOVERABLE ERROR OPERATION-*op* CSW-*status***

**Where:**

*sda* The symbolic device address (SDA).

*op* The input/output (I/O) operation that was in progress.

*status*
The channel status word (CSW) associated with the I/O operation.

**Explanation:** An irrecoverable error was detected during an I/O operation for an Internet Protocol (IP) router.

**System Action:** The IP router is cleaned up.

**User Response:** See your network administrator to determine the error and correct the problem.

---

**TTCP0215E IP ROUTER SDA-*sda* XID3 FAILED, SENSE *sense***

**Where:**

*sda* The symbolic device address (SDA).

*sense*
The sense data associated with the input/output (I/O) operation that was in progress.

**Explanation:** An irrecoverable error was detected during an I/O operation that was part of exchange identification (XID) processing between the TPF system and an Internet Protocol (IP) router.

**System Action:** The XID fails and the IP router is cleaned up.

**User Response:** Do the following:

1. Review the sense data information to determine the cause of the XID failure.
2. Correct the problem.

---

**TTCP0216E IP ROUTER SDA-*sda* INVALID XID FORMAT RECEIVED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An exchange identification (XID) information field (I-field) was received by the TPF system that was not format 3.

**System Action:** The XID fails and the Internet Protocol (IP) router is cleaned up.

**User Response:** Do the following:

1. Determine why the IP router is not using format 3 XID I-fields.
2. Correct the problem.

---

**TTCP0217E IP ROUTER SDA-*sda* NOT DEFINED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An exchange identification (XID) was started by an Internet Protocol (IP) router with an SDA that is not in the IP configuration record for the TPF system.

**System Action:** The XID fails and the IP router is cleaned up.

**User Response:** Enter **ZTTCP DISPLAY ALL** to show all valid SDAs defined for the TPF system and do one of the following:

- If the SDA was not defined but is one that you do not need to use at this time, there is no more action for you to take.
- If the SDA was not defined and is one that you need to use, enter the ZTTCP DEFINE command with the SDA parameter specified to define the SDA.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0218E IP ROUTER SDA-*sda* NOT AVAILABLE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An exchange identification (XID) was started by an Internet Protocol (IP) router with an SDA that was deactivated with the ZTTCP INACTIVATE command while link activation was in progress.

**System Action:** The XID fails and the IP router is cleaned up.

**User Response:** Do one of the following:

- If the SDA is one that you do not need to use at this time, there is no more action for you to take.
- If the SDA is one that you need to use, enter the ZTTCP ACTIVATE command to activate the SDA.

See *TPF Operations* for more information about the ZTTCP commands.

---

**TTCP0219E IP ROUTER SDA-*sda* XID3 FAILED, NO CV57 RECEIVED**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An exchange identification (XID) information field (I-field) was received that did not include control vector (CV) X'57', which is the data link control (DLC) connection data CV.

**System Action:** The XID fails and the Internet Protocol (IP) router is cleaned up.

**User Response:** Do the following:

1. Determine why the IP router did not provide CV57 in the XID I-field.
2. Correct the problem.

---

**TTCP0220E IP ROUTER SDA-*sda* XID3 FAILED, INVALID STATE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An exchange identification (XID) information field (I-field) was received that included an incorrect XID state setting.

**System Action:** The XID fails and the Internet Protocol (IP) router is cleaned up.

**User Response:** Do the following:

1. Deactivate the link from the IP router.
2. Activate the link again.

---

**TTCP0221E IP ROUTER SDA-*sda* XID3 FAILED, READ BUFFER MISMATCH**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** An exchange identification (XID) information field (I-field) was received that included a read buffer count that did not match the IPRBUFFS parameter setting in the SNAKEY macro. The IPRBUFFS parameter defines the number of read buffers per channel program.

**System Action:** The XID fails and the Internet Protocol (IP) router is cleaned up.

**User Response:** Do the following:

1. Examine the IP router definitions to determine why this value was incorrect.
2. Correct the problem.

**TTCP0222E IP ROUTER SDA-*sda* XID3 FAILED, ALL READ BUFFERS IN USE**

**Where:**

*sda* The symbolic device address (SDA).

**Explanation:** During exchange identification (XID) processing, the TPF system attempted to allocate channel data link control (CDLC) read buffers for an Internet Protocol (IP) channel command word (CCW) area, but there were no read buffers available.

**System Action:** The XID fails and the IP router is cleaned up.

**User Response:** Do the following:

1. Determine why all read buffers are in use.
2. Correct the problem.

See *TPF Transmission Control Protocol/Internet Protocol* for more information about the `read`, `recv`, and `activate_on_receipt` functions.

**TTCP0301E OSA-*osaname* FAILED, CHANNEL STATUS *xxyy* ON SDA-*sda* RECEIVED**

**Where:**

*osaname*
The name of the OSA-Express connection.

*xx* The device status.

*yy* The subchannel status.

*sda* The symbolic device address (SDA).

**Explanation:** An OSA-Express connection failed because error status was received on the channel.

**System Action:** A 007859 system error dump is issued and the OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Examine the system error dump to determine the cause of the error.
2. Correct the error.

**TTCP0302E OSA-*osaname* FAILED, INCORRECT CONTROL DATA RECEIVED**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed because incorrect control data was received from the OSA-Express card.

**System Action:** A 007858 system error dump is issued and the OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Examine the system error dump to determine the cause of the error.
2. Correct the error.

**TTCP0303E OSA-*osaname* FAILED, OSA REJECTED CONTROL COMMAND**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed because the OSA-Express card rejected a control command sent by the TPF system.

**System Action:** A 007857 system error dump is issued and the OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Examine the system error dump to determine the cause of the error.
2. Correct the error.

**TTCP0304E OSA-*osaname* FAILED, LOST INTERRUPT ON SDA-*sda***

**Where:**

*osaname*
The name of the OSA-Express connection.

*sda* The symbolic device address (SDA).

**Explanation:** An OSA-Express connection failed because no response was received to a control command sent to the OSA-Express card, resulting in a lost interrupt condition.

**System Action:** A 007856 system error dump is issued and the OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Examine the system error dump to determine the cause of the error.
2. Correct the error.

**TTCP0305E OSA-*osaname* FAILED, CC *condcode* ON SIOSC FOR SDA-*sda***

**Where:**

*osaname*
The name of the OSA-Express connection.

*condcode*
The condition code from the SIOSC macro.

*sda* The symbolic device address (SDA).

**Explanation:** An OSA-Express connection failed because an error return code was received from the SIOSC macro.

**System Action:** A 00785A system error dump is issued and the OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Examine the system error dump to determine the cause of the error.
2. Correct the error.

---

**TTCP0306E OSA-*osaname* FAILED, ERROR WRITING IP PACKETS TO OSA**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed because an error occurred while writing Internet Protocol (IP) packets to the OSA-Express card.

**System Action:** A 007854 system error dump is issued and the OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Examine the system error dump to determine the cause of the error.
2. Correct the error.

---

**TTCP0307E OSA-*osaname* FAILED, ERROR READING IP PACKETS FROM OSA**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed because an error occurred while reading Internet Protocol (IP) packets from the OSA-Express card.

**System Action:** A 007855 system error dump is issued and the OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Examine the system error dump to determine the cause of the error.
2. Correct the error.

---

**TTCP0308E OSA-*osaname* ACTIVATION FAILED, OSA NAME ALREADY IN USE**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed because the OSA-Express connection name is already in use by another host connnected to the OSA-Express card.

**System Action:** The OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Enter the ZOSAE command with the DEFINE and OSA parameters specified to define a different OSA-Express connection.
2. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE and ZTTCP ACTIVATE commands.

---

**TTCP0309E OSA-*osaname* ACTIVATION FAILED, INCORRECT PORT NAME**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed because the port name is not correct.

**System Action:** The OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Enter the ZOSAE command with the MODIFY and PORT parameters specified to define a different port name.
2. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE and ZTTCP ACTIVATE commands.

---

**TTCP0310E OSA-*osaname* ACTIVATION FAILED, DATA SDA-*sda* IS NOT VALID**

**Where:**

*osaname*
The name of the OSA-Express connection.

*sda* The symbolic device address (SDA).

**Explanation:** An OSA-Express connection failed because the data SDA is not valid.

**System Action:** The OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Enter the ZOSAE command with the MODIFY and DATA parameters specified to define a valid data SDA to this OSA-Express card.
2. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE and ZTTCP ACTIVATE commands.

---

**TTCP0312E OSA-*osaname* ACTIVATION FAILED, OSA CANNOT CONNECT TO THE NETWORK**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed because the OSA-Express card was unable to connect to the network.

**System Action:** The OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Correct the connection between the OSA-Express card and the network.
2. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE and ZTTCP ACTIVATE commands.

---

**TTCP0313E OSA-*osaname* FAILED, OSA DETECTED NETWORK OUTAGE**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed because the connection between the OSA-Express card and the network failed.

**System Action:** The OSA-Express connection is cleaned up.

**User Response:** Do the following:

1. Correct the connection between the OSA-Express card and the network.
2. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE and ZTTCP ACTIVATE commands.

---

**TTCP0314E OSA-*osaname* FAILED, IP-*ipaddr* IS IN USE BY ANOTHER HOST**

**Where:**

*osaname*
The name of the OSA-Express connection.

*ipaddr*
The Internet Protocol (IP) address.

**Explanation:** An OSA-Express connection failed because one of the IP addresses defined to this connection is already in use by another host connected to the OSA-Express card.

**System Action:** The OSA-Express connection is cleaned up.

**User Response:** Do one of the following:

- If the IP address is a virtual IP address (VIPA), do the following:
  1. Enter the ZOSAE command with the REMOVE and VIPA parameters specified to remove the association of the specified VIPA from the OSA-Express connection.
  2. Enter the ZOSAE command with the ADD, OSA, and VIPA parameters specified to define a VIPA that has not already been defined to another host, and associate it with the OSA-Express connection.
  3. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.
- If the IP address is a real IP address, do the following:
  1. Enter the ZOSAE command with the DELETE and OSA parameters specified to delete the OSA-Express connection.
  2. Enter the ZOSAE command with the DEFINE and OSA parameters specified to define the OSA-Express connection.
  3. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE and ZTTCP ACTIVATE commands.

---

**TTCP0315E OSA-*osaname* FAILED, IP-*ipaddr* EXISTS ELSEWHERE IN THE NETWORK**

**Where:**

*osaname*
The name of the OSA-Express connection.

*ipaddr*
The Internet Protocol (IP) address.

**Explanation:** An OSA-Express connection failed because the real IP address of this connection is already in use elsewhere in the network.

**System Action:** The OSA-Express connection is cleaned up.

**User Response:** Do one of the following:

- If the IP address is a virtual IP address (VIPA), do the following:
  1. Enter the ZOSAE command with the REMOVE and VIPA parameters specified to remove the association of the specified VIPA from the OSA-Express connection.
  2. Enter the ZOSAE command with the ADD, OSA, and VIPA parameters specified to define a VIPA that has not already been defined to another host, and associate it with the OSA-Express connection.
  3. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.
- If the IP address is a real IP address, do the following:
  1. Enter the ZOSAE command with the DELETE and OSA parameters specified to delete the OSA-Express connection.
  2. Enter the ZOSAE command with the DEFINE and OSA parameters specified to define the OSA-Express connection.
  3. Enter the ZTTCP ACTIVATE command to activate the OSA-Express connection.

See *TPF Operations* for more information about the ZOSAE and ZTTCP ACTIVATE commands.

---

**TTCP0316E OSA-*osaname* FAILED, IP TABLE IS FULL IN THE OSA CARD**

**Where:**

*osaname*
The name of the OSA-Express connection.

**Explanation:** An OSA-Express connection failed because the IP address table in the OSA-Express card is full.

**System Action:** The OSA-Express connection is cleaned up.

**User Response:** Do one of the following to decrease the number of IP addresses in the Internet Protocol (IP) address table (IPT):

- Delete the definitions for virtual IP addresses (VIPAs) by entering the ZOSAE command with the REMOVE parameter specified, then enter the ZTTCP ACTIVATE command to activate the OSA-Express connection again.
- Delete the definitions of OSA-Express connections by entering the ZOSAE command with the DELETE parameter specified, then enter the ZTTCP ACTIVATE command to activate the OSA-Express connection again.
- Deactivate some OSA-Express connections to the OSA-Express card by entering the ZTTCP INACTIVATE command with the OSA parameter specified for each connection, then enter the ZTTCP ACTIVATE command to activate the OSA-Express connection again.

See *TPF Operations* for more information about the ZOSAE and ZTTCP commands.

---

**TWRT0001E** *name tapename devaddr* **CC***code* **CCW–***command* **CSW–***word* **SNS–***data*

**Where:**

*name*
The subsystem user (SSU) name or the basic subsystem (BSS) name.

*tapename*
The symbolic tape name (for example, RTL).

*devaddr*
The device address.

**Note:** Where two paths are defined for the drive, the address given is that used for the failing operation.

*code*
The SIO condition code. When a deferred SIOF condition code occurs the deferred condition code is given.

*command*
The failing channel command.

**Note:** When a data chained channel program specified through the TDCTC macro fails, the operation code given is that of the first CCW in the chain.

*word*
The channel status word. This is the CSW associated with the error.

**Note:** For the SIO condition code 3 (not operational), the CSW is not meaningful and is not included in the message.

*data*
The sense data. The sense data is only included in the message for unit-check conditions. The number of sense bytes displayed is dependent on the device type. There are 24 bytes displayed for the IBM 3400 series tape drives. If an input/output (I/O) error prevents the successful sensing of the device, the UNABLE word is displayed in place of the sense data.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

# UBKD–UVSN

---

**UBKD0003I ERROR CHECK ORDINAL NUMBER**

**Explanation:** The ZRBKD command was entered specifying an incorrect ordinal number.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct ordinal number.
2. Enter the ZRBKD command again specifying the correct ordinal number.

See *TPF Operations* for more information about the ZRBKD command.

---

**UCTK0001I TPFDF CENTRAL DATABASE INIT COMPLETE**

**Explanation:** TPF Database Facility (TPFDF) database definition (DBDEF) table initialization is completed.

**System Action:** None.

**User Response:** None.

See the TPFDF library for more information about the TPFDF product.

---

**UCTK0002I TPFDF FAST-LINK DIRECTORY BUILD COMPLETE**

**Explanation:** TPF Database Facility (TPFDF) fast-link table initalization is completed.

**System Action:** None.

**User Response:** None.

See the TPFDF library for more information about the TPFDF product.

---

**UDRR0001E ZRDRS FUNCTION IS NOT IMPLEMENTED AT THIS TIME**

**Explanation:** You entered the ZRDRS command to activate user data recovery restore support; however, this support cannot be activated because it is not supported in your installation.

**System Action:** The TPF system ends the activate request.

**User Response:** Use the UDRR user exit for user data recovery restore support.

See *TPF System Installation Support Reference* for more information about the user data recovery support user exit.

---

**UDRS0001E ZFDRS FUNCTION IS NOT IMPLEMENTED AT THIS TIME**

**Explanation:** You entered the ZFDRS command to activate user data recovery copy support; however, this support cannot be activated because it is not supported in your installation.

**System Action:** The TPF system ends the activate request.

**User Response:** Use the UDRS user exit for user data recovery copy support.

See *TPF System Installation Support Reference* for more information about the user data copy support user exit.

---

**UIM10001E INVALID SCROLL REQUEST**

**Explanation:** A scroll request command that is not valid was entered.

**System Action:** None.

**User Response:** Enter a valid scroll command.

See *TPF Operations* for more information about the Z Mxyy command.

---

**UIM10002E SCROLL MAP NOT ACTIVE**

**Explanation:** A scroll command was entered where is nothing to scroll.

**System Action:** None.

**User Response:** Only enter a a scroll command when the scroll bar is visible on the screen.

See *TPF Operations* for more information about the Z Mxyy command.

---

**URIO0001W** *addr* **CCW** *code1* **SCSW** *value* **CC** *code2* **SNS** *data* **INTERVENTION REQUIRED**

**Where:**

*addr*
The physical device address.

*code1*
The last CCW command code issued. C'**' is printed if the CCW command code cannot be determined.

*value*
The SCSW at the time of error.

*code2*
The condition code for the SIOSC error.

*data*
The sense data associated with the error. Then length of data is device dependent and varies from 2 characters to 12 characters.

**Explanation:** The device specified in the message is in the Not Ready state and requires operator intervention. After this condition is corrected, the START button should be pressed and this job will start again or continue.

**System Action:** None.

**User Response:** With the information provided on the console printout, you should use the following publications for recommended error recovery procedures:

- *3211 Printer 3216 Interchangeable Train 3811 Printer Control Unit Guide*
- *3811 Printer Control Unit Stage 1 & 2 - Parts Catalogs*.

---

**URIO0002W** *addr* **CCW** *code1* **SCSW** *value* **CC** *code2* **SNS** *data* **CHECK DEVICE**

**Where:**

*addr*
The physical device address.

*code1*
The last CCW command code issued. C'**' is printed if the CCW command code cannot be determined.

*value*
The SCSW at the time of error.

*code2*
The condition code for the SIOSC error.

*data*
The sense data associated with the error. The length of data is device dependent and varies from 2 characters to 12 characters.

**Explanation:** A hardware error condition was detected during the I/O operation and the error condition could be recovered by operator intervention.

**Note:** Depending on the situation, the condition code or sense data might not be present.

**System Action:** None.

**User Response:** With the information provided on the console printout, you should use the following publications recommended error recovery procedures:

- *3211 Printer 3216 Interchangeable Train 3811 Printer Control Unit Guide*
- *3811 Printer Control Unit Stage 1 & 2 - Parts Catalogs*.

Example:

- If the UNBLOCK DATA CHECK option is specified in the loading of the UCS buffer to a 3211 and a PRINT CHECK occurs for an output line this message is printed.
- If you decide that the situation is not serious, the STOP and START buttons on the 3211 should be pressed in sequence and the job is continued.
- If you decide that this condition cannot be tolerated for this job, do one of the following:
  - Load the UCS again with the correct buffer.
  - Enter the unit record abort command.

---

**URIO0005E** *addr* **CCW** *code1* **SCSW** *value* **CC** *code2* **SNS** *data* **SIO ERROR**

**Where:**

*addr*
The physical device address.

*code1*
The last CCW command code issued. C'**' is printed if the CCW command code cannot be determined.

*value*
The SCSW at the time of error.

*code2*
The condition code for the SIOSC error.

*data*
The sense data associated with the error. Then length of data is device dependent and varies from 2 characters to 12 characters.

**Explanation:** The Unit Record Support CSECT detected an error condition (nonzero condition code) on an SIOSC macro to initiate input/output (I/O) on the device and the job is aborted.

A device that is not operational would be indicated in the unit record status table.

**System Action:** None.

**User Response:** Enter the display unit record status table command. No other operator action is required.

---

**URIO0014E** *addr* **CCW** *code1* **SCSW** *value* **CC** *code2* **SNS** *data* **JOB ABORTED — CHECK DEVICE**

**Where:**

*addr*
The physical device address.

*code1*
The last CCW command code issued. C'**' is printed if the CCW command code cannot be determined.

*value*
The SCSW at the time of error.

*code2*
The condition code for the SIOSC error.

*data*
The sense data associated with the error. Then length of data is device dependent and varies from 2 characters to 12 characters.

**Explanation:** An unrecoverable device error occurred and the job is aborted.

**Note:** Depending on the situation, the condition code or sense data might not be present.

**System Action:** None.

**User Response:** With the information provided on the console printout, you should use the following publications for recommended error recovery procedures:

- *3211 Printer 3216 Interchangeable Train 3811 Printer Control Unit Guide*
- *3811 Printer Control Unit Stage 1 & 2 - Parts Catalogs*.

---

**UVSN0001I** **999 MIGRATION DRIVER STARTED FOR SS** *ssname*

**Where:**

*ssname*
The subsystem name.

**Explanation:** Keypoint V indicates that the 999 migration driver, UVSN, must be run for this subsystem. This means there are volume serial numbers in AAANNN format (where A is an alphanumeric character and N is a numeric character) that need to be converted to CCNNNN format (where C is an alphabetic character). UVSN makes use of the value for CCN contained in keypoint V when constructing the new volume serial number (VSN). The CCN value is generated from input to the SIP user macro, ONLFIL.

**System Action:** Program processing continues converting online DASD VSNs to the CCNNNN format.

**User Response:** None.

See *TPF System Generation* for more information about the UVSN listing, the ONLFIL macro, and the keypoint V DSECT (IDSCKV).

---

**UVSN0002E** **ERROR READING CTKV – VSNS FOR SS** *ssname* **MAY BE INVALID**

**Where:**

*ssname*
The subsystem name.

**Explanation:** This message is issued when an error occurs while reading keypoint V. The 999 UVSN migration driver requires information from Keypoint V to convert the volume serial numbers from AAANNN format to CCNNNN format. Therefore, the volume serial numbers (VSNs) are not converted for this subsystem. See the UVSNO1I message for a description of the AAANNN and CCNNNN formats.

This subsystem remains in migration mode. That is, the migration indicator was not turned off in keypoint V. Therefore, UVSN will be processed again during restart on the next IPL.

**System Action:** UVSN is ended and the restart schedule is continued.

**User Response:** The error may be a result of a hardware or software error. Contact your system programmer if it is not a hardware error. After the problem is corrected, the system must be IPLed again.

See *TPF System Generation* for more information about the UVSN listing and Keypoint V DSECT (IDSCKV).

---

**UVSN0003I** **999 MIGRATION DRIVER HAS ENDED FOR SS** *ssname*

**Where:**

*ssname*
The subsystem name.

**Explanation:** This message indicates that the 999 UVSN migration driver completed processing.

**System Action:** The restart schedule is continued.

**User Response:** None.

See *TPF System Generation* for more information about the UVSN listing.

---

**UVSN0004I** **SS** *ssname* **IS NO LONGER IN 999 MIGRATION MODE**

**Where:**

*ssname*
The subsystem name.

**Explanation:** This message indicates that all volume serial numbers (VSNs) were converted from AAANNN format to

CCNNNN format. See the UVSN0001I message for a description of these formats.

The online copy of keypoint V was updated to turn the migration indicator off. The UVSN migration driver will not be processed again during restart as a result of a prime module IPL.

**System Action:** The UVSN migration driver is completed and the restart schedule is continued.

**User Response:** None.

See *TPF System Generation* for more information about the UVSN listing and the keypoint V DSECT (IDSCKV).

---

**UVSN0005E UNABLE TO READ VSN RECORD FROM REL MOD *modnum* — VSN IS NOT IN CORRECT >999 FORMAT**

**Where:**

*modnum*
The relative module number.

**Explanation:** This message is issued when an error occurs during an attempt to read the volume serial number (VSN) of this module while changing its format from AAANNN to CCNNNN. See the UVSN0001I message for a description of these formats.

The VSN is not changed. This subsystem remains in migration mode, which means the migration indicator was not turned off in keypoint V. Therefore, the UVSN migration driver is processed again during restart on the next IPL.

**System Action:** The 999 UVSN migration driver continues converting other VSNs as necessary. Once completed, the restart schedule is continued.

**User Response:** Do the following:

1. See your system programmer or your IBM service representative to determine the source of the error and to correct the hardware problem.
2. IPL the TPF system again.

See *TPF System Generation* for more information about the UVSN listing and the keypoint V DSECT (IDSCKV).

---

**UVSN0006E UNABLE TO FILE MODIFIED VSN RECORD TO REL MOD *modnum* — VSN IS NOT IN CORRECT >999 FORMAT**

**Where:**

*modnum*
The relative module number.

**Explanation:** This message is issued when an error occurs during an attempt to file the volume serial number (VSN) of this module while changing its format from AAANNN to CCNNNN. See the UVSN0001I message for a description of these formats. The VSN is not changed. This subsystem remains in migration mode, which means the migration indicator was not turned off in keypoint V. Therefore, the migration driver is processed again during restart on the next IPL.

**System Action:** The migration driver continues converting other VSNs as necessary. Once completed, the restart schedule is continued.

**User Response:** Do the following:

1. See your system programmer or your IBM service representative to determine the source of the error and to correct the hardware problem.
2. IPL the TPF system again.

See *TPF System Generation* for more information about the UVSN listing and the keypoint V DSECT (IDSCKV).

---

**UVSN0007E ALL VSNs SUCCESSFULLY MODIFIED FOR SS *ssname* — ERROR FILING CTKV — STILL IN MIGRATION MODE**

**Where:**

*ssname*
The subsystem name.

**Explanation:** This message indicates that all volume serial numbers (VSNs) that were in AAANNN format were converted to CCNNNN format. See the UVSN0001I message for a description of these formats. However, an input/output (I/O) error occurred while trying to take the subsystem out of migration mode by filing keypoint V with the migration indicator off. The migration driver is processed again during restart on the next IPL. The VSNs are not converted during the next processing.

This may be a hardware or software error.

**System Action:** The migration driver is completed and the restart schedule is continued.

**User Response:** Do the following:

1. See your system programmer to determine the cause of the error.
2. Correct the error.
3. Do one of the following:
   - Load a new keypoint V with the migration indicator turned off to prevent processing of the migration driver during the next IPL.
   - Run the UVSN migration driver again to turn off the migration indicator in keypoint V.

See *TPF System Generation* for more information about the UVSN listing and the keypoint V DSECT (IDSCKV).

---

**UVSN0008I ALL VSNS FOR SS *ssname* SUCCESSFULLY MODIFIED — LGF STILL IN >999 MIGRATION MODE.**

**Where:**

*ssname*
The subsystem name.

**Explanation:** This message indicates that all volume serial numbers (VSNs) that were in AAANNN format were converted to CCNNNN format. See the UVSN0001I message for a description of these formats. Since the CYYA keypoint update program is not capable of filing keypoints to the loader general file, the migration indicator is not turned off in the loader general file version of keypoint V. The online copy of keypoint V still indicates that the associated subsystem is in migration mode. The UVSN migration driver is processed again during restart as a result of a prime module IPL. However, no VSNs will are changed. At this point, the

migration indicator is turned off in the online version of keypoint V.

**System Action:** The migration driver is completed and the restart schedule is continued.

**User Response:** Load CTKV again with the migration bit off to prevent the UVSN migration driver from being entered during restart as result of a loader general file IPL.

See *TPF System Generation* for more information about the UVSN listing and the Keypoint V DSECT (IDSCKV).

---

**UVSN0009E VSN OF IPL DEVICE FOR SS** *ssname* **MIGRATED — UNABLE TO UPDATE FILE COPY OF CTKM**

**Where:**

*ssname*
The subsystem name.

**Explanation:** The volume serial number (VSN) of the IPL device was converted from AAANNN format to CCNNNN format. See the UVSN0001I message for a description of these formats. The migration driver tried to update keypoint M with the new VSN for the IPL device but an error occurred while filing keypoint M.

**System Action:** The migration driver is completed and the restart schedule is continued.

**User Response:** The error may be a result of a hardware or software error. See your system programmer if it is not a hardware problem. A hardware IPL must be performed on the system.

See *TPF System Generation* for more information about the UVSN listing.

# VFAC–VIPA

---

**VFAC0006I VFA KEYPOINT VALUES ARE:**

**Explanation:** This is the normal response to the ZVFAC DISPLAY command with the RESOURCE parameter specified. This message header is followed by a display of the virtual file access (VFA) buffer ratios and reserve chain values.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC DISPLAY command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0011I FLUSH REQUEST COMPLETED FOR RECORD ID** *recordid***, NUMBER RECORDS FLUSHED** *number*

**Where:**

*recordid*
The record ID.

*number*
The number of records flushed.

**Explanation:** This is the normal response to the ZVFAC FLUSH command with the RECID parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC FLUSH command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0013I PURGE REQUEST COMPLETED FOR RECORD ID** *recordid***, NUMBER RECORDS PURGED** *number*

**Where:**

*recordid*
The record ID.

*number*
The number of records purged.

**Explanation:** This is the normal response to the ZVFAC PURGE command with the RECID parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC PURGE command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0015I DELAYED FILES ENABLED**

**Explanation:** This is a normal response when one of the following is entered:
- **ZVFAC DISPLAY STATUS**
- **ZVFAC ENABLE**

This message is issued when the TPF system is cycled to NORM state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC and ZVFAC DISPLAY commands. See *TPF Database Reference* for more information about VFA.

---

**VFAC0016I DELAYED FILES DISABLED BY OPERATOR**

**Explanation:** This is a normal response when one of the following is entered:
- **ZVFAC DISPLAY STATUS**
- **ZVFAC DISABLE**

This message is issued when the TPF system is cycled to NORM state.

**System Action:** None.

**User Response:** Do the following:

1. Cycle the TPF system to NORM state.
2. Enter **ZVFAC ENABLE** unless you want to keep delay filing disabled.

See *TPF Operations* for more information about the ZVFAC and ZVFAC DISPLAY commands. See *TPF Database Reference* for more information about VFA.

**VFAC0017I DELAYED FILES DISABLED BY SYSTEM**

**Explanation:** This is a normal response when one of the following is entered:
- **ZVFAC DISPLAY STATUS**
- **ZVFAC ENABLE**

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC DISPLAY and ZVFAC commands. See *TPF Database Reference* for more information about VFA.

**VFAC0024I VFA EFFICIENCY STATISTICS**

**Explanation:** This is the response to the ZVFAC INDICATE command. This message is followed by a display of the virtual file access (VFA) measurements. A description of these measurements follows.

- FAST RSHTs IN USE (PERCENT), which is the percentage of fast record sharing hash table (RSHT) entries that are currently in use. In an active TPF system, this value indicates the spread of file addresses across the RSHT and, therefore, the effectiveness of the RSHT hashing technique.
- MASTER RSHTs IN USE (PERCENT), which is the percentage of the master record sharing hash hash table (RSHT) entries that are currently in use. In an active TPF system, this value indicates the spread of file addresses across the RSHT and, therefore, the effectiveness of the RSHT hashing technique for the master RSHTs.
- AVERAGE ALIAS CHAIN LENGTH, which is the average number of record sharing table (RST) entries that are attached to each master RSHT entry. This value indicates the synonym rate resulting from the RSHT hashing technique. The larger the value, the greater the amount of VFA processing required to locate a file address in an RST.
- LONGEST ALIAS CHAIN, which is the largest number of RST entries that are attached to any one RSHT entry.
- PROG READS, which is the rate of requests for VFA candidate programs resulting from enter-type macros. Information about the requests that were satisfied from VFA buffers and those that required DASD file accesses.
- DATA READS, which is the rate of requests for VFA candidate data records resulting from find-type macros. Information about the requests that were satisfied from VFA buffers and those that required DASD file accesses is included.
- FIND I/O, which is the rate of the combined requests for PROG READS and DATA READS that could not be satisfied from VFA buffers and required DASD file accesses. The ratio of PROG READS + DATA READS to FIND I/O is an indication of the reduction of file accesses that are attributed to VFA.
- FILES CAND, which is the rate of requests for VFA candidate data records resulting from file-type macros. Includes the requests that required DASD file accesses and those whose DASD file accesses could be delayed (VFA delay filing).
- FILE IMMD, which is the rate of requests for VFA candidate data records resulting from file-type macros that required immediate DASD file accesses. The ratio of FILES to FILE IMMD is an indication of the reduction of file accesses that are attributed to VFA.
- FORCE FILE, which is the rate at which VFA buffers containing delay file records are being stolen by requests for other records. If too many candidate records are defined and active simultaneously, this value can become so large that a condition similar to virtual storage page thrashing occurs, which could affect TPF performance.
- FILE NCAND, which is the rate of requests for data records resulting from file-type macros that are not VFA candidates.
- REJECTED, which is the rate of requests for data records that are rejected by VFA because there are no buffers available for the required record size.
- INTERVAL, which is the period of time since the last ZVFAC INDICATE command was entered. This is the period over which the previous measurements are calculated.
- VFA-S HITS, which is the rate of requests for VFA synchronization shared lock resources.
- VFA-X HITS, which is the rate of requests for VFA synchronization exclusive lock resources.
- VFA LOCK MISSES, which is the rate of requests for non-VFA synchronization resources.
- VFA CONTENTIONS, which is the rate of requests for VFA synchronization resources that are already locked.
- RHT CONTENTIONS, which is the rate of requests for VFA synchronization resources that are already held.
- CACHED RHT HITS, which is the rate of requests for VFA synchronization held resources that are already in cache.
- VFA LOCK AGEOUTS, which is the number of VFA synchronization lock requests that have aged out.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC command. See *TPF Database Reference* for more information about VFA and VFA synchronization.

**VFAC0053T UNABLE TO RETRIEVE KEYPOINT A**

**Explanation:** The ZVFAC DEFINE command was entered. However, during processing or restart of the command, virtual file access (VFA) was not able to retrieve Keypoint record A (CTKA) from DASD.

This message is associated with system error CTL-000540.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC DEFINE command. See *TPF Database Reference* for more information about VFA.

**VFAC0062E INVALID PARAMETER VALUE — *parameter***

**Where:**

*parameter*
The parameter is not valid.

**Explanation:** The ZVFAC DEFINE command was entered with a parameter that is not valid.

**System Action:** The ZVFAC DEFINE command is rejected.

**User Response:** Do the following:

1. Determine the correct format for the command.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the ZVFAC DEFINE command.

---

**VFAC0063W DEFINITION NOT ACCEPTED**

**Explanation:** The ZVFAC DEFINE command was entered to update the virtual file access (VFA) definition record but an error occurred.

The message is preceded by another message explaining the nature of the error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC DEFINE command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0064E ZVFAC DEFINE VALID FOR BSS ONLY**

**Explanation:** The ZVFAC DEFINE command was entered from a subsystem other than the basic subsystem (BSS).

**System Action:** None.

**User Response:** Enter the command from the BSS.

See *TPF Operations* for more information about the ZVFAC DEFINE command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0067E VFA RESOURCE DISPLAY VALID FOR BSS ONLY**

**Explanation:** The ZVFAC DISPLAY command with the RESOURCE parameter specified was entered from a subsystem other than the basic subsystem (BSS).

**System Action:** None.

**User Response:** Enter the command again from the BSS.

See *TPF Operations* for more information about the ZVFAC DISPLAY command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0068T INVALID FACE-ID**

**Explanation:** The ZVFAC LOCATE command was entered with an undefined file address compute program (FACE) ID specified.

**System Action:** the ZVFAC LOCATE command is rejected.

**User Response:** Enter the command again and specify a valid FACE ID.

See *TPF Operations* for more information about the ZVFAC LOCATE command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0069T INVALID FILE ADDRESS**

**Explanation:** The ZVFAC LOCATE, ZVFAC FLUSH, or ZVFAC PURGE command was entered with an undefined file address specified.

**System Action:** The command is rejected.

**User Response:** Enter the command again and specify a valid file address.

See *TPF Operations* for more information about the ZVFAC LOCATE, ZVFAC FLUSH, or ZVFAC PURGE commands. See *TPF Database Reference* for more information about VFA.

---

**VFAC0070T INVALID ORDINAL NUMBER**

**Explanation:** The ZVFAC LOCATE command was entered with an undefined ordinal number specified.

**System Action:** The ZVFAC LOCATE command is rejected.

**User Response:** Enter the command again and specify a valid ordinal number.

See *TPF Operations* for more information about the ZVFAC LOCATE command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0071T RECORD NOT FOUND IN VFA**

**Explanation:** The ZVFAC LOCATE command was entered when the target specified is not currently in virtual file access (VFA).

**System Action:** The ZVFAC LOCATE command is rejected.

**User Response:** Enter the command again and specify a valid target.

See *TPF Operations* for more information about the ZVFAC LOCATE command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0073T INVALID PROGRAM NAME**

**Explanation:** The ZVFAC LOCATE command was entered with an undefined program name specified.

**System Action:** The ZVFAC LOCATE command is rejected.

**User Response:** Enter the command and specify a valid program name.

See *TPF Operations* for more information about the ZVFAC LOCATE command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0082I VFA BUFFERS WILL BE RE-USED**

**Explanation:** This message is issued during restart when virtual file access (VFA) restart finds that the VFA delay file buffers were not previously filed to DASD successfully. The data contained in the buffers after the IPL was found to be reasonably valid and the buffers will be filed to DASD.

**System Action:** The buffers are filed to DASD.

**User Response:** None.

See *TPF Database Reference* for more information about VFA.

**VFAC0083E VFA SUBSYSTEM CONFIGURATION DOES NOT MATCH**

**Explanation:** The subsystem information saved in the control area of of virtual file access (VFA) does not match the subsystem configuration for this IPL. Therefore, the data currently in VFA is considered not valid and VFA will reinitialize itself.

This message is followed by the VFAC0085I message.

**System Action:** The VFA area is reinitialized.

**User Response:** This is a normal response when the subsystem configuration at the time of this IPL is different from the configuration of the previous IPL.

If it was not changed, then either the saved information was corrupted or there is a problem in the VFA logic.

Either way, once this message is displayed, the VFA area has already been reinitialized. A trap must be created in the CVF3 copy segment of CCVFAC to catch the problem.

See *TPF Database Reference* for more information about VFA.

**VFAC0084E VFA CONTROL STRUCTURE INVALID**

**Explanation:** The virtual file access (VFA) control blocks did not pass VFA validation testing and therefore cannot be reused. The data currently in VFA is considered not valid and VFA will reinitialize itself.

This message is followed by the VFAC0085I VFA IS BEING REINITIALIZED message.

**System Action:** The VFA area is reinitialized.

**User Response:** Either the VFA control structure was corrupted or there is a problem in the VFA validation logic.

Either way, once this message is displayed, the VFA area has already been reinitialized. A trap must be created in the CVF3 copy segment of CCVFAC to catch the problem.

See *TPF Database Reference* for more information about VFA.

**VFAC0085I VFA IS BEING REINITIALIZED**

**Explanation:** This message is issued during restart when virtual file access (VFA) detects a need to reconstruct the VFA tables and buffers.

**System Action:** None.

**User Response:** None.

**VFAC0086I VFA BUFFER STATUS BUFFER TYPE 4K LARGE SMALL**

**Explanation:** This is a response to a ZVFAC DISPLAY command with the BUFFER parameter specified. This message header is followed by a display that contains the following information:

- NUMBER OF BUFFERS, which is the number of each type of buffer allocated in virtual file access (VFA). Those numbers are obtained from the VFA control area.
- NUMBER ON RESERVE, which is the number of each type of buffer found on the reserve chain. The numbers are obtained by running the reserve chain.
- NUMBER ON AGING, which is the number of each type of buffer found on the aging chain. The numbers are obtained by running the aging chain.
- NUMBER IN IO WAIT, which is the number of each type of buffer marked in input/output (I/O) wait. Those numbers are obtained from the VFA control areas.
- PROGRAM RECORDS, which is the number of file resident programs currently in VFA. The file resident programs are counted in this category regardless of the filing attribute associated with the program record ID.
- DELAYED-FILE PENDING, which is the number of delayed-file pending records currently in VFA. The numbers are obtained by running the aging and reserve chains.
- VFA-S LOCK BUFFERS, which is the number of VFA-S lock buffers.
- VFA-X LOCK BUFFERS, which is the number of VFA-X lock buffers.
- CACHED RHT LOCKS, which is the number of cached record hold table (RHT) locks.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC DISPLAY command. See *TPF Database Reference* for more information about VFA and VFA synchronization.

**VFAC0111I RECORD STATUS IN VFA**

**Explanation:** This is the normal response to the ZVFAC LOCATE command. The following type of information, which is associated with the virtual file access (VFA) resident, is displayed:

- RSTBCA core address
- VFA buffer core address
- Type of buffer
- Filing status
- Program record, if the resident is a file resident program.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC LOCATE command and for an example of the informational display. See *TPF Database Reference* for more information about VFA.

**VFAC0112I FLUSH REQUEST COMPLETED FILE ADDRESS** *fileaddr*

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** This is the normal response to the ZVFAC FLUSH command with the FA parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC FLUSH command. See *TPF Database Reference* for more information about VFA.

**VFAC0113I PURGE REQUEST COMPLETED FILE ADDRESS** *fileaddr*

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** This is the normal response to the ZVFAC PURGE command with the FA parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC PURGE command. See *TPF Database Reference* for more information about virtual file access (VFA).

---

**VFAC0114E FILE ADDRESS** *fileaddr* **NOT IN VFA**

**Where:**

*fileaddr*
The 16-digit hexadecimal file address.

**Explanation:** The ZVFAC FLUSH or ZVFAC PURGE command was entered with a file address specified that was not found in virtual file access (VFA).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVFAC FLUSH or ZVFAC PURGE command. See *TPF Database Reference* for more information about VFA.

---

**VFAC0115W VFA SYNC BCA – LOCK PENDING TIMEOUT FILE ADDRESS-***fileaddr* **ECB ADDRESS-***ecbaddr*

**Where:**

*fileaddr*
The file address.

*ecbaddr*
The entry control block (ECB) address.

**Explanation:** The buffer control area (BCA) queue is stalled because of an error in the CCSONA CSECT.

**System Action:** The E-type program exits without starting the I/O.

**User Response:** None.

---

**VIPA0001I VIPA-***x.x.x.x* **MOVED FROM CPU-***y* **TO CPU-***z*

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that was moved.

*y* The original processor ID that owned the VIPA.

*z* The current processor ID that owns the VIPA.

**Explanation:** This is the normal response to the ZVIPA command with the MOVE parameter specified, which indicates that the VIPA has been moved.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0002I OSA IP ADDRESS DISPLAY BEGINS**

**Explanation:** This is the normal response to the ZVIPA command with the DISPLAY parameter specified, and either the CPU, TYPE, or ALL parameter specified to display the Open Systems Adapter (OSA) Internet Protocol (IP) addresses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0003I OSA IP ADDRESS SUMMARY DISPLAY BEGINS**

**Explanation:** This is the normal response to the ZVIPA command with the SUMMARY parameter specified to display the summary of the Open Systems Adapter (OSA) Internet Protocol (IP) address activity in the complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0004I VIPA-***x.x.x.x* **MOVING FROM CPU-***y* **TO CPU-***z*

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that is moving.

*y* The current processor ID that owns the VIPA.

*z* The processor ID to which the VIPA is being moved.

**Explanation:** This is the normal response to the ZVIPA command with the MOVE parameter specified, which indicates that the VIPA move has begun.

**System Action:** The VIPA move operation continues.

**User Response:** None.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0005I VIPA-***x.x.x.x* **MOVING TO CPU-***z*

**Where:**

*x.x.x.x.*
The virtual IP address (VIPA) that is moving.

*z* The processor ID to which the VIPA is being moved.

**Explanation:** This is the normal response to the ZVIPA command with the MOVE parameter specified, which indicates that the move of the VIPA has begun and the VIPA is not currently owned by any processor in the complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0006I VIPA-*x.x.x.x* MOVED TO CPU-*z***

**Where:**

*x.x.x.x.*
The virtual IP address (VIPA) that was moved.

*z* The current processor ID that owns the VIPA.

**Explanation:** This is the normal response to the ZVIPA command with the MOVE parameter specified, which indicates that the move of the VIPA has completed successfully and the VIPA was not owned by any processor in the complex.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0010I OSA IP ADDRESS DISPLAY BEGINS**

**Explanation:** This is the normal response to the ZVIPA command with the DISPLAY and IP parameters specified to display the Open Systems Adapter (OSA) Internet Protocol (IP) addresses.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0050E VIPA-*x.x.x.x* IS NOT DEFINED AS MOVABLE**

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that was specified for the ZVIPA command.

**Explanation:** The ZVIPA command was entered with the MOVE parameter specified; however, the VIPA specified is not defined as movable.

**System Action:** The command is rejected.

**User Response:** Enter the ZVIPA command again and specify a VIPA that is defined as movable.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0051E VIPA-*x.x.x.x* IS NOT DEFINED TO CPU-*y***

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that was specified for the ZVIPA command.

*y* The processor ID.

**Explanation:** The ZVIPA command was entered with the MOVE parameter specified; however, the VIPA specified is not defined to the processor specified by the CPU parameter.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Define the VIPA to the TPF processor where it will be moved.
2. Enter the ZVIPA command again with the MOVE parameter specified.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0052E CPU-*y* IS NOT IN THE COMPLEX**

**Where:**

*y* The processor ID.

**Explanation:** The ZVIPA command was entered with the CPU parameter specified; however, the processor specified is not defined in the loosely coupled TPF complex.

**System Action:** The command is rejected.

**User Response:** Enter the ZVIPA command again and specify a valid and active TPF processor for the CPU parameter.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0053E CPU-*y* IS NOT ACTIVE**

**Where:**

*y* The processor ID.

**Explanation:** The ZVIPA command was entered with the CPU parameter specified; however, the processor specified is not active in the loosely coupled TPF complex.

**System Action:** The command is rejected.

**User Response:** Enter the ZVIPA command again and specify an active TPF processor for the CPU parameter.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0054E REJECTED, SYSTEM IS IN RESTART**

**Explanation:** The ZVIPA command was entered while the TPF processor was in system restart.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the TPF system to reach 1052 state.
2. Enter the ZVIPA command again.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0055E VIPA SPECIFIED IS NOT VALID**

**Explanation:** The ZVIPA command was entered with the VIPA parameter specified; however, the virtual IP address (VIPA) specified is not in a valid format or is a reserved Internet Protocol (IP) address.

**System Action:** The command is rejected.

**User Response:** Enter the ZVIPA command again and specify a valid value for the VIPA parameter.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0057E REJECTED, OSA SUPPORT IS NOT DEFINED**

**Where:**

**Explanation:** The ZVIPA command was entered, but Open Systems Adapter (OSA)-Express support is not defined to the TPF system.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Code the OSA-Express support parameters in the SNAKEY macro.
2. Reassemble keypoint record 2 (CTK2) against the SNAKEY macro.
3. Reload CTK2.
4. IPL the TPF system.
5. Enter the ZVIPA command again.

See *TPF Operations* for more information about the ZVIPA command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about the SNAKEY parameters that are required for OSA-Express support. See *TPF ACF/SNA Network Generation* for more information about the SNAKEY macro.

---

**VIPA0058E VIPA-*x.x.x.x* IS NOT DEFINED**

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that was specified for the ZVIPA command.

**Explanation:** The ZVIPA command was entered with the VIPA parameter specified; however, the VIPA specified is not defined anywhere in the loosely coupled TPF complex.

**System Action:** The command is rejected.

**User Response:** Enter the ZVIPA command again and specify a virtual IP address for the VIPA parameter that is defined to the loosely coupled TPF complex.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0059E VIPA-*x.x.x.x* IS ALREADY MOVING TO CPU-*y***

**Where:**

*x.x.x.x*
The virtual IP address (VIPA) that was specified for the ZVIPA command.

*y* The processor ID where the VIPA is currently in the process of moving.

**Explanation:** The ZVIPA command was entered with the MOVE parameter specified; however, the VIPA specified is already in the process of being moved to another processor in the loosely coupled TPF complex.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Wait for the move in progress to be completed.
2. Enter the ZVIPA command again.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0061E NO STORAGE AVAILABLE FOR MALOC**

**Explanation:** The ZVIPA command was entered, but the TPF system has no more storage available for MALOC usage.

**System Action:** The command is rejected.

**User Response:** See your system administrator for more information.

See *TPF Operations* for more information about the ZVIPA command. See *TPF General Macros* for more information about MALOC usage and storage.

---

**VIPA0062E CPU-*y* ALREADY OWNS VIPA-*x.x.x.x***

**Where:**

*y* The processor ID.

*x.x.x.x*
The virtual IP address (VIPA) that was specified for the ZVIPA command.

**Explanation:** The ZVIPA command was entered with the MOVE parameter specified; however, the specified central processing unit (CPU) already owns the specified VIPA.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- If the VIPA is owned by the processor that you want to own the VIPA, no action is necessary.
- If the VIPA is not owned by the processor that you want to own the VIPA, enter the ZVIPA command again and specify a different CPU to which you want to move the VIPA.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0063E TYPE SPECIFIED IS NOT VALID**

**Explanation:** The ZVIPA command was entered with the TYPE parameter specified; however, the TYPE parameter specified not valid.

**System Action:** The command is rejected.

**User Response:** Enter the ZVIPA command again and specify a valid type for the TYPE parameter.

See *TPF Operations* for more information about the ZVIPA command.

---

**VIPA0064E IP-*x.x.x.x.* IS NOT DEFINED**

**Where:**

*x.x.x.x.*
The Internet Protocol (IP) address that was specified for the ZVIPA command.

**Explanation:** The ZVIPA command was entered with the IP parameter specified; however, the Open Systems Adapter (OSA) Internet Protocol (IP) address specified is not defined in the loosely coupled TPF complex.

**System Action:** The command is rejected.

**User Response:** Enter the ZVIPA command again and specify an IP address that is defined to the TPF complex.

See *TPF Operations* for more information about the ZVIPA command.

**VIPA0065E IP SPECIFIED IS NOT VALID**

**Explanation:** The ZVIPA command was entered with the IP parameter specified; however, the Internet Protocol (IP) address specified is not in a valid format or is a reserved IP address.

**System Action:** The command is rejected.

**User Response:** Enter the ZVIPA command again and specify a valid value for the IP parameter.

See *TPF Operations* for more information about the ZVIPA command.

**VIPA0066E TOO MANY PARAMETERS ENTERED**

**Explanation:** The ZVIPA command was entered with an incorrect combination of valid parameters specified.

**System Action:** The command is rejected.

**User Response:** Enter the ZVIPA command again and specify a valid combination of parameters.

See *TPF Operations* for more information about the ZVIPA command.

**VIPA0067E ERROR ACCESSING OSIT**

**Explanation:** The ZVIPA command was entered, but the OSA shared Internet Protocol address table (OSIT) is not accessible.

**System Action:** The system issues the 0078E1 system error dump and the command is rejected.

**User Response:** Do the following:

1. Examine the 0078E1 system error dump to determine the cause of the error.
2. Correct the error.

See *TPF Operations* for more information about the ZVIPA command. See *TPF Transmission Control Protocol/Internet Protocol* for more information about OSIT.

# XID2–XXFF

**XID20000I SDA *sda* NODE NAME *nodename* SUCCESSFUL XID COMPLETED**

**Where:**

*sda* The symbolic device address (SDA).

*nodename*
The node name.

**Explanation:** This is an informational message that indicates the write exchange ID (XID), read XID, channel contact sequence with an adjacent node completed successfully.

**System Action:** None.

**User Response:** None.

**XID20002I SDA *sda* NODE NAME *nodename* NCP IN SLOWDOWN DURING XID**

**Where:**

*sda* The symbolic device address (SDA).

*nodename*
The node name.

**Explanation:** Unit exception is received at write exchange ID (XID) completion. This message is sent to the operator.

**System Action:** None.

**User Response:** None.

**XID20050E SDA *sda* NODE NAME *nodename* XID I-FIELD WITH ERROR INDICATOR RECEIVED**

**Where:**

*sda* The symbolic device address (SDA).

*nodename*
The node name.

**Explanation:** During exchange ID (XID) processing, an XID was received from an adjacent node with error status set.

**System Action:** The channel contact sequence is ended.

**User Response:** None.

**XID20051E SDA *sda* NODE NAME *nodename* XID FAILURE SENSE *sense* RECEIVED**

**Where:**

*sda* The symbolic device address (SDA).

*nodename*
The node name.

*sense*
The 3088 sense data associated with the error.

**Explanation:** During exchange ID (XID) processing, sense code of command reject, intervention required, not initialized, abort or data check is received. This message is sent to the operator.

**System Action:** None.

**User Response:** None.

**XID20055E** **SDA *sda* NODE NAME *nodename* LOST INTERRUPT TIMEOUT DURING XID**

**Where:**

*sda* The symbolic device address (SDA).

*nodename*
The node name.

**Segment Reference:** CS01 (CS0H) in CCSNA1 and CSX5

**Explanation:** This message is sent to the operator when a lost interrupt is detected during exchange ID (XID) processing. Since the node name is not available until XID processing is completed, no node name will be provided in the message.

**System Action:** None.

**User Response:** None.

---

**XID20056E** **SDA *sda* NODE NAME *nodename* INVALID XID EXCHANGE DATA RECEIVED**

**Where:**

*sda* The symbolic device address (SDA).

*nodename*
The node name.

**Explanation:** An exchange ID (XID) protocol violation occurred.

**System Action:** XID processing is ended.

**User Response:** Have your system programmer review the system error dump to determine the cause of the error and to correct it.

---

**XID20057E** **SDA *sda* NODE NAME *nodename* XID REQUEST FOR SDA HAS FAILED**

**Where:**

*sda* The symbolic device address (SDA).

*nodename*
The node name.

**Explanation:** The exchange ID (XID) request for the symbolic device address (SDA) failed.

**System Action:** XID processing is ended.

**User Response:** Have your system programmer review the system error dump to determine the cause of the error and to correct it.

---

**XID20058E** **NULL XID RECEIVED. ACTIVATE REMOTE LINK STATION.**

**Explanation:** The local TPF system initiated exchange ID (XID) processing. A null XID input field (I-field) was received by the TPF system This indicates that the remote link station is not active.

**System Action:** XID processing resumes when the TPF system is notified (through an asynchronous interrupt) that the remote link station is active.

**User Response:** Activate the remote link station.

---

**XID30060I** **SDA-*sda* ALS-*alsname* TG-*tgn* CP-*netid.cpname* SUCCESSFUL NEGOTIATION PROC XID COMPLETED**

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

**Explanation:** The negotiation proceeding exchange ID (XID) completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**XID30061I** **SDA-*sda* ALS-*alsname* TG-*tgn* CP-*netid.cpname* SUCCESSFUL NON-ACTIVATION XID HAS COMPLETED**

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

**Explanation:** The non-activation exchange ID (XID) completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**XID30062I** **SDA-*sda* ALS-*alsname* TG-*tgn* CP-*netid.cpname* DISCONTACT COMPLETE**

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

**Explanation:** The disconnect completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

**XID30070E** **SDA-***sda* **ALS-***alsname* **TG-***tgn* **CP-***netid.cpname* **XID I-FIELD WITH CONTROL VECTOR 22 RECEIVED**

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

**Explanation:** An exchange ID (XID) was received from the Network Control Program (NCP) with an error in the input field (I-field).

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**XID30071E** **SDA-***sda* **ALS-***alsname* **TG-***tgn* **CP-***netid.cpname* **CONTACT FAILURE**

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

**Explanation:** A contact exchange ID (XID) failed.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**XID30072E** **SDA-***sda* **ALS-***alsname* **TG-***tgn* **CP-***netid.cpname* **PRE-NEGOTIATION XID FAILURE** *cause*

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

*cause*
Explanation of the problem that caused the failure.

**Explanation:** A pre-negotiation exchange ID (XID) failed.

**System Action:** XID3 exchange processing is ended.

**User Response:** Review the explanation about the problem specified in the message. Several different problems may have caused this error. A few of these problems follow here:

- ALS IS ALREADY ACTIVE
- RVT ENTRY FOR ALS WAS NOT FOUND
- XID 3 NOT RECEIVED FROM ALS
- CV 0E (CPNAME) NOT PRESENT IN XID I-FIELD

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**XID30073E** **SDA-***sda* **ALS-***alsname* **TG-***tgn* **CP-***netid.cpname* **NEGOTIATION PROCEEDING XID FAILURE** *cause*

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

*cause*
Explanation of the problem that caused the failure.

**Explanation:** A negotiation proceeding exchange ID (XID) failed.

**System Action:** XID3 exchange processing is ended.

**User Response:** Review the explanation about the problem specified in the message. Several different problems may have caused this error. A few of these problems follow here:

- NO TG NUMBER AVAILABLE FOR ALS
- REQUESTED TG ALREADY IN USE
- RVT ENTRY FOR REMOTE CP NOT FOUND
- NAME IN CV 0E NOT DEFINED AS CP

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**XID30074E** **SDA-***sda* **ALS-***alsname* **TG-***tgn* **CP-***netid.cpname* **NON-ACTIVATION XID FAILURE** *cause*

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

*cause*
Explanation of the problem that caused the failure.

**Explanation:** A non-activation exchange ID (XID) failed.

**System Action:** The TPF system issues a DISCONTACT and the ALS link is deactivated.

**User Response:** Review the explanation about the problem specified in the message. Several different problems may have caused this error. A few of these problems follow here:

- ALS NAME IN RVT ENTRY DOES NOT MATCH I-FIELD

- SDA IN RVT ENTRY DOES NOT MATCH ALS
- ALS IS NOT ACTIVE
- TAPST UPDATE FAILURE

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**XID30075E** **SDA-***sda* **ALS-***alsname* **TG-***tgn* **CP-***netid.cpname* **LOST INTERRUPT TIMEOUT DURING XID**

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

**Explanation:** A lost interrupt time-out occurred during the exchange ID (XID) operation.

**System Action:** None.

**User Response:** None.

See *TPF ACF/SNA Data Communications Reference* for more information.

---

**XID30076E** **SDA-***sda* **ALS-***alsname* **TG-***tgn* **CP-***netid.cpname* **XID3 FAILURE SENSE** *sense* **RECEIVED**

**Where:**

*sda* The symbolic device address (SDA).

*alsname*
The name of the adjacent link station (ALS).

*tgn* The transmission group (TG) number.

*netid.cpname*
The network-qualified remote control point (CP) name.

*sense*
The sense data associated with the error.

**Explanation:** During exchange ID (XID) processing, sense code of command reject, intervention required, not initialized, abort, or data check is received. This message is sent to the operator.

**System Action:** None.

**User Response:** Review the sense data and the channel status word (CSW) to determine the type of error.

See *TPF ACF/SNA Data Communications Reference* for more information. Also see the appropriate NCP EP reference publications for information about the sense data and the corrective action you should take.

---

**XLMA0099A** **LMT FAILURE TO FSC ON** *lniata* **— QUEUE HELD**

**Where:**

*lniata*
The line number, interchange address, and terminal address (LNIATA) for the device where the long message transmitter (LMT) timed out.

**Explanation:** The LMT timed out for the device with the LNIATA referenced in the message. The device that timed out is currently defined as a functional support console (FSC).

**System Action:** No further transmission to the device is attempted by the LMT. The queue is held. All messages subsequently sent to the device are placed on the queue.

**User Response:** To prevent a build up of messages on the queue, you can enter the ZACRS command to delete the FSC assignments for the device (which will swing the queue to the RO) or assign a new FSC to replace the failing device (which will swing the queue to the new FSC). Enter the ZDCRS CONS command to display the current FSC assignments.

Check the hardware configuration to ensure that the device is operational. If the device is not operational, the number of time out intervals in the XLMT assembly area (XS0AA) record for the device (XS0OTM field) may be too small.

See *TPF Database Reference* for more information about computer room agent set (CRAS) support.

---

**XXFF0000I** *recordnum type* **RCDS COPIED**

**Where:**

*recordnum*
The number of records copied.

*type*
The type of record copied, which is one of the following:
- XTAT
- XLMA
- XSAT.

**Explanation:** The number of indicated records have been copied to the copy file used by the message switching error correction program.

**System Action:** None.

**User Response:** None.

# ZRPD

---

**ZRPD0003I** **NO ITEMS IN EXCLUSION TABLE**

**Explanation:** The ZRPDU PURGE command was entered specifying the ALL parameter but there are no items in the PDU (pool directory update) exclusion table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU PURGE command.

---

**ZRPD0004I** **ALL SETS PURGED**

**Explanation:** This is the normal response to the ZRPDU PURGE command specifying the ALL parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU PURGE command.

**ZRPD0005I INPUT SET NOT VALID, REDISPLAY**

**Explanation:** The ZRPDU PURGE command was entered specifying the SET parameter but the specified set does not exist.

**System Action:** None.

**User Response:** Do the following:

1. Enter **ZRPDU DISP ALL** to display the pool directory update (PDU) exclusion table.
2. Enter the ZRPDU PURGE command again, specifying a valid set.

See *TPF Operations* for more information about the ZRPDU DISP and ZRPDU PURGE commands.

**ZRPD0006I INPUT SET PURGED**

**Explanation:** This is the normal response to the ZRPDU PURGE command specifying the SET parameter.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRPDU PURGE command.

**ZRPD0007I INCORRECT FORMAT -**

**Explanation:** The ZRPDU PURGE command was entered incorrectly.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command.
2. Enter the command again using the correct format.

See *TPF Operations* for more information about the ZRPDU PURGE command.

# 3705

**37050001E MESSAGE NUMBER NOT SUPPORTED**

**Explanation:** The message number requested is not in use or is not in the range of valid messages.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050002E 3705 KEYPT NOT INITIALIZED**

**Explanation:** The Z3705 DSP command was entered before the 3705 keypoint (CCPK) was copied to a fixed-file record.

**System Action:** None.

**User Response:** Do the following:

1. Enter the Z3705 RNT command with the ALL parameter specified to initialize the 3705 keypoint (CCKP).
2. Enter the Z3705 DSP command again.

See *TPF Operations* for more information about the Z3705 RNT and Z3705 DSP commands.

**37050010E DIAG READ ERROR**

**Explanation:** The diagnostic support programs could not be read from the online files.

**System Action:** The job is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050011E DIAG NOT SUPPORTED**

**Explanation:** The diagnostic support programs are not available. An IPL without diagnostics will be run.

**System Action:** The job is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050016E UNABLE DUE FIXED RECORD UPDATE IN PROGRESS**

**Explanation:** The 3705 fixed records are being updated.

**System Action:** The entry is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050017E UNABLE DUE OTHER ACTIVITY TO CU *cuaddr* IN PROGRESS**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** An IPL or dump is already in progress on the control unit referenced in the message.

**System Action:** The job is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050018E UNABLE DUE FACE ERROR**

**Explanation:** Whatever activity was to be started is ended. This program has no terminating errors. If an error occurs, the loading of a single load module or support module will be aborted and CCLD will attempt to load the next program to file. The program was unable to calculate the file address for writing out a program block.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050019E UNABLE DUE FILE I/O ERROR**

**Explanation:** The only error condition in routine CCLB is a FINWC error when accessing the 3705 utility keypoint. Alternatively, the only error condition possible is a FINWC error when retrieving the 3705 utility keypoint. Alternatively, the program was unable to write out a program to file.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050020E UNABLE DUE C.U.** *cuaddr* **NOT OPERATIONAL**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** An error occurred on the first input/output (I/O) operation to the 3705 control unit.

**System Action:** The job is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050021E UNABLE DUE C.U.** *cuaddr* **I/O ERROR**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** This warning message is issued and the indicator that is showing this unit is being processed by the load/dump utility is cleared.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050022I C.U.** *cuaddr* **AUTO—DUMP INHIBITED OK**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** The request to inhibit auto-dump completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050023I C.U.** *cuaddr* **AUTO—DUMP RESTORED OK**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** The request to restore auto-dump completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050024E DUMP REQUEST REJECTED–C.U.** *cuaddr* **ACTIVE**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** The control unit was active, the TPF system was in computer room agent set (CRAS) state or higher, and BP is not indicated.

**System Action:** The entry is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050025E KEYPOINT UNHOOK FAILED — PROCEDURE ABORTED**

**Explanation:** Whatever activity was to be started is ended. The only error condition possible is a FINWC error when retrieving the 3705 utility keypoint.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050026E PROGRAM LOAD FAILED FOR** *modname*

**Where:**

*modname*
The 1 to 8 character load module name.

**Explanation:** If the program is scratching an individual load module, it can get either a file address compute program (FACE) error or a FINWC error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050027E NO AVAILABLE ORDINAL NUMBERS**

**Explanation:** The program is unable to load a module because the keypoint indicates that there are not enough free ordinal numbers.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050028E TAPE I/O ERROR**

**Explanation:** The program was unable to read a tape block.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050029I PROGRAM *modname* LOADED**

**Where:**

*modname*
The one through eight character load module name.

**Explanation:** The load module referenced in the message was loaded to file.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050030E NO AVAILABLE DIRECTORY SLOTS**

**Explanation:** An attempt was made to load a load module on file but there is no space in the load module directory in the 3705 keypoint.

If the program is scratching an individual load module, it can get either a file address compute program (FACE) error or a FINWC error. In addition, one of the following messages is output:
- NO AVAILABLE ORDINAL NUMBERS
- PROGRAM LOAD FAILED FOR *modname*

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050031E SEQUENCE ERROR ON INPUT TAPE *modname***

**Where:**

*modname*
The 1 to 8 character load module name.

**Explanation:** Tape records were not in expected sequence — the tape may be in error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050032I LOADID *loadmodule* DELETED FROM SYSTEM**

**Where:**

*loadmodule*
The one through eight character load module name.

**Explanation:** An SCR load module was completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050033E LOADID *loadmodule* NOT IN SYSTEM**

**Where:**

*loadmodule*
The 1 to 8 character load module name.

**Explanation:** Load modules cannot have a name of ALL because they are all treated generically. Alternatively, a request was made to scratch a load module not on file.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050034I ALL LOADIDS SCRATCHED OK**

**Explanation:** A SCR ALL was completed.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050035I C.U. *cuaddr* DUMPED OK, DUMP NUMBER *nnnn***

**Where:**

*cuaddr*
The control unit address.

*nnnn*
The dump number.

**Explanation:** The request to restore auto-dump completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050036E C.U. *cuaddr* NOT DUMPED DUE TABLE FULL**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** There are no slots available in the keypoint.

**System Action:** The entry is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050037W WARNING DUMP TABLE FULL**

**Explanation:** The dump table is full.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050038W ONE SLOT REMAINS IN DUMP TABLE — PREVIOUS DUMPS WILL BE LOST IF NOT PURGED**

**Explanation:** There is only one slot available in the dump table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050039E PURGE ALREADY ACTIVE**

**Explanation:** A previous purge is in progress.

**System Action:** The entry is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050040E PURGE REJECTED DUE 3705 DUMP(S) TO FILE IN PROGRESS**

**Explanation:** The tape was being dumped to file at the time purge was requested.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050041E PURGE REJECTED DUE DUMP TABLE EMPTY**

**Explanation:** No entries were found in the dump table.

**System Action:** The entry is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050042E DUMP *dumpnumber* LOST DUE TO FILE RETRIEVAL ERROR**

**Where:**

*dumpnumber*
The dump number.

**Explanation:** If the error was on the retrieval of a dump header block, then this message is sent to the originating terminal.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050043E REJECTED DUE *cuaddr* NOT A VALID 3705 C.U.**

**Where:**

*cuaddr*
The control unit address.

**Segment Reference:** CCL1

**Explanation:** The control unit referenced in the message is not valid. A request was made to dump or IPL a control unit not in the 3705 keypoint record.

**System Action:** The program continues to check the next parameter.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050044E REJECTED DUE INVALID PARAMETER**

**Explanation:** A parameter that is not valid was found. If CCLA/CCLH cannot decode the input message, it issues this error message and exits the entry.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

**37050045I IPL COMPLETE — *loadmdle* NOW LOADED IN C.U. *cuaddr***

**Where:**

*loadmdle*
The one through eight character load module name.

*cuaddr*
The control unit address.

**Explanation:** The load module referenced in the message is in the CU referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050046E** **NO LOADID FOR C.U.** *cuaddr* **— AUTO—IPL ABORTED**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** On an auto-IPL, no load module was associated with the control unit.

**System Action:** The job is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050047E** **IPL RECORDS NOT AVAILABLE — NO IPL OF C.U.** *cuaddr*

**Where:**

*cuaddr*
The control unit address.

**Explanation:** Because the IPL records are either being updated or are not usable, the IPL is ended.

**System Action:** The job is ended.

**User Response:** None.

See *TPF Operations* for more information about the 3705 commands.

---

**37050048E** **C.U.** *cuaddr* **ACTIVE — NO IPL**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** You requested an initial program load (IPL) for an operational 3705 above the computer room agent set (CRAS) state. If the control unit must be IPLed, the BP (Bypass) parameter should be used.

**System Action:** The job is ended.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050049I** *loadmodule* **ASSOCIATED WITH C.U.** *cu*

**Where:**

*loadmodule*
The one through eight character load module name.

*cu* The control unit address.

**Explanation:** The control unit referenced in the message now has the load module associated with it in the 3705 keypoint.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050050E** *loadmdle* **NOT IN SYSTEM — NO IPL OF C.U.** *cuaddr*

**Where:**

*cuaddr*
The control unit address.

**Explanation:** The requested load module or the load module associated with the control unit (auto-IPL) is not on the online files.

**System Action:** The job is ended.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050051W** *loadmdle* **NOT LOADED TO C.U.** *cuaddr*

**Where:**

*cuaddr*
The control unit address.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050052W** **ORDINAL NUMBERS MAY BE LOST**

**Explanation:** Because an ordinal chain could not be released, ordinal numbers may be erroneously marked unavailable.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050053I** **C.U.** *cuaddr* **STATUS REINITIALIZED**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** The CCL1 segment.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050054W UNABLE DUE LOAD/SCRATCH ALREADY IN PROCESS**

**Explanation:** The request is not valid. If a load or scratch message is issued when load or scratch is already in progress, the second message is rejected. This program displays the control units and their status from the 3705 keypoint. It also displays the names of all 3705 load modules on file. It can also clear the status bit for the 3705 LOAD/DUMP IN PROGRESS (CC0CST) for any specified control units and clear any ECBs waiting for a 3705 IPL or dump request.

Upon activation, CCLB gets the file address of the 3705 keypoint record and then does a FINWC to retrieve a copy of the keypoint.

**System Action:** If the program gets an error on the FINWC, it goes to CZMM to output the appropriate error message and then exits. When the keypoint is read in, CCLB prints out, for each control unit in the keypoint, control unit number, control unit status, and the name of the load module (if any) associated with the control unit. When all control units are displayed, CCLB prints out the names of all 3705 load modules resident on the online files. When this display is complete, CCLB is exited. When CCL1 is activated, the CUs specified are checked for validity. They will have their status bits for the LOAD/DUMP cleared, a routine in the common functions program (CCLC) is activated to clear the input/output (I/O) queues for the requested 3705s and a response from CZMM goes out indicating the reinitialization is complete.

If all the CUs are reinitialized, the counter of the number of current users of the keypoint (CC0CNT) is set to zero and the keypoint updated by the common functions program (CCLC). If only selected CUs are reinitialized, the keypoint counter and the keypoint are updated appropriately by CCLC.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050055I COMPLETE — CDM TAPE DETAILS TO RO**

**Explanation:** The CDM tape dump is complete — status is sent to the RO.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050098I ENT NEXT OPT**

**Explanation:** At this time step 2 should be done. If no response is issued within 60 seconds, the response to step 5 is issued.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050099I REPLY STP TO STOP TRACE**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050100I STOP ACKNOWLEDGED**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050101I TRC BLOCK *blocknumber* WRITTEN**

**Where:**

*blocknumber*
The block number.

**Explanation:** This is output for the first, last, and every 256th block written to the DYN tape.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050102I TRC ENDED**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050103I 60 SEC. LIMIT ACTIVE**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050104I 60 SEC. LIMIT XCELD**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

---

**37050105E SEQUENCE ERROR**

**Explanation:** Trace was not active. Before ending the trace facility, the END operand stops any active trace in the 3705 and stops trace transmission to the host when it is active. Alternatively,:

- The previous input was not OPT/STP
- The previous input was not NSC/OPT/STP
- The previous input was not DYN.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

**37050106E INVLD TRC ADR — *de***

**Explanation:** The address referenced in the message is not valid for the option or there was an ITL that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

**37050107E INVLD TRC OPT — *option***

**Where:**

*option*
The option that is not valid.

**Explanation:** There was an improper sequence or a number that is not valid was specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

**37050108E NO EP IN *cuaddr***

**Where:**

*cuaddr*
The control unit address.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

**37050109E OPT AT MAX**

**Explanation:** Sixteen is the maximum.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

**37050110E TRC INVLD IN 1052 STATE**

**Explanation:** The trace function is not valid in 1052 state. The TPF system must be cycled to a higher state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

**37050114I C.U. *cuaddr* AUTO—IPL INHIBITED OK**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** The request to inhibit auto-IPL completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

**37050115I C.U. *cuaddr* AUTO—IPL RESTORED OK**

**Where:**

*cuaddr*
The control unit address.

**Explanation:** The request to restore auto-IPL completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

**37050116E NO EPS DEFINED TO SYSTEM**

**Explanation:** This message occurs when you enter a Z3705 command but there are no EP 3705s defined to the TPF system. If you want to use the 3705, it must be defined at system initialization program (SIP) generation time.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

**37050117E PROGRAM SIZE TOO LARGE**

**Explanation:** An error occurred while trying to load a 3705 load module that is too large to physically fit into the 3705.

**System Action:** The load module is not loaded and processing is continued with the next load module.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 commands.

# Miscellaneous

**000000000**

**Segment Reference:** CTRM

**Explanation:** Refer to the CSIO Line Error Messages for more information about CTRM Line Error Messages, including definitions for symbols and terms used.

**System Action:** None.

**User Response:** None.

---

**000000000** *valuesln* **CU***number* **CHN***number2* **ADD***number3***SUB***address* **ASSIGN COMPLETE**

**Segment Reference:** LASN, LREP

**Where:**

*value*
AI or BS.

*sln* The symbolic line number (SLN).

*number1*
The symbolic control unit (CU) number.

*number2*
The physical channel number.

*number3*
The physical control unit (CU) number.

*address*
The physical line address.

**Explanation:** This is a normal response to the ZLREP or ZLASN command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP and ZLASN commands.

---

**000000000** *valuesln* **CU***number1* **CHN***number2* **ADD***number3* **SUB***address* **IDLE COMPLETE**

**Segment Reference:** LIDL, LREP

**Where:**

*value*
AI or BS.

*sln* The symbolic line number (SLN).

*number1*
The symbolic control unit (CU) number.

*number2*
The physical channel number.

*number3*
The physical control unit (CU) number.

*address*
The physical line address.

**Explanation:** This is the normal response to the ZLREP or ZLIDL command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP and ZLIDL commands.

---

**000000000** *linetype sln* **CU***number* **SUB***subchannel* **LINE NOT VALIDATED**

**Segment Reference:** LSTA

**Where:**

*linetype*
The symbolic line type.

*sln* The symbolic line number (SLN).

*number*
Th symbolic control unit number.

*subchannel*
The send line subchannel.

**Explanation:** This message is generated for each case that is applicable.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000** *value sln* **FACE/FIND ERROR**

**Segment Reference:** LDLE

**Where:**

*value*
HS, LS, AR, AI, or BS

*sln* The symbolic line number (SLN).

**Explanation:** All line display only — an error was encountered while trying to locate or find the SCK for the SLN referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLE command.

---

**000000000** *value sln* **HUNG—RECONFG IN PROGRESS**

**Segment Reference:** LASN, LIDL, LREP

**Where:**

*value*
AI or BS.

*sln* Symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP, ZLASN, and ZLIDL commands.

**000000000** *type number* **INVALID**

**Segment Reference:** LDTI

**Where:**

*type*
The line type.

*number*
The line number.

**Explanation:** The line number specified in the ZLDTI command is not valid.

**System Action:** None.

**User Response:** Enter the command again and specify a valid line number.

See *TPF Operations* for more information about the ZLDTI command.

---

**000000000** *value sln* **INVALID LINE NUMBER**

**Segment Reference:** LASN, LIDL, LM2740, LREP

**Where:**

*value*
AI, BS, HS, LS, or AR.

*sln* The symbolic line number (SLN).

**Explanation:** The SLN referenced in the message contains a line number that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP, ZLASN, and ZLIDL commands.

---

**000000000** *mod1* **INVALID UP TO MOD** *mod2*

**Segment Reference:** DMFS

**Where:**

*mod1*
The number of the starting module.

*mod2*
The number of the ending module.

**Explanation:** This indicates the starting and ending module number of a gap that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDMFS and ZSONS commands.

---

**000000000** *value sln* **LINE ALREADY ASSIGNED**

**Segment Reference:** LASN

**Where:**

*value*
BS or AI.

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLASN command.

---

**000000000** *value sln* **LINE ALREADY IDLED**

**Segment Reference:** LIDL, LM2740, LREP

**Where:**

*value*
AI or BS.

*sln* The symbolic line number (SLN).

**Explanation:** The line for the SLN referenced in the message is already idled.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP and ZLIDL commands.

---

**000000000** *sln* **LINE NOT IDLE**

**Segment Reference:** AI

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** The line is stopped but is not command free.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000** *value sln* **NO NEW PATH AVAILABLE**

**Segment Reference:** LASN, LM2740, LREP

**Where:**

*value*
AI or BS.

*sln* The symbolic line number (SLN).

**Explanation:** There is no new path available for the SLN referenced in the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP and ZLASN commands.

---

**000000000** *type number* **NO TI ON LINE**

**Segment Reference:** LDTI

**Where:**

*type*
The line type.

## 000000000

*number*
The line number.

**Explanation:** This is the normal response to the ZLDTI command when there are no TIs or stations on the line.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDTI command.

---

**000000000** *value sln* **PATH***path* **ILLEGAL**

**Segment Reference:** LASN

**Where:**

*value*
BS or AI.

*sln* The symbolic line number (SLN).

*path*
The SLCT path address (00 through 03).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLASN command.

---

**000000000** *value sln* **PATH***path* **MANUALLY SWITCH**

**Segment Reference:** LASN, LM2740, LREP

**Where:**

*value*
AI or BS.

*sln* The symbolic line number (SLN).

*path*
The SLCT path address (00 through 03).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP and ZLASN commands.

---

**000000000** *value sln* **PATH***path* **NOT USEABLE**

**Segment Reference:** LASN

**Where:**

*value*
BS or AI.

*sln* The symbolic line number (SLN).

*path*
The SLCT path address (00 through 03).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLASN command.

---

**000000000** *value sln* **SCK FACE ERROR**

**Segment Reference:** LASN, LM2740, LREP

**Where:**

*value*
AI or BS.

*sln* The symbolic line number (SLN).

**Explanation:** The SLN referenced in the message has an SCK file address compute program (FACE) error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP and ZLASN commands.

---

**000000000** *value sln* **SCK FIND ERROR**

**Segment Reference:** LASN, LM2740, LREP

**Where:**

*value*
BS or AI.

*sln* The symbolic line number (SLN).

**Explanation:** The SLN referenced in the message has an SCK FIND error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLASN and ZLREP commands.

---

**000000000** *type sln* **SUB***subchannel* **NO TI VALID**

**Segment Reference:** LSTA

**Where:**

*type*
The symbolic line type.

*sln* The symbolic line number (SLN).

*subchannel*
The send line subchannel.

**Explanation:** This message is generated for each case that is applicable.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000** *value sln* **UNABLE TO ASSIGN LINE**

**Segment Reference:** LASN, LM2740, LREP

**Where:**

*value*
AI or BS.

*sln* The symbolic line number (SLN).

**Explanation:** The SLN referenced in the message was unable to assign the line.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP and ZLASN commands.

---

**000000000** **ACTION CODE ALTERED**

**Explanation:** BSP/ERS found primary action code was overlaid.

**System Action:** None.

**User Response:** None.

---

**000000000** **ADDR NOT FOUND**

**Explanation:** The 3705 address that was supplied was not found in the network control program (NCP) polling table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPOL commands.

---

**000000000** **AI** *sln* **ALREADY VALID**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** The line specified in the ZLVAL command is already valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000** **AI** *sln* **LINE MAY HAVE HUNG PCI**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** The line is stopped but is not command free.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about ZLSTP command.

---

**000000000** **AI** *sln* **LINE NOT IDLE**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000** **AI** *sln* **LINE NUMBER INVALID**

**Segment Reference:** LSTA, LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA and ZLSTP commands.

---

**000000000** **AI** *sln* **LINE WAS OFF**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000** **AI** *sln* **LINE WAS ON**

**Segment Reference:** LSTA

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 AI *sln* LINK CYCLING**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 AI*sln* NOT AI LINE**

**Segment Reference:** LASN, LIDL, LM2740, LREP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLIDL, ZLASN, and ZLREP commands.

---

**000000000 AI *sln* NUMBER INVALID**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** The line number specified in the ZLVAL AI command is not valid.

**System Action:** None.

**User Response:** Enter the command and specify a valid line number.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 AI *sln* OFF OK**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** This is the normal response to the ZLSTP command with the AI parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 AI *sln* ON OK**

**Segment Reference:** LSTA

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** This is the normal response to the ZLSTA command with the AI parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 AI *sln* REQUEST REJECTED**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** The SLN referenced in the message had a duplicated subchannel number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 AI *sln* VALIDATED**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** This is the normal response to the ZLVAL command with the AI parameter specified. The SLN specified in the message was validated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 AI ALL LINKS OFF OR CYCLING**

**Segment Reference:** LSTP

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about ZLSTA command.

---

**000000000 AI ALL OFF OK**

**Segment Reference:** LSTP

**Explanation:** This is the normal response to the ZLSTP command with the AI parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about ZLSTP command.

---

**000000000 AI ALL ON OK**

**Segment Reference:** LSTA

**Explanation:** This is the normal response to the ZLSTA command with the AI parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 AI LK *number* LINK NUMBER INVALID**

**Segment Reference:** LSTA, LSTP

**Where:**

*number*
The symbolic control unit (CU) number or the symbolic link number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA and ZLSTP commands.

---

**000000000 AI LK *cunumber* LINK WAS ON**

**Segment Reference:** LSTA

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 AI LK *number* OFF OK**

**Segment Reference:** LSTP

**Where:**

*number*
The symbolic link number.

**Explanation:** This is the normal response to the ZLSTP command with the AI parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command. See *TPF Non-SNA Data Communications Logic* for more information about the synchronous link control (SLC) stop synchronous link lines.

---

**000000000 AI LK *cunumber* ON OK**

**Segment Reference:** LSTA

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** This is the normal response to the ZLSTA command with the AI parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 ALL COUNTS RESET OK**

**Segment Reference:** LAEC

**Explanation:** This is the normal response to the ZLAEC command with the ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLAEC command.

---

**000000000 ALL OFF OK**

**Segment Reference:** LSTP

**Explanation:** This is the normal response to the ZLSTP command with the ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 ALL ON OK**

**Segment Reference:** LSTA

**Explanation:** This is the normal response to the ZLSTA command with the ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 ALL REQUEST REJECTED**

**Segment Reference:** LVAL

**Explanation:** There is at least one line specified that had a duplicated subchannel number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 ALL VALIDATED**

**Segment Reference:** LVAL

**Explanation:** This is the normal response to the ZLVAL command with the AI ALL parameters specified. All AI lines were validated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 ALLOW FOLLOWING ACTIVE POOL FUNCTIONS TO COMPLETE. THEN RE-ENTER ZCYCL REQUEST** *xxx...xxx xxx...xxx*

**Explanation:** The utilities listed are lethal utilities associated with pool operations. Cycling down is not allowed while these utilities are running because:

- TPF system integrity may be damaged
- The data generated by the utility would be incorrect.

**System Action:** The ZCYCL request is not honored and the ECB is ended.

**User Response:** Do one of the following:

- Turn off the pool utilities listed
- Wait for the pool utilities to complete before entering the ZCYCL command again.

If the TPF system must be cycled while the pool utilities are active, then force cycling by entering the ZCYCL command with the *xxxx* BP parameter specified.

See *TPF Operations* for more information about the ZCYCL command.

---

**000000000 APPL** *applname* **STOP IN PROGRESS**

**Where:**

*applname*
The application name.

**Explanation:** This is the normal response to the ZROUT STOP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT STOP command.

---

**000000000 APPL** *applname* **STOPPED**

**Where:**

*applname*
The application name.

**Explanation:** This is the normal response to the ZROUT STOP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT STOP command.

---

**000000000 APPL. NOT AVAILABLE RETRY LATER**

**Explanation:** The application program is not available or is inactive currently.

**System Action:** None.

**User Response:** Try the application program again at a later time.

See *TPF Operations* for more information about the LOGx function.

---

**000000000 APPL NOT IN TA0PP LIST**

**Explanation:** The application program is not in the Terminal Application Authorization list so it cannot be deleted from the list.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

---

**000000000 ATT OPTIONS (DET,IC,MOD) FOR MAP** *–mapname–* **CODE INCORRECTLY OPTIONS IGNORED _ CHK DDATA STMNT NAMED** *–labelname–*

**Where:**

*mapname*
The map name.

*labelname*
The label name.

**Explanation:** This is an E-type error message. A DDATA statement in the map referenced in the message with the label specified in the message does not have the ATT options indicated coded in the proper sequence. These options will be ignored but the defaults will be supplied and the map generated.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 ATTEMPT TO TURN OFF THE TRACE WHEN IT IS NOT ON.**

**Explanation:** There was an attempt to turn off the trace when the trace is not on.

**System Action:** A reject message is sent to the originating terminal.

**User Response:** None.

---

**000000000 ATTEMPT TO TURN THE TRACE ON WHEN IT IS ALREADY ON.**

**Explanation:** There was an attempt to turn on the trace when it is already on.

**System Action:** A reject message is sent to the originating terminal.

**User Response:** None.

---

**000000000 BS*sln* CU*cunumber* SUB0*subchannel* LINE NOT VALIDATED**

**Segment Reference:** LSTA, LSTP

**Where:**

*sln* The symbolic line number (SLN).

*cunumber*
The symbolic control unit (CU) number.

*subchannel*
The send line subchannel.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA and ZLSTP commands.

---

**000000000 BS*sln* CU*cunumber* SUB0*subchannel* WAS OFF**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

*cunumber*
The symbolic control unit (CU) number.

*subchannel*
The subchannel number.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 BS*sln* CU*cunumber* SUB0*subchannel* WAS ON**

**Segment Reference:** LSTA

**Where:**

*sln* The symbolic line number (SLN).

*cunumber*
The symbolic control unit (CU) number.

*subchannel*
The send line subchannel.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 BS*sln* ILLEGAL LINE NBR**

**Segment Reference:** LASP, LTOF

**Where:**

*sln* The symbolic line number (SLN) of the binary synchronous communication (BSC) line.

**Explanation:** The SLN referenced in the message is not legal for the following reasons:

- The SLN is not a binary synchronous communication (BSC) line number.
- The BSC line referenced in the message is flagged as *not initialized* in the symbolic line status table (SLST).
- The BSC line is not a multipoint line.
- The TPF system is not the control station for the BSC line referenced in the message.

**System Action:** None.

**User Response:** Enter the command again and specify a legal BSC SLN.

See *TPF Operations* for more information about the ZLASP and ZLTOF commands.

---

**000000000 BS *sln address* ILLEGAL STATION ADDR**

**Segment Reference:** LTOF, LTON

**Where:**

*sln* The symbolic line number (SLN) of the binary synchronous communication (BSC) line.

*address*
The station identification address.

**Explanation:** The station identification address referenced in the message is illegal because the terminal interchange status table indicates that the station does not exist on the BSC line referenced in the message.

**System Action:** None.

**User Response:** Enter the command again and specify a legal station address.

See *TPF Operations* for more information about the ZLTOF and ZLTON commands.

---

**000000000 BS*sln* ILLEG LN**

**Segment Reference:** LAPR, LASL

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** The SLN referenced in the message does not identify a legal BS point-to-point line.

**System Action:** None.

**User Response:** Enter the command again and specify a legal BS point-to-point SLN.

## 000000000

See *TPF Operations* for more information about the ZLAPR command.

---

**000000000 BS*sln* ILLEG OPT**

**Segment Reference:** LAPR

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** The SLN referenced in the message contains an illegal option.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLAPR command.

---

**000000000 BS*sln* INVALID INPUT**

**Segment Reference:** LSTA, LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA and ZLSTP commands.

---

**000000000 BS*sln* NOT BS LINE**

**Segment Reference:** LASN, LIDL

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** The SLN referenced in the message is not a binary synchronous (BS) line.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLASN and ZLIDL command.

---

**000000000 BS *sln address* OFF**

**Segment Reference:** LTOF

**Where:**

*sln* The symbolic line number (SLN) of the binary synchronous communication (BSC) line.

*address*
The station identification address.

**Explanation:** This is the normal response to the ZLTOF command with the BS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLTOF command.

---

**000000000 BS*sln* OK**

**Segment Reference:** LAPR, LASL

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** This is the normal response to the ZLAPR and ZLASL commands.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLAPR and ZLASL commands.

---

**000000000 BS*sln interval* OK**

**Segment Reference:** LASP

**Where:**

*sln* The symbolic line number (SLN).

*interval*
The slow poll interval.

**Explanation:** This is the normal response to the ZLASP command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLASP command.

---

**000000000 BS *sln address* ON**

**Segment Reference:** LTON

**Where:**

*sln* The symbolic line number (SLN).

*address*
The station identification address.

**Explanation:** This is the normal response to the ZLTON command with the BS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLTON command.

---

**000000000 BS*sln* OFF OK**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** This is the normal response to the ZLSTP command with the BS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 BS*sln* ON OK**

**Segment Reference:** LSTA

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** This is the normal response to the ZLSTA command with the BS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 BS*sln* SUB0*subchannel* BS LN VALIDATED**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel number.

**Explanation:** This is the normal response to the ZLVAL command with the BS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 BS*sln* SUB0*subchannel* ILLEG LN**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel number.

**Explanation:** The line number specified in the ZLVAL BS command is not valid.

**System Action:** None.

**User Response:** Enter the command again and specify a valid line number.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 BX*sln* SUB*subchannel* LINE NOT VALIDATED—TIME OUT**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel number.

**Explanation:** The line specified in the ZLVAL command was not validated due to a time out.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 BS*sln* SUB0*subchannel* LN ALREADY VALID**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel number.

**Explanation:** The line number specified in the ZLVAL BS command is already validated.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 BS*bss* SUB*subchannel* NO POLLS RECVD. CHK MSTR**

**Segment Reference:** CRMQ

**Where:**

*bss* The basic subsystem (BSS).

*subchannel*
The subchannel number.

**Explanation:** If the master station for the binary synchronous communication (BSC) line fails to pool the TPF system within the specified time interval for the line, this message is issued and the line is placed in an output inhibited status.

**System Action:** None.

**User Response:** None.

---

**000000000 BS*sln* SUB0*subchannel* NO SUB CH.**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel number.

**Explanation:** The subchannel specified in the ZLVAL BS command is not valid.

**System Action:** None.

**User Response:** Enter the command again and specify a valid subchannel number.

See *TPF Operations* for more information about the ZLVAL command.

**000000000 BS*sln* SUB*subchannel* POLL RECVD**

**Segment Reference:** CTRM

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel address.

**Explanation:** If subsequently, a poll is received, this message is issued and the output inhibited status is removed.

**System Action:** None.

**User Response:** None.

---

**000000000 BS*sln* SUB0*subchannel* POSSIBLE DUPLICATE SUBCHANNEL**

**Segment Reference:** LVAL

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel number.

**Explanation:** The line specified in the ZLVAL BS command is not validated because the slot in the internal line table (ITLT) is nonzero for this line. The ITLT contains 255 one byte slots and it is indexed by subchannel address. The internal line number for the line is stored in the corresponding ITLT slot when the line is validated. If the slot is nonzero, a duplicate subchannel may be defined in the line status table (LSTB).

**System Action:** None.

**User Response:** Review the LSTB to determine whether a subchannel is associated with more than one line. The LSTB can be located in the CTL-9E dump (taken when this condition is detected) by using the LNS dump tag.

See *TPF Operations* for more information about the ZLVAL command.

---

**000000000 BS*sln* SUB*subchannel* STA*ta* DOWN**

**Segment Reference:** CTRM

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel address.

*ta* The terminal address (TA).

**Explanation:** When a binary synchronous communication (BSC) tributary station fails to respond to polling or selection, this message is issued and the BSC station is placed in Slow-Poll mode.

**System Action:** None.

**User Response:** None.

---

**000000000 BS*sln* SUB*subchannel* STA*ta* SP UP**

**Segment Reference:** CTRM

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel address.

*ta* The terminal address (TA).

**Explanation:** The binary synchronous communication (BSC) station will be polled at the Slow-Poll rate specified for the line. If the station response successfully to the Slow-Pool rate, the following message is issued and the station is returned to normal polling.

**System Action:** None.

**User Response:** None.

---

**000000000 BS ALL OFF OK**

**Segment Reference:** LSTP

**Explanation:** This is the normal response to the ZLSTP command with the BS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 BS ALL ON OK**

**Segment Reference:** LSTA

**Explanation:** This is the normal response to the ZLSTA command with the BS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 CANNOT FILE MSGS-ABORTED**

**Segment Reference:** LDLE

**Explanation:** None.

**System Action:** None.

**User Response:** None.

---

**000000000 CARD IN ERROR ***

**Explanation:** There was an error in the format of the input card. This is an E-message that is sent to a printer.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 CATASTROPHIC ERROR OCCURRED LAST BLOCK PROCESSED BL*name***

**Where:**

*name*
The name of the block.

**Explanation:** This message is issued following an IPL after an irrecoverable error occurred during a system test vehicle (STV) run. Processing of follow on messages may continue after the restart of the program test vehicle (PTV)/STV by entering the ZSTVS START command with the BL parameter specified. The system test compiler (STC) block number indicated is the last test unit tape (TUT) input block in process at the time of the error.

This message is sent to the printer.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the program test vehicle (PTV).

**000000000 CHAIN ADDRESS FOLLOWED BY 'EOC'**

**Explanation:** All forward chain addresses were printed. This is an I-type message.

**System Action:** None.

**User Response:** None.

**000000000 CHAIN ADDRESSES FOLLOWED BY 'MOC'**

**Explanation:** There are more than 33 chain records and only the first 33 addresses have been printed. This is an I-type message.

**System Action:** None.

**User Response:** None.

**000000000 CHECK DATA AND CALL SUPERVISOR**

**Explanation:** When a command received from a remote terminal causes a system error, this message is sent to the terminal to unlock the keyboard and also to alert the operator that an abnormal event occurred.

**System Action:** None.

**User Response:** None.

**000000000 CNTS HAVE BEEN ZEROED**

**Segment Reference:** NERR00

**Explanation:** This is the normal response to the ZNERR command with the ZERO parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNERR command.

**000000000 COMMANDS OUT OF SEQUENCE RESET PTV**

**Explanation:** You did not reply to the following message before trying to run the program test vehicle (PTV):

```
IDENTIFY TEST RUN PH1 PH3  ZSTVS TEST YES
             STV  -----   ZSTVS TEST STV
             LIVE -----   ZSTVS TEST LIVE
```

For example, you may have entered a ZSTVS START RUNID RX command before entering a ZSTVS TEST STV command.

**System Action:** None.

**User Response:** Enter **ZSTVS TEST RESET** to reset PTV.

See *TPF Operations* for more information about PTV.

**000000000 COMMON KEYPOINT/RESTART — USE BSS ***

**Explanation:** COMMON areas must be updated by the basic subsystem (BSS). Only area specific to the subsystem may be updated by that subsystem. This is a T-type message and is sent to a printer.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAURS commands.

**000000000 CON LEN > THE FIELD LEN MAP-*name*-TERMINATED**

**Where:**

*name*
The user output map name.

**Explanation:** This is an E-type error. The user output map referenced in the message as a DDATA statement with a CON= operand coded in which the constant data is greater than the length specified in the LENGTH= operand.

**System Action:** This map is not created.

**User Response:** Do the following:

1. Correct the DDATA statement.
2. Run the function again.

See *TPF Database Reference* for more information about mapping support installation.

**000000000 CONVERSION ERROR**

**Segment Reference:** ZPLMT

**Explanation:** This message is for the 3270 synchronous data link control (SDLC) pseudo line. The RIDCC macro conversion routine (RIDCC) encountered a possible database error.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZPLMT command.

**000000000 CORE COPY OF *progname* PATCHED**

**Where:**

*progname*
The program name.

**Explanation:** The program referenced in the message was patched in core as a result of interprocessor communications (IPC). This is an I type message.

**System Action:** None.

**User Response:** None.

**000000000 CORE RCD NOT LOADED**

**Explanation:** The map sharing table is not in core.

**System Action:** None.

**User Response:** Do the following:

1. Create a core record.
2. Try again.

See *TPF Operations* for more information about the ZAMAP command.

**000000000 CRET ACTIVE — ENTRY IGNORED**

**Explanation:** TPF system status shows duplicate time initiated entry.

**System Action:** None.

**User Response:** None.

**000000000 CTKA READ ERROR — E-TYPE LOADER PST CLEANUP BYPASSED**

**Explanation:** The E-type loader did not clean up the program sharing table (PST) because the loader could not read keypoint A, which it uses to determine whether a program is sharable. Back level versions of the loaded file resident programs may remain active as other programs are loaded and become available.

**System Action:** None.

**User Response:** It may be necessary to re-IPL the processor that issued the message, especially if back level versions of loaded file resident programs remain active for an extended length of time.

See *TPF System Installation Support Reference* for more information about the loaders program.

**000000000 CU*cunumber* ASSIGN COMPLETE**

**Segment Reference:** LASN

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** This is the normal response to the ZLASN CU command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLASN command.

**000000000 CU*cunumber* HUNG—RECONFIG IN PROGRESS**

**Segment Reference:** LASN, LIDL, LM2740, LREP

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLIDL, ZLASN, and ZLREP commands.

**000000000 CU*cunumber* IDLE COMPLETE**

**Segment Reference:** LIDL

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** This is the normal response to the ZLIDL CU command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLIDL command.

**000000000 CU*cunumber* INVALID CU**

**Segment Reference:** LASN, LIDL, LM2740, LREP

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** The symbolic control unit (CU) number referenced in the message is not a valid CU.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLIDL, ZLASN, and ZLREP commands.

**000000000 CU*cunumber* REPLACE COMPLETE**

**Segment Reference:** LREP

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** This is the normal response to the ZLREP command with the CU parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP command.

---

**000000000 CU*cunumber* 2703 ALREADY ASSIGNED**

**Segment Reference:** LASN

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLASN command.

---

**000000000 CU*cunumber* 2703 NOT ONLINE**

**Segment Reference:** LIDL, LM2740, LREP

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLIDL and ZLREP commands.

---

**000000000 CU*cunumber* HUNG—RECONFG IN PROGRESS**

**Segment Reference:** LASN

**Where:**

*cunumber*
The symbolic control unit (CU) number.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLASN command.

---

**000000000 CU ILLEGAL**

**Segment Reference:** LDLE

**Explanation:** The symbolic control unit specified is not in the control unit (CU) status table.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLE command.

---

**000000000 CU OFFLINE**

**Segment Reference:** LDLE

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLE command.

---

**000000000 CVIO INPUT ERROR**

**Explanation:** None.

**System Action:** See the dump that is provided for more information.

**User Response:** None.

---

**000000000 DBSI*msgtext***

**Segment Reference:** DBSI

**Where:**

*msgtext*
The message text.

**Explanation:** For information about the messages prefixed with DBSI, see the corresponding DBRI messages found in *Messages (System Error and Offline)* and *Messages (Online)*.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**000000000 DBSO*msgtext***

**Segment Reference:** DBSO

**Where:**

*msgtext*
The message text.

**Explanation:** For more information about the messages prefixed with DBSO, see the corresponding DBRO messages found in *Messages (System Error and Offline)* and *Messages (Online)*.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about database reorganization (DBR).

---

**000000000 DDATA EXPECTED NOT READ MAP—*msgtext*—TERMINATED**

**Where:**

*msgtext*
The map name.

**Explanation:** This is a Type E error. The user map specified in the message has a statement other than a DDATA statement included between the two DPANL statements.

## 000000000

**System Action:** The map is not created.

**User Response:** Do the following:

1. Make the necessary corrections.
2. Run again.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 DELETE ENCOUNTERED AFTER ADD OR MODIFY — DELETE STATEMENT**

**Explanation:** This is a Type E error. A delete statement was found after an ADD (A) or REPLACE (R) statement was processed. This is an error because ***all*** DELETE statements must be placed before any ADD or REPLACE statements.

**System Action:** This DELETE statement is ignored and the next MODIFY statement is read.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 DELETE FOR MAP SEQ # NNNN TYPE X GENERATED**

**Explanation:** This is a Type C error. This message indicates that the DELETE statement was processed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 DEVICE ADDRESSED NOT VALID**

**Explanation:** This error is the result of:

- Not being able to find the device hardware address in CTK0
- Determining, by examining the keypoint record B, that the channel address is not allocated to the TPF system.

**System Action:** None.

**User Response:** None.

---

**000000000 DEVICD CODED FOR MODE=BOTH NOT A 3720 CRT, MAP-.*mapname*-TERMINATED**

**Where:**

*mapname*
The map name.

**Explanation:** This is a Type E error. The user map specified in the message has a non-3270 cathode ray tube device coded in the DEV operand for a map with MODE=BOTH coded in the DPANL statement.

**System Action:** The map is not created for all devices.

**User Response:** Do the following:

1. Make the necessary corrections.
2. Run again.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 DEVICE TYPE -*type*-FOR MAP-.*mapname*-INVALID, MAP TERMINATED**

**Where:**

*type*
The device type.

*mapname*
The map name.

**Explanation:** This is a type E error. A non-3270 CRT was requested for the input map specified in the message.

**System Action:** The map is not generated.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 DEVICE TYPE-*type*-FOR MAP-*mapname*-OT ALLOWED, MAP TERMINATED**

**Where:**

*type*
The device type.

*mapname*
The map name.

**Explanation:** This is a type E error. The user map specified in the message has a device coded that is not valid for the mode specified, for example, 1977 for an input map.

**System Action:** The map is not created for ***all*** devices specified.

**User Response:** Do the following:

1. Make any necessary corrections.
2. Run again.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 DMSPL*error* PL/I COMPILER ERROR**

**Where:**

*error*
The PL/I compiler error.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *OS PL/I Checkout Compiler Messages* and *OS PL/I Optimizing Compiler Messages* for more information.

---

**000000000 DOT MATRIX BUSY — REPEAT REQUEST**

**Explanation:** The dot matrix control record contains 200 terminal entries and cannot process any more terminal requests.

**System Action:** The error message is sent to the originating console and the program is exited.

**User Response:** None.

**000000000 DOT MATRIX CONTROL RECORD RETRIEVAL ERROR**

**Explanation:** An error occurred while retrieving the dot matrix control record.

**System Action:** An error message is sent to the prime computer room agent set (CRAS) console and then the program is exited.

If the error occurs during timeout transmission, the error message is sent only to the prime CRAS console.

**User Response:** None.

**000000000 DOT MATRIX INVALID ENTRY**

**Explanation:** A message was sent to the dot matrix loader program that did not contain a lozenge end-of-message-complete (EOM) character or an answer back message was received that does not have a terminal entry in the dot matrix control record.

**System Action:** The error message is sent to the originating terminal and the program is exited.

**User Response:** None.

**000000000 DOT MATRIX MESSAGE RECORD RETRIEVAL ERROR**

**Explanation:** An error occurred while retrieving the dot matrix message record.

**System Action:** The error message is sent to the prime computer room agent set (CRAS) console and the program is exited.

If this error occurred during timeout transmission the error message is sent to the prime CRAS console.

Processing is ended on all consoles receiving this error.

**User Response:** None.

**000000000 DOT MATRIX TRANSMISSION FAILURE TO *lniata***

**Where:**

*lniata*
The line number, interchange address, and terminal address (LNIATA).

**Explanation:** The dot matrix messages cannot be sent to the terminal.

**System Action:** The error message is sent to the prime computer room agent set (CRAS) console and processing on this console is ended.

**User Response:** None.

**000000000 DPANL SEQUENCE ERROR FOR MAP—*mapname*—TERMINATED**

**Where:**

*mapname*
The map name.

**Explanation:** This is a Type E message. The user map specified in the message does not have the DPANL statements in proper order.

**System Action:** This map is not created.

**User Response:** Do the following:

1. Correct the map and ensure that the DPANL DSECT=START is the first statement of the map and that the DPANL DSECT=END is the last statement of the map.
2. Run the job again.

See *TPF Database Reference* for more information about mapping support installation.

**000000000 DPANL STMNT IN ERROR, MAP NAMED—*mapname*—TERMINATED**

**Where:**

*mapname*
The map name.

**Explanation:** This is a Type E message. An operand that is not valid or was misspelled was coded in the DPANL statement for the map specified in the message.

**System Action:** This map is not created.

**User Response:** Do the following:

1. Correct the map.
2. Run the job again.

See *TPF Database Reference* for more information about mapping support installation.

**000000000 DSECT NOT CODED CORRECTLY FOR MAP—*mapname*—TERMINATED**

**Where:**

*mapname*
The map name.

**Explanation:** This is a Type E error. The DSECT= operand of the DPANL statement for the map specified in the message was not coded with the words START or END.

**System Action:** This map is not created.

**User Response:** Do the following:

1. Correct the map.
2. Run the job again.

See *TPF Database Reference* for more information about mapping support installation.

**000000000 DUPLICATE RETURN LABELS SPECIFIED**

**Explanation:** The FIND and NOFIND parameters were specified as the same user routine.

**System Action:** None.

**User Response:** None.

**000000000 DUPLICATE — SEQ #**

**Explanation:** A map was found on the MRT tape with the same sequence number and device type as the previous map.

**System Action:** This map record and any chains are bypassed.

**User Response:** Do the following:

1. Check the data.
2. Assign a new sequence number if a duplicate was created inadvertently.

See *TPF Database Reference* for more information.

**000000000 DUPLICATE — SEQ # DEVICE TYPE**

**Explanation:** On an add request, a sequence number and device type match were found on file.

**System Action:** None.

**User Response:** Do one of the following:

- If the file map is not correct, delete it and try again.
- If this is a user error, assign a new sequence number.
- Correct the map on file.
- Ignore the error.

See *TPF Database Reference* for more information.

**000000000 DYDU — END OF DIRECTORY UPDATE**

**Explanation:** This is the normal response to the ZDUPD command following completion of the address roll-in phase of the directory update.

**System Action:** None.

**User Response:** Verify the proper completion results through the pool address report that follows this message.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

**000000000 DYDU — END OF DUPL CHECK PASS**

**Explanation:** This is the normal response to the ZDUPD command following completion of the duplicate address phase of the pool directory update.

**System Action:** None.

**User Response:** Determine whether the address roll-in phase of directory update should be started or whether the directory update should be ended.

See *TPF Operations* for more information about the ZDUPD command. See *TPF Database Reference* for more information about online pool directory update.

**000000000 END OF FILE ERROR — JOB TERMINATED**

**Explanation:** An end of file was reached on MEMLIB.

**System Action:** The job is ended.

**User Response:** None.

**000000000 END OF TEST MOUNT NEW REEL TO CONTINUE TO INITIATE NEXT TEST RUN ENTER ZRIPL**

**Explanation:** There was an end of job indication after the test unit tape (TUT) was processed to completion.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the program test vehicle (PTV).

**000000000 ENTER REQ.**

**Explanation:** This message is received at a 3270 terminal receives as a result of pressing the PA1 Key (System Service Request).

**System Action:** None.

**User Response:** None.

**000000000 EQUAL SIGN DOESN'T FOLLOW KEYWORD/CARD REJECTED**

**Explanation:** This message occurs when a keyword on the control card is not followed by an equal sign.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about variable cross references.

**000000000 ERROR ACT CODE ALTERED**

**Explanation:** If the editing process would delete any of the control areas or action code of the message (bytes 0 through 21), UIB1 ends by sending this message to the agent.

**System Action:** None.

**User Response:** None.

**000000000 ERROR DURING FIND/FILE — JOB ABORTED**

**Explanation:** An error occurred that indicates that processing should be ended.

**System Action:** None.

**User Response:** Do the following:

1. Review the system error dump.
2. Take the appropriate corrective action.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 ERROR FINDING ID *nn* ADDRESS *addr* SSU *ssu* — I-S *is***

**Explanation:** A main storage allocator record or global record cannot be found with the ID, ordinal number, and address specified.

**System Action:** None.

**User Response:** None.

---

**000000000 ERROR IN PARAMETER OF CALL CARD**

**Explanation:** There was an input card in error.

**System Action:** The card is bypassed and the card in error is printed.

**User Response:** None.

---

**000000000 ERROR ON OBR/MDR TAPEWRITE +**

**Explanation:** The OBR or MDR record record was not written to a real-time tape and the data contained in the tape record was lost.

**System Action:** None.

**User Response:** None.

---

**000000000 ERROR READING MAP LIB DIR. THIS MAP RUN TERMINATED**

**Explanation:** This is a Type E error. An input/output (I/O) error occurred while trying to read the user's map library directory.

**System Action:** The program ends with an ABEND core dump with a user code of 08.

**User Response:** Verify the integrity of the library before submitting the run again.

See *TPF System Installation Support Reference* for more information about mapping support installation.

---

**000000000 ERROR RETURN CODE FROM SORT**

**Explanation:** On return from the sort phase of the program, general R15 contains a nonzero value, which indicates that an error occurred in the sort.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about variable cross references.

---

**000000000 ERROR WHILE RESETTING COUNTS**

**Segment Reference:** LAEC

**Explanation:** There was an error while resetting the counts.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLAEC command.

---

**000000000 FACE ERROR ON OPER ID RECORD**

**Explanation:** A file address compute program (FACE) error occurred when an operator ID was specified as a prefix to a message and an attempt was made to retrieve the operator ID record from file.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOG command.

---

**000000000 FACE ERROR WITH SYSTEM ERROR DUMP**

**Explanation:** There was a file address compute program (FACE) error with the system error dump.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNNCB and ZNSPA commands.

---

**000000000 FACE/FIND ERROR**

**Segment Reference:** LDLE

**Explanation:** Single line display only – an error was encountered while trying to locate or find the SCK for the requested line.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLE command.

---

**000000000 FACE OR FIND ERROR ON TA0PP**

**Explanation:** There was an error returned from the file address compute program (FACE) or FIND while retrieving a terminal application authorization table record.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

---

**000000000 FACE OR FIND ERROR ON UA1UA**

**Explanation:** There was an error returned from the file address compute program (FACE) or FIND while trying to get the AAA initialization table record for the terminal from file.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

---

**000000000 FACE OR FIND ERROR WHEN GETTING BSS CLOCK RECORD.**

**Explanation:** There was a file address compute program (FACE) or FIND error while trying to access the basic subsystem (BSS) clock record.

**System Action:** A reject message is sent to the originating terminal.

**User Response:** None.

---

**000000000 FIELD LENGTH EXCEEDS 255 BYTES, MAP NAMED —*xxxx*— FIELD NAMED—*yyyy* — TERMINATED**

**Explanation:** This is a Type E error. You coded a DDATA statement with the name specified in the message and this statement has a LENGTH= operand that contains a value exceeding 255.

**System Action:** The map generation is ended for the map specified in the message.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 FILE ERROR — MSG IGNORED**

**Explanation:** This error involves keypoint A.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLACL command.

---

**000000000 FILN MACRO *recordname* FIND ERROR**

**Where:**

*recordname*
The data record name, which is PKST or SCK.

**Explanation:** There was a find error with the data record specified in the message.

**System Action:** None.

**User Response:** None.

---

**000000000 FILN MACRO *recordname* INVALID FILE ADDRESS**

**Where:**

*recordname*
The data record name, which is PKST or SCK.

**Explanation:** A file address that is not valid was found in the data record specified in the message.

**System Action:** None.

**User Response:** None.

---

**000000000 FIND ERROR ON OPER ID RECORD**

**Explanation:** A FIND error occurred when an operator ID was specified as a prefix to a message and an attempt was made to retrieve the operator ID record from file.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOG command.

---

**000000000 FIND ERROR WITH SYSTEM ERROR DUMP**

**Explanation:** There was a FIND error with a system error dump.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNSPA command.

---

**000000000 FIRST STMNT OF MAP—*maplibrary*—NOT A DPANL, MAP TERMIN ATED**

**Where:**

*maplibrary*
The name of the map library.

**Explanation:** This is a Type E error. The source number read from the user's map library does not have the DPANL operation code coded immediately following the name field.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 FROM CPU *cpuid* NOT BELOW CRAS STATE**

**Where:**

*cpuid*
The central processing unit (CPU) ID.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALMT command.

---

**000000000 FROM CPUID NOT SPECIFIED**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALMT command.

**000000000 GLOBAL VALUE NOT A,B,C**

**Explanation:** The value of the GLOBAL= field on the control card is not A, B, or C.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about variable cross references.

---

**000000000 HS*sln* SUB*subchannel* TIA*ta* MAIN SIDE DOWN**

**Segment Reference:** CTRM

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel address.

*ta* The terminal address (TA).

**Explanation:** A failing terminal interchange (TI) will cause the TI fallback program to issue this message when placing the TI in Slow-Poll mode.

**System Action:** None.

**User Response:** None.

---

**000000000 HS*sln* SUB*subchannel* TIA*ta* MONITOR SIDE DOWN**

**Segment Reference:** CTRM

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel address.

*ta* The terminal address (TA).

**Explanation:** A failing terminal interchange (TI) causes the TI fallback program to issue this message when placing the TI in Slow-Poll mode.

**System Action:** None.

**User Response:** None.

---

**000000000 HS*sln* SUB*subchannel* TIA*ta* SP UP**

**Segment Reference:** CTRM

**Where:**

*sln* The symbolic line number (SLN).

*subchannel*
The subchannel address.

*ta* The terminal address (TA).

**Explanation:** Because Slow-Poll mode does not require the monitor side of the terminal interchange (TI) the first slow poll should cause the TI to respond successfully and the validate TIA in the Slow-Mode program will issue this message when returning the TI to the normal poll schedule.

Depending on the Slow-Poll time interval, the TI oscillates up and down between 15 seconds and 4 minutes. In this case, do one of the following:

- Place the line associated with the failing TI in roll call (by entering the ZLROL command). The failing TI should now operate without errors.
- Turn off (by entering the ZLTOF command) the failing TI and see your IBM service representative for more information. When the TI is fixed, enter the ZLTON command to restore the TI to service.
- See your IBM service representative for more information and ignore the error messages. The TI will oscillate up and down between 15 seconds and 4 minutes.

  **Note:** Enter the ZLTOF command to turn off any TIs that are in the Slow-Poll Monitor Side before entering the ZLSTP command to stop polling on the line.

**System Action:** None.

**User Response:** None.

---

**000000000 (ICS-*lniata-cpuid*/AIC-*cpuid*) APPL**

**Segment Reference:** ZROUT

**Where:**

*lniata*
The initiating line number, interchange address, and terminal address (LNIATA).

*cpuid*
The initiating CPU ID.

**Explanation:** This message is issued prior to any response from the ZROUT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT commands.

---

**000000000 IEL*error* PL/I COMPILER ERROR**

**Where:**

*error*
The compiler error.

**Explanation:** There was a PL/I compiler error.

**System Action:** None.

**User Response:** None.

See *OS PL/I Optimizing Compiler Messages* for more information.

---

**000000000 IEN*error* PL/I COMPILER ERROR**

**Where:**

*error*
The compiler error.

**Explanation:** There was a PL/I compiler error.

**System Action:** None.

## 000000000

**User Response:** None.

See *OS PL/I Optimizing Compiler Messages* for more information.

---

**000000000 ILLEGAL ENTRY**

**Explanation:** The ZLACL command was entered with a value specified for restart that is not more than the value specified for the shutdown level. The restart value must be more than the value specified for the shutdown level.

**System Action:** The ZLACL command is rejected.

**User Response:** Enter the ZLACL command again and specify valid restart and shutdown level values.

See *TPF Operations* for more information about the ZLACL command.

---

**000000000 ILLEGAL FUNCTION CP NOT IN TEST MODE**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTEST command.

---

**000000000 ILLEGAL LINE NO.**

**Segment Reference:** ALCT, DLCT

**Explanation:** One of the following errors occurred:

- The symbolic line number (SLN) specified is not a valid hexadecimal number.
- The SLN is out of range of the valid SLNs.
- There was an illegal line number.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT and the ZDLCT commands.

---

**000000000 ILLEGAL LINE NO.** *sln*

**Segment Reference:** BOLT

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBOLT command.

---

**000000000 ILLEGAL PATH**

**Segment Reference:** ALCT, DLCT

**Explanation:** One of the following errors occurred:

- The path number is either greater than the maximum path number or it is not a valid hexadecimal number.
- The path was illegal.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT and ZDLCT commands.

---

**000000000 INACTIVE RECORD**

**Segment Reference:** DLCT

**Explanation:** There was an inactive record.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDLCT command.

---

**000000000 INSUFFICIENT CORE/INCREASE REGION SIZE**

**Explanation:** A GETMAIN for core to be used as work area cannot be satisfied.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about variable cross references.

---

**000000000 INVAL BKSPC OVER PRIME ACT. CODE**

**Explanation:** The condition causing the backspace character tried to delete the the error: Primary Action Code.

**System Action:** None.

**User Response:** None.

---

**000000000 INVALID** *type* **FIELD** *type*

**Segment Reference:** BOLT

**Where:**

*type*
The test type.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBOLT command.

---

**000000000 INVALID APPLICATION**

**Explanation:** The application program is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOBx and ZAUTH commands.

**000000000 INVALID CHK PARAMETER SPECIFIED**

**Explanation:** The CHK parameter specified is not valid.

**System Action:** None.

**User Response:** None.

**000000000 INVALID CHK/TYPE PARAMETER SPECIFIED**

**Explanation:** No valid CHK parameter or TYPE list is null.

**System Action:** None.

**User Response:** None.

**000000000 INVALID CODE IN RECORD HEADER** *record1 record2* **RECORDS READ =** *record3* **RECORDS WRITTEN =** *record4*

**Segment Reference:** ACPD

**Where:**

*record1*
Date and 1 byte address code from header record.

*record2*
First 12 bytes of the header record.

*record3*
The records that were read.

*record4*
The records that were written.

**Explanation:** The data record header does not contain an absolute address code (X'09') or a symbolic address code (X'07'). An attempt is made to print the erroneous code and the first 12 bytes of the header record (mapped by the SDFPF DSECT).

**System Action:** The data load continues.

**User Response:** Correct and load the pilot tape again.

**Note:** A threshold is set for this message to prevent the system from running out of main storage blocks when loading a tape with defective records. The system issues a maximum of 12 error messages. A summary message indicating the total count of code errors that are not valid is issued at the end of the load.

See *TPF System Installation Support Reference* for more information about loaders.

**000000000 INVALID DATA TYPE** *type*

**Segment Reference:** BOLT

**Where:**

*type*
The data type.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBOLT command.

**000000000 INVALID DEVICE ADDRESS**

**Explanation:** The hardware address specified in the command is not correct.

**System Action:** The ECB is exited.

**User Response:** None.

**000000000 INVALID DS NAME**

**Explanation:** The data set name specified in the command is too long or contains blanks.

**System Action:** The ECB is exited.

**User Response:** None.

**000000000 INVALID ENTRY**

**Segment Reference:** LKST, LREP, LRST, LVAL

**Explanation:** One of the following errors occurred:

- An incomplete ZLKST command was entered. For example, th e ZLSTA command was entered without the parameter that specify the type of line; that is, ZLSTA AI for SLC or ZLSTA BS for BSC.
- There was an entry that was not valid.
- The line specified in the ZLVAL command is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLKSTA, ZLREP, ZLRST, and ZLVAL commands.

**000000000 INVALID ENTRY — BSS ONLY**

**Explanation:** The command entered can only be processed within the basic subsystem (BSS).

**System Action:** None.

**User Response:** Enter the command again prefixed to the BSS: BSS//message.

**000000000 INVALID ENTRY — EP PROC ONLY ID — CPUID**

**Explanation:** The command entered can only be processed in the EP processor.

## 000000000

**System Action:** None.

**User Response:** Enter the command again and specify a prefix of the EP processor (SMP*x*// message where *x* is the CPU ID of the EP processor) or enter the command again from an EP-attached computer room agent set (CRAS) console.

---

**000000000 INVALID ENTRY — FORMAT ERROR**

**Explanation:** There was a format error because of an entry that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCRS command.

---

**000000000 INVALID ENTRY — MSG TOO LONG**

**Explanation:** The message was too long because of an entry that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZRCRS command.

---

**000000000 INVALID FACE INPUT ID/ ORDNBR** *ordnum record1* **RECORDS READ =** *record2* **RECORDS WRITTEN =** *record3*

**Segment Reference:** ACPD

**Where:**

*ordnum*
8-byte FACE ID/ordinal number.

*record1*
First 12 bytes of the header record.

*record2*
The records that were read.

*record3*
The records that were written.

**Explanation:** An error from the file address compute (FACE) program indicated an attempt to load a record type that is not valid or a record with an ordinal number that is not valid.

**Note:** A threshold is set for this message to prevent the system from running out of main storage blocks when loading a tape with defective records. The system issues a maximum of 12 error messages. A summary message that indicates the total count of FACE errors is issued at the end of the load.

**System Action:** The record is not filed and an attempt is made to print the first 12 bytes of the header record (mapped by the SDFPF DSECT).

**User Response:** Do the following:

1. Correct the error.
2. Run the job again.

See *TPF System Installation Support Reference* for more information about loaders.

---

**000000000 INVALID FILE/CORE ADDRESS ***

**Explanation:** The input data address is not valid. This is a Type E error sent sent to printer and console devices.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 INVALID FORMAT**

**Segment Reference:** ALCT, DLCT

**Explanation:** One of the following errors occurred:

- The format of the ZALCT command is not valid.
- The format of the ZDLCT command is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT and ZDLCT commands.

---

**000000000 INVALID HEX DATA** *data*

**Segment Reference:** BOLT

**Where:**

*data*
The data.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBOLT command.

---

**000000000 INVALID HS LINE #**

**Segment Reference:** LRST

**Explanation:** The line number specified in the ZLRST command is out of range or the input does not specify a network extension facility (NEF) LEID in a TPF/Advanced Communication Function (ACF) system that was generated with the NEF.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information in the ZLRST command.

---

**000000000 INVALID INPUT MESSAGE**

**Segment Reference:** ACPD

**Explanation:** The input message to start the data loader was not valid.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders and the proper format of the data loader commands.

---

**000000000 INVALID LINE NO.**

**Segment Reference:** LREP

**Explanation:** The line number is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP command.

---

**000000000 INVALID LINE NO. — 2703**

**Segment Reference:** LREP

**Explanation:** The line number is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP command.

---

**000000000 INVALID LINE SPECIFIED**

**Segment Reference:** LDLE

**Explanation:** The specified line is not valid in the symbolic line status table (SLST).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLE command.

---

**000000000 INVALID LIT ADDRESS**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

---

**000000000 INVALID LIT LENGTH**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

---

**000000000 INVALID LIT/RID CONVERSION ERROR**

**Explanation:** A CLAC// message was issued from a terminal whose address is not a true pseudo-LNIATA. That is, it is not a NEF/ALC terminal.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGx command.

---

**000000000 INVALID LOGU FORMAT**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGx command.

---

**000000000 INVALID/ MISSING PARM FIELD, CHECK PARM STMNT**

**Explanation:** This is a Type E error. The parameter field was not coded with the words CREATE, MODIFY or the parameter field was omitted from the EXEC JCL card.

**System Action:** The run is ended.

**User Response:** Do the following:

1. Correct the error.
2. Run the job again.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 INVALID OMSG CHARACTER COUNT**

**Explanation:** In this case, UIH issues the 01F010 system error message with the EXIT option or a SERRC with the RETURN option if a AI-NAK retransmission.

**System Action:** None.

**User Response:** None.

---

**000000000 INVALID OPERAND IN DDATA STMNT, MAP — *mapname* — TERMINATED — CHK DDATA STMNT NAMED — *name***

**Where:**

*mapname*
The map name.

*name*
The DDATA statement name.

**Explanation:** This is a Type E error. The user map referenced in the message with a DDATA statement also referenced in the message has an operand that is not valid or is misspelled.

**System Action:** The map is not created.

**User Response:** Do the following:

1. Correct the problem.

2. Run the job again.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 INVALID OPTION SPECIFIED**

**Explanation:** An option other than those supported by the TPF system was specified or the option specified was misspelled.

**System Action:** The request is ended.

**User Response:** Enter the proper command.

See *TPF System Installation Support Reference* for more information about loaders.

---

**000000000 INVALID PARM**

**Explanation:** The parameter is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNPOL commands.

---

**000000000 INVALID PARAMETER IN TYPE LIST**

**Explanation:** The line type list is not within the range of valid line types defined in the TPF system.

**System Action:** None.

**User Response:** None.

---

**000000000 INVALID PARAMETERS — REENTER MESSAGE**

**Explanation:** Parameters that are not valid were specified in the command.

**System Action:** None.

**User Response:** Enter the command again and specify parameters that are valid.

See *TPF Operations* for more information about the ZSTAT command.

---

**000000000 INVALID PATCH DISPL ***

**Explanation:** A patch for the segment goes beyond the segment block. This is a Type E error and is sent to the printer device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record support commands.

---

**000000000 INVALID PROCESSOR ID**

**Explanation:** The input processor ID is not valid. This is a Type E error and is sent to the printer device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 INVALID RECEIVE/SEND LIMIT**

**Segment Reference:** LREP

**Explanation:** The receive and send limit is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLREP command.

---

**000000000 INVALID REQUEST**

**Segment Reference:** ALCT

**Explanation:** One of the following errors occurred:

- The requested action code is not valid. Valid options are:
  - ACT
  - DWN.
- The parameter specified with the command is not correct.
- This is the normal response to the LOGI command when you try to log into more than one application program. Once you are logged into an application program you cannot log into another one.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT, ZAUTH, and LOGx commands.

---

**000000000 INVALID REQUEST BSS ONLY**

**Explanation:** If a keypoint is shared by all subsystems in a processor, the word SHARED will be appended to the response.

**System Action:** None.

**User Response:** None.

---

**000000000 INVALID SLST ENTRY**

**Segment Reference:** LDLS

**Explanation:** There is a symbolic line status table (SLST) entry that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS command.

---

**000000000 INVALID STORAGE PROTECT OPTIONS SPECIFIED**

**Explanation:** The storage protect options specified are not valid.

**System Action:** None.

**User Response:** None.

**000000000 INVALID SYMBOLIC KEYPOINT LABEL**

**Explanation:** The symbol used to specify the keypointable data is incorrect.

**System Action:** None.

**User Response:** None.

See *TPF System Macros* for more information about the PKEYC macro.

**000000000 INVALID SYSID CARD/SS NAME ***

**Explanation:** The subsystem ID on the SYSID card does not match the subsystem ID prefixing the ZAURS command. This is a Type T error and is sent to the console device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

**000000000 INVALID VOLUME**

**Explanation:** The volume sequence number (VSN) specified in the command is not numeric.

**System Action:** The ECB is exited.

**User Response:** None.

**000000000 INVLD ENT**

**Explanation:** A scroll map does not exist for the previous entry. The message is rejected and the INVLD ENT canned message is sent to the agent through the output message writer.

**System Action:** None.

**User Response:** None.

**000000000 INVLD FORMAT**

**Explanation:** The request is rejected and the INVLD FORMAT canned message is sent through the output message writer.

**System Action:** None.

**User Response:** None.

**000000000 INVLD IN 1052 STATE**

**Explanation:** Map file maintenance cannot be activated when the TPF system is in 1052 state or utility (UTIL) state.

**System Action:** None.

**User Response:** Activate the map file maintenance again when the TPF system is no longer in 1052 state or utility (UTIL) state.

**000000000 INVLD SEC ACT CODE**

**Explanation:** The MSW message was found to have a secondary action code that is not valid. This canned message is sent to the terminal.

**System Action:** None.

**User Response:** None.

**000000000 INVLD SINE FOR ENT**

**Explanation:** The sine must be SU or RC.

**System Action:** None.

**User Response:** None.

**000000000 INVLD TERM ADDR**

**Explanation:** The terminal address is not valid.

**System Action:** None.

**User Response:** None.

**000000000 INV LN NO**

**Segment Reference:** LSTP

**Explanation:** The ZLSTP command with the PS parameter specified was entered with a line number that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

**000000000 INV LN NO.**

**Segment Reference:** LDLS, LSTA

**Explanation:** One of the following errors occurred:

- The ZLSTA command was entered with the PS parameter specified and a line number that is not valid.
- The ZLDLS command was entered with the PS parameter specified and a line number that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS and ZLSTA commands.

**000000000 INV PS LINES**

**Segment Reference:** LSTP

**Explanation:** None.

**System Action:** None.

**User Response:** None.

## 000000000

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 INV RATE PARAMETER**

**Segment Reference:** LSTA, LSTP

**Explanation:** There is a rate parameter that is not valid.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA and ZLSTP commands.

---

**000000000 I/O ERROR READING CTKA**

**Explanation:** While trying to read CTKA, a file input/output (I/O) error occurred.

**System Action:** Collection is aborted.

**User Response:** None.

---

**000000000 I/O ERROR READING CTKI**

**Explanation:** While trying to read CTKI, a file input/output (I/O) error occurred.

**System Action:** Collection is aborted.

**User Response:** None.

---

**000000000 I/O ERROR READING RCIT**

**Explanation:** While trying to read the RCIT, a file input/output (I/O) error occurred.

**System Action:** Collection is aborted.

**User Response:** None.

---

**000000000 I/O ERROR READING UAT**

**Explanation:** While trying to read the UAT, a file input/output (I/O) error occurred.

**System Action:** Collection is aborted.

**User Response:** None.

---

**000000000 IPC READ ERROR — PROC ID** *procid* *****

**Where:**

*procid*
The processor ID.

**Explanation:** This is a response from interprocessor communications (IPC). This is a Type E message and is sent to the printer and console devices.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 JOB ABORTED — SEE PRINTER ***

**Explanation:** An error occurred causing ARD to end processing. Printed output will provide specific explanations. This is a Type T error that is sent to a console device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 LC***sln* **A-03-WGR RETURN ERROR**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 LC***sln* **CU***cunumber* **SUB***subchannel* **OFF OK**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

*cunumber*
The symbolic control unit (CU) number.

*subchannel*
The symbolic subchannel number.

**Explanation:** This is the normal response to the ZLSTP command with the LC parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 LC***sln* **INVALID INPUT — SLN**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 LC*sln* INV LN NO.**

**Segment Reference:** LDLS

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS command.

---

**000000000 LC*sln* — SLST INVALID DEVICE TYPE**

**Segment Reference:** LDLS

**Where:**

*sln* The symbolic line number (SLN)

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS command.

---

**000000000 LC*sln* SLST NOT INITIALIZED**

**Segment Reference:** LSTA, LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA and ZLSTP commands.

---

**000000000 LC*sln* WAS OFF**

**Segment Reference:** LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 LC*sln* WAS ON**

**Segment Reference:** LSTA

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 LC*sln* CU*cunumber* SUB*subchannel* INTERVENTION REQUIRED**

**Segment Reference:** LSTA

**Where:**

*sln* The symbolic line number (SLN).

*cunumber*
The symbolic control unit (CU) number.

*subchannel*
The send line subchannel.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 LC*sln* CU*cunumber* SUB*subchannel* ON OK**

**Segment Reference:** LSTA

**Where:**

*sln* The symbolic line number (SLN).

*cunumber*
The symbolic control unit (CU) number.

*subchannel*
The send line subchannel.

**Explanation:** This is the normal response to the ZLSTA command with the LC parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 LC*sln* CU*cunumber* SUB*subchannel* UNABLE TO ACCESS DEV**

**Segment Reference:** LSTA

**Where:**

*sln* The symbolic line number (SLN).

*cunumber*
The symbolic control unit (CU) number.

*subchannel*
The send line subchannel.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 LC*sln* INVALID INPUT SLN**

**Segment Reference:** LSTA

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA command.

---

**000000000 LC*sln* 3270 LOCAL NOT SYSGENED**

**Segment Reference:** LSTA, LSTP

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA and ZLSTP commands.

---

**000000000 LC ALL OFF OK**

**Segment Reference:** LSTP

**Explanation:** This is the normal response to the ZLSTP command with the LC parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP command.

---

**000000000 LDTI *type number* ONLINE *address* OFFLIN *address* SLOPOL *address***

**Where:**

*type*
The line type.

*number*
The line number.

*address*
The terminal interchange address or station identification.

**Explanation:** This is the normal response to the ZLDTI command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDTI command the format of the display.

---

**000000000 LINE ALREADY ACTIVE**

**Explanation:** The line requested is already active.

**System Action:** None.

**User Response:** None.

---

**000000000 LINE ALREADY IN RCAT**

**Explanation:** The line is already in the routing control application table (RCAT).

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT commands.

---

**000000000 LINE LENGTH FOR TYPE T OR FD EXCEEDED FOR THIS DEV. TYPE. —*type*— MAP NAMED *mapname* TERMINATED**

**Where:**

*type*
The device type.

*mapname*
The map name.

**Explanation:** This is a Type E error. A DDATA statement with a TYPE= T or FD has a CON= parameter coded. This constant data exceeds the line size coded for the device type referenced in the message.

**System Action:** The map referenced in the message is not generated.

**User Response:** None.

---

**000000000 LINE NOT STARTED**

**Segment Reference:** BOLT

**Explanation:** The line did not start.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZBOLT command.

---

**000000000 LINE SECTION FULL**

**Explanation:** The line section is full.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT commands.

---

**000000000 LK *linkid* SERVICE MSG SENT**

**Segment Reference:** LSTA, LSTP

**Where:**

*linkid*
Identifies the link associated with the pseudo line.

**Explanation:** This is the normal response to the ZLSTP command with the PS parameter specified or the ZLSTA command with the PS parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTP and ZLSTA commands.

---

**000000000 LK *linkid* UNABLE TO SEND SERV MSG**

**Segment Reference:** LSTA, LSTP

**Where:**

*linkid*
Identifies the link associated with the pseudo line.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLSTA and ZLSTP commands.

---

**000000000 LN *linestatus***

**Segment Reference:** DLCT

**Where:**

*linestatus*
The line path status information.

**Explanation:** This is the normal response to the ZDLCT command. This message is followed by a display of the line path status.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDLCT command and its display.

---

**000000000 LN *xx zz* AL OFF OK**

**Segment Reference:** ALCT

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**000000000 LN *xx zz* AL ON OK**

**Segment Reference:** ALCT

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**000000000 LN *xx zz* INACTIVE RECORD**

**Segment Reference:** ALCT

**Explanation:** Either bit 0 of SCKIND is zero or the 6 bytes of data for the path are all zero.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**000000000 LN *xx zz* OFF OK**

**Segment Reference:** ALCT

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**000000000 LN *xx zz* ON OK**

**Segment Reference:** ALCT

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**000000000 LN *xx zz* RETRIEVAL ERROR**

**Segment Reference:** ALCT

**Explanation:** There was an error while retrieving the SCK record.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

---

**000000000 LN *xx zz* WAS OFF**

**Segment Reference:** ALCT

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

**000000000 LN *xx zz* WAS ON**

**Segment Reference:** ALCT

**Explanation:** This is the normal response to the ZALCT command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALCT command.

**000000000 LOGI COMPLETE**

**Explanation:** This is the normal response to the LOGI command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGI command.

**000000000 LOGO COMPLETE**

**Explanation:** This is the normal response to the LOGO command.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGO command.

**000000000 LOST INTERRUPT, REINITIALIZATION STARTED ON *xxx***

**Explanation:** The TPF system detected a lost interrupt and retrying.

**System Action:** None.

**User Response:** None.

**000000000 LTON BS *sln* ILLEGAL LINE NBR**

**Segment Reference:** LTON

**Where:**

*sln* The symbolic line number (SLN).

**Explanation:** The SLN referenced in the message is illegal for one of the following reasons:

- The SLN is not a binary synchronous communication (BSC) SLN.
- The BSC line referenced in the message is flagged as *not initialized* in the Symbolic Line Status Line (SLST).
- The BSC line referenced in the message is not a multipoint line.
- The TPF system is not the control station for the BSS line referenced in the message.

**System Action:** None.

**User Response:** Enter the command again and specify a legal BSC SLN.

See *TPF Operations* for more information about the ZLTON command.

**000000000 MADE ACTIVE**

**Explanation:** This is the normal response to the ZROUT command with the STRT parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZROUT command.

**000000000 MAINT COMPLETE**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

**000000000 MAINT COMPLETE — ERRORS DETECTED**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

**000000000 MAP-*mapname*-FOR DEV. TYPE -*type*-GENERATED SUCCESSFULLY**

**Where:**

*mapname*
The map name.

*type*
The device type.

**Explanation:** This is a type C error.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

**000000000 MAP—*mapname*—HAS NO SEQUENCE #, TERMINATED**

**Where:**

*mapname*
The user map name.

**Explanation:** This is a Type E error. The user map referenced in the message is not coded with a SEQNO operand or the sequence number (1 through 9999) is not valid.

**System Action:** None.

**User Response:** Do the following:

1. Correct the error.
2. Run the job again.

See *TPF Database Reference* for more information about mapping support installation.

**000000000 MAP NAME MISSING FROM DPANL STMNT MAP TERMINATED DIR NAME=***dirname*

**Where:**

*dirname*
The directory name.

**Explanation:** This is a Type E error. The source member read from the user map library does not contain a four character map name.

**System Action:** The map is not created.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 MATCH NOT FOUND — SEQ # DEVICE TYPE**

**Explanation:** On a delete or modify Request, no match was found on the file.

**System Action:** None.

**User Response:** Do one of the following:

- For a delete request, no action is necessary.
- For a modify request, validate the data and possibly recreate it as an add request.

---

**000000000 MAXIMUM NUMBER OF LINES EXCEEDED**

**Explanation:** More lines were requested than are available.

**System Action:** None.

**User Response:** None.

---

**000000000 MODIFY STATEMENT — INVALID OPTION IN COL 1, CARD IGNORED**

**Explanation:** This is a Type E error. The modify statement displayed with this error message does not have A, D, M or A in column 1.

**System Action:** This statement is ignored and the next statement is read.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 MPIF IO TRACE TABLE ADDRESSES**

**Explanation:** This is an informational message about the addresses displayed from the MPIF input/output (I/O) trace table.

**System Action:** None.

**User Response:** None.

---

**000000000 MSG TOO LONG**

**Explanation:** The input message exceeds maximum size.

**System Action:** The entry is rejected and the MSG TOO LONG canned message is sent through the output edit CRT driver.

**User Response:** None.

---

**000000000 NBR OF CARDS EXCEEDS IPC LIMIT**

**Explanation:** There is a limit of 22 patch cards for each program so as not to split patch data across an interprocessor communication (IPC) This is an E-type message, that is sent to a printer.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 NO FORWARD CHAIN FOR THIS BLOCK**

**Explanation:** The patch displacement assumes the patch belongs in the next block but no forward chain is available. This is an E-type message that is sent to a printer and a console.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 NO MESSAGE FOR APPLICATION**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for information about the LOGx command.

---

**000000000 NO MESSAGE FOR TERM**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for information about the LOGx command.

---

**000000000 NO MESSAGE PENDING**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for information about the LOGx command.

---

**000000000 NO PS LINES**

**Segment Reference:** LDLS, LSTA

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS and ZLSTA commands.

**000000000 NO PTR AVAILABLE**

**Explanation:** A print request was made but there are no printers available.

**System Action:** None.

**User Response:** None.

**000000000 NOT FILED — SEQ # DEVICE TYPE**

**Explanation:** A file error encountered on an Add or Modify request.

**System Action:** None.

**User Response:** Do the following:

1. Correct the file problem.
2. Enter the Add or Modify request again.

See *TPF Database Reference* for more information about mapping support.

**000000000 NOT LOGGED TO APPLICATION**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for information about the LOGx command.

**000000000 NSC ERR.CNT**

**Segment Reference:** NERR00

**Explanation:** This is the normal response to the ZNERR command with the DSPY parameter specified. This message is followed by a display of the error counters.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNERR command.

**000000000 NUMBER OF AVAILABLE 381 BYTE BLOCKS IS TOO LOW FOR THE TRACE SECTION TO GET A NEW CORE BLOCK WHEN THE PREVIOUS ONE IS FULL.**

**Explanation:** The trace program must check this level before attempting a GETCC because a GETCC failure would result in an irrecoverable system error. (The trace section operates as an extension of CMC0, CMR, or the CCP.) If the core level is not high enough, a system error dump is generated, and the old trace block is reused. This means that the information that was in the block (the previous 12 items) is lost.

**System Action:** None.

**User Response:** None.

**000000000 PATCH DISPL EXCEEDS RESTART AREA ***

**Explanation:** Patch displacement for restart area not within segment blocks. This is a Type E error that is sent to a console device.

**System Action:** None.

**User Response:** None.

**000000000 PATCH ON ODD BOUNDARY ***

**Explanation:** Patch not on halfword boundary. This is a Type E error that is sent to the printer and to the console devices.

**System Action:** None.

**User Response:** None.

**000000000 PGM PARAMETER INVALID**

**Explanation:** The PGM parameter is not RT or CP.

**System Action:** None.

**User Response:** None.

See *TPF General Macros* for more information about the RCATC macro.

**000000000 POS. VALUE – LAST LINE OF NOT VALID SCREEN REQUESTED**

**Explanation:** This is a type E error. You defined a field in a DDATA statement with the POS operand coded for the last line of a 3270 workstation. This line is reserved for system messages.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

**000000000 PRINTER/CARD READER UNAVAILABLE ***

**Explanation:** One or more of the devices required are unavailable. This is a type T error that is sent to a console device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

**000000000 PRINTER ERROR – JOB TERMINATED**

**Explanation:** There was an error on the printer and the job being processed was ended.

**System Action:** None.

**User Response:** None.

---

**000000000 PROG NAME/DATA ID INVALID ***

**Explanation:** The program name data ID does not match the input program name or data ID. This is a type E error that is sent to a printer device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 RCD** *record* **ORD** *ordnum*

**Segment Reference:** CWCV

**Where:**

*record*
The data record name (PKST or SCK).

*ordnum*
The data record ordinal number in hexadecimal.

**Explanation:** This is a time-initiated file address compute program (FACE) message that is sent to the system receive-only (RO) console.

**System Action:** None.

**User Response:** None.

---

**000000000 READD – SEQ # DEVICE TYPE**

**Explanation:** There was a retrieval error on an add request when shuffle of existing records is required.

**System Action:** None.

**User Response:** Do the following:

1. Correct the file error.
2. Initiate a new update tape to add the lost map records to file.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 RECORD FILE ERROR AT LOCATION** *record1 record2* **RECORDS READ =** *record3* **RECORDS WRITTEN =** *record4*

**Segment Reference:** ACPD

**Where:**

*record1*
8 byte record address

*record2*
First 12 bytes of the header record.

*record3*
The records that were read.

*record4*
The records that were written.

**Explanation:** An error occurred when a record was being filed. The error may have occurred for one of the following reasons:

- The block length read from the tape is larger than the block length of the file for the record
- A physical input/output (I/O) error occurred.

The record address may in MCHR format or file address reference format (FARF):

- If the record is in MCHR format, the address contains the module, cylinder, head, and record numbers of the record causing the error.
- If the record is in FARF format, the address consists of a record type and ordinal number.

**System Action:** An attempt is made to print the first 12 bytes of the header record (mapped by the SDFPF DSECT). The data load is continued.

**User Response:** Correct the error and run the job again.

**Note:** A threshold is set for this message to prevent the system from running out of main storage blocks when loading a tape with defective records. The system issues a maximum of 12 error messages. A summary message indicating the total count of record file errors is issued at the end of the load.

See *TPF System Installation Support Reference* for more information about loaders.

---

**000000000 REENTER ORIGINAL MESSAGE**

**Explanation:** An E-type loader LOAD request was not in progress when the TPF system was re-IPLed.

**System Action:** The OLD directory was updated to allow loader functions.

**User Response:** Enter the proper loader function request again, as required.

See *TPF System Installation Support Reference* for more information about the loaders program.

---

**000000000 REINITIALIZATION HAS FAILED ON DEVICE** *devname*

**Where:**

*devname*
The name of the device.

**Explanation:** No action is required.

**System Action:** The lost interrupt retry was unsuccessful. The logical interface is made unavailable and the system is continued.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about the loaders program.

---

**000000000 REINITIALIZATION SUCCESSFUL ON DEVICE** *type*

**Where:**

*type*
The device type.

**Explanation:** No action is required.

**System Action:** The lost interrupt retry was successful.

**User Response:** None.

**000000000 REJECT SYSTEM IN 1052 STATE**

**Segment Reference:** LDLE

**Explanation:** get file storage (GFS) macros issued — GFS is inactive in 1052 state.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLE command.

**000000000 REQ PERM TO USE** *dtype ptype dirno* **—** *time* **MIN LEFT**

**Where:**

*dtype*
The device type.

*ptype*
The pool type.

*dirno*
The directory number.

*time*
The time left until the scheduled recycle.

**Segment Reference:** CYC1

**Explanation:** This is a request to use a short-term pool directory record before the scheduled time limit has expired.

**System Action:** None.

**User Response:** If you want to recycle the pool record, enter the ZGFSP command with the RCY parameter specified. The pool records addressed by this directory can now be reused without the scheduled reuse time expiring.

See *TPF Operations* for more information about the ZGFSP command. See *TPF Database Reference* for more information.

**000000000 REQUESTED DEVICE CAN NOT BE ACCESSED**

**Explanation:** The requested device cannot be accessed.

**System Action:** None.

**User Response:** None.

**000000000 REQUESTED PILOT SYSTEM NOT ON TAPE**

**Segment Reference:** ACPD

**Explanation:** The pilot system requested by the command was not found.

**System Action:** The data load is ended.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

**000000000 RESET STARTED**

**Segment Reference:** LAEC

**Explanation:** This is the normal response to the ZLAEC command with the ALL parameter specified.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLAEC command.

**000000000 RETRIEVAL ERROR**

**Segment Reference:** DLCT

**Explanation:** There was a retrieval error.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZDLCT command.

**000000000 RETRIEVAL ERROR — MSG IGNORED**

**Explanation:** In-core changes were made but keypoint A could not be altered to reflect changes.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLACL, ZLDCL, and ZACLV commands.

**000000000 RETRIEVAL ERROR OF A DUMP BLOCK**

**Explanation:** The 0001E5 system error message is issued unless a dump already given as the error is due to hardware.

**System Action:** None.

**User Response:** None.

**000000000 RETRY WHEN COPY IS THRU**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

**000000000 RID CONVERSION ERROR**

**Explanation:** An error was returned from the RIDCC macro. This is possibly a database problem.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZNETW commands.

**000000000 RTT IN**

**Explanation:** A real-time trace (RTT) start message (either the ZTRAC or the ZCNTM command) was entered and processing completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Program Development Support Reference* for more information about RTT. See *TPF Operations* for more information about the ZTRAC and ZCNTM commands.

**000000000 RTT NOT ACTIVE ENSURED RTT SWITCH IN KEYPOINT B(SW@RTT) IS OFF**

**Explanation:** The ZSTOP command is entered when real-time trace (RTT) is not active.

**System Action:** The RTT switch in keypoint B (SW@RTT) is turned OFF if ON and the entry is exited.

**User Response:** None.

See *TPF Operations* for more information about the ZSTOP command. See *TPF Program Development Support Reference* for more information about RTT.

**000000000 RTT STOP ALREADY ACTIVE**

**Explanation:** One ZSTOP command was already entered and is processing.

**System Action:** The entry is exited.

**User Response:** None.

See *TPF Operations* for more information about the ZSTOP command. See *TPF Program Development Support Reference* for more information about RTT.

**000000000 RTT STOPPED BY SS:** *ssname*

**Where:**

*ssname*
The subsystem name.

**Explanation:** The real-time trace (RTT) stop message (the ZSTOPP command) was entered and processing completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF Program Development Support Reference* for more information about RTT. See *TPF Operations* for more information about the ZSTOP command.

**000000000 RTT UNABLE ALREADY ACTIVE**

**Explanation:** Real-time trace (RTT) is already active when this RTT start message was entered. Only one RTT can be active at a time.

**System Action:** The entry is exited.

**User Response:** RTT that started before should be stopped before a new one can be started.

See *TPF Program Development Support Reference* for more information about RTT.

**000000000 RTT UNABLE IMPROPER INPUT MESSAGE FORMAT**

**Explanation:** A real-time trace (RTT) command (ZTRAC, ZCNTM, or ZSTOP) was entered, but the command format is not correct.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct format of the command. There may be a missing blank or delimiter.
2. Enter the command again by using the correct format.

See *TPF Operations* for more information about the correct format for the ZTRAC, ZCNTM, and ZSTOP commands. See *TPF Program Development Support Reference* for more information about RTT.

**000000000 RTT UNABLE INVALID TRACE OPTIONS**

**Explanation:** A ZTRAC or ZCNTM command was entered to start real-time trace (RTT), but the trace options specified are not valid.

**System Action:** The command is rejected.

**User Response:** Do the following:

1. Determine the correct trace options for the command.
2. Enter the command again by using valid trace options.

See *TPF Operations* for more information about the trace options for the ZTRAC and ZCNTM commands. See *TPF Program Development Support Reference* for more information about RTT.

**000000000 RTT UNABLE NO RTA TAPE MOUNTED**

**Explanation:** The real-time trace (RTT) needs the tape indicated by the tape option byte, which in this case is the RTA tape, to be mounted before RTT is activated. The RTA tape is not mounted.

**System Action:** The entry is exited.

**User Response:** Do the following:

1. Mount the RTA tape.
2. Enter the start command again.

See *TPF Program Development Support Reference* for more information about RTT.

**000000000 RTT UNABLE NO RTL TAPE MOUNTED**

**Explanation:** The real-time trace (RTT) needs the tape indicated by the tape option byte, which in this case is the RTL tape, to be mounted before RTT is activated. The RTL tape is not mounted.

**System Action:** The entry is exited.

**User Response:** Do the following:

1. Mount the RTL tape.
2. Enter the start command again.

See *TPF Program Development Support Reference* for more information about RTT.

**000000000 SCK FIND ERROR**

**Explanation:** There was a FIND macro error.

**System Action:** None.

**User Response:** None.

**000000000 SCK INVALID FILE ADDRESS**

**Explanation:** This is a file macro error.

**System Action:** None.

**User Response:** None.

**000000000 SFD COMPLETE**

**Explanation:** This is the normal response to a ZSELD command and indicates that the selective file dump (SFD) debugging tool has successfully completed processing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZSELD command. See *TPF Program Development Support Reference* for more information about the selective file dump and trace (SFDT) debugging tools, including the SFD debugging tool.

**000000000 SIMULATION NOT ACTIVE**

**Explanation:** End or display the message if the lines not active.

**System Action:** None.

**User Response:** None.

**000000000 SIPC TIMEOUT ON THE FOLLOWING MESSAGE/FUNCTION *procid* PROCESSOR CHAIN CHASE NOT STARTED**

**Where:**

*procid*
The processor ID.

**Explanation:** Recoup phase 1 has stopped processors to continue chain-chasing, but the chain chase has not started.

**System Action:** Recoup is exited.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.
3. Start recoup phase 1 again.

**000000000 SIPC TIMEOUT ON THE FOLLOWING MESSAGE/FUNCTION *procid* PROCESSOR RTA NOT SWITCHED VFA ALSO NOT FILED OUT**

**Where:**

*procid*
The processor ID.

**Explanation:** An attempt to switch RTAs at the start of recoup phase 1 did not complete successfully. If virtual file access (VFA) is in the TPF 4.1 system, the VFA file out also did not complete successfully.

**System Action:** Recoup continues in all processors except the processor named in the message.

**User Response:** Do the following:

1. Determine the cause of the error.
2. Correct the error.
3. Start recoup phase 1 again.

See *TPF Operations* for more information about online recoup and specific messages that relate to subsystem user (SSU) processing.

**000000000 SUBSYSTEM ID/APPL NAME INVALID**

**Explanation:** A message prefix was specified that was not a valid subsystem or a valid application program name.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGx function.

**000000000 SUBSYSTEM INACTIVE OR SSU DORMANT**

**Explanation:** The message prefix specified was for an inactive subsystem or subsystem user.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the LOGx command.

**000000000 SUBSYSTEM NOT IN 1052 STATE IN ALL PROCESSORS — JOB ABORTED**

**Segment Reference:** ACPD

**Explanation:** The ZSLDR command was entered to load a pilot tape, but the subsystem was not in 1052 state. When loading a pilot tape, the subsystem must be in 1052 state unless the ID of the pilot tape is N. If the ID of the pilot tape is N, the subsystem can be in any state.

**System Action:** The command is rejected.

**User Response:** Do one of the following:

- Do the following:
  1. Cycle the TPF system to 1052 state.
  2. Enter the ZSLDR command again to load the pilot tape.
- Do the following:
  1. Use the system test compiler (STC) program to create the pilot tape again with an ID of N.
  2. Enter the ZSLDR command again to load the pilot tape.

See *TPF System Installation Support Reference* for more information about loaders. See *TPF Operations* for more information about the ZSLDR command. See *TPF Program Development Support Reference* for more information about the STC program.

---

**000000000 SYSTEM DATA LOAD COMPLETE GLOBAL RECORDS LOADED REIPL FROM MODULE *maddr* ** ON ALL PROCESSORS ** RECORDS READ = *records1* RECORDS WRITTEN = *records2***

**Segment Reference:** ACPD

**Where:**

*maddr*
The address of the prime module.

*records1*
The records that were read.

*records2*
The records that were written.

**Explanation:** The data load was completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**000000000 SYSTEM DATA LOAD COMPLETE RECORDS READ = *records1* RECORDS WRITTEN = *records2***

**Segment Reference:** ACPD

**Where:**

*records1*
The records that were read.

*records2*
The records that were written.

**Explanation:** The data load was completed successfully.

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**000000000 SYSTEM DATA LOAD ENDED ERRORS DURING LOAD RECORDS READ = *records1* RECORDS WRITTEN = *records2***

**Segment Reference:** ACPD

**Where:**

*records1*
The records that were read.

*records2*
The records that were written.

**Explanation:** This message is issued at the completion of a load in which any of the following errors may have occurred (these errors are indicated by separate error messages):

- A code that is not valid in the record header
- A file address compute program (FACE) input ID or ordinal number that is not valid
- A record file error.

This message may also contain information about global records. If global records were loaded, the following message is added to the previous message, preceding the records read and written information:

```
GLOBAL RECORDS LOADED
REIPL FROM MODULE ccud MAY BE REQUIRED ON ALL PROCESSORS
```

**System Action:** None.

**User Response:** None.

See *TPF System Installation Support Reference* for more information about loaders.

---

**000000000 SYSTEM IN 1052/UTIL STATE**

**Explanation:** An attempt was made to start data collection with the system in 1052/UTIL state.

**System Action:** The data collection is aborted.

**User Response:** None.

---

**000000000 TA NOT VALID FOR 1980 ON 2946**

**Segment Reference:** LRST

**Explanation:** The 1980/24 TA address is out of range.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information in the ZLRST command.

---

**000000000 TAPE *tapename* NOT MOUNTED. SE DUMP BYPASSED**

**Where:**

*tapename*
The tape name.

**Explanation:** The dump device is defined as an RT tape by the CPMOPM option byte but the dump tape is not mounted.

**System Action:** None.

**User Response:** None.

**000000000 TAPE *tapename* — REMOUNT FIRST REEL**

**Where:**

*tapename*
The tape name.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands. Also see the COTT090A message for more information.

**000000000 TAPE *yyy* – REMOUNT PREVIOUS REEL**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the tape support commands. Also see the COTT091A message for more information.

**000000000 TAPE ERR – MAINT ABORTED LAST MAP — SEQ # DEVICE TYPE**

**Explanation:** The tape is bad or the end-of-tape mark is missing.

**System Action:** None.

**User Response:** Do one of the following:

- The end-of-tape mark that is missing requires no action because all records were loaded.
- Create the tape again and try the function again.

See *TPF Database Reference* for more information about mapping support installation.

**000000000 TAPE ERROR — MAINT ABORTED LAST MAP—**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Database Reference* for more information about mapping support installation.

**000000000 TAPE READ ERROR — SUD VALUE — *value*000000 *record1* RECORDS READ = *record2* RECORDS WRITTEN = *record3***

**Segment Reference:** ACPD

**Where:**

*value*
SUD value

*record1*
First 12 bytes of the header record.

*record2*
The records that were read.

*record3*
The records that were written.

**Explanation:** An input/output (I/O) error was found while reading a data record from the SDF tape.

The SUD value and the record header on tape of this record (or of a recent data record) is also indicated.

**System Action:** The record with the error is ignored.

**User Response:** Load the pilot tape again. If the error persists, recreate the pilot tape.

See *TPF System Installation Support Reference* for more information about loaders.

**000000000 TAPE WRITE ERROR**

**Explanation:** The dump currently being processed is deleted from the CDM tape

**Explanation:** The dump that is currently being processed is deleted from the CDM tape content display. Then, the tape switch is activated internally and the dump is reprocessed as the first on the new CDM tape.

**System Action:** None.

**User Response:** None.

**000000000 TA0PP INITIALIZATION COMPLETE**

**Explanation:** A ZAUTH command was entered with the INITIALI parameter specified and the terminal application authorization table records were initialized.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

**000000000 TERMINATE ALREADY IN PROGRESS**

**Explanation:** The input message specified that data collection is to be ended, but the system is already in the process of ending data collection.

**System Action:** None.

**User Response:** None.

**000000000 TEST – INVALID ENTRY**

**Explanation:** This message activates the CVZZ program that can be modified as required by the installation. For example, the CVZZ program can be modified to activate test driver programs. If left unmodified, the CVZZ program returns the TEST – INVALID ENTRY message to the prime computer room agent set (CRAS) console that input the message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTEST command.

**000000000 TIME IS NOW** *hoursminutes*

**Where:**

*hours*
Hours (24 hour clock)

*minutes*
Minutes

**Explanation:** Responses are sent by the system test vehicle (STV) to the prime CRAS in the format previously described. The same message is logged on the real-time (RTL) tape with the other input/output (I/O) messages in the sequence received.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the program test vehicle (PTV).

---

**000000000 TO AND FROM CPUID ARE IDENTICAL**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALMT command.

---

**000000000 TO CPU** *b* **NOT IN OR ABOVE CRAS STATE**

**Where:**

*cpuid*
The CPU ID.

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZALMT command.

---

**000000000 TO TERMINATE TEST UNIT DEACTIVE LINES AND ENTER**

**Explanation:** The program test vehicle (PTV) waits for an indication that live input has ended before proceeding to the next test unit after all messages from the current test unit are processed. PTV indicates the end of test message input in these circumstances with this message.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the program test vehicle (PTV).

---

**000000000 TOTAL NUMBER OF GENERATED MAP FIELDS NOT EQUAL TO THE NUMBER CODED IN MAXFLDS MAP–***mapname***–TERMINATED**

**Where:**

*mapname*
The name of the map.

**Explanation:** This error is type E. This error occurs when you have coded the MAXFLDS= parameter but the total number of input fields for the map specified does not equal that number coded.

**System Action:** The map referenced in the message is not generated.

**User Response:** None.

See *TPF Database Reference* for more information about the mapping support installation.

---

**000000000 TPF CANNOT ACCESS SMP***procid*

**Where:**

*procid*
The processor ID.

**Explanation:** The TPF 4.1 system is unable to access the system message processor (SMP) for the processor requested.

**System Action:** The command is rejected. The system continues to run.

**User Response:** Your system programmer should check interprocessor communications (IPC).

---

**000000000 TRCE INITIATED**

**Explanation:** This is the normal response to a ZTRCE command and indicates that the selective file trace (SFT) debugging tool has started processing.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTRCE command. See *TPF Program Development Support Reference* for more information about the selective file dump and trace (SFDT) debugging tools, including the SFT debugging tool.

---

**000000000 TRCE COMPLETED**

**Explanation:** This is the normal response to a ZTHLT command and indicates that the selective file trace (SFT) debugging tool has been stopped.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZTHLT command. See *TPF Program Development Support Reference* for more information about the selective file dump and trace (SFDT) debugging tools, including the SFT debugging tool.

---

**000000000 UAT FACE ERROR**

**Segment Reference:** RCBI

**Explanation:** This message is sent because of an error return from the file address compute program (FACE) 000470 system error. The message is sent from the ALL, MOD, or SGL functions.

**System Action:** None.

**User Response:** None.

**000000000 UAT FIND ERROR**

**Segment Reference:** RCBI

**Explanation:** This message is sent because of an error during the FINWC of the routing control block (RCB) initialization table. This message comes along with the 000471 system error. The message is sent from ALL, MOD, or the SGL functions.

**System Action:** None.

**User Response:** None.

**000000000 UA1UA RECORD NOT FOUND FOR TERMINAL**

**Explanation:** The agent assembly area (AAA) initialization table entry for the terminal cannot be found on file.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

**000000000 UNABLE OTHER ACTIVITY IN PROGRESS**

**Explanation:** The load and dump of the 3705 communications controller is active.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the Z3705 TRC command. See *TPF Database Reference* for more information about the 3705 communications controller.

**000000000 UNABLE TO FILE — NO RELEASE OMSG**

**Explanation:** None.

**System Action:** A system error (SERRC) is issued.

**User Response:** None.

**000000000 UNABLE TO FILE — NO RELEASE SCROLL MAP.**

**Explanation:** None.

**System Action:** A system error (SYSRA) is issued.

**User Response:** None.

**000000000 UNABLE TO FIND AN OMSG BLOCK**

**Explanation:** None.

**System Action:** UIH issues a system error (SYSRA) (#01F011) with the Exit option or a SYSRA (#11F027) with the Return option when there is an AI-NAK retransmission.

**User Response:** None.

**000000000 UNABLE TO FIND CTKX ***

**Explanation:** The system is unable to retrieve CTKX. This is a T-type message that sent to both the printer and console devices.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

**000000000 UNABLE TO FIND KEYPOINT ***

**Explanation:** The file address is not valid for a keypoint in CTKX. This is an E-type message that is sent to both the printer and console devices.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

**000000000 UNABLE TO FIND OLD SCROLL MAP-01F00E BY UIS2**

**Explanation:** None.

**System Action:** A system error is issued with a return requested. Upon return, the program is returned to normal processing.

**User Response:** None.

**000000000 UNABLE TO FIND OMSG**

**Explanation:**

**System Action:** A system error (SYSRA) is issued.

**User Response:** None.

**000000000 UNABLE TO FIND SCROLL MAP**

**Explanation:** None.

**System Action:** A system error (SYSRA) is issued.

**User Response:** None.

**000000000 UNABLE TO PROCESS**

**Explanation:** There was a retrieval error on the map index table.

**System Action:** None.

**User Response:** Do the following:

1. Correct the bad file and file record.
2. Try the request again.

See *TPF Database Reference* for more information about the mapping support installation.

---

**000000000 UNABLE TO PROCESS — LIST FULL**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

---

**000000000 UNABLE TO PROCESS NOT FILED – SEQ # DEVICE TYPE**

**Explanation:** There was a retrieval error on an existing file record.

**System Action:** None.

**User Response:** Do the following:

1. Correct the file record.
2. Try the request again.

See *TPF Database Reference* for more information about the mapping support installation.

---

**000000000 UNBL TO FIND FILE ERROR REC**

**Explanation:** AI lines only — cannot find the AI Link Error Counter record.

**Note:** The line error count is the accumulation of line errors since the line is assigned. The assignment of a line resets the error count to zero.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLE command.

---

**000000000 UNEXPECTED PATCH TYPE IN IPC MESSAGE ***

**Explanation:** The patch type in an interprocessor communication (IPC) was not valid for synchronizing across processors.

This is a W-type message that is sent to a console device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the unit record commands.

---

**000000000 UNKNOWN KEYPOINT NAME ***

**Explanation:** The keypoint address is not valid. This is am E-type message that is sent to a printer device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about unit record commands.

---

**000000000 U/R DEVICE ERROR ***

**Explanation:** There is a hardware error with the printer. This is a T-type message that is sent to a console device.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about unit record commands.

---

**000000000 WCC NOT CODED CORRECTLY MAP—*mapname*—TERMINATED**

**Where:**

*mapname*
The map name.

**Explanation:** This is a Type E error. The user map referenced in the message and found on the DPANL WCCC= operand was not coded according to specifications or the option is misspelled.

**System Action:** The map is not created.

**User Response:** Do the following:

1. Correct the incorrect WCC option.
2. Run the job again.

See *TPF Database Reference* for more information about mapping support installation.

---

**000000000 WGTA RETRIEVAL ERROR**

**Explanation:** There was an error retrieving the WGTA entry for the terminal.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZAUTH command.

---

**000000000 WRITE TAPEMARK ERROR**

**Explanation:** Tape switch is activated immediately.

**System Action:** None.

**User Response:** None.

---

## 000000000

**000000000 WRONG TAPE**

**Explanation:** None.

**System Action:** None.

**User Response:** None.

**000000000 3270 LOCAL NOT SYSGENED**

**Segment Reference:** LDLS

**Explanation:** None.

**System Action:** None.

**User Response:** None.

See *TPF Operations* for more information about the ZLDLS command.
